1 Overview

1.1 What Is MRS?

Big data is a huge challenge facing the Internet era as the data volume and types increase rapidly. Conventional data processing technologies, such as single-node storage and relational databases, are unable to solve the emerging big data problems. In this case, the Apache Software Foundation (ASF) has launched an open source Hadoop big data processing solution. Hadoop is an open source distributed computing platform that can fully utilize computing and storage capabilities of clusters to process massive amounts of data. If enterprises deploy Hadoop systems by themselves, the disadvantages include high costs, long deployment period, difficult maintenance, and inflexible use.

To solve the preceding problems, the cloud provides MapReduce Service (MRS) for managing the Hadoop system. With MRS, you can deploy a Hadoop cluster in just one click. MRS provides enterprise-level big data clusters on the cloud. Tenants can fully control clusters and easily run big data components such as Storm, Hadoop, Spark, HBase, and Kafka. MRS is fully compatible with open source APIs, and incorporates advantages of the cloud computing and storage and big data industry experience to provide customers with a full-stack big data platform featuring high performance, low cost, flexibility, and ease-of-use. In addition, the platform can be customized based on service requirements to help enterprises quickly build a massive data processing system and discover new value points and business opportunities by analyzing and mining massive amounts of data in real time or in non-real time.

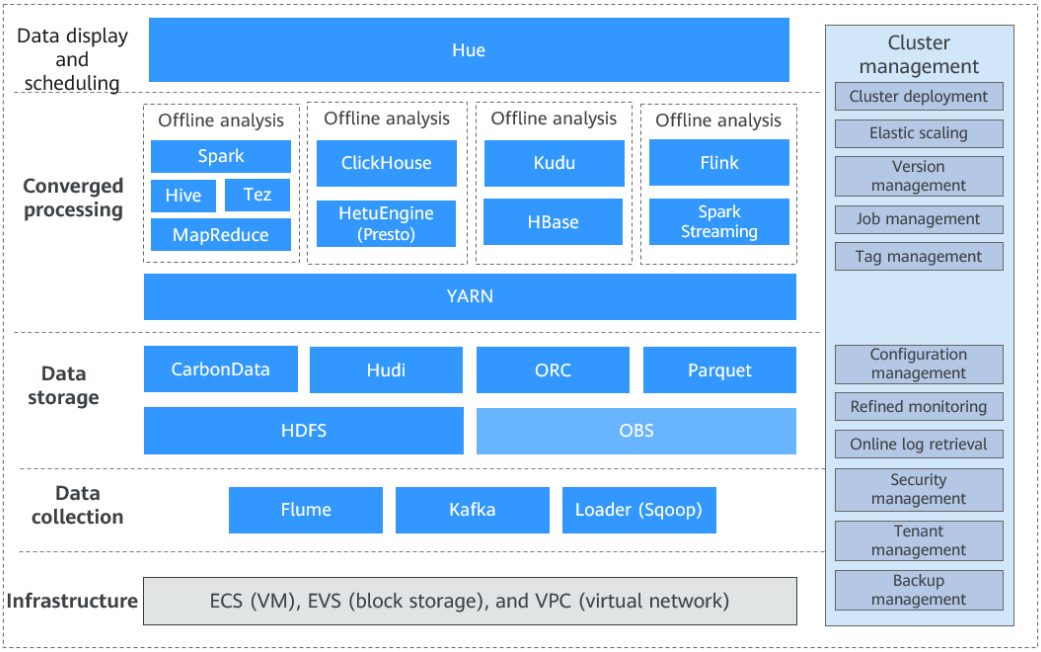
Product Architecture

Figure 1-1 shows the MRS logical architecture.

NOTE

MRS 3.x or later does not support patch management on the management console.

Figure 1-1 MRS architecture



MRS architecture includes infrastructure and big data processing phases.

- Infrastructure

  MRS big data clusters are built based on Elastic Cloud Server (ECS), and make full use of the high reliability and security capabilities of the virtualization layer.

  - A Virtual Private Cloud (VPC) is a virtual internal network provided for each tenant. It is isolated from other networks by default.
  - Elastic Volume Service (EVS) provides highly reliable and high-performance storage.
  - ECS provides scalable VMs, and works with VPCs, security groups, and the EVS multi-replica mechanism to build an efficient, reliable, and secure computing environment.

- Data integration

  The data integration layer provides data access capabilities of MRS clusters, including components Flume (data ingestion), Loader (relational data import), and Kafka (highly reliable message queue). Data can be imported to MRS clusters from various data sources.

- Data storage

  MRS clusters can store structured and unstructured data, and support multiple efficient formats to meet the requirements of different computing engines.

  - HDFS is a general-purpose distributed file system on a big data platform.
  - OBS is an object storage service that features high availability and low cost.
  - HBase supports data storage with indexes, and is applicable to high-performance index-based query scenarios.

- Data computing

  MRS provides multiple mainstream computing engines, including Storm (stream computing), MapReduce (batch processing), Tez (DAG model), Spark (in-memory computing), SparkStreaming (micro-batch stream computing), and Flink (stream computing), to meet the requirements of various big data application scenarios. The engines convert data structures and logic into data models that meet service requirements.

- Data analysis

  Based on the preset data model and easy-to-use SQL data analysis, users can select Hive (data warehouse), SparkSQL, and Presto (interactive query engine).

- Data display and scheduling

  To present data analysis results, MRS is integrated with Data Lake Factory (DLF), which is a one-stop big data collaboration development platform, to help you easily complete multiple tasks, such as data modeling, data integration, script development, job scheduling, and job monitoring. This makes big data more accessible than ever before, helping you quickly build big data processing centers.

- Cluster management

  All components of the Hadoop-based big data ecosystem are deployed in distributed mode, and their deployment, management, and O&M are complex.

  MRS provides a unified O&M management platform for cluster management, supporting one-click cluster deployment, multi-version selection, as well as manual scaling and auto scaling of clusters without service interruption. In addition, MRS provides job management, resource tag management, and O&M of the preceding data processing components at each layer. It also provides one-stop O&M capabilities, covering monitoring, alarm reporting, configuration, and patch upgrade.

Product Advantages

MRS has a powerful Hadoop kernel team and is deployed based on enterprise-level FusionInsight big data platform. MRS has been deployed on tens of thousands of nodes and can ensure Service Level Agreements (SLAs) for multi-level users.

MRS has the following advantages:

- High performance

  MRS supports self-developed CarbonData storage technology. CarbonData is a high-performance big data storage solution. It allows one data set to apply to multiple scenarios and supports features, such as multi-level indexing, dictionary encoding, pre-aggregation, dynamic partitioning, and quasi-real-time data query. This improves I/O scanning and computing performance and returns analysis results of tens of billions of data records in seconds. In addition, MRS supports self-developed enhanced scheduler Superior, which breaks the scale bottleneck of a single cluster and is capable of scheduling over 10,000 nodes in a cluster.

- Cost-effectiveness

Based on diversified cloud infrastructure, MRS provides various computing and storage choices and separates computing from storage, delivering cost-effective massive data storage solutions. MRS supports auto scaling to address peak and off-peak service loads, releasing idle resources on the big data platform for customers. MRS clusters can be created and scaled out when you need them, and can be terminated or scaled in after you use them, minimizing cost.

- High security

  MRS delivers enterprise-level big data multi-tenant permissions management and security management to support table-based and column-based access control and data encryption.

- Easy O&M

  MRS provides a visualized big data cluster management platform, improving O&M efficiency. MRS supports rolling patch upgrade and provides visualized patch release information and one-click patch installation without manual intervention, ensuring long-term stability of user clusters.

- High reliability

  The proven large-scale reliability and long-term stability of MRS meet enterprise-level high reliability requirements. In addition, MRS supports automatic data backup across AZs and regions, as well as automatic anti-affinity. It allows VMs to be distributed on different physical machines.

1.2 Advantages of MRS Compared with Self-Built Hadoop

MRS provides enterprise-level big data clusters on the cloud. Tenants can fully control the clusters and run big data components such as Hadoop, Spark, HBase, Kafka, and Storm with ease. MRS frees you from hardware purchase and maintenance. MRS is built based on FusionInsight big data enterprise-class platform, and has been deployed on tens of thousands of nodes in the industry, providing multi-level SLA assurance with professional Hadoop kernel service support. Compared with self-built Hadoop clusters, MRS has the following advantages:

1. **MRS supports one-click cluster creation, deletion, and scaling. You can use an elastic IP address (EIP) to access MRS Manager, making big data clusters easier to use.**
   - Self-built big data clusters pose problems such as high costs, long periods, difficult and inflexible O&M. To solve these problems, MRS provides one-click cluster creation, deletion, scale-out, and scale-in, allowing you to customize the cluster type, component range, number of nodes of each type, VM specifications, availability zones (AZs), VPC network, and authentication information. MRS can automatically create a cluster that meets the configuration requirements. In addition, you can quickly create multi-application clusters, for example, Hadoop analysis cluster, HBase cluster, and Kafka cluster. MRS supports heterogeneous cluster deployment. That is, VMs of different specifications can be combined in a cluster based on CPU types, disk capacities, disk types, and memory sizes.

- MRS provides an EIP-based secure channel for you to easily access the web UIs of components. This is more convenient than binding an EIP by yourself, and you can access the web UIs with a few clicks, avoiding the steps for logging in to a VPC, adding security group rules, and obtaining a public IP address.
- MRS provides custom bootstrap actions to flexibly configure your dedicated clusters. Third-party software that is not supported by MRS can be automatically installed, allowing you to perform custom operations such as modifying the cluster running environment.
- MRS supports the WrapperFS feature, provides the OBS translation capability (that is, access to OBS through address mapping) and can smoothly migrate data from HDFS to OBS. After migration, you can access the data stored in OBS from clients without modifying service code logic.

2. **MRS supports auto scaling, which is more cost-effective than the self-built Hadoop cluster.**

   MRS supports auto scaling to address peak and off-peak service loads. It applies for extra resources during peak hours and releases idle resources during off-peak hours, helping you save idle resources on the big data platform during off-peak hours, minimize costs, and focus on core services.

   In big data applications, especially in periodic data analysis and processing, cluster computing resources need to be dynamically adjusted based on service data changes to meet service requirements. The auto scaling function of MRS enables clusters to be elastically scaled out or in based on cluster loads. In addition, if the data volume changes regularly and you want to scale out or in a cluster before the data volume changes, you can use the MRS resource plan feature. MRS supports two types of auto scaling policies: auto scaling rules and resource plans

   - Auto scaling rules: You can increase or decrease Task nodes based on real-time cluster loads. Auto scaling will be triggered when the data volume changes but there may be some delay.
   - Resource plans: If the data volume changes periodically, you can create resource plans to resize the cluster before the data volume changes, thereby avoiding a delay in increasing or decreasing resources.

   Both auto scaling rules and resource plans can trigger auto scaling. You can configure both of them or configure one of them. Configuring both resource plans and auto scaling rules improves the cluster node scalability to cope with occasionally unexpected data volume peaks.

3. **MRS supports storage-compute decoupling, greatly improving the resource utilization of big data clusters.**

   In the traditional big data architecture where storage and compute resources are integrated, scaling-out is difficult and resources are not well-utilized. To solve these problems, MRS adopts a compute-storage separation architecture. Based on OBS, the storage achieves 99.999999999% reliability and unlimited capacity, supporting continuous growth of enterprise data. Computing resources can be elastically scaled in or out from 0 to *N* nodes. Hundreds of nodes can be quickly provisioned. With the new architecture, compute nodes can be elastically scaled. OBS-based cross-AZ data storage ensures higher reliability, frees you from worrying about emergencies such as earthquakes and fiber cuts. Storage and compute resources can be flexibly configured and

elastically scaled as required. This makes resource allocation more accurate and reasonable, greatly improving the resource utilization of big data clusters and reducing the comprehensive analysis cost by 50%.

In addition, the high performance compute-storage separation architecture breaks the limit of parallel computing of the integrated storage-compute architecture. It maximizes the high bandwidth and high concurrency of OBS, and optimizes the data access efficiency and in-depth parallel computing (such as metadata operation and write algorithm optimization) to improve higher performance.

4. **MRS supports self-developed CarbonData and Superior Scheduler, delivering better performance.**
   - MRS supports self-developed CarbonData storage technology. CarbonData is a high-performance big data storage solution. It allows one data set to apply to multiple scenarios and supports features, such as multi-level indexing, dictionary encoding, pre-aggregation, dynamic partitioning, and quasi-real-time data query. This improves I/O scanning and computing performance and returns analysis results of tens of billions of data records in seconds.
   - In addition, MRS supports self-developed Superior Scheduler, which enhances the scaling capability of a single cluster and is capable of scheduling over 10,000 nodes in a cluster. Superior Scheduler is a scheduling engine designed for the Hadoop YARN distributed resource management system. It is a high-performance and enterprise-level scheduler designed for converged resource pools and multi-tenant service requirements. Superior Scheduler achieves all functions of open-source schedulers, Fair Scheduler, and Capacity Scheduler. Compared with the open-source schedulers, Superior Scheduler is enhanced in the enterprise multi-tenant resource scheduling policy, resource isolation and sharing by multiple users in a tenant, scheduling performance, system resource utilization, and cluster scalability, and is designed to replace open source schedulers.
5. **MRS optimizes software and hardware based on Kunpeng processors to fully release hardware computing power and achieve cost-effectiveness.**

   MRS supports self-developed Kunpeng servers whose multi-core and high-concurrency capabilities are fully utilized to provide full-stack self-optimized chips, and uses self-developed EulerOS, JDK, and data acceleration layer to ensure hardware performance, delivering high computing power for big data computing. With the similar performance, the cost of the end-to-end big data solution is reduced by 30%.
6. **MRS supports multiple isolation modes and multi-tenant permission management of enterprise-level big data, ensuring higher security.**
   - MRS supports resource deployment and isolation of physical resources in dedicated zones. You can flexibly combine computing and storage resources, such as dedicated computing resources + shared storage resources, shared computing resources + dedicated storage resources, and dedicated computing resources + dedicated storage resources. An MRS cluster supports multiple logical tenants. Permission isolation enables the computing, storage, and table resources of the cluster to be divided based on tenants.
   - With Kerberos authentication, MRS provides role-based access control (RBAC) and sound audit functions.

- With Cloud Trace Service (CTS) being interconnected with MRS, you are provided with operation records of MRS resource operation requests and request results for querying, auditing, and backtracking. You can use CTS to audit and trace all cluster operations.
- It is proved that with Host Security Service (HSS) interconnected with MRS, service security is enhanced without deteriorating functions and performance.
- MRS supports unified user login based on web UI. Manager provides user authentication, which grants you permission to access a cluster.
- MRS supports data storage encryption, encrypted storage of all user accounts and passwords, encrypted transmission of data channels, and bidirectional certificate authentication for cross-trusted-zone data access of service modules.
- MRS big data clusters provide a complete multi-tenant solution for enterprise-level big data. Multi-tenant refers to a collection of multiple resources (each resource set is a tenant) in an MRS big data cluster. It can allocate and schedule resources, including computing and storage resources. Multi-tenant isolates the resources of a big data cluster into resource sets. Users can lease desired resource sets to run applications and jobs and store data. In a big data cluster, multiple resource sets can be deployed to meet diverse requirements of multiple users.
- MRS supports fine-grained permission management. With the fine-grained authorization capability provided by CLOUD IAM, MRS can specify the operations, resources, and request conditions of specific services. This mechanism allows for more flexible policy-based authorization, meeting requirements for secure access control. For example, you can grant MRS users only the permissions for performing specified operations on MRS clusters, such as creating a cluster and querying a cluster list rather than deleting a cluster. In addition, MRS supports fine-grained permission management of OBS for multiple tenants. Permissions to access OBS buckets and objects in the buckets are differentiated based on user roles, so that MRS users can each control a different directory in OBS buckets.
- MRS supports enterprise project management. The enterprise project is one way of managing cloud resources. Enterprise Management provides comprehensive management services for enterprise customers, such as cloud resources, personnel, permissions, and financial statuses. Common management consoles are oriented to the control and configuration of individual cloud products. The Enterprise Management console, in contrast, is more focused on resource management. It is designed to help enterprises manage cloud-based resources, personnel, permissions, and finances, in a hierarchical management manner, such as management of companies, departments, and projects. MRS allows users who have enabled Enterprise Project Management Service (EPS) to configure enterprise projects for a cluster during cluster creation and use EPS to manage MRS resources by group. This feature is applicable to scenarios where you need to manage multiple resources by group and perform operations such as permission control and project-based fee query on enterprise projects.

7. **MRS implements HA for all management nodes and supports comprehensive reliability mechanism, making the system more reliable.**

Based on Apache Hadoop open-source software, MRS optimizes and improves the reliability of main service components.

- HA for all management nodes

  In the Hadoop open-source version, data and compute nodes are managed in a distributed system, in which a single point of failure (SPOF) does not affect the operation of the entire system. However, a SPOF may occur on management nodes running in centralized mode, which becomes the weakness of the overall system reliability.

  MRS provides similar double-node mechanisms for all management nodes of the service components, such as Manager, Presto, HDFS NameNodes, Hive Servers, HBase HMasters, YARN Resource Managers, Kerberos Servers, and Ldap Servers. All of them are deployed in active/standby mode or configured with load sharing, effectively preventing SPOFs from affecting system reliability.

- Comprehensive reliability mechanism

  By reliability analysis, the following measures to handle software and hardware exceptions are provided to improve the system reliability:

  - After power supply is restored, services are running properly regardless of a power failure of a single node or the whole cluster, ensuring data reliability in case of unexpected power failures. Key data will not be lost unless the hard disk is damaged.
  - Health status checks and fault handling of the hard disk do not affect services.
  - The file system faults can be automatically handled, and affected services can be automatically restored.
  - The process and node faults can be automatically handled, and affected services can be automatically restored.
  - The network faults can be automatically handled, and affected services can be automatically restored.

8. **MRS provides a visualized big data cluster management interface in a unified manner, making O&M easier.**

   - On the big data cluster management interface, service startup and stopping, configuration modification, and health check are available. MRS also provides visualized and convenient cluster management, monitoring, and alarm functions. Additionally, you can check and audit the system health status in one click, ensuring normal system running and lowering system O&M costs.
   - After Simple Message Notification (SMN) is configured, MRS can send real-time cluster health status information, including cluster changes and component alarms in real time to you through SMS messages or emails, facilitating O&M, real-time monitoring, and real-time alarm sending.
   - MRS supports rolling patch upgrade and provides visualized patch release information and one-click patch installation without manual intervention, ensuring long-term stability of user clusters.
   - If a problem occurs when you use an MRS cluster, you can initiate O&M authorization on the MRS management console. O&M personnel can

help you quickly locate the problem, and you can revoke the authorization at any time. You can also initiate log sharing on the MRS management console to share a specified log scope with O&M personnel, so that O&M personnel can locate faults without accessing the cluster.

- MRS supports to dump logs about cluster creation failures to OBS for O&M personnel to obtain and analyze the logs.

9. **MRS has an open ecosystem and supports seamless interconnection with peripheral services, allowing you to quickly build a unified big data platform.**
   - Based on MRS, a full-stack big data service, enterprises can build a unified big data platform for data access, data storage, data analysis, and value mining, and interconnect with Data Lake Governance Center (DGC) and data visualization services to help customers easily resolve difficulties in data channel cloudification, big data job development and scheduling, and data display. Thereby, customers are free from complex big data platform construction and professional big data optimization and maintenance, and they can focus on industry applications and use one piece of data in multiple service scenarios. DGC is a one-stop operation platform for entire data lifecycle management. It provides data integration, data development, data governance, data service, and data visualization functions. MRS data can be connected to DGC, which greatly reduces the threshold for using big data. Based on the visualized development GUI, diverse data development types (script development and job development), fully hosted job scheduling and O&M monitoring capabilities, and built-in industry data processing pipelines, it helps you quickly build big data processing centers with visualized development processes and online collaborative operations. In this way, data can be well-managed and scheduled for real profits quicker.
   - MRS is fully compatible with the open source big data ecosystem. With abundant data and application migration tools, MRS helps you quickly migrate data from your own platforms without code modification and service interruption.

1.3 Application Scenarios

Big data is ubiquitous in people's lives. MRS is suitable to process big data in the industries such as the Internet of things (IoT), e-commerce, finance, manufacturing, healthcare, energy, and government departments.

Large-scale data analysis

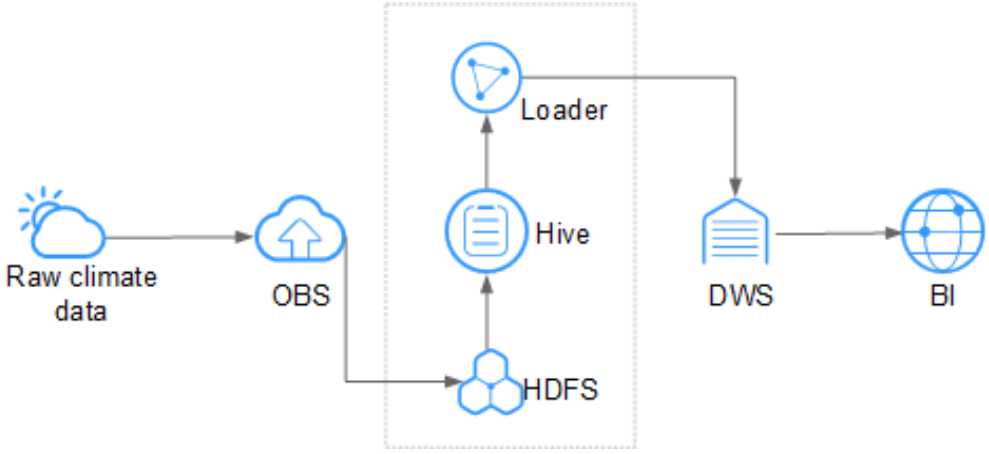
Large-scale data analysis is a major scenario in modern big data systems. Generally, an enterprise has multiple data sources. After data is accessed,extract, transform, and load (ETL) processing is required to generate modelized data for each service module to analyze and sort out data. This type of service has the following characteristics:

- The requirements for real-time execution are not high, and job execution time ranges from dozens of minutes to hours.
- The data volume is large.

- There are various data sources and diversified formats.
- Data processing usually consists of multiple tasks, and resources need to be planned in detail.

In the environmental protection industry, climate data is stored on OBS and periodically dumped into HDFS for batch analysis. 10 TB of climate data can be analyzed in 1 hour.

Figure 1-2 Large-scale data analysis in the environmental protection industry



MRS has the following advantages in this scenario.

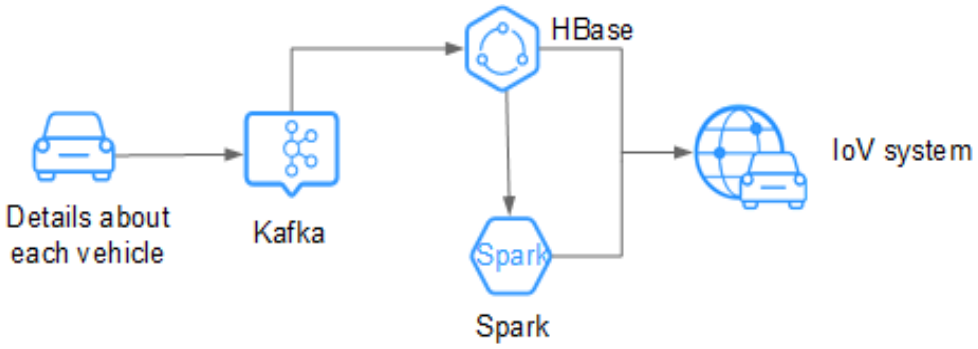
- Low cost: OBS offers cost-effective storage.
- Massive data analysis: TB/PB-level data is analyzed by Hive.
- Visualized data import and export tool: Loader exports data to Data Warehouse Service (DWS) for business intelligence (BI) analysis.

Large-scale data storage

A user who has a large amount of structured data usually requires index-based quasi-real-time query capabilities. For example, in an Internet of Vehicles (IoV) scenario, vehicle maintenance information is queried by vehicle number. Therefore, vehicle information is indexed based on vehicle numbers when it is being stored, to implement second-level response in this scenario. Generally, the data volume is large. The user may store data for one to three years.

For example, in the IoV industry, an automobile company stores data on HBase, which supports PB-level storage and CDR queries in milliseconds.

Figure 1-3 Large-scale data storage in the IoV industry



MRS has the following advantages in this scenario.

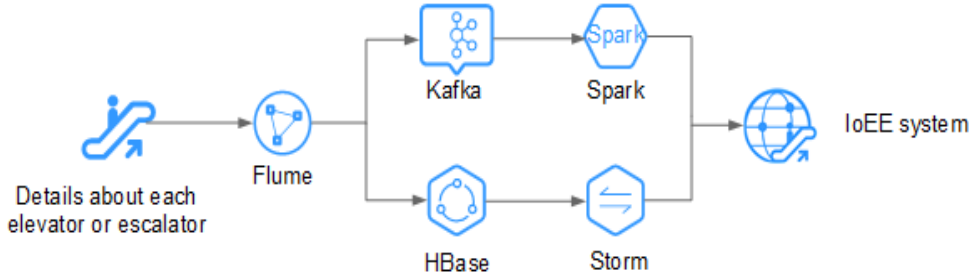
- Real time: Kafka accesses massive amounts of vehicle messages in real time.
- Massive data storage: HBase stores massive volumes of data and supports data queries in milliseconds.
- Distributed data query: Spark analyzes and queries massive volumes of data.

Real-time data processing

Real-time data processing is usually used in scenarios such as anomaly detection, fraud detection, rule-based alarming, and service process monitoring. Data is processed while it is being inputted to the system.

For example, in the Internet of elevators & escalators (IoEE) industry, data of smart elevators and escalators is imported to MRS streaming clusters in real time for real-time alarming.

Figure 1-4 Low-latency streaming processing in the IoEE industry



MRS has the following advantages in this scenario.

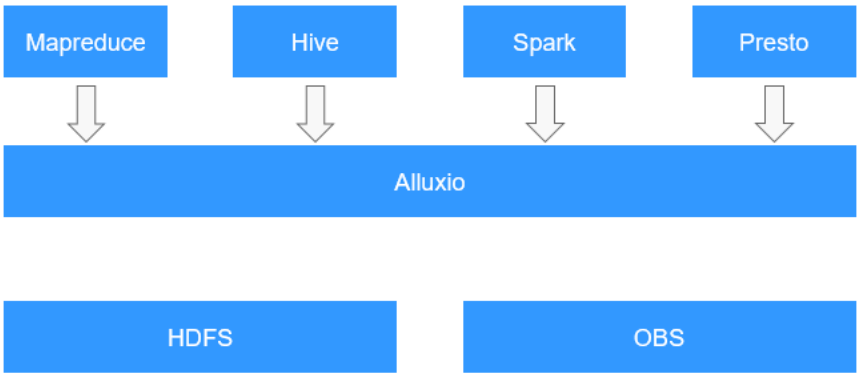
- Real-time data ingestion: Flume implements real-time data ingestion and provides various data collection and storage access methods.
- Data source access: Kafka accesses data of tens of thousands of elevators and escalators in real time.

1.4 Components

1.4.1 Alluxio

Alluxio is data orchestration technology for analytics and AI for the cloud. In the MRS big data ecosystem, Alluxio lies between computing and storage. It provides a data abstraction layer for computing frameworks including Apache Spark, Presto, MapReduce, and Apache Hive, so that upper-layer computing applications can access persistent storage systems including HDFS and OBS through unified client APIs and a global namespace. In this way, computing and storage are separated.

Figure 1-5 Alluxio architecture



Advantages:

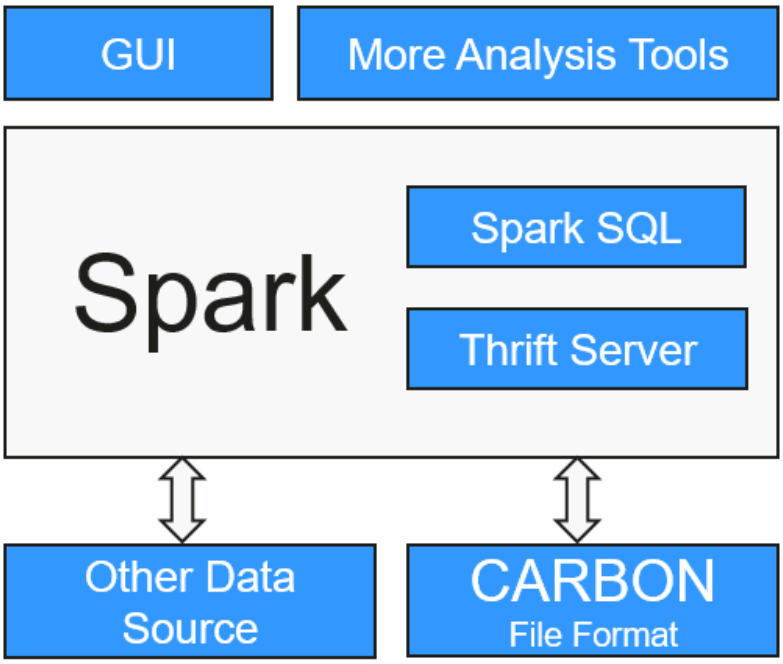
- Provides in-memory I/O throughput, and makes elastically scale data-driven applications cost effective.
- Simplified cloud and object storage access
- Simplified data management and a single point of access to multiple data sources
- Easy application deployment

For details about Alluxio, visit **https://docs.alluxio.io/os/user/stable/en/Overview.html**.

1.4.2 CarbonData

CarbonData is a new Apache Hadoop native data-store format. CarbonData allows faster interactive queries over PetaBytes of data using advanced columnar storage, index, compression, and encoding techniques to improve computing efficiency. In addition, CarbonData is also a high-performance analysis engine that integrates data sources with Spark.

Figure 1-6 Basic architecture of CarbonData



The purpose of using CarbonData is to provide quick response to ad hoc queries of big data. Essentially, CarbonData is an Online Analytical Processing (OLAP) engine, which stores data using tables similar to those in Relational Database Management System (RDBMS). You can import more than 10 TB data to tables created in CarbonData format, and CarbonData automatically organizes and stores data using the compressed multi-dimensional indexes. After data is loaded to CarbonData, CarbonData responds to ad hoc queries in seconds.

CarbonData integrates data sources into the Spark ecosystem. You can use Spark SQL to query and analyze data, or use the third-party tool ThriftServer provided by Spark to connect to Spark SQL.

CarbonData features

- SQL: CarbonData is compatible with Spark SQL and supports SQL query operations performed on Spark SQL.
- Simple Table dataset definition: CarbonData allows you to define and create datasets by using user-friendly Data Definition Language (DDL) statements. CarbonData DDL is flexible and easy to use, and can define complex tables.
- Easy data management: CarbonData provides various data management functions for data loading and maintenance. It can load historical data and incrementally load new data. The loaded data can be deleted according to the loading time and specific data loading operations can be canceled.
- CarbonData file format is a columnar store in HDFS. It has many features that a modern columnar format has, such as splittable and compression schema.

Unique features of CarbonData

- Stores data along with index: Significantly accelerates query performance and reduces the I/O scans and CPU resources, when there are filters in the query. CarbonData index consists of multiple levels of indices. A processing

framework can leverage this index to reduce the task it needs to schedule and process, and it can also perform skip scan in more finer grain unit (called blocklet) in task side scanning instead of scanning the whole file.

- Operable encoded data: Through supporting efficient compression and global encoding schemes, CarbonData can query on compressed/encoded data. The data can be converted just before returning the results to the users, which is "late materialized".
- Supports various use cases with one single data format: like interactive OLAP-style query, Sequential Access (big scan), and Random Access (narrow scan).

Key technologies and advantages of CarbonData

- Quick query response: CarbonData features high-performance query. The query speed of CarbonData is 10 times of that of Spark SQL. It uses dedicated data formats and applies multiple index technologies, global dictionary code, and multiple push-down optimizations, providing quick response to TB-level data queries.
- Efficient data compression: CarbonData compresses data by combining the lightweight and heavyweight compression algorithms. This significantly saves 60% to 80% data storage space and the hardware storage cost.

For details about CarbonData architecture and principles, see **https://carbondata.apache.org/**.

1.4.3 ClickHouse

Introduction to ClickHouse

ClickHouse is an open-source columnar database oriented to online analysis and processing. It is independent of the Hadoop big data system and features ultimate compression rate and fast query performance. In addition, ClickHouse supports SQL query and provides good query performance, especially the aggregation analysis and query performance based on large and wide tables. The query speed is one order of magnitude faster than that of other analytical databases.

The core functions of ClickHouse are as follows:

Comprehensive DBMS functions

ClickHouse has comprehensive database management functions, including the basic functions of a Database Management System (DBMS):

- Data Definition Language (DDL): allows databases, tables, and views to be dynamically created, modified, or deleted without restarting services.
- Data Manipulation Language (DML): allows data to be queried, inserted, modified, or deleted dynamically.
- Permission control: supports user-based database or table operation permission settings to ensure data security.
- Data backup and restoration: supports data backup, export, import, and restoration to meet the requirements of the production environment.
- Distributed management: provides the cluster mode to automatically manage multiple database nodes.

Column-based storage and data compression

ClickHouse is a database that uses column-based storage. Data is organized by column. Data in the same column is stored together, and data in different columns is stored in different files.

During data query, columnar storage can reduce the data scanning range and data transmission size, thereby improving data query efficiency.

In a traditional row-based database system, data is stored in the sequence in **Table 1-1**:

Table 1-1 Row-based database

row	ID	Flag	Name	Event	Time
0	12345678901	0	name1	1	2020/1/11 15:19
1	32345678901	1	name2	1	2020/5/12 18:10
2	42345678901	1	name3	1	2020/6/13 17:38
N	...	...	...	...	...

In a row-based database, data in the same row is physically stored together. In a column-based database system, data is stored in the sequence in **Table 1-2**:

Table 1-2 Columnar database

row:	0	1	2	N
ID:	12345678901	32345678901	42345678901	...
Flag:	0	1	1	...
Name:	name1	name2	name3	...
Event:	1	1	1	...
Time:	2020/1/11 15:19	2020/5/12 18:10	2020/6/13 17:38	...

This example shows only the arrangement of data in a columnar database. Columnar databases store data in the same column together and data in different columns separately. Columnar databases are more suitable for online analytical processing (OLAP) scenarios.

Vectorized executor

ClickHouse uses CPU's Single Instruction Multiple Data (SIMD) to implement vectorized execution. SIMD is an implementation mode that uses a single instruction to operate multiple pieces of data and improves performance with data

parallelism (other methods include instruction-level parallelism and thread-level parallelism). The principle of SIMD is to implement parallel data operations at the CPU register level.

Relational model and SQL query

ClickHouse uses SQL as the query language and provides standard SQL query APIs for existing third-party analysis visualization systems to easily integrate with ClickHouse.

In addition, ClickHouse uses a relational model. Therefore, the cost of migrating the system built on a traditional relational database or data warehouse to ClickHouse is lower.

Data sharding and distributed query

The ClickHouse cluster consists of one or more shards, and each shard corresponds to one ClickHouse service node. The maximum number of shards depends on the number of nodes (one shard corresponds to only one service node).

ClickHouse introduces the concepts of local table and distributed table. A local table is equivalent to a data shard. A distributed table itself does not store any data. It is an access proxy of the local table and functions as the sharding middleware. With the help of distributed tables, multiple data shards can be accessed by using the proxy, thereby implementing distributed query.

ClickHouse Applications

ClickHouse is short for Click Stream and Data Warehouse. It is initially applied to a web traffic analysis tool to perform OLAP analysis for data warehouses based on page click event flows. Currently, ClickHouse is widely used in Internet advertising, app and web traffic analysis, telecommunications, finance, and Internet of Things (IoT) fields. It is applicable to business intelligence application scenarios and has a large number of applications and practices worldwide. For details, visit **https://clickhouse.tech/docs/en/introduction/adopters/**.

ClickHouse Enhanced Open Source Features

MRS ClickHouse has advantages such as automatic cluster mode, HA deployment, and smooth and elastic scaling.

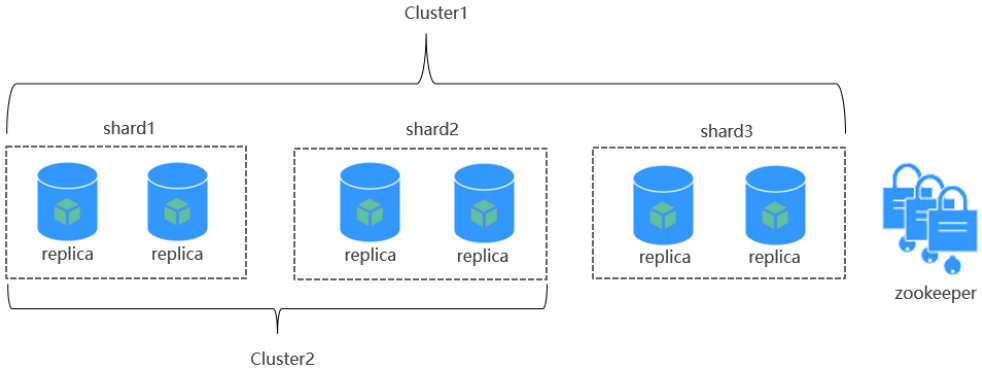
- Automatic Cluster Mode

  As shown in **Figure 1-7**, a cluster consists of multiple ClickHouse nodes, which has no central node. It is more of a static resource pool. If the ClickHouse cluster mode is used for services, you need to pre-define the cluster information in the configuration file of each node. Only in this way, services can be correctly accessed.

  Figure 1-7 ClickHouse cluster

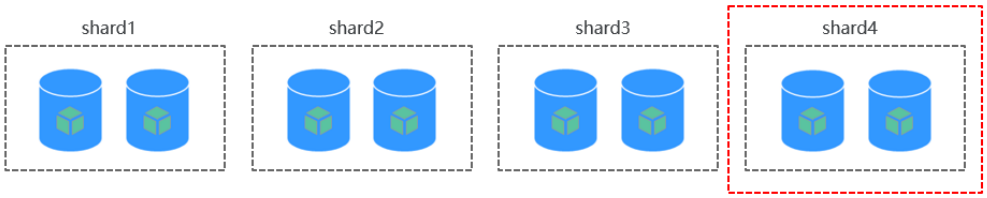
Users are unaware of data partitions and replica storage in common database systems. However, ClickHouse allows you to proactively plan and define detailed configurations such as shards, partitions, and replica locations. The ClickHouse instance of MRS packs the work in a unified manner and adapts it to the automatic mode, implementing unified management, which is flexible and easy to use. A ClickHouse instance consists of three ZooKeeper nodes and multiple ClickHouse nodes. The Dedicated Replica mode is used to ensure high reliability of dual data copies.

Figure 1-8 ClickHouse cluster structure



- Smooth and Elastic Scaling

  With the rapid growth of services, MRS provides smooth and elastic scaling capabilities to quickly meet service growth requirements in scenarios where the cluster storage capacity or CPU computing resources are not enough. When you expand the capacity of ClickHouse nodes in a cluster, MRS provides a one-click data balancing tool and gives you the initiative to balance data. You can determine the data balancing mode and time based on service characteristics to ensure service availability, implementing smooth scaling.

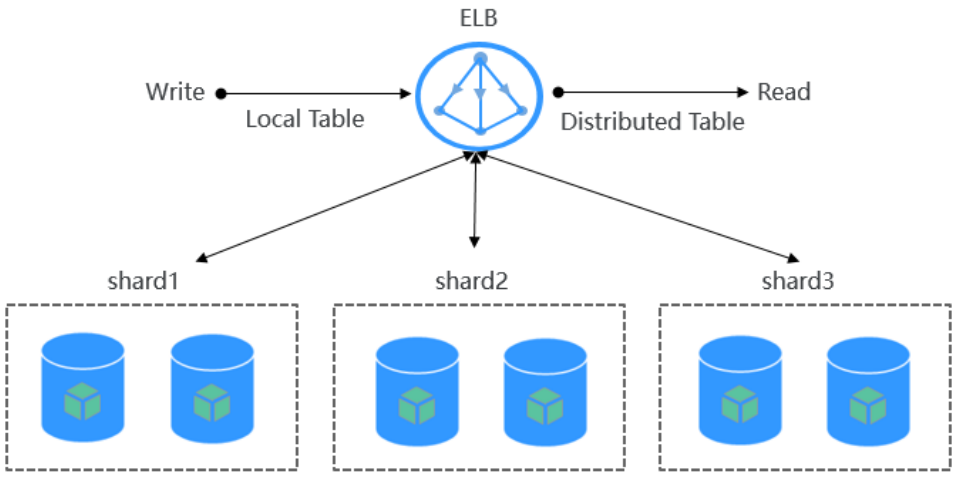


- HA Deployment Architecture

  MRS uses the ELB-based high availability (HA) deployment architecture to automatically distribute user access traffic to multiple backend nodes, expanding service capabilities to external systems and improving fault tolerance. As shown in **Figure 1-9**, when a client application requests a cluster, Elastic Load Balance (ELB) is used to distribute traffic. With the ELB polling mechanism, data is written to local tables and read from distributed tables on different nodes. In this way, data read/write load and high availability of application access are guaranteed.

  After the ClickHouse cluster is provisioned, each ClickHouse instance node in the cluster corresponds to a replica, and two replicas form a logical shard. For example, when creating a ReplicatedMergeTree table, you can specify shards so that data can be automatically synchronized between two replicas in the same shard.

Figure 1-9 HA deployment architecture



1.4.4 DBService

1.4.4.1 DBService Basic Principles

Overview

DBService is a HA storage system for relational databases, which is applicable to the scenario where a small amount of data (about 10 GB) needs to be stored, for example, component metadata. DBService can only be used by internal components of a cluster and provides data storage, query, and deletion functions.

DBService is a basic component of a cluster. Components such as Hive, Hue, Oozie, Loader, and Redis, and Loader store their metadata in DBService, and provide the metadata backup and restoration functions by using DBService.

DBService Architecture

DBService in the cluster works in active/standby mode. Two DBServer instances are deployed and each instance contains three modules: HA, Database, and FloatIP.

Figure 1-10 shows the DBService logical architecture.

Figure 1-10 DBService architecture

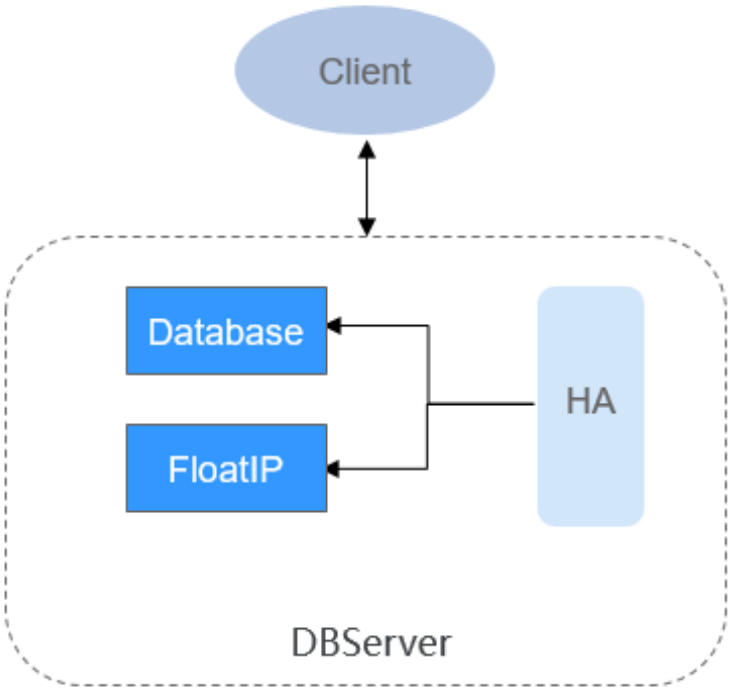


Table 1-3 describes the modules shown in **Figure 1-10**

Table 1-3 Module description

Name	Description
HA	HA management module. The active/standby DBServer uses the HA module for management.
Database	Database module. This module stores the metadata of the Client module.
FloatIP	Floating IP address that provides the access function externally. It is enabled only on the active DBServer instance and is used by the Client module to access Database.
Client	Client using the DBService component, which is deployed on the component instance node. The client connects to the database by using FloatIP and then performs metadata adding, deleting, and modifying operations.

1.4.4.2 Relationship Between DBService and Other Components

DBService is a basic component of a cluster. Components such as Hive, Hue, Oozie, Loader, Metadata, and Redis, and Loader store their metadata in DBService, and provide the metadata backup and restoration functions by using DBService.

1.4.5 Flink

1.4.5.1 Flink Basic Principles

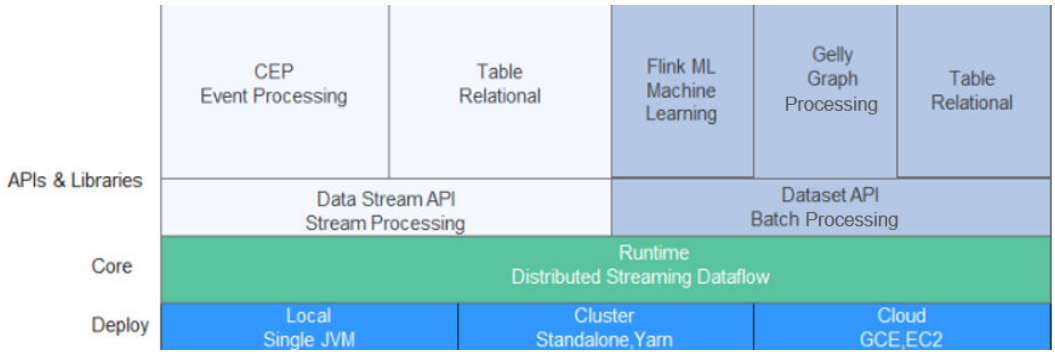
Overview

Flink is a unified computing framework that supports both batch processing and stream processing. It provides a stream data processing engine that supports data distribution and parallel computing. Flink features stream processing and is a top open source stream processing engine in the industry.

Flink provides high-concurrency pipeline data processing, millisecond-level latency, and high reliability, making it extremely suitable for low-latency data processing.

Figure 1-11 shows the technology stack of Flink.

Figure 1-11 Technology stack of Flink



Flink provides the following features in the current version:

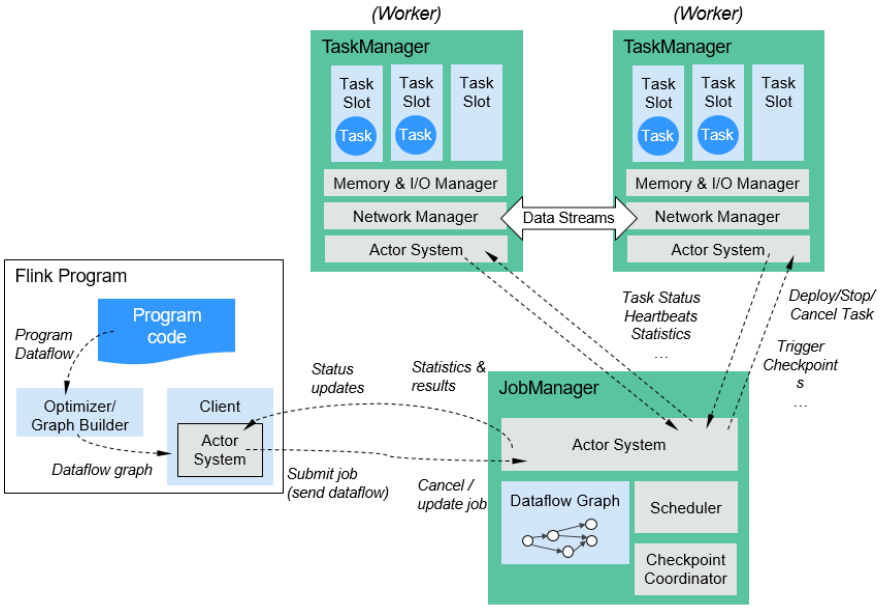
- DataStream
- Checkpoint
- Window
- Job Pipeline
- Configuration Table

Other features are inherited from the open source community and are not enhanced. For details, visit **https://ci.apache.org/projects/flink/flink-docs-release-1.12/**.

Flink Architecture

Figure 1-12 shows the Flink architecture.

Figure 1-12 Flink architecture



As shown in the above figure, the entire Flink system consists of three parts:

- Client

  Flink client is used to submit jobs (streaming jobs) to Flink.

- TaskManager

  TaskManager is a service execution node of Flink. It executes specific tasks. A Flink system can have multiple TaskManagers. These TaskManagers are equivalent to each other.

- JobManager

  JobManager is a management node of Flink. It manages all TaskManagers and schedules tasks submitted by users to specific TaskManagers. In high-availability (HA) mode, multiple JobManagers are deployed. Among these JobManagers, one is selected as the active JobManager, and the others are standby.

For more information about the Flink architecture, visit **https://ci.apache.org/projects/flink/flink-docs-master/docs/concepts/flink-architecture/**.

Flink Principles

- **Stream & Transformation & Operator**

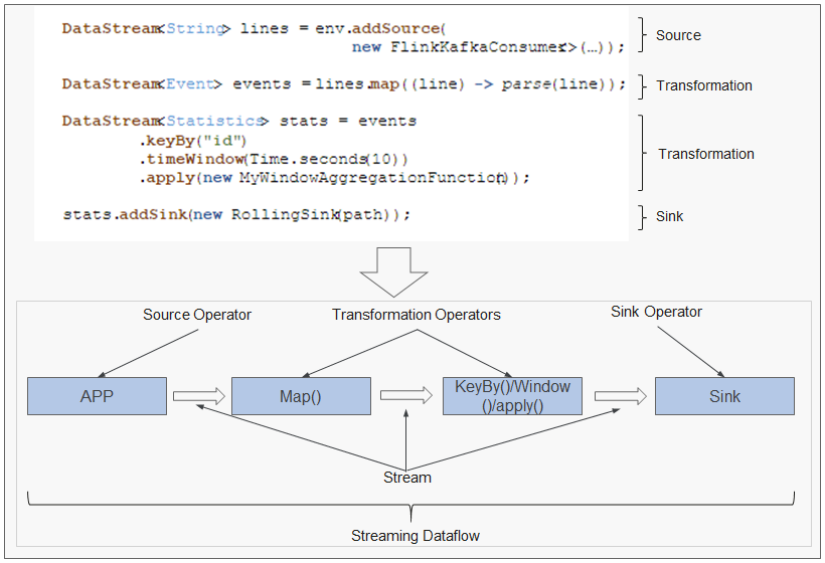
  A Flink program consists of two building blocks: stream and transformation.

  a. Conceptually, a stream is a (potentially never-ending) flow of data records, and a transformation is an operation that takes one or more streams as input, and produces one or more output streams as a result.

  b. When a Flink program is executed, it is mapped to a streaming dataflow. A streaming dataflow consists of a group of streams and transformation operators. Each dataflow starts with one or more source operators and ends in one or more sink operators. A dataflow resembles a directed acyclic graph (DAG).

Figure 1-13 shows the streaming dataflow to which a Flink program is mapped.

Figure 1-13 Example of Flink DataStream



As shown in Figure 1-13, **FlinkKafkaConsumer** is a source operator; Map, KeyBy, TimeWindow, and Apply are transformation operators; RollingSink is a sink operator.

- **Pipeline Dataflow**

  Applications in Flink can be executed in parallel or distributed modes. A stream can be divided into one or more stream partitions, and an operator can be divided into multiple operator subtasks.

  The executor of streams and operators are automatically optimized based on the density of upstream and downstream operators.

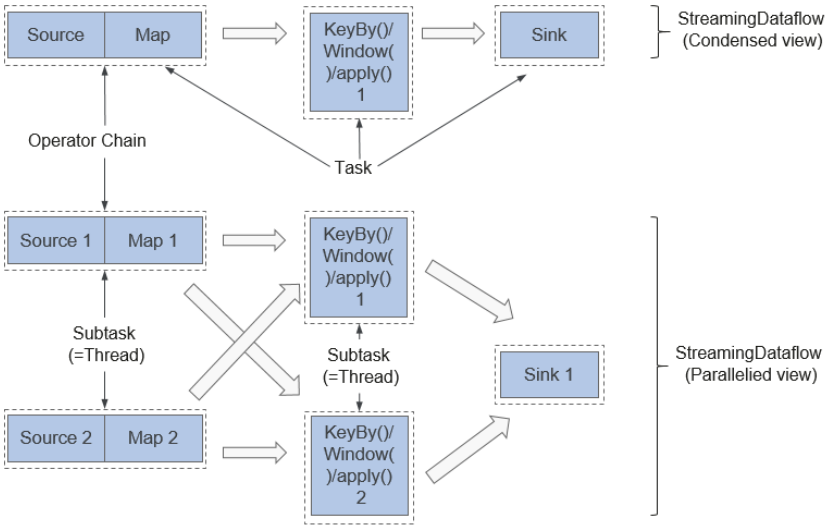
  – Operators with low density cannot be optimized. Each operator subtask is separately executed in different threads. The number of operator subtasks is the parallelism of that particular operator. The parallelism (the total number of partitions) of a stream is that of its producing operator. Different operators of the same program may have different levels of parallelism, as shown in Figure 1-14.

  Figure 1-14 Operator

  
  – Operators with high density can be optimized. Flink chains operator subtasks together into a task, that is, an operator chain. Each operator

chain is executed by one thread on TaskManager, as shown in **Figure 1-15**.

Figure 1-15 Operator chain



- In the upper part of **Figure 1-15**, the condensed Source and Map operators are chained into an Operator Chain, that is, a larger operator. The Operator Chain, KeyBy, and Sink all represent an operator respectively and are connected with each other through streams. Each operator corresponds to one task during the running. Namely, there are three tasks in the upper part.
- In the lower part of **Figure 1-15**, each task, except Sink, is paralleled into two subtasks. The parallelism of the Sink operator is one.

Key Features

- Stream processing

  The real-time stream processing engine features high throughput, high performance, and low latency, which can provide processing capability within milliseconds.

- Various status management

  The stream processing application needs to store the received events or intermediate result in a certain period of time for subsequent access and processing at a certain time point. Flink provides diverse features for status management, including:

  - Multiple basic status types: Flink provides various states for data structures, such as ValueState, ListState, and MapState. Users can select the most efficient and suitable status type based on the service model.
  - Rich State Backend: State Backend manages the status of applications and performs Checkpoint operations as required. Flink provides different State Backends. State can be stored in the memory or RocksDB, and supports the asynchronous and incremental Checkpoint mechanism.

  - Exactly-once state consistency: The Checkpoint and fault recovery capabilities of Flink ensure that the application status of tasks is consistent before and after a fault occurs. Flink supports transactional output for some specific storage devices. In this way, exactly-once output can be ensured even when a fault occurs.

- Various time semantics

  Time is an important part of stream processing applications. For real-time stream processing applications, operations such as window aggregation, detection, and matching based on time semantics are very common. Flink provides various time semantics.

  - Event-time: The timestamp provided by the event is used for calculation, making it easier to process the events that arrive at a random sequence or arrive late.
  - Watermark: Flink introduces the concept of Watermark to measure the development of event time. Watermark also provides flexible assurance for balancing processing latency and data integrity. When processing event streams with Watermark, Flink provides multiple processing options if data arrives after the calculation, for example, redirecting data (side output) or updating the calculation result.
  - Processing-time and Ingestion-time are supported.
  - Highly flexible streaming window: Flink supports the time window, count window, session window, and data-driven customized window. You can customize the triggering conditions to implement the complex streaming calculation mode.

- Fault tolerance mechanism

  In a distributed system, if a single task or node breaks down or is faulty, the entire task may fail. Flink provides a task-level fault tolerance mechanism, which ensures that user data is not lost when an exception occurs in a task and can be automatically restored.

  - Checkpoint: Flink implements fault tolerance based on checkpoint. Users can customize the checkpoint policy for the entire task. When a task fails, the task can be restored to the status of the latest checkpoint and data after the snapshot is resent from the data source.
  - Savepoint: A savepoint is a consistent snapshot of application status. The savepoint mechanism is similar to that of checkpoint. However, the savepoint mechanism needs to be manually triggered. The savepoint mechanism ensures that the status information of the current stream application is not lost during task upgrade or migration, facilitating task suspension and recovery at any time point.

- Flink SQL

  Table APIs and SQL use Apache Calcite to parse, verify, and optimize queries. Table APIs and SQL can be seamlessly integrated with DataStream and DataSet APIs, and support user-defined scalar functions, aggregation functions, and table value functions. The definition of applications such as data analysis and ETL is simplified. The following code example shows how to use Flink SQL statements to define a counting application that records session times.

  ```
  SELECT userId, COUNT(*)
  FROM clicks
  GROUP BY SESSION(clicktime, INTERVAL '30' MINUTE), userId
  ```

For more information about Flink SQL, see **https://ci.apache.org/projects/flink/flink-docs-master/dev/table/sqlClient.html**.

- CEP in SQL

  Flink allows users to represent complex event processing (CEP) query results in SQL for pattern matching and evaluate event streams on Flink.

  CEP SQL is implemented through the **MATCH_RECOGNIZE** SQL syntax. The **MATCH_RECOGNIZE** clause is supported by Oracle SQL since Oracle Database 12c and is used to indicate event pattern matching in SQL. The following is an example of CEP SQL:

```
SELECT T.aid, T.bid, T.cid
FROM MyTable
   MATCH_RECOGNIZE (
     PARTITION BY userid
     ORDER BY proctime
     MEASURES
       A.id AS aid,
       B.id AS bid,
       C.id AS cid
     PATTERN (A B C)
     DEFINE
       A AS name = 'a',
       B AS name = 'b',
       C AS name = 'c'
   ) AS T
```

1.4.5.2 Flink HA Solution

Flink HA Solution

A Flink cluster has only one JobManager. This has the risks of single point of failures (SPOFs). There are three modes of Flink: Flink On Yarn, Flink Standalone, and Flink Local. Flink On Yarn and Flink Standalone modes are based on clusters and Flink Local mode is based on a single node. Flink On Yarn and Flink Standalone provide an HA mechanism. With such a mechanism, you can recover the JobManager from failures and thereby eliminate SPOF risks. This section describes the HA mechanism of the Flink On Yarn.

Flink supports the HA mode and job exception recovery that highly depend on ZooKeeper. If you want to enable the two functions, configure ZooKeeper in the **flink-conf.yaml** file in advance as follows:

```
high-availability: zookeeper
high-availability.zookeeper.quorum:  ZooKeeper IP address:2181
high-availability.storageDir: hdfs:///flink/recovery
```

Flink On Yarn

Flink JobManager and Yarn ApplicationMaster are in the same process. Yarn ResourceManager monitors ApplicationMaster. If ApplicationMaster is abnormal, Yarn restarts it and restores all JobManager metadata from HDFS. During the recovery, existing tasks cannot run and new tasks cannot be submitted. ZooKeeper stores JobManager metadata, such as information about jobs, to be used by the new JobManager. A TaskManager failure is listened and processed by the DeathWatch mechanism of Akka on JobManager. When a TaskManager fails, a container is requested again from Yarn and a TaskManager is created.

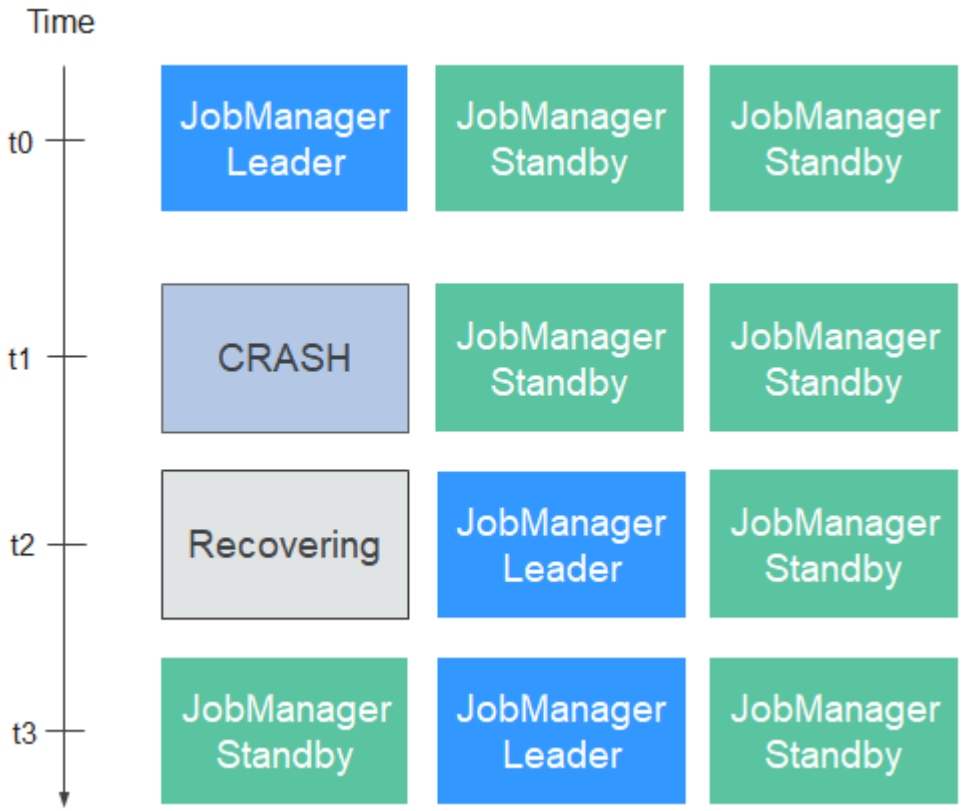
For more information about the HA solution of Flink on Yarn, visit **https://hadoop.apache.org/docs/r3.1.1/hadoop-yarn/hadoop-yarn-site/ResourceManagerHA.html**.

For details about how to set **yarn-site.xml**, visit **https://ci.apache.org/projects/flink/flink-docs-release-1.12/ops/jobmanager_high_availability.html**.

Standalone

In the standalone mode, multiple JobManagers can be started and ZooKeeper elects one as the leader JobManager. In this mode, there is a leader JobManager and multiple standby JobManagers. If the leader JobManager fails, a standby JobManager takes over the leadership. **Figure 1-16** shows the process of a leader/standby JobManager switchover.

Figure 1-16 Switchover process



Restoring TaskManager

A TaskManager failure is listened and processed by the DeathWatch mechanism of Akka on JobManager. If the TaskManager fails, the JobManager creates a TaskManager and migrates services to the created TaskManager.

Restoring JobManager

Flink JobManager and Yarn ApplicationMaster are in the same process. Yarn ResourceManager monitors ApplicationMaster. If ApplicationMaster is abnormal, Yarn restarts it and restores all JobManager metadata from HDFS. During the recovery, existing tasks cannot run and new tasks cannot be submitted.

Restoring Jobs

If you want to restore jobs, ensure that the startup policy is configured in Flink configuration files. Supported restart policies are **fixed-delay**, **failure-rate**, and **none**. Jobs can be restored only when the policy is configured to **fixed-delay** or **failure-rate**. If the restart policy is configured to **none** and checkpoint is configured for jobs, the restart policy is automatically configured to **fixed-delay** and the value of **restart-strategy.fixed-delay.attempts** (which specifies the number of retry times) is configured to **Integer.MAX_VALUE**.

For details about the three strategies, visit **https://ci.apache.org/projects/flink/flink-docs-release-1.12/dev/task_failure_recovery.html**. The following is an example of the restart policy configuration:

```
restart-strategy: fixed-delay
restart-strategy.fixed-delay.attempts: 3
restart-strategy.fixed-delay.delay: 10 s
```

Jobs will be restored in the following scenarios:

- If a JobManager fails, all its jobs are stopped, and will be recovered after another JobManager is created and running.
- If a TaskManager fails, all tasks on the TaskManager are stopped, and will be started until there are available resources.
- When a task of a job fails, the job is restarted.

  NOTE

  For details about how to configure the restart policy of a job, visit **https://ci.apache.org/projects/flink/flink-docs-release-1.12/ops/jobmanager_high_availability.html**.

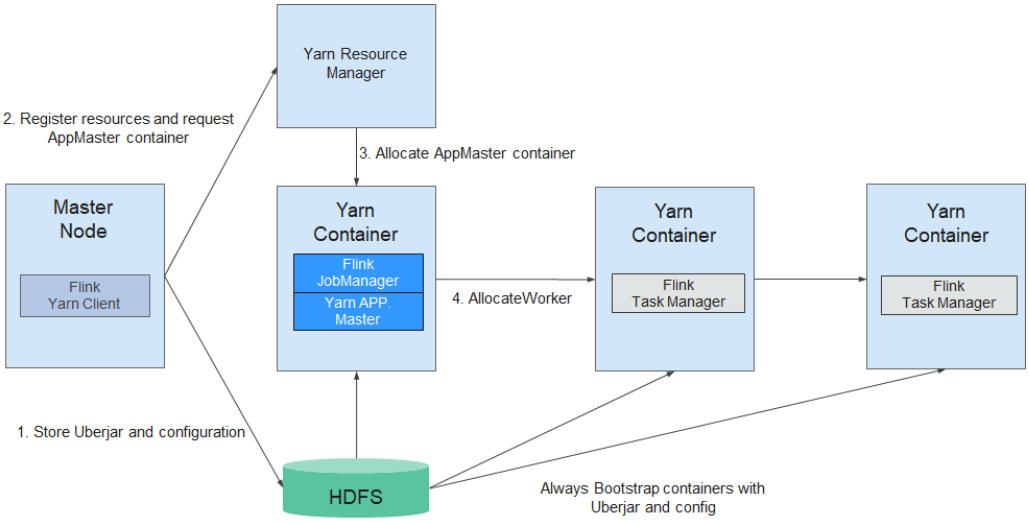
1.4.5.3 Relationship with Other Components

Relationship between Flink and Yarn

Flink supports Yarn-based cluster management mode. In this mode, Flink serves as an application of Yarn and runs on Yarn.

Figure 1-17 shows how Flink interacts with Yarn.

Figure 1-17 Flink interaction with Yarn



1. The Flink Yarn Client first checks whether there are sufficient resources for starting the Yarn cluster. If yes, the Flink Yarn client uploads JAR packages and configuration files to HDFS.
2. Flink Yarn client communicates with Yarn ResourceManager to request a container for starting ApplicationMaster. After all Yarn NodeManagers finish downloading the JAR package and configuration files, the ApplicationMaster is started.
3. During the startup, the ApplicationMaster interacts with the Yarn ResourceManager to request the container for starting a TaskManager. After the container is ready, the TaskManager process is started.
4. In the Flink Yarn cluster, the ApplicationMaster and Flink JobManager are running in the same container. The ApplicationMaster informs each TaskManager of the RPC address of the JobManager. After TaskManagers are started successfully, they register with the JobManager.
5. After all TaskManagers have registered with the JobManager successfully, Flink starts up in the Yarn cluster. Then, the Flink Yarn client can submit Flink jobs to the JobManager, and Flink can perform mapping, scheduling, and computing for the jobs.

1.4.5.4 Flink Enhanced Open Source Features

1.4.5.4.1 Window

Enhanced Open Source Feature: Window

This section describes the sliding window of Flink and provides the sliding window optimization method. For details about windows, visit **https://ci.apache.org/projects/flink/flink-docs-release-1.12/dev/stream/operators/windows.html**.

Introduction to Window

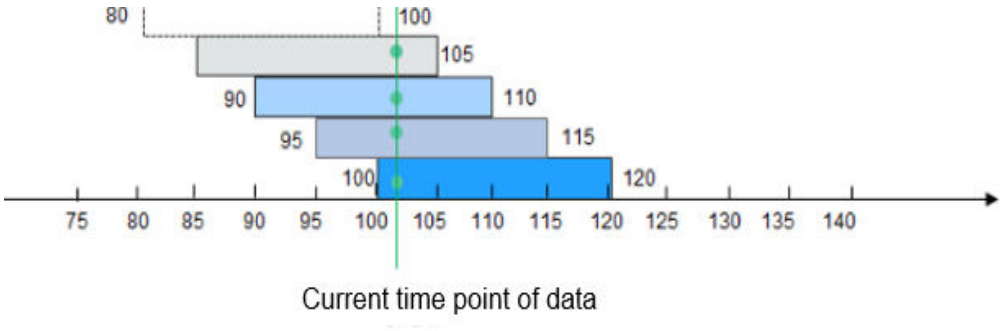
Data in a window is saved as intermediate results or original data. If you perform a sum operation (**window(SlidingEventTimeWindows.of(Time.seconds(20), Time.seconds(5))).sum**) on data in the window, only the intermediate result will be retained. If a custom window (**window(SlidingEventTimeWindows.of(Time.seconds(20), Time.seconds(5))).apply(new UDF)**) is used, all original data in the window will be saved.

If custom windows **SlidingEventTimeWindow** and **SlidingProcessingTimeWindow** are used, data is saved as multiple backups. Assume that the window is defined as follows:

```
window(SlidingEventTimeWindows.of(Time.seconds(20), Time.seconds(5))).apply(new
UDFWindowFunction)
```

If a block of data arrives, it is assigned to four different windows (20/5 = 4). That is, the data is saved as four copies in the memory. When the window size or sliding period is set to a large value, data will be saved as excessive copies, causing redundancy.

Figure 1-18 Original structure of a window



If a data block arrives at the 102nd second, it is assigned to windows [85, 105), [90, 110), [95, 115), and [100, 120).

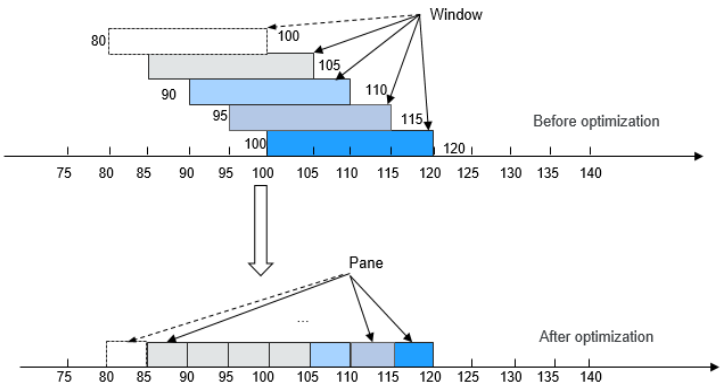
Window Optimization

As mentioned in the preceding, there are excessive data copies when original data is saved in SlidingEventTimeWindow and SlidingProcessingTimeWindow. To resolve this problem, the window that stores the original data is restructured, which optimizes the storage and greatly lowers the storage space. The window optimization scheme is as follows:

1. Use the sliding period as a unit to divide a window into different panes.

   A window consists of one or multiple panes. A pane is essentially a sliding period. For example, the sliding period (namely, the pane) of **window(SlidingEventTimeWindows.of(Time.seconds(20), Time.seconds.of(5)))** lasts for 5 seconds. If this window ranges from [100, 120), this window can be divided into panes [100, 105), [105, 110), [110, 115), and [115, 120).

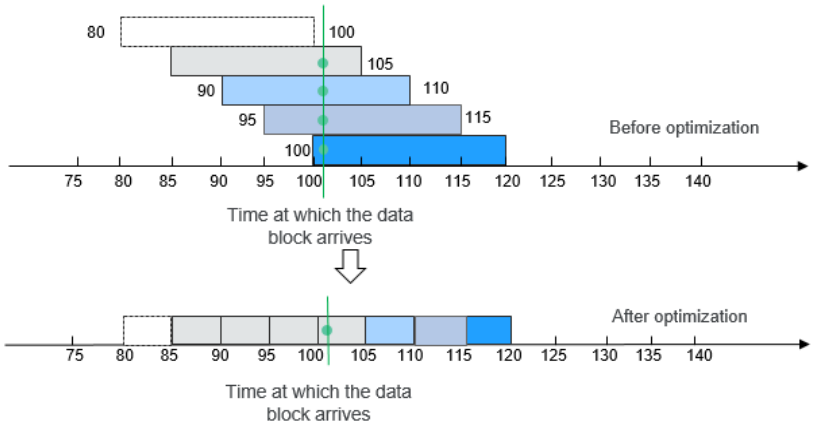
   Figure 1-19 Window optimization

2. When a data block arrives, it is not assigned to a specific window. Instead, Flink determines the pane to which the data block belongs based on the timestamp of the data block, and saves the data block into the pane.

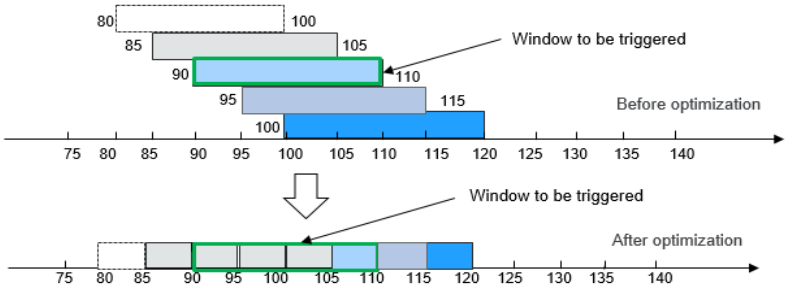
   A data block is saved only in one pane. In this case, only a data copy exists in the memory.

Figure 1-20 Saving data in a window



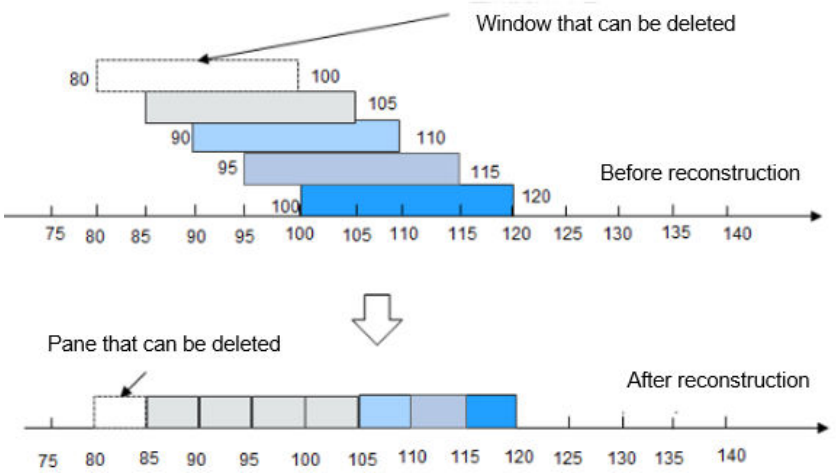
3. To trigger a window, compute all panes contained in the window, and combine all these panes into a complete window.

Figure 1-21 Triggering a window



4. If a pane is not required, you can delete it from the memory.

Figure 1-22 Deleting a window



After optimization, the quantity of data copies in the memory and snapshot is greatly reduced.

1.4.5.4.2 Job Pipeline

Enhanced Open Source Feature: Job Pipeline

Generally, logic code related to a service is stored in a large JAR package, which is called Fat JAR. Disadvantages of Fat JAR are as follows:

- When service logic becomes more and more complex, the size of the Fat JAR increases.
- Fat Jar makes coordination complex. Developers of all services are working with the same service logic. Even though the service logic can be divided into several modules, all modules are tightly coupled with each other. If the requirement needs to be changed, the entire flow diagram needs to be replanned.

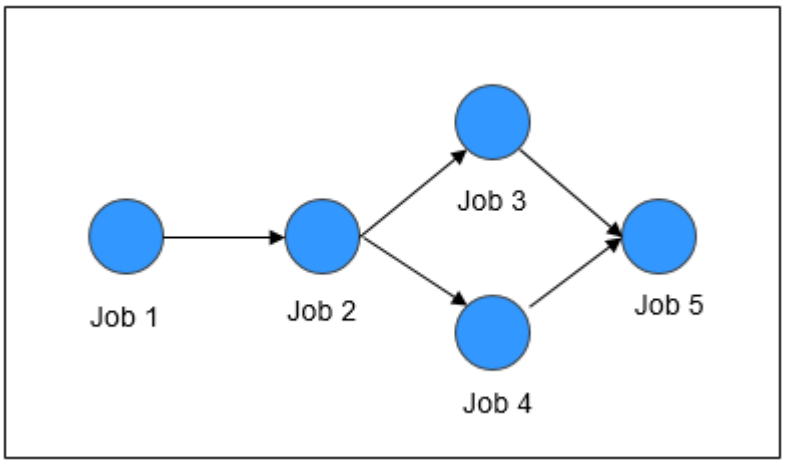
Splitting of jobs is facing the following problems:

- Data transmission between jobs can be achieved using Kafka. For example, job A transmits data to the topic A in Kafka, and then job B and job C read data from the topic A in Kafka. This solution is simple and easy to implement, but the latency is always longer than 100 ms.
- Operators are connected using the TCP protocol. In distributed environment, operators can be scheduled to any node and upstream and downstream services cannot detect the scheduling.

Job Pipeline

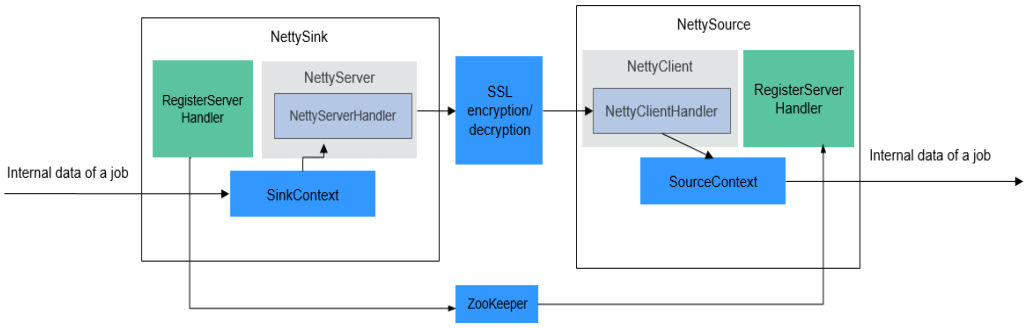
A pipeline consists of multiple Flink jobs connected through TCP. Upstream jobs can send data to downstream jobs. The flow diagram about data transmission is called a job pipeline, as shown in **Figure 1-23**.

Figure 1-23 Job pipeline



Job Pipeline Principles

Figure 1-24 Job pipeline principles



- NettySink and NettySource

  In a pipeline, upstream jobs and downstream jobs communicate with each other through Netty. The Sink operator of the upstream job works as a server and the Source operator of the downstream job works as a client. The Sink operator of the upstream job is called NettySink, and the Source operator of the downstream job is called NettySource.

- NettyServer and NettyClient

  NettySink functions as the server of Netty. In NettySink, NettyServer achieves the function of a server. NettySource functions as the client of Netty. In NettySource, NettyClient achieves the function of a client.

- Publisher

  The job that sends data to downstream jobs through NettySink is called a publisher.

- Subscriber

  The job that receives data from upstream jobs through NettySource is called a subscriber.

- RegisterServer

  RegisterServer is the third-party memory that stores the IP address, port number, and concurrency information about NettyServer.

- The general outside-in architecture is as follows:
  - NettySink->NettyServer->NettyServerHandler
  - NettySource->NettyClient->NettyClientHandler

Job Pipeline Functions

- **NettySink**

  NettySink consists of the following major modules:

  - RichParallelSinkFunction

    NettySink inherits RichParallelSinkFunction and attributes of Sink operators. The RichParallelSinkFunction API implements following functions:

    - Starts the NettySink operator.
    - Runs the NettySink operator and receives data from the upstream operator.

- Cancels the running of NettySink operators.

Following information can be obtained using the attribute of RichParallelSinkFunction:

- subtaskIndex about the concurrency of each NettySink operator.
- Concurrency of the NettySink operator.

– RegisterServerHandler

RegisterServerHandler interacts with the component of RegisterServer and defines following APIs:

- **start();**: Starts the RegisterServerHandler and establishes a contact with the third-party RegisterServer.
- **createTopicNode();**: Creates a topic node.
- **register();**: Registers information such as the IP address, port number, and concurrency to the topic node.
- **deleteTopicNode();**: Deletes a topic node.
- **unregister();**: Deletes registration information.
- **query();**: Queries registration information.
- **isExist();**: Verifies that a specific piece of information exists.
- **shutdown();**: Disables the RegisterServerHandler and disconnects from the third-party RegisterServer.

NOTE

- RegisterServerHandler API enables ZooKeeper to work as the handler of RegisterServer. You can customize your handler as required. Information is stored in ZooKeeper in the following form:

```
Namespace
|---Topic-1
  |---parallel-1
  |---parallel-2
  |....
  |---parallel-n
|---Topic-2
  |---parallel-1
  |---parallel-2
  |....
  |---parallel-m
|...
```

- Information about NameSpace can be obtained from the following parameters of the **flink-conf.yaml** file:

```
nettyconnector.registerserver.topic.storage: /flink/nettyconnector
```

- The simple authentication and security layer (SASL) authentication between ZookeeperRegisterServerHandler and ZooKeeper is implemented through the Flink framework.
- Ensure that each job has a unique topic. Otherwise, the subscription relationship may be unclear.
- When calling **shutdown()**, ZookeeperRegisterServerHandler deletes the registration information about the current concurrency, and then attempts to delete the topic node. If the topic node is not empty, deletion will be canceled, because not all concurrency has exited.

  - NettyServer

    NettyServer is the core of the NettySink operator, whose main function is to create a NettyServer and receive connection requests from NettyClient. Use NettyServerHandler to send data received from upstream operators of a same job. The port number and subnet of NettyServer needs to be configured in the **flink-conf.yaml** file.

    - Port range
      ```
      nettyconnector.sinkserver.port.range: 28444-28943
      ```
    - Subnet
      ```
      nettyconnector.sinkserver.subnet: 10.162.222.123/24
      ```

      NOTE

      The **nettyconnector.sinkserver.subnet** parameter is set to the subnet (service IP address) of the Flink client by default. If the client and TaskManager are not in the same subnet, an error may occur. Therefore, you need to manually set this parameter to the subnet (service IP address) of TaskManager.

  - NettyServerHandler

    The handler enables the interaction between NettySink and subscribers. After NettySink receives messages, the handler sends these messages out. To ensure data transmission security, this channel is encrypted using SSL. The **nettyconnector.ssl.enabled** configures whether to enable SSL encryption. The SSL encryption is enabled only when **nettyconnector.ssl.enabled** is set to **true**.

- **NettySource**

  NettySource consists of the following major modules:

  - RichParallelSourceFunction

    NettySource inherits RichParallelSinkFunction and attributes of Source operators. The RichParallelSourceFunction API implements following functions:

    - Starts the NettySink operator.
    - Runs the NettySink operator, receives data from subscribers, and injects the data to jobs.
    - Cancels the running of Source operators.

    Following information can be obtained using the attribute of RichParallelSourceFunction:

    - subtaskIndex about the concurrency of each NettySource operator.
    - Concurrency of the NettySource operator.

    When the NettySource operator enters the running stage, the NettyClient status is monitored. Once abnormality occurs, NettyClient is restarted and reconnected to NettyServer, preventing data confusion.

  - RegisterServerHandler

    RegisterServerHandler of NettySource has similar function as the RegisterServerHandler of NettySink. It obtains the IP address, port number, and information of concurrent operators of each subscribed job obtained in the NettySource operator.

- NettyClient

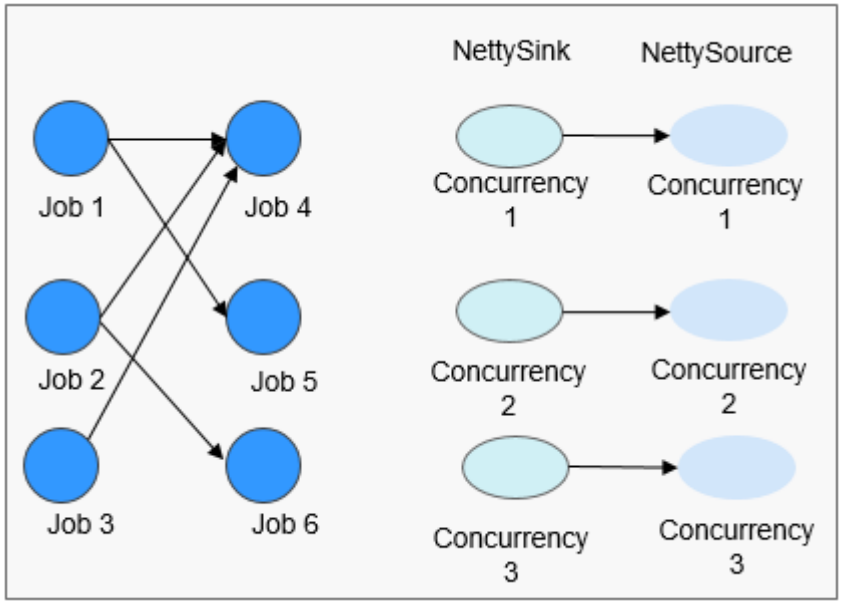
  NettyClient establishes a connection with NettyServer and uses NettyClientHandler to receive data. Each NettySource operator must have a unique name (specified by the user). NettyServer determines whether each client comes from different NettySources based on unique names. When a connection is established between NettyClient and NettyServer, NettyClient is registered with NettyServer and the NettySource name of NettyClient is transferred to NettyServer.

- NettyClientHandler

  The NettyClientHandler enables the interaction with publishers and other operators of the job. When messages are received, NettyClientHandler transfers these messages to the job. To ensure secure data transmission, SSL encryption is enabled for the communication with NettySink. The SSL encryption is enabled only when SSL is enabled and **nettyconnector.ssl.enabled** is set to **true**.

The relationship between the jobs may be many-to-many. The concurrency between each NettySink and NettySource operator is one-to-many, as shown in **Figure 1-25**.

Figure 1-25 Relationship diagram



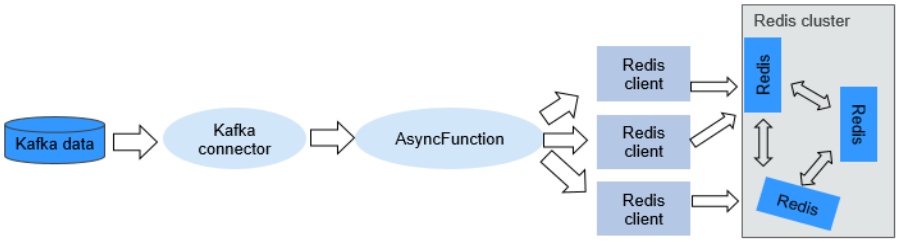
1.4.5.4.3 Configuration Table

Enhanced Open Source Feature: Configuration Table

In some scenarios, users have fixed configuration tables that store basic information. After Flink receives stream data, Flink needs to be configured to match configuration tables. Redis is recommended for storage because the configuration table may be of large size. Redis is a high-performance key-value database with low query latency for stream data.

The detailed process is as follows:

Figure 1-26 Process flow



Data Stored on Redis

Redis is a data structure server supporting various types of values, in addition to key-value storage. The following data types are supported:

- Binary-safe string.
- List: A collection of string elements sorted by their insertion order. It is basically a linked list.
- Sets: Disordered collection of character string elements without repetition.
- Sorted sets: Each string element is associated with a score floating number value. Elements are sorted by score and can be searched.
- Hashes: The map that consists of fields and related values. Fields and values are strings.
- Bit arrays: You can process strings as a series of bits by running certain commands. For example, you are allowed to configure and clear certain bits, calculate the number of bits that are configured to 1, and find the first bit that is configured to 1 or 0.
- HyperLogLogs: A probabilistic data structure which is used to estimate the cardinality of a set.

Redis clusters are used to store configuration tables containing a maximum of 500 million pieces of data, enabling quick query response. Asynchronous I/Os of streams are used to query messages, improving throughput of the data processing.

NOTE

- Redis cluster: In a Redis cluster, Redis is deployed on all nodes in the cluster and data is stored on all nodes with high storage capacity. MRS provides Redis.
- Asynchronous I/O: Asynchronous I/O is used to processes data with maximized data processing throughput, improving the processing efficiency.

Operations on Redis are as follows:

1. Install Redis.

   When installing clusters, you can select Redis provided by MRS.

2. Import configuration tables to Redis.

   You are allowed to select the main key or multiple key columns as the keys based on the feature of the configuration table. If to-be-stored configuration tables contain a large number of attributes, you are advised to storage them in the Hashes data format.

   The Redis component provided by MRS provides the Redis client for inserting queries. For details, see Redis sample code.

NOTE

For details about Redis data types, visit the official website at **https://redis.io/topics/data-types-intro**.

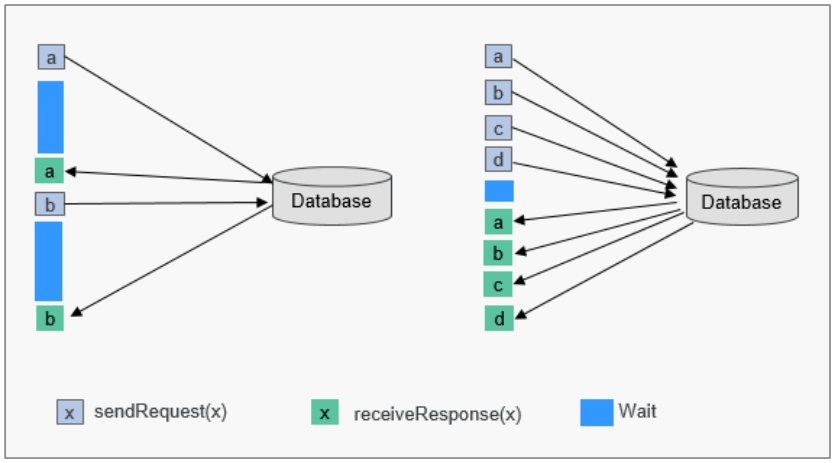
Asynchronous I/Os

When Flink interacts with external systems, such as external databases, the waiting time for responses is too long, reducing data processing efficiency. In asynchronous I/O mode, other requests can be sent without waiting for the response to the previous request, improving data throughput.

The following requirements are required for achieving the API of asynchronous I/O:

- You need to rewrite the **asyncInvoke** method of the AsyncFunction function to implement asynchronous data processing.
- Callback function obtains operator results and AsyncCollector collects the obtained results.

Figure 1-27 Comparison of Async.I/O



- You need to configure the timeout period and maximum capacity.

  Timeout period defines the maximum allowed period for an asynchronous request. The maximum capacity refers to the maximum concurrent number of asynchronous requests. You are advised to configure maximum capacity based on data source features, because an improperly large value will cause high resources consumption and an improperly small value will reduce the throughput.

1.4.5.4.4 Stream SQL Join

Enhanced Open Source Feature: Stream SQL Join

Flink's Table API&SQL is an integrated query API for Scala and Java that allows the composition of queries from relational operators such as selection, filter, and join in an intuitive way. For details about Table API&SQL, visit the official website at **https://ci.apache.org/projects/flink/flink-docs-release-1.12/dev/table/index.html**.

Introduction to Stream SQL Join

SQL Join is used to query data based on the relationship between columns in two or more tables. Flink Stream SQL Join allows you to join two streaming tables and query results from them. Queries similar to the following are supported:

```
SELECT o.proctime, o.productId, o.orderId, s.proctime AS shipTime
FROM Orders AS o
JOIN Shipments AS s
ON o.orderId = s.orderId
AND o.proctime BETWEEN s.proctime AND s.proctime + INTERVAL '1' HOUR;
```

Currently, Stream SQL Join needs to be performed within a specified window. The join operation for data within the window requires at least one equi-join predicate and a join condition that bounds the time on both sides. Such a condition can be defined by two appropriate range predicates (**<**, **<=**, **>=**, **>**), a **BETWEEN** predicate, or a single equality predicate that compares the same type of time attributes (such as processing time or event time) of both input tables.

The following example will join all orders with their corresponding shipments if the order was shipped four hours after the order was received.

```
SELECT *
FROM Orders o, Shipments s
WHERE o.id = s.orderId AND
o.ordertime BETWEEN s.shiptime - INTERVAL '4' HOUR AND s.shiptime
```

NOTE

1. Stream SQL Join supports only inner join.
2. The **ON** clause should include an equal join condition.
3. Time attributes support only the processing time and event time.
4. The window condition supports only the bounded time range, for example, **o.proctime BETWEEN s.proctime - INTERVAL '1' HOUR AND s.proctime + INTERVAL '1' HOUR**. The unbounded range such as **o. proctime > s.proctime** is not supported. The **proctime** attribute of two streams must be included. **o.proctime BETWEEN proctime () AND proctime () + 1** is not supported.

1.4.5.4.5 Flink CEP in SQL

Flink CEP in SQL

Flink allows users to represent complex event processing (CEP) query results in SQL for pattern matching and evaluate event streams on Flink engines.

SQL Query Syntax

CEP SQL is implemented through the **MATCH_RECOGNIZE** SQL syntax. The **MATCH_RECOGNIZE** clause is supported by Oracle SQL since Oracle Database 12c and is used to indicate event pattern matching in SQL. Apache Calcite also supports the **MATCH_RECOGNIZE** clause.

Flink uses Calcite to analyze SQL query results. Therefore, this operation complies with the Apache Calcite syntax.

```
MATCH_RECOGNIZE (
    [ PARTITION BY expression [, expression ]* ]
    [ ORDER BY orderItem [, orderItem ]* ]
    [ MEASURES measureColumn [, measureColumn ]* ]
    [ ONE ROW PER MATCH | ALL ROWS PER MATCH ]
```

```
[ AFTER MATCH
      ( SKIP TO NEXT ROW
      | SKIP PAST LAST ROW
      | SKIP TO FIRST variable
      | SKIP TO LAST variable
      | SKIP TO variable )
]
PATTERN ( pattern )
[ WITHIN intervalLiteral ]
[ SUBSET subsetItem [, subsetItem ]* ]
DEFINE variable AS condition [, variable AS condition ]*
)
```

The syntax elements of the **MATCH_RECOGNIZE** clause are defined as follows:

(Optional) **-PARTITION BY**: defines partition columns. This clause is optional. If this parameter is not defined, the parallelism 1 is used.

(Optional) **-ORDER BY**: defines the sequence of events in a data flow. The **ORDER BY** clause is optional. If it is ignored, non-deterministic sorting is used. Since the order of events is important in pattern matching, this clause should be specified in most cases.

(Optional) **-MEASURES**: specifies the attribute value of the successfully matched event.

(Optional) **-ONE ROW PER MATCH | ALL ROWS PER MATCH**: defines how to output the result. **ONE ROW PER MATCH** indicates that only one row is output for each matching. **ALL ROWS PER MATCH** indicates that one row is output for each matching event.

(Optional) **-AFTER MATCH**: specifies the start position for processing after the next pattern is successfully matched.

-PATTERN: defines the matching pattern as a regular expression. The following operators can be used in the **PATTERN** clause: join operators, quantifier operators (*, +, ?, {n}, {n,}, {n,m}, and {,m}), branch operators (vertical bar |), and differential operators ('{- -}').

(Optional) **-WITHIN**: outputs a pattern clause match only when the match occurs within the specified time.

(Optional) **-SUBSET**: combines one or more associated variables defined in the **DEFINE** clause.

-DEFINE: specifies the Boolean condition, which defines the variables used in the **PATTERN** clause.

In addition, the **MATCH_RECOGNIZE** clause supports the following functions:

-MATCH_NUMBER(): Used in the **MEASURES** clause to allocate the same number to each row that is successfully matched.

-CLASSIFIER(): Used in the **MEASURES** clause to indicate the mapping between matched rows and variables.

-FIRST() and **LAST()**: Used in the **MEASURES** clause to return the value of the expression evaluated in the first or last row of the row set mapped to the schema variable.

-NEXT() and **PREV()**: Used in the **DEFINE** clause to evaluate an expression using the previous or next row in a partition.

-RUNNING and **FINAL** keywords: Used to determine the semantics required for aggregation. **RUNNING** can be used in the **MEASURES** and **DEFINE** clauses, whereas **FINAL** can be used only in the **MEASURES** clause.

- Aggregate functions (**COUNT**, **SUM**, **AVG**, **MAX**, **MIN**): Used in the **MEASURES** and **DEFINE** clauses.

Query Example

The following query finds the V-shaped pattern in the stock price data flow.

```
SELECT *
   FROM MyTable
   MATCH_RECOGNIZE (
     ORDER BY rowtime
     MEASURES
       STRT.name as s_name,
       LAST(DOWN.name) as down_name,
       LAST(UP.name) as up_name
     ONE ROW PER MATCH
     PATTERN (STRT DOWN+ UP+)
     DEFINE
       DOWN AS DOWN.v < PREV(DOWN.v),
       UP AS UP.v > PREV(UP.v)
   )
```

In the following query, the aggregate function **AVG** is used in the **MEASURES** clause of **SUBSET E** consisting of variables related to A and C.

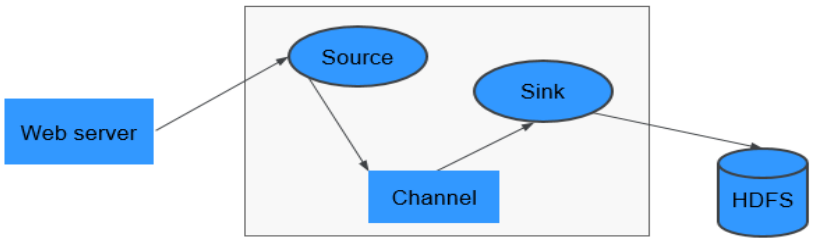
```
SELECT *
   FROM Ticker
   MATCH_RECOGNIZE (
     MEASURES
       AVG(E.price) AS avgPrice
     ONE ROW PER MATCH
     AFTER MATCH SKIP PAST LAST ROW
     PATTERN (A B+ C)
     SUBSET E = (A,C)
     DEFINE
       A AS A.price < 30,
       B AS B.price < 20,
       C AS C.price < 30
   )
```

1.4.6 Flume

1.4.6.1 Flume Basic Principles

Flume is a distributed, reliable, and HA system that supports massive log collection, aggregation, and transmission. Flume supports customization of various data senders in the log system for data collection. In addition, Flume can roughly process data and write data to various data receivers (customizable). A Flume-NG is a branch of Flume. It is simple, small, and easy to deploy. The following figure shows the basic architecture of the Flume-NG.

Figure 1-28 Flume-NG architecture



A Flume-NG consists of agents. Each agent consists of three components (source, channel, and sink). A source is used for receiving data. A channel is used for transmitting data. A sink is used for sending data to the next end.

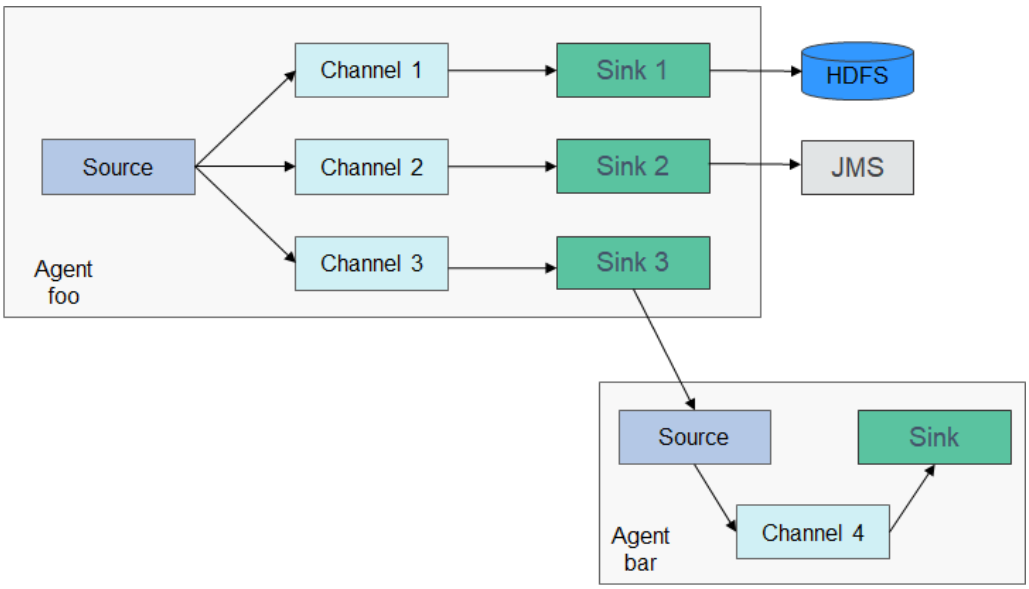
Table 1-4 Module description

Module	Description
Source	A source receives data or generates data by using a special mechanism, and places the data in batches in one or more channels. The source can work in data-driven or polling mode. Typical source types are as follows: ● Sources that are integrated with the system, such as Syslog and Netcat ● Sources that automatically generate events, such as Exec and SEQ ● IPC sources that are used for communication between agents, such as Avro A source must be associated with at least one channel.
Channel	A channel is used to buffer data between a source and a sink. The channel caches data from the source and deletes that data after the sink sends the data to the next-hop channel or final destination. Different channels provide different persistence levels. ● Memory channel: non-persistency ● File channel: Write-Ahead Logging (WAL)-based persistence ● JDBC channel: persistency implemented based on the embedded database The channel supports the transaction feature to ensure simple sequential operations. A channel can work with sources and sinks of any quantity.

Module	Description
Sink	A sink sends data to the next-hop channel or final destination. Once completed, the transmitted data is removed from the channel. Typical sink types are as follows: • Sinks that send storage data to the final destination, such as HDFS and HBase • Sinks that are consumed automatically, such as Null Sink • IPC sinks used for communication between Agents, such as Avro A sink must be associated with a specific channel.

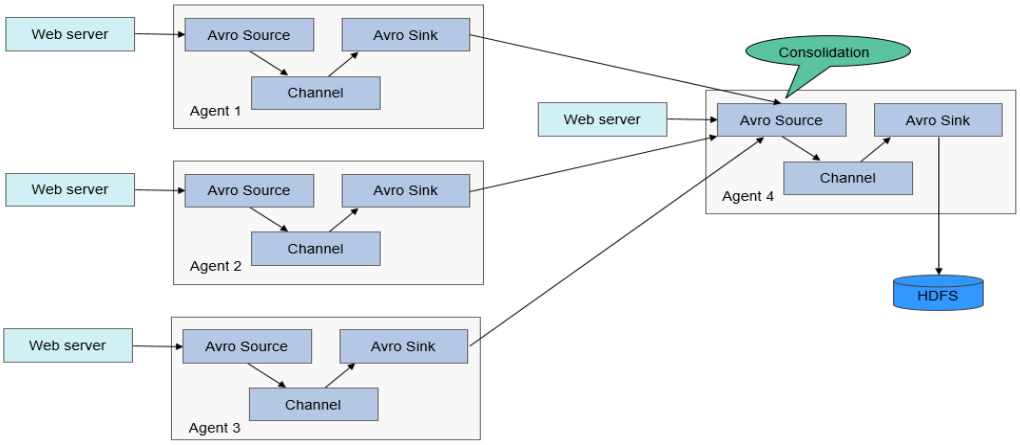
As shown in **Figure 1-29**, a Flume client can have multiple sources, channels, and sinks.

Figure 1-29 Flume structure



The reliability of Flume depends on transaction switchovers between agents. If the next agent breaks down, the channel stores data persistently and transmits data until the agent recovers. The availability of Flume depends on the built-in load balancing and failover mechanisms. Both the channel and agent can be configured with multiple entities between which they can use load balancing policies. Each agent is a Java Virtual Machine (JVM) process. A server can have multiple agents. Collection nodes (for example, Agents 1, 2, 3) process logs. Aggregation nodes (for example, Agent 4) write the logs into HDFS. The agent of each collection node can select multiple aggregation nodes for load balancing.

Figure 1-30 Flume cascading



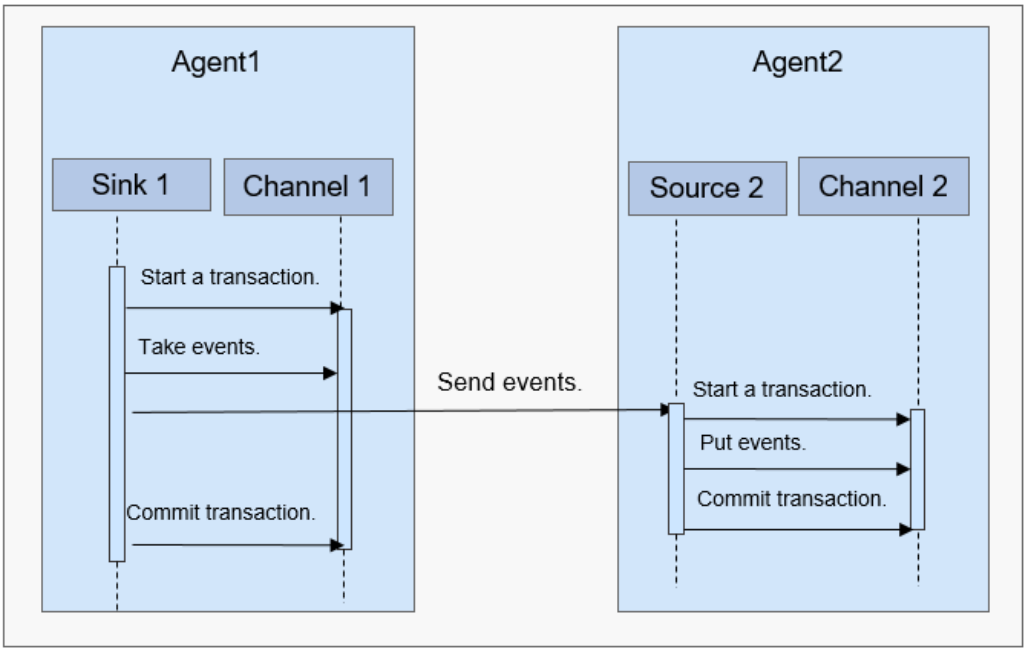
For details about Flume architecture and principles, see **https://flume.apache.org/releases/1.9.0.html**.

Principle

Reliability Between Agents

Figure 1-31 shows the data exchange between agents.

Figure 1-31 Data transmission process



1. Flume ensures reliable data transmission based on transactions. When data flows from one agent to another agent, the two transactions take effect. The sink of Agent 1 (agent that sends a message) needs to obtain a message from a channel and sends the message to Agent 2 (agent that receives the

message). If Agent 2 receives and successfully processes the message, Agent 1 will submit a transaction, indicating a successful and reliable data transmission.

2. When Agent 2 receives the message sent by Agent 1 and starts a new transaction, after the data is processed successfully (written to a channel), Agent 2 submits the transaction and sends a success response to Agent 1.
3. Before a commit operation, if the data transmission fails, the last transcription starts and retransmits the data that fails to be transmitted last time. The commit operation has written the transaction into a disk. Therefore, the last transaction can continue after the process fails and restores.

1.4.6.2 Relationship Between Flume and Other Components

Relationship Between Flume and HDFS

If HDFS is configured as the Flume sink, HDFS functions as the final data storage system of Flume. Flume installs, configures, and writes all transmitted data into HDFS.

Relationship Between Flume and HBase

If HBase is configured as the Flume sink, HBase functions as the final data storage system of Flume. Flume writes all transmitted data into HBase based on configurations.

1.4.6.3 Flume Enhanced Open Source Features

Flume Enhanced Open Source Features

- Improving transmission speed: Multiple lines instead of only one line of data can be specified as an event. This improves the efficiency of code execution and reduces the times of disk writes.
- Transferring ultra-large binary files: According to the current memory usage, Flume automatically adjusts the memory used for transferring ultra-large binary files to prevent out-of-memory.
- Supporting the customization of preparations before and after transmission: Flume supports customized scripts to be run before or after transmission for making preparations.
- Managing client alarms: Flume receives Flume client alarms through MonitorServer and reports the alarms to the alarm management center on MRS Manager.

1.4.7 HBase

1.4.7.1 HBase Basic Principles

HBase undertakes data storage. HBase is an open source, column-oriented, distributed storage system that is suitable for storing massive amounts of unstructured or semi-structured data. It features high reliability, high performance,

and flexible scalability, and supports real-time data read/write. For more information about HBase, see **https://hbase.apache.org/**.

Typical features of a table stored in HBase are as follows:

- Big table (BigTable): One table contains hundred millions of lines and millions of columns.
- Column-oriented: Column-oriented storage, retrieval, and permission control
- Sparse: Null columns in the table do not occupy any storage space.

The HBase component of MRS separates computing from storage. Data can be stored in cloud storage services at low cost, for example, Object Storage Service (OBS), and can be backed up across AZs. MRS supports secondary indexes for HBase and allows adding indexes for column values to filter data by column through native HBase APIs.

HBase architecture

An HBase cluster consists of active and standby HMaster processes and multiple RegionServer processes, as shown in **Figure 1-32**.

Figure 1-32 HBase architecture

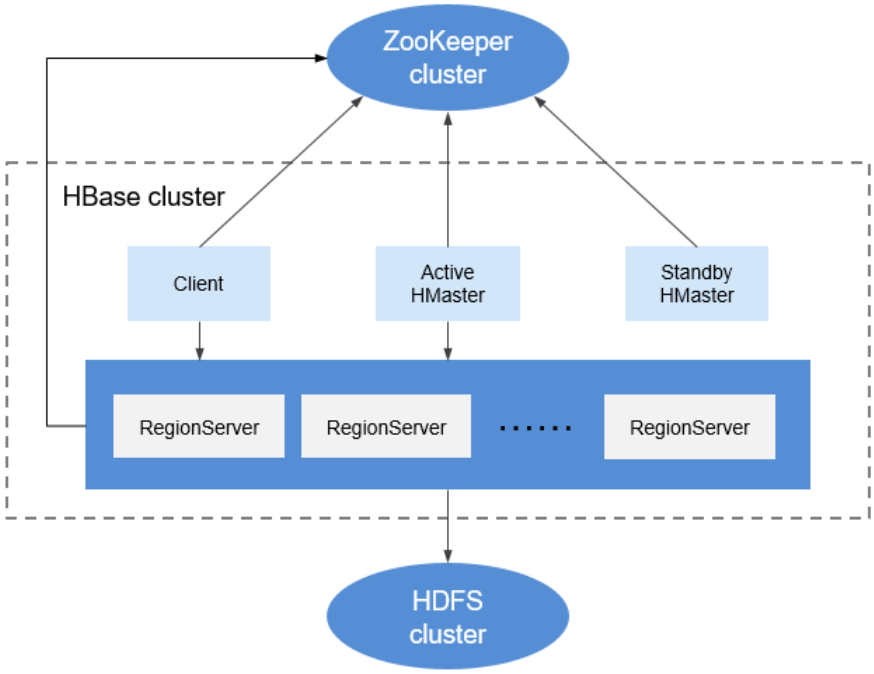


Table 1-5 Module description

Module	Description
Master	Master is also called HMaster. In HA mode, HMaster consists of an active HMaster and a standby HMaster. • Active Master: manages RegionServer in HBase, including the creation, deletion, modification, and query of a table, balances the load of RegionServer, adjusts the distribution of Region, splits Region and distributes Region after it is split, and migrates Region after RegionServer expires. • Standby Master: takes over services when the active HMaster is faulty. The original active HMaster demotes to the standby HMaster after the fault is rectified.
Client	Client communicates with Master for management and with RegionServer for data protection by using the Remote Procedure Call (RPC) mechanism of HBase.
RegionServer	RegionServer provides read and write services of table data as a data processing and computing unit in HBase. RegionServer is deployed with DataNodes of HDFS clusters to store data.
ZooKeeper cluster	ZooKeeper provides distributed coordination services for processes in HBase clusters. Each RegionServer is registered with ZooKeeper so that the active Master can obtain the health status of each RegionServer.
HDFS cluster	HDFS provides highly reliable file storage services for HBase. All HBase data is stored in the HDFS.

HBase Principles

- **HBase Data Model**

  HBase stores data in tables, as shown in **Figure 1-33**. Data in a table is divided into multiple Regions, which are allocated by Master to RegionServers for management.

  Each Region contains data within a RowKey range. An HBase data table contains only one Region at first. As the number of data increases and reaches the upper limit of the Region capacity, the Region is split into two Regions. You can define the RowKey range of a Region when creating a table or define the Region size in the configuration file.

Figure 1-33 HBase data model

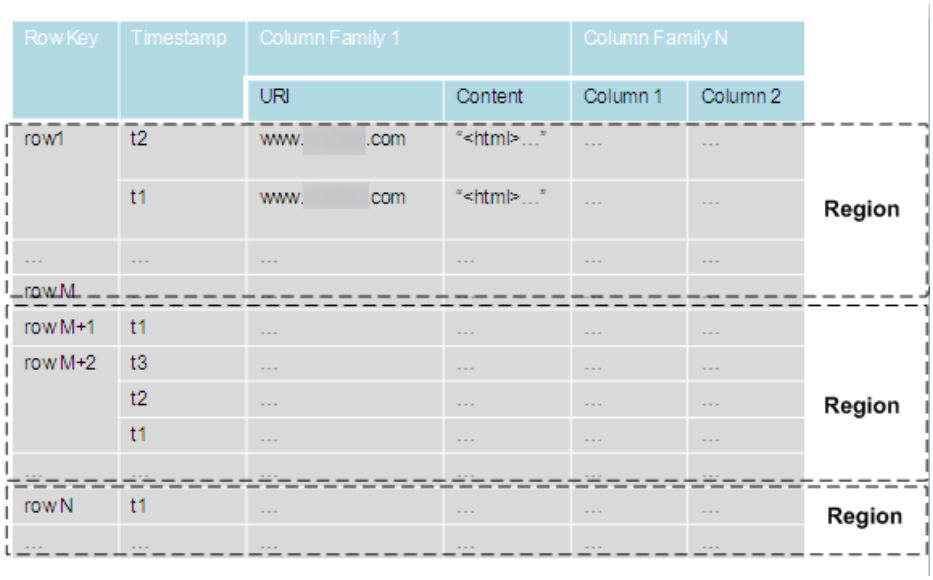

Table 1-6 Concepts

Module	Description
RowKey	Similar to the primary key in a relationship table, which is the unique ID of the data in each row. A RowKey can be a string, integer, or binary string. All records are stored after being sorted by RowKey.
Timestamp	The timestamp of a data operation. Data can be specified with different versions by time stamp. Data of different versions in each cell is stored by time in descending order.
Cell	Minimum storage unit of HBase, consisting of keys and values. A key consists of six fields, namely row, column family, column qualifier, timestamp, type, and MVCC version. Values are the binary data objects.
Column Family	One or multiple horizontal column families form a table. A column family can consist of multiple random columns. A column is a label under a column family, which can be added as required when data is written. The column family supports dynamic expansion so the number and type of columns do not need to be predefined. Columns of a table in HBase are sparsely distributed. The number and type of columns in different rows can be different. Each column family has the independent time to live (TTL). You can lock the row only. Operations on the row in a column family are the same as those on other rows.
Column	Similar to traditional databases, HBase tables also use columns to store data of the same type.

- **RegionServer Data Storage**

RegionServer manages the regions allocated by HMaster. **Figure 1-34** shows the data storage structure of RegionServer.

Figure 1-34 RegionServer data storage structure

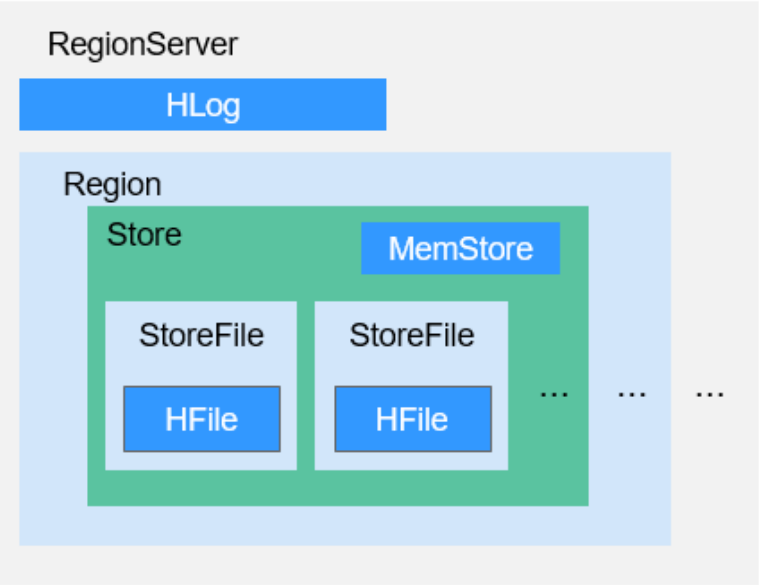

Table 1-7 lists each component of Region described in **Figure 1-34**.

Table 1-7 Region structure description

Module	Description
Store	A Region consists of one or multiple Stores. Each Store maps a column family in **Figure 1-33**.
MemStore	A Store contains one MemStore. The MemStore caches data inserted to a Region by the client. When the MemStore capacity reaches the upper limit, RegionServer flushes data in MemStore to the HDFS.
StoreFile	The data flushed to the HDFS is stored as a StoreFile in the HDFS. As more data is inserted, multiple StoreFiles are generated in a Store. When the number of StoreFiles reaches the upper limit, RegionServer merges multiple StoreFiles into a big StoreFile.
HFile	HFile defines the storage format of StoreFiles in a file system. HFile is the underlying implementation of StoreFile.
HLog	HLogs prevent data loss when RegionServer is faulty. Multiple Regions in a RegionServer share the same HLog.

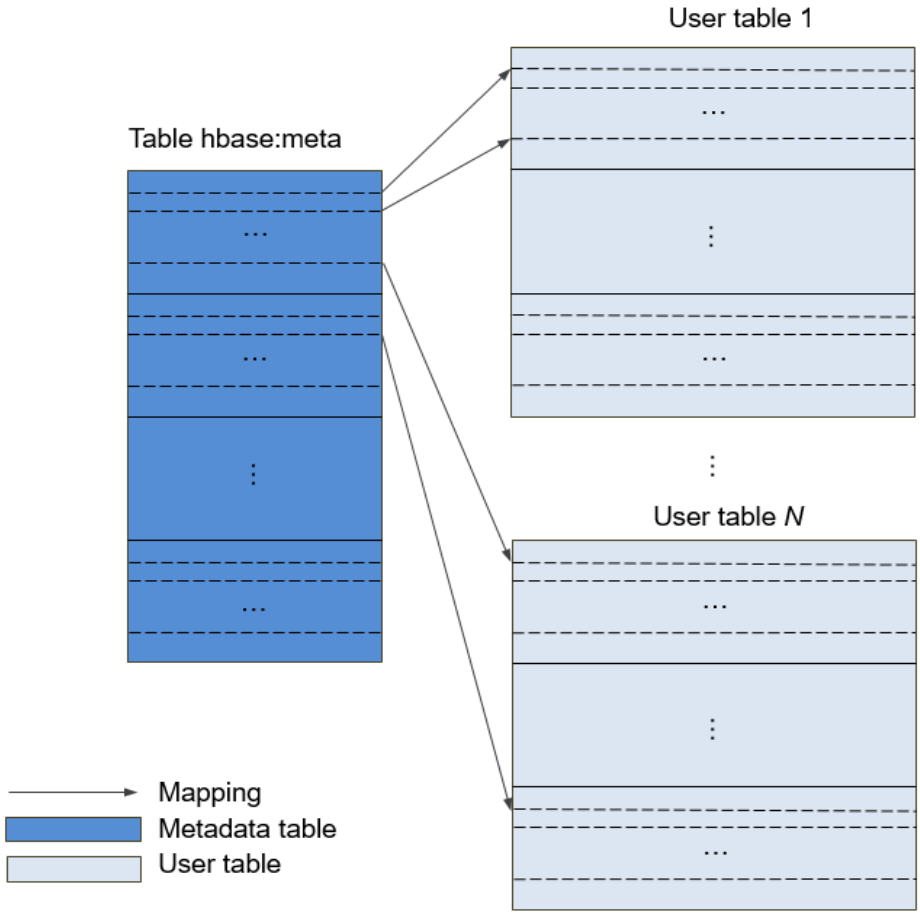
- **Metadata Table**

  The metadata table is a special HBase table, which is used by the client to locate a region. Metadata table includes **hbase:meta** table to record region

information of user tables, such as the region location and start and end RowKey.

Figure 1-35 shows the mapping relationship between metadata tables and user tables.

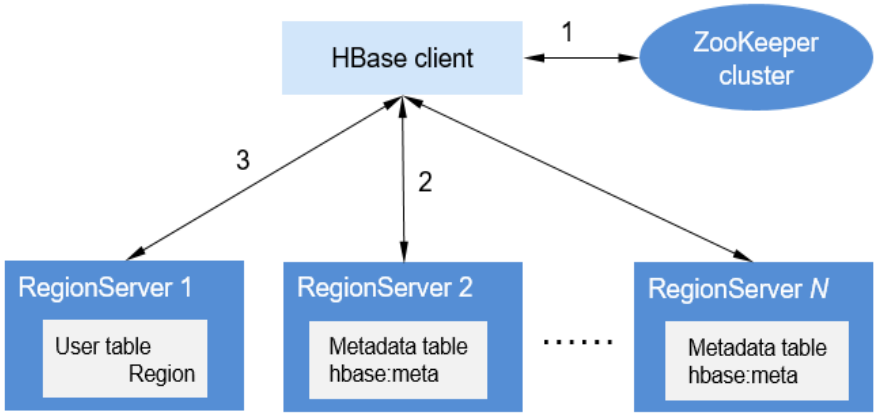
Figure 1-35 Mapping relationships between metadata tables and user tables



- **Data Operation Process**

  Figure 1-36 shows the HBase data operation process.

  Figure 1-36 Data processing



a. When you add, delete, modify, and query HBase data, the HBase client first connects to ZooKeeper to obtain information about the RegionServer where the **hbase:meta** table is located. If you modify the namespace, such as creating and deleting a table, you need to access HMaster to update the meta information.
b. The HBase client connects to the RegionServer where the region of the **hbase:meta** table is located and obtains the RegionServer location where the region of the user table resides.
c. Then the HBase client connects to the RegionServer where the region of the user table is located and issues a data operation command to the RegionServer. The RegionServer executes the command.

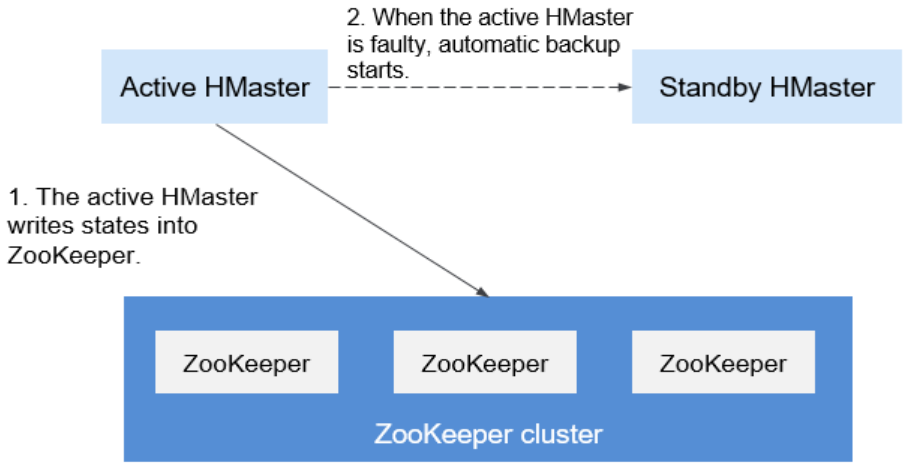
To improve data processing efficiency, the HBase client caches region information of the **hbase:meta** table and user table. When an application initiates a second data operation, the HBase client queries the region information from the memory. If no match is found in the memory, the HBase client performs the preceding operations to obtain region information.

1.4.7.2 HBase HA Solution

HBase HA

HMaster in HBase allocates Regions. When one RegionServer service is stopped, HMaster migrates the corresponding Region to another RegionServer. The HMaster HA feature is brought in to prevent HBase functions from being affected by the HMaster single point of failure (SPOF).

Figure 1-37 HMaster HA implementation architecture



The HMaster HA architecture is implemented by creating the ephemeral ZooKeeper node in a ZooKeeper cluster.

Upon startup, HMaster nodes try to create a master znode in the ZooKeeper cluster. The HMaster node that creates the master znode first becomes the active HMaster, and the other is the standby HMaster.

It will add watch events to the master node. If the service on the active HMaster is stopped, the active HMaster disconnects from the ZooKeeper cluster. After the

session expires, the active HMaster disappears. The standby HMaster detects the disappearance of the active HMaster through watch events and creates a master node to make itself be the active one. Then, the active/standby switchover completes. If the failed node detects existence of the master node after being restarted, it enters the standby state and adds watch events to the master node.

When the client accesses the HBase, it first obtains the HMaster's address based on the master node information on the ZooKeeper and then establishes a connection to the active HMaster.

1.4.7.3 Relationship with Other Components

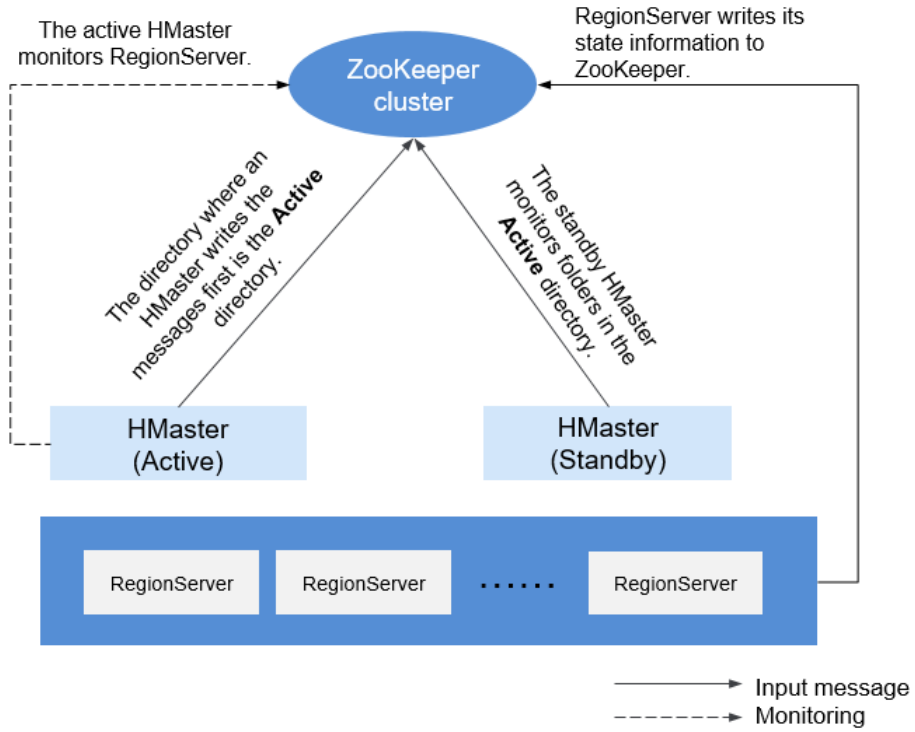
Relationship Between HDFS and HBase

HDFS is the subproject of Apache Hadoop. HBase uses the Hadoop Distributed File System (HDFS) as the file storage system. HBase is located in structured storage layer. The HDFS provides highly reliable support for lower-layer storage of HBase. All the data files of HBase can be stored in the HDFS, except some log files generated by HBase.

Relationship Between ZooKeeper and HBase

Figure 1-38 describes the relationship between ZooKeeper and HBase.

Figure 1-38 Relationship between ZooKeeper and HBase



1. HRegionServer registers itself to ZooKeeper in Ephemeral node. ZooKeeper stores the HBase information, including the HBase metadata and HMaster addresses.
2. HMaster detects the health status of each HRegionServer using ZooKeeper, and monitors them.

3. HBase can deploy multiple HMasters (like HDFS NameNode). When the active HMatser node is faulty, the standby HMaster node obtains the state information of the entire cluster using ZooKeeper, which means that HBase single point faults can be avoided using ZooKeeper.

1.4.7.4 HBase Enhanced Open Source Features

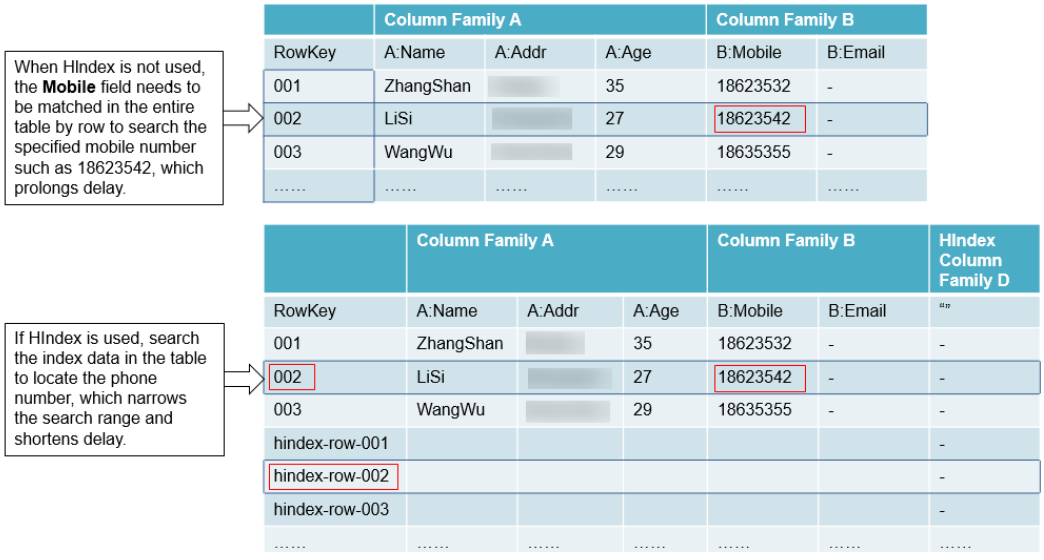
HIndex

HBase is a distributed storage database of the Key-Value type. Data of a table is sorted in the alphabetic order based on row keys. If you query data based on a specified row key or scan data in the scale of a specified row key, HBase can quickly locate the target data, enhancing the efficiency.

However, in most actual scenarios, you need to query the data of which the column value is *XXX*. HBase provides the Filter feature to query data with a specific column value. All data is scanned in the order of row keys, and then the data is matched with the specific column value until the required data is found. The Filter feature scans some unnecessary data to obtain the only required data. Therefore, the Filter feature cannot meet the requirements of frequent queries with high performance standards.

HBase HIndex is designed to address these issues. HBase HIndex enables HBase to query data based on specific column values.

Figure 1-39 HIndex



- Rolling upgrade is not supported for index data.
- Restrictions of combined indexes:
  - All columns involved in combined indexes must be entered or deleted in a single mutation. Otherwise, inconsistency will occur.

    Index: **IDX1=>cf1:[q1->datatype],[q2];cf2:[q2->datatype]**

    Correct write operations:

    ```
    Put put = new Put(Bytes.toBytes("row"));
    put.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q1"), Bytes.toBytes("valueA"));
    ```

```
put.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q2"), Bytes.toBytes("valueB"));
put.addColumn(Bytes.toBytes("cf2"), Bytes.toBytes("q2"), Bytes.toBytes("valueC"));
table.put(put);
```

Incorrect write operations:

```
Put put1 = new Put(Bytes.toBytes("row"));
put1.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q1"), Bytes.toBytes("valueA"));
table.put(put1);
Put put2 = new Put(Bytes.toBytes("row"));
put2.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q2"), Bytes.toBytes("valueB"));
table.put(put2);
Put put3 = new Put(Bytes.toBytes("row"));
put3.addColumn(Bytes.toBytes("cf2"), Bytes.toBytes("q2"), Bytes.toBytes("valueC"));
table.put(put3);
```

– The combined conditions-based query is supported only when the combined index column contains filter criteria, or StartRow and StopRow are not specified for some index columns.

  Index: **IDX1=>cf1:[q1->datatype],[q2];cf2:[q1->datatype]**

  Correct query operations:

```
scan 'table', {FILTER=>"SingleColumnValueFilter('cf1','q1',>=,'binary:valueA',true,true) AND
SingleColumnValueFilter('cf1','q2',>=,'binary:valueB',true,true) AND
SingleColumnValueFilter('cf2','q1',>=,'binary:valueC',true,true) "}

scan 'table', {FILTER=>"SingleColumnValueFilter('cf1','q1',=,'binary:valueA',true,true) AND
SingleColumnValueFilter('cf1','q2',>=,'binary:valueB',true,true)" }

scan 'table', {FILTER=>"SingleColumnValueFilter('cf1','q1',>=,'binary:valueA',true,true) AND
SingleColumnValueFilter('cf1','q2',>=,'binary:valueB',true,true) AND
SingleColumnValueFilter('cf2','q1',>=,'binary:valueC',true,true)",STARTROW=>'row001',STOPROW
=>'row100'}
```

  Incorrect query operations:

```
scan 'table', {FILTER=>"SingleColumnValueFilter('cf1','q1',>=,'binary:valueA',true,true) AND
SingleColumnValueFilter('cf1','q2',>=,'binary:valueB',true,true) AND
SingleColumnValueFilter('cf2','q1',>=,'binary:valueC',true,true)  AND
SingleColumnValueFilter('cf2','q2',>=,'binary:valueD',true,true)"}

scan 'table', {FILTER=>"SingleColumnValueFilter('cf1','q1',=,'binary:valueA',true,true) AND
SingleColumnValueFilter('cf2','q1',>=,'binary:valueC',true,true)" }

scan 'table', {FILTER=>"SingleColumnValueFilter('cf1','q1',=,'binary:valueA',true,true) AND
SingleColumnValueFilter('cf2','q2',>=,'binary:valueD',true,true)" }

scan 'table', {FILTER=>"SingleColumnValueFilter('cf1','q1',=,'binary:valueA',true,true) AND
SingleColumnValueFilter('cf1','q2',>=,'binary:valueB',true,true)" ,STARTROW=>'row001',STOPROW
=>'row100' }
```

- Do not explicitly configure any split policy for tables with index data.
- Other mutation operations, such as **increment** and **append**, are not supported.
- Index of the column with **maxVersions** greater than 1 is not supported.
- The data index column in a row cannot be updated.

  Index 1: **IDX1=>cf1:[q1->datatype],[q2];cf2:[q1->datatype]**

  Index 2: **IDX2=>cf2:[q2->datatype]**

  Correct update operations:

```
Put put1 = new Put(Bytes.toBytes("row"));
put1.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q1"), Bytes.toBytes("valueA"));
put1.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q2"), Bytes.toBytes("valueB"));
put1.addColumn(Bytes.toBytes("cf2"), Bytes.toBytes("q1"), Bytes.toBytes("valueC"));
put1.addColumn(Bytes.toBytes("cf2"), Bytes.toBytes("q2"), Bytes.toBytes("valueD"));
table.put(put1);
```

```
Put put2 = new Put(Bytes.toBytes("row"));
put2.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q3"), Bytes.toBytes("valueE"));
put2.addColumn(Bytes.toBytes("cf2"), Bytes.toBytes("q3"), Bytes.toBytes("valueF"));
table.put(put2);
```

Incorrect update operations:

```
Put put1 = new Put(Bytes.toBytes("row"));
put1.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q1"), Bytes.toBytes("valueA"));
put1.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q2"), Bytes.toBytes("valueB"));
put1.addColumn(Bytes.toBytes("cf2"), Bytes.toBytes("q1"), Bytes.toBytes("valueC"));
put1.addColumn(Bytes.toBytes("cf2"), Bytes.toBytes("q2"), Bytes.toBytes("valueD"));
table.put(put1);

Put put2 = new Put(Bytes.toBytes("row"));
put2.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q1"), Bytes.toBytes("valueA_new"));
put2.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q2"), Bytes.toBytes("valueB_new"));
put2.addColumn(Bytes.toBytes("cf2"), Bytes.toBytes("q1"), Bytes.toBytes("valueC_new"));
put2.addColumn(Bytes.toBytes("cf2"), Bytes.toBytes("q2"), Bytes.toBytes("valueD_new"));
table.put(put2);
```

- The table to which an index is added cannot contain a value greater than 32 KB.
- If user data is deleted due to the expiration of the column-level TTL, the corresponding index data is not deleted immediately. It will be deleted in the major compaction operation.
- The TTL of the user column family cannot be modified after the index is created.
  - If the TTL of a column family increases after an index is created, delete the index and re-create one. Otherwise, some generated index data will be deleted before user data is deleted.
  - If the TTL value of the column family decreases after an index is created, the index data will be deleted after user data is deleted.
- The index query does not support the reverse operation, and the query results are disordered.
- The index does not support the **clone snapshot** operation.
- The index table must use HIndexWALPlayer to replay logs. WALPlayer cannot be used to replay logs.

```
hbase org.apache.hadoop.hbase.hindex.mapreduce.HIndexWALPlayer
Usage: WALPlayer [options] <wal inputdir> <tables> [<tableMappings>]
Read all WAL entries for <tables>.
If no tables ("") are specific, all tables are imported.
(Careful, even -ROOT- and hbase:meta entries will be imported in that case.)
Otherwise <tables> is a comma separated list of tables.

The WAL entries can be mapped to new set of tables via <tableMapping>.
<tableMapping> is a command separated list of targettables.
If specified, each table in <tables> must have a mapping.

By default WALPlayer will load data directly into HBase.
To generate HFiles for a bulk data load instead, pass the option:
  -Dwal.bulk.output=/path/for/output
  (Only one table can be specified, and no mapping is allowed!)
Other options: (specify time range to WAL edit to consider)
  -Dwal.start.time=[date|ms]
  -Dwal.end.time=[date|ms]
For performance also consider the following options:
  -Dmapreduce.map.speculative=false
  -Dmapreduce.reduce.speculative=false
```

- When the **deleteall** command is executed for the index table, the performance is low.

- The index table does not support HBCK. To use HBCK to repair the index table, delete the index data first.

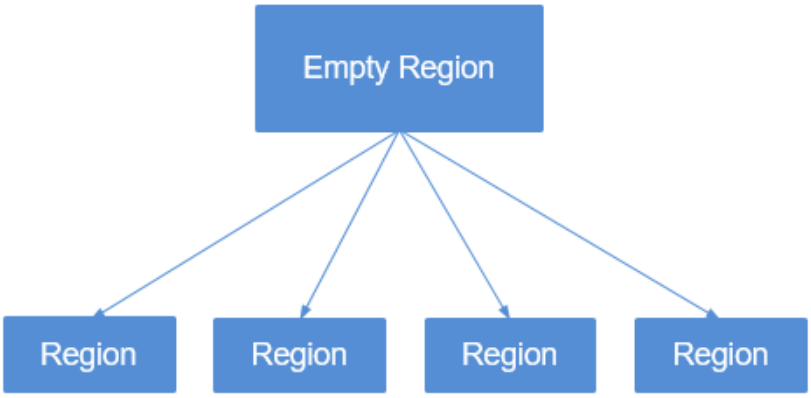
Multi-point Division

When you create tables that are pre-divided by region in HBase, you may not know the data distribution trend so the division by region may be inappropriate. After the system runs for a period, regions need to be divided again to achieve better performance. Only empty regions can be divided.

The region division function delivered with HBase divides regions only when they reach the threshold. This is called "single point division".

To achieve better performance when regions are divided based on user requirements, multi-point division is developed, which is also called "dynamic division". That is, an empty region is pre-divided into multiple regions to prevent performance deterioration caused by insufficient region space.

Figure 1-40 Multi-point division



Connection Limitation

Too many sessions mean that too many queries and MapReduce tasks are running on HBase, which compromises HBase performance and even causes service rejection. You can configure parameters to limit the maximum number of sessions that can be established between the client and the HBase server to achieve HBase overload protection.

Improved Disaster Recovery

The disaster recovery (DR) capabilities between the active and standby clusters can enhance HA of the HBase data. The active cluster provides data services and the standby cluster backs up data. If the active cluster is faulty, the standby cluster takes over data services. Compared with the open source replication function, this function is enhanced as follows:

1. The standby cluster whitelist function is only applicable to pushing data to a specified cluster IP address.
2. In the open source version, replication is synchronized based on WAL, and data backup is implemented by replaying WAL in the standby cluster. For

BulkLoad operations, since no WAL is generated, data will not be replicated to the standby cluster. By recording BulkLoad operations on the WAL and synchronizing them to the standby cluster, the standby cluster can read BulkLoad operation records through WAL and load HFile in the active cluster to the standby cluster to implement data backup.

3. In the open source version, HBase filters ACLs. Therefore, ACL information will not be synchronized to the standby cluster. By adding a filter (**org.apache.hadoop.hbase.replication.SystemTableWALEntryFilterAllowACL**), ACL information can be synchronized to the standby cluster. You can configure **hbase.replication.filter.sytemWALEntryFilter** to enable the filter and implement ACL synchronization.
4. As for read-only restriction of the standby cluster, only super users within the standby cluster can modify the HBase of the standby cluster. In other words, HBase clients outside the standby cluster can only read the HBase of the standby cluster.

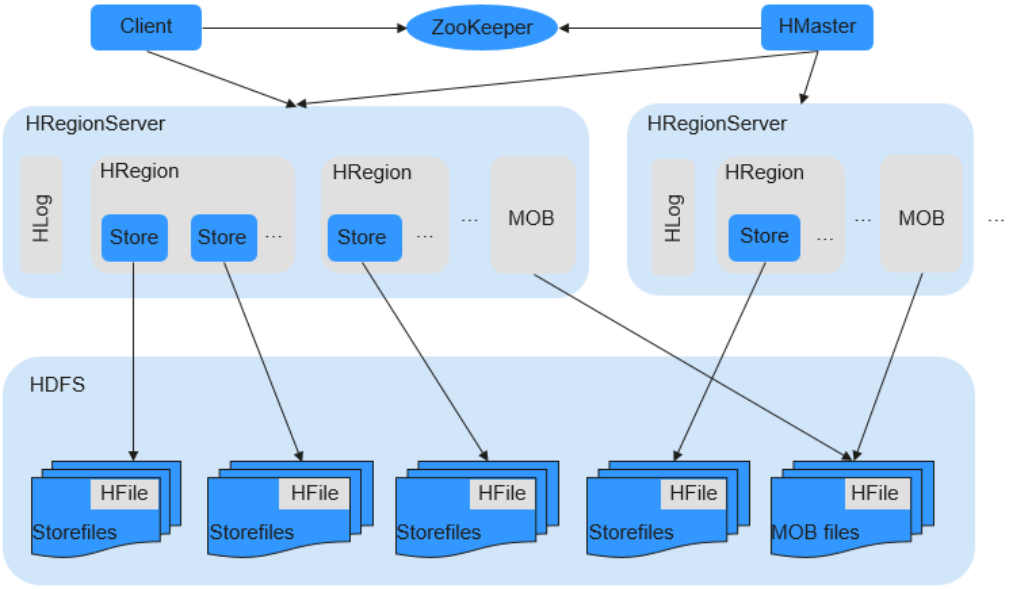
HBase MOB

In the actual application scenarios, data in various sizes needs to be stored, for example, image data and documents. Data whose size is smaller than 10 MB can be stored in HBase. HBase can yield the best read-and-write performance for data whose size is smaller than 100 KB. If the size of data stored in HBase is greater than 100 KB or even reaches 10 MB and the same number of data files are inserted, the total data amount is large, causing frequent compaction and split, high CPU consumption, high disk I/O frequency, and low performance.

MOB data (whose size ranges from 100 KB to 10 MB) is stored in a file system (for example, HDFS) in HFile format. The expiredMobFileCleaner and Sweeper tools are used to manage HFiles and save the address and size information about the HFiles to the store of HBase as values. This greatly decreases the compaction and split frequency in HBase and improves performance.

As shown in **Figure 1-41**, MOB indicates mobstore stored on HRegion. Mobstore stores keys and values. Wherein, a key is the corresponding key in HBase, and a value is the reference address and data offset stored in the file system. When reading data, mobstore uses its own scanner to read key-value data objects and uses the address and data size information in the value to obtain target data from the file system.

Figure 1-41 MOB data storage principle



HFS

HBase FileStream (HFS) is an independent HBase file storage module. It is used in MRS upper-layer applications by encapsulating HBase and HDFS interfaces to provide these upper-layer applications with functions such as file storage, read, and deletion.

In the Hadoop ecosystem, the HDFS and HBase face tough problems in mass file storage in some scenarios:

- If a large number of small files are stored in HDFS, the NameNode will be under great pressure.
- Some large files cannot be directly stored on HBase due to HBase APIs and internal mechanisms.

HFS is developed for the mixed storage of massive small files and some large files in Hadoop. Simply speaking, massive small files (smaller than 10 MB) and some large files (greater than 10 MB) need to be stored in HBase tables.

For such a scenario, HFS provides unified operation APIs similar to HBase function APIs.

Multiple RegionServers Deployed on the Same Server

Multiple RegionServers can be deployed on one node to improve HBase resource utilization.

If only one RegionServer is deployed, resource utilization is low due to the following reasons:

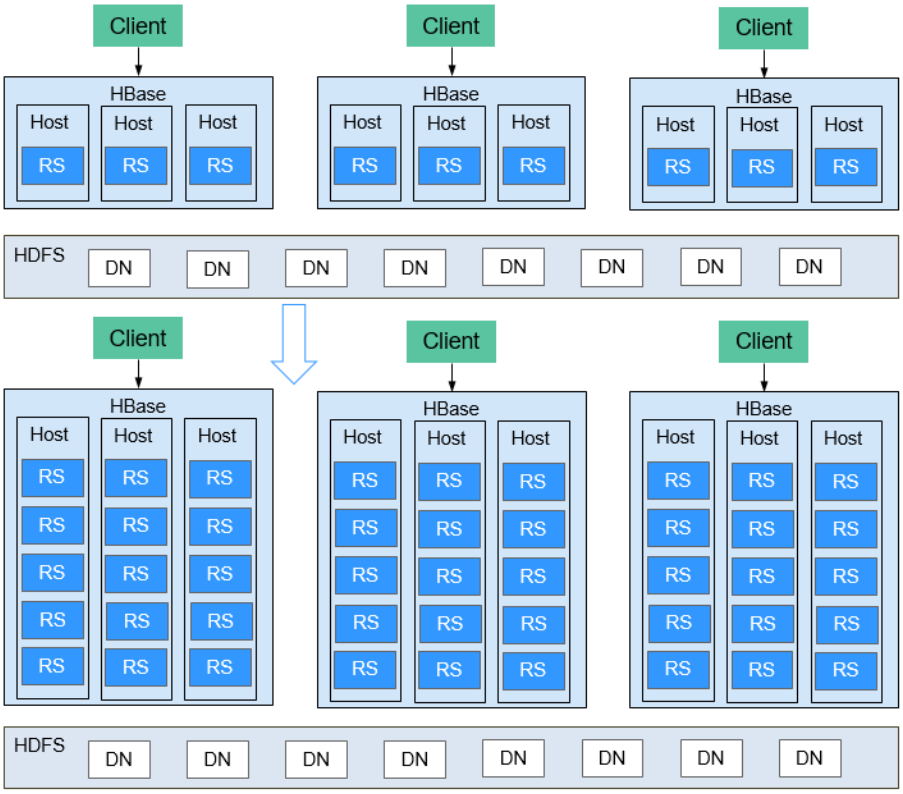
1. A RegionServer supports a limited number of regions, and therefore memory and CPU resources cannot be fully used.
2. A single RegionServer supports a maximum of 20 TB data, of which two copies require 40 TB, and three copies require 60 TB. In this case, 96 TB capacity cannot be used up.

3. Poor write performance: One RegionServer is deployed on a physical server, and only one HLog exists. Only three disks can be written at the same time.

The HBase resource utilization can be improved when multiple RegionServers are deployed on the same server.

1. A physical server can be configured with a maximum of five RegionServers. The number of RegionServers deployed on each physical server can be configured as required.
2. Resources such as memory, disks, and CPUs can be fully used.
3. A physical server supports a maximum of five HLogs and allows data to be written to 15 disks at the same time, significantly improving write performance.

Figure 1-42 Improved HBase resource utilization

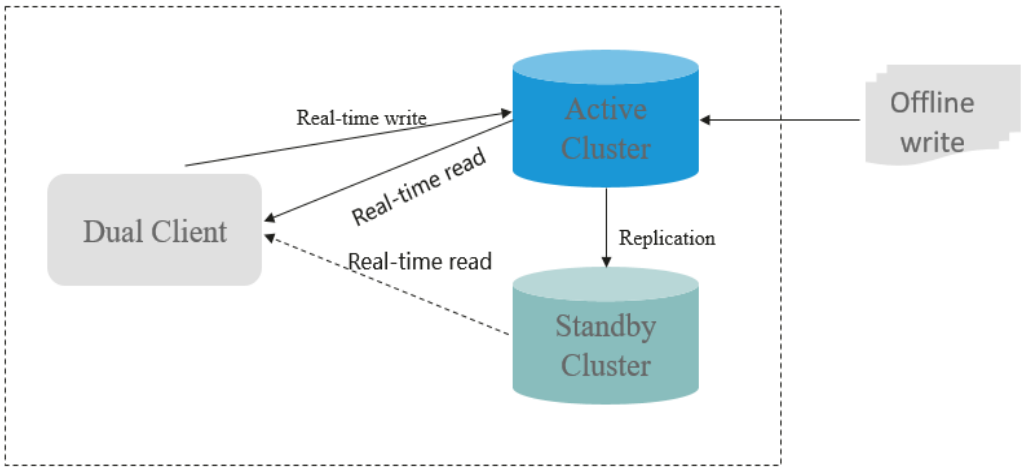


HBase Dual-Read

In the HBase storage scenario, it is difficult to ensure 99.9% query stability due to GC, network jitter, and bad sectors of disks. The HBase dual-read feature is added to meet the requirements of low glitches during large-data-volume random read.

The HBase dual-read feature is based on the DR capability of the active and standby clusters. The probability that the two clusters generate glitches at the same time is far less than that of one cluster. The dual-cluster concurrent access mode is used to ensure query stability. When a user initiates a query request, the HBase service of the two clusters is queried at the same time. If the active cluster does not return any result after a period of time (the maximum tolerable glitch

time), the data of the cluster with the fastest response can be used. The following figure shows the working principle.



1.4.8 HDFS

1.4.8.1 HDFS Basic Principles

Hadoop Distributed File System (HDFS) implements reliable and distributed read/write of massive amounts of data. HDFS is applicable to the scenario where data read/write features "write once and read multiple times". However, the write operation is performed in sequence, that is, it is a write operation performed during file creation or an adding operation performed behind the existing file. HDFS ensures that only one caller can perform write operation on a file but multiple callers can perform read operation on the file at the same time.

Architecture

HDFS consists of active and standby NameNodes and multiple DataNodes, as shown in **Figure 1-43**.

HDFS works in master/slave architecture. NameNodes run on the master (active) node, and DataNodes run on the slave (standby) node. ZKFC should run along with the NameNodes.

The communication between NameNodes and DataNodes is based on Transmission Control Protocol (TCP)/Internet Protocol (IP). The NameNode, DataNode, ZKFC, and JournalNode can be deployed on Linux servers.

Figure 1-43 HA HDFS architecture

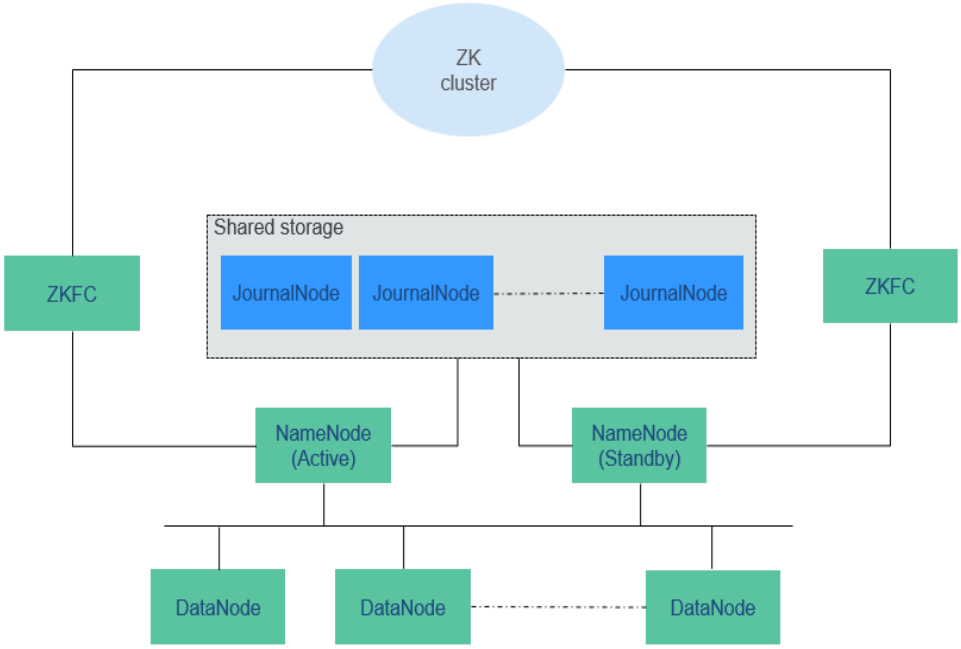


Table 1-8 describes the functions of each module shown in **Figure 1-43**.

Table 1-8 Module description

Module	Description
NameNode	A NameNode is used to manage the namespace, directory structure, and metadata information of a file system and provide the backup mechanism. The NameNode is classified into the following two types: • Active NameNode: manages the namespace, maintains the directory structure and metadata of file systems, and records the mapping relationships between data blocks and files to which the data blocks belong. • Standby NameNode: synchronizes with the data in the active NameNode, and takes over services from the active NameNode when the active NameNode is faulty. • Observer NameNode: synchronizes with the data in the active NameNode, and processes read requests from the client.
DataNode	A DataNode is used to store data blocks of each file and periodically report the storage status to the NameNode.
JournalNode	In HA cluster, synchronizes metadata between the active and standby NameNodes.
ZKFC	ZKFC must be deployed for each NameNode. It monitors NameNode status and writes status information to ZooKeeper. ZKFC also has permissions to select the active NameNode.

Module	Description
ZK Cluster	ZooKeeper is a coordination service which helps the ZKFC to elect the active NameNode.
HttpFS gateway	HttpFS is a single stateless gateway process which provides the WebHDFS REST API for external processes and FileSystem API for the HDFS. HttpFS is used for data transmission between different versions of Hadoop. It is also used as a gateway to access the HDFS behind a firewall.

- **HDFS HA Architecture**

  HA is used to resolve the SPOF problem of NameNode. This feature provides a standby NameNode for the active NameNode. When the active NameNode is faulty, the standby NameNode can quickly take over to continuously provide services for external systems.

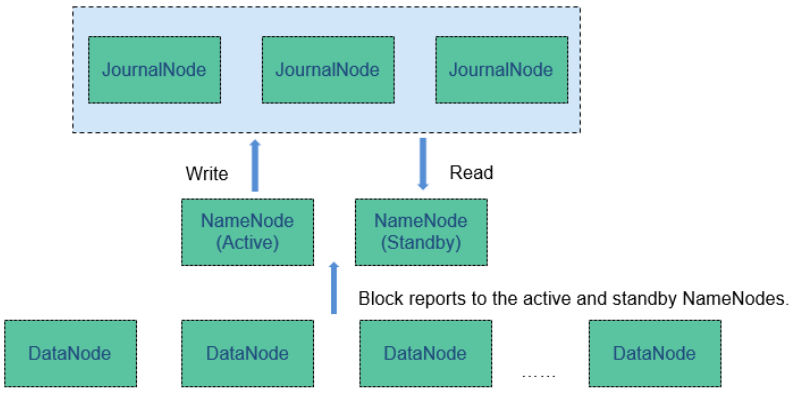
  In a typical HDFS HA scenario, there are usually two NameNodes. One is in the active state, and the other in the standby state.

  A shared storage system is required to support metadata synchronization of the active and standby NameNodes. This version provides Quorum Journal Manager (QJM) HA solution, as shown in **Figure 1-44**. A group of JournalNodes are used to synchronize metadata between the active and standby NameNodes.

  Generally, an odd number (2N+1) of JournalNodes are configured, and at least three JournalNodes are required. For one metadata update message, data writing is considered successful as long as data writing is successful on N +1 JournalNodes. In this case, data writing failure of a maximum of N JournalNodes is allowed. For example, when there are three JournalNodes, data writing failure of one JournalNode is allowed; when there are five JournalNodes, data writing failure of two JournalNodes is allowed.

  JournalNode is a lightweight daemon process and shares a host with other services of Hadoop. It is recommended that the JournalNode be deployed on the control node to prevent data writing failure on the JournalNode during massive data transmission.

  Figure 1-44 QJM-based HDFS architecture

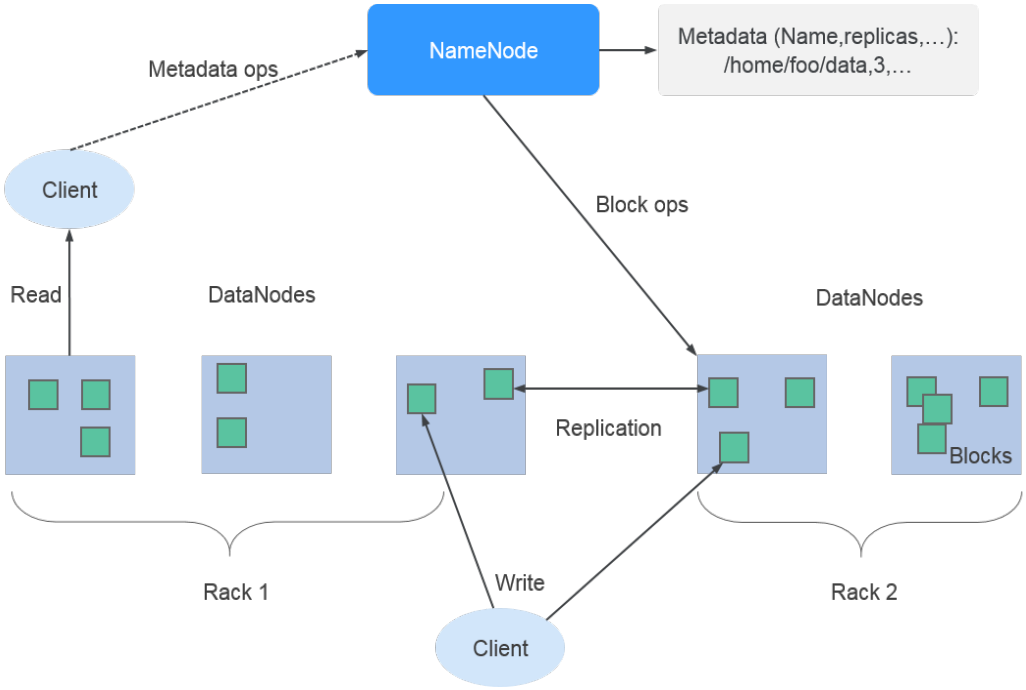


Principle

MRS uses the HDFS copy mechanism to ensure data reliability. One backup file is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The number of HDFS copies can be queried using the **dfs.replication** parameter.

- When the Core node specification of the MRS cluster is set to non-local hard disk drive (HDD) and the cluster has only one Core node, the default number of HDFS copies is 1. If the number of Core nodes in the cluster is greater than or equal to 2, the default number of HDFS copies is 2.
- When the Core node specification of the MRS cluster is set to local disk and the cluster has only one Core node, the default number of HDFS copies is 1. If there are two Core nodes in the cluster, the default number of HDFS copies is 2. If the number of Core nodes in the cluster is greater than or equal to 3, the default number of HDFS copies is 3.

Figure 1-45 HDFS architecture



The HDFS component of MRS supports the following features:

- Supports erasure code, reducing data redundancy to 50% and improving reliability. In addition, the striped block storage structure is introduced to maximize the use of the capability of a single node and multiple disks in an existing cluster. After the coding process is introduced, the data write performance is improved, and the performance is close to that with the multi-copy redundancy.
- Supports balanced node scheduling on HDFS and balanced disk scheduling on a single node, improving HDFS storage performance after node or disk scale-out.

For details about the Hadoop architecture and principles, see **https://hadoop.apache.org/**.

1.4.8.2 HDFS HA Solution

HDFS HA Background

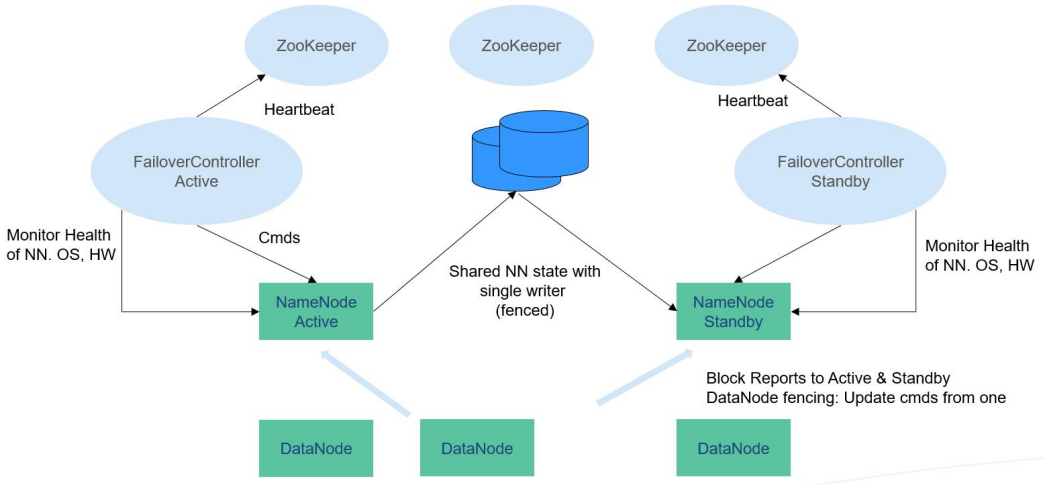
In versions earlier than Hadoop 2.0.0, SPOF occurs in the HDFS cluster. Each cluster has only one NameNode. If the host where the NameNode is located is faulty, the HDFS cluster cannot be used unless the NameNode is restarted or started on another host. This affects the overall availability of HDFS in the following aspects:

1. In the case of an unplanned event such as host breakdown, the cluster would be unavailable until the NameNode is restarted.
2. Planned maintenance tasks, such as software and hardware upgrade, will cause the cluster stop working.

To solve the preceding problems, the HDFS HA solution enables a hot-swap NameNode backup for NameNodes in a cluster in automatic or manual (configurable) mode. When a machine fails (due to hardware failure), the active/standby NameNode switches over automatically in a short time. When the active NameNode needs to be maintained, the MRS cluster administrator can manually perform an active/standby NameNode switchover to ensure cluster availability during maintenance. For details about the automatic failover of HDFS, see **https://hadoop.apache.org/docs/r3.1.1/hadoop-project-dist/hadoop-hdfs/HDFSHighAvailabilityWithQJM.html#Automatic_Failover**.

HDFS HA Implementation

Figure 1-46 Typical HA deployment



In a typical HA cluster (as shown in **Figure 1-46**), two NameNodes need to be configured on two independent servers, respectively. At any time point, one NameNode is in the active state, and the other NameNode is in the standby state. The active NameNode is responsible for all client operations in the cluster, while the standby NameNode maintains synchronization with the active node to provide fast switchover if necessary.

To keep the data synchronized with each other, both nodes communicate with a group of JournalNodes. When the active node modifies any file system's metadata,

it will store the modification log to a majority of these JournalNodes. For example, if there are three JournalNodes, then the log will be saved on two of them at least. The standby node monitors changes of JournalNodes and synchronizes changes from the active node. Based on the modification log, the standby node applies the changes to the metadata of the local file system. Once a switchover occurs, the standby node can ensure its status is the same as that of the active node. This ensures that the metadata of the file system is synchronized between the active and standby nodes if the switchover is incurred by the failure of the active node.

To ensure fast switchover, the standby node needs to have the latest block information. Therefore, DataNodes send block information and heartbeat messages to two NameNodes at the same time.

It is vital for an HA cluster that only one of the NameNodes be active at any time. Otherwise, the namespace state would split into two parts, risking data loss or other incorrect results. To prevent the so-called "split-brain scenario", the JournalNodes will only ever allow a single NameNode to write data to it at a time. During switchover, the NameNode which is to become active will take over the role of writing data to JournalNodes. This effectively prevents the other NameNodes from being in the active state, allowing the new active node to safely proceed with switchover.

For more information about the HDFS HA solution, visit the following website:

http://hadoop.apache.org/docs/r3.1.1/hadoop-project-dist/hadoop-hdfs/HDFSHighAvailabilityWithQJM.html

1.4.8.3 Relationship Between HDFS and Other Components

Relationship Between HDFS and HBase

HDFS is a subproject of Apache Hadoop, which is used as the file storage system for HBase. HBase is located in the structured storage layer. HDFS provides highly reliable support for lower-layer storage of HBase. All the data files of HBase can be stored in the HDFS, except some log files generated by HBase.

Relationship Between HDFS and MapReduce

- HDFS features high fault tolerance and high throughput, and can be deployed on low-cost hardware for storing data of applications with massive data sets.
- MapReduce is a programming model used for parallel computation of large data sets (larger than 1 TB). Data computed by MapReduce comes from multiple data sources, such as Local FileSystem, HDFS, and databases. Most data comes from the HDFS. The high throughput of HDFS can be used to read massive data. After being computed, data can be stored in HDFS.

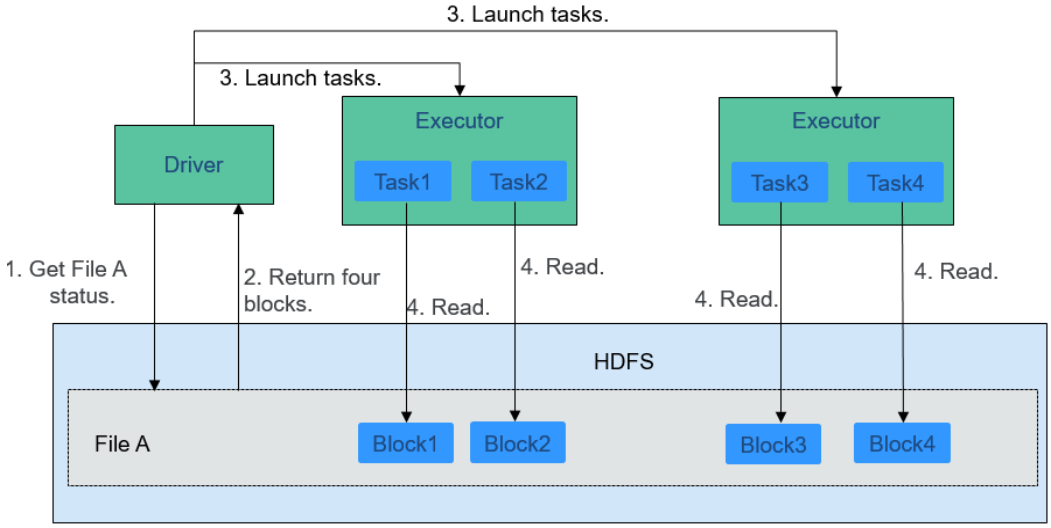
Relationship Between HDFS and Spark

Data computed by Spark comes from multiple data sources, such as local files and HDFS. Most data comes from HDFS which can read data in large scale for parallel computing. After being computed, data can be stored in HDFS.

Spark involves Driver and Executor. Driver schedules tasks and Executor runs tasks.

Figure 1-47 shows how data is read from a file.

Figure 1-47 File reading process

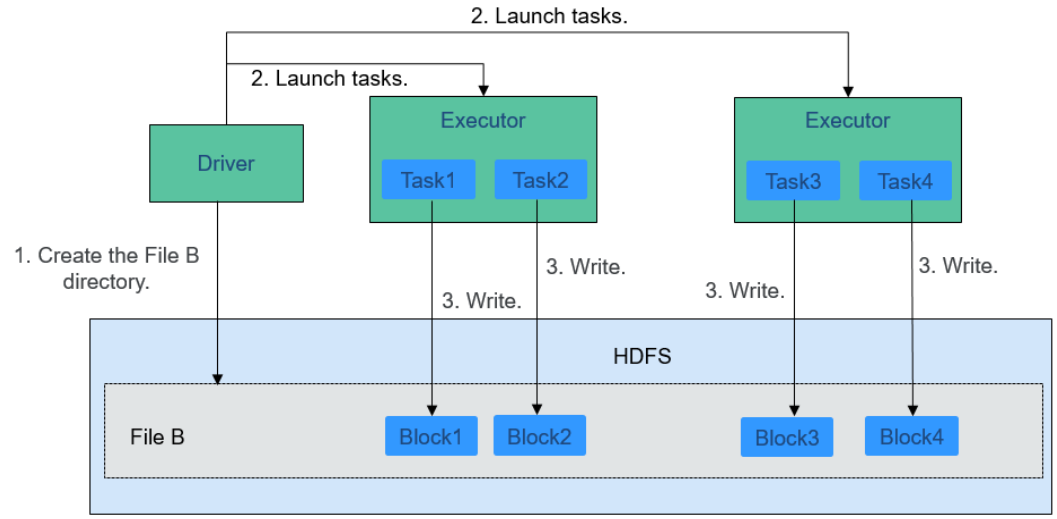


The file reading process is as follows:

1. Driver interconnects with HDFS to obtain the information of File A.
2. The HDFS returns the detailed block information about this file.
3. Driver sets a parallel degree based on the block data amount, and creates multiple tasks to read the blocks of this file.
4. Executor runs the tasks and reads the detailed blocks as part of the Resilient Distributed Dataset (RDD).

Figure 1-48 shows how data is written to a file.

Figure 1-48 File writing process



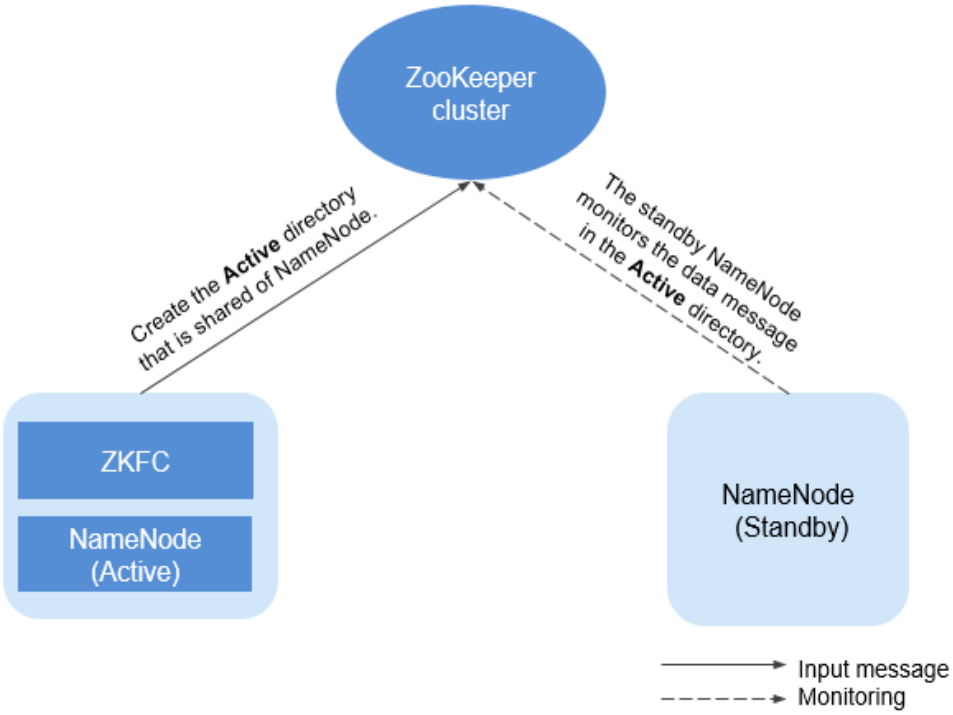
The file writing process is as follows:

1. Driver creates a directory where the file is to be written.
2. Based on the RDD distribution status, the number of tasks related to data writing is computed, and these tasks are sent to Executor.
3. Executor runs these tasks, and writes the computed RDD data to the directory created in 1.

Relationship Between HDFS and ZooKeeper

Figure 1-49 shows the relationship between ZooKeeper and HDFS.

Figure 1-49 Relationship between ZooKeeper and HDFS



As the client of a ZooKeeper cluster, ZKFailoverController (ZKFC) monitors the status of NameNode. ZKFC is deployed only in the node where NameNode resides, and in both the active and standby HDFS NameNodes.

1. The ZKFC connects to ZooKeeper and saves information such as host names to ZooKeeper under the znode directory **/hadoop-ha**. NameNode that creates the directory first is considered as the active node, and the other is the standby node. NameNodes read the NameNode information periodically through ZooKeeper.
2. When the process of the active node ends abnormally, the standby NameNode detects changes in the **/hadoop-ha** directory through ZooKeeper, and then takes over the service of the active NameNode.

1.4.8.4 HDFS Enhanced Open Source Features

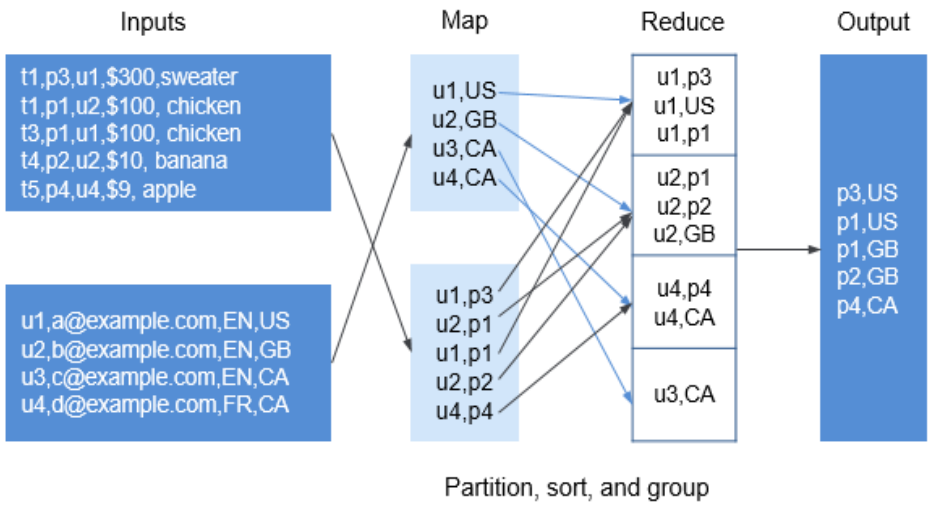
Enhanced Open Source Feature: File Block Colocation

In the offline data summary and statistics scenario, Join is a frequently used computing function, and is implemented in MapReduce as follows:

1. The Map task processes the records in the two table files into Join Key and Value, performs hash partitioning by Join Key, and sends the data to different Reduce tasks for processing.
2. Reduce tasks read data in the left table recursively in the nested loop mode and traverse each line of the right table. If join key values are identical, join results are output.

   The preceding method sharply reduces the performance of the join calculation. Because a large amount of network data transfer is required when the data stored in different nodes is sent from MAP to Reduce, as shown in **Figure 1-50**.

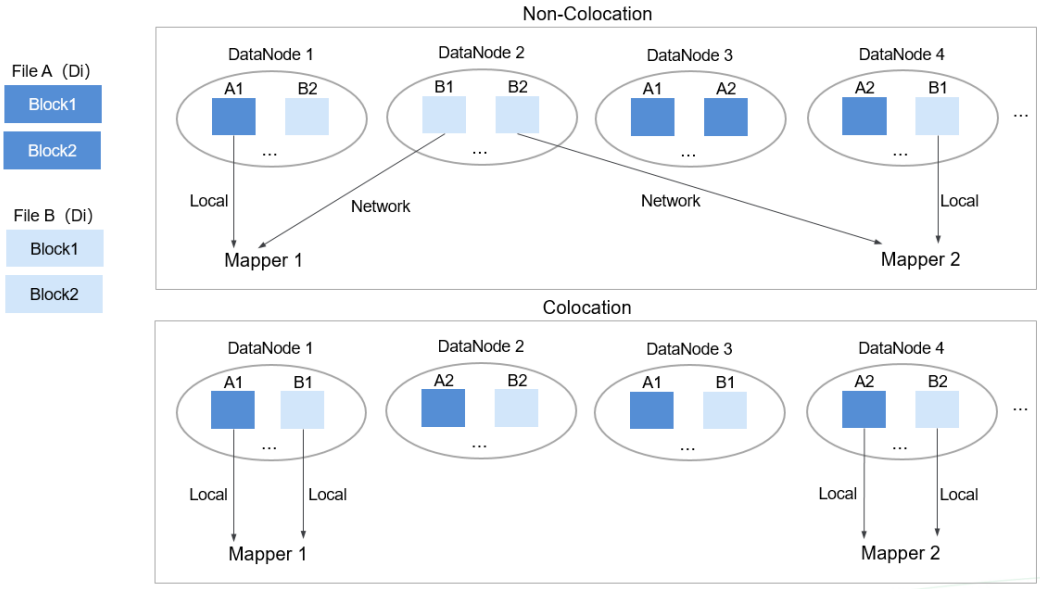
Figure 1-50 Data transmission in the non-colocation scenario



Data tables are stored in physical file system by HDFS block. Therefore, if two to-be-joined blocks are put into the same host accordingly after they are partitioned by join key, you can obtain the results directly from Map join in the local node without any data transfer in the Reduce process of the join calculation. This will greatly improve the performance.

With the identical distribution feature of HDFS data, a same distribution ID is allocated to files, FileA and FileB, on which association and summation calculations need to be performed. In this way, all the blocks are distributed together, and calculation can be performed without retrieving data across nodes, which greatly improves the MapReduce join performance.

Figure 1-51 Data block distribution in colocation and non-colocation scenarios

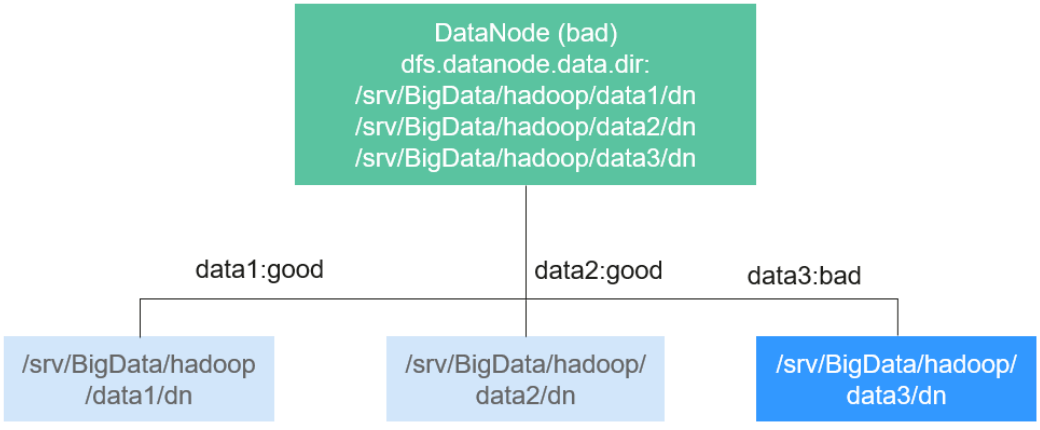


Enhanced Open Source Feature: Damaged Hard Disk Volume Configuration

In the open source version, if multiple data storage volumes are configured for a DataNode, the DataNode stops providing services by default if one of the volumes is damaged. If the configuration item **dfs.datanode.failed.volumes.tolerated** is set to specify the number of damaged volumes that are allowed, DataNode continues to provide services when the number of damaged volumes does not exceed the threshold.

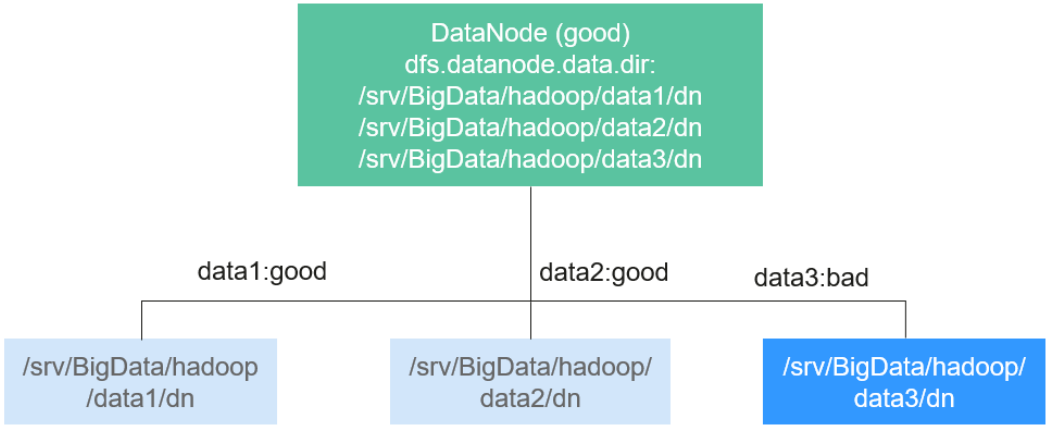
The value of **dfs.datanode.failed.volumes.tolerated** ranges from -1 to the number of disk volumes configured on the DataNode. The default value is **-1**, as shown in **Figure 1-52**.

Figure 1-52 Item being set to 0



For example, three data storage volumes are mounted to a DataNode, and **dfs.datanode.failed.volumes.tolerated** is set to 1. In this case, if one data storage volume of the DataNode is unavailable, this DataNode can still provide services, as shown in **Figure 1-53**.

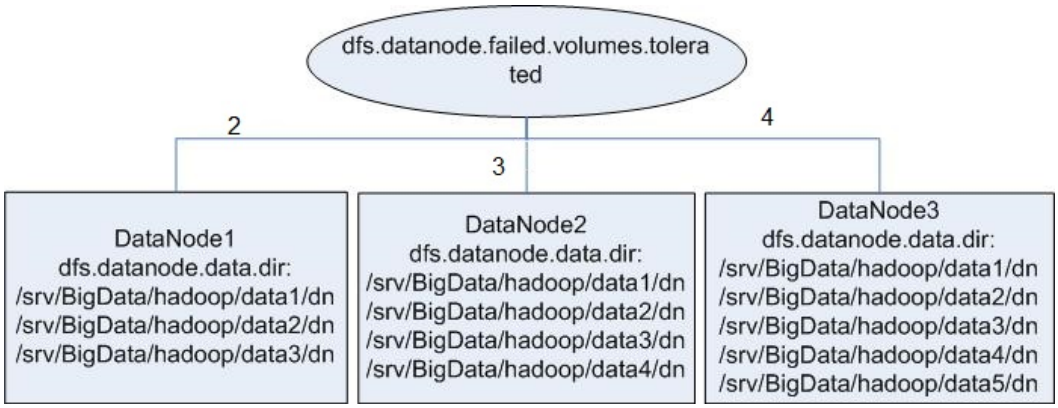
Figure 1-53 Item being set to 1



This native configuration item has some defects. When the number of data storage volumes in each DataNode is inconsistent, you need to configure each DataNode independently instead of generating the unified configuration file for all nodes.

Assume that there are three DataNodes in a cluster. The first node has three data directories, the second node has four, and the third node has five. If you want to ensure that DataNode services are available when only one data directory is available, you need to perform the configuration as shown in **Figure 1-54**.

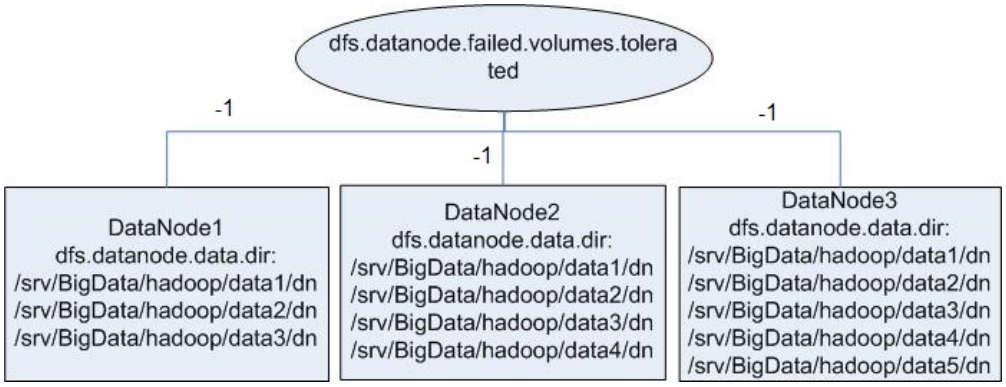
Figure 1-54 Attribute configuration before being enhanced



In self-developed enhanced HDFS, this configuration item is enhanced, with a value **-1** added. When this configuration item is set to **-1**, all DataNodes can provide services as long as one data storage volume in all DataNodes is available.

To resolve the problem in the preceding example, set this configuration to **-1**, as shown in **Figure 1-55**.

Figure 1-55 Attribute configuration after being enhanced



Enhanced Open Source Feature: HDFS Startup Acceleration

In HDFS, when NameNodes start, the metadata file FsImage needs to be loaded. Then, DataNodes will report the data block information after the DataNodes startup. When the data block information reported by DataNodes reaches the preset percentage, NameNodes exits safe mode to complete the startup process. If the number of files stored on the HDFS reaches the million or billion level, the two processes are time-consuming and will lead to a long startup time of the NameNode. Therefore, this version optimizes the process of loading metadata file FsImage.

In the open source HDFS, FsImage stores all types of metadata information. Each type of metadata information (such as file metadata information and folder metadata information) is stored in a section block, respectively. These section blocks are loaded in serial mode during startup. If a large number of files and folders are stored on the HDFS, loading of the two sections is time-consuming, prolonging the HDFS startup time. HDFS NameNode divides each type of metadata by segments and stores the data in multiple sections when generating the FsImage files. When the NameNodes start, sections are loaded in parallel mode. This accelerates the HDFS startup.

Enhanced Open Source Feature: Label-based Block Placement Policies (HDFS Nodelabel)

You need to configure the nodes for storing HDFS file data blocks based on data features. You can configure a label expression to an HDFS directory or file and assign one or more labels to a DataNode so that file data blocks can be stored on specified DataNodes. If the label-based data block placement policy is used for selecting DataNodes to store the specified files, the DataNode range is specified based on the label expression. Then proper nodes are selected from the specified range.

- You can store the replicas of data blocks to the nodes with different labels accordingly. For example, store two replicas of the data block to the node labeled with L1, and store other replicas of the data block to the nodes labeled with L2.
- You can set the policy in case of block placement failure, for example, select a node from all nodes randomly.

Figure 1-56 gives an example:

- Data in **/HBase** is stored in A, B, and D.
- Data in **/Spark** is stored in A, B, D, E, and F.
- Data in **/user** is stored in C, D, and F.
- Data in **/user/shl** is stored in A, E, and F.

Figure 1-56 Example of label-based block placement policy

Enhanced Open Source Feature: HDFS Load Balance

The current read and write policies of HDFS are mainly for local optimization without considering the actual load of nodes or disks. Based on I/O loads of different nodes, the load balance of HDFS ensures that when read and write operations are performed on the HDFS client, the node with low I/O load is selected to perform such operations to balance I/O load and fully utilize the overall throughput of the cluster.

If HDFS Load Balance is enabled during file writing, the NameNode selects a DataNode (in the order of local node, local rack, and remote rack). If the I/O load of the selected node is heavy, the NameNode will choose another DataNode with lighter load.

If HDFS Load Balance is enabled during file reading, an HDFS client sends a request to the NameNode to provide the list of DataNodes that store the block to be read. The NameNode returns a list of DataNodes sorted by distance in the network topology. With the HDFS Load Balance feature, the DataNodes on the list

are also sorted by their I/O load. The DataNodes with heavy load are at the bottom of the list.

Enhanced Open Source Feature: HDFS Auto Data Movement

Hadoop has been used for batch processing of immense data in a long time. The existing HDFS model is used to fit the needs of batch processing applications very well because such applications focus more on throughput than delay.

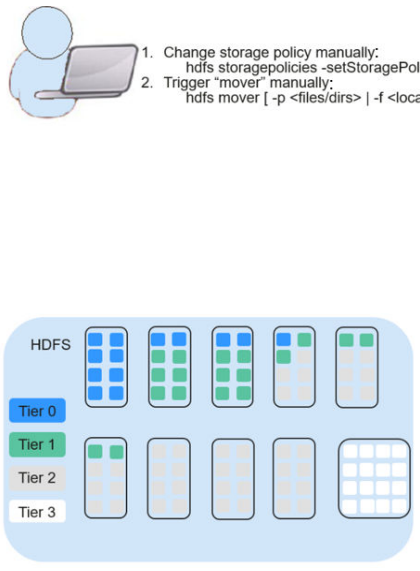
However, as Hadoop is increasingly used for upper-layer applications that demand frequent random I/O access such as Hive and HBase, low latency disks such as solid state disk (SSD) are favored in delay-sensitive scenarios. To cater to the trend, HDFS supports a variety of storage types. Users can choose a storage type according to their needs.

Storage policies vary depending on how frequently data is used. For example, if data that is frequently accessed in the HDFS is marked as **ALL_SSD** or **HOT**, the data that is accessed several times may be marked as **WARM**, and data that is rarely accessed (only once or twice access) can be marked as **COLD**. You can select different data storage policies based on the data access frequency.

However, low latency disks are far more expensive than spinning disks. Data typically sees heavy initial usage with decline in usage over a period of time. Therefore, it can be useful if data that is no longer used is moved out from expensive disks to cheaper ones storage media.

A typical example is storage of detail records. New detail records are imported into SSD because they are frequently queried by upper-layer applications. As access frequency to these detail records declines, they are moved to cheaper storage.

Before automatic data movement is achieved, you have to manually determine by service type whether data is frequently used, manually set a data storage policy, and manually trigger the HDFS Auto Data Movement Tool, as shown in the figure below.



1. Change storage policy manually:
   hdfs storagepolicies -setStoragePolicy –path <path> -policy <policy>
2. Trigger "mover" manually:
   hdfs mover [-p <files/dirs> | -f <local file name>]

Policy ID	PolicyName	Block Placement (n replacas)	Fallback storages for creation	Fallback storages for replication
15	Lazy_Persist	RAN_DISK:1 DISK:n-1	DISK	DISK
12	All_SSD	SSD:n	DISK	DISK
10	One_SSD	SSD:1,DISK:n-1	SSD,DISK	SSD,DISK
7	Hot(default)	DISK:n	<none>	ARCHIVE
5	Warm	DISK:1,ARCHIVE:n-1	ARCHIVE, DISK	ARCHIVE, DISK
2	Cold	ARCHIVE:n	<none>	<none>

If aged data can be automatically identified and moved to cheaper storage (such as disk/archive), you will see significant cost cuts and data management efficiency improvement.

The HDFS Auto Data Movement Tool is at the core of HDFS Auto Data Movement. It automatically sets a storage policy depending on how frequently data is used. Specifically, functions of the HDFS Auto Data Movement Tool can:

- Mark a data storage policy as **All_SSD**, **One_SSD**, **Hot**, **Warm**, **Cold**, or **FROZEN** according to age, access time, and manual data movement rules.
- Define rules for distinguishing cold and hot data based on the data age, access time, and manual migration rules.
- Define the action to be taken if age-based rules are met.

  MARK: the action for identifying whether data is frequently or rarely used based on the age rules and setting a data storage policy. **MOVE**: the action for invoking the HDFS Auto Data Movement Tool and moving data based on the age rules to identify whether data is frequently or rarely used after you have determined the corresponding storage policy.

  - **MARK**: identifies whether data is frequently or rarely used and sets the data storage policy.
  - **MOVE**: the action for invoking the HDFS Auto Data Movement Tool and moving data across tiers.
  - **SET_REPL**: the action for setting new replica quantity for a file.
  - **MOVE_TO_FOLDER**: the action for moving files to a target folder.
  - **DELETE**: the action for deleting a file or directory.
  - **SET_NODE_LABEL**: the action for setting node labels of a file.

With the HDFS Auto Data Movement feature, you only need to define age based on access time rules. HDFS Auto Data Movement Tool matches data according to age-based rules, sets storage policies, and moves data. In this way, data management efficiency and cluster resource efficiency are improved.

1.4.9 Hive

1.4.9.1 Hive Basic Principles

Hive is a data warehouse infrastructure built on Hadoop. It provides a series of tools that can be used to extract, transform, and load (ETL) data. Hive is a mechanism that can store, query, and analyze mass data stored on Hadoop. Hive defines simple SQL-like query language, which is known as HiveQL. It allows a user familiar with SQL to query data. Hive data computing depends on MapReduce, Spark, and Tez.

The new execution engine **Tez** is used to replace the original MapReduce, greatly improving performance. Tez can convert multiple dependent jobs into one job, so only once HDFS write is required and fewer transit nodes are needed, greatly improving the performance of DAG jobs.

Hive provides the following functions:

- Analyzes massive structured data and summarizes analysis results.

- Allows complex MapReduce jobs to be compiled in SQL languages.
- Supports flexible data storage formats, including JavaScript object notation (JSON), comma separated values (CSV), TextFile, RCFile, SequenceFile, and ORC (Optimized Row Columnar).

Hive system structure:

- User interface: Three user interfaces are available, that is, CLI, Client, and WUI. CLI is the most frequently-used user interface. A Hive transcript is started when CLI is started. Client refers to a Hive client, and a client user connects to the Hive Server. When entering the client mode, you need to specify the node where the Hive Server resides and start the Hive Server on this node. The web UI is used to access Hive through a browser. MRS can access Hive only in client mode.
- Metadata storage: Hive stores metadata into databases, for example, MySQL and Derby. Metadata in Hive includes a table name, table columns and partitions and their properties, table properties (indicating whether a table is an external table), and the directory where table data is stored.

Hive Framework

Hive is a single-instance service process that provides services by translating HQL into related MapReduce jobs or HDFS operations. **Figure 1-57** shows how Hive is connected to other components.

Figure 1-57 Hive framework

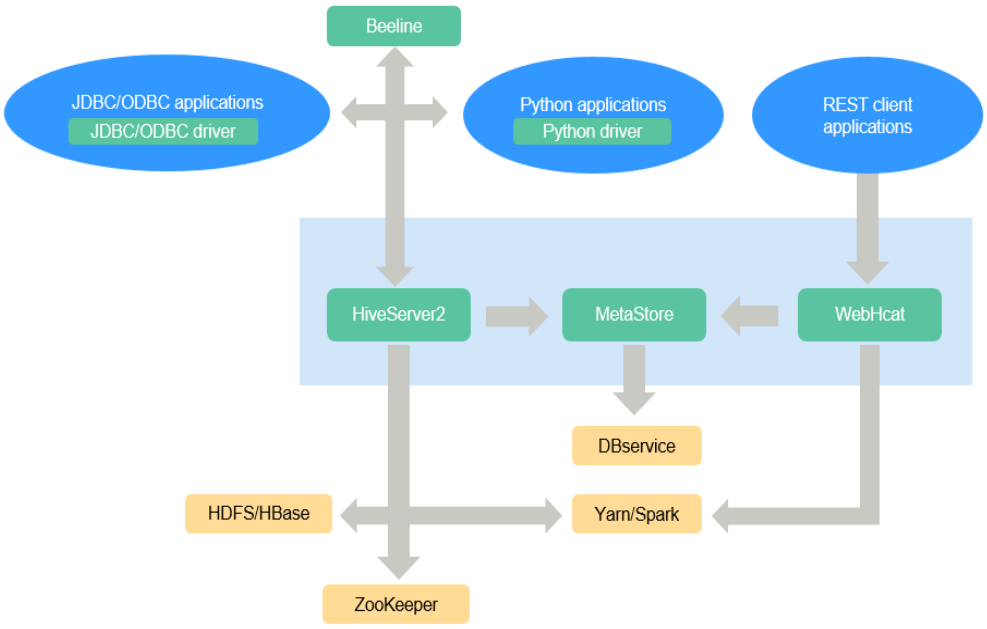


Table 1-9 Module description

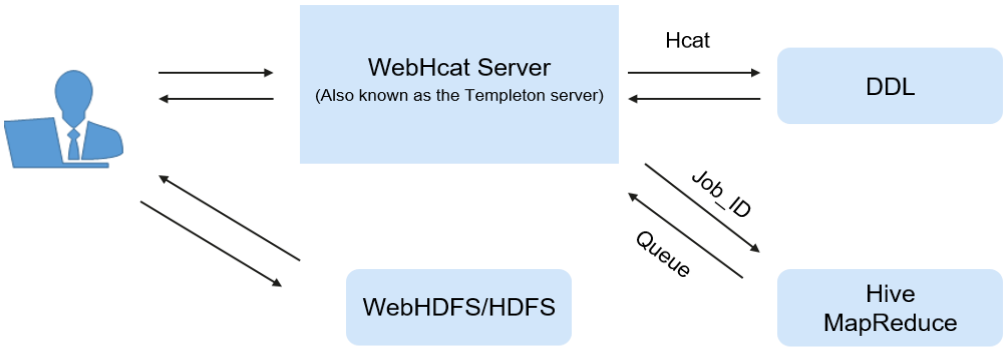
Module	Description
HiveServer	Multiple HiveServers can be deployed in a cluster to share loads. HiveServer provides Hive database services externally, translates HQL statements into related YARN tasks or HDFS operations to complete data extraction, conversion, and analysis.
MetaStore	• Multiple MetaStores can be deployed in a cluster to share loads. MetaStore provides Hive metadata services as well as reads, writes, maintains, and modifies the structure and properties of Hive tables. • MetaStore provides Thrift APIs for HiveServer, Spark, WebHCat, and other MetaStore clients to access and operate metadata.
WebHCat	Multiple WebHCats can be deployed in a cluster to share loads. WebHCat provides REST APIs and runs the Hive commands through the REST APIs to submit MapReduce jobs.
Hive client	Hive client includes the human-machine command-line interface (CLI) Beeline, JDBC drive for JDBC applications, Python driver for Python applications, and HCatalog JAR files for MapReduce.
ZooKeeper cluster	As a temporary node, ZooKeeper records the IP address list of each HiveServer instance. The client driver connects to ZooKeeper to obtain the list and selects corresponding HiveServer instances based on the routing mechanism.
HDFS/HBase cluster	The HDFS cluster stores the Hive table data.
MapReduce/ YARN cluster	Provides distributed computing services. Most Hive data operations rely on MapReduce. The main function of HiveServer is to translate HQL statements into MapReduce jobs to process massive data.

HCatalog is built on Hive Metastore and incorporates the DDL capability of Hive. HCatalog is also a Hadoop-based table and storage management layer that enables convenient data read/write on tables of HDFS by using different data processing tools such as MapReduce. Besides, HCatalog also provides read/write APIs for these tools and uses a Hive CLI to publish commands for defining data and querying metadata. After encapsulating these commands, WebHCat Server can provide RESTful APIs, as shown in **Figure 1-58**.

Figure 1-58 WebHCat logical architecture



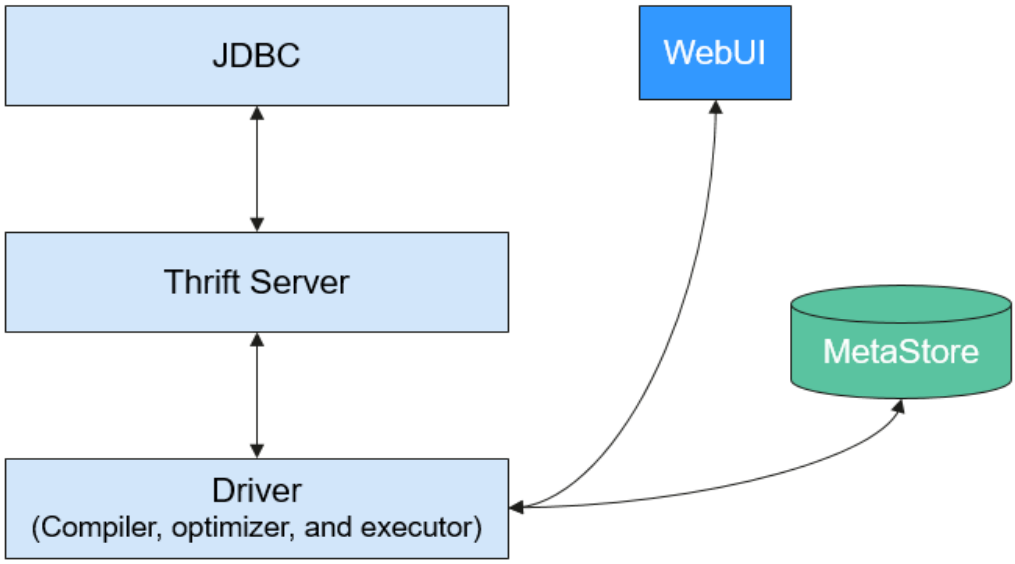
Principles

Hive functions as a data warehouse based on HDFS and MapReduce architecture and translates HQL statements into MapReduce jobs or HDFS operations. For details about Hive and HQL, see **HiveQL Language Manual**.

Figure 1-59 shows the Hive structure.

- **Metastore**: reads, writes, and updates metadata such as tables, columns, and partitions. Its lower layer is relational databases.
- **Driver**: manages the lifecycle of HiveQL execution and participates in the entire Hive job execution.
- **Compiler**: translates HQL statements into a series of interdependent Map or Reduce jobs.
- **Optimizer**: is classified into logical optimizer and physical optimizer to optimize HQL execution plans and MapReduce jobs, respectively.
- **Executor**: runs Map or Reduce jobs based on job dependencies.
- **ThriftServer**: functions as the servers of JDBC, provides Thrift APIs, and integrates with Hive and other applications.
- **Clients**: include the WebUI and JDBC APIs and provides APIs for user access.

Figure 1-59 Hive framework



1.4.9.2 Hive CBO Principles

Hive CBO Principles

CBO is short for Cost-Based Optimization.

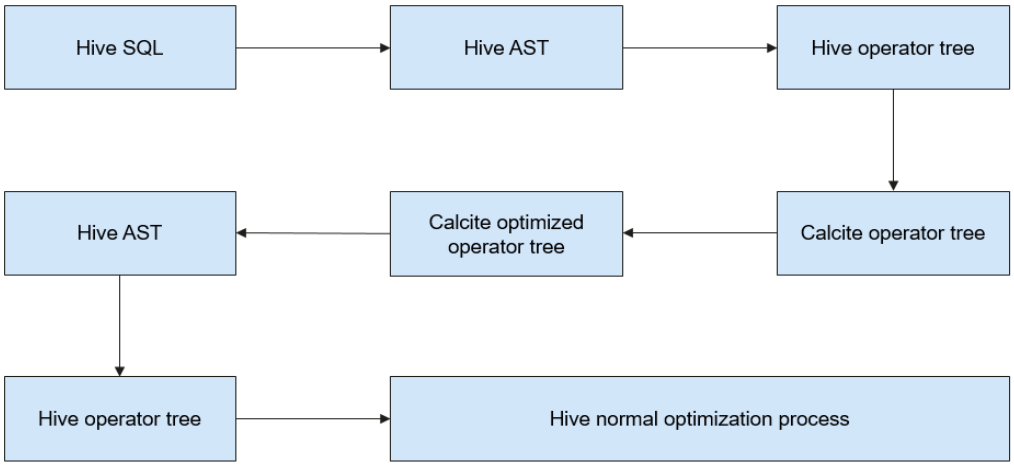
It will optimize the following:

During compilation, the CBO calculates the most efficient join sequence based on tables and query conditions involved in query statements to reduce time and resources required for query.

In Hive, the CBO is implemented as follows:

Hive uses open-source component Apache Calcite to implement the CBO. SQL statements are first converted into Hive Abstract Syntax Trees (ASTs) and then into RelNodes that can be identified by Calcite. After Calcite adjusts the join sequence in RelNodes, RelNodes are converted into ASTs by Hive to continue the logical and physical optimization. **Figure 1-60** shows the working flow.

Figure 1-60 CBO Implementation process



Calcite adjusts the join sequence as follows:

1. A table is selected as the first table from the tables to be joined.
2. The second and third tables are selected based on the cost. In this way, multiple different execution plans are obtained.
3. A plan with the minimum costs is calculated and serves as the final sequence.

The cost calculation method is as follows:

In the current version, costs are measured based on the number of data entries after joining. Fewer data entries mean less cost. The number of joined data entries depends on the selection rate of joined tables. The number of data entries in a table is obtained based on the table-level statistics.

The number of data entries in a table after filtering is estimated based on the column-level statistics, including the maximum values (max), minimum values (min), and Number of Distinct Values (NDV).

For example, there is a table **table_a** whose total number of data records is 1,000,000 and NDV is 50. The query conditions are as follows:

```
Select * from table_a where colum_a='value1';
```

The estimated number of queried data entries is: 1,000,000 x 1/50 = 20,000. The selection rate is 2%.

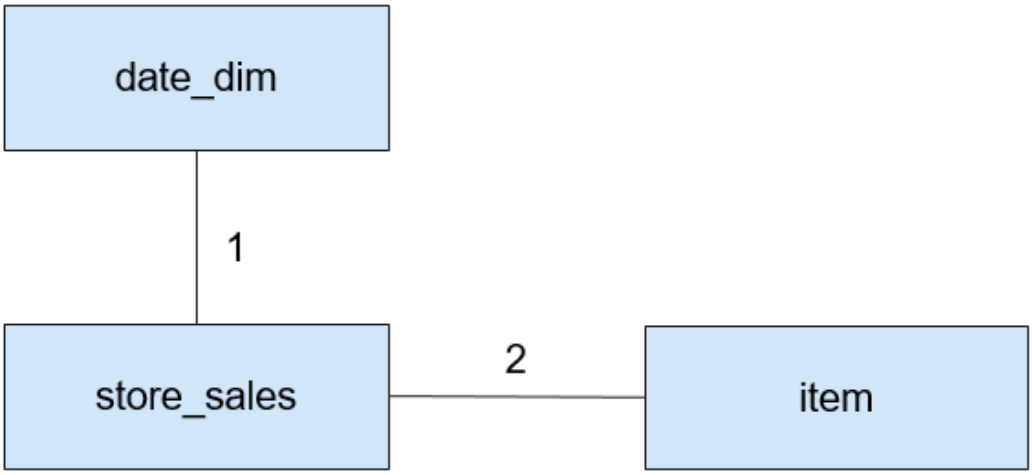
The following takes the TPC-DS Q3 as an example to describe how the CBO adjusts the join sequence:

```
select
    dt.d_year,
    item.i_brand_id brand_id,
    item.i_brand brand,
    sum(ss_ext_sales_price) sum_agg
from
    date_dim dt,
    store_sales,
    item
where
    dt.d_date_sk = store_sales.ss_sold_date_sk
    and store_sales.ss_item_sk = item.i_item_sk
```

```
   and item.i_manufact_id = 436
   and dt.d_moy = 12
group by dt.d_year , item.i_brand , item.i_brand_id
order by dt.d_year , sum_agg desc , brand_id
limit 10;
```

Statement explanation: This statement indicates that inner join is performed for three tables: table **store_sales** is a fact table with about 2,900,000,000 data entries, table **date_dim** is a dimension table with about 73,000 data entries, and table **item** is a dimension table with about 18,000 data entries. Each table has filtering conditions. **Figure 1-61** shows the join relationship.

Figure 1-61 Join relationship



The CBO must first select the tables that bring the best filtering effect for joining.

By analyzing min, max, NDV, and the number of data entries, the CBO estimates the selection rates of different dimension tables, as shown in **Table 1-10**.

Table 1-10 Data filtering

Table	Number of Original Data Entries	Number of Data Entries After Filtering	Selection Rate
date_dim	73,000	6,200	8.5%
item	18,000	19	0.1%

The selection rate can be estimated as follows: Selection rate = Number of data entries after filtering/Number of original data entries

As shown in the preceding table, the **item** table has a better filtering effect. Therefore, the CBO joins the **item** table first before joining the **date_dim** table.

Figure 1-62 shows the join process when the CBO is disabled.

Figure 1-62 Join process when the CBO is disabled

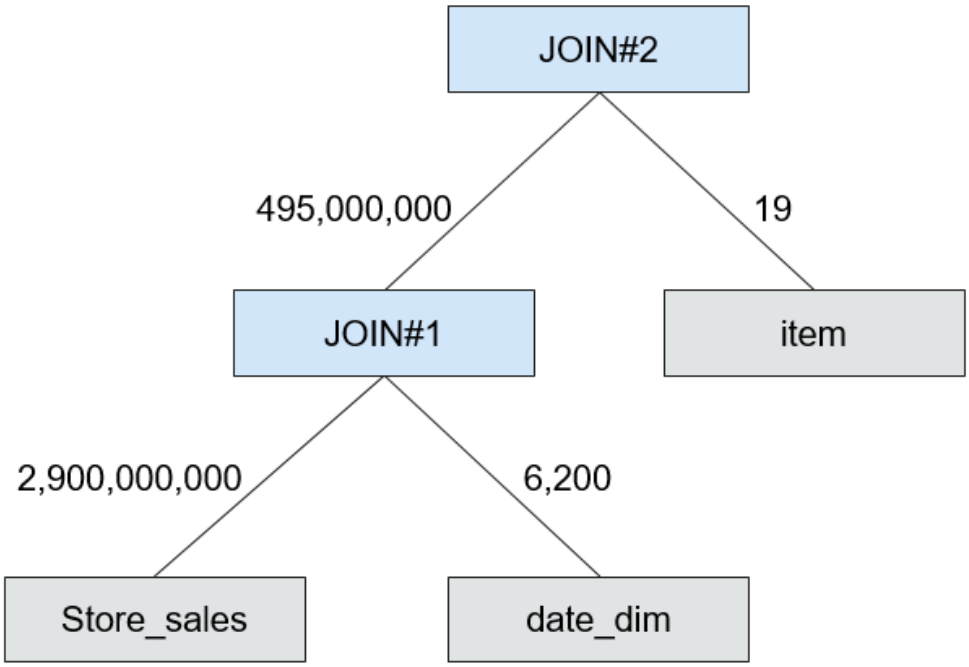


Figure 1-63 shows the join process when the CBO is enabled.

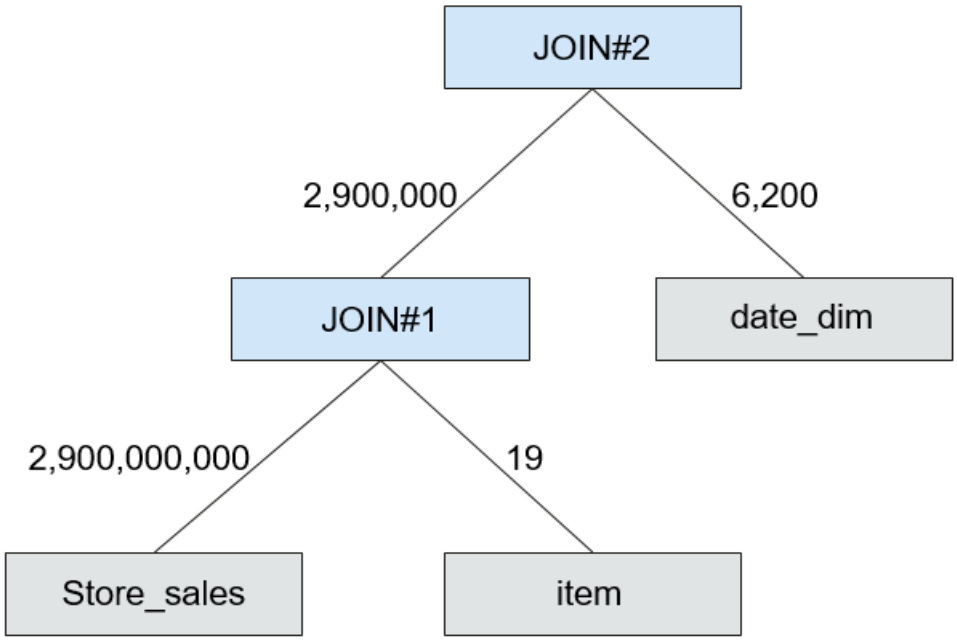
Figure 1-63 Join process when the CBO is enabled



After the CBO is enabled, the number of intermediate data entries is reduced from 495,000,000 to 2,900,000 and thus the execution time can be remarkably reduced.

1.4.9.3 Relationship Between Hive and Other Components

Relationship Between Hive and HDFS

Hive is a sub-project of Apache Hadoop, which uses HDFS as the file storage system. It parses and processes structured data with highly reliable underlying storage supported by HDFS. All data files in the Hive database are stored in HDFS, and all data operations on Hive are also performed using HDFS APIs.

Relationship Between Hive and MapReduce

Hive data computing depends on MapReduce. MapReduce is also a sub-project of Apache Hadoop and is a parallel computing framework based on HDFS. During data analysis, Hive parses HQL statements submitted by users into MapReduce tasks and submits the tasks for MapReduce to execute.

Relationship Between Hive and Tez

Tez, an open-source project of Apache, is a distributed computing framework that supports directed acyclic graphs (DAGs). When Hive uses the Tez engine to analyze data, it parses HQL statements submitted by users into Tez tasks and submits the tasks to Tez for execution.

Relationship Between Hive and DBService

MetaStore (metadata service) of Hive processes the structure and attribute information of Hive metadata, such as Hive databases, tables, and partitions. The information needs to be stored in a relational database and is managed and processed by MetaStore. In the product, the metadata of Hive is stored and maintained by the DBService component, and the metadata service is provided by the Metadata component.

1.4.9.4 Enhanced Open Source Feature

Enhanced Open Source Feature: HDFS Colocation

HDFS Colocation is the data location control function provided by HDFS. The HDFS Colocation API stores associated data or data on which associated operations are performed on the same storage node.

Hive supports HDFS Colocation. When Hive tables are created, after the locator information is set for table files, the data files of related tables are stored on the same storage node. This ensures convenient and efficient data computing among associated tables.

Enhanced Open Source Feature: Column Encryption

Hive supports encryption of one or more columns. The columns to be encrypted and the encryption algorithm can be specified when a Hive table is created. When data is inserted into the table using the INSERT statement, the related columns are encrypted. The Hive column encryption does not support views and the Hive over HBase scenario.

The Hive column encryption mechanism supports two encryption algorithms that can be selected to meet site requirements during table creation:

- AES (the encryption class is **org.apache.hadoop.hive.serde2.AESRewriter**)
- SMS4 (the encryption class is **org.apache.hadoop.hive.serde2.SMS4Rewriter**)

Enhanced Open Source Feature: HBase Deletion

Due to the limitations of underlying storage systems, Hive does not support the ability to delete a single piece of table data. In Hive on HBase, Hive in the MRS solution supports the ability to delete a single piece of HBase table data. Using a specific syntax, Hive can delete one or more pieces of data from an HBase table.

Enhanced Open Source Feature: Row Delimiter

In most cases, a carriage return character is used as the row delimiter in Hive tables stored in text files, that is, the carriage return character is used as the terminator of a row during queries.

However, some data files are delimited by special characters, and not a carriage return character.

MRS Hive allows you to specify different characters or character combinations as row delimiters for Hive data in text files.

Enhanced Open Source Feature: HTTPS/HTTP-based REST API Switchover

WebHCat provides external REST APIs for Hive. By default, the open source community version uses the HTTP protocol.

MRS Hive supports the HTTPS protocol that is more secure, and enables switchover between the HTTP protocol and the HTTPS protocol.

Enhanced Open Source Feature: Transform Function

The Transform function is not allowed by Hive of the open source version. MRS Hive supports the configuration of the Transform function. The function is disabled by default, which is the same as that of the open source community version.

Users can modify configurations of the Transform function to enable the function. However, security risks exist when the Transform function is enabled.

Enhanced Open Source Feature: Temporary Function Creation Without ADMIN Permission

You must have **ADMIN** permission when creating temporary functions on Hive of the open source community version. MRS Hive supports the configuration of the function for creating temporary functions with **ADMIN** permission. The function is disabled by default, which is the same as that of the open-source community version.

You can modify configurations of this function. After the function is enabled, you can create temporary functions without **ADMIN** permission.

Enhanced Open Source Feature: Database Authorization

In the Hive open source community version, only the database owner can create tables in the database. You can be granted with the **CREATE** and **SELECT** permissions on tables by MRS Hive in a database. After you are granted with the permission to query data in the database, the system automatically associates the query permission on all tables in the database.

Enhanced Open Source Feature: Column Authorization

The Hive open source community version supports only table-level permission control. MRS Hive supports column-level permission control. You can be granted with column-level permissions, such as **SELECT**, **INSERT**, and **UPDATE**.

1.4.10 Hue

1.4.10.1 Hue Basic Principles

Hue is a group of web applications that interact with MRS big data components. It helps you browse HDFS, perform Hive query, and start MapReduce jobs. Hue bears applications that interact with all MRS big data components.

Hue provides the file browser and query editor functions:

- File browser allows you to directly browse and operate different HDFS directories on the GUI.
- Query editor can write simple SQL statements to query data stored on Hadoop, for example, HDFS, HBase, and Hive. With the query editor, you can easily create, manage, and execute SQL statements and download the execution results as an Excel file.

On the WebUI provided by Hue, you can perform the following operations on the components:

- HDFS:
  - View, create, manage, rename, move, and delete files or directories.
  - File upload and download
  - Search for files, directories, file owners, and user groups; change the owners and permissions of the files and directories.
  - Manually configure HDFS directory storage policies and dynamic storage policies.
- Hive:
  - Edit and execute SQL/HQL statements. Save, copy, and edit the SQL/HQL template. Explain SQL/HQL statements. Save the SQL/HQL statement and query it.
  - Database presentation and data table presentation
  - Supporting different types of Hadoop storage
  - Use MetaStore to add, delete, modify, and query databases, tables, and views.

NOTE

If Internet Explorer is used to access the Hue page to execute HiveSQL statements, the execution fails, because the browser has functional problems. You are advised to use a compatible browser, for example, Google Chrome.

- Impala:
  - Edit and execute SQL/HQL statements. Save, copy, and edit the SQL/HQL template. Explain SQL/HQL statements. Save the SQL/HQL statement and query it.
  - Database presentation and data table presentation
  - Supporting different types of Hadoop storage
  - Use MetaStore to add, delete, modify, and query databases, tables, and views.

    NOTE

    If Internet Explorer is used to access the Hue page to execute HiveSQL statements, the execution fails, because the browser has functional problems. You are advised to use a compatible browser, for example, Google Chrome.
- MapReduce: Check MapReduce tasks that are being executed or have been finished in the clusters, including their status, start and end time, and run logs.
- Oozie: Hue provides the Oozie job manager function, in this case, you can use Oozie in GUI mode.
- ZooKeeper: Hue provides the ZooKeeper browser function for you to use ZooKeeper in GUI mode.

For details about Hue, visit **https://gethue.com/**.

Architecture

Hue, adopting the MTV (Model-Template-View) design, is a web application program running on Django Python. (Django Python is a web application framework that uses open source codes.)

Hue consists of Supervisor Process and WebServer. Supervisor Process is the core Hue process that manages application processes. Supervisor Process and WebServer interact with applications on WebServer through Thrift/REST APIs, as shown in **Figure 1-64**.

Figure 1-64 Hue architecture

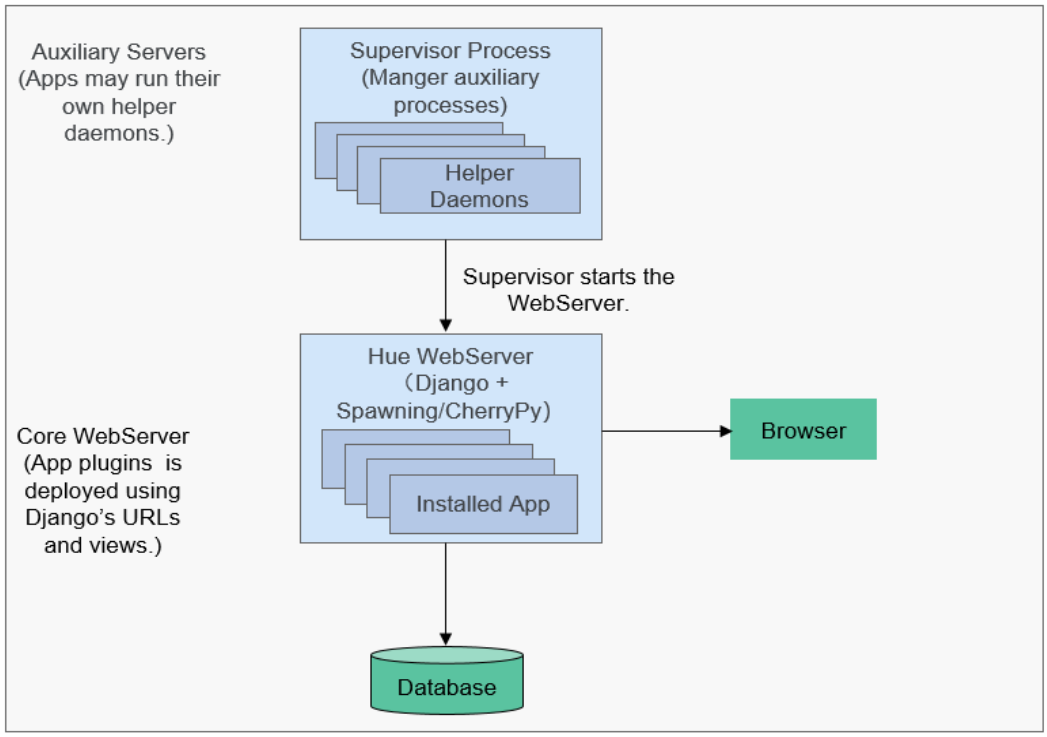


Table 1-11 describes the components shown in **Figure 1-64**.

Table 1-11 Architecture description

Connection Name	Description
Supervisor Process	Manages processes of WebServer applications, such as starting, stopping, and monitoring the processes.
Hue WebServer	Provides the following functions through the Django Python web framework: • Deploys applications. • Provides the GUI. • Connects to databases to store persistent data of applications.

1.4.10.2 Relationship Between Hue and Other Components

Relationship Between Hue and Hadoop Clusters

Figure 1-65 shows how Hue interacts with Hadoop clusters.

Figure 1-65 Hue and Hadoop clusters

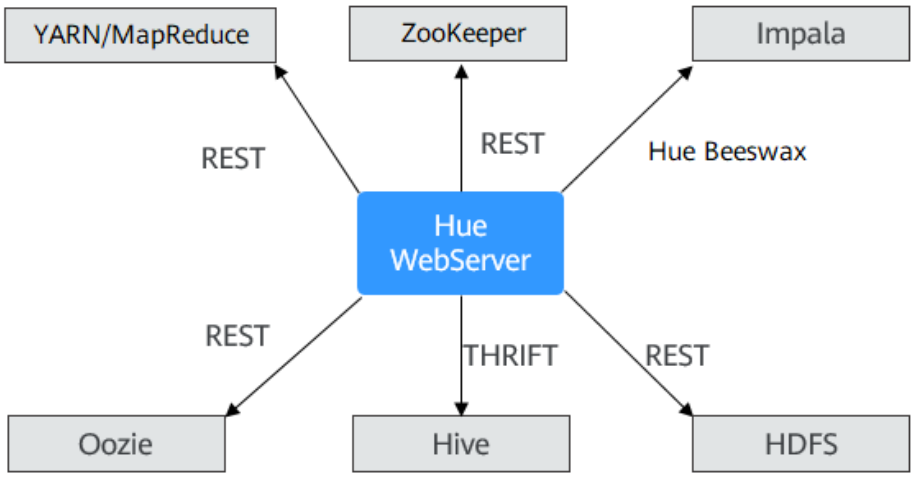

Table 1-12 Relationship Between Hue and Other Components

Connection Name	Description
HDFS	HDFS provides REST APIs to interact with Hue to query and operate HDFS files. Hue packages a user request into interface data, sends the request to HDFS through REST APIs, and displays execution results on the web UI.
Hive	Hive provides Thrift interfaces to interact with Hue, execute Hive SQL statements, and query table metadata. If you edit HQL statements on the Hue web UI, then, Hue submits the HQL statements to the Hive server through the Thrift APIs and displays execution results on the web UI.
YARN/ MapReduce	MapReduce provides REST APIs to interact with Hue and query YARN job information. If you go to the Hue web UI, enter the filter parameters, the UI sends the parameters to the background, and Hue invokes the REST APIs provided by MapReduce (MR1/MR2-YARN) to obtain information such as the status of the task running, the start/end time, the run log, and more.
Oozie	Oozie provides REST APIs to interact with Hue, create workflows, coordinators, and bundles, and manage and monitor tasks. A graphical workflow, coordinator, and bundle editor are provided on the Hue web UI. Hue invokes the REST APIs of Oozie to create, modify, delete, submit, and monitor workflows, coordinators, and bundles.

Connection Name	Description
ZooKeeper	ZooKeeper provides REST APIs to interact with Hue and query ZooKeeper node information. ZooKeeper node information is displayed in the Hue web UI. Hue invokes the REST APIs of ZooKeeper to obtain the node information.
Impala	Impala provides Hue Beeswax APIs to interact with Hue, execute Hive SQL statements, and query table metadata. If you edit HQL statements on the Hue web UI, then, Hue submits the HQL statements to the Hive server through the Hue Beeswax APIs and displays execution results on the web UI.

1.4.10.3 Hue Enhanced Open Source Features

Hue Enhanced Open Source Features

- Storage policy: The number of HDFS file copies varies depending on the storage media. This feature allows you to manually set an HDFS directory storage policy or can automatically adjust the file storage policy, modify the number of file copies, move the file directory, and delete files based on the latest access time and modification time of HDFS files to fully utilize storage capacity and improve storage performance.
- MR engine: You can use the MapReduce engine to execute Hive SQL statements.
- Reliability enhancement: Hue is deployed in active/standby mode. When interconnecting with HDFS, Oozie, Hive, and YARN, Hue can work in failover or load balancing mode.

1.4.11 Impala

Impala provides fast, interactive SQL queries directly on your Apache Hadoop data stored in HDFS, HBase, or the Object Storage Service (OBS). In addition to using the same unified storage platform, Impala also uses the same metadata, SQL syntax (Hive SQL), ODBC driver, and user interface (Impala query UI in Hue) as Apache Hive. This provides a familiar and unified platform for real-time or batch-oriented queries. Impala is an addition to tools available for querying big data. Impala does not replace the batch processing frameworks built on MapReduce such as Hive. Hive and other frameworks built on MapReduce are best suited for long running batch jobs.

Impala provides the following features:

- Most common SQL-92 features of Hive Query Language (HiveQL) including SELECT, JOIN, and aggregate functions
- HDFS, HBase, and OBS storage, including:
  - HDFS file formats: delimited text files, Parquet, Avro, SequenceFile, and RCFile

  - Compression codecs: Snappy, GZIP, Deflate, BZIP
- Common data access interfaces including:
  - JDBC driver
  - ODBC driver
  - Hue Beeswax and the Impala query UI
- **impala-shell** command line interface
- Kerberos authentication

Impala applies to offline analysis (such as log and cluster status analysis) of real-time data queries, large-scale data mining (such as user behavior analysis, interest region analysis, and region display), and other scenarios.

For details about Impala, visit **https://impala.apache.org/impala-docs.html**.

1.4.12 Kafka

1.4.12.1 Kafka Basic Principles

Kafka is an open source, distributed, partitioned, and replicated commit log service. Kafka is publish-subscribe messaging, rethought as a distributed commit log. It provides features similar to Java Message Service (JMS) but another design. It features message endurance, high throughput, distributed methods, multi-client support, and real time. It applies to both online and offline message consumption, such as regular message collection, website activeness tracking, aggregation of statistical system operation data (monitoring data), and log collection. These scenarios engage large amounts of data collection for Internet services.

Kafka Structure

Producers publish data to topics, and consumers subscribe to the topics and consume messages. A broker is a server in a Kafka cluster. For each topic, the Kafka cluster maintains partitions for scalability, parallelism, and fault tolerance. Each partition is an ordered, immutable sequence of messages that is continually appended to - a commit log. Each message in a partition is assigned a sequential ID, which is called offset.

Figure 1-66 Kafka architecture

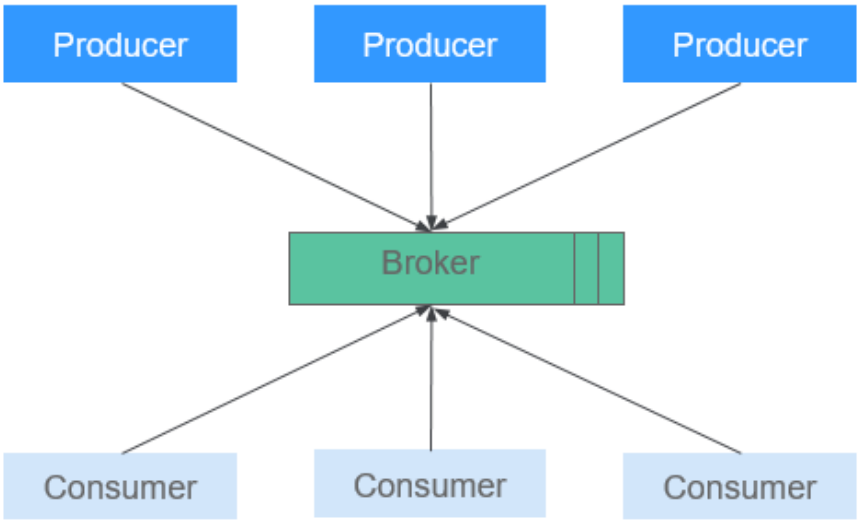

Table 1-13 Kafka architecture description

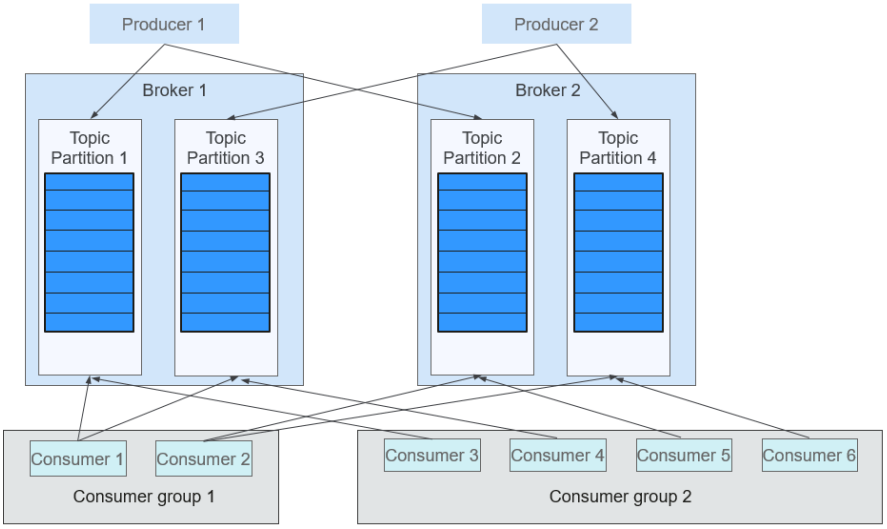
Name	Description
Broker	A broker is a server in a Kafka cluster.
Topic	A topic is a category or feed name to which messages are published. A topic can be divided into multiple partitions, which can act as a parallel unit.
Partition	A partition is an ordered, immutable sequence of messages that is continually appended to - a commit log. The messages in the partitions are each assigned a sequential ID number called the offset that uniquely identifies each message within the partition.
Producer	Producers publish messages to a Kafka topic.
Consumer	Consumers subscribe to topics and process the feed of published messages.

Figure 1-67 shows the relationships between modules.

Figure 1-67 Relationships between Kafka modules



Consumers label themselves with a consumer group name, and each message published to a topic is delivered to one consumer instance within each subscribing consumer group. If all the consumer instances belong to the same consumer group, loads are evenly distributed among the consumers. As shown in the preceding figure, Consumer1 and Consumer2 work in load-sharing mode; Consumer3, Consumer4, Consumer5, and Consumer6 work in load-sharing mode. If all the consumer instances belong to different consumer groups, messages are broadcast to all consumers. As shown in the preceding figure, the messages in Topic 1 are broadcast to all consumers in Consumer Group1 and Consumer Group2.

For details about Kafka architecture and principles, see **https://kafka.apache.org/24/documentation.html**.

Principle

- **Message Reliability**

  When a Kafka broker receives a message, it stores the message on a disk persistently. Each partition of a topic has multiple replicas stored on different broker nodes. If one node is faulty, the replicas on other nodes can be used.

- **High Throughput**

  Kafka provides high throughput in the following ways:

  - Messages are written into disks instead of being cached in the memory, fully utilizing the sequential read and write performance of disks.
  - The use of zero-copy eliminates I/O operations.
  - Data is sent in batches, improving network utilization.
  - Each topic is divided in to multiple partitions, which increases concurrent processing. Concurrent read and write operations can be performed between multiple producers and consumers. Producers send messages to specified partitions based on the algorithm used.

- **Message Subscribe-Notify Mechanism**

Consumers subscribe to interested topics and consume data in pull mode. Consumers can choose the consumption mode, such as batch consumption, repeated consumption, and consumption from the end, and control the message pulling speed based on actual situation. Consumers need to maintain the consumption records by themselves.

- **Scalability**

  When broker nodes are added to expand the Kafka cluster capacity, the newly added brokers register with ZooKeeper. After the registration is successful, procedures and consumers can sense the change in a timely manner and make related adjustment.

Open Source Features

- Reliability

  Message processing methods such as **At-Least Once**, **At-Most Once**, and **Exactly Once** are provided. The message processing status is maintained by consumers. Kafka needs to work with the application layer to implement **Exactly Once**.

- High throughput

  High throughput is provided for message publishing and subscription.

- Persistence

  Messages are stored on disks and can be used for batch consumption and real-time application programs. Data persistence and replication prevent data loss.

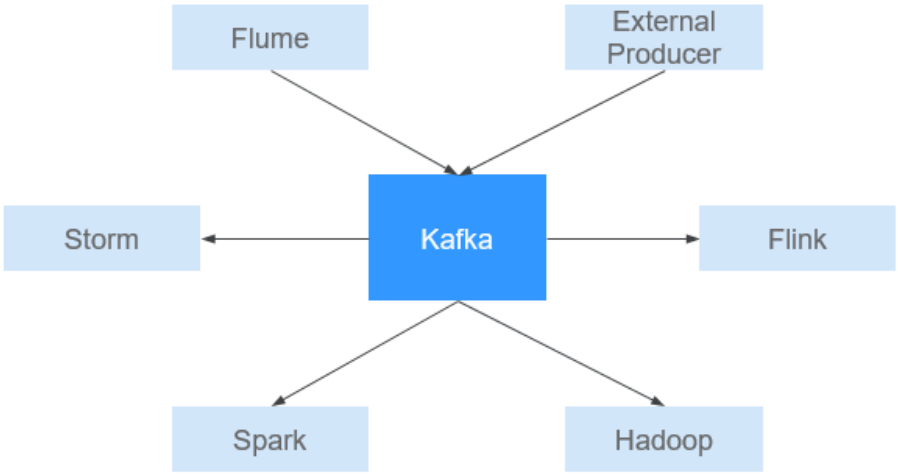
- Distribution

  A distributed system is easy to be expanded externally. All producers, brokers, and consumers support the deployment of multiple distributed clusters. Systems can be scaled without stopping the running of software or shutting down the machines.

1.4.12.2 Relationship Between Kafka and Other Components

As a message publishing and subscription system, Kafka provides high-speed data transmission methods for data transmission between different subsystems of the FusionInsight platform. It can receive external messages in a real-time manner and provides the messages to the online and offline services for processing. The following figure shows the relationship between Kafka and other components.

Figure 1-68 Relationship with Other Components



1.4.12.3 Kafka Enhanced Open Source Features

Kafka Enhanced Open Source Features

- Monitors the following topic-level metrics:
  - Topic Input Traffic
  - Topic Output Traffic
  - Topic Rejected Traffic
  - Number of Failed Fetch Requests Per Second
  - Number of Failed Produce Requests Per Second
  - Number of Topic Input Messages Per Second
  - Number of Fetch Requests Per Second
  - Number of Produce Requests Per Second
- Queries the mapping between broker IDs and node IP addresses. On Linux clients, **kafka-broker-info.sh** can be used to query the mapping between broker IDs and node IP addresses.

1.4.13 KafkaManager

KafkaManager is a tool for managing Apache Kafka and provides GUI-based metric monitoring and management of Kafka clusters.

KafkaManager supports the following operations:

- Manage multiple Kafka clusters.
- Easy inspection of cluster states (topics, consumers, offsets, partitions, replicas, and nodes)
- Run preferred replica election.
- Generate partition assignments with option to select brokers to use.

- Run reassignment of partition (based on generated assignments).
- Create a topic with optional topic configurations (Multiple Kafka cluster versions are supported).
- Delete a topic (only supported on 0.8.2+ and **delete.topic.enable=true** is set in broker configuration).
- Batch generate partition assignments for multiple topics with option to select brokers to use.
- Batch run reassignment of partitions for multiple topics.
- Add partitions to an existing topic.
- Update configurations for an existing topic.
- Optionally enable JMX polling for broker-level and topic-level metrics.
- Optionally filter out consumers that do not have ids/ owner / & offsets/ directories in ZooKeeper.

1.4.14 KrbServer and LdapServer

1.4.14.1 KrbServer and LdapServer Principles

Overview

To manage the access control permissions on data and resources in a cluster, it is recommended that the cluster be installed in security mode. In security mode, a client application must be authenticated and a secure session must be established before the application accesses any resource in the cluster. MRS uses KrbServer to provide Kerberos authentication for all components, implementing a reliable authentication mechanism.

LdapServer supports Lightweight Directory Access Protocol (LDAP) and provides the capability of storing user and user group data for Kerberos authentication.

Architecture

The security authentication function for user login depends on Kerberos and LDAP.

Figure 1-69 Security authentication architecture

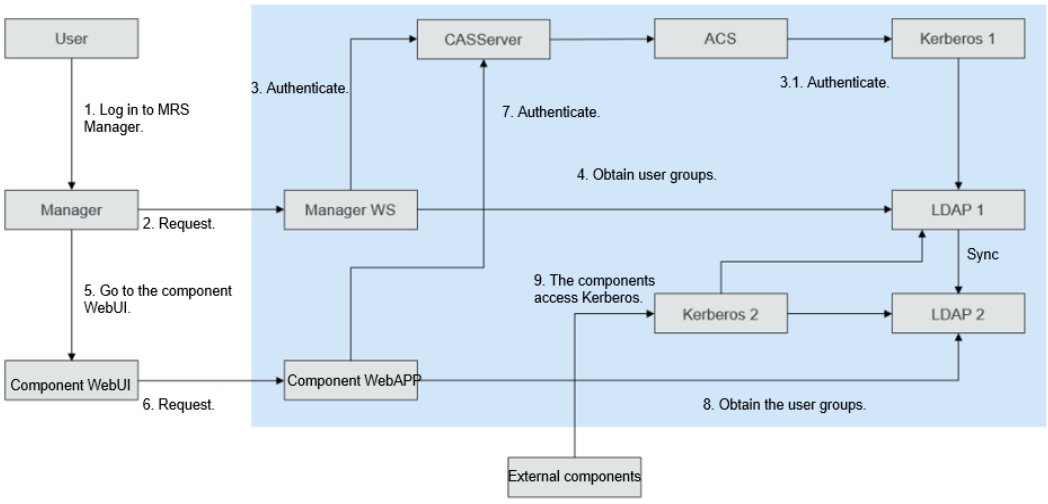


Figure 1-69 includes three scenarios:

- Logging in to the MRS Manager Web UI
  The authentication architecture includes steps 1, 2, 3, and 4.
- Logging in to a component web UI
  The authentication architecture includes steps 5, 6, 7, and 8.
- Accessing between components
  The authentication architecture includes step 9.

Table 1-14 Key modules

Connection Name	Description
Manager	Cluster Manager
Manager WS	WebBrowser
Kerberos1	KrbServer (management plane) service deployed in MRS Manager, that is, OMS Kerberos
Kerberos2	KrbServer (service plane) service deployed in the cluster
LDAP1	LdapServer (management plane) service deployed in MRS Manager, that is, OMS LDAP
LDAP2	LdapServer (service plane) service deployed in the cluster

Data operation mode of Kerberos1 in LDAP: The active and standby instances of LDAP1 and the two standby instances of LDAP2 can be accessed in load balancing mode. Data write operations can be performed only in the active LDAP1 instance. Data read operations can be performed in LDAP1 or LDAP2.

Data operation mode of Kerberos2 in LDAP: Data read operations can be performed in LDAP1 and LDAP2. Data write operations can be performed only in the active LDAP1 instance.

Principle

Kerberos authentication

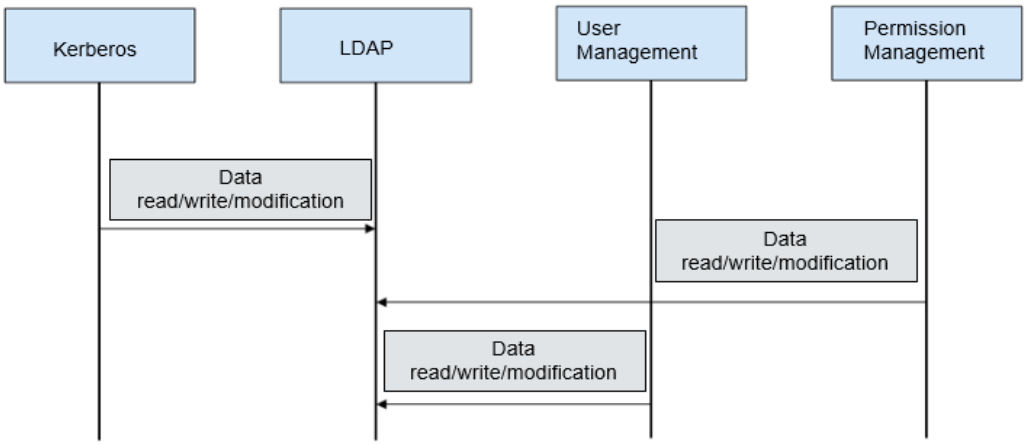
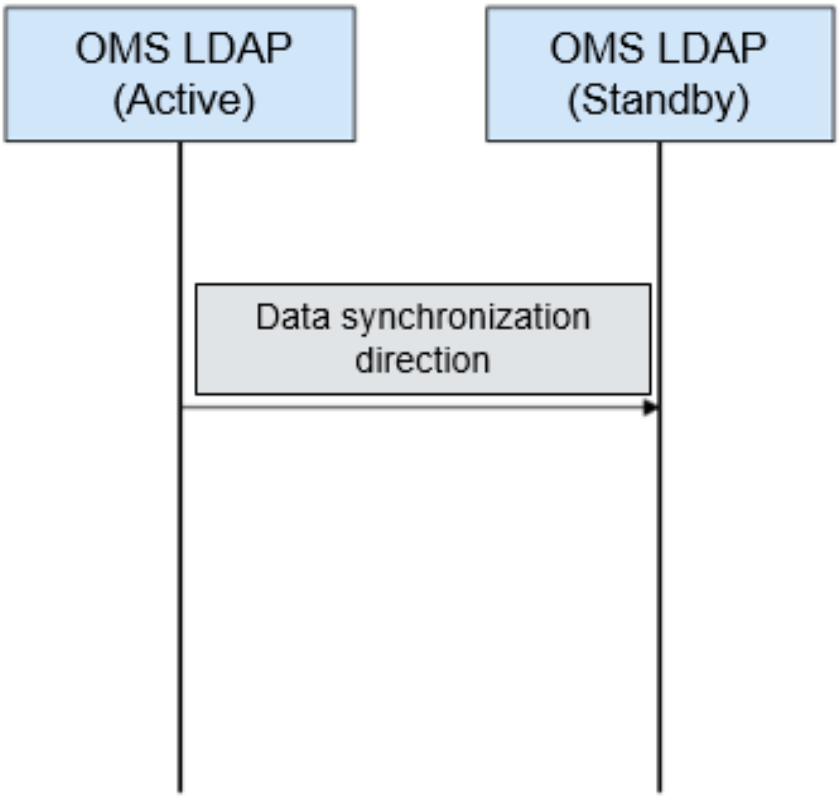
Figure 1-71 Data modification process



LDAP data synchronization

- OMS LDAP data synchronization before cluster installation

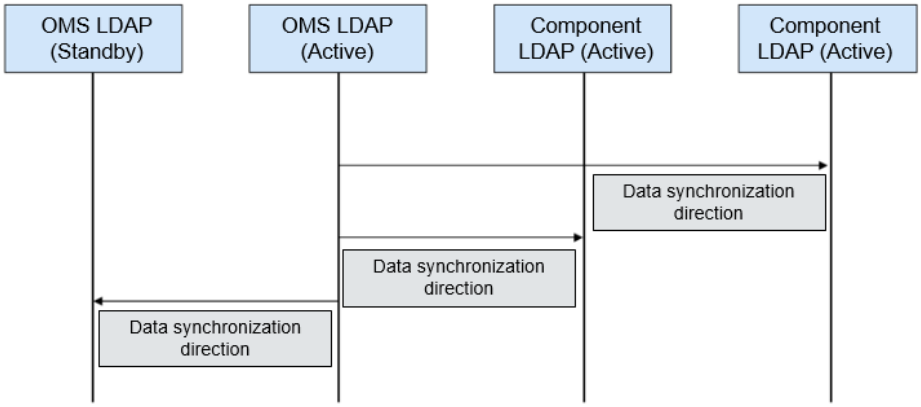
Figure 1-72 OMS LDAP data synchronization



Data synchronization direction before cluster installation: Data is synchronized from the active OMS LDAP to the standby OMS LDAP.

- LDAP data synchronization after cluster installation

Figure 1-73 LDAP data synchronization



Data synchronization direction after cluster installation: Data is synchronized from the active OMS LDAP to the standby OMS LDAP, standby component LDAP, and standby component LDAP.

1.4.14.2 KrbServer and LdapServer Enhanced Open Source Features

Enhanced open-source features of KrbServer and LdapServer: intra-cluster service authentication

In an MRS cluster that uses the security mode, mutual access between services is implemented based on the Kerberos security architecture. When a service (such as HDFS) in the cluster is to be started, the corresponding sessionkey (keytab, used for identity authentication of the application) is obtained from Kerberos. If another service (such as YARN) needs to access HDFS and add, delete, modify, or query data in HDFS, the corresponding TGT and ST must be obtained for secure access.

Enhanced Open-Source Features of KrbServer and LdapServer: Application Development Authentication

MRS components provide application development interfaces for customers or upper-layer service product clusters. During application development, a cluster in security mode provides specified application development authentication interfaces to implement application security authentication and access. For example, the UserGroupInformation class provided by the hadoop-common API provides multiple security authentication APIs.

- **setConfiguration()** is used to obtain related configuration and set parameters such as global variables.
- **loginUserFromKeytab():** is used to obtain TGT interfaces.

Enhanced Open-Source Features of KrbServer and LdapServer: Cross-System Mutual Trust

MRS provides the mutual trust function between two Managers to implement data read and write operations between systems.

1.4.15 Kudu

Kudu is a columnar storage manager developed for the Apache Hadoop platform. Kudu shares the common technical properties of Hadoop ecosystem applications: it runs on commodity hardware, is horizontally scalable, and supports highly available operation.

Kudu's design has the following benefits:

- Fast processing of OLAP workloads
- Integration with MapReduce, Spark and other Hadoop ecosystem components
- Tight integration with Apache Impala, making it a good, mutable alternative to using HDFS with Apache Parquet
- Strong but flexible consistency model, allowing you to choose consistency requirements on a per-request basis, including the option for strict-serializable consistency
- Strong performance for running sequential and random workloads simultaneously

- Easy to manage
- High availability Tablet Servers and Masters use the Raft Consensus Algorithm, which ensures that as long as more than half the total number of replicas is available, the tablet is available for reads and writes. For example, if 2 out of 3 replicas or 3 out of 5 replicas are available, the tablet is available. Reads can be serviced by read-only follower tablets, even in the event of a leader tablet failure.
- Structured data model

By combining all of these properties, Kudu targets support for families of applications that are difficult or impossible to implement on current generation Hadoop storage technologies.

A few examples of applications for which Kudu is a great solution are:

- Reporting applications where newly-arrived data needs to be immediately available for end users
- Time-series applications that must simultaneously support queries across large amounts of historic data and granular queries about an individual entity that must return very quickly
- Applications that use predictive models to make real-time decisions with periodic refreshes of the predictive model based on all historic data

1.4.16 Loader

1.4.16.1 Loader Basic Principles

Loader is developed based on the open source Sqoop component. It is used to exchange data and files between MRS and relational databases and file systems. Loader can import data from relational databases or file servers to the HDFS and HBase components, or export data from HDFS and HBase to relational databases or file servers.

A Loader model consists of Loader Client and Loader Server, as shown in **Figure 1-74**.

Figure 1-74 Loader model

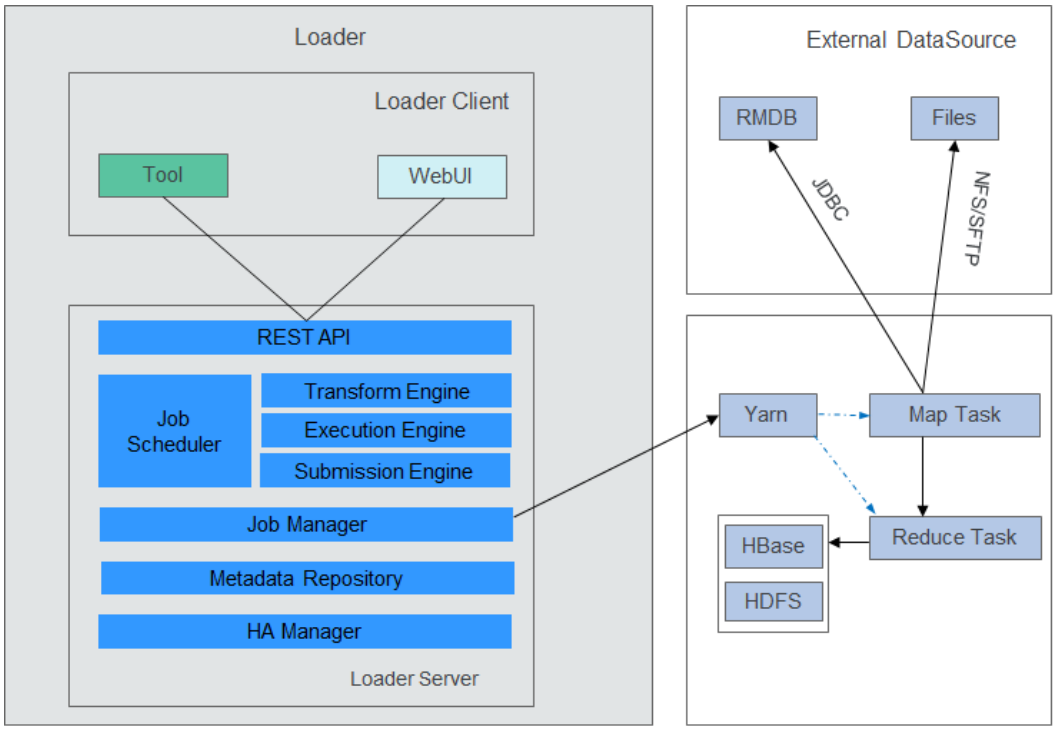


Table 1-15 describes the functions of each module shown in the preceding figure.

Table 1-15 Components of the Loader model

Module	Description
Loader Client	Loader client. It provides two interfaces: web UI and CLI.
Loader Server	Loader server. It processes operation requests sent from the client, manages connectors and metadata, submits MapReduce jobs, and monitors MapReduce job status.
REST API	It provides a Representational State Transfer (RESTful) APIs (HTTP + JSON) to process the operation requests sent from the client.
Job Scheduler	Simple job scheduler. It periodically executes Loader jobs.
Transform Engine	Data transformation engine. It supports field combination, string cutting, and string reverse.
Execution Engine	Loader job execution engine. It executes Loader jobs in MapReduce manner.
Submission Engine	Loader job submission engine. It submits Loader jobs to MapReduce.
Job Manager	It manages Loader jobs, including creating, querying, updating, deleting, activating, deactivating, starting, and stopping jobs.

Module	Description
Metadata Repository	Metadata repository. It stores and manages data about Loader connectors, transformation procedures, and jobs.
HA Manager	It manages the active/standby status of Loader Server processes. The Loader Server has two nodes that are deployed in active/standby mode.

Loader imports or exports jobs in parallel using MapReduce jobs. Some job import or export may involve only the Map operations, while some may involve both Map and Reduce operations.

Loader implements fault tolerance using MapReduce. Jobs can be rescheduled upon a job execution failure.

- **Importing data to HBase**

  When the Map operation is performed for MapReduce jobs, Loader obtains data from an external data source.

  When a Reduce operation is performed for a MapReduce job, Loader enables the same number of Reduce tasks based on the number of Regions. The Reduce tasks receive data from Map tasks, generate HFiles by Region, and store the HFiles in a temporary directory of HDFS.

  When a MapReduce job is submitted, Loader migrates HFiles from the temporary directory to the HBase directory.

- **Importing Data to HDFS**

  When a Map operation is performed for a MapReduce job, Loader obtains data from an external data source and exports the data to a temporary directory (named *export directory*-**ldtmp**).

  When a MapReduce job is submitted, Loader migrates data from the temporary directory to the output directory.

- **Exporting data to a relational database**

  When a Map operation is performed for a MapReduce job, Loader obtains data from HDFS or HBase and inserts the data to a temporary table (Staging Table) through the Java DataBase Connectivity (JDBC) API.

  When a MapReduce job is submitted, Loader migrates data from the temporary table to a formal table.

- **Exporting data to a file system**

  When a Map operation is performed for a MapReduce job, Loader obtains data from HDFS or HBase and writes the data to a temporary directory of the file server.

  When a MapReduce job is submitted, Loader migrates data from the temporary directory to a formal directory.

For details about the Loader architecture and principles, see **https://sqoop.apache.org/docs/1.99.3/index.html**.

1.4.16.2 Relationship Between Loader and Other Components

The components that interact with Loader include HDFS, HBase, MapReduce, and ZooKeeper. Loader works as a client to use certain functions of these components, such as storing data to HDFS and HBase and reading data from HDFS and HBase tables. In addition, Loader functions as an MapReduce client to import or export data.

1.4.16.3 Loader Enhanced Open Source Features

Loader Enhanced Open-Source Feature: Data Import and Export

Loader is developed based on Sqoop. In addition to the Sqoop functions, Loader has the following enhanced features:

- Provides data conversion functions.
- Supports GUI-based configuration conversion.
- Imports data from an SFTP/FTP server to HDFS/OBS.
- Imports data from an SFTP/FTP server to an HBase table.
- Imports data from an SFTP/FTP server to a Phoenix table.
- Imports data from an SFTP/FTP server to a Hive table.
- Exports data from HDFS/OBS to an SFTP/FTP server.
- Exports data from an HBase table to an SFTP/FTP server.
- Exports data from a Phoenix table to an SFTP/FTP server.
- Imports data from a relational database to an HBase table.
- Imports data from a relational database to a Phoenix table.
- Imports data from a relational database to a Hive table.
- Exports data from an HBase table to a relational database.
- Exports data from a Phoenix table to a relational database.
- Imports data from an Oracle partitioned table to HDFS/OBS.
- Imports data from an Oracle partitioned table to an HBase table.
- Imports data from an Oracle partitioned table to a Phoenix table.
- Imports data from an Oracle partitioned table to a Hive table.
- Exports data from HDFS/OBS to an Oracle partitioned table.
- Exports data from HBase to an Oracle partitioned table.
- Exports data from a Phoenix table to an Oracle partitioned table.
- Imports data from HDFS to an HBase table, a Phoenix table, and a Hive table in the same cluster.
- Exports data from an HBase table and a Phoenix table to HDFS/OBS in the same cluster.
- Imports data to an HBase table and a Phoenix table by using **bulkload** or **put list**.
- Imports all types of files from an SFTP/FTP server to HDFS. The open source component Sqoop can import only text files.
- Exports all types of files from HDFS/OBS to an SFTP server. The open source component Sqoop can export only text files and SequenceFile files.

- Supports file coding format conversion during file import and export. The supported coding formats include all formats supported by Java Development Kit (JDK).
- Retains the original directory structure and file names during file import and export.
- Supports file combination during file import and export. For example, if a large number of files are to be imported, these files can be combined into *n* files (*n* can be configured).
- Supports file filtering during file import and export. The filtering rules support wildcards and regular expressions.
- Supports batch import and export of ETL tasks.
- Supports query by page and key word and group management of ETL tasks.
- Provides floating IP addresses for external components.

1.4.17 Manager

1.4.17.1 Manager Basic Principles

Overview

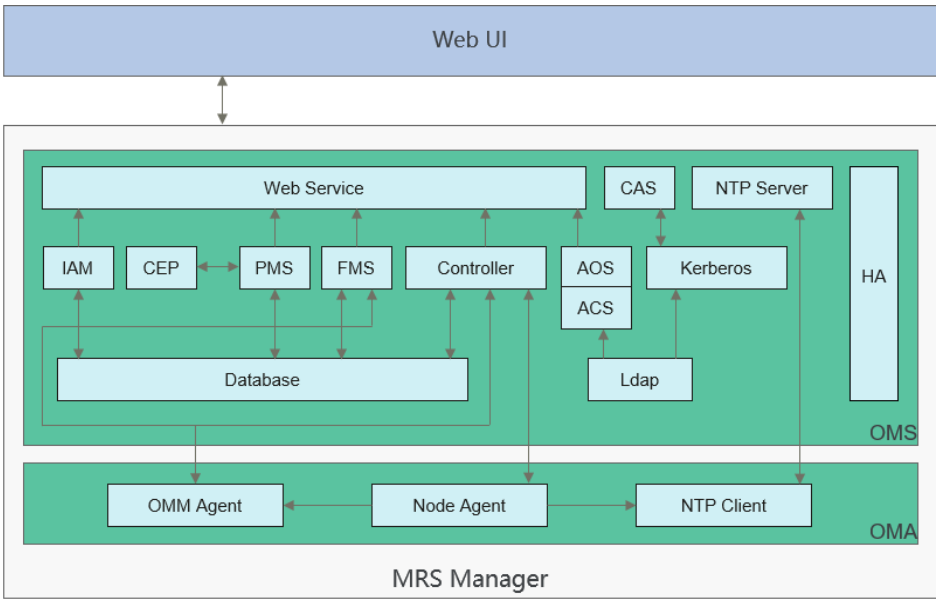
Manager is the O&M management system of MRS and provides unified cluster management capabilities for services deployed in clusters.

Manager provides functions such as performance monitoring, alarms, user management, permission management, auditing, service management, health check, and log collection.

Architecture

Figure 1-75 shows the overall logical architecture of FusionInsight Manager.

Figure 1-75 Manager logical architecture



Manager consists of OMS and OMA.

- OMS: serves as management node in the O&M system. There are two OMS nodes deployed in active/standby mode.
- OMA: managed node in the O&M system. Generally, there are multiple OMA nodes.

Figure 1-75 describes the modules shown in **Table 1-16**.

Table 1-16 Service module description

Module	Description
Web Service	A web service deployed under Tomcat, providing HTTPS API of Manager. It is used to access Manager through the web browser. In addition, it provides the northbound access capability based on the Syslog and SNMP protocols.
OMS	Management node of the O&M system. Generally, there are two OMS nodes that work in active/standby mode.
OMA	Managed node in the O&M system. Generally, there are multiple OMA nodes.
Controller	The control center of Manager. It can converge information from all nodes in the cluster and display it to the MRS administrators, as well as receive from the MRS cluster administrators, and synchronize information to all nodes in the cluster according to the operation instruction range. Control process of Manager. It implements various management actions: 1. The web service delivers various management actions (such as installation, service startup and stop, and configuration modification) to Controller. 2. Controller decomposes the command and delivers the action to each Node Agent, for example, starting a service involves multiple roles and instances. 3. Controller is responsible for monitoring the implementation of each action.
Node Agent	Node Agent exists on each cluster node and is an enabler of Manager on a single node. • Node Agent represents all the components deployed on the node to interact with Controller, implementing convergence from multiple nodes of a cluster to a single node. • Node Agent enables Controller to perform all operations on the components deployed on the node. It allows Controller functions to be implemented. Node Agent sends heartbeat messages to Controller at an interval of 3 seconds. The interval cannot be configured.
IAM	Records audit logs. Each non-query operation on the Manager UI has a related audit log.

Module	Description
PMS	The performance monitoring module. It collects the performance monitoring data on each OMA and provides the query function.
CEP	Convergence function module. For example, the used disk space of all OMAs is collected as a performance indicator.
FMS	Alarm module. It collects and queries alarms on each OMA.
OMM Agent	Agent for performance monitoring and alarm reporting on the OMA. It collects performance monitoring data and alarm data on Agent Node.
CAS	Unified authentication center. When a user logs in to the web service, CAS authenticates the login. The browser automatically redirects the user to the CAS through URLs.
AOS	Permission management module. It manages the permissions of users and user groups.
ACS	User and user group management module. It manages users and user groups to which users belong.
Kerberos	LDAP is deployed in OMS and a cluster, respectively. ● OMS Kerberos provides the single sign-on (SSO) and authentication between Controller and Node Agent. ● Kerberos in the cluster provides the user security authentication function for components. The service name is **KrbServer**, which contains two role instances: – KerberosServer: is an authentication server that provides security authentication for MRS. – KerberosAdmin: manages processes of Kerberos users.
Ldap	LDAP is deployed in OMS and a cluster, respectively. ● OMS LDAP provides data storage for user authentication. ● The LDAP in the cluster functions as the backup of the OMS LDAP. The service name is **LdapServer** and the role instance is **SlapdServer**.
Database	Manager database used to store logs and alarms.
HA	HA management module that manages the active and standby OMSs.
NTP Server NTP Client	It synchronizes the system clock of each node in the cluster.

1.4.17.2 Manager Key Features

Key Feature: Unified Alarm Monitoring

Manager provides the visualized and convenient alarm monitoring function. Users can quickly obtain key cluster performance indicators, evaluate cluster health status, customize performance indicator display, and convert indicators to alarms. Manager can monitor the running status of all components and report alarms in real time when faults occur. The online help on the GUI allows you to view performance counters and alarm clearance methods to quickly rectify faults.

Key Feature: Unified User Permission Management

Manager provides permission management of components in a unified manner.

Manager introduces the concept of role and uses role-based access control (RBAC) to manage system permissions. It centrally displays and manages scattered permission functions of each component in the system and organizes the permissions of each component in the form of permission sets (roles) to form a unified system permission concept. By doing so, common users cannot obtain internal permission management details, and permissions become easy for the MRS cluster administrators to manage, greatly facilitating permission management and improving user experience.

Key Feature: SSO

Single sign-on (SSO) is provided between the Manager web UI and component web UI as well as for integration between MRS and third-party systems.

This function centrally manages and authenticates Manager users and component users. The entire system uses LDAP to manage users and uses Kerberos for authentication. A set of Kerberos and LDAP management mechanisms are used between the OMS and components. SSO (including single sign-on and single sign-out) is implemented through CAS. With SSO, users can easily switch tasks between the Manager web UI, component web UIs, and third-party systems, without switching to another user.

NOTE

- To ensure security, the CAS Server can retain a ticket-granting ticket (TGT) used by a user only for 20 minutes.
- If a user does not perform any operation on the page (including on the Manager web UI and component web UIs) within 20 minutes, the page is automatically locked.

Key Feature: Automatic Health Check and Inspection

Manager provides users with automatic inspection on system running environments and helps users check and audit system running health by one click, ensuring correct system running and lowering system operation and maintenance costs. After viewing inspection results, you can export reports for archiving and fault analysis.

Key Feature: Tenant Management

Manager introduces the multi-tenant concept. The CPU, memory, and disk resources of a cluster can be integrated into a set. The set is called a tenant. A mode involving different tenants is called multi-tenant mode.

Manager provides the multi-tenant function, supports a level-based tenant model and allows tenants to be added and deleted dynamically, achieving resource isolation. As a result, it can dynamically manage and configure the computing resources and the storage resources of tenants.

- The computing resources indicate tenants' Yarn task queue resources. The task queue quota can be modified, and the task queue usage status and statistics can be viewed.
- The storage resources can be stored on HDFS. You can add and delete the HDFS storage directories of tenants, and set the quotas of file quantity and the storage space of the directories.

As a unified tenant management platform of MRS, MRS Manager allows users to create and manage tenants in clusters based on service requirements.

- Roles, computing resources, and storage resources are automatically created when tenants are created. By default, all permissions of the new computing resources and storage resources are allocated to a tenant's roles.
- After you have modified the tenant's computing or storage resources, permissions of the tenant's roles are automatically updated.

Manager also provides the multi-instance function so that users can use the HBase, Hive, or Spark alone in the resource control and service isolation scenario. The multi-instance function is disabled by default and can be manually enabled.

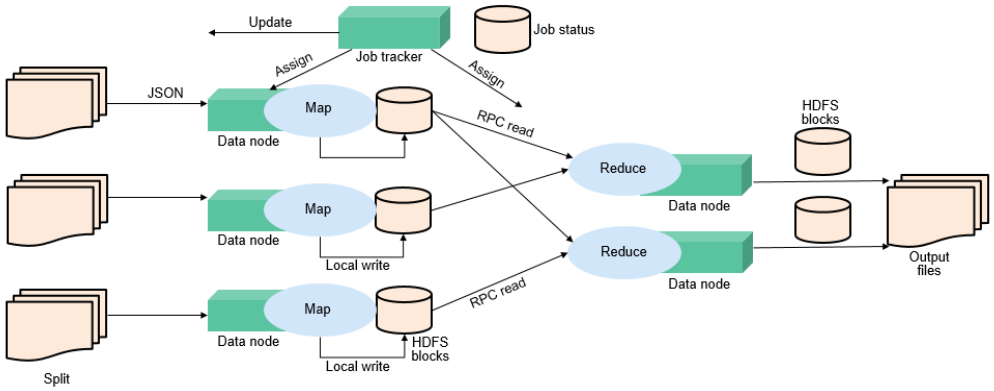
1.4.18 MapReduce

1.4.18.1 MapReduce Basic Principles

MapReduce is the core of Hadoop. As a software architecture proposed by Google, MapReduce is used for parallel computing of large-scale datasets (larger than 1 TB). The concepts "Map" and "Reduce" and their main thoughts are borrowed from functional programming language and also borrowed from the features of vector programming language.

Current software implementation is as follows: Specify a Map function to map a series of key-value pairs into a new series of key-value pairs, and specify a Reduce function to ensure that all values in the mapped key-value pairs share the same key.

Figure 1-76 Distributed batch processing engine



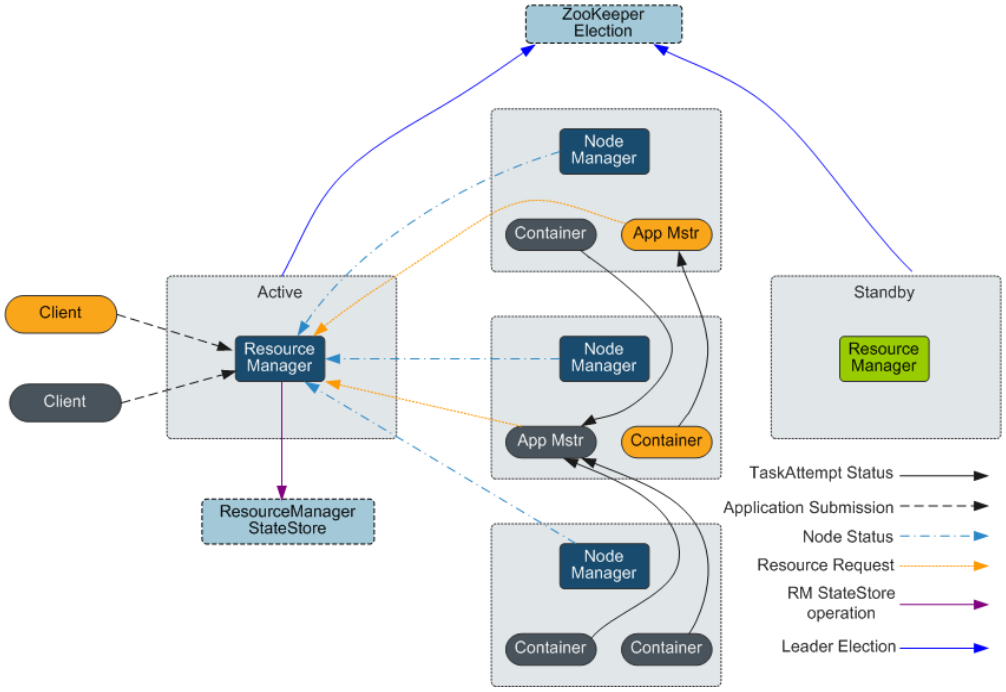
MapReduce is a software framework for processing large datasets in parallel. The root of MapReduce is the Map and Reduce functions in functional programming. The Map function accepts a group of data and transforms it into a key-value pair list. Each element in the input domain corresponds to a key-value pair. The Reduce function accepts the list generated by the Map function, and then shrinks the key-value pair list based on the keys. MapReduce divides a task into multiple parts and allocates them to different devices for processing. In this way, the task can be finished in a distributed environment instead of a single powerful server.

For more information, see **MapReduce Tutorial**.

MapReduce structure

As shown in **Figure 1-77**, MapReduce is integrated into YARN through the Client and ApplicationMaster interfaces of YARN, and uses YARN to apply for computing resources.

Figure 1-77 Basic architecture of Apache YARN and MapReduce



1.4.18.2 Relationship Between MapReduce and Other Components

Relationship Between MapReduce and HDFS

- HDFS features high fault tolerance and high throughput, and can be deployed on low-cost hardware for storing data of applications with massive data sets.
- MapReduce is a programming model used for parallel computation of large data sets (larger than 1 TB). Data computed by MapReduce comes from multiple data sources, such as Local FileSystem, HDFS, and databases. Most data comes from the HDFS. The high throughput of HDFS can be used to read massive data. After being computed, data can be stored in HDFS.

Relationship Between MapReduce and Yarn

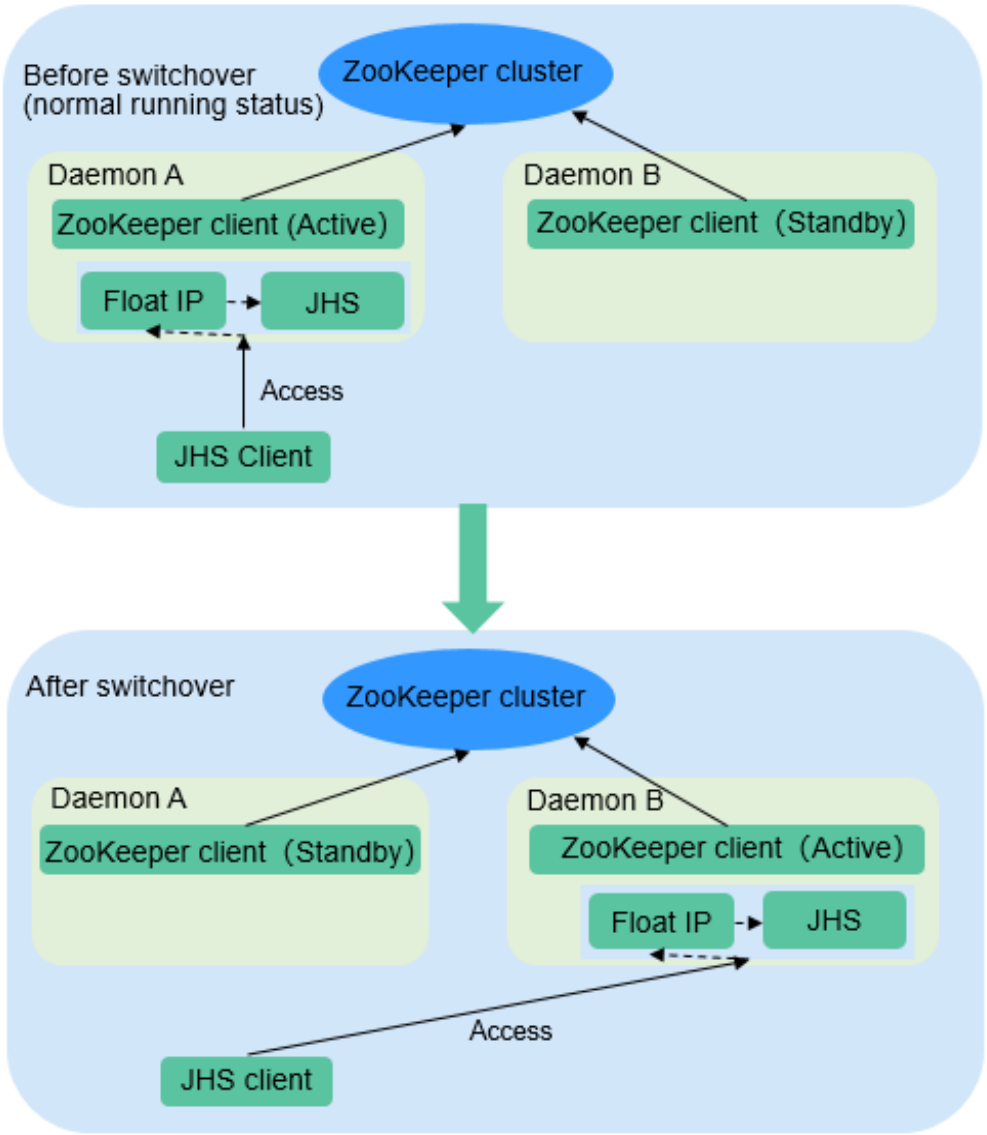
MapReduce is a computing framework running on Yarn, which is used for batch processing. MRv1 is implemented based on MapReduce in Hadoop 1.0, which is composed of programming models (new and old programming APIs), running environment (JobTracker and TaskTracker), and data processing engine (MapTask and ReduceTask). This framework is still weak in scalability, fault tolerance (JobTracker SPOF), and compatibility with multiple frameworks. (Currently, only the MapReduce computing framework is supported.) MRv2 is implemented based on MapReduce in Hadoop 2.0. The source code reuses MRv1 programming models and data processing engine implementation, and the running environment is composed of ResourceManager and ApplicationMaster. ResourceManager is a brand new resource manager system, and ApplicationMaster is responsible for cutting MapReduce job data, assigning tasks, applying for resources, scheduling tasks, and tolerating faults.

1.4.18.3 MapReduce Enhanced Open Source Features

MapReduce Enhanced Open-Source Feature: JobHistoryServer HA

JobHistoryServer (JHS) is the server used to view historical MapReduce task information. Currently, the open source JHS supports only single-instance services. JHS HA can solve the problem that an application fails to access the MapReduce API when SPOFs occur on the JHS, which causes the application fails to be executed. This greatly improves the high availability of the MapReduce service.

Figure 1-78 Status transition of the JobHistoryServer HA active/standby switchover



JobHistoryServer High Availability

- ZooKeeper is used to implement active/standby election and switchover.
- JHS uses the floating IP address to provide services externally.
- Both the JHS single-instance and HA deployment modes are supported.
- Only one node starts the JHS process at a time point to prevent multiple JHS operations from processing the same file.
- You can perform scale-out, scale-in, instance migration, upgrade, and health check.

Enhanced Open Source Feature: Improving MapReduce Performance by Optimizing the Merge/Sort Process in Specific Scenarios

The figure below shows the workflow of a MapReduce task.

Figure 1-79 MapReduce job

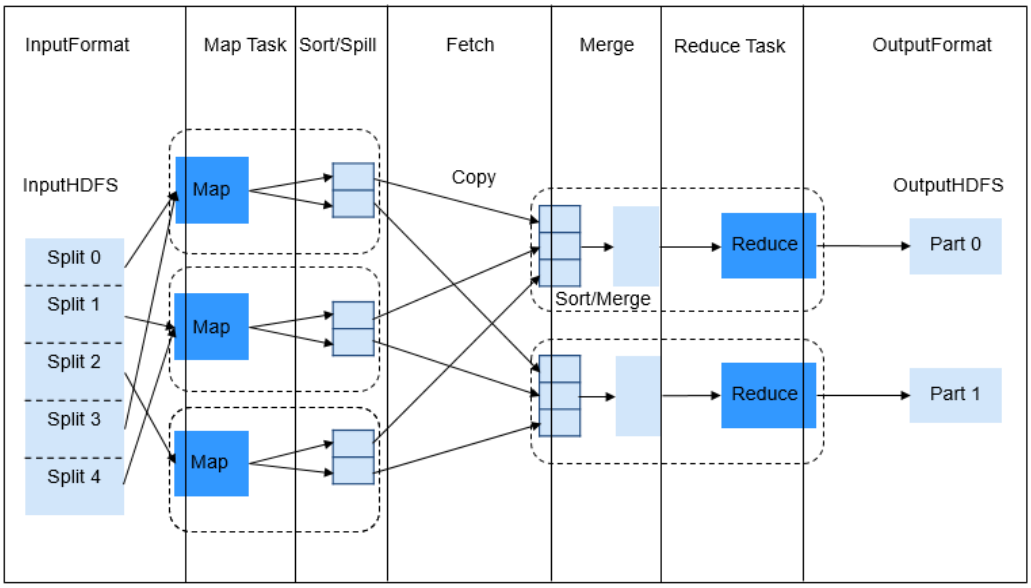


Figure 1-80 MapReduce job execution flow

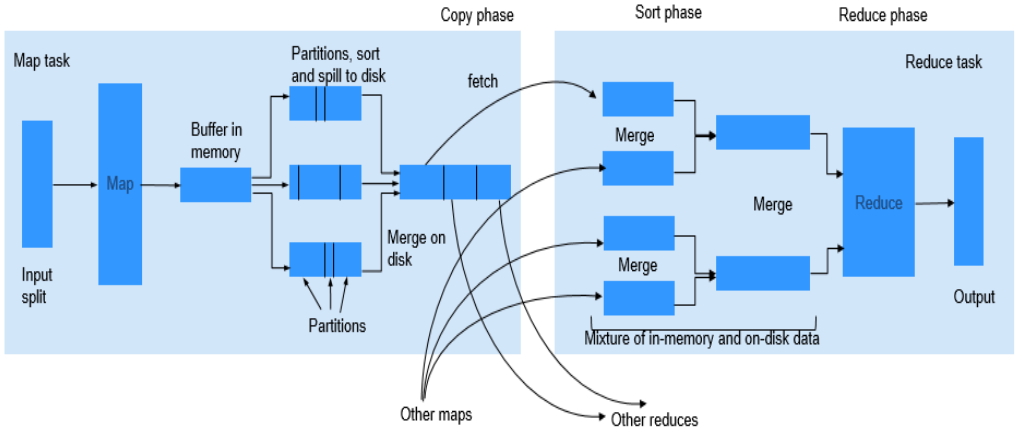

The Reduce process is divided into three different steps: Copy, Sort (actually supposed to be called Merge), and Reduce. In Copy phase, Reducer tries to fetch the output of Maps from NodeManagers and store it on Reducer either in memory or on disk. Shuffle (Sort and Merge) phase then begins. All the fetched map outputs are being sorted, and segments from different map outputs are merged before being sent to Reducer. When a job has a large number of maps to be processed, the shuffle process is time-consuming. For specific tasks (for example, SQL tasks such as hash join and hash aggregation), sorting is not mandatory during the shuffle process. However, the sorting is required by default in the shuffle process.

This feature is enhanced by using the MapReduce API, which can automatically close the Sort process for such tasks. When the sorting is disabled, the API directly merges the fetched Maps output data and sends the data to Reducer. This greatly saves time, and significantly improves the efficiency of SQL tasks.

Enhanced Open Source Feature: Small Log File Problem Solved After Optimization of MR History Server

After the job running on Yarn is executed, NodeManager uses LogAggregationService to collect and send generated logs to HDFS and deletes them from the local file system. After the logs are stored to HDFS, they are managed by MR HistoryServer. LogAggregationService will merge local logs generated by containers to a log file and upload it to the HDFS, reducing the number of log files to some extent. However, in a large-scale and busy cluster, there will be excessive log files on HDFS after long-term running.

For example, if there are 20 nodes, about 18 million log files are generated within the default clean-up period (15 days), which occupy about 18 GB of the memory of a NameNode and slow down the HDFS system response.

Only the reading and deletion are required for files stored on HDFS. Therefore, Hadoop Archives can be used to periodically archive the directory of collected log files.

Archiving Logs

The AggregatedLogArchiveService module is added to MR HistoryServer to periodically check the number of files in the log directory. When the number of files reaches the threshold, AggregatedLogArchiveService starts an archiving task to archive log files. After archiving, it deletes the original log files to reduce log files on HDFS.

Cleaning Archived Logs

Hadoop Archives does not support deletion in archived files. Therefore, the entire archive log package must be deleted upon log clean-up. The latest log generation time is obtained by modifying the AggregatedLogDeletionService module. If all log files meet the clean-up requirements, the archive log package can be deleted.

Browsing Archived Logs

Hadoop Archives allows URI-based access to file content in the archive log package. Therefore, if MR History Server detects that the original log files do not exist during file browsing, it directly redirects the URI to the archive log package to access the archived log file.

NOTE

- This function invokes Hadoop Archives of HDFS for log archiving. Because the execution of an archiving task by Hadoop Archives is to run an MR application. Therefore, after an archiving task is executed, an MR execution record is added.
- This function of archiving logs is based on the log collection function. Therefore, this function is valid only when the log collection function is enabled.

1.4.19 Oozie

1.4.19.1 Oozie Basic Principles

Introduction to Oozie

Oozie is an open-source workflow engine that is used to schedule and coordinate Hadoop jobs.

Architecture

The Oozie engine is a web application integrated into Tomcat by default. Oozie uses PostgreSQL databases.

Oozie provides an Ext-based web console, through which users can view and monitor Oozie workflows. Oozie provides an external REST web service API for the Oozie client to control workflows (such as starting and stopping operations), and orchestrate and run Hadoop MapReduce tasks. For details, see Figure 1-81.

Figure 1-81 Oozie architecture

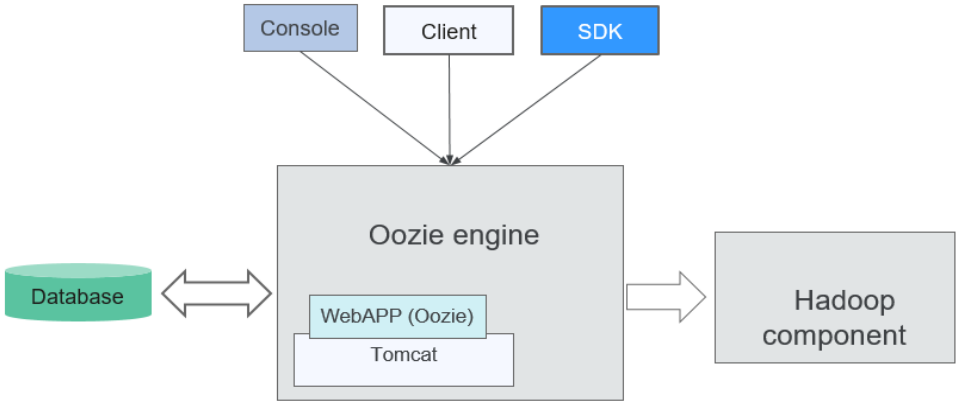

Table 1-17 describes the functions of each module shown in Figure 1-81.

Table 1-17 Architecture description

Connection Name	Description
Console	Allows users to view and monitor Oozie workflows.
Client	Controls workflows, including submitting, starting, running, planting, and restoring workflows, through APIs.
SDK	Is short for software development kit. An SDK is a set of development tools used by software engineers to establish applications for particular software packages, software frameworks, hardware platforms, and operating systems.
Database	PostgreSQL database

Connection Name	Description
WebApp (Oozie)	Functions as the Oozie server. It can be deployed on a built-in or an external Tomcat container. Information recorded by WebApp (Oozie) including logs is stored in the PostgreSQL database.
Tomcat	A free open-source web application server
Hadoop components	Underlying components, such as MapReduce and Hive, that execute the workflows orchestrated by Oozie.

Principle

Oozie is a workflow engine server that runs MapReduce workflows. It is also a Java web application running in a Tomcat container.

Oozie workflows are constructed using Hadoop Process Definition Language (HPDL). HPDL is an XML-defined language, similar to JBoss jBPM Process Definition Language (jPDL). An Oozie workflow consists of the Control Node and Action Node.

- Control Node controls workflow orchestration, such as **start**, **end**, **error**, **decision**, **fork**, and **join**.
- An Oozie workflow contains multiple Action Nodes, such as MapReduce and Java.

  All Action Nodes are deployed and run in Direct Acyclic Graph (DAG) mode. Therefore, Action Nodes run in direction. That is, the next Action Node can run only when the running of the previous Action Node ends. When one Action Node ends, the remote server calls back the Oozie interface. Then Oozie executes the next Action Node of workflow in the same manner until all Action Nodes are executed (execution failures are counted).

Oozie workflows provide various types of Action Nodes, such as MapReduce, Hadoop distributed file system (HDFS), Secure Shell (SSH), Java, and Oozie sub-flows, to support a wide range of business requirements.

1.4.19.2 Oozie Enhanced Open Source Features

Enhanced Open Source Feature: Improved Security

Provides roles of administrator and common users to support Oozie permission management.

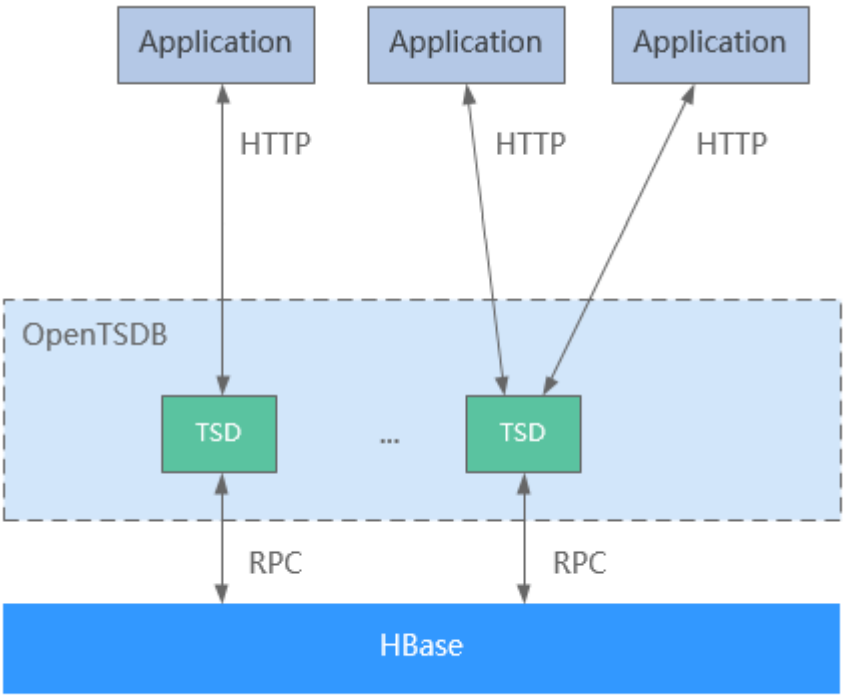
Supports single sign-on and sign-out, HTTPS access, and audit logs.

1.4.20 OpenTSDB

OpenTSDB is a distributed, scalable time series database based on HBase. OpenTSDB is designed to collect monitoring information of a large-scale cluster and implement second-level data query, eliminating the limitations of querying and storing massive amounts of monitoring data in common databases.

OpenTSDB consists of a Time Series Daemon (TSD) as well as a set of command line utilities. Interaction with OpenTSDB is primarily implemented by running one or more TSDs. Each TSD is independent. There is no master server and no shared state, so you can run as many TSDs as required to handle any load you throw at it. Each TSD uses HBase in a CloudTable cluster to store and retrieve time series data. The data schema is highly optimized for fast aggregations of similar time series to minimize storage space. TSD users never need to directly access the underlying storage. You can communicate with the TSD through an HTTP API. All communications happen on the same port (the TSD figures out the protocol of the client by looking at the first few bytes it receives).

Figure 1-82 OpenTSDB architecture



Application scenarios of OpenTSDB have the following features:

- The collected metrics have a unique value at a time point and do not have a complex structure or relationship.
- Monitoring metrics change with time.
- Like HBase, OpenTSDB features high throughput and good scalability.

OpenTSDB provides an HTTP based application programming interface to enable integration with external systems. Almost all OpenTSDB features are accessible via the API such as querying time series data, managing metadata, and storing data points. For details, visit **https://opentsdb.net/docs/build/html/api_http/index.html**.

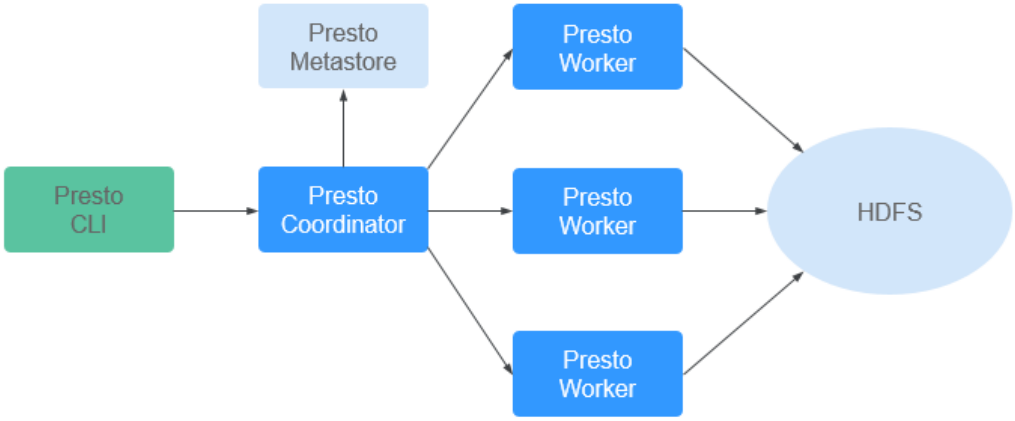
1.4.21 Presto

Presto is an open source SQL query engine for running interactive analytic queries against data sources of all sizes. It applies to massive structured/semi-structured

data analysis, massive multi-dimensional data aggregation/report, ETL, ad-hoc queries, and more scenarios.

Presto allows querying data where it lives, including HDFS, Hive, HBase, Cassandra, relational databases or even proprietary data stores. A Presto query can combine different data sources to perform data analysis across the data sources.

Figure 1-83 Presto architecture



Presto runs in a cluster in distributed mode and contains one coordinator and multiple worker processes. Query requests are submitted from clients (for example, CLI) to the coordinator. The coordinator parses SQL statements, generates execution plans, and distributes the plans to multiple worker processes for execution.

For details about Presto, visit **https://prestodb.github.io/** or **https://prestosql.io/**.

Multiple Presto Instances

MRS supports the installation of multiple Presto instances for a large-scale cluster by default. That is, multiple Worker instances, such as Worker1, Worker2, and Worker3, are installed on a Core/Task node. Multiple Worker instances interact with the Coordinator to execute computing tasks, greatly improving node resource utilization and computing efficiency.

Presto multi-instance applies only to the Arm architecture. Currently, a single node supports a maximum of four instances.

For more Presto deployment information, see **https://prestodb.io/docs/current/installation/deployment.html** or **https://trino.io/docs/current/installation/deployment.html**.

1.4.22 Ranger

1.4.22.1 Ranger Basic Principles

Apache Ranger offers a centralized security management framework and supports unified authorization and auditing. It manages fine grained access

control over Hadoop and related components, such as Storm, HDFS, Hive, HBase, and Kafka. You can use the front-end web UI console provided by Ranger to configure policies to control users' access to these components.

Figure 1-84 shows the Ranger architecture.

Figure 1-84 Ranger structure

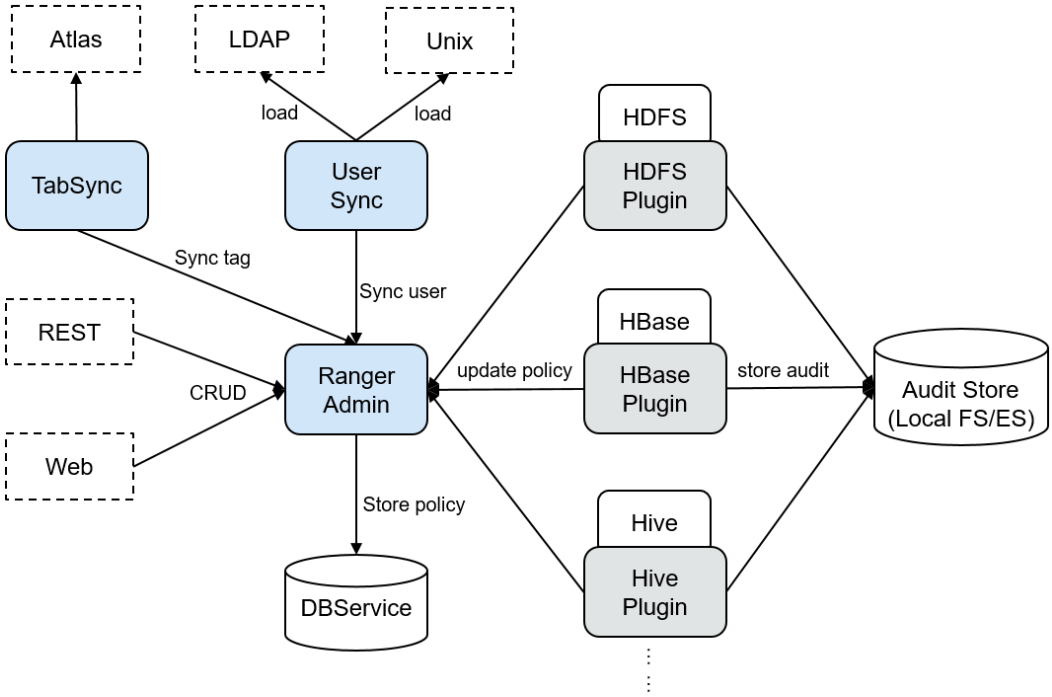


Table 1-18 Architecture description

Connection Name	Description
RangerAdmin	Provides a WebUI and RESTful API to manage policies, users, and auditing.
UserSync	Periodically synchronizes user and user group information from an external system and writes the information to RangerAdmin.
TagSync	Periodically synchronizes tag information from the external Atlas service and writes the tag information to RangerAdmin.

Ranger Principles

- Ranger Plugins

  Ranger provides policy-based access control (PBAC) plug-ins to replace the original authentication plug-ins of the components. Ranger plug-ins are developed based on the authentication interface of the components. Users set permission policies for specified services on the Ranger WebUI. Ranger plug-ins periodically update policies from the RangerAdmin and caches them in the

local file of the component. When a client request needs to be authenticated, the Ranger plug-in matches the user carried in the request with the policy and then returns an accept or reject message.

- UserSync User Synchronization

  UserSync periodically synchronizes data from LDAP/Unix to RangerAdmin. In security mode, data is synchronized from LDAP. In non-security mode, data is synchronized from Unix. By default, the incremental synchronization mode is used. In each synchronization period, UserSync updates only new or modified users and user groups. When a user or user group is deleted, UserSync does not synchronize the change to RangerAdmin. That is, the user or user group is not deleted from the RangerAdmin. To improve performance, UserSync does not synchronize user groups to which no user belongs to RangerAdmin.

- Unified auditing

  Ranger plug-ins can record audit logs. Currently, audit logs can be stored in local files.

- High reliability

  Ranger supports two RangerAdmins working in active/active mode. Two RangerAdmins provide services at the same time. If either RangerAdmin is faulty, Ranger continues to work.

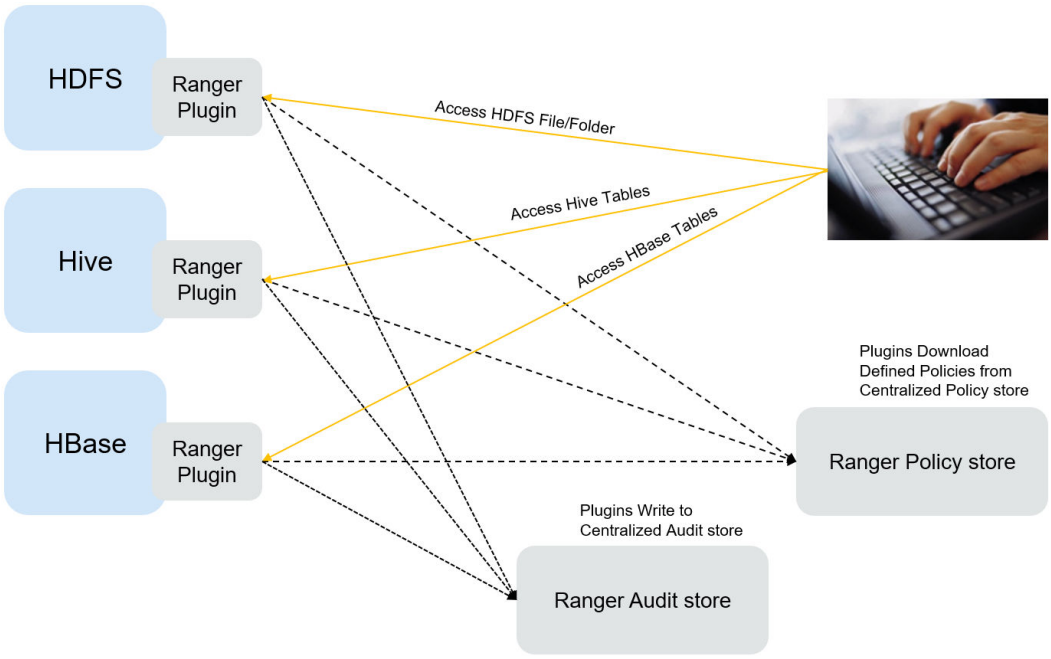
- High performance

  Ranger provides the Load-Balance capability. When a user accesses Ranger WebUI using a browser, the Load-Balance automatically selects the RangerAdmin with the lightest load to provide services.

1.4.22.2 Relationship Between Ranger and Other Components

Ranger provides PABC-based authentication plug-ins for components to run on their servers. Ranger currently supports authentication for the following components like HDFS, YARN, Hive, HBase, Kafka, Storm, and Spark2x. More components will be supported in the future.

Figure 1-85 Relationship Between Ranger and Other Components



1.4.23 Spark

1.4.23.1 Basic Principles of Spark

NOTE

The Spark component applies to versions earlier than MRS 3.x.

Description

Spark is an open source parallel data processing framework. It helps you to easily develop unified big data applications and perform offline processing, stream processing, and interactive analysis on data.

Spark provides a framework featuring fast computing, write, and interactive query. Spark has obvious advantages over Hadoop in terms of performance. Spark uses the in-memory computing mode to avoid I/O bottlenecks in scenarios where multiple tasks in a MapReduce workflow process the same dataset. Spark is implemented by using Scala programming language. Scala enables distributed datasets to be processed in a method that is the same as that of processing local data. In addition to interactive data analysis, Spark supports interactive data mining. Spark adopts in-memory computing, which facilitates iterative computing. By coincidence, iterative computing of the same data is a general problem facing data mining. In addition, Spark can run in Yarn clusters where Hadoop 2.0 is installed. The reason why Spark cannot only retain various features like MapReduce fault tolerance, data localization, and scalability but also ensure high performance and avoid busy disk I/Os is that a memory abstraction structure called Resilient Distributed Dataset (RDD) is created for Spark.

Original distributed memory abstraction, for example, key-value store and databases, supports small-granularity update of variable status. This requires

backup of data or log updates to ensure fault tolerance. Consequently, a large amount of I/O consumption is brought about to data-intensive workflows. For the RDD, it has only one set of restricted APIs and only supports large-granularity update, for example, map and join. In this way, Spark only needs to record the transformation operation logs generated during data establishment to ensure fault tolerance without recording a complete dataset. This data transformation link record is a source for tracing a data set. Generally, parallel applications apply the same computing process for a large dataset. Therefore, the limit to the mentioned large-granularity update is not large. As described in Spark theses, the RDD can function as multiple different computing frameworks, for example, programming models of MapReduce and Pregel. In addition, Spark allows you to explicitly make a data transformation process be persistent on hard disks. Data localization is implemented by allowing you to control data partitions based on the key value of each record. (An obvious advantage of this method is that two copies of data to be associated will be hashed in the same mode.) If memory usage exceeds the physical limit, Spark writes relatively large partitions into hard disks, thereby ensuring scalability.

Spark has the following features:

- Fast: The data processing speed of Spark is 10 to 100 times higher than that of MapReduce.
- Easy-to-use: Java, Scala, and Python can be used to simply and quickly compile parallel applications for processing massive amounts of data. Spark provides over 80 operators to help you compile parallel applications.
- Integration with Hadoop: Spark can directly run in a Hadoop cluster and read existing Hadoop data.

The Spark component of MRS has the following advantages:

- The Spark Streaming component of MRS supports real-time data processing rather than triggering as scheduled.
- The Spark component of MRS provides Structured Streaming and allows you to build streaming applications using the Dataset API. Spark supports exactly-once semantics and inner and outer joins for streams.
- The Spark component of MRS uses **pandas_udf** to replace the original user-defined functions (UDFs) in PySpark to process data, which reduces the processing duration by 60% to 90% (affected by specific operations).
- The Spark component of MRS also supports graph data processing and allows modeling using graphs during graph computing.
- Spark SQL of MRS is compatible with some Hive syntax (based on the 64 SQL statements of the Hive-Test-benchmark test set) and standard SQL syntax (based on the 99 SQL statements of the TPC-DS test set).

Architecture

Figure 1-86 describes the Spark architecture and **Table 1-19** lists the Spark modules.

Figure 1-86 Spark architecture

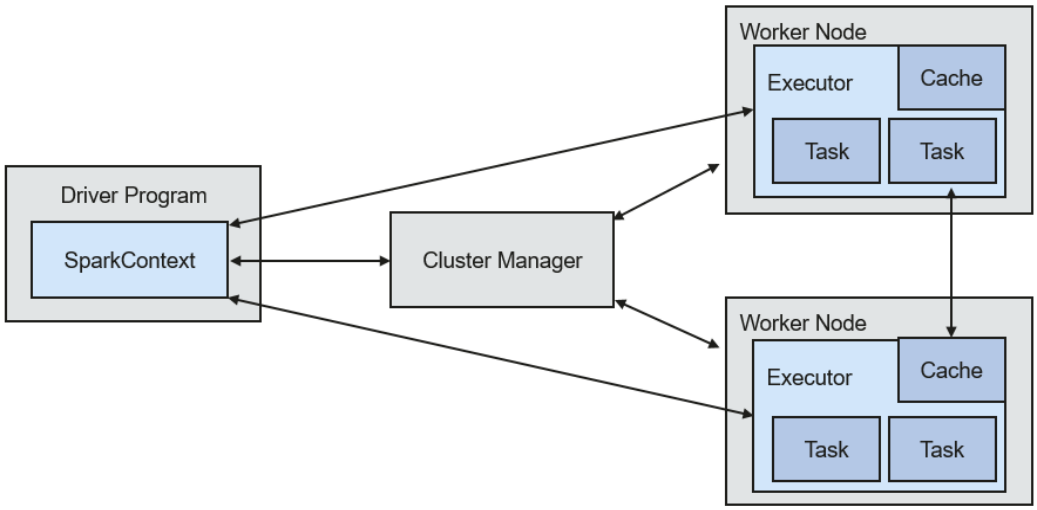


Table 1-19 Basic concepts

Module	Description
Cluster Manager	Cluster manager manages resources in the cluster. Spark supports multiple cluster managers, including Mesos, Yarn, and the Standalone cluster manager that is delivered with Spark.
Application	Spark application. It consists of one Driver Program and multiple executors.
Deploy Mode	Deployment in cluster or client mode. In cluster mode, the driver runs on a node inside the cluster. In client mode, the driver runs on the client (outside the cluster).
Driver Program	The main process of the Spark application. It runs the **main()** function of an application and creates SparkContext. It is used for parsing applications, generating stages, and scheduling tasks to executors. Usually, SparkContext represents Driver Program.
Executor	A process started on a Work Node. It is used to execute tasks, and manage and process the data used in applications. A Spark application usually contains multiple executors. Each executor receives commands from the driver and executes one or multiple tasks.
Worker Node	A node that starts and manages executors and resources in a cluster.
Job	A job consists of multiple concurrent tasks. One action operator (for example, a collect operator) maps to one job.
Stage	Each job consists of multiple stages. Each stage is a task set, which is separated by Directed Acyclic Graph (DAG).

Module	Description
Task	A task carries the computation unit of the service logics. It is the minimum working unit that can be executed on the Spark platform. An application can be divided into multiple tasks based on the execution plan and computation amount.

Spark Application Running Principle

Figure 1-87 shows the Spark application running architecture. The running process is as follows:

1. An application is running in the cluster as a collection of processes. Driver coordinates the running of the application.
2. To run an application, Driver connects to the cluster manager (such as Standalone, Mesos, and Yarn) to apply for the executor resources, and start ExecutorBackend. The cluster manager schedules resources between different applications. Driver schedules DAGs, divides stages, and generates tasks for the application at the same time.
3. Then, Spark sends the codes of the application (the codes transferred to **SparkContext**, which is defined by JAR or Python) to an executor.
4. After all tasks are finished, the running of the user application is stopped.

Figure 1-87 Spark application running architecture

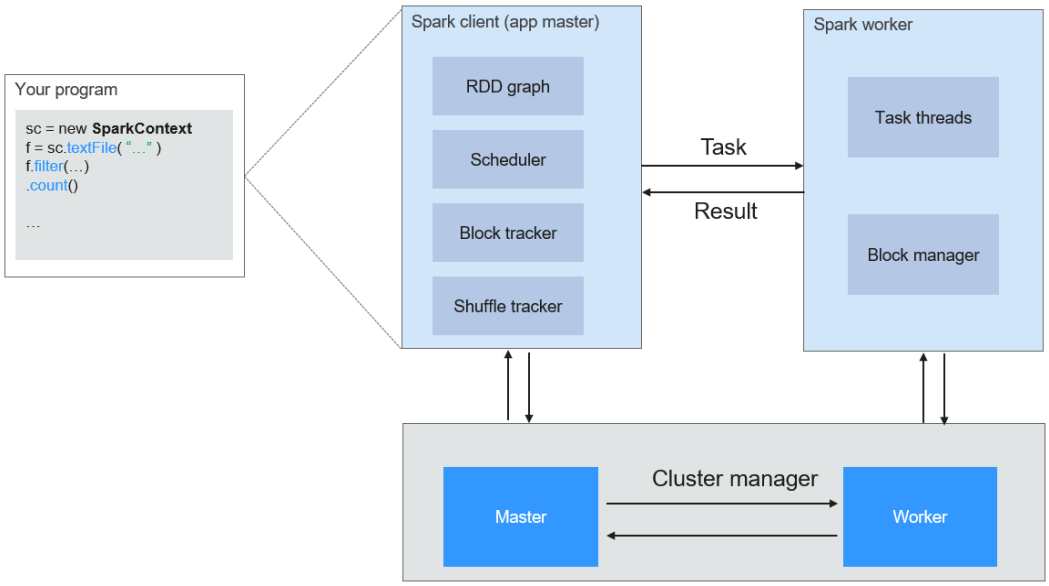

Figure 1-88 shows the Master and Worker modes adopted by Spark. A user submits an application on the Spark client, and then the scheduler divides a job into multiple tasks and sends the tasks to each Worker for execution. Each Worker reports the computation results to Driver (Master), and then the Driver aggregates and returns the results to the client.

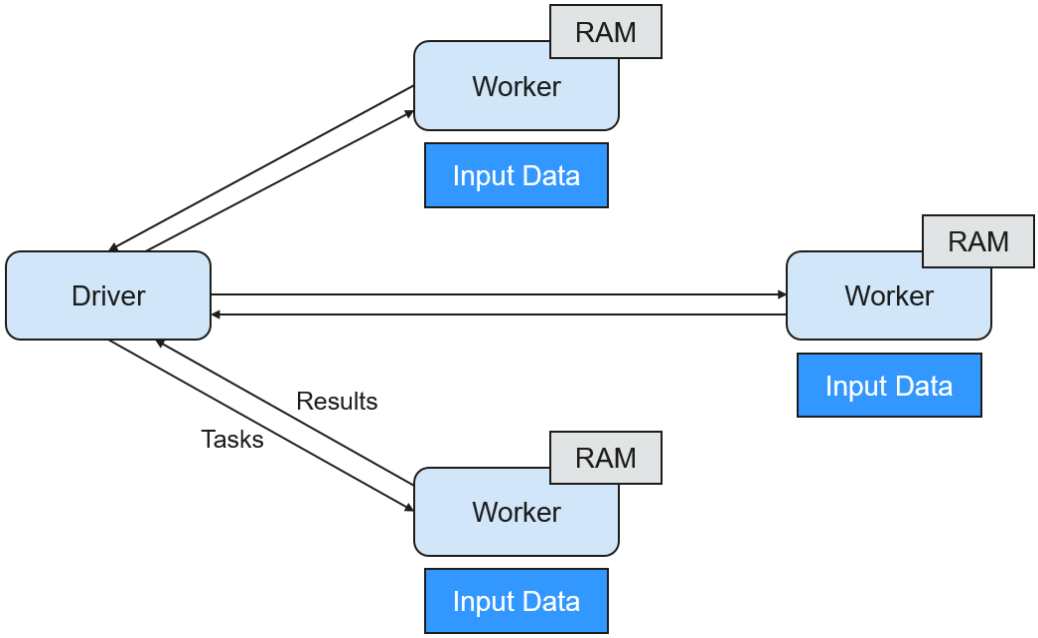
Figure 1-88 Spark Master-Worker mode



Note the following about the architecture:

- Applications are isolated from each other.

  Each application has an independent executor process, and each executor starts multiple threads to execute tasks in parallel. Whether in terms of scheduling or task running on executors. Each driver independently schedules its own tasks. Different application tasks run on different JVMs, that is, different executors.
- Different Spark applications do not share data, unless data is stored in the external storage system such as HDFS.
- You are advised to deploy the Driver program in a location that is close to the Worker node because the Driver program schedules tasks in the cluster. For example, deploy the Driver program on the network where the Worker node is located.

Spark on YARN can be deployed in two modes:

- In Yarn-cluster mode, the Spark driver runs inside an ApplicationMaster process which is managed by Yarn in the cluster. After the ApplicationMaster is started, the client can exit without interrupting service running.
- In Yarn-client mode, the driver is started in the client process, and the ApplicationMaster process is used only to apply for resources from the Yarn cluster.

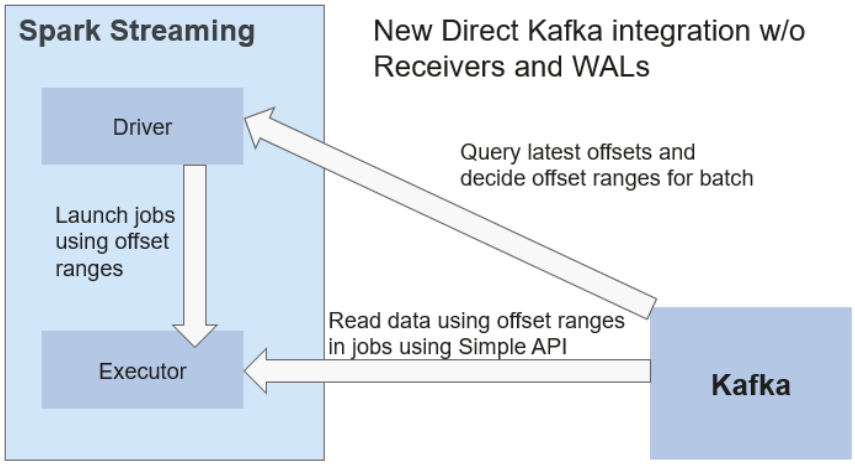
Spark Streaming Principle

Spark Streaming is a real-time computing framework built on the Spark, which expands the capability for processing massive streaming data. Currently, Spark supports the following data processing methods:

- Direct Streaming

In Direct Streaming approach, Direct API is used to process data. Take Kafka Direct API as an example. Direct API provides offset location that each batch range will read from, which is much simpler than starting a receiver to continuously receive data from Kafka and written data to write-ahead logs (WALs). Then, each batch job is running and the corresponding offset data is ready in Kafka. These offset information can be securely stored in the checkpoint file and read by applications that failed to start.

Figure 1-89 Data transmission through Direct Kafka API



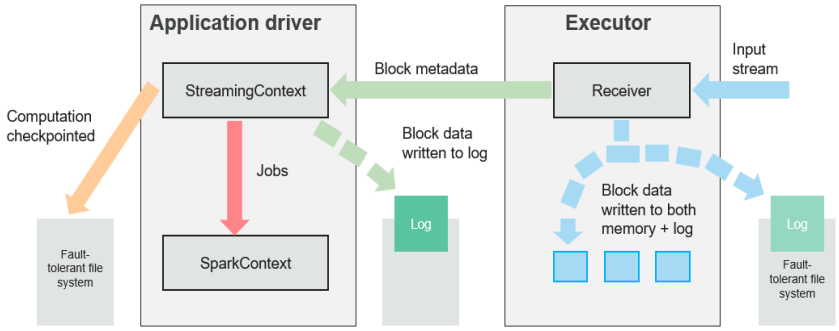
After the failure, Spark Streaming can read data from Kafka again and process the data segment. The processing result is the same no matter Spark Streaming fails or not, because the semantic is processed only once.

Direct API does not need to use the WAL and Receivers, and ensures that each Kafka record is received only once, which is more efficient. In this way, the Spark Streaming and Kafka can be well integrated, making streaming channels be featured with high fault-tolerance, high efficiency, and ease-of-use. Therefore, you are advised to use Direct Streaming to process data.

- Receiver

  When a Spark Streaming application starts (that is, when the driver starts), the related StreamingContext (the basis of all streaming functions) uses SparkContext to start the receiver to become a long-term running task. These receivers receive and save streaming data to the Spark memory for processing. **Figure 1-90** shows the data transfer lifecycle.

Figure 1-90 Data transfer lifecycle



a. Receive data (blue arrow).

   Receiver divides a data stream into a series of blocks and stores them in the executor memory. In addition, after WAL is enabled, it writes data to the WAL of the fault-tolerant file system.

b. Notify the driver (green arrow).

   The metadata in the received block is sent to StreamingContext in the driver. The metadata includes:

   - Block reference ID used to locate the data position in the Executor memory.
   - Block data offset information in logs (if the WAL function is enabled).

c. Process data (red arrow).

   For each batch of data, StreamingContext uses block information to generate resilient distributed datasets (RDDs) and jobs. StreamingContext executes jobs by running tasks to process blocks in the executor memory.

d. Periodically set checkpoints (orange arrows).

   For fault tolerance, StreamingContext periodically sets checkpoints and saves them to external file systems.

Fault Tolerance

Spark and its RDD allow seamless processing of failures of any Worker node in the cluster. Spark Streaming is built on top of Spark. Therefore, the Worker node of Spark Streaming also has the same fault tolerance capability. However, Spark Streaming needs to run properly in case of long-time running. Therefore, Spark must be able to recover from faults through the driver process (main process that coordinates all Workers). This poses challenges to the Spark driver fault-tolerance because the Spark driver may be any user application implemented in any computation mode. However, Spark Streaming has internal computation architecture. That is, it periodically executes the same Spark computation in each batch data. Such architecture allows it to periodically store checkpoints to reliable storage space and recover them upon the restart of Driver.

For source data such as files, the Driver recovery mechanism can ensure zero data loss because all data is stored in a fault-tolerant file system such as HDFS. However, for other data sources such as Kafka and Flume, some received data is cached only in memory and may be lost before being processed. This is caused by the distribution operation mode of Spark applications. When the driver process fails, all executors running in the Cluster Manager, together with all data in the memory, are terminated. To avoid such data loss, the WAL function is added to Spark Streaming.

WAL is often used in databases and file systems to ensure persistence of any data operation. That is, first record an operation to a persistent log and perform this operation on data. If the operation fails, the system is recovered by reading the log and re-applying the preset operation. The following describes how to use WAL to ensure persistence of received data:

Receiver is used to receive data from data sources such as Kafka. As a long-time running task in Executor, Receiver receives data, and also confirms received data if supported by data sources. Received data is stored in the Executor memory, and Driver delivers a task to Executor for processing.

After WAL is enabled, all received data is stored to log files in the fault-tolerant file system. Therefore, the received data does not lose even if Spark Streaming fails. Besides, receiver checks correctness of received data only after the data is pre-written into logs. Data that is cached but not stored can be sent again by data sources after the driver restarts. These two mechanisms ensure zero data loss. That is, all data is recovered from logs or re-sent by data sources.

To enable the WAL function, perform the following operations:

- Set **streamingContext.checkpoint** to configure the checkpoint directory, which is an HDFS file path used to store streaming checkpoints and WALs.
- Set **spark.streaming.receiver.writeAheadLog.enable** of SparkConf to **true** (the default value is **false**).

After WAL is enabled, all receivers have the advantage of recovering from reliable received data. You are advised to disable the multi-replica mechanism because the fault-tolerant file system of WAL may also replicate the data.

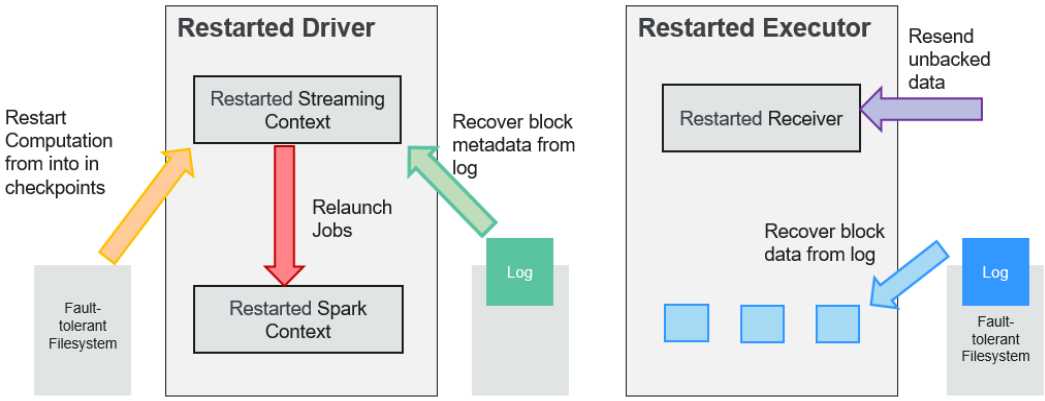
NOTE

The data receiving throughput is lowered after WAL is enabled. All data is written into the fault-tolerant file system. As a result, the write throughput of the file system and the network bandwidth for data replication may become the potential bottleneck. To solve this problem, you are advised to create more receivers to increase the degree of data receiving parallelism or use better hardware to improve the throughput of the fault-tolerant file system.

Recovery Process

When a failed driver is restarted, restart it as follows:

Figure 1-91 Computing recovery process



1. Recover computing. (Orange arrow)

   Use checkpoint information to restart Driver, reconstruct SparkContext and restart Receiver.

2. Recover metadata block. (Green arrow)

   This operation ensures that all necessary metadata blocks are recovered to continue the subsequent computing recovery.

3. Relaunch unfinished jobs. (Red arrow)

   Recovered metadata is used to generate RDDs and corresponding jobs for interrupted batch processing due to failures.

4. Read block data saved in logs. (Blue arrow)

   Block data is directly read from WALs during execution of the preceding jobs, and therefore all essential data reliably stored in logs is recovered.

5. Resend unconfirmed data. (Purple arrow)

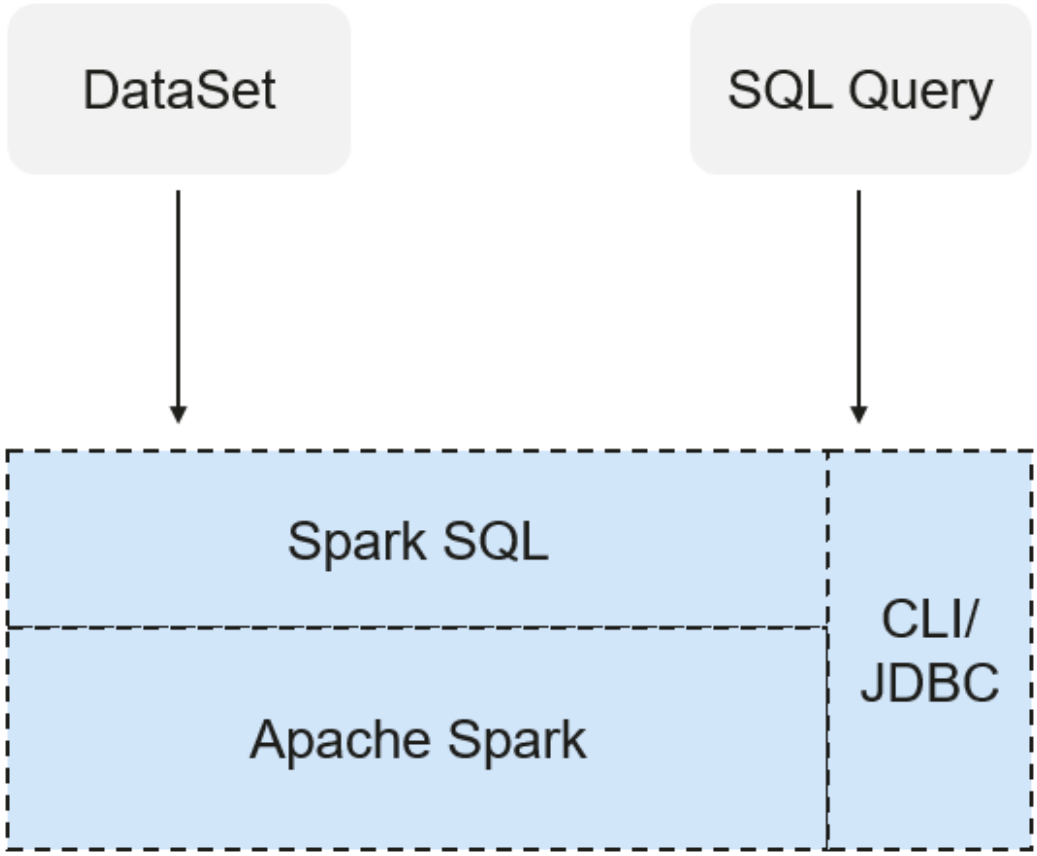
   Data that is cached but not stored to logs upon failures is re-sent by data sources, because the receiver does not confirm the data.

Therefore, by using WALs and reliable Receiver, Spark Streaming can avoid input data loss caused by Driver failures.

SparkSQL and DataSet Principle

SparkSQL

Figure 1-92 SparkSQL and DataSet



Spark SQL is a module for processing structured data. In Spark application, SQL statements or DataSet APIs can be seamlessly used for querying structured data.

Spark SQL and DataSet also provide a universal method for accessing multiple data sources such as Hive, CSV, Parquet, ORC, JSON, and JDBC. These data sources also allow data interaction. Spark SQL reuses the Hive frontend processing logic and metadata processing module. With the Spark SQL, you can directly query existing Hive data.

In addition, Spark SQL also provides API, CLI, and JDBC APIs, allowing diverse accesses to the client.

Spark SQL Native DDL/DML

In Spark 1.5, lots of Data Definition Language (DDL)/Data Manipulation Language (DML) commands are pushed down to and run on the Hive, causing coupling with the Hive and inflexibility such as unexpected error reports and results.

Spark 3.1.1 realizes command localization and replaces the Hive with Spark SQL Native DDL/DML to run DDL/DML commands. Additionally, the decoupling from the Hive is realized and commands can be customized.

DataSet

A DataSet is a strongly typed collection of domain-specific objects that can be transformed in parallel using functional or relational operations. Each Dataset also has an untyped view called a DataFrame, which is a Dataset of Row.

The DataFrame is a structured and distributed dataset consisting of multiple columns. The DataFrame is equal to a table in the relationship database or the DataFrame in the R/Python. The DataFrame is the most basic concept in the Spark SQL, which can be created by using multiple methods, such as the structured dataset, Hive table, external database or RDD.

Operations available on DataSets are divided into transformations and actions.

- A transformation operation can generate a new DataSet,
  for example, **map**, **filter**, **select**, and **aggregate (groupBy)**.
- An action operation can trigger computation and return results,
  for example, **count**, **show**, or write data to the file system.

You can use either of the following methods to create a DataSet:

- The most common way is by pointing Spark to some files on storage systems, using the **read** function available on a SparkSession.
  ```
  val people = spark.read.parquet("...").as[Person]  // Scala
  DataSet<Person> people = spark.read().parquet("...").as(Encoders.bean(Person.class));//Java
  ```
- You can also create a DataSet using the transformation operation available on an existing one.
  For example, apply the map operation on an existing DataSet to create a DataSet:
  ```
  val names = people.map(_.name) // In Scala: names is Dataset.
  Dataset<String> names = people.map((Person p) -> p.name, Encoders.STRING)); // Java
  ```

CLI and JDBCServer

In addition to programming APIs, Spark SQL also provides the CLI/JDBC APIs.

- Both **spark-shell** and **spark-sql** scripts can provide the CLI for debugging.
- JDBCServer provides JDBC APIs. External systems can directly send JDBC requests to calculate and parse structured data.

SparkSession Principle

SparkSession is a unified API for Spark programming and can be regarded as a unified entry for reading data. SparkSession provides a single entry point to perform many operations that were previously scattered across multiple classes, and also provides accessor methods to these older classes to maximize compatibility.

A SparkSession can be created using a builder pattern. The builder will automatically reuse the existing SparkSession if there is a SparkSession; or create a SparkSession if it does not exist. During I/O transactions, the configuration item settings in the builder are automatically synchronized to Spark and Hadoop.

```
import org.apache.spark.sql.SparkSession
val sparkSession = SparkSession.builder
  .master("local")
  .appName("my-spark-app")
  .config("spark.some.config.option", "config-value")
  .getOrCreate()
```

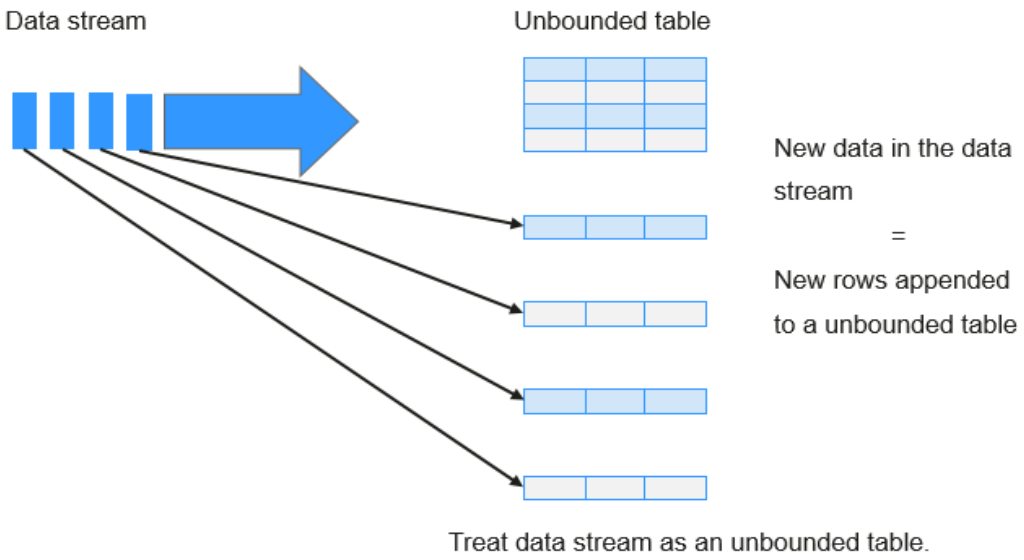
- SparkSession can be used to execute SQL queries on data and return results as DataFrame.
  ```
  sparkSession.sql("select * from person").show
  ```
- SparkSession can be used to set configuration items during running. These configuration items can be replaced with variables in SQL statements.
  ```
  sparkSession.conf.set("spark.some.config", "abcd")
  sparkSession.conf.get("spark.some.config")
  sparkSession.sql("select ${spark.some.config}")
  ```
- SparkSession also includes a "catalog" method that contains methods to work with Metastore (data catalog). After this method is used, a dataset is returned, which can be run using the same Dataset API.
  ```
  val tables = sparkSession.catalog.listTables()
  val columns = sparkSession.catalog.listColumns("myTable")
  ```
- Underlying SparkContext can be accessed by SparkContext API of SparkSession.
  ```
  val sparkContext = sparkSession.sparkContext
  ```

Structured Streaming Principle

Structured Streaming is a stream processing engine built on the Spark SQL engine. You can use the Dataset/DataFrame API in Scala, Java, Python, or R to express streaming aggregations, event-time windows, and stream-stream joins. If streaming data is incrementally and continuously produced, Spark SQL will continue to process the data and synchronize the result to the result set. In addition, the system ensures end-to-end exactly-once fault-tolerance guarantees through checkpoints and WALs.

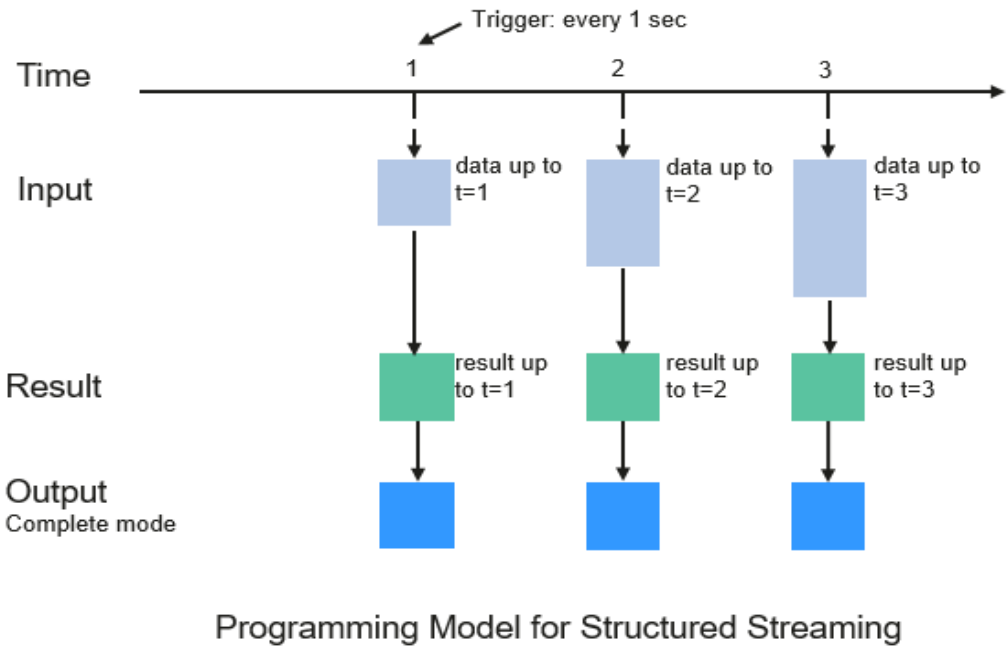
The core of Structured Streaming is to take streaming data as an incremental database table. Similar to the data block processing model, the streaming data processing model applies query operations on a static database table to streaming computing, and Spark uses standard SQL statements for query, to obtain data from the incremental and unbounded table.

Figure 1-93 Unbounded table of Structured Streaming



Each query operation will generate a result table. At each trigger interval, updated data will be synchronized to the result table. Whenever the result table is updated, the updated result will be written into an external storage system.

Figure 1-94 Structured Streaming data processing model



Storage modes of Structured Streaming at the output phase are as follows:

- Complete Mode: The updated result sets are written into the external storage system. The write operation is performed by a connector of the external storage system.

- Append Mode: If an interval is triggered, only added data in the result table will be written into an external system. This is applicable only on the queries where existing rows in the result table are not expected to change.
- Update Mode: If an interval is triggered, only updated data in the result table will be written into an external system, which is the difference between the Complete Mode and Update Mode.

Basic Concepts

- **RDD**

  Resilient Distributed Dataset (RDD) is a core concept of Spark. It indicates a read-only and partitioned distributed dataset. Partial or all data of this dataset can be cached in the memory and reused between computations.

  RDD Creation

  - An RDD can be created from the input of HDFS or other storage systems that are compatible with Hadoop.
  - A new RDD can be converted from a parent RDD.
  - An RDD can be converted from a collection of datasets through encoding.

  RDD Storage

  - You can select different storage levels to store an RDD for reuse. (There are 11 storage levels to store an RDD.)
  - By default, the RDD is stored in the memory. When the memory is insufficient, the RDD overflows to the disk.

- **RDD Dependency**

  The RDD dependency includes the narrow dependency and wide dependency.

  Figure 1-95 RDD dependency

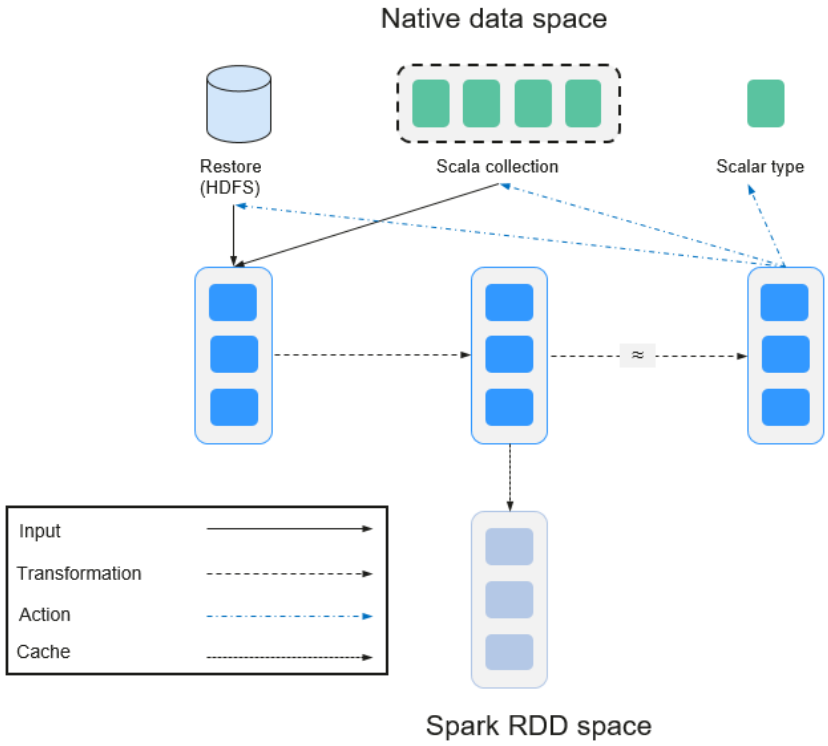
  
  - **Narrow dependency**: Each partition of the parent RDD is used by at most one partition of the child RDD.
  - **Wide dependency**: Partitions of the child RDD depend on all partitions of the parent RDD.

The narrow dependency facilitates the optimization. Logically, each RDD operator is a fork/join (the join is not the join operator mentioned above but the barrier used to synchronize multiple concurrent tasks); fork the RDD to each partition, and then perform the computation. After the computation, join the results, and then perform the fork/join operation on the next RDD operator. It is uneconomical to directly translate the RDD into physical implementation. The first is that every RDD (even intermediate result) needs to be physicalized into memory or storage, which is time-consuming and occupies much space. The second is that as a global barrier, the join operation is very expensive and the entire join process will be slowed down by the slowest node. If the partitions of the child RDD narrowly depend on that of the parent RDD, the two fork/join processes can be combined to implement classic fusion optimization. If the relationship in the continuous operator sequence is narrow dependency, multiple fork/join processes can be combined to reduce a large number of global barriers and eliminate the physicalization of many RDD intermediate results, which greatly improves the performance. This is called pipeline optimization in Spark.

- **Transformation and Action (RDD Operations)**

  Operations on RDD include transformation (the return value is an RDD) and action (the return value is not an RDD). **Figure 1-96** shows the RDD operation process. The transformation is lazy, which indicates that the transformation from one RDD to another RDD is not immediately executed. Spark only records the transformation but does not execute it immediately. The real computation is started only when the action is started. The action returns results or writes the RDD data into the storage system. The action is the driving force for Spark to start the computation.

Figure 1-96 RDD operation



The data and operation model of RDD are quite different from those of Scala.

```
val file = sc.textFile("hdfs://...")
val errors = file.filter(_.contains("ERROR"))
errors.cache()
errors.count()
```

a. The textFile operator reads log files from the HDFS and returns files (as an RDD).

b. The filter operator filters rows with **ERROR** and assigns them to errors (a new RDD). The filter operator is a transformation.

c. The cache operator caches errors for future use.

d. The count operator returns the number of rows of errors. The count operator is an action.

Transformation includes the following types:

– The RDD elements are regarded as simple elements.

  The input and output has the one-to-one relationship, and the partition structure of the result RDD remains unchanged, for example, map.

  The input and output has the one-to-many relationship, and the partition structure of the result RDD remains unchanged, for example, flatMap (one element becomes a sequence containing multiple elements after map and then flattens to multiple elements).

  The input and output has the one-to-one relationship, but the partition structure of the result RDD changes, for example, union (two RDDs integrates to one RDD, and the number of partitions becomes the sum of the number of partitions of two RDDs) and coalesce (partitions are reduced).

  Operators of some elements are selected from the input, such as filter, distinct (duplicate elements are deleted), subtract (elements only exist in this RDD are retained), and sample (samples are taken).

– The RDD elements are regarded as key-value pairs.

  Perform the one-to-one calculation on the single RDD, such as mapValues (the partition mode of the source RDD is retained, which is different from map).

  Sort the single RDD, such as sort and partitionBy (partitioning with consistency, which is important to the local optimization).

  Restructure and reduce the single RDD based on key, such as groupByKey and reduceByKey.

  Join and restructure two RDDs based on the key, such as join and cogroup.

  > NOTE
  >
  > The later three operations involving sorting are called shuffle operations.

Action includes the following types:

– Generate scalar configuration items, such as **count** (the number of elements in the returned RDD), **reduce**, **fold/aggregate** (the number of scalar configuration items that are returned), and **take** (the number of elements before the return).

  - Generate the Scala collection, such as **collect** (import all elements in the RDD to the Scala collection) and **lookup** (look up all values corresponds to the key).
  - Write data to the storage, such as **saveAsTextFile** (which corresponds to the preceding **textFile**).
  - Check points, such as the **checkpoint** operator. When Lineage is quite long (which occurs frequently in graphics computation), it takes a long period of time to execute the whole sequence again when a fault occurs. In this case, checkpoint is used as the check point to write the current data to stable storage.

- **Shuffle**

  Shuffle is a specific phase in the MapReduce framework, which is located between the Map phase and the Reduce phase. If the output results of Map are to be used by Reduce, the output results must be hashed based on a key and distributed to each Reducer. This process is called Shuffle. Shuffle involves the read and write of the disk and the transmission of the network, so that the performance of Shuffle directly affects the operation efficiency of the entire program.

  The figure below shows the entire process of the MapReduce algorithm.

  Figure 1-97 Algorithm process

  Shuffle is a bridge to connect data. The following describes the implementation of shuffle in Spark.

  Shuffle divides a job of Spark into multiple stages. The former stages contain one or more ShuffleMapTasks, and the last stage contains one or more ResultTasks.

- **Spark Application Structure**

  The Spark application structure includes the initialized SparkContext and the main program.

  - Initialized SparkContext: constructs the operating environment of the Spark Application.

    Constructs the SparkContext object. The following is an example:

    ```
    new SparkContext(master, appName, [SparkHome], [jars])
    ```

    Parameter description:

    master: indicates the link string. The link modes include local, Yarn-cluster, and Yarn-client.

appName: indicates the application name.

SparkHome: indicates the directory where Spark is installed in the cluster.

jars: indicates the code and dependency package of an application.

– Main program: processes data.

- **Spark Shell Commands**

  The basic Spark shell commands support the submission of Spark applications. The Spark shell commands are as follows:

```
./bin/spark-submit \
  --class <main-class> \
  --master <master-url> \
  ... # other options
  <application-jar> \
  [application-arguments]
```

  Parameter description:

  --class: indicates the name of the class of a Spark application.

  --master: indicates the master to which the Spark application links, such as Yarn-client and Yarn-cluster.

  application-jar: indicates the path of the JAR file of the Spark application.

  application-arguments: indicates the parameter required to submit the Spark application. This parameter can be left blank.

- **Spark JobHistory Server**

  The Spark web UI is used to monitor the details in each phase of the Spark framework of a running or historical Spark job and provide the log display, which helps users to develop, configure, and optimize the job in more fine-grained units.

1.4.23.2 Spark HA Solution

Spark Multi-Active Instance HA Principles and Implementation Solution

Based on existing JDBCServer in the community, multi-active-instance mode is used to achieve HA. In this mode, multiple JDBCServers coexist in the cluster and the client can randomly connect any JDBCServer to perform service operations. When one or multiple JDBCServers stop working, a client can connect to another normal JDBCServer.

Compared with active/standby HA mode, multi-active instance mode has following advantages:

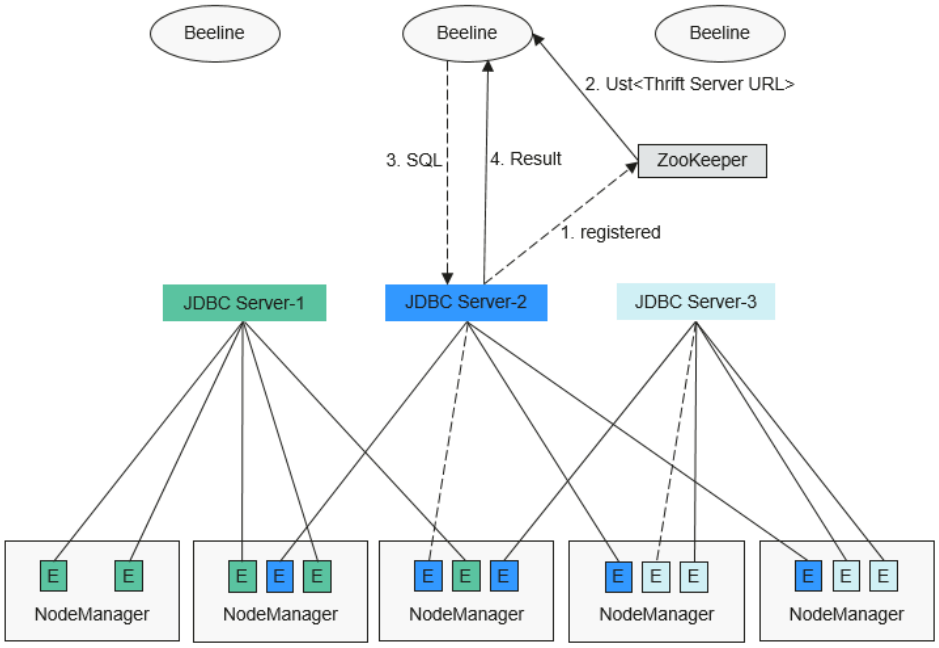
- In active/standby HA, when the active/standby switchover occurs, the unavailable period cannot be controlled by JDBCServer, but it depends on Yarn service resources.
- In Spark, the Thrift JDBC similar to HiveServer2 provides services and users access services through Beeline and JDBC API. Therefore, the processing capability of the JDBCServer cluster depends on the single-point capability of the primary server, and the scalability is insufficient.

The multi-active instance HA mode not only can prevent service interruption caused by switchover, but also enables cluster scale-out to improve high concurrency.

- **Implementation**

  The following figure shows the basic principle of multi-active instance HA of Spark JDBCServer.

  Figure 1-98 Spark JDBCServer HA



1. When a JDBCServer is started, it registers with ZooKeeper by writing node information in a specified directory. Node information includes the instance IP address, port number, version, and serial number.
2. To connect to JDBCServer, the client must specify the namespace, which is the directory of JDBCServer instances in ZooKeeper. During the connection, a JDBCServer instance is randomly selected from the specified namespace.
3. After the connection succeeds, the client sends SQL statements to JDBCServer.
4. JDBCServer executes received SQL statements and returns results to the client.

If multi-active instance HA of Spark JDBCServer is enabled, all JDBCServer instances are independent and equivalent. When one JDBCServer instance is interrupted during upgrade, other JDBCServer instances can accept the connection request from the client.

The rules below must be followed in the multi-active instance HA of Spark JDBCServer.

- If a JDBCServer instance exits abnormally, no other instance will take over the sessions and services running on the abnormal instance.
- When the JDBCServer process is stopped, corresponding nodes are deleted from ZooKeeper.
- The client randomly selects the server, which may result in uneven session allocation caused by random distribution of policy results, and finally result in load imbalance of instances.
- After the instance enters the maintenance mode (in which no new connection requests from clients are accepted), services running on the instance may fail when the decommissioning times out.

- **URL Connection**
  - Multi-active instance mode

    In multi-active instance mode, the client reads content from the ZooKeeper node and connects to JDBCServer. The connection strings are list below.

    - Security mode:

      If Kinit authentication is enabled, the JDBCURL is as follows:

      jdbc:hive2://<*zkNode1_IP*>**:**<*zkNode1_Port*>**,**<*zkNode2_IP*>**:**<*zkNode2_Port*>**,**<*zkNode3_IP*>**:**<*zkNode3_Port*>**/;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;saslQop=auth-conf;auth=KERBEROS;principal=spark/hadoop.**<*System domain name*>**@**<*System domain name*>**;**

      NOTE

      - In the above JDBCURL, **<zkNode_IP>:<zkNode_Port>** indicates the ZooKeeper URL. Use commas (,) to separate multiple URLs,

        Example: 192.168.81.37:2181,192.168.195.232:2181,192.168.169.84:2181.
      - **sparkthriftserver2x** indicates the ZooKeeper directory, where a random JDBCServer instance is connected to the client.

      For example, when you use Beeline client to connect JDBCServer, run the following command:

      sh *CLIENT_HOME*/**spark/bin/beeline -u "jdbc:hive2://**<*zkNode1_IP*>**:**<*zkNode1_Port*>**,**<*zkNode2_IP*>**:**<*zkNode2_Port*>**,**<*zkNode3_IP*>**:**<*zkNode3_Port*>**/;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;saslQop=auth-conf;auth=KERBEROS;principal=spark/hadoop.**<*System domain name*>**@**<*System domain name*>**;"**

      If Keytab authentication is enabled, the JDBCURL is as follows:

      jdbc:hive2://<*zkNode1_IP*>**:**<*zkNode1_Port*>**,**<*zkNode2_IP*>**:**<*zkNode2_Port*>**,**<*zkNode3_IP*>**:**<*zkNode3_Port*>**/;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;saslQop=auth-conf;auth=KERBEROS;principal=spark/hadoop.**<*System domain name*>@<*System domain name*>**;user.principal=**<*principal_name*>**;user.keytab=**<*path_to_keytab*>

      In the above URL, <*principal_name*> indicates the principal of the Kerberos user, for example, **test@**<*System domain name*>; <*path_to_keytab*> indicates the Keytab file path corresponding to <*principal_name*>, for example, **/opt/auth/test/user.keytab**.

    - Common mode:

      jdbc:hive2://<*zkNode1_IP*>**:**<*zkNode1_Port*>**,**<*zkNode2_IP*>**:**<*zkNode2_Port*>**,**<*zkNode3_IP*>**:**<*zkNode3_Port*>**/;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;**

      For example, when you use Beeline client, in normal mode, for connection, run the following command:

      sh *CLIENT_HOME*/**spark/bin/beeline -u "jdbc:hive2://**<*zkNode1_IP*>**:**<*zkNode1_Port*>**,**<*zkNode2_IP*>**:**<*zkNode2_Port*>**,**<*zkNode3_IP*>**:**<*zkNode3_Port*>**/;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;"**

  - Non-multi-active instance mode

    In this mode, a client connects to a specified JDBCServer node. Compared with multi-active instance mode, the connection string in this mode does

not contain **serviceDiscoveryMode** and **zooKeeperNamespace** parameters about ZooKeeper.

For example, when you use Beeline client, in security mode, to connect JDBCServer in non-multi-active instance mode, run the following command:

sh *CLIENT_HOME*/**spark/bin/beeline -u "jdbc:hive2://***<server_IP>:<server_Port>***/;user.principal=spark/hadoop.***<System domain name>***@***<System domain name>***;saslQop=auth-conf;auth=KERBEROS;principal=spark/hadoop.***<System domain name>***@***<System domain name>***;"**

NOTE

- In the above command, **<server_IP>:<server_Port>** indicates the URL of the specified JDBCServer node.
- **CLIENT_HOME** indicates the client path.

Except the connection method, other operations of JDBCServer API in the two modes are the same. Spark JDBCServer is another implementation of HiveServer2 in Hive.

Spark Multi-Tenant HA

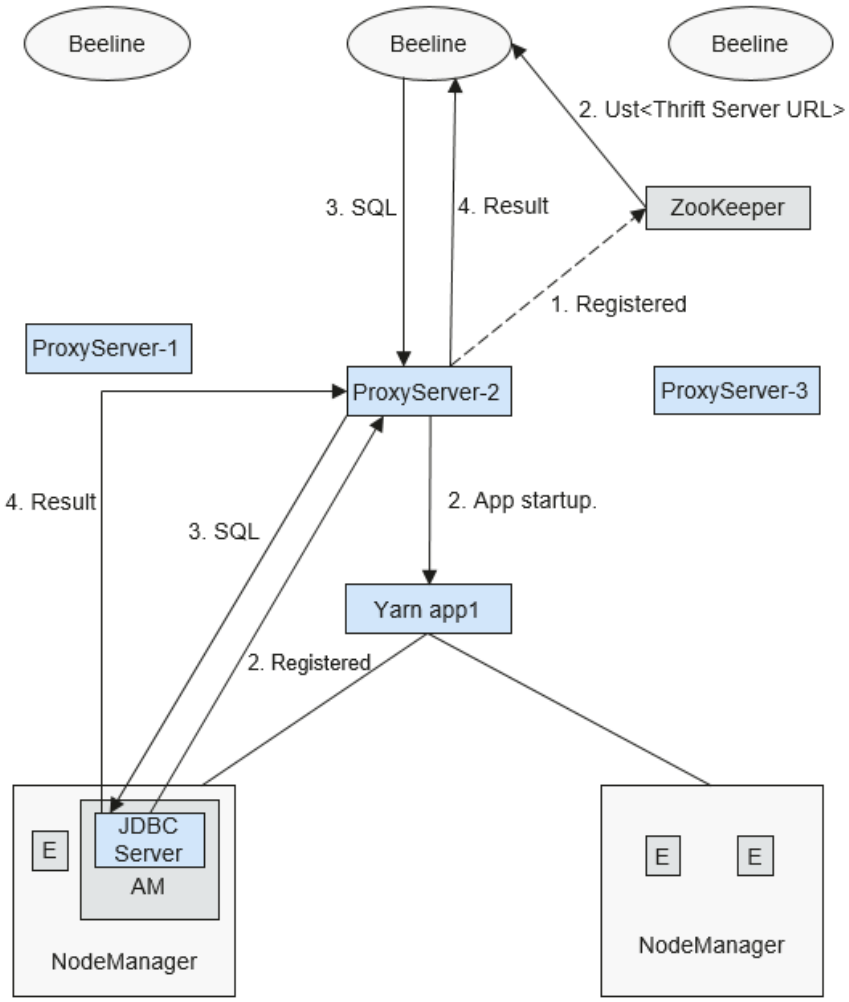
In the JDBCServer multi-active instance solution, JDBCServer uses the Yarn-client mode, but there is only one Yarn resource queue available. To solve this resource limitation problem, the multi-tenant mode is introduced.

In multi-tenant mode, JDBCServers are bound with tenants. Each tenant corresponds to one or more JDBCServers, and a JDBCServer provides services for only one tenant. Different tenants can be configured with different Yarn queues to implement resource isolation. In addition, JDBCServer can be dynamically started as required to avoid resource waste.

- **Implementation**

  Figure 1-99 shows the HA solution of the multi-tenant mode.

Figure 1-99 Multi-tenant mode of Spark JDBCServer



a. When ProxyServer is started, it registers with ZooKeeper by writing node information in a specified directory. Node information includes the instance IP address, port number, version, and serial number.

   NOTE

   In multi-tenant mode, the JDBCServer instance refers to the ProxyServer (JDBCServer proxy).

b. To connect to ProxyServer, the client must specify a namespace, which is the directory of the ProxyServer instance where you want to access ZooKeeper. When the client connects to the ProxyServer, a random instance under the namespace is selected for connection. For details about the URL, see **URL Connection Overview**.

c. After the client successfully connects to the ProxyServer, which first checks whether the JDBCServer of a tenant exists. If yes, Beeline connects the JDBCServer. If no, a new JDBCServer is started in Yarn-cluster mode. After the startup of JDBCServer, ProxyServer obtains the IP address of the JDBCServer and establishes the connection between Beeline and JDBCServer.

d. The client sends SQL statements to ProxyServer, which forwards statements to the connected JDBCServer. JDBCServer returns the results to ProxyServer, which then returns the results to the client.

In the multi-active instance HA mode, all instances are independent and equivalent. If one instance is interrupted during upgrade, other instances can accept the connection request from the client.

- **URL Connection Overview**
  - Multi-tenant mode

    In multi-tenant mode, the client reads content from the ZooKeeper node and connects to ProxyServer. The connection strings are list below.

    - Security mode:

      If Kinit authentication is enabled, the client URL is as follows:

      jdbc:hive2://<*zkNode1_IP*>:<*zkNode1_Port*>,<*zkNode2_IP*>:<*zkNode2_Port*>,<*zkNode3_IP*>:<*zkNode3_Port*>**/;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;saslQop=auth-conf;auth=KERBEROS;principal=spark/hadoop.**<*System domain name*>@<*System domain name*>;

      NOTE

      - In the above URL, **<zkNode_IP>:<zkNode_Port>** indicates the ZooKeeper URL. Use commas (,) to separate multiple URLs,

        Example:
        192.168.81.37:2181,192.168.195.232:2181,192.168.169.84:2181.
      - **sparkthriftserver2x** indicates the ZooKeeper directory, where a random JDBCServer instance is connected to the client.

      For example, when you use Beeline client for connection, run the following command:

      sh *CLIENT_HOME*/**spark/bin/beeline -u "jdbc:hive2://**<*zkNode1_IP*>:<*zkNode1_Port*>,<*zkNode2_IP*>:<*zkNode2_Port*>,<*zkNode3_IP*>:<*zkNode3_Port*>**/;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;saslQop=auth-conf;auth=KERBEROS;principal=spark/hadoop.**<*System domain name*>**@**<*System domain name*>**;"**

      If Keytab authentication is enabled, the URL is as follows:

      jdbc:hive2://<*zkNode1_IP*>:<*zkNode1_Port*>,<*zkNode2_IP*>:<*zkNode2_Port*>,<*zkNode3_IP*>:<*zkNode3_Port*>**/;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;saslQop=auth-conf;auth=KERBEROS;principal=spark/hadoop.**<*System domain name*>@<*System domain name*>**;user.principal=**<*principal_name*>**;user.keytab=**<*path_to_keytab*>

      In the above URL, <*principal_name*> indicates the principal of the Kerberos user, for example, **test@**<*System domain name*>; <*path_to_keytab*> indicates the Keytab file path corresponding to <*principal_name*>, for example, **/opt/auth/test/user.keytab**.

    - Common mode:

      jdbc:hive2://<*zkNode1_IP*>:<*zkNode1_Port*>,<*zkNode2_IP*>:<*zkNode2_Port*>,<*zkNode3_IP*>:<*zkNode3_Port*>/;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=**sparkthriftserver2x**;

      For example, run the following command when you use Beeline client for connection in normal mode:

      sh *CLIENT_HOME*/**spark/bin/beeline -u "jdbc:hive2://**<*zkNode1_IP*>:<*zkNode1_Port*>,<*zkNode2_IP*>:<*zkNode2_Port*>,<*zkN*

ode3_IP>:<zkNode3_Port>/;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;"

- Non-multi-tenant mode

  In non-multi-tenant mode, a client connects to a specified JDBCServer node. Compared with multi-tenant instance mode, the connection string in this mode does not contain **serviceDiscoveryMode** and **zooKeeperNamespace** parameters about ZooKeeper.

  For example, when you use Beeline client to connect JDBCServer in non-multi-tenant instance mode, run the following command:

  sh *CLIENT_HOME*/**spark/bin/beeline -u "jdbc:hive2://***<server_IP>:<server_Port>*/;user.principal=spark/hadoop.*<System domain name>@<System domain name>*;saslQop=auth-conf;auth=KERBEROS;principal=spark/hadoop.*<System domain name>@<System domain name>*;"

  NOTE

  - In the above command, **<server_IP>:<server_Port>** indicates the URL of the specified JDBCServer node.
  - **CLIENT_HOME** indicates the client path.

  Except the connection method, other operations of JDBCServer API in multi-tenant mode and non-multi-tenant mode are the same. Spark JDBCServer is another implementation of HiveServer2 in Hive.

  Specifying a Tenant

  Generally, the client submitted by a user connects to the default JDBCServer of the tenant to which the user belongs. If you want to connect the client to the JDBCServer of a specified tenant, add the **--hiveconf mapreduce.job.queuename** parameter.

  If you use Beeline client for connection, run the following command (**aaa** is the tenant name):

  beeline --hiveconf mapreduce.job.queuename=aaa -u 'jdbc:hive2://192.168.39.30:2181,192.168.40.210:2181,192.168.215.97:2181;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;saslQop=auth-conf;auth=KERBEROS;principal=spark/hadoop.*<System domain name>@<System domain name>*;'

1.4.23.3 Relationship Among Spark, HDFS, and Yarn

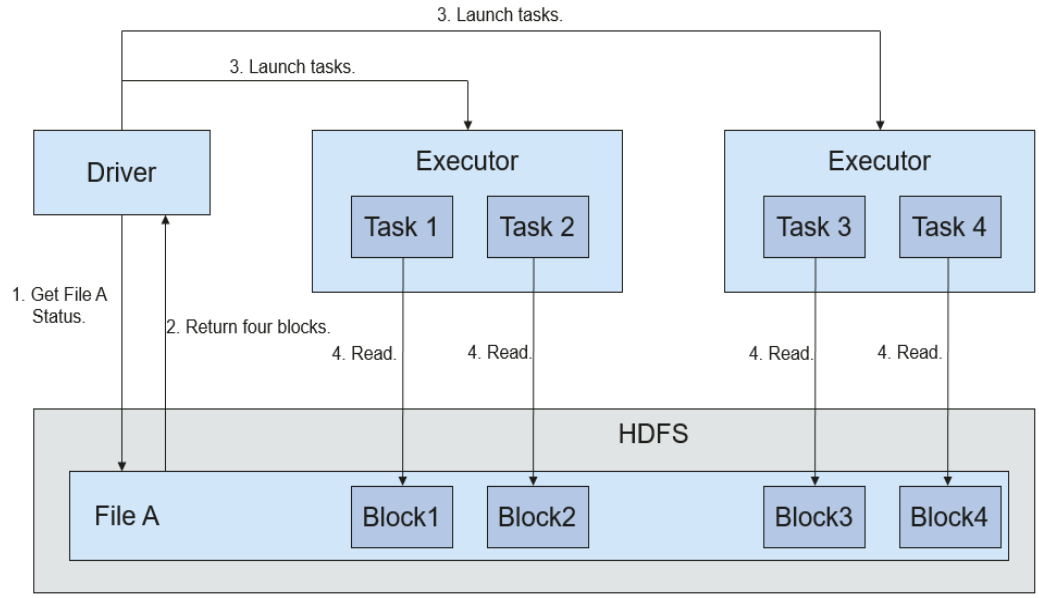
Relationship Between Spark and HDFS

Data computed by Spark comes from multiple data sources, such as local files and HDFS. Most data computed by Spark comes from the HDFS. The HDFS can read data in large scale for parallel computing. After being computed, data can be stored in the HDFS.

Spark involves Driver and Executor. Driver schedules tasks and Executor runs tasks.

Figure 1-100 shows the process of reading a file.

Figure 1-100 File reading process

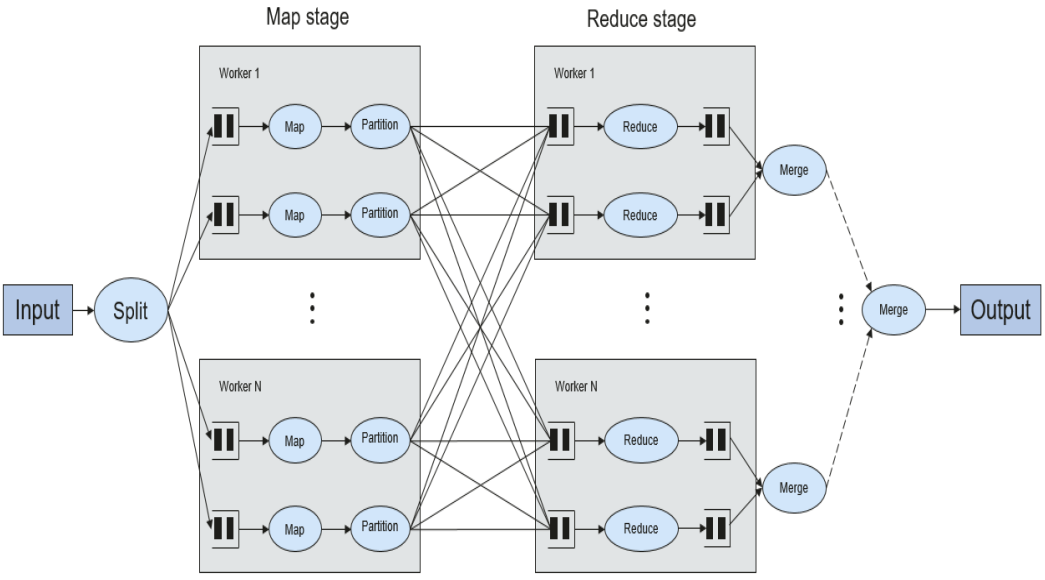


The file reading process is as follows:

1. Driver interconnects with the HDFS to obtain the information of File A.
2. The HDFS returns the detailed block information about this file.
3. Driver sets a parallel degree based on the block data amount, and creates multiple tasks to read the blocks of this file.
4. Executor runs the tasks and reads the detailed blocks as part of the Resilient Distributed Dataset (RDD).

Figure 1-101 shows the process of writing data to a file.

Figure 1-101 File writing process



The file writing process is as follows:

1. Driver creates a directory where the file is to be written.
2. Based on the RDD distribution status, the number of tasks related to data writing is computed, and these tasks are sent to Executor.
3. Executor runs these tasks, and writes the RDD data to the directory created in 1.

Relationship Between Spark and Yarn

The Spark computing and scheduling can be implemented using Yarn mode. Spark enjoys the computing resources provided by Yarn clusters and runs tasks in a distributed way. Spark on Yarn has two modes: Yarn-cluster and Yarn-client.

- Yarn-cluster mode

  Figure 1-102 shows the running framework of Spark on Yarn-cluster.

  Figure 1-102 Spark on Yarn-cluster operation framework

  Spark on Yarn-cluster implementation process:

  a. The client generates the application information, and then sends the information to ResourceManager.
  b. ResourceManager allocates the first container (ApplicationMaster) to SparkApplication and starts driver on the container.
  c. ApplicationMaster applies for resources from ResourceManager to run the container.

     ResourceManager allocates the container to ApplicationMaster, which communicates with NodeManager, and starts the executor in the obtained container. After the executor is started, it registers with the driver and applies for tasks.

d. The driver allocates tasks to the executor.

e. The executor runs tasks and reports the operating status to the driver.

- Yarn-client mode

  Figure 1-103 shows the running framework of Spark on Yarn-cluster.

  Figure 1-103 Spark on Yarn-client operation framework

  Spark on Yarn-client implementation process:

  NOTE

  In Yarn-client mode, Driver is deployed on the client and started on the client. In Yarn-client mode, the client of the earlier version is incompatible. You are advised to use the Yarn-cluster mode.

  a. The client sends the Spark application request to ResourceManager, then ResourceManager returns the results. The results include information such as Application ID and the maximum and minimum available resources. The client packages all information required to start ApplicationMaster, and sends the information to ResourceManager.

  b. After receiving the request, ResourceManager finds a proper node for ApplicationMaster and starts it on this node. ApplicationMaster is a role in Yarn, and the process name in Spark is ExecutorLauncher.

  c. Based on the resource requirements of each task, ApplicationMaster can apply for a series of Containers to run tasks from ResourceManager.

  d. After receiving the newly allocated container list (from ResourceManager), ApplicationMaster sends information to the related NodeManagers to start the containers.

     ResourceManager allocates the containers to ApplicationMaster, which communicates with the related NodeManagers, and starts the executors in the obtained containers. After the executors are started, it registers with drivers and applies for tasks.

NOTE

Running containers are not suspended and resources are not released.

e. The drivers allocate tasks to the executors. The executor executes tasks and reports the operating status to the driver.

1.4.23.4 Spark Enhanced Open Source Feature: Optimized SQL Query of Cross-Source Data

Scenario

Enterprises usually store massive data, such as from various databases and warehouses, for management and information collection. However, diversified data sources, hybrid dataset structures, and scattered data storage lower query efficiency.

The open source Spark only supports simple filter pushdown during querying of multi-source data. The SQL engine performance is deteriorated due of a large amount of unnecessary data transmission. The pushdown function is enhanced, so that **aggregate**, complex **projection**, and complex **predicate** can be pushed to data sources, reducing unnecessary data transmission and improving query performance.

Only the JDBC data source supports pushdown of query operations, such as **aggregate**, **projection**, **predicate**, **aggregate over inner join**, and **aggregate over union all**. All pushdown operations can be enabled based on your requirements.

Table 1-20 Enhanced query of cross-source query

Module	Before Enhancement	After Enhancement
aggregate	The pushdown of **aggregate** is not supported.	• Aggregation functions including **sum**, **avg**, **max**, **min**, and **count** are supported. Example: select count(*) from table • Internal expressions of aggregation functions are supported. Example: select sum(a+b) from table • Calculation of aggregation functions is supported. Example: select avg(a) + max(b) from table • Pushdown of **having** is supported. Example: select sum(a) from table where a>0 group by b having sum(a)>10 • Pushdown of some functions is supported. Pushdown of lines in mathematics, time, and string functions, such as **abs()**, **month()**, and **length()** are supported. In addition to the preceding built-in functions, you can run the **SET** command to add functions supported by data sources. Example: select sum(abs(a)) from table • Pushdown of **limit** and **order by** after **aggregate** is supported. However, the pushdown is not supported in Oracle, because Oracle does not support **limit**. Example: select sum(a) from table where a>0 group by b order by sum(a) limit 5
projection	Only pushdown of simple **projection** is supported. Example: select a, b from table	• Complex expressions can be pushed down. Example: select (a+b)*c from table • Some functions can be pushed down. For details, see the description below the table. Example: select length(a)+abs(b) from table • Pushdown of **limit** and **order by** after **projection** is supported. Example: select a, b+c from table order by a limit 3

Module	Before Enhancement	After Enhancement
predicate	Only simple filtering with the column name on the left of the operator and values on the right is supported. Example: select * from table where a>0 or b in ("aaa", "bbb")	• Complex expression pushdown is supported. Example: select * from table where a +b>c*d or a/c in (1, 2, 3) • Some functions can be pushed down. For details, see the description below the table. Example: select * from table where length(a)>5
aggregate over inner join	Related data from the two tables must be loaded to Spark. The join operation must be performed before the **aggregate** operation.	The following functions are supported: • Aggregation functions including **sum**, **avg**, **max**, **min**, and **count** are supported. • All **aggregate** operations can be performed in a same table. The **group by** operations can be performed on one or two tables and only inner join is supported. The following scenarios are not supported: • **aggregate** cannot be pushed down from both the left- and right-join tables. • **aggregate** contains operations, for example, sum(a+b). • **aggregate** operations, for example, sum(a)+min(b).
aggregate over union all	Related data from the two tables must be loaded to Spark. **union** must be performed before **aggregate**.	Supported scenarios: Aggregation functions including **sum**, **avg**, **max**, **min**, and **count** are supported. Unsupported scenarios: • **aggregate** contains operations, for example, sum(a+b). • **aggregate** operations, for example, sum(a)+min(b).

Precautions

- If external data source is Hive, query operation cannot be performed on foreign tables created by Spark.
- Only MySQL and MPPDB data sources are supported.

1.4.24 Spark2x

1.4.24.1 Basic Principles of Spark2x

NOTE

The Spark2x component applies to MRS 3.x and later versions.

Description

Spark is a memory-based distributed computing framework. In iterative computation scenarios, the computing capability of Spark is 10 to 100 times higher than MapReduce, because data is stored in memory when being processed. Spark can use HDFS as the underlying storage system, enabling users to quickly switch to Spark from MapReduce. Spark provides one-stop data analysis capabilities, such as the streaming processing in small batches, offline batch processing, SQL query, and data mining. Users can seamlessly use these functions in a same application. For details about the new open-source features of Spark2x, see **Spark2x Open Source New Features**.

Features of Spark are as follows:

- Improves the data processing capability through distributed memory computing and directed acyclic graph (DAG) execution engine. The delivered performance is 10 to 100 times higher than that of MapReduce.
- Supports multiple development languages (Scala/Java/Python) and dozens of highly abstract operators to facilitate the construction of distributed data processing applications.
- Builds data processing stacks using **SQL**, **Streaming**, MLlib, and GraphX to provide one-stop data processing capabilities.
- Fits into the Hadoop ecosystem, allowing Spark applications to run on Standalone, Mesos, or Yarn, enabling access of multiple data sources such as HDFS, HBase, and Hive, and supporting smooth migration of the MapReduce application to Spark.

Architecture

Figure 1-104 describes the Spark architecture and **Table 1-21** lists the Spark modules.

Figure 1-104 Spark architecture

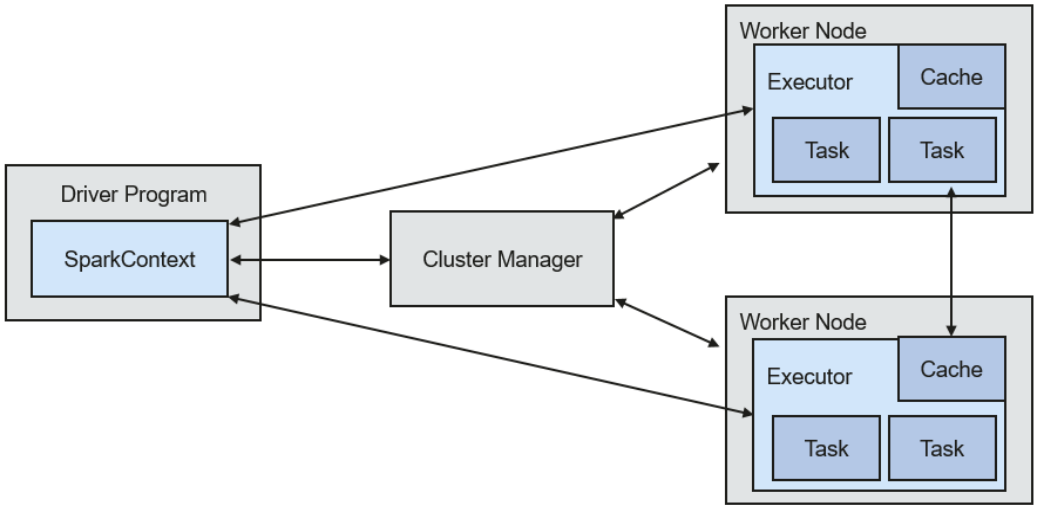


Table 1-21 Basic concepts

Module	Description
Cluster Manager	Cluster manager manages resources in the cluster. Spark supports multiple cluster managers, including Mesos, Yarn, and the Standalone cluster manager that is delivered with Spark. By default, Spark clusters adopt the Yarn cluster manager.
Application	Spark application. It consists of one Driver Program and multiple executors.
Deploy Mode	Deployment in cluster or client mode. In cluster mode, the driver runs on a node inside the cluster. In client mode, the driver runs on the client (outside the cluster).
Driver Program	The main process of the Spark application. It runs the **main()** function of an application and creates SparkContext. It is used for parsing applications, generating stages, and scheduling tasks to executors. Usually, SparkContext represents Driver Program.
Executor	A process started on a Work Node. It is used to execute tasks, and manage and process the data used in applications. A Spark application usually contains multiple executors. Each executor receives commands from the driver and executes one or multiple tasks.
Worker Node	A node that starts and manages executors and resources in a cluster.
Job	A job consists of multiple concurrent tasks. One action operator (for example, a collect operator) maps to one job.
Stage	Each job consists of multiple stages. Each stage is a task set, which is separated by Directed Acyclic Graph (DAG).

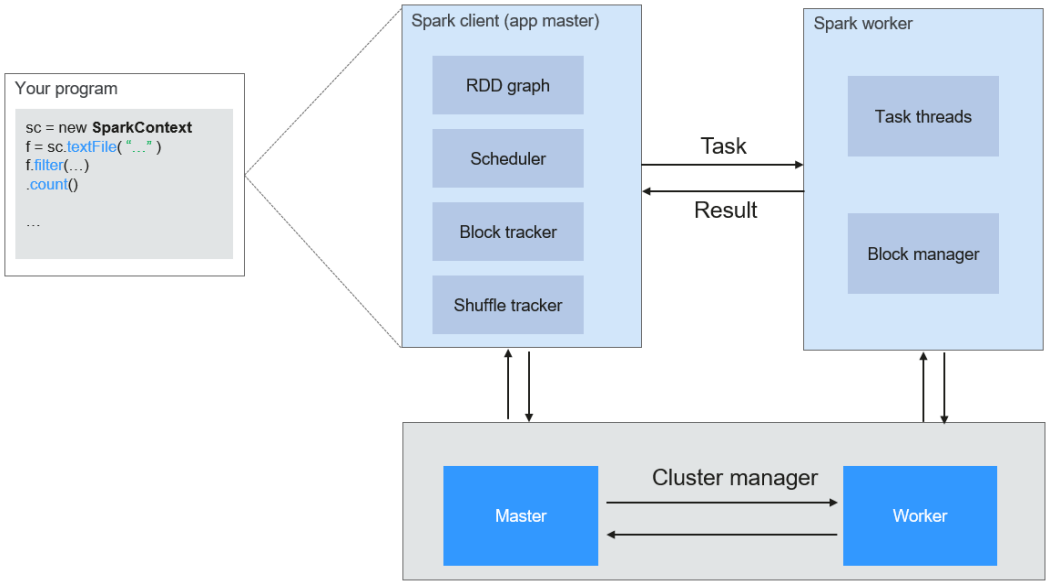
Module	Description
Task	A task carries the computation unit of the service logics. It is the minimum working unit that can be executed on the Spark platform. An application can be divided into multiple tasks based on the execution plan and computation amount.

Spark Principle

Figure 1-105 describes the application running architecture of Spark.

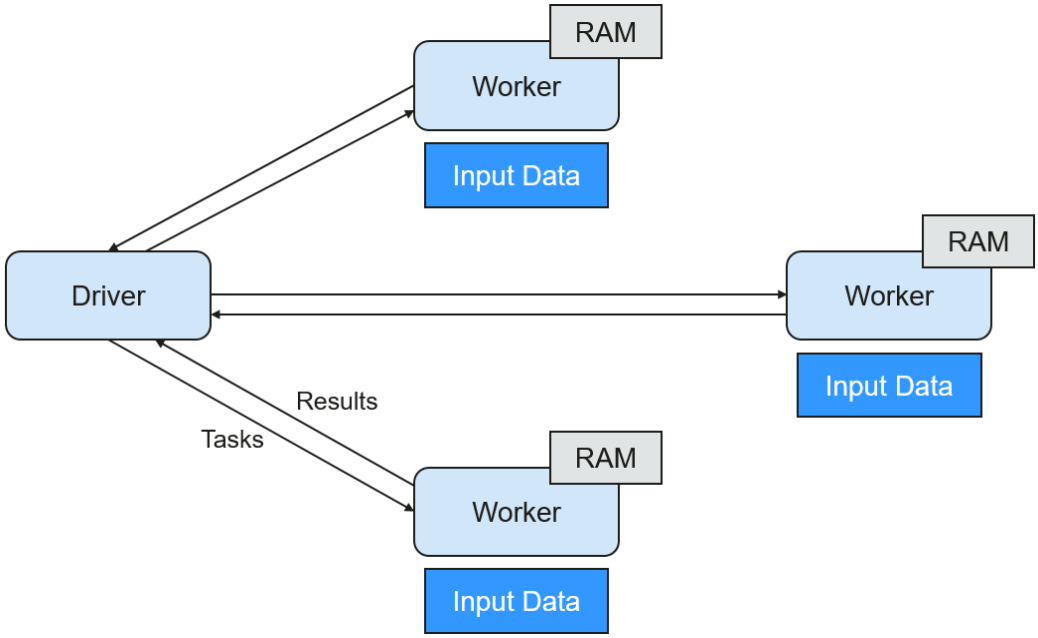
1. An application is running in the cluster as a collection of processes. Driver coordinates the running of the application.
2. To run an application, Driver connects to the cluster manager (such as Standalone, Mesos, and Yarn) to apply for the executor resources, and start ExecutorBackend. The cluster manager schedules resources between different applications. Driver schedules DAGs, divides stages, and generates tasks for the application at the same time.
3. Then, Spark sends the codes of the application (the codes transferred to **SparkContext**, which is defined by JAR or Python) to an executor.
4. After all tasks are finished, the running of the user application is stopped.

Figure 1-105 Spark application running architecture



Spark uses Master and Worker modes, as shown in **Figure 1-106**. A user submits an application on the Spark client, and then the scheduler divides a job into multiple tasks and sends the tasks to each Worker for execution. Each Worker reports the computation results to Driver (Master), and then the Driver aggregates and returns the results to the client.

Figure 1-106 Spark Master-Worker mode



Note the following about the architecture:

- Applications are isolated from each other.

  Each application has an independent executor process, and each executor starts multiple threads to execute tasks in parallel. Each driver schedules its own tasks, and different application tasks run on different JVMs, that is, different executors.
- Different Spark applications do not share data, unless data is stored in the external storage system such as HDFS.
- You are advised to deploy the Driver program in a location that is close to the Worker node because the Driver program schedules tasks in the cluster. For example, deploy the Driver program on the network where the Worker node is located.

Spark on YARN can be deployed in two modes:

- In Yarn-cluster mode, the Spark driver runs inside an ApplicationMaster process which is managed by Yarn in the cluster. After the ApplicationMaster is started, the client can exit without interrupting service running.
- In Yarn-client mode, Driver runs in the client process, and the ApplicationMaster process is used only to apply for requesting resources from Yarn.

Spark Streaming Principle

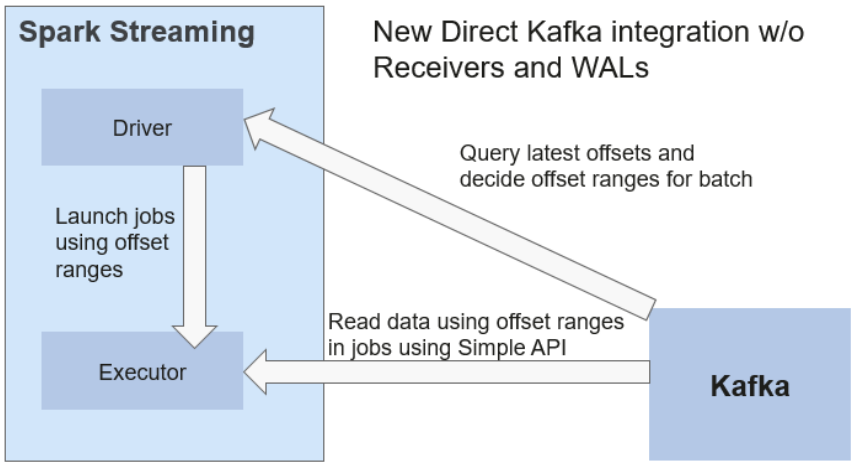
Spark Streaming is a real-time computing framework built on the Spark, which expands the capability for processing massive streaming data. Spark supports two data processing approaches: Direct Streaming and Receiver.

Direct Streaming computing process

In Direct Streaming approach, Direct API is used to process data. Take Kafka Direct API as an example. Direct API provides offset location that each batch range will

read from, which is much simpler than starting a receiver to continuously receive data from Kafka and written data to write-ahead logs (WALs). Then, each batch job is running and the corresponding offset data is ready in Kafka. These offset information can be securely stored in the checkpoint file and read by applications that failed to start.

Figure 1-107 Data transmission through Direct Kafka API



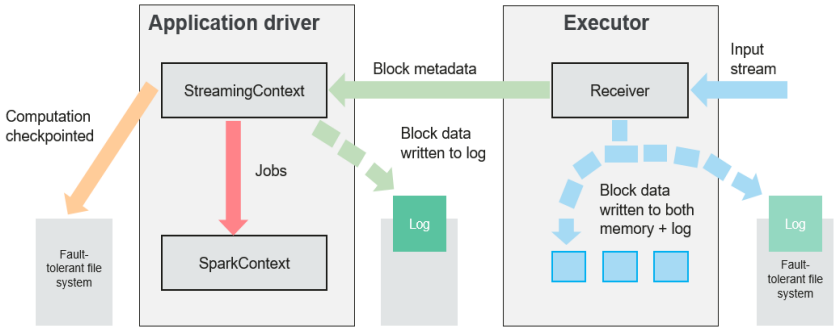
After the failure, Spark Streaming can read data from Kafka again and process the data segment. The processing result is the same no matter Spark Streaming fails or not, because the semantic is processed only once.

Direct API does not need to use the WAL and Receivers, and ensures that each Kafka record is received only once, which is more efficient. In this way, the Spark Streaming and Kafka can be well integrated, making streaming channels be featured with high fault-tolerance, high efficiency, and ease-of-use. Therefore, you are advised to use Direct Streaming to process data.

Receiver computing process

When a Spark Streaming application starts (that is, when the driver starts), the related StreamingContext (the basis of all streaming functions) uses SparkContext to start the receiver to become a long-term running task. These receivers receive and save streaming data to the Spark memory for processing. **Figure 1-108** shows the data transfer lifecycle.

Figure 1-108 Data transfer lifecycle



1. Receive data (blue arrow).

   Receiver divides a data stream into a series of blocks and stores them in the executor memory. In addition, after WAL is enabled, it writes data to the WAL of the fault-tolerant file system.

2. Notify the driver (green arrow).

   The metadata in the received block is sent to StreamingContext in the driver. The metadata includes:

   - Block reference ID used to locate the data position in the Executor memory.
   - Block data offset information in logs (if the WAL function is enabled).

3. Process data (red arrow).

   For each batch of data, StreamingContext uses block information to generate resilient distributed datasets (RDDs) and jobs. StreamingContext executes jobs by running tasks to process blocks in the executor memory.

4. Periodically set checkpoints (orange arrows).
5. For fault tolerance, StreamingContext periodically sets checkpoints and saves them to external file systems.

Fault Tolerance

Spark and its RDD allow seamless processing of failures of any Worker node in the cluster. Spark Streaming is built on top of Spark. Therefore, the Worker node of Spark Streaming also has the same fault tolerance capability. However, Spark Streaming needs to run properly in case of long-time running. Therefore, Spark must be able to recover from faults through the driver process (main process that coordinates all Workers). This poses challenges to the Spark driver fault-tolerance because the Spark driver may be any user application implemented in any computation mode. However, Spark Streaming has internal computation architecture. That is, it periodically executes the same Spark computation in each batch data. Such architecture allows it to periodically store checkpoints to reliable storage space and recover them upon the restart of Driver.

For source data such as files, the Driver recovery mechanism can ensure zero data loss because all data is stored in a fault-tolerant file system such as HDFS. However, for other data sources such as Kafka and Flume, some received data is cached only in memory and may be lost before being processed. This is caused by the distribution operation mode of Spark applications. When the driver process fails, all executors running in the Cluster Manager, together with all data in the memory, are terminated. To avoid such data loss, the WAL function is added to Spark Streaming.

WAL is often used in databases and file systems to ensure persistence of any data operation. That is, first record an operation to a persistent log and perform this operation on data. If the operation fails, the system is recovered by reading the log and re-applying the preset operation. The following describes how to use WAL to ensure persistence of received data:

Receiver is used to receive data from data sources such as Kafka. As a long-time running task in Executor, Receiver receives data, and also confirms received data if supported by data sources. Received data is stored in the Executor memory, and Driver delivers a task to Executor for processing.

After WAL is enabled, all received data is stored to log files in the fault-tolerant file system. Therefore, the received data does not lose even if Spark Streaming

fails. Besides, receiver checks correctness of received data only after the data is pre-written into logs. Data that is cached but not stored can be sent again by data sources after the driver restarts. These two mechanisms ensure zero data loss. That is, all data is recovered from logs or re-sent by data sources.

To enable the WAL function, perform the following operations:

- Set **streamingContext.checkpoint** (path-to-directory) to configure the checkpoint directory, which is an HDFS file path used to store streaming checkpoints and WALs.
- Set **spark.streaming.receiver.writeAheadLog.enable** of SparkConf to **true** (the default value is **false**).

After WAL is enabled, all receivers have the advantage of recovering from reliable received data. You are advised to disable the multi-replica mechanism because the fault-tolerant file system of WAL may also replicate the data.

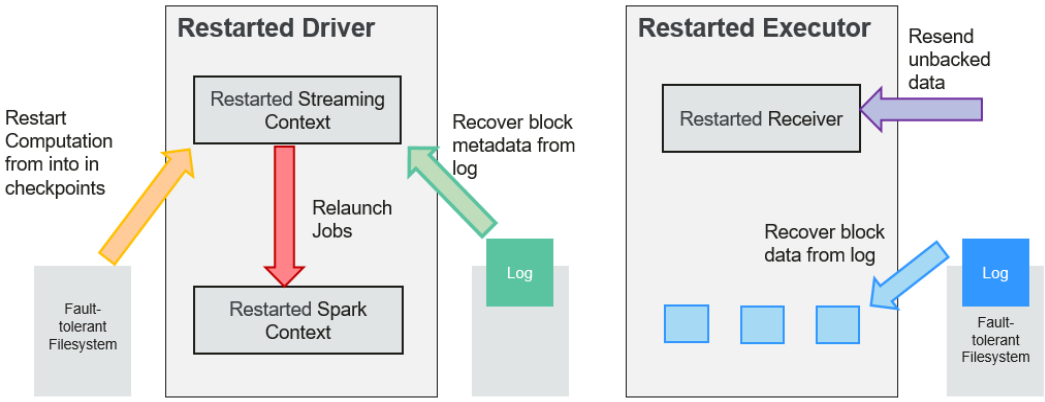
NOTE

The data receiving throughput is lowered after WAL is enabled. All data is written into the fault-tolerant file system. As a result, the write throughput of the file system and the network bandwidth for data replication may become the potential bottleneck. To solve this problem, you are advised to create more receivers to increase the degree of data receiving parallelism or use better hardware to improve the throughput of the fault-tolerant file system.

Recovery Process

When a failed driver is restarted, restart it as follows:

Figure 1-109 Computing recovery process



1. Recover computing. (Orange arrow)

   Use checkpoint information to restart Driver, reconstruct SparkContext and restart Receiver.

2. Recover metadata block. (Green arrow)

   This operation ensures that all necessary metadata blocks are recovered to continue the subsequent computing recovery.

3. Relaunch unfinished jobs. (Red arrow)

   Recovered metadata is used to generate RDDs and corresponding jobs for interrupted batch processing due to failures.

4. Read block data saved in logs. (Blue arrow)

   Block data is directly read from WALs during execution of the preceding jobs, and therefore all essential data reliably stored in logs is recovered.

5. Resend unconfirmed data. (Purple arrow)

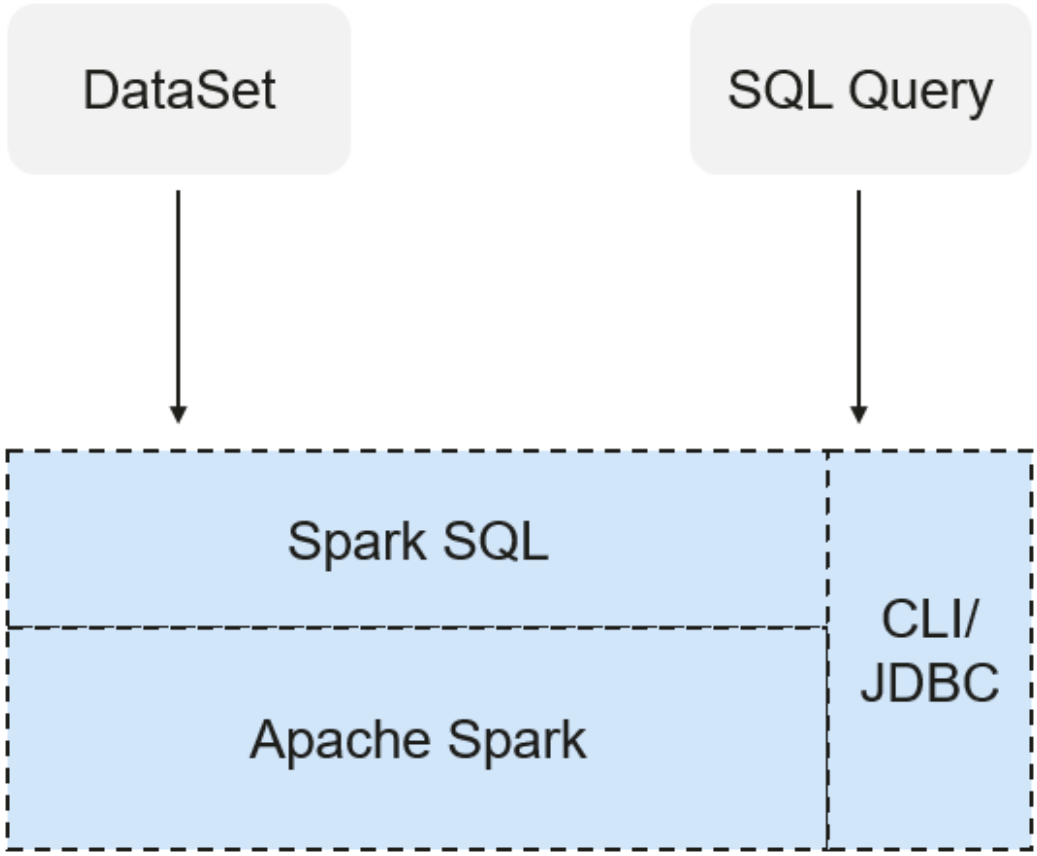
   Data that is cached but not stored to logs upon failures is re-sent by data sources, because the receiver does not confirm the data.

Therefore, by using WALs and reliable Receiver, Spark Streaming can avoid input data loss caused by Driver failures.

SparkSQL and DataSet Principle

SparkSQL

Figure 1-110 SparkSQL and DataSet



Spark SQL is a module for processing structured data. In Spark application, SQL statements or DataSet APIs can be seamlessly used for querying structured data.

Spark SQL and DataSet also provide a universal method for accessing multiple data sources such as Hive, CSV, Parquet, ORC, JSON, and JDBC. These data sources also allow data interaction. Spark SQL reuses the Hive frontend processing logic and metadata processing module. With the Spark SQL, you can directly query existing Hive data.

In addition, Spark SQL also provides API, CLI, and JDBC APIs, allowing diverse accesses to the client.

Spark SQL Native DDL/DML

In Spark 1.5, lots of Data Definition Language (DDL)/Data Manipulation Language (DML) commands are pushed down to and run on the Hive, causing coupling with the Hive and inflexibility such as unexpected error reports and results.

Spark2x realizes command localization and replaces the Hive with Spark SQL Native DDL/DML to run DDL/DML commands. Additionally, the decoupling from the Hive is realized and commands can be customized.

DataSet

A DataSet is a strongly typed collection of domain-specific objects that can be transformed in parallel using functional or relational operations. Each Dataset also has an untyped view called a DataFrame, which is a Dataset of Row.

The DataFrame is a structured and distributed dataset consisting of multiple columns. The DataFrame is equal to a table in the relationship database or the DataFrame in the R/Python. The DataFrame is the most basic concept in the Spark SQL, which can be created by using multiple methods, such as the structured dataset, Hive table, external database or RDD.

Operations available on DataSets are divided into transformations and actions.

- A transformation operation can generate a new DataSet,
  for example, **map**, **filter**, **select**, and **aggregate (groupBy)**.
- An action operation can trigger computation and return results,
  for example, **count**, **show**, or write data to the file system.

You can use either of the following methods to create a DataSet:

- The most common way is by pointing Spark to some files on storage systems, using the **read** function available on a SparkSession.
  ```
  val people = spark.read.parquet("...").as[Person]  // Scala
  DataSet<Person> people = spark.read().parquet("...").as(Encoders.bean(Person.class));//Java
  ```
- You can also create a DataSet using the transformation operation available on an existing one. For example, apply the map operation on an existing DataSet to create a DataSet:
  ```
  val names = people.map(_.name) // In Scala: names is Dataset.
  Dataset<String> names = people.map((Person p) -> p.name, Encoders.STRING)); // Java
  ```

CLI and JDBCServer

In addition to programming APIs, Spark SQL also provides the CLI/JDBC APIs.

- Both **spark-shell** and **spark-sql** scripts can provide the CLI for debugging.
- JDBCServer provides JDBC APIs. External systems can directly send JDBC requests to calculate and parse structured data.

SparkSession Principle

SparkSession is a unified API in Spark2x and can be regarded as a unified entry for reading data. SparkSession provides a single entry point to perform many operations that were previously scattered across multiple classes, and also provides accessor methods to these older classes to maximize compatibility.

A SparkSession can be created using a builder pattern. The builder will automatically reuse the existing SparkSession if there is a SparkSession; or create

a SparkSession if it does not exist. During I/O transactions, the configuration item settings in the builder are automatically synchronized to Spark and Hadoop.

```
import org.apache.spark.sql.SparkSession
val sparkSession = SparkSession.builder
  .master("local")
  .appName("my-spark-app")
  .config("spark.some.config.option", "config-value")
  .getOrCreate()
```

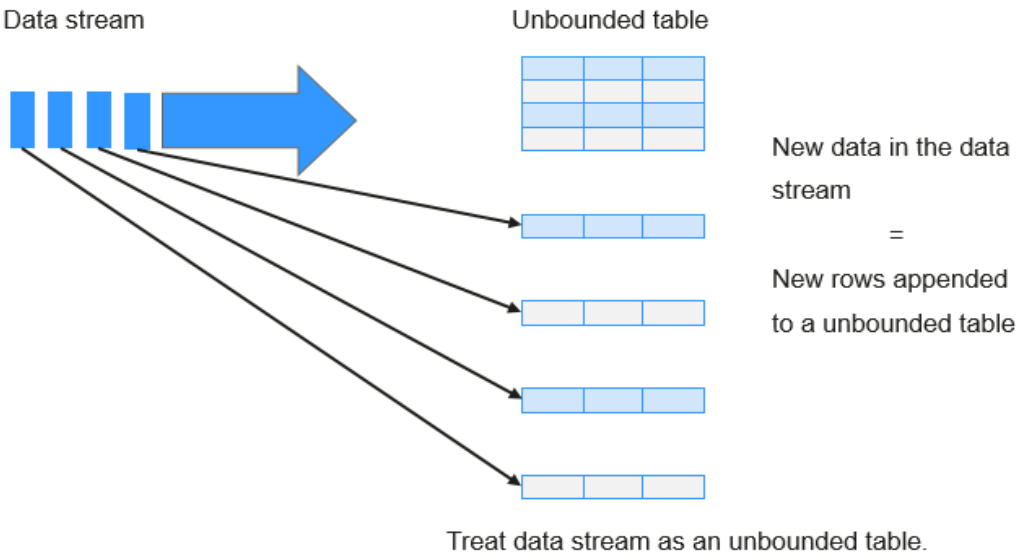
- SparkSession can be used to execute SQL queries on data and return results as DataFrame.
  ```
  sparkSession.sql("select * from person").show
  ```
- SparkSession can be used to set configuration items during running. These configuration items can be replaced with variables in SQL statements.
  ```
  sparkSession.conf.set("spark.some.config", "abcd")
  sparkSession.conf.get("spark.some.config")
  sparkSession.sql("select ${spark.some.config}")
  ```
- SparkSession also includes a "catalog" method that contains methods to work with Metastore (data catalog). After this method is used, a dataset is returned, which can be run using the same Dataset API.
  ```
  val tables = sparkSession.catalog.listTables()
  val columns = sparkSession.catalog.listColumns("myTable")
  ```
- Underlying SparkContext can be accessed by SparkContext API of SparkSession.
  ```
  val sparkContext = sparkSession.sparkContext
  ```

Structured Streaming Principle

Structured Streaming is a stream processing engine built on the Spark SQL engine. You can use the Dataset/DataFrame API in Scala, Java, Python, or R to express streaming aggregations, event-time windows, and stream-stream joins. If streaming data is incrementally and continuously produced, Spark SQL will continue to process the data and synchronize the result to the result set. In addition, the system ensures end-to-end exactly-once fault-tolerance guarantees through checkpoints and WALs.

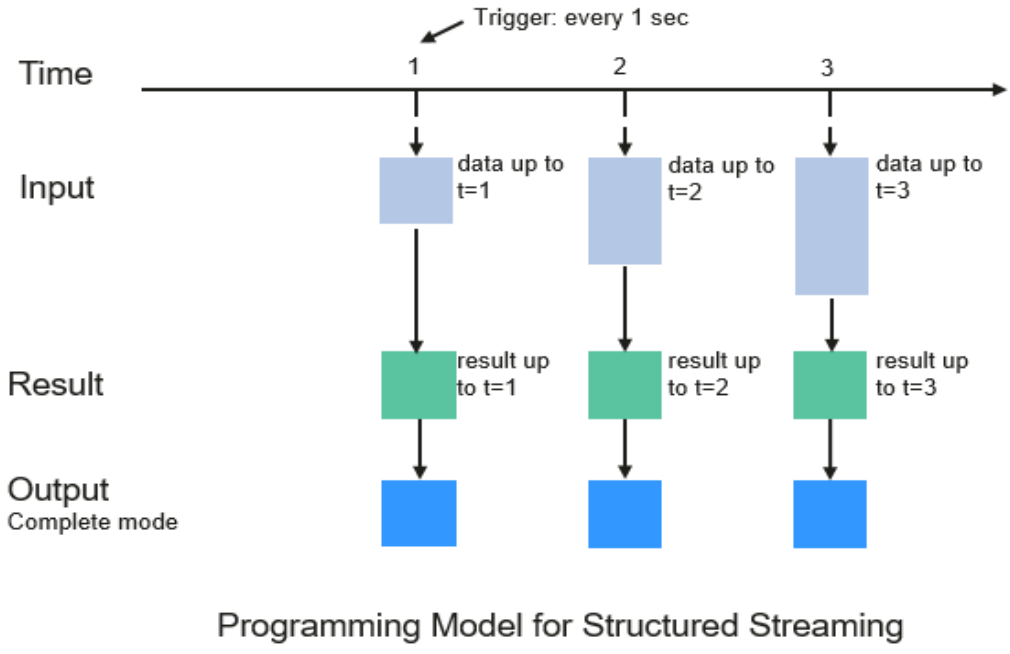
The core of Structured Streaming is to take streaming data as an incremental database table. Similar to the data block processing model, the streaming data processing model applies query operations on a static database table to streaming computing, and Spark uses standard SQL statements for query, to obtain data from the incremental and unbounded table.

Figure 1-111 Unbounded table of Structured Streaming



Each query operation will generate a result table. At each trigger interval, updated data will be synchronized to the result table. Whenever the result table is updated, the updated result will be written into an external storage system.

Figure 1-112 Structured Streaming data processing model



Storage modes of Structured Streaming at the output phase are as follows:

- Complete Mode: The updated result sets are written into the external storage system. The write operation is performed by a connector of the external storage system.

- Append Mode: If an interval is triggered, only added data in the result table will be written into an external system. This is applicable only on the queries where existing rows in the result table are not expected to change.
- Update Mode: If an interval is triggered, only updated data in the result table will be written into an external system, which is the difference between the Complete Mode and Update Mode.

Concepts

- **RDD**

  Resilient Distributed Dataset (RDD) is a core concept of Spark. It indicates a read-only and partitioned distributed dataset. Partial or all data of this dataset can be cached in the memory and reused between computations.

  RDD Creation

  - An RDD can be created from the input of HDFS or other storage systems that are compatible with Hadoop.
  - A new RDD can be converted from a parent RDD.
  - An RDD can be converted from a collection of datasets through encoding.

  RDD Storage

  - You can select different storage levels to store an RDD for reuse. (There are 11 storage levels to store an RDD.)
  - By default, the RDD is stored in the memory. When the memory is insufficient, the RDD overflows to the disk.

- **RDD Dependency**

  The RDD dependency includes the narrow dependency and wide dependency.

  Figure 1-113 RDD dependency

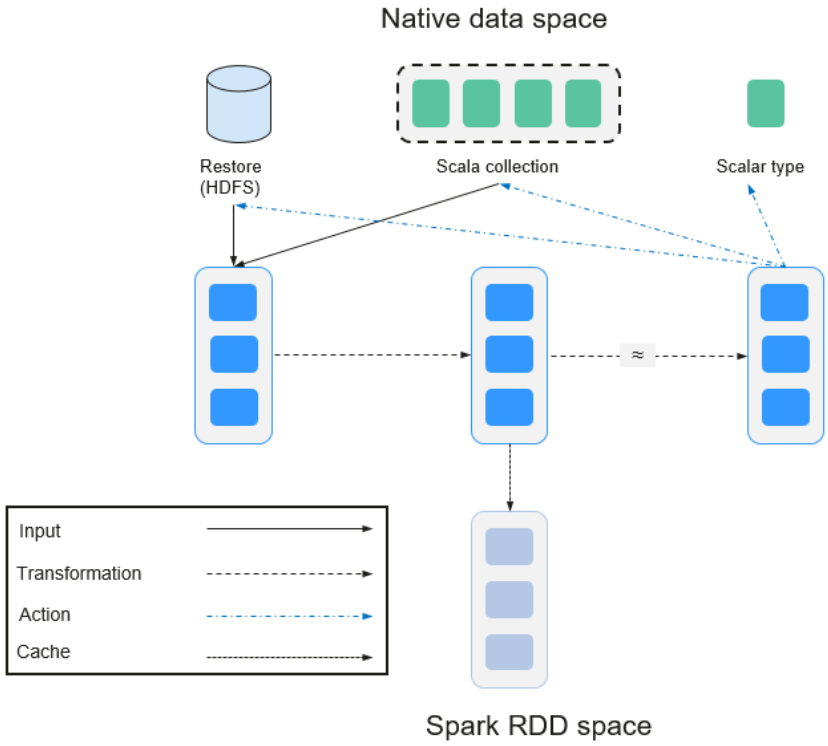
  
  - **Narrow dependency**: Each partition of the parent RDD is used by at most one partition of the child RDD.
  - **Wide dependency**: Partitions of the child RDD depend on all partitions of the parent RDD.

The narrow dependency facilitates the optimization. Logically, each RDD operator is a fork/join (the join is not the join operator mentioned above but the barrier used to synchronize multiple concurrent tasks); fork the RDD to each partition, and then perform the computation. After the computation, join the results, and then perform the fork/join operation on the next RDD operator. It is uneconomical to directly translate the RDD into physical implementation. The first is that every RDD (even intermediate result) needs to be physicalized into memory or storage, which is time-consuming and occupies much space. The second is that as a global barrier, the join operation is very expensive and the entire join process will be slowed down by the slowest node. If the partitions of the child RDD narrowly depend on that of the parent RDD, the two fork/join processes can be combined to implement classic fusion optimization. If the relationship in the continuous operator sequence is narrow dependency, multiple fork/join processes can be combined to reduce a large number of global barriers and eliminate the physicalization of many RDD intermediate results, which greatly improves the performance. This is called pipeline optimization in Spark.

- **Transformation and Action (RDD Operations)**

  Operations on RDD include transformation (the return value is an RDD) and action (the return value is not an RDD). **Figure 1-114** shows the RDD operation process. The transformation is lazy, which indicates that the transformation from one RDD to another RDD is not immediately executed. Spark only records the transformation but does not execute it immediately. The real computation is started only when the action is started. The action returns results or writes the RDD data into the storage system. The action is the driving force for Spark to start the computation.

Figure 1-114 RDD operation



The data and operation model of RDD are quite different from those of Scala.

```
val file = sc.textFile("hdfs://...")
val errors = file.filter(_.contains("ERROR"))
errors.cache()
errors.count()
```

a. The textFile operator reads log files from the HDFS and returns files (as an RDD).

b. The filter operator filters rows with **ERROR** and assigns them to errors (a new RDD). The filter operator is a transformation.

c. The cache operator caches errors for future use.

d. The count operator returns the number of rows of errors. The count operator is an action.

Transformation includes the following types:

– The RDD elements are regarded as simple elements.

  The input and output has the one-to-one relationship, and the partition structure of the result RDD remains unchanged, for example, map.

  The input and output has the one-to-many relationship, and the partition structure of the result RDD remains unchanged, for example, flatMap (one element becomes a sequence containing multiple elements after map and then flattens to multiple elements).

  The input and output has the one-to-one relationship, but the partition structure of the result RDD changes, for example, union (two RDDs integrates to one RDD, and the number of partitions becomes the sum of the number of partitions of two RDDs) and coalesce (partitions are reduced).

  Operators of some elements are selected from the input, such as filter, distinct (duplicate elements are deleted), subtract (elements only exist in this RDD are retained), and sample (samples are taken).

– The RDD elements are regarded as key-value pairs.

  Perform the one-to-one calculation on the single RDD, such as mapValues (the partition mode of the source RDD is retained, which is different from map).

  Sort the single RDD, such as sort and partitionBy (partitioning with consistency, which is important to the local optimization).

  Restructure and reduce the single RDD based on key, such as groupByKey and reduceByKey.

  Join and restructure two RDDs based on the key, such as join and cogroup.

  > NOTE
  >
  > The later three operations involving sorting are called shuffle operations.

Action includes the following types:

– Generate scalar configuration items, such as **count** (the number of elements in the returned RDD), **reduce**, **fold/aggregate** (the number of scalar configuration items that are returned), and **take** (the number of elements before the return).

  - Generate the Scala collection, such as **collect** (import all elements in the RDD to the Scala collection) and **lookup** (look up all values corresponds to the key).
  - Write data to the storage, such as **saveAsTextFile** (which corresponds to the preceding **textFile**).
  - Check points, such as the **checkpoint** operator. When Lineage is quite long (which occurs frequently in graphics computation), it takes a long period of time to execute the whole sequence again when a fault occurs. In this case, checkpoint is used as the check point to write the current data to stable storage.

- **Shuffle**

  Shuffle is a specific phase in the MapReduce framework, which is located between the Map phase and the Reduce phase. If the output results of Map are to be used by Reduce, the output results must be hashed based on a key and distributed to each Reducer. This process is called Shuffle. Shuffle involves the read and write of the disk and the transmission of the network, so that the performance of Shuffle directly affects the operation efficiency of the entire program.

  The figure below shows the entire process of the MapReduce algorithm.

  Figure 1-115 Algorithm process

  Shuffle is a bridge to connect data. The following describes the implementation of shuffle in Spark.

  Shuffle divides a job of Spark into multiple stages. The former stages contain one or more ShuffleMapTasks, and the last stage contains one or more ResultTasks.

- **Spark Application Structure**

  The Spark application structure includes the initialized SparkContext and the main program.

  - Initialized SparkContext: constructs the operating environment of the Spark Application.

    Constructs the SparkContext object. The following is an example:

    ```
    new SparkContext(master, appName, [SparkHome], [jars])
    ```

    Parameter description:

    master: indicates the link string. The link modes include local, Yarn-cluster, and Yarn-client.

appName: indicates the application name.

SparkHome: indicates the directory where Spark is installed in the cluster.

jars: indicates the code and dependency package of an application.

– Main program: processes data.

For details about how to submit an application, visit **https://archive.apache.org/dist/spark/docs/3.1.1/submitting-applications.html**.

- **Spark Shell Commands**

  The basic Spark shell commands support the submission of Spark applications. The Spark shell commands are as follows:

```
./bin/spark-submit \
  --class <main-class> \
  --master <master-url> \
  ... # other options
  <application-jar> \
  [application-arguments]
```

  Parameter description:

  --class: indicates the name of the class of a Spark application.

  --master: indicates the master to which the Spark application links, such as Yarn-client and Yarn-cluster.

  application-jar: indicates the path of the JAR file of the Spark application.

  application-arguments: indicates the parameter required to submit the Spark application. This parameter can be left blank.

- **Spark JobHistory Server**

  The Spark web UI is used to monitor the details in each phase of the Spark framework of a running or historical Spark job and provide the log display, which helps users to develop, configure, and optimize the job in more fine-grained units.

1.4.24.2 Spark2x HA Solution

1.4.24.2.1 Spark2x Multi-active Instance

Background

Based on existing JDBCServers in the community, multi-active-instance HA is used to achieve the high availability. In this mode, multiple JDBCServers coexist in the cluster and the client can randomly connect any JDBCServer to perform service operations. When one or multiple JDBCServers stop working, a client can connect to another normal JDBCServer.

Compared with active/standby HA, multi-active instance HA eliminates the following restrictions:

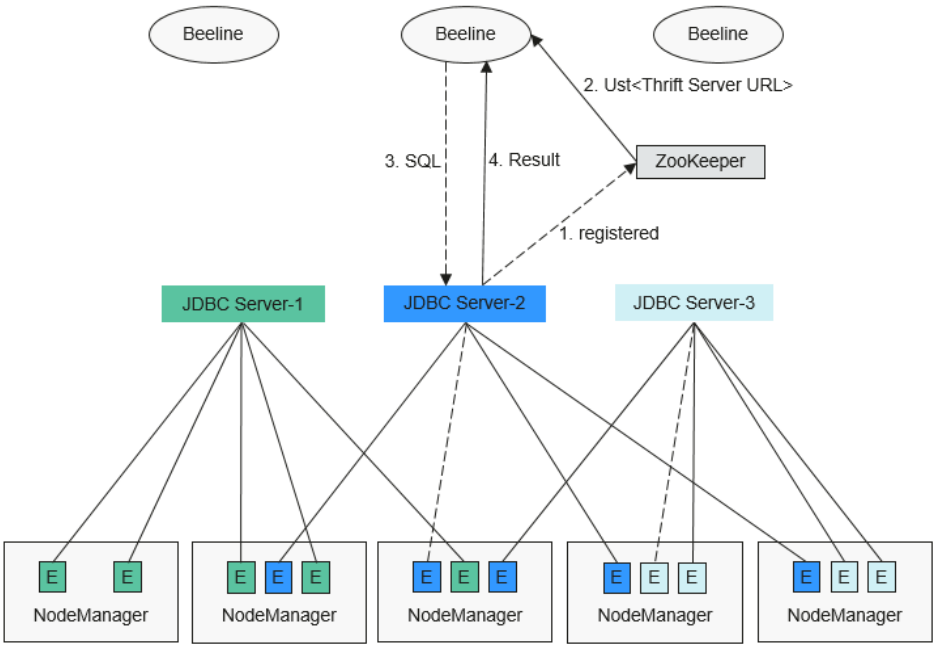
- In active/standby HA, when the active/standby switchover occurs, the unavailable period cannot be controlled by JDBCServer, but determined by Yarn service resources.
- In Spark, the Thrift JDBC similar to HiveServer2 provides services and users access services through Beeline and JDBC API. Therefore, the processing capability of the JDBCServer cluster depends on the single-point capability of the primary server, and the scalability is insufficient.

Multi-active instance HA not only prevents service interruption caused by switchover, but also enables cluster scale-out to secure high concurrency.

Implementation

The following figure shows the basic principle of multi-active instance HA of Spark JDBCServer.

Figure 1-116 Spark JDBCServer HA



1. After JDBCServer is started, it registers with ZooKeeper by writing node information in a specified directory. Node information includes the JDBCServer instance IP, port number, version, and serial number (information of different nodes is separated by commas).

   An example is provided as follows:

   ```
   [serverUri=192.168.169.84:22550
   ;version=8.1.2;sequence=0000001244,serverUri=192.168.195.232:22550 ;version=8.1.2;sequence=00000
   01242,serverUri=192.168.81.37:22550 ;version=8.1.2;sequence=0000001243]
   ```

2. To connect to JDBCServer, the client must specify the namespace, which is the directory of JDBCServer instances in ZooKeeper. During the connection, a JDBCServer instance is randomly selected from the specified namespace. For details about URL, see **URL Connection**.
3. After the connection succeeds, the client sends SQL statements to JDBCServer.
4. JDBCServer executes received SQL statements and sends results back to the client.

In multi-active instance HA mode, all JDBCServer instances are independent and equivalent. When one instance is interrupted during upgrade, other JDBCServer instances can accept the connection request from the client.

Following rules must be followed in the multi-active instance HA of Spark JDBCServer:

- If a JDBCServer instance exits abnormally, no other instance will take over the sessions and services running on this abnormal instance.
- When the JDBCServer process is stopped, corresponding nodes are deleted from ZooKeeper.
- The client randomly selects the server, which may result in uneven session allocation, and finally result in imbalance of instance load.
- After the instance enters the maintenance mode (in which no new connection request from the client is accepted), services still running on the instance may fail when the decommissioning times out.

URL Connection

Multi-active instance mode

In multi-active instance mode, the client reads content from the ZooKeeper node and connects to JDBCServer. The connection strings are as follows:

- Security mode:
  - If Kinit authentication is enabled, the JDBCURL is as follows:
    jdbc:hive2://<*zkNode1_IP*>**:**<*zkNode1_Port*>**,**<*zkNode2_IP*>**:**<*zkNode2_Port*>**,**<*zkNode3_IP*>**:**<*zkNode3_Port*>**/;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;saslQop=auth-conf;auth=KERBEROS;principal=spark2x/hadoop.**<*System domain name*>**@**<*System domain name*>**;**

    NOTE

    - **<zkNode_IP>:<zkNode_Port>** indicates the ZooKeeper URL. Use commas (,) to separate multiple URLs,

      For example, **192.168.81.37:2181,192.168.195.232:2181,192.168.169.84:2181**.
    - **sparkthriftserver2x** indicates the directory in ZooKeeper, where a random JDBCServer instance is connected to the client.

    For example, when you use Beeline client for connection in security mode, run the following command:

    sh *CLIENT_HOME*/**spark/bin/beeline -u "jdbc:hive2://**<*zkNode1_IP*>**:**<*zkNode1_Port*>**,**<*zkNode2_IP*>**:**<*zkNode2_Port*>**,**<*zkNode3_IP*>**:**<*zkNode3_Port*>**/;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;saslQop=auth-conf;auth=KERBEROS;principal=spark2x/hadoop.**<*System domain name*>**@**<*System domain name*>**;"**
  - If Keytab authentication is enabled, the JDBCURL is as follows:
    jdbc:hive2://<*zkNode1_IP*>**:**<*zkNode1_Port*>**,**<*zkNode2_IP*>**:**<*zkNode2_Port*>**,**<*zkNode3_IP*>**:**<*zkNode3_Port*>**/;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;saslQop=auth-conf;auth=KERBEROS;principal=spark2x/hadoop.**<*System domain name*>**@**<*System domain name*>**;user.principal=**<*principal_name*>**;user.keytab=**<*path_to_keytab*>

    <*principal_name*> indicates the principal of Kerberos user, for example, **test@**<*System domain name*>. <*path_to_keytab*> indicates the Keytab file path corresponding to <*principal_name*>, for example, **/opt/auth/test/user.keytab**.
- Common mode:
  jdbc:hive2://<*zkNode1_IP*>**:**<*zkNode1_Port*>**,**<*zkNode2_IP*>**:**<*zkNode2_Port*>**,**<*zkNode3_IP*>**:**<*zkNode3_Port*>**/**;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=**sparkthriftserver2x**;

For example, when you use Beeline client for connection in common mode, run the following command:

sh *CLIENT_HOME*/**spark/bin/beeline -u "jdbc:hive2://***<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkNode3_IP>:<zkNode3_Port>*/**;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;"**

Non-multi-active instance mode

In non-multi-active instance mode, a client connects to a specified JDBCServer node. Compared with multi-active instance mode, the connection string in non-multi-active instance mode does not contain **serviceDiscoveryMode** and **zooKeeperNamespace** parameters about ZooKeeper.

For example, when you use Beeline client to connect JDBCServer in non-multi-active instance mode, run the following command:

sh *CLIENT_HOME*/**spark/bin/beeline -u "jdbc:hive2://***<server_IP>:<server_Port>*/**;user.principal=spark2x/hadoop.***<System domain name>*@*<System domain name>*;saslQop=auth-conf;auth=KERBEROS;principal=spark2x/hadoop.***<System domain name>*@*<System domain name>*;"**

NOTE

- **<server_IP>:<server_Port>** indicates the URL of the specified JDBCServer node.
- **CLIENT_HOME** indicates the client path.

Except the connection method, operations of JDBCServer API in multi-active instance mode and non-multi-active instance mode are the same. Spark JDBCServer is another implementation of HiveServer2 in Hive.

1.4.24.2.2 Spark2x Multi-tenant

Background

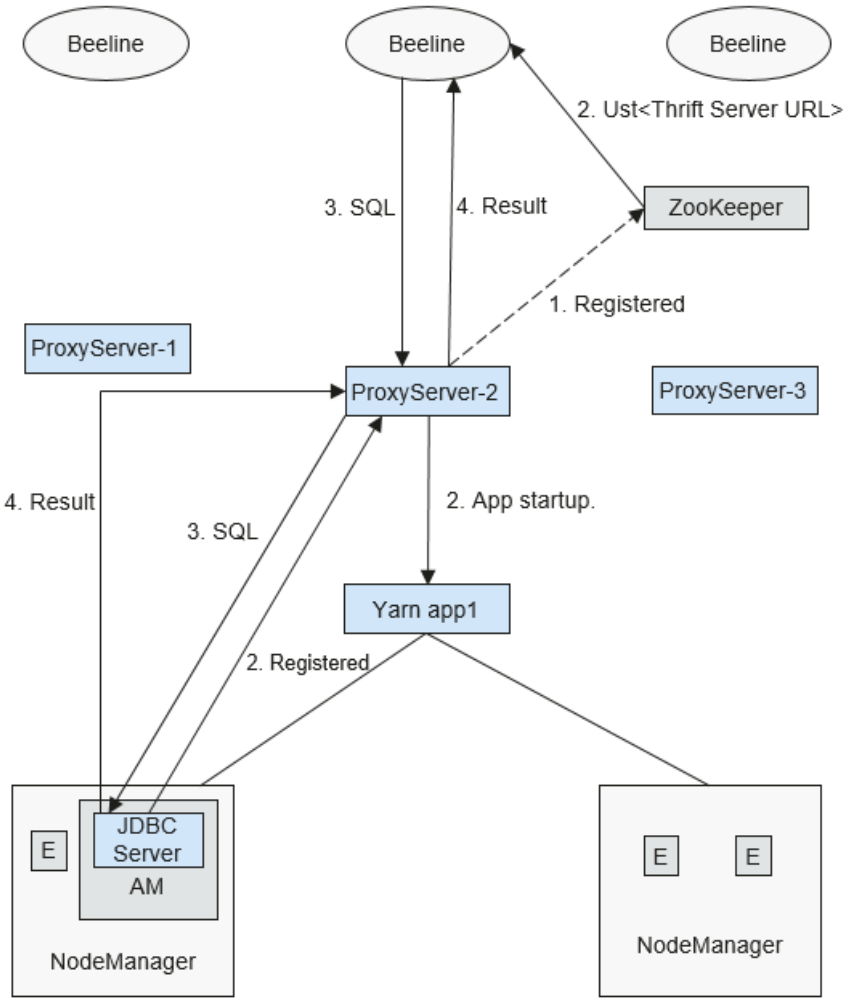
In the JDBCServer multi-active instance mode, JDBCServer implements the Yarn-client mode but only one Yarn resource queue is available. To solve the resource limitation problem, the multi-tenant mode is introduced.

In multi-tenant mode, JDBCServers are bound with tenants. Each tenant corresponds to one or more JDBCServers, and a JDBCServer provides services for only one tenant. Different tenants can be configured with different Yarn queues to implement resource isolation. In addition, JDBCServer can be dynamically started as required to avoid resource waste.

Implementation

Figure 1-117 shows the HA solution of the multi-tenant mode.

Figure 1-117 Multi-tenant mode of Spark JDBCServer



1. When ProxyServer is started, it registers with ZooKeeper by writing node information in a specified directory. Node information includes the instance IP, port number, version, and serial number (information of different nodes is separated by commas).

   NOTE

   In multi-tenant mode, the JDBCServer instance on MRS page indicates ProxyServer, the JDBCServer agent.

   An example is provided as follows:

   ```
   serverUri=192.168.169.84:22550
   ;version=8.1.2;sequence=0000001244,serverUri=192.168.195.232:22550
   ;version=8.1.2;sequence=0000001242,serverUri=192.168.81.37:22550
   ;version=8.1.2;sequence=0000001243,
   ```

2. To connect to ProxyServer, the client must specify a namespace, which is the directory of the ProxyServer instance that you want to access in ZooKeeper. When the client connects to ProxyServer, an instance under Namespace is randomly selected for connection. For details about the URL, see **URL Connection**.
3. After the client successfully connects to ProxyServer, ProxyServer checks whether the JDBCServer of a tenant exists. If yes, Beeline connects the

JDBCServer. If no, a new JDBCServer is started in Yarn-cluster mode. After the startup of JDBCServer, ProxyServer obtains the IP address of the JDBCServer and establishes the connection between Beeline and JDBCServer.

4. The client sends SQL statements to ProxyServer, which then forwards statements to the connected JDBCServer. JDBCServer returns the results to ProxyServer, which then returns the results to the client.

In multi-tenant HA mode, all ProxyServer instances are independent and equivalent. If one instance is interrupted during upgrade, other instances can accept the connection request from the client.

URL Connection

Multi-tenant mode

In multi-tenant mode, the client reads content from the ZooKeeper node and connects to ProxyServer. The connection strings are as follows:

- Security mode:
  - If Kinit authentication is enabled, the client URL is as follows:
    jdbc:hive2://<*zkNode1_IP*>:<*zkNode1_Port*>,<*zkNode2_IP*>:<*zkNode2_Port*>,<*zkNode3_IP*>:<*zkNode3_Port*>**/;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;saslQop=auth-conf;auth=KERBEROS;principal=spark2x/hadoop.**<*System domain name*>@<*System domain name*>;

    NOTE

    - **<zkNode_IP>:<zkNode_Port>** indicates the ZooKeeper URL. Use commas (,) to separate multiple URLs,

      For example, **192.168.81.37:2181,192.168.195.232:2181,192.168.169.84:2181**.
    - **sparkthriftserver2x** indicates the ZooKeeper directory, where a random JDBCServer instance is connected to the client.

    For example, when you use Beeline client for connection in security mode, run the following command:

    sh *CLIENT_HOME*/**spark/bin/beeline -u "jdbc:hive2://**<*zkNode1_IP*>:<*zkNode1_Port*>,<*zkNode2_IP*>:<*zkNode2_Port*>,<*zkNode3_IP*>:<*zkNode3_Port*>**/;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;saslQop=auth-conf;auth=KERBEROS;principal=spark2x/hadoop.**<*System domain name*>**@**<*System domain name*>**;"**
  - If Keytab authentication is enabled, the URL is as follows:
    jdbc:hive2://<*zkNode1_IP*>:<*zkNode1_Port*>,<*zkNode2_IP*>:<*zkNode2_Port*>,<*zkNode3_IP*>:<*zkNode3_Port*>**/;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;saslQop=auth-conf;auth=KERBEROS;principal=spark2x/hadoop.**<*System domain name*>@<*System domain name*>**;user.principal=**<*principal_name*>**;user.keytab=**<*path_to_keytab*>

    <*principal_name*> indicates the principal of Kerberos user, for example, **test@**<*System domain name*>. <*path_to_keytab*> indicates the Keytab file path corresponding to <*principal_name*>, for example, **/opt/auth/test/user.keytab**.
- Common mode:
  jdbc:hive2://<*zkNode1_IP*>:<*zkNode1_Port*>,<*zkNode2_IP*>:<*zkNode2_Port*>,<*zkNode3_IP*>:<*zkNode3_Port*>|;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=**sparkthriftserver2x**;

For example, when you use Beeline client for connection in common mode, run the following command:

sh *CLIENT_HOME*/**spark/bin/beeline -u "jdbc:hive2://***<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkNode3_IP>:<zkNode3_Port>*/**;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;"**

Non-multi-tenant mode

In non-multi-tenant mode, a client connects to a specified JDBCServer node. Compared with multi-active instance mode, the connection string in non-multi-active instance mode does not contain **serviceDiscoveryMode** and **zooKeeperNamespace** parameters about ZooKeeper.

For example, when you use Beeline client to connect JDBCServer in non-multi-tenant instance mode, run the following command:

sh *CLIENT_HOME*/**spark/bin/beeline -u "jdbc:hive2://***<server_IP>:<server_Port>*/**;user.principal=spark/hadoop.***<System domain name>@<System domain name>***;saslQop=auth-conf;auth=KERBEROS;principal=spark/hadoop.***<System domain name>@<System domain name>***;"**

NOTE

- **<server_IP>:<server_Port>** indicates the URL of the specified JDBCServer node.
- **CLIENT_HOME** indicates the client path.

Except the connection method, other operations of JDBCServer API in multi-tenant mode and non-multi-tenant mode are the same. Spark JDBCServer is another implementation of HiveServer2 in Hive.

Specifying a Tenant

Generally, the client submitted by a user connects to the default JDBCServer of the tenant to which the user belongs. If you want to connect the client to the JDBCServer of a specified tenant, add the **--hiveconf mapreduce.job.queuename** parameter.

Command for connecting Beeline is as follows (**aaa** indicates the tenant name):

beeline --hiveconf mapreduce.job.queuename=aaa -u 'jdbc:hive2://192.168.39.30:2181,192.168.40.210:2181,192.168.215.97:2181;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;saslQop=auth-conf;auth=KERBEROS;principal=spark2x/hadoop.*<System domain name>@<System domain name>*;'

1.4.24.3 Relationship Between Spark2x and Other Components

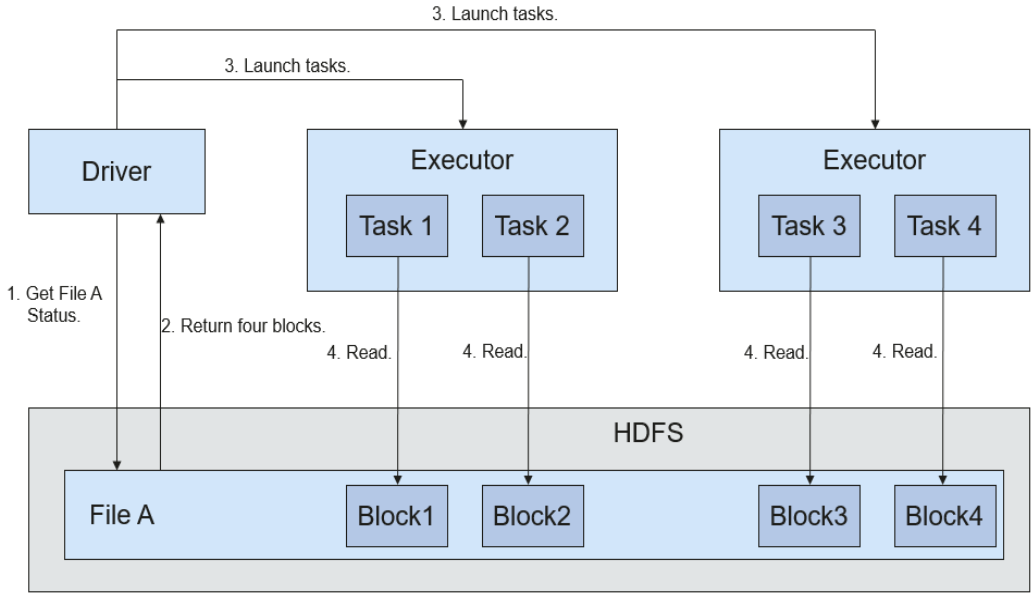
Relationship Between Spark and HDFS

Data computed by Spark comes from multiple data sources, such as local files and HDFS. Most data comes from HDFS which can read data in large scale for parallel computing After being computed, data can be stored in HDFS.

Spark involves Driver and Executor. Driver schedules tasks and Executor runs tasks.

Figure 1-118 describes the file reading process.

Figure 1-118 File reading process

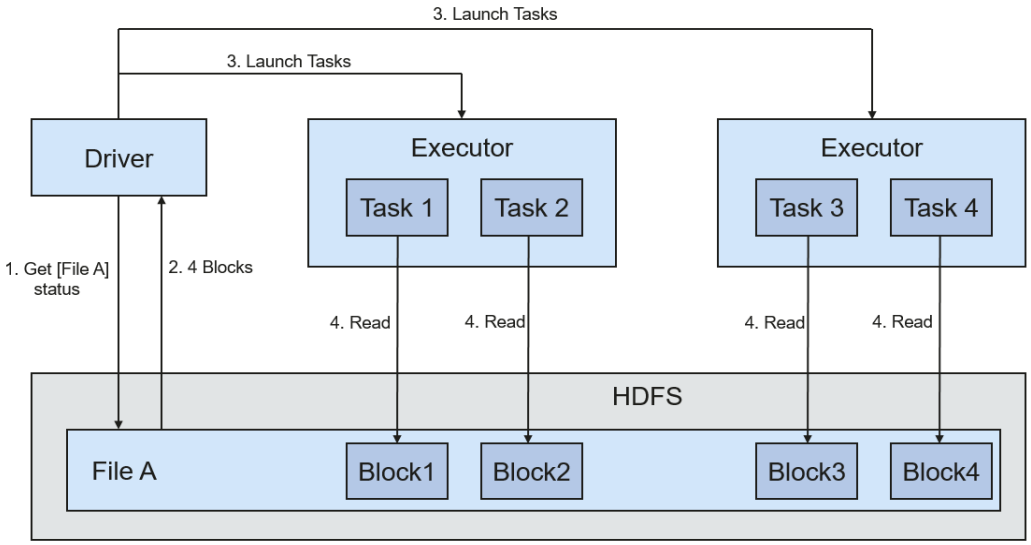


The file reading process is as follows:

1. Driver interconnects with HDFS to obtain the information of File A.
2. The HDFS returns the detailed block information about this file.
3. Driver sets a parallel degree based on the block data amount, and creates multiple tasks to read the blocks of this file.
4. Executor runs the tasks and reads the detailed blocks as part of the Resilient Distributed Dataset (RDD).

Figure 1-119 describes the file writing process.

Figure 1-119 File writing process



The file writing process is as follows:

1. Driver creates a directory where the file is to be written.
2. Based on the RDD distribution status, the number of tasks related to data writing is computed, and these tasks are sent to Executor.
3. Executor runs these tasks, and writes the RDD data to the directory created in 1.

Relationship with Yarn

The Spark computing and scheduling can be implemented using Yarn mode. Spark enjoys the computing resources provided by Yarn clusters and runs tasks in a distributed way. Spark on Yarn has two modes: Yarn-cluster and Yarn-client.

- Yarn-cluster mode

  Figure 1-120 describes the operation framework.

  Figure 1-120 Spark on Yarn-cluster operation framework

  Spark on Yarn-cluster implementation process:

  a. The client generates the application information, and then sends the information to ResourceManager.
  b. ResourceManager allocates the first container (ApplicationMaster) to SparkApplication and starts the driver on the container.
  c. ApplicationMaster applies for resources from ResourceManager to run the container.

     ResourceManager allocates the containers to ApplicationMaster, which communicates with the related NodeManagers and starts the executor in the obtained container. After the executor is started, it registers with drivers and applies for tasks.

d. Drivers allocate tasks to the executors.

e. Executors run tasks and report the operating status to Drivers.

- Yarn-client mode

  Figure 1-121 describes the operation framework.

  Figure 1-121 Spark on Yarn-client operation framework

  Spark on Yarn-client implementation process:

  NOTE

  In Yarn-client mode, the Driver is deployed and started on the client. In Yarn-client mode, the client of an earlier version is incompatible. The Yarn-cluster mode is recommended.

  a. The client sends the Spark application request to ResourceManager, and packages all information required to start ApplicationMaster and sends the information to ResourceManager. ResourceManager then returns the results to the client. The results include information such as ApplicationId, and the upper limit as well as lower limit of available resources. After receiving the request, ResourceManager finds a proper node for ApplicationMaster and starts it on this node. ApplicationMaster is a role in Yarn, and the process name in Spark is ExecutorLauncher.

  b. Based on the resource requirements of each task, ApplicationMaster can apply for a series of containers to run tasks from ResourceManager.

  c. After receiving the newly allocated container list (from ResourceManager), ApplicationMaster sends information to the related NodeManagers to start the containers.

     ResourceManager allocates the containers to ApplicationMaster, which communicates with the related NodeManagers and starts the executor in the obtained container. After the executor is started, it registers with drivers and applies for tasks.

NOTE

Running Containers will not be suspended to release resources.

d. Drivers allocate tasks to the executors. Executors run tasks and report the operating status to Drivers.

1.4.24.4 Spark2x Open Source New Features

Purpose

Compared with Spark 1.5, Spark2*x* has some new open-source features. The specific features or concepts are as follows:

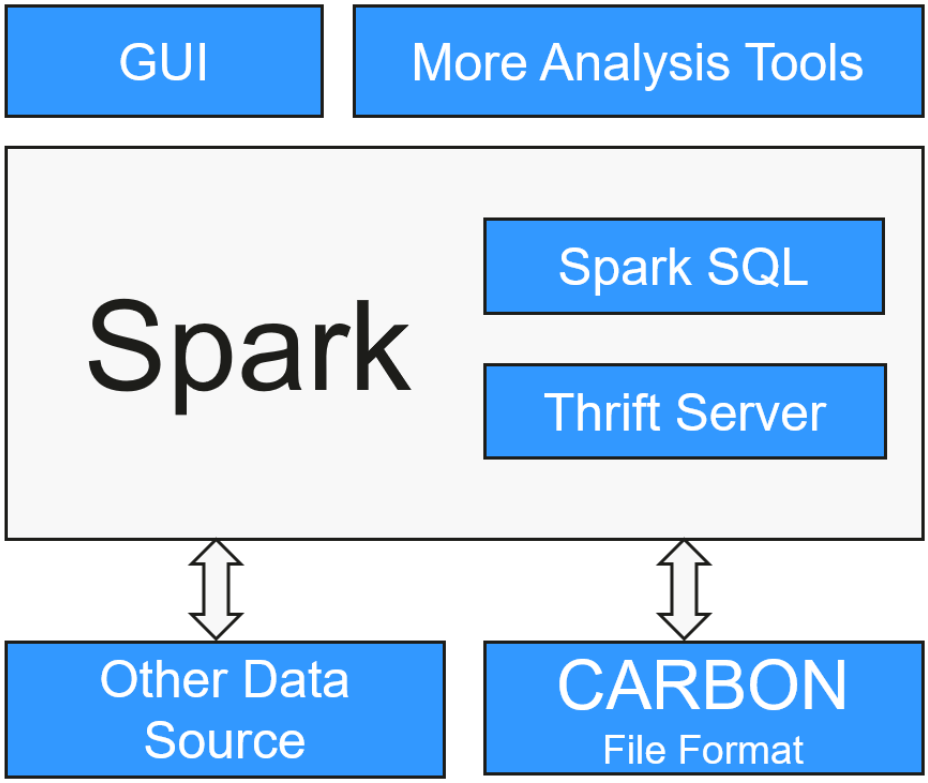
- DataSet: For details, see **SparkSQL and DataSet Principle**.
- Spark SQL Native DDL/DML: For details, see **SparkSQL and DataSet Principle**.
- SparkSession: For details, see **SparkSession Principle**.
- Structured Streaming: For details, see **Structured Streaming Principle**.
- Optimizing Small Files
- Optimizing the Aggregate Algorithm
- Optimizing Datasource Tables
- Merging CBO

1.4.24.5 Spark2x Enhanced Open Source Features

1.4.24.5.1 CarbonData Overview

CarbonData is a new Apache Hadoop native data-store format. CarbonData allows faster interactive queries over PetaBytes of data using advanced columnar storage, index, compression, and encoding techniques to improve computing efficiency. In addition, CarbonData is also a high-performance analysis engine that integrates data sources with Spark.

Figure 1-122 Basic architecture of CarbonData



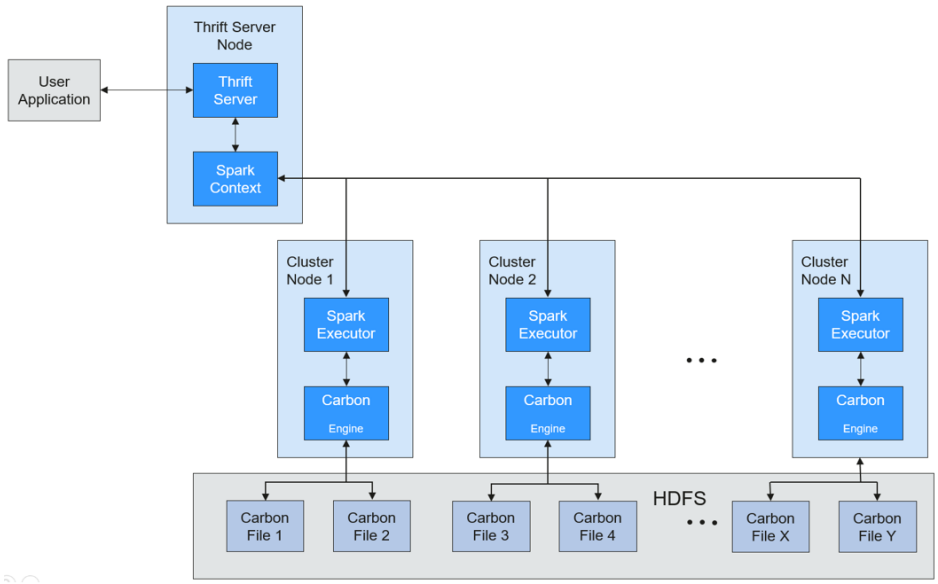
The purpose of using CarbonData is to provide quick response to ad hoc queries of big data. Essentially, CarbonData is an Online Analytical Processing (OLAP) engine, which stores data by using tables similar to those in Relational Database Management System (RDBMS). You can import more than 10 TB data to tables created in CarbonData format, and CarbonData automatically organizes and stores data using the compressed multi-dimensional indexes. After data is loaded to CarbonData, CarbonData responds to ad hoc queries in seconds.

CarbonData integrates data sources into the Spark ecosystem and you can query and analyze the data using Spark SQL. You can also use the third-party tool JDBCServer provided by Spark to connect to SparkSQL.

Topology of CarbonData

CarbonData runs as a data source inside Spark. Therefore, CarbonData does not start any additional processes on nodes in clusters. CarbonData engine runs inside the Spark executor.

Figure 1-123 Topology of CarbonData



Data stored in CarbonData Table is divided into several CarbonData data files. Each time when data is queried, CarbonData Engine reads and filters data sets. CarbonData Engine runs as a part of the Spark Executor process and is responsible for handling a subset of data file blocks.

Table data is stored in HDFS. Nodes in the same Spark cluster can be used as HDFS data nodes.

CarbonData Features

- SQL: CarbonData is compatible with Spark SQL and supports SQL query operations performed on Spark SQL.
- Simple Table dataset definition: CarbonData allows you to define and create datasets by using user-friendly Data Definition Language (DDL) statements. CarbonData DDL is flexible and easy to use, and can define complex tables.
- Easy data management: CarbonData provides various data management functions for data loading and maintenance. CarbonData supports bulk loading of historical data and incremental loading of new data. Loaded data can be deleted based on load time and a specific loading operation can be undone.
- CarbonData file format is a columnar store in HDFS. This format has many new column-based file storage features, such as table splitting and data compression. CarbonData has the following characteristics:
  - Stores data along with index: Significantly accelerates query performance and reduces the I/O scans and CPU resources, when there are filters in the query. CarbonData index consists of multiple levels of indices. A processing framework can leverage this index to reduce the task that needs to be schedules and processed, and it can also perform skip scan in more finer grain unit (called blocklet) in task side scanning instead of scanning the whole file.
  - Operable encoded data: Through supporting efficient compression and global encoding schemes, CarbonData can query on compressed/encoded

data. The data can be converted just before returning the results to the users, which is called late materialized.

- Supports various use cases with one single data format: like interactive OLAP-style query, sequential access (big scan), and random access (narrow scan).

Key Technologies and Advantages of CarbonData

- Quick query response: CarbonData features high-performance query. The query speed of CarbonData is 10 times of that of Spark SQL. It uses dedicated data formats and applies multiple index technologies, global dictionary code, and multiple push-down optimizations, providing quick response to TB-level data queries.
- Efficient data compression: CarbonData compresses data by combining the lightweight and heavyweight compression algorithms. This significantly saves 60% to 80% data storage space and the hardware storage cost.

CarbonData Index Cache Server

To solve the pressure and problems brought by the increasing data volume to the driver, an independent index cache server is introduced to separate the index from the Spark application side of Carbon query. All index content is managed by the index cache server. Spark applications obtain required index data in RPC mode. In this way, a large amount of memory on the service side is released so that services are not affected by the cluster scale and the performance or functions are not affected.

1.4.24.5.2 Optimizing SQL Query of Data of Multiple Sources

Scenario

Enterprises usually store massive data, such as from various databases and warehouses, for management and information collection. However, diversified data sources, hybrid dataset structures, and scattered data storage lower query efficiency.

The open source Spark only supports simple filter pushdown during querying of multi-source data. The SQL engine performance is deteriorated due of a large amount of unnecessary data transmission. The pushdown function is enhanced, so that **aggregate**, complex **projection**, and complex **predicate** can be pushed to data sources, reducing unnecessary data transmission and improving query performance.

Only the JDBC data source supports pushdown of query operations, such as **aggregate**, **projection**, **predicate**, **aggregate over inner join**, and **aggregate over union all**. All pushdown operations can be enabled based on your requirements.

Table 1-22 Enhanced query of cross-source query

Module	Before Enhancement	After Enhancement
aggregate	The pushdown of **aggregate** is not supported.	• Aggregation functions including **sum**, **avg**, **max**, **min**, and **count** are supported. Example: select count(*) from table • Internal expressions of aggregation functions are supported. Example: select sum(a+b) from table • Calculation of aggregation functions is supported. Example: select avg(a) + max(b) from table • Pushdown of **having** is supported. Example: select sum(a) from table where a>0 group by b having sum(a)>10 • Pushdown of some functions is supported. Pushdown of lines in mathematics, time, and string functions, such as **abs()**, **month()**, and **length()** are supported. In addition to the preceding built-in functions, you can run the **SET** command to add functions supported by data sources. Example: select sum(abs(a)) from table • Pushdown of **limit** and **order by** after **aggregate** is supported. However, the pushdown is not supported in Oracle, because Oracle does not support **limit**. Example: select sum(a) from table where a>0 group by b order by sum(a) limit 5
projection	Only pushdown of simple **projection** is supported. Example: select a, b from table	• Complex expressions can be pushed down. Example: select (a+b)*c from table • Some functions can be pushed down. For details, see the description below the table. Example: select length(a)+abs(b) from table • Pushdown of **limit** and **order by** after **projection** is supported. Example: select a, b+c from table order by a limit 3

Module	Before Enhancement	After Enhancement
predicate	Only simple filtering with the column name on the left of the operator and values on the right is supported. Example: select * from table where a>0 or b in ("aaa", "bbb")	• Complex expression pushdown is supported. Example: select * from table where a +b>c*d or a/c in (1, 2, 3) • Some functions can be pushed down. For details, see the description below the table. Example: select * from table where length(a)>5
aggregate over inner join	Related data from the two tables must be loaded to Spark. The join operation must be performed before the **aggregate** operation.	The following functions are supported: • Aggregation functions including **sum**, **avg**, **max**, **min**, and **count** are supported. • All **aggregate** operations can be performed in a same table. The **group by** operations can be performed on one or two tables and only inner join is supported. The following scenarios are not supported: • **aggregate** cannot be pushed down from both the left- and right-join tables. • **aggregate** contains operations, for example, sum(a+b). • **aggregate** operations, for example, sum(a)+min(b).
aggregate over union all	Related data from the two tables must be loaded to Spark. **union** must be performed before **aggregate**.	Supported scenarios: Aggregation functions including **sum**, **avg**, **max**, **min**, and **count** are supported. Unsupported scenarios: • **aggregate** contains operations, for example, sum(a+b). • **aggregate** operations, for example, sum(a)+min(b).

Precautions

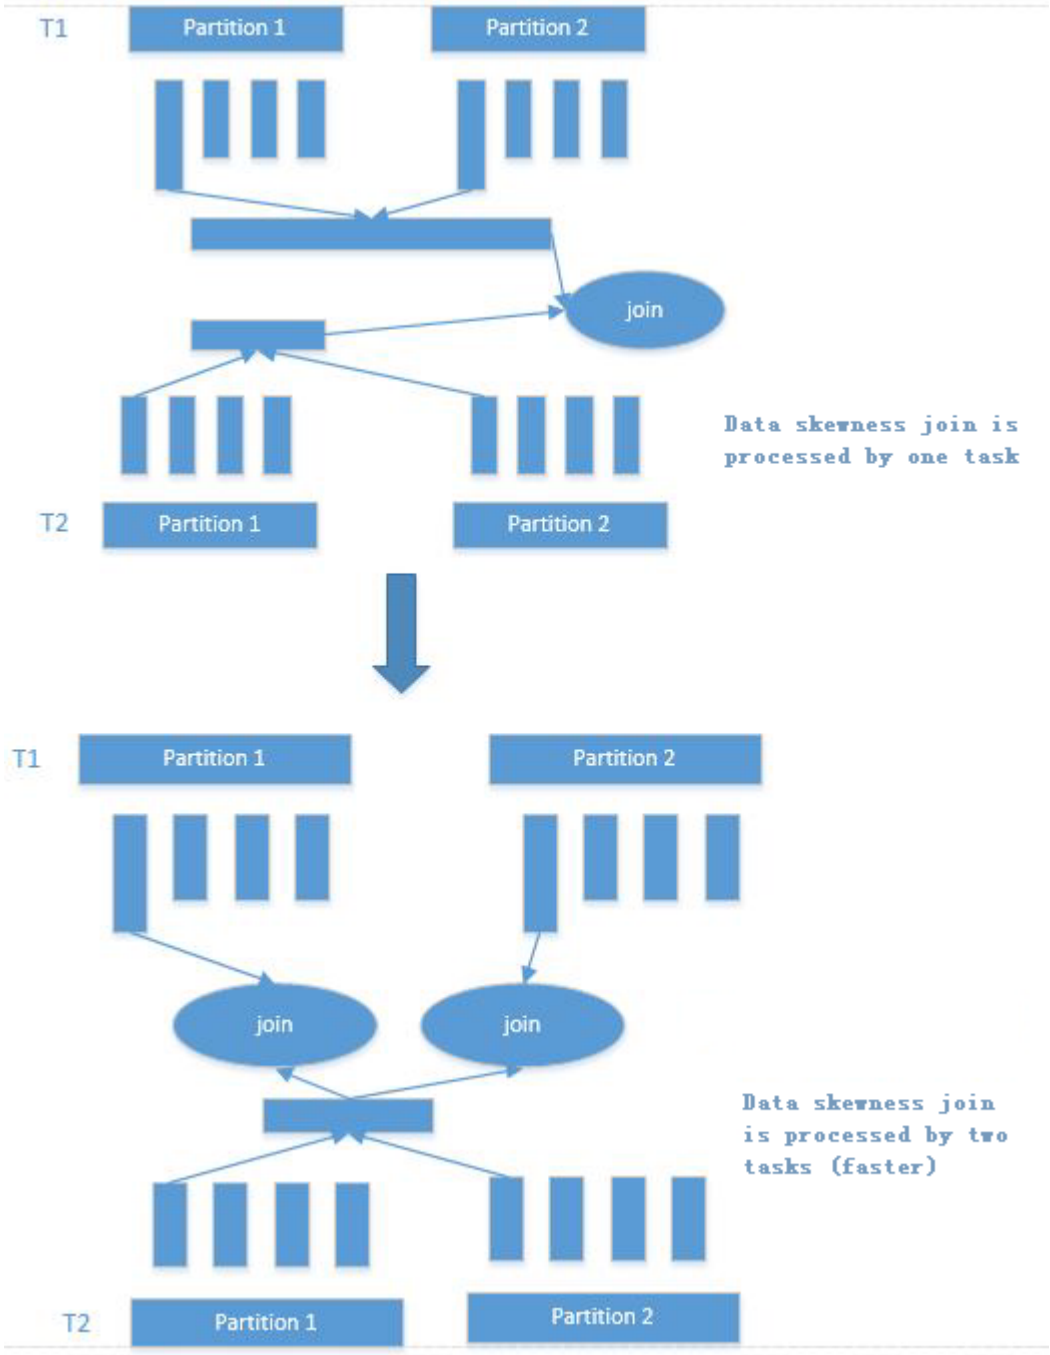
- If external data source is Hive, query operation cannot be performed on foreign tables created by Spark.
- Only MySQL and MPPDB data sources are supported.

1.4.24.5.3 Data Skewness Optimization

In the Spark SQL multi-table join scenario, severe association skewness may occur. As a result, data in some buckets is far more than that in others after data distribution by using Hash. In this case, some tasks are overloaded and run slowly while other tasks are light and run fast. Heavy tasks run slowly hindering computing performance and light tasks will result in idle CPUs, wasting CPU resources.

If there is data skewness, you are advised to configure the **spark.sql.adaptive.skewjoin.threshold** parameter to enable data skewness optimization and view data volumes of buckets. If the data volume in one bucket is too large and data skewness occurs, split the bucket and process skewed data with multiple tasks. Each task pulls full data in buckets with same join tables, improving CPU resource usage and overall performance.

Figure 1-124 Converting skewed data join



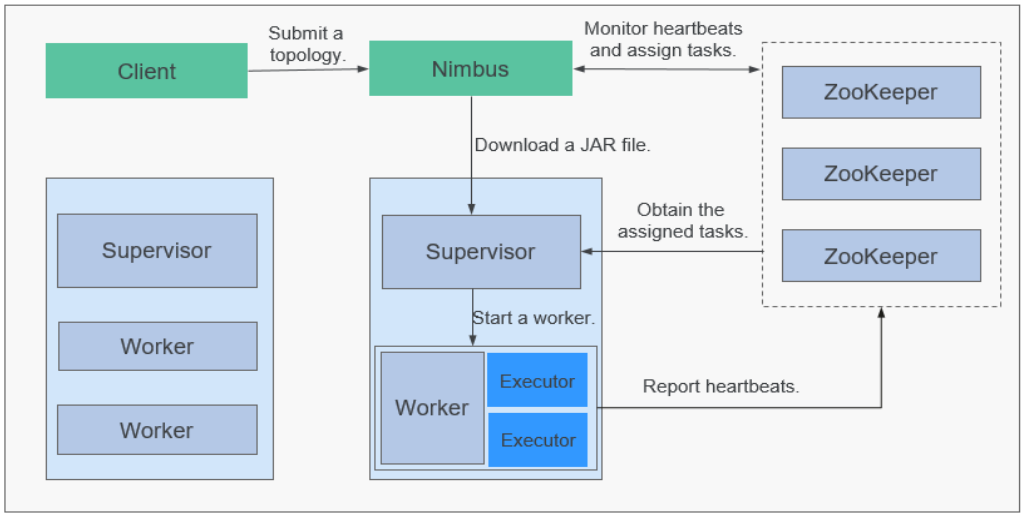
1.4.25 Storm

1.4.25.1 Storm Basic Principles

Apache Storm is a distributed, reliable, and fault-tolerant real-time stream data processing system. In Storm, a graph-shaped data structure called topology needs to be designed first for real-time computing. The topology will be submitted to a cluster. Then a master node in the cluster distributes codes and assigns tasks to

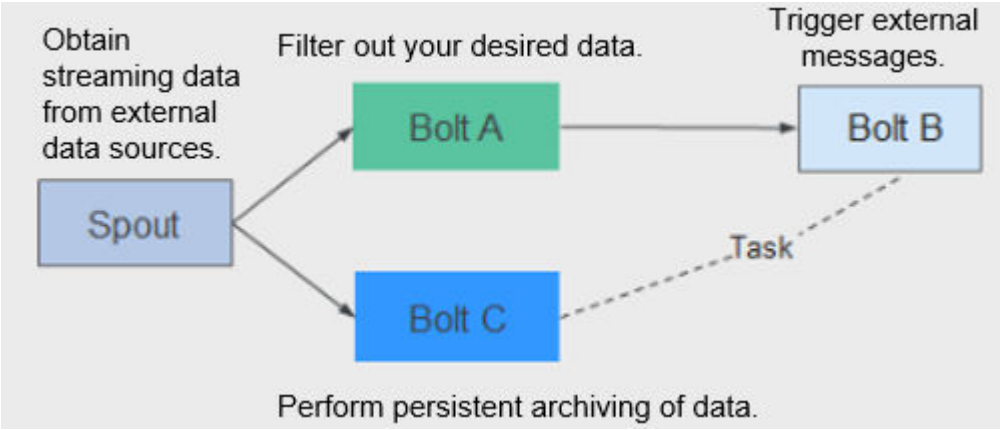
worker nodes. A topology contains two roles: spout and bolt. A spout sends messages and sends data streams in tuples. A bolt converts the data streams and performs computing and filtering operations. The bolt can randomly send data to other bolts. Tuples sent by a spout are unchangeable arrays and map to fixed key-value pairs.

Figure 1-125 System architecture of Storm



Service processing logic is encapsulated in the topology of Storm. A topology is a set of spout (data sources) and bolt (logical processing) components that are connected using Stream Groupings in DAG mode. All components (spout and bolt) in a topology are working in parallel. In a topology, you can specify the parallelism for each node. Then, Storm allocates tasks in the cluster for computing to improve system processing capabilities.

Figure 1-126 Topology



Storm is applicable to real-time analysis, continuous computing, and distributed extract, transform, and load (ETL). It has the following advantages:

- Wide applications
- High scalability

- Zero data loss
- High fault tolerance
- Easy to construct and control
- Multi-language support

Storm is a computing platform and provides Continuous Query Language (CQL) in the service layer to facilitate service implementation. CQL has the following features:

- Easy to use: The CQL syntax is similar to the SQL syntax. Users who have basic knowledge of SQL can easily learn CQL and use it to develop services.
- Rich functions: In addition to basic expressions provided by SQL, CQL provides functions, such as windows, filtering, and concurrency setting, for stream processing.
- Easy to scale: CQL provides an extension API to support increasingly complex service scenarios. Users can customize the input, output, serialization, and deserialization to meet specific service requirements.
- Easy to debug: CQL provides detailed explanation of error codes, facilitating users to rectify faults.

For details about Storm architecture and principles, see **https://storm.apache.org/**.

Principle

- **Basic Concepts**

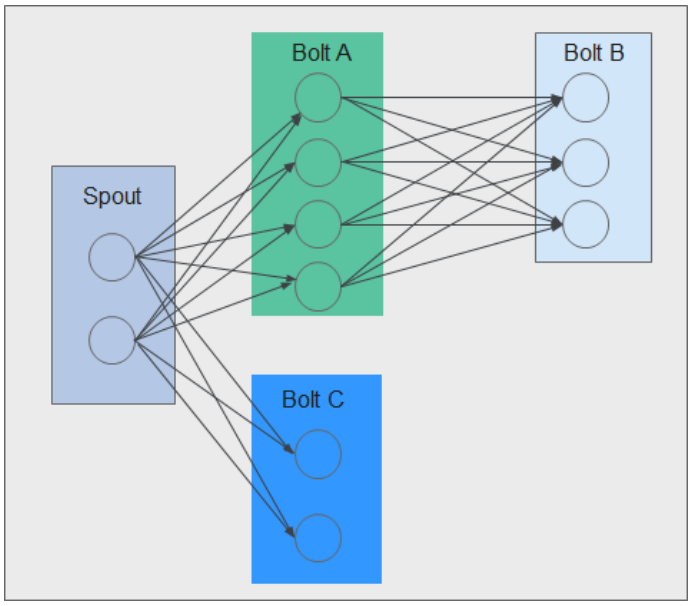
Table 1-23 Concepts

Concept	Description
Tuple	A tuple is an invariable key-value pair used to transfer data. Tuples are created and processed in distributed manner.
Stream	A stream is an unbounded sequence of tuples.
Topology	A topology is a real-time application running on the Storm platform. It is a Directed Acyclic Graph (DAG) composed of components. A topology can concurrently run on multiple machines. Each machine runs a part of the DAG. A topology is similar to a MapReduce job. The difference is that the topology is a resident program. Once started, the topology cannot stop unless it is manually terminated.
Spout	A spout is the source of tuples. For example, a spout may read data from a message queue, database, file system, or TCP connection and converts them as tuples, which are processed by the next component.

Concept	Description
Bolt	In a Topology, a bolt is a component that receives data and executes specific logic, such as filtering or converting tuples, joining or aggregating streams, and performing statistics and result persistence.
Worker	A Worker is a physical processing in running state in a Topology. Each Worker is a JVM process. Each Topology may be executed by multiple Workers. Each Worker executes a logic subset of the Topology.
Task	A task is a spout or bolt thread of a Worker.
Stream groupings	A stream grouping specifies the tuple dispatching policies. It instructs the subsequent bolt how to receive tuples. The supported policies include Shuffle Grouping, Fields Grouping, All Grouping, Global Grouping, Non Grouping, and Directed Grouping.

Figure 1-127 shows a Topology (DAG) consisting of a Spout and Bolt. In the figure, a rectangle indicates a Spout or Bolt, the node in each rectangle indicate tasks, and the lines between tasks indicate streams.

Figure 1-127 Topology



- **Reliability**

  Storm provides three levels of data reliability:

  - At Most Once: The processed data may be lost, but it cannot be processed repeatedly. This reliability level offers the highest throughput.
  - At Least Once: Data may be processed repeatedly to ensure reliable data transmission. If a response is not received within the specified time, the Spout resends the data to Bolts for processing. This reliability level may slightly affect system performance.

  - Exactly Once: Data is successfully transmitted without loss or redundancy processing. This reliability level delivers the poorest performance.

  Select the reliability level based on service requirements. For example, for the services requiring high data reliability, use Exactly Once to ensure that data is processed only once. For the services insensitive to data loss, use other levels to improve system performance.

- **Fault Tolerance**

  Storm is a fault-tolerant system that offers high availability. **Table 1-24** describes the fault tolerance of the Storm components.

  Table 1-24 Fault tolerance

Scenario	Description
Nimbus failed	Nimbus is fail-fast and stateless. If the active Nimbus is faulty, the standby Nimbus takes over services immediately, and provide external services.
Supervisor failed	Supervisor is a background daemon of Workers. It is fail-fast and stateless. If a Supervisor is faulty, the Workers running on the node are not affected but cannot receive new tasks. The OMS can detect the fault of the Supervisor and restart the processes.
Worker failed	If a Worker is faulty, the Supervisor on the Worker will restart it again. If the restart fails for multiple times, Nimbus reassigns tasks to other nodes.
Node failed	If a node is faulty, all the tasks being processed by the node time out and Nimbus will assign the tasks to another node for processing.

Open Source Features

- Distributed real-time computing

  In a Storm cluster, each machine supports the running of multiple work processes and each work process can create multiple threads. Each thread can execute multiple tasks. A task indicates concurrent data processing.

- High fault tolerance

  During message processing, if a node or a process is faulty, the message processing unit can be redeployed.

- Reliable messages

  Data processing methods including At-Least Once, At-Most Once, and Exactly Once are supported.

- Security mechanism

  Storm provides Kerberos-based authentication and pluggable authorization mechanisms, supports SSL Storm UI and Log Viewer UI, and supports security integration with other big data platform components (such as ZooKeeper and HDFS).

- Flexible topology defining and deployment

  The Flux framework is used to define and deploy service topologies. If the service DAG is changed, users only need to modify YAML domain specific language (DSL), but do not need to recompile or package service code.

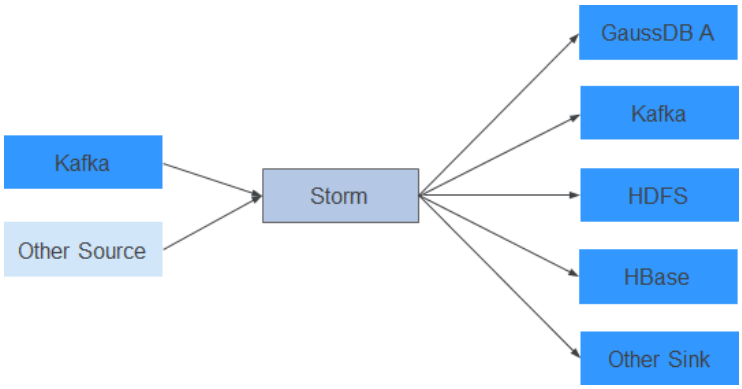
- Integration with external components

  Storm supports integration with multiple external components such as Kafka, HDFS, HBase, Redis, and JDBC/RDBMS, implementing services that involve multiple data sources.

1.4.25.2 Relationship Between Storm and Other Components

Storm provides a real-time distributed computing framework. It can obtain real-time messages from data sources (such as Kafka and TCP connection), perform high-throughput and low-latency real-time computing on a real-time platform, and export results to message queues or implement data persistence. **Figure 1-128** shows the relationship between Storm and other components.

Figure 1-128 Relationship with other components



Relationship between Storm and Streaming

Both Storm and Streaming use the open source Apache Storm kernel. However, the kernel version used by Storm is 1.2.1 whereas that used by Streaming is 0.10.0. Streaming is used to inherit transition services in upgrade scenarios. For example, if Streaming has been deployed in an earlier version and services are running, Streaming can still be used after the upgrade. Storm is recommended in a new cluster.

Storm 1.2.1 has the following new features:

- **Distributed cache**: Provides external resources (configurations) required for sharing and updating the topology using CLI tools. You do not need to re-package and re-deploy the topology.
- **Native Streaming Window API**: Provides window-based APIs.
- **Resource scheduler**: Added the resource scheduler plug-in. When defining a topology, you can specify the maximum resources available and assign resource quotas to users, thus to manage topology resources of the users.
- **State management**: Provides the Bolt API with the checkpoint mechanism. When an event fails, Storm automatically manages the Bolt status and restore the event.

- **Message sampling and debugging**: On the Storm UI, you can enable or disable topology- or component-level debugging to output stream messages to specified logs based on the sampling ratio.
- **Worker dynamic analysis**: On the Storm UI, you can collect jstack and heap logs of the Worker process and restart the Worker process.
- **Dynamic adjustment of topology logs**: You can dynamically change the running topology logs on the CLI or Storm UI.
- **Improved performance**: Compared with earlier versions, the performance of Storm is greatly improved. Although the topology performance is closely related to the use case scenario and dependency on external services, the performance is three times higher in most scenarios.

1.4.25.3 Storm Enhanced Open Source Features

- CQL

  Continuous Query Language (CQL) is an SQL-like language used for real-time stream processing. Compared with SQL, CQL has introduced the concept of (time-sequencing) window, which allows data to be stored and processed in the memory. The CQL output is the computing results of data streams at specific time. The use of CQL accelerates service development, enables tasks to be easily submitted to the Storm platform for real-time processing, facilitates output of results, and allows tasks to be terminated at the appropriate time.
- High Availability

  Nimbus HA ensures continuous service processing such as adding topologies and management even if one Nimbus is faulty, improving cluster availability.

1.4.26 Tez

Tez is Apache's latest open source computing framework that supports Directed Acyclic Graph (DAG) jobs. It can convert multiple dependent jobs into one job, greatly improving the performance of DAG jobs. If projects like Hive use Tez instead of MapReduce as the backbone of data processing, response time will be significantly reduced. Tez is built on YARN and can run MapReduce jobs without any modification.

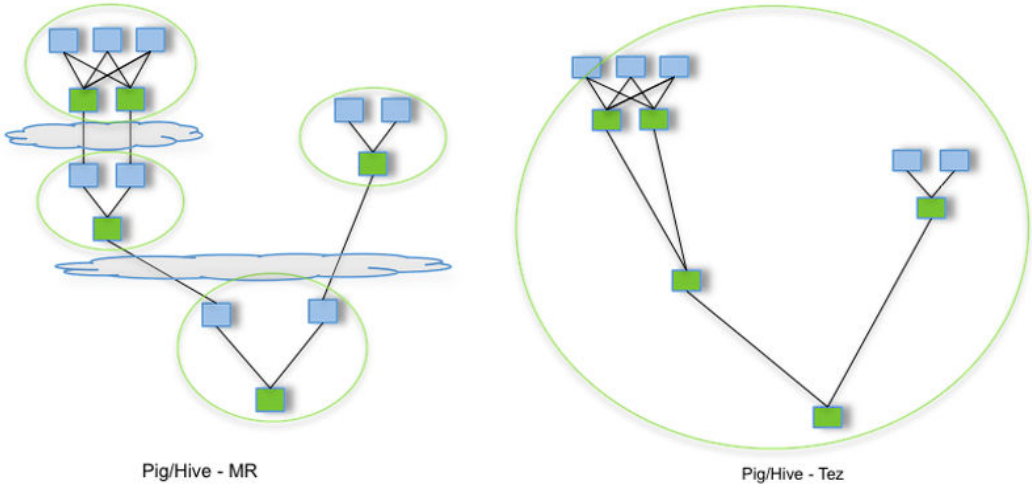
MRS uses Tez as the default execution engine of Hive. Tez remarkably surpasses the original MapReduce computing engine in terms of execution efficiency.

For details about Tez, see **https://tez.apache.org/**.

Relationship Between Tez and MapReduce

Tez uses a DAG to organize MapReduce tasks. In the DAG, a node is an RDD, and an edge indicates an operation on the RDD. The core idea is to further split Map tasks and Reduce tasks. A Map task is split into the Input-Processor-Sort-Merge-Output tasks, and the Reduce task is split into the Input-Shuffle-Sort-Merge-Process-output tasks. Tez flexibly regroups several small tasks to form a large DAG job.

Figure 1-129 Processes for submitting tasks using Hive on MapReduce and Hive on Tez



A Hive on MapReduce task contains multiple MapReduce tasks. Each task stores intermediate results to HDFS. The reducer in the previous step provides data for the mapper in the next step. A Hive on Tez task can complete the same processing process in only one task, and HDFS does not need to be accessed between tasks.

Relationship Between Tez and Yarn

Tez is a computing framework running on Yarn. The runtime environment consists of ResourceManager and ApplicationMaster of Yarn. ResourceManager is a brand new resource manager system, and ApplicationMaster is responsible for cutting MapReduce job data, assigning tasks, applying for resources, scheduling tasks, and tolerating faults. In addition, TezUI depends on TimelineServer provided by Yarn to display the running process of Tez tasks.

1.4.27 Yarn

1.4.27.1 Yarn Basic Principles

The Apache open source community introduces the unified resource management framework **Yarn** to share Hadoop clusters, improve their scalability and reliability, and eliminate a performance bottleneck of JobTracker in the early MapReduce framework.

The fundamental idea of Yarn is to split up the two major functionalities of the JobTracker, resource management and job scheduling/monitoring, into separate daemons. The idea is to have a global ResourceManager (RM) and per-application ApplicationMaster (AM).

NOTE

An application is either a single job in the classical sense of MapReduce jobs or a Directed Acyclic Graph (DAG) of jobs.

Architecture

ResourceManager is the essence of the layered structure of Yarn. This entity controls an entire cluster and manages the allocation of applications to underlying compute resources. The ResourceManager carefully allocates various resources (compute, memory, bandwidth, and so on) to underlying NodeManagers (Yarn's per-node agents). The ResourceManager also works with ApplicationMasters to allocate resources, and works with the NodeManagers to start and monitor their underlying applications. In this context, the ApplicationMaster has taken some of the role of the prior TaskTracker, and the ResourceManager has taken the role of the JobTracker.

ApplicationMaster manages each instance of an application running in Yarn. The ApplicationMaster negotiates resources from the ResourceManager and works with the NodeManagers to monitor container execution and resource usage (CPU and memory resource allocation).

The NodeManager manages each node in a Yarn cluster. The NodeManager provides per-node services in a cluster, from overseeing the management of a container over its lifecycle to monitoring resources and tracking the health of its nodes. MRv1 manages execution of the Map and Reduce tasks through slots, whereas the NodeManager manages abstract containers, which represent per-node resources available for a particular application.

Figure 1-130 Architecture

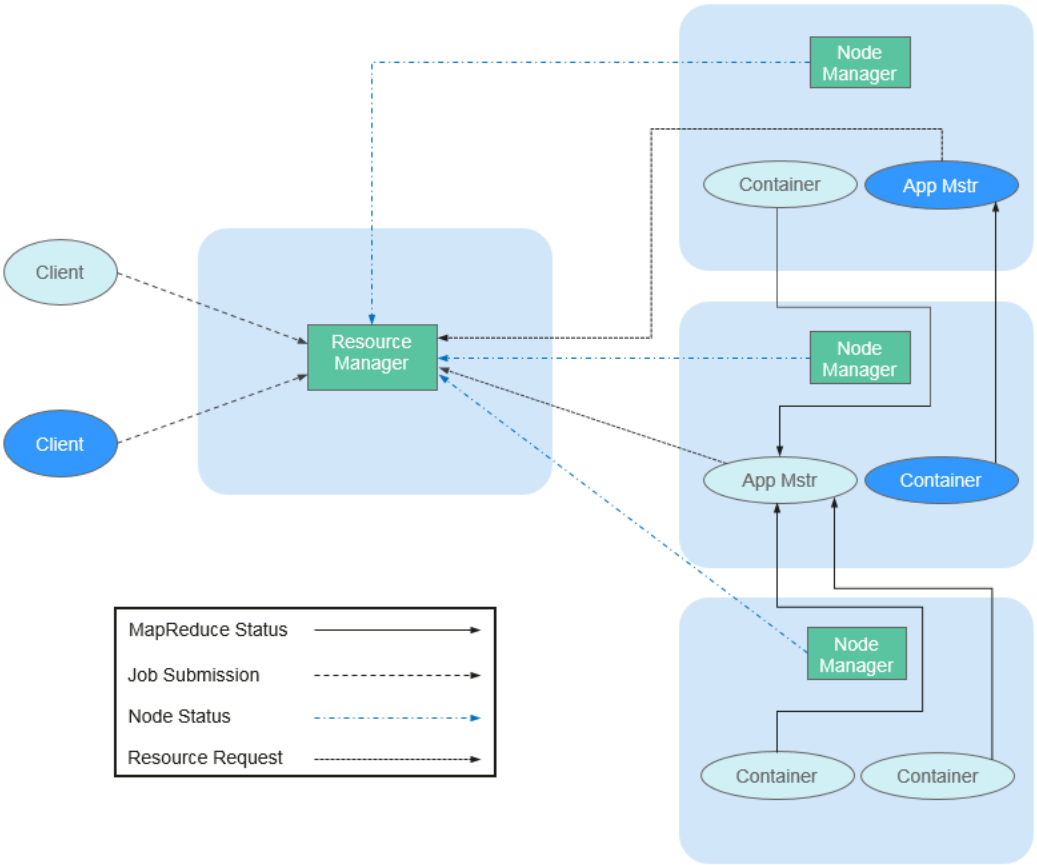


Table 1-25 describes the components shown in **Figure 1-130**.

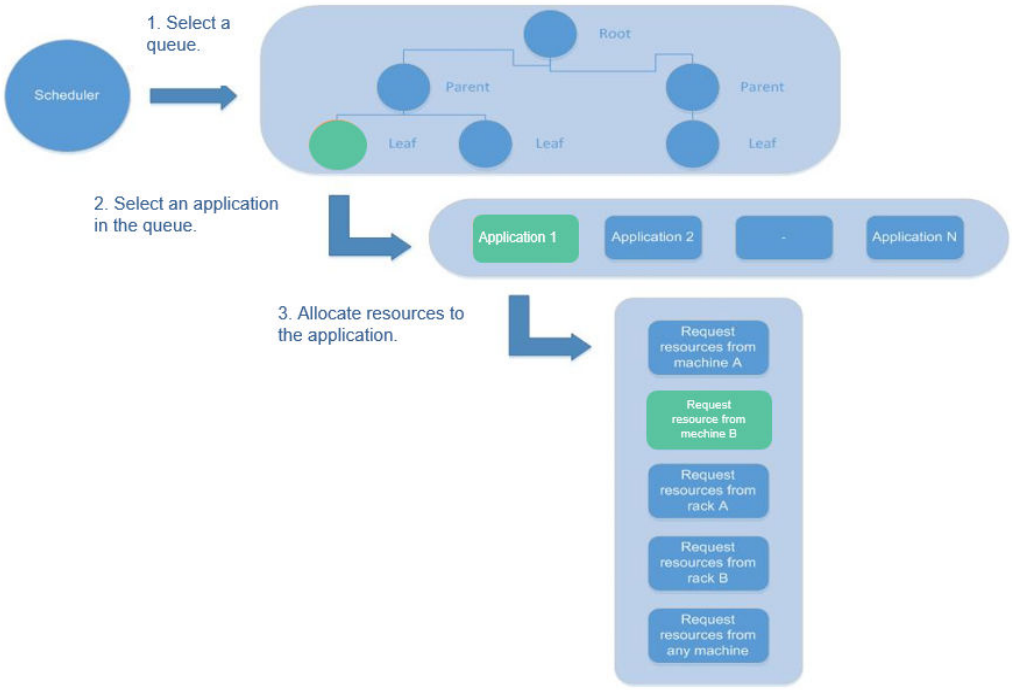
Table 1-25 Architecture description

Name	Description
Client	Client of a Yarn application. You can submit a task to ResourceManager and query the operating status of an application using the client.
ResourceManager(RM)	RM centrally manages and allocates all resources in the cluster. It receives resource reporting information from each node (NodeManager) and allocates resources to applications on the basis of the collected resources according a specified policy.
NodeManager(NM)	NM is the agent on each node of Yarn. It manages the computing node in Hadoop cluster, establishes communication with ResourceManger, monitors the lifecycle of containers, monitors the usage of resources such as memory and CPU of each container, traces node health status, and manages logs and auxiliary services used by different applications.
ApplicationMaster(AM)	AM (App Mstr in the figure above) is responsible for all tasks through the lifcycle of in an application. The tasks include the following: Negotiate with an RM scheduler to obtain a resource; further allocate the obtained resources to internal tasks (secondary allocation of resources); communicate with the NM to start or stop tasks; monitor the running status of all tasks; and apply for resources for tasks again to restart the tasks when the tasks fail to be executed.
Container	A resource abstraction in Yarn. It encapsulates multi-dimensional resources (including only memory and CPU) on a certain node. When ApplicationMaster applies for resources from ResourceManager, the ResourceManager returns resources to the ApplicationMaster in a container. Yarn allocates one container for each task and the task can only use the resources encapsulated in the container.

In Yarn, resource schedulers organize resources through hierarchical queues. This ensures that resources are allocated and shared among queues, thereby improving the usage of cluster resources. The core resource allocation model of Superior Scheduler is the same as that of Capacity Scheduler, as shown in the following figure.

A scheduler maintains queue information. You can submit applications to one or more queues. During each NM heartbeat, the scheduler selects a queue according to a specific scheduling rule, selects an application in the queue, and then allocates resources to the application. If resources fail to be allocated to the application due to the limit of some parameters, the scheduler will select another application. After the selection, the scheduler processes the resource request of this application. The scheduler gives priority to the requests for local resources first, and then for resources on the same rack, and finally for resources from any machine.

Figure 1-131 Resource allocation model



Principle

The new Hadoop MapReduce framework is named MRv2 or Yarn. Yarn consists of ResourceManager, ApplicationMaster, and NodeManager.

- ResourceManager is a global resource manager that manages and allocates resources in the system. ResourceManager consists of Scheduler and Applications Manager.
  - Scheduler allocates system resources to all running applications based on the restrictions such as capacity and queue (for example, allocates a certain amount of resources for a queue and executes a specific number of jobs). It allocates resources based on the demand of applications, with container being used as the resource allocation unit. Functioning as a dynamic resource allocation unit, Container encapsulates memory, CPU, disk, and network resources, thereby limiting the resource consumed by each task. In addition, the Scheduler is a pluggable component. You can design new schedulers as required. Yarn provides multiple directly available schedulers, such as Fair Scheduler and Capacity Scheduler.
  - Applications Manager manages all applications in the system and involves submitting applications, negotiating with schedulers about resources, enabling and monitoring ApplicationMaster, and restarting ApplicationMaster upon the startup failure.
- NodeManager is the resource and task manager of each node. On one hand, NodeManager periodically reports resource usage of the local node and the running status of each Container to ResourceManager. On the other hand, NodeManager receives and processes requests from ApplicationMaster for starting or stopping Containers.
- ApplicationMaster is responsible for all tasks through the lifecycle of an application, these channels include the following:

  - Negotiate with the RM scheduler to obtain resources.
  - Assign resources to internal components (secondary allocation of resources).
  - Communicates with NodeManager to start or stop tasks.
  - Monitor the running status of all tasks, and applies for resources again for tasks when tasks fail to run to restart the tasks.

Capacity Scheduler Principle

Capacity Scheduler is a multi-user scheduler. It allocates resources by queue and sets the minimum/maximum resources that can be used for each queue. In addition, the upper limit of resource usage is set for each user to prevent resource abuse. Remaining resources of a queue can be temporarily shared with other queues.

Capacity Scheduler supports multiple queues. It configures a certain amount of resources for each queue and adopts the first-in-first-out queuing (FIFO) scheduling policy. To prevent one user's applications from exclusively using the resources in a queue, Capacity Scheduler sets a limit on the number of resources used by jobs submitted by one user. During scheduling, Capacity Scheduler first calculates the number of resources required for each queue, and selects the queue that requires the least resources. Then, it allocates resources based on the job priority and time that jobs are submitted as well as the limit on resources and memory. Capacity Scheduler supports the following features:

- Guaranteed capacity: As the MRS cluster administrator, you can set the lower and upper limits of resource usage for each queue. All applications submitted to this queue share the resources.
- High flexibility: Temporarily, the remaining resources of a queue can be shared with other queues. However, such resources must be released in case of new application submission to the queue. Such flexible resource allocation helps notably improve resource usage.
- Multi-tenancy: Multiple users can share a cluster, and multiple applications can run concurrently. To avoid exclusive resource usage by a single application, user, or queue, the MRS cluster administrator can add multiple constraints (for example, limit on concurrent tasks of a single application).
- Assured protection: An ACL list is provided for each queue to strictly limit user access. You can specify the users who can view your application status or control the applications. Additionally, the administrator can specify a queue administrator and a cluster system administrator.
- Dynamic update of configuration files: The MRS cluster administrators can dynamically modify configuration parameters to manage clusters online.

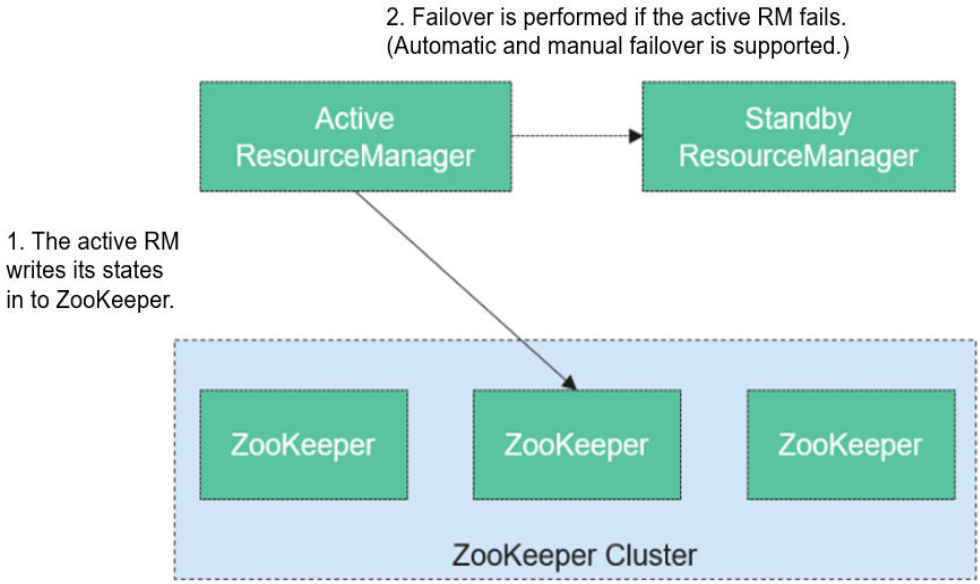
Each queue in Capacity Scheduler can limit the resource usage. However, the resource usage of a queue determines its priority when resources are allocated to queues, indicating that queues with smaller capacity are competitive. If the throughput of a cluster is big, delay scheduling enables an application to give up cross-machine or cross-rack scheduling, and to request local scheduling.

1.4.27.2 Yarn HA Solution

HA Principles and Implementation Solution

ResourceManager in Yarn manages resources and schedules tasks in the cluster. In versions earlier than Hadoop 2.4, SPOFs may occur on ResourceManager in the Yarn cluster. The Yarn HA solution uses redundant ResourceManager nodes to tackle challenges of service reliability and fault tolerance.

Figure 1-132 ResourceManager HA architecture



ResourceManager HA is achieved using active-standby ResourceManager nodes, as shown in **Figure 1-132**. Similar to the HDFS HA solution, the ResourceManager HA allows only one ResourceManager node to be in the active state at any time. When the active ResourceManager fails, the active-standby switchover can be triggered automatically or manually.

When the automatic failover function is not enabled, after the Yarn cluster is enabled, the MRS cluster administrators need to run the ***yarn rmadmin*** command to manually switch one of the ResourceManager nodes to the active state. Upon a planned maintenance event or a fault, they are expected to first demote the active ResourceManager to the standby state and the standby ResourceManager promote to the active state.

When the automatic switchover is enabled, a built-in ActiveStandbyElector that is based on ZooKeeper decide which ResourceManager node should be the active one. When the active ResourceManager is faulty, another ResourceManager node is automatically selected to be the active one to take over the faulty node.

When ResourceManager nodes in the cluster are deployed in HA mode, the configuration **yarn-site.xml** used by clients needs to list all the ResourceManager nodes. The client (including ApplicationMaster and NodeManager) searches for the active ResourceManager in polling mode. That is, the client needs to provide the fault tolerance mechanism. If the active ResourceManager cannot be connected with, the client continuously searches for a new one in polling mode.

After the standby ResourceManager promotes to be the active one, the upper-layer applications can recover to their status when the fault occurs. (For details, see **ResourceManger Restart**.) When ResourceManager Restart is enabled, the restarted ResourceManager node loads the information of the previous active ResourceManager node, and takes over container status information on all NodeManager nodes to continue service running. In this way, status information can be saved by periodically executing checkpoint operations, avoiding data loss. Ensure that both active and standby ResourceManager nodes can access the status information. Currently, three methods are provided for sharing status information by file system (FileSystemRMStateStore), LevelDB database (LeveldbRMStateStore), and ZooKeeper (ZKRMStateStore). Among them, only ZKRMStateStore supports the Fencing mechanism. By default, Hadoop uses ZKRMStateStore.

1.4.27.3 Relationship Between YARN and Other Components

Relationship Between YARN and Spark

The Spark computing and scheduling can be implemented using YARN mode. Spark enjoys the compute resources provided by YARN clusters and runs tasks in a distributed way. Spark on YARN has two modes: YARN-cluster and YARN-client.

- YARN Cluster mode

  Figure 1-133 describes the operation framework.

  Figure 1-133 Spark on YARN-cluster operation framework

  Spark on YARN-cluster implementation process:

  a. The client generates the application information, and then sends the information to ResourceManager.

  b. ResourceManager allocates the first container (ApplicationMaster) to SparkApplication and starts the driver on the container.

  c. ApplicationMaster applies for resources from ResourceManager to run the container.

ResourceManager allocates the containers to ApplicationMaster, which communicates with the related NodeManagers and starts the executor in the obtained container. After the executor is started, it registers with drivers and applies for tasks.

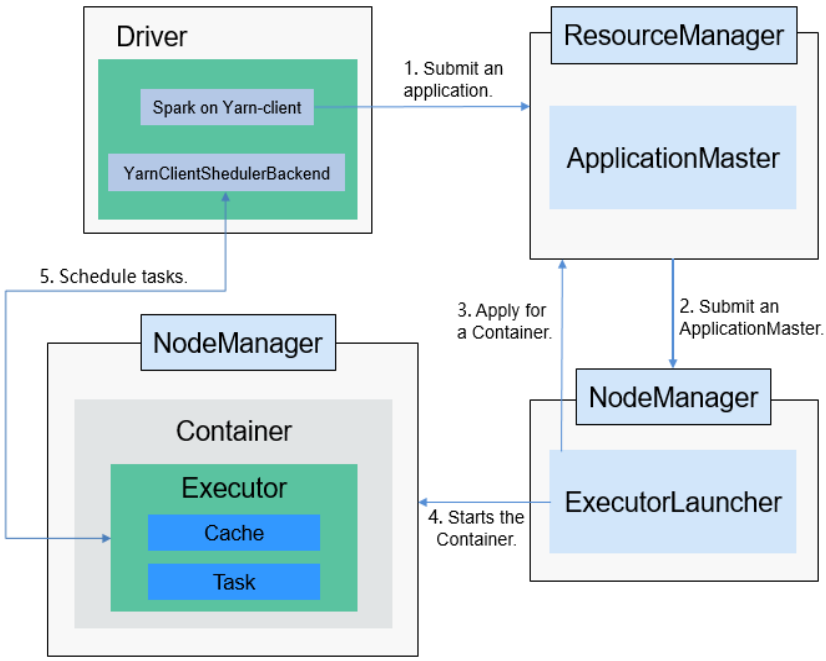
d. Drivers allocate tasks to the executors.

e. Executors run tasks and report the operating status to Drivers.

- YARN Client mode

  Figure 1-134 describes the operation framework.

  Figure 1-134 Spark on YARN-client operation framework



Spark on YARN-client implementation process:

NOTE

In YARN-client mode, the driver is deployed and started on the client. In YARN-client mode, the client of an earlier version is incompatible. You are advised to use the YARN-cluster mode.

a. The client sends the Spark application request to ResourceManager, then ResourceManager returns the results. The results include information such as Application ID and the maximum and minimum available resources. The client packages all information required to start ApplicationMaster, and sends the information to ResourceManager.

b. After receiving the request, ResourceManager finds a proper node for ApplicationMaster and starts it on this node. ApplicationMaster is a role in YARN, and the process name in Spark is ExecutorLauncher.

c. Based on the resource requirements of each task, ApplicationMaster can apply for a series of containers to run tasks from ResourceManager.

d. After receiving the newly allocated container list (from ResourceManager), ApplicationMaster sends information to the related NodeManagers to start the containers.

ResourceManager allocates the containers to ApplicationMaster, which communicates with the related NodeManagers and starts the executor in the obtained container. After the executor is started, it registers with drivers and applies for tasks.

NOTE

Running containers are not suspended and resources are not released.

e. Drivers allocate tasks to the executors. Executors run tasks and report the operating status to Drivers.

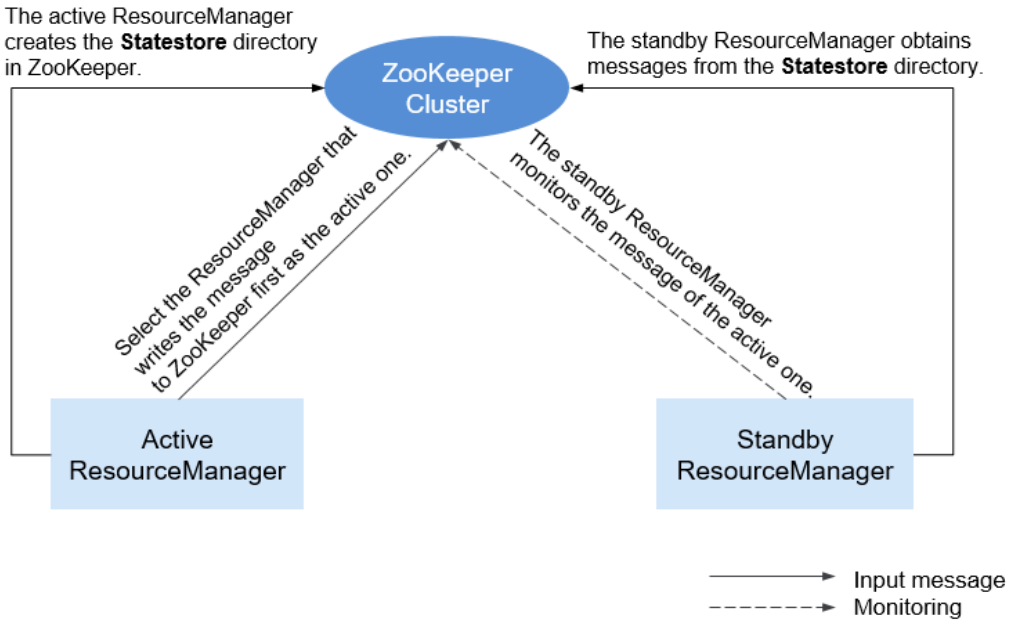
Relationship Between YARN and MapReduce

MapReduce is a computing framework running on YARN, which is used for batch processing. MRv1 is implemented based on MapReduce in Hadoop 1.0, which is composed of programming models (new and old programming APIs), running environment (JobTracker and TaskTracker), and data processing engine (MapTask and ReduceTask). This framework is still weak in scalability, fault tolerance (JobTracker SPOF), and compatibility with multiple frameworks. (Currently, only the MapReduce computing framework is supported.) MRv2 is implemented based on MapReduce in Hadoop 2.0. The source code reuses MRv1 programming models and data processing engine implementation, and the running environment is composed of ResourceManager and ApplicationMaster. ResourceManager is a brand new resource manager system, and ApplicationMaster is responsible for cutting MapReduce job data, assigning tasks, applying for resources, scheduling tasks, and tolerating faults.

Relationship Between YARN and ZooKeeper

Figure 1-135 shows the relationship between ZooKeeper and YARN.

Figure 1-135 Relationship Between ZooKeeper and YARN



1. When the system is started, ResourceManager attempts to write state information to ZooKeeper. ResourceManager that first writes state information to ZooKeeper is selected as the active ResourceManager, and others are standby ResourceManagers. The standby ResourceManagers periodically monitor active ResourceManager election information in ZooKeeper.
2. The active ResourceManager creates the **Statestore** directory in ZooKeeper to store application information. If the active ResourceManager is faulty, the standby ResourceManager obtains application information from the **Statestore** directory and restores the data.

Relationship Between YARN and Tez

The Hive on Tez job information requires the TimeLine Server capability of YARN so that Hive tasks can display the current and historical status of applications, facilitating storage and retrieval.

1.4.27.4 Yarn Enhanced Open Source Features

Priority-based task scheduling

In the native Yarn resource scheduling mechanism, if the whole Hadoop cluster resources are occupied by those MapReduce jobs submitted earlier, jobs submitted later will be kept in pending state until all running jobs are executed and resources are released.

The MRS cluster provides the task priority scheduling mechanism. With this feature, you can define jobs of different priorities. Jobs of high priority can preempt resources released from jobs of low priority though the high-priority jobs are submitted later. The low-priority jobs that are not started will be suspended unless those jobs of high priority are completed and resources are released, then they can properly be started.

This feature enables services to control computing jobs more flexibly, thereby achieving higher cluster resource utilization.

NOTE

Container reuse is in conflict with task priority scheduling. If container reuse is enabled, resources are being occupied, and task priority scheduling does not take effect.

Yarn Permission Control

The permission mechanism of Hadoop Yarn is implemented through ACLs. The following describes how to grant different permission control to different users:

- Admin ACL

  An O&M administrator is specified for the Yarn cluster. The Admin ACL is determined by **yarn.admin.acl**. The cluster O&M administrator can access the ResourceManager web UI and operate NodeManager nodes, queues, and NodeLabel, **but cannot submit tasks**.
- Queue ACL

  To facilitate user management in the cluster, users or user groups are divided into several queues to which each user and user group belongs. Each queue

contains permissions to submit and manage applications (for example, terminate any application).

Open source functions:

Currently, Yarn supports the following roles for users:

- Cluster O&M administrator
- Queue administrator
- Common user

However, the APIs (such as the web UI, REST API, and Java API) provided by Yarn do not support role-specific permission control. Therefore, all users have the permission to access the application and cluster information, which does not meet the isolation requirements in the multi-tenant scenario.

This is an enhanced function.

In security mode, permission management is enhanced for the APIs such as web UI, REST API, and Java API provided by Yarn. Permission control can be performed based on user roles.

Role-based permissions are as follows:

- Cluster O&M administrator: performs management operations in the Yarn cluster, such as accessing the ResourceManager web UI, refreshing queues, setting NodeLabel, and performing active/standby switchover.
- Queue administrator: has the permission to modify and view queues managed by the Yarn cluster.
- Common user: has the permission to modify and view self-submitted applications in the Yarn cluster.

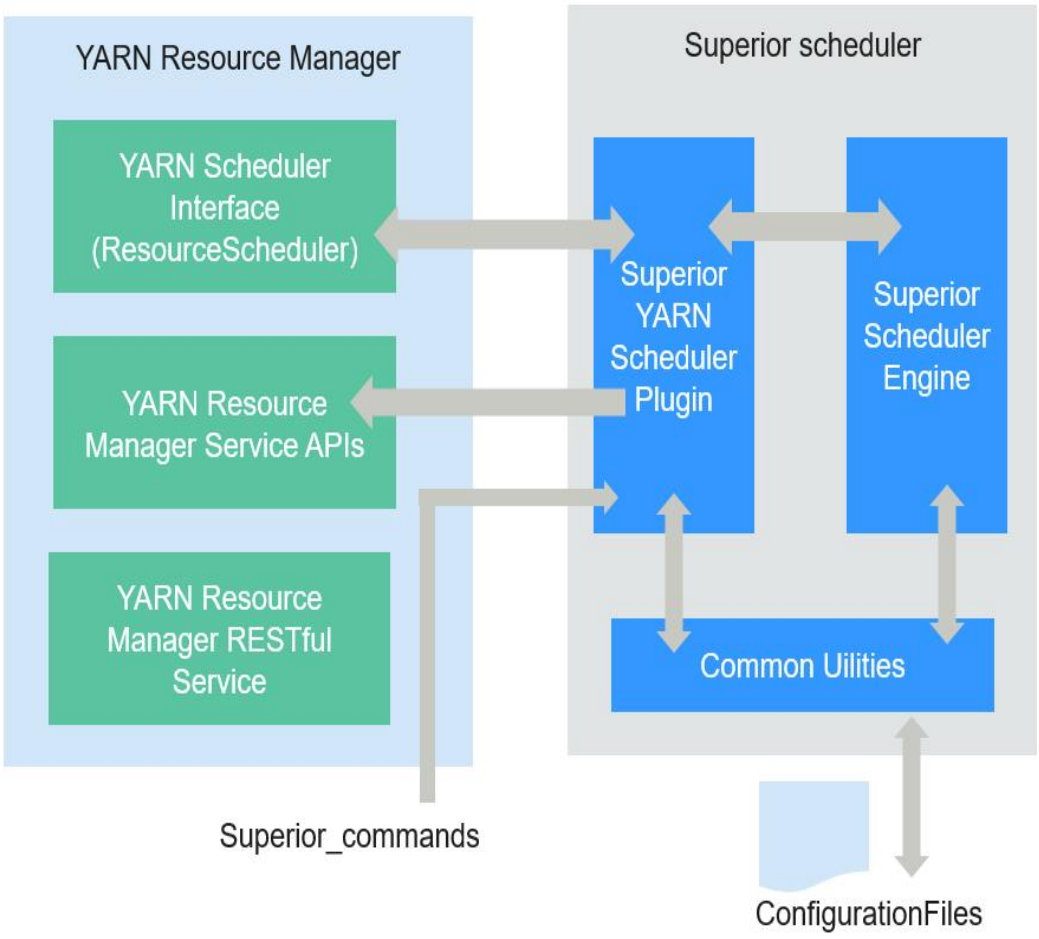
Superior Scheduler Principle (Self-developed)

Superior Scheduler is a scheduling engine designed for the Hadoop Yarn distributed resource management system. It is a high-performance and enterprise-level scheduler designed for converged resource pools and multi-tenant service requirements.

Superior Scheduler achieves all functions of open source schedulers, Fair Scheduler, and Capacity Scheduler. Compared with the open source schedulers, Superior Scheduler is enhanced in the enterprise multi-tenant resource scheduling policy, resource isolation and sharing among users in a tenant, scheduling performance, system resource usage, and cluster scalability. Superior Scheduler is designed to replace open source schedulers.

Similar to open source Fair Scheduler and Capacity Scheduler, Superior Scheduler follows the Yarn scheduler plugin API to interact with Yarn ResourceManager to offer resource scheduling functionalities. **Figure 1-136** shows the overall system diagram.

Figure 1-136 Internal architecture of Superior Scheduler



In **Figure 1-136**, Superior Scheduler consists of the following modules:

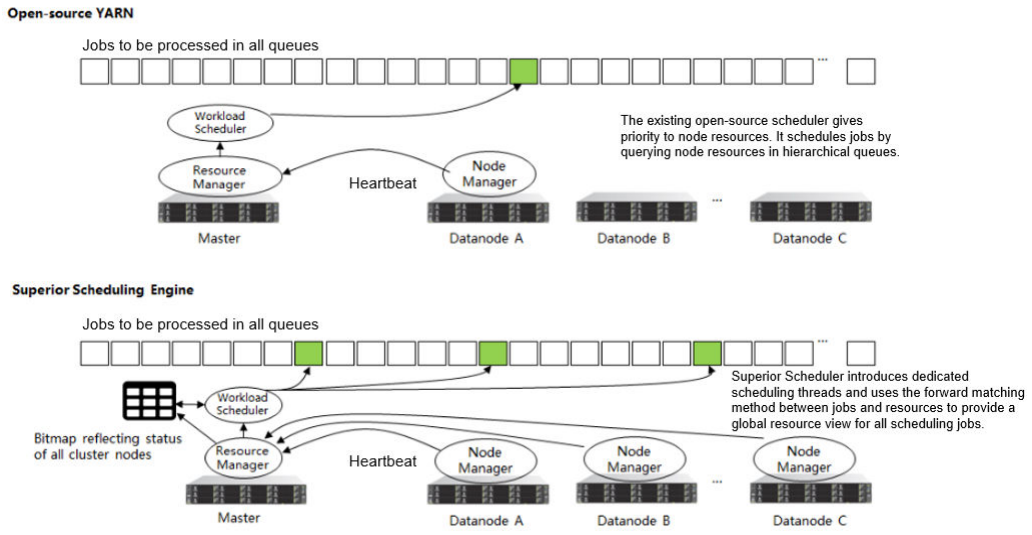
- Superior Scheduler Engine is a high performance scheduler engine with rich scheduling policies.
- Superior Yarn Scheduler Plugin functions as a bridge between Yarn ResourceManager and Superior Scheduler Engine and interacts with Yarn ResourceManager.

  The scheduling principle of open source schedulers is that resources match jobs based on the heartbeats of computing nodes. Specifically, each computing node periodically sends heartbeat messages to ResourceManager of Yarn to notify the node status and starts the scheduler to assign jobs to the node itself. In this scheduling mechanism, the scheduling period depends on the heartbeat. If the cluster scale increases, bottleneck on system scalability and scheduling performance may occur. In addition, because resources match jobs, the scheduling accuracy of an open source scheduler is limited. For example, data affinity is random and the system does not support load-based scheduling policies. The scheduler may not make the best choice due to lack of the global resource view when selecting jobs.

  Superior Scheduler adopts multiple scheduling mechanisms. There are dedicated scheduling threads in Superior Scheduler, separating heartbeats with scheduling and preventing system heartbeat storms. Additionally,

Superior Scheduler matches jobs with resources, providing each scheduled job with a global resource view and increasing the scheduling accuracy. Compared with the open source scheduler, Superior Scheduler excels in system throughput, resource usage, and data affinity.

Figure 1-137 Comparison of Superior Scheduler with open source schedulers



Apart from the enhanced system throughput and utilization, Superior Scheduler provides following major scheduling features:

- Multiple resource pools

  Multiple resource pools help logically divide cluster resources and share them among multiple tenants or queues. The division of resource pools supports heterogeneous resources. Resource pools can be divided exactly according to requirements on the application resource isolation. You can configure further policies for different queues in a pool.

- Multi-tenant scheduling (**reserve**, **min**, **share**, and **max**) in each resource pool

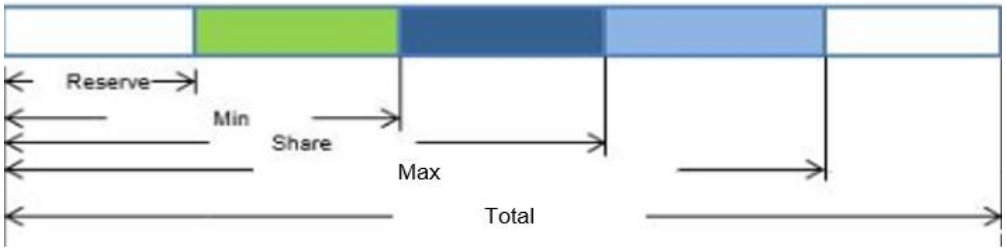
  Superior Scheduler provides flexible hierarchical multi-tenant scheduling policy. Different policies can be configured for different tenants or queues that can access different resource pools. The following figure lists supported policies:

Table 1-26 Policy description

Name	Description
reserve	This policy is used to reserve resources for a tenant. Even though tenant has no jobs available, other tenant cannot use the reserved resource. The value can be a percentage or an absolute value. If both the percentage and absolute value are configured, the percentage is automatically calculated into an absolute value, and the larger value is used. The default **reserve** value is **0**. Compared with the method of specifying a dedicated resource pool and hosts, the **reserve** policy provides a flexible floating reservation function. In addition, because no specific hosts are specified, the data affinity for calculation is improved and the impact by the faulty hosts is avoided.
min	This policy allows preemption of minimum resources. Other tenants can use these resources, but the current tenant has the priority to use them. The value can be a percentage or an absolute value. If both the percentage and absolute value are configured, the percentage is automatically calculated into an absolute value, and the larger value is used. The default value is **0**.
share	This policy is used for shared resources that cannot be preempted. To use these resources, the current tenant needs to wait for other tenants to complete jobs and release resources. The value can be a percentage or an absolute value.
max	This policy is used for the maximum resources that can be utilized. The tenant cannot obtain more resources than the allowed maximum value. The value can be a percentage or an absolute value. If both the percentage and absolute value are configured, the percentage is automatically calculated into an absolute value, and the larger value is used. By default value, there is no restriction on resources.

Figure 1-138 shows the tenant resource allocation policy.

Figure 1-138 Resource scheduling policies



NOTE

In the above figure, **Total** indicates the total number of resources, not the scheduling policy.

Compared with open source schedulers, Superior Scheduler supports both percentage and absolute value of tenants for allocating resources, flexibly addressing resource scheduling requirements of enterprise-level tenants. For example, resources can be allocated according to the absolute value of level-1 tenants, avoiding impact caused by changes of cluster scale. However, resources can be allocated according to the allocation percentage of sub-tenants, improving resource usages in the level-1 tenant.

- Heterogeneous and multi-dimensional resource scheduling

  Superior Scheduler supports following functions except CPU and memory scheduling:

  - **Node labels** can be used to identify multi-dimensional attributes of nodes such as **GPU_ENABLED** and **SSD_ENBALED**, and can be scheduled based on these labels.
  - Resource pools can be used to group resources of the same type and allocate them to specific tenants or queues.

- Fair scheduling of multiple users in a tenant

  In a leaf tenant, multiple users can use the same queue to submit jobs. Compared with the open source schedulers, Superior Scheduler supports configuring flexible resource sharing policy among different users in a same tenant. For example, VIP users can be configured with higher resource access weight.

- Data locality aware scheduling

  Superior Scheduler adopts the job-to-node scheduling policy. That is, Superior Scheduler attempts to schedule specified jobs between available nodes so that the selected node is suitable for the specified jobs. By doing so, the scheduler will have an overall view of the cluster and data. Localization is ensured if there is an opportunity to place tasks closer to the data. The open source scheduler uses the node-to-job scheduling policy to match the appropriate jobs to a given node.

- Dynamic resource reservation during container scheduling

  In a heterogeneous and diversified computing environment, some containers need more resources or multiple resources. For example, Spark job may require large memory. When such containers compete with containers requiring fewer resources, containers requiring more resources may not obtain sufficient resources within a reasonable period. Open source schedulers allocate resources to jobs, which may cause unreasonable resource reservation for these jobs. This mechanism leads to the waste of overall system resources. Superior Scheduler differs from open source schedulers in following aspects:

  - Requirement-based matching: Superior Scheduler schedules jobs to nodes and selects appropriate nodes to reserve resources to improve the startup time of containers and avoid waste.
  - Tenant rebalancing: When the reservation logic is enabled, the open source schedulers do not comply with the configured sharing policy. Superior Scheduler uses different methods. In each scheduling period, Superior Scheduler traverses all tenants and attempts to balance

resources based on the multi-tenant policy. In addition, Superior Scheduler attempts to meet all policies (**reserve**, **min**, and **share**) to release reserved resources and direct available resources to other containers that should obtain resources under different tenants.

- Dynamic queue status control (**Open**/**Closed**/**Active**/**Inactive**)

  Multiple queue statuses are supported, helping administrators operate and maintain multiple tenants.

  - Open status (**Open/Closed**): If the status is **Open** by default, applications submitted to the queue are accepted. If the status is **Closed**, no application is accepted.
  - Active status (**Active/Inactive**): If the status is **Active** by default, resources can be scheduled and allocated to applications in the tenant. Resources will not be scheduled to queues in **Inactive** status.

- Application pending reason

  If the application is not started, provide the job pending reasons.

Table 1-27 describes the comparison result of Superior Scheduler and Yarn open source schedulers.

Table 1-27 Comparative analysis

Scheduling	Yarn Open Source Scheduler	Superior Scheduler
Multi-tenant scheduling	In homogeneous clusters, either Capacity Scheduler or Fair Scheduler can be selected and the cluster does not support Fair Scheduler. Capacity Scheduler supports the scheduling by percentage and Fair Scheduler supports the scheduling by absolute value.	• Supports heterogeneous clusters and multiple resource pools. • Supports **reservation** to ensure direct access to resources.
Data locality aware scheduling	The node-to-job scheduling policy reduces the success rate of data localization and potentially affects application execution performance.	The **job-to-node scheduling policy** can aware data location more accurately, and the job hit rate of data localization scheduling is higher.
Balanced scheduling based on load of hosts	Not supported	**Balanced scheduling can be achieved when Superior Scheduler considers the host load and resource allocation during scheduling.**
Fair scheduling of multiple users in a tenant	Not supported	Supports keywords **default** and **others**.

Scheduling	Yarn Open Source Scheduler	Superior Scheduler
Job waiting reason	Not supported	Job waiting reasons illustrate why a job needs to wait.

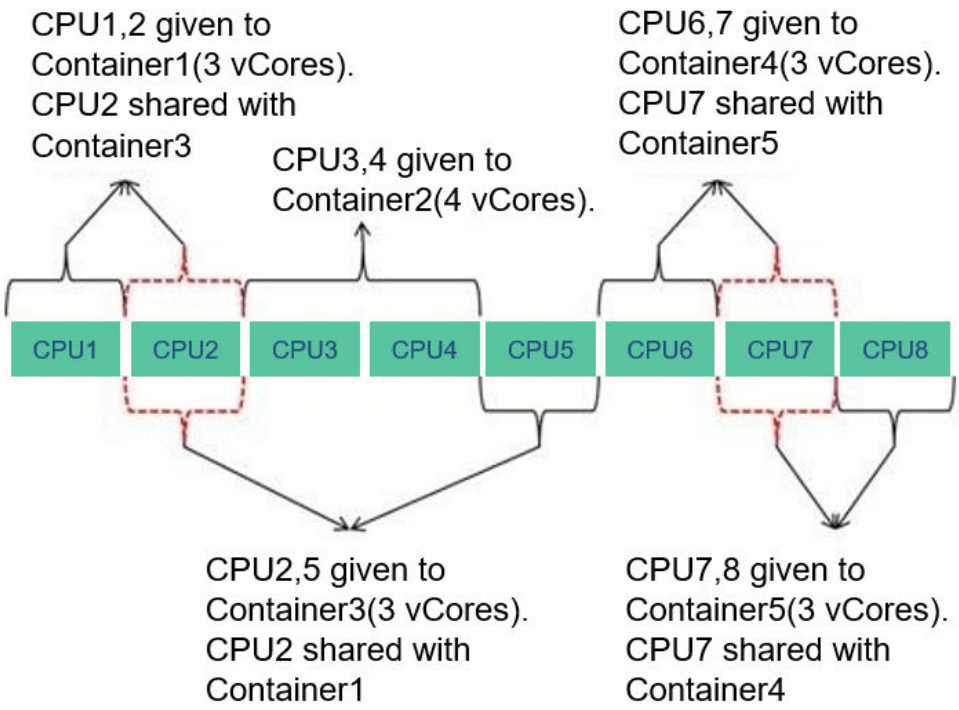
In conclusion, Superior Scheduler is a high-performance scheduler with various scheduling policies and is better than Capacity Scheduler in terms of functionality, performance, resource usage, and scalability.

CPU Hard Isolation

Yarn cannot strictly control the CPU resources used by each container. When the CPU subsystem is used, a container may occupy excessive resources. Therefore, CPUset is used to control resource allocation.

To solve this problem, the CPU resources are allocated to each container based on the ratio of virtual cores (vCores) to physical cores. If a container requires an entire physical core, the container has it. If a container needs only some physical cores, several containers may share the same physical core. The following figure shows an example of the CPU quota. The given ratio of vCores to physical cores is 2:1.

Figure 1-139 CPU quota



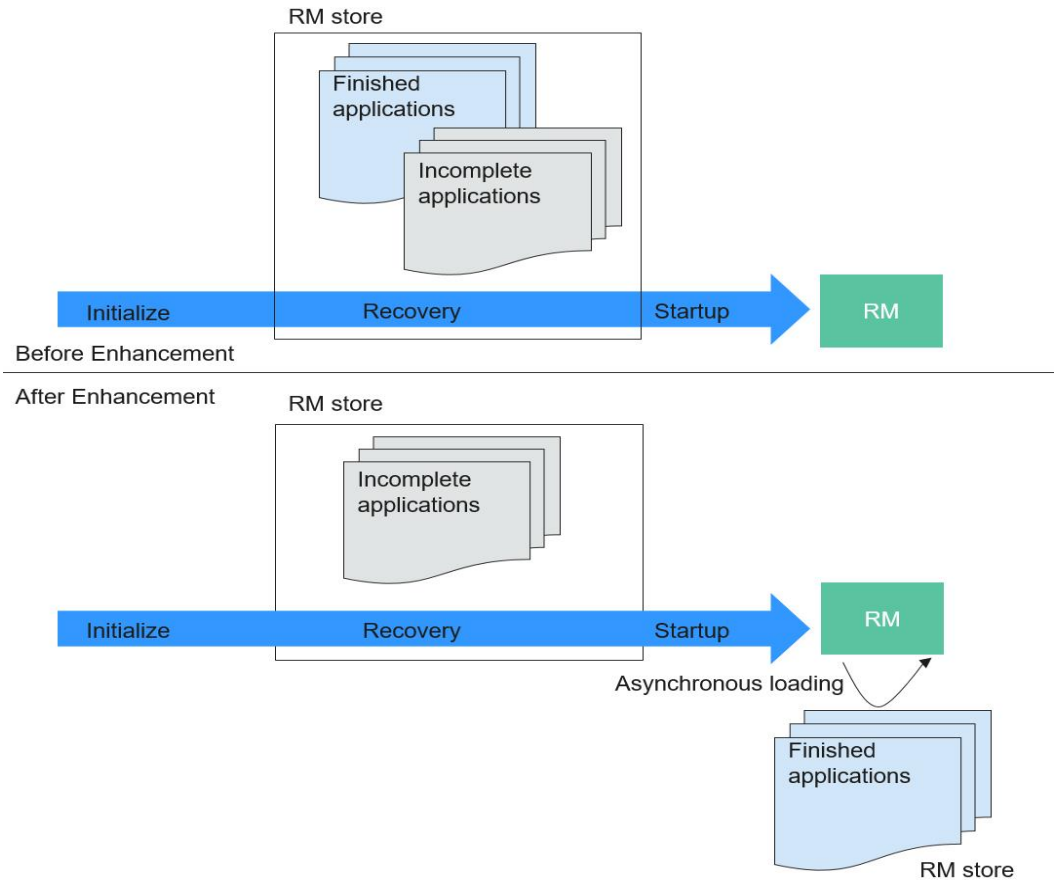
Enhanced Open Source Feature: Optimizing Restart Performance

Generally, the recovered ResourceManager can obtain running and completed applications. However, a large number of completed applications may cause

problems such as slow startup and long HA switchover/restart time of ResourceManagers.

To speed up the startup, obtain the list of unfinished applications before starting the ResourceManagers. In this case, the completed application continues to be recovered in the background asynchronous thread. The following figure shows how the ResourceManager recovery starts.

Figure 1-140 Starting the ResourceManager recovery



1.4.28 ZooKeeper

1.4.28.1 ZooKeeper Basic Principle

ZooKeeper Overview

ZooKeeper is a distributed, highly available coordination service. ZooKeeper provides two functions:

- Prevents the system from single point of failures (SPOFs) and provides reliable services for applications.
- Provides distributed coordination services and manages configuration information.

ZooKeeper Architecture

Nodes in a ZooKeeper cluster have three roles: Leader, Follower, and Observer. Figure 1-141 shows the ZooKeeper architecture. Generally, an odd number (2N+1) of ZooKeeper servers are configured. At least (N+1) vote majority is required to successfully perform write operation.

Figure 1-141 ZooKeeper architecture

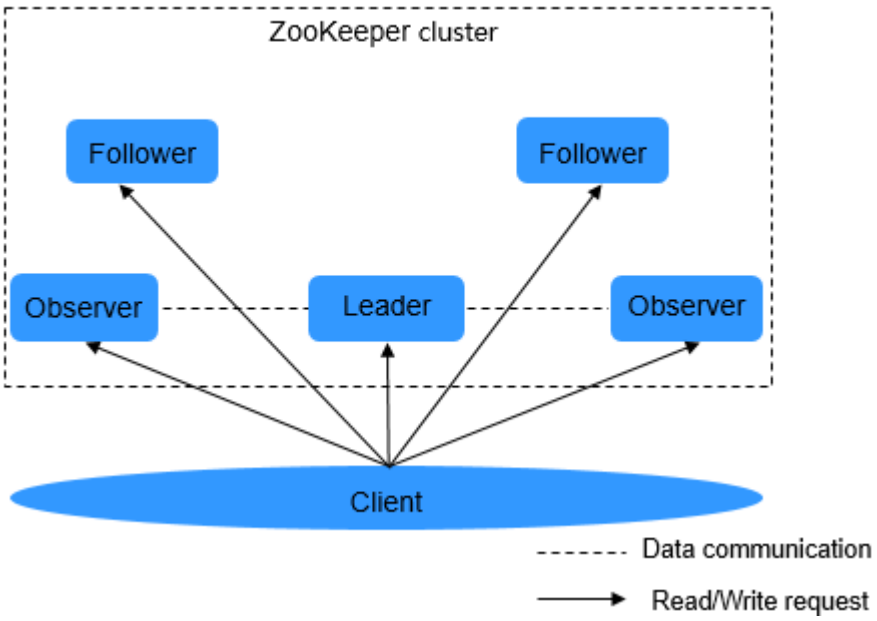


Table 1-28 describes the functions of each module shown in Figure 1-141.

Table 1-28 ZooKeeper modules

Module	Description
Leader	Only one node serves as the Leader in a ZooKeeper cluster. The Leader, elected by Followers using the ZooKeeper Atomic Broadcast (ZAB) protocol, receives and coordinates all write requests and synchronizes written information to Followers and Observers.
Follower	Follower has two functions: • Prevents SPOF. A new Leader is elected from Followers when the Leader is faulty. • Processes read requests and interacts with the Leader to process write requests.
Observer	The Observer does not take part in voting for election and write requests. It only processes read requests and forwards write requests to the Leader, increasing system processing efficiency.

Module	Description
Client	Reads and writes data from or to the ZooKeeper cluster. For example, HBase can serve as a ZooKeeper client and use the arbitration function of the ZooKeeper cluster to control the active/standby status of the HMaster.

If security services are enabled in the cluster, authentication is required during the connection to ZooKeeper. The authentication modes are as follows:

- keytab mode: Obtain a human-machine user from the MRS cluster administrator for login to the platform and authentication, and obtain the keytab file of the user.
- Ticket mode: Obtain a human-machine user from the MRS cluster administrator for subsequent secure login, enable the renewable and forwardable functions of the Kerberos service, set the ticket update interval, and restart Kerberos and related components.

  NOTE

  - The default validity period of a user password is 90 days. Therefore, the validity period of the obtained keytab file is 90 days. To prolong the validity period of the keytab file, modify the user password policy and obtain the keytab file again. For details, see the *Administrator Guide*.
  - The parameters for enabling the renewable and forwardable functions and setting the ticket update interval are on the **System** tab of the Kerberos service configuration page. The ticket update interval can be set to **kdc_renew_lifetime** or **kdc_max_renewable_life** based on the actual situation.

ZooKeeper Principle

- **Write Request**
  a. After the Follower or Observer receives a write request, the Follower or Observer sends the request to the Leader.
  b. The Leader coordinates Followers to determine whether to accept the write request by voting.
  c. If more than half of voters return a write success message, the Leader submits the write request and returns a success message. Otherwise, a failure message is returned.
  d. The Follower or Observer returns the processing results.
- **Read Request**

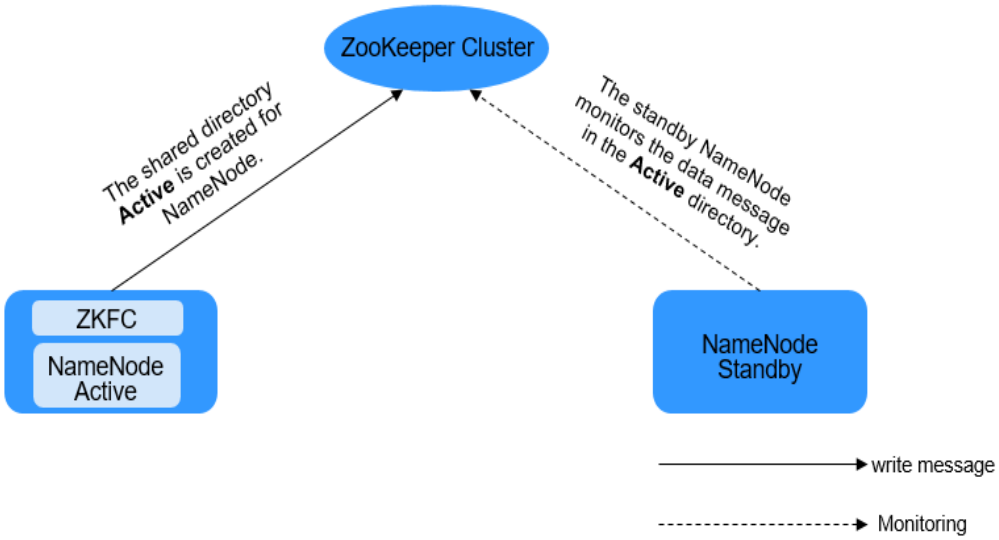
  The client directly reads data from the Leader, Follower, or Observer.

1.4.28.2 Relationship Between ZooKeeper and Other Components

Relationship Between ZooKeeper and HDFS

Figure 1-142 shows the relationship between ZooKeeper and HDFS.

Figure 1-142 Relationship between ZooKeeper and HDFS



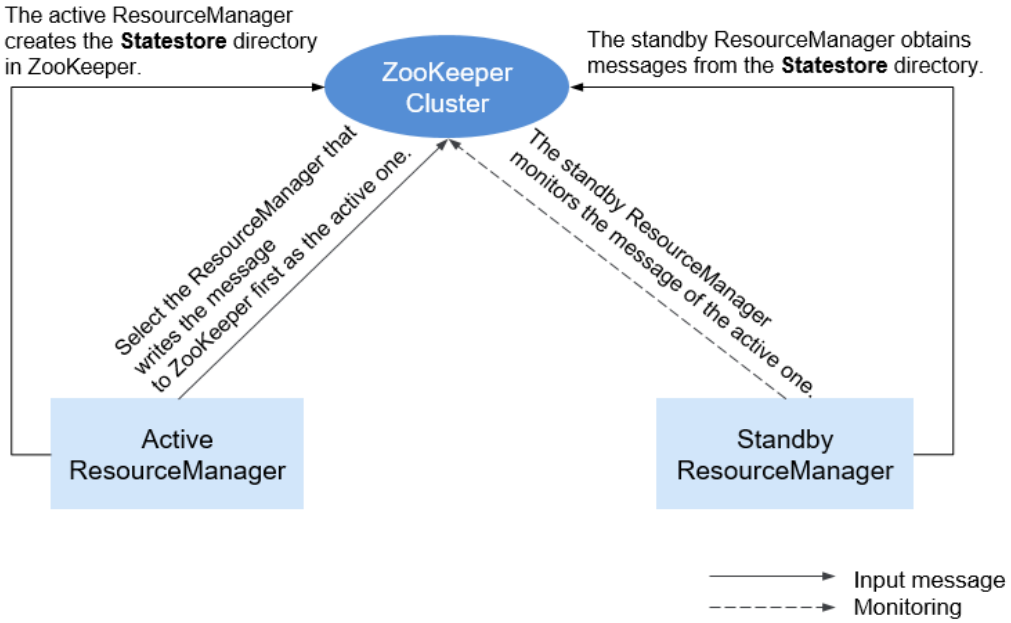
As the client of a ZooKeeper cluster, ZKFailoverController (ZKFC) monitors the status of NameNode. ZKFC is deployed only in the node where NameNode resides, and in both the active and standby HDFS NameNodes.

1. The ZKFC connects to ZooKeeper and saves information such as host names to ZooKeeper under the znode directory **/hadoop-ha**. NameNode that creates the directory first is considered as the active node, and the other is the standby node. NameNodes read the NameNode information periodically through ZooKeeper.
2. When the process of the active node ends abnormally, the standby NameNode detects changes in the **/hadoop-ha** directory through ZooKeeper, and then takes over the service of the active NameNode.

Relationship Between ZooKeeper and YARN

Figure 1-143 shows the relationship between ZooKeeper and YARN.

Figure 1-143 Relationship Between ZooKeeper and YARN

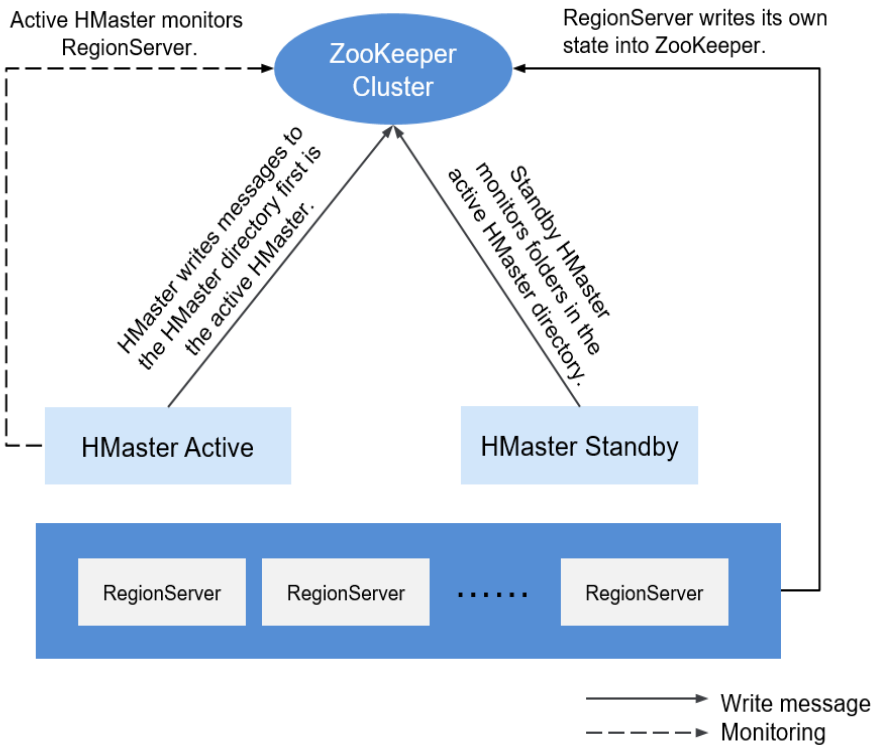


1. When the system is started, ResourceManager attempts to write state information to ZooKeeper. ResourceManager that first writes state information to ZooKeeper is selected as the active ResourceManager, and others are standby ResourceManagers. The standby ResourceManagers periodically monitor active ResourceManager election information in ZooKeeper.
2. The active ResourceManager creates the **Statestore** directory in ZooKeeper to store application information. If the active ResourceManager is faulty, the standby ResourceManager obtains application information from the **Statestore** directory and restores the data.

Relationship Between ZooKeeper and HBase

Figure 1-144 shows the relationship between ZooKeeper and HBase.

Figure 1-144 Relationship between ZooKeeper and HBase

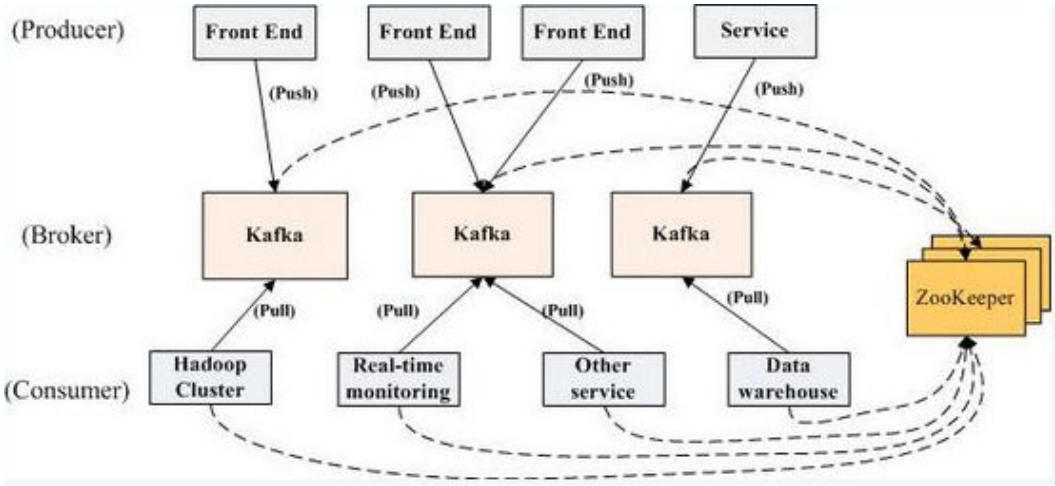


1. HRegionServer registers itself to ZooKeeper on Ephemeral node. ZooKeeper stores the HBase information, including the HBase metadata and HMaster addresses.
2. HMaster detects the health status of each HRegionServer using ZooKeeper, and monitors them.
3. HBase supports multiple HMaster nodes (like HDFS NameNodes). When the active HMatser is faulty, the standby HMaster obtains the state information about the entire cluster using ZooKeeper. That is, using ZooKeeper can avoid HBase SPOFs.

Relationship Between ZooKeeper and Kafka

Figure 1-145 shows the relationship between ZooKeeper and Kafka.

Figure 1-145 Relationship between ZooKeeper and Kafka



1. Broker uses ZooKeeper to register broker information and elect a partition leader.
2. The consumer uses ZooKeeper to register consumer information, including the partition list of consumer. In addition, ZooKeeper is used to discover the broker list, establish a socket connection with the partition leader, and obtain messages.

1.4.28.3 ZooKeeper Enhanced Open Source Features

Enhanced Log

In security mode, an ephemeral node is deleted as long as the session that created the node expires. Ephemeral node deletion is recorded in audit logs so that ephemeral node status can be obtained.

Usernames must be added to audit logs for all operations performed on ZooKeeper clients.

On the ZooKeeper client, create a znode, of which the Kerberos principal is **zkcli/hadoop.***<System domain name>***@***<System domain name>*.

For example, open the **<ZOO_LOG_DIR>/zookeeper_audit.log** file. The file content is as follows:

```
2016-12-28 14:17:10,505 | INFO  | CommitProcWorkThread-4 | session=0x12000007553b4903?
user=10.177.223.78,zkcli/hadoop.hadoop.com@HADOOP.COM?ip=10.177.223.78?operation=create znode?
target=ZooKeeperServer?znode=/test1?result=success
2016-12-28 14:17:10,530 | INFO  | CommitProcWorkThread-4 | session=0x12000007553b4903?
user=10.177.223.78,zkcli/hadoop.hadoop.com@HADOOP.COM?ip=10.177.223.78?operation=create znode?
target=ZooKeeperServer?znode=/test2?result=success
2016-12-28 14:17:10,550 | INFO  | CommitProcWorkThread-4 | session=0x12000007553b4903?
user=10.177.223.78,zkcli/hadoop.hadoop.com@HADOOP.COM?ip=10.177.223.78?operation=create znode?
target=ZooKeeperServer?znode=/test3?result=success
2016-12-28 14:17:10,570 | INFO  | CommitProcWorkThread-4 | session=0x12000007553b4903?
user=10.177.223.78,zkcli/hadoop.hadoop.com@HADOOP.COM?ip=10.177.223.78?operation=create znode?
target=ZooKeeperServer?znode=/test4?result=success
2016-12-28 14:17:10,592 | INFO  | CommitProcWorkThread-4 | session=0x12000007553b4903?
user=10.177.223.78,zkcli/hadoop.hadoop.com@HADOOP.COM?ip=10.177.223.78?operation=create znode?
target=ZooKeeperServer?znode=/test5?result=success
2016-12-28 14:17:10,613 | INFO  | CommitProcWorkThread-4 | session=0x12000007553b4903?
user=10.177.223.78,zkcli/hadoop.hadoop.com@HADOOP.COM?ip=10.177.223.78?operation=create znode?
```

```
target=ZooKeeperServer?znode=/test6?result=success
2016-12-28 14:17:10,633 | INFO  | CommitProcWorkThread-4 | session=0x12000007553b4903?
user=10.177.223.78,zkcli/hadoop.hadoop.com@HADOOP.COM?ip=10.177.223.78?operation=create znode?
target=ZooKeeperServer?znode=/test7?result=success
```

The content shows that logs of the ZooKeeper client user **zkcli/hadoop.hadoop.com@HADOOP.COM** are added to the audit log.

User details in ZooKeeper

In ZooKeeper, different authentication schemes use different credentials as users. Based on the authentication provider requirement, any parameter can be considered as users.

Example:

- **SAMLAuthenticationProvider** uses the client principal as a user.
- **X509AuthenticationProvider** uses the user client certificate as a user.
- **IAuthenticationProvider** uses the client IP address as a user.
- A username can be obtained from the custom authentication provider by implementing the **org.apache.zookeeper.server.auth.ExtAuthenticationProvider.getUserName(String)** method. If the method is not implemented, getting the username from the authentication provider instance will be skipped.

Enhanced Open Source Feature: ZooKeeper SSL Communication (Netty Connection)

The ZooKeeper design contains the Nio package and does not support SSL later than version 3.5. To solve this problem, Netty is added to ZooKeeper. Therefore, if you need to use SSL, enable Netty and set the following parameters on the server and client:

The open source server supports only plain text passwords, which may cause security problems. Therefore, such text passwords are no longer used on the server.

- Client
  a. Set **-Dzookeeper.client.secure** in the **zkCli.sh/zkEnv.sh** file to **true** to use secure communication on the client. Then, the client can connect to the secureClientPort on the server.
  b. Set the following parameters in the **zkCli.sh/zkEnv.sh** file to configure the client environment:

Parameter	Description
-Dzookeeper.clientCnxnSocket	Used for Netty communication between clients. Default value: **org.apache.zookeeper.ClientCnxnSocketNetty**
-Dzookeeper.ssl.keyStore.location	Indicates the path for storing the keystore file.

Parameter	Description
-Dzookeeper.ssl.keyStore.password	Encrypts a password.
-Dzookeeper.ssl.trustStore.location	Indicates the path for storing the truststore file.
-Dzookeeper.ssl.trustStore.password	Encrypts a password.
-Dzookeeper.config.crypt.class	Decrypts an encrypted password.
-Dzookeeper.ssl.password.encrypted	Default value: **false** If the keystore and truststore passwords are encrypted, set this parameter to **true**.
-Dzookeeper.ssl.enabled.protocols	Defines the SSL protocols to be enabled for the SSL context.
-Dzookeeper.ssl.exclude.cipher.ext	Defines the list of passwords separated by a comma which should be excluded from the SSL context.

NOTE

The preceding parameters must be set in the **zkCli.sh/zk.Env.sh** file.

- Server
  a. Set **secureClientPort** to **3381** in the **zoo.cfg** file.
  b. Set **zookeeper.serverCnxnFactory** to **org.apache.zookeeper.server.NettyServerCnxnFactory** in the **zoo.cfg** file on the server.
  c. Set the following parameters in the **zoo.cfg** file (in the **zookeeper/conf/zoo.cfg** path) to configure the server environment:

Parameter	Description
ssl.keyStore.location	Path for storing the **keystore.jks** file
ssl.keyStore.password	Encrypts a password.
ssl.trustStore.location	Indicates the path for storing the truststore file.
ssl.trustStore.password	Encrypts a password.
config.crypt.class	Decrypts an encrypted password.

Parameter	Description
ssl.keyStore.password.encrypted	Default value: **false** If this parameter is set to **true**, the encrypted password can be used.
ssl.trustStore.password.encrypted	Default value: **false** If this parameter is set to **true**, the encrypted password can be used.
ssl.enabled.protocols	Defines the SSL protocols to be enabled for the SSL context.
ssl.exclude.cipher.ext	Defines the list of passwords separated by a comma which should be excluded from the SSL context.

d. Start ZKserver and connect the security client to the security port.

- Credential

  The credential used between client and server in ZooKeeper is **X509AuthenticationProvider**. This credential is initialized using the server certificates specified and trusted by the following parameters:

  – zookeeper.ssl.keyStore.location
  – zookeeper.ssl.keyStore.password
  – zookeeper.ssl.trustStore.location
  – zookeeper.ssl.trustStore.password

  NOTE

  If you do not want to use default mechanism of ZooKeeper, then it can be configured with different trust mechanisms as needed.

1.5 Functions

1.5.1 Multi-tenant

Feature Introduction

Modern enterprises' data clusters are developing towards centralization and cloudification. Enterprise-class big data clusters must meet the following requirements:

- Carry data of different types and formats and run jobs and applications of different types (analysis, query, and stream processing).
- Isolate data of a user from that of another user who has demanding requirements on data security, such as a bank or government institute.

The preceding requirements bring the following challenges to the big data cluster:

- Proper allocation and scheduling of resources to ensure stable operating of applications and jobs
- Strict access control to ensure data and service security

Multi-tenant isolates the resources of a big data cluster into resource sets. Users can lease desired resource sets to run applications and jobs and store data. In a big data cluster, multiple resource sets can be deployed to meet diverse requirements of multiple users.

The MRS big data cluster provides a complete enterprise-class big data multi-tenant solution. Multi-tenant is a collection of multiple resources (each resource set is a tenant) in an MRS big data cluster. It can allocate and schedule resources, including computing and storage resources.

Advantages

- Proper resource configuration and isolation

  The resources of a tenant are isolated from those of another tenant. The resource use of a tenant does not affect other tenants. This mechanism ensures that each tenant can configure resources based on service requirements, improving resource utilization.
- Resource consumption measurement and statistics

  Tenants are system resource applicants and consumers. System resources are planned and allocated based on tenants. Resource consumption by tenants can be measured and recorded.
- Ensured data security and access security

  In multi-tenant scenarios, the data of each tenant is stored separately to ensure data security. The access to tenants' resources is controlled to ensure access security.

Enhanced Schedulers

Schedulers are divided into the open source Capacity scheduler and proprietary Superior scheduler.

To meet enterprise requirements and tackle challenges facing the Yarn community in scheduling, develops the Superior scheduler. In addition to inheriting the advantages of the Capacity scheduler and Fair scheduler, this scheduler is enhanced in the following aspects:

- Enhanced resource sharing policy

  The Superior scheduler supports queue hierarchy. It integrates the functions of open source schedulers and shares resources based on configurable policies. In terms of instances, the MRS cluster administrators can use the Superior scheduler to configure an absolute value or percentage policy for queue resources. The resource sharing policy of the Superior scheduler enhances the label scheduling policy of Yarn as a resource pool feature. The nodes in the Yarn cluster can be grouped based on the capacity or service type to ensure that queues can more efficiently utilize resources.
- Tenant-based resource reservation policy

  Resources required by tenants must be ensured for running critical tasks. The Superior scheduler builds a mechanism to support the resource reservation

policy. By doing so, reserved resources can be allocated to the tasks run by the tenant queues in a timely manner to ensure proper task execution.

- Fair sharing among tenants and resource pool users

  The Superior scheduler allows shared resources to be configured for users in a queue. Each tenant may have users with different weights. Heavily weighted users may require more shared resources.

- Ensured scheduling performance in a big cluster

  The Superior scheduler receives heartbeats from each NodeManager and saves resource information in memory, which enables the scheduler to control cluster resource usage globally. The Superior scheduler uses the push scheduling model, which makes the scheduling more precise and efficient and remarkably improves cluster resource utilization. Additionally, the Superior scheduler delivers excellent performance when the interval between NodeManager heartbeats is long and prevents heartbeat storms in big clusters.

- Priority policy

  If the minimum resource requirement of a service cannot be met after the service obtains all available resources, a preemption occurs. The preemption function is disabled by default.

1.5.2 Security Hardening

MRS is a platform for massive data management and analysis and has high security. MRS protects user data and service running from the following aspects:

- Network isolation

  The entire system is deployed in a VPC on the public cloud to provide an isolated network environment and ensure service and management security of the cluster. By combining the subnet division, route control, and security group functions of VPC, MRS provides a secure and reliable isolated network environment.

- Resource isolation

  MRS supports resource deployment and isolation of physical resources in dedicated zones. You can flexibly combine computing and storage resources, such as dedicated computing resources + shared storage resources, shared computing resources + dedicated storage resources, and dedicated computing resources + dedicated storage resources.

- Host security

  MRS can be integrated with public cloud security services, including Vulnerability Scan Service (VSS), Host Security Service (HSS), Web Application Firewall (WAF), Cloud Bastion Host (CBH), and Web Tamper Protection (WTP). The following measures are provided to improve security of the OS and ports:

  - Security hardening of OS kernels
  - OS patch update
  - OS permission control
  - OS port management
  - OS protocol and port attack defense

- Application security

  The following measures are used to ensure normal running of big data services:

  - Identification and authentication
  - Web application security
  - Access control
  - Audit security
  - Password security

- Data security

  The following measures are provided to ensure the confidentiality, integrity, and availability of massive amounts of user data:

  - Disaster recovery: MRS supports data backup to OBS and cross-region high reliability.
  - Backup: MRS supports backup of DBService, NameNode, and LDAP metadata and backup of HDFS and HBase service data.

- Data integrity

  Data is verified to ensure its integrity during storage and transmission.

  - CRC32C is used by default to verify the correctness of user data stored in HDFS.
  - DataNodes of HDFS store the verified data. If the data transmitted from a client is abnormal (incomplete), DataNodes report the abnormality to the client, and the client rewrites the data.
  - The client checks data integrity when reading data from a DataNode. If the data is incomplete, the client will read data from another DataNode.

- Data confidentiality

  Based on Apache Hadoop, the distributed file system of MRS supports encrypted storage of files to prevent sensitive data from being stored in plaintext, improving data security. Applications need only to encrypt specified sensitive data. Services are not affected during the encryption process. Based on file system data encryption, Hive provides table-level encryption and HBase provides column family-level encryption. Sensitive data can be encrypted and stored after you specify an encryption algorithm during table creation.

  Encrypted storage and access control of data are used to ensure user data security.

  - HBase stores service data to the HDFS after compression. Users can configure the AES and SMS4 encryption algorithm to encrypt data.
  - All the components allow access permissions to be set for local data directories. Unauthorized users are not allowed to access data.
  - All cluster user information is stored in ciphertext.

- Security authentication

  - Uses a unified user- and role-based authentication system as well as an account- and role-based access control (RBAC) model to centrally control user permissions and batch manage user authorization.

  - Employs Lightweight Directory Access Protocol (LDAP) as an account management system and performs the Kerberos authentication on accounts.
  - Provides the single sign-on (SSO) function that centrally manages and authenticates MRS system and component users.
  - Audits users who have logged in to Manager.

1.5.3 Easy Access to Web UIs of Components

Big data components have their own web UIs to manage their own systems. However, you cannot easily access the web UIs due to network isolation. For example, to access the HDFS web UI, you need to create an ECS to remotely log in to the web UI. This makes the UI access complex and unfriendly.

MRS provides an EIP-based secure channel for you to easily access the web UIs of components. This is more convenient than binding an EIP by yourself, and you can access the web UIs with a few clicks, avoiding the steps for logging in to a VPC, adding security group rules, and obtaining a public IP address. For the Hadoop, Spark, HBase, and Hue components in analysis clusters and the Storm component in streaming clusters, you can quickly access their web UIs from the entries on Manager.

1.5.4 Reliability Enhancement

Based on Apache Hadoop open source software, MRS optimizes and improves the reliability and performance of main service components.

System Reliability

- HA for all management nodes

  In the Hadoop open source version, data and compute nodes are managed in a distributed system, in which a single point of failure (SPOF) does not affect the operation of the entire system. However, a SPOF may occur on management nodes running in centralized mode, which becomes the weakness of the overall system reliability.

  MRS provides similar double-node mechanisms for all management nodes of the service components, such as Manager, HDFS NameNodes, HiveServers, HBase HMasters, Yarn ResourceManagers, KerberosServers, and LdapServers. All of them are deployed in active/standby mode or configured with load sharing, effectively preventing SPOFs from affecting system reliability.

- Reliability guarantee in case of exceptions

  By reliability analysis, the following measures to handle software and hardware exceptions are provided to improve the system reliability:

  - After power supply is restored, services are running properly regardless of a power failure of a single node or the whole cluster, ensuring data reliability in case of unexpected power failures. Key data will not be lost unless the hard disk is damaged.
  - Health status checks and fault handling of the hard disk do not affect services.
  - The file system faults can be automatically handled, and affected services can be automatically restored.

  - The process and node faults can be automatically handled, and affected services can be automatically restored.
  - The network faults can be automatically handled, and affected services can be automatically restored.
- Data backup and restoration

  MRS provides full backup, incremental backup, and restoration functions based on service requirements, preventing the impact of data loss and damages on services and ensuring fast system restoration in case of exceptions.

  - Automatic backup

    MRS provides automatic backup for data on Manager. Based on the customized backup policy, data on clusters, including LdapServer and DBService data, can be automatically backed up.
  - Manual backup

    You can also manually back up data of the cluster management system before the capacity expansion and patch installation to recover the cluster management system functions upon faults.

    To improve the system reliability, data on Manager and HBase is backed up to a third-party server manually.

Node Reliability

- OS health status monitoring

  MRS periodically collects OS hardware resource usage data, including usage of CPUs, memory, hard disks, and network resources.
- Process health status monitoring

  MRS checks the status of service instances and health indicators of service instance processes, enabling you to know the health status of processes in a timely manner.
- Automatic disk troubleshooting

  MRS is enhanced based on the open source version. It can monitor the status of hardware and file systems on all nodes. If an exception occurs, the corresponding partitions will be removed from the storage pool. If a disk is faulty and replaced, a new hard disk will be added for running services. In this case, maintenance operations are simplified. Replacement of faulty disks can be completed online. In addition, users can set hot backup disks to reduce the faulty disk restoration time and improve the system reliability.
- LVM configuration for node disks

  MRS allows you to configure Logic Volume Management (LVM) to plan multiple disks as a logical volume group. Configuring LVM can avoid uneven usage of disks. It is especially important to ensure even usage of disks on components that can use multiple disk capabilities, such as HDFS and Kafka. In addition, LVM supports disk capacity expansion without re-attaching, preventing service interruption.

Data Reliability

MRS can use the anti-affinity node groups and placement group capabilities provided by ECS and the rack awareness capability of Hadoop to redundantly

distribute data to multiple physical host machines, preventing data loss caused by physical hardware failures.

1.5.5 Job Management

The job management function provides an entry for you to submit jobs in a cluster, including MapReduce, Spark, HiveQL, and SparkSQL jobs. MRS works with Data Lake Factory (DLF) to provide a one-stop big data collaboration development environment and fully-managed big data scheduling capabilities, helping you effortlessly build big data processing centers.

DLF allows you to develop and debug MRS HiveQL/SparkSQL scripts online and develop MRS jobs by performing drag-and-drop operations to migrate and integrate data between MRS and more than 20 heterogeneous data sources. Powerful job scheduling and flexible monitoring and alarming help you easily manage data and job O&M.

1.5.6 Bootstrap Actions

Feature Introduction

MRS provides standard elastic big data clusters on the cloud. Nine big data components, such as Hadoop and Spark, can be installed and deployed. Currently, standard cloud big data clusters cannot meet all user requirements, for example, in the following scenarios:

- Common operating system configurations cannot meet data processing requirements, for example, increasing the maximum number of system connections.
- Software tools or running environments need to be installed, for example, Gradle and dependency R language package.
- Big data component packages need to be modified based on service requirements, for example, modifying the Hadoop or Spark installation package.
- Other big data components that are not supported by MRS need to be installed.

To meet the preceding customization requirements, you can manually perform operations on the existing and newly added nodes. The overall process is complex and error-prone. In addition, manual operations cannot be traced, and data cannot be processed immediately after creating a cluster based on your demand.

Therefore, MRS supports custom bootstrap actions that enable you to run scripts on a specified node before or after a cluster component is started. You can run bootstrap actions to install third-party software that is not supported by MRS, modify the cluster running environment, and perform other customizations. If you choose to run bootstrap actions when expanding a cluster, the bootstrap actions will be run on the newly added nodes in the same way. MRS runs the script you specify as user **root**. You can run the **su - *xxx*** command in the script to switch the user.

Customer Benefits

You can use the custom bootstrap actions to flexibly and easily configure your dedicated clusters and customize software installation.

1.5.7 Enterprise Project Management

An enterprise project is a cloud resource management mode. Enterprise Management provides users with comprehensive management of cloud-based resources, personnel, permissions, and finances. Common management consoles are oriented to the control and configuration of individual cloud products. The Enterprise Management console, in contrast, is more focused on resource management. It is designed to help enterprises manage cloud-based resources, personnel, permissions, and finances, in a hierarchical management manner, such as management of companies, departments, and projects.

MRS allows users who have enabled Enterprise Project Management Service (EPS) to configure enterprise projects for a cluster during cluster creation and use EPS to manage MRS resources by group.

- The users can manage multiple resources by group.
- The users can view resource information and expenditure details of enterprise projects.
- The users can control access permissions at the enterprise project level.
- The users can view detailed financial information by enterprise project, including orders, expenditure summary, and expenditure details.

1.5.8 Metadata

MRS provides multiple metadata storage methods. When deploying Hive and Ranger during MRS cluster creation, select one of the following storage modes as required:

- **Local**: Metadata is stored in the local GaussDB of a cluster. When the cluster is deleted, the metadata is also deleted. To retain the metadata, manually back up the metadata in the database in advance.
- **Data Connection**: Metadata is stored in the associated PostgreSQL or MySQL database of the RDS service in the same VPC and subnet as the current cluster. When the cluster is terminated, the metadata is not deleted. Multiple MRS clusters can share the metadata.

NOTE

Hive in MRS 1.9.*x* or later allows you to specify a metadata storage method.

Ranger in MRS 1.9.*x* allows metadata to be stored only in the associated MySQL database of the RDS service.

1.5.9 Cluster Management

1.5.9.1 Cluster Lifecycle Management

MRS supports cluster lifecycle management, including creating and terminating clusters.

- Creating a cluster: After you specify a cluster type, components, number of nodes of each type, VM specifications, AZ, VPC, and authentication information, MRS automatically creates a cluster that meets the configuration requirements. You can run customized scripts in the cluster. In addition, you can create clusters of different types for multiple application scenarios, such as Hadoop analysis clusters, HBase clusters, and Kafka clusters. The big data platform supports heterogeneous cluster deployment. That is, VMs of different specifications can be combined in a cluster based on CPU types, disk capacities, disk types, and memory sizes. Various VM specifications can be mixed in a cluster.
- Terminating a cluster: You can terminate a cluster that is no longer needed (including data and configurations in the cluster). MRS will delete all resources related to the cluster.

Creating a Cluster

On the MRS management console, you can create an MRS cluster. You can select a region and cloud resource specifications to create an MRS cluster that is suitable for enterprise services in one click. MRS automatically installs and deploys the enterprise-level big data platform and optimizes parameters based on the selected cluster type, version, and node specifications.

MRS provides you with fully managed big data clusters. When creating a cluster, you can set a VM login mode (password or key pair). You can use all resources of the created MRS cluster. In addition, MRS allows you to deploy a big data cluster on only two ECSs with 4 vCPUs and 8 GB memory, providing more flexible choices for testing and development.

MRS clusters are classified into analysis, streaming, and hybrid clusters.

- Analysis cluster: is used for offline data analysis and provides Hadoop components.
- Streaming cluster: is used for streaming tasks and provides stream processing components.
- Hybrid cluster: is used for not only offline data analysis but also streaming processing, and provides Hadoop components and stream processing components.
- Custom: You can flexibly combine required components (MRS 3.x and later versions) based on service requirements.

MRS cluster nodes are classified into Master, Core, and Task nodes.

- Master node: management node in a cluster. Master processes of a distributed system, Manager, and databases are deployed on Master nodes. Master nodes cannot be scaled out. The processing capability of Master nodes determines the upper limit of the management capability of the entire cluster. MRS supports scale-up of Master node specifications to provide support for management of a larger cluster.
- Core node: used for both storage and computing and can be scaled in or out. Since Core nodes bear data storage, there are many restrictions on scale-in to prevent data loss and auto scaling cannot be performed.
- Task node: used only for computing only and can be scaled in or out. Task nodes bear only computing tasks. Therefore, auto scaling can be performed.

You can create a cluster in two modes: custom create a cluster and quick create a cluster.

- **Custom config**: On the **Custom Config** page, you can flexibly configure cluster parameters based on application scenarios, such as ECS specifications to better suit your service requirements.
- **Quick config**: On the **Quick Config** page, you can quickly create a cluster based on application scenarios, improving cluster configuration efficiency. Currently, Hadoop analysis clusters, HBase clusters, and Kafka clusters are available for your quick creation.
  - Hadoop analysis cluster: uses components in the open-source Hadoop ecosystem to analyze and query vast amounts of data. For example, use Yarn to manage cluster resources, Hive and Spark to provide offline storage and computing of large-scale distributed data, Spark Streaming and Flink to offer streaming data computing, and Presto to enable interactive queries, and Tez to provide a distributed computing framework of directed acyclic graphs (DAGs).
  - HBase cluster: uses Hadoop and HBase components to provide a column-oriented distributed cloud storage system featuring enhanced reliability, excellent performance, and elastic scalability. It applies to the storage and distributed computing of massive amounts of data. You can use HBase to build a storage system capable of storing TB- or even PB-level data. With HBase, you can filter and analyze data with ease and get responses in milliseconds, rapidly mining data value.
  - Kafka cluster: uses Kafka and Storm to provide an open source message system with high throughput and scalability. It is widely used in scenarios such as log collection and monitoring data aggregation to implement efficient streaming data collection and real-time data processing and storage.

Terminating a Cluster

MRS allows you to terminate a cluster when it is no longer needed. After the cluster is terminated, all cloud resources used by the cluster will be released. Before terminating a cluster, you are advised to migrate or back up data. Terminate the cluster only when no service is running in the cluster or the cluster is abnormal and cannot provide services based on O&M analysis. If data is stored on EVS disks or pass-through disks in a big data cluster, the data will be deleted after the cluster is terminated. Therefore, exercise caution when terminating a cluster.

1.5.9.2 Manually Scale Out/In a Cluster

The processing capability of a big data cluster can be horizontally expanded by adding nodes. If the cluster scale does not meet service requirements, you can manually scale out or scale in the cluster. MRS intelligently selects the node with the least load or the minimum amount of data to be migrated for scale-in. The node to be scaled in will not receive new tasks, and continues to execute the existing tasks. At the same time, MRS copies its data to other nodes and the node is decommissioned. If the tasks on the node cannot be completed after a long time, MRS migrates the tasks to other nodes, minimizing the impact on cluster services.

Scaling Out a Cluster

Currently, you can add Core or Task nodes to scale out a cluster to handle peak service loads. The capacity expansion of an MRS cluster node does not affect the services of the existing cluster.

Scaling In a Cluster

You can reduce the number of Core or Task nodes to scale in a cluster so that MRS delivers better storage and computing capabilities at lower O&M costs based on service requirements. After you scale in an MRS cluster, MRS automatically selects nodes that can be scaled in based on the type of services installed on the nodes.

During the scale-in of Core nodes, data on the original nodes is migrated. If the data location is cached, the client automatically updates the location information, which may affect the latency. Node scale-in may affect the response duration of the first access to some HBase on HDFS data. You can restart HBase or disable or enable related tables to avoid this problem.

Task nodes do not store cluster data. They are compute nodes and do not involve migration of data on the nodes.

1.5.9.3 Auto Scaling

Feature Introduction

More and more enterprises use technologies such as Spark and Hive to analyze data. Processing a large amount of data consumes huge resources and costs much. Typically, enterprises regularly analyze data in a fixed period of time every day rather than all day long. To meet enterprises' requirements, MRS provides the auto scaling function to apply for extra resources during peak hours and release resources during off-peak hours. This enables users to use resources on demand and focus on core business at lower costs.

In big data applications, especially in periodic data analysis and processing scenarios, cluster computing resources need to be dynamically adjusted based on service data changes to meet service requirements. The auto scaling function of MRS enables clusters to be elastically scaled out or in based on cluster loads. In addition, if the data volume changes regularly and you want to scale out or in a cluster before the data volume changes, you can use the MRS resource plan feature.

MRS supports two types of auto scaling policies: auto scaling rules and resource plans

- Auto scaling rules: You can increase or decrease Task nodes based on real-time cluster loads. Auto scaling will be triggered when the data volume changes but there may be some delay.
- Resource plans: If the data volume changes periodically, you can create resource plans to resize the cluster before the data volume changes, thereby avoiding a delay in increasing or decreasing resources.

Both auto scaling rules and resource plans can trigger auto scaling. You can configure both of them or configure one of them. Configuring both resource plans

and auto scaling rules improves the cluster node scalability to cope with occasionally unexpected data volume peaks.

In some service scenarios, resources need to be reallocated or service logic needs to be modified after cluster scale-out or scale-in. If you manually scale out or scale in a cluster, you can log in to cluster nodes to reallocate resources or modify service logic. If you use auto scaling, MRS enables you to customize automation scripts for resource reallocation and service logic modification. Automation scripts can be executed before and after auto scaling and automatically adapt to service load changes, all of which eliminates manual operations. In addition, automation scripts can be fully customized and executed at various moments, which can meet your personalized requirements and improve auto scaling flexibility.

Customer Benefits

MRS auto scaling provides the following benefits:

- Reducing costs

  Enterprises do not analyze data all the time but perform a batch data analysis in a specified period of time, for example, 03:00 a.m. The batch analysis may take only two hours.

  The auto scaling function enables enterprises to add nodes for batch analysis and automatically releases the nodes after completion of the analysis, minimizing costs.

- Meeting instant query requirements

  Enterprises usually encounter instant analysis tasks, for example, data reports for supporting enterprise decision-making. As a result, resource consumption increases sharply in a short period of time. With the auto scaling function, computing nodes can be added for emergent big data analysis, avoiding a service breakdown due to insufficient computing resources. You do not need to purchase extra resources. After the emergency event ends, MRS can automatically release the nodes.

- Focusing on core business

  It is difficult for developers to determine resource consumption on the big data secondary development platform because of complex query analysis conditions (such as global sorting, filtering, and merging) and data complexity, for example, uncertainty of incremental data. As a result, estimating the computing volume is difficult. MRS's auto scaling function enable developers to focus on service development without the need for resource estimation.

1.5.9.4 Task Node Creation

Feature Introduction

Task nodes can be created and used for computing only. They do not store persistent data and are the basis for implementing auto scaling.

Customer Benefits

When MRS is used only as a computing resource, Task nodes can be used to reduce costs and facilitate cluster node scaling, flexibly meeting users' requirements for increasing or decreasing cluster computing capabilities.

Application Scenarios

When the data volume change is small in a cluster but the cluster's service processing capabilities need to be remarkably and temporarily improved, add Task nodes to address the following situations:

- The number of temporary services is increased, for example, report processing at the end of the year.
- Long-term tasks need to be completed in a short time, for example, some urgent analysis tasks.

1.5.9.5 Scaling Up Master Node Specifications

MRS provides Manager for managing clusters and services in the clusters, such as NameNodes of HDFS, ResourceManagers of Yarn, and Manager management services of MRS, are deployed on the Master node of the clusters.

With the rollout of new services, a cluster scale increases continuously, and Master nodes bear more and more loads. Enterprise users are faced with the problem that CPU loads are too high and memory usage exceeds the threshold. Generally, in an on-premises big data cluster, you need to migrate data and purchase hardware with advanced configurations to scale up the Master node specifications. MRS leverages the advantages of cloud services to enable you to scale up Master node specifications in one click. During the scale-up, the active/standby HA mode of the Master nodes ensures that existing services are not interrupted.

For details about how to scale up the Master node specifications, see **Scaling Up Master Node Specifications**.

1.5.9.6 Isolating a Host

When detecting that a host is abnormal or faulty and cannot provide services or affects cluster performance, you can exclude the host from the available nodes in the cluster temporarily so that the client can access other available nodes. In scenarios where patches are to be installed in a cluster, you can also exclude a specified node from patch installation. Only non-management nodes can be isolated.

After a host is isolated, all role instances on the host will be stopped, and you cannot start, stop, or configure the host and all instances on the host. In addition, after a host is isolated, statistics about the monitoring status and metric data of hardware and instances on the host cannot be collected or displayed.

1.5.9.7 Managing Tags

Tags are cluster identifiers. Adding tags to clusters can help you identify and manage your cluster resources. By associating with Tag Management Service (TMS), MRS allows users with a large number of cloud resources to tag cloud resources, quickly search for cloud resources with the same tag attribute, and

perform unified management operations such as review, modification, and deletion, facilitating unified management of big data clusters and other cloud resources.

You can add a maximum of 10 tags to a cluster when creating the cluster or add them on the details page of the created cluster.

1.5.10 Cluster O&M

Alarm Management

MRS can monitor big data clusters in real time and identify system health status based on alarms and events. In addition, MRS allows you to customize monitoring and alarm thresholds to focus on the health status of each metric. When monitoring data reaches the alarm threshold, the system triggers an alarm.

MRS can also interconnect with the message service system of the Simple Message Notification (SMN) service to push alarm information to users by SMS message or email. For details, see **Message Notification**.

Patch Management

MRS supports cluster patching operations and will release patches for open source big data components in a timely manner. On the MRS cluster management page, you can view patch release information related to running clusters, including the detailed description of the resolved issues and impacts. You can determine whether to install a patch based on the service running status. One-click patch installation involves no manual intervention, and will not cause service interruption through rolling installation, ensuring long-term availability of the clusters.

MRS can display the detailed patch installation process. Patch management also supports patch uninstallation and rollback.

NOTE

MRS 3.x or later does not support patch management on the management console.

O&M Support

Cluster resources provided by MRS belong to users. Generally, when O&M personnel's support is required for troubleshooting of a cluster, O&M personnel cannot directly access the cluster. To better serve customers, MRS provides the following two methods to improve communication efficiency during fault locating:

- Log sharing: You can initiate log sharing on the MRS management console to share a specified log scope with O&M personnel, so that O&M personnel can locate faults without accessing the cluster.
- O&M authorization: If a problem occurs when you use an MRS cluster, you can initiate O&M authorization on the MRS management console. O&M personnel can help you quickly locate the problem, and you can revoke the authorization at any time.

Health Check

MRS provides automatic inspection on system running environments for you to check and audit system running health status in one click, ensuring proper system running and lowering system operation and maintenance costs. After viewing inspection results, you can export reports for archiving and fault analysis.

1.5.11 Message Notification

Feature Introduction

The following operations are often performed during the running of a big data cluster:

- Big data clusters often change, for example, cluster scale-out and scale-in.
- When a service data volume changes abruptly, auto scaling will be triggered.
- After related services are stopped, a big data cluster needs to be stopped.

To immediately notify you of successful operations, cluster unavailability, and node faults, MRS uses Simple Message Notification (SMN) to send notifications to you through SMS and emails, facilitating maintenance.

Customer Benefits

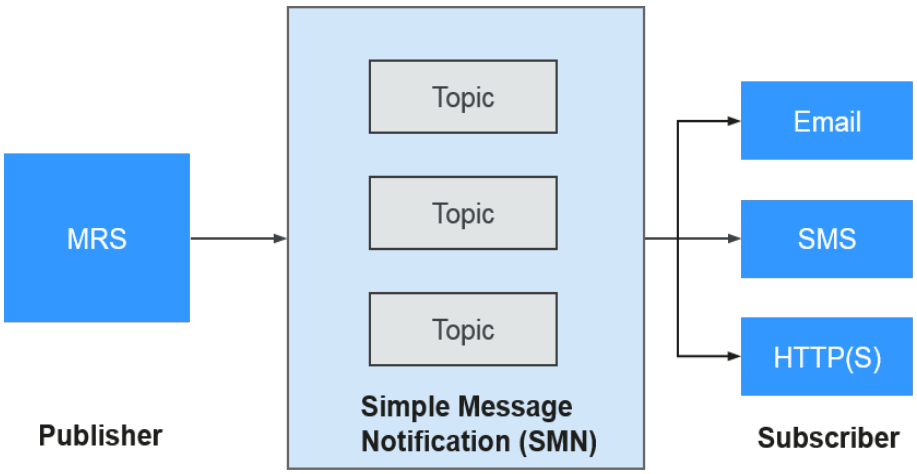
After configuring SMN, you can receive MRS cluster health status, updates, and component alarms through SMS or emails in real time. MRS sends real-time monitoring and alarm notification to help you easily perform O&M and efficiently deploy big data services.

Feature Description

MRS uses SMN to provide one-to-multiple message subscription and notification over a variety of protocols.

You can create a topic and configure topic policies to control publisher and subscriber permissions on the topic. MRS sends cluster messages to the topic to which you have permission to publish messages. Then, all subscribers who subscribe to the topic can receive cluster updates and component alarms through SMS and emails.

Figure 1-146 Implementation process



1.6 Constraints

Before using MRS, ensure that you have read and understand the following restrictions.

- MRS clusters must be created in VPC subnets.
- You are advised to use any of the following browsers to access MRS:
  - Google Chrome: 36.0 or later
  - Internet Explorer: 9.0 or later

    If you use Internet Explorer 9.0, you may fail to log in to the MRS management console because user **Administrator** is disabled by default in some Windows systems, such as Windows 7 Ultimate. Internet Explorer automatically selects a system user for installation. As a result, Internet Explorer cannot access the management console. Reinstall Internet Explorer 9.0 or later (recommended) or run Internet Explorer 9.0 as user **Administrator**.
- When you create an MRS cluster, you can select **Auto create** from the drop-down list of **Security Group** to create a security group or select an existing security group. After the MRS cluster is created, do not delete or modify the used security group. Otherwise, a cluster exception may occur.
- To prevent illegal access, only assign access permission for security groups used by MRS where necessary.
- Do not perform the following operations because they will cause cluster exceptions:
  - Shutting down, restarting, or deleting MRS cluster nodes displayed in ECS, changing or reinstalling their OS, or modifying their specifications.
  - Deleting the existing processes, applications or files on cluster nodes.
- If a cluster exception occurs when no incorrect operations have been performed, contact technical support engineers. They will ask you for your password and then perform troubleshooting.
- Plan disks of cluster nodes based on service requirements. If you want to store a large volume of service data, add EVS disks or storage space to prevent insufficient storage space from affecting node running.
- The cluster nodes store only users' service data. Non-service data can be stored in the OBS or other ECS nodes.
- The cluster nodes only run MRS cluster programs. Other client applications or user service programs are deployed on separate ECS nodes.
- The storage capacity of MRS cluster nodes (including master, core, and task nodes) can be expanded only by attaching new disks instead of expanding capacity of the existing disks.
- If the cluster is still used to execute tasks or modify configurations after a master node in the cluster has been stopped, and other master nodes in the cluster are stopped before the stopped master node is started after the task execution or configuration modification, data may be lost due to an active/standby switchover. In this scenario, after the task is executed or the configuration is modified, start the master node that has been stopped and

then stop all nodes. If all nodes in the cluster have been stopped, start them in the reverse order of node shutdown.

- The Capacity and Superior scheduler switchover is complete when the MRS cluster is used, while configuration synchronization is not complete. Configure synchronization again based on the new scheduler if necessary.

1.7 Technical Support

MRS is a one-stop big data platform that provides enterprise-class clusters on the cloud. Tenants can fully control clusters and easily run big data components such as Hadoop, Hive, Spark, HBase, Kafka, and Flink. In addition, MRS helps enterprises quickly build a system to process massive amounts of data and discover new value and business opportunities in real time or in non-real time.

Maintenance Policy Statement

MRS provides tenants with fully controllable clusters and semi-hosting cloud services. By default, cloud services do not have permissions to perform operations on the clusters. Tenants are responsible for routine cluster O&M and management. They can contact technical support team for help if any technical issues occur, excluding those not related to MRS, for example, how to build an application system based on the big data platform.

Technical Support Scope

- The MRS console provides the following functions:
  - Creating, deleting, and scaling in or out a cluster
  - Managing cluster jobs
  - Managing cluster alarms
  - Managing cluster patches
  - Managing IAM users
  - Managing external APIs
- MRS supports vulnerability analysis of open-source components, such as impact analysis and fixing suggestions. It enables tenants to evaluate the impact of vulnerabilities on services and fix the vulnerabilities.

1.8 Permissions Management

If you need to assign different permissions to employees in your enterprise to access your MRS resources in the cloud, IAM is a good choice for fine-grained permissions management. IAM provides identity authentication, permissions management, and access control, helping you secure access to your cloud resources.

With IAM, you can create IAM users under your cloud account, and assign permissions to these users to control their access to specific resources. For example, some software developers in your enterprise need to use MRS resources but must not delete MRS clusters or perform any high-risk operations. To achieve this goal, you can create IAM users for the software developers and grant them only the permissions required for using MRS cluster resources.

If your cloud account does not require individual IAM users for permissions management, skip this section.

IAM is free of charge.

MRS Permission Description

By default, new IAM users do not have any permissions. To assign permissions to a user, add the user to one or more groups and assign permissions policies or roles to these groups. The user then inherits permissions from the groups it is a member of and can perform specified operations on cloud services based on the permissions.

MRS is a project-level service deployed and accessed in specific physical regions. To assign permissions to a user group, specify **Scope** as **Region-specific projects** and select projects in the corresponding region for the permissions to take effect. If **All projects** is selected, the permissions will take effect for the user group in all region-specific projects. When accessing MRS, the users need to switch to a region where they have been authorized to use the MRS service.

You can grant users permissions by using roles and policies.

- Roles: A type of coarse-grained authorization mechanism that defines permissions related to user responsibilities. This mechanism provides only a limited number of service-level roles for authorization. When using roles to grant permissions, you need to also assign other roles on which the permissions depend to take effect. However, roles are not an ideal choice for fine-grained authorization and secure access control.
- Policies: A type of fine-grained authorization mechanism that defines permissions required to perform operations on specific cloud resources under certain conditions. This mechanism allows for more flexible policy-based authorization, meeting requirements for secure access control. For example, you can grant MRS users only the permissions for performing specified operations on MRS clusters, such as creating a cluster and querying a cluster list rather than deleting a cluster. Most policies define permissions based on APIs.

Table 1-29 lists all the system policies supported by MRS.

Table 1-29 MRS system policies

Policy	Description	Type
MRS FullAccess	Administrator permissions for MRS. Users granted these permissions can operate and use all MRS resources.	Fine-grained policy
MRS CommonOperations	Common user permissions for MRS. Users granted these permissions can use MRS but cannot add or delete resources.	Fine-grained policy
MRS ReadOnlyAccess	Read-only permission for MRS. Users granted these permissions can only view MRS resources.	Fine-grained policy

Policy	Description	Type
MRS Administrator	Permissions: • All operations on MRS • Users with permissions of this policy must also be granted permissions of the **Tenant Guest**, **Server Administrator**, and **BSS Administrator** policies.	RBAC policy

Table 1-30 lists the common operations supported by each system-defined policy or role of MRS. Select the policies or roles as required.

Table 1-30 Common operations supported by each system-defined policy

Operation	MRS FullAccess	MRS CommonOperations	MRS ReadOnlyAccess	MRS Administrator
Creating a cluster	√	x	x	√
Resizing a cluster	√	x	x	√
Upgrading node specifications	√	x	x	√
Deleting a cluster	√	x	x	√
Querying cluster details	√	√	√	√
Querying a cluster list	√	√	√	√
Configuring an auto scaling rule	√	x	x	√
Querying a host list	√	√	√	√
Querying operation logs	√	√	√	√

Operation	MRS FullAccess	MRS CommonOperations	MRS ReadOnlyAccess	MRS Administrator
Creating and executing a job	√	√	x	√
Stopping a job	√	√	x	√
Deleting a single job	√	√	x	√
Deleting jobs in batches	√	√	x	√
Querying job details	√	√	√	√
Querying a job list	√	√	√	√
Creating a folder	√	√	x	√
Deleting a file	√	√	x	√
Querying a file list	√	√	√	√
Operating cluster tags in batches	√	√	x	√
Creating a single cluster tag	√	√	x	√
Deleting a single cluster tag	√	√	x	√
Querying a resource list by tag	√	√	√	√
Querying cluster tags	√	√	√	√
Accessing Manager	√	√	x	√

Operation	MRS FullAccess	MRS CommonOperations	MRS ReadOnlyAccess	MRS Administrator
Querying a patch list	√	√	√	√
Installing a patch	√	√	x	√
Uninstalling a patch	√	√	x	√
Authorizing O&M channels	√	√	x	√
Sharing O&M channel logs	√	√	x	√
Querying an alarm list	√	√	√	√
Subscribing to alarm notification	√	√	x	√
Submitting an SQL statement	√	√	x	√
Querying SQL results	√	√	x	√
Canceling an SQL execution task	√	√	x	√

1.9 Related Services

Relationships with Other Services

Table 1-31 Relationships with other services

Service	Relationships
Virtual Private Cloud (VPC)	MRS clusters are created in the subnets of a VPC. VPCs provide a secure, isolated, and logical network environment for your MRS clusters.
Object Storage Service (OBS)	OBS stores the following user data: • MRS job input data, such as user programs and data files • MRS job output data, such as result files and log files of jobs In MRS clusters, HDFS, Hive, MapReduce, YARN, Spark, Flume, and Loader can import or export data from OBS. MRS uses the parallel file system of OBS to provide services.
Elastic Cloud Server (ECS)	MRS uses elastic cloud servers (ECSs) as cluster nodes.
Relational Database Service (RDS)	RDS stores MRS system running data, including MRS cluster metadata.
Identity and Access Management (IAM)	IAM provides authentication for MRS.
Simple Message Notification (SMN)	MRS uses SMN to provide one-to-multiple message subscription and notification over a variety of protocols.
Cloud Trace Service (CTS)	CTS provides you with operation records of MRS resource operation requests and request results for querying, auditing, and backtracking.

Table 1-32 MRS operations recorded by CTS

Operation	Resource Type	Trace Name
Creating a cluster	cluster_mrs	createCluster
Deleting a cluster	cluster_mrs	deleteCluster
Expanding a cluster	cluster_mrs	scaleOutCluster
Shrinking a cluster	cluster_mrs	scaleInCluster

After you enable CTS, the system starts recording operations on cloud resources. You can view operation records of the last 7 days on the CTS management

console. For details, see **Cloud Trace Service** > **Getting Started** > **Querying Real-Time Traces**.

1.10 Common Concepts

HBase Table

An HBase table is a three-dimensional map comprised of one or more columns or rows of data.

Column

Column is a dimension of an HBase table. The column name is in the format of *<family>*:*<label>*, where *<family>* and *<label>* can be any combination of characters. An HBase table consists of a set of column families. Each column in the HBase table belongs to a column family.

Column Family

A column family is a collection of columns stored in the HBase schema. To create columns, you must create a column family first. A column family organizes data with the same property in HBase. Each row of data in the same column family is stored on the same server. Each column family can be one attribute, such as compressed packages, timestamps, and data block cache.

MemStore

MemStore is a core of HBase storage. When the amount of data stored in WAL reaches the upper limit, the data is loaded to MemStore for sorting and storage.

RegionServer

RegionServer is a service running on each DataNode in the HBase cluster. It is responsible for serving and managing regions, uploading the load information of regions, and managing distributed master nodes.

Timestamp

A timestamp is a 64-bit integer used to index different versions of the same data. A timestamp can be automatically assigned by HBase when data is written or assigned by users.

Store

Store is a core of HBase storage. A Store hosts one MemStore and multiple StoreFiles. A Store corresponds to a column family of a table in a region.

Index

An index is a data structure that improves the efficiency of data retrieval in a database table. One or more columns in a database table can be used for fast random retrieval of data and efficient access to ordered records.

Coprocessor

A coprocessor is an interface provided by HBase for implementing calculation logic on RegionServer. Coprocessors are classified into system coprocessors and table coprocessors. The former can import all data tables on RegionServer, and the latter can process a specified table.

Block Pool

A block pool is a collection of blocks that belong to a single namespace. DataNodes store blocks from all block pools in a cluster. Each block pool is managed independently, which allows a namespace to generate an ID for a new block without relying on other namespaces. If one NameNode is invalid, the DataNode can still provide services for other NameNodes in the cluster.

DataNode

A DataNode is a worker node in the HDFS cluster. Scheduled by the client or NameNode, DataNodes store and retrieve data and periodically report file blocks to NameNodes.

File Block

A file block is the minimum logical unit stored in the HDFS. Each HDFS file is stored in one or more file blocks. All file blocks are stored in DataNodes.

Block Replica

A replica is a block copy stored in HDFS. A file block stores multiple replicas for system availability and fault tolerance.

Namespace Volume

A namespace volume is an independent management unit that consists of a namespace and its block pool. When a NameNode or namespace is deleted, the related block pools on the DataNode are also deleted. During a cluster upgrade, each namespace volume is upgraded as a whole.

NodeManager

NodeManager executes applications, monitors the usage of resources (including CPUs, memory, disks, and network resources) of applications, and reports the resource usage to the ResourceManager.

ResourceManager

ResourceManager schedules resources required by applications. It provides a scheduling plug-in for allocating cluster resources to multiple queues and applications. The scheduling plug-in schedules resources based on existing capabilities or using the fair scheduling model.

Partition

Each topic can be divided into multiple partitions. Each partition corresponds to an appendant log file whose sequence is fixed.

Follower

A follower processes read requests and works with a leader to process write requests. It can also be used as a leader backup. When the leader is faulty, a follower is elected to take over the leader's workload to prevent a single point of failure.

Observer

Observers do not take part in voting for election and write requests. They only process read requests and forward write requests to the leader, improving processing efficiency.

Leader

A leader of the ZooKeeper clusters is elected by followers using the Zookeeper Atomic Broadcast (ZAB) protocol. It receives and schedules all write requests, and synchronizes written information to followers and observers.

CarbonData

A Carbon is an open architecture based on Spark SQL. It integrates the developed MOLAP engine and Spark, and quickly builds the Spark-based distributed multi-dimensional analysis engine, shortening the analysis duration from minutes to seconds and strengthening the multi-dimensional analysis capability of Spark.

DStream

DStream is an abstract concept provided by Spark Streaming. It is a continuous data stream which is obtained from the data source or the transformed input stream. In essence, a DStream is a series of continuous resilient distributed datasets (RDDs).

Heap Memory

A heap indicates the data area where the Java Virtual Machine (JVM) is running and from which memory for all class instances and arrays is committed. The JVM startup parameters **-Xms** and **-Xmx** are used to set the initial heap memory and the maximum heap memory, respectively.

- Maximum heap memory: Heap memory that can be committed to a program at most by the system, which is specified by the **-Xmx** parameter.
- Committed heap memory: total heap memory committed by the system for running a program. It ranges from the initial heap memory and the maximum heap memory.
- Used heap memory: heap memory that has been used by a program. It is smaller than the committed heap memory.

- Non-heap memory: memory excluded from the JVM heaps and the memory area for running the JVM. Non-heap memory has the following three memory pools:
  - Code Cache: stores JIT compiled code. Its value is set through the JVM startup parameter **-XX:InitialCodeCacheSize -XX:ReservedCodeCacheSize**. The default value is 240 MB.
  - Compressed Class Space: stores metadata of a pointer. Its value is set through the JVM startup parameter **-XX:CompressedClassSpaceSize**. The default value is 1024 MB.
  - Metaspace: stores metadata. Its value is set through the JVM startup parameter **-XX:MetaspaceSize -XX:MaxMetaspaceSize**.
- Maximum non heap memory: non-heap memory committed to a program at most by the system. Its value is the sum of the maximum values of Code Cache, Compressed Class Space, and Metaspace.
- Committed non-heap memory: total non-heap memory committed by the system for running a program. It ranges from the initial non-heap memory and the maximum non-heap memory.
- Used non-heap memory: non-heap memory that has been used by aprogram. It is smaller than the committed non-heap memory.

Hadoop

Hadoop is a distributed system framework. It allows users to develop distributed applications using high-speed computing and storage provided by clusters without knowing the underlying details of the distributed system. It can also reliably and efficiently process massive amounts of data in scalable, distributed mode. Hadoop is reliable because it maintains multiple work data duplicates, enabling distributed processing for failed nodes. Hadoop is highly efficient because it processes data in parallel mode. Hadoop is scalable because it can process petabytes of data. Hadoop consists of HDFS, MapReduce, HBase, and Hive.

Role

A role is an element of a service. A service contains one or multiple roles. Services are installed on servers through roles so that they can run properly.

Cluster

A cluster is computer technology that enables multiple servers to work as one server. Clusters improve the stability, reliability, and data processing or service capability of the system. For example, clusters can prevent single point of failures (SPOFs), share storage resources, reduce system load, and improve system performance.

Instance

An instance is formed when a service role is installed on the host. A service has one or more role instances.

Metadata

Metadata is data that provides information about other data and is also called media data or relay data. It is used to define data properties, specify data storage locations and historical data, retrieve resources, and record files.

2 MRS Quick Start

2.1 How to Use MRS

MapReduce Service (MRS) is a cloud service that is used to deploy and manage Hadoop systems and enables one-click Hadoop cluster deployment. MRS provides Hadoop-based high-performance big data components, such as Hadoop, Spark, HBase, Kafka, and Storm.

MRS is easy to use. You can execute various tasks and process or store PB-level data using computers connected in a cluster. The procedure of using MRS is as follows:

1. Upload local programs and data files to OBS.
2. Create a cluster by following instructions in **Creating a Custom Cluster**. You can choose a cluster type for offline data analysis or stream processing or both, and set ECS instance specifications, instance count, data disk type (common I/O, high I/O, and ultra-high I/O), and components to be installed such as Hadoop, Spark, HBase, Hive, Kafka, and Storm in a cluster. You can use a **bootstrap action** to execute a script on a specified node before or after the cluster is started to install additional third-party software, modify the cluster running environment, and perform other customizations.
3. **Manage jobs**. MRS provides a platform for executing programs you develop. You can submit, execute, and monitor such programs on MRS.
4. **Manage clusters**. MRS provides you with MRS Manager, an enterprise-level unified management platform of big data clusters, helping you quickly know health status of services and hosts. Through graphical metric monitoring and customization, you can obtain critical system information in a timely manner. In addition, you can modify service attribute configurations based on service performance requirements, and start or stop clusters, services, and role instances in one click.
5. **Terminating a Cluster**. You can terminate an MRS cluster that is no longer use after job execution is complete.

2.2 Creating a Cluster

The first step of using MRS is to a cluster. This section describes how to create a cluster on the MRS management console.

Procedure

Step 1 Log in to the MRS console.

Step 2

NOTE

When creating a cluster, pay attention to quota notification. If a resource quota is insufficient, increase the resource quota as prompted and create a cluster.

Step 3 On the page for a cluster, click the **Custom Config** tab.

Step 4 Configure cluster software information.

- **Region**: Use the default value.
- **Cluster Name**: You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, for example, **mrs_20180321**.
- **Cluster Version**: Select the latest version, which is the default value.
- **Cluster Type**: Use the default **Analysis Cluster**.
- **Component**: Select components such as Spark2x, HBase, and Hive for the analysis cluster. For a streaming cluster, select components such as Kafka and Storm. For a hybrid cluster, you can select the components of the analysis cluster and streaming cluster based on service requirements.
- **Metadata**: Retain the default value.

  NOTE

  For versions earlier than MRS 3.x, select components such as Spark, HBase, and Hive for the analysis cluster.

Step 5 Click **Next**.

- **AZ**: Use the default value.
- **VPC**: Use the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
- **Subnet**: Use the default value.
- **Security Group**: Select **Auto create**.
- **EIP**: Select **Bind later**.
- **Enterprise Project**: Use the default value.
- **Instance Specifications**: Select General Computing S3 -> 8 vCPUs | 16 GB (s3.2xlarge.2) for both Master and Core nodes.
- **System Disk**: Select **Common I/O** and retain the default settings.
- **Data Disk**: Select **Common I/O** and retain the default settings.
- **Instance Count**: The default number of Master nodes is 2, and that of Core nodes is 3.

Step 6 Click **Next**. The **Set Advanced Options** tab page is displayed. Configure the following parameters. Retain the default settings for the other parameters.

- Kerberos authentication:
  - **Kerberos Authentication**: Disable Kerberos authentication.
  - **Username**: name of the Manager administrator. **admin** is used by default.
  - **Password**: password of the Manager administrator.
- **Login Mode**: Select a mode for logging in to an ECS.
  - **Password**: Set a password for logging in to an ECS.
  - **Key Pair**: Select a key pair from the drop-down list. Select **"I acknowledge that I have obtained private key file *SSHkey-xxx* and that without this file I will not be able to log in to my ECS.**" If you have never created a key pair, click **View Key Pair** to create or import a key pair. And then, obtain a private key file.
- **Secure Communications**: Select **Enable**.

Step 7 Click **Apply Now**.

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

Step 8 Click **Back to Cluster List** to view the cluster status.

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

----End

2.3 Uploading Data and Programs

Through the **Files** tab page, you can create, delete, import, export, delete files in the analysis cluster.

Background

MRS clusters process data from OBS or HDFS. OBS provides customers with the data storage capabilities that are massive, secure, reliable, and cost-effective. MRS can directly process data in OBS. You can browse, manage, and use data on the web page of the management console and OBS Client.

Importing Data

Currently, MRS can only import data from OBS to HDFS. The file upload rate decreases with the increase of the file size. This mode applies to scenarios where the data volume is small.

You can perform the following steps to import files and directories:

1. Log in to the MRS console.

2. Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's information.
3. Click the **Files** tab to go to the file management page.
4. Select **HDFS File List**.
5. Go to the data storage directory, for example, **bd_app1**.

   The **bd_app1** directory is only an example. You can use any directory on the page or create a new one.

   The requirements for creating a folder are as follows:

   - The folder name contains a maximum of 255 characters
   - The folder name cannot be empty.
   - The folder name cannot contain the following special characters: /:*?"<>|\;&,'`!{}[]$%+
   - The value cannot start or end with a period (.).
   - The spaces at the beginning and end are ignored.
6. Click **Import Data** and configure the HDFS and OBS paths correctly. When configuring the OBS or HDFS path, click **Browse**, select a file directory, and click **Yes**.
   - OBS path
     - The path must start with **obs://**.
     - Files or programs encrypted by KMS cannot be imported.
     - An empty folder cannot be imported.
     - The directory and file name can contain letters, digits, hyphens (-), and underscores (_), but cannot contain the following special characters ;|&>,<'$*?\
     - The directory and file name cannot start or end with a space, but can contain spaces between them.
     - The OBS full path contains a maximum of 255 characters.
   - HDFS path
     - The path starts with **/user** by default.
     - The directory and file name can contain letters, digits, hyphens (-), and underscores (_), but cannot contain the following special characters: ;|&>,<'$*?\:
     - The directory and file name cannot start or end with a space, but can contain spaces between them.
     - The HDFS full path contains a maximum of 255 characters.
7. Click **OK**.

   You can view the file upload progress on the **File Operation Records** tab page. MRS processes the data import operation as a DistCp job. You can also check whether the DistCp job is successfully executed on the **Jobs** tab page.

Exporting Data

After the data analysis and computing are completed, you can store the data in HDFS or export them to OBS.

You can perform the following steps to export files and directories:

1. Log in to the MRS console.
2. Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.
3. Click the **Files** tab to go to the file management page.
4. Select **HDFS File List**.
5. Go to the data storage directory, for example, **bd_app1**.
6. Click **Export Data** and configure the OBS and HDFS paths. When configuring the OBS or HDFS path, click **Browse**, select a file directory, and click **Yes**.
   - OBS path
     - The path must start with **obs://**.
     - The directory and file name can contain letters, digits, hyphens (-), and underscores (_), but cannot contain the following special characters ;|&>,<'$*?\
     - The directory and file name cannot start or end with a space, but can contain spaces between them.
     - The OBS full path contains a maximum of 255 characters.
   - HDFS path
     - The path starts with **/user** by default.
     - The directory and file name can contain letters, digits, hyphens (-), and underscores (_), but cannot contain the following special characters: ;|&>,<'$*?\:
     - The directory and file name cannot start or end with a space, but can contain spaces between them.
     - The HDFS full path contains a maximum of 255 characters.

   NOTE

   When a folder is exported to OBS, a label file named **folder name_$folder$** is added to the OBS path. Ensure that the exported folder is not empty. If the exported folder is empty, OBS cannot display the folder and only generates a file named **folder name_$folder$**.
7. Click **OK**.

   You can view the file upload progress on the **File Operation Records** tab page. MRS processes the data export operation as a DistCp job. You can also check whether the DistCp job is successfully executed on the **Jobs** tab page.

2.4 Creating a Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results.

This section describes how to submit a job (take a MapReduce job as an example) on the MRS management console. MapReduce jobs are used to submit JAR programs to quickly process massive amounts of data in parallel and create a distributed data processing and execution environment.

If the job and file management functions are not supported on the cluster details page, submit the jobs in the background.

Before creating a job, you need to upload local data to OBS for data computing and analyzing. MRS allows exporting data from OBS to HDFS for computing and analyzing. After the analyzing and computing are complete, you can store the data in HDFS or export them to OBS. HDFS and OBS can also store the compressed data in the format of **bz2** or **gz**.

Submitting a Job on the GUI

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

In the **Basic Information** area on the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users. For details, see **Synchronizing IAM Users to MRS**.

NOTE

- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.

Step 4 Click the **Jobs** tab.

Step 5 Click **Create**. The **Create Job** page is displayed.

NOTE

If the IAM username contains spaces (for example, **admin 01**), a job cannot be created.

Step 6 In **Type**, select **MapReduce**. Configure other job information.

Table 2-1 Job configuration information

Parameter	Description
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. **NOTE** You are advised to set different names for different jobs.
Program Path	Path of the program package to be executed. The following requirements must be met: • Contains a maximum of 1,023 characters, excluding special characters such as ;|&><'$. The parameter value cannot be empty or full of spaces. • The path of the program to be executed can be stored in HDFS or OBS. The path varies depending on the file system. – OBS: The path must start with **obs://**. Example: **obs://wordcount/program/*xxx*.jar** – HDFS: The path must start with **/user**. For details about how to import data to HDFS, see **Importing Data**. • For SparkScript and HiveScript, the path must end with **.sql**. For MapReduce, the path must end with **.jar**. For Flink and SparkSubmit, the path must end with **.jar** or **.py**. The **.sql**, **.jar**, and **.py** are case-insensitive.
Parameters	(Optional) It is the key parameter for program execution. Multiple parameters are separated by space. Configuration method: *Program class name Data input path Data output path* • Program class name: It is specified by a function in your program. MRS is responsible for transferring parameters only. • Data input path: Click **HDFS** or **OBS** to select a path or manually enter a correct path. • Data output path: Enter a directory that does not exist. The parameter contains a maximum of 150,000 characters. It cannot contain special characters ;|&><'$, but can be left blank. **CAUTION** If you enter a parameter with sensitive information (such as the login password), the parameter may be exposed in the job details display and log printing. Exercise caution when performing this operation.
Service Parameter	(Optional) It is used to modify service parameters for the job. The parameter modification applies only to the current job. To make the modification take effect permanently for the cluster, follow instructions in **Configuring Service Parameters**. To add multiple parameters, click ⊕ on the right. To delete a parameter, click **Delete** on the right. **Table 2-2** lists the common service configuration parameters.

Parameter	Description
Command Reference	Command submitted to the background for execution when a job is submitted.

Table 2-2 Service Parameter parameters

Parameter	Description	Example Value
fs.obs.access.key	Key ID for accessing OBS.	-
fs.obs.secret.key	Key corresponding to the key ID for accessing OBS.	-

Step 7 Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

Submitting a Job in the Background

The default client installation path for MRS 3.x or later is /opt/Bigdata/client, and for versions earlier than MRS 3.x is /opt/client. Configure the path based on site requirements.

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 On the **Nodes** tab page, click the name of a Master node to go to the ECS management console.

Step 4 Click **Remote Login** in the upper right corner of the page.

Step 5 Enter the username and password of the Master node as prompted. The username is **root** and the password is the one set during cluster creation.

Step 6 Run the following command to initialize environment variables:

source /opt/Bigdata/client/bigdata_env

Step 7 If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If the Kerberos authentication is disabled for the current cluster, skip this step.

kinit *MRS cluster user*

Example: **kinit admin**

Step 8 Run the following command to copy the program in the OBS file system to the Master node in the cluster:

hadoop fs -Dfs.obs.access.key=AK -Dfs.obs.secret.key=SK -copyToLocal source_path.jar target_path.jar

Example: **hadoop fs -Dfs.obs.access.key=XXXX -Dfs.obs.secret.key=XXXX -copyToLocal "obs://mrs-word/program/hadoop-mapreduce-examples-XXX.jar" "/home/omm/hadoop-mapreduce-examples-XXX.jar"**

You can log in to OBS Console using AK/SK. To obtain AK/SK information, click the username in the upper right corner of the management console and choose **My Credentials** > **Access Keys**.

Step 9 Run the following command to submit a wordcount job. If data needs to be read from OBS or outputted to OBS, the AK/SK parameters need to be added.

source /opt/Bigdata/client/bigdata_env;hadoop jar execute_jar wordcount input_path output_path

Example: **source /opt/Bigdata/client/bigdata_env;hadoop jar /home/omm/hadoop-mapreduce-examples-XXX.jar wordcount -Dfs.obs.access.key=XXXX -Dfs.obs.secret.key=XXXX "obs://mrs-word/input/*" "obs://mrs-word/output/"**

In the preceding command, **input_path** indicates a path for storing job input files on OBS. **output_path** indicates a path for storing job output files on OBS and needs to be set to a directory that does not exist

----End

2.5 Using Clusters with Kerberos Authentication Enabled

This section instructs you to use security clusters and run MapReduce, Spark, and Hive programs.

The Presto component of MRS 3.x does not support Kerberos authentication.

You can get started by reading the following topics:

1. **Creating a Security Cluster and Logging In to Manager**
2. **Creating a Role and a User**
3. **Running a MapReduce Program**
4. **Running a Spark Program**
5. **Running a Hive Program**

Creating a Security Cluster and Logging In to Manager

Step 1 Create a security cluster. For details, see **Creating a Custom Cluster**. Enable **Kerberos Authentication**, set **Password**, and confirm the password. This password is used to log in to Manager. Keep it secure.

Step 2 Log in to the MRS console.

Step 3 In the navigation pane on the left, choose **Active Clusters** and click the target cluster name on the right to access the cluster details page.

Step 4 Click **Access Manager** on the right of **MRS Manager** to log in to Manager.

- If you have bound an EIP when creating the cluster, perform the following operations:
  a. Add a security group rule. By default, your public IP address used for accessing port 9022 is filled in the rule. If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

     NOTE

     - It is normal that the automatically generated public IP address is different from your local IP address and no action is required.
     - If port 9022 is a Knox port, you need to enable the permission to access port 9022 of Knox for accessing Manager.

  b. Select **I confirm that xx.xx.xx.xx is a trusted public IP address and MRS Manager can be accessed using this IP address.**
- If you have not bound an EIP when creating the cluster, perform the following operations:
  a. Select an available EIP from the drop-down list or click **Manage EIP** to create one.
  b. Add a security group rule. By default, your public IP address used for accessing port 9022 is filled in the rule. If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

     NOTE

     - It is normal that the automatically generated public IP address is different from the local IP address and no action is required.
     - If port 9022 is a Knox port, you need to enable the permission of port 9022 to access Knox for accessing MRS Manager.

  c. Select **I confirm that xx.xx.xx.xx is a trusted public IP address and MRS Manager can be accessed using this IP address.**

Step 5 Click **OK**. The Manager login page is displayed. To assign permissions to other users to access Manager, add their public IP addresses as trusted ones by referring to **Accessing MRS Manager MRS 2.1.0 or Earlier)**.

Step 6 Enter the default username **admin** and the password you set when creating the cluster, and click **Log In**.

----End

Creating a Role and a User

For clusters with Kerberos authentication enabled, perform the following steps to create a user and assign permissions to the user to run programs.

Step 1 On Manager, choose **System** > **Permission** > **Role**.

Step 2 Click **Create Role**. For details, see **Creating a Role**.

Specify the following information:

- Enter a role name, for example, **mrrole**.
- In **Configure Resource Permission**, select the cluster to be operated, choose **Yarn** > **Scheduler Queue** > **root**, and select **Submit** and **Admin** in the **Permission** column. After you finish configuration, do not click **OK** but click the name of the target cluster shown in the following figure and then configure other permissions.
- Choose **HBase** > **HBase Scope**. Locate the row that contains **global**, and select **create**, **read**, **write**, and **execute** in the **Permission** column. After you finish configuration, do not click **OK** but click the name of the target cluster shown in the following figure and then configure other permissions.
- Choose **HDFS** > **File System** > **hdfs://hacluster/** and select **Read**, **Write**, and **Execute** in the **Permission** column. After you finish configuration, do not click **OK** but click the name of the target cluster shown in the following figure and then configure other permissions.
- Choose **Hive** > **Hive Read Write Privileges**, select **Select**, **Delete**, **Insert**, and **Create** in the **Permission** column, and click **OK**.

Step 3 Choose **System**. In the navigation pane on the left, choose **Permission** > **User Group** > **Create User Group** to create a user group for the sample project, for example, **mrgroup**. For details, see **Creating a User Group**.

Step 4 Choose **System**. In the navigation pane on the left, choose **Permission** > **User** > **Create** to create a user for the sample project. For details, see **Creating a User**.

- Enter a username, for example, **test**. If you want to run a Hive program, enter **hiveuser** in **Username**.
- Set **User Type** to **Human-Machine**.
- Enter a password. This password will be used when you run the program.
- In **User Group**, add **mrgroup** and **supergroup**.
- Set **Primary Group** to **supergroup** and bind the **mrrole** role to obtain the permission.

  Click **OK**.

Step 5 Choose **System**. In the navigation pane on the left, choose **Permission** > **User**, locate the row where user **test** locates, and select **Download Authentication Credential** from the **More** drop-down list. Save the downloaded package and decompress it to obtain the **keytab** and **krb5.conf** files.

----End

Running a MapReduce Program

This section describes how to run a MapReduce program in security cluster mode.

Prerequisites

You have compiled the program and prepared data files, for example, **mapreduce-examples-1.0.jar**, **input_data1.txt**, and **input_data2.txt**..

Procedure

Step 1 Use a remote login software (for example, MobaXterm) to log in to the master node of the security cluster using SSH (using the EIP).

Step 2 After the login is successful, run the following commands to create the **test** folder in the **/opt/Bigdata/client** directory and create the **conf** folder in the **test** directory:

```
cd /opt/Bigdata/client
mkdir test
cd test
mkdir conf
```

Step 3 Use an upload tool (for example, WinSCP) to copy **mapreduce-examples-1.0.jar**, **input_data1.txt**, and **input_data2.txt** to the **test** directory, and copy the **keytab** and **krb5.conf** files obtained in **Step 5** in **Creating Roles and Users** to the **conf** directory.

Step 4 Run the following commands to configure environment variables and authenticate the created user, for example, **test**:

```
cd /opt/Bigdata/client
source bigdata_env
export YARN_USER_CLASSPATH=/opt/Bigdata/client/test/conf/
kinit test
```

Enter the password as prompted. If no error message is displayed (you need to change the password as prompted upon the first login), Kerberos authentication is complete.

Step 5 Run the following commands to import data to the HDFS:

```
cd test
hdfs dfs -mkdir /tmp/input
hdfs dfs -put input_data* /tmp/input
```

Step 6 Run the following commands to run the program:

```
yarn jar mapreduce-examples-1.0.jar com.xxx.bigdata.mapreduce.examples.FemaleInfoCollector /tmp/
input /tmp/mapreduce_output
```

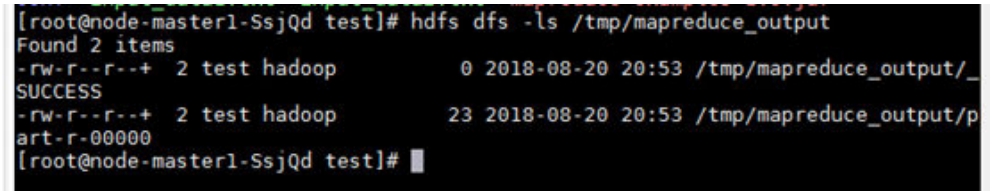
In the preceding commands:

/tmp/input indicates the input path in the HDFS.

/tmp/mapreduce_output indicates the output path in the HDFS. This directory must not exist. Otherwise, an error will be reported.

Step 7 After the program is executed successfully, run the **hdfs dfs -ls /tmp/mapreduce_output** command. The following command output is displayed.

Figure 2-1 Program running result



----End

Running a Spark Program

This section describes how to run a Spark program in security cluster mode.

Prerequisites

You have compiled the program and prepared data files, for example, **FemaleInfoCollection.jar**, **input_data1.txt**, and **input_data2.txt**..

Procedure

Step 1 Use a remote login software (for example, MobaXterm) to log in to the master node of the security cluster using SSH (using the EIP).

Step 2 After the login is successful, run the following commands to create the **test** folder in the **/opt/Bigdata/client** directory and create the **conf** folder in the **test** directory:

```
cd /opt/Bigdata/client
mkdir test
cd test
mkdir conf
```

Step 3 Use an upload tool (for example, WinSCP) to copy **FemaleInfoCollection.jar**, **input_data1.txt**, and **input_data2.txt** to the **test** directory, and copy the **keytab** and **krb5.conf** files obtained in **Step 5** in section **Creating Roles and Users** to the **conf** directory.

Step 4 Run the following commands to configure environment variables and authenticate the created user, for example, **test**:

```
cd /opt/Bigdata/client
source bigdata_env
export YARN_USER_CLASSPATH=/opt/Bigdata/client/test/conf/
kinit test
```

Enter the password as prompted. If no error message is displayed, Kerberos authentication is complete.

Step 5 Run the following commands to import data to the HDFS:

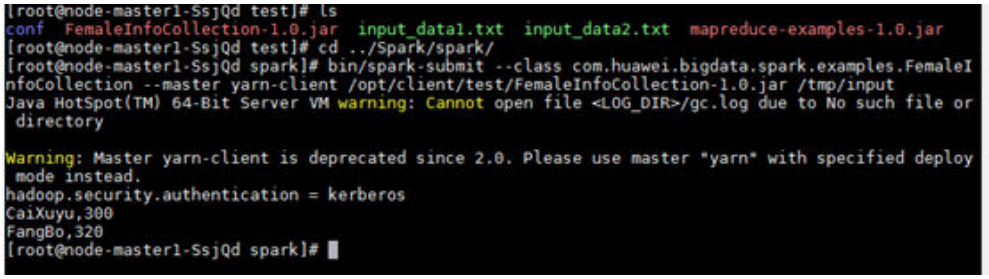
```
cd test
hdfs dfs -mkdir /tmp/input
hdfs dfs -put input_data* /tmp/input
```

Step 6 Run the following commands to run the program:

```
cd /opt/Bigdata/client/Spark/spark
bin/spark-submit --class com.xxx.bigdata.spark.examples.FemaleInfoCollection --master yarn-client /opt/Bigdata/client/test/FemaleInfoCollection-1.0.jar /tmp/input
```

Step 7 After the program is run successfully, the following information is displayed.

Figure 2-2 Program running result



----End

Running a Hive Program

This section describes how to run a Hive program in security cluster mode.

Prerequisites

You have compiled the program and prepared data files, for example, **hive-examples-1.0.jar**, **input_data1.txt**, and **input_data2.txt**..

Procedure

Step 1 Use a remote login software (for example, MobaXterm) to log in to the master node of the security cluster using SSH (using the EIP).

Step 2 After the login is successful, run the following commands to create the **test** folder in the **/opt/Bigdata/client** directory and create the **conf** folder in the **test** directory:

```
cd /opt/Bigdata/client
mkdir test
cd test
mkdir conf
```

Step 3 Use an upload tool (for example, WinSCP) to copy **FemaleInfoCollection.jar**, **input_data1.txt**, and **input_data2.txt** to the **test** directory, and copy the **keytab** and **krb5.conf** files obtained in **Step 5** in section **Creating Roles and Users** to the **conf** directory.

Step 4 Run the following commands to configure environment variables and authenticate the created user, for example, **test**:

```
cd /opt/Bigdata/client
source bigdata_env
export YARN_USER_CLASSPATH=/opt/Bigdata/client/test/conf/
kinit test
```

Enter the password as prompted. If no error message is displayed, Kerberos authentication is complete.

Step 5 Run the following command to run the program:

```
chmod +x /opt/hive_examples -R  cd /opt/hive_examples  java -cp .:hive-examples-1.0.jar:/opt/hive_examples/conf:/opt/Bigdata/client/Hive/Beeline/lib/*:/opt/Bigdata/client/HDFS/hadoop/lib/* com.xxx.bigdata.hive.example.ExampleMain
```

Step 6 After the program is run successfully, the following information is displayed.

Figure 2-3 Program running result

----End

2.6 Terminating a Cluster

You can terminate an MRS cluster that is no longer use after job execution is complete.

Background

You can manually delete a cluster after data analysis is complete or when the cluster encounters an exception. A cluster failed to be deployed will be automatically deleted.

Procedure

Step 1 Log in to the MRS management console.

Step 2 In the navigation pane on the left, choose **Active Clusters**.

Step 3 In the cluster list, locate the row containing the cluster to be deleted, and click **Delete** in the **Operation** column.

The cluster status changes from **Running** to **Deleting**, and finally to **Deleted**. You can view the deleted cluster in **Cluster History**.

----End

3 Preparing a User

3.1 Creating an MRS User

Use IAM to implement fine-grained permission control over your MRS. With IAM, you can:

- Create IAM users under your cloud account for employees based on your enterprise's organizational structure so that each employee is allowed to access MRS resources using their unique security credential (IAM user).
- Grant only the permissions required for users to perform a specific task.
- Entrust a cloud account or cloud service to perform efficient O&M on your MRS resources.

If your cloud account does not require IAM users, skip this section.

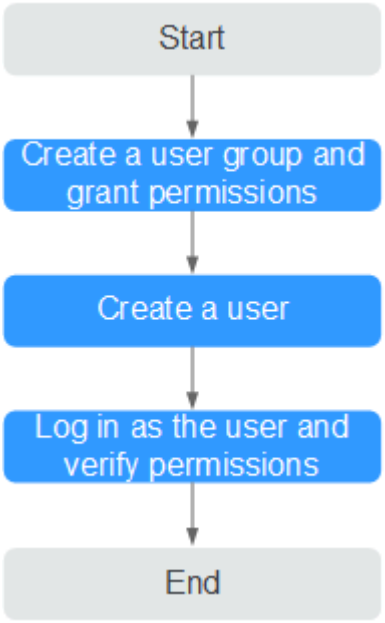
This section describes the procedure for granting permissions (see **Figure 3-1**).

Prerequisites

Learn about the permissions.

Process Flow

Figure 3-1 Process for granting MRS permissions



1. Create a user group and assign permissions to it.

   Create a user group on the IAM console, and assign MRS permissions to the group.

2. Create a user and add it to a user group.

   Create a user on the IAM console and add the user to the group created in **1. Create a user group and assign permissions to it**.

3. Log in and verify permissions.

   Log in to the console by using the user created, and verify that the user has the granted permissions.

   - Choose **Service List** > **MapReduce Service**. Then click **Create Cluster** on the MRS console. If a message appears indicating that you have insufficient permissions to perform the operation, the **MRS ReadOnlyAccess** policy has already taken effect.
   - Choose any other service in **Service List**. If a message appears indicating that you have insufficient permissions to access the service, the **MRS ReadOnlyAccess** policy has already taken effect.

MRS Permission Description

By default, new IAM users do not have any permissions. To assign permissions to a user, add the user to one or more groups and assign permissions policies or roles to these groups. The user then inherits permissions from the groups it is a member of and can perform specified operations on cloud services based on the permissions.

MRS is a project-level service deployed and accessed in specific physical regions. To assign permissions to a user group, specify **Scope** as **Region-specific projects** and select projects in the corresponding region for the permissions to take effect.

If **All projects** is selected, the permissions will take effect for the user group in all region-specific projects. When accessing MRS, the users need to switch to a region where they have been authorized to use the MRS service.

You can grant users permissions by using roles and policies.

- Roles: A type of coarse-grained authorization mechanism that defines permissions related to user responsibilities. This mechanism provides only a limited number of service-level roles for authorization. When using roles to grant permissions, you need to also assign other roles on which the permissions depend to take effect. However, roles are not an ideal choice for fine-grained authorization and secure access control.
- Policies: A type of fine-grained authorization mechanism that defines permissions required to perform operations on specific cloud resources under certain conditions. This mechanism allows for more flexible policy-based authorization, meeting requirements for secure access control. For example, you can grant MRS users only the permissions for performing specified operations on MRS clusters, such as creating a cluster and querying a cluster list rather than deleting a cluster. Most policies define permissions based on APIs.

Table 3-1 lists all the system policies supported by MRS.

Table 3-1 MRS system policies

Policy	Description	Type
MRS FullAccess	Administrator permissions for MRS. Users granted these permissions can operate and use all MRS resources.	Fine-grained policy
MRS CommonOperations	Common user permissions for MRS. Users granted these permissions can use MRS but cannot add or delete resources.	Fine-grained policy
MRS ReadOnlyAccess	Read-only permission for MRS. Users granted these permissions can only view MRS resources.	Fine-grained policy
MRS Administrator	Permissions: • All operations on MRS • Users with permissions of this policy must also be granted permissions of the **Tenant Guest**, **Server Administrator**, and **BSS Administrator** policies.	RBAC policy

Table 3-2 lists the common operations supported by each system-defined policy or role of MRS. Select the policies or roles as required.

Table 3-2 Common operations supported by each system-defined policy

Operation	MRS FullAccess	MRS CommonOperations	MRS ReadOnlyAccess	MRS Administrator
Creating a cluster	√	x	x	√
Resizing a cluster	√	x	x	√
Upgrading node specifications	√	x	x	√
Deleting a cluster	√	x	x	√
Querying cluster details	√	√	√	√
Querying a cluster list	√	√	√	√
Configuring an auto scaling rule	√	x	x	√
Querying a host list	√	√	√	√
Querying operation logs	√	√	√	√
Creating and executing a job	√	√	x	√
Stopping a job	√	√	x	√
Deleting a single job	√	√	x	√
Deleting jobs in batches	√	√	x	√
Querying job details	√	√	√	√

Operation	MRS FullAccess	MRS CommonOperations	MRS ReadOnlyAccess	MRS Administrator
Querying a job list	√	√	√	√
Creating a folder	√	√	x	√
Deleting a file	√	√	x	√
Querying a file list	√	√	√	√
Operating cluster tags in batches	√	√	x	√
Creating a single cluster tag	√	√	x	√
Deleting a single cluster tag	√	√	x	√
Querying a resource list by tag	√	√	√	√
Querying cluster tags	√	√	√	√
Accessing Manager	√	√	x	√
Querying a patch list	√	√	√	√
Installing a patch	√	√	x	√
Uninstalling a patch	√	√	x	√
Authorizing O&M channels	√	√	x	√
Sharing O&M channel logs	√	√	x	√

Operation	MRS FullAccess	MRS CommonOperations	MRS ReadOnlyAccess	MRS Administrator
Querying an alarm list	√	√	√	√
Subscribing to alarm notification	√	√	x	√
Submitting an SQL statement	√	√	x	√
Querying SQL results	√	√	x	√
Canceling an SQL execution task	√	√	x	√

3.2 Creating a Custom Policy

Custom policies can be created to supplement the system-defined policies of MRS.

You can create custom policies in either of the following ways:

- Visual editor: Select cloud services, actions, resources, and request conditions. This does not require knowledge of policy syntax.
- JSON: Edit JSON policies from scratch or based on an existing policy.

Example Custom Policies

- Example 1: Allowing users to create MRS clusters only

```
{
    "Version": "1.1",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "mrs:cluster:create",
                "ecs:*:*",
                "bms:*:*",
                "evs:*:*",
                "vpc:*:*",
                "smn:*:*"
            ]
        }
    ]
}
```

- Example 2: Allowing users to resize an MRS cluster

```
{
   "Version": "1.1",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "mrs:cluster:resize"
         ]
      }
   ]
}
```

- Example 3: Allowing users to create a cluster, create and execute a job, and delete a single job, but denying cluster deletion

```
{
   "Version": "1.1",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "mrs:cluster:create",
            "mrs:job:submit",
            "mrs:job:delete"
         ]
      },
      {
         "Effect": "Deny",
         "Action": [
            "mrs:cluster:delete"
         ]
      }
   ]
}
```

- Example 4: Allowing users to create an ECS cluster with the minimum permission

  NOTE

  - If you need a key pair when creating a cluster, add the following permissions: **ecs:serverKeypairs:get** and **ecs:serverKeypairs:list**.
  - Add the **kms:cmk:list** permission when encrypting data disks during cluster creation.
  - Add the **mrs:alarm:subscribe** permission to enable the alarm function during cluster creation.
  - Add the **rds:instance:list** permission to use external data sources during cluster creation.

```
{
   "Version": "1.1",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "mrs:cluster:create"
         ]
      },
      {
         "Effect": "Allow",
         "Action": [
            "ecs:cloudServers:updateMetadata",
            "ecs:cloudServerFlavors:get",
            "ecs:cloudServerQuotas:get",
            "ecs:servers:list",
            "ecs:servers:get",
            "ecs:cloudServers:delete",
            "ecs:cloudServers:list",
            "ecs:serverInterfaces:get",
```

```
                "ecs:serverGroups:manage",
                "ecs:servers:setMetadata",
                "ecs:cloudServers:get",
                "ecs:cloudServers:create"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "vpc:securityGroups:create",
                "vpc:securityGroupRules:delete",
                "vpc:vpcs:create",
                "vpc:ports:create",
                "vpc:securityGroups:get",
                "vpc:subnets:create",
                "vpc:privateIps:delete",
                "vpc:quotas:list",
                "vpc:networks:get",
                "vpc:publicIps:list",
                "vpc:securityGroups:delete",
                "vpc:securityGroupRules:create",
                "vpc:privateIps:create",
                "vpc:ports:get",
                "vpc:ports:delete",
                "vpc:publicIps:update",
                "vpc:subnets:get",
                "vpc:publicIps:get",
                "vpc:ports:update",
                "vpc:vpcs:list"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "evs:quotas:get",
                "evs:types:get"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "bms:serverFlavors:get"
            ]
        }
    ]
}
```

- Example 5: Allowing users to create a BMS cluster with the minimum permission

  NOTE

  - If you need a key pair when creating a cluster, add the following permissions: **ecs:serverKeypairs:get** and **ecs:serverKeypairs:list**.
  - Add the **kms:cmk:list** permission when encrypting data disks during cluster creation.
  - Add the **mrs:alarm:subscribe** permission to enable the alarm function during cluster creation.
  - Add the **rds:instance:list** permission to use external data sources during cluster creation.

```
{
    "Version": "1.1",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "mrs:cluster:create"
```

```
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "ecs:servers:list",
                "ecs:servers:get",
                "ecs:cloudServers:delete",
                "ecs:serverInterfaces:get",
                "ecs:serverGroups:manage",
                "ecs:servers:setMetadata",
                "ecs:cloudServers:create",
                "ecs:cloudServerFlavors:get",
                "ecs:cloudServerQuotas:get"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "vpc:securityGroups:create",
                "vpc:securityGroupRules:delete",
                "vpc:vpcs:create",
                "vpc:ports:create",
                "vpc:securityGroups:get",
                "vpc:subnets:create",
                "vpc:privateIps:delete",
                "vpc:quotas:list",
                "vpc:networks:get",
                "vpc:publicIps:list",
                "vpc:securityGroups:delete",
                "vpc:securityGroupRules:create",
                "vpc:privateIps:create",
                "vpc:ports:get",
                "vpc:ports:delete",
                "vpc:publicIps:update",
                "vpc:subnets:get",
                "vpc:publicIps:get",
                "vpc:ports:update",
                "vpc:vpcs:list"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "evs:quotas:get",
                "evs:types:get"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "bms:servers:get",
                "bms:servers:list",
                "bms:serverQuotas:get",
                "bms:servers:updateMetadata",
                "bms:serverFlavors:get"
            ]
        }
    ]
}
```

- Example 6: Allowing users to create a hybrid ECS and BMS cluster with the minimum permission

NOTE

- If you need a key pair when creating a cluster, add the following permissions: **ecs:serverKeypairs:get** and **ecs:serverKeypairs:list**.
- Add the **kms:cmk:list** permission when encrypting data disks during cluster creation.
- Add the **mrs:alarm:subscribe** permission to enable the alarm function during cluster creation.
- Add the **rds:instance:list** permission to use external data sources during cluster creation.

```
{
  "Version": "1.1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "mrs:cluster:create"
      ]
    },
    {
      "Effect": "Allow",
      "Action": [
        "ecs:cloudServers:updateMetadata",
        "ecs:cloudServerFlavors:get",
        "ecs:cloudServerQuotas:get",
        "ecs:servers:list",
        "ecs:servers:get",
        "ecs:cloudServers:delete",
        "ecs:cloudServers:list",
        "ecs:serverInterfaces:get",
        "ecs:serverGroups:manage",
        "ecs:servers:setMetadata",
        "ecs:cloudServers:get",
        "ecs:cloudServers:create"
      ]
    },
    {
      "Effect": "Allow",
      "Action": [
        "vpc:securityGroups:create",
        "vpc:securityGroupRules:delete",
        "vpc:vpcs:create",
        "vpc:ports:create",
        "vpc:securityGroups:get",
        "vpc:subnets:create",
        "vpc:privateIps:delete",
        "vpc:quotas:list",
        "vpc:networks:get",
        "vpc:publicIps:list",
        "vpc:securityGroups:delete",
        "vpc:securityGroupRules:create",
        "vpc:privateIps:create",
        "vpc:ports:get",
        "vpc:ports:delete",
        "vpc:publicIps:update",
        "vpc:subnets:get",
        "vpc:publicIps:get",
        "vpc:ports:update",
        "vpc:vpcs:list"
      ]
    },
    {
      "Effect": "Allow",
      "Action": [
        "evs:quotas:get",
        "evs:types:get"
      ]
```

```
        },
        {
            "Effect": "Allow",
            "Action": [
                "bms:servers:get",
                "bms:servers:list",
                "bms:serverQuotas:get",
                "bms:servers:updateMetadata",
                "bms:serverFlavors:get"
            ]
        }
    ]
}
```

3.3 Synchronizing IAM Users to MRS

IAM user synchronization is to synchronize IAM users bound with MRS policies to the MRS system and create accounts with the same usernames but different passwords as the IAM users. Then, you can use an IAM username (the password needs to be reset by user **admin** of Manager) to log in to Manager for cluster management, and submit jobs on the GUI in a cluster with Kerberos authentication enabled.

Table 3-3 compares IAM users' permission policies and the synchronized users' permissions on MRS. For details about the default permissions on Manager, see **Users and Permissions of MRS Clusters**.

Table 3-3 Policy and permission mapping after synchronization

Policy Type	IAM Policy	User's Default Permissions on MRS After Synchronization	Have Permission to Perform the Synchronization	Have Permission to Submit Jobs
Fine-grained	MRS ReadOnlyAccess	Manager_viewer	No	No
	MRS CommonOperations	• Manager_viewer • default • launcher-job	No	Yes

Policy Type	IAM Policy	User's Default Permissions on MRS After Synchronization	Have Permission to Perform the Synchronization	Have Permission to Submit Jobs
	MRS FullAccess	• Manager_administrator • Manager_auditor • Manager_operator • Manager_tenant • Manager_viewer • System_administrator • default • launcher-job	Yes	Yes
RBAC	MRS Administrator	• Manager_administrator • Manager_auditor • Manager_operator • Manager_tenant • Manager_viewer • System_administrator • default • launcher-job	No	Yes

Policy Type	IAM Policy	User's Default Permissions on MRS After Synchronization	Have Permission to Perform the Synchronization	Have Permission to Submit Jobs
	Server Administrator, Tenant Guest, and MRS Administrator	• Manager_administrator • Manager_auditor • Manager_operator • Manager_tenant • Manager_viewer • System_administrator • default • launcher-job	Yes	Yes
	Tenant Administrator	• Manager_administrator • Manager_auditor • Manager_operator • Manager_tenant • Manager_viewer • System_administrator • default • launcher-job	Yes	Yes

Policy Type	IAM Policy	User's Default Permissions on MRS After Synchronization	Have Permission to Perform the Synchronization	Have Permission to Submit Jobs
Custom	Custom policy	• Manager_viewer • default • launcher-job	• If custom policies use RBAC policies as a template, refer to the RBAC policies. • If custom policies use fine-grained policies as a template, refer to the fine-grained policies. The fine-grained policies are recommended.	Yes

NOTE

To facilitate user permission management, use fine-grained policies rather than RBAC policies. In fine-grained policies, the Deny action takes precedence over other actions.

- A user has permission to synchronize IAM users only when the user has the Tenant Administrator role or has the Server Administrator, Tenant Guest, and MRS Administrator roles at the same time.
- A user with the **action:mrs:cluster:syncUser** policy has permission to synchronize IAM users.

Procedure

Step 1 Create a user and authorize the user to use MRS. For details, see **Creating an MRS User**.

Step 2 Log in to the MRS management console and create a cluster. For details, see **Creating a Custom Cluster**.

Step 3 In the left navigation pane, choose **Clusters** > **Active Clusters**. Click the cluster name to go to the cluster details page.

Step 4 In the **Basic Information** area on the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.

Step 5 After a synchronization request is sent, choose **Operation Logs** in the left navigation pane on the MRS console to check whether the synchronization is successful. For details about the logs, see **Viewing MRS Operation Logs**.

Step 6 After the synchronization is successful, use the user synchronized with IAM to perform subsequent operations.

NOTE

- When the policy of the user group to which the IAM user belongs changes from **MRS ReadOnlyAccess** to **MRS CommonOperations**, **MRS FullAccess**, or **MRS Administrator**, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from **MRS CommonOperations**, **MRS FullAccess**, or **MRS Administrator** to **MRS ReadOnlyAccess**, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.
- After you click **Synchronize** on the right side of **IAM User Sync**, the cluster details page is blank for a short time, because user data is being synchronized. The page will be properly displayed after the data synchronization is complete.

- Submitting jobs in a security cluster: Users can submit jobs using the job management function on the GUI in the security cluster. For details, see **Running a MapReduce Job**.
- All tabs are displayed on the cluster details page, including **Components**, **Tenants**, and **Backups & Restorations**.
- Logging in to Manager

  a. Log in to Manager as user **admin**. For details, see **Accessing Manager**.

  b. Initialize the password of the user synchronized with IAM. For details, see **Initializing the Password of a System User**.

  c. Modify the role bound to the user group to which the user belongs to control user permissions on Manager. For details, see **Related Tasks**. For details about how to create and modify a role, see **Creating a Role**. After the component role bound to the user group to which the user belongs is modified, it takes some time for the role permissions to take effect.

  d. Log in to Manager using the user synchronized with IAM and the password after the initialization in **Step 6.b**.

NOTE

If the IAM user's permission changes, go to **Step 4** to perform second synchronization. After the second synchronization, a system user's permissions are the union of the permissions defined in the IAM system policy and the permissions of roles added by the system user on Manager. After the second synchronization, a custom user's permissions are subject to the permissions configured on Manager.

- System user: If all user groups to which an IAM user belongs are bound to system policies (RABC policies and fine-grained policies belong to system policies), the IAM user is a system user.
- Custom user: If the user group to which an IAM user belongs is bound to any custom policy, the IAM user is a custom user.

----End

4 Configuring a Cluster

4.1 Methods of Creating MRS Clusters

This section describes how to MRS clusters.

- **Quick Creation of a Hadoop Analysis Cluster**: On the **Quick Config** tab page, you can quickly configure parameters to Hadoop analysis clusters within a few minutes, facilitating analysis and queries of vast amounts of data.
- **Quick Creation of an HBase Analysis Cluster**: On the **Quick Config** tab page, you can quickly configure parameters to HBase query clusters within a few minutes, facilitating storage and distributed computing of vast amounts of data.
- **Quick Creation of a Kafka Streaming Cluster**: On the **Quick Config** tab page, you can quickly configure parameters to Kafka streaming clusters within a few minutes, facilitating streaming data ingestion as well as real-time data processing and storage.
- **Quick Creation of a ClickHouse Cluster**: You can quickly a ClickHouse cluster. ClickHouse is a columnar database management system used for online analysis. It features the ultimate compression rate and fast query performance.
- **Quick Creation of a Real-time Analysis Cluster**: You can a real-time analysis cluster within a few minutes to quickly collect, analyze, and query a large amount of data.
- **Creating a Custom Cluster**: On the **Custom Config** tab page, you can flexibly configure parameters to clusters based on application scenarios, such as ECS specifications to better suit your service requirements.

4.2 Quick Creation of a Cluster

4.2.1 Quick Creation of a Hadoop Analysis Cluster

This section describes how to quickly a Hadoop analysis cluster for analyzing and querying vast amounts of data. In the open-source Hadoop ecosystem, Hadoop

uses Yarn to manage cluster resources, Hive and Spark to provide offline storage and computing of large-scale distributed data, Spark Streaming and Flink to offer streaming data computing, and Presto to enable interactive queries, Tez to provide a distributed computing framework of directed acyclic graphs (DAGs).

Quick Creation of a Hadoop Analysis Cluster

Step 1 Log in to the MRS console.

Step 2 Click **Create Cluster**. The page for creating a cluster is displayed.

Step 3 Click the **Quick Config** tab.

Step 4 Configure basic cluster information. For details about the parameters, see **Creating a Custom Cluster**.

- **Region**: Use the default value.
- **Cluster Name**: You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, for example, **mrs_20180321**.
- **Cluster Version**: Select the latest version, which is the default value. (The components provided by a cluster vary according to the cluster version. Select a cluster version based on site requirements.)
- **Component**: Select **Hadoop analysis cluster**.
- **AZ**: Use the default value.
- **VPC**: Use the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
- **Subnet**: Use the default value.
- **Enterprise Project**: Use the default value.
- **CPU Architecture**: Use the default value.
- **Cluster Node**: Select the number of cluster nodes and node specifications based on site requirements. For MRS 3.*x* or later, the memory of the master node must be greater than 64 GB.
- **Cluster HA**: Use the default value. This parameter is not available in MRS 3.*x*.
- **Kerberos Authentication**: Select whether to enable Kerberos authentication.
- **Username**: The default value is **root/admin**. User **root** is used to remotely log in to ECSs, and user **admin** is used to access the cluster management page.
- **Password**: Set a password for user **root**/**admin**.
- **Confirm Password**: Enter the password of user **root**/**admin** again.

Step 5 Select **Enable** to enable secure communications. For details, see **Communication Security Authorization**.

Step 6 **Click Apply Now.**

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

Step 7 Click **Back to Cluster List** to view the cluster status. Click **Access Cluster** to view cluster details.

For details about cluster status during creation, see the description of the status parameters in **Table 5-4**.

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

On the MRS management console, a maximum of 10 clusters can be concurrently created, and a maximum of 100 clusters can be managed.

----End

4.2.2 Quick Creation of an HBase Analysis Cluster

This section describes how to quickly an HBase query cluster. The HBase cluster uses Hadoop and HBase components to provide a column-oriented distributed cloud storage system featuring enhanced reliability, excellent performance, and elastic scalability. It applies to the storage and distributed computing of massive amounts of data. You can use HBase to build a storage system capable of storing TB- or even PB-level data. With HBase, you can filter and analyze data with ease and get responses in milliseconds, rapidly mining data value.

Quick Creation of an HBase Analysis Cluster

Step 1 Log in to the MRS console.

Step 2 Click **Create Cluster**. The page for creating a cluster is displayed.

Step 3 Click the **Quick Config** tab.

Step 4 Configure basic cluster information. For details about the parameters, see **Creating a Custom Cluster**.

- **Region**: Use the default value.
- **Cluster Name**: You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, for example, **mrs_20180321**.
- **Cluster Version**: Select the latest version, which is the default value. (The components provided by a cluster vary according to the cluster version. Select a cluster version based on site requirements.)
- **Component**: Select **HBase Query Cluster**.
- **AZ**: Use the default value.
- **VPC**: Use the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
- **Subnet**: Use the default value.
- **Enterprise Project**: Use the default value.
- **CPU Architecture**: Use the default value.
- **Cluster Node**: Select the number of cluster nodes and node specifications based on site requirements. For MRS 3.*x* or later, the memory of the master node must be greater than 64 GB.
- **Cluster HA**: Use the default value. This parameter is not available in MRS 3.*x*.
- **Kerberos Authentication**: Select whether to enable Kerberos authentication.

- **Username**: The default value is **root/admin**. User **root** is used to remotely log in to ECSs, and user **admin** is used to access the cluster management page.
- **Password**: Set a password for user **root**/**admin**.
- **Confirm Password**: Enter the password of user **root**/**admin** again.

Step 5 Select **Enable** to enable secure communications. For details, see **Communication Security Authorization**.

Step 6 **Click Apply Now.**

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

Step 7 Click **Back to Cluster List** to view the cluster status. Click **Access Cluster** to view cluster details.

For details about cluster status during creation, see the description of the status parameters in **Table 5-4**.

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

On the MRS management console, a maximum of 10 clusters can be concurrently created, and a maximum of 100 clusters can be managed.

----End

4.2.3 Quick Creation of a Kafka Streaming Cluster

This section describes how to quickly a Kafka streaming cluster. The Kafka cluster uses the Kafka and Storm components to provide an open-source messaging system with high throughput and scalability. It is widely used in scenarios such as log collection and monitoring data aggregation to implement efficient streaming data collection and real-time data processing and storage.

Quick Creation of a Kafka Streaming Cluster

Step 1 Log in to the MRS console.

Step 2 Click **Create Cluster**. The page for creating a cluster is displayed.

Step 3 Click the **Quick Config** tab.

Step 4 Configure basic cluster information. For details about the parameters, see **Creating a Custom Cluster**.

- **Region**: Use the default value.
- **Cluster Name**: You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, for example, **mrs_20200321**.
- **Cluster Version**: The components provided by a cluster vary according to the cluster version. Select a cluster version based on site requirements.
- **Component**: Select **Kafka streaming cluster**.

- **AZ**: Use the default value.
- **VPC**: Use the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
- **Subnet**: Use the default value.
- **Enterprise Project**: Use the default value.
- **CPU Architecture**: Use the default value.
- **Cluster Node**: Select the number of cluster nodes and node specifications based on site requirements. For MRS 3.*x* or later, the memory of the master node must be greater than 64 GB.
- **Cluster HA**: Use the default value. This parameter is not available in MRS 3.*x*.
- LVM: Use the default value. This parameter is not available in MRS 3.*x*.
- **Kerberos Authentication**: Select whether to enable Kerberos authentication.
- **Username**: The default value is **root/admin**. User **root** is used to remotely log in to ECSs, and user **admin** is used to access the cluster management page.
- **Password**: Set a password for user **root**/**admin**.
- **Confirm Password**: Enter the password of user **root**/**admin** again.

Step 5 Select **Enable** to enable secure communications. For details, see **Communication Security Authorization**.

Step 6 **Click Apply Now.**

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

Step 7 Click **Back to Cluster List** to view the cluster status. Click **Access Cluster** to view cluster details.

For details about cluster status during creation, see the description of the status parameters in **Table 5-4**.

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

On the MRS management console, a maximum of 10 clusters can be concurrently created, and a maximum of 100 clusters can be managed.

----End

4.2.4 Quick Creation of a ClickHouse Cluster

This section describes how to quickly a ClickHouse cluster. ClickHouse is a columnar database management system used for online analysis. It features the ultimate compression rate and fast query performance. It is widely used in Internet advertisement, app and web traffic analysis, telecom, finance, and IoT fields.

The ClickHouse cluster consists of the following components:

- MRS 3.1.0: ClickHouse 21.3.4.25 and ZooKeeper 3.5.6.

The ClickHouse cluster table engine that uses Kunpeng as the CPU architecture does not support HDFS and Kafka.

Quick Creation of a ClickHouse Cluster

Step 1 Log in to the MRS console.

Step 2 Click **Create Cluster**. The page for creating a cluster is displayed.

Step 3 Click the **Quick Config** tab.

Step 4 Configure basic cluster information. For details about the parameters, see **Creating a Custom Cluster**.

- **Region**: Use the default value.
- **Cluster Name**: You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, Example: **mrs_20201121**.
- **Cluster Version**: Select the latest version, which is the default value. (The components provided by a cluster vary according to the cluster version. Select a cluster version based on site requirements.)
- **Component**: Select **ClickHouse cluster**.
- **AZ**: Use the default value.
- **VPC**: Use the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
- **Subnet**: Use the default value.
- **Enterprise Project**: Use the default value.
- **CPU Architecture**: Use the default value.
- **Cluster Node**: Select the number of cluster nodes and node specifications based on site requirements. For MRS 3.*x* or later, the memory of the master node must be greater than 64 GB.
- **Kerberos Authentication**: Select whether to enable Kerberos authentication.
- **Username**: The default value is **root/admin**. User **root** is used to remotely log in to ECSs, and user **admin** is used to access the cluster management page.
- **Password**: Set a password for user **root**/**admin**.
- **Confirm Password**: Enter the password of user **root**/**admin** again.

Step 5 Select **Enable** to enable secure communications. For details, see **Communication Security Authorization**.

Step 6 **Click Apply Now.**

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

Step 7 Click **Back to Cluster List** to view the cluster status. Click **Access Cluster** to view cluster details.

For details about cluster status during creation, see the description of the status parameters in **Table 5-4**.

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

On the MRS management console, a maximum of 10 clusters can be concurrently created, and a maximum of 100 clusters can be managed.

----End

4.2.5 Quick Creation of a Real-time Analysis Cluster

This section describes how to quickly a real-time analysis cluster. The real-time analysis cluster uses Hadoop, Kafka, Flink, and ClickHouse to collect, analyze, and query a large amount of data in real time.

The real-time analysis cluster consists of the following components:

- MRS 3.1.0: Hadoop 3.1.1, Kafka 2.11-2.4.0, Flink 1.12.0, ClickHouse 21.3.4.25, ZooKeeper 3.5.6, and Ranger 2.0.0.

Quick Creation of a Real-time Analysis Cluster

Step 1 Log in to the MRS console.

Step 2 Click **Create Cluster**. The page for creating a cluster is displayed.

Step 3 Click the **Quick Config** tab.

Step 4 Configure basic cluster information. For details about the parameters, see **Creating a Custom Cluster**.

- **Region**: Use the default value.
- **Cluster Name**: You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, Example: **mrs_20201130**.
- **Cluster Version**: Select the latest version, which is the default value. (The components provided by a cluster vary according to the cluster version. Select a cluster version based on site requirements.)
- **Component**: Select **Real-time Analysis Cluster**.
- **AZ**: Use the default value.
- **VPC**: Use the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
- **Subnet**: Use the default value.
- **Enterprise Project**: Use the default value.
- **CPU Architecture**: Use the default value.
- **Cluster Node**: Select the number of cluster nodes and node specifications based on site requirements. For MRS 3.*x* or later, the memory of the master node must be greater than 64 GB.
- **Kerberos Authentication**: Select whether to enable Kerberos authentication.
- **Username**: The default value is **root/admin**. User **root** is used to remotely log in to ECSs, and user **admin** is used to access the cluster management page.
- **Password**: Set a password for user **root**/**admin**.
- **Confirm Password**: Enter the password of user **root**/**admin** again.

Step 5 Select **Enable** to enable secure communications. For details, see **Communication Security Authorization**.

Step 6 **Click Apply Now.**

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

Step 7 Click **Back to Cluster List** to view the cluster status. Click **Access Cluster** to view cluster details.

For details about cluster status during creation, see the description of the status parameters in **Table 5-4**.

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

On the MRS management console, a maximum of 10 clusters can be concurrently created, and a maximum of 100 clusters can be managed.

----End

4.3 Creating a Custom Cluster

The first step of using MRS is to a cluster. This section describes how to create a cluster on the **Custom Config** tab of the MRS management console.

You can create an IAM user or user group on the IAM management console and grant it specific operation permissions, to perform refined resource management after registering an account. For details, see **Creating an MRS User**.

Step 1 Log in to the MRS console.

Step 2 Click **Create Cluster**. The page for creating a cluster is displayed.

NOTE

When creating a cluster, pay attention to quota notification. If a resource quota is insufficient, increase the resource quota as prompted and create a cluster.

Step 3 Click the **Custom Config** tab.

Step 4 Configure cluster information by referring to **Software Configurations** and click **Next**.

Step 5 Configure cluster information by referring to **Hardware Configurations** and click **Next**.

Step 6 Set advanced options by referring to **(Optional) Advanced Configuration** and click **Apply Now**.

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

Step 7 Click **Back to Cluster List** to view the cluster status.

For details about cluster status during creation, see the description of the status parameters in **Table 5-4**.

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

On the MRS management console, a maximum of 10 clusters can be concurrently created, and a maximum of 100 clusters can be managed.

----End

Software Configurations

Table 4-1 MRS cluster software configuration

Parameter	Description
Region	Select a region. Cloud service products in different regions cannot communicate with each other over an intranet. For low network latency and quick access, select the nearest region.
Cluster Name	The cluster name must be unique. A cluster name can contain 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. The default name is **mrs**_*xxxx*. *xxxx* is a random collection of letters and digits.
Cluster Version	Currently, MRS 2.1.1 and MRS 3.0.5 are supported.
Cluster Type	The cluster types are as follows: • **Analysis cluster**: is used for offline data analysis and provides Hadoop components. • **Streaming cluster**: is used for streaming tasks and provides stream processing components. • **Hybrid cluster**: is used for both offline data analysis and streaming processing and provides Hadoop components and streaming processing components. You are advised to use a hybrid cluster to perform offline data analysis and streaming processing tasks at the same time. • **Custom**: You can adjust the cluster service deployment mode based on service requirements. For details, see **Creating a Custom Topology Cluster**. (**Custom** is supported in MRS 3.x only.) **NOTE** • MRS streaming clusters do not support job and file management functions. • To install all components in a cluster, select **Custom**.

Parameter	Description
Components	MRS components are as follows. Components of an analysis cluster: • Presto: open source and distributed SQL query engine • Hadoop: distributed system architecture • Spark: in-memory distributed computing framework (not supported in MRS 3.*x*) • Spark2x: A fast general-purpose engine for large-scale data processing. It is developed based on the open-source Spark2.x version. (supported only by MRS 3.*x*) • Hive: data warehouse framework built on Hadoop • HBase: distributed column-oriented database • Tez: an application framework which allows for a complex directed-acyclic-graph of tasks for processing data • Hue: provides the Hadoop UI capability, which enables users to analyze and process Hadoop cluster data on browsers • Loader: a tool based on source Sqoop 1.99.7, designed for efficiently transferring bulk data between Apache Hadoop and structured datastores such as relational databases (not supported in MRS 3.*x*) Hadoop is mandatory, and Spark and Hive must be used together. Select components based on service requirements. • Flink: a distributed big data processing engine that can perform stateful computations over both finite and infinite data streams • Oozie: a Hadoop job scheduling system (supported only by MRS 3.*x*) • Alluxio: a memory speed virtual distributed storage system • Ranger: a framework to enable, monitor, and manage data security across the Hadoop platform • Impala: an SQL query engine for processing huge volumes of data • ClickHouse: A column database management system (DBMS) for on-line analytical processing (OLAP). The ClickHouse cluster table engine that uses Kunpeng as the CPU architecture does not support HDFS and Kafka. • Kudu: a column-oriented data store Components of a streaming cluster:

Parameter	Description
	• Kafka: distributed messaging system • Flume: distributed, reliable, and available service for efficiently collecting, aggregating, and moving large amounts of log data
Metadata	Whether to use external data sources to store metadata. • **Local**: Metadata is stored in the local cluster. • **Data connections**: Metadata of external data sources is used. If the cluster is abnormal or deleted, metadata is not affected. This mode applies to scenarios where storage and compute are decoupled. Clusters that support the Hive or Ranger component support this function.
Component	This parameter is valid only when **Metadata** is set to **Data connections**. It indicates the type of an external data source. This function is not available in MRS 3.*x*. • Hive • Ranger
Data Connection Type	This parameter is valid only when **Metadata** is set to **Data connections**. It indicates the type of an external data source. • Hive supports the following data connection types: – RDS PostgreSQL database – RDS MySQL database – Local database • Ranger supports the following data connection types: – RDS MySQL database – Local database
Data Connection Instance	This parameter is valid only when **Data Connection Type** is set to **RDS PostgreSQL database** or **RDS MySQL database**. This parameter indicates the name of the connection between the MRS cluster and the RDS database. This instance must be created before being referenced here. You can click **Create Data Connection** to create a data connection. For details, see **Configuring Data Connections**.

Hardware Configurations

Table 4-2 MRS cluster hardware configuration

Parameter	Description
AZ	Select the AZ associated with the region of the cluster. An AZ is a physical area that uses independent power and network resources. AZs are physically isolated but interconnected through the internal network. This improves the availability of applications. You are advised to create clusters in different AZs.
VPC	A VPC is a secure, isolated, and logical network environment. Select the VPC for which you want to create a cluster and click **View VPC** to view the name and ID of the VPC. If no VPC is available, create one.
Subnet	A subnet provides dedicated network resources that are isolated from other networks, improving network security. Select the subnet for which you want to create a cluster. Click **View Subnet** to view details about the selected subnet. If no subnet is created in the VPC, go to the VPC console and choose **Subnets** > **Create Subnet** to create one. For details about how to configure network ACL outbound rules, see **How Do I Configure a Network ACL Outbound Rule?** **NOTE** The number of IP addresses required by creating an MRS cluster depends on the number of cluster nodes and selected components, but not the cluster type. In MRS, IP addresses are automatically assigned to clusters during cluster creation basically based on the following formula: Quantity of IP addresses = Number of cluster nodes + 2 (one for Manager; one for the DB). In addition, if the Hadoop, Hue, Sqoop, and Presto or Loader and Presto components are selected during cluster deployment, one IP address is added for each component. To a ClickHouse cluster independently, the number of IP addresses required is calculated as follows: Number of IP addresses = Number of cluster nodes + 1 (for Manager).

Parameter	Description
Security Group	A security group is a set of ECS access rules. It provides access policies for ECSs that have the same security protection requirements and are mutually trusted in a VPC. When you create a cluster, you can select **Auto create** from the drop-down list of **Security Group** to create a security group or select an existing security group. **NOTE** When you select a security group created by yourself, ensure that the inbound rule contains a rule in which **Protocol** is set to **All**, **Port** is set to **All**, and **Source** is set to a trusted accessible IP address range. Do not use **0.0.0.0/0** as a source address. Otherwise, security risks may occur. If you do not know the trusted accessible IP address range, select **Auto create**.
EIP	After binding an EIP to an MRS cluster, you can use the EIP to access the Manager web UI of the cluster. When creating a cluster, you can select an available EIP from the drop-down list and bind it. If no EIP is available in the drop-down list, click **Manage EIP** to access the **EIPs** service page to one. **NOTE** The EIP must be in the same region as the cluster.
Enterprise Project	Select the enterprise project to which the cluster belongs. To use an enterprise project, create one on the **Enterprise** > **Project Management** page. The **Enterprise Management** console of the enterprise project is designed for resource management. It helps enterprises manage cloud-based personnel, resources, permissions, and finance in a hierarchical manner, such as management of companies, departments, and projects.

Table 4-3 Cluster node information

Parameter	Description
CPU Architecture	CPU architecture supported by MRS: • **x86**: The x86-based CPU architecture uses Complex Instruction Set Computing (CISC). Each instruction can be used to execute low-level hardware operations. The number of instructions is large, and the length of each instruction is different. Therefore, executing such an instruction is complex and time-consuming. • **Kunpeng**: The Kunpeng-based CPU architecture uses Reduced Instruction Set Computing (RISC). RISC is a microprocessor that executes fewer types of computer instructions but at a higher speed than CISC. RISC simplifies the computer architecture and improves the running speed. Compared with the x86-based CPU architecture, the Kunpeng-based CPU architecture has a more balanced performance and power consumption ratio. Kunpeng features high density, low power consumption, high cost-effectiveness.
Common Template	This parameter is valid only when **Cluster Type** is set to **Custom**. For details, see **Custom Cluster Template Description**.

Parameter	Description
Node Type	MRS provides three types of nodes: ● Master: A Master node in an MRS cluster manages the cluster, assigns executable cluster files to Core nodes, traces the execution status of each job, and monitors the DataNode running status. ● Core: A Core node in a cluster processes data and stores process data in HDFS. Analysis Core nodes are created in an analysis cluster. Streaming Core nodes are created in a streaming cluster. Both analysis and streaming Core nodes are created in a hybrid cluster. ● Task: A Task node in a cluster is used for computing and does not store persistent data. Yarn and Storm are mainly installed on Task nodes. Task nodes are optional, and the number of Task nodes can be zero. Analysis Task nodes are created in an analysis cluster. Streaming Task nodes are created in a streaming cluster. Both analysis and streaming Task nodes are created in a hybrid cluster. When the data volume change is small in a cluster but the cluster's service processing capabilities need to be remarkably and temporarily improved, add Task nodes to address the following situations: – Service volumes temporarily increase, for example, report processing at the end of the year. – Long-term tasks must be completed in a short time, for example, some urgent analysis tasks.
Instance Specifications	Instance specifications of Master or Core nodes. MRS supports host specifications determined by CPU, memory, and disk space. Click  to configure the instance specifications, system disk, and data disk parameters of the cluster node. **NOTE** ● More advanced instance specifications provide better data processing. ● If you select non-HDD disks for Core nodes, the disk types of Master and Core nodes are determined by **Data Disk**. ● If **Sold out** appears next to an instance specification of a node, the node of this specification cannot be d. You can only nodes of other specifications. ● For MRS 3.*x* or later, the memory of the master node must be greater than 64 GB.

Parameter	Description
System Disk	Storage type and storage space of the system disk on a node. Storage type can be any of the following: ● SATA: common I/O ● SAS: high I/O ● SSD: ultra-high I/O ● GPSSD: general-purpose SSD
Data Disk	Data disk storage space of a node. To increase data storage capacity, you can add disks at the same time when creating a cluster. The following two application scenarios are involved. ● Data storage and computing are separated. Data is stored in OBS, which features low cost and unlimited storage capacity. The clusters can be terminated at any time in OBS. The computing performance is determined by OBS access performance and is lower than that of HDFS. This configuration is recommended if data computing is infrequent. ● Data storage and computing are not separated. Data is stored in HDFS, which features high cost, high computing performance, and limited storage capacity. Before terminating clusters, you must export and store the data. This configuration is recommended if data computing is frequent. The storage type can be any of the following: ● SATA: common I/O ● SAS: high I/O ● SSD: ultra-high I/O ● GPSSD: general-purpose SSD **NOTE** More nodes in a cluster require higher disk capacity of Master nodes. To ensure stable cluster running, set the disk capacity of the Master node to over 600 GB if the number of nodes is 300 and increase it to over 1 TB if the number of nodes reaches 500.

Parameter	Description
Instance Count	Number of Master and Core nodes. For Master nodes: • If **Cluster HA** is enabled, the number of Master nodes is fixed to **2**. • If **Cluster HA** is disabled, the number of Master nodes is fixed to **1**. At least one Core node must exist and the total number of Core and Task nodes cannot exceed 500. Task: Click to add a Task node. Click to modify the instance specifications and disk configuration of a Task node. Click to delete the added Task node. **NOTE** • A maximum of 500 Core nodes are supported by default. If more than 500 Core nodes are required, contact technical support. • A small number of nodes may cause clusters to run slowly while a large number of nodes may be unnecessarily costly. Set an appropriate value based on data to be processed.
LVM	This parameter is valid when a streaming Core node is created only. Click this parameter to enable or disable the disk LVM management function. This parameter is not available in MRS 3.*x* and later versions. If LVM is enabled, all disks on a node are mounted as logical volumes. This delivers more proper disk planning to avoid data skew, thereby improving system stability.
Topology Adjustment	If the deployment mode in the **Common Node** does not meet the requirements, set **Topology Adjustment** to **Enable** and adjust the instance deployment mode based on service requirements. For details, see **Topology Adjustment for a Custom Cluster**. This parameter is valid only when **Cluster Type** is set to **Custom**.

(Optional) Advanced Configuration

Table 4-4 MRS cluster advanced configuration topology

Parameter	Description
Tag	For details, see **Adding a Tag to a Cluster**.
Hostname Prefix	Enter the prefix for the computer hostname of an ECS in the cluster.

Parameter	Description
Auto Scaling	Auto scaling can be configured only after you specify Task node specifications in the **Configure Hardware** step. For details about how to configure Task node specifications, see **Configuring an Auto Scaling Rule**.
Bootstrap Action	For details, see **Adding a Bootstrap Action**. This parameter is not available in MRS 3.*x*.
Agency	By binding an agency, ECSs or BMSs can manage some of your resources. Determine whether to configure an agency based on the actual service scenario. For example, you can configure an agency of the ECS type to automatically obtain the AK/SK to access OBS. For details, see **Configuring a Storage-Compute Decoupled Cluster (Agency)**. The **MRS_ECS_DEFAULT_AGENCY** agency has the OBSOperateAccess permission of OBS and the CESFullAccess (for users who have enabled fine-grained policies), CES Administrator, and KMS Administrator permissions in the region where the cluster is located.
Metric Sharing	Monitoring metrics of big data components are collected. If a fault occurs when you use a cluster, share the monitoring metrics withtechnical support personnel for troubleshooting. This parameter is not available in MRS 3.*x*.
OBS Permission Control	Users who have enabled fine-grained permission control can use this function to grant permissions on different directories in OBS file systems to different MRS users. For details, see **Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS**. This parameter is not available in MRS 3.*x*.
Data Disk Encryption	Whether to encrypt data in the data disk mounted to the cluster. This function is disabled by default. To use this function, you must have the Security Administrator and KMS Administrator permissions. This parameter is not available in MRS 3.*x*. Keys used by encrypted data disks are provided by the Key Management Service (KMS) of the Data Encryption Workshop (DEW), secure and convenient. Therefore, you do not need to establish and maintain the key management infrastructure. Click **Data Disk Encryption** to enable or disable the data disk encryption function.
Key ID	This parameter is displayed only when the **Data Disk Encryption** function is enabled. This parameter indicates the key ID corresponding to the selected key name. This parameter is not available in MRS 3.*x*.

Parameter	Description
Key Name	This parameter is mandatory when the **Data Disk Encryption** function is enabled. Select the name of the key used to encrypt the data disk. By default, the default master key named **evs/default** is selected. You can select another master key from the drop-down list. This parameter is not available in MRS 3.*x*. If disks are encrypted using a CMK, which is then disabled or scheduled for deletion, the disks can no longer be read from or written to, and data on these disks may never be restored. Exercise caution when performing this operation. Click **View Key List** to enter a page where you can create and manage keys.
Alarm	If the alarm function is enabled, the cluster maintenance personnel can be notified in a timely manner to locate faults when the cluster runs abnormally or the system is faulty.
Rule Name	Name of the rule for sending alarm messages. The value can contain only digits, letters, hyphens (-), and underscores (_).
Topic Name	Select an existing topic or click **Create Topic** to create a topic. To deliver messages published to a topic, you need to add a subscriber to the topic. For details, see **Adding Subscriptions to a Topic**. A topic serves as a message sending channel, where publishers and subscribers can interact with each other.
Kerberos Authentication	Whether to enable Kerberos authentication when logging in to Manager. •  : If **Kerberos Authentication** is disabled, common users can use all functions of an MRS cluster. You are advised to disable Kerberos authentication in single-user scenarios. •  : If **Kerberos Authentication** is enabled, common users cannot use the file and job management functions of an MRS cluster and cannot view cluster resource usage or the job records for Hadoop and Spark. To use more cluster functions, the users must contact the Manager administrator to assign more permissions. You are advised to enable Kerberos authentication in multi-user scenarios.
Username	Name of the administrator of Manager. **admin** is used by default.

Parameter	Description
Password	Password of the Manager administrator The following requirements must be met: ● Must contain 8 to 26 characters. ● Must contain at least four of the following: – Lowercase letters – Uppercase letters – Digits – Have at least one of the following special characters: !?,.: -_{} [ ]@ $% ^ + = / ● Cannot be the same as the username or the username spelled backwards. Password Strength: The colorbar in red, orange, and green indicates weak, medium, and strong password, respectively.
Confirm Password	Enter the password of the Manager administrator again.

Parameter	Description
Login Mode	• Password You can log in to ECS nodes using a password. A password must meet the following requirements: 1. Must be a string and 8 to 26 characters long. 2. The password must contain at least four types of the following characters: uppercase letters, lowercase letters, digits, and special characters (! ?,.: -_{} [ ]@ $% ^ + = /). 3. The password cannot be the username or the reverse username. • Key Pair Key pairs are used to log in to ECS nodes of the cluster. Select a key pair from the drop-down list. Select "I acknowledge that I have obtained private key file *SSHkey-xxx* and that without this file I will not be able to log in to my ECS." If you have never created a key pair, click **View Key Pair** to create or import a key pair. And then, obtain a private key file. A key pair, also called an SSH key, consists of a public key and a private key. You can create an SSH key and download the private key for authenticating remote login. For security, a private key can only be downloaded once. Keep it secure. Use an SSH key in either of the following two methods: 1. Creating an SSH key: After you create an SSH key, a public key and a private key are generated. The public key is stored in the system, and the private key is stored in the local ECS. When you log in to an ECS, the public and private keys are used for authentication. 2. Importing an SSH key: If you have obtained the public and private keys, import the public key into the system. When you log in to an ECS, the public and private keys are used for authentication.

Parameter	Description
Secure Communications	MRS clusters provision, manage, and use big data components through the management console. Big data components are deployed in a user's VPC. If the MRS management console needs to directly access big data components deployed in the user's VPC, you need to enable the corresponding security group rules after you have obtained user authorization. This authorization process is called secure communications. For details, see **Communication Security Authorization**. If the secure communications function is not enabled, MRS clusters cannot be created.

Failed to Create a Cluster

If a cluster fails to be created, the failed task will be managed on the **Manage Failed Tasks** page. Choose **Clusters** > **Active Clusters**. Click shown in **Figure 4-1** to go to the **Manage Failed Tasks** page. In the **Status** column, hover the cursor over to view the failure cause. You can delete failed tasks by referring to **Viewing Failed MRS Tasks**.

Figure 4-1 Failed task management

Table 4-5 lists the error codes of MRS cluster creation failures.

Table 4-5 Error codes

Error Code	Description
MRS.101	Insufficient quota to meet your request. Contact customer service to increase the quota.
MRS.102	The token cannot be null or invalid. Try again later or contact customer service.
MRS.103	Invalid request. Try again later or contact customer service.
MRS.104	Insufficient resources. Try again later or contact customer service.
MRS.105	Insufficient IP addresses in the existing subnet. Try again later or contact customer service.
MRS.201	Failed due to an ECS error. Try again later or contact customer service.

Error Code	Description
MRS.202	Failed due to an IAM error. Try again later or contact customer service.
MRS.203	Failed due to a VPC error. Try again later or contact customer service.
MRS.400	MRS system error. Try again later or contact customer service.

4.4 Creating a Custom Topology Cluster

The analysis cluster, streaming cluster, and hybrid cluster provided by MRS use fixed templates to deploy cluster processes. Therefore, you cannot customize service processes on management nodes and control nodes. If you want to customize the cluster deployment, set **Cluster Type** to **Custom** when creating a cluster. In this way, you can customize the deployment mode of process instances on the management nodes and control nodes in the cluster. Only MRS 3.x and later versions support the creation of clusters in a custom topology.

A custom cluster provides the following functions:

- Separated deployment of the management and control roles: The management role and control role are deployed on different Master nodes.
- Co-deployment of the management and control roles: The management and control roles are co-deployed on the Master node.
- ZooKeeper is deployed on an independent node to improve reliability.
- Components are deployed separately to avoid resource contention.

Roles in an MRS cluster:

- Management Node (MN): is the node to install Manager (the management system of the MRS cluster). It provides a unified access entry. Manager centrally manages nodes and services deployed in the cluster.
- Control Node (CN): controls and monitors how data nodes store and receive data, and send process status, and provides other public functions. Control nodes of MRS include HMaster, HiveServer, ResourceManager, NameNode, JournalNode, and SlapdServer.
- Data Node (DN): A data node executes the instructions sent by the management node, reports task status, stores data, and provides other public functions. Data nodes of MRS include DataNode, RegionServer, and NodeManager.

Customizing a Cluster

Step 1 Log in to the MRS console.

Step 2 Click **Create Cluster**. The page for creating a cluster is displayed.

Step 3 Click the **Custom Config** tab.

Step 4 Configure basic cluster information. For details about the parameters, see **Software Configurations**.

- **Region**: Retain the default value.
- **Cluster Name**: You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, for example, **mrs_20180321**.
- **Cluster Version**: Currently, only MRS 3.x are supported.
- **Cluster Type**: Select **Custom** and select components as required.

Step 5 Click **Next**. Configure hardware information.

- **AZ**: Retain the default value.
- **VPC**: Retain the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
- **Subnet**: Retain the default value.
- **Security Group**: Select **Auto create**.
- **EIP**: Select **Bind later**.
- **Enterprise Project**: Retain the default value.
- **CPU Architecture**: Retain the default value. This parameter is unavailable in MRS 3.x.
- **Common Node**: For details, see **Custom Cluster Template Description**.
- **Instance Specifications**: Click  to configure the instance specifications, system disk and data disk storage types, and storage space.
- **Instance Count**: Adjust the number of cluster instances based on the service volume. For details, see **Table 4-7**.
- **Topology Adjustment**: If the deployment mode in the **Common Node** does not meet the requirements, you need to manually install some instances that are not deployed by default, or you need to manually install some instances, set **Topology Adjustment** to **Enable** and adjust the instance deployment mode based on service requirements. For details, see **Topology Adjustment for a Custom Cluster**.

Step 6 Click **Next** and set advanced options.

For details about the parameters, see **(Optional) Advanced Configuration**.

Step 7 Click **Create Now**.

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

Step 8 Click **Back to Cluster List** to view the cluster status.

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

----End

Custom Cluster Template Description

Table 4-6 Common templates for custom clusters

Common Node	Description	Node Range
Compact	The management role and control role are deployed on the Master node, and data instances are deployed in the same node group. This deployment mode applies to scenarios where the number of control nodes is less than 100, reducing costs.	• The number of Master nodes is greater than or equal to 3 and less than or equal to 11. • The total number of node groups is less than or equal to 10, and the total number of nodes in non-Master node groups is less than or equal to 10,000.
OMS-separate	The management role and control role are deployed on different Master nodes, and data instances are deployed in the same node group. This deployment mode is applicable to a cluster with 100 to 500 nodes and delivers better performance in high-concurrency load scenarios.	• The number of Master nodes is greater than or equal to 5 and less than or equal to 11. • The total number of node groups is less than or equal to 10, and the total number of nodes in non-Master node groups is less than or equal to 10,000.
Full-size	The management role and control role are deployed on different Master nodes, and data instances are deployed in different node groups. This deployment mode is applicable to a cluster with more than 500 nodes. Components can be deployed separately, which can be used for a larger cluster scale.	• The number of Master nodes is greater than or equal to 9 and less than or equal to 11. • The total number of node groups is less than or equal to 10, and the total number of nodes in non-Master node groups is less than or equal to 10,000.

Table 4-7 Node deployment scheme of a customized MRS cluster

Node Deployment Principle		Applicable Scenario	Networking Rule
Management nodes, control nodes, and data nodes are deployed separately. (This scheme requires at least eight nodes.)	MN × 2 + CN × 9 + DN × n	(Recommended) This scheme is used when the number of data nodes is 500–2000.	• If the number of nodes in a cluster exceeds 200, the nodes are distributed to different subnets and the subnets are interconnected with each other in Layer 3 using core switches. Each subnet can contain a maximum of 200 nodes and the allocation of nodes to different subnets must be balanced. • If the number of nodes is less than 200, the nodes in the cluster are deployed in the same subnet and the nodes are interconnected with each other in Layer 2 using aggregation switches.
	MN × 2 + CN × 5 + DN × n	(Recommended) This scheme is used when the number of data nodes is 100–500.	
	MN × 2 + CN × 3 + DN × n	(Recommended) This scheme is used when the number of data nodes is 30–100.	
The management nodes and control nodes are deployed together, and the data nodes are deployed separately.	(MN+CN) × 3 + DN × n	(Recommended) This scheme is used when the number of data nodes is 3–30.	Nodes in the cluster are deployed in the same subnet and are interconnected with each other at Layer 2 through aggregation switches.

Node Deployment Principle	Applicable Scenario	Networking Rule
The management nodes, control nodes, and data nodes are deployed together.	• This scheme is applicable to a cluster having fewer than 6 nodes. • This scheme requires at least three nodes. **NOTE** This template is not recommended in the production environment or commercial environment. • If management, control, and data nodes are co-deployed, cluster performance and reliability are greatly affected. • If the number of nodes meet the requirements, deploy data nodes separately. • If the number of nodes is insufficient to support separately deployed data nodes, use the dual-plane networking mode for this scenario. The traffic of the management network is isolated from that of the service network to prevent excessive data volumes on the service plane, ensuring correct delivery of management operations.	Nodes in the cluster are deployed in the same subnet and are interconnected with each other at Layer 2 through aggregation switches.

Topology Adjustment for a Custom Cluster

Table 4-8 Topology adjustment

Service	Dependency	Role	Role Deployment Suggestions	Description
OMSServer	-	OMSServer	This role can be deployed it on the Master node and cannot be modified.	-

Service	Dependency	Role	Role Deployment Suggestions	Description
ClickHouse	Depends on ZooKeeper.	CHS (ClickHouseServer)	This role can be deployed on all nodes. Number of role instances to be deployed: an even number ranging from 2 to 256	A non-Master node group with this role assigned is considered as a Core node.
		CLB (ClickHouseBalancer)	This role can be deployed on all nodes. Number of role instances to be deployed: 2 to 256	-
ZooKeeper	-	QP(quorumpeer)	This role can be deployed on the Master node only. Number of role instances to be deployed: 3 to 9, with the step size of 2	-
Hadoop	Depends on ZooKeeper.	NN(NameNode)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2	The NameNode and ZKFC processes are deployed on the same server for cluster HA.
		HFS (HttpFS)	This role can be deployed on the Master node only. Number of role instances to be deployed: 0 to 10	-
		JN(JournalNode)	This role can be deployed on the Master node only. Number of role instances to be deployed: 3 to 60, with the step size of 2	-

Service	Dependency	Role	Role Deployment Suggestions	Description
		DN(DataNode)	This role can be deployed on all nodes. Number of role instances to be deployed: 3 to 10,000	A non-Master node group with this role assigned is considered as a Core node.
		RM(ResourceManager)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2	-
		NM(NodeManager)	This role can be deployed on all nodes. Number of role instances to be deployed: 3 to 10,000	-
		JHS(JobHistoryServer)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2	-
		TLS(TimelineServer)	This role can be deployed on the Master node only. Number of role instances to be deployed: 0 to 1	-
Presto	Depends on Hive.	PCD(Coordinator)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2	-

Service	Dependency	Role	Role Deployment Suggestions	Description
		PWK(Worker)	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to 10,000	-
Spark2x	• Depends on Hadoop. • Depends on Hive. • Depends on ZooKeeper.	JS2X(JDBCServer2x)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2 to 10	-
		JH2X(JobHistory2x)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2	-
		SR2X(SparkResource2x)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2 to 50	-
		IS2X(IndexServer2x)	(Optional) This role can be deployed on the Master node only. Number of role instances to be deployed: 0 to 2, with the step size of 2	-
HBase	Depends on Hadoop.	HM(HMaster)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2	-

Service	Dependency	Role	Role Deployment Suggestions	Description
		TS(ThriftServer)	This role can be deployed on all nodes. Number of role instances to be deployed: 0 to 10,000	-
		RT(RESTServer)	This role can be deployed on all nodes. Number of role instances to be deployed: 0 to 10,000	-
		RS(RegionServer)	This role can be deployed on all nodes. Number of role instances to be deployed: 3 to 10,000	-
		TS1(Thrift1Server)	This role can be deployed on all nodes. Number of role instances to be deployed: 0 to 10,000	If the Hue service is installed in a cluster and HBase needs to be used on the Hue web UI, install this instance for the HBase service.
Hive	• Depends on Hadoop. • Depends on DBService.	MS(MetaStore)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2 to 10	-
		WH(WebHCat)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 10	-

Service	Dependency	Role	Role Deployment Suggestions	Description
		HS(HiveServer)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2 to 80	-
Hue	Depends on DBService.	H(Hue)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2	-
Sqoop	Depends on Hadoop.	SC(Sqoop Client)	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to 10,000	-
Kafka	Depends on ZooKeeper.	B(Broker)	This role can be deployed on all nodes. Number of role instances to be deployed: 3 to 10,000	-
Flume	-	MS(MonitorServer)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2	-
		F(Flume)	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to 10,000	A non-Master node group with this role assigned is considered as a Core node.

Service	Dependency	Role	Role Deployment Suggestions	Description
Tez	• Depends on Hadoop. • Depends on DBService. • Depends on ZooKeeper.	TUI(TezUI)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2	-
Flink	• Depends on ZooKeeper. • Depends on Hadoop.	FR(FlinkResource)	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to 10,000	-
		FS(FlinkServer)	This role can be deployed on all nodes. Number of role instances to be deployed: 0 to 2	-
Oozie	• Depends on Hadoop. • Depends on DBService. • Depends on ZooKeeper.	O(oozie)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2	-

Service	Dependency	Role	Role Deployment Suggestions	Description
Impala	• Depends on Hadoop. • Depends on Hive. • Depends on DBService. • Depends on ZooKeeper.	StateStore	This role can be deployed on the Master node only. Number of role instances to be deployed: 1	-
		Catalog	This role can be deployed on the Master node only. Number of role instances to be deployed: 1	-
		Impalad	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to 10,000	-
Kudu	-	KuduMaster	This role can be deployed on the Master node only. Number of role instances to be deployed: 3 or 5	-
		KuduTserver	This role can be deployed on all nodes. Number of role instances to be deployed: 3 to 10,000	-
Ranger	Depends on DBService.	RA(RangerAdmin)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2	-

Service	Dependency	Role	Role Deployment Suggestions	Description
		USC(User Sync)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1	-
		TSC (TagSync)	This role can be deployed on all nodes. Number of role instances to be deployed: 0 to 1	-

4.5 Adding a Tag to a Cluster

Tags are used to identify clusters. Adding tags to clusters can help you identify and manage your cluster resources.

You can add a maximum of 10 tags to a cluster when creating the cluster or add them on the details page of the created cluster.

A tag consists of a tag key and a tag value. **Table 4-9** provides tag key and value requirements.

Table 4-9 Tag key and value requirements

Parameter	Requirement	Example
Key	A tag key cannot be left blank. A tag key must be unique in a cluster. A tag key contains a maximum of 36 characters. A tag value cannot contain special characters (=*<>\,|/) or start or end with spaces.	Organization

Parameter	Requirement	Example
Value	A tag value contains a maximum of 43 characters. A tag value cannot contain special characters (=*<>\,|/) or start or end with spaces. This parameter can be left blank.	Apache

Adding Tags to a Cluster

You can perform the following operations to add tags to a cluster when creating the cluster.

1. Log in to the MRS console.
2. Click **Create Cluster**. The corresponding page is displayed.
3. Click the **Custom Config** tab.
4. Configure the cluster software and hardware by referring to **Creating a Custom Cluster**.
5. On the **Set Advanced Options** tab page, add a tag.

   Enter the key and value of a tag to be added.

   You can add a maximum of 10 tags to a cluster and use intersections of tags to search for the target cluster.

   NOTE

   You can also add tags to existing clusters. For details, see **Managing Tags**.

Searching for the Target Cluster

On the **Active Clusters** page, search for the target cluster by tag key or tag value.

1. Log in to the MRS console.
2. In the upper right corner of the **Active Clusters** page, click **Search by Tag** to access the search page.
3. Enter the tag of the cluster to be searched.

   You can select a tag key or tag value from their drop-down lists. When the tag key or tag value is exactly matched, the system can automatically locate the target cluster. If you enter multiple tags, their intersections are used to search for the cluster.
4. Click **Search**.

   The system searches for the target cluster by tag key or value.

Managing Tags

You can view, add, modify, and delete tags on the **Tags** tab page of the cluster.

1. Log in to the MRS console.
2. On the **Active Clusters** page, click the name of a cluster for which you want to manage tags.

   The cluster details page is displayed.
3. Click the **Tags** tab and view, add, modify, and delete tags on the tab page.
   - View

     On the **Tags** tab page, you can view details about tags of the cluster, including the number of tags and the key and value of each tag.
   - Add

     Click **Add Tag** in the upper left corner. In the displayed **Add Tag** dialog box, enter the key and value of the tag to be added, and click **OK**.
   - Modify

     In the **Operation** column of the tag, click **Edit**. In the displayed **Edit Tag** page, enter new tag key and value and click **OK**.
   - Delete

     In the **Operation** column of the tag, click **Delete**. After confirmation, click **OK** in the displayed page for deleting a tag.

     NOTE

     MRS cluster tag updates will be synchronized to every ECS in the cluster. You are advised not to modify ECS tags on the ECS console to prevent inconsistency between ECS tags and MRS cluster tags. If the number of tags of an ECS in the MRS cluster reaches the upper limit, you cannot create any tag for the MRS cluster.

4.6 Communication Security Authorization

MRS clusters provision, manage, and use big data components through the management console. Big data components are deployed in a user's VPC. If the MRS management console needs to directly access big data components deployed in the user's VPC, you need to enable the corresponding security group rules after you have obtained user authorization. This authorization process is called secure communications.

If the secure communications function is not enabled, MRS clusters cannot be created. If you disable the communication after a cluster is created, the cluster status will be **Network channel is not authorized** and the following functions will be affected:

- Functions, such as big data component installation, cluster scale-out/scale-in, and Master node specification upgrade, are unavailable.
- The cluster running status, alarms, and events cannot be monitored.
- The node management, component management, alarm management, file management, job management, patch management, and tenant management functions on the cluster details page are unavailable.
- The Manager page and the website of each component cannot be accessed.

After the secure communications function is enabled again, the cluster status is restored to **Running**, and the preceding functions become available. For details, see **Enabling Secure Communications for Clusters with This Function Disabled**.

If the security group rules authorized in the cluster are insufficient for you to provision, manage, and use big data components, is displayed on the right of **Secure Communications**. In this case, click **Update** to update the security group rules. For details, see **Update**.

Enabling Secure Communications During Cluster Creation

Step 1 Log in to the MRS console.

Step 2 Click Create **Cluster**. The corresponding page is displayed.

Step 3 Click **Quick Config** or **Custom Config**.

Step 4 Configure cluster information by referring to **Creating a Custom Cluster**.

Step 5 In the **Secure Communications** area of the **Advanced Settings** tab page, select **Enable**.

Step 6 Click **Create Now**.

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

----End

Disabling Secure Communications After a Cluster Is Created

Step 1 Log in to the MRS console.

Step 2 In the active cluster list, click the name of the cluster for which you want to disable secure communications.

The cluster details page is displayed.

Step 3 Click the switch on the right of **Secure Communications** to disable authorization. In the dialog box that is displayed, click **OK**.

After the authorization is disabled, the cluster status changes to **Network channel unauthorized**, and some functions of the cluster are unavailable. Exercise caution when performing this operation.

----End

Enabling Secure Communications for Clusters with This Function Disabled

Step 1 Log in to the MRS console.

Step 2 In the active cluster list, click the name of the cluster for which you want to enable secure communications.

The cluster details page is displayed.

Step 3 Click the switch on the right of **Secure Communications** to enable the function.

After the function is enabled, the cluster status changes to **Running**.

----End

Update

If the security group rules authorized in the cluster are insufficient for you to provision, manage, and use big data components, is displayed on the right of **Secure Communications**. In this case, click **Update** to update the security group rules. For details, see **Update**.

Step 1 Log in to the MRS console.

Step 2 In the active cluster list, click the name of the cluster for which you want to update secure communications.

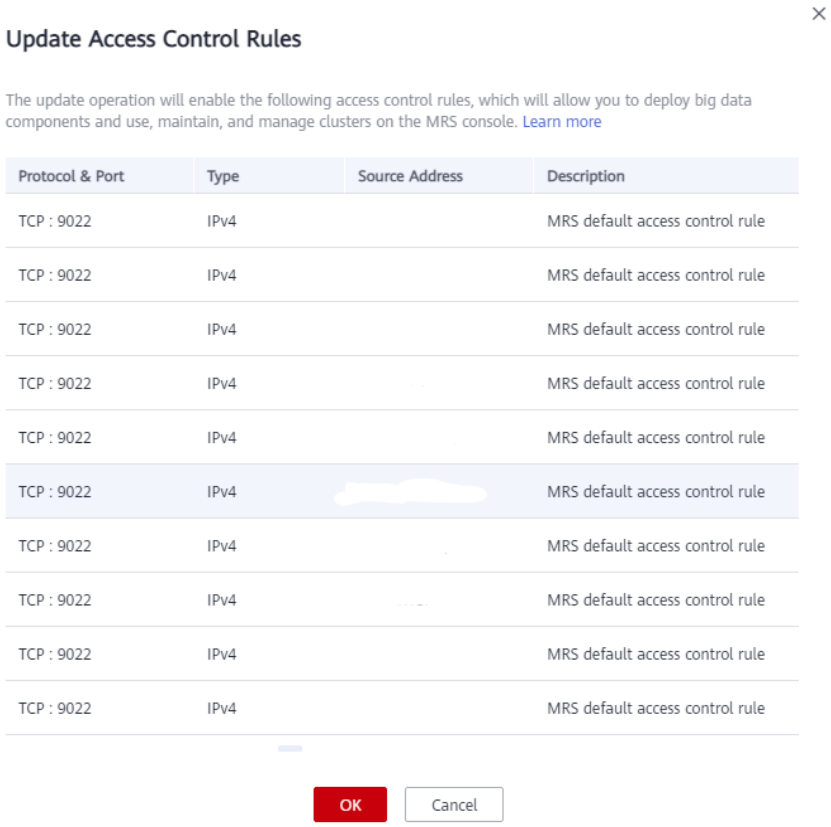
The cluster details page is displayed.

Step 3 Click **Update** on the right of **Secure Communications**.

Figure 4-2 Update

Step 4 Click **OK**.

Figure 4-3 Updating access control rules



----End

4.7 Configuring an Auto Scaling Rule

Background

In big data application scenarios, especially real-time data analysis and processing, the number of cluster nodes needs to be dynamically adjusted according to data volume changes to provide the required number of resources. The auto scaling function of MRS enables the task nodes of a cluster to be automatically scaled to match cluster loads. If the data volume changes periodically, you can configure an auto scaling rule so that the number of task nodes can be automatically adjusted in a fixed period of time before the data volume changes.

- Auto scaling rules: You can increase or decrease task nodes based on real-time cluster loads. Auto scaling will be triggered with a certain delay when the data volume changes.
- Resource plans: Set the task node quantity based on the time range. If the data volume changes periodically, you can create resource plans to resize the cluster before the data volume changes, thereby avoiding delays in increasing or decreasing resources.

You can configure either auto scaling rules or resource plans or both to trigger auto scaling. Configuring both resource plans and auto scaling rules improves the cluster node scalability to cope with occasionally unexpected data volume peaks.

In some service scenarios, resources need to be reallocated or service logic needs to be modified after cluster scale-out or scale-in. If you manually scale out or scale in a cluster, you can log in to cluster nodes to reallocate resources or modify service logic. If you use auto scaling, MRS enables you to customize automation scripts for resource reallocation and service logic modification. Automation scripts can be executed before and after auto scaling and automatically adapt to service load changes, all of which eliminates manual operations. In addition, automation scripts can be fully customized and executed at various moments, meeting your personalized requirements and improving auto scaling flexibility.

- Auto scaling rules:
  - You can set a maximum of five rules for scaling out or in a cluster, respectively.
  - The system determines the scale-out and then scale-in based on your configuration sequence. Important policies take precedence over other policies to prevent repeated triggering when the expected effect cannot be achieved after a scale-out or scale-in.
  - Comparison factors include greater than, greater than or equal to, less than, and less than or equal to.
  - Cluster scale-out or scale-in can be triggered only after the configured metric threshold is reached for consecutive 5*n* (the default value of *n* is 1) minutes.
  - After each scale-out or scale-in, there is a cooling duration is greater than 0, and lasts 20 minutes by defaults.
  - In each cluster scale-out or scale-in, at least one node and at most 100 nodes can be added or reduced.

- Resource plans (setting the number of Task nodes by time range):
  - You can specify a Task node range (minimum number to maximum number) in a time range. If the number of Task nodes is beyond the Task node range in a resource plan, the system triggers cluster scale-out or scale-in.
  - You can set a maximum of five resource plans for a cluster.
  - A resource plan cycle is by day. The start time and end time can be set to any time point between 00:00 and 23:59. The start time must be at least 30 minutes earlier than the end time. Time ranges configured for different resource plans cannot overlap.
  - After a resource plan triggers cluster scale-out or scale-in, there is 10-minute cooling duration. Auto scaling will not be triggered again within the cooling time.
  - When a resource plan is enabled, the number of Task nodes in the cluster is limited to the default node range configured by you in other time periods except the time period configured in the resource plan.
  - If the resource plan is not enabled, the number of Task nodes is not limited to the default node range.
- Automation scripts:
  - You can set an automation script so that it can automatically run on cluster nodes when auto scaling is triggered.
  - You can set a maximum number of 10 automation scripts for a cluster.
  - You can specify an automation script to be executed on one or more types of nodes.
  - Automation scripts can be executed before or after scale-out or scale-in.
  - Before using automation scripts, upload them to a cluster VM or OBS file system in the same region as the cluster. The automation scripts uploaded to the cluster VM can be executed only on the existing nodes. If you want to make the automation scripts run on the new nodes, upload them to the OBS file system.

Accessing the Auto Scaling Configuration Page

You can configure an auto scaling rule on the **Set Advanced Options** page during cluster creation or on the **Nodes** page after the cluster is created.

Configuring an auto scaling rule when creating a cluster

Step 1 Log in to the MRS console.

Step 2 When you a cluster containing task nodes, configure the cluster software and hardware information by referring to **Creating a Custom Cluster**. Then, on the **Set Advanced Options** page, enable **Analysis Task** and configure or modify auto scaling rules and resource plans.

You can configure the auto scaling rules by referring to the following scenarios:

- **Scenario 1: Using Auto Scaling Rules Alone**
- **Scenario 2: Using Resource Plans Alone**

- **Scenario 3: Using Both Auto Scaling Rules and Resource Plans**

----End

Configure an auto scaling rule for an existing cluster

Step 1 Log in to the MRS console.

Step 2 In the navigation pane on the left, choose **Clusters** > **Active Clusters** and click the name of a running cluster to go to the cluster details page.

Step 3 Click the **Nodes** tab and then **Auto Scaling** in the **Operation** column of the task node group. The **Auto Scaling** page is displayed.

NOTE

- If no task node exists in the cluster, click **Configure Task Node** to add one and then configure the auto scaling rules.
- For MRS 3.*x* or later, **Configure Task Node** is available only for analysis clusters, streaming clusters, and hybrid clusters. For details about how to add a task node for a custom cluster of MRS 3.*x* or later, see **Adding a Task Node**.

Step 4 Enable **Auto Scaling** and configure or modify auto scaling rules and resource plans.

You can configure the auto scaling rules by referring to the following scenarios:

- **Scenario 1: Using Auto Scaling Rules Alone**
- **Scenario 2: Using Resource Plans Alone**
- **Scenario 3: Using Both Auto Scaling Rules and Resource Plans**

----End

Scenario 1: Using Auto Scaling Rules Alone

The following is an example scenario:

The number of nodes needs to be dynamically adjusted based on the Yarn resource usage. When the memory available for Yarn is less than 20% of the total memory, five nodes need to be added. When the memory available for Yarn is greater than 70% of the total memory, five nodes need to be removed. The number of nodes in a task node group ranges from 1 to 10.

Step 1 Go to the **Auto Scaling** page to configure auto scaling rules.

- Configure the **Default Range** parameter.

  Enter a task node range, in which auto scaling is performed. This constraint applies to all scale-in and scale-out rules. The maximum value range allowed is 0 to 500.

  The value range in this example is 1 to 10.

- Configure an auto scaling rule.

  To enable **Auto Scaling**, you must configure a scale-out or scale-in rule.

  a. Select **Scale-Out** or **Scale-In**.

  b. Click **Add Rule**.

  c. Configure the **Rule Name**, **If**, **Last for**, **Add**, and **Cooldown Period** parameters.

d. Click **OK**.

You can view, edit, or delete the rules you configured in the **Scale-out** or **Scale-in** area on the **Auto Scaling** page. You can click **Add Rule** to configure multiple rules.

Step 2 (Optional) Configure automation scripts.

Set **Advanced Settings** to **Configure** and click **Created**, or click **Add Automation Script** to go to the **Automation Script** page.

MRS 3.*x* does not support this operation.

1. Set the following parameters: **Name**, **Script Path**, **Execution Node**, **Parameter**, **Executed**, and **Action upon Failure**. For details about the parameters, see **Table 4-12**.
2. Click **OK** to save the automation script configurations.

Step 3 Click **OK**.

NOTE

If you want to configure an auto scaling rule for an existing cluster, select **I agree to authorize MRS to scale out or in nodes based on the above rule**.

----End

Scenario 2: Using Resource Plans Alone

If the data volume changes regularly every day and you want to scale out or in a cluster before the data volume changes, you can create resource plans to adjust the number of Task nodes as planned in the specified time range.

Example:

A real-time processing service sees a sharp increase in data volume from 7:00 to 13:00 every day. Assume that an MRS streaming cluster is used to process the service data. Five task nodes are required from 7:00 to 13:00, while only two are required at other time.

Step 1 Go to the **Auto Scaling** page to configure a resource plan.

1. For example, the **Default Range** is set to **2-2**, indicating that the number of Task nodes is fixed to 2 except the time range specified in the resource plan.
2. Click **Configure Node Range for Specific Time Range** under **Default Range** or **Add Resource Plan**.
3. Configure **Time Range** and **Node Range**.

   For example, set **Time Range** to **07:00-13:00**, and **Node Range** to **5-5**. This indicates that the number of task nodes is fixed at 5 from 07:00 to 13:00.

   For details about parameter configurations, see **Table 4-11**. You can click **Configure Node Range for Specific Time Range** to configure multiple resource plans.

NOTE

- If you do not set **Node Range**, its default value will be used.
- If you set both **Node Range** and **Time Range**, the node range you set will be used during the time range you set, and the default node range will be used beyond the time range you set. If the time is not within the configured time range, the default range is used.

Step 2 (Optional) Configure automation scripts.

Set **Advanced Settings** to **Configure** and click **Created**, or click **Add Automation Script** to go to the **Automation Script** page.

MRS 3.*x* does not support this operation.

1. Set the following parameters: **Name**, **Script Path**, **Execution Node**, **Parameter**, **Executed**, and **Action upon Failure**. For details about the parameters, see **Table 4-12**.
2. Click **OK** to save the automation script configurations.

Step 3 Click **OK**.

NOTE

If you want to configure an auto scaling rule for an existing cluster, select **I agree to authorize MRS to scale out or in nodes based on the above rule**.

----End

Scenario 3: Using Both Auto Scaling Rules and Resource Plans

If the data volume is not stable and the expected fluctuation may occur, the fixed Task node range cannot guarantee that the requirements in some service scenarios are met. In this case, it is necessary to adjust the number of Task nodes based on the real-time loads and resource plans.

The following is an example scenario:

A real-time processing service sees an unstable increase in data volume from 7:00 to 13:00 every day. For example, 5 to 8 task nodes are required from 7:00 to 13:00, and 2 to 4 are required beyond this period. Therefore, you can set an auto scaling rule based on a resource plan. When the data volume exceeds the expected value, the number of Task nodes can be adjusted if resource loads change, without exceeding the node range specified in the resource plan. When a resource plan is triggered, the number of nodes is adjusted within the specified node range with minimum affect. That is, increase nodes to the upper limit and decrease nodes to the lower limit.

Step 1 Go to the **Auto Scaling** page to configure auto scaling rules.

- **Default Range**

  Enter a task node range, in which auto scaling is performed. This constraint applies to all scale-in and scale-out rules.

  For example, this parameter is set to **2-4** in this scenario.

- **Auto Scaling**

  To enable **Auto Scaling**, you must configure a scale-out or scale-in rule.

a. Select **Scale-Out** or **Scale-In**.

b. Click **Add Rule**. The **Add Rule** page is displayed.

c. Configure the **Rule Name**, **If**, **Last for**, **Add**, and **Cooldown Period** parameters.

d. Click **OK**.

You can view, edit, or delete the rules you configured in the **Scale-out** or **Scale-in** area on the **Auto Scaling** page.

Step 2 Configure a resource plan.

1. Click **Configure Node Range for Specific Time Range** under **Default Range** or **Add Resource Plan**.
2. Configure **Time Range** and **Node Range**.

   For example, **Time Range** is set to **07:00-13:00** and **Node Range** to **5-8**.

   For details about parameter configurations, see **Table 4-11**. You can click **Configure Node Range for Specific Time Range** or **Add Resource Plan** to configure multiple resource plans.

   NOTE

   - If you do not set **Node Range**, its default value will be used.
   - If you set both **Node Range** and **Time Rang**e, the node range you set will be used during the time range you set, and the default node range will be used beyond the time range you set. If the time is not within the configured time range, the default range is used.

Step 3 (Optional) Configure automation scripts.

Set **Advanced Settings** to **Configure** and click **Created**, or click **Add Automation Script** to go to the **Automation Script** page.

MRS 3.*x* does not support this operation.

1. Set the following parameters: **Name**, **Script Path**, **Execution Node**, **Parameter**, **Executed**, and **Action upon Failure**. For details about the parameters, see **Table 4-12**.
2. Click **OK** to save the automation script configurations.

Step 4 Click **OK**.

NOTE

If you want to configure an auto scaling rule for an existing cluster, select **I agree to authorize MRS to scale out or in nodes based on the above rule**.

----End

Related Information

When adding a rule, you can refer to **Table 4-10** to configure the corresponding metrics.

Table 4-10 Auto scaling metrics

Cluster Type	Metric	Value Type	Description
Streaming cluster	StormSlotAvailable	Integer	Number of available Storm slots Value range: 0 to 2147483646
	StormSlotAvailablePercentage	Percentage	Percentage of available Storm slots, that is, the proportion of the available slots to total slots Value range: 0 to 100
	StormSlotUsed	Integer	Number of the used Storm slots Value range: 0 to 2147483646
	StormSlotUsedPercentage	Percentage	Percentage of the used Storm slots, that is, the proportion of the used slots to total slots Value range: 0 to 100
	StormSupervisorMemAverageUsage	Integer	Average memory usage of the Supervisor process of Storm Value range: 0 to 2147483646
	StormSupervisorMemAverageUsagePercentage	Percentage	Average percentage of the used memory of the Supervisor process of Storm to the total memory of the system Value range: 0 to 100
	StormSupervisorCPUAverageUsagePercentage	Percentage	Average percentage of the used CPUs of the Supervisor process of Storm to the total CPUs Value range: 0 to 6000
Analysis cluster	YARNAppPending	Integer	Number of pending tasks on YARN Value range: 0 to 2147483646
	YARNAppPendingRatio	Ratio	Ratio of pending tasks on Yarn, that is, the ratio of pending tasks to running tasks on Yarn Value range: 0 to 2147483646
	YARNAppRunning	Integer	Number of running tasks on Yarn Value range: 0 to 2147483646
	YARNContainerAllocated	Integer	Number of containers allocated to Yarn Value range: 0 to 2147483646

Cluster Type	Metric	Value Type	Description
	YARNContainerPending	Integer	Number of pending containers on Yarn Value range: 0 to 2147483646
	YARNContainerPendingRatio	Ratio	Ratio of pending containers on Yarn, that is, the ratio of pending containers to running containers on Yarn. Value range: 0 to 2147483646
	YARNCPUAllocated	Integer	Number of virtual CPUs (vCPUs) allocated to Yarn Value range: 0 to 2147483646
	YARNCPUAvailable	Integer	Number of available vCPUs on Yarn Value range: 0 to 2147483646
	YARNCPUAvailablePercentage	Percentage	Percentage of available vCPUs on Yarn, that is, the proportion of available vCPUs to total vCPUs Value range: 0 to 100
	YARNCPUPending	Integer	Number of pending vCPUs on Yarn Value range: 0 to 2147483646
	YARNMemoryAllocated	Integer	Memory allocated to Yarn. The unit is MB. Value range: 0 to 2147483646
	YARNMemoryAvailable	Integer	Available memory on Yarn. The unit is MB. Value range: 0 to 2147483646
	YARNMemoryAvailablePercentage	Percentage	Percentage of available memory on Yarn, that is, the proportion of available memory to total memory on Yarn Value range: 0 to 100
	YARNMemoryPending	Integer	Pending memory on Yarn Value range: 0 to 2147483646

NOTE

- When the value type is percentage or ratio in Table 4-10, the valid value can be accurate to percentile. The percentage metric value is a decimal value with a percent sign (%) removed. For example, 16.80 represents 16.80%.
- Hybrid clusters support all metrics of analysis and streaming clusters.

When adding a resource plan, you can set parameters by referring to Table 4-11.

Table 4-11 Configuration items of a resource plan

Configuration Item	Description
Time Range	Start time and End time of a resource plan are accurate to minutes, with the value ranging from **00:00** to **23:59**. For example, if a resource plan starts at 8:00 and ends at 10:00, set this parameter to 8:00-10:00. The end time must be at least 30 minutes later than the start time.
Node Range	The number of nodes in a resource plan ranges from **0** to **500**. In the time range specified in the resource plan, if the number of Task nodes is less than the specified minimum number of nodes, it will be increased to the specified minimum value of the node range at a time. If the number of Task nodes is greater than the maximum number of nodes specified in the resource plan, the auto scaling function reduces the number of Task nodes to the maximum value of the node range at a time. The minimum number of nodes must be less than or equal to the maximum number of nodes.

NOTE

- When a resource plan is enabled, the **Default Range** value on the auto scaling page forcibly takes effect beyond the time range specified in the resource plan. For example, if **Default Range** is set to **1-2**, **Time Range** is between **08:00-10:00**, and **Node Range** is **4-5** in a resource plan, the number of Task nodes in other periods (0:00-8:00 and 10:00-23:59) of a day is forcibly limited to the default node range (1 to 2). If the number of nodes is greater than 2, auto scale-in is triggered; if the number of nodes is less than 1, auto scale-out is triggered.
- When a resource plan is not enabled, the **Default Range** takes effect in all time ranges. If the number of nodes is not within the default node range, the number of Task nodes is automatically increased or decreased to the default node range.
- Time ranges of resource plans cannot be overlapped. The overlapped time range indicates that two effective resource plans exist at a time point. For example, if resource plan 1 takes effect from **08:00** to **10:00** and resource plan 2 takes effect from **09:00** to **11:00**, the time range between **09:00** to **10:00** is overlapped.
- The time range of a resource plan must be on the same day. For example, if you want to configure a resource plan from **23:00** to **01:00** in the next day, configure two resource plans whose time ranges are **23:00-00:00** and **00:00-01:00**, respectively.

When adding an automation script, you can set related parameters by referring to Table 4-12.

Table 4-12 Configuration items of an automation script

Configuration Item	Description
Name	Automation script name. The value can contain only digits, letters, spaces, hyphens (-), and underscores (_) and must not start with a space. The value can contain 1 to 64 characters. **NOTE** A name must be unique in the same cluster. You can set the same name for different clusters.
Script Path	Script path. The value can be an OBS file system path or a local VM path. ● An OBS file system path must start with **s3a://** and end with **.sh**, for example, **s3a://mrs-samples/*xxx*.sh**. ● A local VM path must start with a slash (/) and end with **.sh**. For example, the path of the example script for installing the Zepelin is **/opt/bootstrap/zepelin/zepelin_install.sh**.
Execution Node	Select a type of the node where an automation script is executed. **NOTE** ● If you select **Master** nodes, you can choose whether to run the script only on the active Master nodes by enabling or disabling the **Active Master** switch. ● If you enable it, the script runs only on the active Master nodes. If you disable it, the script runs on all Master nodes. This switch is disabled by default.
Parameter	Automation script parameter. The following predefined variables can be imported to obtain auto scaling information: ● **${mrs_scale_node_num}**: Number of auto scaling nodes. The value is always positive. ● **${mrs_scale_type}**: Scale-out/in type. The value can be **scale_out** or **scale_in**. ● **${mrs_scale_node_hostnames}**: Host names of the auto scaling nodes. Use commas (,) to separate multiple host names. ● **${mrs_scale_node_ips}**: IP address of the auto scaling nodes. Use commas (,) to separate multiple IP addresses. ● **${mrs_scale_rule_name}**: Name of the triggered auto scaling rule. For a resource plan, this parameter is set to **resource_plan**.

Configuration Item	Description
Executed	Time for executing an automation script. The following four options are supported: **Before scale-out**, **After scale-out**, **Before scale-in**, and **After scale-in**. **NOTE** Assume that the execution nodes include Task nodes. • The automation script executed before scale-out cannot run on the Task nodes to be added. • The automation script executed after scale-out can run on the added Task nodes. • The automation script executed before scale-in can run on Task nodes to be deleted. • The automation script executed after scale-in cannot run on the deleted Task nodes.
Action upon Failure	Whether to continue to execute subsequent scripts and scale-out/in after the script fails to be executed. **NOTE** • You are advised to set this parameter to **Continue** in the commissioning phase so that the cluster can continue the scale-out/in operation no matter whether the script is executed successfully. • If the script fails to be executed, view the log in **/var/log/Bootstrap** on the cluster VM. • The scale-in operation cannot be rolled back. Therefore, the **Action upon Failure** can only be set to **Continue** after scale-in.

NOTE

The automation script is triggered only during auto scaling. It is not triggered when the cluster node is manually scaled out or in.

4.8 Managing Data Connections

4.8.1 Configuring Data Connections

MRS data connections are used to manage external source connections used by components in a cluster. For example, if Hive metadata uses an external relational database, a data connection can be used to associate the external relational database with the Hive component.

- **Local**: Metadata is stored in the local GaussDB of a cluster. When the cluster is deleted, the metadata is also deleted. To retain the metadata, manually back up the metadata in the database in advance.
- **Data Connection**: Metadata is stored in the associated PostgreSQL or MySQL database of the RDS service in the same VPC and subnet as the current cluster. When the cluster is terminated, the metadata is not deleted. Multiple MRS clusters can share the metadata.

> NOTE
>
> When Hive metadata is switched between different clusters, MRS synchronizes only the permissions in the metadata database of the Hive component. The permission model on MRS is maintained on MRS Manager. Therefore, when Hive metadata is switched between clusters, the permissions of users or user groups cannot be automatically synchronized to MRS Manager of another cluster.

Performing Operations Before Data Connection

Step 1 Log in to the RDS console.

Step 2 Click the **Instance Management** tab and click the name of the RDS DB instance used by the MRS data connection.

Step 3 Click **Log In** in the upper right corner to log in to the instance as user **root**.

Step 4 On the home page of the instance, click **Create Database** to create a database.

Step 5 On the top of the page, choose **Account Management** > **User Management**.

> NOTE
>
> If the selected data connection is **RDS MySQL database**, ensure that the database user is user **root**. If the user is not **root**, perform **Step 5** to **Step 7**.

Step 6 Click **Create User** to create a non-root user.

Step 7 On the top of the page, choose **SQL Operations** > **SQL Query**, switch to the target database by database name, and run the following SQL statements to grant permissions to the database user. In the following statements, *${db_name}* and *${db_user}* indicate the name of the database to be connected to MRS and the name of the new user, respectively.

```
grant SELECT, INSERT on mysql.* to '${db_user}'@'%' with grant option;
grant all privileges on ${db_name}.* to '${db_user}'@'%' with grant option;
grant reload on *.* to '${db_user}'@'%' with grant option;
flush privileges;
```

Step 8 Create a data connection by referring to **Creating a Data Connection**.

----End

Creating a Data Connection

Step 1 Log in to the MRS management console, and choose **Data Connections** in the left navigation pane.

Step 2 Click **Create Data Connection**.

Step 3 Set parameters according to **Table 4-13**.

Table 4-13 Data connection parameters

Parameter	Description
Type	Type of an external source connection. • RDS for PostgreSQL database. Clusters of that support Hive can connect to this type of database. • RDS for MySQL database. Clusters of that supports Hive or Ranger can connect to this type of database.
Name	Name of a data connection.
RDS Instance	RDS database instance. This instance must be created in RDS before being referenced here, and the database must have been created. For details, see **Performing Operations Before Data Connection**. Click **View RDS Instance** to view the created instances. **NOTE** • To ensure network communications between the cluster and the PostgreSQL database, you are advised to create the instance in the same VPC and subnet as the cluster. • The inbound rule of the security group of the RDS instance must allow access of the instance to port 3306. To configure that, click the instance name on the RDS console to go to the instance management page. In **Connection Information** area, click the name of **Security Group**. On the page that is displayed, click the **Inbound Rules** tab, and click **Add Rule**. On the displayed dialog box, in **Protocol & Port** area, select **TCP** and enter port number **3306**. In **Source** area, enter the IP address of all nodes where the MetaStore instance of Hive resides. • Currently, MRS supports **PostgreSQL9.5/PostgreSQL9.6** on RDS. • Currently, MRS supports only **MySQL 5.7.*x*** on RDS.
Database	Name of the database to be connected to.
Username	Username for logging in to the database to be connected.
Password	Password for logging in to the database to be connected.

NOTE

If the selected data connection is an **RDS MySQL** database, ensure that the database user is a **root** user. If the user is not **root**, perform operations by referring to **Performing Operations Before Data Connection**.

Step 4 Click **OK**.

----End

Editing a Data Connection

Step 1 Log in to the MRS management console, and choose **Data Connections** in the left navigation pane.

Step 2 In the **Operation** column of the data connection list, click **Edit** in the row where the data connection to be edited is located.

Step 3 Modify parameters according to **Table 4-13**.

If the selected data connection has been associated with a cluster, the configuration changes will be synchronized to the cluster.

----End

Deleting a Data Connection

Step 1 Log in to the MRS management console, and choose **Data Connections** in the left navigation pane.

Step 2 In the **Operation** column of the data connection list, click **Delete** in the row where the data connection to be deleted is located.

If the selected data connection has been associated with a cluster, the deletion does not affect the cluster.

----End

Configuring a data connection during cluster creation

Step 1 Log in to the MRS console.

Step 2 Click **Create Cluster**. The **Create Cluster** page is displayed.

Step 3 Click the **Custom Config** tab.

Step 4 In the software configuration area, set **Metadata** by referring to **Table 4-14**. For other parameters, see **Creating a Custom Cluster** for configuration and cluster creation.

Table 4-14 Data connection parameters

Parameter	Description
Metadata	Whether to use external data sources to store metadata. • **Local**: Metadata is stored in the local cluster. • **Data connections**: Metadata of external data sources is used. If the cluster is abnormal or deleted, metadata is not affected. This mode applies to scenarios where storage and compute are decoupled. Clusters that support the Hive or Ranger component support this function.
Component	This parameter is valid only when **Use External Data Sources to Store Metadata** is enabled. It indicates the type of an external data source. • Hive • Ranger
Data Connection Type	This parameter is valid only when **Use External Data Sources to Store Metadata** is enabled. It indicates the type of an external data source. • Hive supports the following data connection types: – RDS for PostgreSQL (supported for clusters of MRS 1.9.*x*) – RDS MySQL database – Local database • Ranger supports the following data connection types: – RDS MySQL database – Local database
Data Connection Instance	This parameter is valid only when **Data Connection Type** is set to **RDS PostgreSQL database** or **RDS MySQL database**. This parameter indicates the name of the connection between the MRS cluster and the RDS database. This instance must be created before being referenced here. You can click **Create Data Connection** to create a data connection. For details, see **Performing Operations Before Data Connection** and **Creating a Data Connection**.

----End

4.8.2 Configuring Ranger Data Connections

Switch the Ranger metadata of the existing cluster to the metadata stored in the RDS database. This operation enables multiple MRS clusters to share the same

metadata, and the metadata will not be deleted when the clusters are deleted. In this way, Ranger metadata migration is not required during cluster migration.

Prerequisites

You have created an RDS MySQL database instance. For details, see **Creating a Data Connection**.

NOTE

- For versions earlier than MRS 3.x, if the selected data connection is an **RDS MySQL database**, ensure that the database user is a **root** user. If the user is not **root**, create a user and grant permissions to the user by referring to **Performing Operations Before Data Connection**.
- In MRS 3.x or later, if the selected data connection is **RDS MySQL database**, the database user cannot be user **root**. In this case, create a user and grant permissions to the user by following the instructions provided in **Performing Operations Before Data Connection**.

Preparing for MySQL Database Ranger Metadata Configuration

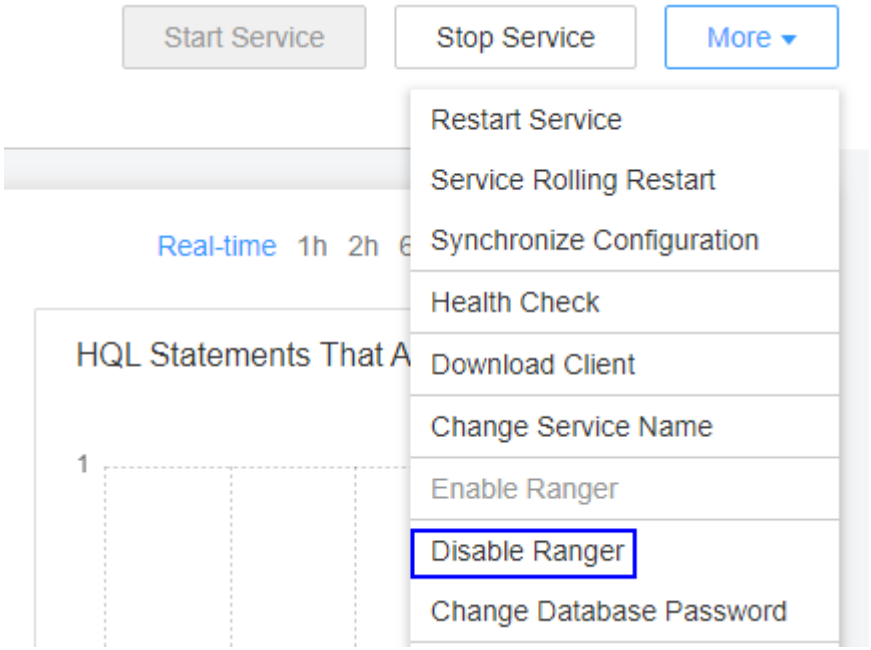
This operation is required only for **MRS 3.1.0 or later**.

Step 1 Log in to FusionInsight Manager. For details, see **Accessing FusionInsight Manager (MRS 3.x or Later)**. Choose **Clusters** > **Services** > *Service name*.

Currently, the following components in an MRS 3.1.*x* cluster support Ranger authentication: HDFS, HBase, Hive, Spark, Impala, Storm, and Kafka.

Step 2 In the upper right corner of the **Dashboard** page, click **More** and select **Disable Ranger**. If **Disable Ranger** is dimmed, Ranger authentication is disabled, as shown in **Figure 4-4**.

Figure 4-4 Disabling Ranger authentication

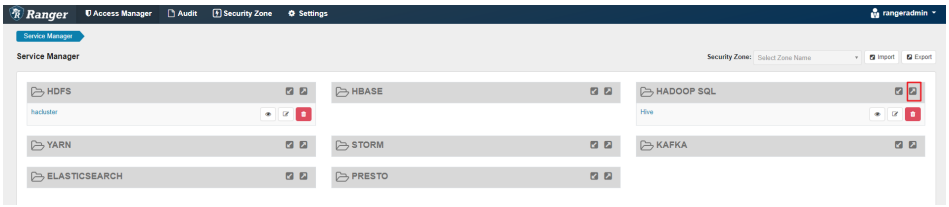


Step 3 (Optional) To use an existing authentication policy, perform this step to export the authentication policy on the Ranger web page. After the Ranger metadata is switched, you can import the existing authentication policy again. The following uses Hive as an example. After the export, a policy file in JSON format is generated in a local directory.

1. Log in to FusionInsight Manager.
2. Choose **Cluster** > **Services** > **Ranger** to go to the Ranger service overview page.
3. Click **RangerAdmin** in the **Basic Information** area to go to the Ranger web UI.

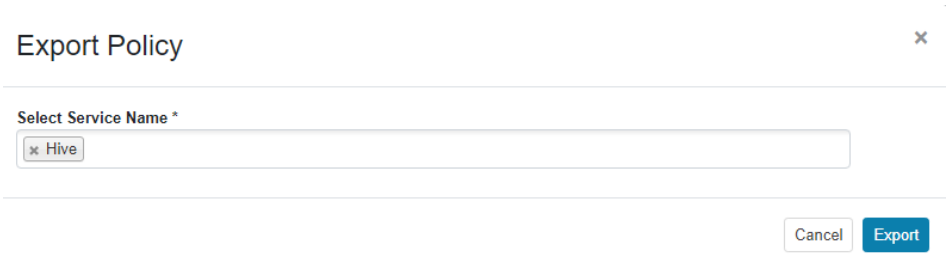
   The **admin** user in Ranger belongs to the **User** type. To view all management pages, click the username in the upper right corner and select **Log Out** to log out of the system.
4. Log in to the system as user **rangeradmin** (default password: **Rangeradmin@123**) or another user who has the Ranger administrator permissions.
5. Click the export button  in the row where the Hive component is located to export the authentication policy.

   Figure 4-5 Exporting authentication policies

6. Click **Export**. After the export is complete, a policy file in JSON format is generated in a local directory.

   Figure 4-6 Exporting Hive authentication policies

----End

Configuring a Data Connection for an MRS Cluster

Step 1 Log in to the MRS console.

Step 2 Click the name of the cluster to view its details.

Step 3 Click **Manage** on the right of **Data Connection** to go to the data connection configuration page.

Step 4 Click **Configure Data Connection** and set related parameters.

- **Component Name**: Ranger
- **Module Type**: Ranger metadata
- **Connection Type**: RDS MySQL database
- **Connection Instance**: Select a created RDS MySQL DB instance. To create a new data connection, see **Creating a Data Connection**.

Step 5 Select **I understand the consequences of performing the scale-in operation** and click **Test**.

Step 6 After the test is successful, click **OK** to complete the data connection configuration.

Step 7 Log in to FusionInsight Manager.

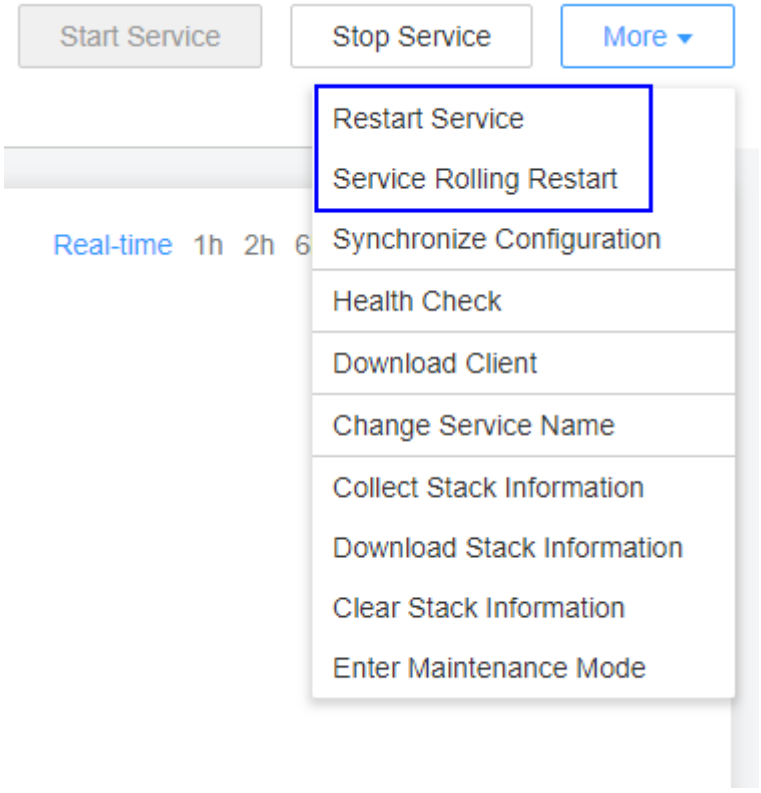
Step 8 Choose **Cluster** > **Services** > **Ranger** to go to the Ranger service overview page.

Step 9 Choose **More** > **Restart Service** or **More** > **Service Rolling Restart**.

If you choose **Restart Service**, services will be interrupted during the restart. If you select **Service Rolling Restart**, rolling restart can minimize the impact or do not affect service running.

Restarting Ranger will affect the permissions of all components controlled by Ranger and may affect the normal running of services. Therefore, restart Ranger when the cluster is idle or during off-peak hours. Before the Ranger component is restarted, the policies in the Ranger component still take effect.

Figure 4-7 Restarting a service

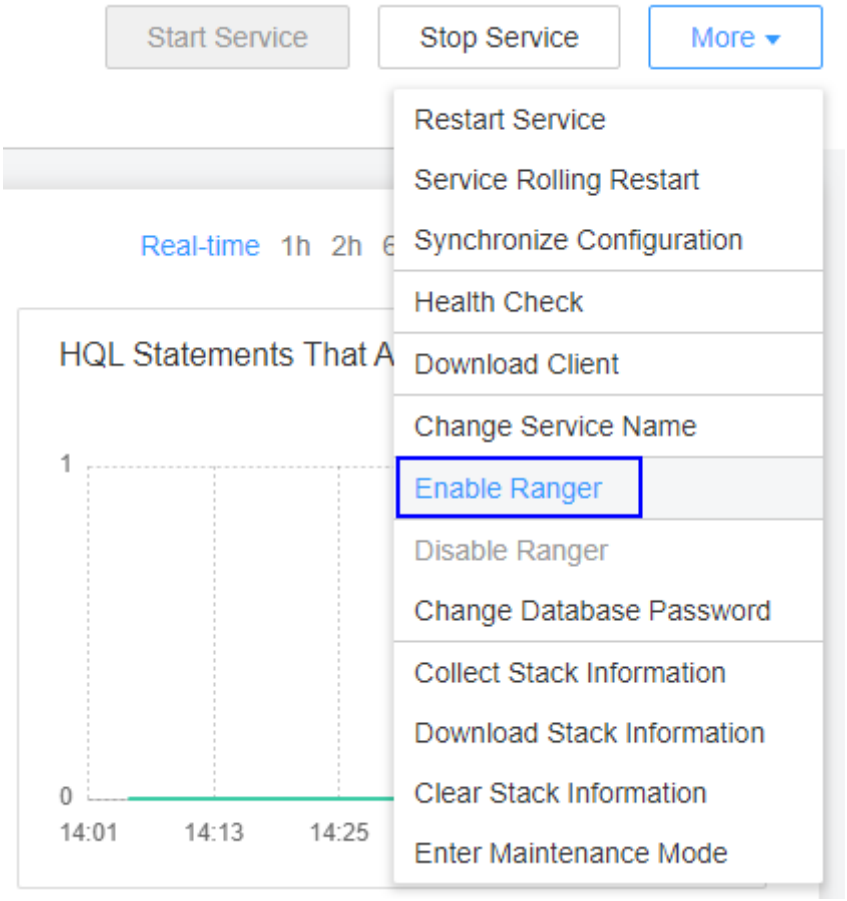


Step 10 Enable Ranger authentication for the component to be authenticated. The Hive component is used as an example.

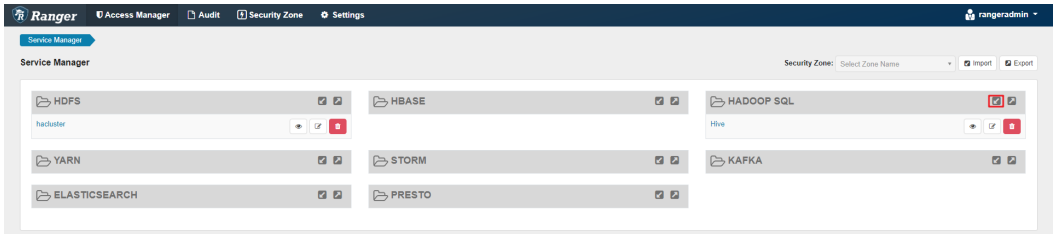
Currently, the following components in an MRS 3.1.*x* cluster support Ranger authentication: HDFS, HBase, Hive, Spark, Impala, Storm, and Kafka.

1. Log in to FusionInsight Manager and choose **Cluster** > **Services** > *Service Name*.
2. In the upper right corner of the **Dashboard** page, click **More** and select **Enable Ranger**.

Figure 4-8 Enabling Ranger authentication



Step 11 Log in to the Ranger web UI and click the import button in the row of the Hive component.

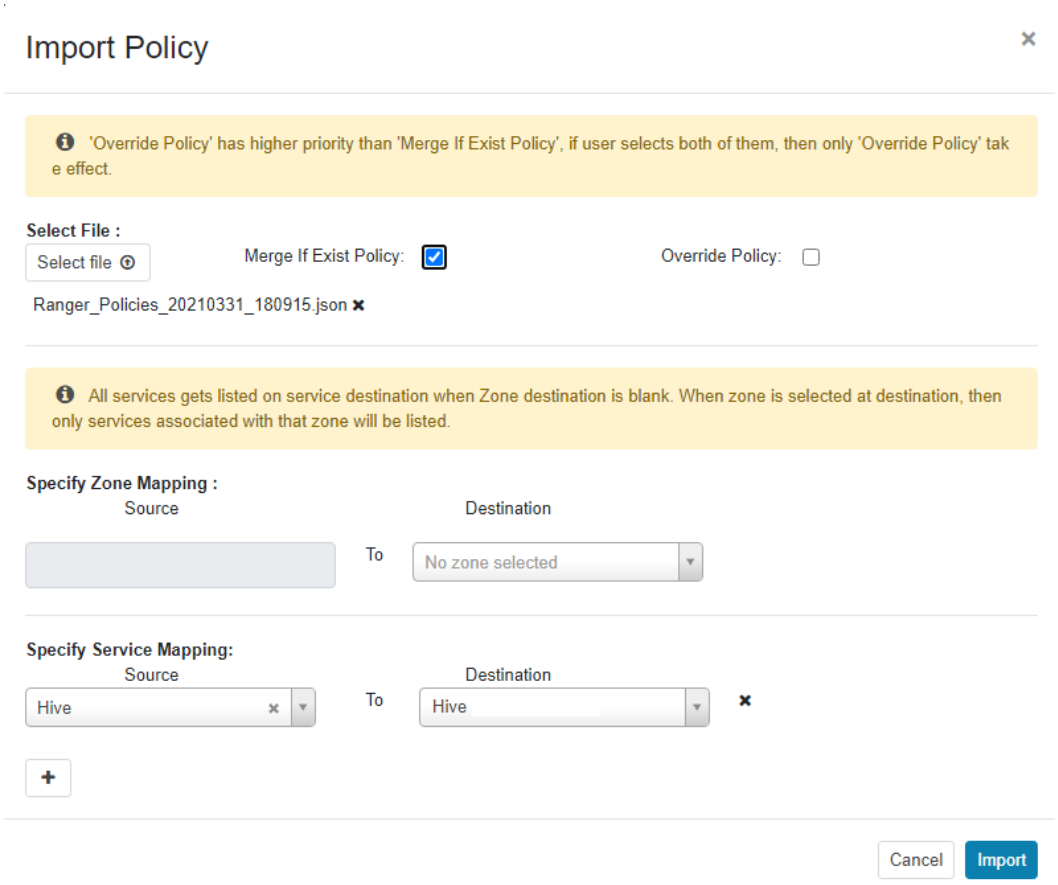


Step 12 Import parameters.

- Click **Select file** and select the authentication policy file downloaded in **Step 3.6**.

- Select **Merge If Exist Policy**.

Figure 4-9 Importing authentication policies



Step 13 Restart the component for which Ranger authentication is enabled.

1. Log in to FusionInsight Manager.
2. Choose **Cluster** > **Services** > **Hive** to go to the Hive service overview page.
3. Choose **More** > **Restart Service** or **More** > **Service Rolling Restart**.

   If you choose **Restart Service**, services will be interrupted during the restart. If you select **Service Rolling Restart**, rolling restart can minimize the impact or do not affect service running.

----End

4.8.3 Configuring a Hive Data Connection

This section describes how to switch the Hive metadata of an active cluster to the metadata stored in a local database or RDS database after you create a cluster. This operation enables multiple MRS clusters to share the same metadata, and the metadata will not be deleted when the clusters are deleted. In this way, Hive metadata migration is not required during cluster migration.

NOTE

- When Hive metadata is switched between different clusters, MRS synchronizes only the permissions in the metadata database of the Hive component. The permission model on MRS is maintained on MRS Manager. Therefore, when Hive metadata is switched between clusters, the permissions of users or user groups cannot be automatically synchronized to MRS Manager of another cluster.
- For clusters whose version is earlier than MRS 3.*x*, if the selected data connection is **RDS MySQL database**, ensure that the database user is **root**. If the user is not **root**, create a user and grant permissions to the user by referring to **Performing Operations Before Data Connection**.
- For clusters whose version is MRS 3.*x* or later, if the selected data connection is **RDS MySQL database**, the database user cannot be user **root**. In this case, create a user and grant permissions to the user by following the instructions provided in **Performing Operations Before Data Connection**.

Configuring a Hive Data Connection

This function is not supported in MRS 3.0.5.

Step 1 Log in to the MRS console. In the navigation pane on the left, choose **Clusters** > **Active Clusters**.

Step 2 Click the name of a cluster to go to the cluster details page.

Step 3 On the **Dashboard** tab page, click **Manage** next to **Data Connection**.

Step 4 On the **Data Connection** dialog box, the data connections associated with the cluster are displayed. You can click **Edit** or **Delete** to edit or delete the data connections.

Step 5 If there is no associated data connection on the **Data Connection** dialog box, click **Configure Data Connection** to add a connection.

NOTE

Only one data connection can be configured for a module type. For example, after a data connection is configured for Hive metadata, no other data connection can be configured for it. If no module type is available, the **Configure Data Connection** button is unavailable.

Table 4-15 Configuring a Hive data connection

Parameter	Description
Component	Hive
Module Type	Hive metadata
Data Connection Type	• RDS PostgreSQL database (supported for clusters of MRS 1.9.*x*) • RDS MySQL database • Local database

Parameter	Description
Instance	This parameter is valid only when **Data Connection Type** is set to **RDS PostgreSQL database** or **RDS MySQL database**. Select the name of the connection between the MRS cluster and the RDS database. This instance must be created before being referenced here. You can click **Create Data Connection** to create a data connection. For details, see **Creating a Data Connection**.

Step 6 Click **Test** to test connectivity of the data connection.

Step 7 After the data connection is successful, click **OK**.

NOTE

- After Hive metadata is configured, restart Hive. Hive will create necessary database tables in the specified database. (If tables already exist, they will not be created.)
- Before restarting the Hive service, ensure that the driver package has been installed on all nodes where Metastore instances are located.
  - Postgres: Use the open source Postgres driver package to replace the existing one of the cluster. Upload the Postgres driver package **postgresql-42.2.5.jar** to the *${BIGDATA_HOME}*/**third_lib/Hive** directory on all MetaStore instance nodes.
  - MySQL: Go to the MySQL official website (https://www.mysql.com/). Choose **DOWNLOADS** and click **MySQL Community (GPL) Downloads**. On the displayed page, click **Connector/J** to download the driver package of the corresponding version and upload the driver package to the **/opt/Bigdata/FusionInsight_HD_*/install/FusionInsight-Hive-*/hive-*/lib/** directory on all RDSMetastore nodes.

----End

4.9 Installing the Third-Party Software Using Bootstrap Actions

4.9.1 Introduction to Bootstrap Actions

Bootstrap actions indicate that you can run your scripts on a specified cluster node before or after starting big data components. You can run bootstrap actions to install additional third-party software, modify the cluster running environment, and perform other customizations.

If you choose to run bootstrap actions when scaling out a cluster, the bootstrap actions will be run on the newly added nodes in the same way. If auto scaling is enabled in a cluster, you can add an automation script in addition to configuring a resource plan. Then the automation script executes the corresponding script on the nodes that are scaled out or in to implement custom operations.

MRS runs the script you specify as user **root**. You can run the **su - *XXX*** command in the script to switch the user.

NOTE

The bootstrap action scripts must be executed as user **root**. Improper use of the script may affect the cluster availability. Therefore, exercise caution when performing this operation.

MRS determines the result based on the return code after the execution of the bootstrap action script. If the return code is **0**, the script is executed successfully. If the return code is not **0**, the execution fails. If a bootstrap action script fails to be executed on a node, the corresponding boot script will fail to be executed. In this case, you can set **Action upon Failure** to choose whether to continue to execute the subsequent scripts. Example 1: If you set **Action upon Failure** to **Continue** for all scripts during cluster creation, all the scripts will be executed regardless of whether they are successfully executed, and the startup process will be complete. Example 2: If a script fails to be executed and **Action upon Failure** is set to **Stop**, subsequent scripts will not be executed and cluster creation or scale-out will fail.

You can add a maximum of 18 bootstrap actions, which will be executed before or after the cluster component is started in the order you specified. The bootstrap actions performed before or after the component startup must be completed within 60 minutes. Otherwise, the cluster creation or scale-out will fail.

4.9.2 Preparing the Bootstrap Action Script

Currently, bootstrap actions support Linux shell scripts only. Script files must end with **.sh**.

Uploading the Installation Packages and Files to an OBS File System

Before compiling a script, you need to upload all required installation packages, configuration packages, and relevant files to the OBS file system in the same region. Because networks of different regions are isolated from each other, MRS VMs cannot download OBS files from other regions.

Compiling a Script for Downloading Files from the OBS File System

You can specify the file to be downloaded from OBS in the script. If you upload files to a private file system, you need to run the **hadoop fs** command to download the files. The following example shows that the **obs://yourbucket/myfile.tar.gz** file will be downloaded to the local host and decompressed to the **/your-dir** directory.

```
#!/bin/bash
source /opt/Bigdata/client/bigdata_env;hadoop fs -D fs.obs.endpoint=<obs-endpoint> -D fs.obs.access.key=<your-ak> -D fs.obs.secret.key=<your-sk> -copyToLocal obs://yourbucket/myfile.tar.gz ./
mkdir -p /<your-dir>
tar -zxvf myfile.tar.gz -C /<your-dir>
```

NOTE

- In MRS 3.x and later versions, the default installation path of the client is /opt/Bigdata/client. In MRS 3.x and earlier versions, the default installation path is /opt/client. For details, see the actual situation.
- The Hadoop client has been preinstalled on the MRS node. You can run the **hadoop fs** command to download or upload data from or to OBS.
- Obtain the obs-endpoint of each region..

Uploading the Script to the OBS File System

After script compilation, upload the script to the OBS file system in the same region. At the time you specify, each node in the cluster downloads the script from OBS and executes the script as user **root**.

4.9.3 View Execution Records

You can view the execution result of the bootstrap operation on the **Bootstrap Action** page.

Viewing the Execution Result

1. Log in to the MRS console.
2. In the left navigation pane, choose **Clusters** > **Active Clusters**. Click a cluster you want to query.

   The cluster details page is displayed.
3. On the cluster details page, click the **Bootstrap Action** tab. Information about the bootstrap actions added during cluster creation is displayed.

   NOTE

   - You select **Before initial component start** or **After initial component start** in the upper right corner to query information about the related bootstrap actions.
   - The last execution result is listed here. For a newly created cluster, the records of bootstrap actions executed during cluster creation are listed. If a cluster is expanded, the records of bootstrap actions executed on the newly added nodes are listed.

Viewing Execution Logs

If you want to view the run logs of a bootstrap action, set **Action upon Failure** to **Continue** when adding the bootstrap action. And then, log in to each node to view the run logs in the **/var/log/Bootstrap** directory. If you add bootstrap actions before and after component start, you can distinguish bootstrap action logs of the two phases based on the timestamps.

You are advised to print logs in detail in the script so that you can view the detailed run result. MRS redirects the standard output and error output of the script to the log directory of the bootstrap action.

4.9.4 Adding a Bootstrap Action

This operation applies to clusters of MRS 3.*x* or earlier.

In MRS 3.*x*, bootstrap actions cannot be added during cluster creation.

Adding a Bootstrap Action When Creating a Cluster

Step 1 Log in to the MRS console.

Step 2 Click **Create Cluster**. The page for creating a cluster is displayed.

Step 3 Click the **Custom Config** tab.

Step 4 Configure the cluster software and hardware by referring to **Creating a Custom Cluster**.

Step 5 On the **Set Advanced Options** tab page, click **Add** in the **Bootstrap Action** area.

Table 4-16 Parameters

Parameter	Description
Name	Name of a bootstrap action script The value can contain only digits, letters, spaces, hyphens (-), and underscores (_) and must not start with a space. The value can contain 1 to 64 characters. **NOTE** A name must be unique in the same cluster. You can set the same name for different clusters.
Script Path	Script path. The value can be an OBS file system path or a local VM path. • An OBS file system path must start with **s3a://** and end with **.sh**, for example, **s3a://mrs-samples/***xxx***.sh**. • A local VM path must start with a slash (/) and end with **.sh**.
Parameters	Bootstrap action script parameters
Execution Node	Select a type of the node where the bootstrap action script is executed.
Executed	Select the time when the bootstrap action script is executed. • Before initial component start • After initial component start
Action upon Failure	Whether to continue to execute subsequent scripts and create a cluster after the script fails to be executed. **NOTE** You are advised to set this parameter to **Continue** in the debugging phase so that the cluster can continue to be installed and started no matter whether the bootstrap action is successful.

Step 6 Click **OK**.

After the bootstrap action is successfully added, you can edit, clone, or delete it in the **Operation** column.

----End

Adding an Automation Script on the Auto Scaling Page

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters** > **Active Clusters**, select a running cluster, and click its name. The cluster details page is displayed.

Step 3 On the **Nodes** tab page, click **Auto Scaling** in the **Operation** column of the Task node group. The **Auto Scaling** page is displayed.

If no Task node exists in the cluster, click **Configure Task Node** to add a Task node and then perform this step.

NOTE

For MRS 3.*x* or later, **Configure Task Node** applies only to analysis clusters, streaming clusters, and hybrid clusters.

Step 4 Configure a resource plan.

Configuration procedure:

1. On the **Auto Scaling** page, enable **Auto Scaling**.
2. For example, the **Default Range** of node quantity is set to **2-2**, indicating that the number of Task nodes is fixed to 2 except the time range specified in the resource plan.
3. Click **Configure Node Range for Specific Time Range** under **Default Range**.
4. Configure the **Time Range** and **Node Range** parameters. For example, set **Time Range** to **07:00-13:00**, and **Node Range** to **5-5**. This indicates that the number of Task nodes is fixed to 5 in the time range specified in the resource plan. For details about the parameters, see **Table 4-11**.

   You can click **Configure Node Range for Specific Time Range** to configure multiple resource plans.

Step 5 (Optional) Configure automation scripts.

1. Set **Advanced Settings** to **Configure**.
2. Click **Create**. The **Automation Script** page is displayed.
3. Set the following parameters: **Name**, **Script Path**, **Execution Node**, **Parameter**, **Executed**, and **Action upon Failure**. For details about the parameters, see **Table 4-12**.
4. Click **OK** to save the automation script configurations.

Step 6 Select **I agree to authorize MRS to scale out or scale in nodes based on the above rule**.

Step 7 Click **OK**.

----End

4.10 Viewing Failed MRS Tasks

This section describes how to view and delete a failed MRS task.

Background

If a cluster fails to be created, terminated, scaled out, or scaled in, the **Manage Failed Tasks** page is displayed. Only the tasks that fail to be deleted are displayed on the **Cluster History** page. You can delete a failed task that is not required.

Procedure

Step 1 Log in to the MRS console.

Step 2 In the left navigation pane, choose **Clusters** > **Active Clusters**.

Step 3 Click  or the number on the right of **Failed Tasks**. The **Manage Failed Tasks** page is displayed.

Step 4 In the **Operation** column of the cluster that you want to start, click **Delete**.

In this step, only one job can be deleted.

Step 5 You can click **Delete All** in the upper left corner of the task list to delete all failed tasks.

----End

4.11 Viewing Information of a Historical Cluster

Choose **Clusters > Cluster History** and click the name of a target cluster. You can view the cluster configuration and deployed node information.

The following table describes the parameters for the historical cluster information.

Table 4-17 Basic cluster information

Parameter	Description
Cluster Name	Name of a cluster. The cluster name is set when the cluster is created.
Cluster Status	Status of a cluster.
Cluster Version	Cluster version
Cluster Type	Type of the cluster to be created.
Obtaining a cluster ID	Unique identifier of a cluster, which is automatically assigned when a cluster is created
Created	Time when a cluster is created.
AZ	Availability zone (AZ) in the region of a cluster, which is set when a cluster is created.
Default Subnet	Subnet selected during cluster creation. A subnet provides dedicated network resources that are isolated from other networks, improving network security.
VPC	VPC selected during cluster creation. A VPC is a secure, isolated, and logical network environment.

Parameter	Description
OBS Permission Control	Click **Manage** and modify the mapping between MRS users and OBS permissions. For details, see **Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS**.
Creating a data connection	Click **Manage** to view the data connection type associated with the cluster. For details, see **Configuring Data Connections**.
Agency	Click **Manage Agency** to bind or modify an agency for the cluster. An agency allows ECS or BMS to manage MRS resources. You can configure an agency of the ECS type to automatically obtain the AK/SK to access OBS. For details, see **Configuring a Storage-Compute Decoupled Cluster (Agency)**. The **MRS_ECS_DEFAULT_AGENCY** agency has the OBSOperateAccess permission of OBS and the CESFullAccess (for users who have enabled fine-grained policies), CES Administrator, and KMS Administrator permissions in the region where the cluster is located.
Key Pair	Name of a key pair. Set this parameter when creating a cluster. If the login mode is set to password during cluster creation, this parameter is not displayed.
Kerberos Authentication	Whether to enable Kerberos authentication when logging in to Manager.
Enterprise project	Enterprise project to which a cluster belongs. Only on the **Active Clusters** page, you can click the name of an enterprise project to go to its **Enterprise Project Management** page.
Security Group	Security group name of the cluster.
Streaming Core Node LVM	Indicates whether to enable the Logical Volume Manager (LVM) function of streaming Core nodes.
Data Disk Key Name	Name of the key used to encrypt data disks. To manage the used keys, log in to the key management console.
Data Disk Key ID	ID of the key used to encrypt data disks.
Component Version	Version of each component installed in the cluster.
License Version	License version of the cluster.
Agency	Delegates ECSs or BMSs to manage some of your resources.

Go back to the historical clusters page. You can use the following buttons to perform operations. For details about the buttons, see the following table.

Table 4-18 Icon description

Icon	Description
	Click  to manually refresh the node information.
	Enter a cluster name in the search bar and click  to search for a cluster.

5 Managing Clusters

5.1 Logging In to a Cluster

5.1.1 MRS Cluster Node Overview

This section describes remote login, MRS cluster node types, and node functions.

MRS cluster nodes support remote login. The following remote login methods are available:

- GUI login: Use the remote login function provided by the ECS management console to log in to the Linux interface of the Master node in the cluster.
- SSH login: Applies to Linux ECSs only. You can use a remote login tool (such as PuTTY) to log in to an ECS. The ECS must have a bound EIP.

  For details about how to apply for and bind EIP for the Master node, see **Virtual Private Cloud** > **User Guide** > **Elastic IP** > **Assigning an EIP and Binding It to an ECS**.

  You can log in to a Linux ECS using either a key pair or password.

  NOTICE

  If you use a key pair to access a node in a cluster, you need to log in to the node as user **root**. For details, see **Logging In to an ECS Using a Key Pair (SSH)**.

  For details about how to access a cluster node using a password, see **Logging In to an ECS Using a Password (SSH)**.

In an MRS cluster, a node is an ECS. **Table 5-1** describes the node types and node functions.

Table 5-1 Cluster node types

Node Type	Functions
Master node	Management node of an MRS cluster. It manages and monitors the cluster. In the navigation tree of the MRS management console, choose **Clusters** > **Active Clusters**, select a running cluster, and click its name to switch to the cluster details page. On the **Nodes** tab page, view the **Name**. The node that contains **master1** in its name is the Master1 node. The node that contains **master2** in its name is the Master2 node. You can log in to a Master node either using VNC on the ECS management console or using SSH. After logging in to the Master node, you can access Core nodes without entering passwords. The system automatically deploys the Master nodes in active/standby mode and supports the high availability (HA) feature for MRS cluster management. If the active management node fails, the standby management node switches to the active state and takes over services. To determine whether the Master1 node is the active management node, see **Determining Active and Standby Management Nodes of Manager**.
Core node	Work node of an MRS cluster. It processes and analyzes data and stores process data.
Task node	Compute node. It is used for auto scaling when the computing resources in a cluster are insufficient.

5.1.2 Logging In to an ECS

This section describes how to remotely log in to an ECS in an MRS cluster using the remote login (VNC mode) function provided on the ECS management console or a key or password (SSH mode). Remote login (VNC mode) is mainly used for emergency O&M. In other scenarios, it is recommended that you log in to the ECS using SSH.

NOTE

To log in to a cluster node using SSH, you need to manually add an inbound rule in the security group of the cluster. The source address is **Client IPv4 address/32** (or **Client IPv6 address/128**) and the port number is **22**. For details, see **Virtual Private Cloud > User Guide > Security > Security Group > Adding a Security Group Rule**.

Logging In to an ECS Using VNC

Step 1 Log in to the MRS management console.

Step 2 Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 On the **Nodes** tab page, click the name of a Master node in the Master node group to log in to the ECS management console.

Step 4 In the upper right corner, click **Remote Login**.

----End

Logging In to an ECS Using a Key Pair (SSH)

Logging In to the ECS from Local Windows

To log in to the Linux ECS from local Windows, perform the operations described in this section. The following procedure uses PuTTY as an example to log in to the ECS.

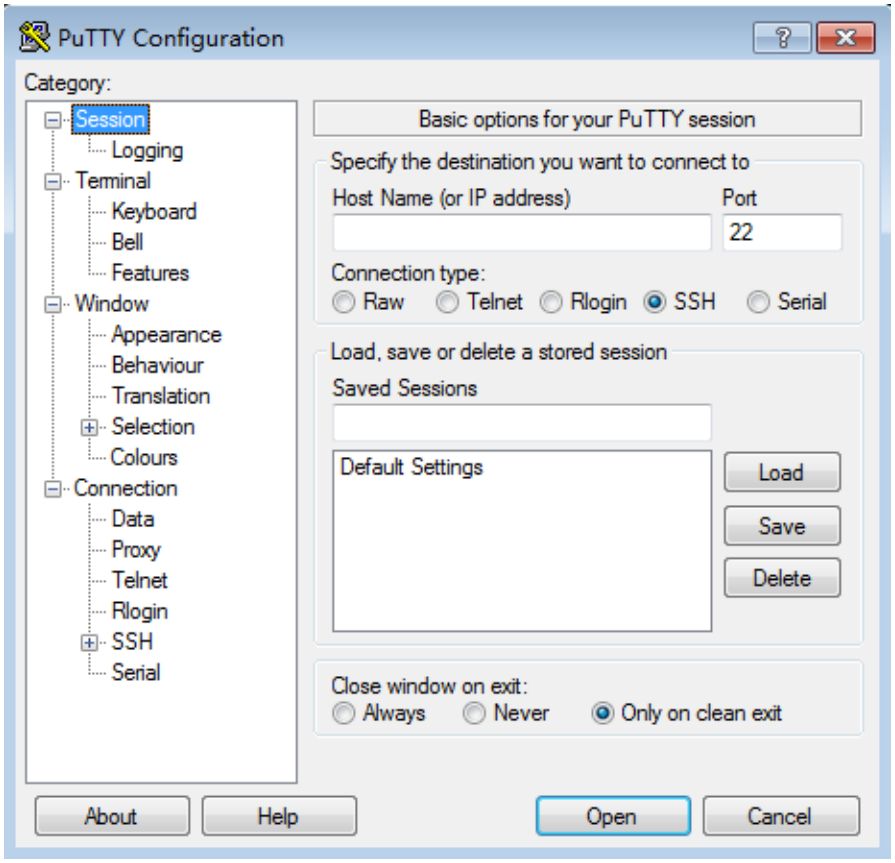
1. Log in to the MRS management console.
2. Choose **Clusters** > **Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.
3. On the **Nodes** tab page, click the name of a Master node in the Master node group to log in to the ECS management console.
4. Click the **EIPs** tab, click **Bind EIP** to bind an EIP to the ECS, and record the EIP. If an EIP has been bound to the ECS, skip this step.
5. Check whether the private key file has been converted to **.ppk** format.
   - If yes, go to **10**.
   - If no, go to **6**.
6. Run PuTTY.
7. In the **Actions** area, click **Load** and import the private key file you used during ECS creation.

   Ensure that the private key file is in the format of **All files (*.*)**.
8. Click **Save private key**.
9. Save the converted private key, for example, **kp-123.ppk**, to a local directory.
10. Run PuTTY.
11. Choose **Connection** > **Data**. Enter the image username in **Auto-login username**.

    NOTE

    The image username for cluster nodes is **root**.
12. Choose **Connection** > **SSH** > **Auth**. In the last configuration item **Private key file for authentication**, click **Browse** and select the private key converted in **9**.
13. Click **Session**.
    a. **Host Name (or IP address)**: Enter the EIP bound to the ECS.
    b. **Port**: Enter **22**.
    c. **Connection Type**: Select **SSH**.
    d. **Saved Sessions**: Task name, which can be clicked for remote connection when you use PuTTY next time

Figure 5-1 Clicking **Session**



14. Click **Open** to log in to the ECS.

    If you log in to the ECS for the first time, PuTTY displays a security warning dialog box, asking you whether to accept the ECS security certificate. Click **Yes** to save the certificate to your local registry.

Logging In to the ECS from Local Linux

To log in to the Linux ECS from local Linux, perform the operations described in this section. The following procedure uses private key file **kp-123.pem** as an example to log in to the ECS. The name of your private key file may differ.

1. On the Linux CLI, run the following command to change operation permissions:

   chmod 400 /*path*/kp-123.pem

   NOTE

   In the preceding command, *path* refers to the path where the key file is saved.

2. Run the following command to log in to the ECS:

   ssh -i /*path*/kp-123.pem*Default username*@*EIP*

   For example, if the default username is **root** and the EIP is **123.123.123.123**, run the following command:

   ssh -i /*path*/kp-123.pem root@123.123.123.123

NOTE

- *path* indicates the path where the key file is saved.
- *EIP* indicates the EIP bound to the ECS.
- The image username is **root** for cluster nodes.

Logging In to an ECS Using a Password (SSH)

Logging In to the ECS from Local Windows

To log in to the Linux ECS from local Windows, perform the operations described in this section. The following procedure uses PuTTY as an example to log in to the ECS.

Step 1 Log in to the MRS management console.

Step 2 Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 On the **Nodes** tab page, click the name of a Master node in the Master node group to log in to the ECS management console.

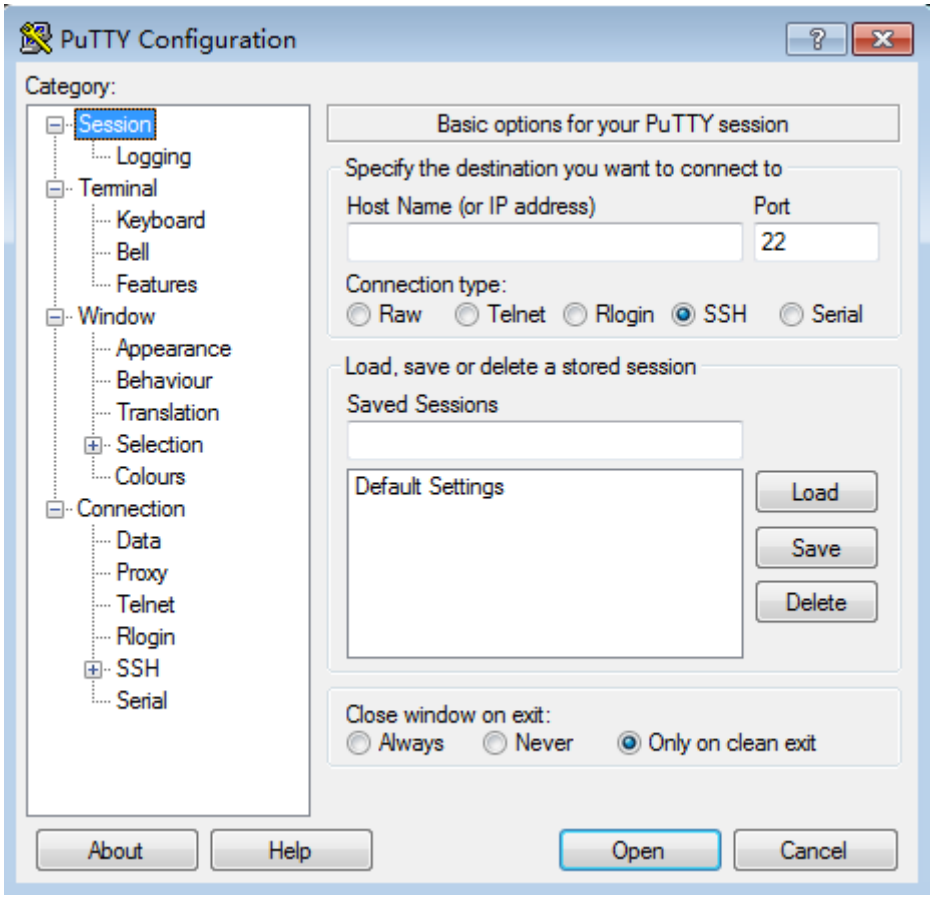
Step 4 Click the **EIPs** tab, click **Bind EIP** to bind an EIP to the ECS, and record the EIP. If an EIP has been bound to the ECS, skip this step.

Step 5 Run PuTTY.

Step 6 Click **Session**.

1. **Host Name (or IP address)**: Enter the EIP bound to the ECS.
2. **Port**: Enter **22**.
3. **Connection Type**: Select **SSH**.
4. **Saved Sessions**: Task name, which can be clicked for remote connection when you use PuTTY next time

Figure 5-2 Clicking **Session**



Step 7 Click **Window** and select **UTF-8** for **Remote character set:** in **Translation**.

Step 8 Click **Open** to log in to the ECS.

If you log in to the ECS for the first time, PuTTY displays a security warning dialog box, asking you whether to accept the ECS security certificate. Click **Yes** to save the certificate to your local registry.

Step 9 After the SSH connection to the ECS is set up, enter the username and password as prompted to log in to the ECS.

NOTE

The username is **root** and the password is the one you set during cluster creation.

----End

Logging In to the ECS from Local Linux

If the local host runs Linux, perform steps **Step 1** to **Step 4** to bind an EIP to the ECS, and run the following command on the CLI to log in to the ECS: **ssh *EIP bound by the ECS***

5.1.3 Determining Active and Standby Management Nodes of Manager

This section describes how to determine the active and standby management nodes of Manager on the Master1 node.

Background

You can log in to other nodes in the cluster from the Master node. After logging in to the Master node, you can determine the active and standby management nodes of Manager and run commands on corresponding management nodes.

In active/standby mode, a switchover can be implemented between Master1 and Master2. For this reason, Master1 may not be the active management node for Manager.

Procedure

Step 1 Confirm the Master nodes of an MRS cluster.

1. In the navigation tree of the MRS management console, choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page. View basic information of the specified cluster.
2. On the **Nodes** tab page, view the node name. The node that contains **master1** in its name is the Master1 node. The node that contains **master2** in its name is the Master2 node.

Step 2 Determine the active and standby Manager management nodes.

1. Remotely log in to the Master1 node. For details, see **Logging In to an ECS**.

   Master nodes support Cloud-Init. The preset username for Cloud-Init is **root** and the password is the one you set during cluster creation.
2. Run the following commands to switch the user:

   sudo su - root

   su - omm
3. Run the following command to identify the active and standby management nodes:

   For versions earlier than MRS 3.*x*, run the **sh ${BIGDATA_HOME}/om-0.0.1/sbin/status-oms.sh** command.

   For MRS 3.*x* or later: Run the **sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh** command.

   In the command output, the node whose **HAActive** is **active** is the active management node (mgtomsdat-sh-3-01-1 in the following example), and the node whose **HAActive** is **standby** is the standby management node (mgtomsdat-sh-3-01-2 in the following example).

   ```
   Ha mode
   double
   NodeName            HostName                HAVersion       StartTime           HAActive
   HAAllResOK          HARunPhase
   192-168-0-30        mgtomsdat-sh-3-01-1     V100R001C01     2014-11-18 23:43:02
   active              normal                  Actived
   192-168-0-24        mgtomsdat-sh-3-01-2     V100R001C01     2014-11-21 07:14:02
   standby             normal                  Deactived
   ```

   NOTE

   If the Master1 node to which you have logged in is the standby management node and you need to log in to the active management node, run the following command:

   ssh *IP address of Master2 node*

----End

5.2 Cluster Overview

5.2.1 Cluster List

You can quickly view the status of all clusters and jobs by viewing the dashboard information, and obtain relevant MRS documents from **Help** in the left navigation pane on the MRS console.

MRS is used to manage and analyze massive data. It is easy to use. You can create a cluster and add MapReduce, Spark, and Hive jobs to the cluster to analyze and process user data. After being processed, you can transmit the data in SSL encryption mode to OBS to ensure data integrity and confidentiality.

Cluster Status

Table 5-2 lists the statuses of all MRS clusters after you log in to the MRS management console.

Table 5-2 Cluster status

Status	Description
Starting	If a cluster is being created, the cluster is in the **Starting** state.
Running	If a cluster is created successfully and all components in the cluster are normal, the cluster is in the **Running** state.
Scaling out	If the Core or Task node in a cluster is being added, the cluster is in the **Scaling out** state. **NOTE** If the cluster scale-out fails, you can add node to the cluster again.
Scaling in	If you stop, delete, change or reinstall the OSs of cluster nodes, and modify the specifications of the cluster node, the cluster nodes are being terminated. Then, the cluster is in the **Scaling in** state.
Abnormal	If some components in a cluster are abnormal, the cluster is **Abnormal**.
Terminating	If a cluster node is being terminated, the cluster is in the **Terminating** state.
Terminated	The cluster has been terminated. This parameter is displayed only in **Cluster History**.

Job Status

Table 5-3 describes the status of jobs that you execute after logging in to the MRS management console.

Table 5-3 Job status

Status	Description
Accepted	Initial status of a job after it is successfully submitted.
Running	A job is being executed.
Completed	A job has been executed and completed successfully.
Terminated	A job is stopped during execution.
Abnormal	An error occurs during job execution or job execution fails.

5.2.2 Checking the Cluster Status

The cluster list contains all clusters in MRS. You can view clusters in various states. If a large number of clusters are involved, navigate through multiple pages to view all of the clusters.

MRS, as a platform managing and analyzing massive data, provides a PB-level data processing capability. MRS allows you to multiple clusters. The cluster quantity is subject to that of ECSs.

Clusters are listed in chronological order by default in the cluster list, with the most recent cluster displayed at the top. **Table 5-4** describes the cluster list parameters.

- **Active Clusters**: contain all clusters except the clusters in the **Failed** and **Terminated** states.
- **Cluster History**: contains the tasks in the **Terminated** states. Only clusters terminated within the last six months are displayed. If you want to view clusters terminated six months ago, contact technical support engineers.
- **Failed Tasks**: only contain the tasks in the **Failed** state. Task failures include:
  - Cluster creation failure
  - Cluster termination failure
  - Cluster scale-out failure
  - Cluster scale-in failure
  - Cluster patch installation failure (supported only by versions earlier than MRS 3.x)
  - Cluster patch uninstallation failure (supported only by versions earlier than MRS 3.x)
  - Cluster specifications upgrade failure

Table 5-4 Parameters in the active cluster list

Parameter	Description
Name/ID	Cluster name, which is set when a cluster is created. Unique identifier of a cluster, which is automatically assigned when a cluster is created. • : Change the cluster name. • : Copy the cluster ID.
Cluster Version	Cluster version.
Nodes	Number of nodes that can be deployed in a cluster. This parameter is set when a cluster is created.
Status	Status and operation progress description of a cluster. The cluster creation progress includes: • Verifying cluster parameters • Applying for cluster resources • Creating VMs • Initializing VMs • Installing MRS Manager • Deploying the cluster • Cluster installation failed The cluster scale-out progress includes: • Preparing for scale-out • Creating VMs • Initializing VMs • Adding nodes to the cluster • Scale-out failed The cluster scale-in progress includes: • Preparing for scale-in • Decommissioning instance • Deleting VMs • Deleting nodes from the cluster • Scale-in failed The system will display causes of cluster installation, scale-out, and scale-in failures. For details, see **Table 4-5**.
Created	The cluster node is successfully created.
Terminated	Time when a cluster node stops and the cluster node begins to be terminated. This parameter is valid only for historical clusters displayed on the **Cluster History** page.

Parameter	Description
AZ	Availability zone (AZ) in the region of a cluster, which is set when a cluster is created.
Enterprise Project	Enterprise project to which a cluster belongs.
Operation	**Terminate**: If you want to terminate a cluster after jobs are complete, click **Terminate**. The cluster status changes from **Running** to **Terminating**. After the cluster is terminated, the cluster status will change to **Terminated** and will be displayed in **Cluster History**. If the MRS cluster fails to be deployed, the cluster is automatically terminated. This parameter is displayed in **Active Clusters** only. **NOTE** Typically after data is analyzed and stored, or when the cluster encounters an exception and cannot work, you can terminate a cluster. If a cluster is terminated before data processing and analysis are completed, data loss may occur. Therefore, exercise caution when terminating a cluster.

Table 5-5 Button description

Button	Description
	Select an enterprise project from the drop-down list to filter the corresponding cluster.
	In the drop-down list, select a status to filter clusters: • Active Clusters – All operation types: displays all existing clusters. – Starting: displays existing clusters in the **Starting** state. – Running: displays existing clusters in the **Running** state. – Scaling out: displays existing clusters in the **Scaling out** state. – Scaling in: displays existing clusters in the **Scaling in** state. – Abnormal: displays existing clusters in the **Abnormal** state. – Terminating: displays existing clusters in the **Terminating** state.
	Choose **Clusters** > **Active Clusters** and click  to go to the page for managing failed tasks.  *Num*: displays the failed tasks in the **failed** state.

Button	Description
	Enter a cluster name in the search bar and click  to search for a cluster.
Search by Tag	Click **Search by Tag**, enter the tag of the cluster to be queried, and click **Search** to search for the clusters. You can select a tag key or tag value from their drop-down lists. When the tag key or tag value is exactly matched, the system can automatically locate the target cluster. If you enter multiple tags, their intersections are used to search for the cluster.
	Click  to manually refresh the cluster list.

5.2.3 Viewing Basic Cluster Information

You can monitor and manage the clusters you have created. Choose **Clusters > Active Clusters**. Select a cluster and click its name to go to the cluster details page. On the displayed page, view the basic configuration and node information of the cluster.

NOTE

On the MRS console, operations performed on an ECS cluster are basically the same as those performed on a BMS cluster. This document describes operations on an ECS cluster. If operations on the two clusters differ, the operations will be described separately.

On the cluster details page, click **Dashboard**. Table 5-6 describes the parameters on the **Dashboard** tab page.

Table 5-6 Basic cluster information

Parameter	Description
Cluster Name	Name of a cluster. Set this parameter when creating a cluster. Click  to change the cluster name. For versions earlier than MRS 3.x, only the cluster name displayed on the MRS management console is changed, while the cluster name on MRS Manager is not changed synchronously.
Cluster Status	Cluster status. For details, see Table 5-2.

Parameter	Description
MRS Manager	Portal for the Manager page. • For MRS 3.*x* or later, see **Accessing FusionInsight Manager (MRS 3.x or Later)**. • For versions earlier than MRS 3.x, you need to bind an EIP and add a security group rule as prompted before accessing the MRS Manager page. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.
Cluster Version	MRS version information.
Cluster Type	There are three types of clusters: • **Analysis cluster**: is used for offline data analysis and provides Hadoop components. • **Streaming cluster**: is used for streaming tasks and provides stream processing components. • **Hybrid cluster**: is used for both offline data analysis and streaming processing and provides Hadoop components and streaming processing components. • Custom: An MRS cluster with all custom components. MRS 3.*x* and later versions support this type.
Cluster ID	Unique identifier of a cluster, which is automatically assigned when a cluster is created.
Created	Time when a cluster is created.
AZ	Availability zone (AZ) in the region of a cluster, which is set when a cluster is created.
Default Subnet	Subnet selected during cluster creation. If the subnet IP addresses are insufficient, click **Change Subnet** to switch to another subnet in the same VPC of the current cluster to obtain more available subnet IP addresses. Changing a subnet does not affect the IP addresses and subnets of existing nodes. A subnet provides dedicated network resources that are isolated from other networks, improving network security.
VPC	VPC selected during cluster creation. A VPC is a secure, isolated, and logical network environment.
Elastic IP (EIP)	After binding an EIP to an MRS cluster, you can use the EIP to access the Manager web UI of the cluster.
OBS Permission Control	Click **Manage** and modify the mapping between MRS users and OBS permissions. For details, see **Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS**.
Data Connection	Click **Manage** to view the data connection type associated with the cluster. For details, see **Configuring Data Connections**.

Parameter	Description
Agency	Click **Manage Agency** to bind or modify an agency for the cluster. An agency allows ECS or BMS to manage MRS resources. You can configure an agency of the ECS type to automatically obtain the AK/SK to access OBS. For details, see **Configuring a Storage-Compute Decoupled Cluster (Agency)**. The **MRS_ECS_DEFAULT_AGENCY** agency has the OBS OperateAccess permission of OBS and the CES FullAccess (for users who have enabled fine-grained policies), CES Administrator, and KMS Administrator permissions in the region where the cluster is located.
Key Pair	Name of a key pair. Set this parameter when creating a cluster. If the login mode is set to password during cluster creation, this parameter is not displayed.
Kerberos Authentication	Whether to enable Kerberos authentication when logging in to Manager.
Logging	Used to collect logs about cluster creation and scaling failures.
Enterprise Project	Enterprise project to which a cluster belongs. Only on the **Active Clusters** page, you can click the name of an enterprise project to go to its **Enterprise Project Management** page.
Security Group	Security group name of the cluster.
Streaming Core Node LVM	Indicates whether to enable the Logical Volume Manager (LVM) function of streaming Core nodes.
Data Disk Key Name	Name of the key used to encrypt data disks. To manage the used keys, log in to the key management console.
Data Disk Key ID	ID of the key used to encrypt data disks.
IAM User Synchronization	IAM user information can be synchronized to an MRS cluster for cluster management. For details, see **Synchronizing IAM Users to MRS**. **NOTE** The **Components**, **Tenants**, and **Backups & Restorations** tab pages on the cluster details page can be used only after users are synchronized. After clusters of MRS 3.x are synchronized, you can use the **Component Management** function.
Secure Communications	Used to display the security authorization status. You can click  to enable or disable security authorization. Disabling security authorization brings high risks. Exercise caution when performing this operation. For details, see **Communication Security Authorization**.

Table 5-7 Component versions

Parameter	Description
Hadoop Version	Displays the Hadoop version information.
Spark Version	Version of the Spark component. Only clusters of versions earlier than MRS 3.x support this parameter.
HBase Version	Displays the HBase version information.
Hive Version	Displays the Hive version information.
Hue Version	Displays the Hue version information.
Loader Version	Displays the Loader version information.
Kafka Version	Displays the Kafka version information.
Storm Version	Displays the Storm version information.
Flume Version	Displays the Flume version information.
Tez Version	Displays the Tez version information.
Presto Version	Displays the Presto version information.
KafkaManager Version	Displays the KafkaManager version information.
Flink Version	Displays the Flink version information.
Alluxio Version	Displays the Alluxio version information.
Ranger Version	Displays the Ranger version information.
Impala Version	Displays the Impala version information.
Kudu Version	Displays the Kudu version information.
Spark2x Version	Displays the version information about the Spark2x component. Only clusters of MRS 3.x or later support this function.
Oozie Version	Displays the Oozie version information. Only clusters of MRS 3.x or later support this function.
ClickHouse Version	Displays ClickHouse version information. Only clusters of MRS 3.x or later support this function.

On the cluster details page, click **Nodes**. For details about the node parameters, see **Table 5-8**.

Table 5-8 Node information

Parameter	Description
Configure Task Node	Used to add a Task node. For details, see **Adding a Task Node**. For 3.x and later versions, this operation applies only to the analysis cluster, streaming cluster, and hybrid cluster.
Add Node Group	This parameter applies only to 3.x and later versions. It applies to customized clusters only and is used to add node groups. For details, see **Adding a Node Group**.
Node Group	Node group name.
Node Type	Node type: • **Master**: A Master node in an MRS cluster manages the cluster, assigns MapReduce executable files to Core nodes, traces the execution status of each job, and monitors the DataNode running status. • A task node group is a group of nodes where only data roles that do not store data are deployed. The roles include NodeManager, ThriftServer, Thrift1Server, RESTServer, Supervisor, LogViewer, HBaseIndexer, and TagSync. • If other roles are deployed in the node group in addition to the preceding roles, the node group is the Core node group. On the **Nodes** tab page, click ⌄ next to a node group name to unfold the nodes contained in the node group. Click a node name to remotely log in to the ECS using the password or key pair configured during cluster creation. For details about the parameters, see **Managing Components and Monitoring Hosts**.
Node Count	Number of nodes in a node group.
Operation	• **Scale Out**: For details, see **Manually Scaling Out a Cluster**. • **Scale In**: For details, see **Manually Scaling In a Cluster**. • **Auto Scaling**: For details, see **Configuring an Auto Scaling Rule**. • **View Roles**: You can view information about roles deployed on the node group. This function applies only to custom clusters of 3.x and later.

5.2.4 Viewing Cluster Patch Information

To view patch information about cluster components, you can download the required patch if the cluster component, such as Hadoop or Spark, is faulty. On the MRS console, choose **Clusters > Active Clusters**, select a cluster, and click the

cluster name. On the cluster details page that is displayed, upgrade the component and rectify the fault.

NOTE

MRS 3.x does not have patch version information. Therefore, this section is not involved.

- Patch Name: name of the patch package
- Published: time when the patch package is released
- Status: patch status
- Patch Description: patch version description
- Operation: patch installation or uninstallation

5.2.5 Viewing and Customizing Cluster Monitoring Metrics

MRS cluster nodes are classified into management nodes, control nodes, and data nodes. The change trends of key host monitoring metrics on each type of node can be calculated and displayed as curve charts in reports based on the customized periods. If a host belongs to multiple node types, the metric statistics will be repeatedly collected.

This section provides overview of MRS clusters and describes how to view, customize, and export node monitoring metrics on MRS Manager.

Method 1 (applicable to clusters of versions earlier than MRS 3.x):

Step 1 Choose **Clusters** > **Active Clusters** and click a cluster name to go to the cluster details page.

Step 2 Click the **Dashboard** tab, you can view the cluster host health status statistics on the lower part of the displayed tab page.

Step 3 To view or export reports of other metrics, click **Access Manager** next to **MRS Manager** in the **Basic Information** area to access the Manager page. For details, see **Accessing Manager**.

Step 4 On the Manager page, view, customize, and export the node monitoring metric report. For details, see **Dashboard**.

----End

Method 2

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters > Active Clusters** and click a cluster name to go to the cluster details page.

Step 3 In the **Basic Information** area on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users.

Step 4 After the synchronization is complete, you can view the cluster monitoring metric report on the right of the page.

Step 5 In time range area, specify a period to view monitoring data. The options are as follows:

- Last 1 hour

- Last 3 hours
- Last 12 hours
- Last 24 hours
- Recent 7 days
- Recent 30 days
- Customize: You can customize the period for viewing monitoring data.

Step 6 Customize a monitoring metric report.

1. Click **Customize** and select monitoring metrics to be displayed.

   MRS supports a maximum of 14 monitoring metrics, but at most 12 customized monitoring metrics can be displayed on the page.

   - Cluster Host Health Status
   - Cluster Network Read Speed Statistics
   - Host Network Read Speed Distribution
   - Host Network Write Speed Distribution
   - Cluster Disk Write Speed Statistics
   - Cluster Disk Usage Statistics
   - Cluster Disk Information
   - Host Disk Usage Statistics
   - Cluster Disk Read Speed Statistics
   - Cluster Memory Usage Statistics
   - Host Memory Usage Distribution
   - Cluster Network Write Speed Statistics
   - Host CPU Usage Distribution
   - Cluster CPU Usage Statistics

2. Click **OK** to save the selected monitoring metrics for display.

   NOTE

   Click **Clear** to cancel all the selected monitoring metrics in a batch.

Step 7 Export a monitoring report.

1. Select a period. The options are as follows:
   - Last 1 hour
   - Last 3 hours
   - Last 12 hours
   - Last 24 hours
   - Recent 7 days
   - Recent 30 days
   - Customize: You can customize the period for viewing monitoring data.
2. Click **Export**. MRS will generate a report about the selected monitoring metrics in a specified time of period. Save the report.

----End

Method 3: (applicable to MRS 3.x clusters)

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters > Active Clusters** and click a cluster name to go to the cluster details page.

Step 3 In the **Basic Information** area on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users.

Step 4 After the synchronization is complete, you can view the cluster monitoring metric report on the right of the page.

Step 5 In time range area, specify a period to view monitoring data. The options are as follows:

- Last 1 hour
- Last 3 hours
- Last 12 hours
- Last 24 hours
- Recent 7 days
- Recent 30 days
- Customize: You can customize the period for viewing monitoring data.

Step 6 Customize a monitoring metric report.

1. Click **Customize** and select monitoring metrics to be displayed.

   At most 12 customized monitoring metrics can be displayed on the page.

2. Click **OK** to save the selected monitoring metrics for display.

   NOTE

   Click **Clear** to cancel all the selected monitoring metrics in a batch.

----End

5.2.6 Managing Components and Monitoring Hosts

You can manage the following status and metrics of all components (including role instances) and hosts on the MRS console:

- Status information: includes operation, health, configuration, and role instance status.
- Indicator information: includes key monitoring indicators for each component.
- Export monitoring metrics. (This function is not supported in MRS 3.x or later.)

NOTE

- For , see **Managing Services and Monitoring Hosts**.
- For MRS 3.x or later, see **Procedure**.
- You can set the interval for automatically refreshing the page or click to refresh the page immediately.
- Component management supports the following parameter values:
  - Refresh every 30 seconds
  - Refresh every 60 seconds
  - Stop refreshing

Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Managing Components

NOTE

For details about how to perform operations on MRS Manager, see **Managing Service Monitoring**.

Step 1 On the MRS cluster details page, click **Components**.

On the **Components** tab page, **Service**, **Operating Status**, **Health Status**, **Configuration Status**, **Role**, and **Operation** are displayed in the component list.

- **Table 5-9** describes the service operating status.

  Table 5-9 Service operating status

Status	Description
Started	The service is started.
Stopped	The service is stopped.
Failed to start	Failed to start the role instance.
Failed to stop	Failed to stop the service.
Unknown	Indicates initial service status after the background system restarts.

- **Table 5-10** describes the service health status.

Table 5-10 Service health status

Status	Description
Good	Indicates that all role instances in the service are running properly.
Faulty	Indicates that the running status of at least one role instance is **Faulty** or the status of the service on which the current service depends is abnormal.
Unknown	Indicates that all role instances in the service are in the **Unknown** state.
Restoring	Indicates that the background system is restarting the service.
Partially Healthy	Indicates that the status of the service on which the service depends is abnormal, and APIs related to the abnormal service cannot be invoked by external systems.

- Table 5-11 describes the service health status.

Table 5-11 Service configuration status

Status	Description
Synchronized	The latest configuration takes effect.
Configuration expired	The latest configuration does not take effect after the parameter modification. Related services need to be restarted.
Configuration failed	The communication is incorrect or data cannot be read or written during the parameter configuration. Use **Synchronize Configuration** to rectify the fault.
Configuring	Parameters are being configured.
Unknown	Indicates that configuration status cannot be obtained.

By default, the **Service** column is sorted in ascending order. You can click the icon next to **Service**, **Operating Status**, **Health Status**, or **Configuration Status** to change the sorting mode.

Step 2 Click a specified service in the list to view its status and metric information.

Step 3 Customize and view monitoring graphs.

1. In the **Charts** area, click **Customize** to customize service monitoring metrics.
2. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.

----End

Managing Role Instances

NOTE

For versions earlier than MRS 3.x, see **Managing Role Instances**.

Step 1 On the MRS cluster details page, click **Components**. In the component list, click the specified service name.

Step 2 Click **Instances** to view the role status.

The role instance list contains the Role, Host Name, Management IP Address, Service IP Address, Rack, Running Status, and Configuration Status of each instance.

- **Table 5-12** shows the running status of a role instance.

Table 5-12 Role instance running status

Status	Description
Good	Indicates that the instance is running properly.
Bad	Indicates that the instance cannot run properly.
Decommissioned	Indicates that the instance is out of service.
Not started	Indicates that the instance is stopped.
Unknown	Indicates that the initial status of the instance cannot be detected.
Starting	Indicates that the instance is being started.
Stopping	Indicates that the instance is being stopped.
Restoring	Indicates that an exception may occur in the instance and the instance is being automatically rectified.
Decommissioning	Indicates that the instance is being decommissioned.
Recommissioning	Indicates that the instance is being recommissioned.
Failed to start	Indicates that the service fails to be started.
Failed to stop	Indicates that the service fails to be stopped.

- **Table 5-13** shows the configuration status of a role instance.

Table 5-13 Role instance configuration status

Status	Description
Synchronized	The latest configuration takes effect.

Status	Description
Configuration expired	The latest configuration does not take effect after the parameter modification. Related services need to be restarted.
Configuration failed	The communication is incorrect or data cannot be read or written during the parameter configuration. Use **Synchronize Configuration** to rectify the fault.
Configuring	Parameters are being configured.
Unknown	Current configuration status cannot be obtained.

By default, the **Role** column is sorted in ascending order. You can click the sorting icon next to **Role**, **Host Name**, **OM IP Address**, **Business IP Address**, **Rack**, **Running Status**, or **Configuration Status** to change the sorting mode.

You can filter out all instances of the same role in the **Role** column.

You can set search criteria in the role search area by clicking **Advanced Search**, and click **Search** to view specified role information. You can click **Reset** to reset the search criteria. Fuzzy search is supported.

Step 3 Click the target role instance to view its status and metric information.

Step 4 Customize and view monitoring graphs.

1. In the **Charts** area, click **Customize** to customize service monitoring metrics.
2. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.

----End

Managing Hosts

NOTE

For versions earlier than MRS 3.x, see **Managing Hosts**.

Step 1 On the MRS cluster details page, click the **Nodes** tab and expand a node group to view the host status.

The host list contains the **Node Name**, **IP Address**, **Rack**, **Operating Status**, **Health Status**, **CPU Usage**, **Memory Usage**, **Disk Usage**, **Network Speed**, Specification Name, **Specifications** and **AZ**.

- **Table 5-14** shows the host operating status.

Table 5-14 Host operating status

Status	Description
Normal	The host and service roles on the host are running properly.

Status	Description
Isolated	The host is isolated, and the service roles on the host stop running.

- Table 5-15 describes the host health status.

  Table 5-15 Host health status

Status	Description
Good	The host can properly send heartbeats.
Bad	The host fails to send heartbeats due to timeout.
Unknown	The host initial status is unknown during the operation of adding or deleting a host.

The nodes are sorted in ascending order by default. You can click **Node Name**, **IP Address**, **Rack**, **Operating Status**, **Health Status**, **CPU Usage**, **Memory Usage**, **Disk Usage**, **Network Speed**, **Specification Name**, or **Specifications** to change the sorting mode.

Step 2 Click the target node in the list to view its status and metric information.

----End

5.3 Cluster O&M

5.3.1 Importing and Exporting Data

Through the **Files** tab page, you can create, delete, import, export, delete files in the analysis cluster. Currently, file creation is not supported. Streaming clusters do not support the file management function on the MRS GUI. In a cluster with Kerberos authentication enabled, to read or write the folders in the root directory, add a role that has the required permissions on the folders by referring to **Creating a Role**. Then, add the new role to the user group to which the user who submits the job belongs by referring to **Related Tasks**.

Background

Data sources processed by MRS are from OBS or HDFS. OBS is an object-based storage service that provides you with massive, secure, reliable, and cost-effective data storage capabilities. MRS can process data in OBS directly. You can view, manage, and use data by using the web page of the management control platform or OBS client. In addition, you can use REST APIs independently or integrate APIs to service applications to manage and access data.

Before creating jobs, upload the local data to OBS for MRS to compute and analyze. MRS allows exporting data from OBS to HDFS for computing and analyzing. After the data analysis and computing are completed, you can store the

data in HDFS or export them to OBS. HDFS and OBS can also store the compressed data in the format of **bz2** or **gz**.

Importing Data

Currently, MRS can only import data from OBS to HDFS. The file upload rate decreases with the increase of the file size. This mode applies to scenarios where the data volume is small.

You can perform the following steps to import files and directories:

1. Log in to the MRS console.
2. Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's information.
3. Click the **Files** tab, and go to the file management page.
4. Select **HDFS File List**.
5. Go to the data storage directory, for example, **bd_app1**.

   The **bd_app1** directory is only an example. You can use any directory on the page or create a new one.

   The requirements for creating a folder are as follows:
   - The folder name contains a maximum of 255 characters
   - The folder name cannot be empty.
   - The folder name cannot contain the following special characters: /:*?"<>|\;&,'`!{}[]$%+
   - The value cannot start or end with a period (.).
   - The spaces at the beginning and end are ignored.
6. Click **Import Data** and configure the HDFS and OBS paths correctly. When configuring the OBS or HDFS path, click **Browse**, select a file directory, and click **Yes**.
   - OBS path
     - The path must start with **obs://**.
     - Files or programs encrypted by KMS cannot be imported.
     - An empty folder cannot be imported.
     - The directory and file name can contain letters, digits, hyphens (-), and underscores (_), but cannot contain the following special characters: ;|&>,<'$*?\
     - The directory and file name cannot start or end with a space, but can contain spaces between them.
     - The OBS full path contains a maximum of 255 characters.
   - HDFS path
     - The path starts with **/user** by default.
     - The directory and file name can contain letters, digits, hyphens (-), and underscores (_), but cannot contain the following special characters: ;|&>,<'$*?\

- The directory and file name cannot start or end with a space, but can contain spaces between them.
- The HDFS full path contains a maximum of 255 characters.

7. Click **OK**.

   You can view the file upload progress on the **File Operation Records** tab page. MRS processes the data import operation as a DistCp job. You can also check whether the DistCp job is successfully executed on the **Jobs** tab page.

Exporting Data

After the data analysis and computing are completed, you can store the data in HDFS or export them to OBS.

You can perform the following steps to export files and directories:

1. Log in to the MRS console.
2. Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.
3. Click the **Files** tab, and the file management page is displayed.
4. Select **HDFS File List**.
5. Go to the data storage directory, for example, **bd_app1**.
6. Click **Export Data** and configure the OBS and HDFS paths. When configuring the OBS or HDFS path, click **Browse**, select a file directory, and click **Yes**.
   - OBS path
     - The path must start with **obs://**.
     - The directory and file name can contain letters, digits, hyphens (-), and underscores (_), but cannot contain the following special characters: ;|&>,<'$*?\
     - The directory and file name cannot start or end with a space, but can contain spaces between them.
     - The OBS full path contains a maximum of 255 characters.
   - HDFS path
     - The path starts with **/user** by default.
     - The directory and file name can contain letters, digits, hyphens (-), and underscores (_), but cannot contain the following special characters: ;|&>,<'$*?\
     - The directory and file name cannot start or end with a space, but can contain spaces between them.
     - The HDFS full path contains a maximum of 255 characters.

NOTE

When a folder is exported to OBS, a label file named **folder name_$folder$** is added to the OBS path. Ensure that the exported folder is not empty. If the exported folder is empty, OBS cannot display the folder and only generates a file named **folder name_$folder$**.

7. Click **OK**.

   You can view the file upload progress on the **File Operation Records** tab page. MRS processes the data export operation as a DistCp job. You can also check whether the DistCp job is successfully executed on the **Jobs** tab page.

Viewing Operation Logs

When importing and exporting data on the MRS management console, you can choose **Files** > **File Operation Records** to view the data import and export progress.

Table 5-16 describes the parameters of the file operation record.

Table 5-16 File operation record parameters

Parameter	Description
Submitted	Start time of data import or export.
Source Path	Source path of data. • OBS path during data import. • HDFS path during data export.
Target Path	Target path of data. • HDFS path during data import. • OBS path during data import.
Status	Status during data import or export. • Submitted • Accepted • Running • Completed • Terminated • Abnormal
Duration (min)	Time of data import or export. The unit is minute.
Result	Result of data import or export. • Successful • Failed • Killed • Undefined

Parameter	Description
Operation	View Log: allows you to view file operation logs.

5.3.2 Changing the Subnet of a Cluster

If the current subnet does not have sufficient IP addresses, you can change to another subnet in the same VPC of the current cluster to obtain more available subnet IP addresses. Changing a subnet does not affect the IP addresses or subnets of existing nodes.

For details about how to configure network ACL outbound rules, see **How Do I Configure a Network ACL Outbound Rule?**

Changing a Subnet When No Network ACL Is Associated

Step 1 Log in to the MRS console.

Step 2 Click the target cluster name to go to its details page.

Step 3 Click **Change Subnet** on the right of **Default Subnet**.

Step 4 Select the target subnet and click **OK**.

If no subnet is available, click **Create Subnet** to create a subnet first.

----End

Changing a Subnet When a Network ACL Is Associated

Step 1 Log in to the MRS console and click the target cluster to go to its details page.

Step 2 In the **Basic Information** area, view **VPC**.

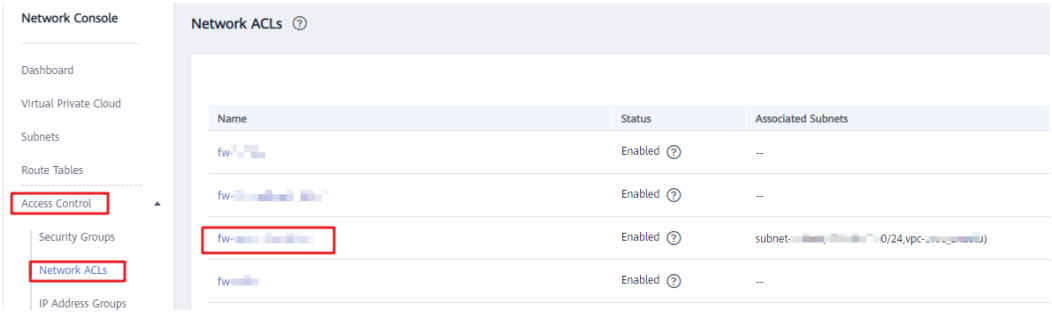
Step 3 Log in to the VPC console. In the navigation pane on the left, choose **Virtual Private Cloud** and obtain the IPv4 CIDR block corresponding to the VPC obtained in **Step 2**.

Step 4 Choose **Access Control** > **Network ACLs** and click the name of the network ACL that is associated with the default and new subnets.

NOTE

If both the default and new subnets are associated with a network ACL, add inbound rules to the network ACL by referring to **Step 5** to **Step 7**.

Figure 5-3 Network ACLs



Step 5 On the **Inbound Rules** page, choose **More** > **Insert Rule Above** in the **Operation** column.

Step 6 Add a network ACL rule. Set **Action** to **Allow**, **Source** to the VPC IPv4 CIDR block obtained in **Step 3**, and retain the default values for other parameters.

Step 7 Click **OK**.

NOTE

If you do not want to allow access from all IPv4 CIDR blocks of the VPC, add the IPv4 CIDR blocks of the default and new subnets by performing **Step 8** to **Step 12**. If the rules for VPC IPv4 CIDR blocks have been added, skip **Step 8** to **Step 12**.

Step 8 Log in to the MRS console.

Step 9 Click the target cluster to go to its details page.

Step 10 Click **Change Subnet** on the right of **Default Subnet**.

Step 11 Obtain the IPv4 CIDR blocks of the default and new subnets.

NOTICE

In this case, you do not need to click **OK** displayed in the **Change Subnet** dialog box. Otherwise, the default subnet will be updated to the new subnet, thereby making it difficult to query the IPv4 CIDR block of the default subnet. Exercise caution when performing this operation.

Step 12 Add the IPv4 CIDR blocks of the default and target subnets to the inbound rules of the network ACL bound to the two subnets by referring to **Step 4** to **Step 7**.

Step 13 Log in to the MRS console.

Step 14 Click the target cluster to go to its details page.

Step 15 Click **Change Subnet** on the right of **Default Subnet**.

Step 16 Select the target subnet and click **OK**.

----End

How Do I Configure a Network ACL Outbound Rule?

- Method 1

  Allow all outbound traffic. This method ensures that clusters can be created and used properly.

- Method 2

  Allow the mandatory outbound rules that can ensure the successful creation of clusters. You are not advised to use this method because created clusters may not run properly due to absent outbound rules. If the preceding problem occurs, contact O&M personnel.

  Similar to the example provided in method 1, set **Action** to **Allow** and add the outbound rules whose destinations are the address with **Secure Communications** enabled, NTP server address, OBS server address, OpenStack address, and DNS server address, respectively.

5.3.3 Configuring Message Notification

MRS uses SMN to offer a publish/subscribe model to achieve one-to-multiple message subscriptions and notifications in a variety of message types (SMSs and emails).

Scenario

On the MRS management console, you can enable or disable the notification service on the **Alarms** page. The functions in the following scenarios can be implemented only after the required cluster function is enabled:

- After a user subscribes to the notification service, the MRS management plane notifies the user of success or failure of manual cluster scale-out and scale-in, cluster termination, and auto scaling by emails or SMS messages.
- The management plane checks the alarms about the MRS cluster and sends a notification to the tenant if the alarms are critical.
- If either of the operations such as deletion, shutdown, specifications modification, restart, and OS update is performed on an ECS in a cluster, the MRS cluster works abnormally. The management plane notifies a user when detecting that the VM of the user is in either of the preceding operations.

Creating a Topic

A topic is a specified event for message publication and notification subscription. It serves as a message sending channel, where publishers and subscribers can interact with each other.

1. Log in to the management console.
2. Click **Service List**. Under **Management & Governance**, click **Simple Message Notification**.

   The **SMN** page is displayed.
3. In the navigation pane, choose **Topic Management** > **Topics**.

   The **Topics** page is displayed.
4. Click **Create Topic**.

   The **Create Topic** dialog box is displayed.
5. In **Topic Name**, enter a topic name. In **Display Name**, enter a display name.
6. Select an existing project from the **Enterprise Project** drop-down list, or click **Create Enterprise Project** to create an enterprise project on the **Enterprise Project Management** page and then select it.
7. Set tag keys and tag values. Tags consist of keys and values. They identify cloud resources so that you can easily categorize and search for your resources.

Adding Subscriptions to a Topic

To deliver messages published to a topic to subscribers, you must add subscription endpoints to the topic. SMN automatically sends a confirmation message to the subscription endpoint. The confirmation message is valid only within 48 hours. The

subscribers must confirm the subscription within 48 hours so that they can receive notification messages. Otherwise, the confirmation message becomes invalid, and you need to send it again.

1. Log in to the management console.
2. Under **Management & Governance**, click **Simple Message Notification**.

   The **SMN** page is displayed.
3. In the navigation pane, choose **Topic Management** > **Topics**.

   The **Topics** page is displayed.
4. Locate the topic to which you want to add a subscription, click **More** in the **Operation** column, and select **Add Subscription**.

   The **Add Subscription** box is displayed.

   Protocol can be set to **SMS**, FunctionGraph (function), **HTTP**, **HTTPS**, and **Email**.

   Endpoint indicates the address of the subscription endpoint. SMS and email, endpoints can be entered in batches. When adding endpoints in batches, each endpoint address occupies a line. You can enter a maximum of 10 endpoints.
5. Click **OK**.

The subscription you added is displayed in the subscription list.

Sending Notifications to Subscribers

1. Log in to the MRS console.
2. Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.
3. Click **Alarms**.
4. Choose **Notification Rules** > **Add Notification Rule**. The **Add Notification Rule** page is displayed.
5. Set the notification rule parameters.

Table 5-17 Parameters of a notification rule

Parameter	Description
Rule Name	User-defined notification rule name. Only digits, letters, hyphens (-), and underscores (_) are allowed.
Message Notification	• If you enable this function, the system sends notifications to subscribers based on the notification rule. • If you disable this function, the rule does not take effect, that is, notifications are not sent to subscribers.
Topic Name	Select an existing topic or click **Create Topic** to create a topic.

Parameter	Description
Notification Type	Select the type of the notification to be subscribed to. • Alarm
Subscription Items	Select the items to be subscribed to. You can select all or some items as required. Subscription rules in MRS 3.*x* or later: Alarm severity: critical, major, and minor Subscription rules in versions earlier than MRS 3.x: • Critical • Major • Minor • Suggestion

6. Click **OK**.

5.3.4 Checking Health Status

5.3.4.1 Before You Start

This section describes how to manage health checks on the MRS console.

Health check management operations on the MRS console apply only to clusters of **MRS 1.9.2 to MRS 2.1.x**.

Health check management on Manager applies to all versions. For MRS 3.x and later versions, see **Viewing a Health Check Task**. For versions earlier than MRS 3.x, see **Performing a Health Check**.

5.3.4.2 Performing a Health Check

Scenario

To ensure that cluster parameters, configurations, and monitoring are correct and that the cluster can run stably for a long time, you can perform a health check during routine maintenance.

NOTE

A system health check includes MRS Manager, service-level, and host-level health checks:

- MRS Manager health checks focus on whether the unified management platform can provide management functions.
- Service-level health checks focus on whether components can provide services properly.
- Host-level health checks focus on whether host indicators are normal.

The system health check includes three types of check items: health status, related alarms, and customized monitoring indicators for each check object. The health check results are not always the same as the **Health Status** on the portal.

Procedure

- Manually perform the health check for all services.

  On the MRS details page, choose **Management Operations** > **Start Cluster Health Check**.

  NOTE

  For the operations on MRS Manager, see **Performing a Health Check**; for the operations on FusionInsight Manager of MRS 3.*x* or later, see **Overview**.

  - The cluster health check includes Manager, service, and host status checks.
  - To perform cluster health checks, you can also choose **System** > **Check Health Status** > **Start Cluster Health Check** on MRS Manager.
  - To export the health check result, click **Export Report** in the upper left corner.
- Manually perform the health check for a service.
  a. On the MRS cluster details page, click **Components**.
  b. Select the target service from the service list.
  c. Choose **More** > **Start Service Health Check** to start the health check for the service.
- Manually perform the health check for a host.
  a. On the MRS details page, click **Nodes**.
  b. Expand the node group information and select the check box of the host to be checked.
  c. Choose **Node** > **Start Host Health Check** to start the health check for the host.

5.3.4.3 Viewing and Exporting a Health Check Report

Scenario

You can view the health check result on MRS and export it for further analysis.

NOTE

A system health check includes MRS Manager, service-level, and host-level health checks:

- MRS Manager health checks focus on whether the unified management platform can provide management functions.
- Service-level health checks focus on whether components can provide services properly.
- Host-level health checks focus on whether host indicators are normal.

The system health check includes three types of check items: health status, related alarms, and customized monitoring indicators for each check object. The health check results are not always the same as the **Health Status** on the portal.

Prerequisites

You have performed a health check.

Procedure

Step 1 On the MRS details page, choose **Management Operations** > **View Cluster Health Check Report**.

Step 2 Click **Export Report** on the health check report pane to export the report and view detailed information about check items.

----End

5.3.5 Remote O&M

5.3.5.1 Authorizing O&M

If you need technical support personnel to help you with troubleshooting, you can use the O&M authorization function to authorize technical support personnel to access your local host for fault location.

Procedure

Step 1 Log in to the MRS management console.

Step 2 In the navigation tree of the MRS management console, choose **Clusters** > **Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 In the upper right corner of the page, click **O&M**, choose **Authorize O&M**, and select the deadline for the support personnel to access the local host. Before the deadline, the support personnel have the temporary permission to access the local host.

Step 4 After the fault is rectified, click **O&M** in the upper right corner of the page and select **Cancel Authorization** to cancel the access permission for the support personnel.

----End

5.3.5.2 Sharing Logs

If you need technical support personnel to help you with troubleshooting, you can use the log sharing function to provide logs in a specific time to technical support personnel for fault location.

Procedure

Step 1 Log in to the MRS management console.

Step 2 In the navigation tree of the MRS management console, choose **Clusters** > **Active Clusters**, select a cluster, and click its name to switch to the cluster details page.

Step 3 In the upper right corner of the displayed page, choose **O&M** > **Share Log** to open the **Share Log** dialog box.

Step 4 Select the start time and end time in **Time Range**.

NOTE

- Select **Time Range** based on the suggestions of support personnel.
- **End Date** must be later than **Start Date**. Otherwise, logs cannot be filtered by time.

----End

5.3.6 Viewing MRS Operation Logs

You can view operation logs of clusters and jobs on the **Operation Logs** page. Log information is typically used for quickly locating faults in case of cluster exceptions, helping users resolve problems.

Operation Type

Currently, the following operation logs are provided by MRS. You can filter the logs in the search box.

- Cluster operations
  - Creating, deleting, scaling out, and scaling in a cluster
  - Creating and deleting a directory, deleting a file
- Job operations: Creating, stopping, and deleting a job
- Data operations: IAM user tasks, adding user, and adding user group

Log Fields

Logs are listed in chronological order by default in the log list, with the most recent logs displayed at the top.

Table 5-18 describes various fields in a log.

Table 5-18 Log description

Parameter	Description
Operation Type	Various types of operations, including: • Cluster operations • Job operations • Data operations
Operation IP	IP address where an operation is performed. **NOTE** If an MRS cluster fails to be deployed, the cluster is automatically deleted, and the operation logs of the automatically deleted cluster do not contain the **Operation IP** of the user.
Operation	Operation details. The value can contain a maximum of 2048 characters.
Time	Operation time. For a deleted cluster, only logs generated within the last six months are displayed. To view logs generated six months ago, contact technical support.
Enterprise Project	Enterprise project to which the cluster belongs

Table 5-19 Icon description

Icon	Description
	Select an enterprise project from the drop-down list box to filter logs.
	Select an operation type from the drop-down list box to filter logs. • **All Operation Types**: Filter all logs. • **Cluster**: Filter logs for **Cluster**. • **Job**: Filter logs for **Job**. • **Data**: Filter logs for **Data**.
	Filter logs by time. 1. Click the input box. 2. Specify the date and time. 3. Click **OK**. The left-side input box indicates the start time and the right-side one indicates the end time. The start time must be earlier than or equal to the end time. Otherwise, logs cannot be filtered.
	Enter a keyword of the **Operation Details** in the search box and click  to search for logs.

Icon	Description
	Click  to manually refresh the log list.

5.3.7 Terminating a Cluster

You can terminate an MRS cluster after job execution is complete.

Background

You can manually terminate a cluster after data analysis is complete or when the cluster encounters an exception. A cluster failed to be deployed will be automatically terminated.

Procedure

Step 1 Log in to the MRS console.

Step 2 In the navigation tree of the MRS console, choose **Clusters** > **Active Clusters**.

Step 3 Locate the cluster to be terminated, and click **Terminate** in the **Operation** column.

The cluster status changes from **Running** to **Terminating**, and finally to **Terminated**. You can view the clusters in **Terminated** state in **Cluster History**. The terminated cluster is no longer charged.

----End

5.4 Managing Nodes

5.4.1 Manually Scaling Out a Cluster

The storage and computing capabilities of MRS can be improved by simply adding Core nodes or Task nodes instead of modifying system architecture, reducing O&M costs. Core nodes can process and store data. You can add Core nodes to expand the node quantities and handle peak loads. Task nodes are used for computing and do not store persistent data.

Background

The MRS cluster supports a maximum of 500 Core and Task nodes. If more than 500 Core/Task nodes are required, contact technical support engineers or invoke a background interface to modify the database.

Core nodes and Task nodes can be added, excluding the Master node. Here, the maximum number of Core/Task nodes to be added is 500 minus the number of Core/Task nodes. For example, the current number of Core nodes is 3, the number of Core nodes to be added must be less than or equal to 497. If the cluster scale-out fails, you can add node to the cluster again.

If no node is added during cluster creation, you can specify the number of nodes to be added during scale-out. However, you cannot specify the nodes to be added.

The operations for scaling out a cluster vary depending on the selected version.

Procedure

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters** > **Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 Click the **Nodes** tab. In the **Operation** column of the node group, click **Scale Out**. The **Scale Out** page is displayed.

The scale-out operation can only be performed on the running clusters.

Step 4 Set **Scaled Out Nodes**, **Enable Component**, and **Run Bootstrap Action**, and click **OK**

NOTE

- If the Task node group does not exist in the cluster, configure the Task node by referring to **Adding a Task Node**.
- If a bootstrap action is added during cluster creation, the **Run Bootstrap Action** parameter is valid. If this function is enabled, the bootstrap actions added during cluster creation will be run on all the scaled out nodes.
- If the **New Specifications** parameter is available, the specifications that are the same as those of the original nodes have been sold out or discontinued. Nodes with new specifications will be added.
- Before scaling out the cluster, check whether its security group configuration is correct. Ensure that an inbound security group rule contains a rule in which **Protocol & Port** is set to **All**, and **Source** is set to a trusted accessible IP address range.

Step 5 In the **Scale Out Node** dialog box, click **OK**.

Step 6 A dialog box is displayed, indicating that the scale-out task is submitted successfully.

The following parameters explain the cluster scale-out process:

- Expanding: If a cluster is being expanded, its status is **Scaling out**. The submitted jobs will be executed and you can submit new jobs. You are not allowed to continue to scale out, or delete the cluster. You are advised not to restart the cluster or modify the cluster configuration.
- Expansion succeeded: If a cluster is expanded successfully, its status is **Running**.
- Failed scale-out: The cluster status is **Running** when the cluster scale-out failed. You can execute jobs and scale out the cluster again.

After the cluster is scaled out, you can view the node information of the cluster on the **Nodes** page.

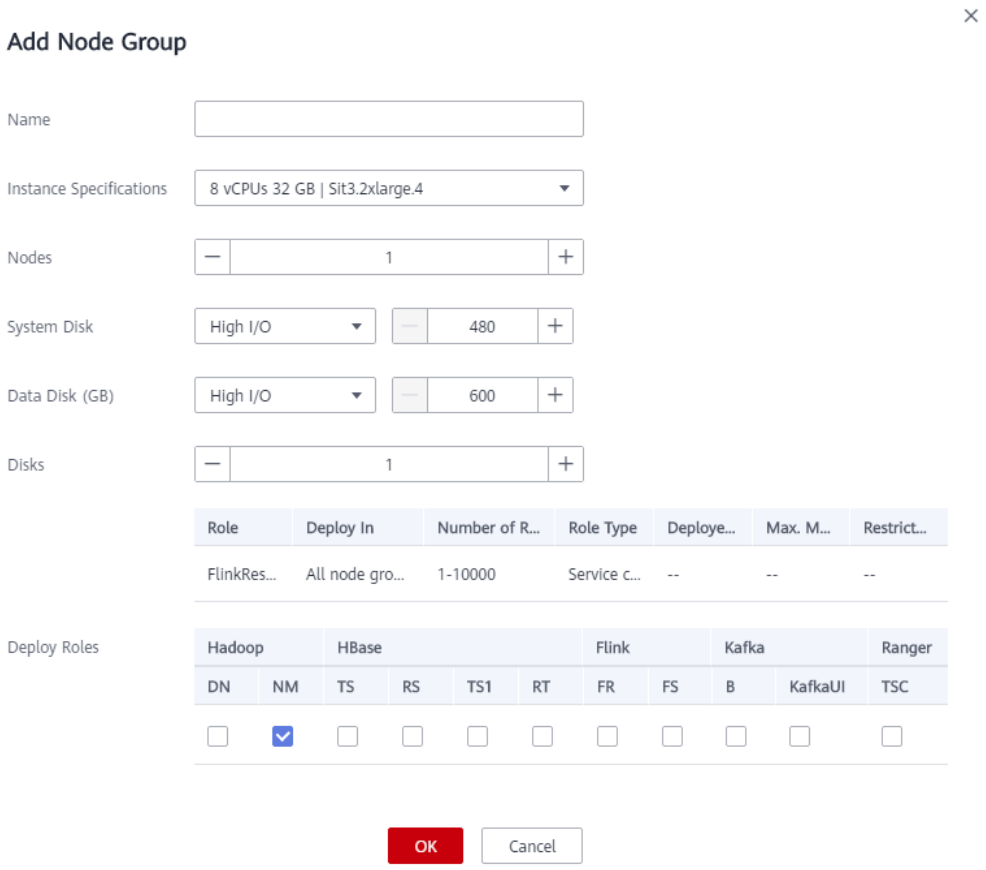
----End

Adding a Task Node

To add a task node to a custom cluster, perform the following steps:

1. On the cluster details page, click the **Nodes** tab and click **Add Node Group**. The **Add Node Group** page is displayed.
2. Select **NM** for **Deploy Roles** and set other parameters as required.

Figure 5-4 Adding a task node group



To add a task node to a non-custom cluster, perform the following steps:

1. On the cluster details page, click the **Nodes** tab and click **Configure Task Node**. The **Configure Task Node** page is displayed.
2. On the **Configure Task Node** page, set **Node Type**, **Instance Specifications**, **Nodes**, **System Disk**. In addition, if **Add Data Disk** is enabled, configure the storage type, size, and number of data disks.
3. Click **OK**.

Adding a Node Group

NOTE

Used to add node groups and applies to customized clusters of MRS 3.*x*.

1. On the cluster details page, click the **Nodes** tab and click **Add Node Group**. The **Add Node Group** page is displayed.
2. Set the parameters as needed.

Table 5-20 Parameters for adding a node group

Parameter	Description
Instance Specifications	Select the flavor type of the hosts in the node group.
Nodes	Set the number of nodes in the node group.
System Disk	Set the specifications and capacity of the system disk on the new node.
Data Disk (GB)	Set the specifications, capacity, and number of data disks of the new node.
Deploy Roles	Deploy the instances of each node in the new node group. The setting can be manually adjusted.

3. Click **OK**.

5.4.2 Manually Scaling In a Cluster

You can reduce the number of core or task nodes to scale in a cluster based on service requirements so that MRS delivers better storage and computing capabilities at lower O&M costs.

The scale-in operation is not allowed for a cluster that is performing active/standby synchronization.

Background

A cluster can have three types of nodes, master, core, and task nodes. Currently, only core and task nodes can be removed. To scale in a cluster, you only need to adjust the number of nodes on the MRS console. MRS then automatically selects the nodes to be removed.

The policies for MRS to automatically select nodes are as follows:

- MRS does not select the nodes with basic components installed, such as ZooKeeper, DBService, KrbServer, and LdapServer, because these basic components are the basis for the cluster to run.
- Core nodes store cluster service data. When scaling in a cluster, ensure that all data on the core nodes to be removed has been migrated to other nodes. You can perform follow-up scale-in operations only after all component services are decommissioned, for example, removing nodes from Manager and deleting ECSs. When selecting core nodes, MRS preferentially selects the nodes with a small amount of data and healthy instances to be decommissioned to prevent decommissioning failures. For example, if DataNodes are installed on core nodes in an analysis cluster, MRS preferentially selects the nodes with small data volume and good health status during scale-in.

  When core nodes are removed, their data is migrated to other nodes. If the user business has cached the data storage path, the client will automatically update the path, which may increase the service processing latency

temporarily. Cluster scale-in may slow the response of the first access to some HBase on HDFS data. You can restart HBase or disable or enable related tables to resolve this issue.

- Task nodes are computing nodes and do not store cluster data. Data migration is not involved in removing task nodes. Therefore, when selecting task nodes, MRS preferentially selects nodes whose health status is faulty, unknown, or subhealthy. On the **Components** tab of the MRS console, click a service and then the **Instances** tab to view the health status of the node instances.

Scale-In Verification Policy

To prevent component decommissioning failures, components provide different decommissioning constraints. Scale-in is allowed only when the constraints of all installed components are met. **Table 5-21** describes the scale-in verification policies.

Table 5-21 Decommissioning constraints

Component	Constraint
HDFS/DataNode	The number of available nodes after the scale-in is greater than or equal to the number of HDFS copies and the total HDFS data volume does not exceed 80% of the total HDFS cluster capacity. This ensures that the remaining space is sufficient for storing existing data after the scale-in and reserves some space for future use. **NOTE** To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total.
HBase/ RegionServer	The total available memory of RegionServers on all nodes except the nodes to be removed is greater than 1.2 times of the memory which is currently used by RegionServers on these nodes. This ensures that the node to which the region on a decommissioned node is migrated has sufficient memory to bear the region of the decommissioned node.
Storm/ Supervisor	After the scale-in, ensure that the number of slots in the cluster is sufficient for running the submitted tasks. This prevents no sufficient resources being available for running the stream processing tasks after the scale-in.
Flume/ FlumeServer	If FlumeServer is installed on a node and Flume tasks have been configured for the node, the node cannot be deleted. This prevents the deployed service program from being deleted by mistake.

Scaling In a Cluster by Specifying the Node Quantity

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters** > **Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 Click the **Nodes** tab. In the **Operation** column of the node group, click **Scale In** to go to the **Scale In** page.

This operation can be performed only when the cluster and all nodes in it are running.

Step 4 Set **Scale-In Nodes** and click **OK**.

NOTE

- Before scaling in the cluster, check whether its security group configuration is correct. Ensure that an inbound security group rule contains a rule in which **Protocol & Port** is set to **All**, and **Source** is set to a trusted accessible IP address range.
- If damaged data blocks exist in HDFS, the cluster may fail to be scaled in. Contact technical support.

Step 5 A dialog box displayed in the upper right corner of the page indicates that the task of removing the node is submitted successfully.

The cluster scale-in process is explained as follows:

- During scale-in: The cluster status is **Scaling In**. The submitted jobs will be executed, and you can submit new jobs. You are not allowed to continue to scale in or terminate the cluster. You are advised not to restart the cluster or modify the cluster configuration.
- Successful scale-in: The cluster status is **Running**.
- Failed scale-in: The cluster status is **Running**. You can execute jobs or scale-in the cluster again.

After the cluster is scaled in, you can view the node information of the cluster on the **Nodes** page.

----End

5.4.3 Managing a Host (Node)

Scenario

To check an abnormal or faulty host (node), you need to stop all host roles on MRS. To recover host services after the host fault is rectified, restart all roles.

Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Step 1 On the MRS details page, click **Nodes**.

Step 2 Unfold the node group information and select the check box of the target node.

Step 3 Choose **Node Operation** > **Start All Roles** or **Stop All Roles** to perform the required operation.

----End

5.4.4 Isolating a Host

Scenario

If a host is found to be abnormal or faulty, affecting cluster performance or preventing services from being provided, you can temporarily exclude that host from the available nodes in the cluster. In this way, the client can access other available nodes. In scenarios where patches are to be installed in a cluster, you can also exclude a specified node from patch installation.

You can isolate a host manually on MRS based on the actual service requirements or O&M plan. Only non-management nodes can be isolated.

Impact on the System

- After a host is isolated, all role instances on the host will be stopped. You cannot start, stop, or configure the host and any instances on the host.
- After a host is isolated, statistics of the monitoring status and indicator data of the host hardware and instances cannot be collected or displayed.

Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Step 1 On the MRS details page, click **Nodes**.

Step 2 Unfold the node group information and select the check box of the target host.

Step 3 Choose **Node Operation** > **Isolate Host**.

Step 4 Confirm the information about the host to be isolated and click **OK**.

When **Operation successful** is displayed, click **Finish**. The host is isolated successfully, and the value of **Operating Status** becomes **Isolated**.

NOTE

For isolated hosts, you can cancel the isolation and add them to the cluster again. For details, see **Canceling Host Isolation**.

----End

5.4.5 Canceling Host Isolation

Scenario

After the exception or fault of a host is handled, you must cancel the isolation of the host for proper usage.

You can cancel the isolation of a host on MRS.

Prerequisites

- The host is in the **Isolated** state.
- The exception or fault of the host has been rectified.
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Step 1 On the MRS details page, click **Nodes**.

Step 2 Unfold the node group information and select the check box of the target host that you want to cancel its isolation.

Step 3 Choose **Node Operation** > **Cancel Host Isolation**.

Step 4 Confirm the information about the host for which the isolation is to be cancelled and click **OK**.

When **Operation successful** is displayed, click **Finish**. The host is de-isolated successfully, and the value of **Operating Status** becomes **Normal**.

Step 5 Select the host that has been de-isolated and choose **Node Operation** > **Start All Roles**.

----End

5.4.6 Scaling Up Master Node Specifications

As users' increasing services lead to Core node scale-out and high CPU usage, Master node specifications cannot meet user requirements and need to be scaled up. This section describes how to scale up Master node specifications.

Prerequisites

You have checked whether the Host Security Service (HSS) is enabled. If HSS is enabled, disable the HSS monitoring on the MRS cluster before upgrading the Master node specifications.

Use Restrictions

- Master nodes can be scaled up for clusters with two or more master nodes.
- The specifications of the Master node in a BMS cluster cannot be upgraded.

Master Node Specification Upgrade (One-Click Upgrade)

Step 1 Log in to the MRS console.

Step 2 In the left navigation pane, choose **Clusters** > **Active Clusters**, select the cluster for which you want to scale up Master node specifications, and click its name to switch to the cluster details page.

Step 3 On the **Nodes** tab page, select **Scale Up Specifications** in the **Operation** column of the Master node group. The **Scale Up Master Node Specifications** page is displayed.

Step 4 Select the target specifications and click **Submit Order**. The order has been submitted successfully.

The node specification scale-up takes some time. After the scale-up is successful, the cluster status changes to **Running**.

NOTE

- The VM to be scaled up is automatically stopped during the scale-up and started after the scale-up is complete.
- The scale-up does not automatically upgrade the memory of components due to different component usage requirements. You can adjust the memory of components as needed.

----End

5.5 Job Management

5.5.1 Introduction to MRS Jobs

An MRS job is the program execution platform of MRS. It is used to process and analyze user data. After a job is created, all job information is displayed on the **Jobs** tab page. You can view a list of all jobs and create and manage jobs. If the **Jobs** tab is not displayed on the cluster details page, submit a job in the background.

Data sources processed by MRS are from OBS or HDFS. OBS is an object-based storage service that provides you with massive, secure, reliable, and cost-effective data storage capabilities. MRS can process data in OBS directly. You can view, manage, and use data by using the web page of the management control platform or OBS client. In addition, you can use REST APIs independently or integrate APIs to service applications to manage and access data.

Before creating jobs, upload the local data to OBS for MRS to compute and analyze. MRS allows exporting data from OBS to HDFS for computing and analyzing. After the analyzing and computing are complete, you can store the data in HDFS or export them to OBS. HDFS and OBS can also store the compressed data in the format of **bz2** or **gz**.

Category

An MRS cluster allows creating and managing the following jobs: If a cluster in the **Running** state fails to create a job, check the health status of related

components on the cluster management page. For details, see **Viewing and Customizing Cluster Monitoring Metrics**.

- MapReduce: provides the capability of processing massive data quickly and in parallel. It is a distributed data processing mode and execution environment. MRS supports the submission of MapReduce JAR programs.
- Spark: a distributed in-memory computing framework. MRS supports SparkSubmit, Spark Script, and Spark SQL jobs.
  - SparkSubmit: You can submit the Spark JAR and Spark Python programs, execute the Spark Application, and compute and process user data.
  - SparkScript: You can submit the SparkScript scripts and batch execute Spark SQL statements.
  - Spark SQL: You can use Spark SQL statements (similar to SQL statements) to query and analyze user data in real time.
- Hive: an open-source data warehouse based on Hadoop. MRS allows you to submit HiveScript scripts and execute Hive SQL statements.
- Flink: provides a distributed big data processing engine that can perform stateful computations over both finite and infinite data streams.

Job List

Tasks are listed in chronological order by default in the task list, with the most recent jobs displayed at the top. **Table 5-22** describes the parameters in the job list.

Table 5-22 Job list parameters

Parameter	Description
Name/ID	Job name, which is set when a job is created. ID is the unique identifier of a job. After a job is added, the system automatically assigns a value to ID.
Username	Name of the user who submits a job.

Parameter	Description
Type	The following data types are supported: • DistCp: importing and exporting data • MapReduce • Spark • SparkSubmit • SparkScript • Spark SQL • Hive SQL • HiveScript • Flink **NOTE** • After importing and exporting files on the **Files** tab page, you can view the DistCp job on the **Jobs** tab page. • Spark, Hive, and Flink jobs can be added only when the Spark, Hive, and Flink components are selected during cluster creation and the cluster is running.
Status	Job status. • Submitted • Accepted • Running • Completed • Terminated • Abnormal
Result	Execution result of a job. • Undefined: indicates that the job is being executed. • **Successful**: indicates that the job has been successfully executed. • **Killed**: indicates that the job is manually terminated during execution. • **Failed**: indicates that the job fails to be executed. **NOTE** Once a job has succeeded or failed, you cannot execute it again. However, you can add a job, and set job parameters to submit a job again.
Submitted	Time when a job is submitted.
Ended	Time when a job is completed or manually stopped.

Parameter	Description
Operation	• Viewing Log: Click **View Log** to view the real-time logs of running jobs. For details, see **Viewing Job Configuration and Logs**. • View Details: Click **View Details** to view the detailed configuration information about jobs. For details, see **Viewing Job Configuration and Logs**. • More – Stop: You can click **Stop** to stop a running job. For details, see **Stopping a Job**. – Delete: Click **Delete** to delete a job. For details, see **Deleting a Job**. – View Result: Click **View Result** to view the execution results of SparkSQL and SparkScript jobs whose status is **Completed** and result is **Successful**. **NOTE** • You cannot stop Spark SQL jobs. • A deleted job cannot be restored. Therefore, exercise caution when deleting a job. • If you choose to save job logs to OBS or HDFS, the system compresses and saves the logs to the corresponding path after the job execution is completed. Therefore, after a job execution of this type is completed, the job status is still **Running**. After the log is successfully stored, the job status changes to **Completed**. The log storage duration depends on the log size and takes several minutes.

Table 5-23 Icon description

Icon	Description
	Select a time range for job submission to filter jobs submitted in the time range.
	Select a certain job execution result from the drop-down list to display jobs of the status. • All statuses: Filter all jobs. • Successful: Filter jobs that are successfully executed. • Undefined: Filter jobs that are being executed. • Killed: Filter jobs that are manually stopped. • Failed: Filter jobs that fail to be executed.

Icon	Description
	Select a certain job type from the drop-down list to display jobs of the type. • All types • MapReduce • HiveScript • Distcp • SparkScript • Spark SQL • Hive SQL • SparkSubmit • Flink
	In the search box, search for a job by setting the corresponding search condition and click  . • Job name. • Job ID. • Username. • Queue name.
	Click  to manually refresh the job list.

Job Execution Permission Description

For a security cluster with Kerberos authentication enabled, a user needs to synchronize an IAM user before submitting a job on the MRS web UI. After the synchronization is completed, the MRS system generates a user with the same IAM username. Whether a user has the permission to submit jobs depends on the IAM policy bound to the user during IAM synchronization. For details about the job submission policy, see **Table 3-3** in **Synchronizing IAM Users to MRS**.

When a user submits a job that involves the resource usage of a specific component, such as accessing HDFS directories and Hive tables, user **admin** (Manager administrator) must grant the relevant permission to the user. Detailed operations are as follows:

Step 1 Log in to Manager as user **admin**.

Step 2 Add the role of the component whose permission is required by the user. For details, see **Creating a Role**.

Step 3 Change the user group to which the user who submits the job belongs and add the new component role to the user group. For details, see **Related Tasks**.

NOTE

After the component role bound to the user group to which the user belongs is modified, it takes some time for the role permissions to take effect.

----End

5.5.2 Running a MapReduce Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results. This section describes how to submit a MapReduce job on the MRS management console. MapReduce jobs are used to submit JAR programs to quickly process massive amounts of data in parallel and create a distributed data processing and execution environment.

If the job and file management functions are not supported on the cluster details page, submit the jobs in the background.

Prerequisites

You have uploaded the program packages and data files required for running jobs to OBS or HDFS.

Submitting a Job on the GUI

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

In the **Basic Information** area on the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users. For details, see **Synchronizing IAM Users to MRS**.

NOTE

- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.

Step 4 Click the **Jobs** tab.

Step 5 Click **Create**. The **Create Job** page is displayed.

Step 6 In **Type**, select **MapReduce**. Configure other job information.

Table 5-24 Job configuration information

Parameter	Description
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. **NOTE** You are advised to set different names for different jobs.
Program Path	Path of the program package to be executed. The following requirements must be met: • Contains a maximum of 1,023 characters, excluding special characters such as ;|&><'$. The parameter value cannot be empty or full of spaces. • The path of the program to be executed can be stored in HDFS or OBS. The path varies depending on the file system. – OBS: The path must start with **obs://**. Example: **obs://wordcount/program/*xxx*.jar** – HDFS: The path must start with **/user**. For details about how to import data to HDFS, see **Importing Data**. • For SparkScript and HiveScript, the path must end with **.sql**. For MapReduce, the path must end with **.jar**. For Flink and SparkSubmit, the path must end with **.jar** or **.py**. The **.sql**, **.jar**, and **.py** are case-insensitive.
Parameters	(Optional) It is the key parameter for program execution. Multiple parameters are separated by space. Configuration method: *Program class name Data input path Data output path* • Program class name: It is specified by a function in your program. MRS is responsible for transferring parameters only. • Data input path: Click **HDFS** or **OBS** to select a path or manually enter a correct path. • Data output path: Enter a directory that does not exist. The parameter contains a maximum of 150,000 characters. It cannot contain special characters ;|&><'$, but can be left blank. **CAUTION** If you enter a parameter with sensitive information (such as the login password), the parameter may be exposed in the job details display and log printing. Exercise caution when performing this operation.
Service Parameter	(Optional) It is used to modify service parameters for the job. The parameter modification applies only to the current job. To make the modification take effect permanently for the cluster, follow instructions in **Configuring Service Parameters**. To add multiple parameters, click ⊕ on the right. To delete a parameter, click **Delete** on the right. **Table 5-25** lists the common service configuration parameters.

Parameter	Description
Command Reference	Command submitted to the background for execution when a job is submitted.

Table 5-25 Service Parameter parameters

Parameter	Description	Example Value
fs.obs.access.key	Key ID for accessing OBS.	-
fs.obs.secret.key	Key corresponding to the key ID for accessing OBS.	-

Step 7 Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

Submitting a Job in the Background

In MRS 3.x and later versions, the default installation path of the client is /opt/Bigdata/client. In MRS 3.x and earlier versions, the default installation path is /opt/client. For details, see the actual situation.

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 On the **Nodes** tab page, click the name of a Master node to go to the ECS management console.

Step 4 Click **Remote Login** in the upper right corner of the page.

Step 5 Enter the username and password of the Master node as prompted. The username is **root** and the password is the one set during cluster creation.

Step 6 Run the following command to initialize environment variables:

source /opt/Bigdata/client/bigdata_env

Step 7 If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If the Kerberos authentication is disabled for the current cluster, skip this step.

kinit *MRS cluster user*

Example: **kinit admin**

Step 8 Run the following command to copy the program in the OBS file system to the Master node in the cluster:

hadoop fs -Dfs.obs.access.key=AK -Dfs.obs.secret.key=SK -copyToLocal source_path.jar target_path.jar

Example: **hadoop fs -Dfs.obs.access.key=XXXX -Dfs.obs.secret.key=XXXX -copyToLocal "obs://mrs-word/program/hadoop-mapreduce-examples-XXX.jar" "/home/omm/hadoop-mapreduce-examples-XXX.jar"**

You can log in to OBS Console using AK/SK. To obtain AK/SK information, click the username in the upper right corner of the management console and choose **My Credentials** > **Access Keys**.

Step 9 Run the following command to submit a wordcount job. If data needs to be read from OBS or outputted to OBS, the AK/SK parameters need to be added.

source /opt/Bigdata/client/bigdata_env;hadoop jar execute_jar wordcount input_path output_path

Example: **source /opt/Bigdata/client/bigdata_env;hadoop jar /home/omm/hadoop-mapreduce-examples-XXX.jar wordcount -Dfs.obs.access.key=XXXX -Dfs.obs.secret.key=XXXX "obs://mrs-word/input/*" "obs://mrs-word/output/"**

In the preceding command, **input_path** indicates a path for storing job input files on OBS. **output_path** indicates a path for storing job output files on OBS and needs to be set to a directory that does not exist

----End

5.5.3 Running a SparkSubmit Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results. This section describes how to submit a Spark job on the MRS console.

Prerequisites

You have uploaded the program packages and data files required for running jobs to OBS or HDFS.

Submitting a Job on the GUI

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters** > **Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

In the **Basic Information** area on the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users. For details, see **Synchronizing IAM Users to MRS**.

NOTE

- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.

Step 4 Click the **Jobs** tab.

Step 5 Click **Create**. The **Create Job** page is displayed.

Step 6 Configure job information.

Table 5-26 Job configuration information

Parameter	Description
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. **NOTE** You are advised to set different names for different jobs.
Program Path	Path of the program package to be executed. The following requirements must be met: • Contains a maximum of 1,023 characters, excluding special characters such as ;|&><'$. The parameter value cannot be empty or full of spaces. • The path of the program to be executed can be stored in HDFS or OBS. The path varies depending on the file system. – OBS: The path must start with **obs://**. Example: **obs://wordcount/program/*xxx*.jar** – HDFS: The path must start with **/user**. For details about how to import data to HDFS, see **Importing Data**. • For SparkScript and HiveScript, the path must end with **.sql**. For MapReduce, the path must end with **.jar**. For Flink and SparkSubmit, the path must end with **.jar** or **.py**. The **.sql**, **.jar**, and **.py** are case-insensitive.
Program Parameter	(Optional) Used to configure optimization parameters such as threads, memory, and vCPUs for the job to optimize resource usage and improve job execution performance. **Table 5-27** describes the common parameters of a running program.

Parameter	Description
Parameters	(Optional) Key parameter for program execution. The parameter is specified by the function of the user's program. MRS is only responsible for loading the parameter. Multiple parameters are separated by space. The parameter contains a maximum of 150,000 characters. It cannot contain special characters ;|&><'$, but can be left blank. **CAUTION** If you enter a parameter with sensitive information (such as the login password), the parameter may be exposed in the job details display and log printing. Exercise caution when performing this operation.
Service Parameter	(Optional) It is used to modify service parameters for the job. The parameter modification applies only to the current job. To make the modification take effect permanently for the cluster, follow instructions in **Configuring Service Parameters**. To add multiple parameters, click ⊕ on the right. To delete a parameter, click **Delete** on the right. **Table 5-28** lists the common service configuration parameters. **NOTE** If you need to run a long-term job, such as SparkStreaming, and access OBS, you need to use **Service Parameter** to import the AK/SK for accessing OBS.
Command Reference	Command submitted to the background for execution when a job is submitted.

Table 5-27 Program parameters

Parameter	Description	Example Value
--conf	Add the task configuration items.	spark.executor.memory=2G
--driver-memory	Set the running memory of driver.	2G
--num-executors	Set the number of executors to be started.	5
--executor-cores	Set the number of executor cores.	2
--class	Set the main class of a task.	org.apache.spark.examples.SparkPi
--files	Upload files to a task. The files can be custom configuration files or some data files from OBS or HDFS.	-
--jars	Upload additional dependency packages of a task to add the external dependency packages to the task.	-

Parameter	Description	Example Value
--executor-memory	Set executor memory.	2G
--conf spark-yarn.maxAppAttempts	Control the number of AM retries.	If this parameter is set to **0**, retry is not allowed. If this parameter is set to **1**, one retry is allowed.

Table 5-28 Service Parameter parameters

Parameter	Description	Example Value
fs.obs.access.key	Key ID for accessing OBS.	-
fs.obs.secret.key	Key corresponding to the key ID for accessing OBS.	-

Step 7 Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

Submitting a Job in the Background

In MRS 3.x and later versions, the default installation path of the client is /opt/Bigdata/client. In MRS 3.x and earlier versions, the default installation path is /opt/client. For details, see the actual situation.

Step 1 Create a user for submitting jobs. For details, see **Creating a User**.

In this example, a machine-machine user used in the user development scenario has been created, and user groups (**hadoop** and **supergroup**), the primary group (**supergroup**), and role permissions (**System_administrator** and **default**) have been correctly assigned to the user.

Step 2 Download the authentication credential.

- For clusters of MRS 3.*x* or later, log in to FusionInsight Manager and choose **System** > **Permission** > **User**. In the **Operation** column of the newly created user, choose **More** > **Download Authentication Credential**.
- For clusters whose version is earlier than MRS 3.*x*, log in to MRS Manager and choose **System** > **Manage User**. In the **Operation** column of the newly created user, choose **More** > **Download Authentication Credential**.

Step 3 Upload JAR files related to the job to the cluster. In this example, the sample JAR file built in Spark is used. It is stored in **$SPARK_HOME/examples/jars/**.

Step 4 Upload the authentication credential of the user created in **Step 2** to the **/opt/** directory of the cluster and run the following command to decompress the credential:

tar –xvf MRSTest *_xxxxxx_***keytab.tar**

You will obtain two files: **user.keytab** and **krb5.conf**.

Step 5 Before performing operations on the cluster, run the following commands:

source /opt/Bigdata/client/bigdata_env

cd $SPARK_HOME

Step 6 Run the following command to submit the Spark job:

./bin/spark-submit --master yarn --deploy-mode client --conf spark.yarn.principal=MRSTest --conf spark.yarn.keytab=/opt/user.keytab --class org.apache.spark.examples.SparkPi examples/jars/spark-examples_2.11-2.3.2-mrs-2.0.jar 10

Parameter description:

1. Computing capability of Yarn, which specifies that the job is submitted in client mode.
2. Configuration item of the Spark job. The authentication file and username are transferred here.
3. **spark.yarn.principal**: user created in step 1
4. **spark.yarn.keytab**: keytab file used for authentication
5. *xx***.jar**: JAR file used by the job

----End

5.5.4 Running a HiveSQL Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results. This section describes how to submit a HiveSQL job on the MRS management console. HiveSQL jobs are used to submit SQL statements and script files for data query and analysis. Both SQL statements and scripts are supported. If SQL statements contain sensitive information, use Script to submit them.

Prerequisites

You have uploaded the program packages and data files required for running jobs to OBS or HDFS.

Submitting a Job on the GUI

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

In the **Basic Information** area on the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users. For details, see **Synchronizing IAM Users to MRS**.

NOTE

- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.

Step 4 Click the **Jobs** tab.

Step 5 Click **Create**. The **Create Job** page is displayed.

Step 6 Configure job information.

Table 5-29 Job configuration information

Parameter	Description
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. **NOTE** You are advised to set different names for different jobs.
SQL Type	Submission type of the SQL statement • SQL • Script
SQL Statement	This parameter is valid only when **SQL Type** is set to **SQL**. Enter the SQL statement to be executed, and then click **Check** to check whether the SQL statement is correct. If you want to submit and execute multiple statements at the same time, use semicolons (;) to separate them.

Parameter	Description
SQL File	This parameter is valid only when **SQL Type** is set to **Script**. The path of the SQL file to be executed must meet the following requirements: • Contains a maximum of 1,023 characters, excluding special characters such as ;|&><'$. The parameter value cannot be empty or full of spaces. • The path of the program to be executed can be stored in HDFS or OBS. The path varies depending on the file system. – OBS: The path must start with **obs://**. Example: **obs://wordcount/program/*xxx*.jar** – HDFS: The path must start with **/user**. For details about how to import data to HDFS, see **Importing Data**. • For SparkScript and HiveScript, the path must end with **.sql**. For MapReduce, the path must end with **.jar**. For Flink and SparkSubmit, the path must end with **.jar** or **.py**. The **.sql**, **.jar**, and **.py** are case-insensitive. **NOTE** A file path on OBS can start with **obs://**. To submit jobs in this format, you need to configure permissions for accessing OBS. • If the OBS permission control function is enabled during cluster creation, you can use the **obs://** directory without extra configuration. • If the OBS permission control function is not enabled or is not supported when you create a cluster, configure the function by following instructions in **Accessing OBS**.
Program Parameter	(Optional) Used to configure optimization parameters such as threads, memory, and vCPUs for the job to optimize resource usage and improve job execution performance. **Table 5-30** describes the common parameters of a running program.
Service Parameter	(Optional) It is used to modify service parameters for the job. The parameter modification applies only to the current job. To make the modification take effect permanently for the cluster, follow instructions in **Configuring Service Parameters**. To add multiple parameters, click ⊕ on the right. To delete a parameter, click **Delete** on the right. **Table 5-31** lists the common service configuration parameters.
Command Reference	Command submitted to the background for execution when a job is submitted.

Table 5-30 Program parameters

Parameter	Description	Example Value
--hiveconf	Hive service configuration, for example, set the execution engine to MapReduce.	Setting the execution engine to MR: **--hiveconf "hive.execution.engine=mr"**
--hivevar	Custom variable, for example, variable ID.	Setting the variable ID: **--hivevar id="123" select * from test where id = ${hivevar:id}**

Table 5-31 Service parameters

Parameter	Description	Example Value
fs.obs.access.key	Key ID for accessing OBS.	-
fs.obs.secret.key	Key corresponding to the key ID for accessing OBS.	-
hive.execution.engine	Engine for running a job.	• mr • tez

Step 7 Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

Submitting a Job in the Background

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters** > **Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 On the **Nodes** tab page, click the name of a Master node to go to the ECS management console.

Step 4 Click **Remote Login** in the upper right corner of the page.

Step 5 Enter the username and password of the Master node as prompted. The username is **root** and the password is the one set during cluster creation.

Step 6 Run the following command to initialize environment variables:

source /opt/BigData/client/bigdata_env

NOTE

- In MRS 3.x and later versions, the default installation path of the client is /opt/Bigdata/client. In MRS 3.x and earlier versions, the default installation path is /opt/client. For details, see the actual situation.
- If you use the client to connect to a specific Hive multi-instance in a scenario where multiple Hive instances are installed, run the following command to load the environment variables of the instance. Otherwise, skip this step. For example, load the environment variables of the Hive2 instance.

  source /opt/BigData/client/Hive2/component_env

Step 7 If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If the Kerberos authentication is disabled for the current cluster(normal mode), skip this step.

kinit *MRS cluster user* (The user must be in the **hive** user group.)

Step 8 Run the **beeline** command to connect to HiveServer and run tasks.

beeline

For clusters in normal mode, run the following commands. If no component service user is specified, the current OS user is used to log in to the HiveServer.

beeline -n *Component service user*

beeline -f *SQL files* (SQLs in the execution files)

----End

5.5.5 Running a SparkSql Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results. This section describes how to submit a SparkSQL job on the MRS console. SparkSQL jobs are used for data query and analysis. Both SQL statements and scripts are supported. If SQL statements contain sensitive information, use Spark Script to submit them.

Prerequisites

You have uploaded the program packages and data files required for running jobs to OBS or HDFS.

Submitting a Job on the GUI

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

In the **Basic Information** area on the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users. For details, see **Synchronizing IAM Users to MRS**.

NOTE

- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.

Step 4 Click the **Jobs** tab.

Step 5 Click **Create**. On the displayed **Create Job** page, set **Type** to **SparkSql** and configure SparkSql job information by referring to **Table 5-32**.

Table 5-32 Job configuration information

Parameter	Description
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. **NOTE** You are advised to set different names for different jobs.
SQL Type	Submission type of the SQL statement • SQL • Script
SQL Statement	This parameter is valid only when **SQL Type** is set to **SQL**. Enter the SQL statement to be executed, and then click **Check** to check whether the SQL statement is correct. If you want to submit and execute multiple statements at the same time, use semicolons (;) to separate them.

Parameter	Description
SQL File	This parameter is valid only when **SQL Type** is set to **Script**. The path of the SQL file to be executed must meet the following requirements: • Contains a maximum of 1,023 characters, excluding special characters such as ;|&><'$. The parameter value cannot be empty or full of spaces. • The path of the program to be executed can be stored in HDFS or OBS. The path varies depending on the file system. – OBS: The path must start with **obs://**. Example: **obs://wordcount/program/*xxx*.jar** – HDFS: The path must start with **/user**. For details about how to import data to HDFS, see **Importing Data**. • For SparkScript and HiveScript, the path must end with **.sql**. For MapReduce, the path must end with **.jar**. For Flink and SparkSubmit, the path must end with **.jar** or **.py**. The **.sql**, **.jar**, and **.py** are case-insensitive. **NOTE** A file path on OBS can start with **obs://**. To submit jobs in this format, you need to configure permissions for accessing OBS. • If the OBS permission control function is enabled during cluster creation, you can use the **obs://** directory without extra configuration. • If the OBS permission control function is not enabled or is not supported when you create a cluster, configure the function by following instructions in **Accessing OBS**.
Program Parameter	(Optional) Used to configure optimization parameters such as threads, memory, and vCPUs for the job to optimize resource usage and improve job execution performance. **Table 5-33** describes the common parameters of a running program.
Service Parameter	(Optional) It is used to modify service parameters for the job. The parameter modification applies only to the current job. To make the modification take effect permanently for the cluster, follow instructions in **Configuring Service Parameters**. To add multiple parameters, click ⊕ on the right. To delete a parameter, click **Delete** on the right. **Table 5-34** lists the common service configuration parameters.
Command Reference	Command submitted to the background for execution when a job is submitted.

Table 5-33 Program parameters

Parameter	Description	Example Value
--conf	Task configuration items to be added.	spark.executor.memory=2G
--driver-memory	Running memory of a driver.	2G
--num-executors	Number of executors to be started.	5
--executor-cores	Number of executor cores.	2
--jars	Additional dependency packages of a task, which is used to add the external dependency packages to the task.	-
--executor-memory	Executor memory.	2G

Table 5-34 Service parameters

Parameter	Description	Example Value
fs.obs.access.key	Key ID for accessing OBS.	-
fs.obs.secret.key	Key corresponding to the key ID for accessing OBS.	-

Step 6 Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

Submitting a Job in the Background

In MRS 3.x and later versions, the default installation path of the client is /opt/Bigdata/client. In MRS 3.x and earlier versions, the default installation path is /opt/client. For details, see the actual situation.

Step 1 Create a user for submitting jobs. For details, see **Creating a User**.

In this example, a machine-machine user used in the user development scenario has been created, and user groups (**hadoop** and **supergroup**), the primary group (**supergroup**), and role permissions (**System_administrator** and **default**) have been correctly assigned to the user.

Step 2 Download the authentication credential.

- For clusters of MRS 3.*x* or later, log in to FusionInsight Manager and choose **System** > **Permission** > **User**. In the **Operation** column of the newly created user, choose **More** > **Download Authentication Credential**.

- For clusters whose version is earlier than MRS 3.*x*, log in to MRS Manager and choose **System** > **Manage User**. In the **Operation** column of the newly created user, choose **More** > **Download Authentication Credential**.

Step 3 Log in to the node where the Spark client is located, upload the user authentication credential created in 2 to the **/opt/** directory of the cluster, and run the following command to decompress the package:

tar –xvf MRSTest _xxxxxx_keytab.tar

After the decompression, you obtain the **user.keytab** and **krb5.conf** files.

Step 4 Before performing operations on the cluster, run the following commands:

source /opt/Bigdata/client/bigdata_env

cd $SPARK_HOME

Step 5 Open the **spark-sql** CLI and run the following SQL statement:

./bin/spark-sql --conf spark.yarn.principal=MRSTest --conf spark.yarn.keytab=/opt/user.keytab

To execute the SQL file, you need to upload the SQL file (for example, to the **/opt/** directory). After the file is uploaded, run the following command:

./bin/spark-sql --conf spark.yarn.principal=MRSTest --conf spark.yarn.keytab=/opt/user.keytab -f /opt/script.sql

----End

5.5.6 Running a Flink Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results. This section describes how to submit a Flink job on the MRS management console. Flink jobs are used to submit JAR programs to process streaming data.

Prerequisites

You have uploaded the program packages and data files required for running jobs to OBS or HDFS.

Submitting a Job on the GUI

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

In the **Basic Information** area on the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users. For details, see **Synchronizing IAM Users to MRS**.

NOTE

- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.

Step 4 Click the **Jobs** tab.

Step 5 Click **Create**. The **Create Job** page is displayed.

Step 6 Set **Type** to **Flink**. Configure Flink job information by referring to **Table 5-35**.

Table 5-35 Job configuration information

Parameter	Description
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. **NOTE** You are advised to set different names for different jobs.
Program Path	Path of the program package to be executed. The following requirements must be met: • Contains a maximum of 1,023 characters, excluding special characters such as ;|&><'$. The parameter value cannot be empty or full of spaces. • The path of the program to be executed can be stored in HDFS or OBS. The path varies depending on the file system. – OBS: The path must start with **obs://**. Example: **obs://wordcount/program/*xxx*.jar** – HDFS: The path must start with **/user**. For details about how to import data to HDFS, see **Importing Data**.
Program Parameter	(Optional) Used to configure optimization parameters such as threads, memory, and vCPUs for the job to optimize resource usage and improve job execution performance. **Table 5-36** describes the common parameters of a running program.

Parameter	Description
Parameters	(Optional) Key parameter for program execution. The parameter is specified by the function of the user's program. MRS is only responsible for loading the parameter. Multiple parameters are separated by space. The parameter contains a maximum of 150,000 characters. It cannot contain special characters ;|&><'$, but can be left blank. **CAUTION** If you enter a parameter with sensitive information (such as the login password), the parameter may be exposed in the job details display and log printing. Exercise caution when performing this operation.
Service Parameter	(Optional) It is used to modify service parameters for the job. The parameter modification applies only to the current job. To make the modification take effect permanently for the cluster, follow instructions in **Configuring Service Parameters**. To add multiple parameters, click ⊕ on the right. To delete a parameter, click **Delete** on the right. **Table 5-37** describes the common parameters of a service.
Command Reference	Command submitted to the background for execution when a job is submitted.

Table 5-36 Program parameters

Parameter	Description	Example Value
-ytm	Memory size of each TaskManager container. (Optional unit. The unit is MB by default.)	1024
-yjm	Memory size of JobManager container. (Optional unit. The unit is MB by default.)	1024
-yn	Number of Yarn containers allocated to applications. The value is the same as the number of TaskManagers.	2
-ys	Number of TaskManager cores.	2
-ynm	Custom name of an application on Yarn.	test
-c	Class of the program entry point (for example, the **main** or **getPlan()** method). This parameter is required only when the JAR file does not specify the class of its manifest.	com.bigdata.mrs.test

NOTE

For MRS 3.x or later, the **-yn** parameter is not supported.

Table 5-37 Service parameters

Parameter	Description	Example Value
fs.obs.access.key	Key ID for accessing OBS.	-
fs.obs.secret.key	Key corresponding to the key ID for accessing OBS.	-

Step 7 Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

Submitting a Job in the Background

In MRS 3.x and later versions, the default installation path of the client is /opt/Bigdata/client. In MRS 3.x and earlier versions, the default installation path is /opt/client. For details, see the actual situation.

Step 1 Log in to the MRS client.

Step 2 Run the following command to initialize environment variables:

source /opt/Bigdata/client/bigdata_env

Step 3 If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

1. Prepare a user for submitting Flink jobs.
2. Log in to Manager as the newly created user.
   - For MRS 3.x earlier: Log in to Manager of the cluster. Choose **System** > **Manage User**. In the **Operation** column of the row that contains the added user, choose **More** > **Download authentication credential** to locate the row that contains the user.
   - For MRS 3.*x* or later: Log in to Manager of the cluster. Choose **System** > **Permission** > **Manage User**. On the displayed page, locate the row that contains the added user, click **More** in the **Operation** column, and select **Download authentication credential**.
3. Decompress the downloaded authentication credential package and copy the **user.keytab** file to the client node, for example, to the **/opt/Bigdata/client/Flink/flink/conf** directory on the client node. If the client is installed on a node outside the cluster, copy the **krb5.conf** file to the **/etc/** directory on this node.
4. For MRS 3.x or later: In security mode, add the service IP address of the node where the client is installed and floating IP address of Manager to the **jobmanager.web.allow-access-address** configuration item in the **/opt/Bigdata/client/Flink/flink/conf/flink-conf.yaml** file.

5. Run the following commands to configure security authentication by adding the **keytab** path and username to the **/opt/Bigdata/client/Flink/flink/conf/flink-conf.yaml** configuration file.

   security.kerberos.login.keytab: *<user.keytab file path>*

   security.kerberos.login.principal: *<Username>*

   Example:

   security.kerberos.login.keytab: /opt/Bigdata/client/Flink/flink/conf/user.keytab

   security.kerberos.login.principal: test

6. Run the following command to perform security hardening in the **bin** directory of the Flink client. Set password to a new password for submitting jobs.

   sh generate_keystore.sh <*password*>

   This script automatically replaces the SSL value in the **/opt/Bigdata/client/Flink/flink/conf/flink-conf.yaml** file. For MRS 3.x or earlier, external SSL is disabled by default in security clusters. To enable external SSL, run this script again after configuration. The configuration parameters do not exist in the default Flink configuration of MRS, if you enable SSL for external connections, you need to add the parameters listed in **Table 5-38**.

Table 5-38 Parameter description

Parameter	Example Value	Description
security.ssl.rest.enabled	true	Switch to enable external SSL.
security.ssl.rest.keystore	${path}/flink.keystore	Path for storing **keystore**.
security.ssl.rest.keystore-password	123456	Password of the **keystore**. **123456** indicates a user-defined password is required.
security.ssl.rest.key-password	123456	Password of the SSL key. **123456** indicates a user-defined password is required.
security.ssl.rest.truststore	${path}/flink.truststore	Path for storing the **truststore**.
security.ssl.rest.truststore-password	123456	Password of the **truststore**. **123456** indicates a user-defined password is required.

NOTE

- For MRS 3.x or earlier: The **generate_keystore.sh** script is automatically generated.
- Perform **Authentication and Encryption**. The generated **flink.keystore**, **flink.truststore**, and **security.cookie** files are automatically filled in the corresponding configuration items in **flink-conf.yaml**.
- For MRS 3.*x* or later: You can obtain the values of **security.ssl.key-password**, **security.ssl.keystore-password**, and **security.ssl.truststore-password** using the Manager plaintext encryption API by running the following command:

  curl -k -i -u <*user name*>:<*password*> -X POST -HContent-type:application/json -d '{"plainText":"<*password*>"}' 'https://*x.x.x.x*:28443/web/api/v2/tools/encrypt'; In the preceding command, <*password*> must be the same as the password used for issuing the certificate, and *x.x.x.x* indicates the floating IP address of Manager in the cluster.

7. Configure paths for the client to access the **flink.keystore** and **flink.truststore** files.
   - Absolute path: After the script is executed, the file path of **flink.keystore** and **flink.truststore** is automatically set to the absolute path **opt/Bigdata/client/Flink/flink/conf/** in the **flink-conf.yaml** file. In this case, you need to move the **flink.keystore** and **flink.truststore** files from the **conf** directory to this absolute path on the Flink client and Yarn nodes.
   - Relative path: Perform the following steps to set the file path of **flink.keystore** and **flink.truststore** to the relative path and ensure that the directory where the Flink client command is executed can directly access the relative paths.
     i. In the **/opt/Bigdata/client/Flink/flink/conf/**directory, create a new directory, for example, **ssl**.
     ii. Move the **flink.keystore** and **flink.truststore** file to the /**opt/Bigdata/client/Flink/flink/conf/ssl/** directory.
     iii. For MRS 3.*x* or later: Change the values of the following parameters in the **flink-conf.yaml** file to relative paths:
     ```
     security.ssl.keystore: ssl/flink.keystore
     security.ssl.truststore: ssl/flink.truststore
     ```
     iv. For MRS 3.x or earlier: Change the values of the following parameters in the **flink-conf.yaml** file to relative paths:
     ```
     security.ssl.internal.keystore: ssl/flink.keystore
     security.ssl.internal.truststore: ssl/flink.truststore
     ```
8. If the client is installed on a node outside the cluster, add the following configuration to the configuration file (for example, **/opt/Bigdata/client/Flink/fink/conf/flink-conf.yaml**). Replace ***xx.xx.xxx.xxx*** with the IP address of the node where the client resides.
   ```
   web.access-control-allow-origin: xx.xx.xxx.xxx
   jobmanager.web.allow-access-address: xx.xx.xxx.xxx
   ```

Step 4 Run a wordcount job.

- Normal cluster (Kerberos authentication disabled)
  - Run the following commands to start a session and submit a job in the session:
    ```
    yarn-session.sh -nm "session-name"
    flink run /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
    ```
  - Run the following command to submit a single job on Yarn:
    ```
    flink run -m yarn-cluster /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
    ```

- Security cluster (Kerberos authentication enabled)
  - If the **flink.keystore** and **flink.truststore** file are stored in the absolute path:
    - Run the following commands to start a session and submit a job in the session:
      ```
      yarn-session.sh -nm "session-name"
      flink run /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
      ```
    - Run the following command to submit a single job on Yarn:
      ```
      flink run -m yarn-cluster /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
      ```
  - If the **flink.keystore** and **flink.truststore** file are stored in the relative path:
    - In the same directory of SSL, run the following command to start a session and submit jobs in the session. The SSL directory is a relative path. For example, if the SSL directory is **opt/Bigdata/client/Flink/flink/conf/**, then run the following command in this directory:
      ```
      yarn-session.sh -t ssl/ -nm "session-name"
      flink run /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
      ```
    - Run the following command to submit a single job on Yarn:
      ```
      flink run -m yarn-cluster -yt ssl/ /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
      ```

----End

5.5.7 Running a Kafka Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results. This topic describes how to generate and consume messages in a Kafka topic.

Currently, Kafka jobs cannot be submitted on the GUI. You can submit them in the background.

Submitting a Job in the Background

Query the instance addresses of ZooKeeper and Kafka, and then run the Kafka job.

Querying the Instance Address (3.x)

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters** > **Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 Go to the FusionInsight Manager page. For details, see **Accessing FusionInsight Manager (MRS 3.x or Later)**. On MRS Manager, choose **Services** > **ZooKeeper** > **Instance** to query the IP addresses of ZooKeeper instances. Record any IP address of a ZooKeeper instance.

Step 4 Choose **Services** > **Kafka** > **Instance** to query the IP addresses of Kafka instances. Record any IP address of a Kafka instance.

----End

Querying the Instance Address (Versions Earlier Than 3.x)

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters** > **Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 On the MRS cluster details page, choose **Components > ZooKeeper > Instance** to query the IP addresses of ZooKeeper instances. Record any IP address of a ZooKeeper instance.

Step 4 Choose **Components > Kafka > Instance** to query the IP addresses of Kafka instances. Record any IP address of a Kafka instance.

----End

Running a Kafka Job

In MRS 3.x and later versions, the default installation path of the client is /opt/Bigdata/client. In MRS 3.x and earlier versions, the default installation path is /opt/client. For details, see the actual situation.

Step 1 On the **Nodes** tab page of the cluster detail page, click the name of the Master2 node to go to the ECS management console.

Step 2 Click **Remote Login** in the upper right corner of the page.

Step 3 Enter the username and password of the Master node as prompted. The username is **root** and the password is the one set during cluster creation.

Step 4 Run the following command to initialize environment variables:

source /opt/Bigdata/client/bigdata_env

Step 5 If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If the Kerberos authentication is disabled for the current cluster, skip this step.

kinit *MRS cluster user*

Example: **kinit admin**

Step 6 Run the following command to create a Kafka topic:

kafka-topics.sh --create --zookeeper <IP address of the ZooKeeper role instance:2181/kafka> --partitions 2 --replication-factor 2 --topic <Topic name>

Step 7 Produce messages in a topic test.

Run the following command: **kafka-console-producer.sh --broker-list <IP address of the Kafka role instance:9092> --topic <Topic name> --producer.config /opt/Bigdata/client/Kafka/kafka/config/producer.properties**.

Input specified information as the messages produced by the producer and then press **Enter** to send the messages. To end message production, press **Ctrl+C** to exit.

Step 8 Consume messages in the topic test.

kafka-console-consumer.sh --topic <Topic name> --bootstrap-server <Kafka role instance IP:210079092> --consumer.config /opt/Bigdata/client/Kafka/kafka/config/consumer.properties

NOTE

If Kerberos authentication is enabled in the cluster, change the port number 9092 to 21007 when running the preceding two commands. For details, see **List of Open Source Component Ports**.

----End

5.5.8 Viewing Job Configuration and Logs

This section describes how to view job configuration and logs.

Background

- You can view configuration information of all jobs.
- You can only view logs of running jobs.

  Because logs of Spark SQL and DistCp jobs are not in the background, you cannot view logs of running Spark SQL and DistCp jobs.

Procedure

Step 1 Log in to the MRS management console.

Step 2 Choose **Clusters** > **Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 Click **Jobs**.

Step 4 In the **Operation** column of the job to be viewed, click **View Details**.

In the **View Details** window that is displayed, configuration of the selected job is displayed.

Step 5 Select a running job, and click **View Log** in the **Operation** column.

In the new page that is displayed, real-time log information of the job is displayed.

Each tenant can submit and view 10 jobs concurrently.

----End

5.5.9 Stopping a Job

This section describes how to stop running MRS jobs.

Background

You cannot stop Spark SQL jobs. After a job is stopped, its status changes to **Terminated** and the job cannot be executed again.

Procedure

Step 1 Log in to the MRS management console.

Step 2 Choose **Clusters** > **Active Clusters**, select a running cluster, and click its name.

The cluster details page is displayed.

Step 3 Click **Jobs**.

Step 4 Select a running job, and choose **More > Stop** in the **Operation** column.

The job status changes from **Running** to **Terminated**.

----End

5.5.10 Deleting a Job

This section describes how to delete an MRS job. After a job is executed, you can delete it if you do not need to view its information.

Background

Jobs can be deleted one after another or in a batch. A deleted job cannot be restored. Therefore, exercise caution when deleting a job.

Procedure

Step 1 Log in to the MRS management console.

Step 2 Choose **Clusters** > **Active Clusters**, select a running cluster, and click its name.

The cluster details page is displayed.

Step 3 Click **Jobs**.

Step 4 Choose **More > Delete** from the **Operation** in the row of the target job to be deleted.

In this step, you can only delete one job only.

Step 5 If you select multiple jobs and click **Delete** on the upper left of the job list.

You can delete one, multiple, or all jobs.

----End

5.5.11 Using Encrypted OBS Data for Job Running

In encrypted data in OBS file systems can be used to run jobs, and the encrypted job running results can be stored in OBS file systems. Currently, data can be accessed only through an OBS protocol.

OBS supports data encryption and decryption using KMS keys. All encryption and decryption operations are performed on OBS, and keys are managed by DEW.

To use the OBS encryption function in MRS, you must have the KMS Administrator permissions and configure the following settings for the corresponding component:

NOTE

If the **OBS permission control** function is enabled in a cluster, the default agency **MRS_ECS_DEFAULT_AGENCY** configured on the ECS or the AK/SK of the custom agency is used for accessing OBS. OBS uses the received AK/SK to access DEW to obtain the KMS key status. Therefore, you need to bind the KMS Administrator policy to the used agency. Otherwise, OBS returns the "403 Forbidden" error when processing encrypted data. Currently, the KMS Administrator policy is bound to the agency **MRS_ECS_DEFAULT_AGENCY** by default. If you use a custom agency, you need to manually bind the policy to your custom agency.

Prerequisites

You have configured the function of accessing OBS from MRS first to use the OBS encryption function. For details, see **Configuring a Storage-Compute Decoupled Cluster (Agency)**.

Hive Configuration

Step 1 Log in to the MRS management console. In the navigation tree on the left, choose **Clusters** > **Active Clusters** and click the cluster name.

Step 2 Choose **Components** > **Hive** > **Service Configuration**.

Step 3 Switch **Basic** to **All**, and search for and set the following parameters:

Table 5-39 Data encryption parameters

Parameter	Value	Description
fs.obs.server-side-encryption-type	SSE-KMS	• **SSE-KMS**: KMS keys are used for encryption and decryption • **NONE**: The encryption function is disabled.
fs.obs.server-side-encryption-key	-	(Optional) This parameter indicates an ID of the KMS key used for encryption. If **fs.obs.server-side-encryption-type** is set to **SSE-KMS** and this parameter is not set, OBS uses the default KMS key for encryption.
fs.obs.connection.ssl.enabled	true	Whether to establish a secure connection with OBS. • **true**: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to **true**. • **false**: The secure connection is disabled.

Step 4 Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK**.

----End

Hadoop Configuration

Method 1: Configuration on the GUI

Step 1 Log in to the MRS management console. In the navigation tree on the left, choose **Clusters** > **Active Clusters** and click the cluster name.

Step 2 Choose **Components** > **HDFS** > **Service Configuration**.

Step 3 Switch **Basic** to **All**, and search for and set the following parameters:

Table 5-40 Data encryption parameters

Parameter	Value	Description
fs.obs.server-side-encryption-type	SSE-KMS	• **SSE-KMS**: KMS keys are used for encryption and decryption • **NONE**: The encryption function is disabled.
fs.obs.server-side-encryption-key	-	ID of the KMS key used for encryption. This parameter is optional. If **fs.obs.server-side-encryption-type** is set to **SSE-KMS** and this parameter is not set, OBS uses the default KMS key for encryption.
fs.obs.connection.ssl.enabled	true	Whether to establish a secure connection with OBS. • **true**: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to **true**. • **false**: The secure connection is disabled.

Step 4 Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK**.

Step 5 Log in to the Master node as user **root**. The password is the password of user **root** you set when you create the cluster. If the cluster has multiple Master nodes, log in to each Master node and repeat **Step 5** to **Step 7**.

Step 6 Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

cd /opt/Bigdata/client

Step 7 Run the following command to update client configurations, and enter the username and password. The username is **admin**, and the password is the password of user **admin** you set when you create the cluster.

./ autoRefreshConfig.sh

----End

Method 2: Configuration Through the Client Configuration File

Add the following parameter settings to the client configuration file, for example, **/opt/Bigdata/client/HDFS/hadoop/etc/hadoop/core-site.xml**, on the Master node. If the cluster has multiple Master nodes, log in to each Master node and perform this operation.

Table 5-41 Data encryption parameters

Parameter	Value	Description
fs.obs.server-side-encryption-type	SSE-KMS	• **SSE-KMS**: KMS keys are used for encryption and decryption • **NONE**: The encryption function is disabled.
fs.obs.server-side-encryption-key	-	ID of the KMS key used for encryption. This parameter is optional. If **fs.obs.server-side-encryption-type** is set to **SSE-KMS** and this parameter is not set, OBS uses the default KMS key for encryption.
fs.obs.connection.ssl.enabled	true	Whether to establish a secure connection with OBS. • **true**: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to **true**. • **false**: The secure connection is disabled.

HBase Configuration

Method 1: Configuration on the GUI

Step 1 Log in to the MRS management console. In the navigation tree on the left, choose **Clusters** > **Active Clusters** and click the cluster name.

Step 2 Choose **Components** > **HBase** > **Service Configuration**.

Step 3 Switch **Basic** to **All**, and search for and set the following parameters:

Table 5-42 Data encryption parameters

Parameter	Value	Description
fs.obs.server-side-encryption-type	SSE-KMS	• **SSE-KMS**: KMS keys are used for encryption and decryption • **NONE**: The encryption function is disabled.
fs.obs.server-side-encryption-key	-	ID of the KMS key used for encryption. This parameter is optional. If **fs.obs.server-side-encryption-type** is set to **SSE-KMS** and this parameter is not set, OBS uses the default KMS key for encryption.
fs.obs.connection.ssl.enabled	true	Whether to establish a secure connection with OBS. • **true**: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to **true**. • **false**: The secure connection is disabled.

Step 4 Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK**.

Step 5 Log in to the Master node as user **root**. The password is the password of user **root** you set when you create the cluster. If the cluster has multiple Master nodes, log in to each Master node and repeat **Step 5** to **Step 7**.

Step 6 Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

cd /opt/Bigdata/client

Step 7 Run the following command to update client configurations, and enter the username and password. The username is **admin**, and the password is the password of user **admin** you set when you create the cluster.

./ autoRefreshConfig.sh

----End

Method 2: Configuration Through the Client Configuration File

Add the following parameter settings to the client configuration file, for example, **/opt/Bigdata/client/HBase/hbase/conf/core-site.xml**, on the Master node. If the cluster has multiple Master nodes, log in to each Master node and perform this operation.

Table 5-43 Data encryption parameters

Parameter	Value	Description
fs.obs.server-side-encryption-type	SSE-KMS	• **SSE-KMS**: KMS keys are used for encryption and decryption • **NONE**: The encryption function is disabled.
fs.obs.server-side-encryption-key	-	ID of the KMS key used for encryption. This parameter is optional. If **fs.obs.server-side-encryption-type** is set to **SSE-KMS** and this parameter is not set, OBS uses the default KMS key for encryption.
fs.obs.connection.ssl.enabled	true	Whether to establish a secure connection with OBS. • **true**: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to **true**. • **false**: The secure connection is disabled.

Spark Configuration

Method 1: Configuration on the GUI

Step 1 Log in to the MRS management console. In the navigation tree on the left, choose **Clusters** > **Active Clusters** and click the cluster name.

Step 2 Choose **Components** > **Spark** > **Service Configuration**.

Step 3 Switch **Basic** to **All**, and search for and set the following parameters:

Table 5-44 Data encryption parameters

Parameter	Value	Description
fs.obs.server-side-encryption-type	SSE-KMS	• **SSE-KMS**: KMS keys are used for encryption and decryption • **NONE**: The encryption function is disabled.
fs.obs.server-side-encryption-key	-	ID of the KMS key used for encryption. This parameter is optional. If **fs.obs.server-side-encryption-type** is set to **SSE-KMS** and this parameter is not set, OBS uses the default KMS key for encryption.

Parameter	Value	Description
fs.obs.connection.ssl.enabled	true	Whether to establish a secure connection with OBS. • **true**: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to **true**. • **false**: The secure connection is disabled.

Step 4 Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK**.

Step 5 Log in to the Master node as user **root**. The password is the password of user **root** you set when you create the cluster. If the cluster has multiple Master nodes, log in to each Master node and repeat **Step 5** to **Step 7**.

Step 6 Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

cd /opt/Bigdata/client

Step 7 Run the following command to update client configurations, and enter the username and password. The username is **admin**, and the password is the password of user **admin** you set when you create the cluster.

./autoRefreshConfig.sh

----End

Method 2: Configuration Through the Client Configuration File

Add the following parameter settings to the client configuration file, for example, **/opt/Bigdata/client/Spark/spark/conf/core-site.xml**, on the Master node. If the cluster has multiple Master nodes, log in to each Master node and perform this operation.

Table 5-45 Data encryption parameters

Parameter	Value	Description
fs.obs.server-side-encryption-type	SSE-KMS	• **SSE-KMS**: KMS keys are used for encryption and decryption • **NONE**: The encryption function is disabled.
fs.obs.server-side-encryption-key	-	ID of the KMS key used for encryption. This parameter is optional. If **fs.obs.server-side-encryption-type** is set to **SSE-KMS** and this parameter is not set, OBS uses the default KMS key for encryption.

Parameter	Value	Description
fs.obs.connection.ssl.enabled	true	Whether to establish a secure connection with OBS. • **true**: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to **true**. • **false**: The secure connection is disabled.

Presto Configuration

Step 1 Log in to the MRS management console. In the navigation tree on the left, choose **Clusters** > **Active Clusters** and click the cluster name.

Step 2 Choose **Components** > **Presto** > **Service Configuration**.

Step 3 Switch **Basic** to **All**, and search for and set the following parameters:

Table 5-46 Data encryption parameters

Parameter	Value	Description
fs.obs.server-side-encryption-type	SSE-KMS	• **SSE-KMS**: KMS keys are used for encryption and decryption • **NONE**: The encryption function is disabled.
fs.obs.server-side-encryption-key	-	ID of the KMS key used for encryption. This parameter is optional. If **fs.obs.server-side-encryption-type** is set to **SSE-KMS** and this parameter is not set, OBS uses the default KMS key for encryption.
fs.obs.connection.ssl.enabled	true	Whether to establish a secure connection with OBS. • **true**: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to **true**. • **false**: The secure connection is disabled.

Step 4 Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK**.

----End

5.5.12 Configuring Job Notification Rules

MRS uses SMN to offer a publish/subscribe model to achieve one-to-multiple message subscriptions and notifications in a variety of message types (SMSs and emails). You can configure job notification rules to receive notifications immediately upon a job execution success or failure.

Procedure

Step 1 Log in to the management console.

Step 2 Click **Service List**. Under **Management & Governance**, click **Simple Message Notification**.

Step 3 Create a topic and add subscriptions to the topic. For details, see **Configuring Message Notification**.

Step 4 Go to the MRS management console, and click the cluster name to go to the cluster details page.

Step 5 Click the **Alarms** tab, and choose **Notification Rules** > **Add Notification Rule**.

Step 6 Configure a notification rule for sending job execution results to subscribers.

Table 5-47 Parameters of adding a notification rule

Parameter	Description
Rule Name	User-defined notification rule name. Only digits, letters, hyphens (-), and underscores (_) are allowed.
Message Notification	If you enable this function, subscription messages will be sent to subscribers.
Topic Name	Select an existing topic or click **Create Topic** to create a topic.
Notification Type	Select **Event**.
Subscription Items	1. Click ⊞ next to **Suggestion**. 2. Click ⊞ next to **Manager**. 3. Select **Job Running Succeeded** and **Job Running Failed**.

----End

5.6 Component Management

5.6.1 Object Management

MRS contains different types of basic objects. **Table 5-48** describes these objects.

Table 5-48 MRS basic object overview

Object	Description	Example
Service	Function set that can complete specific business.	KrbServer service and LdapServer service
Service instance	Specific instance of a service, usually called service.	KrbServer service
Service role	Function entity that forms a complete service, usually called role.	KrbServer is composed of the KerberosAdmin role and KerberosServer role.
Role instance	Specific instance of a service role running on a host.	KerberosAdmin that is running on Host2 and KerberosServer that is running on Host3
Host	An ECS running Linux OS.	Host1 to Host5
Rack	Physical entity that contains multiple hosts connecting to the same switch.	Rack1 contains Host1 to Host5.
Cluster	Logical entity that consists of multiple hosts and provides various services.	Cluster1 cluster consists of five hosts (Host1 to Host5) and provides services such as KrbServer and LdapServer.

5.6.2 Viewing Configuration

On MRS, you can view the configuration of services (including roles) and role instances.

Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

- Query service configuration.
  a. On the MRS cluster details page, click **Components**.
  b. Select the target service from the service list.
  c. Click **Service Configuration**.
  d. Switch **Basic** to **All**. All configuration parameters of the service are displayed in the navigation tree. The service name and role names are displayed from upper to lower in the navigation tree.
  e. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

The parameters under the service nodes and role nodes are service configuration parameters and role configuration parameters respectively.

f. Select **Non-default** from the **--Select--** drop-down list. The parameters whose values are not default values are displayed.

- Query role instance configurations.

a. On the MRS cluster details page, click **Components**.

b. Select the target service from the service list.

c. Click the **Instances** tab.

d. Click the target role instance from the role instance list.

e. Click **Instance Configuration**.

f. Switch **Basic** to **All** on the right of the page. All configuration parameters of the role instance are displayed in the navigation tree.

g. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

h. Select **Non-default** from the **--Select--** drop-down list. The parameters whose values are not default values are displayed.

5.6.3 Managing Services

You can perform the following operations on MRS:

- Start the service in the **Stopped**, **Stop Failed**, or **Failed to Start** state to use the service.
- Stop the services or stop abnormal services.
- Restart abnormal services or configure expired services to restore or enable the services.

Prerequisites

- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Impact on the System

- The stateful component cannot be added to the task node group.

Starting, Stopping, and Restarting a Service

Step 1 On the MRS cluster details page, click **Components**.

Step 2 Locate the row that contains the target service, **Start**, **Stop**, and **Restart** to start, stop, or restart the service.

Services are interrelated. If a service is started, stopped, and restarted, services dependent on it will be affected.

The services will be affected in the following ways:

- If a service is to be started, the lower-layer services dependent on it must be started first.

- If a service is stopped, the upper-layer services dependent on it are unavailable.
- If a service is restarted, the running upper-layer services dependent on it must be restarted.

----End

5.6.4 Configuring Service Parameters

On the MRS console, you can view and modify the default service configurations based on site requirements and export or import the configurations.

Impact on the System

- You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.
- The parameters of DBService cannot be modified when only one DBService role instance exists in the cluster.

Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Modifying Service Parameters

1. On the MRS cluster details page, click **Components**.
2. Select the target service from the service list.
3. Click **Service Configuration**.
4. Switch **Basic** to **All**. All configuration parameters of the service are displayed in the navigation tree. The service name and role names are displayed from upper to lower in the navigation tree.
5. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

   If you want to cancel the modification of a parameter value, click to restore it.
6. Click **Save Configuration**, select **Restart the affected services or instances**, and click **OK**.

   NOTE

   To update the queue configuration of Yarn without restarting service, choose **More** > **Refresh Queue** on the **Service Status** tab page to update the queue for the configuration to take effect.

5.6.5 Configuring Customized Service Parameters

Each component of MRS supports all open-source parameters. MRS supports the modification of some parameters for key application scenarios. Some component clients may not include all parameters with open-source features. To modify the

component parameters that are not directly supported by MRS, you can add new parameters for components by using the configuration customization function on MRS. Newly added parameters are saved in component configuration files and take effect after restart.

Impact on the System

- After the service attributes are configured, the service needs to be restarted. The service cannot be accessed during restart.
- You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.

Prerequisites

- You have understood the meanings of parameters to be added, configuration files that have taken effect, and the impact on components.
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Step 1 On the MRS cluster details page, click **Components**.

Step 2 Select the target service from the service list.

Step 3 Click **Service Configuration**.

Step 4 In the configuration type drop-down box on the right side, switch **Basic** to **All**.

Step 5 In the navigation tree, select **Customization**. The customized parameters of the current component are displayed on MRS.

The configuration files that save the newly added customized parameters are displayed in the **Parameter File** column. Different configuration files may have same open-source parameters. After the parameters in different files are set to different values, whether the configuration takes effect depends on the loading sequence of the configuration files by components. You can customize parameters for services and roles as required. Adding customized parameters for a single role instance is not supported.

Step 6 Based on the configuration files and parameter functions, locate the row where a specified parameter resides, enter the parameter name supported by the component in the **Parameter** column and enter the parameter value in the **Value** column.

- You can click ⊕ or ⊕ to add or delete a customized parameter. You can delete a customized parameter only after you click ⊕ for the first time.
- If you want to cancel the modification of a parameter value, click ↻ to restore it.

Step 7 Click **Save Configuration**, select **Restart the affected services or instances**, and click **OK**.

----End

Task Example

Configuring Customized Hive Parameters

Hive depends on HDFS. By default, Hive accesses the HDFS client. The configuration parameters to take effect are controlled by HDFS in a unified manner. For example, the HDFS parameter **ipc.client.rpc.timeout** affects the RPC timeout period for all clients to connect to the HDFS server. If you need to modify the timeout period for Hive to connect to HDFS, you can use the configuration customization function. After this parameter is added to the **core-site.xml** file of Hive, this parameter can be identified by the Hive service and its configuration overwrites the parameter configuration in HDFS.

Step 1 On the MRS cluster details page, click **Components**.

Step 2 Choose **Hive** > **Service Configuration**.

Step 3 In the configuration type drop-down box on the right side, switch **Basic** to **All**.

Step 4 In the navigation tree on the left, select **Customization** for the Hive service. The system displays the customized service parameters supported by Hive.

Step 5 In **core-site.xml**, locate the row that contains the **core.site.customized.configs** parameter, enter **ipc.client.rpc.timeout** in the **Parameter** column, and enter a new value in the **Value** column, for example, **150000**. The unit is millisecond.

Step 6 Click **Save Configuration**, select **Restart the affected services or instances**, and click **OK**.

Operation successful is displayed. Click **Finish**. The service is started successfully.

----End

5.6.6 Synchronizing Service Configuration

Scenario

If **Configuration Status** of some services is **Configuration expired** or **Configuration failed**, synchronize configuration for the cluster or service to restore its configuration status. If all services in the cluster are in the **Configuration failed** state, synchronize the cluster configuration with the background configuration.

Impact on the System

After synchronizing service configurations, you need to restart the services whose configurations have expired. These services are unavailable during restart.

Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Step 1 On the MRS cluster details page, click **Components**.

Step 2 Select the target service from the service list.

Step 3 On the Service Status tab page, choose **More** > **Synchronize Configuration**.

Step 4 In the dialog box that is displayed, select **Restart the service or instances whose configurations have expired** and click **Yes** to restart the service.

----End

5.6.7 Managing Role Instances

Scenario

You can start a role instance that is in the **Stopped**, **Failed to stop** or **Failed to start** status, stop an unused or abnormal role instance or restart an abnormal role instance to recover its functions.

Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Step 1 On the MRS cluster details page, click **Components**.

Step 2 Select the target service from the service list.

Step 3 Click the **Instances** tab.

Step 4 Select the check box on the left of the target role instance.

Step 5 Click **More**, select operations such as **Start Instance**, **Stop Instance**, **Restart Instance**, **Rolling-restart Instance**, or **Delete Instance** based on site requirements.

----End

5.6.8 Configuring Role Instance Parameters

Scenario

You can view and modify default role instance configuration on MRS based on site requirements. The configurations can be imported and exported.

Impact on the System

You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.

Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Modifying Role Instance Parameters

1. On the MRS cluster details page, click **Components**.
2. Select the target service from the service list.
3. Click the **Instances** tab.
4. Click the target role instance from the role instance list.
5. Click the **Instance Configuration** tab.
6. Switch **Basic** to **All** from the drop-down list on the right of the page. All configuration parameters of the role instance are displayed in the navigation tree.
7. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

   If you want to cancel the modification of a parameter value, click  to restore it.
8. Click **Save Configuration**, select **Restart the affected services or instances**, and click **OK**.

5.6.9 Synchronizing Role Instance Configuration

Scenario

When **Configuration Status** of a role instance is **Configuration expired** or **Configuration failed**, you can synchronize the configuration data of the role instance with the background configuration.

Impact on the System

After synchronizing a role instance configuration, you need to restart the role instance whose configuration has expired. The role instance is unavailable during restart.

Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Step 1 On the MRS cluster details page, click **Components**.

Step 2 Select a service name.

Step 3 Click the **Instances** tab.

Step 4 Click the target role instance from the role instance list.

Step 5 Choose **More** > **Synchronize Configuration** above the role instance status and indicator information.

Step 6 In the dialog box that is displayed, select **Restart the service or instances whose configurations have expired** and click **Yes** to restart the role instance.

----End

5.6.10 Decommissioning and Recommissioning a Role Instance

Scenario

If a Core or Task node is faulty, the cluster status may be displayed as **Abnormal**. In an MRS cluster, data can be stored on different Core nodes. You can decommission the specified role instance on MRS to stop the role instance from providing services. After fault rectification, you can recommission the role instance.

The following role instances can be decommissioned or recommissioned:

- DataNode role instance on HDFS
- NodeManager role instance on Yarn
- RegionServer role instance on HBase
- ClickHouseServer role instance on ClickHouse
- Broker role instance on Kafka

Restrictions:

- If the number of the DataNodes is less than or equal to that of HDFS copies, decommissioning cannot be performed. If the number of HDFS copies is three and the number of DataNodes is less than four in the system, decommissioning cannot be performed. In this case, an error will be reported and force MRS to exit the decommissioning 30 minutes after MRS attempts to perform the decommissioning.
- If the number of Kafka Broker instances is less than or equal to that of Kafka copies, decommissioning cannot be performed. For example, if the number of Kafka copies is two and the number of nodes is less than three in the system, decommissioning cannot be performed. Instance decommissioning will fail and exit.
- If a role instance is out of service, you must recommission the instance to start it before using it again.

Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Step 1 On the MRS cluster details page, click **Components**.

Step 2 Click a service in the service list.

Step 3 Click the **Instances** tab.

Step 4 Select an instance.

Step 5 Choose **More** > **Decommission** or **Recommission** to perform the corresponding operation.

NOTE

During the instance decommissioning, if the service corresponding to the instance is restarted in the cluster using another browser, MRS displays a message indicating that the instance decommissioning is stopped, but the **Operating Status** of the instance is displayed as **Started**. In this case, the instance has been decommissioned on the background. You need to decommission the instance again to synchronize the operating status.

----End

5.6.11 Starting and Stopping a Cluster

A cluster is a collection of service components. You can start or stop all services in a cluster.

Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

On the cluster details page, choose **Management Operations** > **Start All Components** or **Stop All Components** in the upper right corner to perform the required operation.

5.6.12 Synchronizing Cluster Configuration

Scenario

If **Configuration Status** of all services or some services is **Configuration expired** or **Configuration failed**, synchronize configuration for the cluster or service to restore its configuration status.

- If all services in the cluster are in the **Configuration failed** status, synchronize the cluster configuration with the background configuration.
- If all services in the cluster are in the **Configuration failed** status, synchronize the service configuration with the background configuration.

NOTE

In **MRS 3.x**, you cannot perform operations in this section on the management console.

Impact on the System

After synchronizing cluster configurations, you need to restart the services whose configurations have expired. These services are unavailable during restart.

Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Step 1 On the cluster details page, choose **Configuration** > **Synchronize Configuration** in the upper right corner.

Step 2 In the displayed dialog box, select **Restart services and instances whose configuration have expired**, and click **OK** to restart the service whose configuration has expired.

When **Operation successful** is displayed, click **Finish**. The cluster is started successfully.

----End

5.6.13 Exporting Cluster Configuration

Scenario

You can export all configuration data of a cluster using MRS to meet site requirements. The exported configuration data is used to rapidly update service configuration.

NOTE

In **MRS 3.x**, you cannot perform operations in this section on the management console.

Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

On the cluster details page, choose **Configuration** > **Export Cluster Configuration** in the upper right corner.

The exported file is used to update service configurations. For details, see **Importing Service Configuration Parameters** in **Configuring Service Parameters**.

5.6.14 Performing Rolling Restart

After modifying the configuration items of a big data component, you need to restart the corresponding service to make new configurations take effect. If you use a normal restart mode, all services or instances are restarted concurrently, which may cause service interruption. To ensure that services are not affected during service restart, you can restart services or instances in batches by rolling restart. For instances in active/standby mode, a standby instance is restarted first and then an active instance is restarted. Rolling restart takes longer than normal restart.

Table 5-49 provides services and instances that support or do not support rolling restart in the MRS cluster.

Table 5-49 Services and instances that support or do not support rolling restart

Service	Instance	Whether to Support Rolling Restart
HDFS	NameNode	Yes
	Zkfc	
	JournalNode	
	HttpFS	
	DataNode	
Yarn	ResourceManager	Yes
	NodeManager	
Hive	MetaStore	Yes
	WebHCat	
	HiveServer	
Mapreduce	JobHistoryServer	Yes
HBase	HMaster	Yes
	RegionServer	
	ThriftServer	
	RESTServer	
Spark	JobHistory	Yes
	JDBCServer	
	SparkResource	No
Hue	Hue	No
Tez	TezUI	No
Loader	Sqoop	No
Zookeeper	Quorumpeer	Yes
Kafka	Broker	Yes
	MirrorMaker	No
Flume	Flume	Yes
	MonitorServer	
Storm	Nimbus	Yes

Service	Instance	Whether to Support Rolling Restart
	UI	
	Supervisor	
	Logviewer	

Restrictions

- Perform a rolling restart during off-peak hours.
  - Otherwise, a rolling restart failure may occur. For example, if the throughput of Kafka is high (over 100 MB/s) during the Kafka rolling restart, the Kafka rolling restart may fail.
  - For example, if the requests per second of each RegionServer on the native interface exceed 10,000 during the HBase rolling restart, you need to increase the number of handles to prevent a RegionServer restart failure caused by heavy loads during the restart.
- Before the restart, check the number of current requests of HBase. If the number of requests of each RegionServer on the native interface exceeds 10,000, increase the number of handles to prevent a failure.
- If the number of Core nodes in a cluster is less than six, services may be affected for a short period of time.
- Preferentially perform a rolling instance or service restart and select **Only restart instances whose configurations have expired**.

Performing a Rolling Service Restart

Step 1 Choose **Clusters** > **Active Clusters** and click a cluster name to go to the cluster details page.

Step 2 Click **Components** and select a service for which you want to perform a rolling restart.

Step 3 On the **Service Status** tab page, click **More** and select **Rolling-restart Service**.

Step 4 The **Rolling-restart Service** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the service.

Step 5 After the rolling restart task is complete, click **Finish**.

----End

Performing a Rolling Instance Restart

Step 1 Choose **Clusters** > **Active Clusters** and click a cluster name to go to the cluster details page.

Step 2 Click **Components** and select a service for which you want to perform a rolling restart.

Step 3 On the **Instance** tab page, select the instance to be restarted. Click **More** and select **Rolling-restart Instance**.

Step 4 After you enter the administrator password, the **Rolling-restart Instance** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the instance.

Step 5 After the rolling restart task is complete, click **Finish**.

----End

Perform a Rolling Cluster Restart

Step 1 Choose **Clusters** > **Active Clusters** and click a cluster name to go to the cluster details page.

Step 2 In the upper right corner of the page, choose **Management Operations** > **Perform Rolling Cluster Restart**.

Step 3 The **Rolling-restart Cluster** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the cluster.

Step 4 After the rolling restart task is complete, click **Finish**.

----End

Rolling Restart Parameter Description

Table 5-50 describes rolling restart parameters.

Table 5-50 Rolling restart parameter description

Parameter	Description
Only restart instances whose configurations have expired	Specifies whether to restart only the modified instances in a cluster.
Data Node Instances to Be Batch Restarted	Specifies the number of instances that are restarted in each batch when the batch rolling restart strategy is used. The default value is **1**. The value ranges from 1 to 20. This parameter is valid only for data nodes.
Batch Interval	Specifies the interval between two batches of instances for rolling restart. The default value is **0**. The value ranges from 0 to 2147483647. The unit is second. Note: Setting the batch interval parameter can increase the stability of the big data component process during the rolling restart. You are advised to set this parameter to a non-default value, for example, 10.

Parameter	Description
Batch Fault Tolerance Threshold	Specifies the tolerance times when the rolling restart of instances fails to be executed in batches. The default value is **0**, which indicates that the rolling restart task ends after any batch of instances fails to be restarted. The value ranges from 0 to 2147483647.

Procedure in a Typical Scenario

Step 1 Choose **Clusters** > **Active Clusters** and click a cluster name to go to the cluster details page.

Step 2 Click **Components** and select **HBase**. The **HBase** service page is displayed.

Step 3 Click the **Service Configuration** tab, and modify an HBase parameter. After the following dialog box is displayed, click **OK** to save the configurations.

NOTE

Do not select **Restart the affected services or instances**. This option indicates a normal restart. If you select this option, all services or instances will be restarted, which may cause service interruption.

Step 4 After saving the configurations, click **Finish**.

Step 5 Click the **Service Status** tab.

Step 6 On the **Service Status** tab page, click **More** and select **Rolling-restart Service**.

Step 7 After you enter the administrator password, the **Rolling-restart Service** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart.

Step 8 After the rolling restart task is complete, click **Finish**.

----End

5.7 Alarm Management

5.7.1 Viewing the Alarm List

The alarm list displays all alarms in the MRS cluster. The MRS page displays the alarms that need to be handled in a timely manner and the events.

On the MRS management console, you can only query basic information about uncleared MRS alarms on the **Alarms** tab page. For details about how to view alarm details or manage alarms, see **Viewing and Manually Clearing an Alarm**.

Alarms are listed in chronological order by default in the alarm list, with the most recent alarms displayed at the top.

Table 5-51 describes various fields in an alarm.

Table 5-51 Alarm description

Parameter	Description
Alarm ID	ID of an alarm.
Alarm Name	Name of an alarm.

Parameter	Description
Severity	Alarm severity. In versions earlier than MRS 3.x, the cluster alarm severity is as follows: • Critical Indicates alarms reporting errors that affect cluster running, such as unavailable cluster services, node faults, data inconsistency between the active and standby GaussDB databases, and abnormal LdapServer data synchronization. You need to check the cluster status based on the alarms and rectify the faults in a timely manner. • Major Indicates alarms reporting errors that affect some cluster functions, including process faults, periodic backup task failures, and abnormal key file permissions. Check the objects for which the alarms are generated based on the alarms and clear the alarms in a timely manner. • Minor Indicates alarms reporting errors that do not affect major functions of the current cluster, including alarms indicating that the certificate file is about to expire, audit logs fail to be dumped, and the license file is about to expire. • Warning Indicates an alarm of the lowest severity. It is used for information display or prompt and indicates that an event occurs in the scenarios when you stop a service, delete a service, stop an instance, delete an instance, delete a node, restart a service, restart an instance, perform an active/standby switchover for MRS Manager, scale in a host, or restore an instance. Additionally, this type of alarms also occurs when an instance is faulty, a job executed successfully, or a job failed to be executed. In MRS 3.x or later, the alarm severity of a cluster is as follows: • Critical Indicates alarms reporting errors that affect cluster running, such as unavailable cluster services, node faults, data inconsistency between the active and standby GaussDB databases, and abnormal LdapServer data synchronization. You need to check the cluster status based on the alarms and rectify the faults in a timely manner. • Major Indicates alarms reporting errors that affect some cluster functions, including process faults, periodic backup task failures, and abnormal key file permissions. Check the objects for which the alarms are generated based on the alarms and clear the alarms in a timely manner. • Minor Indicates alarms reporting errors that do not affect major functions of the current cluster, including alarms indicating

Parameter	Description
	that the certificate file is about to expire, audit logs fail to be dumped, and the license file is about to expire. • Suggestion Indicates an alarm of the lowest severity. It is used for information display or prompt and indicates that an event occurs in the scenarios when you stop a service, delete a service, stop an instance, delete an instance, delete a node, restart a service, restart an instance, perform an active/standby switchover for MRS Manager, scale in a host, or restore an instance. Additionally, this type of alarms also occurs when an instance is faulty, a job executed successfully, or a job failed to be executed.
Generated	Time when the alarm is generated.
Location	Details about the alarm.
Operation	If the alarm can be manually cleared, click **Clear Alarm**.

Table 5-52 Button description

Button	Description
	Select an interval for refreshing the alarm list from the drop-down list. • Refresh every 30s • Refresh every 60s • Stop refreshing
	Select an alarm severity from the drop-down list box to filter alarms. For versions earlier than MRS 3.x, the following alarms can be filtered: All, Critical, Major, Minor, and Warning. (For MRS 3.x or later) You can filter the following alarms: All, Critical, Major, Minor, and Warning.
	Click  and manually refresh the alarm list.
Advanced Search	Click **Advanced Search**. In the displayed alarm search area, set search criteria and click **Search** to view the information about specified alarms. You can click **Reset** to clear the search criteria.

5.7.2 Viewing the Event List

The event list displays information about all events in a cluster, such as service restart and service termination.

Events are listed in chronological order by default in the event list, with the most recent events displayed at the top.

Table 5-53 describes various fields for an event.

Table 5-53 Event description

Parameter	Description
Event ID	Specifies the ID of an event.
Event Severity	Specifies the event severity. In versions earlier than MRS 3.x, the cluster event level is as follows: • Critical • Major • Minor • Suggestion In MRS 3.x or later, the event level of a cluster is as follows: • Critical • Major • Minor • Suggestion
Event Name	Name of the generated event.
Generated	Time when the event is generated.
Location	Specifies the detailed information for locating the event,

Table 5-54 Icon description

Icon	Description
	Select an interval for refreshing the event list from the drop-down list. • Refresh every 30s • Refresh every 60s • Stop refreshing
	Click  to manually refresh the event list.
Advanced Search	Click **Advanced Search**. In the displayed event search area, set search criteria and click **Search** to view the information about specified events. Click **Reset** to clear the search criteria.

Exporting events

Step 1 Choose **Clusters > Active Clusters** and click a cluster name to go to the cluster details page.

Step 2 Click **Alarm Management** > **Events**.

Step 3 Click **Export All**.

Step 4 In the displayed dialog box, select the type and click **OK**.

----End

Common Events

Table 5-55 Common events

Event ID	Event Name
12019	Stop Service
12020	Delete Service
12021	Stop RoleInstance
12022	Delete RoleInstance
12023	Delete Node
12024	Restart Service
12025	Restart RoleInstance
12026	Manager Switchover
12065	Process Restart
12070	Job Running Succeeded
12071	Job Running Failed
12072	Job killed
12086	Agent Restart
14005	NameNode Switchover
14028	HDFS DiskBalancer Task
14029	Active NameNode enters safe mode and generates new Fsimage
17001	Oozie Workflow Execution Failure
17002	Oozie Scheduled Job Execution Failure
18001	ResourceManager Switchover
18004	JobHistoryServer Switchover

Event ID	Event Name
19001	HMaster Failover
20003	Hue Failover
24002	Flume Channel Overflow
25001	LdapServer Failover
27000	DBServer Switchover
38003	Adjusts the topic data storage period
43014	Spark Data Skew
43015	Spark SQL Large Query Results
43016	Spark SQL Execution Timeout
43024	Start JDBCServer
43025	Stop JDBCServer
43026	ZooKeeper Connection Succeeded
43027	Zookeeper Connection Failed

5.7.3 Viewing and Manually Clearing an Alarm

Scenario

You can view and clear alarms on MRS.

Generally, the system automatically clears an alarm when the fault is rectified. If the fault has been rectified and the alarm cannot be automatically cleared, you can manually clear the alarm.

You can view the latest 100,000 alarms (including uncleared, manually cleared, and automatically cleared alarms) on MRS. If the number of cleared alarms exceeds 100,000 and is about to reach 110,000, the system automatically dumps the earliest 10,000 cleared alarms to the dump path.

3. In versions earlier than x, the value is the same as that of ${BIGDATA_HOME}/OMSV100R001C00x8664/workspace/data for the active management node.

(For 3.x and later versions) The path is **${BIGDATA_HOME}/om-server/OMS/workspace/data** of the active management node.

A directory is automatically generated when alarms are dumped for the first time.

NOTE

Set an automatic refresh interval or click  for an immediate refresh.

The following refresh interval options are supported:

- Refresh every 30 seconds
- Refresh every 60 seconds
- Stop refreshing

Procedure

Step 1 Choose **Clusters > Active Clusters** and click a cluster name to go to the cluster details page.

Step 2 Click **Alarms** and view the alarm information in the alarm list.

- By default, the alarm list page displays the latest 10 alarms.
- By default, data is sorted in descending order based on the generation time. For MRS 3.x or earlier, you can click the alarm ID, severity, and generation time to modify the sorting mode. For clusters of MRS 3.x or later, you can click the severity and generation time to modify the sorting mode.
- You can filter all alarms of the same severity. The results include cleared and uncleared alarms.
- For clusters of MRS 3.x and earlier versions, you can click  ,  , or  in the upper right corner of the page to quickly filter **Critical**, **Major**, **Minor**, or **Suggestion** alarms that are uncleared.
- For clusters of MRS 3.x or later: You can click  ,  , or  in the upper right corner of the page to quickly filter uncleared **Critical**, **Major**, **Minor** or **Warning** alarms.

Step 3 Click **Advanced Search**. In the displayed alarm search area, set search criteria and click **Search** to view the information about specified alarms. You can click **Reset** to clear the search criteria.

NOTE

The start time and end time are specified in **Time Range**. You can search for alarms generated within the time range.

Handle the alarm by referring to **Alarm Reference**. If the alarms in some scenarios are generated due to other cloud services that MRS depends on, you need to contact maintenance personnel of the corresponding cloud services.

Step 4 If the alarm needs to be manually cleared after errors are rectified, click **Clear Alarm**.

NOTE

If multiple alarms have been handled, you can select one or more alarms to be cleared and click **Clear Alarm** to clear the alarms in batches. A maximum of 300 alarms can be cleared in each batch.

----End

Exporting Alarms

Step 1 Choose **Clusters > Active Clusters** and click a cluster name to go to the cluster details page.

Step 2 Click **Alarm Management** > **Alarms**.

Step 3 Click **Export All**.

Step 4 In the displayed dialog box, select the type and click **OK**.

----End

5.8 Patch Management

5.8.1 Patch Operation Guide for Versions Earlier Than MRS 3.x

If you obtain patch information from the following sources, upgrade the patch according to actual requirements.

- You obtain information about the patch released by MRS from a message pushed by the message center service.
- You obtain information about the patch by accessing the cluster and viewing patch information.

Preparing for Patch Installation

- Follow instructions in **Performing a Health Check** to check cluster status. If the cluster health status is normal, install a patch.
- You need to confirm the target patch to be installed according to the patch information in the patch content.

Installing a Patch

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.

Step 3 On the **Patches** tab page, click **Install** in the **Operation** column to install the target patch.

NOTE

- For the isolated host nodes in the cluster, follow instructions in **Restoring Patches for the Isolated Hosts** to restore the patch.

----End

Uninstalling a Patch

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.

Step 3 On the **Patches** page, click **Uninstall** in the **Operation** column to uninstall the target patch.

NOTE

- For the isolated host nodes in the cluster, follow instructions in **Restoring Patches for the Isolated Hosts** to restore the patch.

----End

5.8.2 Rolling Patches

The rolling patch function indicates that patches are installed or uninstalled for one or more services in a cluster by performing a rolling service restart (restarting services or instances in batches), without interrupting the services or within a minimized service interruption interval. Services in a cluster are divided into the following three types based on whether they support rolling patch:

- Services supporting rolling patch installation or uninstallation: All businesses or part of them (varying depending on different services) of the services are not interrupted during patch installation or uninstallation.
- Services not supporting rolling patch installation or uninstallation: Businesses of the services are interrupted during patch installation or uninstallation.
- Services with some roles supporting rolling patch installation or uninstallation: Some businesses of the services are not interrupted during patch installation or uninstallation.

NOTE

In **MRS 3.x**, you cannot perform operations in this section on the management console.

Table 5-56 provides services and instances that support or do not support rolling restart in the MRS cluster.

Table 5-56 Services and instances that support or do not support rolling restart

Service	Instance	Whether to Support Rolling Restart
HDFS	NameNode	Yes
	Zkfc	
	JournalNode	
	HttpFS	
	DataNode	
Yarn	ResourceManager	Yes
	NodeManager	
Hive	MetaStore	Yes
	WebHCat	
	HiveServer	

Service	Instance	Whether to Support Rolling Restart
MapReduce	JobHistoryServer	Yes
HBase	HMaster	Yes
	RegionServer	
	ThriftServer	
	RESTServer	
Spark	JobHistory	Yes
	JDBCServer	
	SparkResource	No
Hue	Hue	No
Tez	TezUI	No
Loader	Sqoop	No
Zookeeper	Quorumpeer	Yes
Kafka	Broker	Yes
	MirrorMaker	No
Flume	Flume	Yes
	MonitorServer	
Storm	Nimbus	Yes
	UI	
	Supervisor	
	LogViewer	

Installing a Patch

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters** > **Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.

Step 3 On the **Patches** page, click **Install** in the **Operation** column.

Step 4 On the **Warning** page, enable or disable **Rolling Patch**.

NOTE

- Enabling the rolling patch installation function: Services are not stopped before patch installation, and rolling service restart is performed after the patch installation. This minimizes the impact on cluster services but takes more time than common patch installation.
- Disabling the rolling patch uninstallation function: All services are stopped before patch uninstallation, and all services are restarted after the patch uninstallation. This temporarily interrupts the cluster and the services but takes less time than rolling patch uninstallation.
- The rolling patch installation function is not available in clusters with less than two Master nodes and three Core nodes.

Step 5 Click **Yes** to install the target patch.

Step 6 View the patch installation progress.

1. Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.
2. Choose **System** > **Manage Patch**. On the **Manage Patch** page, you can view the patch installation progress.

NOTE

For the isolated host nodes in the cluster, follow instructions in **Restoring Patches for the Isolated Hosts** to restore the patch.

----End

Uninstalling a Patch

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters** > **Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.

Step 3 On the **Patches** page, click **Uninstall** in the **Operation** column.

Step 4 On the **Warning** page, enable or disable **Rolling Patch**.

NOTE

- Enabling the rolling patch uninstallation function: Services are not stopped before patch uninstallation, and rolling service restart is performed after the patch uninstallation. This minimizes the impact on cluster services but takes more time than common patch uninstallation.
- Disabling the rolling patch uninstallation function: All services are stopped before patch uninstallation, and all services are restarted after the patch uninstallation. This temporarily interrupts the cluster and the services but takes less time than rolling patch uninstallation.
- Only patches that are installed in rolling mode can be uninstalled in the same mode.

Step 5 Click **Yes** to uninstall the target patch.

Step 6 View the patch uninstallation progress.

1. Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.
2. Choose **System** > **Manage Patch**. On the **Manage Patch** page, you can view the patch uninstallation progress.

NOTE

For the isolated host nodes in the cluster, follow instructions in **Restoring Patches for the Isolated Hosts** to restore the patch.

----End

5.8.3 Restoring Patches for the Isolated Hosts

If some hosts are isolated in a cluster, perform the following operations to restore patches for these isolated hosts after patch installation on other hosts in the cluster. After patch restoration, versions of the isolated host nodes are consistent with those are not isolated.

NOTE

In **MRS 3.x**, you cannot perform operations in this section on the management console.

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.

Step 2 Choose **System > Manage Patch**. The **Manage Patch** page is displayed.

Step 3 In the **Operation** column, click **View Details**.

Step 4 On the patch details page, select host nodes whose **Status** is **Isolated**.

Step 5 Click **Select and Restore** to restore the isolated host nodes.

----End

5.9 Tenant Management

5.9.1 Before You Start

This section describes how to manage tenants on the MRS console.

Tenant management operations on the console apply only to clusters of versions earlier than MRS 3.x.

Tenant management operations on FusionInsight Manager apply to all versions. For MRS 3.x and later versions, see **Overview**. For versions earlier than MRS 3.x, see **Overview**.

5.9.2 Overview

Definition

An MRS cluster provides various resources and services for multiple organizations, departments, or applications to share. The cluster provides tenants as a logical entity to use these resources and services. A mode involving different tenants is called multi-tenant mode. Currently, only the analysis cluster supports tenant management.

Principles

The MRS cluster provides the multi-tenant function. It supports a layered tenant model and allows dynamic adding or deleting of tenants to isolate resources. It dynamically manages and configures tenants' computing and storage resources.

The computing resources indicate tenants' Yarn task queue resources. The task queue quota can be modified, and the task queue usage status and statistics can be viewed.

The storage resources can be stored on HDFS. You can add and delete the HDFS storage directories of tenants, and set the quotas of file quantity and the storage space of the directories.

Tenants can create and manage tenants in a cluster based on service requirements.

- Roles, computing resources, and storage resources are automatically created when tenants are created. By default, all permissions of the new computing resources and storage resources are allocated to a tenant's roles.
- Permissions to view the current tenant's resources, add a subtenant, and manage the subtenant's resources are granted to the tenant's roles by default.
- After you have modified the tenant's computing or storage resources, permissions of the tenant's roles are automatically updated.

MRS supports a maximum of 512 tenants. The default tenants created by the system include **default**. Tenants that are in the topmost layer with the default tenant are called level-1 tenants.

Resource Pools

Yarn task queues support only the label-based scheduling policy. This policy enables Yarn task queues to associate NodeManagers that have specific node labels. In this way, Yarn tasks run on specified nodes so that tasks are scheduled and certain hardware resources are utilized. For example, Yarn tasks requiring a large memory capacity can run on nodes with a large memory capacity by means of label association, preventing poor service performance.

In an MRS cluster, the tenant logically divides Yarn cluster nodes to combine multiple NodeManagers into a resource pool. Yarn task queues can be associated with specified resource pools by configuring queue capacity policies, ensuring efficient and independent resource utilization in the resource pools.

MRS supports a maximum of 50 resource pools. By default, the system contains a **default** resource pool.

5.9.3 Creating a Tenant

Scenario

You can create a tenant on MRS Manager to specify the resource usage.

Prerequisites

- A tenant name has been planned. The name must not be the same as that of a role or Yarn queue that exists in the current cluster.

- If a tenant requires storage resources, a storage directory has been planned based on service requirements, and the planned directory does not exist under the HDFS directory.
- The resources that can be allocated to the current tenant have been planned and the sum of the resource percentages of direct sub-tenants under the parent tenant at every level does not exceed 100%.
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Step 1 On the MRS details page, click **Tenants**.

NOTE

For MRS 3.x or later, see **Overview**.

Step 2 Click **Create Tenant**. On the page that is displayed, configure tenant properties.

Table 5-57 Tenant parameters

Parameter	Description
Name	Specifies the name of the current tenant. The value consists of 3 to 50 characters, and can contain letters, digits, and underscores (_).
Tenant Type	The options include **Leaf** and **Non-leaf**. If **Leaf** is selected, the current tenant is a leaf tenant and no sub-tenant can be added. If **Non-leaf** is selected, sub-tenants can be added to the current tenant.
Dynamic Resource	Specifies the dynamic computing resources for the current tenant. The system automatically creates a task queue named after the tenant name in Yarn. When dynamic resources are not **Yarn**, the system does not automatically create a task queue.
Default Resource Pool Capacity (%)	Specifies the percentage of the computing resources used by the current tenant in the **default** resource pool.
Default Resource Pool Max. Capacity (%)	Specifies the maximum percentage of the computing resources used by the current tenant in the **default** resource pool.
Storage Resource	Specifies storage resources for the current tenant. The system automatically creates a file folder named after the tenant name in the **/tenant** directory. When a tenant is created for the first time, the system automatically creates the **/tenant** directory in the HDFS root directory. If storage resources are not **HDFS**, the system does not create a storage directory under the root directory of HDFS.

Parameter	Description
Space Quota (MB)	Specifies the quota for HDFS storage space used by the current tenant. The value ranges from **1** to **8796093022208**. The unit is MB. This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used. If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk. **NOTE** To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value is set to **500**, the actual space for storing files is about 250 MB (500/2 = 250).
Storage Path	Specifies the tenant's HDFS storage directory. The system automatically creates a file folder named after the tenant name in the **/tenant** directory by default. For example, the default HDFS storage directory for **ta1** is **tenant/ta1**. When a tenant is created for the first time, the system automatically creates the **/tenant** directory in the HDFS root directory. The storage path is customizable.
Service	Specifies other service resources associated with the current tenant. HBase is supported. To configure this parameter, click **Associate Services**. In the dialog box that is displayed, set **Service** to **HBase**. If **Association Mode** is set to **Exclusive**, service resources are occupied exclusively. If **share** is selected, service resources are shared.
Description	Specifies the description of the current tenant.

Step 3 Click **OK** to save the settings.

It takes a few minutes to save the settings. If the **Tenant created successfully** is displayed in the upper-right corner, the tenant is added successfully. The tenant is created successfully.

NOTE

- Roles, computing resources, and storage resources are automatically created when tenants are created.
- The new role has permissions on the computing and storage resources. The role and its permissions are controlled by the system automatically and cannot be controlled manually under **Manage Role**.
- If you want to use the tenant, create a system user and assign the Manager_tenant role and the role corresponding to the tenant to the user. For details, see **Creating a User**.

----End

Related Tasks

Viewing an added tenant

Step 1 On the MRS details page, click **Tenants**.

Step 2 In the tenant list on the left, click the name of the added tenant.

The **Summary** tab is displayed on the right by default.

Step 3 View **Basic Information**, **Resource Quota**, and **Statistics** of the tenant.

If HDFS is in the **Stopped** state, **Available** and **Used** of **Space** in **Resource Quota** are **unknown.**

----End

5.9.4 Creating a Sub-tenant

Scenario

You can create a sub-tenant on MRS if the resources of the current tenant need to be further allocated.

Prerequisites

- A parent tenant has been added.
- A tenant name has been planned. The name must not be the same as that of a role or Yarn queue that exists in the current cluster.
- If a sub-tenant requires storage resources, a storage directory has been planned based on service requirements, and the planned directory does not exist under the storage directory of the parent tenant.
- The resources that can be allocated to the current tenant have been planned and the sum of the resource percentages of direct sub-tenants under the parent tenant at every level does not exceed 100%.
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Step 1 On the MRS details page, click **Tenants**.

NOTE

For MRS 3.x or later, see **Overview**.

Step 2 In the tenant list on the left, move the cursor to the tenant node to which a sub-tenant is to be added. Click **Create sub-tenant**. On the displayed page, configure the sub-tenant attributes according to the following table:

Table 5-58 Sub-tenant parameters

Parameter	Description
Parent tenant	Specifies the name of the parent tenant.

Parameter	Description
Name	Specifies the name of the current tenant. The value consists of 3 to 20 characters, and can contain letters, digits, and underscores (_).
Tenant Type	The options include **Leaf** and **Non-leaf**. If **Leaf** is selected, the current tenant is a leaf tenant and no sub-tenant can be added. If **Non-leaf** is selected, sub-tenants can be added to the current tenant.
Dynamic Resource	Specifies the dynamic computing resources for the current tenant. The system automatically creates a task queue named after the sub-tenant name in the Yarn parent queue. When dynamic resources are not **Yarn**, the system does not automatically create a task queue. If the parent tenant does not have dynamic resources, the sub-tenant cannot use dynamic resources.
Default Resource Pool Capacity (%)	Specifies the percentage of the resources used by the current tenant. The base value is the total resources of the parent tenant.
Default Resource Pool Max. Capacity (%)	Specifies the maximum percentage of the computing resources used by the current tenant. The base value is the total resources of the parent tenant.
Storage Resource	Specifies storage resources for the current tenant. The system automatically creates a file in the HDFS parent tenant directory. The file is named the same as the name of the sub-tenant. If storage resources are not **HDFS**, the system does not create a storage directory under the root directory of HDFS. If the parent tenant does not have storage resources, the sub-tenant cannot use storage resources.

Parameter	Description
Space Quota (MB)	Specifies the quota for HDFS storage space used by the current tenant. The minimum value is 1, and the maximum value is the total storage quota of the parent tenant. The unit is MB. This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used. If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk. If the quota is greater than the quota of the parent tenant, the actual storage capacity is subject to the quota of the parent tenant. **NOTE** To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value is set to **500**, the actual space for storing files is about 250 MB (500/2 = 250).
Storage Path	Specifies the tenant's HDFS storage directory. The system automatically creates a file folder named after the sub-tenant name in the directory of the parent tenant by default. For example, if the sub-tenant is **ta1s** and the parent directory is **tenant/ta1**, the system sets this parameter for the sub-tenant to **tenant/ta1/ta1s**. The storage path is customizable in the parent directory. The parent directory for the storage path must be the storage directory of the parent tenant.
Service	Specifies other service resources associated with the current tenant. HBase is supported. To configure this parameter, click **Associate Services**. In the dialog box that is displayed, set **Service** to **HBase**. If **Association Mode** is set to **Exclusive**, service resources are occupied exclusively. If **share** is selected, service resources are shared.
Description	Specifies the description of the current tenant.

Step 3 Click **OK** to save the settings.

It takes a few minutes to save the settings. If the **Tenant created successfully** is displayed in the upper-right corner, the tenant is added successfully. The tenant is created successfully.

NOTE

- Roles, computing resources, and storage resources are automatically created when tenants are created.
- The new role has permissions on the computing and storage resources. The role and its permissions are controlled by the system automatically and cannot be controlled manually under **Manage Role**.
- When using this tenant, create a system user and assign the user a related tenant role. For details, see **Creating a User**.

----End

5.9.5 Deleting a Tenant

Scenario

You can delete a tenant that is not required on MRS.

Prerequisites

- A tenant has been added.
- You have checked whether the tenant to be deleted has sub-tenants. If the tenant has sub-tenants, delete them; otherwise, you cannot delete the tenant.
- The role of the tenant to be deleted cannot be associated with any user or user group. For details about how to cancel the binding between a role and a user, see **Modifying User Information**.
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Step 1 On the MRS details page, click **Tenants**.

NOTE

For MRS 3.x or later, see **Overview**.

Step 2 In the tenant list on the left, move the cursor to the tenant node to be deleted and click **Delete**.

The **Delete Tenant** dialog box is displayed. If you want to save the tenant data, select **Reserve the data of this tenant**. Otherwise, the tenant's storage space will be deleted.

Step 3 Click **OK**.

It takes a few minutes to save the configuration. After the tenant is deleted successfully, the role and storage space of the tenant are also deleted.

NOTE

- After the tenant is deleted, the task queue of the tenant still exists in Yarn.
- If you choose not to reserve data when deleting the parent tenant, data of sub-tenants is also deleted if the sub-tenants use storage resources.

----End

5.9.6 Managing a Tenant Directory

Scenario

You can manage the HDFS storage directory used by a specific tenant on MRS. The management operations include adding a tenant directory, modifying the directory file quota, modifying the storage space, and deleting a directory.

Prerequisites

- A tenant associated with HDFS storage resources has been added.
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

- View a tenant directory.
  a. On the MRS details page, click **Tenants**.

     NOTE

     For MRS 3.x or later, see **Overview**.
  b. In the tenant list on the left, click the target tenant.
  c. Click the **Resources** tab.
  d. View the **HDFS Storage** table.
     - The **Maximum Number of Files/Directories** column indicates the quotas for the file and directory quantity of the tenant directory.
     - The **Space Quota** column indicates storage space size of tenant directories.
- Add a tenant directory.
  a. On the MRS details page, click **Tenants**.

     NOTE

     For MRS 3.x or later, see **Overview**.
  b. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be added.
  c. Click the **Resources** tab.
  d. In the **HDFS Storage** table, click **Create Directory**.
     - Set **Path** to a tenant directory path.

       NOTE

       - If the current tenant is not a sub-tenant, the new path is created in the HDFS root directory.
       - If the current tenant is a sub-tenant, the new path is created in the specified directory.

       A complete HDFS storage directory can contain a maximum of 1,023 characters. An HDFS directory name contains digits, letters, spaces, and underscores (_). The name cannot start or end with a space.

- Set **Maximum Number of Files/Directories** to the quotas of file and directory quantity.

  Maximum Number of Files/Directories is optional. Its value ranges from **1** to **9223372036854775806**.

- Set **Storage Space Quota** to the storage space size of the tenant directory.

  The value of **Storage Space Quota** ranges from **1** to **8796093022208**.

  NOTE

  To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value of **Storage Space Quota** is set to **500**, the actual space for storing files is about 250 MB (500/2 = 250).

e. Click **OK**. The system creates tenant directories in the HDFS root directory.

- Modify a tenant directory.

  a. On the MRS details page, click **Tenants**.

  NOTE

  For MRS 3.x or later, see **Overview**.

  b. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be modified.

  c. Click the **Resources** tab.

  d. In the **HDFS Storage** table, click **Modify** in the **Operation** column of the specified tenant directory.

  - Set **Maximum Number of Files/Directories** to the quotas of file and directory quantity.

    Maximum Number of Files/Directories is optional. Its value ranges from **1** to **9223372036854775806**.

  - Set **Storage Space Quota** to the storage space size of the tenant directory.

    The value of **Storage Space Quota** ranges from **1** to **8796093022208**.

    NOTE

    To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value of **Storage Space Quota** is set to **500**, the actual space for storing files is about 250 MB (500/2 = 250).

  e. Click **OK**.

- Delete a tenant directory.

  a. On the MRS details page, click **Tenants**.

NOTE

For MRS 3.x or later, see **Overview**.

b. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be deleted.

c. Click the **Resources** tab.

d. In the **HDFS Storage** table, click **Delete** in the **Operation** column of the specified tenant directory.

The default HDFS storage directory set during tenant creation cannot be deleted. Only the newly added HDFS storage directory can be deleted.

e. Click **OK**. The tenant directory is deleted.

5.9.7 Restoring Tenant Data

Scenario

Tenant data is stored on Manager and in cluster components by default. When components are restored from faults or reinstalled, some tenant configuration data may be abnormal. In this case, you can manually restore the tenant data.

Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Step 1 On the MRS details page, click **Tenants**.

NOTE

For MRS 3.x or later, see **Overview**.

Step 2 In the tenant list on the left, click a tenant node.

Step 3 Check the status of the tenant data.

1. In **Summary**, check the color of the circle on the left of **Basic Information**. Green indicates that the tenant is available and gray indicates that the tenant is unavailable.
2. Click **Resources** and check the circle on the left of **Yarn** or **HDFS Storage**. Green indicates that the resource is available, and gray indicates that the resource is unavailable.
3. Click **Service Association** and check the **Status** column of the associated service table. **Good** indicates that the component can provide services for the associated tenant. **Bad** indicates that the component cannot provide services for the tenant.
4. If any check result is abnormal, go to **Step 4** to restore tenant data.

Step 4 Click **Restore Tenant Data**.

Step 5 In the **Restore Tenant Data** window, select one or more components whose data needs to be restored. Click **OK**. The system automatically restores the tenant data.

----End

5.9.8 Creating a Resource Pool

Scenario

In an MRS cluster, users can logically divide Yarn cluster nodes to combine multiple NodeManagers into a Yarn resource pool. Each NodeManager belongs to one resource pool only. The system contains a **default** resource pool by default. All NodeManagers that are not added to customized resource pools belong to this resource pool.

You can create a customized resource pool on MRS and add hosts that have not been added to other customized resource pools to it.

Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Step 1 On the MRS details page, click **Tenants**.

NOTE

For MRS 3.x or later, see **Overview**.

Step 2 Click the **Resource Pools** tab.

Step 3 Click **Create Resource Pool**.

Step 4 In **Create Resource Pool**, set the properties of the resource pool.

- **Name**: Enter a name for the resource pool. The name of the newly created resource pool cannot be **default**.

  The name consists of 1 to 20 characters and can contain digits, letters, and underscores (_) but cannot start with an underscore (_).

- **Available Hosts**: In the host list on the left, select a specified host name and add it to the resource pool. Only hosts in the cluster can be selected. The host list of a resource pool can be left blank.

Step 5 Click **OK**.

Step 6 After a resource pool is created, users can view the **Name**, **Members**, **Type**, **vCore** and **Memory** in the resource pool list. Hosts that are added to the customized resource pool are no longer members of the **default** resource pool.

----End

5.9.9 Modifying a Resource Pool

Scenario

You can modify members of an existing resource pool on MRS.

Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Step 1 On the MRS details page, click **Tenants**.

NOTE

For MRS 3.x or later, see **Overview**.

Step 2 Click the **Resource Pools** tab.

Step 3 Locate the row that contains the specified resource pool, and click **Modify** in the **Operation** column.

Step 4 In **Modify Resource Pool**, modify **Added Hosts**.

- Adding a host: In the host list on the left, select the specified host name and add it to the resource pool.
- Deleting a host: In the host list on the right, click  next to a host to remove the host from the resource pool. The host list of a resource pool can be left blank.

Step 5 Click **OK**.

----End

5.9.10 Deleting a Resource Pool

Scenario

You can delete an existing resource pool on MRS.

Prerequisites

- Any queue in a cluster cannot use the resource pool to be deleted as the default resource pool. Before deleting the resource pool, cancel the default resource pool. For details, see **Configuring a Queue**.
- Resource distribution policies of all queues have been cleared from the resource pool being deleted. For details, see **Clearing Configuration of a Queue**.
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Step 1 On the MRS details page, click **Tenant**.

NOTE

For MRS 3.x or later, see **Overview**.

Step 2 Click the **Resource Pools** tab.

Step 3 Locate the row that contains the specified resource pool, and click **Delete** in the **Operation** column.

In the displayed dialog box, click **OK**.

----End

5.9.11 Configuring a Queue

Scenario

You can modify the queue configuration of a specified tenant on MRS based on service requirements.

Prerequisites

- A tenant associated with Yarn and allocated dynamic resources has been added.
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Step 1 On the MRS details page, click **Tenants**.

NOTE

For MRS 3.x or later, see **Overview**.

Step 2 Click the **Queue Configuration** tab.

Step 3 In the tenant queue table, click **Modify** in the **Operation** column of the specified tenant queue.

NOTE

- In the tenant list on the left of the **Tenant Management** tab, click the target tenant. In the window that is displayed, choose **Resource**. On the page that is displayed, click  to open the queue modification page.
- A queue can be bound to only one non-default resource pool.

Versions earlier than MRS 3.x:

Table 5-59 Queue configuration parameters

Parameter	Description
Maximum Applications	Specifies the maximum number of applications. The value ranges from 1 to 2147483647.
Maximum AM Resource Percent	Specifies the maximum percentage of resources that can be used to run the ApplicationMaster in a cluster. The value ranges from 0 to 1.
Minimum User Limit Percent (%)	Specifies the minimum percentage of resources consumed by a user. The value ranges from 0 to 100.
User Limit Factor	Specifies the limit factor of the maximum user resource usage. The maximum user resource usage percentage can be obtained by multiplying the limit factor with the percentage of the tenant's actual resource usage in the cluster. The minimum value is **0**.
Status	Specifies the current status of a resource plan. The values are **Running** and **Stopped**.
Default Resource Pool (Default Node Label Expression)	Specifies the resource pool used by a queue. The default value is **default**. If you want to change the resource pool, configure the queue capacity first. For details, see **Configuring the Queue Capacity Policy of a Resource Pool**.

MRS 3.x or later:

Table 5-60 Queue configuration parameters

Parameter	Description
Max Master Shares (%)	Indicates the maximum percentage of resources occupied by all ApplicationMasters in the current queue.
Max Allocated vCores	Indicates the maximum number of cores that can be allocated to a single YARN container in the current queue. The default value is **-1**, indicating that the number of cores is not limited within the value range.
Max Allocated Memory (MB)	Indicates the maximum memory that can be allocated to a single Yarn container in the current queue. The default value is **-1**, indicating that the memory is not limited within the value range.

Parameter	Description
Max Running Apps	Maximum number of tasks that can be executed at the same time in the current queue. The default value is **-1**, indicating that the number is not limited within the value range (the meaning is the same if the value is empty). The value 0 indicates that the task cannot be executed. The value ranges from -1 to 2147483647.
Max Running Apps per User	Maximum number of tasks that can be executed by each user in the current queue at the same time. The default value is **-1**, indicating that the number is not limited within the value range. If the value is **0**, the task cannot be executed. The value ranges from -1 to 2147483647.
Max Pending Apps	Maximum number of tasks that can be suspended at the same time in the current queue. The default value is **-1**, indicating that the number is not limited within the value range (the meaning is the same if the value is empty). The value **0** indicates that tasks cannot be suspended. The value ranges from -1 to 2147483647.
Resource Allocation Rule	Indicates the rule for allocating resources to different tasks of a user. The rule can be FIFO or FAIR. If a user submits multiple tasks in the current queue and the rule is FIFO, the tasks are executed one by one in sequential order. If the rule is FAIR, resources are evenly allocated to all tasks.
Default Resource Label	Indicates that tasks are executed on a node with a specified resource label. **NOTE** If you need to use a new resource pool, change the default label to the new resource pool label.
Active	• **ACTIVE**: indicates that the current queue can receive and execute tasks. • **INACTIVE**: indicates that the current queue can receive but cannot execute tasks. Tasks submitted to the queue are suspended.
Open	• **OPEN**: indicates that the current queue is opened. • **CLOSED**: indicates that the current queue is closed. Tasks submitted to the queue are rejected.

----End

5.9.12 Configuring the Queue Capacity Policy of a Resource Pool

Scenario

After a resource pool is added, the capacity policies of available resources need to be configured for Yarn task queues. This ensures that tasks in the resource pool are running properly. Each queue can be configured with the queue capacity policy of only one resource pool. Users can view the queues in any resource pool and configure queue capacity policies. After the queue policies are configured, Yarn task queues and resource pools are associated.

You can configure queue policies on MRS.

Prerequisites

- A resource pool has been added.
- The task queues are not associated with other resource pools. By default, all queues are associated with the **default** resource pool.
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Step 1 On the MRS details page, click **Tenants**.

NOTE

For MRS 3.x or later, see **Overview**.

Step 2 Click the **Resource Distribution Policies** tab.

Step 3 In **Resource Pools**, select a specified resource pool.

Available Resource Quota: indicates that all resources in each resource pool are available for queues by default.

Step 4 Locate the specified queue in the **Resource Allocation** table, and click **Modify** in the **Operation** column.

Step 5 In **Modify Resource Allocation**, configure the resource capacity policy of the task queue in the resource pool.

- **Capacity (%)**: specifies the percentage of the current tenant's computing resource usage.
- **Maximum Capacity (%)**: specifies the percentage of the current tenant's maximum computing resource usage.

Step 6 Click **OK** to save the settings.

----End

5.9.13 Clearing Configuration of a Queue

Scenario

Users can clear the configuration of a queue on MRS Manager when the queue does not need resources from a resource pool or if a resource pool needs to be disassociated from the queue. Clearing queue configurations means that the resource capacity policy of the queue is canceled.

Prerequisites

- If a queue is to be unbound from a resource pool, this resource pool cannot serve as the default resource pool of the queue. Therefore, you must first change the default resource pool of the queue to another one. For details, see **Configuring a Queue**.
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Step 1 On the MRS details page, click **Tenants**.

NOTE

For MRS 3.x or later, see **Overview**.

Step 2 Click the **Resource Distribution Policies** tab.

Step 3 In **Resource Pools**, select a specified resource pool.

Step 4 Locate the specified queue in the **Resource Allocation** table, and click **Clear** in the **Operation** column

In the **Clear Queue Configuration** dialog box, click **OK** to clear the queue configuration in the current resource pool.

NOTE

If no resource capacity policy is configured for a queue, the clearing function is unavailable for the queue by default.

----End

6 Using an MRS Client

6.1 Installing a Client

6.1.1 Installing a Client (Version 3.x or Later)

Scenario

This section describes how to install clients of all services (excluding Flume) in an MRS cluster. For details about how to install the Flume client, see "Using Flume" > "Installing the Flume Client" in *MapReduce Service Component Operation Guide*.

A client can be installed on a node inside or outside the cluster. This section uses the installation directory **//opt/client** as an example. Replace it with the actual one.

Prerequisites

- A Linux ECS has been prepared. For details about the supported OS of the ECS, see **Table 6-1**.

Table 6-1 Reference list

CPU Architecture	OS	Supported Version
x86 computing	Euler	Euler OS 2.5
	SuSE	SUSE Linux Enterprise Server 12 SP4 (SUSE 12.4)
	Red Hat	Red Hat-7.5-x86_64 (Red Hat 7.5)
	CentOS	CentOS 7.6

CPU Architecture	OS	Supported Version
Kunpeng computing (Arm)	Euler	Euler OS 2.8
	CentOS	CentOS 7.6

In addition, sufficient disk space is allocated for the ECS, for example, 40 GB.

- The ECS and the MRS cluster are in the same VPC.
- The security group of the ECS must be the same as that of the master node in the MRS cluster.
- The NTP service has been installed on the ECS OS and is running properly.

  If the NTP service is not installed, run the **yum install ntp -y** command to install it when the **yum** source is configured.
- A user can log in to the Linux ECS using the password (in SSH mode).

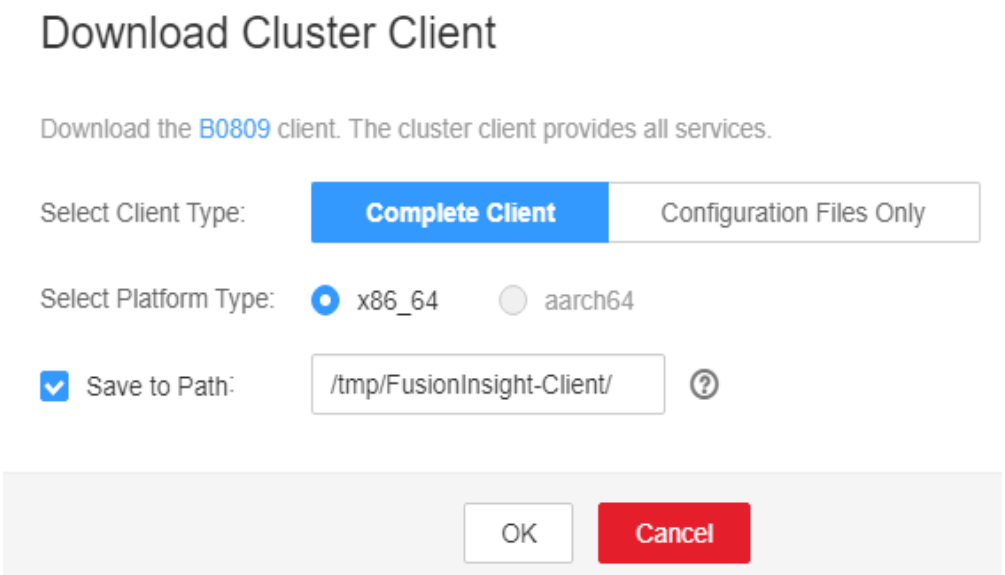
Installing a Client on a Node Inside a Cluster

1. Obtain the software package.

   Log in to FusionInsight Manager. For details, see **Accessing FusionInsight Manager (MRS 3.x or Later)**. Click the name of the cluster to be operated in the **Cluster** drop-down list.

   Choose **More > Download Client**. The **Download Cluster Client** dialog box is displayed.

   Figure 6-1 Downloading a client



NOTE

In the scenario where only one client is to be installed, choose **Cluster > Service >** *Service name* **> More > Download Client**. The **Download Client** dialog box is displayed.

2. Set the client type to **Complete Client**.

   Configuration Files Only is to download client configuration files in the following scenario: After a complete client is downloaded and installed and administrators modify server configurations on Manager, developers need to update the configuration files during application development.

   The platform type can be set to **x86_64** or **aarch64**.

   - **x86_64**: indicates the client software package that can be deployed on the x86 servers.
   - **aarch64**: indicates the client software package that can be deployed on the TaiShan servers.

   NOTE

   The cluster supports two types of clients: **x86_64** and **aarch64**. The client type must match the architecture of the node for installing the client. Otherwise, client installation will fail.

3. Select **Save to Path** and click **OK** to generate the client file.

   The generated file is stored in the **/tmp/FusionInsight-Client** directory on the active management node by default. You can also store the client file in a directory on which user **omm** has the read, write, and execute permissions. Copy the software package to the file directory on the server where the client is to be installed as user **omm** or **root**.

   The name of the client software package is in the follow format: **FusionInsight_Cluster_***<Cluster ID>***_Services_Client.tar**.

   The following steps and sections use **FusionInsight_Cluster_1_Services_Client.tar** as an example.

   NOTE

   If you cannot obtain the permissions of user **root**, use user **omm**.

   To install the client on another node in the cluster, run the following command to copy the client to the node where the client is to be installed:

   scp -p /*tmp/FusionInsight-Client***/FusionInsight_Cluster_1_Services_Client.tar** *IP address of the node where the client is to be installed:/opt/Bigdata/client*

4. Log in to the server where the client software package is located as user **user_client**.
5. Decompress the software package.

   Go to the directory where the installation package is stored, such as **/tmp/FusionInsight-Client**. Run the following command to decompress the installation package to a local directory:

   tar -xvf FusionInsight_Cluster_1_Services_Client.tar

6. Verify the software package.

   Run the following command to verify the decompressed file and check whether the command output is consistent with the information in the **sha256** file.

   sha256sum -c FusionInsight_Cluster_1_Services_ClientConfig.tar.sha256

```
FusionInsight_Cluster_1_Services_ClientConfig.tar: OK
```

7. Decompress the obtained installation file.

   tar -xvf FusionInsight_Cluster_1_Services_ClientConfig.tar

8. Go to the directory where the installation package is stored, and run the following command to install the client to a specified directory (an absolute path), for example, **/opt/client**:

   cd /tmp/FusionInsight-Client/FusionInsight_Cluster_1_Services_ClientConfig

   Run the **./install.sh /opt/client** command to install the client. The client is successfully installed if information similar to the following is displayed:

   ```
   The component client is installed successfully
   ```

   NOTE

   - If the clients of all or some services use the **/opt/client** directory, other directories must be used when you install other service clients.
   - You must delete the client installation directory when uninstalling a client.
   - To ensure that an installed client can only be used by the installation user (for example, **user_client**), add parameter **-o** during the installation. That is, run the **./install.sh /opt/client -o** command to install the client.
   - If an HBase client is installed, it is recommended that the client installation directory contain only uppercase and lowercase letters, digits, and characters (_-?.@+=) due to the limitation of the Ruby syntax used by HBase.

Using a Client

1. On the node where the client is installed, run the **sudo su - omm** command to switch the user. Run the following command to go to the client directory:

   cd /opt/client

2. Run the following command to configure environment variables:

   source bigdata_env

3. If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step.

   kinit *MRS cluster user*

   Example: **kinit admin**

   NOTE

   User **admin** is created by default for MRS clusters with Kerberos authentication enabled and is used for administrators to maintain the clusters.

4. Run the client command of a component directly.

   For example, run the **hdfs dfs -ls /** command to view files in the HDFS root directory.

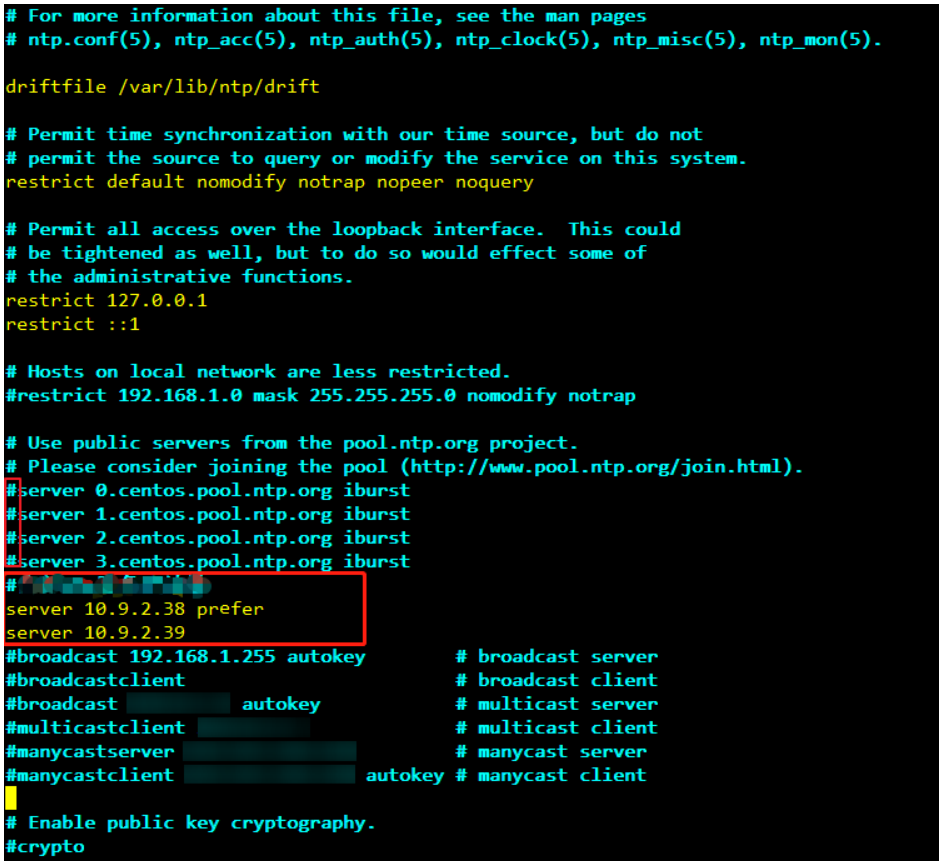
Installing a Client on a Node Outside a Cluster

1. Create an ECS that meets the requirements in **Prerequisites**.
2. Perform NTP time synchronization to synchronize the time of nodes outside the cluster with that of the MRS cluster.

a. Run the **vi /etc/ntp.conf** command to edit the NTP client configuration file, add the IP addresses of the master node in the MRS cluster, and comment out the IP address of other servers.

```
server master1_ip prefer
server master2_ip
```

Figure 6-2 Adding the master node IP addresses



b. Run the **service ntpd stop** command to stop the NTP service.

c. Run the **/usr/sbin/ntpdate** *IP address of the active master node* command to manually synchronize time.

d. Run the **service ntpd start** or **systemctl restart ntpd** command to start the NTP service.

e. Run the **ntpstat** command to check the time synchronization result.

3. Perform the following steps to download the cluster client software package from FusionInsight Manager, copy the package to the ECS node, and install the client:

a. Log in to FusionInsight Manager and download the cluster client to the specified directory on the active management node by referring to **Accessing FusionInsight Manager (MRS 3.x or Later)** and **Installing a Client on a Node Inside a Cluster**.

b. Log in to the active management node as user **root** and run the following command to copy the client installation package to the target node:

scp -p /tmp/FusionInsight-Client/FusionInsight_Cluster_1_Services_Client.tar *IP address of the node where the client is to be installed*:**/tmp**

c. Log in to the node on which the client is to be installed as the client user.

Run the following commands to install the client. If the user does not have operation permissions on the client software package and client installation directory, grant the permissions using the **root** user.

cd /tmp

tar -xvf FusionInsight_Cluster_1_Services_Client.tar

tar -xvf FusionInsight_Cluster_1_Services_ClientConfig.tar

cd FusionInsight_Cluster_1_Services_ClientConfig

./install.sh /opt/client

d. Run the following commands to switch to the client directory and configure environment variables:

cd /opt/client

source bigdata_env

e. If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step.

kinit *MRS cluster user*

Example: **kinit admin**

f. Run the client command of a component directly.

For example, run the **hdfs dfs -ls /** command to view files in the HDFS root directory.

6.1.2 Installing a Client (Versions Earlier Than 3.x)

Scenario

An MRS client is required. The MRS cluster client can be installed on the Master or Core node in the cluster or on a node outside the cluster.

After a cluster of versions earlier than MRS 3.x is created, a client is installed on the active Master node by default. You can directly use the client. The installation directory is **/opt/client**.

For details about how to install a client of MRS 3.x or later, see **Installing a Client (Version 3.x or Later)**.

NOTE

If a client has been installed on the node outside the MRS cluster and the client only needs to be updated, update the client using the user who installed the client, for example, user **root**.

Prerequisites

- An ECS has been prepared. For details about the OS and its version of the ECS, see **Table 6-2**.

Table 6-2 Reference list

OS	Supported Version
EulerOS	• Available: EulerOS 2.2 • Available: EulerOS 2.3 • Available: EulerOS 2.5

For example, a user can select an ECS running the EulerOS.

In addition, sufficient disk space is allocated for the ECS, for example, 40 GB.

- The ECS and the MRS cluster are in the same VPC.
- The security group of the ECS is the same as that of the Master node of the MRS cluster.

  If this requirement is not met, modify the ECS security group or configure the inbound and outbound rules of the ECS security group to allow the ECS security group to be accessed by all security groups of MRS cluster nodes.
- To enable users to log in to a Linux ECS using a password (SSH), see ***Instances*** > ***Logging In to a Linux ECS*** > ***Login Using an SSH Password*** *in the Elastic Cloud Server User Guide*.

Installing a Client on the Core Node

1. Log in to MRS Manager and choose **Services** > **Download Client** to download the client installation package to the active management node.

   NOTE

   If only the client configuration file needs to be updated, see method 2 in **Updating a Client (Versions Earlier Than 3.x)**.
2. Use the IP address to search for the active management node, and log in to the active management node using VNC.
3. Log in to the active management node, and run the following command to switch the user:

   sudo su - omm
4. On the MRS management console, view the IP address on the **Nodes** tab page of the specified cluster.

   Record the IP address of the Core node where the client is to be used.
5. On the active management node, run the following command to copy the client installation package to the Core node:

   scp -p /tmp/MRS-client/MRS_Services_Client.tar *IP address of the Core node*:**/opt/client**
6. Log in to the Core node as user **root**.

   Master nodes support Cloud-Init. The preset username for Cloud-Init is **root** and the password is the one you set during cluster creation.
7. Run the following commands to install the client:

   cd /opt/client

   tar -xvf MRS_Services_Client.tar

tar -xvf MRS_Services_ClientConfig.tar

cd /opt/client/MRS_Services_ClientConfig

./install.sh *Client installation directory*

For example, run the following command:

./install.sh /opt/client

8. For details about how to use the client, see **Using an MRS Client**.

Using an MRS Client

1. On the node where the client is installed, run the **sudo su - omm** command to switch the user. Run the following command to go to the client directory:

   cd /opt/client

2. Run the following command to configure environment variables:

   source bigdata_env

3. If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step.

   kinit *MRS cluster user*

   Example: **kinit admin**

   NOTE

   User **admin** is created by default for MRS clusters with Kerberos authentication enabled and is used for administrators to maintain the clusters.

4. Run the client command of a component directly.

   For example, run the **hdfs dfs -ls /** command to view files in the HDFS root directory.

Installing a Client on a Node Outside the Cluster

Step 1 Create an ECS that meets the requirements in the prerequisites.

Step 2 Log in to MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**. Then, choose **Services**.

Step 3 Click **Download Client**.

Step 4 In **Client Type**, select **All client files**.

Step 5 In **Download To**, select **Remote host**.

Step 6 Set **Host IP Address** to the IP address of the ECS, **Host Port** to **22**, and **Save Path** to **/tmp**.

- If the default port **22** for logging in to an ECS using SSH has been changed, set **Host Port** to the new port.
- **Save Path** contains a maximum of 256 characters.

Step 7 Set **Login User** to **root**.

If other users are used, ensure that the users have read, write, and execute permission on the save path.

Step 8 Select **Password** or **SSH Private Key** for **Login Mode**.

- **Password**: Enter the password of user **root** set during cluster creation.
- **SSH Private Key**: Select and upload the key file used for creating the cluster.

Step 9 Click **OK** to generate a client file.

If the following information is displayed, the client package is saved. Click **Close**. Obtain the client file from the save path on the remote host that is set when the client is downloaded.

```
Client files downloaded to the remote host successfully.
```

If the following information is displayed, check the username, password, and security group configurations of the remote host. Ensure that the username and password are correct and an inbound rule of the SSH (22) port has been added to the security group of the remote host. And then, go to **Step 2** to download the client again.

```
Failed to connect to the server. Please check the network connection or parameter settings.
```

NOTE

Generating a client will occupy a large number of disk I/Os. You are advised not to download a client when the cluster is being installed, started, and patched, or in other unstable states.

Step 10 Log in to the ECS using VNC. For details, see **Instance** > **Logging In to a Linux** > **Logging In to a Linux** in the *Elastic Cloud Server User Guide*

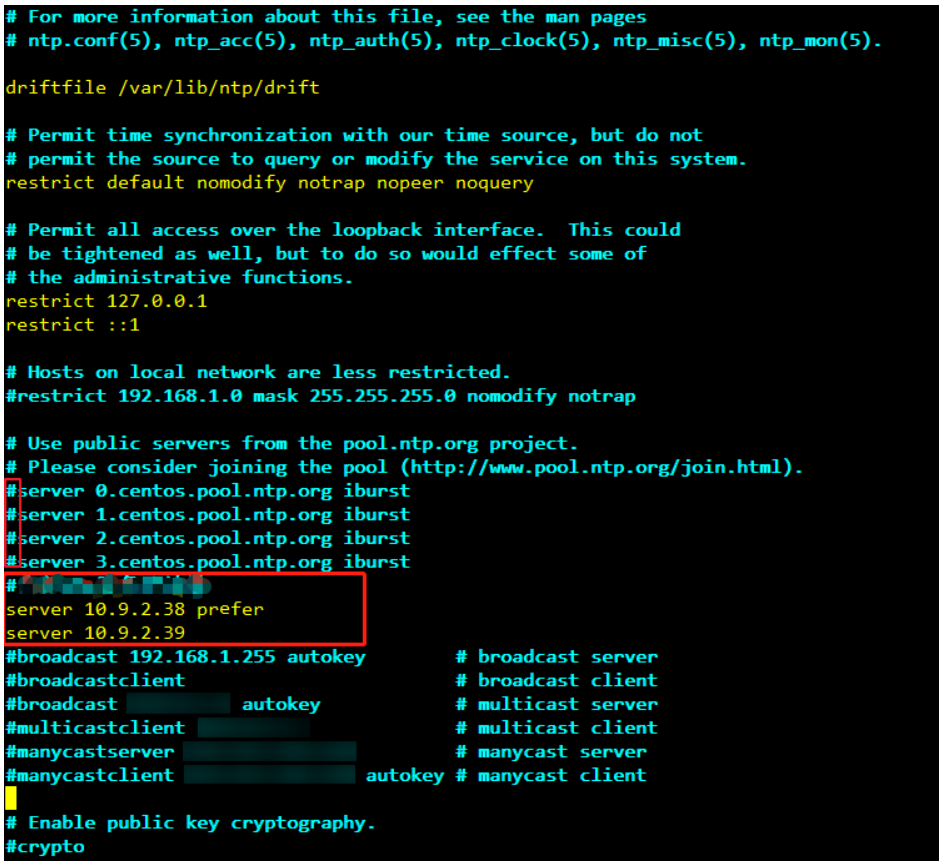
All images support Cloud-Init. The preset username for Cloud-Init is **root** and the password is the one you set during cluster creation. It is recommended that you change the password upon the first login.

Step 11 Perform NTP time synchronization to synchronize the time of nodes outside the cluster with the time of the MRS cluster.

1. Check whether the NTP service is installed. If it is not installed, run the **yum install ntp -y** command to install it.
2. Run the **vim /etc/ntp.conf** command to edit the NTP client configuration file, add the IP address of the Master node in the MRS cluster, and comment out the IP addresses of other servers.

   ```
   server master1_ip prefer
   server master2_ip
   ```

Figure 6-3 Adding the Master node IP addresses



3. Run the **service ntpd stop** command to stop the NTP service.
4. Run the**/usr/sbin/ntpdate** *IP address of the active Master node* command to manually synchronize the time.
5. Run the **service ntpd start** or **systemctl restart ntpd** command to start the NTP service.
6. Run the **ntpstat** command to check the time synchronization result:

Step 12 On the ECS, switch to user **root** and copy the installation package in **Save Path** in **Step 6** to the **/opt** directory. For example, if **Save Path** is set to **/tmp**, run the following commands:

sudo su - root

cp /tmp/MRS_Services_Client.tar /opt

Step 13 Run the following command in the **/opt** directory to decompress the package and obtain the verification file and the configuration package of the client:

tar -xvf MRS_Services_Client.tar

Step 14 Run the following command to verify the configuration file package of the client:

sha256sum -c MRS_Services_ClientConfig.tar.sha256

The command output is as follows:

```
MRS_Services_ClientConfig.tar: OK
```

Step 15 Run the following command to decompress **MRS_Services_ClientConfig.tar**:

tar -xvf MRS_Services_ClientConfig.tar

Step 16 Run the following command to install the client to a new directory, for example, **/opt/Bigdata/client**. A directory is automatically generated during the client installation.

sh /opt/MRS_Services_ClientConfig/install.sh /opt/Bigdata/client

If the following information is displayed, the client has been successfully installed:

```
Components client installation is complete.
```

Step 17 Check whether the IP address of the ECS node is connected to the IP address of the cluster Master node.

For example, run the following command: **ping** *Master node IP address*.

- If yes, go to **Step 18**.
- If no, check whether the VPC and security group are correct and whether the ECS and the MRS cluster are in the same VPC and security group, and go to **Step 18**.

Step 18 Run the following command to configure environment variables:

source /opt/Bigdata/client/bigdata_env

Step 19 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step.

kinit *MRS cluster user*

Example: **kinit admin**

Step 20 Run the client command of a component.

For example, run the following command to query the HDFS directory:

hdfs dfs -ls /

----End

6.2 Updating a Client

6.2.1 Updating a Client (Version 3.x or Later)

A cluster provides a client for you to connect to a server, view task results, or manage data. If you modify service configuration parameters on Manager and restart the service, you need to download and install the client again or use the configuration file to update the client.

Updating the Client Configuration

Method 1:

Step 1 Log in to FusionInsight Manager. For details, see **Accessing FusionInsight Manager (MRS 3.x or Later)**. Click the name of the cluster to be operated in the **Cluster** drop-down list.

Step 2 Choose **More** > **Download Client** > **Configuration Files Only**.

The generated compressed file contains the configuration files of all services.

Step 3 Determine whether to generate a configuration file on the cluster node.

- If yes, select **Save to Path**, and click **OK** to generate the client file. By default, the client file is generated in **/tmp/FusionInsight-Client** on the active management node. You can also store the client file in other directories, and user **omm** has the read, write, and execute permissions on the directories. Then go to **Step 4**.
- If no, click **OK**, specify a local save path, and download the complete client. Wait until the download is complete and go to **Step 4**.

Step 4 Use WinSCP to save the compressed file to the client installation directory, for example, **/opt/hadoopclient**, as the client installation user.

Step 5 Decompress the software package.

Run the following commands to go to the directory where the client is installed, and decompress the file to a local directory. For example, the downloaded client file is **FusionInsight_Cluster_1_Services_Client.tar**.

cd /opt/hadoopclient

tar -xvf FusionInsight_Cluster_1_Services_Client.tar

Step 6 Verify the software package.

Run the following command to verify the decompressed file and check whether the command output is consistent with the information in the **sha256** file.

sha256sum -c FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles.tar.sha256

```
FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles.tar: OK
```

Step 7 Decompress the package to obtain the configuration file.

tar -xvf FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles.tar

Step 8 Run the following command in the client installation directory to update the client using the configuration file:

sh refreshConfig.sh *Client installation directory Directory where the configuration file is located*

For example, run the following command:

sh refreshConfig.sh /opt/hadoopclient /opt/hadoopclient/FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles

If the following information is displayed, the configurations have been updated successfully.

```
Succeed to refresh components client config.
```

----End

Method 2:

Step 1 Log in to the client installation node as user **root**.

Step 2 Go to the client installation directory, for example, **/opt/hadoopclient** and run the following commands to update the configuration file:

cd /opt/hadoopclient

sh autoRefreshConfig.sh

Step 3 Enter the username and password of the FusionInsight Manager administrator and the floating IP address of FusionInsight Manager.

Step 4 Enter the names of the components whose configuration needs to be updated. Use commas (,) to separate the component names. Press **Enter** to update the configurations of all components if necessary.

If the following information is displayed, the configurations have been updated successfully.

```
Succeed to refresh components client config.
```

----End

6.2.2 Updating a Client (Versions Earlier Than 3.x)

NOTE

This section applies to clusters of versions earlier than MRS 3.x. For MRS 3.x or later, see **Updating a Client (Version 3.x or Later)**.

Updating a Client Configuration File

Scenario

An MRS cluster provides a client for you to connect to a server, view task results, or manage data. Before using an MRS client, you need to download and update the client configuration file if service configuration parameters are modified and a service is restarted or the service is merely restarted on MRS Manager.

During cluster creation, the original client is stored in the **/opt/client** directory on all nodes in the cluster by default. After the cluster is created, only the client of a Master node can be directly used. To use the client of a Core node, you need to update the client configuration file first.

Procedure

Method 1:

Step 1 Log in to MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**. Then, choose **Services**.

Step 2 Click **Download Client**.

Set **Client Type** to **Only configuration files**, **Download To** to **Server**, and click **OK** to generate the client configuration file. The generated file is saved in the **/tmp/MRS-client** directory on the active management node by default. You can customize the file path.

Step 3 Query and log in to the active Master node.

Step 4 If you use the client in the cluster, run the following command to switch to user **omm**. If you use the client outside the cluster, switch to user **root**.

sudo su - omm

Step 5 Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

cd /opt/Bigdata/client

Step 6 Run the following command to update client configurations:

sh refreshConfig.sh *Client installation directory Full path of the client configuration file package*

For example, run the following command:

sh refreshConfig.sh /opt/Bigdata/client /tmp/MRS-client/MRS_Services_Client.tar

If the following information is displayed, the configurations have been updated successfully.

```
ReFresh components client config is complete.
Succeed to refresh components client config.
```

----End

Method 2:

Step 1 After the cluster is installed, run the following command to switch to user **omm**. If you use the client outside the cluster, switch to user **root**.

sudo su - omm

Step 2 Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

cd /opt/Bigdata/client

Step 3 Run the following command and enter the name of an MRS Manager user with the download permission and its password (for example, the username is **admin** and the password is the one set during cluster creation) as prompted to update client configurations.

sh autoRefreshConfig.sh

Step 4 After the command is executed, the following information is displayed, where *XXX* indicates the name of the component installed in the cluster. To update client configurations of all components, press **Enter**. To update client configurations of some components, enter the component names and separate them with commas (,).

```
Components "xxx" have been installed in the cluster. Please input the comma-separated names of the components for which you want to update client configurations. If you press Enter without inputting any component name, the client configurations of all components will be updated:
```

If the following information is displayed, the configurations have been updated successfully.

```
Succeed to refresh components client config.
```

If the following information is displayed, the username or password is incorrect.

```
login manager failed,Incorrect username or password.
```

NOTE

- This script automatically connects to the cluster and invokes the **refreshConfig.sh** script to download and update the client configuration file.
- By default, the client uses the floating IP address specified by **wsom=xxx** in the **Version** file in the installation directory to update the client configurations. To update the configuration file of another cluster, modify the value of **wsom=xxx** in the **Version** file to the floating IP address of the corresponding cluster before performing this step.

----End

Fully Updating the Original Client of the Active Master Node

Scenario

During cluster creation, the original client is stored in the **/opt/client** directory on all nodes in the cluster by default. The following uses **/opt/Bigdata/client** as an example.

- For a normal MRS cluster, you will use the pre-installed client on a Master node to submit a job on the management console page.
- You can also use the pre-installed client on the Master node to connect to a server, view task results, and manage data.

After installing the patch on the cluster, you need to update the client on the Master node to ensure that the functions of the built-in client are available.

Procedure

Step 1 Log in to MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**. Then, choose **Services**.

Step 2 Click **Download Client**.

Set **Client Type** to **All client files**, **Download To** to **Server**, and click **OK** to generate the client configuration file. The generated file is saved in the **/tmp/MRS-client** directory on the active management node by default. You can customize the file path.

Step 3 Query and log in to the active Master node.

Step 4 On the ECS, switch to user **root** and copy the installation package to the **/opt** directory.

sudo su - root

cp /tmp/MRS-client/MRS_Services_Client.tar /opt

Step 5 Run the following command in the **/opt** directory to decompress the package and obtain the verification file and the configuration package of the client:

tar -xvf MRS_Services_Client.tar

Step 6 Run the following command to verify the configuration file package of the client:

sha256sum -c MRS_Services_ClientConfig.tar.sha256

The command output is as follows:

```
MRS_Services_ClientConfig.tar: OK
```

Step 7 Run the following command to decompress **MRS_Services_ClientConfig.tar**:

tar -xvf MRS_Services_ClientConfig.tar

Step 8 Run the following command to move the original client to the **/opt/Bigdata/client_bak** directory:

mv /opt/Bigdata/client /opt/Bigdata/client_bak

Step 9 Run the following command to install the client in a new directory. The client path must be **/opt/Bigdata/client**.

sh /opt/MRS_Services_ClientConfig/install.sh /opt/Bigdata/client

If the following information is displayed, the client has been successfully installed:

```
Components client installation is complete.
```

Step 10 Run the following command to modify the user and user group of the **/opt/Bigdata/client** directory:

chown omm:wheel /opt/Bigdata/client -R

Step 11 Run the following command to configure environment variables:

source /opt/Bigdata/client/bigdata_env

Step 12 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step.

kinit *MRS cluster user*

Example: **kinit admin**

Step 13 Run the client command of a component.

For example, run the following command to query the HDFS directory:

hdfs dfs -ls /

----End

Fully Updating the Original Client of the Standby Master Node

Step 1 Repeat **Step 1** to **Step 3** to log in to the standby Master node, and run the following command to switch to user **omm**:

sudo su - omm

Step 2 Run the following command on the standby master node to copy the downloaded client package from the active master node:

scp omm@*master1 nodeIP address***:/tmp/MRS-client/MRS_Services_Client.tar /tmp/MRS-client/**

NOTE

- In this command, **master1** node is the active master node.
- **/tmp/MRS-client/** is an example target directory of the standby master node.

Step 3 Repeat **Step 4** to **Step 13** to update the client of the standby Master node.

----End

6.3 Using the Client of Each Component

6.3.1 Using a ClickHouse Client

ClickHouse is a column-based database oriented to online analysis and processing. It supports SQL query and provides good query performance. The aggregation analysis and query performance based on large and wide tables is excellent, which is one order of magnitude faster than other analytical databases.

Prerequisites

You have installed the client, for example, in the **/opt/hadoopclient** directory. The client directory in the following operations is only an example. Change it to the actual installation directory. Before using the client, download and update the client configuration file, and ensure that the active management node of Manager is available.

Procedure

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to go to the client installation directory:

cd /opt/hadoopclient

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the current user. The current user must have the permission to create ClickHouse tables. For details about how to bind a role to the user, see **ClickHouse User and Permission Management**. If Kerberos authentication is disabled for the current cluster, skip this step.

1. Run the following command if it is an MRS 3.1.0 cluster:

   export CLICKHOUSE_SECURITY_ENABLED=true

2. **kinit** *Component service user*

   Example: **kinit clickhouseuser**

Step 5 Run the client command of the ClickHouse component.

Run the **clickhouse -h** command to view the command help of ClickHouse.

The command output is as follows:

```
Use one of the following commands:
clickhouse local [args]
clickhouse client [args]
clickhouse benchmark [args]
clickhouse server [args]
clickhouse performance-test [args]
clickhouse extract-from-config [args]
clickhouse compressor [args]
clickhouse format [args]
clickhouse copier [args]
clickhouse obfuscator [args]
...
```

Run the **clickhouse client** command to connect to the ClickHouse serverif MRS 3.1.0 or later.

- Using SSL for login when Kerberos authentication is disabled for the current cluster:

  clickhouse client --host *IP address of the ClickHouse instance* **--user** *Username* **--password** *Password* **--port** 9440 **--secure**

- Using SSL for login when Kerberos authentication is enabled for the current cluster:

  You must create a user on Manager because there is no default user. For details, see **ClickHouse User and Permission Management**.

  After the user authentication is successful, you do not need to carry the **--user** and **--password** parameters when logging in to the client as the authenticated user.

  clickhouse client --host *IP address of the ClickHouse instance* **--port** 9440 **--secure**

  The following table describes the parameters of the **clickhouse client** command.

Table 6-3 Parameters of the **clickhouse client** command

Parameter	Description
--host	Host name of the server. The default value is **localhost**. You can use the host name or IP address of the node where the ClickHouse instance is located. **NOTE** You can log in to FusionInsight Manager and choose **Cluster** > **Services** > **ClickHouse** > **Instance** to obtain the service IP address of the ClickHouseServer instance.
--port	Port for connection. • If the SSL security connection is used, the default port number is **9440**, the parameter **--secure** must be carried. For details about the port number, search for the **tcp_port_secure** parameter in the ClickHouseServer instance configuration. • If non-SSL security connection is used, the default port number is **9000**, the parameter **--secure** does not need to be carried. For details about the port number, search for the **tcp_port** parameter in the ClickHouseServer instance configuration.

Parameter	Description
--user	Username. You can create the user on Manager and bind a role to the user. For details, see **ClickHouse User and Permission Management**. • If Kerberos authentication is enabled for the current cluster and the user authentication is successful, you do not need to carry the **--user** and **--password** parameters when logging in to the client as the authenticated user. You must create a user with this name on Manager because there is no default user in the Kerberos cluster scenario. • If Kerberos authentication is not enabled for the current cluster, you can specify a user and its password created on Manager when logging in to the client. If the user and password parameters are not carried, user **default** is used for login by default.
--password	Password. The default password is an empty string. This parameter is used together with the **--user** parameter. You can set a password when creating a user on Manager.
--query	Query to process when using non-interactive mode.
--database	Current default database. The default value is **default**, which is the default configuration on the server.
--multiline	If this parameter is specified, multiline queries are allowed. (**Enter** only indicates line feed and does not indicate that the query statement is complete.)
--multiquery	If this parameter is specified, multiple queries separated with semicolons (;) can be processed. This parameter is valid only in non-interactive mode.
--format	Specified default format used to output the result.
--vertical	If this parameter is specified, the result is output in vertical format by default. In this format, each value is printed on a separate line, which helps to display a wide table.
--time	If this parameter is specified, the query execution time is printed to **stderr** in non-interactive mode.
--stacktrace	If this parameter is specified, stack trace information will be printed when an exception occurs.
--config-file	Name of the configuration file.
--secure	If this parameter is specified, the server will be connected in SSL mode.
--history_file	Path of files that record command history.

Parameter	Description
--param_<name>	Query with parameters. Pass values from the client to the server. For details, see **https://clickhouse.tech/docs/en/interfaces/cli/#cli-queries-with-parameters**.

----End

6.3.2 Using a Flink Client

This section describes how to use Flink to run wordcount jobs.

Prerequisites

- Flink has been installed in an MRS cluster.
- The cluster runs properly and the client has been correctly installed, for example, in the **/opt/hadoopclient** directory. The client directory in the following operations is only an example. Change it to the actual installation directory.

Using the Flink Client (Versions Earlier Than MRS 3.x)

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to go to the client installation directory:

cd /opt/hadoopclient

Step 3 Run the following command to initialize environment variables:

source /opt/hadoopclient/bigdata_env

Step 4 If Kerberos authentication is enabled for the cluster, perform the following steps. If not, skip this whole step.

1. Prepare a user for submitting Flink jobs..
2. Log in to Manager and download the authentication credential.

   Log in to Manager of the cluster. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**. Choose **System Settings** > **User Management**. In the **Operation** column of the row that contains the added user, choose **More** > **Download Authentication Credential**.
3. Decompress the downloaded authentication credential package and copy the **user.keytab** file to the client node, for example, to the **/opt/hadoopclient/Flink/flink/conf** directory on the client node. If the client is installed on a node outside the cluster, copy the **krb5.conf** file to the **/etc/** directory on this node.
4. Configure security authentication by adding the **keytab** path and username in the **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml** configuration file.

   security.kerberos.login.keytab: *<user.keytab file path>*

   security.kerberos.login.principal: *<Username>*

   Example:

   security.kerberos.login.keytab: /opt/hadoopclient/Flink/flink/conf/user.keytab

security.kerberos.login.principal: test

5. Generate the **generate_keystore.sh** script by referring to "Using Flink" > "Reference" > "Example of Issuing a Certificate" in *MapReduce Service Component Operation Guide* and place it in the **bin** directory of the Flink client.In the **bin** directory of the Flink client, run the following command to perform security hardening and set password to a new one for submitting jobs. For details, see "Using Flink" > "Security Hardening" > "Authentication and Encryption" in *MapReduce Service Component Operation Guide*.

   sh generate_keystore.sh <*password*>

   The script automatically replaces the SSL value in the **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml** file. For an MRS 2.*x* or earlier security cluster, external SSL is disabled by default. To enable external SSL, configure the parameter and run the script again. For details, see "Using Flink" > "Security Hardening" in *MapReduce Service Component Operation Guide*.

   NOTE

   - You do not need to manually generate the **generate_keystore.sh** script.
   - After authentication and encryption, the generated **flink.keystore**, **flink.truststore**, and **security.cookie** items are automatically filled in the corresponding configuration items in **flink-conf.yaml**.

6. Configure paths for the client to access the **flink.keystore** and **flink.truststore** files.
   - Absolute path: After the script is executed, the file path of **flink.keystore** and **flink.truststore** is automatically set to the absolute path **/opt/hadoopclient/Flink/flink/conf/** in the **flink-conf.yaml** file. In this case, you need to move the **flink.keystore** and **flink.truststore** files from the **conf** directory to this absolute path on the Flink client and Yarn nodes.
   - Relative path: Perform the following steps to set the file path of **flink.keystore** and **flink.truststore** to the relative path and ensure that the directory where the Flink client command is executed can directly access the relative paths.
     i. Create a directory, for example, **ssl**, in **/opt/hadoopclient/Flink/flink/conf/**.

        cd /opt/hadoopclient/Flink/flink/conf/

        mkdir ssl

     ii. Move the **flink.keystore** and **flink.truststore** files to the **/opt/hadoopclient/Flink/flink/conf/ssl/** directory.

        mv flink.keystore ssl/

        mv flink.truststore ssl/

     iii. Change the values of the following parameters to relative paths in the **flink-conf.yaml** file:

```
security.ssl.internal.keystore: ssl/flink.keystore
security.ssl.internal.truststore: ssl/flink.truststore
```

Step 5 Run a wordcount job.

NOTICE

To submit or run jobs on Flink, the user must have the following permissions:

- If Ranger authentication is enabled, the current user must belong to the **hadoop** group or the user has been granted the **/flink** read and write permissions in Ranger.
- If Ranger authentication is disabled, the current user must belong to the **hadoop** group.

- Normal cluster (Kerberos authentication disabled)
  - Run the following commands to start a session and submit a job in the session:

    yarn-session.sh -nm "*session-name***"**

    flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
  - Run the following command to submit a single job on Yarn:

    flink run -m yarn-cluster /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
- Security cluster (Kerberos authentication enabled)
  - If the **flink.keystore** and **flink.truststore** file are stored in the absolute path:
    - Run the following commands to start a session and submit a job in the session:

      yarn-session.sh -nm "*session-name***"**

      flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
    - Run the following command to submit a single job on Yarn:

      flink run -m yarn-cluster /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
  - If the **flink.keystore** and **flink.truststore** files are stored in the relative path:
    - In the same directory of SSL, run the following commands to start a session and submit jobs in the session. The SSL directory is a relative path. For example, if the SSL directory is **opt/hadoopclient/Flink/flink/conf/**, then run the following commands in this directory:

      yarn-session.sh -t ssl/ -nm "*session-name***"**

      flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
    - Run the following command to submit a single job on Yarn:

      flink run -m yarn-cluster -yt ssl/ /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar

Step 6 After the job has been successfully submitted, the following information is displayed on the client:

Figure 6-4 Job submitted successfully on Yarn

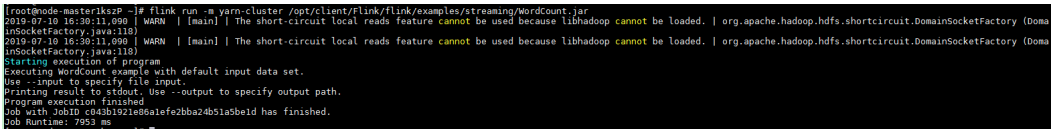


Figure 6-5 Session started successfully

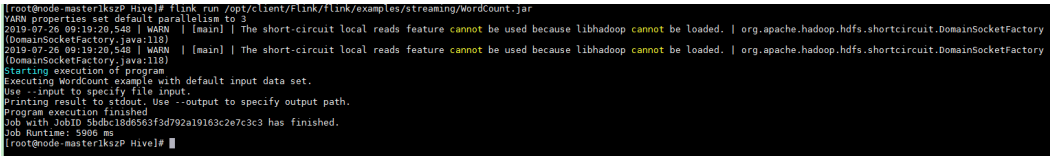
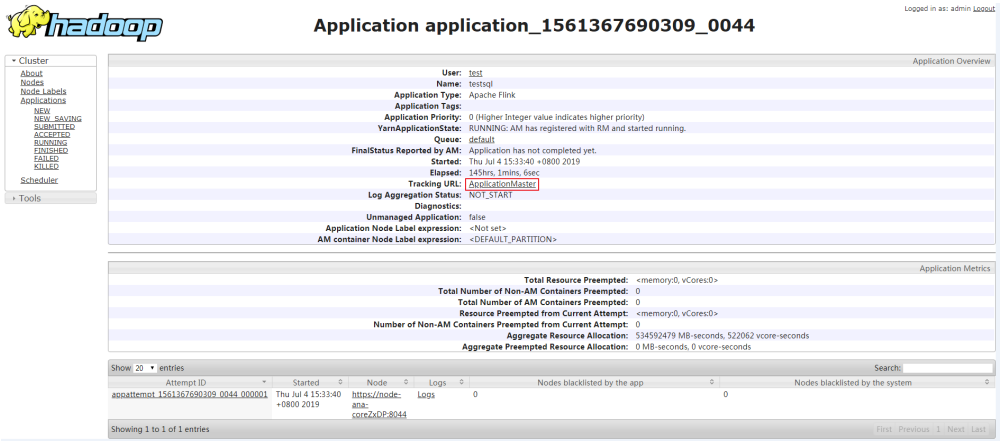
Figure 6-6 Job submitted successfully in the session



Step 7 Go to the native YARN service page, find the application of the job, and click the application name to go to the job details page. For details, see "Using Flink" > "Viewing Flink Job Information" in *MapReduce Service Component Operation Guide*.

- If the job is not completed, click **Tracking URL** to go to the native Flink page and view the job running information.
- If the job submitted in a session has been completed, you can click **Tracking URL** to log in to the native Flink service page to view job information.

Figure 6-7 Application



----End

Using the Flink Client (MRS 3.x or Later)

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to go to the client installation directory:

cd /opt/hadoopclient

Step 3 Run the following command to initialize environment variables:

source /opt/hadoopclient/bigdata_env

Step 4 If Kerberos authentication is enabled for the cluster, perform the following steps. If not, skip this whole step.

1. Prepare a user for submitting Flink jobs.
2. Log in to Manager and download the authentication credential.

   Log in to Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**. Choose **System** > **Permission** > **Manage User**. On the displayed page, locate the row that contains the added user, click **More** in the **Operation** column, and select **Download authentication credential**.
3. Decompress the downloaded authentication credential package and copy the **user.keytab** file to the client node, for example, to the **/opt/hadoopclient/Flink/flink/conf** directory on the client node. If the client is installed on a node outside the cluster, copy the **krb5.conf** file to the **/etc/** directory on this node.
4. Append the service IP address of the node where the client is installed, floating IP address of Manager, and IP address of the master node to the **jobmanager.web.access-control-allow-origin** and **jobmanager.web.allow-access-address** configuration item in the **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml** file. Use commas (,) to separate IP addresses.

   ```
   jobmanager.web.access-control-allow-origin: xx.xx.xxx.xxx,xx.xx.xxx.xxx,xx.xx.xxx.xxx
   jobmanager.web.allow-access-address: xx.xx.xxx.xxx,xx.xx.xxx.xxx,xx.xx.xxx.xxx
   ```

   NOTE

   - To obtain the service IP address of the node where the client is installed, perform the following operations:
     - Node inside the cluster:

       In the navigation tree of the MRS management console, choose **Clusters** > **Active Clusters**, select a cluster, and click its name to switch to the cluster details page.

       On the **Nodes** tab page, view the IP address of the node where the client is installed.
     - Node outside the cluster: IP address of the ECS where the client is installed.
   - To obtain the floating IP address of Manager, perform the following operations:
     - In the navigation tree of the MRS management console, choose **Clusters** > **Active Clusters**, select a cluster, and click its name to switch to the cluster details page.

       On the **Nodes** tab page, view the **Name**. The node that contains **master1** in its name is the Master1 node. The node that contains **master2** in its name is the Master2 node.
     - Log in to the Master2 node remotely, and run the **ifconfig** command. In the command output, **eth0:wsom** indicates the floating IP address of MRS Manager. Record the value of **inet**. If the floating IP address of MRS Manager cannot be queried on the Master2 node, switch to the Master1 node to query and record the floating IP address. If there is only one Master node, query and record the cluster manager IP address of the Master node.
5. Configure security authentication by adding the **keytab** path and username in the **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml** configuration file.

security.kerberos.login.keytab: *<user.keytab file path>*

security.kerberos.login.principal: *<Username>*

Example:

security.kerberos.login.keytab: /opt/hadoopclient/Flink/flink/conf/user.keytab

security.kerberos.login.principal: test

6. Generate the **generate_keystore.sh** script by referring to "Using Flink" > "Reference" > "Example of Issuing a Certificate" in *MapReduce Service Component Operation Guide* and place it in the **bin** directory of the Flink client.In the **bin** directory of the Flink client, run the following command to perform security hardening and set password to a new one for submitting jobs. For details, see "Using Flink" > "Security Hardening" > "Authentication and Encryption" in *MapReduce Service Component Operation Guide*.

   sh generate_keystore.sh <*password*>

   The script automatically replaces the SSL value in the **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml** file.

   sh generate_keystore.sh <*password*>

   NOTE

   After authentication and encryption, the **flink.keystore** and **flink.truststore** files are generated in the **conf** directory on the Flink client and the following configuration items are set to the default values in the **flink-conf.yaml** file:

   - Set **security.ssl.keystore** to the absolute path of the **flink.keystore** file.
   - Set **security.ssl.truststore** to the absolute path of the **flink.truststore** file.
   - Set **security.cookie** to a random password automatically generated by the **generate_keystore.sh** script.
   - By default, **security.ssl.encrypt.enabled** is set to **false** in the **flink-conf.yaml** file by default. The **generate_keystore.sh** script sets **security.ssl.key-password**, **security.ssl.keystore-password**, and **security.ssl.truststore-password** to the password entered when the **generate_keystore.sh** script is called.
   - For MRS 3.1.0 or later, if ciphertext is required and **security.ssl.encrypt.enabled** is set to **true** in the **flink-conf.yaml** file, the **generate_keystore.sh** script does not set **security.ssl.key-password**, **security.ssl.keystore-password**, and **security.ssl.truststore-password**. To obtain the values, use the Manager plaintext encryption API by running the following command: **curl -k -i -u** *Username*:*Password* **-X POST -HContent-type:application/json -d '{"plainText":"***Password***"}' 'https://***x.x.x.x***:28443/web/api/v2/tools/encrypt'**

     In the preceding command, *Username*:*Password* indicates the user name and password for logging in to the system. The password of **"plainText"** indicates the one used to call the **generate_keystore.sh** script. *x.x.x.x* indicates the floating IP address of Manager.

7. Configure paths for the client to access the **flink.keystore** and **flink.truststore** files.
   - Absolute path: After the script is executed, the file path of **flink.keystore** and **flink.truststore** is automatically set to the absolute path **/opt/hadoopclient/Flink/flink/conf/** in the **flink-conf.yaml** file. In this case, you need to move the **flink.keystore** and **flink.truststore** files from the **conf** directory to this absolute path on the Flink client and Yarn nodes.
   - Relative path: Perform the following steps to set the file path of **flink.keystore** and **flink.truststore** to the relative path and ensure that the directory where the Flink client command is executed can directly access the relative paths.

i. Create a directory, for example, **ssl**, in **/opt/hadoopclient/Flink/flink/conf/**.

cd /opt/hadoopclient/Flink/flink/conf/

mkdir ssl

ii. Move the **flink.keystore** and **flink.truststore** files to the **/opt/hadoopclient/Flink/flink/conf/ssl/** directory.

mv flink.keystore ssl/

mv flink.truststore ssl/

iii. Change the values of the following parameters to relative paths in the **flink-conf.yaml** file:

```
security.ssl.keystore: ssl/flink.keystore
security.ssl.truststore: ssl/flink.truststore
```

Step 5 Run a wordcount job.

NOTICE

To submit or run jobs on Flink, the user must have the following permissions:

- If Ranger authentication is enabled, the current user must belong to the **hadoop** group or the user has been granted the **/flink** read and write permissions in Ranger.
- If Ranger authentication is disabled, the current user must belong to the **hadoop** group.

- Normal cluster (Kerberos authentication disabled)
  - Run the following commands to start a session and submit a job in the session:

    yarn-session.sh -nm "*session-name***"**

    flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
  - Run the following command to submit a single job on Yarn:

    flink run -m yarn-cluster /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
- Security cluster (Kerberos authentication enabled)
  - If the **flink.keystore** and **flink.truststore** files are stored in the absolute path:
    - Run the following commands to start a session and submit a job in the session:

      yarn-session.sh -nm "*session-name***"**

      flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
    - Run the following command to submit a single job on Yarn:

      flink run -m yarn-cluster /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
  - If the **flink.keystore** and **flink.truststore** file are stored in the relative path:

- In the same directory of SSL, run the following commands to start a session and submit jobs in the session. The SSL directory is a relative path. For example, if the SSL directory is **opt/hadoopclient/Flink/flink/conf/**, then run the following commands in this directory:

  yarn-session.sh -t ssl/ -nm "*session-name***"**

  flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar

- Run the following command to submit a single job on Yarn:

  flink run -m yarn-cluster -yt ssl/ /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar

Step 6 After the job has been successfully submitted, the following information is displayed on the client:

Figure 6-8 Job submitted successfully on Yarn

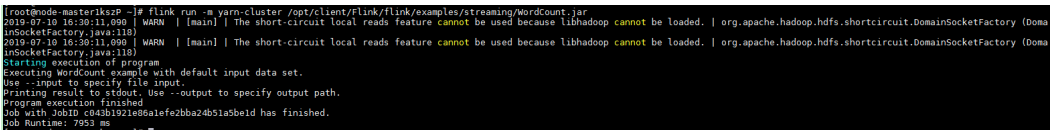


Figure 6-9 Session started successfully

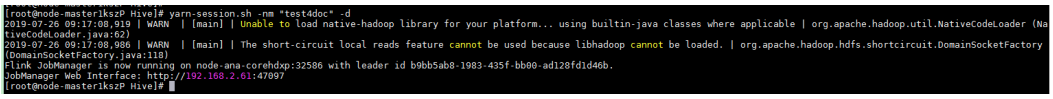

Figure 6-10 Job submitted successfully in the session

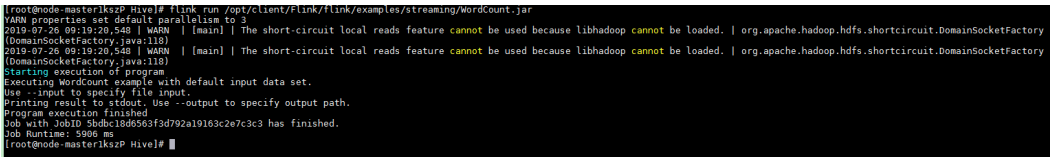
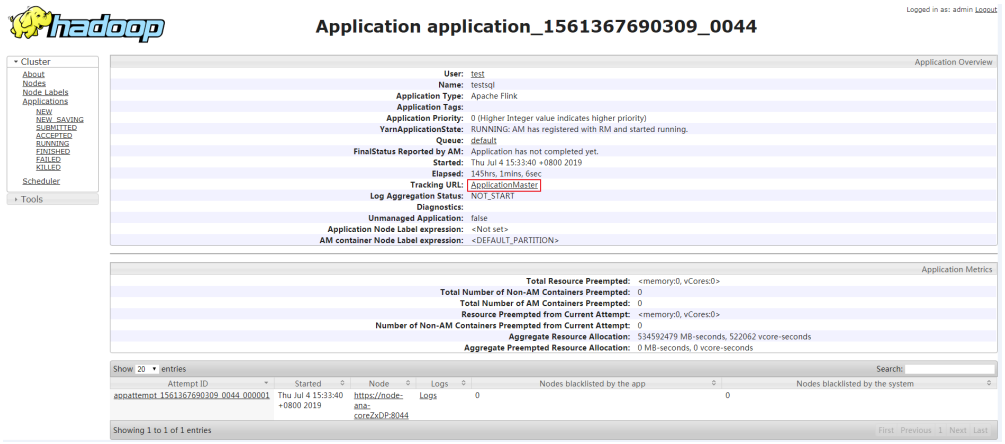


Step 7 Go to the native YARN service page, find the application of the job, and click the application name to go to the job details page. For details, see "Using Flink" > "Viewing Flink Job Information" in *MapReduce Service Component Operation Guide*.

- If the job is not completed, click **Tracking URL** to go to the native Flink page and view the job running information.
- If the job submitted in a session has been completed, you can click **Tracking URL** to log in to the native Flink service page to view job information.

Figure 6-11 Application



----End

6.3.3 Using a Flume Client

Scenario

You can use Flume to import collected log information to Kafka.

Prerequisites

- A streaming cluster with Kerberos authentication enabled has been created.
- The Flume client has been installed in a directory, for example, **/opt/Flumeclient**, on the node where logs are generated. For details about how to install the Flume client, see "Using Flume" > "Installing the Flume Client" in *MapReduce Service Component Operation Guide*. The client directory in the following operations is only an example. Change it to the actual installation directory.
- The streaming cluster can properly communicate with the node where logs are generated.

Using the Flume Client (Versions Earlier Than MRS 3.x)

NOTE

You do not need to perform **Step 2** to **Step 6** for a normal cluster.

Step 1 Install the client.

Step 2 Copy the configuration file of the authentication server from the Master1 node to the *Flume client installation directory*/**fusioninsight-flume-***Flume component version number*/**conf** directory on the node where the Flume client resides.

The full file path is **${BIGDATA_HOME}/MRS_Current/1_X_KerberosClient/etc/kdc.conf**.

In the preceding paths, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

Step 3 Check the service IP address of any node where the Flume role is deployed.

Log in to the cluster details page, choose *Name of the desired cluster* > **Components** > **Flume** > **Instances**, and check the service IP address of any node where the Flume role is deployed.

NOTE

If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Step 4 Copy the user authentication file from this node to the *Flume client installation directory*/**fusioninsight-flume-Flume component version number/conf** directory on the Flume client node.

The full file path is **${BIGDATA_HOME}/MRS_XXX/install/FusionInsight-Flume-Flume component version number/flume/conf/flume.keytab**.

In the preceding paths, **XXX** indicates the product version number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

Step 5 Copy the **jaas.conf** file from this node to the **conf** directory on the Flume client node.

The full file path is **${BIGDATA_HOME}/MRS_Current/1_X_Flume/etc/jaas.conf**.

In the preceding path, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

Step 6 Log in to the Flume client node and go to the client installation directory. Run the following command to modify the file:

vi conf/jaas.conf

Change the full path of the user authentication file defined by **keyTab** to the **Flume client installation directory/fusioninsight-flume-*Flume component version number*/conf** saved in **Step 4**, and save the modification and exit.

Step 7 Run the following command to modify the **flume-env.sh** configuration file of the Flume client:

vi *Flume client installation directory*/**fusioninsight-flume-***Flume component version number*/**conf/flume-env.sh**

Add the following information after **-XX:+UseCMSCompactAtFullCollection**:

```
-Djava.security.krb5.conf=Flume client installation directory/fusioninsight-flume-1.9.0/conf/kdc.conf -Djava.security.auth.login.config=Flume client installation directory/fusioninsight-flume-1.9.0/conf/jaas.conf -Dzookeeper.request.timeout=120000
```

For example, **"-XX:+UseCMSCompactAtFullCollection -Djava.security.krb5.conf=*Flume client installation directory*/fusioninsight-flume-*Flume component version number*/conf/kdc.conf -Djava.security.auth.login.config=***Flume client installation directory*/fusioninsight-flume-*Flume component version number*/conf/jaas.conf -Dzookeeper.request.timeout=120000"**

Change *Flume client installation directory* to the actual installation directory. Then save and exit.

Step 8 Assume that the Flume client installation path is **/opt/FlumeClient**. Run the following command to restart the Flume client:

cd /opt/FlumeClient/fusioninsight-flume-*Flume component version number***/bin**

./flume-manage.sh restart

Step 9 Run the following command to modify the **properties.properties** configuration file of the Flume client:

vi *Flume client installation directory***/fusioninsight-flume-***Flume component version number***/conf/properties.properties**

Add the following information to the file:

```
################################################################################
################
client.sources = static_log_source
client.channels = static_log_channel
client.sinks = kafka_sink
################################################################################
################
#LOG_TO_HDFS_ONLINE_1

client.sources.static_log_source.type = spooldir
client.sources.static_log_source.spoolDir = PATH
client.sources.static_log_source.fileSuffix = .COMPLETED
client.sources.static_log_source.ignorePattern = ^$
client.sources.static_log_source.trackerDir = PATH
client.sources.static_log_source.maxBlobLength = 16384
client.sources.static_log_source.batchSize = 51200
client.sources.static_log_source.inputCharset = UTF-8
client.sources.static_log_source.deserializer = LINE
client.sources.static_log_source.selector.type = replicating
client.sources.static_log_source.fileHeaderKey = file
client.sources.static_log_source.fileHeader = false
client.sources.static_log_source.basenameHeader = true
client.sources.static_log_source.basenameHeaderKey = basename
client.sources.static_log_source.deletePolicy = never

client.channels.static_log_channel.type = file
client.channels.static_log_channel.dataDirs = PATH
client.channels.static_log_channel.checkpointDir = PATH
client.channels.static_log_channel.maxFileSize = 2146435071
client.channels.static_log_channel.capacity = 1000000
client.channels.static_log_channel.transactionCapacity = 612000
client.channels.static_log_channel.minimumRequiredSpace = 524288000

client.sinks.kafka_sink.type = org.apache.flume.sink.kafka.KafkaSink
client.sinks.kafka_sink.kafka.topic = flume_test
client.sinks.kafka_sink.kafka.bootstrap.servers = XXX.XXX.XXX.XXX:Kafka port number,XXX.XXX.XXX.XXX:Kafka
port number,XXX.XXX.XXX.XXX:Kafka port number
client.sinks.kafka_sink.flumeBatchSize = 1000
client.sinks.kafka_sink.kafka.producer.type = sync
client.sinks.kafka_sink.kafka.security.protocol  = SASL_PLAINTEXT
client.sinks.kafka_sink.kafka.kerberos.domain.name = hadoop.XXX.com
client.sinks.kafka_sink.requiredAcks = 0

client.sources.static_log_source.channels = static_log_channel
client.sinks.kafka_sink.channel = static_log_channel
```

Modify the following parameters as required. Then save and exit the file.

- spoolDir

- trackerDir
- dataDirs
- checkpointDir
- topic

  If the topic does not exist in Kafka, the topic is automatically created by default.
- kafka.bootstrap.servers

  By default, the port for a security cluster is port 21007 and that for a normal cluster is port 9092.
- kafka.security.protocol

  Set this parameter to **SASL_PLAINTEXT** for a security cluster and **PLAINTEXT** for a normal cluster.
- **kafka.kerberos.domain.name**

  You do not need to set this parameter for a normal cluster. For a security cluster, the value of this parameter is the value of **kerberos.domain.name** in the Kafka cluster.

  You can check **${BIGDATA_HOME}/MRS_Current/1_X_Broker/etc/server.properties** on the node where the broker instance resides.

  In the preceding paths, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

Step 10 The Flume client automatically loads the information in the **properties.properties** file.

After new log files are generated in the directory specified by **spoolDir**, the logs will be sent to Kafka producers and can be consumed by Kafka consumers.

----End

Using the Flume Client (MRS 3.x or Later)

NOTE

You do not need to perform **Step 2** to **Step 6** for a normal cluster.

Step 1 Install the client.

Step 2 Copy the configuration file of the authentication server from the Master1 node to the *Flume client installation directory*/**fusioninsight-flume-***Flume component version number*/**conf** directory on the node where the Flume client resides.

The full file path is **${BIGDATA_HOME}/FusionInsight_Current/1_X_KerberosClient/etc/kdc.conf**. In the preceding path, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

Step 3 Check the service IP address of any node where the Flume role is deployed.

Log in to FusionInsight Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**. Choose **Cluster > Services > Flume > Instance**. Check the service IP address of any node where the Flume role is deployed.

NOTE

If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Step 4 Copy the user authentication file from this node to the *Flume client installation directory*/**fusioninsight-flume-Flume component version number/conf** directory on the Flume client node.

The full file path is **${BIGDATA_HOME}/FusionInsight_Porter_XXX/install/FusionInsight-Flume-Flume component version number/flume/conf/flume.keytab**.

In the preceding paths, **XXX** indicates the product version number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

Step 5 Copy the **jaas.conf** file from this node to the **conf** directory on the Flume client node.

The full file path is **${BIGDATA_HOME}/FusionInsight_Current/1_X_Flume/etc/jaas.conf**.

In the preceding path, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

Step 6 Log in to the Flume client node and go to the client installation directory. Run the following command to modify the file:

vi conf/jaas.conf

Change the full path of the user authentication file defined by **keyTab** to the **Flume client installation directory/fusioninsight-flume-*Flume component version number*/conf** saved in **Step 4**, and save the modification and exit.

Step 7 Run the following command to modify the **flume-env.sh** configuration file of the Flume client:

vi *Flume client installation directory*/**fusioninsight-flume-***Flume component version number*/**conf/flume-env.sh**

Add the following information after **-XX:+UseCMSCompactAtFullCollection**:

```
-Djava.security.krb5.conf=Flume client installation directory/fusioninsight-flume-1.9.0/conf/kdc.conf -Djava.security.auth.login.config=Flume client installation directory/fusioninsight-flume-1.9.0/conf/jaas.conf -Dzookeeper.request.timeout=120000
```

For example, **"-XX:+UseCMSCompactAtFullCollection -Djava.security.krb5.conf=*Flume client installation directory*/fusioninsight-flume-*Flume component version number*/conf/kdc.conf -Djava.security.auth.login.config=***Flume client installation directory*/fusioninsight-flume-*Flume component version number*/conf/jaas.conf -Dzookeeper.request.timeout=120000"**

Change *Flume client installation directory* to the actual installation directory. Then save and exit.

Step 8 Assume that the Flume client installation path is **/opt/FlumeClient**. Run the following command to restart the Flume client:

cd /opt/FlumeClient/fusioninsight-flume-*Flume component version number***/bin**

./flume-manage.sh restart

Step 9 Run the following command to modify the **properties.properties** configuration file of the Flume client:

vi *Flume client installation directory***/fusioninsight-flume-***Flume component version number***/conf/properties.properties**

Add the following information to the file:

```
################################################################################################
client.sources = static_log_source
client.channels = static_log_channel
client.sinks = kafka_sink
################################################################################################
#LOG_TO_HDFS_ONLINE_1

client.sources.static_log_source.type = spooldir
client.sources.static_log_source.spoolDir = PATH
client.sources.static_log_source.fileSuffix = .COMPLETED
client.sources.static_log_source.ignorePattern = ^$
client.sources.static_log_source.trackerDir = PATH
client.sources.static_log_source.maxBlobLength = 16384
client.sources.static_log_source.batchSize = 51200
client.sources.static_log_source.inputCharset = UTF-8
client.sources.static_log_source.deserializer = LINE
client.sources.static_log_source.selector.type = replicating
client.sources.static_log_source.fileHeaderKey = file
client.sources.static_log_source.fileHeader = false
client.sources.static_log_source.basenameHeader = true
client.sources.static_log_source.basenameHeaderKey = basename
client.sources.static_log_source.deletePolicy = never

client.channels.static_log_channel.type = file
client.channels.static_log_channel.dataDirs = PATH
client.channels.static_log_channel.checkpointDir = PATH
client.channels.static_log_channel.maxFileSize = 2146435071
client.channels.static_log_channel.capacity = 1000000
client.channels.static_log_channel.transactionCapacity = 612000
client.channels.static_log_channel.minimumRequiredSpace = 524288000

client.sinks.kafka_sink.type = org.apache.flume.sink.kafka.KafkaSink
client.sinks.kafka_sink.kafka.topic = flume_test
client.sinks.kafka_sink.kafka.bootstrap.servers = XXX.XXX.XXX.XXX:Kafka port number,XXX.XXX.XXX.XXX:Kafka port number,XXX.XXX.XXX.XXX:Kafka port number
client.sinks.kafka_sink.flumeBatchSize = 1000
client.sinks.kafka_sink.kafka.producer.type = sync
client.sinks.kafka_sink.kafka.security.protocol  = SASL_PLAINTEXT
client.sinks.kafka_sink.kafka.kerberos.domain.name = hadoop.XXX.com
client.sinks.kafka_sink.requiredAcks = 0

client.sources.static_log_source.channels = static_log_channel
client.sinks.kafka_sink.channel = static_log_channel
```

Modify the following parameters as required. Then save and exit the file.

- spoolDir
- trackerDir
- dataDirs
- checkpointDir
- topic

If the topic does not exist in Kafka, the topic is automatically created by default.

- kafka.bootstrap.servers

  By default, the port for a security cluster is port 21007 and that for a normal cluster is port 9092.

- kafka.security.protocol

  Set this parameter to **SASL_PLAINTEXT** for a security cluster and **PLAINTEXT** for a normal cluster.

- **kafka.kerberos.domain.name**

  You do not need to set this parameter for a normal cluster. For a security cluster, the value of this parameter is the value of **kerberos.domain.name** in the Kafka cluster.

  For details, check **${BIGDATA_HOME}/FusionInsight_Current/1_X_Broker/etc/server.properties** on the node where the broker instance resides.

  In the preceding paths, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

Step 10 The Flume client automatically loads the information in the **properties.properties** file.

After new log files are generated in the directory specified by **spoolDir**, the logs will be sent to Kafka producers and can be consumed by Kafka consumers.

----End

6.3.4 Using an HBase Client

Scenario

This section describes how to use the HBase client in an O&M scenario or a service scenario.

Prerequisites

- The client has been installed. For example, the installation directory is **/opt/hadoopclient**. The client directory in the following operations is only an example. Change it to the actual installation directory.
- Service component users are created by the administrator as required.

  A machine-machine user needs to download the **keytab** file and a human-machine user needs to change the password upon the first login.

- If a non-**root** user uses the HBase client, ensure that the owner of the HBase client directory is this user. Otherwise, run the following command to change the owner.

  chown user:group -R *Client installation directory*/**HBase**

Using the HBase Client (Versions Earlier Than MRS 3.x)

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to go to the client directory:

cd /opt/hadoopclient

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the current user. The current user must have the permission to create HBase tables. If Kerberos authentication is disabled for the current cluster, skip this step.

kinit *Component service user*

For example, **kinit hbaseuser**.

Step 5 Run the following HBase client command:

hbase shell

----End

Using the HBase Client (MRS 3.x or Later)

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to go to the client directory:

cd /opt/hadoopclient

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 If you use the client to connect to a specific HBase instance in a scenario where multiple HBase instances are installed, run the following command to load the environment variables of the instance. Otherwise, skip this step. For example, to load the environment variables of the HBase2 instance, run the following command:

source HBase2/component_env

Step 5 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the current user. The current user must have the permission to create HBase tables. If Kerberos authentication is disabled for the current cluster, skip this step.

kinit *Component service user*

For example, **kinit hbaseuser**.

Step 6 Run the following HBase client command:

hbase shell

----End

Common HBase client commands

The following table lists common HBase client commands. For more commands, see **http://hbase.apache.org/2.2/book.html**.

Table 6-4 HBase client commands

Command	Description
create	Used to create a table, for example, **create 'test', 'f1', 'f2', 'f3'**.
disable	Used to disable a specified table, for example, **disable 'test'**.
enable	Used to enable a specified table, for example, **enable 'test'**.
alter	Used to alter the table structure. You can run the **alter** command to add, modify, or delete column family information and table-related parameter values, for example, **alter 'test', {NAME => 'f3', METHOD => 'delete'}**.
describe	Used to obtain the table description, for example, **describe 'test'**.
drop	Used to delete a specified table, for example, **drop 'test'**. Before deleting a table, you must stop it.
put	Used to write the value of a specified cell, for example, **put 'test','r1','f1:c1','myvalue1'**. The cell location is unique and determined by the table, row, and column.
get	Used to get the value of a row or the value of a specified cell in a row, for example, **get 'test','r1'**.
scan	Used to query table data, for example, **scan 'test'**. The table name and scanner must be specified in the command.

6.3.5 Using an HDFS Client

Scenario

This section describes how to use the HDFS client in an O&M scenario or service scenario.

Prerequisites

- The client has been installed.

  For example, the installation directory is **/opt/hadoopclient**. The client directory in the following operations is only an example. Change it to the actual installation directory.
- Service component users are created by the administrator as required. In security mode, machine-machine users need to download the keytab file. A human-machine user needs to change the password upon the first login. (This operation is not required in normal mode.)

Using the HDFS Client

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to go to the client installation directory:

cd /opt/hadoopclient

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 If the cluster is in security mode, run the following command to authenticate the user. In normal mode, user authentication is not required.

kinit *Component service user*

Step 5 Run the HDFS Shell command. Example:

hdfs dfs -ls /

----End

Common HDFS Client Commands

The following table lists common HDFS client commands.

For more commands, see **https://hadoop.apache.org/docs/stable/hadoop-project-dist/hadoop-common/CommandsManual.html#User_Commands**.

Table 6-5 Common HDFS client commands

Command	Description	Example
hdfs dfs -mkdir *Folder name*	Used to create a folder.	**hdfs dfs -mkdir /tmp/mydir**
hdfs dfs -ls *Folder name*	Used to view a folder.	**hdfs dfs -ls /tmp**
hdfs dfs -put *Local file on the client node Specified HDFS path*	Used to upload a local file to a specified HDFS path.	**hdfs dfs -put /opt/test.txt /tmp** Upload the **/opt/test.txt** file on the client node to the **/tmp** directory of HDFS.
hdfs dfs -get *Specified file on HDFS Specified path on the client node*	Used to download the HDFS file to the specified local path.	**hdfs dfs -get /tmp/test.txt /opt/** Download the **/tmp/test.txt** file on HDFS to the **/opt** path on the client node.
hdfs dfs -rm -r -f *Specified folder on HDFS*	Used to delete a folder.	**hdfs dfs -rm -r -f /tmp/mydir**

Command	Description	Example
hdfs dfs -chmod *Permission parameter File directory*	Used to configure the HDFS directory permission for a user.	**hdfs dfs -chmod 700 /tmp/test**

Client-related FAQs

1. What do I do when the HDFS client exits abnormally and error message "java.lang.OutOfMemoryError" is displayed after the HDFS client command is running?

   This problem occurs because the memory required for running the HDFS client exceeds the preset upper limit (128 MB by default). You can change the memory upper limit of the client by modifying **CLIENT_GC_OPTS** in *<Client installation path>***/HDFS/component_env**. For example, if you want to set the upper limit to 1 GB, run the following command:

   ```
   CLIENT_GC_OPTS="-Xmx1G"
   ```

   After the modification, run the following command to make the modification take effect:

   source <*Client installation path*>/**/bigdata_env**

2. How do I set the log level when the HDFS client is running?

   By default, the logs generated during the running of the HDFS client are printed to the console. The default log level is INFO. To enable the DEBUG log level for fault locating, run the following command to export an environment variable:

   export HADOOP_ROOT_LOGGER=DEBUG,console

   Then run the HDFS Shell command to generate the DEBUG logs.

   If you want to print INFO logs again, run the following command:

   export HADOOP_ROOT_LOGGER=INFO,console

3. How do I delete HDFS files permanently?

   HDFS provides a recycle bin mechanism. Typically, after an HDFS file is deleted, the file is moved to the recycle bin of HDFS. If the file is no longer needed and the storage space needs to be released, clear the corresponding recycle bin directory, for example, **hdfs://hacluster/user/xxx/.Trash/Current/***xxx*.

6.3.6 Using a Hive Client

Scenario

This section guides users to use a Hive client in an O&M or service scenario.

Prerequisites

- The client has been installed. For example, the client is installed in the **/opt/hadoopclient** directory. The client directory in the following operations is only an example. Change it to the actual installation directory.
- Service component users are created by the administrator as required. In security mode, machine-machine users need to download the keytab file. A human-machine user must change the password upon the first login.

Using the Hive Client (Versions Earlier Than MRS 3.x)

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to go to the client installation directory:

cd /opt/hadoopclient

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 Log in to the Hive client based on the cluster authentication mode.

- In security mode, run the following command to complete user authentication and log in to the Hive client:

  kinit *Component service user*

  beeline

- In common mode, run the following command to log in to the Hive client. If no component service user is specified, the current OS user is used to log in to the Hive client.

  beeline -n *component service user*

  NOTE

  After a beeline connection is established, you can compile and submit HQL statements to execute related tasks. To run the Catalog client command, you need to run the **!q** command first to exit the beeline environment.

Step 5 Run the following command to execute the HCatalog client command:

hcat -e *"cmd"*

cmd must be a Hive DDL statement, for example, **hcat -e "show tables"**.

NOTE

- To use the HCatalog client, choose **More** > **Download Client** on the service page to download the clients of all services. This restriction does not apply to the beeline client.
- Due to permission model incompatibility, tables created using the HCatalog client cannot be accessed on the HiveServer client. However, the tables can be accessed on the WebHCat client.
- If you use the HCatalog client in Normal mode, the system performs DDL commands using the current user who has logged in to the operating system.
- Exit the beeline client by running the **!q** command instead of by pressing **Ctrl + c**. Otherwise, the temporary files generated by the connection cannot be deleted and a large number of junk files will be generated as a result.
- If multiple statements need to be entered during the use of beeline clients, separate the statements from each other using semicolons (**;**) and set the value of **entireLineAsCommand** to **false**.

  Setting method: If beeline has not been started, run the **beeline --entireLineAsCommand=false** command. If the beeline has been started, run the **!set entireLineAsCommand false** command.

  After the setting, if a statement contains semicolons (**;**) that do not indicate the end of the statement, escape characters must be added, for example, **select concat_ws('\;', collect_set(col1)) from tbl**.

----End

Using the Hive Client (MRS 3.x or Later)

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to go to the client installation directory:

cd /opt/hadoopclient

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 MRS 3.*X* supports multiple Hive instances. If you use the client to connect to a specific Hive instance in a scenario when multiple Hive instances are installed, run the following command to load the environment variables of the instance. Otherwise, skip this step. For example, load the environment variables of the Hive2 instance.

source Hive2/component_env

Step 5 Log in to the Hive client based on the cluster authentication mode.

- In security mode, run the following command to complete user authentication and log in to the Hive client:

  kinit *Component service user*

  beeline

- In common mode, run the following command to log in to the Hive client. If no component service user is specified, the current OS user is used to log in to the Hive client.

  beeline -n *component service user*

Step 6 Run the following command to execute the HCatalog client command:

hcat -e *"cmd"*

cmd must be a Hive DDL statement, for example, **hcat -e "show tables"**.

NOTE

- To use the HCatalog client, choose **More** > **Download Client** on the service page to download the clients of all services. This restriction does not apply to the beeline client.
- Due to permission model incompatibility, tables created using the HCatalog client cannot be accessed on the HiveServer client. However, the tables can be accessed on the WebHCat client.
- If you use the HCatalog client in Normal mode, the system performs DDL commands using the current user who has logged in to the operating system.
- Exit the beeline client by running the **!q** command instead of by pressing **Ctrl + C**. Otherwise, the temporary files generated by the connection cannot be deleted and a large number of junk files will be generated as a result.
- If multiple statements need to be entered during the use of beeline clients, separate the statements from each other using semicolons (**;**) and set the value of **entireLineAsCommand** to **false**.

  Setting method: If beeline has not been started, run the **beeline --entireLineAsCommand=false** command. If the beeline has been started, run the **!set entireLineAsCommand false** command.

  After the setting, if a statement contains semicolons (**;**) that do not indicate the end of the statement, escape characters must be added, for example, **select concat_ws('\;', collect_set(col1)) from tbl**.

----End

Common Hive Client Commands

The following table lists common Hive Beeline commands.

For more commands, see **https://cwiki.apache.org/confluence/display/Hive/HiveServer2+Clients#HiveServer2Clients-BeelineCommands**.

Table 6-6 Common Hive Beeline commands

Command	Description
set <key>=<value>	Sets the value of a specific configuration variable (key). **NOTE** If the variable name is incorrectly spelled, the Beeline does not display an error.
set	Prints the list of configuration variables overwritten by users or Hive.
set -v	Prints all configuration variables of Hadoop and Hive.
add FILE[S] <filepath> <filepath>*add JAR[S] <filepath> <filepath>*add ARCHIVE[S] <filepath> <filepath>*	Adds one or more files, JAR files, or ARCHIVE files to the resource list of the distributed cache.

Command	Description
add FILE[S] <ivyurl> <ivyurl>* add JAR[S] <ivyurl> <ivyurl>* add ARCHIVE[S] <ivyurl> <ivyurl>*	Adds one or more files, JAR files, or ARCHIVE files to the resource list of the distributed cache using the lvy URL in the **ivy://goup:module:version?query_string** format.
list FILE[S]list JAR[S]list ARCHIVE[S]	Lists the resources that have been added to the distributed cache.
list FILE[S] <filepath>*list JAR[S] <filepath>*list ARCHIVE[S] <filepath>*	Checks whether given resources have been added to the distributed cache.
delete FILE[S] <filepath>*delete JAR[S] <filepath>*delete ARCHIVE[S] <filepath>*	Deletes resources from the distributed cache.
delete FILE[S] <ivyurl> <ivyurl>* delete JAR[S] <ivyurl> <ivyurl>* delete ARCHIVE[S] <ivyurl> <ivyurl>*	Delete the resource added using **<ivyurl>** from the distributed cache.
reload	Enable HiveServer2 to discover the change of the JAR file **hive.reloadable.aux.jars.path** in the specified path. (You do not need to restart HiveServer2.) Change actions include adding, deleting, or updating JAR files.
dfs <dfs command>	Runs the **dfs** command.
<query string>	Executes the Hive query and prints the result to the standard output.

6.3.7 Using an Impala Client

Impala is a massively parallel processing (MPP) SQL query engine for processing vast amounts of data stored in Hadoop clusters. It is an open source software written in C++ and Java. It provides high performance and low latency compared with other SQL engines for Hadoop.

Background

Suppose a user develops an application to manage users who use service A in an enterprise. The procedure of operating service A on the Impala client is as follows:

Operations on common tables:

- Create the **user_info** table.
- Add users' educational backgrounds and titles to the table.
- Query user names and addresses by user ID.
- Delete the user information table after service A ends.

Table 6-7 User information

No.	Name	Gender	Age	Address
12005000201	A	Male	19	City A
12005000202	B	Female	23	City B
12005000203	C	Male	26	City C
12005000204	D	Male	18	City D
12005000205	E	Female	21	City E
12005000206	F	Male	32	City F
12005000207	G	Female	29	City G
12005000208	H	Female	30	City H
12005000209	I	Male	26	City I
12005000210	J	Female	25	City J

Prerequisites

The client has been installed. For example, the client is installed in the **/opt/hadoopclient** directory. The client directory in the following operations is only an example. Change it to the actual installation directory.

Procedure

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to go to the client installation directory:

cd /opt/hadoopclient

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 Run the Impala client command to implement service A.

Run the client command of the Impala component directly.

impala-shell

NOTE

By default, **impala-shell** attempts to connect to the Impala daemon on port 21000 of **localhost**. To connect to another host, use the **-i < host:port >** option, for example, **impala-shell -i** *xxx.xxx.xxx.xxx***:21000**. To automatically connect to a specific Impala database, use the **-d <database>** option. For example, if all your Kudu tables are in the **impala_kudu** database, **-d impala_kudu** can use this database. To exit the Impala Shell, run the **quit** command.

Operations on internal tables:

1. Create the **user_info** user information table according to **Table 6-7** and add data to it.
   ```
   create table user_info(id string,name string,gender string,age int,addr string);
   insert into table user_info(id,name,gender,age,addr) values("12005000201", "A", "Male", 19, "City A");
   ```
   ... (Other statements are the same.)
2. Add users' educational backgrounds and titles to the **user_info** table.

   For example, to add educational background and title information about user 12005000201, run the following commands.
   ```
   alter table user_info add columns(education string,technical string);
   ```
3. Query user names and addresses by user ID.

   For example, to query the name and address of user 12005000201, run the following command:
   ```
   select name,addr from user_info where id='12005000201';
   ```
4. Delete the user information table:
   ```
   drop table user_info;
   ```

Operations on external partition tables:

Create an external partition table and import data.

1. Create a path for storing external table data.
   - Security mode (Kerberos authentication is enabled for clusters)

     cd /opt/hadoopclient

     source bigdata_env

     kinit *hive*

     NOTE

     The user must have the hive administrator permissions.

     impala-shell

     hdfs dfs -mkdir /hive

     hdfs dfs -mkdir /hive/user_info
   - Normal mode (Kerberos authentication is disabled for clusters)

     su - omm

     cd /opt/hadoopclient

     source bigdata_env

     impala-shell

     hdfs dfs -mkdir /hive

     hdfs dfs -mkdir /hive/user_info

2. Create a table.
   ```
   create external table user_info(id string,name string,gender string,age int,addr string) partitioned by(year string) row format delimited fields terminated by ' ' lines terminated by '\n' stored as textfile location '/hive/user_info';
   ```

   NOTE

   fields terminated indicates delimiters, for example, spaces.

   lines terminated indicates line breaks, for example, **\n**.

   /hive/user_info indicates the path of the data file.

3. Import data.
   a. Execute the **insert** statement to insert data.
      ```
      insert into user_info partition(year="2018") values ("12005000201", "A", "Male", 19, "City A");
      ```
   b. Run the **load data** command to import file data.
      i. Create a file based on the data in **Table 6-7**. For example, the file name is **txt.log**. Fields are separated by space, and the line feed characters are used as the line breaks.
      ii. Upload the file to HDFS.

      hdfs dfs -put txt.log /tmp

      iii. Load data to the table.

      load data inpath '/tmp/txt.log' into table user_info partition (year='2018');

4. Query the imported data:
   ```
   select * from user_info;
   ```
5. Delete the user information table:
   ```
   drop table user_info;
   ```

----End

6.3.8 Using a Kafka Client

Scenario

You can create, query, and delete topics on a cluster client.

Prerequisites

The client has been installed. For example, the client is installed in the **/opt/hadoopclient** directory. The client directory in the following operations is only an example. Change it to the actual installation directory.

Using the Kafka Client (Versions Earlier Than MRS 3.x)

Step 1 Access the ZooKeeper instance page.

Click the cluster name to go to the cluster details page and choose **Components** > **ZooKeeper** > **Instances**.

NOTE

If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Step 2 View the IP addresses of the ZooKeeper role instance.

Record any IP address of the ZooKeeper instance.

Step 3 Log in to the node where the client is installed.

Step 4 Run the following command to switch to the client directory, for example, **/opt/hadoopclient/Kafka/kafka/bin**.

cd /opt/hadoopclient/Kafka/kafka/bin

Step 5 Run the following command to configure environment variables:

source /opt/hadoopclient/bigdata_env

Step 6 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the current user. If Kerberos authentication is disabled for the current cluster, skip this step.

kinit *Kafka user*

Step 7 Create a topic.

sh kafka-topics.sh --create --topic *Topic name* **--partitions** *Number of partitions occupied by the topic* **--replication-factor** *Number of replicas of the topic* **--zookeeper** *IP address of the node where the ZooKeeper instance resides:clientPort*/**kafka**

Step 8 Run the following command to view the topic information in the cluster:

sh kafka-topics.sh --list --zookeeper *IP address of the node where the ZooKeeper instance resides:clientPort*/**kafka**

Step 9 Delete the topic created in **Step 7**.

sh kafka-topics.sh --delete --topic *Topic name* **--zookeeper** *IP address of the node where the ZooKeeper instance resides*:*clientPort*/**kafka**

Type **y** and press **Enter**.

----End

Using the Kafka Client (MRS 3.x or Later)

Step 1 Access the ZooKeeper instance page.

Log in to FusionInsight Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**. Choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** > **Instance**.

Step 2 View the IP addresses of the ZooKeeper role instance.

Record any IP address of the ZooKeeper instance.

Step 3 Log in to the node where the client is installed.

Step 4 Run the following command to switch to the client directory, for example, **/opt/hadoopclient/Kafka/kafka/bin**.

cd /opt/hadoopclient/Kafka/kafka/bin

Step 5 Run the following command to configure environment variables:

source /opt/hadoopclient/bigdata_env

Step 6 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the current user. If Kerberos authentication is disabled for the current cluster, skip this step.

kinit *Kafka user*

Step 7 Log in to FusionInsight Manager, choose **Cluster** > **Name of the desired cluster** > **Services** > **ZooKeeper**, and click the **Configurations** tab and then **All Configurations**. On the displayed page, search for the **clientPort** parameter and record its value.

Step 8 Create a topic.

sh kafka-topics.sh --create --topic *Topic name* **--partitions** *Number of partitions occupied by the topic* **--replication-factor** *Number of replicas of the topic* **--zookeeper** *IP address of the node where the ZooKeeper instance resides:clientPort*/**kafka**

Step 9 Run the following command to view the topic information in the cluster:

sh kafka-topics.sh --list --zookeeper *IP address of the node where the ZooKeeper instance resides:clientPort*/**kafka**

Step 10 Delete the topic created in **Step 8**.

sh kafka-topics.sh --delete --topic *Topic name* **--zookeeper** *IP address of the node where the ZooKeeper instance resides:clientPort*/**kafka**

----End

6.3.9 Using a Kudu Client

Kudu is a columnar storage manager developed for the Apache Hadoop platform. Kudu shares the common technical properties of Hadoop ecosystem applications. It is horizontally scalable and supports highly available operations.

Prerequisites

The cluster client has been installed. For example, the client is installed in the **/opt/hadoopclient** directory. The client directory in the following operations is only an example. Change it to the actual installation directory.

Procedure

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to go to the client installation directory:

cd /opt/hadoopclient

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 Run the Kudu command line tool.

Run the command line tool of the Kudu component to view help information.

kudu -h

The command output is as follows:

```
Usage: kudu <command> [<args>]

<command> can be one of the following:
        cluster   Operate on a Kudu cluster
       diagnose   Diagnostic tools for Kudu servers and clusters
             fs   Operate on a local Kudu filesystem
            hms   Operate on remote Hive Metastores
  local_replica   Operate on local tablet replicas via the local filesystem
         master   Operate on a Kudu Master
            pbc   Operate on PBC (protobuf container) files
           perf   Measure the performance of a Kudu cluster
 remote_replica   Operate on remote tablet replicas on a Kudu Tablet Server
          table   Operate on Kudu tables
         tablet   Operate on remote Kudu tablets
           test   Various test actions
        tserver   Operate on a Kudu Tablet Server
            wal   Operate on WAL (write-ahead log) files
```

NOTE

The Kudu command line tool does not support DDL and DML operations, but provides the refined query function for the **cluster**, **master**, **tserver**, **fs**, and **table** parameters.

Common operations:

- Check the tables in the current cluster.

  kudu table list *KuduMaster instance IP1:7051, KuduMaster instance IP2:7051, KuduMaster instance IP3:7051*

- Query the configurations of the KuduMaster instance of the Kudu service.

  kudu master get_flags *KuduMaster instance IP:7051*

- Query the schema of a table.

  kudu table describe *KuduMaster instance IP1:7051, KuduMaster instance IP2:7051, KuduMaster instance IP3:7051 Table name*

- Delete a table.

  kudu table delete *KuduMaster instance IP1:7051, KuduMaster instance IP2:7051, KuduMaster instance IP3:7051 Table name*

  NOTE

  To obtain the IP address of the KuduMaster instance, choose **Components** > **Kudu** > **Instances** on the cluster details page.

----End

6.3.10 Using the Oozie Client

Scenario

This section describes how to use the Oozie client in an O&M scenario or service scenario.

Prerequisites

- The client has been installed. For example, the installation directory is **/opt/client**. The client directory in the following operations is only an example.
- Service component users are created by the administrator as required. In security mode, machine-machine users need to download the keytab file. A human-machine user must change the password upon the first login.

Using the Oozie Client

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to switch to the client installation directory (change it to the actual installation directory):

cd /opt/client

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 Check the cluster authentication mode.

- If the cluster is in security mode, run the following command to authenticate the user: *exampleUser* indicates the name of the user who submits tasks.

  kinit *exampleUser*
- If the cluster is in normal mode, go to **Step 5**.

Step 5 Perform the following operations to configure Hue:

1. Configure the Spark2x environment (skip this step if the Spark2x task is not involved):

   hdfs dfs -put /opt/client/Spark2x/spark/jars/*.jar /user/oozie/share/lib/spark2x/

   When the JAR package in the HDFS directory **/user/oozie/share** changes, you need to restart the Oozie service.
2. Upload the Oozie configuration file and JAR package to HDFS.

   hdfs dfs -mkdir /user/*exampleUser*

   hdfs dfs -put -f /opt/client/Oozie/oozie-client-*/examples /user/*exampleUser*/

NOTE

- *exampleUser* indicates the name of the user who submits tasks.
- If the user who submits the task and other files except **job.properties** are not changed, client installation directory **Oozie/oozie-client-*/examples** can be repeatedly used after being uploaded to HDFS.
- Resolve the JAR file conflict between Spark and Yarn about Jetty.

  hdfs dfs -rm -f /user/oozie/share/lib/spark/jetty-all-9.2.22.v20170606.jar
- In normal mode, if **Permission denied** is displayed during the upload, run the following commands:

  su - omm

  source /opt/client/bigdata_env

  hdfs dfs -chmod -R 777 /user/oozie

  exit

----End

6.3.11 Using a Storm Client

Scenario

This section describes how to use the Storm client in an O&M scenario or service scenario.

Prerequisites

- You have installed the client. For example, the installation directory is **/opt/hadoopclient**.
- Service component users are created by the administrator as required. In security mode, machine-machine users have downloaded the keytab file. A human-machine user must change the password upon the first login. (Not involved in normal mode)

Procedure

Step 1 Prepare the client based on service requirements. Log in to the node where the client is installed.

Log in to the node where the client is installed. For details, see **Using an MRS Client**.

Step 2 Run the following command to go to the client installation directory:

cd /opt/hadoopclient

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 If multiple Storm instances are installed, run the following command to load the environment variables of a specific instance when running the Storm command to submit the topology. Otherwise, skip this step. The following command uses the instance Storm-2 as an example.

source Storm-2/component_env

Step 5 Run the following command to perform user authentication (skip this step in normal mode):

kinit *Component service user*

Step 6 Run the following command to perform operations on the client:

For example, run the following command:

- **cql**
- **storm**

NOTE

A Storm client cannot be connected to secure and non-secure ZooKeepers at the same time.

----End

6.3.12 Using a Yarn Client

Scenario

This section guides users to use a Yarn client in an O&M or service scenario.

Prerequisites

- The client has been installed.

  For example, the installation directory is **/opt/hadoopclient**. The client directory in the following operations is only an example. Change it to the actual installation directory.
- Service component users are created by the administrator as required. In security mode, machine-machine users need to download the keytab file. A human-machine user must change the password upon the first login. In common mode, you do not need to download the keytab file or change the password.

Using the Yarn Client

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to go to the client installation directory:

cd /opt/hadoopclient

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 If the cluster is in security mode, run the following command to authenticate the user. In normal mode, user authentication is not required.

kinit *Component service user*

Step 5 Run the Yarn command. The following provides an example:

yarn application -list

----End

Client-related FAQs

1. What Do I Do When the Yarn Client Exits Abnormally and Error Message "java.lang.OutOfMemoryError" Is Displayed After the Yarn Client Command Is Run?

   This problem occurs because the memory required for running the Yarn client exceeds the upper limit (128 MB by default) set on the Yarn client. For clusters of MRS 3.x or later: You can modify **CLIENT_GC_OPTS** in *<Client installation path>***/HDFS/component_env** to change the memory upper limit of the Yarn client. For example, if you want to set the maximum memory to 1 GB, run the following command:

   ```
   export CLIENT_GC_OPTS="-Xmx1G"
   ```

   For clusters earlier than MRS 3.x: You can modify **GC_OPTS_YARN** in *< Client installation path >***/HDFS/component_env** to change the memory upper limit of the Yarn client. For example, if you want to set the maximum memory to 1 GB, run the following command:

   ```
   export GC_OPTS_YARN="-Xmx1G"
   ```

   After the modification, run the following command to make the modification take effect:

   source <*Client installation path*>/**/bigdata_env**

2. How Can I Set the Log Level When the Yarn Client Is Running?

   By default, the logs generated during the running of the Yarn client are printed to the console. The default log level is INFO. To enable the DEBUG log level for fault locating, run the following command to export an environment variable:

   export YARN_ROOT_LOGGER=DEBUG,console

   Then run the Yarn Shell command to print DEBUG logs.

   If you want to print INFO logs again, run the following command:

   export YARN_ROOT_LOGGER=INFO,console

7 Configuring a Cluster with Storage and Compute Decoupled

7.1 Introduction to Storage-Compute Decoupling

In scenarios that require large storage capacity and elastic compute resources, MRS enables you to store data in OBS and use an MRS cluster for data computing only. In this way, storage and compute are separated.

NOTE

In the big data decoupled storage-compute scenario, the OBS parallel file system must be used to configure a cluster. Using common object buckets will greatly affect the cluster performance.

Process of using the storage-compute decoupling function:

1. Configure a storage-compute decoupled cluster using either of the following methods (agency is recommended):
   - Bind an agency of the ECS type to an MRS cluster to access OBS, preventing the AK/SK from being exposed in the configuration file. For details, see **Configuring a Storage-Compute Decoupled Cluster (Agency)**.
   - Configure the AK/SK in an MRS cluster. The AK/SK will be exposed in the configuration file in plaintext. Exercise caution when performing this operation. For details, see **Configuring a Storage-Compute Decoupled Cluster (AK/SK)**.
2. Use the cluster.

   For details, see the following sections':
   - **Interconnecting Flink with OBS**
   - **Interconnecting Flume with OBS**
   - **Interconnecting HDFS with OBS**
   - **Interconnecting Hive with OBS**
   - **Interconnecting MapReduce with OBS**

  - **Interconnecting Spark2x with OBS**
  - **Interconnecting Sqoop with External Storage Systems**

7.2 Configuring a Storage-Compute Decoupled Cluster (Agency)

MRS allows you to store data in OBS and use an MRS cluster for data computing only. In this way, storage and compute are separated. You can create an IAM agency, which enables ECS to automatically obtain the temporary AK/SK to access OBS. This prevents the AK/SK from being exposed in the configuration file.

By binding an agency, ECSs or BMSs can manage some of your resources. Determine whether to configure an agency based on the actual service scenario.

MRS provides the following configuration modes for accessing OBS. You can select one of them. The agency mode is recommended.

- Bind an agency of the ECS type to an MRS cluster to access OBS, preventing the AK/SK from being exposed in the configuration file. For details, see the following part in this section.
- Configure the AK/SK in an MRS cluster. The AK/SK will be exposed in the configuration file in plaintext. Exercise caution when performing this operation. For details, see **Configuring a Storage-Compute Decoupled Cluster (AK/SK)**.

This function is available for components Hadoop, Hive, Spark, Presto, and Flink in clusters of .

(Optional) Step 1: Create an ECS Agency with OBS Access Permissions

NOTE

- MRS presets **MRS_ECS_DEFAULT_AGENCY** in the agency list of IAM so that you can select this agency when creating a cluster. This agency has the **OBSOperateAccess** permission and the **CESFullAccess** (only available for users who have enabled fine-grained policies), **CES Administrator**, and **KMS Administrator** permissions in the region where the cluster is located. Do not modify **MRS_ECS_DEFAULT_AGENCY** on IAM.
- If you want to use the preset agency, skip the step for creating an agency. If you want to use a custom agency, perform the following steps to create an agency. (To create or modify an agency, you must have the Security Administrator permission.)

1. Log in to the management console.
2. Choose **Service List** > **Management & Governance** > **Identity and Access Management**.
3. Choose **Agencies**. On the displayed page, click **Create Agency**.
4. Enter an agency name, for example, **mrs_ecs_obs**.
5. Set **Agency Type** to **Cloud service** and select **ECS BMS** to authorize ECS or BMS to invoke OBS.
6. Set **Validity Period** to **Unlimited** and click **Next**.
7. On the displayed page, search for the **OBS OperateAccess** and select it.

8. Click **Next**. On the displayed page, select the desired scope for permissions you selected. By default, **All resources** is selected. Click **Show More** and select **Global resources**.
9. In the dialog box that is displayed, click **OK** to start authorization. After the message "**Authorization successful.**" is displayed, click **Finish**. The agency is successfully created.

Step 2: Create a Cluster with Storage and Compute Separated

You can configure an agency when creating a cluster or bind an agency to an existing cluster to separate storage and compute. This section uses a cluster with Kerberos authentication enabled as an example.

Configuring an agency when creating a cluster:

1. Log in to the MRS management console.
2. Click **Create Cluster**. The page for creating a cluster is displayed.
3. Click the **Custom Config** tab.
4. On the **Custom Config** tab page, set software parameters.
   - **Region**: Select a region as required.
   - **Cluster Name**: You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing.
   - Cluster Version: Select a cluster version.
   - **Cluster Type**: Select **Analysis cluster** or **Hybrid cluster** and select all components.
   - **Metadata**: Select **Local**.
5. Click **Next** and set hardware parameters.
   - **AZ**: Use the default value.
   - **VPC**: Use the default value.
   - **Subnet**: Use the default value.
   - **Security Group**: Use the default value.
   - **EIP**: Use the default value.
   - **Enterprise Project**: Use the default value.
   - **Cluster Node**: Select the number of cluster nodes and node specifications based on site requirements.
6. Click **Next** and set related parameters.
   - **Kerberos Authentication**: This function is enabled by default. You can enable or disable it.
   - **Username**: The default username is **admin**, which is used to log in to MRS Manager.
   - **Password**: Set a password for user **admin**.
   - **Confirm Password**: Enter the password of user **admin** again.
   - **Login Mode**: Select a method for logging in to ECSs. In this example, select **Password**.
   - **Username**: The default username is **root**, which is used to remotely log in to ECSs.

- **Password**: Set a password for user **root**.
- **Confirm Password**: Enter the password of user **root** again.

7. In this example, configure an agency and leave other parameters blank. For details about how to configure other parameters, see **(Optional) Advanced Configuration**.

   Agency: Select the agency created in **(Optional) Step 1: Create an ECS Agency with OBS Access Permissions** or **MRS_ECS_DEFAULT_AGENCY** preset in IAM.

8. To enable secure communications, select **Enable**. For details, see **Communication Security Authorization**.
9. Click and wait until the cluster is created.

   If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

Configuring an agency for an existing cluster:

1. Log in to the MRS management console. In the left navigation pane, choose **Clusters** > **Active Clusters**.
2. Click the name of the cluster to enter its details page.
3. On the **Dashboard** page, click **Synchronize** on the right of **IAM User Sync** to synchronize IAM users.
4. On the **Dashboard** tab page, click **Manage Agency** on the right side of **Agency** to select an agency and click **OK** to bind it. Alternatively, click **Create Agency** to go to the IAM console to create an agency and select it.

Step 3: Create an OBS File System for Storing Data

NOTE

In the big data decoupled storage-compute scenario, the OBS parallel file system must be used to configure a cluster. Using common object buckets will greatly affect the cluster performance.

1. Log in to OBS Console.
2. Choose **Parallel File System** > **Create Parallel File System**.
3. Enter the file system name, for example, **mrs-word001**.

   Set other parameters as required.

4. Click **Create Now**.
5. In the parallel file system list on the OBS console, click the file system name to go to the details page.
6. In the navigation pane, choose **Files** and create the **program** and **input** folders.
   - **program**: Upload the program package to this folder.
   - **input**: Upload the input data to this folder.

Step 4: Accessing the OBS File System

1. Log in to a Master node as user **root**. For details, see **Logging In to an ECS**.

2. Run the following command to set the environment variables:

   For versions earlier than MRS 3.x, run the **source /opt/client/bigdata_env** command.

   For MRS 3.x or later, run the **source /opt/Bigdata/client/bigdata_env** command.

3. Verify that Hadoop can access OBS.

   a. View the list of files in the file system **mrs-word001**.

      hadoop fs -ls obs://mrs-word001/

   b. Check whether the file list is returned. If it is returned, OBS access is successful.

      Figure 7-1 Returned file list

      ```
      Found 2 items
      drwxrwxrwx   - root root          0 2019-12-21 11:04 obs://mrs-word001/input
      drwxrwxrwx   - root root          0 2019-12-21 11:04 obs://mrs-word001/program
      ```

4. Verify that Hive can access OBS.

   a. If Kerberos authentication has been enabled for the cluster, run the following command to authenticate the current user. The current user must have a permission to create Hive tables. For details about how to configure a role with a permission to create Hive tables, see **Creating a Role**. For details about how to create a user and bind a role to the user, see **Creating a User**. If Kerberos authentication is disabled for the current cluster, skip this step.

      kinit *MRS cluster user*

      Example: **kinit hiveuser**

   b. Run the client command of the Hive component.

      beeline

   c. Access the OBS directory in the beeline. For example, run the following command to create a Hive table and specify that data is stored in the **test_obs** directory of the file system **mrs-word001**:

      create table test_obs(a int, b string) row format delimited fields terminated by "," stored as textfile location "obs://mrs-word001/test_obs";

   d. Run the following command to query all tables. If table **test_obs** is displayed in the command output, OBS access is successful.

      show tables;

      Figure 7-2 Returned table name

      ```
      +-----------+
      | tab_name  |
      +-----------+
      | test_obs  |
      +-----------+
      1 row selected (0.352 seconds)
      ```

   e. Press **Ctrl+C** to exit the Hive beeline.

5. Verify that Spark can access OBS.

a. Run the client command of the Spark component.

spark-beeline

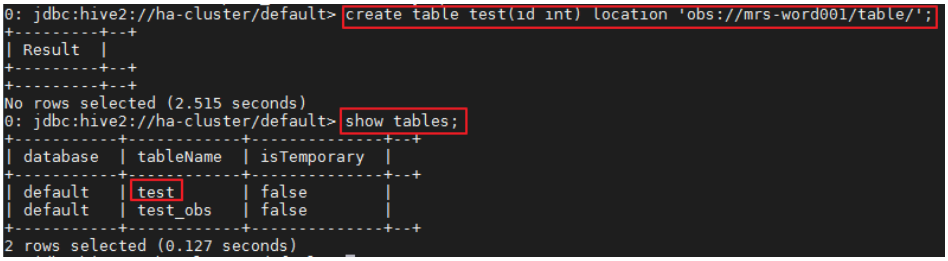
b. Access OBS in spark-beeline. For example, create table **test** in the **obs://mrs-word001/table/** directory.

create table test(id int) location 'obs://mrs-word001/table/';

c. Run the following command to query all tables. If table **test** is displayed in the command output, OBS access is successful.

show tables;

Figure 7-3 Returned table name



d. Press **Ctrl+C** to exit the Spark beeline.

6. Verify that Presto can access OBS.

– For normal clusters with Kerberos authentication disabled

i. Run the following command to connect to the client:

presto_cli.sh

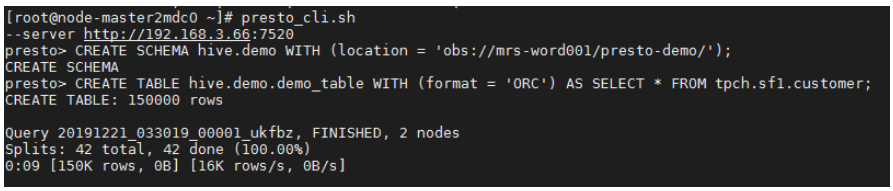
ii. On the Presto client, run the following statement to create a schema and set **location** to an OBS path:

CREATE SCHEMA hive.demo01 WITH (location = 'obs://mrs-word001/presto-demo002/');

iii. Create a table in the schema. The table data is stored in the OBS file system. The following is an example.

CREATE TABLE hive.demo.demo_table WITH (format = 'ORC') AS SELECT * FROM tpch.sf1.customer;

Figure 7-4 Return result



iv. Run **exit** to exit the client.

– For security clusters with Kerberos authentication enabled

i. Log in to MRS Manager and create a role with the Hive Admin Privilege permissions, for example, **prestorole**. For details about how to create a role, see **Creating a Role**.

ii. Create a user that belongs to the Presto and Hive groups and bind the role created in **6.i** to the user, for example, **presto001**. For details about how to create a user, see **Creating a User**.

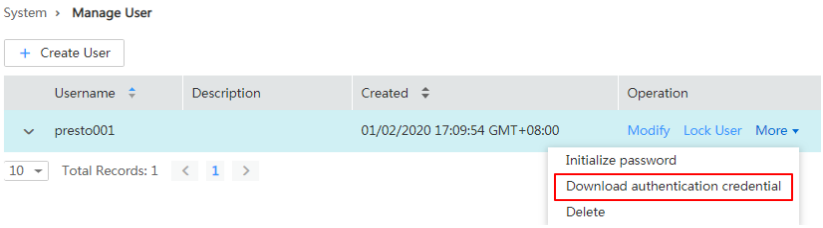
iii. Authenticate the current user.

kinit presto001

iv. Download the user credential.

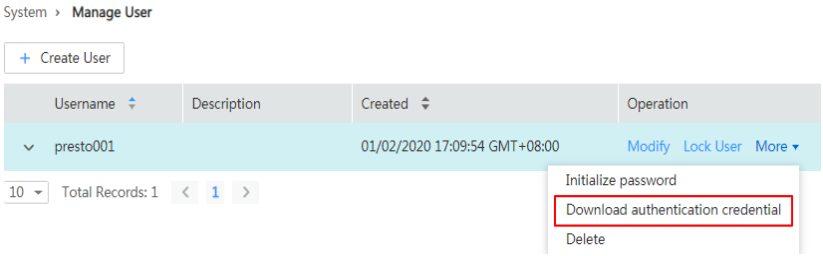
1) For MRS 3.x earlier, on MRS Manager, choose **System** > **Manage User**. In the row of the new user, choose **More** > **Download Authentication Credential**.

Figure 7-5 Downloading the Presto user authentication credential



2) On FusionInsight Manager for MRS 3.x or later,, choose **System > Permission > User**. In the row that contains the newly added user, click **More > Download Authentication Credential**.

Figure 7-6 Downloading the Presto user authentication credential



v. Decompress the downloaded user credential file, and save the obtained **krb5.conf** and **user.keytab** files to the client directory, for example, **/opt/Bigdata/client/Presto/**.

vi. Run the following command to obtain a user principal:

klist -kt /opt/Bigdata/client/Presto/user.keytab

vii. For clusters with Kerberos authentication enabled, run the following command to connect to the Presto Server of the cluster:

presto_cli.sh --krb5-config-path {krb5.conf file path} --krb5-principal {user principal} --krb5-keytab-path {user.keytab file path} --user {presto username}

- **krb5.conf** file path: Replace it with the file path set in **6.v**, for example, **/opt/Bigdata/client/Presto/krb5.conf**.
- **user.keytab** file path: Replace it with the file path set in **6.v**, for example, **/opt/Bigdata/client/Presto/user.keytab**.
- **user principal**: Replace it with the result returned in **6.vi**.
- **presto username**: Replace it with the name of the user created in **6.ii**, for example, **presto001**.

Example: presto_cli.sh --krb5-config-path /opt/Bigdata/client/Presto/krb5.conf --krb5-principal prest001@xxx_xxx_xxx_xxx.COM --krb5-keytab-path /opt/Bigdata/client/Presto/user.keytab --user presto001

viii. On the Presto client, run the following statement to create a schema and set **location** to an OBS path:

CREATE SCHEMA hive.demo01 WITH (location = 'obs://mrs-word001/presto-demo002/');

ix. Create a table in the schema. The table data is stored in the OBS file system. The following is an example.

CREATE TABLE hive.demo01.demo_table WITH (format = 'ORC') AS SELECT * FROM tpch.sf1.customer;

Figure 7-7 Return result

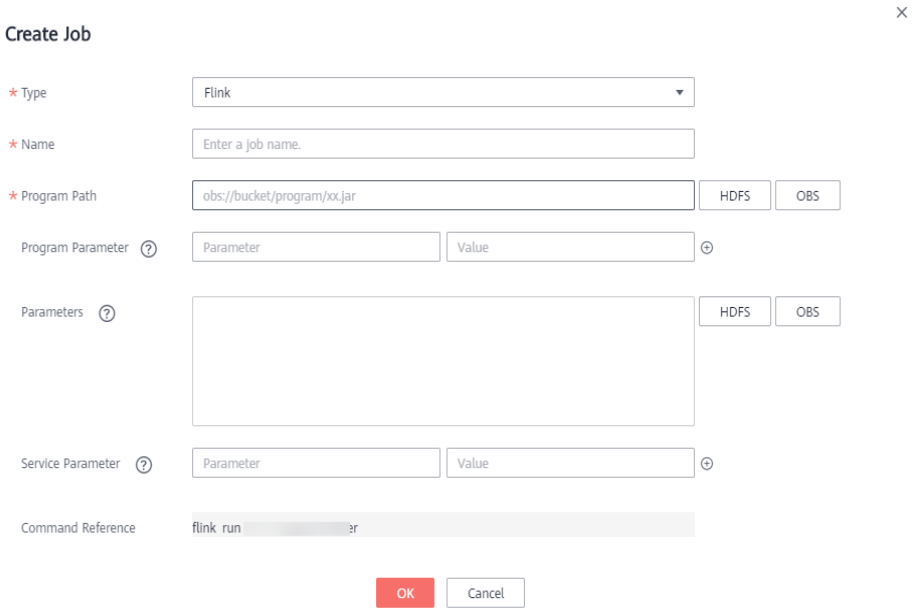
x. Run **exit** to exit the client.

7. Verify that Flink can access OBS.

a. On the **Dashboard** page, click **Synchronize** on the right of **IAM User Sync** to synchronize IAM users.

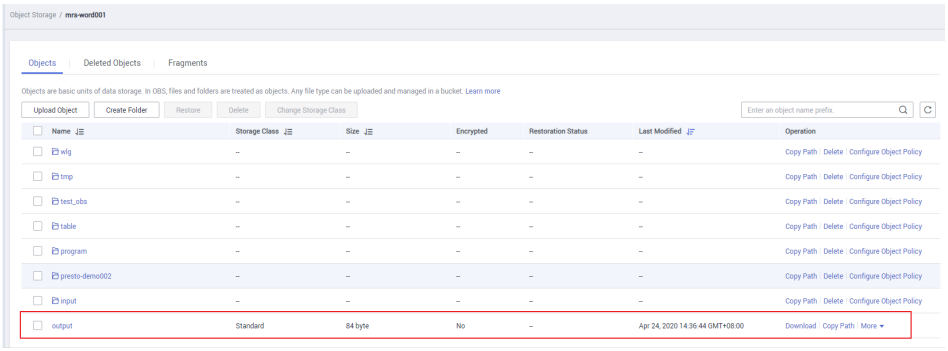
b. After user synchronization is complete, choose **Jobs** > **Create** on the cluster details page to create a Flink job. In **Parameters**, enter parameters in **--input <Job input path> --output <Job output path>** format. You can click **OBS** to select a job input path, and enter a job output path that does not exist, for example, **obs://mrs-word001/output/**. See **Figure 7-8**.

Figure 7-8 Creating a Flink job



c. On OBS Console, go to the output path specified during job creation. If the output directory is automatically created and contains the job execution results, OBS access is successful.

Figure 7-9 Flink job execution result



Reference

For details about how to control permissions to access OBS, see **Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS**.

7.3 Configuring a Storage-Compute Decoupled Cluster (AK/SK)

In or later, OBS can be interconnected with MRS using **obs://**. Currently, Hadoop, Hive, Spark, Presto, and Flink are supported. HBase cannot use **obs://** to interconnect with OBS.

MRS provides the following configuration modes for accessing OBS. You can select one of them. The agency mode is recommended.

- Bind an agency of the ECS type to an MRS cluster to access OBS, preventing the AK/SK from being exposed in the configuration file. For details, see **Configuring a Storage-Compute Decoupled Cluster (Agency)**.
- Configure the AK/SK in an MRS cluster. The AK/SK will be exposed in the configuration file in plaintext. Exercise caution when performing this operation. For details, see the following part in this section.

NOTE

- To improve data write performance, change the value of the **fs.obs.buffer.dir** parameter of the corresponding service to a data disk directory.
- In the big data decoupled storage-compute scenario, the OBS parallel file system must be used to configure a cluster. Using common object buckets will greatly affect the cluster performance.

Using Hadoop to Access OBS

- Add the following content to file **core-site.xml** in the HDFS directory (**$client_home/ HDFS/hadoop/etc/hadoop**) on the MRS client:

```
<property>
  <name>fs.obs.access.key</name>
  <value>ak</value>
```

```
</property>
<property>
    <name>fs.obs.secret.key</name>
    <value>sk</value>
</property>
<property>
    <name>fs.obs.endpoint</name>
    <value>obs endpoint</value>
</property>
```

NOTICE

AK and SK will be displayed as plaintext in the configuration file. Exercise caution when setting AK and SK in the file.

After the configuration is added, you can directly access data on OBS without manually adding the AK/SK and endpoint. For example, run the following command to view the file list of the **test_obs_orc** directory in the **obs-test** file system:

hadoop fs -ls "obs://obs-test/test_obs_orc"

- Add AK/SK and endpoint to the command line to access data on OBS.

  hadoop fs -Dfs.obs.endpoint=xxx -Dfs.obs.access.key=xx -Dfs.obs.secret.key=xx -ls "obs://obs-test/ test_obs_orc"

Using Hive to Access OBS

Step 1 Log in to the service configuration page.

- For versions earlier than MRS 3.x, log in to the cluster details page and choose **Components** > **Hive** > **Service Configuration**.
- For MRS 3.*x* or later, log in to FusionInsight Manager. For details, see **Accessing FusionInsight Manager (MRS 3.x or Later)**. Choose **Cluster** > **Services** > **Hive** > **Configurations**.

Step 2 In the configuration type drop-down box, switch **Basic Configurations** to **All Configurations**.

Step 3 Search for **fs.obs.access.key** and **fs.obs.secret.key** and set them to the AK and SK of OBS respectively.

If the preceding two parameters cannot be found in the current cluster, choose **Hive** > **Customization** in the navigation tree on the left and add the two parameters to the customized parameter **core.site.customized.configs**.

Step 4 Click **Save Configuration** and select **Restart the affected services or instances**. to restart the Hive service.

Step 5 Access the OBS directory in the beeline. For example, run the following command to create a Hive table and specify that data is stored in the **test_obs** directory in the **test-bucket** file system:

create table test_obs(a int, b string) row format delimited fields terminated by "," stored as textfile location "obs://test-bucket/test_obs";

----End

Using Spark to Access OBS

NOTE

SparkSQL depends on Hive. Therefore, when configuring OBS on Spark, you need to modify the OBS configuration used in **Using Hive to Access OBS**.

- spark-beeline and spark-sql

  You can add the following OBS attributes to the shell to access OBS:

  ```
  set fs.obs.endpoint=xxx
  set fs.obs.access.key=xxx
  set fs.obs.secret.key=xxx
  ```

- spark-beeline

  The spark-beeline can access OBS by configuring service parameters on Manager. The procedure is as follows:

  a. Log in to the service configuration page.

     - For versions earlier than MRS 3.x, log in to the cluster details page and choose **Components > Spark > Service Configuration**.
     - For MRS 3.*x* or later, log in to FusionInsight Manager. For details, see **Accessing FusionInsight Manager (MRS 3.x or Later)**. Choose **Cluster > Services > Spark2x > Configurations**.

  b. In the configuration type drop-down box, switch **Basic Configurations** to **All Configurations**.

  c. Choose **JDBCServer** > **OBS**, and set values for **fs.obs.access.key** and **fs.obs.secret.key**.

     If the preceding two parameters cannot be found in the current cluster, choose **JDBCServer** > **Customization** in the navigation tree on the left and add the two parameters to the customized parameter **spark.core-site.customized.configs**.

     Figure 7-10 Parameters for adding an OBS

     
  d. Click **Save Configuration** and select **Restart the affected services or instances**. Restart the Spark service.

  e. Access OBS in **spark-beeline**. For example, access the **obs://obs-demo-input/table/** directory.

     create table test(id int) location 'obs://obs-demo-input/table/';

- spark-sql and spark-submit

  The spark-sql can also access OBS by modifying the **core-site.xml** configuration file.

  The method of modifying the configuration file is the same when you use the spark-sql and spark-submit to submit a task to access OBS.

  Add the following content to **core-site.xml** in the Spark configuration folder (**$client_home/Spark/spark/conf**) on the MRS client:

```
<property>
   <name>fs.obs.access.key</name>
   <value>ak</value>
</property>
<property>
   <name>fs.obs.secret.key</name>
   <value>sk</value>
</property>
<property>
   <name>fs.obs.endpoint</name>
   <value>obs endpoint</value>
</property>
```

Using Presto to Access OBS

Step 1 Go to the cluster details page and choose **Components** > **Presto** > **Service Configuration**.

Step 2 In the configuration type drop-down box, switch **Basic Configurations** to **All Configurations**.

Step 3 Search for and configure the following parameters:

- Set **fs.obs.access.key** to **AK**.
- Set **fs.obs.secret.key** to **SK**.

If the preceding two parameters cannot be found in the current cluster, choose **Presto > Hive** in the navigation tree on the left and add the two parameters to the customized parameter **core.site.customized.configs**.

Step 4 Click **Save Configuration** and select **Restart the affected services or instances**. to restart the Presto service.

Step 5 Choose **Components** > **Hive** > **Service Configuration**.

Step 6 In the configuration type drop-down box, switch **Basic Configurations** to **All Configurations**.

Step 7 Search for and configure the following parameters:

- Set **fs.obs.access.key** to **AK**.
- Set **fs.obs.secret.key** to **SK**.

Step 8 Click **Save Configuration** and select **Restart the affected services or instances**. to restart the Hive service.

Step 9 On the Presto client, run the following statement to create a schema and set **location** to an OBS path:

CREATE SCHEMA hive.demo WITH (location = 'obs://obs-demo/presto-demo/');

Step 10 Create a table in the schema. The table data is stored in the OBS file system. The following is an example.

CREATE TABLE hive.demo.demo_table WITH (format = 'ORC') AS SELECT * FROM tpch.sf1.customer;

----End

Using Flink to Access OBS

Add the following configuration to the Flink configuration file of the MRS client in ***Client installation path*/Flink/flink/conf/flink-conf.yaml**:

```
fs.obs.access.key:ak
fs.obs.secret.key: sk
fs.obs.endpoint: obs endpoint
```

NOTICE

AK and SK will be displayed as plaintext in the configuration file. Exercise caution when setting AK and SK in the file.

After the configuration is added, you can directly access data on OBS without manually adding the AK/SK and endpoint.

7.4 Using a Storage-Compute Decoupled Cluster

7.4.1 Interconnecting Flink with OBS

Before performing the following operations, ensure that you have configured a storage-compute decoupled cluster by referring to **Configuring a Storage-Compute Decoupled Cluster (Agency)** or **Configuring a Storage-Compute Decoupled Cluster (AK/SK)**.

Step 1 Log in to the Flink client installation node as the client installation user.

Step 2 Run the following command to initialize environment variables:

source ${client_home}/bigdata_env

Step 3 Configure the Flink client properly. For details, see **Installing a Client (Version 3.x or Later)**.

Step 4 For a security cluster, run the following command to perform user authentication. If Kerberos authentication is not enabled for the current cluster, you do not need to run this command.

kinit *Username*

Step 5 Explicitly add the OBS file system to be accessed in the Flink command line.

./bin/flink run --class com.xxx.bigdata.flink.examples.FlinkProcessingTimeAPIMain ./config/FlinkCheckpointJavaExample.jar --chkPath obs://*Name of the OBS parallel file system*

----End

NOTE

Flink jobs are running on Yarn. Before configuring Flink to interconnect with the OBS file system, ensure that the interconnection between Yarn and the OBS file system is normal.

7.4.2 Interconnecting Flume with OBS

This section applies to MRS 3.x or later.

Before performing the following operations, ensure that you have configured a storage-compute decoupled cluster by referring to **Configuring a Storage-Compute Decoupled Cluster (Agency)** or **Configuring a Storage-Compute Decoupled Cluster (AK/SK)**.

Step 1 Configure an agency.

1. Log in to the MRS console. In the navigation pane on the left, choose **Clusters** > **Active Clusters**.
2. Click the name of a cluster to go to the cluster details page.
3. On the **Dashboard** page, click **Synchronize** on the right of **IAM User Sync** to synchronize IAM users.
4. Click **Manage Agency** on the right of **Agency**, select the target agency, and click **OK**.

Step 2 Create an OBS file system for storing data.

1. Log in to the OBS console.
2. In the navigation pane on the left, choose **Parallel File Systems**. On the displayed page, click **Create Parallel File System**.
3. Enter the file system name, for example, **esdk-c-test-pfs1**, and set other parameters as required. Click **Create Now**.
4. In the parallel file system list on the OBS console, click the created file system name to go to its details page.
5. In the navigation pane on the left, choose **Files** and click **Create Folder** to create the **testFlumeOutput** folder.

Step 3 Prepare the **properties.properties** file and upload it to the **/opt/flumeInput** directory.

1. Prepare the **properties.properties** file on the local host. Its content is as follows:

```
# source
server.sources = r1
# channels
server.channels = c1
# sink
server.sinks = obs_sink
# ----- define net source -----
server.sources.r1.type = seq
server.sources.r1.spooldir = /opt/flumeInput
# ---- define OBS sink ----
server.sinks.obs_sink.type = hdfs
server.sinks.obs_sink.hdfs.path = obs://esdk-c-test-pfs1/testFlumeOutput
server.sinks.obs_sink.hdfs.filePrefix = %[localhost]
server.sinks.obs_sink.hdfs.useLocalTimeStamp = true
# set file size to trigger roll
server.sinks.obs_sink.hdfs.rollSize = 0
server.sinks.obs_sink.hdfs.rollCount = 0
server.sinks.obs_sink.hdfs.rollInterval = 5
#server.sinks.obs_sink.hdfs.threadsPoolSize = 30
server.sinks.obs_sink.hdfs.fileType = DataStream
server.sinks.obs_sink.hdfs.writeFormat = Text
server.sinks.obs_sink.hdfs.fileCloseByEndEvent = false
```

```
# define channel
server.channels.c1.type = memory
server.channels.c1.capacity = 1000
# transaction size
server.channels.c1.transactionCapacity = 1000
server.channels.c1.byteCapacity = 800000
server.channels.c1.byteCapacityBufferPercentage = 20
server.channels.c1.keep-alive = 60
server.sources.r1.channels = c1
server.sinks.obs_sink.channel = c1
```

NOTE

The value of **server.sinks.obs_sink.hdfs.path** is the OBS file system created in **Step 2**.

2. Log in to the node where the Flume client is installed as user **root**.
3. Create the **/opt/flumeInput** directory and create a customized **.txt** file in this directory.
4. Log in to FusionInsight Manager.
5. Choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the displayed page, click **Configurations** and then **Upload File** in the **Value** column corresponding to the **flume.config.file** parameter, upload the **properties.properties** file prepared in **Step 3.1**, and click **Save**.

Step 4 View the result in the OBS system.

1. Log in to the OBS console.
2. Click **Parallel File Systems** and go to the folder created in **Step 2** to view the result.

----End

7.4.3 Interconnecting HDFS with OBS

Before performing the following operations, ensure that you have configured a storage-compute decoupled cluster by referring to **Configuring a Storage-Compute Decoupled Cluster (Agency)** or **Configuring a Storage-Compute Decoupled Cluster (AK/SK)**.

Step 1 Log in to the node on which the HDFS client is installed as a client installation user.

Step 2 Run the following command to switch to the client installation directory.

cd ${client_home}

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 If the cluster is in security mode, run the following command to authenticate the user. In normal mode, skip user authentication.

kinit *Component service user*

Step 5 Explicitly add the OBS file system to be accessed in the HDFS command line.

Example:

- Run the following command to access the OBS file system:

  hdfs dfs -ls obs://*OBS parallel file system name*/*Path*

- Run the following command to upload the **/opt/test.txt** file from the client node to the **/tmp** directory of HDFS:

  hdfs dfs -put /opt/test.txt /tmp

----End

NOTE

If a large number of logs are printed in the OBS file system, the read and write performance may be affected. You can adjust the log level of the OBS client as follows:

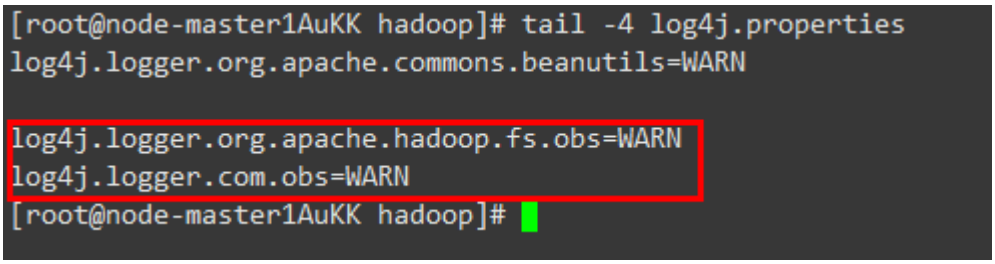
cd ${client_home}/HDFS/hadoop/etc/hadoop

vi log4j.properties

Add the OBS log level configuration to the file as follows:

log4j.logger.org.apache.hadoop.fs.obs=WARN

log4j.logger.com.obs=WARN



7.4.4 Interconnecting Hive with OBS

Before performing the following operations, ensure that you have configured a storage-compute decoupled cluster by referring to **Configuring a Storage-Compute Decoupled Cluster (Agency)** or **Configuring a Storage-Compute Decoupled Cluster (AK/SK)**.

When creating a table, set the table location to an OBS path.

Step 1 Log in to the client installation node as the client installation user.

Step 2 Run the following command to initialize environment variables:

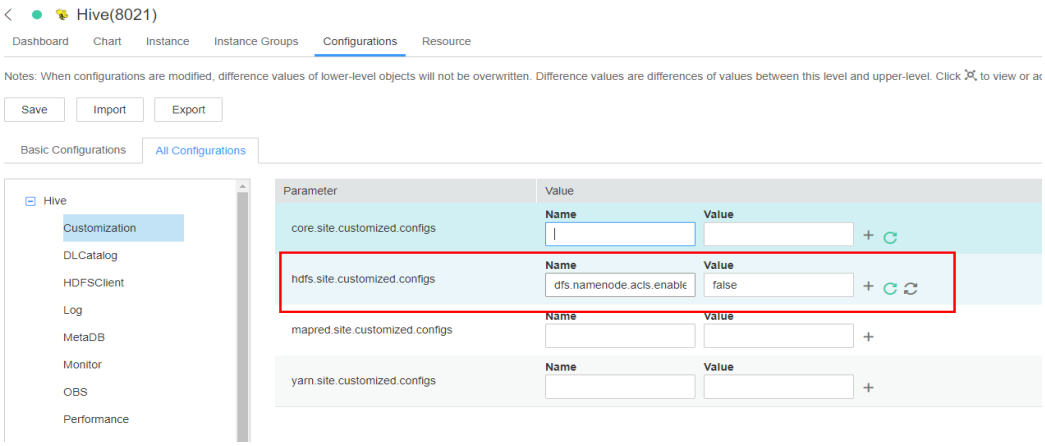
source ${client_home}/bigdata_env

Step 3 For a security cluster, run the following command to perform user authentication (the user must have the permission to perform Hive operations). If Kerberos authentication is not enabled for the current cluster, you do not need to run this command.

kinit *User performing Hive operations*

Step 4 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Hive** > **Configurations** > **All Configurations**.

In the left navigation tree, choose **Hive** > **Customization**. In the customized configuration items, add **dfs.namenode.acls.enabled** to the **hdfs.site.customized.configs** parameter and set its value to **false**.



Step 5 Click **Save**. Click the **Dashboard** tab and choose **More** > **Restart Service**. In the **Verify Identity** dialog box that is displayed, enter the password of the current user, and click **OK**. In the displayed **Restart Service** dialog box, select **Restart upper-layer services** and click **OK**. Hive is restarted.

Step 6 Log in to the beeline client and set **Location** to the OBS file system path when creating a table.

beeline

For example, run the following command to create table **test** in **obs://***OBS parallel file system name/user/hive/warehouse/*:

create table test(name string) location "obs://*OBS parallel file system name/user/hive/warehouse/***";**

NOTE

You need to add the component operator to the URL policy in the Ranger policy. Set the URL to the complete path of the object on OBS. Select the Read and Write permissions.

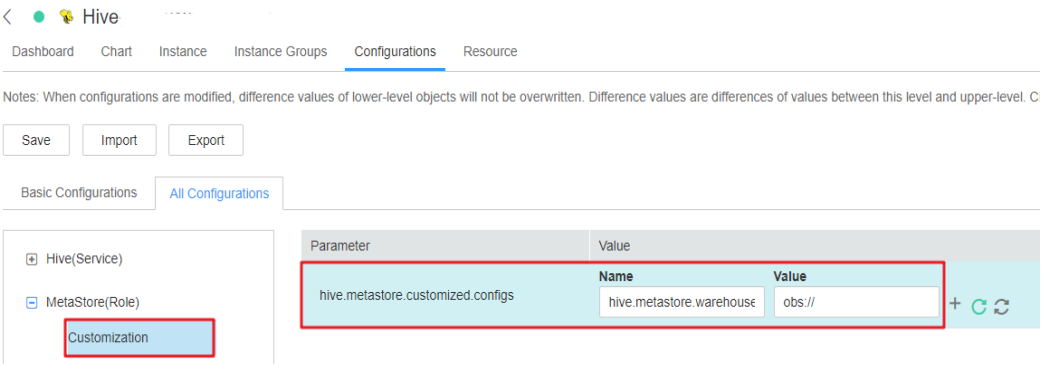
----End

Setting the Default Location of the Created Hive Table to the OBS Path

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Hive** > **Configurations** > **All Configurations**.

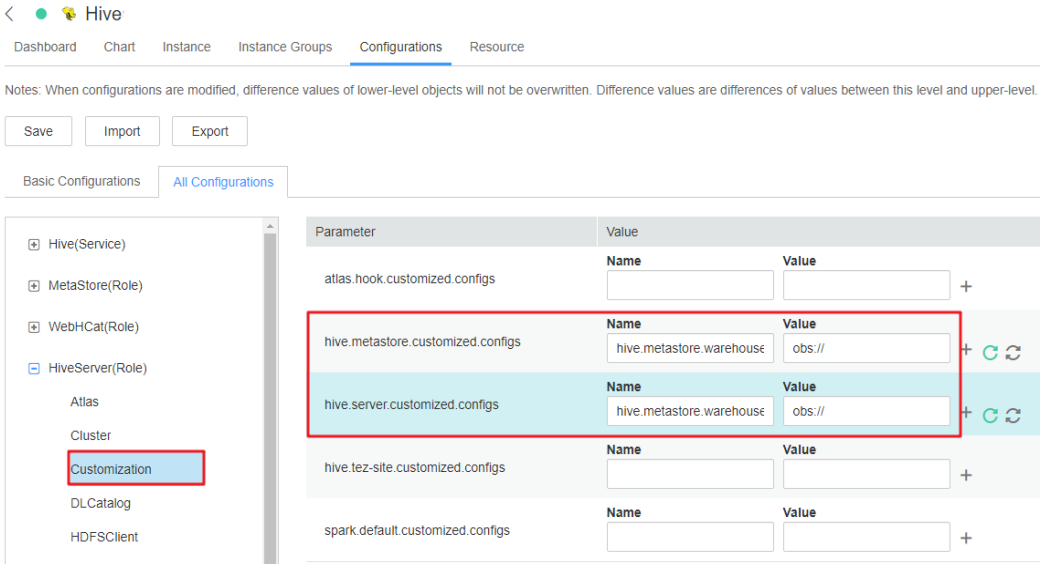
Step 2 In the left navigation tree, choose **MetaStore** > **Customization**. Add **hive.metastore.warehouse.dir** to the **hive.metastore.customized.configs** parameter and set it to the OBS path.

Figure 7-11 Configurations of **hive.metastore.warehouse.dir**



Step 3 In the left navigation tree, choose **HiveServer** > **Customization**. Add **hive.metastore.warehouse.dir** to the **hive.metastore.customized.configs** and **hive.metastore.customized.configs** parameters, and set it to the OBS path.

Figure 7-12 hive.metastore.warehouse.dir configuration



Step 4 Save the configurations and restart Hive.

Step 5 Update the client configuration file.

1. Run the following command to open **hivemetastore-site.xml** in the Hive configuration file directory on the client:

   vim /opt/Bigdata/client/Hive/config/hivemetastore-site.xml

2. Change the value of **hive.metastore.warehouse.dir** to the corresponding OBS path.

```
</property>
<property>
<name>hive.metastore.warehouse.dir</name>
<value>obs://</value>
</property>
<property>
<name>hive.metastore.metrics.enabled</name>
```

Step 6 Log in to the beeline client, create a table, and check whether the location is the OBS path.

beeline

create table test(name string);

desc formatted test;

NOTE

If the database location points to HDFS, the table to be created in the database (without specifying the location) also points to HDFS. If you want to modify the default table creation policy, change the location of the database to OBS by performing the following operations:

1. Run the following command to query the location of the database:

   show create database *obs_test*;

   ```
   +----------------------------------------------------+
   |                    createdb_stmt                   |
   +----------------------------------------------------+
   | CREATE DATABASE `obs_test`                         |
   | LOCATION                                           |
   |   'hdfs://hacluster/user/hive/warehouse/obs_test.db'  |
   +----------------------------------------------------+
   3 rows selected (0.038 seconds)
   ```

2. Run the following command to change the database location:

   alter database *obs_test* **set location** *'obs://test1231/'*

   Run the **show create database** *obs_test* command to check whether the database location points to OBS.

   ```
   INFO  : Concurrency mode is disabled, not creating
   +----------------------------+
   |        createdb_stmt       |
   +----------------------------+
   | CREATE DATABASE `obs_test` |
   | LOCATION                   |
   |   'obs://test1231/'        |
   +----------------------------+
   3 rows selected (0.063 seconds)
   ```

3. Run the following command to change the table location:

   alter table *user_info* **set location** *'obs://test1231/'*

   If the table contains data, migrate the original data file to the new location.

----End

7.4.5 Interconnecting MapReduce with OBS

Before performing the following operations, ensure that you have configured a storage-compute decoupled cluster by referring to **Configuring a Storage-Compute Decoupled Cluster (Agency)** or **Configuring a Storage-Compute Decoupled Cluster (AK/SK)**.

Step 1 Log in to the MRS management console and click the cluster name to go to the cluster details page.

Step 2 Choose **Components > MapReduce**. The **All Configurations** page is displayed. In the navigation tree on the left, choose **MapReduce > Customization**. In the customized configuration items, add the configuration item **mapreduce.jobhistory.always-scan-user-dir** to **core-site.xml** and set its value to **true**.

Step 3 Save the configurations and restart the MapReduce service.

----End

7.4.6 Interconnecting Spark2x with OBS

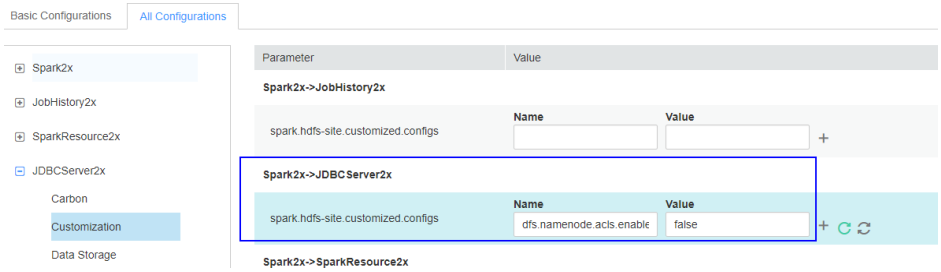
The OBS file system can be interconnected with Spark2x after an MRS cluster is installed.

Before performing the following operations, ensure that you have configured a storage-compute decoupled cluster by referring to **Configuring a Storage-Compute Decoupled Cluster (Agency)** or **Configuring a Storage-Compute Decoupled Cluster (AK/SK)**.

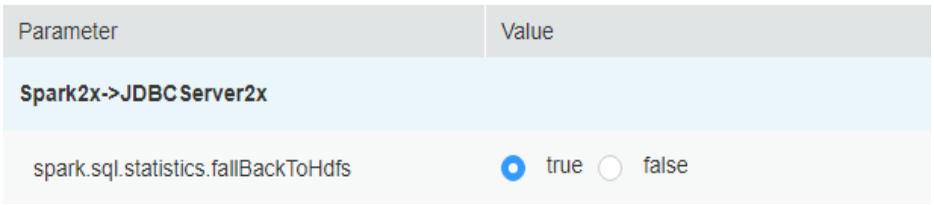
Using Spark Beeline After Cluster Installation

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Spark2x** > **Configurations** > **All Configurations**.

In the left navigation tree, choose **JDBCServer2x** > **Customization**. Add **dfs.namenode.acls.enabled** to the **spark.hdfs-site.customized.configs** parameter and set its value to **false**.



Step 2 Search for the **spark.sql.statistics.fallBackToHdfs** parameter and set its value to **false**.



Step 3 Save the configurations and restart the JDBCServer2x instance.

Step 4 Log in to the client installation node as the client installation user.

Step 5 Run the following command to configure environment variables:

source ${client_home}/bigdata_env

Step 6 For a security cluster, run the following command to perform user authentication. If Kerberos authentication is not enabled for the current cluster, you do not need to run this command.

kinit *Username*

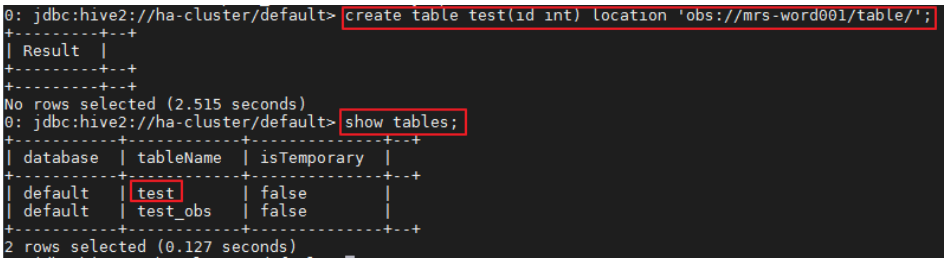
Step 7 Access OBS in spark-beeline. For example, create a table named **test** in the **obs://mrs-word001/table/** directory.

create table test(id int) location '*obs://mrs-word001/table/*';

Step 8 Run the following command to query all tables. If table **test** is displayed in the command output, OBS access is successful.

show tables;

Figure 7-13 Verifying the created table name returned using Spark2x



Step 9 Press **Ctrl+C** to exit the Spark Beeline.

----End

Using Spark SQL After Cluster Installation

Step 1 Log in to the client installation node as the client installation user.

Step 2 Run the following command to configure environment variables:

source ${client_home}/bigdata_env

Step 3 Modify the configuration file:

vim ${client_home}/Spark2x/spark/conf/hdfs-site.xml

```
<property>
<name>dfs.namenode.acls.enabled</name>
<value>false</value>
</property>
```

Step 4 For a security cluster, run the following command to perform user authentication. If Kerberos authentication is not enabled for the current cluster, you do not need to run this command.

kinit *Username*

Step 5 Access OBS in spark-sql. For example, create a table named **test** in the **obs://mrs-word001/table/** directory.

Step 6 Run the **cd ${client_home}/Spark2x/spark/bin** command to access the **spark bin** directory and run **./spark-sql** to log in to spark-sql CLI.

Step 7 Run the following command in the spark-sql CLI:

create table test(id int) location '*obs://mrs-word001/table/***';**

Step 8 Run the **show tables;** command to confirm that the table is created successfully.

Step 9 Run **exit;** to exit the spark-sql CLI.

NOTE

If a large number of logs are printed in the OBS file system, the read and write performance may be affected. You can adjust the log level of the OBS client as follows:

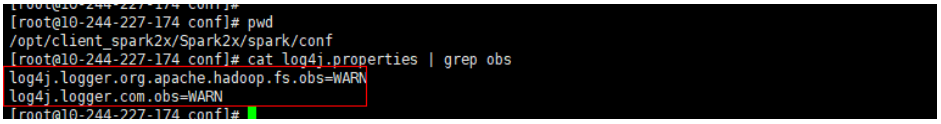
cd ${client_home}/Spark2x/spark/conf

vi log4j.properties

Add the OBS log level configuration to the file as follows:

log4j.logger.org.apache.hadoop.fs.obs=WARN

log4j.logger.com.obs=WARN



----End

7.4.7 Interconnecting Sqoop with External Storage Systems

Exporting Data From HDFS to MySQL Using the sqoop export Command

Step 1 Log in to the node where the client is located.

Step 2 Run the following command to initialize environment variables:

source /opt/client/bigdata_env

Step 3 Run the following command to operate the Sqoop client:

sqoop export --connect jdbc:mysql://10.100.231.134:3306/test --username root --password xxxxxx --table component13 -export-dir hdfs://hacluster/user/hive/warehouse/component_test3 --fields-terminated-by ',' -m 1

Table 7-1 Parameter description

Parameter	Description
-direct	Imports data to a relational database using a database import tool, for example, mysqlimport of MySQL, more efficient than the JDBC connection mode.
-export-dir <dir>	Specifies the source directory for storing data in the HDFS.
-m or -num-mappers <n>	Starts *n* (4 by default) maps to import data concurrently. The value cannot be greater than the maximum number of maps in a cluster.
-table <table-name>	Specifies the relational database table to be imported.

Parameter	Description
-update-key <col-name>	Specifies the column used for updating the existing data in a relational database.
-update-mode <mode>	Specifies how updates are performed. The value can be **updateonly** or **allowinsert**. This parameter is used only when the relational data table does not contain the data record to be imported. For example, if the HDFS data to be imported to the destination table contains a data record **id=1** and the table contains an existing data record **id=2**, the update will fail.
-input-null-string <null-string>	This parameter is optional. If it is not specified, **null** will be used.
-input-null-non-string <null-string>	This parameter is optional. If it is not specified, **null** will be used.
-staging-table <staging-table-name>	Creates a table with the same data structure as the destination table for storing data before it is imported to the destination table. This parameter ensures the transaction security when data is imported to a relational database table. Due to multiple transactions during an import, this parameter can prevent other transactions from being affected when one transaction fails. For example, the imported data is incorrect or duplicate records exist.
-clear-staging-table	Clears data in the staging table before data is imported if the staging-table is not empty.

----End

Importing Data from MySQL to Hive Using the sqoop import Command

Step 1 Log in to the node where the client is located.

Step 2 Run the following command to initialize environment variables:

source /opt/client/bigdata_env

Step 3 Run the following command to operate the Sqoop client:

sqoop import --connect jdbc:mysql://10.100.231.134:3306/test --username root --password xxxxxx --table component --hive-import --hive-table component_test2 --delete-target-dir --fields-terminated-by "," -m 1 --as-textfile

Table 7-2 Parameter description

Parameter	Description
-append	Appends data to an existing dataset in the HDFS. Once this parameter is used, Sqoop imports data to a temporary directory, renames the temporary file where the data is stored, and moves the file to a formal directory to avoid duplicate file names in the directory.
-as-avrodatafile	Imports data to a data file in the Avro format.
-as-sequencefile	Imports data to a sequence file.
-as-textfile	Import data to a text file. After the text file is generated, you can run SQL statements in Hive to query the result.
-boundary-query <statement>	Specifies the SQL statement for performing boundary query. Before importing data, use a SQL statement to obtain a result set and import the data in the result set. The data format can be **-boundary-query 'select id,creationdate from person where id = 3'** (indicating a data record whose ID is 3) or **select min(<split-by>), max(<split-by>) from <table name>**. The fields to be queried cannot contain fields whose data type is string. Otherwise, the error message "java.sql.SQLException: Invalid value for getLong()" is displayed.
-columns<col,col,col...>	Specifies the fields to be imported. The format is ***-Column id,Username***.
-direct	Imports data to a relational database using a database import tool, for example, mysqlimport of MySQL, more efficient than the JDBC connection mode.
-direct-split-size	Splits the imported streams by byte. Especially when data is imported from PostgreSQL using the direct mode, a file that reaches the specified size can be divided into several independent files.
-inline-lob-limit	Sets the maximum value of an inline LOB.
-m or -num-mappers	Starts *n* (4 by default) maps to import data concurrently. The value cannot be greater than the maximum number of maps in a cluster.
-query, -e<statement>	Imports data from the query result. To use this parameter, you must specify the **-target-dir** and **-hive-table** parameters and use the query statement containing the WHERE clause as well as $CONDITIONS. Example: **-query'select * from person where $CONDITIONS' -target-dir /user/hive/warehouse/person -hive-table person**

Parameter	Description
-split-by<column-name>	Specifies the column of a table used to split work units. Generally, the column name is followed by the primary key ID.
-table <table-name>	Specifies the relational database table from which data is obtained.
-target-dir <dir>	Specifies the HDFS path.
-warehouse-dir <dir>	Specifies the directory for storing data to be imported. This parameter is applicable when data is imported to HDFS but cannot be used when you import data to Hive directories. This parameter cannot be used together with **-target-dir**.
-where	Specifies the WHERE clause when data is imported from a relational database, for example, **-where 'id = 2'**.
-z,-compress	Compresses sequence, text, and Avro data files using the GZIP compression algorithm. Data is not compressed by default.
–compression-codec	Specifies the Hadoop compression codec. GZIP is used by default.
–null-string <null-string>	Specifies the string to be interpreted as **NULL** for string columns.
–null-non-string<null-string>	Specifies the string to be interpreted as null for non-string columns. If this parameter is not specified, **NULL** will be used.
-check-column (col)	Specifies the column for checking incremental data import, for example, **id**.
-incremental (mode) append or last modified	Incrementally imports data. **append**: appends records, for example, appending records that are greater than the value specified by **last-value**. **lastmodified**: appends data that is modified after the date specified by **last-value**.
-last-value (value)	Specifies the maximum value (greater than the specified value) of the column after the last import. This parameter can be set as required.

----End

Sqoop Usage Example

- Importing data from MySQL to HDFS using the **sqoop import** command

sqoop import --connect jdbc:mysql://10.100.231.134:3306/test --username root --password *xxx* --query 'SELECT * FROM component where $CONDITIONS and component_id ="MRS 1.0_002"' --target-dir /tmp/component_test --delete-target-dir --fields-terminated-by "," -m 1 --as-textfile

- Exporting data from OBS to MySQL using the **sqoop export** command

  sqoop export --connect jdbc:mysql://10.100.231.134:3306/test --username root --password *xxx* --table component14 -export-dir obs://obs-file-bucket/xx/part-m-00000 --fields-terminated-by ',' -m 1

- Importing data from MySQL to OBS using the **sqoop import** command

  sqoop import --connect jdbc:mysql://10.100.231.134:3306/test --username root --password *xxx* --table component --target-dir obs://obs-file-bucket/xx --delete-target-dir --fields-terminated-by "," -m 1 --as-textfile

- Importing data from MySQL to OBS tables outside Hive

  sqoop import --connect jdbc:mysql://10.100.231.134:3306/test --username root --password *xxx* --table component --hive-import --hive-table component_test01 --fields-terminated-by "," -m 1 --as-textfile

8 Accessing Web Pages of Open Source Components Managed in MRS Clusters

8.1 Web UIs of Open Source Components

Scenario

Web UIs of different components are created and hosted on the Master or Core nodes in the MRS cluster by default. You can view information about the components on these web UIs.

Procedure for accessing the web UIs of open-source component:

1. Select an access method.

   MRS provides the following methods for accessing the web UIs of open-source components:

   - **EIP-based Access**: This method is recommended because it is easy to bind an EIP to a cluster.
   - **Access Using a Windows ECS**: Independent ECSs need to be created and configured.
   - **Creating an SSH Channel for Connecting to an MRS Cluster and Configuring the Browser**: Use this method when the user and the MRS cluster are on different networks.

2. Access the web UIs. For details, see **Table 8-1**.

Web UIs

NOTE

For clusters with Kerberos authentication enabled, user **admin** does not have the management permission on each component. To access the web UI of each component, add a user who has the management permission on the corresponding component.

Table 8-1 Web UI addresses of open-source components

Cluster Type	Web UI Type	Web UI Address
All Types	MRS Manager	• Applicable to clusters of all versions **https://***Floating IP address of Manager***:28443/web** **NOTE** 1. Ensure that the local host can communicate with the MRS cluster. 2. Log in to the Master2 node remotely, and run the **ifconfig** command. In the command output, **eth0:wsom** indicates the floating IP address of MRS Manager. Record the value of **inet**. If the floating IP address of MRS Manager cannot be queried on the Master2 node, switch to the Master1 node to query and record the floating IP address. If there is only one Master node, query and record the cluster manager IP address of the Master node. • For versions earlier than MRS 3.x: https://<*EIP*>:9022/mrsmanager?locale=en-us For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**. • For MRS 3.*x* or later, see **Accessing FusionInsight Manager (MRS 3.x or Later)**.
Analysis cluster	HDFS NameNode	• Versions earlier than MRS 3.x: On the cluster details page, choose **Components** > **HDFS** > **NameNode Web UI** > **NameNode (Active)**. • MRS 3.x or later: On the Manager homepage, choose **Cluster** > **Services** > **HDFS** > **NameNode Web UI** > **NameNode (*Host name*, Active)**.

Cluster Type	Web UI Type	Web UI Address
	HBase HMaster	• Versions earlier than MRS 3.x: On the cluster details page, choose **Components** > **HBase** > **HMaster Web UI** > **HMaster (Active)**. • MRS 3.x or later: On the Manager homepage, choose **Cluster** > **Services** > **HBase** > **HMaster Web UI** > **HMaster (*Host name*, Active)**.
	MapReduce JobHistoryServer	• Versions earlier than MRS 3.x: On the cluster details page, choose **Components** > **MapReduce** > **JobHistoryServer Web UI** > **JobHistoryServer**. • MRS 3.x or later: On the Manager homepage, choose **Cluster** > **Services** > **MapReduce** > **JobHistoryServer Web UI** > **JobHistoryServer (*Host name*, Active)**.
	YARN ResourceManager	• Versions earlier than MRS 3.x: On the cluster details page, choose **Components** > **Yarn** > **ResourceManager Web UI** > **ResourceManager (Active)**. • MRS 3.x or later: On the Manager homepage, choose **Cluster** > **Services** > **Yarn** > **ResourceManager Web UI** > **ResourceManager (*Host name*, Active)**.
	Spark JobHistory	• Versions earlier than MRS 3.x: On the cluster details page, choose **Components** > **Spark** > **Spark Web UI** > **JobHistory**. • MRS 3.x or later: On the Manager homepage, choose **Cluster** > **Services** > **Spark2x** > **Spark2x Web UI** > **JobHistory2x (*Host name*, Active)**.

Cluster Type	Web UI Type	Web UI Address
	Hue	• Versions earlier than MRS 3.x: On the cluster details page, choose **Components** > **Hue** > **Hue Web UI** > **Hue (Active)**. • MRS 3.x or later: On the Manager homepage, choose **Cluster** > **Services** > **Hue** > **Hue Web UI** > **Hue (*Host name*, Active)**. Loader is a graphical data migration management tool based on the open-source Sqoop web UI, and its interface is hosted on the Hue web UI.
	Tez	• Versions earlier than MRS 3.x: On the cluster details page, choose **Components** > **Tez** > **Tez Web UI** > **TezUI**. • MRS 3.x or later: On the Manager homepage, choose **Cluster** > **Services** > **Tez** > **Tez Web UI** > **TezUI (*Host name*, Active)**.
	Presto	• Versions earlier than MRS 3.x: On the cluster details page, choose **Components** > **Presto** > **Presto Web UI** > **Coordinator (Active)**. • On the Manager homepage, choose **Cluster** > **Services** > **Presto** > **Coordinator Web UI** > **Coordinator (Coordinator)**.
	Ranger	• Versions earlier than MRS 3.x: On the cluster details page, choose **Components** > **Ranger** > **Ranger Web UI** > **RangerAdmin (Active)**. • MRS 3.x or later: On the Manager homepage, choose **Cluster** > **Services** > **Ranger** > **Ranger Web UI** > **RangerAdmin**.
Stream processing cluster	Storm	• Versions earlier than MRS 3.x: On the cluster details page, choose **Components** > **Storm** > **Storm Web UI** > **UI**. • On the Manager homepage, choose **Cluster** > **Services** > **Storm** > **Storm Web UI** > **UI (*Host name*)**.

8.2 List of Open Source Component Ports

Common HBase Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
hbase.master.port	16000	HMaster RPC port. This port is used to connect the HBase client to HMaster. **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes
hbase.master.info.port	16010	HMaster HTTPS port. This port is used by the remote web client to connect to the HMaster UI. **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes
hbase.regionserver.port	16020	RegoinServer (RS) RPC port. This port is used to connect the HBase client to RegionServer. **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes

Parameter	Default Port	Port Description
hbase.regionserver.info.port	16030	HTTPS port of the Region server. This port is used by the remote web client to connect to the RegionServer UI. **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
hbase.thrift.info.port	9095	Thrift Server listening port of Thrift Server. This port is used for: Listening when the client is connected **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
hbase.regionserver.thrift.port	9090	Thrift Server listening port of RegionServer. This port is used for: Listening when the client is connected to the RegionServer **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
hbase.rest.info.port	8085	Port of the RegionServer RESTServer native web page
-	21309	REST port of RegionServer RESTServer

Common HDFS Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
dfs.namenode.rpc.port	• 9820 (versions earlier than MRS 3.*x*) • 8020 (MRS 3.*x* and later)	NameNode RPC port. This port is used for: 1. Communication between the HDFS client and NameNode 2. Connection between the DataNode and NameNode **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes
dfs.namenode.http.port	9870	HDFS HTTP port (NameNode). This port is used for: 1. Point-to-point NameNode checkpoint operations. 2. Connecting the remote web client to the NameNode UI **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes
dfs.namenode.https.port	9871	HDFS HTTPS port (NameNode). This port is used for: 1. Point-to-point NameNode checkpoint operations 2. Connecting the remote web client to the NameNode UI **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes

Parameter	Default Port	Port Description
dfs.datanode.ipc.port	9867	IPC server port of DataNode. This port is used for: Connection between the client and DataNode to perform RPC operations. **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
dfs.datanode.port	9866	DataNode data transmission port. This port is used for: 1. Transmitting data from HDFS client from or to the DataNode 2. Point-to-point DataNode data transmission **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
dfs.datanode.http.port	9864	DataNode HTTP port. This port is used for: Connecting to the DataNode from the remote web client in security mode **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes

Parameter	Default Port	Port Description
dfs.datanode.https.port	9865	HTTPS port of DataNode. This port is used for: Connecting to the DataNode from the remote web client in security mode **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
dfs.JournalNode.rpc.port	8485	RPC port of JournalNode. This port is used for: Client communication to access multiple types of information **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
dfs.journalnode.http.port	8480	JournalNode HTTP port This port is used for: Connecting to the JournalNode from the remote web client in security mode **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes

Parameter	Default Port	Port Description
dfs.journalnode.https.port	8481	HTTPS port of JournalNode. This port is used for: Connecting to the JournalNode from the remote web client in security mode **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
httpfs.http.port	14000	Listening port of the HttpFS HTTP server. This port is used for: Connecting to the HttpFS from the remote REST API **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes

Common Hive Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
templeton.port	9111	Port used by WebHCat for providing the REST service. This port is used for: Communication between the WebHCat client and WebHCat server ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes

Parameter	Default Port	Port Description
hive.server2.thrift.port	10000	Port for HiveServer to provide Thrift services. This port is used for: Communication between the HiveServer and HiveServer client ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
hive.metastore.port	9083	Port for MetaStore to provide Thrift services. This port is used for: Communication between the MetaStore client and MetaStore, that is, communication between HiveServer and MetaStore. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
hive.server2.webui.port	10002	Web UI port of Hive. This port is used for: HTTPS/HTTP communication between Web requests and the Hive UI server

Common Hue Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
HTTP_PORT	8888	Port for Hue to provide HTTPS services. This port is used for: providing web services in HTTPS mode (The port can be modified.) ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes

Common Kafka Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
port	9092	Port for a broker to receive data and obtain services
ssl.port	9093	SSL port used by a broker to receive data and obtain services
sasl.port	21007	SASL security authentication port provided by a broker, which provides the secure Kafka service
sasl-ssl.port	21009	Port used by a broker to provide encrypted service based on the SASL and SSL protocols

Common Loader Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
LOADER_HTTPS_PORT	21351	This port is used for: providing REST APIs for configuration and running of Loader jobs • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes

Common Manager Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
-	8080	Port provided by WebService for user access. This port is used to access the web UI over HTTP. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes

Parameter	Default Port	Port Description
-	28443	Port provided by WebService for user access. This port is used to access the web UI over HTTPS. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes

Common MapReduce Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
mapreduce.jobhistory.webapp.port	19888	Web HTTP port of the JobHistory server. This port is used for: viewing the web page of the JobHistory server **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
mapreduce.jobhistory.port	10020	Port of the JobHistory server. This port is used for: 1. Task data restoration in the MapReduce client 2. Obtaining task report in the Job client **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes

Parameter	Default Port	Port Description
mapreduce.jobhistory.webapp.https.port	19890	Web HTTPS port of the JobHistory server. This port is used for: viewing the web page of the JobHistory server **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes

Common Spark Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
hive.server2.thrift.port	22550	JDBC thrift port. This port is used for: Socket communication between Spark2.1.0 CLI/ JDBC client and server **NOTE** If **hive.server2.thrift.port** is occupied, an exception indicating that the port is occupied is reported. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes

Parameter	Default Port	Port Description
spark.ui.port	4040	Web UI port of JDBC This port is used for: HTTPS/HTTP communication between Web requests and the JDBC Server Web UI server **NOTE** The system verifies the port configuration. If the port is invalid, the value of the port plus 1 is used till the calculated value is valid. (A maximum number of 16 attempts are allowed. The number of attempts is specified by **spark.port.maxRetries**.) • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes
spark.history.ui.port	18080	JobHistory Web UI port This port is used for: HTTPS/HTTP communication between Web requests and Spark2.1.0 History Server **NOTE** The system verifies the port configuration. If the port is invalid, the value of the port plus 1 is used till the calculated value is valid. (A maximum number of 16 attempts are allowed. The number of attempts is specified by **spark.port.maxRetries**.) • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes

Common Storm Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
nimbus.thrift.port	6627	Port for Nimbus to provide thrift services

Parameter	Default Port	Port Description
supervisor.slots.ports	6700,6701,6702,6703	Port for receiving service requests that are forwarded from other servers
logviewer.https.port	29248	Port for the LogViewer to provide HTTPS services
ui.https.port	29243	Port for the Storm UI to provide HTTPS services (ui.https.port)

Common Yarn Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
yarn.resourcemanager.webapp.port	8088	Web HTTP port of the ResourceManager service.
yarn.resourcemanager.webapp.https.port	8090	Web HTTPS port of the ResourceManager service. This port is used for: accessing the Resource Manager web applications in security mode **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes

Parameter	Default Port	Port Description
yarn.nodemanager.webapp.port	8042	NodeManager Web HTTP port
yarn.nodemanager.webapp.https.port	8044	NodeManager Web HTTPS port. This port is used for: Accessing the NodeManager web application in security mode **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes

Common ZooKeeper Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
clientPort	2181	ZooKeeper client port. This port is used for: Connection between the ZooKeeper client and server. **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes

Common Kerberos Ports

The protocol type of all ports in the table is UDP.

Parameter	Default Port	Port Description
kdc_ports	21732	Kerberos server port. This port is used for: Performing Kerberos authentication for components This parameter may be used during the configuration of mutual trust between clusters. **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes

Common OpenTSDB Ports

The protocol type of the port in the table is TCP.

Parameter	Default Port	Port Description
tsd.network.port	4242	Web UI port of OpenTSDB. This port is used for: HTTPS/HTTP communication between web requests and the OpenTSDB UI server

Common Tez Ports

The protocol type of the port in the table is TCP.

Parameter	Default Port	Port Description
tez.ui.port	28888	Web UI port of Tez

Common KafkaManager Ports

The protocol type of the port in the table is TCP.

Parameter	Default Port	Port Description
kafka_manager_port	9099	Web UI port of KafkaManager.

Common Presto Ports

The protocol type of the port in the table is TCP.

Parameter	Default Port	Port Description
http-server.http.port	7520	HTTP port of Presto coordinator to provide services for external entities
http-server.https.port	7521	HTTPS port of Presto coordinator to provide services for external entities
http-server.http.port	7530	HTTP port used by Presto worker to provide services for external entities
http-server.https.port	7531	HTTPS port used by Presto worker to provide services for external entities

Common Flink Ports

The protocol type of the port in the table is TCP.

Parameter	Default Port	Port Description
jobmanager.web.port	32261-32325	Web UI port of Flink. This port is used for: HTTP/HTTPS communication between the client web requests and Flink server

Common ClickHouse Ports

The protocol type of the port in the table is TCP.

Parameter	Default Port	Port Description
tcp_port	9000	TCP port for accessing the service client.
http_port	8123	HTTP port for accessing the service client.
https_port	8443	HTTPS port for accessing the service client.
tcp_port_secure	9440	TCP With SSL port for accessing the service client. This port is enabled only in security mode by default.

Common Impala Ports

The protocol type of the port in the table is TCP.

Parameter	Default Port	Port Description
--beeswax_port	21000	Port for impala-shell communication.
--hs2_port	21050	Port for Impala application communication.
--hs2_http_port	28000	Port used by Impala to provide the HiveServer2 protocol for external systems.

8.3 Access Through Direct Connect

MRS allows you to access MRS clusters using Direct Connect. Direct Connect is a high-speed, low-latency, stable, and secure dedicated network connection that connects your local data center to an online cloud VPC. It extends online cloud

services and existing IT facilities to build a flexible, scalable hybrid cloud computing environment.

Prerequisites

Direct Connect is available, and the connection between the local data center and the online VPC has been established.

Accessing an MRS Cluster Using Direct Connect

Step 1 Log in to the MRS console.

Step 2 Click the name of the cluster to enter its details page.

Step 3 On the **Dashboard** tab page of the cluster details page, click **Access Manager** next to **MRS Manager**.

Step 4 Set **Access Mode** to **Direct Connect** and select **I confirm that the network between the local PC and the floating IP address is connected and that MRS Manager is accessible using the Direct Connect connection**.

The floating IP address is automatically allocated by MRS to access MRS Manager. Before using Direct Connect to access MRS Manager, ensure that the connection between the local data center and the online VPC has been established.

Step 5 Click **OK**. The MRS Manager login page is displayed. Enter the username **admin** and the password set during cluster creation.

----End

Switching the MRS Manager Access Mode

To facilitate user operations, the browser cache records the selected Manager access mode. To change the access mode, perform the following steps:

Step 1 Log in to the MRS console.

Step 2 Click the name of the cluster to enter its details page.

Step 3 On the **Dashboard** tab page of the cluster details page, click ⇌ next to **MRS Manager**.

Step 4 On the displayed page, set **Access Mode**.

- To change **EIP** to **Direct Connect**, ensure that the network for direct connections is available, set **Access Mode** to **Direct Connect**, and select **I confirm that the network between the local PC and the floating IP address is connected and that MRS Manager is accessible using the Direct Connect connection**. Click **OK**.
- To change **Direct Connect** to **EIP**, set **Access Mode** to **EIP** and configure the EIP by referring to **Accessing FusionInsight Manager Using an EIP**. If a public IP address has been configured for the cluster, click **OK** to access MRS Manager using an EIP.

----End

8.4 EIP-based Access

You can bind an EIP to a cluster to access the web UIs of the open-source components managed in the MRS cluster. This method is simple and easy to use and is recommended for accessing the web UIs of the open-source components.

Binding an EIP to a Cluster and Adding a Security Group Rule

1. On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users. After the IAM users are synchronized, the **Components** tab is available.
2. Click **Access Manager** on the right of **MRS Manager**.
3. The page for accessing MRS Manager is displayed. Bind an EIP and add a security group rule. Perform the following operations only when you access the web UIs of the open-source components of the cluster for the first time.
   a. Select an available EIP from the EIP drop-down list to bind it. If there is no available EIP, click **Manage EIP** to an EIP. If an EIP has been bound during cluster creation, skip this step.
   b. Select the security group to which the security group rule to be added belongs. The security group is configured when the group is created.
   c. Add a security group rule. By default, your public IP address used for accessing port 9022 is filled in the rule. If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

      NOTE

      - It is normal that the automatically generated public IP address is different from the local IP address and no action is required.
      - If port 9022 is a Knox port, you need to enable the permission of port 9022 to access Knox for accessing MRS components.

   d. Select the checkbox stating that **I confirm that xx.xx.xx.xx is a trusted public IP address and MRS Manager can be accessed using this IP address**.
   e. Click **OK**. The login page is displayed. Enter the username **admin** and the password set during cluster creation.
4. Log in to FusionInsight Manager and choose **Cluster** > **Services** > **HDFS**. On the displayed page, click **NameNode(*Host name*, active)** to access the HDFS web UI. The HDFS NameNode is used as an example. For details about the web UIs of other components, see **Web UIs of Open Source Components**.

8.5 Access Using a Windows ECS

MRS allows you to access the web UIs of open-source components through a Windows ECS. This method is complex and is recommended for MRS clusters that do not support the EIP function.

Step 1 On the MRS management console, click **Clusters**.

Step 2 On the **Active Clusters** page, click the name of the specified cluster.

On the cluster details page, record the **AZ**, **VPC**, **Cluster Manager IP Address**, and **Security Group** of the cluster.

NOTE

To obtain the cluster manager IP address, remotely log in to the Master2 node, and run the **ifconfig** command. In the command output, **eth0:wsom** indicates the cluster manager IP address. Record the value of **inet**. If the cluster manager IP address cannot be queried on the Master2 node, switch to the Master1 node to query and record the cluster manager IP address. If there is only one Master node, query and record the cluster manager IP address of the Master node.

Step 3 On the ECS management console, create an ECS.

- The **AZ**, **VPC**, and **Security Group** of the ECS must be the same as those of the cluster to be accessed.
- Select a Windows public image. For example, select the standard image **Windows Server 2012 R2 Standard 64bit(40GB)**.
- For details about other configuration parameters, see **Elastic Cloud Server > User Guide > Getting Started > Creating and Logging In to a Windows ECS**.

NOTE

If the security group of the ECS is different from **Security Group** of the MRS cluster, you can modify the configuration using either of the following methods:

- Change the security group of the ECS to the security group of the MRS cluster. For details, see **Elastic Cloud Server** > **User Guide** > **Security Group** > **Changing a Security Group**.
- Add two security group rules to the security groups of the Master and Core nodes to enable the ECS to access the cluster. Set **Protocol** to **TCP** and **ports** of the two security group rules to **28443** and **20009**, respectively. For details, see **Virtual Private Cloud** > **User Guide** > **Security** > **Security Group** > **Adding a Security Group Rule**.

Step 4 On the VPC management console, apply for an EIP and bind it to the ECS.

For details, see **Virtual Private Cloud** > **User Guide** > **Elastic IP** > **Assigning an EIP and Binding It to an ECS**.

Step 5 Log in to the ECS.

The Windows system account, password, EIP, and the security group rules are required for logging in to the ECS. For details, see **Elastic Cloud Server > User Guide > Instances > Logging In to a Windows ECS**.

Step 6 On the Windows remote desktop, use your browser to access Manager.

For example, you can use Internet Explorer 11 in the Windows 2012 OS.

The MRS Manager access address is in the format of **https://*Cluster Manager IP Address*:28443/web**. Enter the name and password of the MRS cluster user, for example, user **admin**.

NOTE

- To obtain the cluster manager IP address, remotely log in to the Master2 node, and run the **ifconfig** command. In the command output, **eth0:wsom** indicates the cluster manager IP address. Record the value of **inet**. If the cluster manager IP address cannot be queried on the Master2 node, switch to the Master1 node to query and record the cluster manager IP address. If there is only one Master node, query and record the cluster manager IP address of the Master node.
- If you access MRS Manager with other MRS cluster usernames, change the password upon your first access. The new password must meet the requirements of the current password complexity policies.
- By default, a user is locked after inputting an incorrect password five consecutive times. The user is automatically unlocked after 5 minutes.

Step 7 Visit the web UIs of the open-source components by referring to the addresses listed in **Web UIs of Open Source Components**.

----End

Related Tasks

Configuring the Mapping Between Cluster Node Names and IP Addresses

Step 1 Log in to MRS Manager, and choose **Host Management**.

Record the host names and management IP addresses of all nodes in the cluster.

Step 2 In the work environment, use Notepad to open the **hosts** file and add the mapping between node names and IP addresses to the file.

Fill in one row for each mapping relationship, as shown in the following figure.

```
192.168.4.127 node-core-Jh3ER
192.168.4.225 node-master2-PaWVE
192.168.4.19 node-core-mtZ81
192.168.4.33 node-master1-zbYN8
192.168.4.233 node-core-7KoGY
```

Save the modifications.

----End

8.6 Creating an SSH Channel for Connecting to an MRS Cluster and Configuring the Browser

Scenario

Users and an MRS cluster are in different networks. As a result, an SSH channel needs to be created to send users' requests for accessing websites to the MRS cluster and dynamically forward them to the target websites.

The MAC system does not support this function. For details about how to access MRS, see **EIP-based Access**.

Prerequisites

- You have prepared an SSH client for creating the SSH channel, for example, the Git open-source SSH client. You have downloaded and installed the client.
- You have created a cluster and prepared a key file in PEM format or obtained the password used during cluster creation.
- Users can access the Internet on the local PC.

Procedure

Step 1 Log in to the MRS management console and choose **Clusters** > **Active Clusters**.

Step 2 Click the specified MRS cluster name.

Record the security group of the cluster.

Step 3 Add an inbound rule to the security group of the Master node to allow data access to the IP address of the MRS cluster through port **22**.

For details, see **Virtual Private Cloud** > **User Guide** > **Security** > **Security Group** > **Adding a Security Group Rule**.

Step 4 Query the primary management node of the cluster. For details, see **Determining Active and Standby Management Nodes of Manager**.

Step 5 Bind an elastic IP address to the primary management node.

For details, see **Virtual Private Cloud** > **User Guide** > **Elastic IP** > **Assigning an EIP and Binding It to an ECS**.

Step 6 Start Git Bash locally and run the following command to log in to the active management node of the cluster: **ssh root@*Elastic IP address*** or **ssh -i *Path of the key file* root@*Elastic IP address***.

Step 7 Run the following command to view data forwarding configurations:

cat /etc/sysctl.conf | grep net.ipv4.ip_forward

- If **net.ipv4.ip_forward=1** is displayed, the forwarding function has been configured. Go to **Step 9**.
- If **net.ipv4.ip_forward=0** is displayed, the forwarding function has not been configured. Go to **Step 8**.
- If **net.ipv4.ip_forward** fails to be queried, this parameter has not been configured. Run the following command and then go to **Step 9**:

  echo "net.ipv4.ip_forward = 1" >> /etc/sysctl.conf

Step 8 Modify forwarding configurations on the node.

1. Run the following command to switch to user **root**:

   sudo su - root

2. Run the following commands to modify forwarding configurations:

   echo 1 > /proc/sys/net/ipv4/ip_forward

   sed -i "s/net.ipv4.ip_forward=0/net.ipv4.ip_forward = 1/g" /etc/sysctl.conf

   sysctl -w net.ipv4.ip_forward=1

3. Run the following command to modify the **sshd** configuration file:

vi /etc/ssh/sshd_config

Press **I** to enter the edit mode. Locate **AllowTcpForwarding** and **GatewayPorts** and delete comment tags. Modify them as follows. Save the changes and exit.

```
AllowTcpForwarding yes
GatewayPorts yes
```

4. Run the following command to restart the sshd service:

   service sshd restart

Step 9 Run the following command to view the floating IP address:

ifconfig

In the command output, **eth0:FI_HUE** indicates the floating IP address of Hue and **eth0:wsom** specifies the floating IP address of Manager. Record the value of **inet**.

Run the **exit** command to exit.

Step 10 Run the following command on the local PC to create an SSH channel supporting dynamic port forwarding:

ssh -i *Path of the key file* -v -ND *Local port* root@*Elastic IP address* or ***ssh -v -ND Local port root@Elastic IP address***. After running the command, enter the password you set when you create the cluster.

In the command, set **Local port** to the user's local port that is not occupied. Port **8157** is recommended.

After the SSH channel is created, add **-D** to the command and run the command to start the dynamic port forwarding function. By default, the dynamic port forwarding function enables a SOCKS proxy process and monitors the user's local port. Port data will be forwarded to the primary management node using the SSH channel.

Step 11 Run the following command to configure the browser proxy.

1. Go to the Google Chrome client installation directory on the local PC.
2. Press **Shift** and right-click the blank area, choose **Open Command Window Here** and enter the following command:

   chrome --proxy-server="socks5://localhost:8157" --host-resolver-rules="MAP * 0.0.0.0 , EXCLUDE localhost" --user-data-dir=c:/tmppath --proxy-bypass-list="*google*com,*gstatic.com,*gvt*.com,*:80"

   NOTE

   - In the preceding command, **8157** is the local proxy port configured in **Step 10**.
   - If the local OS is Windows 10, start the Windows OS, click **Start** and enter **cmd**. In the displayed CLI, run the command in **Step 11.2**. If this method fails, click **Start**, enter the command in the search box, and run the command in **Step 11.2**.

Step 12 In the address box of the browser, enter the address for accessing Manager.

Address format: **https://***Floating IP address of FusionInsight Manager***:28443/web**

The username and password of the MRS cluster need to be entered for accessing clusters with Kerberos authentication enabled, for example, user **admin**. They are not required for accessing clusters with Kerberos authentication disabled.

When accessing Manager for the first time, you must add the address to the trusted site list.

Step 13 Prepare the website access address.

1. Obtain the website address format and the role instance according to **Web UIs**.
2. Click **Services**.
3. Click the specified service name, for example, HDFS.
4. Click **Instance** and view **Service IP Address** of **NameNode(Active)**.

Step 14 In the address bar of the browser, enter the website address to access it.

Step 15 When logging out of the website, terminate and close the SSH tunnel.

----End

9 Accessing Manager

9.1 Accessing FusionInsight Manager (MRS 3.*x* or Later)

Scenario

In MRS 3.*x* or later, FusionInsight Manager is used to monitor, configure, and manage clusters. After the cluster is installed, you can use the account to log in to FusionInsight Manager.

NOTE

If you cannot log in to the WebUI of the component, access FusionInsight Manager by referring to **Accessing FusionInsight Manager from an ECS**.

Accessing FusionInsight Manager Using EIP

Step 1 Log in to the MRS management console.

Step 2 In the navigation pane, choose **Clusters** > **Active Clusters**. Click the target cluster name to access the cluster details page.

Step 3 Click **Manager** next to **MRS Manager**. In the displayed dialog box, configure the EIP information.

1. If no EIP is bound during MRS cluster creation, select an available EIP from the drop-down list on the right of **IEP**. If you have bound an EIP when creating a cluster, go to **Step 3.2**.

   NOTE

   If no EIP is available, click **Manage EIP** to one. Then, select the d EIP from the drop-down list on the right of **EIP**.

2. Select the security group to which the security group rule to be added belongs. The security group is configured when the cluster is created.
3. Add a security group rule. By default, the filled-in rule is used to access the EIP. To enable multiple IP address segments to access Manager, see steps **Step**

6 to Step 9. If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

4. Select the information to be confirmed and click **OK**.

Step 4 Click **OK**. The Manager login page is displayed.

Step 5 Enter the default username **admin** and the password set during cluster creation, and click **Log In**. The Manager page is displayed.

Step 6 On the MRS management console, choose **Clusters** > **Active Clusters**. Click the target cluster name to access the cluster details page.

NOTE

To grant other users the permission to access Manager, perform **Step 6** to **Step 9** to add the users' public IP addresses to the trusted IP address range.

Step 7 Click **Add Security Group Rule** on the right of **EIP**.

Step 8 On the **Add Security Group Rule** page, add the IP address segment for users to access the public network and select **I confirm that *public network IP*|*port* is a trusted public IP address. I understand that using 0.0.0.0/0. poses security risks**.

By default, the IP address used for accessing the public network is filled. You can change the IP address segment as required. To enable multiple IP address segments, repeat steps **Step 6** to **Step 9**. If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

Step 9 Click **OK**.

----End

Accessing FusionInsight Manager from an ECS

Step 1 On the MRS management console, click **Clusters**.

Step 2 On the **Active Clusters** page, click the name of the specified cluster.

Record the **AZ**, **VPC**, **MRS ManagerSecurity Group** of the cluster.

Step 3 On the homepage of the management console, choose **Service List** > **Elastic Cloud Server** to switch to the ECS management console and create an ECS.

- The **AZ**, **VPC**, and **Security Group** of the ECS must be the same as those of the cluster to be accessed.
- Select a Windows public image. For example, a standard image **Windows Server 2012 R2 Standard 64bit(40GB)**.
- For details about other configuration parameters, see **Elastic Cloud Server > User Guide > Getting Started > Creating and Logging In to a Windows ECS**.

NOTE

If the security group of the ECS is different from **Default Security Group** of the Master node, you can modify the configuration using either of the following methods:

- Change the security group of the ECS to the default security group of the Master node. For details, see **Elastic Cloud Server** > **User Guide** > **Security Group** > **Changing a Security Group**.
- Add two security group rules to the security groups of the Master and Core nodes to enable the ECS to access the cluster. Set **Protocol** to **TCP**, **Ports** of the two security group rules to **28443** and **20009**, respectively. For details, see **Virtual Private Cloud > User Guide > Security > Security Group > Adding a Security Group Rule**.

Step 4 On the VPC management console, apply for an EIP and bind it to the ECS.

For details, see **Virtual Private Cloud** > **User Guide** > **Elastic IP** > **Assigning an EIP and Binding It to an ECS**.

Step 5 Log in to the ECS.

The Windows system account, password, EIP, and the security group rules are required for logging in to the ECS. For details, see **Elastic Cloud Server > User Guide > Instances > Logging In to a Windows ECS**.

Step 6 On the Windows remote desktop, use your browser to access Manager.

For example, you can use Internet Explorer 11 in the Windows 2012 OS.

The address for accessing Manager is the address of the **MRS Manager** page. Enter the name and password of the cluster user, for example, user **admin**.

NOTE

- If you access Manager with other cluster usernames, change the password upon your first access. The new password must meet the requirements of the current password complexity policies. For details, contact the administrator.
- By default, a user is locked after inputting an incorrect password five consecutive times. The user is automatically unlocked after 5 minutes.

Step 7 Log out of FusionInsight Manager. To log out of Manager, move the cursor to  in the upper right corner and click **Log Out**.

----End

9.2 Accessing MRS Manager MRS 2.1.0 or Earlier)

Scenario

MRS uses FusionInsight Manager to monitor, configure, and manage clusters. You can access FusionInsight Manager by clicking **Access Manager** on the **Dashboard** tab page of your MRS cluster and entering username **admin** and the password configured during cluster creation on the login page that is displayed.

Accessing FusionInsight Manager Using an EIP

Step 1 Log in to the MRS management console.

Step 2 In the navigation pane, choose **Clusters** > **Active Clusters**. Click the target cluster name to access the cluster details page.

Step 3 Click **Access Manager** next to **MRS Manager**. In the displayed dialog box, set **Access Mode** to **EIP**. For details about **Direct Connect**, see **Access Through Direct Connect**.

1. If no EIP is bound during MRS cluster creation, select an available EIP from the drop-down list on the right of **IEP**. If you have bound an EIP when creating a cluster, go to **Step 3.2**.

   NOTE

   If no EIP is available, click **Manage EIP** to one. Then, select the d EIP from the drop-down list on the right of **EIP**.

2. Select the security group to which the security group rule to be added belongs. The security group is configured when the cluster is created.
3. Add a security group rule. By default, your public IP address used for accessing port 9022 is filled in the rule. To enable multiple IP address segments to access MRS Manager, see **Step 6** to **Step 9**. If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

   NOTE

   - It is normal that the automatically generated public IP address is different from the local IP address and no action is required.
   - If port 9022 is a Knox port, you need to enable the permission of port 9022 to access Knox for accessing MRS Manager.

4. Select the checkbox stating that **I confirm that xx.xx.xx.xx is a trusted public IP address and MRS Manager can be accessed using this IP address**.

Step 4 Click **OK**. The MRS Manager login page is displayed.

Step 5 Enter the default username **admin** and the password set during cluster creation, and click **Log In**. The MRS Manager page is displayed.

Step 6 On the MRS management console, choose **Clusters** > **Active Clusters**, and click the target cluster name to access the cluster details page.

NOTE

To assign MRS Manager access permissions to other users, follow instructions from **Step 6** to **Step 9** to add the users' public IP addresses to the trusted range.

Step 7 Click **Add Security Group Rule** on the right of **EIP**.

Step 8 On the **Add Security Group Rule** page, add the IP address segment for users to access the public network and select **I confirm that the authorized object is a trusted public IP address range. Do not use 0.0.0.0/0. Otherwise, security risks may arise**.

By default, the IP address used for accessing the public network is filled. You can change the IP address segment as required. To enable multiple IP address

segments, repeat steps **Step 6** to **Step 9**. If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

Step 9 Click **OK**.

----End

Accessing MRS Manager Using an ECS

Step 1 On the MRS management console, click **Clusters**.

Step 2 On the **Active Clusters** page, click the name of the specified cluster.

Record the **AZ**, **VPC**, and **Security Group** of the cluster.

Step 3 On the ECS management console, create an ECS.

- The **AZ**, **VPC**, and **Security Group** of the ECS must be the same as those of the cluster to be accessed.
- Select a Windows public image. For example, select the standard image **Windows Server 2012 R2 Standard 64bit(40GB)**.
- For details about other configuration parameters, see **Elastic Cloud Server > User Guide > Getting Started > Creating and Logging In to a Windows ECS**.

NOTE

If the security group of the ECS is different from **Default Security Group** of the MRS cluster, you can modify the configuration using either of the following methods:

- Change the default security group of the ECS to the security group of the MRS cluster. For details, see **Elastic Cloud Server** > **User Guide** > **Security Group** > **Changing a Security Group**.
- Add two security group rules to the security groups of the Master and Core nodes to enable the ECS to access the cluster. Set **Protocol** to **TCP** and **ports** of the two security group rules to **28443** and **20009**, respectively. For details, see **Virtual Private Cloud** > **User Guide** > **Security** > **Security Group** > **Adding a Security Group Rule**.

Step 4 On the VPC management console, apply for an EIP and bind it to the ECS.

For details, see **Virtual Private Cloud** > **User Guide** > **Elastic IP** > **Assigning an EIP and Binding It to an ECS**.

Step 5 Log in to the ECS.

The Windows system account, password, EIP, and the security group rules are required for logging in to the ECS. For details, see **Elastic Cloud Server > User Guide > Instances > Logging In to a Windows ECS**.

Step 6 On the Windows remote desktop, use your browser to access Manager.

For example, you can use Internet Explorer 11 in the Windows 2012 OS.

The Manager access address is in the format of **https://***Cluster Manager IP Address*:**28443/web**. Enter the name and password of the MRS cluster user, for example, user **admin**.

NOTE

- To obtain the cluster manager IP address, remotely log in to the Master2 node, and run the **ifconfig** command. In the command output, **eth0:wsom** indicates the cluster manager IP address. Record the value of **inet**. If the cluster manager IP address cannot be queried on the Master2 node, switch to the Master1 node to query and record the cluster manager IP address. If there is only one Master node, query and record the cluster manager IP address of the Master node.
- If you access MRS Manager with other MRS cluster usernames, change the password upon your first access. The new password must meet the requirements of the current password complexity policies.
- By default, a user is locked after inputting an incorrect password five consecutive times. The user is automatically unlocked after 5 minutes.

Step 7 Log out of FusionInsight Manager. To log out of Manager, move the cursor to  in the upper right corner and click **Log Out**.

----End

Changing an EIP for a Cluster

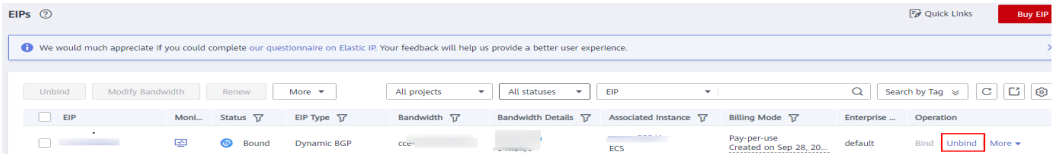
Step 1 On the MRS management console, choose **Clusters** > **Active Clusters**, and click the target cluster name to access the cluster details page.

Step 2 View EIPs

Step 3 Log in to the VPC management console.

Step 4 Choose **Elastic IP and Bandwidth** > **EIPs**.

Step 5 Search for the EIP bound to the MRS cluster and click **Unbind** in the **Operation** column to unbind the EIP from the MRS cluster.



Step 6 Log in to the MRS management console, choose **Clusters** > **Active Clusters**, and click the target cluster name to access the cluster details page.

EIP on the cluster details page is displayed as **Unbound**.

Step 7 Click **Access Manager** next to **MRS Manager**. In the displayed dialog box, set **Access Mode** to **EIP**.

Step 8 Select a new EIP from the EIP drop-down list and configure other parameters. For details, see **Accessing FusionInsight Manager Using an EIP**.

----End

Granting the Permission to Access MRS Manager to Other Users

Step 1 On the MRS management console, choose **Clusters** > **Active Clusters**, and click the target cluster name to access the cluster details page.

Step 2 Click **Add Security Group Rule** on the right of **EIP**.

Step 3 On the **Add Security Group Rule** page, add the IP address segment for users to access the public network and select **I confirm that the authorized object is a trusted public IP address range. Do not use 0.0.0.0/0. Otherwise, security risks may arise**.

By default, the IP address used for accessing the public network is filled. You can change the IP address segment as required. To enable multiple IP address segments, repeat steps **Step 1** to **Step 4**. If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

Step 4 Click **OK**.

----End

10 FusionInsight Manager Operation Guide (Applicable to 3.x)

10.1 Getting Started

10.1.1 FusionInsight Manager Introduction

Overview

MRS manages and analyzes massive data and helps you rapidly obtain desired data from structured and unstructured data. The structure of open-source components is complex. The installation, configuration, and management processes are time- and labor-consuming. FusionInsight Manager is a unified enterprise-level cluster management platform and provides the following functions:

- **Cluster monitoring**: allows you to better understand status of hosts and services.
- **Graphical indicator monitoring and customization**: allow you to obtain key system information in a timely manner.
- **Service property configuration**: allows you to configure service properties based on the performance requirements of your services.
- **Cluster, service, and role instance operations**: allow you to start or stop services and clusters with just a few clicks.
- **Permission management and audit**: allow you to configure the access control and manage operation logs.

Supported Browsers

- Google Chrome.

  The Google Chrome 93 to 95 versions are recommended.
- Edge

  Supports the Edge browser that comes with the Windows 10 system.

NOTE

It is recommended to access FusionInsight Manager using a browser on the Windows platform.

Introduction to the Manager GUI

FusionInsight Manager provides a unified cluster management platform, facilitating rapid and easy O&M for clusters.

The upper part of the page is the operation bar, the middle part is the display area, and the bottom part is the taskbar.

- **Table 10-1** describes the functions of each portal on the operation bar.

Table 10-1 Functions of each portal on the operation bar

Portal	Function Description
Homepage	Shows the key monitoring indicators and statuses of clusters and the host statuses in column charts, line charts, and tables. You can customize a dashboard for the key monitoring indicators and drag it onto any position on the visualized interface layout. The system overview page supports automatic data update. For details, see **Homepage**.
Cluster	Provides the service monitoring, operation, and configuration guidance, which helps you manage services in a unified manner. For details, see **Cluster**.
Hosts	Provides the host monitoring and operation guidance to help you manage hosts in a unified manner. For details, see **Hosts**.
O&M	Allows you to query and handle alarms, and helps you identify product faults and potential risks in a timely manner, ensuring proper system running. For details, see **O&M**.
Audit	Allows you to query and export audit logs, and view all user activities and operations. For details, see **Audit**.
Tenant Resources	Provides a unified tenant management platform. For details, see **Tenant Resources**.
System	Provides FusionInsight Manager system configuration and management functions, such as user permission configuration. For details, see **System Configuration**.

10.1.2 Querying the FusionInsight Manager Version

Before performing system upgrade and routine maintenance operations, you need to query the current FusionInsight Manager version.

- **Using the GUI**

  On the **Homepage** interface, click  on the upper right corner and choose **About** from the shortcut menu. In the displayed interface, view the version number of FusionInsight Manager.

- **Using the CLI**

  a. Log in to the active management node using the IP address of this node as user **root**.

  b. Run the following command to check the FusionInsight_Manager version and platform information:

  su - omm

  cd ${BIGDATA_HOME}/om-server/om/sbin/pack

  ./queryManager.sh

  Information similar to the following is displayed:

  ```
  Version          Package                          Cputype
  ***              FusionInsight_Manager_***        x86_64
  ```

  NOTE

  The version number *** is subject to the actual version number.

10.1.3 Logging In to FusionInsight Manager

Scenarios

This section describes how to log in to FusionInsight Manager using an account after FusionInsight Manager is installed.

Procedure

Step 1 Obtain the URL of FusionInsight Manager.

Step 2 On login page, enter the username and password.

Step 3 New users need to change their passwords.

The password must meet the following requirements:

- It must contain 8 to 64 characters.
- It must contain at least four of the following character types: uppercase letters, lowercase letters, digits, spaces, and special characters `~!@#$%^&*()-_=+|[{}];',<.>/\?.
- It must be different from the username or its reverse.
- It must be different from the current password.

Step 4 Move your cursor to  in the upper right corner of FusionInsight Manager, and click **Log Out** and and click **OK** from the drop-down list to log out of the current user.

----End

10.1.4 Logging In to the Management Node

Scenarios

Some O&M operation scripts and commands need to be run or can be run only on the active management node. You can identify and log in to the active or standby management node based on the following operations.

Checking and Logging In to the Active and Standby Management Nodes

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **OMS**.

In the **Basic Information** area, **Current Active** indicates the host name of the active management node, and the **Current Standby** indicates the host name of the standby management node.

Click a host name to go to the host details page. On the host details page, record the IP address of the host.

Step 3 Log in to the active or standby management node as user **root**.

----End

Identifying the Active and Standby Management Nodes by Running Scripts and Logging In to Them

Step 1 Log in to any node where FusionInsight Manager is deployed as user **root**.

Step 2 Run the following command to identify the active and standby management nodes:

su - omm

sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh

In the command output, the value of **HAActive** for the active management node is **active**, and that for the standby management node is **standby**. In the following example, **Master1** is the active management node, and **Master2** is the standby management node.

```
HAMode
double
NodeName            HostName        HAVersion          StartTime               HAActive
HAAllResOK          HARunPhase
192-168-0-30        Master1         V100R001C01        xxxx-09-01 07:12:05     active
normal              Actived
192-168-0-24        Master2         V100R001C01        xxxx-09-01 07:14:02     standby
normal              Deactived
```

Step 3 Run the following command to obtain the IP addresses of the active and standby management nodes.

cat /etc/hosts

The following is an example of the IP addresses of the active and standby management nodes:

```
127.0.0.1       localhost
192.168.0.30    Master1
192.168.0.24    Master2
```

Step 4 Log in to the active or standby management node as user **root**.

----End

10.2 Homepage

10.2.1 Overview

After you log in to FusionInsight Manager, the contents on the **Homepage** tab page are displayed by default. The **Summary** page displays the service status preview and the monitoring status report of clusters. The **Alarm Analysis** page displays statistics and analysis on top alarms.

- On the right of the operation bar, you can view the number of alarms of different severities, number of running tasks, current users, and help information.
  - Click  to view the task name, cluster, status, progress, start time, and end time of the latest 100 operation tasks in the **Task Management Center**.

    NOTE

    For a start, stop, restart, or rolling restart task, you can click the task name in the **Task Management Center** and click **Abort**. Then, enter the administrator password as prompted to abort the task. After the task is aborted successfully, the task stops.
  - Click  and choose any help information in the displayed short-cut menu to obtain the details. **Table 10-2** describes the help information in the displayed shortcut menu.

    Table 10-2 List of help information

Item	Description
About	Provides current FusionInsight Manager version number information.

- The taskbar at the bottom of the home page displays the language options of FusionInsight Manager and the current cluster time and time zone information. You can switch the system language.

Service Status Preview Area

On the home page, the number of hosts in clusters and number of installed services are displayed on the left. You can click  to display all service information of a cluster and view status and alarm information of each service installed in the cluster.

Click ⋯ to perform basic O&M operations on the current cluster. For details, see **Table 10-3**.

The icon on the left of each service name indicates that the service is running properly, the icon on the left of each service name indicates that the service is failed to start. The icon indicates that the service is not started.

On the right of the service name, you can check whether an alarm is generated for the service. If an alarm exists, the icon is used to identify the alarm severity and display the number of alarms.

If a component supports multiple services, and multiple services are installed in a cluster, the number of installed services will be displayed on the right of the service.

The icon displayed on the right of the service name indicates that the service configuration has expired.

Monitoring Status Report Area

The chart area is on the right of the **Homepage**, which shows the monitoring reports of the key status, such as the status of all hosts in the cluster, host CPU usage, and host memory usage. You can customize the monitoring reports displayed in the chart area. For details about managing the monitoring indicators, see **Managing the Monitoring Indicator Report**.

The graph data sources are displayed in the lower left. You can zoom in a monitoring report to view the detailed information or close the report.

Alarm Analysis

The **Top 20 Alarms** table and **Analysis on Top 3 Alarms** chart are provided on the **Alarm Analysis** tab page. Click the alarm name in the **Top 20 Alarms** table to display the analysis information of this alarm only. Top alarms and their occurrence time are both provided, so that you could handle alarms accordingly to improve system stability.

10.2.2 Managing the Monitoring Indicator Report

Scenarios

On FusionInsight Manager, you can customize the monitoring items displayed on the **Homepage** page and export monitoring data.

NOTE

The time unit of the horizontal axis varies with the custom duration of historical reports. The details are as follows:

- If the custom duration is 0 to 25 hours, the time unit is 5 minutes. In this case, the cluster must have been installed for at least 10 minutes. The system can reserve monitoring data generated in the latest 15 days.
- If the custom duration is 25 to 150 hours, the time unit is 30 minutes. In this case, the cluster must have been installed for at least 30 minutes. The system can reserve monitoring data generated in the latest 3 months.
- If the custom duration is 150 to 300 hours, the time unit is 1 hour. In this case, the cluster must have been installed for at least 1 hour. The system can reserve monitoring data generated in the latest 3 months.
- If the custom duration is 300 hours to 300 days, the time unit is 1 day. In this case, the cluster must have been installed for at least 1 day. The system can reserve monitoring data generated in the latest 6 months.
- If the custom duration is greater than 300 days, the time unit is 7 days. In this case, the cluster must have been installed for at least 7 days. The system can reserve monitoring data generated in the latest 1 year.
- If the disk usage of the GaussDB partition used by the FusionInsight Manager storage exceeds 80%, the real-time monitoring data and monitoring data whose monitoring period is 5 minutes are cleared.
- For **Storage Resource (HDFS)** in **Tenant Resources**, if the custom duration is 0 to 300 hours, the time unit is 1 hour. In this case, the cluster must have been installed for at least one hour. The system can reserve monitoring data generated in the latest three months.

Customizing the Monitoring Indicator Report

Step 1 Log in to FusionInsight Manager.

Step 2 Click **Homepage**.

Step 3 In the upper right corner of the chart area, click ▼ and choose **Customize** from the displayed menu.

NOTE

The monitoring period is in the unit of five minutes. The monitoring data of the latest one hour is displayed. After the real-time monitoring page is displayed, the real-time monitoring data generated in five minutes is displayed on the right of the monitoring graph.

Step 4 In the navigation tree on the left, select a resource subject to be monitored.

Step 5 Select one or more monitoring indicators from the monitoring list on the right.

Step 6 Click **OK**.

----End

Exporting Monitoring Data

Step 1 Log in to FusionInsight Manager.

Step 2 Click **Homepage**.

Step 3 In the upper right corner of the chart area of the cluster to be operated, select a time range to obtain monitoring data. For example, **1 Week**.

The default setting is real-time monitoring data, which cannot be exported. Click to customize a time range for the monitoring data to be exported.

Step 4 In the upper right corner of the chart area, click and choose **Export** in the displayed menu.

----End

Exporting the Data of Specified Monitoring Items

Step 1 Log in to FusionInsight Manager.

Step 2 Click **Homepage**.

Step 3 In the upper right corner of any monitoring report pane in the chart area of the cluster to be operated, click .

Step 4 Select a time range to obtain monitoring data. For example, **1 Week**.

By default, real-time monitoring data is selected, which cannot be exported. Click to customize a time range for the monitoring data to be exported.

Step 5 Click **Export**.

----End

10.3 Cluster

10.3.1 Cluster Management

10.3.1.1 Overview

Dashboard

Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Dashboard** to view the status of the current cluster.

On the **Dashboard** page, you can start, stop, rolling restart, synchronize configurations for, and perform basic management operations for the current cluster, as described in **Table 10-3**.

Table 10-3 Management and maintenance

UI Portal	Description
Start	Start all services in the cluster.
Stop	Stop all services in the cluster.

UI Portal	Description
More > Restart	Restart all services in the cluster.
More > Rolling-restart Service	Restart all services in the cluster without interrupting services. For details, see **Performing a Rolling Restart of a Cluster**.
More > **Synchronize Configurations**	Synchronize parameter configurations for all services in the cluster.
More > Restart Configuration-Expired Instances	Restart all instances whose configurations have expired. For details, see **Managing Expired Configurations**.
More > **Health Check**	Perform health checks on the OMS, and all services and nodes in the cluster. The health check covers checks on the running status of each object, alarms, and user-defined monitoring metrics. The check result differs from the displayed **Running Status**. To export the result of the health check, click **Export Report** in the upper left corner. If any problem is detected, click **Help**.
More > **Download Client**	Download the default client for the user. For details, see **Downloading the Client**.
More > **Export Installation Template**	Export all installation configurations of the cluster in batches, including the cluster authentication mode, node information, and service configurations. This operation is performed when the cluster needs to be reinstalled in the same environment.
More > **Export Configurations**	Export configurations of all services in the cluster in batches.
More > Enter Maintenance Mode/Exit Maintenance Mode	Configure the cluster to enter or exit the maintenance mode.
More > O&M View	Check the services or hosts that are in the maintenance state.

10.3.1.2 Performing a Rolling Restart of a Cluster

Scenarios

Rolling restart means to restart a cluster without interrupting services after the service role is updated or the configuration is modified in the cluster.

If you need to restart all services in the cluster in batches without interrupting services, you can perform a rolling restart.

NOTE

- Some services do not support a rolling restart. These services will experience a common restart during the rolling restart and may be interrupted. Perform operations as prompted.
- For configurations that must take effect immediately, for example, configuration of the port for a server, a rolling restart is not recommended. Perform a common restart instead.

Impact on the System

Compared with a common restart, a rolling restart does not interrupt services, but it takes longer time than a common restart and may affect throughput and performance of the service to be restarted.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > ***Name of the desired cluster*** **> Dashboard > More > Rolling-restart Service**.

Step 3 In the displayed dialog box, enter the password of the current login user and click **OK**.

Step 4 Set the parameters as required, as shown in **Table 10-4**.

Table 10-4 Rolling restart parameters

Parameter	Description
Restart only instances with expired configurations in the cluster	Specifies whether to restart only the modified instances in a cluster.
Enable rack strategy	Specifies whether to enable the concurrent rolling restart of rack strategy. This option takes effect for roles that meet the rolling restart requirements of the rack strategy. (The roles support the rack-aware function, and instances of the roles belong to two or more racks). **NOTE** This parameter can be set only when a rolling restart is performed on HDFS or YARN.

Parameter	Description
Data Nodes to Be Batch Restarted	Specifies the number of instances that are restarted for each batch when the batch rolling restart strategy is used. The default value is **1**. **NOTE** • This parameter is valid only when the batch rolling restart strategy is used and the instance is the DataNode. • When the rack strategy is enabled, this parameter is invalid. In this case, the cluster uses the default maximum number of instances (20) configured in the rack strategy as the maximum number of instances that are concurrently restarted in a rack. • This parameter can be set only when a rolling restart is performed on HDFS, YARN, Kafka, Storm, or Flume. • This parameter for the RegionServer of HBase cannot be manually configured. Instead, it is automatically adjusted based on the number of RegionServer nodes. Specifically, if the number of RegionServer nodes is less than 30, the parameter value is **1**. If the number is greater than or equal to 30 and less than 300, the parameter value is **2**. If the number is greater than or equal to 300, the parameter value is 1% of the number (rounded-down).
Batch Interval	Specifies the interval between two batches of instances to be rolling restarted. The default value is **0**.
Decommissioning Timeout Interval	Specifies the decommissioning timeout interval for role instances during a rolling restart. The default value is 1800s. Some roles (such as HiveServer and JDBCServer) stop providing services before the rolling restart. Stopped instances cannot establish new connections. Existing connections will be completed after a period of time. A proper configuration of the timeout parameters can minimize the risk of service interruption. **NOTE** This parameter can be set only when a rolling restart is performed for Hive and Spark2x.
Batch Fault Tolerance Threshold	Specifies the tolerance times when the rolling restart of instances fails to be executed in batches. The default value is **0**, which indicates that the rolling restart task ends after any batch of instances fails to be restarted.

NOTE

Set advanced parameters, such as **Data Nodes to Be Batch Restarted**, **Batch Interval**, and **Batch Fault Tolerance Threshold** based on site requirements. Otherwise, services may be interrupted or the performance may be severely affected. Therefore, exercise caution when performing this operation.

The following shows an example:

- If **Data Nodes to Be Batch Restarted** is too large, a great number of instances are restarted at the same time. As a result, services are interrupted or the performance is severely affected because the number of remaining instances is small.
- If **Batch Fault Tolerance Threshold** is too large, services will be interrupted when a new batch of instances is restarted after the previous instance restart failed.

Step 5 Click **OK** and wait until the rolling restart is complete.

----End

10.3.1.3 Managing Expired Configurations

Scenarios

If a new configuration needs to be delivered to all services in the cluster, or **Configuration Status** of multiple services is set to **Expired** or **Failed** after a configuration is modified, the configuration parameters of these services are not synchronized and do not take effect, you can synchronize the configuration and restart related services for the cluster to make new configuration parameters take effect in all services.

If the configuration of the services in the cluster has been synchronized but do not take effect, you need to restart the instances whose configuration has expired.

Impact on the System

- After synchronizing the cluster configuration, you need to restart the services whose configuration has expired. These services are unavailable during restart.
- The instances whose configuration has expired are unavailable during restart.

Procedure

Synchronize configurations.

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Dashboard.**

Step 3 Choose **More** > **Synchronize Configurations**.

Step 4 In the displayed dialog box, click **OK**.

----End

Restart instances whose configurations have expired.

Step 1 Choose **More** > **Restart Configuration-Expired Instances**.

Step 2 In the displayed dialog box, enter the password of the current login user and click **OK**.

Step 3 In the displayed dialog box, click **OK**.

You can click **View Instance** to open the list of all expired instances and confirm that the instances have been restarted.

----End

10.3.1.4 Downloading the Client

Scenarios

A default client is provided for MRS clusters. You can manage the cluster, run services, and perform secondary development using this client. Before using the client, you need to download the client software package.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Dashboard** > **More** > **Download Client**.

The **Download Cluster Client** dialog box is displayed.

Step 3 Select a type in the **Select Client Type** dialog box.

- The **Complete Client** type indicates that the package contains scripts, compilation files, and configuration files.
- The **Configuration Files Only** type indicates that the package contains only the client configuration file.

  This type is applicable to application development tasks. For example, it can be used in the following scenario: All client files are downloaded and installed and the administrator modifies the service configuration on FusionInsight Manager. The developer needs to update the client configuration files.

NOTE

There are two platform types: x86_64 and aarch64, which can be installed on the x86 and TaiShan nodes respectively. By default, the platform type of the downloaded client is the same as that of the server.

Step 4 Determine whether to generate a client software package file on the cluster node.

- If yes, select **Save to Path** and click **OK** to generate the client file.

  After the file is generated, it is stored in the **/tmp/FusionInsight-Client/** directory on the primary management node by default. You can also store the client file in other directories, and user **omm** has the read, write, and execute permissions on the directory. If the client file already exists in the path, the existing client file will be replaced.

  After the file is generated, copy the obtained package to another directory, as user **omm** or client installation user, for example, the **/opt/Bigdata/client** directory.
- If no, click **OK** and download the client file to the local PC.

Download the client software package, and wait until the download is complete.

After the client is successfully downloaded, install the client by referring to **Installing a Client**.

----End

10.3.1.5 Modifying Cluster Properties

Scenarios

FusionInsight Manager allows you to view basic attributes after the cluster is installed.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Cluster Properties**.

You can view the cluster name, cluster description, product type, cluster ID, authentication mode, cluster creation time and installed component by default.

Step 3 Change the cluster name.

1. Click and enter a new name.

   The following naming rules are as follows: Enter 2 to 199 characters, including letters, digits, underscores (_), hyphens (-), and spaces. Spaces can be placed only between characters.

2. Click **OK** for the new cluster name to take effect.

Step 4 Modify the cluster description.

1. Click and enter a new description.

   Contains a maximum of 199 characters, including letters, digits, commas (,), periods(.), underscores(_), spaces, or newline characters.

2. Click **OK** for the new description to take effect.

----End

10.3.1.6 Management Cluster Configuration

Scenario

FusionInsight Manager allows you to view the changes of service configuration parameters in a cluster by one click, helping you quickly locate faults and improve configuration management efficiency.

Administrators can quickly view all non-default values of each service in the cluster, non-unified values between instances of the same role, historical records of cluster configuration modification, and parameters whose configuration status is expired in the cluster on the configuration page.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Configurations**.

Step 3 Select an operation page based on the scenario.

- To view all non-default values:
  a. Click **All Non-default Values**. The system displays the parameters that are inconsistent with the default values of each service, role, or instance in the current cluster.

     You can click  next to a parameter value to quickly restore to the default value. You can click  to view the historical modification records of the parameter.

     If a large number of parameters need to be configured, you can filter the parameters in the service filter box in the upper right corner of the page or enter keywords in the search box to search for the parameters.
  b. If you need to change the parameter values of the configuration items, change the values according to the parameter description, and then click **Save**. In the dialog box that is displayed, click **OK**.
- To view all non-unified values:
  a. Click **All Non-uniform Values**. The system displays configuration items with different role, instance group, service, or instance configurations in the current cluster.

     Click  next to the parameter value. In the window that is displayed, you can view the differences.
  b. If you need to change the parameter values, click  to cancel the configuration difference or manually adjust the parameter values, click **OK**, and then click **Save**. In the dialog box that is displayed, click **OK**.
- To check the expiration configurations:
  a. Click **Expired Configurations**. Expired configuration items in the current cluster are displayed.
  b. You can filter services in the upper corner of the page to view the expired configurations of different services, or enter keywords in the search box.
  c. The expired configuration items do not take effect completely. If services are not affected, restart the services or instances whose configuration items have expired.
- To view historical configuration records:
  a. Click **Historical Configurations**. The historical configuration change records of the current cluster are displayed. You can view the parameter value change details, including the service to which the parameter belongs, parameter values before and after the modification, and parameter files.
  b. To restore a configuration change, click **Restore Configuration** in the **Operation** column. In the dialog box that is displayed, click **OK**.

NOTE

Some configuration items take effect only after the corresponding services are restarted. After the configuration is saved, restart the service or instance whose configuration has expired in a timely manner.

----End

10.3.1.7 Static Service Pool

10.3.1.7.1 Static Service Resources

Overview

The resources allocated to each service in a cluster are static service resources. Such services include Flume, HBase, HDFS and Yarn. The total volume of computing resources allocated to each service is fixed, and they are static. A tenant can exclusively use or share a service to obtain the resources required for running this service.

Static Service Pool

Static service pools are used to specify service resource configurations.

Static service pools centrally manage resources applicable to each service.

- They restrict the total volume of resources used for services and dynamically configure the total CPU, I/O, and memory resources applicable to nodes running Flume, HBase, HDFS and Yarn.
- The resources of services are isolated. The services in a cluster are isolated from each other, and the workload of one service has limited impact on other services.

Scheduling Mechanism

The time-based dynamic resource scheduling mechanism enables different volumes of static resources to be configured for services at different time, optimizing service running environments and improving the cluster efficiency.

In a complex cluster environment, multiple services share resources in the cluster, but the resource service period of each service may be different.

The following use a bank customer as an example:

- The HBase query service is heavy in the daytime.
- The query service is light, but the Hive analysis service is heavy at night.

If fixed resources are allocated to each service, the following problems may occur:

- The query service cannot obtain sufficient resources while the resources for the analysis service are idle in the daytime.
- The analysis service cannot obtain sufficient resources while the resources for the query service are idle at night.

As a result, the cluster resource utilization is low and the service capability is weak. Resolve the problem in the following ways:

- Sufficient resources need to be configured for HBase in the daytime.
- Sufficient resources need to be configured for Hive at night.

The time-based dynamic scheduling mechanism can efficiently utilize resources and run tasks.

10.3.1.7.2 Configuring Cluster Static Resources

Scenarios

You can adjust resource base on FusionInsight Manager and customize resource configuration groups if you need to control service resources used on each node in a cluster or the available CPU or I/O quotas on each node at different time segments.

Impact on the System

- After a static service pool is configured, the configuration status of affected services is displayed as **Expired**. You need to restart the services. Services are unavailable during restart.
- After a static service pool is configured, the maximum number of resources used by each service and role instance cannot exceed the upper limit.

Procedure

Modify the Resource Adjustment Base

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Static Service Pool Configurations**.

Step 2 Click **Configurations** in the upper right corner. The page for configuring resource pools is displayed.

Step 3 Change the values of **CPU (%)** and **Memory (%)** in the **System Resource Adjustment Base** area.

Modifying the system resource adjustment base changes the maximum physical CPU and memory usage on nodes by services. If multiple services are deployed on the same node, the maximum physical resource usage of all services cannot exceed the adjusted CPU or memory usage.

Step 4 Click **Next**.

To modify parameters again, click **Previous**.

Modify the Default Resource Configuration Group

Step 5 Click **default**. In the **Configure weight** table, set **CPU LIMIT(%)**, **CPU SHARE(%)**, **I/O(%)**, and **Memory(%)** for each service.

NOTE

- The sum of **CPU LIMIT(%)** and **CPU SHARE(%)** used by all services can exceed 100%.
- The sum of **I/O(%)** used by all services can exceed 100% but not 0.
- The sum of **Memory(%)** used by all services can be greater than, smaller than, or equal to 100%.
- **Memory(%)** cannot take effect dynamically and can only be modified in the default configuration group.
- **CPU LIMIT(%)** is used to configure the ratio of the number of CPU cores that can be used by a service to those can be allocated to related nodes.
- **CPU SHARE(%**) is used to configure the ratio of the time when a service uses a CPU core to the time when other services use the CPU core. That is, the ratio of time when multiple services compete for the same CPU core.

Step 6 Click **Generate detailed configurations based on weight configurations**. FusionInsight Manager generates the actual values of the parameters in the default weight configuration table based on the cluster hardware resources and allocation information.

Step 7 Click **OK**.

In the displayed dialog box, click **OK**.

Add a Customized Resource Configuration Group

Step 8 Determine whether to automatically adjust resource configurations at different time segments.

- If yes, go to **Step 9**.
- If no, use the default configurations, and no further action is required.

Step 9 Click **Configuration**, change the system resource adjustment base values, and click **Next**.

Step 10 Click **Add** to add a resource configuration group.

Step 11 In **Step 1: Scheduling Time**, click **Configuration**.

The page for configuring the time policy is displayed.

Modify the following parameters based on service requirements and click **OK**.

- **Repeat**: If this parameter is selected, the customized resource configuration is applied repeatedly based on the scheduling period. If this parameter is not selected, set the date and time when the configuration of the group of resources can be applied.
- **Repeat Policy**: The available values are **Daily**, **Weekly**, and **Monthly**. This parameter is valid only when **Repeat** is selected.
- **Between**: indicates the time period between the start time and end time when the resource configuration is applied. Set a unique time range. If the time range overlaps with that of an existing group of resource configuration, the time range cannot be saved.

NOTE

- The default group of resource configuration takes effect in all undefined time segments.
- The newly added resource group is a parameter set that takes effect dynamically in a specified time range.
- The newly added resource group can be deleted. A maximum of four resource configuration groups that take effect dynamically can be added.
- Select a repetition policy. If the end time is earlier than the start time, the resource configuration ends in the next day by default. For example, if a validity period ranges from 22: 00 to 06: 00, the customized resource configuration takes effect from 22: 00 on the current day to 06: 00 on the next day.
- If the repeat policy types of multiple configuration groups are different, the time ranges can overlap. The policy types are listed as follows by priority from low to high: daily, weekly, and monthly. The following is an example. There are two resource configuration groups using the monthly and daily policies, respectively. Their application time ranges in a day overlap as follows: 04: 00 to 07: 00 and 06: 00 to 08: 00. In this case, the configuration of the group that uses the monthly policy prevails.
- If the repeat policy types of multiple resource configuration groups are the same, the time ranges of different dates can overlap. For example, if there are two weekly scheduling groups, you can set the same time range on different day for them, such as to 04: 00 to 07: 00, on Monday and Wednesday, respectively.

Step 12 Modify the resource configuration of each service in **Step 2: Weight Configuration**.

Step 13 Click **Generate detailed configurations based on weight configurations**. FusionInsight Manager generates the actual values of the parameters in the default weight configuration table based on the cluster hardware resources and allocation information.

Step 14 Click **OK**.

In the displayed dialog box, click **OK**.

----End

10.3.1.7.3 Viewing Cluster Static Resources

Scenarios

The big data management platform can manage and isolate service resources that are not running on YARN using static service resource pools. The system supports time-based automatic adjustment of static service resource pools. This enables the cluster to automatically adjust the parameter values at different periods to ensure more efficient resource utilization.

System administrators can view the monitoring indicators of resources used by each service in the static service pool on FusionInsight Manager. The monitoring indicators are as follows:

- CPU usage of services
- Total disk I/O read rate of services
- Total disk I/O write rate of services
- Total used memory of services

NOTE

After the multi-tenant function is enabled, the CPU, I/O, and memory usage of all HBase instances can be centrally managed.

Procedure

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Static Service Pool Configurations**.

Step 2 In the configuration group list, click a configuration group, for example, **default**.

Step 3 Check the system resource adjustment base values.

- **System Resource Adjustment Base** indicates the maximum volume of resources that can be used by each node in the cluster. If a node has only one service, the service exclusively occupies the available resources on the node. If a node has multiple services, all services share the available resources on the node.
- **CPU** indicates the maximum number of CPUs that can be used by services on a node.
- **Memory** indicates the maximum memory that can be used by services on a node.

Step 4 In the Chart, view the indicator data chart of cluster service resource usage.

NOTE

- You can click **Add Service to Chart** to add static service resource data of specific services (up to 12 services) to the chart.
- For details about how to manage a single chart, see **Managing the Monitoring Indicator Report**.

----End

10.3.1.8 Client Management

10.3.1.8.1 Managing the Client

Scenario

FusionInsight Manager supports unified management of client installation information in a cluster. After a user downloads and installs the client, FusionInsight Manager automatically records information about the installed (registered) client to facilitate query and management. In addition, you can manually add or modify the information about clients that are not automatically registered, for example, clients installed in earlier versions.

Procedure

Viewing client information

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Client Management** to view the information about the installed clients in the cluster. You can view the IP address,

installation path, component list, registration time, and installation user of the node where the client is located. When you download and install the client of the latest version, the client information is automatically registered.

Adding client information

Step 3 If you need to manually add information for an installed client, click **Add** and manually add the IP address, installation path, user, platform information, and registration information of the client as prompted.

Step 4 Configure the client information and click **OK**.

Modifying client information

Step 5 Information of a manually registered client can be manually modified.

On the **Client Management** page, select the desired client and click **Modify**. After information is modified, click **OK**.

Deleting client information

Step 6 On the **Client Management** page, select the desired client and click **Delete**. In the displayed dialog box, click **OK**.

To delete information of multiple clients, select the desired clients and click **Batch Delete**. In the displayed dialog box, click **OK**.

Exporting client information

Step 7 On the **Client Management** page, click **Export All** to export information about all registered clients to the local PC.

----End

NOTE

On the **Client Management** page, only components that have clients are displayed in the component list. Therefore, some components that do not have clients and special components are not displayed.

The following components are not displayed:

LdapServer, KrbServer, DBService, Hue, Mapreduce, and Flume

10.3.1.8.2 Batch Upgrading Clients

Scenario

The client package downloaded from FusionInsight Manager contains the client batch upgrade tool. If multiple clients need to be upgraded after a cluster upgrade or capacity expansion, you can use this tool to batch upgrade the clients. In addition, the tool provides a lightweight function for batch updating the **/etc/hosts** file on the nodes where the clients are located.

Procedure

Preparation Before the Client Upgrade

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **More** > **Download Client** to download the client package to the specified directory on the server.

For details, see section **Downloading the Client**.

Decompress the downloaded client package and find the **batch_upgrade** directory, for example, **/tmp/FusionInsight-Client/FusionInsight_Cluster_1_Services_ClientConfig/batch_upgrade**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **Client Management**. On the **Client Management** page that is displayed, and click **Export All** to export the information about the selected clients to the local PC.

Step 4 Decompress the exported client information and upload the **client-info.cfg** file to the **batch_upgrade** directory.

Step 5 Supplement the ciphertext password in the **client-info.cfg** file by referring to **Reference**.

Batch Upgrading Clients

Step 6 Run the **sh client_batch_upgrade.sh -u -f /tmp/FusionInsight-Client/FusionInsight_Cluster_1_Services_Client.tar -g /tmp/FusionInsight-Client/FusionInsight_Cluster_1_Services_ClientConfig/batch_upgrade/client-info.cfg** command to perform the upgrade.

NOTICE

Because the password is configured, you are advised to delete the **client-info.cfg** file as soon as possible after the upgrade.

Step 7 After the upgrade is complete, verify the upgrade result by running the **sh client_batch_upgrade.sh -c** command.

Step 8 If the client is faulty after the upgrade, run the **sh client_batch_upgrade.sh -s** command to roll back the upgrade.

NOTE

- The client batch upgrade tool moves the original client to the backup directory, and then uses the client package specified by the **-f** parameter to install the client again. Therefore, if the original client contains customized contents, manually save the customized contents from the backup directory or move the customized contents to the client directory after the upgrade before you run the **-c** command. Client backup path: *{Original client path}*-backup
- The **-u** parameter is the prerequisite for the **-c** and **-s** commands. You can run the **-c** command to submit or the **-s** command to perform a rollback only after the **-u** command is executed to perform an upgrade.
- You can run the **-u** command multiple times to upgrade only the clients that fail to be upgraded.
- The client batch upgrade tool also supports clients of early versions.
- To upgrade a client installed by a non-root user, the operator must have the read/write permission for the directory where the client is located and its parent directory. Otherwise, the upgrade fails.
- The client package of the **-f** parameter must be a full client. The client package of a single component or some components cannot be used as the input.

----End

Reference

Before upgrading clients in batches, you need to manually configure the user password for remotely logging in to the client node.

Run the **vi client-info.cfg** command to add the user password.

For example:

```
clientIp,clientPath,user,password
10.10.10.100,/home/omm/client /home/omm/client2,omm,password
```

The fields in the configuration file are as follows:

- **clientIp**: Indicates the IP address of the node where the client is located.
- **clientPath**: Indicates the client installation path. Multiple paths are separated by spaces. Note that the path cannot end with a slash (/).
- **user**: Indicates the username of the node.
- **password**: Indicates the user password of the node.

  NOTE

  - Enter a password.
  - If the execution fails, you can check **node.log** in **work_space/log**_*XXX* under the execution directory.

10.3.1.8.3 Updating the hosts File in Batches

Scenario

The client package downloaded from FusionInsight Manager contains the client batch upgrade tool which provides the lightweight functions of upgrading the client in batches and updating the **/etc/hosts** files on the nodes where the clients reside in batches.

Prerequisites

For details about how to prepare for the upgrade, see "Preparation Before the Client Upgrade" in **Procedure**.

Updating the hosts File in Batches

Step 1 Check whether the user configured on the host where the **/etc/hosts** file needs to be updated is user **root**.

- If yes, go to **Step 2** .
- If no, change the configured user to user **root**, and go to **Step 2**.

Step 2 Run the **sh client_batch_upgrade.sh -r -f /tmp/FusionInsight-Client/FusionInsight_Cluster_1_Services_Client.tar** command to update the **/etc/hosts** file on the nodes where the clients are located in batches.

NOTE

- When you batch update the **/etc/hosts** file, the client package name you entered can be either the name of a complete client package or configuration file name only (recommended).
- The configured user of the host where the **/etc/hosts** file needs to be updated must be user **root**. Otherwise, the update fails.

----End

10.3.2 Managing a Service

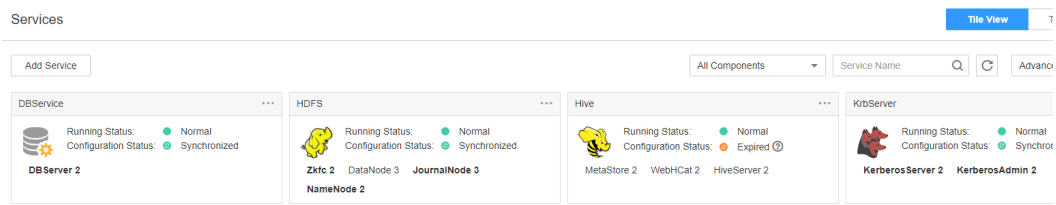
10.3.2.1 Overview

Overview

Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services**.

The service management page containing the function area and service list is displayed.

Figure 10-1 Service management page



Functional Area

In the function area of the service management page, you can select a view type and filter and search by services. You can use the advanced search function to select required services based on the running status.

Service List

The service list on the service management page contains all installed services in the cluster. If the tile view mode is selected, the services will be displayed in pane style. If you select the list view mode, the services will be displayed in a table.

NOTE

In this section, the **Tile View** is used by default.

The service list displays the running status, configuration status, role type, and number of instances of each service. On this page, you can perform some service maintenance tasks, such as starting, stopping, and restarting services.

Table 10-5 Service running status

Status	Description
Normal	Indicates that the service is running properly.
Faulty	Indicates that the service cannot run properly.
Subhealthy	Indicates that some enhanced functions of the service are abnormal.
Not started	Indicates that the service is stopped.
Unknown	Indicates that the initial status of the service cannot be detected.
Starting	Indicates that the service is being started.
Stopping	Indicates that the service is being stopped.
Failed to start	Indicates that the service fails to be started.
Failed to stop	Indicates that the service fails to be stopped.

NOTE

- If the health status of a service is **Faulty**, an alarm is generated. Rectify the fault based on the alarm information.
- HBase, Hive, Spark, and Loader may be in the **Subhealthy** state.
  - If YARN is installed but is abnormal, HBase is in the **Subhealthy** state. If the multi-instance function is enabled, all installed HBase service instances are in the **Subhealthy** state.
  - If HBase is installed but is abnormal, Hive, Spark, and Loader are in the **Subhealthy** state.
  - If any HBase instance is installed but is abnormal after the multi-instance function is enabled, Loader is in the **Subhealthy** state.
  - If an HBase instance is installed but is abnormal after the multi-instance function is enabled, the Hive and Spark instances that map to the HBase instance are in the **Subhealthy** state. That is, if HBase 2 is installed but is abnormal, Hive 2 and Spark2 are in the **Subhealthy** state.

Table 10-6 Service configuration status

Status	Description
Synchronized	Indicates that all service parameter settings have taken effect in the cluster.
Expired	Indicates that the latest configuration is not synchronized and does not take effect after service parameter settings are modified. The configuration needs to be synchronized and the related services need to be restarted. You can click  next to **Configuration Status** to view expired configuration items.
Failed	Indicates that a communication or read/write exception occurs during the parameter configuration synchronization. Use **Synchronize Configuration** to rectify the fault.
Synchronizing	Indicates that the service parameter configuration is being synchronized.
Unknown	Indicates that the initial status of the service cannot be detected.

You can click a service in the service list to perform simple maintenance and management operations on the service, as described in **Table 10-7**.

Table 10-7 Basic management and maintenance

UI Portal	Description
Start Service	Start a specified service in the cluster.
Stop Service	Stop a specified service in the cluster.
Restart Service	Restart a specified service in the cluster. **NOTE** If a service is restarted, other services that depend on this service will be unavailable. Therefore, select **Restart upper-layer services**. Determine whether to perform this operation based on the displayed service list. Services are restarted one by one due to their dependency. **Table 10-8** describes the restart duration of a single service.
Service Rolling Restart	Restart a specified service in the cluster without interrupting services. For details about the parameter settings, see **Table 10-4**.

UI Portal	Description
Synchronize Configuration	• Enable new configuration parameters for a specified service in the cluster. • Deliver new configuration parameters for services whose **Configuration Status** is **Expired**. **NOTE** After some services are synchronized, restart the services for the settings to take effect.

Table 10-8 Restart time

Service Name	Restart Duration	Start Duration	Remarks
CDL	2min	CDLConnector: 1min CDLService: 1min	-
ClickHouse	4min	ClickHouseServer: 2min ClickHouseBalancer: 2min	-
HDFS	10min+x	NameNode: 4 min + x DataNode: 2 min JournalNode: 2 min Zkfc: 2 min	X indicates the duration for loading NameNode metadata. About two minutes are required for each ten million files. For example, if there are 50 million files, x indicates 10 minutes. The start duration is affected by the duration for DataNode to report data blocks.
Yarn	5min+x	ResourceManager: 3 min + x NodeManager: 2 min	x indicates the time corresponding to the number of reserved tasks that need to be restored by ResourceManager. Each 10 thousand reserved tasks require one minute.
MapReduce	2min+x	JobHistoryServer: 2 min + x	x indicates the scanning duration of historical tasks. Each 100 thousand tasks take about 2.5 minutes.
Zookeeper	2min+x	quorumpeer: 2 min + x	x indicates the duration for loading Znodes. Each one million Znodes take about one minute.

Service Name	Restart Duration	Start Duration	Remarks
Hive	3.5min	HiveServer: 3 min MetaStore: 90s WebHcat: 1 min Hiveoverall service: 3 min	-
Spark2x	5min	JobHistory2x: 5 min SparkResource2x: 5 min JDBCServer2x: 5 min	-
Flink	4min	FlinkResource: 1 min FlinkServer: 3min	-
Kafka	2min+x	Broker: 1 min + x	X indicates the data recovery duration. It takes about two minutes to start a single instance with 20000 partitions.
Storm	6min	Nimbus: 3 min UI: 1 min Supervisor: 1 min Logviewer: 1 min	-
Flume	3min	Flume: 2 min MonitorServer: 1 min	-

10.3.2.2 Other Service Management Operations

10.3.2.2.1 Service Details Page

Overview

Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services**. In the service list, click the specified service name to go to the service details page, including the **Dashboard**, **Instance**, **Instance Groups** and **Configurations** tab pages as well as function areas. For some services, the customized management tool page can be displayed.For details about the supported management tools, see**Table 10-9**..

Table 10-9 Customized management tools

Tool	Service	Description
Flume configuration tool	Flume	Configures collection parameters for the Flume server and client.
Flume client management tool	Flume	Views the monitoring information about the Flume client.
Kafka topic monitoring tool	Kafka	Monitors and manages Kafka topics.

The **Dashboard** page is the default page, which contains the basic information, role list, dependency table, and monitoring chart, and more. You can manage services in the upper right corner. For details about basic service management, such as starting, stopping, rolling restart, and synchronization configuration, see **Table 10-7**. For details about other service management operations, see **Table 10-10**.

Table 10-10 Service management operations

Navigation Path	Description
More > **Health Check**	Performs a health check for the current service. The health check items include the health status of each check object, related alarms, and user-defined monitoring indicators. The check result is not the same as the values of **Running Status** displayed on the GUI. To export the result of the health check, click **Export Report** in the upper left corner of the checklist. If you find any problem, click **View Help**.
More > **Download Client**	Download the default client that contains only specific services and perform management operations, run services, or perform secondary development on the client. For details, see **Downloading the Client**.
More > **Change Service Name**	Changes the name of the current service.
More > **Perform** *XX* **Switchover**	For details, see **Performing Active/Standby Switchover of a Role Instance**.
More > **Enter/Exit Maintenance Mode**	Configures a service to enter/exit the maintenance mode.

Navigation Path	Description
Configurations > **Import/Export**	In the scenario where services are migrated to a new cluster or the same services are deployed again, you can import or export all configuration data of a specific service to quickly copy the configuration results.

Basic Information Area

The basic information area on the **Dashboard** tab page contains the basic status data of the service, including the running status, configuration details, version, and key information of the service. If the service supports the open-source web UIs, you can access the open-source web UIs by clicking the links in the basic information area.

NOTE

In the current version, user **admin** does not have the permission to access all the service functions provided on the open source web UI. Create a component service administrator to access the WebUI address.

Role List

The role list on the **Dashboard** tab page contains all roles of the service. The role list displays the running status and the number of instances of each role.

Dependency

The dependency relationship table on the **Dashboard** tab page displays the services on which the current service depends and other services that depend on the service.

Historical Records of Alarms and Events

The alarm and event history area displays the key alarms and events reported by the current service. Up to 20 historical records are displayed.

Chart

The chart area is displayed on the right of the **Dashboard** tab page and contains the key monitoring indicator report of the service. You can customize the monitoring report that is displayed in the chart area, view the description of the monitoring metrics, or export the monitoring data. For a customized resource contribution chart, you can zoom in on the chart and switch between the trend chart and distribution chart.

NOTE

Some services in the cluster provide service-level resource monitoring items. For details, see **Resource Monitoring**.

10.3.2.2.2 Performing Active/Standby Switchover of a Role Instance

Scenarios

Some service roles are deployed in active/standby mode. If the active instance needs to be maintained and cannot provide services, or other maintenance is required, you can manually trigger an active/standby switchover.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 3 Click the specified service name on the service management page.

Step 4 On the service details page, expand the **More** drop-down list and select **Perform** *Role Instance* **Switchover**.

Step 5 In the displayed dialog box, enter the password of the current login user and click **OK**.

Step 6 In the displayed dialog box, click **OK** to perform active/standby switchover for the role instance.

NOTE

- The Manager component package only supports the active/standby switchover of DBService role instances.
- The HD component package supports the active/standby switchover of the following service role instances: HDFS, YARN, Storm, HBase and Mapreduce.
- When an active/standby switchover is performed for a NameNode on HDFS, a NameService must be set.
- The Porter component package only supports the active/standby switchover of Loader role instances.
- This function cannot be used for other role instances.

----End

10.3.2.2.3 Resource Monitoring

Some services in the cluster provide service-level resource monitoring metrics. By default, the monitoring data of the latest 12 hours is displayed. You can click to customize a time range. The default time ranges are as follows: 12 hours, 1 day, 1 week, and 1 month. You can click to export the corresponding report information. If a monitoring item has no data, the report cannot be exported. **Table 10-11** lists the services and monitoring items that support resource monitoring.

Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**, and click **Resource**. The resource monitoring page is displayed.

Table 10-11 Service resource monitoring

Service	Metrics	Description
HDFS	Resource Usage (by Tenant)	• Collects statistics on HDFS resource usage by tenant. • Views the metrics **Capacity** or **Number of File Objects**.
	Resource Usage (by User)	• Collects statistics on HDFS resource usage by user. • Views the metrics **Used Capacity** or **Number of File Objects**.
	Resource Usage (by Directory)	• Collects statistics on HDFS resource usage by directory. • Views the metrics **Used Capacity** or **Number of File Objects**. • You can click  to configure space monitoring. Alternatively, you can specify an HDFS file system directory for monitoring.
	Resource Usage (by Replica)	• Collects statistics on HDFS resource usages by replica count. • Views the metrics **Used Capacity** or **File Count**.
	Resource Usage (by File Size)	• Collects statistics on HDFS resource usages by file size. • Views the metrics **Used Capacity** or **File Count**.
	Recycle Bin (by User)	• Collects statistics on the usage of the HDFS recycle bin by user. • Views the metrics **Recycle Bin Capacity** or **Number of File Objects**.
	Operation Count	• Collects the number of operations in HDFS.
	Automatic Balancer	• Collects statistics on the execution speed of HDFS automatic balancer and the total capacity of the current balancer migration.
	NameNode RPC Open Connections (by User)	• Displays the number of connections of each user in the Client RPC requests connected to NameNodes.
	Slow DataNodes	Displays DataNode that transmits or processes data slowly in the cluster.

Service	Metrics	Description
	Slow Disks	Displays the disk that processes data slowly on the DataNode in the cluster.
HBase	Operation Requests in Tables	Displays the number of PUT, DELETE, GET, SCAN, INCREMENT, and APPEND operation requests in all tables on all RegionServers.
	Operation Requests on RegionServers	Displays the number of PUT, DELETE, GET, SCAN, INCREMENT, and APPEND operation requests and number of all operation requests in RegionServer.
	Operation Requests for Service	Displays the number of PUT, DELETE, GET, SCAN, INCREMENT, and APPEND operation requests in all regions on RegionServers.
	HFiles on RegionServers	Displays the number of HFiles in all RegionServers.
Hive	HiveServer2-Background-Pool Threads (by IP)	Displays the number of HiveServer2-Background-Pool threads of top users. These threads are measured and displayed in a measurement period.
	HiveServer2-Handler-Pool Threads (by IP)	Displays the number of HiveServer2-Handler-Pools of top users collected and displayed in a period.
	Used MetaStore Number (by IP)	Collects statistics on and displays the MetaStore usage of top users in a period.
	Number of Hive jobs	Displays the number of user-related jobs collected by Hive in a period.
	Number of Files Accessed in the Split Phase	Displays the number of files accessed by the underlying file storage system (HDFS by default) in the Split phase in a period.
	Hive Basic Operation Time	Collects time for creating a directory (mkdirTime), creating a file (touchTime), writing a file (writeFileTime), renaming a file (renameTime), moving a file (moveTime), deleting a file (deleteFileTime), and deleting a directory (deleteCatalogTime) in a period of time.

Service	Metrics	Description
	Table Partitions	Displays the number of partitions in all Hive tables, which is displayed in the following format: *database # table name*, *number of table partitions*.
	HQL Map Count	Collects statistics on HQL statements executed in a period and the number of Map statements invoked during the execution. The displayed information includes users, HQL statements, and the number of Map statements.
	HQL Access Statistics	Displays the number of HQL access times in a period.
Kafka	Kafka Disk Usage Distribution	Displays the disk usage distribution statistics of the Kafka cluster.
Spark2x	HQL Access Statistics	Collects HQL access statistics in a period, including the username, HQL statement, and HQL statement execution times.
Yarn	Used resources (by task)	• Displays the number of CPU cores and memory used by a task. • Views the metrics **By memory** or **By CPU**.
	Resource usage (by tenant)	• Displays the number of CPU cores and memory used by a tenant. • Views the metrics **By memory** or **By CPU**.
	Resource usage ratio (by tenant)	• Displays the ratio of the number of CPU cores to the memory used by a tenant. • Views the metrics **By memory** or **By CPU**.
	Task Duration Ranking	Displays Yarn tasks sorted by time consumption.
	ResourceManager RPC Open Connections (by User)	Displays the number of client RPC connections to ResourceManager by user.
	Operation Count	Collects statistics on the number and proportion of operations corresponding to each Yarn operation type.

Service	Metrics	Description
	Ranking of Tasks in a Queue by Resource Usage	• Displays the resources consumed by the tasks running in a queue after the queue (tenant) is selected on the GUI. • Views the metrics **By memory** or **By CPU**.
	Ranking of Users in a Queue by Resource Usage	• Displays the resources consumed by the users who are running tasks in the queue after a queue (tenant) is selected on the GUI. • Views the metrics **By memory** or **By CPU**.
ZooKeeper	Used Resources (By Second-Level Znode)	• Displays the ZooKeeper level-2 znode resource status. • Views the metrics **By Znode quantity** or **By capacity**.
	Number of Connections (by Client IP Address)	Displays the ZooKeeper client connection resource status.

10.3.2.2.4 Collecting Stack Information

Scenario

To meet the project requirements, the administrator can collect the stack information about a specified role or instance on FusionInsight Manager, save the information to a local directory, and download the information. The following information can be collected:

1. jstack information.
2. jmap -histo information.
3. jmap -dump information.
4. jstack and jmap-histo information can be collected consecutively for comparison.

Procedure

Collecting stack information

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > *Name of the desired service*.

Step 3 Choose **More** > **Collect Stack Information**.

NOTE

- To collect stack information of multiple instances, select the desired instances in the instance list and choose **More** > **Collect Stack Information**.
- To collect stack information of a single instance, click the desired instance and choose **More** > **Collect Stack Information**.

Step 4 In the dialog box that is displayed, select the desired role and content, configure advanced options (retain the default settings unless otherwise specified), and click **OK**.

Step 5 After the collection is successful, click **Download**.

Downloading stack information

Step 6 Choose **Cluster** > *Name of the desired cluster* > **Services** > *Name of the desired service*. Choose **More** > **Download Stack Information** in the upper right corner.

Step 7 Select the desired role and content and click **Download** to download the stack information to the local PC.

Clearing stack information

Step 8 Choose **Cluster** > *Name of the desired cluster* > **Services** > *Name of the desired service*.

Step 9 Choose **More** > **Clear Stack Information** in the upper right corner.

Step 10 Select the desired role and content and configure **File Directory**. Click **OK**.

----End

10.3.2.2.5 Switching Ranger Authentication

Scenarios

By default, the Ranger service is installed and Ranger authentication is enabled for a newly installed cluster in security mode. You can set fine-grained security access policies for accessing component resources through the permission plug-in of the component. If Ranger authentication is not required, the administrator can manually disable Ranger authentication on the service page. After Ranger authentication is disabled, the system continues to perform permission control based on the role model of FusionInsight Manager when accessing component resources.

In a cluster upgraded from an earlier version, Ranger authentication is not used by default when users access component resources. The administrator can manually enable Ranger authentication after installing the Ranger service.

NOTE

- In a cluster in security mode, the following components support Ranger authentication: HDFS, Yarn, Kafka, Hive, HBase, Storm, Spark2x, Impala.
- In a cluster in non-security mode, the Ranger supports permission control on component resources based on OS users. The following components support Ranger authentication: HBase, HDFS, Hive, Spark2x, and Yarn.
- After Ranger authentication is enabled, all authentication of the component will be managed by Ranger. The permissions set by the original authentication plug-in will become invalid (The ACL rules of HDFS and Yarn components still take effect). Exercise caution when performing this operation. You are advised to deploy permissions on Ranger in advance. Please restart the service for the modification to take effect.
- After Ranger authentication is disabled, all authentication of the component will be managed by the permission plug-in of the component. The permission set on Ranger will become invalid. Exercise caution when performing this operation. You are advised to deploy permissions on Manager in advance. Please restart the service for the modification to take effect.

Enabling Ranger Authentication

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > **Services**.

Step 3 Click the specified service name on the service management page.

Step 4 On the service details page, expand the **More** drop-down list and select **Enable Ranger**.

Step 5 In the displayed dialog box, enter the password of the current login user and click **OK**.

Step 6 In the service list, restart the service whose configuration has expired.

----End

Disabling Ranger Authentication

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > **Services**.

Step 3 Click the specified service name on the service management page.

Step 4 On the service details page, expand the **More** drop-down list and select **Disable Ranger**.

Step 5 In the displayed dialog box, enter the password of the current login user and click **OK**. In the displayed dialog box, click **OK**.

Step 6 In the service list, restart the service whose configuration has expired.

----End

10.3.2.3 Service Configuration

10.3.2.3.1 Modifying Service Configuration Parameters

Scenarios

To meet site requirements, you can view and modify default configurations of a service on FusionInsight Manager. Configure parameters based on the information provided in the configuration description.

NOTE

The parameters of DBService cannot be modified when only one DBService role instance exists in the cluster.

Impact on the System

- After configuring properties of a service, you need to restart the service. The service is unavailable during restart. If the instance is not restarted, the configuration status of the instance is **Expired**.
- After the service configuration parameters are modified and then take effect after restart, you need to download and install the client again or download the configuration file to update the client. For example, you can modify configuration parameters of the following services: HBase, HDFS, Hive, Spark, YARN, and MapReduce.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services**.

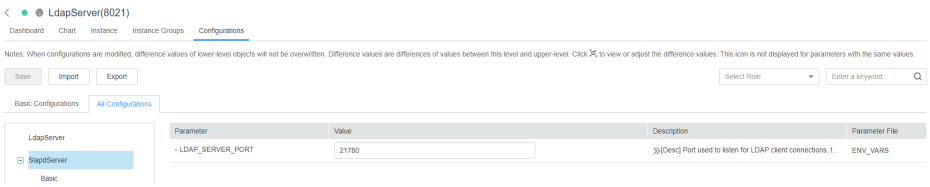
Step 3 Click the specified service name on the service management page.

Step 4 Click **Configurations**.

The **Basic Configuration** tab page is displayed by default. To modify more parameters, click the **All Configurations** tab. The navigation tree displays all configuration parameters of the service. The level-1 nodes in the navigation tree are service names or role names. The parameter category is displayed after the level-1 node is expanded.

As shown in the following figure, the first node **LdapServer** indicates the service name, and the second node **SlapdServer** indicates the role name. The configuration parameter displayed takes effect for all instances of the role and the service.

Figure 10-2 Configuration parameter navigation tree



Step 5 In the navigation tree, select the specified parameter category and change the parameter values on the right.

NOTE

Select a port parameter value from the value range on the right. Ensure that all parameter values in the same service are within the value range and are unique. Otherwise, the service fails to be started.

If you are not sure about the location of a parameter, you can enter the parameter name in search box in the upper right corner. The system searches for the parameter in real time and displays the result.

Step 6 Click **Save**. In the confirmation dialog box, click **OK**.

Wait until the message "Operation succeeded." is displayed. Click **Finish**.

The configuration is modified.

NOTE

- To update the queue configuration of the YARN service without restarting service, choose **More** > **Refresh Queue** to update the queue for the configuration to take effect.
- During configuration of the **flume.config.file** parameter, you can upload and download files. After a configuration file is uploaded, the old file will be overwritten. If the configuration is not saved and the service is restarted, the configuration does not take effect. Save the configuration in time.
- If you need to restart the service for the configuration to take effect after modifying service configuration parameters, choose **More** > **Restart Service** in the upper right corner of the service page.

----End

10.3.2.3.2 Modifying Customized Configuration Parameters of a Service

Scenarios

All open source parameters can be configured for all MRS cluster components. Parameters used in some key application scenarios can be modified on FusionInsight Manager, and some parameters of open source features may not be configured for some component clients. To modify the component parameters that are not directly supported by FusionInsight Manager, you can add new parameters for components by using the configuration customization function on FusionInsight Manager. Newly added parameters are saved in component configuration files and take effect after restart.

Impact on the System

- After configuring properties of a service, you need to restart the service. The service is unavailable during restart. If the instance is not restarted, the configuration status of the instance is **Expired**.
- After the service configuration parameters are modified and then take effect after restart, you need to download and install the client again or download the configuration file to update the client.

Prerequisites

You have understood the meanings of parameters to be added, configuration files to take effect, and impact on components.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 3 Click the specified service name on the service management page.

Step 4 Choose **Configurations** > **All Configurations**.

Step 5 In the navigation tree on the left, locate a level-1 node and select **Customization**. The system displays the customized parameters of the current component.

The configuration files that save the newly added customized parameters are displayed in **Parameter File**. Different configuration files may have same open source parameters. After the parameters in different files are set to different values, the configuration takes effect depends on the loading sequence of the configuration files by components. You can customize parameters for services and roles as required. Adding customized parameters for a single role instance is not supported.

Step 6 Locate the row where a specified parameter resides, enter the parameter name supported by the component in the **Name** column and enter the parameter value in the **Value** column.

You can click **+** or **-** to add or delete a customized parameter.

Step 7 Click **Save**. In the displayed **Save Configuration** dialog box, confirm the modification and click **OK**. Wait until the message "Operation succeeded" is displayed, and click **Finish**.

The configuration is saved successfully.

After the configuration is saved, restart the expired service or instance for the configuration to take effect.

----End

Task Example (Configuring Customized Hive Parameters)

Hive depends on HDFS. By default, Hive accesses the HDFS client. The configuration parameters that have taken effect are controlled by HDFS. For example, the HDFS parameter **ipc.client.rpc.timeout** affects the RPC timeout interval for all the clients (including service and cluster clients) to connect to the HDFS server. To change the timeout interval for Hive to connect to the HDFS, you can change the timeout interval by configuring required customized parameters. After this parameter is added to the **core-site.xml** file of Hive, this parameter can be identified by the Hive service and its configuration overwrites the parameter configuration in HDFS.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 2 Choose **Hive** > **Configurations**. On the displayed page, click the **All Configurations** tab.

Step 3 In the navigation tree on the left, select **Customization** for the Hive service. The system displays the customized service parameters supported by Hive.

Step 4 In **core-site.xml**, locate the row that contains the **core.site.customized.configs** parameter, enter **ipc.client.rpc.timeout** in the **Name** column, and enter a new value in the **Value** column, for example, 150000. The unit is ms.

Step 5 Click **Save**. In the displayed **Save Configuration** dialog box, confirm the modification and click **OK**. Wait until the message "Operation succeeded" is displayed, and click **Finish**.

The configuration is saved successfully.

After the configuration is saved, restart the expired service or instance for the configuration to take effect.

----End

10.3.3 Instance Management

10.3.3.1 Instance Management Overview

Overview

Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **KrbServer** > **Instance**. The displayed instance management page contains the function area and role instance list.

Functional Area

The function area allows you to perform maintenance operations on roles, such as adding roles and starting or stopping instances.

Table 10-12 Instance management and maintenance

UI Portal	Description
Start Instance	Start a specified instance in the cluster. You can start a role instance in the **Not Started**, **Stop Failed**, or **Startup Failed** state to use the role instance.
More > **Stop Instance**	Stop a specified instance in the cluster. Stop role instances that will no longer be used or are abnormal.
More > **Restart Instance**	Restart a specified instance in the cluster. Restart an abnormal role instance to recover its functions.
More > **Instance Rolling Restart**	Restart a specified instance in the cluster without interrupting services. For details about the parameter settings, see **Performing a Rolling Restart of a Cluster**.

UI Portal	Description
More > Decommission/ Recommission	Recommission or decommission a specified instance in the cluster to change the service availability status of the service. For details, see **Decommissioning and Recommissioning an Instance**. **NOTE** Only the role DataNode in HDFS, the role NodeManager in Yarn, the role RegionServe in HBase support the recommissioning and decommissioning functions.
Desired instance > **More** > **Synchronize Configuration**	If **Configuration Status** of a role instance is **Expired**, the role instance is not restarted after its configurations are modified. The new configuration is saved only on FusionInsight Manager. In this case, use this function to deliver the new configuration to the specified instance. **NOTE** • After synchronizing a role instance configuration, restart the role instance whose configuration has expired. The role instance is unavailable during restart. • After the synchronization is complete, restart the instance for the configuration to take effect.
Desired instance > **Instance Configurations**	For details, see **Managing Instance Configurations**.

You can filter instances based on the role they belong to or their running status in this area.

NOTE

Click **Advanced Search** to search for specific instances by specifying filter criteria, such as **Host Name**, **Management IP Address**, **Business IP Address**, or **Instance Groups**.

Role Instance List

The role instance list contains the instances of all roles in the cluster. The list displays the running status, configuration status, hosts, and related IP addresses of each instance.

Table 10-13 Instance running status

Status	Description
Normal	Indicates that the instance is running properly.
Faulty	Indicates that the instance cannot run properly.
Decommissioned	Indicates that the instance is out of service.

Status	Description
Not started	Indicates that the instance is stopped.
Unknown	Indicates that the initial status of the instance cannot be detected.
Starting	Indicates that the instance is being started.
Stopping	Indicates that the instance is being stopped.
Restoring	Indicates that an exception may occur in the instance and the instance is being automatically rectified.
Decommissioning	Indicates that the instance is being decommissioned.
Recommissioning	Indicates that the instance is being recommissioned.
Failed to start	Indicates that the service fails to be started.
Failed to stop	Indicates that the service fails to be stopped.

You can click an instance name to go to the instance details page and view basic information about the instance and the monitoring indicator report of the instance.

10.3.3.2 Decommissioning and Recommissioning an Instance

Scenario

Some role instances provide services for external services in distributed and parallel mode. Services independently store information about whether each instance can be used. Therefore, you need to use FusionInsight Manager to recommission or decommission these instances to change the instance running status.

Some instances do not support the recommissioning and decommissioning functions.

NOTE

The following roles support decommissioning and recommissioning: HDFS DataNode, Yarn NodeManager, and HBase RegionServer.

- If the number of the DataNodes is less than or equal to that of HDFS replicas, decommissioning cannot be performed. If the number of HDFS replicas is three and the number of DataNodes is less than four in the system, decommissioning cannot be performed. In this case, an error will be reported and force FusionInsight Manager to exit the decommissioning 30 minutes after FusionInsight Manager attempts to perform the decommissioning.
- During MapReduce task execution, files with 10 replicas are generated. Therefore, if the number of DataNode instances is less than 10, decommissioning cannot be performed.
- If the number of DataNode racks (the number of racks is determined by the number of racks configured for each DataNode) is greater than 1 before the decommissioning, and after some DataNodes are decommissioned, that of the remaining DataNodes changes to 1, the decommissioning will fail. Therefore, before decommissioning DataNode instances, you need to evaluate the impact of decommissioning on the number of racks to adjust the DataNodes to be decommissioned.
- If multiple DataNodes are decommissioned at the same time, and each of them stores a large volume of data, the DataNodes may fail to be decommissioned due to timeout. To avoid this problem, it is recommended that one DataNode be decommissioned each time and multiple decommissioning operations be performed.

Procedure

Step 1 Perform the following steps to perform a health check for the DataNodes before decommissioning:

1. Log in to the client installation node as a client user and switch to the client installation directory.
2. For a security cluster, use user **hdfs** for permission authentication.

   ```
   source bigdata_env          #Configure client environment variables.
   kinit hdfs                  #Configure kinit authentication.
   Password for hdfs@HADOOP.COM:    #Enter the login password of user hdfs.
   ```

3. Run the **hdfs fsck / -list-corruptfileblocks** command, and check the returned result.
   - If "has 0 CORRUPT files" is displayed, go to **Step 2**.
   - If the result does not contain "has 0 CORRUPT files" and the name of the damaged file is returned, go to **Step 1.4**.
4. Run the **hdfs dfs -rm** *Name of the damaged file* command to delete the damaged file.

   NOTE

   Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

Step 2 Log in to FusionInsight Manager.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 4 Click the specified service name on the service management page. On the displayed page, click the **Instance** tab.

Step 5 Select the specified role instance to be decommissioned.

Step 6 Select **Decommission** or **Recommission** from the **More** drop-down list.

In the displayed dialog box, enter the password of the current login user and click **OK**.

Select **I confirm to decommission these instances and accept the consequence of service performance deterioration** and click **OK** to perform the corresponding operation.

NOTE

During the instance decommissioning, if the service corresponding to the instance is restarted in the cluster using another browser, FusionInsight Manager displays a message indicating that the instance decommissioning is stopped, but the operating status of the instance is displayed as **Started**. In this case, the instance has been decommissioned on the background. You need to decommission the instance again to synchronize the operating status.

----End

10.3.3.3 Managing Instance Configurations

Scenarios

You can modify configuration parameters for each role instance. In the scenario where instances are migrated to a new cluster or the corresponding service needs to be deployed again, you can import or export all configuration data of a service on FusionInsight Manager to quickly copy configuration results.

FusionInsight Manager can manage configuration parameters of a single role instance. Modifying configuration parameters and importing or exporting instance configurations do not affect other instances.

Impact on the System

After modifying the configuration of a role instance, you need to restart the instance. The role instance is unavailable during restart. If the instance is not restarted, the configuration status of the instance is **Expired**.

Modifying Instance Configuration

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 3 Click the specified service name on the service management page. On the displayed page, click the **Instance** tab.

Step 4 Click the specified instance and select **Instance Configurations**.

By default, **Basic Configuration** is displayed. To modify more parameters, select **All Configurations**. All parameter categories supported by the instance are displayed on the **All Configurations** tab page.

Step 5 In the navigation tree, select the specified parameter category and change the parameter values on the right.

If you are not sure about the location of a parameter, you can enter the parameter name in search box in the upper right corner. The system searches for the parameter in real time and displays the result.

Step 6 Click **Save**. In the confirmation dialog box, click **OK**.

Wait until the message "Operation succeeded." is displayed. Click **Finish**.

The configuration is modified.

----End

Exporting/Importing Instance Configuration

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 3 Click the specified service name on the service management page. On the displayed page, click the **Instance** tab.

Step 4 Click the specified instance and select **Instance Configurations**.

Step 5 Click **Export** to export the configuration parameter file to the local host.

Step 6 On the **Instance Configurations** page, click **Import**, select the configuration parameter file of the instance, and import the file.

----End

10.3.3.4 Viewing the Instance Configuration File

Scenario

FusionInsight Manager allows O&M personnel to view the content configuration files such as environment variables and role configurations of the instance node on the management page. If O&M personnel need to quickly check whether configuration items of the instance are incorrectly configured or when some hidden configuration items need to be viewed, the O&M personnel can directly view the configuration files on FusionInsight Manager. In this case, users quickly analyze configuration problems.

Procedure

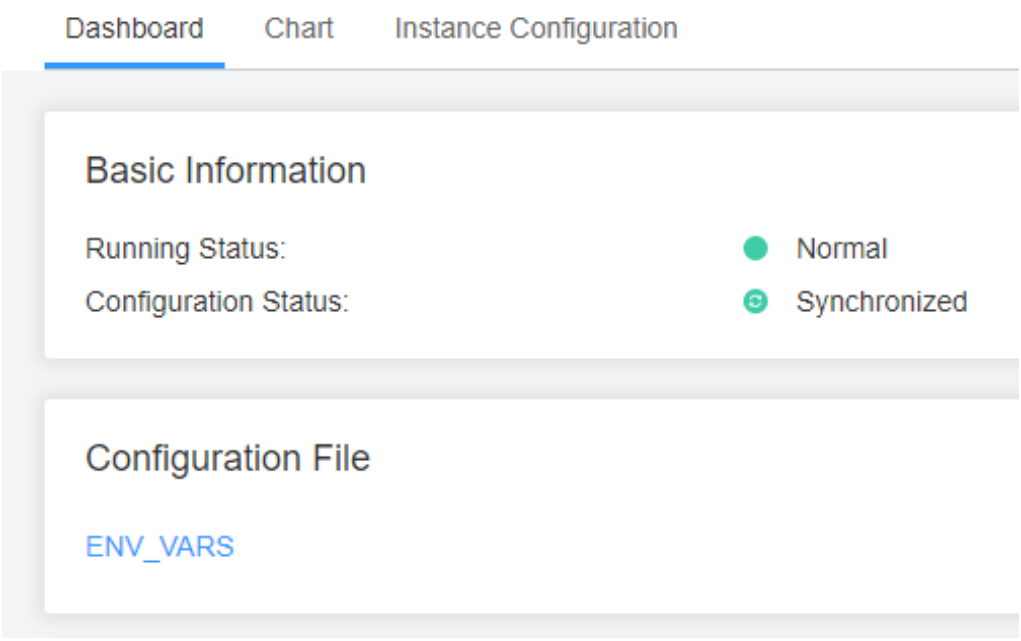
Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 3 Click the specified service name on the service management page. On the displayed page, click the **Instance** tab.

Step 4 Click the name of the target instance. In the **Configuration File** area on the **Instance Status** page, the configuration file list of the instance is displayed.

Figure 10-3 Viewing the instance configuration file



Step 5 Click the name of the configuration file to be viewed to view the parameter values in the configuration file.

To obtain the configuration file, you can download the configuration file to the local PC.

NOTE

If a node in the cluster is faulty, the configuration file cannot be viewed. Rectify the fault before viewing the configuration file again.

----End

10.3.3.5 Instance Group

10.3.3.5.1 Managing Instance Groups

Scenarios

Instance groups can be managed on FusionInsight Manager. That is, you can group multiple instances in the same role based on a specified principle, such as the nodes with the same hardware configuration. The modification on the configuration parameters of an instance group applies to all instances in the group.

In a large cluster, instance groups are used to improve the capability of managing instances in batches in the heterogeneous environment. After instances are grouped, the instances can be configured repeatedly to reduce redundant instance configuration items and improve system performance.

Creating an Instance Group

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 3 Click the specified service name on the service management page.

Step 4 On the displayed page, click the **Instance Groups** tab.

Click  and configure parameters as prompted.

Table 10-14 Instance group configuration parameters

Parameter	Description
Group Name	Indicates the instance group name. The value can contain only letters, digits, underscores (_), hyphens (-), and spaces. It must start with a letter, digit, underscore (_), or hyphen (-) and cannot ends with a space. It can contain a maximum of 99 characters.
Role	Indicates the role to which an instance group belongs.
Copy From	Indicates that the parameter values of a specified instance group are copied to the parameters of a new group. If the value is null, the default values are used for the parameters of the new group.
Description	Indicates the instance group description. It can contain only letters, digits, commas (,), periods (.), underscores (_), spaces, and line breaks, and can contain a maximum of 200 characters.

NOTE

- Each instance must belong to only one instance group. When an instance is installed for the first time, it belongs to the instance group *Role name*-**DEFAULT** by default.
- You can delete unnecessary or unused instance groups. Before deleting an instance group, migrate all instances in the group to other instance groups, see **Deleting an Instance Group** to delete instance group. The default instance group cannot be deleted.

Step 5 Click **OK**.

The instance group is created.

----End

Modifying Properties of an Instance Group

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 3 Click the specified service name on the service management page.

Step 4 Click the **Instance Groups** tab. On the **Instance Groups** tab page, locate the row that contains the target instance group.

Click  and configure parameters as prompted.

Step 5 Click **OK** to save the modifications.

The default instance group cannot be modified.

----End

Deleting an Instance Group

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 3 Click the specified service name on the service management page.

Step 4 Click the **Instance Groups** tab. On the **Instance Groups** tab page, locate the row that contains the target instance group.

Step 5 Click  .

Step 6 In the displayed dialog box, click **OK**.

The default instance group cannot be deleted.

----End

10.3.3.5.2 Viewing Information About an Instance Group

Scenarios

You can view the instance group of a specified service on FusionInsight Manager.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 3 Click the specified service name on the service management page.

Step 4 On the displayed page, click the **Instance Groups** tab.

Step 5 In the navigation tree, select a role. On the **Basic** tab page, view all instances in the instance group.

NOTE

To move an instance from an instance group to another, perform the following operations:

1. Select the instance to be moved and click **Move**.
2. In the displayed dialog box, select an instance group to which the instance to be moved.

   During the migration, the configuration of the new instance group is automatically inherited. If the instance configuration is modified before the migration, the configuration of the instance prevails.
3. Click **OK**.

   Restart the expired service or instance for the configuration to take effect.

----End

10.3.3.5.3 Configuring Instantiation Group Parameters

Scenarios

In a large cluster, users can configure parameters for multiple instances in batches by configuring the related instance groups on FusionInsight Manager, reducing redundant instance configuration items and improving system performance.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 3 Click the specified service name on the service management page.

Step 4 On the displayed page, click the **Instance Groups** tab.

Step 5 In the navigation tree, select the instance group name of a role, and switch to the **Configuration** tab page. Adjust parameters to be modified, and click **Save**. The configuration takes effect for all instances in the instance group.

----End

10.4 Hosts

10.4.1 Host Management Page

10.4.1.1 Viewing the Host List

Overview

Log in to FusionInsight Manager, and click **Hosts**. The host list is displayed on the host management page, you can view the host list and basic information of each host.

You can switch view types and set search criteria to filter and search for hosts.

Host View

Click **Role View** to view the roles deployed on each host. If the role supports the active/standby mode, the role name is displayed in bold.

Host List

The host list on the host management page contains all hosts in the clusters, and O&M operations can be performed on these hosts.

On the host management page, you can filter hosts by node type or cluster. The rules for filtering host types are as follows:

- A Management Node is the node where the OMS is deployed. Additionally, control roles and data roles may also be deployed on Management Nodes.
- A Control Node is the node where control roles are deployed. Additionally, data roles may also be deployed on Control Nodes.
- A Data Node is the node where only data roles are deployed.

If you select the **Host View**, the IP address, rack planning, AZ name, running status, cluster name, and hardware resource usage of each host are displayed.

Table 10-15 Host running status

Status	Description
Normal	Indicates that the host is in the normal state.
Faulty	Indicates that the host is abnormal.
Unknown	Indicates that the initial status of the host cannot be detected.
Isolated	Indicates that the host is isolated.
Suspended	Indicates that the host is suspended.

10.4.1.2 Viewing the Host Dashboard

Overview

Log in to FusionInsight Manager, click **Hosts**, and click a host name in the host list. The host details page contains the basic information area, disk status area, role list area, and monitoring chart.

Basic Information Area

The basic information area contains the key information about the host, such as the management IP address, service IP address, host type, rack, firewall, number of CPU cores, and OS information.

Disk Status Area

The disk status area contains all disk partitions configured for the cluster on the host and the usage of each disk partition.

Instance List Area

The instance list area displays all role instances installed on the host and the status of each role instance. You can click the log file next to a role instance name to view the log file content of the instance online.

Alarm and Event History

The alarm and event history area displays the key alarms and events reported by the current host. The system can display a maximum of 20 history records.

Chart

The monitoring chart area is displayed on the right of the host details page, and contains the key monitoring metrics of the host.

You can click > **Customize** in the upper right corner to customize the monitoring report to be displayed in the chart area. Select a time range and click > **Export** to export detailed monitoring indicator data within the specified time range.

You can click next to the title of a monitoring indicator to open the description of the monitoring indicator.

Click the **Chart** tab of the host to view the full monitoring chart information about the host.

GPU Card Status Area

If the host is configured with GPU cards, the GPU card status area displays the model, location, and status of the GPU card installed on the host.

10.4.1.3 Checking Processes and Resources on the Active Node

Overview

Log in to FusionInsight Manager, click **Hosts**, and click the specified host name in the host list. On the host details page, click the **Process** and **Resource** tabs.

Process

On the **Process** tab page, the information about the role processes of the deployed service instances on the current host is displayed, including the process status, PID, and process running time. You can directly view the log files of each process online.

Resource

On the **Resource** tab page, the detailed resource usage of deployed service instances on the current host is displayed, including the CPU, memory, disk, and port usage.

10.4.2 Host Maintenance Operations

10.4.2.1 Starting and Stopping All Instances on a Host

Scenarios

If a host is faulty, you may need to stop all the roles on the host and perform maintenance check on the host. After the host fault is rectified, start all roles running on the host to recover host services. You can start or stop all instances on a host on the host management page or host details page on FusionInsight Manager. The following describes how to perform such operations on the host management page.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Click **Hosts**.

Step 3 Select the check box of the target host.

Step 4 Select **Start All Instances** or **Stop All Instances** from the **More** drop-down list to start or stop all role instances.

----End

10.4.2.2 Performing a Host Health Check

Scenarios

If the running status of a host is not **Normal**, you can perform health checks on the host to check whether some basic functions are abnormal. During routine O&M, you can perform host health checks to ensure that the configuration parameters and monitoring of each role instance on the host are normal and can run stably for a long time.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Click **Hosts**.

Step 3 Select the check box of the target host.

Step 4 Select **Health Check** from the **More** drop-down list to start the health check.

To export the result of the health check, click **Export Report** in the upper left corner. If any problem is detected, click **Help**.

----End

10.4.2.3 Configuring Racks for Hosts

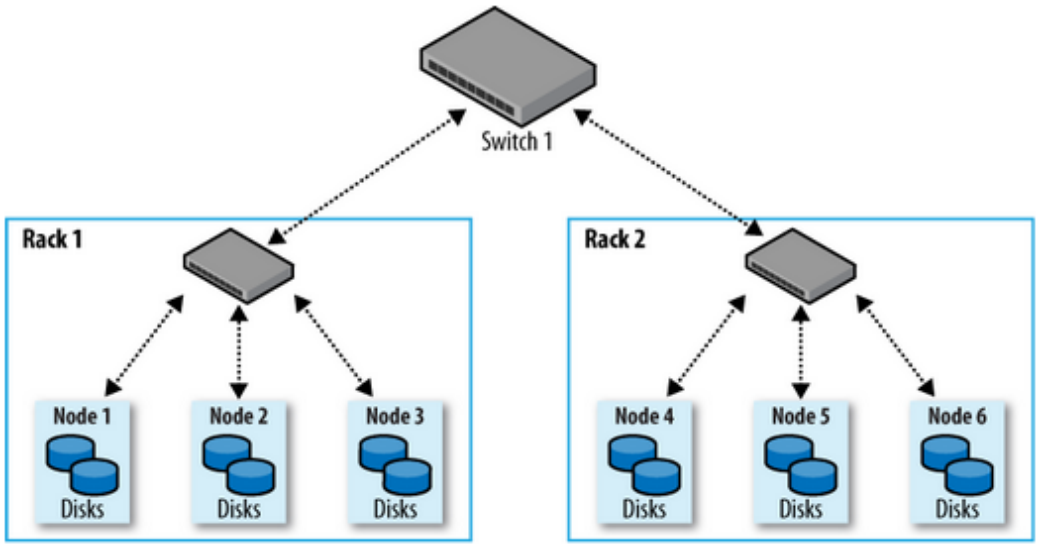
Scenarios

All hosts in a large cluster are usually deployed on multiple racks. Hosts on different racks communicate with each other through switches. The network bandwidth between different hosts on the same rack is much greater than that on different racks. In this case, plan the network topology based on the following requirements:

- To improve the communication speed, it is recommended that data be exchanged between hosts on the same rack.
- To improve the fault tolerance capability, distribute processes or data of distributed services on different hosts of multiple racks as dispersedly as possible.

Hadoop uses a file directory structure to represent hosts. **Figure 10-4** displays a cluster with a two-layer network structure. In this example, you are advised to name the rack for Node 1 as /Switch1/Rack1 and that for Node 4 as /Switch1/Rack2.

Figure 10-4 Two-layer network structure



The HDFS cannot automatically determine the network topology of each DataNode in the cluster. You need to set the rack name to identify the rack where the host is located so that the NameNode can draw the network topology of the required DataNodes and back up data of the DataNodes to different racks. Similarly, YARN needs to obtain rack information and allocate tasks to different NodeManagers as required.

If the cluster network topology changes, you need to reallocate racks for hosts on FusionInsight Manager so that related services can be automatically adjusted.

Impact on the System

If the name of the host rack is changed, policy for storing HDFS replicas, Yarn task assignment, and storage location of Kafka partitions will be affected. After the modification, restart the HDFS, Yarn, and Kafka for the configuration to take effect.

Improper rack configuration will unbalance loads (including CPU, memory, disk, and network) among nodes in the cluster, which decreases the cluster reliability and stability. Therefore, before allocating racks, take all aspects into consideration and properly set racks.

Rack Allocation Policies

NOTE

Physical rack: Indicates the real rack where the host resides.

Logical rack: Indicates the rack name of the host on FusionInsight Manager.

Policy 1: Each logical rack has nearly the same number of hosts.

Policy 2: The name of the logical rack of the host must comply with that of the physical rack to which the host belongs.

Policy 3: If there are only few hosts on a physical rack, combine this physical rack and other physical racks with few hosts into a logical rack, which complies with policy 1. Hosts in two equipment rooms cannot be placed in one logical rack. Otherwise, performance problems may be caused.

Policy 4: If there are lots of hosts on a physical rack, divide these hosts into multiple logical racks, which complies with policy 1. Hosts with great differences should not be placed in the same logical rack. Otherwise, the cluster reliability will be decreased.

Policy 5: You are advised to set **default** or other values for logical racks on the first layer, and the values in the same cluster must be consistent.

Policy 6: The number of hosts in each rack cannot be less than 3.

Policy 7: A cluster can contain at most 50 logical racks. If there are too many logical racks in a cluster, the maintenance is difficult.

Best Practice Example

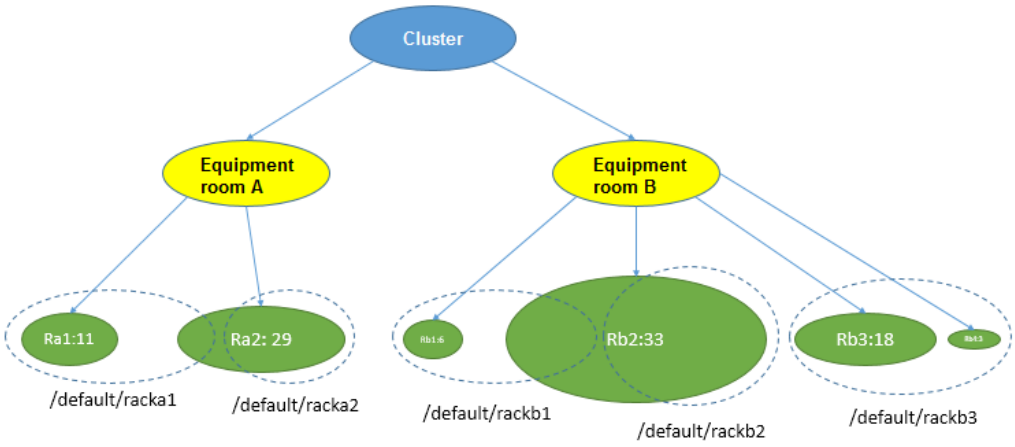
For example, there are 100 hosts in a cluster, 40 located in equipment room A and 60 located in equipment room B. In room A, there are 11 hosts on physical rack Ra1 and 29 hosts on physical rack Ra2. In room B, there are six hosts on physical rack Rb1, 33 hosts on physical rack Rb2, 18 hosts on physical rack Rb3, and three hosts on physical rack Rb4.

According to the rack allocation policy, each logical rack contains nearly the same number (for example, 20) of hosts. The allocation details are as follows:

- Logical rack /default/racka1: contains 11 hosts on physical rack Ra1 and nine hosts on physical rack Ra2
- Logical rack /default/racka2: contains the remaining 20 hosts (except the nine hosts of logical rack /default/racka1) on physical rack Ra2

- Logical rack /default/rackb1: contains six hosts on physical rack Rb1 and 13 hosts on physical rack Rb2
- Logical rack /default/rackb2: contains the remaining 20 hosts (except the 13 hosts of logical rack /default/rackb1) on physical rack Rb2
- Logical rack /default/rackb3: contains 18 hosts on physical rack Rb3 and three hosts on physical rack Rb4

Rack allocation example:



Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Click **Hosts**.

Step 3 Select the check box of the target host.

Step 4 Select **Set Rack** from the **More** drop-down list.

- Set rack names in hierarchy based on the actual network topology. Separate racks from different layers using slashes (/).
- Rack naming rules are as follows: */level1/level2/...* The number of levels must be at least 1, and the name cannot be empty. A rack can contain letters, digits, and underscores (_) and cannot exceed 200 characters.

  For example, /default/rack0.
- If the hosts in the rack to be modified contain DataNode instances, ensure that the rack name levels of the hosts where all DataNode instances reside are the same. Otherwise, the configuration fails to be delivered.

Step 5 Click **OK**.

----End

10.4.2.4 Isolating a Host

Scenarios

If a host is abnormal or faulty and cannot provide services or affects the cluster performance, you can remove the host from the available node in the cluster temporarily so that the client can access other available nodes.

NOTE

Only non-management nodes can be isolated.

Impact on the System

- After a host is isolated, all role instances on the host will be stopped, and you cannot start, stop, or configure the host and all instances on the host.
- For some services, after a host is isolated, some instances on other nodes do not work, and the service configuration status may expire.
- After a host is isolated, statistics about the monitoring status and indicator data of the host hardware and instances on the host cannot be collected or displayed.
- Retain the default SSH port (22) of the target node. Otherwise, the task described in this section will fail.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Click **Hosts**.

Step 3 Select the check box of the host to be isolated.

Step 4 Select **Isolate** from the **More** drop-down list.

In the displayed dialog box, enter the password of the current login user and click **OK**.

Step 5 In the displayed confirmation dialog box, select **I want to isolate the selected hosts and accept the consequences of possible service failures.** Click **OK**.

Wait until the message "Operation succeeded" is displayed, and click **Finish**.

Step 6 Log in to the isolated host as user **root** and run the **pkill -9 -u omm** command to stop the processes of user **omm** on the node. Then run the **ps -ef | grep'container' | grep '${BIGDATA_HOME}' | awk '{print $2}' | xargs -I' {}' kill -9' {}'** command to find and stop the container process.

Step 7 The host is successfully isolated and **Running Status** is **Isolated**.

If you have rectified the host exception or fault, cancel the isolation status of the host before using the host.

On the **Hosts** page, select the isolated host and choose **More > Cancel Isolation**.

NOTE

After the isolation is canceled, all role instances on the host are not started by default. To start role instances on the host, select the target host on the **Hosts** page and choose **More** > **Start All Instances**.

----End

10.4.2.5 Exporting Host Information

Scenarios

Administrators can export information about all hosts on FusionInsight Manager.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Click **Hosts**.

Step 3 Specify the status of required hosts in the drop-down list box on the upper right corner, or click **Advanced Search** to specify hosts.

Step 4 Click **Export All** and select **TXT** or **CSV** for **Save As**. Then, click **OK**.

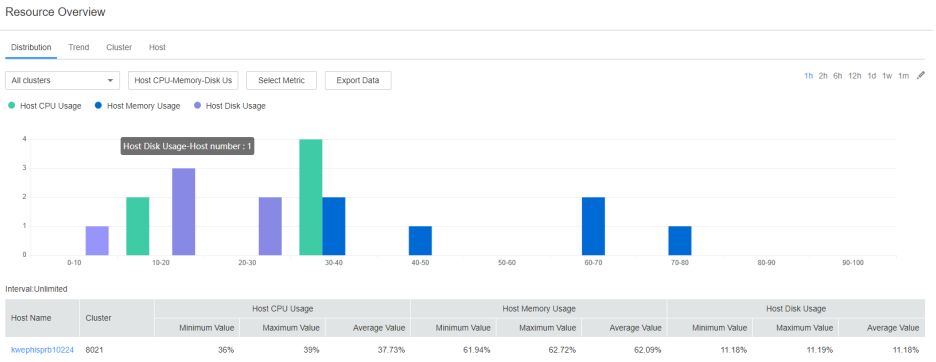
----End

10.4.3 Resource Overview

10.4.3.1 Distribution

Click **Hosts** > **Resource Overview** > **Distribution**, Figure 10-5 shows the interface for monitoring the cluster resource distribution. By default, the monitoring data of the latest one hour is displayed. You can click to customize a time range. The default time ranges are 1 hour, 2 hours, 6 hours, 12 hours, 1 day, 1 week, and 1 month.

Figure 10-5 Resource distribution overview



- Click **Select Metric** to customize the metrics to be viewed. Table 10-16 shows all the metrics. After selecting a metric, the distribution of hosts in the corresponding range is displayed.

- When you move the cursor to a color block, the number of hosts in the current CPU usage range is displayed, as shown in **Figure 10-5**. Click a column to display the hosts in the current range.
  - When you click the host name of a specified host, the page showing the host detailed information is displayed.
  - When you click **View Trends** of a specified host, the page showing the maximum, average, and minimum cluster values, and host values of the current metric are displayed. You cannot view the trends when the metric of the current cluster is **Host CPU-Memory-Disk Usage**.
- Click **Export Data** to export the metric maximum, minimum, and average values of all nodes in the current cluster in the selected time range.

Table 10-16 Metrics

Category	Metric
Process	• Number of Running Processes • Total Number of Processes • Total Number of omm Processes • Uninterruptible Sleep Process
Network Status	• Host Network Packet Collisions • Number of LAST_ACK States • Number of CLOSING States • Number of LISTENING States • Number of CLOSED States • Number of ESTABLISHED States • Number of SYN_RECV States • Number of TIME_WAITING States • Number of FIN_WAIT2 States • Number of FIN_WAIT1 States • Number of CLOSE_WAIT States • DNS Name Resolution Duration • TCP Ephemeral Port Usage • Host Network Packet Frame Errors
Network Reading	• Host Network Read Packets • Host Network Read Dropped Packets • Host Network Read Error Packets • Host Network Rx Speed
Disk	• Host Disk Write Speed • Host Used Disk • Host Free Disk • Host Disk Read Speed • Host Disk Usage

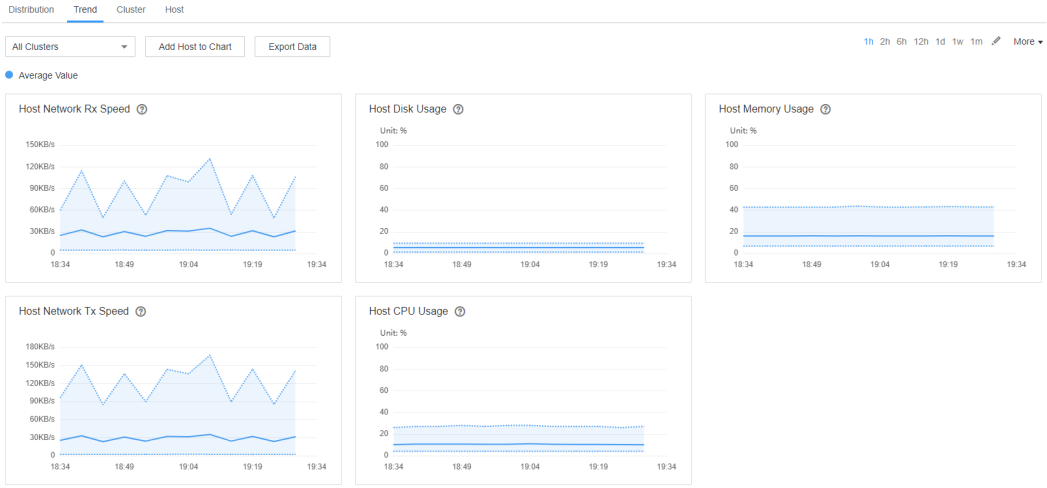
Category	Metric
Memory	• Free Memory • Cache Memory Size • Total Kernel Cache Memory Size • Shared Memory Size • Host Memory Usage • Used Memory
Network Writing	• Host Network Write Packets • Host Network Write Error Packets • Host Network Tx Speed • Host Network Write Dropped Packets
CPU	• CPU Usage of Processes Whose Priorities Have Been Changed • CPU Usage of User Space Processes • CPU Usage of Kernel Space Processes • Host CPU Usage • CPU Total Time • CPU Idle Time
Host Status	• Host File Handle Usage • Average OS Load in 1 Minute • Average OS Load in 5 Minutes • Average OS Load in 15 Minutes • Host PID Usage

10.4.3.2 Trend

Choose **Hosts > Resource Overview > Trend** to view the resource trend monitoring page of all clusters or a single cluster, as shown in **Figure 10-6**.

By default, the monitoring data of the latest one hour is displayed. You can click to customize a time range. The default time ranges are 1 hour, 2 hours, 6 hours, 12 hours, 1 day, 1 week, and 1 month. By default, the trend chart of each metric displays the maximum, minimum, and average values of the entire cluster.

Figure 10-6 Resource trend



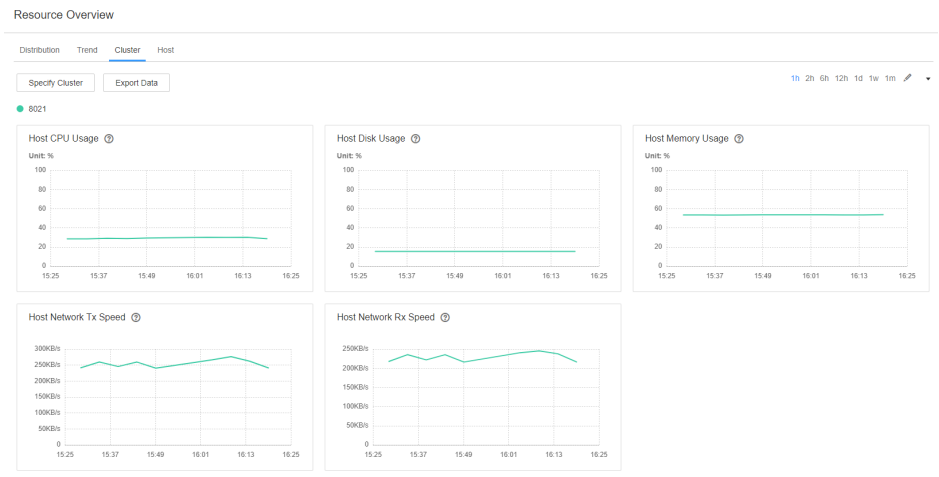
- Click **Add Host to Chart** to add trend lines of a host in the trend charts. A maximum of 12 hosts can be added.
- Choose > **Customize** to customize the metrics to be displayed on the page. For details about the metrics, see **Table 10-16** in section **Distribution**.
- Choose **Export Data** to export the maximum, minimum, and average values of all nodes in the cluster in the selected time range for all selected metrics.

10.4.3.3 Cluster

Choose **Hosts > Resource Overview > Cluster** to view the resource monitoring page of each cluster in FusionInsight Manager, as shown in **Figure 10-7**.

By default, the monitoring data of the latest one hour is displayed. You can click to customize a time range. The default time ranges are 1 hour, 2 hours, 6 hours, 12 hours, 1 day, 1 week, and 1 month.

Figure 10-7 Cluster resource overview



- Click **Specify Cluster** to customize the cluster to be displayed.

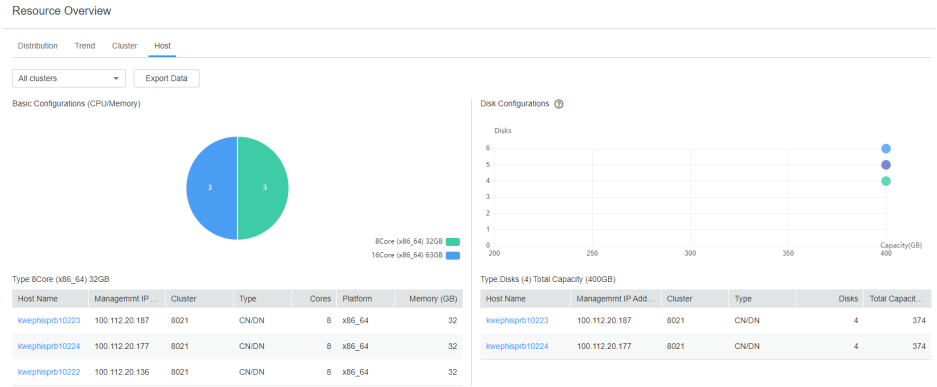
- Choose ▼ > **Customize** to customize the metrics to be displayed on the page. For details about the metrics, see **Table 10-16** in section **Distribution**.
- Choose **Export Data** to export the counter values of all selected counters under the selected time range for each cluster.

10.4.3.4 Host

Click **Hosts > Resource Overview > Host**, the host resources consist of basic resources (CPU/memory) and disk resources, as shown in **Figure 10-8**.

Click **Export Data** to export the configuration list of all hosts in the cluster, including the host name, management IP address, host type, number of cores, platform type, memory capacity, and disk size.

Figure 10-8 Host resource overview



Basic Configurations (CPU/Memory)

Move the cursor to the pie chart to display the information about the hardware configuration of each node in the current cluster. The information is displayed as follows: *Number of cores (platform type) Memory: Host quantity*.

Hosts that have different configurations are contained in different color blocks in a pie chart. You can click any color block to display the corresponding host list in the lower part of the page.

Disk Configurations

The horizontal axis indicates the disk capacity (including the OS disk) of nodes, and the vertical axis indicates the number of logical disks (including the OS disk) of nodes.

When you place the cursor on a dot, the information about the disks in the current configuration state, including the number of disks, total capacity, and number of hosts, is displayed.

Click a dot to display the disks of this configuration in the lower part of the page.

10.5 O&M

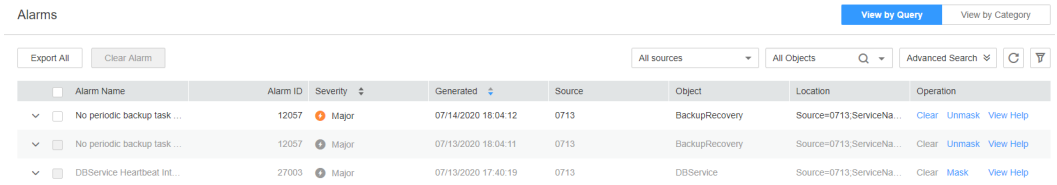
10.5.1 Alarms

10.5.1.1 Overview of Alarms and Events

Alarms

Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. **Figure 10-9** is displayed. You can view alarm information reported by clusters in FusionInsight Manager, including the alarm name, ID, severity, and generation time. By default, the latest ten alarms are displayed on each page.

Figure 10-9 FusionInsight Manager alarm management



Detailed alarm parameters

Click ⌄ on the left of a specified alarm to expand the alarm parameters. **Table 10-17** describes the parameters.

Table 10-17 Alarm parameters

Alarm Parameter	Description
Alarm ID	Indicates the alarm ID.
Alarm Name	Indicates the alarm information name.
Alarm Severity	There are four levels: critical, major, minor, and warning.
Source	Cluster name.
Cleared	Indicates the time when an alarm is cleared. If the alarm is not cleared, -- is displayed.
Object	Indicates the services, processes, or modules that triggers an alarm.
Automatic Clearance	The alarm can be automatically cleared after the fault is rectified.
Alarm Status	Indicates the status of the alarm. Manually Cleared Indicates the current alarm status, including automatic clearance, manual clearance, and uncleared.
Generated	Indicates the time when the alarm is generated

Alarm Parameter	Description
Alarm Cause	Indicates the possible cause of an alarm.
Serial Number	Indicates the number of alarms generated by the system.
Additional Information	Indicates the error information.
Location	Indicates the detailed information for locating the alarm, which includes the following: ● Source: identifies the cluster for which the alarm is generated. ● ServiceName: identifies the service for which the alarm is generated. ● RoleName: identifies the role for which the alarm is generated. ● HostName: identifies the host for which the alarm is generated.

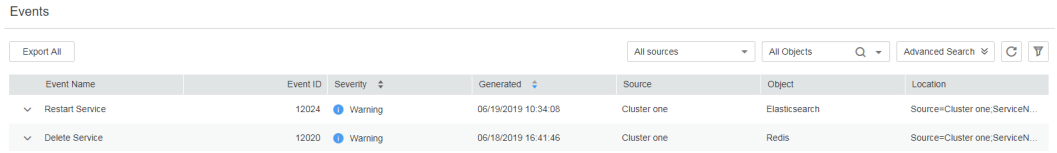
Manage Alarms:

- Click **Export All** to export all alarm details.
- If multiple alarms have been handled, you can select one or more alarms to be cleared and click **Clear Alarm** to clear the alarms in batches. A maximum of 300 alarms can be cleared in each batch.
- Click to manually refresh the current page. Click to filter alarms displayed on the page.
- You are allowed to filter specified alarms by object or cluster.
- Click **Advanced Search**. An area where you can search for alarms is displayed. You can search for alarms by alarm ID, alarm name, alarm type, start time, and end time. Click **Search** to display filtered alarms. After you click **Advanced Search** again, the number of entered search criteria is displayed.
- You can click **Clear**, **Masking**, or **Help** to perform corresponding operations on an alarm.
- If there are a large number of alarms, you can click **View by Category**. The system classifies uncleared alarms by alarm ID. After the alarm is classified, click the number of uncleared alarms next to the alarm name to view the alarm details.

Events

Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Events**. On the displayed page, you can view the information about all events in the cluster, including the alarm name, ID, severity, generation time, object, and location. By default, the latest 10 events are displayed on each page.

Figure 10-10 FusionInsight Manager event management



Click ⌄ on the left of a specified event. The related event parameters are displayed, as shown in **Table 10-18**.

Table 10-18 Event parameters

Parameter	Description
Event ID	Indicates the event ID.
Event Name	Indicates the event name.
Severity	Indicates the event severity. There are four levels: Critical, major, minor, and warning.
Generated	Indicates the time when an event occurs.
Object	Indicates the possible cause of an event.
Serial Number	Indicates the number of events generated in the system.
Location	Indicates the detailed information for locating the event, which includes the following: • Source: identifies the cluster for which the event is generated. • ServiceName: identifies the service for which the event is generated. • RoleName: identifies the role for which the event is generated. • HostName: identifies the host for which the event is generated.
Additional Information	Indicates the error information.
Event Cause	Indicates the possible cause of an event.
Source	Cluster name.

Manage Events:

- Click **Export All** to export all event details.
- Click ↻ to manually refresh the current page. Click ▽ to filter events displayed on the page.
- You are allowed to filter specified events by object or cluster.

- Click **Advanced Search**. An area where you can search for events is displayed. You can search for events by event ID, severity, event name, start time, and end time.

10.5.1.2 Configuring the Threshold

Scenarios

You can configure monitoring indicator thresholds to monitor the health status of indicators on FusionInsight Manager. If abnormal data occurs and the preset conditions are met, the system triggers an alarm and displays the alarm information on the alarm page.

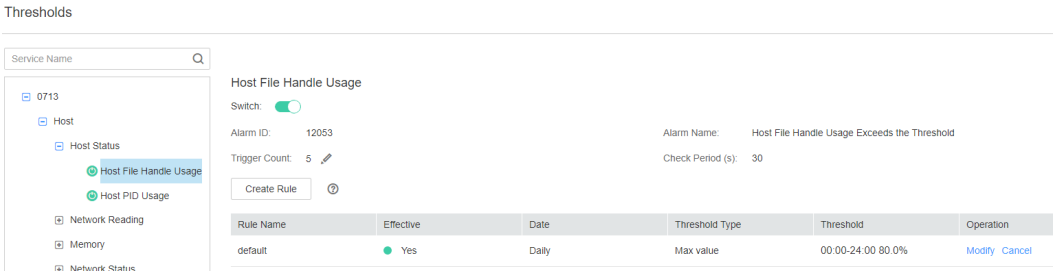
Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **O&M** > **Alarm** > **Thresholds**.

Step 3 Select a monitoring indicator for a specified host or service in the cluster.

Figure 10-11 Configuring indicator thresholds



For example, after selecting **Host Memory Usage**, the information about this indicator threshold is displayed.

- If the alarm sending switch is displayed as , an alarm is triggered if the alarm threshold is reached.
- The alarm ID and alarm name contain the alarm information that is triggered by the threshold:
- FusionInsight Manager checks whether the value of each monitored indicator reaches the threshold. If the number of consecutive check times is equal to the value of **Trigger Count**, and the threshold is not reached in these checks, the system sends an alarm.
- The value can be customized. **Check Period (s)** indicates the interval for the system to check monitoring indicators.
- Rules for triggering an alarm.

Step 4 Click **Create Rule** to add rules used for monitoring indicators.

Table 10-19 Monitoring indicator rule parameters

Parameter	Value	Description
Rule Name	CPU_MAX (example value)	Name of a rule.
Alarm Severity	• Critical • Major • Minor • Warning	Alarm Severity • Critical • Major • Minor • Warning
Threshold Type	• Max value • Min value	You can select the maximum or minimum value of an indicator. Setting this parameter to **Max value**, the system generates an alarm when the actual value of the indicator is greater than the threshold. Setting this parameter to **Min value**, the system generates an alarm when the actual value of the indicator is less than the threshold.
Date	• Daily • Weekly • Others	This parameter is used to set the date when the rule takes effect.
Add Date	09-30	This parameter is available only when **Date** is set to **Others**. You can set the date when the rule takes effect. Multiple options are available.
Thresholds	Start and End Time: 00:00 to 08:30	This parameter is used to set the time range when the rule takes effect.
	Threshold: 10	Specifies the threshold of the rule monitoring indicator.

NOTE

For the last parameter in the table, you can click or to add or delete multiple start and end time or alarm indicator thresholds.

Step 5 Click **OK** to save the rules.

Step 6 Locate the row that contains an added rule, and click **Apply** in the **Operation** column. The value of **Effective** for this rule changes as **Yes**.

You can apply a new rule only after clicking **Cancel**.

----End

Monitoring Indicator Reference

FusionInsight Manager alarm monitoring indicators are categorized into node information indicators and cluster service indicators. **Table 10-20** describes the indicators whose thresholds can be configured on nodes.

Table 10-20 Monitoring indicators on each node

Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
CPU	Host CPU Usage	This indicator reflects the computing and control capabilities of the current cluster in a measurement period. By observing the indicator value, you can better understand the overall resource usage of the cluster.	90.0%
Disk	Disk Usage	Indicates the disk usage of a host.	90.0%
	Disk Inode Usage	Indicates the disk inode usage in a measurement period.	80.0%
Memory	Host Memory Usage	Indicates the average memory usage at the current time.	90.0%

Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
Host Status	Host File Handle Usage	Indicates the usage of file handles of the host in a measurement period.	80.0%
	Host PID Usage	Indicates the PID usage of a host.	90%
Network Status	TCP Ephemeral Port Usage	Indicates the usage of temporary TCP ports of the host in a measurement period.	80.0%
Network Reading	Read Packet Error Rate	Indicates the read packet error rate of the network interface on the host in a measurement period.	0.5%
	Read Packet Dropped Rate	Indicates the read packet dropped rate of the network interface on the host in a measurement period.	0.5%
	Read Throughput Rate	Indicates the average read throughput (at MAC layer) of the network interface in a measurement period.	80%
Network Writing	Write Packet Error Rate	Indicates the write packet error rate of the network interface on the host in a measurement period.	0.5%

Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
	Write Packet Dropped Rate	Indicates the write packet dropped rate of the network interface on the host in a measurement period.	0.5%
	Write Throughput Rate	Indicates the average write throughput (at MAC layer) of the network interface in a measurement period.	80%
Process	Uninterruptible Sleep Process	Indicates the number of D state processes on the host in a measurement period.	0
	omm Process Usage	Indicates the usage of the omm process within a measurement period.	90

Table 10-21 Cluster service indicators

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
DBService	Database	Database Connections Usage	Indicates the usage of the number of database connections.	90%
		Disk Space Usage of the Data Directory	Disk space usage of the data directory.	80%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
Flume	Agent	Heap Memory Usage Calculate	Indicates the Flume heap memory usage.	95.0%
		Flume Direct Memory Usage Statistics	Indicates the Flume direct memory usage.	80.0%
		Flume Non-heap Memory Usage	Indicates the Flume non-heap memory usage.	80.0%
		Total GC duration of Flume process	Indicates the Flume total GC time.	12000ms
HBase	GC	GC time for old generation	Indicates the total GC time of RegionServer.	5000ms
		GC time for old generation	Indicates the total GC time of HMaster.	5000ms
	CPU and Memory	RegionServer Direct Memory Usage Statistics	Indicates the RegionServer Reg direct memory usage.	90%
		RegionServer Heap Memory Usage Statistics	Indicates the RegionServer heap memory usage.	90%
		HMaster Direct Memory Usage	Indicates the HMaster direct memory usage.	90%
		HMaster Heap Memory Usage Statistics	Indicates the HMaster heap memory usage.	90%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
	Service	Regions	Indicates the number of regions of a RegionServer.	2000
		Region in transaction count over threshold	Number of regions that are in the RIT state and reach the threshold duration.	1
	Replication	Replication sync failed times	Indicates the number of times that DR data fails to be synchronized.	1
	Queue	Compaction Queue Size	Compaction queue size.	100
HDFS	File and Block	Lost Blocks	Number of missing copy blocks in the HDFS file system.	0
		Blocks Under Replicated	Total number of blocks that need to be replicated by the NameNode.	1000
	RPC	Average Time of Active NameNode RPC Processing	Indicates the average RPC processing time.	100ms
		Average Time of Active NameNode RPC Queuing	Indicates the average RPC queuing time.	200ms
	Disk	Disk Usage	Indicates the HDFS disk usage.	80%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
		Percentage of DataNode Capacity	Indicates the disk usage of DataNodes in the HDFS.	80%
		Percentage of Reserved Space for Replicas of Unused Space	Indicates the percentage of the reserved disk space of all the copies to the total unused disk space of DataNodes.	90%
	Resource	Faulty DataNodes	Indicates the number of faulty DataNodes.	3
		NameNode Non Heap Memory Usage Statistics	Indicates the percentage of NameNode non-heap memory usage.	90%
		NameNode Direct Memory Usage Statistics	Indicates the percentage of direct memory used by NameNodes.	90%
		NameNode Heap Memory Usage Statistics	Indicates the percentage of NameNode non-heap memory usage.	95%
		DataNode Non Heap Memory Usage Statistics	Indicates the percentage of DataNode non-heap memory usage.	90%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
		DataNode Direct Memory Usage Statistics	Indicates the percentage of direct memory used by DataNodes.	90%
		DataNode Heap Memory Usage Statistics	Indicates the percentage of DataNode non-heap memory usage.	95%
	Garbage Collection	GC Time	Indicates the Garbage collection (GC) duration of NameNodes per minute.	12000ms
		GC Time	Indicates the GC duration of DataNodes per minute.	12000ms
Hive	HQL	Percentage of HQL Statements That Are Executed Successfully by Hive	Indicates the percentage of HQL statements that are executed successfully by Hive.	90.0%
	Background	Background Thread Usage	Indicates the percentage of Background thread usage.	90%
	GC	Total GC Time in Milliseconds	Indicates the total GC time of MetaStore.	12000ms
		Total GC Time in Milliseconds	Indicates the total GC time of HiveServer.	12000ms

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
	Capacity	Percentage of HDFS Space Used by Hive to the Available Space	Indicates the percentage of HDFS space used by Hive to the available space.	85.0%
	CPU and Memory	MetaStore Direct Memory Usage Statistics	Indicates the MetaStore direct memory usage.	95%
		MetaStore Non-Heap Memory Usage Statistics	Indicates the MetaStore non-heap memory usage.	95%
		MetaStore Heap Memory Usage Statistics	Indicates the MetaStore heap memory usage.	95%
		HiveServer Direct Memory Usage Statistics	Indicates the HiveServer direct memory usage.	95%
		HiveServer Non-Heap Memory Usage Statistics	Indicates the HiveServer non-heap memory usage.	95%
		HiveServer Heap Memory Usage Statistics	Indicates the HiveServer heap memory usage.	95%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
	Session	Percentage of Sessions Connected to the HiveServer to Maximum Number of Sessions Allowed by the HiveServer	Indicates the percentage of the number of sessions connected to the HiveServer to the maximum number of sessions allowed by the HiveServer.	90.0%
Kafka	Partition	Percentage of Partitions That Are Not Completely Synchronized	Indicates the percentage of partitions that are not completely synchronized to total partitions.	50%
	Other	Unavailable Partition Percentage	Disk usage of the disk where the Broker data directory is located.	40%
		User Connection Usage on Broker	User connection usage on the broker.	80%
	Disk	Broker Disk Usage	Indicates the disk usage of the disk where the Broker data directory is located.	80%
	Process	Broker GC Duration per Minute	Indicates the GC duration of the Broker process per minute.	12000ms

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
		Heap Memory Usage of Kafka	Indicates the Kafka heap memory usage.	95%
		Kafka Direct Memory Usage	Indicates the Kafka direct memory usage.	95%
Loader	Memory	Heap Memory Usage Calculate	Indicates the Loader heap memory usage.	95%
		Loader Direct Memory Usage Statistics	Indicates the Loader direct memory usage.	80.0%
		Non heap Memory Usage Calculate	Indicates the Loader non-heap memory usage.	80%
	GC	Total GC time in milliseconds	Indicates the total GC time of Loader.	12000ms
MapReduce	Garbage Collection	GC Time	Indicates the GC time.	12000ms
	Resource	JobHistoryServer Direct Memory Usage Statistics	Indicates the JobHistoryServer direct memory usage.	90%
		JobHistoryServer Non Heap Memory Usage Statistics	Indicates the JobHistoryServer non-heap memory usage.	90%
		JobHistoryServer Heap Memory Usage Statistics	Indicates the JobHistoryServer non-heap memory usage.	95%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
Oozie	Memory	Heap Memory Usage Calculate	Indicates the Oozie heap memory usage.	95.0%
		Oozie Direct Buffer Resource Percentage	Indicates the Oozie direct memory usage.	80.0%
		Non Heap Memory Usage Calculate	Indicates the Oozie non-heap memory usage.	80%
	GC	Total GC duration of Oozie process	Indicates the Oozie total GC time.	12000ms
Spark2x	Memory	JDBCServer2x Heap Memory Usage Statistics	Indicates the JDBCServer2x heap memory usage.	95%
		JDBCServer2x Direct Memory Usage Statistics	Indicates the JDBCServer2x direct memory usage.	95%
		JDBCServer2x Non-Heap Memory Usage Statistics	Indicates the JDBCServer2x non-heap memory usage.	95%
		JobHistory2x Direct Memory Usage Statistics	Indicates the JobHistory2x direct memory usage.	95%
		JobHistory2x Non-Heap Memory Usage Statistics	Indicates the JobHistory2x non-heap memory usage.	95%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
		JobHistory2x Heap Memory Usage Statistics	Indicates the JobHistory2x heap memory usage.	95%
		IndexServer2x Direct Memory Usage Statistics	Indicates the IndexServer2x direct memory usage.	95%
		IndexServer2x Heap Memory Usage Statistics	ndicates the IndexServer2x heap memory usage.	95%
		IndexServer2x Non-Heap Memory Usage Statistics	Indicates the IndexServer2x non-heap memory usage.	95%
	GC number	Full GC Number of JDBCServer2x	Indicates the total GC number of JDBCServer2x.	12
		Full GC Number of JobHistory2x	Indicates the total GC number of JobHistory2x.	12
		Full GC Number of IndexServer2x	Indicates the total GC number of IndexServer2x.	12
	GC Time	Total GC time in milliseconds	Indicates the total GC time of JDBCServer2x.	12000ms
		Total GC time in milliseconds	Indicates the total GC time of JobHistory2x.	12000ms

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
		Total GC time in milliseconds	Indicates the total GC time of IndexServer2x.	12000ms
Storm	Cluster	Number of Available Supervisors	Indicates the number of available Supervisor processes in the cluster in a measurement period.	1
		Slot Usage	Indicates the slot usage in the cluster in a measurement period.	80.0%
	Nimbus	Heap Memory Usage Calculate	Indicates the Nimbus heap memory usage.	80%
Yarn	Resource	NodeManager Direct Memory Usage Statistics	Indicates the percentage of direct memory used by NodeManagers.	90%
		NodeManager Heap Memory Usage Statistics	Indicates the percentage of NodeManager heap memory usage.	95%
		NodeManager Non Heap Memory Usage Statistics	Indicates the percentage of NodeManager non-heap memory usage.	90%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
		ResourceManager Direct Memory Usage Statistics	Indicates the Kafka direct memory usage.	90%
		ResourceManager Heap Memory Usage Statistics	Indicates the ResourceManager heap memory usage.	95%
		ResourceManager Non Heap Memory Usage Statistics	Indicates the ResourceManager non-heap memory usage.	90%
	CPU and Memory	Pending Memory	Pending memory capacity.	83886080MB
	Other	Failed Applications of root queue	Number of failed tasks in the **root** queue.	50
		Terminated Applications of root queue	Number of killed tasks in the **root** queue.	50
	Garbage collection	GC Time	Indicates the GC duration of NodeManager per minute.	12000ms
		GC Time	Indicates the GC duration of ResourceManager per minute.	12000ms
	Application	Pending Applications	Pending tasks.	60

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
ZooKeeper	Connection	ZooKeeper Connections Usage	Indicates the percentage of the used connections to the total connections of ZooKeeper.	80%
	CPU and Memory	Heap Memory Usage Calculate	Indicates the ZooKeeper direct memory usage.	95%
		Direct Memory Usage Calculate	Indicates the ZooKeeper heap memory usage.	80%
	GC	ZooKeeper GC Duration per Minute	Indicates the GC time of ZooKeeper every minute.	12000ms
meta	OBS Meta data Operations	Average Time for Calling the OBS Metadata API	Average time for calling the OBS metadata APIs.	500ms
		Success Rate for Calling the OBS Metadata API	Success rate of calling the OBS metadata APIs	99.0%
	OBS data write operation	Success Rate for Calling the OBS Write API	Success rate of calling the OBS data write APIs.	99.0%
	OBS data read operation	Success Rate for Calling the OBS Data Read API	Success rate of calling the OBS data read operation APIs.	99.0%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
Ranger	GC	UserSync GC Duration	UserSync garbage collection (GC) duration.	12000ms
		RangerAdmin GC Duration	RangerAdmin garbage collection (GC) duration.	12000ms
		TagSync GC Duration	TagSync garbage collection (GC) duration.	12000ms
	CPU and Memory	UserSync Non-Heap Memory Usage	UserSync non-heap memory usage in percentage.	80.0%
		UserSync Direct Memory Usage	UserSync direct memory usage in percentage.	80.0%
		UserSync Heap Memory Usage	UserSync heap memory usage in percentage.	95.0%
		RangerAdmin Non-Heap Memory Usage	RangerAdmin non-heap memory usage.	80.0%
		RangerAdmin Heap Memory Usage	RangerAdmin heap memory usage in percentage.	95.0%
		RangerAdmin Direct Memory Usage	RangerAdmin direct memory usage.	80.0%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
		TagSync Direct Memory Usage	TagSync direct memory usage in percentage.	80.0%
		TagSync Non-Heap Memory Usage	TagSync non-heap memory usage in percentage.	80.0%
		TagSync Heap Memory Usage	TagSync heap memory usage in percentage.	95.0%
ClickHouse	Cluster Quota	Clickhouse service quantity quota usage in ZooKeeper	Quota of the ZooKeeper nodes used by the ClickHouse service.	90%
		Capacity quota usage of the Clickhouse service in ZooKeeper	Capacity quota of ZooKeeper directory used by the ClickHouse service.	90%
IoTDB	GC	IoTDBServer GC Duration	IoTDBServer garbage collection (GC) duration.	12000ms
	CPU and Memory	IoTDBServer Heap Memory Usage	IoTDBServer heap memory usage in percentage.	90%
		IoTDBServer Direct Memory Usage	IoTDBServer direct memory usage in percentage.	90%

10.5.1.3 Configuring the Alarm Masking Status

Scenarios

If you do not want FusionInsight Manager to report specified alarms in the following scenarios, you can manually mask the alarms.

- Some unimportant alarms and minor alarms need to be masked.
- When a third-party product is integrated with FusionInsight, some alarms of the product are duplicated with the alarms of FusionInsight and need to be masked.
- When the deployment environment is special, certain alarms may be falsely reported and need to be masked.

After an alarm is masked, new alarms with the same ID as the alarm are neither displayed on the **Alarm** page nor counted. The reported alarms are still displayed.

Procedure

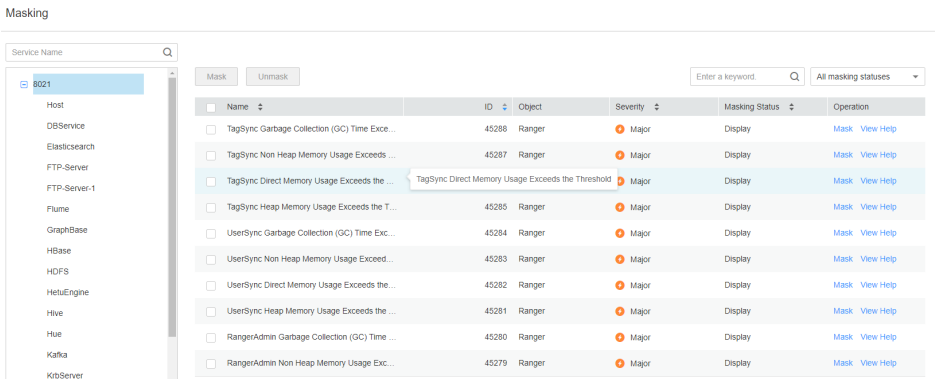
Step 1 Log in to FusionInsight Manager.

Step 2 Choose **O&M** > **Alarm** > **Masking**.

Step 3 In the **Masking** area, select the specified service or module.

Step 4 Select an alarm from the alarm list.

Figure 10-12 Masking an alarm



The information about the alarm is displayed, including the alarm name, ID, severity, masking status, and operations can be performed on the alarm.

- The masking status includes **Display** and **Mask**.
- Operations include **Mask** and **View Help**.

NOTE

You can filter specified alarms based on the masking status and alarm severity.

Step 5 Set the masking status for an alarm:

- Click **Mask**. In the displayed dialog box, click **OK** to change the alarm masking status to **Mask**.

- Click **Cancel Masking**. In the displayed dialog box, click **OK** to change the masking status of the alarm to **Display**.

----End

10.5.2 Log

10.5.2.1 Online Log Searching

Scenarios

FusionInsight Manager supports online search and displays component logs for log viewing scenarios, such as fault locating.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **O&M > Log > Online Search**.

Step 3 Set the parameters listed in **Table 10-22** based on the logs to be queried. You can select a log generation time range, the default time ranges are 0.5 hour, 1 hour, 2 hours, 6 hours, 12 hours, 1 day, 1 week, and 1 month, or click to customize **Start Date** and **End Data**.

Table 10-22 Log search parameters

Parameter	Description
Search Content	Specifies the keywords or regular expressions to be searched for.
Service	Specifies the service or module for which you want to query logs.
File	Specifies the log file to be searched when only one role is selected.
Lowest Log Level	Specifies the lowest level of the logs to be queried. After selecting a level, logs of this level and higher are displayed. The log levels from low to high are as follows: TRACE, DEBUG, INFO, WARN, ERROR, and FATAL

Parameter	Description
Host Scope	• You can click to select the hosts. • Enter the host name of the node for which you want to query logs or the IP address of the management plane. • Use commas (,) to separate IP addresses. For example, **192.168.10.10**,**192.168.10.11**. • Use hyphens (-) to indicate an IP address segment if the IP addresses are consecutive. For example, **192.168.10.[10-20]**. • Use hyphens (-) to indicate an IP address segment if the IP addresses are consecutive, and use commas (,) to separate IP address segments. For example, **192.168.10.[10-20,30-40]**. **NOTE** • If this parameter is not specified, all hosts are selected by default. • A maximum of 10 expressions can be entered at a time. • A maximum of 2000 hosts can be matched for all entered expressions at a time.
Advanced Configurations	• **Max Quantity**: specifies the maximum number of logs that can be displayed at a time. If the number of queried logs exceeds the preset value, the earliest logs will be ignored. If this parameter is not set, the maximum number of logs that can be displayed at a time is not limited. • **Timeout Duration**: specifies the log query timeout duration. This parameter is used to limit the maximum log query time on each node. When the query times out, the query is stopped and the query results are still displayed.

Step 4 Click **Search** to start the search. **Table 10-23**describes the fields in the query result.

Table 10-23 Search results

Parameter	Description
Time	Specifies the time when a piece of log is generated.
Source Cluster	Cluster where logs are generated.
Host Name	Specifies the host name of the node where the log file that records the line of log is located.

Parameter	Description
Location	Specifies the path of the log file that records the line of log. Click the location information to go to the online log browsing page. By default, 100 lines of logs before and 100 lines after the line of log are displayed. You can click **Load More** on the top or bottom of the page to view more logs. Click **Download** to download the log file to the local PC.
Line No.	Specifies the line number of a line of log in the log file.
Level	Specifies the log level.
Log	Specifies the log content.

NOTE

You can click **Stop** to forcibly stop the retrieval. The retrieved results are displayed in the list.

Step 5 Click **Filter** to filter the logs displayed on the page. **Table 10-24** lists the fields that you can use to filter logs. After setting these parameters, click **Filter** to search for logs meeting the search criteria. You can click **Reset** to clear the entered information.

Table 10-24 Filter

Parameter	Description
Keywords	Specifies the keywords of the logs to be searched for.
Host Name	Specifies the name of the host to be searched for.
Location	Specifies the path of the log file to be searched for.
Started	Specifies the start time for logs to be searched for.
Completed	Specifies the end time for logs to be searched for.
Source Cluster	Specifies the cluster of the logs to be searched for.

----End

10.5.2.2 Log Downloadind

Scenarios

FusionInsight Manager allows you to export logs generated by all instances of each service role in batches. You do not need to manually log in to a specified node to obtain the logs.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **O&M** > **Log > Download**.

Step 3 Select a log downloading range:

1. **Service**: Click ... to set a service for **Service**.
2. **Host**: Set the IP address of the host where the service is deployed. You can also click ... to select the host.
3. Click  in the upper right corner to select the corresponding **Start Date** and **End Date**.

Step 4 Click **Download**.

The downloaded log package contains the topology information of the corresponding start time and end time, facilitating locating.

The topology file is named in the format of **topo_<***Topology change time***>.txt.** The file contains the node IP address, node host name, and service instances installed on the node. (The OMS node is identified by Manager:Manager.)

The following shows an example:

```
192.168.204.124|suse-124|
DBService:DBServer;KrbClient:KerberosClient;LdapClient:SlapdClient;LdapServer:SlapdServer;Manager:Manager;meta:meta
```

----End

10.5.3 Perform a Health Check

10.5.3.1 Viewing a Health Check Task

Scenarios

Administrators can view all health check tasks in the health check management center to check whether the cluster is affected after the modification.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **O&M** > **Health Check**.

By default, all the saved check reports are displayed in a list, as listed in the following table.

Table 10-25 Health check report records

Item	Description
Checked Object	Indicates the object being checked, open the drop-down menu to view the details.
Status	Indicates the check result status, including **No problems found**, **Problems found**, and **Checking**.
Check Type	Indicates the entity on which the health check is performed, including four dimensions: **System**, **Cluster**, **Host**, **Service**, and **OMS**. By default, a health check on the cluster dimension contains all checks items.
Start Mode	Indicates whether the health check is automatically triggered or manually executed.
Started	Indicates the start time of the check.
Completed	Indicates the end time of the check.
Operation	You can export the health check report and view the help information.

NOTE

- In the upper pane, you can filter specified health check records by check object and result status.
- If the cluster checked, you can click **Help** in the **Checked Object** drop-down list box.
- During the health check, the system collects the recent historical data instead of the real-time monitoring data of object indicators. Therefore, the check is delayed.

----End

10.5.3.2 Managing Health Check Reports

Scenarios

You can manage all saved health check reports on FusionInsight Manager. That is, you can download or delete historical health check reports.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **O&M** > **Health Check**.

Step 3 Locate the row that contains a target health check report, click **Export Report**, and download the report file.

----End

10.5.3.3 Modifying Health Check Configuration

Scenarios

Administrators can enable automatic health check to reduce manual operation time. By default, the automatic health check checks the entire cluster.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **O&M** > **Health Check** > **Configuration**.

Periodic Health Check indicates whether to enable automatic health check. Selecting **Enable** to enable the automatic health check, and selecting **Disable** to disable the function.

Set the health check period to **Daily**, **Weekly**, or **Monthly** as required.

Step 3 Click **OK** to save the configurations.

----End

10.5.4 Configuring Backup and Backup Restoration

10.5.4.1 Creating a Backup Task

Scenarios

You can create backup tasks on FusionInsight Manager. Executing backup tasks backs up related data.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **O&M** > **Backup and Restoration** > **Backup Management** > **Create**.

Step 3 Set **Backup Object** to **OMS** or the cluster whose data needs to be backed up.

Step 4 Enter a task name in the **Name** text box.

Step 5 Set **Mode** to **Periodic** or **Manual** as required.

Table 10-26 Backup types

Type	Parameter	Description
Periodic	Started	Indicates the time when a periodic backup task is started for the first time.
	Period	Indicates the interval between the time when a task is executed last time and that when the task is started next time. The unit can be hour or day.
	Backup Policy	The following policies can be selected: • Full backup at the first time and subsequent incremental backup • Full backup every time • Full backup once every n times
Manual	N/A	You need to manually execute the task to back up data.

Step 6 Set required parameters in the **Configuration** area.

- Metadata and service data can be backed up.
- For details about how to back up data of different components, see **Backup and Recovery Management**.

Step 7 Click **OK** to save the configurations.

Step 8 In the backup task list, you can view the created backup task.

Locate the row that contains the target backup task, choose **More** > **Back Up Now** in the **Operation** column to execute the task immediately.

----End

10.5.4.2 Creating a Backup Restoration Task

Scenarios

You can create a backup restoration task on FusionInsight Manager. After the restoration task is executed, the specified backup data is restored to the cluster.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **O&M** > **Backup and Restoration** > **Restoration Management**. On the displayed page, click **Create**.

Step 3 Set **Recovery Object** to **OMS** or the cluster whose data needs to be restored.

Step 4 Enter a task name in the **Task Name** text box.

Step 5 Set the required parameters in the **Recovery Configuration** area.

- Metadata and service data can be restored.
- For details about how to how to restore data of different components, see **Backup and Recovery Management**.

Step 6 Click **OK** to save the configurations.

Step 7 In the restoration task list, you can view the created restoration tasks.

Locate the row that contains the target backup restoration task, click **Start** in the **Operation** column to execute the restoration task immediately.

----End

10.5.4.3 Managing Backup and Backup Restoration Tasks

Scenarios

You can also maintain and manage backup restoration tasks on FusionInsight Manager.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **O&M** > **Backup and Restoration** > **Backup Management** or **O&M** > **Backup and Restoration** > **Restoration Management**.

Step 3 In the **Operation** column of the specified task in the task list, select the operation to be performed.

Table 10-27 Maintenance and management operations

Operation Entry	Description
Config	Modify parameters for the backup task.
Recover	After some service data is successfully backed up, you can use this function to quickly restore data.
More > **Back Up Now**	Perform this operation to execute the backup task immediately.
More > **Stop**	Perform this operation to stop a running task.
More > **Delete** or **Delete**	This operation is used to delete tasks.
More > **Suspend**	Perform this operation to disable the automatic backup task function.
More > **Resume**	Perform this operation to enable the automatic backup task function.
More > **View History** or **View History**	Perform this operation to switch to the task run log page to view the task running details and backup path.

Operation Entry	Description
View	Perform this operation to check the parameter settings of the restoration task.
Start	Perform this operation to run the restoration task.

----End

10.6 Audit

10.6.1 Overview

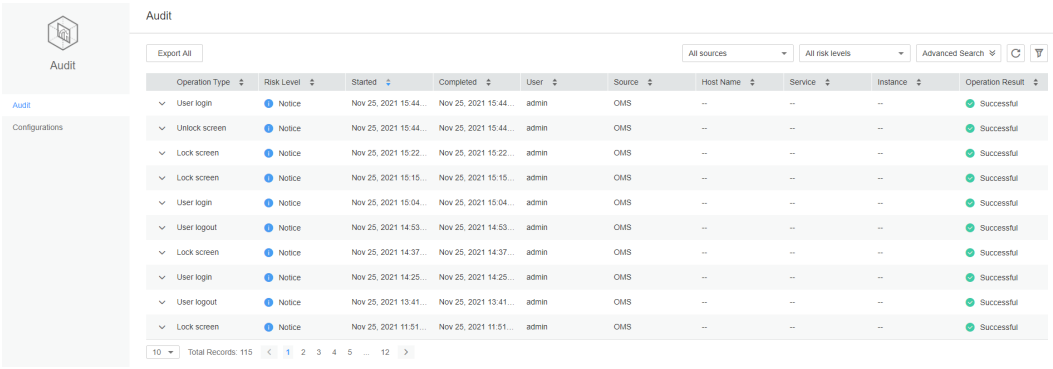
Scenario

The **Audit** page displays the user operations on Manager. On this page, administrators can view historical user operations on Manager. For details about the audit information, see **Audit Logs**.

Overview

Log in to FusionInsight Manager and choose **Audit**. **Figure 10-13** shows the audit information, including the operation type, risk level, start time, end time, user, host name, service, instance, and operation result.

Figure 10-13 Audit information list



- You can select audit logs at the **Major**, **Minor**, or **Notice** level from the **All risk levels** drop-down list.
- In **Advanced Search**, you can set filter criteria to query audit logs.
  a. You can query audit logs by user management, cluster, service, and health in the **Operation Type** column.
  b. In the **Service** column, you can select a service to query corresponding audit logs.

NOTE

You can select -- to search for audit logs using all other search criteria except services.

c. You can query audit logs by operation result, such as, **Successful**, **Failed**, or **Unknown**, as shown in the following figure.

- You can click to manually refresh the current page or click to filter the columns displayed in the page.
- Click **Export All** to export all audit information at a time. The audit information can be exported in **TXT** or **CSV** format.

10.6.2 Configuring Audit Log Dumping

Scenarios

The audit logs of FusionInsight Manager are stored in the database by default. If the audit logs are retained for a long time, the disk space of the data directory may be insufficient. To store audit logs to another archive server, administrators can set the required dump parameters to automatically dump these logs. This facilitates the management of audit logs.

If you do not configure the audit log dumping, the system automatically saves the audit logs to a file when the number of audit logs reaches 100,000 pieces. The save path is **${BIGDATA_DATA_HOME} /dbdata_om/dumpData/iam/operatelog** on the active management node. The file name format is **OperateLog_store**_*YY_MM_DD_HH_MM_SS*.**csv**. The maximum number of historical audit log files is 50.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Audit** > **Configurations**.

Step 3 Click the switch on the right of **Dump Audit Log**.

By default, **Dump Audit Log** is disabled. If this parameter is set to , the function is enabled.

Step 4 Set the dump parameters based on information provided in **Table 10-28**.

Table 10-28 Audit log dump parameters

Parameter	Description	Value
SFTP IP Mode	IP address mode. The value can be **IPv4** or **IPv6**.	**IPv4**
SFTP IP	Specifies the SFTP server for storing dumped audit logs. This parameter is mandatory. You are advised to use the SFTP service based on SSH v2. Otherwise, security risks exist.	**192.168.10.51** (example value)

Parameter	Description	Value
SFTP Port	Specifies the port of the SFTP server for storing dumped audit logs. This parameter is mandatory.	**22** (example value)
Save Path	Specifies the path for storing audit logs on the SFTP server. This parameter is mandatory.	**/opt/omm/oms/auditLog** (example value)
SFTP Username	Specifies the username for logging in to the SFTP server. This parameter is mandatory.	**root** (example value)
SFTP Password	Specifies the password for logging in to the SFTP server. This parameter is mandatory.	*Password for logging in to the SFTP server*
SFTP Public key	Specifies the public key of the SFTP server. This parameter is optional. You are advised to set the public key of the SFTP server. Otherwise, security risks may exist.	-
Dumping Mode	Specifies the dump mode. This parameter is mandatory. • **By Quantity**: If the number of pieces of logs reaches the value of this parameter (**100000** by default), the logs are dumped. • **By Time**: specifies the date when logs are dumped. The dumping frequency is once a year.	• By Quantity • By Time
Dumping Date	This parameter is mandatory. It is available when the dump mode is set to **By Time**. After you select a dump date, the system starts dumping on this date. The logs to be dumped include all the audit logs generated before January 1 00:00 of the current year.	November 06 (example)

NOTE

If the SFTP public key is empty, the system prompts a security risk message. Determine the security risk, then save the configuration.

Step 5 Click **OK** to complete the settings.

NOTE

Key fields in the audit log dump file are as follows:

- **USERTYPE** indicates the user type. Value **0** indicates the Human-machine user, and value **1** indicates the Machine-machine user.
- **LOGLEVEL** indicates the security level. Value **0** indicates Critical, value **1** indicates Major, value **2** indicates Minor, and value **3** indicates Warning.
- **OPERATERESULT** indicates the operation result. Value **0** indicates that the operation is successful, and value **1** indicates that the operation is failed.

----End

10.7 Tenant Resources

10.7.1 Introduction to Multi-Tenant

10.7.1.1 Overview

Definition

Multi-tenant specifies multiple resource sets (a resource set is a tenant) in a MRS big data cluster and is able to allocate and schedule resources. The resources include computing resources and storage resources.

Background

Modern enterprise data clusters are developing towards centralization and cloudification. Enterprise-class big data clusters must meet the following requirements:

- Carry data of different types and formats and run jobs and applications of different types (analysis, query, and stream processing).
- Isolate data of a user from that of another user who has demanding requirements on data security, such as a bank or government institute.

The preceding requirements bring the following challenges to the big data cluster:

- Proper allocation and scheduling of resources to ensure stable operating of applications and jobs
- Strict access control to ensure data and service security

Multi-tenant isolates the resources of a big data cluster into resource sets. Users can lease desired resource sets to run applications and jobs and store data. In a big data cluster, multiple resource sets can be deployed to meet diverse requirements of multiple users.

The MRS enterprise-class big data cluster provides a complete enterprise-class big data multi-tenant solution.

Highlights

- Proper resource configuration and isolation

  The resources of a tenant are isolated from those of another tenant. The resource use of a tenant does not affect other tenants. This mechanism ensures that each tenant can configure resources based on service requirements, improving resource utilization.
- Resource consumption measurement and statistics

  Tenants are system resource applicants and consumers. System resources are planned and allocated based on tenants. Resource consumption by tenants can be measured and recorded.
- Ensured data security and access security

  In multi-tenant scenarios, the data of each tenant is stored separately to ensure data security. The access to tenants' resources is controlled to ensure access security.

10.7.1.2 Technical Principles

10.7.1.2.1 Multi-Tenant Management

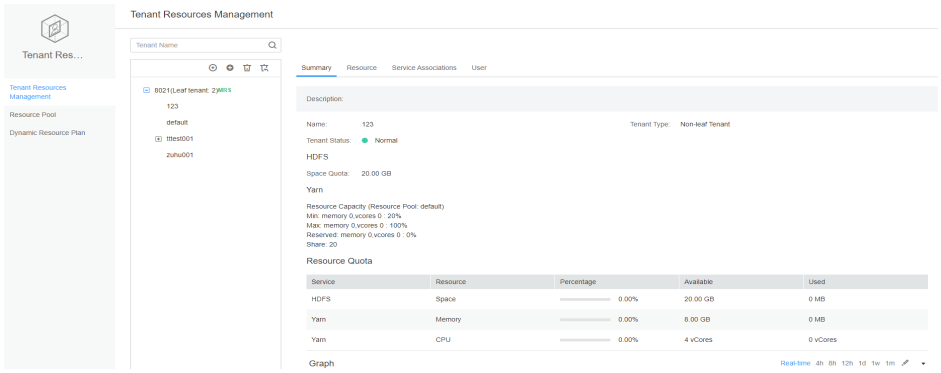
Unified Multi-Tenant Management

Log in to FusionInsight Manager and choose **Tenant Resources** > **Tenant Resources Management**. On the page that is displayed, you can find that FusionInsight Manager is a unified multi-tenant management platform that integrates multiple functions such as tenant lifecycle management, tenant resource configuration, tenant service association, and tenant resource usage statistics, delivering a mature multi-tenant management model and achieving centralized tenant and service management.

Graphical User Interface

FusionInsight Manager provides the graphical multi-tenant management interface and manages and operates multiple levels of tenants using the tree structure. Additionally, FusionInsight Manager integrates the basic information and resource quota of the current tenant in one interface to facilitate O&M and management, as shown in **Figure 10-14**.

Figure 10-14 Tenant management page of FusionInsight Manager



Level-based Tenant Management

FusionInsight Manager supports a level-based tenant management model in which you can add sub-tenants to an existing tenant to re-configure resources. Sub-tenants of level-1 tenants belong to level-2 tenants, and so on. FusionInsight Manager provides enterprises with a field-tested multi-tenant management model, enabling centralized tenant and service management.

Simplified Rights Management

In FusionInsight Manager, common users are shielded from internal rights management details and administrators' rights management operations are simplified, improving rights management usability and user experience.

- FusionInsight Manager adopts the role-based access control (RBAC) mode to configure rights for users as required during multi-tenant management.
- Administrator of tenants, the administrator has tenants' management rights, including viewing resources and services of the current tenant, adding or deleting sub-tenants of the current tenant, and managing rights of sub-tenants' resources. The administrator of a single tenant can be defined and the management over a tenant can be delegated to another user except the system administrator.
- Roles corresponding to tenants, roles have all rights on the computing resources and storage resources of a tenant. During the creation of a tenant, the system automatically creates a corresponding role. You can add a user and bind the user to the tenant role so that it can use the resources of the tenant.

Clear Resource Management

- **Self-Service Resource Configuration**

  In FusionInsight Manager, you can configure the computing resources and storage resources during the creation of a tenant and add, modify, or delete the resources of a tenant.

  Rights of the role that corresponds to the current tenant are updated automatically when you modify the computing resources and storage resources of a tenant.

- **Resource Usage Statistics**

  Resource usage statistics is critical for administrators to make O&M decisions based on the status of cluster applications and services, improving the cluster O&M efficiency. The FusionInsight Manager displays the resource statistics of tenant through the **Resource Quota**, including the dynamic computing resource VCores and Memory of tenant and the usage statistics of HDFS storage resources (Space).

NOTE

- **Resource Quotas** dynamically calculates the resource usage of tenants.

Service	Resource	Percentage	Available	Used
HDFS	Space	0.00%	20.00 GB	0 MB
Yarn	Memory	0.00%	8.00 GB	0 MB
Yarn	CPU	0.00%	4 vCores	0 vCores

  The available resources of the Superior scheduler are calculated as follows:

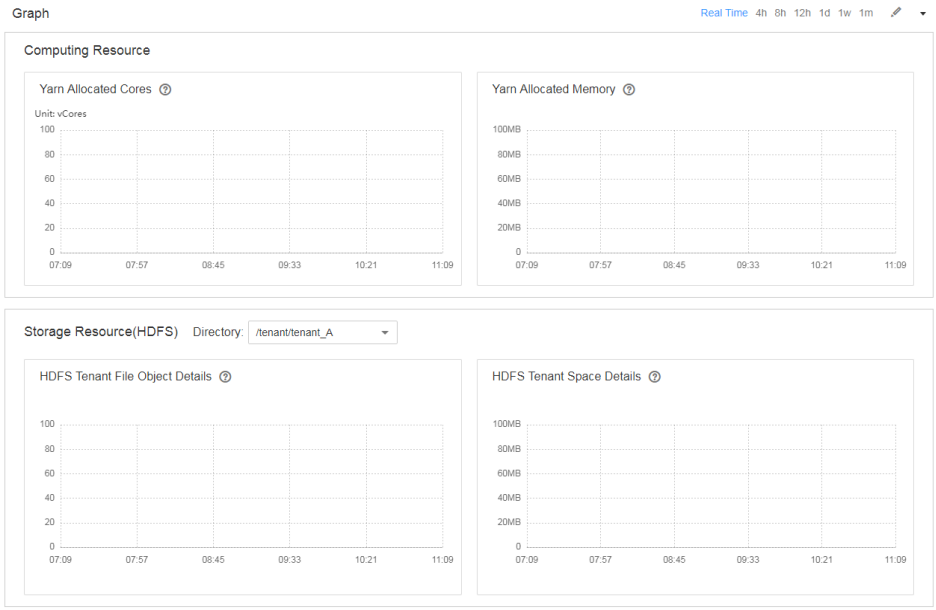
  - Superior

    The available Yarn resources (memory and CPU) are allocated in proportion based on the queue weight.
- When the tenant administrator is bound to a tenant role, the tenant administrator has the rights to manage the tenant and use all resources of the tenant.

- **Graphical Resource Monitoring**

  The resource graphical monitoring supports the graphical display of monitoring items listed in **Table 10-29**, as shown in **Figure 10-15**.

Figure 10-15 Refined monitoring



By default, the real-time monitoring data is displayed. You can click to customize a time range. The default time ranges include 4 hours, 8 hours, 12 hours, 1 day, 1 week, and 1 month. Click and choose **Export** from the shortcut menu to export the monitoring item information.

Table 10-29 Item

Service	Metric	Description
HDFS	HDFS Tenant Space Details • Allocated Space • Used Space	HDFS can select a specified storage directory for monitoring. The storage directory is the same as the directory added by the current tenant in **Resource**.
	HDFS Tenant File Object Details • Number of Used File Objects	
Yarn	Yarn Allocated Cores • Maximum Number of CPU Cores in an AM • Allocated Cores • Number of Used CPU Cores in an AM	Monitoring information of the current tenant can be displayed. If no subitem is configured for a tenant, this information is not displayed. The monitoring data is obtained from **Scheduler** > **Application Queues** > **Queue:** *tenant name* on the native WebUI of Yarn.
	Yarn Allocated Memory • Allocated Maximum AM Memory • Allocated Memory • Used AM Memory	

10.7.1.2.2 Models Related to Multi-Tenant

Models Related to Multi-Tenant

Figure 10-16 shows the models related to multi-tenant.

Figure 10-16 Models related to multi-tenant

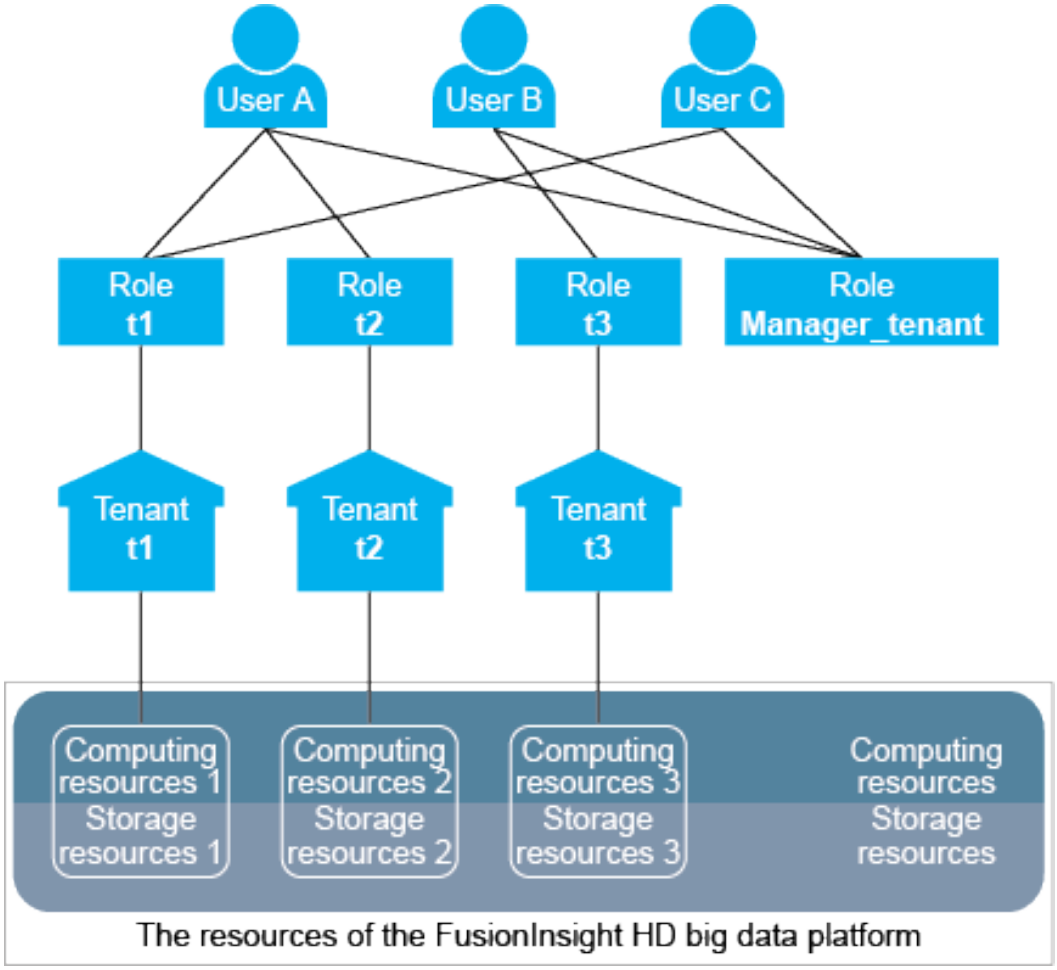


Table 10-30 describes the concepts involved in **Figure 10-16**.

Table 10-30 Concepts involved

Concept	Description
User	A natural person who has a name and password and uses the big data platform. **Figure 10-16** shows three different users: user A, user B, and user C.

Concept	Description
Role	A role is a carrier of one or more rights. Rights are assigned to specific objects, for example, access rights for the **/tenant** directory in HDFS. **Figure 10-16** shows four roles: role **t1**, role **t2**, role **t3**, and role **Manager_tenant**. • Roles **t1**, **t2**, and **t3** are automatically generated when tenants are created. The role names are the same as the tenant names. That is, roles **t1**, **t2**, and **t3** map to tenants **t1**, **t2**, and **t3**. Role names and tenant names need to be used together. • Role **Manager_tenant** is the role of the cluster and cannot be used separately.
Tenant	A tenant is a resource set divided from a big data cluster. Multi-tenant refers to multiple tenants. The source sets further divided in a tenant are called sub-tenants. **Figure 10-16** shows three tenants: tenant **t1**, tenant **t2**, and tenant **t3**.
Resource	• Computing resources include CPUs and memory. The computing resources of a tenant are divided from the total computing resources of the cluster. One tenant cannot occupy the computing resources of another tenant. In **Figure 10-16**, computing resources 1, 2, and 3 are divided from the cluster's computing resources by tenants **t1**, **t2**, and **t3**. • Storage resources include disks and third-party storage systems. The storage resources of a tenant are divided from the total storage resources of the cluster. One tenant cannot occupy the storage resources of another tenant. In **Figure 10-16**, storage resources 1, 2, and 3 are divided from the cluster's storage resources by tenants **t1**, **t2**, and **t3**.

If a user wants to use a tenant's resources or add or delete a sub-tenant from a tenant, the user needs to be bound to both the tenant role and role **Manager_tenant**. **Table 10-31** shows the roles bound to each user in **Table 10-31**.

Table 10-31 Roles bound to each user

User	Role	Rights
User A	• Role **t1** • Role **t2** • Role **Manager_tenant**	• Uses the resources of tenants **t1** and **t2**. • Adds or deletes sub-tenants for tenants **t1** and **t2**.
User B	• Role **t3** • Role **Manager_tenant**	• Uses the resources of tenant **t3**. • Adds or deletes sub-tenants for tenant **t3**.
User C	• Role **t1** • Role **Manager_tenant**	• Uses the resources of tenant **t1**. • Adds or deletes sub-tenants for tenant **t1**.

One user can be bound to multiple roles, and one role can be bound to multiple users. Users are associated with tenants by binding themselves to the tenants. For this reason, tenants and users are in many-to-many relationship. One user can use the resources of multiple tenants, and multiple users can use the resources of a tenant. In **Figure 10-16**, user A uses the resources of tenants **t1** and **t2**, and users A and C uses the resources of tenant **t1**.

NOTE

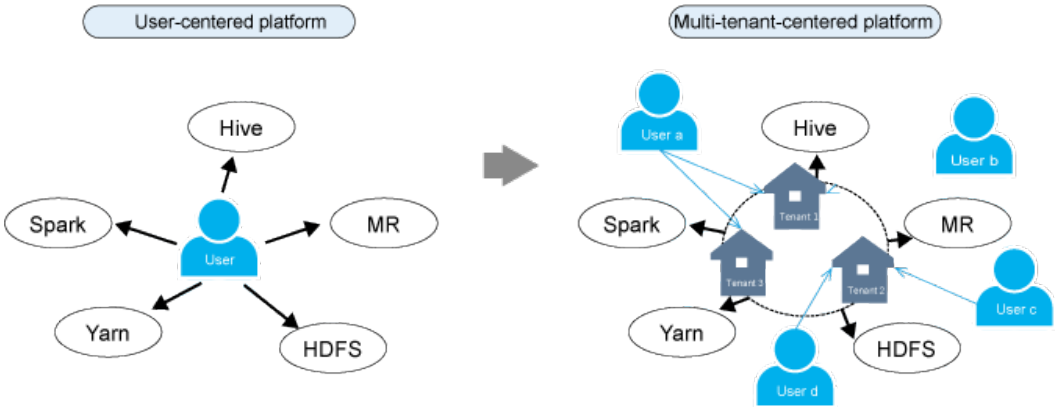
The parent tenant, sub-tenant, level-1 tenants, and level-2 tenants are designed for multi-tenant service scenarios. Pay attention to the differences between these concepts and those of leaf tenant and non-leaf tenant on FusionInsight Manager.

- Level-1 tenant: The name is determined by the tenant's level. For example, the created tenant is a level-1 tenant whose sub-tenant is a level-2 tenant.
- Parent tenant and sub-tenant: indicates the hierarchical relationship between tenants.
- Non-leaf tenant resource: indicates the tenant resource type selected during tenant creation, which can be used to create sub-tenants.
- Leaf tenant resource: indicates the tenant resource type selected during tenant creation, which cannot be used to create sub-tenants.

Multi-Tenant Platform

Tenant is a core concept of the FusionInsight big data platform. It assists in transforming the big data platform from the user-centered platform to the multi-tenant-centered platform to better cope with the multi-tenant application environment of modern enterprises.

Figure 10-17 User-centered platform and multi-tenant-centered platform



On the user-centered big data platform, users can directly access and use all resources and services.

- However, some cluster resources may not be used, lowering resource utilization.
- The data of different users may be stored together, decreasing data security.

On the multi-tenant-centered big data platform, users use required resources and services by accessing the tenants.

- Resources are allocated and scheduled based on application requirements and used based on tenants, increasing resource utilization.
- Users can access the resources of tenants only after being assigned roles, enhancing access security.
- The data of tenants is isolated, ensuring data security.

10.7.1.2.3 Resource Overview

The resources of the MRS big data platform are divided into computing resources and storage resources. Multi-tenant enables resource isolation:

- **Computing Resource**

  Computing resources include CPUs and memory. One tenant cannot occupy the computing resources of another tenant.
- **Storage Resource**

  Storage resources include disks and third-party storage systems. One tenant cannot access the data of another tenant.

Computing Resource

Computing resources are divided into static service resources and dynamic resources.

- **Static service resources**

  Static service resources are computing resources allocated to each service. The total volume of computing resources allocated to each service is fixed. Such services include Flume, HBase, HDFS and Yarn.
- **Dynamic resources**

Dynamic resources are computing resources dynamically scheduled to a task queue by distributed resource management service Yarn. Yarn dynamically schedules resources for the task queues of Mapreduce, Spark2x, Flink, and Hive.

NOTE

The resources allocated to Yarn in a big data cluster are static service resources and can be dynamically allocated to task queues by Yarn.

Storage Resource

Storage resources are data storage resources that can be allocated by distributed file storage service HDFS. Directories are used as the basic unit of HDFS storage resource allocation. Tenants can obtain storage resources by specifying directories in the HDFS file system.

10.7.1.2.4 Dynamic Resources

Overview

Yarn provides the distributed resource management function for a big data cluster. The total volume of resources allocated to Yarn can be configured. Then Yarn allocates and schedules computing resources for task queues. The computing resources of Mapreduce, Spark, Flink and Hive task queues are allocated and scheduled by Yarn.

Yarn queues are basic units of computing resource allocation.

For tenants, the resources obtained using Yarn task queues are dynamic resources. Users can dynamically create and modify the quotas of task queues and view the status and statistics of task queues.

Resource Pool

Complex cluster environments and upper-layer requirements are facing enterprise IT systems. For example:

- Heterogeneous cluster: The computing speed, storage capacity, and network performance of each node in the cluster are different. All the tasks of complex applications need to be properly allocated to each compute node in the cluster based on service requirements.
- Computing isolation: Data must be shared among multiple departments but computing resources must be distributed onto different compute nodes.

Compute nodes must be partitioned.

Resource pools are used to specify the configuration of dynamic resources. Yarn task queues are associated with resource pools for resource allocation and scheduling.

Only one default resource pool can be set for a tenant. Users can bind to the role of a tenant to use the resources in the resource pool of the tenant. If resources in multiple resource pools need to be used, users can bind themselves to multiple tenant roles.

Scheduling Mechanism

Yarn dynamic resources support label based scheduling. This policy creates labels for compute nodes (Yarn NodeManager nodes) of Yarn clusters and adds the compute nodes with the same label into the same resource pool. Then Yarn dynamically associates the task queues with resource pools based on the resource requirements of the task queues.

For example, a cluster has more than 40 nodes. Labels Normal, HighCPU, HighMEM, and HighIO are created based on the hardware and network configurations of nodes and added four resource pools. **Table 10-32** describes the performance of each node in the resource pool.

Table 10-32 Performance of each node in a resource pool

Label	Number of Nodes	Hardware and Network Configuration	Added To	Association
Normal	10	Minor	Resource pool A	Common task queue
HighCPU	10	High-performance CPU	Resource pool B	Computing-intensive task queue
HighMEM	10	Large memory	Resource pool C	Memory-intensive task queue
HighIO	10	High-performance network	Resource pool D	I/O-intensive task queue

Task queues can use the compute nodes in the associated resource pools only.

- Common task queues are associated with resource pool A and use nodes with hardware and network configurations labeled with Normal.
- Computing-intensive task queues are associated with resource pool B and use nodes with CPUs labeled with HighCPU.
- Memory-intensive task queues are associated with resource pool C and use nodes with memory labeled with HighMEM.
- I/O-intensive task queues are associated with resource pool C and use nodes with the network labeled with HighIO.

Yarn task queues are associated with specified resource pools to efficiently utilize resources in resource pools and ensure node performance.

FusionInsight Manager supports a maximum of add 50 resource pools. A default resource pool is included in the system by default.

Introduction to Schedulers

By default, the Superior scheduler is enabled for the MRS cluster.

- The Superior scheduler is an enhanced version and named after the Lake Superior, indicating that the scheduler can manage a large amount of data.

To meet enterprise requirements and tackle challenges facing the Yarn community in scheduling. The Superior scheduler provides the following enhancements:

- Enhanced resource sharing policy

  The Superior scheduler supports queue hierarchy. It integrates the functions of open source schedulers and shares resources based on configurable policies. In terms of instances, administrators can use the Superior scheduler to configure an absolute value or a percentage policy for queue resources. The resource sharing policy of the Superior scheduler enhances the label scheduling policy of Yarn as a resource pool feature. Nodes in a Yarn cluster can be grouped based on the capacity or service type to ensure that queues can more efficiently utilize resources.

- Tenant-based resource reservation policy

  Resources required by tenants must be ensured for running critical tasks. The Superior scheduler builds a resource reservation mechanism. With this mechanism, reserved resources can be allocated to tasks run by tenant queues in a timely manner to ensure proper task execution.

- Fair sharing among tenants and resource pool users

  The Superior scheduler allows shared resources to be configured for users in a queue. Each tenant may have users with different weights. Heavily weighted users may require more shared resources.

- Ensured scheduling performance in a big cluster

  The Superior scheduler receives heartbeats from each NodeManager and saves resource information in memory, which enables the scheduler to control cluster resource usage globally. The Superior scheduler uses the push scheduling model, which makes the scheduling more precise and efficient and remarkably improves cluster resource utilization. Additionally, the Superior scheduler delivers excellent performance when the interval between NodeManager heartbeats is long and prevents heartbeat storms in big clusters.

- Priority policy

  If the minimum resource requirement of a service cannot be met after the service obtains all available resources, a preemption occurs. The preemption function is disabled by default.

10.7.1.2.5 Storage Resource

Overview

As a distributed file storage service in a big data cluster, HDFS stores all the user data of the upper-layer applications in the big data cluster, including the data written to HBase tables or Hive tables.

Directories are used as the basic unit of HDFS storage resource allocation. HDFS supports the conventional hierarchical file structure. Users can create directories and create, delete, move, or rename files in directories. Tenants can obtain storage resources by specifying directories in the HDFS file system.

Scheduling Mechanism

HDFS directories can be stored on nodes with specified labels or disks of specified hardware types. For example:

- When both real-time query and data analysis tasks are running in one cluster, the real-time query tasks are deployed on some nodes; therefore, the queried data must be stored on these nodes.
- Based on actual service requirements, key data needs to be stored on nodes with high reliability.

Administrators can flexibly configure HDFS data storage policies based on actual service requirements and data features to store data on specified nodes.

For tenants, storage resources indicate the HDFS resources occupied by them. They can implement storage resource scheduling by storing data of specified directories in storage paths configured by tenants to ensure data isolation between tenants.

Users can add or delete HDFS storage directories of tenants and set the file quantity quota and storage capacity quota of directories to manage storage resources.

10.7.1.3 Multi-Tenant Use

10.7.1.3.1 Overview

Tenants are used in resource control and service isolation scenarios. Administrators need to confirm the service scenarios of cluster resources, and then plan tenants.

NOTE

- By default, the Yarn component of the newly installed cluster uses the Superior scheduler. For details, see **Using the Superior Scheduler in Multi-Tenant Scenarios**.

Multi-tenant involves three types of operations: creating a tenant, managing tenants, and managing resources. **Table 10-33** describes the operations.

Table 10-33 Operations involved in multi-tenant

Operation	Action	Description
Creating a tenant	• Adding a tenant • Adding a sub-tenant • Creating a user and binding the user to the role of a tenant	During the creation of a tenant, you can configure its computing resources, storage resources, and associated services based on service requirements. In addition, you can add users to the tenant and bind necessary roles to these users. A user who creates level-1 tenants must be bound to the **Manager_administrator** or **System_administrator** role. A user who creates sub-tenants must be bound to the role of the parent tenant at least.
Managing tenants	• Managing tenant directories • Restoring tenant data • Clearing unassociated queues of a tenant • Deleting a tenant	Modifies tenants as the services change. A user who manages or deletes level-1 tenants and restores tenants' data must be bound to the **Manager_administrator** or **System_administrator** role. A user who manages or deletes sub-tenants must be bound to the role of the parent tenant at least.
Managing resources	• Adding a resource pool • Modifying a resource pool • Deleting a resource pool • Configuring a queue • Configuring the queue capacity policy of a resource pool • Clearing queue configurations	Reconfigure resources for tenants as the services change. A user who manages resources must be bound to the **Manager_administrator** or **System_administrator** role.

10.7.1.3.2 Process Overview

Administrators need to confirm the service scenarios of cluster and plan user rights. After that, administrators need to add tenants and configure dynamic resources, storage resources, and related services for tenants on FusionInsight Manager.

Figure 10-18 shows the procedure of creating a tenant.

Figure 10-18 Creating a tenant

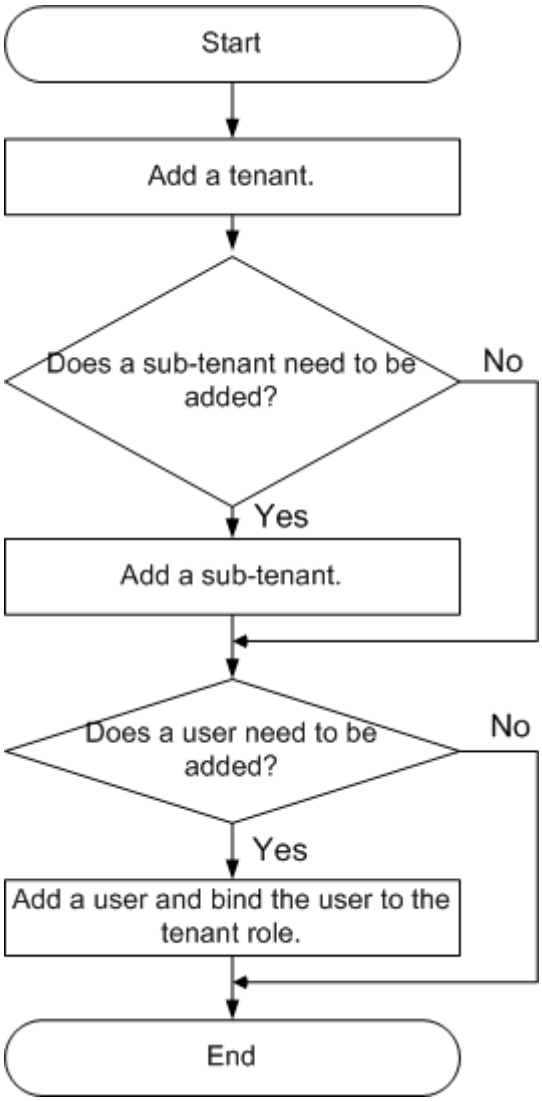


Table 10-34 describes the operations.

Table 10-34 Description on creating a tenant

Operation	Description
Adding a Tenant	Configures computing resources, storage resources, and related services for tenants.
Adding a Sub-Tenant	Configures computing resources, storage resources, and related services for tenants.
Adding a User and Binding the User to a Tenant Role	If a user wants to use the resources of **tenant1** or add or delete a sub-tenant for **tenant1**, the user must be bound with the **Manager_tenant** and **tenant1**_*cluster ID* roles.

10.7.2 Using the Superior Scheduler in Multi-Tenant Scenarios

10.7.2.1 Creating Tenants

10.7.2.1.1 Adding a Tenant

Scenario

Based on the resource consumption and isolation plan and requirements of services, administrators can create tenants on FusionInsight Manager to meet actual application scenarios.

Prerequisites

- A tenant name has been planned based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.
- Resources to be allocated to the current tenant have been planned to ensure that the sum of capacities of direct sub-tenants at every level cannot exceed the current tenant.

Procedure

Step 1 On FusionInsight Manager, click **Tenant Resources**.

Step 2 Click ⊕. On the displayed page, configure tenant properties based on **Table 10-35**.

Table 10-35 Tenant parameters

Parameter	Description
Cluster	Select the cluster for which you want to create a tenant.
Name	• Specifies the name of the current tenant. The value consists of 3 to 50 characters, which can be letters, digits, or underscores (_). • Plan a tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.
Tenant Type	Specifies whether the specified tenant is a leaf tenant. • When **Leaf Tenant** is selected, the current tenant is a leaf tenant and no sub-tenant can be added. • When **Non-leaf Tenant** is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant.

Parameter	Description
Computing Resource	Specifies the dynamic computing resources for the current tenant. ● When **Yarn** is selected, the system automatically creates a task queue in Yarn and the queue is named the same as the name of the tenant. – A leaf tenant can directly submit tasks to the task queue. – A non-leaf tenant cannot directly submit tasks to the task queue. However, Yarn adds an extra task queue (hidden) named **Default** for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual tasks do not run in this queue. ● When dynamic resources are not **Yarn** resources, the system does not automatically create a task queue.
Configuration Mode	Indicates the configuration mode of computing resource parameters. ● If you select **Basic**, you only need to set **Default Resource Pool Capacity (%)**. ● If you select **Advanced**, you can manually configure the resource allocation weight and the minimum, maximum, and reserved resources of a tenant.
Default Resource Pool Capacity (%)	Specifies the computing resource usage in the default resource pool of the current tenant. The value ranges from 0 to 100%.
Weight	Resource allocation weight. The value ranges from 0 to 100.
Minimum Resource	Resources guaranteed for the tenant resource (preemption supported). The value can be a percentage of the parent tenant resource's resources or an absolute value. When a tenant resource has a light workload, the resources of the tenant resource are automatically allocated to other tenant resources. When the available resources of the tenant resource do not meet the minimum threshold, the tenant resource can preempt the resources lent to other tenant resources.
Maximum Resource	Maximum resources that a tenant resource can use. The value can be a percentage of the parent tenant resource's resources or an absolute value.

Parameter	Description
Reserved Resource	Resources reserved for a tenant resource. Even when a tenant resource has no workload, other tenant resources cannot use the reserved resources of the tenant resource. The value can be a percentage of the parent tenant resource's resources or an absolute value.
Storage Resource	Specifies storage resources of the current tenant. ● When **HDFS** is selected, the system automatically allocates storage resources. ● When **HDFS** is not selected, the system does not automatically allocate storage resources.
Quota	Specifies the file and directory quantity quota.
Space Quota	Specifies the used HDFS storage space quota of the current tenant. ● Value range: When Space Quota unit is set to **MB**, this parameter ranges from **1** to **8796093022208**. When Space Quota unit is set to **GB**, this parameter ranges from **1** to **8589934592**. ● This parameter indicates the maximum HDFS storage space that can be used by the tenant, but does not indicate the actual space used. ● If the value is greater than the size of the HDFS physical disk space, the maximum space that can be used is all the HDFS physical disk space.
Storage Path	Specifies the HDFS storage directory for a tenant. ● The system creates a file folder named after the tenant name in the **/tenant** directory by default. For example, the default HDFS storage directory for **ta1** is **/tenant/ta1**. ● When a tenant is created for the first time, the system creates the **/tenant** directory in the HDFS root directory. The storage path is customizable.
Service	For details about whether to associate resources of other services, see **Step 4**.
Description	Configure the description of the current tenant.

NOTE

During the creation of a tenant, the system automatically creates a corresponding role, the computing resources, and the storage resources.

- The new role has the rights on the computing resources and storage resources. The role and its rights are controlled by the system automatically and cannot be controlled manually under **System > Permission > Role**. The role name is *tenant name_cluster ID*. By default, the cluster ID of the first cluster is not displayed.
- When using this tenant, create a system user and bind the user to the role of the tenant. For details, see **Adding a User and Binding the User to a Tenant Role**.
- During the creation of a tenant, the system automatically creates a Yarn task queue named after the tenant. If the queue name exists, the new queue is named **Tenant name-N**. **N** indicates a natural number starting from 1. When a same name exists, the value **N** increases automatically to differentiate the queue from others. For example, **saletenant**, **saletenant-1**, and **saletenant-2**.

Step 3 Whether the current tenant need to associate resources of other services.

- If yes, go to **4**.
- If no, go to **Step 5**.

Step 4 Click **Associated Service** to configure other service resources used by the current tenant.

1. Select **HBase** in **Service**.
2. Make a selection in **Association Type**:
   - **Exclusive** indicates service resources used by the tenant exclusively. Other tenants cannot associate with this service.
   - **Share** indicates shared service resources, which can be used by other tenants.

NOTE

- When creating a tenant, you can only associate HBase with the tenant. For existing tenants, you can associate the following services: HDFS, HBase, and Yarn.
- Associating existing tenants with service resources: In the tenant list on the left of the **Tenant Management** page, click the target tenant. Then, switch to the **Service Association** tab page and click **Associated Service** to associate the current tenant with service services.
- Canceling the association between existing tenants and service resources: In the tenant list on the left of the **Tenant Management** page, click the target tenant. Then, switch to the **Service Association** tab page, click **Delete**, select **I have read the information and understand the impact.**, and click **OK** to cancel the association with service.

3. Click **OK**.

Step 5 Click **OK**. When **Tenant created successfully.** is displayed on the page, the tenant is added successfully.

----End

10.7.2.1.2 Adding a Sub-Tenant

Scenario

Based on the resource consumption and isolation plan and requirements of services, administrators can create Sub-Tenants on FusionInsight Manager, and allocate resources of the current tenant to meet the actual application scenario.

Prerequisites

- A parent tenant has been added, and belongs to a non-leaf tenant.
- A tenant name has been planned based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.
- Resources to be allocated to the current tenant have been planned to ensure that the sum of capacities of direct sub-tenants at every level cannot exceed the current tenant.

Procedure

Step 1 On FusionInsight Manager, click **Tenant Resources**.

Step 2 In the tenant list on the left, move the cursor to the tenant node to which the sub-tenant is added. Click  . In the displayed window, configure the sub-tenant properties based on **Table 10-36**.

Table 10-36 Sub-tenant parameters

Parameter	Description
Cluster	Specifies the cluster of the parent tenant.
Parent Tenant Resource	Specifies the name of the parent tenant.
Name	• Specifies the name of the current tenant. The value consists of 3 to 50 characters, which can be letters, digits, or underscores (_). • Plan a sub-tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.
Tenant Type	Specifies whether the specified tenant is a leaf tenant. • When **Leaf Tenant** is selected, the current tenant is a leaf tenant and no sub-tenant can be added. • When **Non-leaf Tenant** is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant. However, the tenant depth cannot exceed 5 levels.

Parameter	Description
Computing Resource	Specifies the dynamic computing resources for the current tenant. ● When **Yarn** is selected, the system automatically creates a task queue in Yarn and the queue is named the same as the name of the tenant. – A leaf tenant can directly submit tasks to the task queue. – A non-leaf tenant cannot directly submit tasks to the task queue. However, Yarn adds an extra task queue (hidden) named **Default** for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual tasks do not run in this queue. ● When dynamic resources are not **Yarn** resources, the system does not automatically create a task queue.
Configuration Mode	Indicates the configuration mode of computing resource parameters. ● If you select **Basic**, you only need to set **Default Resource Pool Capacity (%)**. ● If you select **Advanced**, you can manually configure the resource allocation weight and the minimum, maximum, and reserved resources of a tenant.
Default Resource Pool Capacity (%)	Specifies the computing resource usage of the current tenant. The base value is the total resources of the parent tenant.
Weight	Resource allocation weight. The value ranges from 0 to 100.
Minimum Resource	Resources guaranteed for the tenant resource (preemption supported). The value can be a percentage of the parent tenant resource's resources or an absolute value. When a tenant resource has a light workload, the resources of the tenant resource are automatically allocated to other tenant resources. When the available resources of the tenant resource do not meet the minimum threshold, the tenant resource can preempt the resources lent to other tenant resources.
Maximum Resource	Maximum resources that a tenant resource can use. The value can be a percentage of the parent tenant resource's resources or an absolute value.

Parameter	Description
Reserved Resource	Resources reserved for a tenant resource. Even when a tenant resource has no workload, other tenant resources cannot use the reserved resources of the tenant resource. The value can be a percentage of the parent tenant resource's resources or an absolute value.
Storage Resource	Specifies storage resources of the current tenant. • When **HDFS** is selected, the system automatically creates a file in the HDFS parent tenant directory. The file is named the same as the name of the sub-tenant. • When **HDFS** is not selected, the system does not automatically allocate storage resources.
Quota	Specifies the file and directory quantity quota.
Space Quota	Specifies the used HDFS storage space quota of the current tenant. • When **Space Quota Unit** is set to **MB**, this parameter ranges from **1** to **8796093022208**. When **Space Quota Unit** is set to GB, this parameter ranges from **1** to **8589934592**. The maximum value of this parameter does not exceed the total storage quota of the parent tenant. • This parameter indicates the maximum HDFS storage space that can be used by the tenant, but does not indicate the actual space used. • If the value is greater than the size of the HDFS physical disk space, the maximum space that can be used is all the HDFS physical disk space. • If this quota is greater than the quota of the parent tenant, the actual storage space will be affected by the quota of the parent tenant.
Storage Path	Specifies the HDFS storage directory for a tenant. • The system creates a file folder named after the sub-tenant name in the directory of the parent tenant by default. For example, if the sub-tenant is **ta1s** and the parent directory is **/tenant/ta1**, the system sets the **Storage Path** for the sub-tenant to **/tenant/ta1/ta1s**. • The storage path is customizable in the parent directory.
Service	For details about whether to associate resources of other services, see **Step 4**.
Description	Configure the description of the current tenant.

NOTE

During the creation of a tenant, the system automatically creates a corresponding role, the computing resources, and the storage resources.

- The new role has the rights on the computing resources and storage resources. The role and its rights are controlled by the system automatically and cannot be controlled manually under **System > Permission > Role**. The role name is *tenant name_cluster ID*. By default, the cluster ID of the first cluster is not displayed.
- When using this tenant, create a system user and bind the user to the role of the tenant. For details, see **Adding a User and Binding the User to a Tenant Role**.
- The sub-tenant can further allocate the resources of the current tenant. The sum of the resource percentage of direct sub-tenants of a parent tenant cannot exceed 100%. The sum of the computing resource percentage of all level-1 tenants cannot exceed 100%.

Step 3 Whether the current tenant need to associate resources of other services.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Click **Associated Service** to configure other service resources used by the current tenant.

1. Select **HBase** in **Service**.
2. Make a selection in **Association Type**:
   - **Exclusive** indicates service resources used by the tenant exclusively. Other tenants cannot associate with this service.
   - **Share** indicates shared service resources, which can be used by other tenants.

NOTE

- When creating a tenant, you can only associate HBase with the tenant. For existing tenants, you can associate the following services: HDFS, HBase, and Yarn.
- Associating existing tenants with service resources: In the tenant list on the left of the **Tenant Management** page, click the target tenant. Then, switch to the **Service Association** tab page and click **Associated Service** to associate the current tenant with service services.
- Canceling the association between existing tenants and service resources: In the tenant list on the left of the **Tenant Management** page, click the target tenant. Then, switch to the **Service Association** tab page, click **Delete**, select **I have read the information and understand the impact.**, and click **OK** to cancel the association with service.

3. Click **OK**.

Step 5 Click **OK**. When **Tenant created successfully.** is displayed on the page, the tenant is added successfully.

----End

10.7.2.1.3 Adding a User and Binding the User to a Tenant Role

Scenario

The created tenant cannot directly log in to the cluster to access resources. Administrators need to create a user for a tenant on FusionInsight Manager and bind the user to a tenant role to assign operation rights to the user.

Prerequisites

The system administrator has understood service requirements and created a tenant.

Procedure

Step 1 On FusionInsight Manager, click **System > Permission > User**.

Step 2 To add a user to the system, click **Create**.

To bind tenant rights to an existing user in the system, click **Modify** in the column where the user locates. The configuration page is displayed.

For details about configuring parameters of a user, see **Table 10-37**.

Table 10-37 User parameters

Parameter	Description
Username	Specifies the name of the current tenant. The value consists of 3 to 32 characters, which can be letters, digits, underlines (_), hyphens(-), or spaces. • **Username** cannot be the same as any username of the OS on each node in the cluster. Otherwise, the user account cannot be used properly. • Usernames of the same letters but different cases are not supported. For example, if **User1** already exists, user **user1** cannot be created. When using user **User1**, enter the correct username.
User Type	Options include **Human-Machine** and **Machine-Machine**. • **Human-Machine** user: Used in FusionInsight Manager O&M scenarios and component client operation scenarios. If you select **Human-Machine**, you need to set **Password** and **Confirm password**. • **Machine-Machine** user: Used in application development scenarios. If you select **Machine-Machine**, the user password is generated randomly.
Password	If you select **Human-Machine**, set **Password**. The password must contain 8 to 64 characters, consisting at least 4 of uppercase letters, lowercase letters, digits, and special characters and spaces. Cannot be the username or username spelled backwards.
Confirm Password	Enter the password again.

Parameter	Description
User Group	In **User Group**, click **Add** to add the user to a user group. ● If a role is added to a user group, users in the user group can obtain the rights of the role. ● For example, assign Hive rights to the new user and add the user to the **Hive** group.
Primary Group	Select a group as the primary group of directories and files of the user. The drop-down list contains groups that are selected in **User Group**.
Role	Click **Add** to add a role to the user as required. **NOTE** ● If a user wants to use resources allocated to **tenant1** add sub-tenants to or delete sub-tenants from **tenant1**, bind the **Manager_tenant** and **tenant1**_*cluster ID* roles to the user. ● If the tenant is associated with the HBase service and Ranger authentication is enabled for the current cluster, you need to configure the HBase execution permission on the Ranger WebUI.
Description	Configure the description of the current user.

Step 3 Click **OK**.

----End

10.7.2.2 Managing Tenants

10.7.2.2.1 Managing a Tenant Directory

Scenario

The administrator manages the HDFS storage directory used by a specified tenant on FusionInsight Manager based on service requirements. The management operations include adding tenant directories, modifying quantity quotas of files and directories, and storage space quota of the directory, and deleting directories.

Prerequisites

Tenants with HDFS storage resources are added.

Procedure

View a tenant directory.

Step 1 On FusionInsight Manager, click **Tenant Resources**.

Step 2 In the tenant list on the left, click a target tenant.

Step 3 Click **Resource**.

Step 4 View the **HDFS Storage** table.

- The **Quota** column indicates quantity quotas of files and directories.
- The **Space Quota** column indicates storage space sizes of tenant directories.

----End

Add a tenant directory.

Step 1 On FusionInsight Manager, click **Tenant Resources**.

Step 2 In the tenant list on the left, click the tenant whose HDFS storage directory needs to be changed.

Step 3 Click **Resource**.

Step 4 In the **HDFS Storage** table, click **Create Directory**.

- The **Parent Directory** indicates the storage directory of the parent tenant corresponding to the current tenant.

  NOTE

  This parameter is not displayed if the current tenant is not a sub-tenant.

- Set **Path** to a tenant directory path.

  NOTE

  If the current tenant is not a sub-tenant, the new path is created in the HDFS root directory.

- Set **Quota** to the quotas of file and directory quantity.
- **File Number Threshold (%)** takes effect only when **Quota** is specified. If the ratio of the number of used files to the value of **Quota** exceeds the value of this threshold, an alarm is generated. If this parameter is not specified, no alarm is reported in this scenario.

  NOTE

  The number of used files is collected every hour. Therefore, the alarm indicating that the file number exceeds the threshold is delayed.

- Set **Space Quota** to storage space sizes of tenant directories.
- **Storage Space Threshold (%)**: If the ratio of used storage space to the value of **Space Quota** exceeds the value of this parameter, an alarm is generated. If this parameter is not specified, no alarm is generated in this scenario.

  NOTE

  The used storage space is collected every hour. Therefore, the alarm indicating that the storage space exceeds the threshold is delayed.

Step 5 Click **OK**.

----End

Modify a tenant directory properties.

Step 1 On FusionInsight Manager, click **Tenant Resources**.

Step 2 In the tenant list on the left, click the tenant whose HDFS storage directory needs to be changed.

Step 3 Click **Resource**.

Step 4 In the **HDFS Storage** table, click **Modify** in the **Operation** column of the specified tenant directory.

- Set **Quota** to the quotas of file and directory quantity.
- **File Number Threshold (%)** takes effect only when **Quota** is specified. If the ratio of the number of used files to the value of **Quota** exceeds the value of this threshold, an alarm is generated. If this parameter is not specified, no alarm is reported in this scenario.
- Set **Space Quota** to storage space sizes of tenant directories.
- **Storage Space Threshold (%)**: If the ratio of used storage space to the value of **Space Quota** exceeds the value of this parameter, an alarm is generated. If this parameter is not specified, no alarm is generated in this scenario.

Step 5 Click **OK**.

----End

Delete tenant directory.

Step 1 On FusionInsight Manager, click **Tenant Resources**.

Step 2 In the tenant list on the left, click the tenant whose HDFS storage directory needs to be changed.

Step 3 Click **Resource**.

Step 4 In the **HDFS Storage** table, click **Delete** in the **Operation** column of the specified tenant directory.

NOTE

The tenant directory that is created by the system during tenant creation cannot be deleted.

Step 5 Click **OK**.

----End

10.7.2.2.2 Restoring Tenant Data

Scenario

Tenant data is stored on Manager and in cluster components. After components are recovered from faults or reinstalled, some tenant configuration data may be in the abnormal state. Administrator need to manually restore the configuration data on FusionInsight Manager.

Procedure

Step 1 On FusionInsight Manager, click **Tenant Resources**.

Step 2 In the tenant list on the left, click a tenant node.

Step 3 Check the status of the tenant data.

1. In **Summary**, check the color of the circle on the right of **Tenant Status**. Green indicates that the tenant is available and gray indicates that the tenant is unavailable.
2. Click **Resource** and check the color of the circle on the left of **Yarn** or **HDFS Storage**. Green indicates that the resource is available and gray indicates that the resource is unavailable.
3. Click **Service Association** and check the **Status** column of the associated service table. **Normal** indicates that the component can provide services for the associated tenant. **Not Available** indicates that the component cannot provide services for the tenant.
4. If any of the preceding check items is abnormal, go to **Step 4** to restore tenant data.

Step 4 Click . In the dialog box that is displayed, enter the password of the administrator who has logged in for authentication, and click **OK**.

Step 5 In the **Restore Tenant Resource Data** window, select one or multiple components whose data needs to be restored and click **OK**. The system automatically restores the tenant data.

----End

10.7.2.2.3 Deleting a Tenant

Scenario

Based on service requirements, the administrator can delete tenants that are no longer used on FusionInsight Manager to release resources occupied by tenants.

Prerequisites

- A tenant has been added.
- The tenant to be deleted has no sub-tenant.
- The role of the tenant to be deleted is not associated with any user or user group.

Procedure

Step 1 On FusionInsight Manager, click **Tenant Resources**.

Step 2 In the tenant list on the left, select the tenant to be deleted and click .

NOTE

- If you want to save the tenant data, select **Reserve the data of this tenant resource.**. Otherwise, the tenant's storage space will be deleted.

Step 3 Click **OK** to save the settings.

It takes a few minutes to save the configuration. The tenant is deleted successfully. Roles and the storage space of the tenant are also deleted.

NOTE

After the tenant is deleted, the task queue of the tenant still exists in Yarn. The task queue of the tenant is not displayed on the role management page in Yarn.

----End

10.7.2.3 Managing Resources

10.7.2.3.1 Add a Resource Pool

Scenario

This section describes how to logically divide Yarn cluster nodes to combine multiple NodeManagers into a Yarn resource pool. Each NodeManager belongs to one resource pool only. The Administrator can create a customized resource pool on FusionInsight Manager and add hosts that are not added to other customized resource pools to the newly created resource pool.

The system contains a **default** resource pool by default. All NodeManagers that are not added to customized resource pools belong to this resource pool.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Tenant Resources** > **Resource Pool**.

Step 3 Click **Add Resource Pool**.

Step 4 In **Add Resource Pool**, set the properties of the resource pool.

- **Cluster**: Select the name of the cluster to which the resource pool is to be added.
- **Name**: Enter the name of the resource pool. The resource pool name consists of 1 to 50 characters, including digits, letters, or underscores (_), but cannot start with an underscore (_).
- **Resource Label**: Resource label of the resource pool, including letters, digists, underscores (_) or hyphens(-). The value contains 1 to 50 characters and must start with a digit or letter.
- **Resource**: In the host list on the left, select the name of a specified host and click >> to add the selected host to the resource pool. Only hosts in the current cluster can be selected. The host list of a resource pool can be left blank.

  NOTE

  You can select the **Resource** based on the host name, CPU, memory, operating system and platform type.

Step 5 Click **OK** to save the settings.

After the resource pool is created, the system administrator can view the name, type, and members of the resource pool in the resource pool list. Hosts that are

added to the customized resource pool are no longer members of the **default** resource pool.

----End

10.7.2.3.2 Modifying a Resource Pool

Scenario

If hosts in the resource pool need to be adjusted based on service requirements, administrators can modify members in the existing resource pool on FusionInsight Manager.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Tenant Resources** > **Resource Pool**.

Step 3 Locate the row that contains the specified resource pool in the resource pool list, and click **Edit** in the **Operation** column.

Step 4 In **Edit Resource Pool**, modify Hosts.

- Adding a host: In the host list on the left, select the name of a specified host and click >> to add the selected host to the resource pool.
- Deleting a host: In the host list on the right, select the name of a specified host and click << to delete the selected host from the resource pool. The host list of a resource pool can be left blank.

Step 5 Click **OK** to save the settings.

----End

10.7.2.3.3 Deleting a Resource Pool

Scenario

This section describes how to delete an existing resource pool on FusionInsight Manager.

Prerequisites

- Any queue in the cluster cannot use the resource pool to be deleted as its default resource pool; therefore, cancel the default resource pool before deleting a resource pool. For details, see **Configuring a Queue**.
- Additionally, any queue in the cluster is not allowed to configure the resource distribution policy in the resource pool to be deleted; therefore, clear the policy before deleting a resource pool. For details, see **Clearing Queue Configurations**.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Tenant Resources** > **Resource Pool**.

Step 3 Locate the row that contains the specified resource pool in the resource pool list, and click **Delete** in the **Operation** column.

Step 4 In the window that is displayed, click **OK**.

----End

10.7.2.3.4 Configuring a Queue

Scenario

The administrator can modify queue configuration of a specific tenant on FusionInsight Manager based on service requirements.

Prerequisites

Tenants who use the Superior scheduler have been added.

Procedure

Step 1 On FusionInsight Manager, click **Tenant Resources**.

Step 2 Click the **Dynamic Resource Plan** tab.

Step 3 Click the **Queue Configuration** tab.

Step 4 Set **Cluster** to the name of the cluster to be operated. In the tenant queue table, click **Modify** in the **Operation** column of the specific tenant queue.

NOTE

- You can also open the queue modification page as follows: Click the target tenant in the tenant list on the left of the **Tenant Resources Management** tab page. In the window that is displayed, click **Resource**. On the page that is displayed, click behind **Queue Configuration (*queue name*)**.
- One queue can be bound to only one non-default resource pool.
- For parameters such as **Max Allocated vCores**, **Max Allocated Memory(MB)**, **Max Running Apps**, **Max Running Apps per User** and **Max Pending Apps**, if the sub-tenant value is **-1**, the parent tenant value can be set to a specific limit. If the parent tenant value is a specific limit, the sub-tenant value can be set to **-1**.
- The values of **Max Allocated vCores** and **Max Allocated Memory(MB)** must be changed to values other than **-1** for the modification to take effect.

Table 10-38 Queue configuration parameters

Parameter	Description
Max Master Shares(%)	Indicates the maximum percentage of resources occupied by all ApplicationMasters in the current queue.
Max Allocated vCores	Indicates the maximum number of cores allocated to a Yarn container in the current queue. The default value is -1, indicating that the value range is not limited.

Parameter	Description
Max Allocated Memory(MB)	Indicates the maximum memory allocated to a Yarn container in the current queue. The default value is -1, indicating that the value range is not limited.
Max Running Apps	Indicates the maximum number of tasks supported by the current queue at one time. The default value is **-1**, which indicates that the number of tasks that can be executed concurrently in the queue is not restricted (same meaning as the parameter value left blank). Value **0** indicates that no task can be executed. The value ranges from -1 to 2147483647.
Max Running Apps per User	Indicates the maximum number of tasks allowed for a user in the current queue at one time. The default value is **-1**, which indicates that the number of tasks that can be executed concurrently in the queue is not restricted (same meaning as the parameter value left blank). Value **0** indicates that no task can be executed. The value ranges from -1 to 2147483647.
Max Pending Apps	Indicates the maximum number of tasks that can be suspended in the current queue at one time. The default value is **-1**, which indicates that the number of tasks that can be suspended concurrently in the queue is not restricted (same meaning as the parameter value left blank). Value **0** indicates that no task can be suspended. The value ranges from -1 to 2147483647.
Resource Allocation Rule	Indicates the rule for allocating resources to different tasks of a user. The rule can be FIFO or FAIR. If a user submits multiple tasks in the current queue and the rule is FIFO, the tasks are executed one by one in sequential order; if the rule is FAIR, resources are evenly allocated to all tasks.
Default Resource Label	Indicates that tasks are executed on a node with a specified resource label.
Active	• ACTIVE: indicates that the current queue can receive and execute tasks. • INACTIVE: indicates that the current queue can receive but cannot execute tasks. Tasks submitted to the queue are suspended.
Open	• OPEN: indicates that the current queue is opened. • CLOSED: indicates that the current queue is closed. Tasks submitted to the queue are rejected.
Migrate Queue Upon Fault	If multi-az availability is enabled for the cluster and an AZ is faulty, set **Migrate Queue Upon Fault** to **TRUE** to submit running queues of the tenant to other AZs.

Step 5 Click **OK**. The queue configuration is complete.

----End

10.7.2.3.5 Configuring the Queue Capacity Policy of a Resource Pool

Scenario

After a resource pool is added, capacity policies of available resources need to be configured for Yarn task queues to ensure the proper running of tasks in the resource pool.

This section describes how to configure the queue policy on FusionInsight Manager. Tenant queues with the Superior scheduler can use resources in different resource pools.

Prerequisites

- You have logged in to FusionInsight Manager.
- You have added a resource pool.
- The task queue is not associated with resource pools of other queues except the default resource pool.

Procedure

Step 1 On FusionInsight Manager, click **Tenant Resources**.

Step 2 Click the **Dynamic Resource Plan** tab.

Step 3 Click the **Resource Distribution Policy** tab.

Step 4 Set **Cluster** to the name of the cluster to be operated. In **Resource Pool**, select the specified resource pool.

Step 5 Locate the specified queue in **Resource Allocation**, and click **Modify** in the **Operation** column.

Step 6 On the **Resource Configuration Policy** tab page in **Modify Resource Allocation**, configure the resource allocation policy for the task queue in the resource pool.

- **Weight**: indicates the resources that a tenant can obtain. Its initial value is the same as the minimum resource percentage.
- **Minimum Resource**: indicates the minimum resources that a tenant can obtain.
- **Maximum Resource**: indicates the maximum resources that a tenant can obtain.
- **Reserved Resource**: indicates the resources that are reserved for a tenant and cannot be shared by other tenants.

Step 7 On the **User Policy** tab page in **Modify Resource Allocation**, configure the user policy.

NOTE

defaultUser(built-in) indicates that the policy specified by **defaultUser** is used if a user does not specify a policy. The default policy cannot be deleted.

- Click **Add User Policy** to add a user policy.
  - **Username**: indicates the user name.
  - **Weight**: indicates the resources that a user can obtain.
  - **Max vCores**: indicates the maximum number of virtual cores that a user can obtain.
  - **Max Memory(MB)**: indicates the maximum memory that a user can obtain.
- Click **Modify** in the **Operation** column to modify a user policy.
- Click **Clear** in the **Operation** column to delete a user policy.

Step 8 Click **OK** to save the configuration.

----End

10.7.2.3.6 Clearing Queue Configurations

Scenario

The system administrator can clear queue configurations on FusionInsight Manager if a queue does not need resources from a resource pool or a resource pool needs to be disassociated from a queue. Clearing queue configurations means that the resource capacity policy of a queue in the resource pool is canceled.

Prerequisites

If a queue is to be unbound from a resource pool, you have ensured that the resource pool is not the default resource pool of the queue. For details, see **Configuring a Queue**.

Procedure

Step 1 Log in to FusionInsight Manager portal.

Step 2 Choose **Tenant Resources** > **Dynamic Resource Plan**

Step 3 Set **Cluster** to the name of the cluster to be operated. In **Resource Pool**, select the specified resource pool.

Step 4 Locate the row that contains the specified queue in **Resource Allocation** and click **Clear** in the **Operation** column.

Step 5 In **Clear Queue Configuration**, click **OK** to clear the queue configurations in the current resource pool.

----End

10.7.2.4 Managing Global User Policies

Scenario

If a tenant uses a Superior scheduler, the system can control the policy for a specific user in using the resource scheduler, including:

- Maximum number of running tasks
- Maximum number of suspended tasks
- Default queue

Procedure

- Add a scheduling policy.
  a. On FusionInsight Manager, click **Tenant Resources**.
  b. Click the **Dynamic Resource Plan** tab.
  c. Click **Global User Policy**.

     NOTE

     defaults(default setting) indicates that the default policy is used if a user does not specify the global user policy. The default policy cannot be deleted.

  d. Click **Create Global User Policy**. In the window that is displayed, configure the following parameters:

     - **Cluster**: Select the cluster to be operated.
     - **Username**: indicates the user for whom resource scheduling is controlled. Enter the name of an existing user in the cluster.
     - **Max Running Apps**: indicates the maximum number of tasks that the user can run in the cluster.
     - **Max Pending Apps**: indicates the maximum number of tasks that the user can suspend in the cluster.
     - **Default Queue**: indicates the user queue. Enter the name of an existing queue in the cluster.
- Modify a policy.
  a. On FusionInsight Manager, click **Tenant Resources**.
  b. Click the **Dynamic Resource Plan** tab.
  c. Click **Global User Policy**.
  d. In the row that contains the desired user policy, click **Modify** in the **Operation** column.
  e. After adjusting the parameters, click **OK**.
- Delete a policy.
  a. On FusionInsight Manager, click **Tenant Resources**.
  b. Click the **Dynamic Resource Plan** tab.
  c. Click **Global User Policy**.
  d. In the row that contains the desired user policy, click **Delete** in the **Operation** column.

     In the window that is displayed, click **OK**.

10.7.3 Using the Capacity Scheduler in Multi-Tenant Scenarios

10.7.3.1 Creating Tenants

10.7.3.1.1 Adding a Tenant

Scenario

Based on the resource consumption and isolation plan and requirements of services, administrators can create tenants on FusionInsight Manager to meet actual application scenarios.

Prerequisites

- A tenant name has been planned based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.
- Resources to be allocated to the current tenant have been planned to ensure that the sum of capacities of direct sub-tenants at every level cannot exceed the current tenant.

Procedure

Step 1 On FusionInsight Manager, click **Tenant Resources**.

Step 2 Click ⊕. On the displayed page, configure tenant properties based on **Table 10-39**.

Table 10-39 Tenant parameters

Parameter	Description
Cluster	Select the cluster for which you want to create a tenant.
Name	• Specifies the name of the current tenant. The value consists of 3 to 50 characters, which can be letters, digits, or underscores (_). • Plan a tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.
Tenant Type	Specifies whether the specified tenant is a leaf tenant. • When **Leaf Tenant** is selected, the current tenant is a leaf tenant and no sub-tenant can be added. • When **Non-leaf Tenant** is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant.

Parameter	Description
Computing Resource	Specifies the dynamic computing resources for the current tenant. ● When **Yarn** is selected, the system automatically creates a task queue in Yarn and the queue is named the same as the name of the tenant. – A leaf tenant can directly submit tasks to the task queue. – A non-leaf tenant cannot directly submit tasks to the task queue. However, Yarn adds an extra task queue (hidden) named **Default** for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual tasks do not run in this queue. ● When dynamic resources are not **Yarn** resources, the system does not automatically create a task queue.
Default Resource Pool Capacity (%)	Specifies the computing resource usage in the **Default** resource pool of the current tenant. The value ranges from 0 to 100%.
Default Resource Pool Max Capacity (%)	Specifies the maximum computing resource usage in the **Default** resource pool of the current tenant. The value ranges from 0 to 100%.
Storage Resource	Specifies storage resources of the current tenant. ● When **HDFS** is selected, the system automatically allocates storage resources. ● When **HDFS** is not selected, the system does not automatically allocate storage resources.
Quota	Specifies the file and directory quantity quota.
Space Quota	Specifies the used HDFS storage space quota of the current tenant. ● Value range: When Space Quota unit is set to **MB**, this parameter ranges from **1** to **8796093022208**. When Space Quota unit is set to **GB**, this parameter ranges from **1** to **8589934592**. ● This parameter indicates the maximum HDFS storage space that can be used by the tenant, but does not indicate the actual space used. ● If the value is greater than the size of the HDFS physical disk space, the maximum space that can be used is all the HDFS physical disk space.

Parameter	Description
Storage Path	Specifies the HDFS storage directory for a tenant. • The system creates a file folder named after the tenant name in the **/tenant** directory by default. For example, the default HDFS storage directory for **ta1** is **/tenant/ta1**. • When a tenant is created for the first time, the system creates the **/tenant** directory in the HDFS root directory. The storage path is customizable.
Description	Configure the description of the current tenant.

NOTE

During the creation of a tenant, the system automatically creates a corresponding role, the computing resources, and the storage resources.

- The new role has the rights on the computing resources and storage resources. The role and its rights are controlled by the system automatically and cannot be controlled manually under **System > Permission > Role**. The role name is *tenant name_cluster ID*. By default, the cluster ID of the first cluster is not displayed.
- When using this tenant, create a system user and bind the user to the role of the tenant. For details, see **Adding a User and Binding the User to a Tenant Role**.
- During the creation of a tenant, the system automatically creates a Yarn task queue named after the tenant. If the queue name exists, the new queue is named **Tenant name-N**. **N** indicates a natural number starting from 1. When a same name exists, the value **N** increases automatically to differentiate the queue from others. For example, **saletenant**, **saletenant-1**, and **saletenant-2**.

Step 3 Whether the current tenant need to associate resources of other services.

- If yes, go to **4**.
- If no, go to **Step 5**.

Step 4 Click **Associated Service** to configure other service resources used by the current tenant.

1. Select **HBase** in **Service**.
2. Make a selection in **Association Type**:
   - **Exclusive** indicates service resources used by the tenant exclusively. Other tenants cannot associate with this service.
   - **Share** indicates shared service resources, which can be used by other tenants.

NOTE

- When creating a tenant, you can only associate HBase with the tenant. For existing tenants, you can associate the following services: HDFS, HBase, and Yarn.
- Associating existing tenants with service resources: In the tenant list on the left of the **Tenant Management** page, click the target tenant. Then, switch to the **Service Association** tab page and click **Associated Service** to associate the current tenant with service services.
- Canceling the association between existing tenants and service resources: In the tenant list on the left of the **Tenant Management** page, click the target tenant. Then, switch to the **Service Association** tab page, click **Delete**, select **I have read the information and understand the impact.**, and click **OK** to cancel the association with service.

3. Click **OK**.

Step 5 Click **OK**. When **Tenant created successfully.** is displayed on the page, the tenant is added successfully.

----End

10.7.3.1.2 Adding a Sub-Tenant

Scenario

Based on the resource consumption and isolation plan and requirements of services, administrators can create Sub-Tenants on FusionInsight Manager, and allocate resources of the current tenant to meet the actual application scenario.

Prerequisites

- A parent tenant has been added, and belongs to a non-leaf tenant.
- A tenant name has been planned based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.
- Resources to be allocated to the current tenant have been planned to ensure that the sum of capacities of direct sub-tenants at every level cannot exceed the current tenant.

Procedure

Step 1 On FusionInsight Manager, click **Tenant Resources**.

Step 2 In the tenant list on the left, move the cursor to the tenant node to which the sub-tenant is added. Click . In the displayed window, configure the sub-tenant properties based on **Table 10-40**.

Table 10-40 Sub-tenant parameters

Parameter	Description
Cluster	Specifies the cluster of the parent tenant.
Parent Tenant Resource	Specifies the name of the parent tenant.

Parameter	Description
Name	• Specifies the name of the current tenant. The value consists of 3 to 50 characters, which can be letters, digits, or underscores (_). • Plan a sub-tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.
Tenant Type	Specifies whether the specified tenant is a leaf tenant. • When **Leaf Tenant** is selected, the current tenant is a leaf tenant and no sub-tenant can be added. • When **Non-leaf Tenant** is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant. However, the tenant depth cannot exceed 5 levels.
Computing Resource	Specifies the dynamic computing resources for the current tenant. • When **Yarn** is selected, the system automatically creates a task queue in Yarn and the queue is named the same as the name of the tenant. – A leaf tenant can directly submit tasks to the task queue. – A non-leaf tenant cannot directly submit tasks to the task queue. However, Yarn adds an extra task queue (hidden) named **Default** for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual tasks do not run in this queue. • When dynamic resources are not **Yarn** resources, the system does not automatically create a task queue.
Default Resource Pool Capacity (%)	Specifies the computing resource usage of the current tenant. The base value is the total resources of the parent tenant.
Default Resource Pool Max Capacity (%)	Specifies the maximum computing resource usage of the current tenant. The base value is the total resources of the parent tenant.
Storage Resource	Specifies storage resources of the current tenant. • When **HDFS** is selected, the system automatically creates a file in the HDFS parent tenant directory. The file is named the same as the name of the sub-tenant. • When **HDFS** is not selected, the system does not automatically allocate storage resources.

Parameter	Description
Quota	Specifies the file and directory quantity quota.
Space Quota	Specifies the used HDFS storage space quota of the current tenant. • When **Space Quota Unit** is set to **MB**, this parameter ranges from **1** to **8796093022208**. When **Space Quota Unit** is set to GB, this parameter ranges from **1** to **8589934592**. The maximum value of this parameter does not exceed the total storage quota of the parent tenant. • This parameter indicates the maximum HDFS storage space that can be used by the tenant, but does not indicate the actual space used. • If the value is greater than the size of the HDFS physical disk space, the maximum space that can be used is all the HDFS physical disk space. • If this quota is greater than the quota of the parent tenant, the actual storage space will be affected by the quota of the parent tenant.
Storage Path	Specifies the HDFS storage directory for a tenant. • The system creates a file folder named after the sub-tenant name in the directory of the parent tenant by default. For example, if the sub-tenant is **ta1s** and the parent directory is **/tenant/ta1**, the system sets the **Storage Path** for the sub-tenant to **/tenant/ta1/ta1s**. • The storage path is customizable in the parent directory.
Description	Configure the description of the current tenant.

NOTE

During the creation of a tenant, the system automatically creates a corresponding role, the computing resources, and the storage resources.

- The new role has the rights on the computing resources and storage resources. The role and its rights are controlled by the system automatically and cannot be controlled manually under **System > Permission > Role**. The role name is *tenant name_cluster ID*. By default, the cluster ID of the first cluster is not displayed.
- When using this tenant, create a system user and bind the user to the role of the tenant. For details, see **Adding a User and Binding the User to a Tenant Role**.
- The sub-tenant can further allocate the resources of the current tenant. The sum of the resource percentage of direct sub-tenants of a parent tenant cannot exceed 100%. The sum of the computing resource percentage of all level-1 tenants cannot exceed 100%.

Step 3 Whether the current tenant need to associate resources of other services.

- If yes, go to **Step 4**.

- If no, go to **Step 5**.

Step 4 Click **Associated Service** to configure other service resources used by the current tenant.

1. Select **HBase** in **Service**.
2. Make a selection in **Association Type**:
   - **Exclusive** indicates service resources used by the tenant exclusively. Other tenants cannot associate with this service.
   - **Share** indicates shared service resources, which can be used by other tenants.

NOTE

- When creating a tenant, you can only associate HBase with the tenant. For existing tenants, you can associate the following services: HDFS, HBase, and Yarn.
- Associating existing tenants with service resources: In the tenant list on the left of the **Tenant Management** page, click the target tenant. Then, switch to the **Service Association** tab page and click **Associated Service** to associate the current tenant with service services.
- Canceling the association between existing tenants and service resources: In the tenant list on the left of the **Tenant Management** page, click the target tenant. Then, switch to the **Service Association** tab page, click **Delete**, select **I have read the information and understand the impact.**, and click **OK** to cancel the association with service.

3. Click **OK**.

Step 5 Click **OK**. When **Tenant created successfully.** is displayed on the page, the tenant is added successfully.

----End

10.7.3.1.3 Adding a User and Binding the User to a Tenant Role

Scenario

The created tenant cannot directly log in to the cluster to access resources. Administrators need to create a user for a tenant on FusionInsight Manager and bind the user to a tenant role to assign operation rights to the user.

Prerequisites

The system administrator has understood service requirements and created a tenant.

Procedure

Step 1 On FusionInsight Manager, click **System > Permission > User**.

Step 2 To add a user to the system, click **Create**.

To bind tenant rights to an existing user in the system, click **Modify** in the column where the user locates. The configuration page is displayed.

For details about configuring parameters of a user, see **Table 10-41**.

Table 10-41 User parameters

Parameter	Description
Username	Specifies the name of the current tenant. The value consists of 3 to 32 characters, which can be letters, digits, underlines (_), hyphens(-), or spaces. ● **Username** cannot be the same as any username of the OS on each node in the cluster. Otherwise, the user account cannot be used properly. ● Usernames of the same letters but different cases are not supported. For example, if **User1** already exists, user **user1** cannot be created. When using user **User1**, enter the correct username.
User Type	Options include **Human-Machine** and **Machine-Machine**. ● **Human-Machine** user: Used in FusionInsight Manager O&M scenarios and component client operation scenarios. If you select **Human-Machine**, you need to set **Password** and **Confirm password**. ● **Machine-Machine** user: Used in application development scenarios. If you select **Machine-Machine**, the user password is generated randomly.
Password	If you select **Human-Machine**, set **Password**. The password must contain 8 to 64 characters, consisting at least 4 of uppercase letters, lowercase letters, digits, and special characters and spaces. Cannot be the username or username spelled backwards.
Confirm Password	Enter the password again.
User Group	In **User Group**, click **Add** to add the user to a user group. ● If a role is added to a user group, users in the user group can obtain the rights of the role. ● For example, assign Hive rights to the new user and add the user to the **Hive** group.
Primary Group	Select a group as the primary group of directories and files of the user. The drop-down list contains groups that are selected in **User Group**.
Role	Click **Add** to add a role to the user as required. **NOTE** ● If a user wants to use resources allocated to **tenant1** add sub-tenants to or delete sub-tenants from **tenant1**, bind the **Manager_tenant** and **tenant1**_*cluster ID* roles to the user.

Parameter	Description
Description	Configure the description of the current user.

Step 3 Click **OK**.

----End

10.7.3.2 Managing Tenants

10.7.3.2.1 Managing a Tenant Directory

Scenario

The administrator manages the HDFS storage directory used by a specified tenant on FusionInsight Manager based on service requirements. The management operations include adding tenant directories, modifying quantity quotas of files and directories, and storage space quota of the directory, and deleting directories.

Prerequisites

Tenants with HDFS storage resources are added.

Procedure

View a tenant directory.

Step 1 On FusionInsight Manager, click **Tenant Resources**.

Step 2 In the tenant list on the left, click a target tenant.

Step 3 Click **Resource**.

Step 4 View the **HDFS Storage** table.

- The **Quota** column indicates quantity quotas of files and directories.
- The **Space Quota** column indicates storage space sizes of tenant directories.

----End

Add a tenant directory.

Step 1 On FusionInsight Manager, click **Tenant Resources**.

Step 2 In the tenant list on the left, click the tenant whose HDFS storage directory needs to be changed.

Step 3 Click **Resource**.

Step 4 In the **HDFS Storage** table, click **Create Directory**.

- The **Parent Directory** indicates the storage directory of the parent tenant corresponding to the current tenant.

  NOTE

  This parameter is not displayed if the current tenant is not a sub-tenant.

- Set **Path** to a tenant directory path.

  NOTE

  If the current tenant is not a sub-tenant, the new path is created in the HDFS root directory.

- Set **Quota** to the quotas of file and directory quantity.
- **File Number Threshold (%)** takes effect only when **Quota** is specified. If the ratio of the number of used files to the value of **Quota** exceeds the value of this threshold, an alarm is generated. If this parameter is not specified, no alarm is reported in this scenario.

  NOTE

  The number of used files is collected every hour. Therefore, the alarm indicating that the file number exceeds the threshold is delayed.

- Set **Space Quota** to storage space sizes of tenant directories.
- **Storage Space Threshold (%)**: If the ratio of used storage space to the value of **Space Quota** exceeds the value of this parameter, an alarm is generated. If this parameter is not specified, no alarm is generated in this scenario.

  NOTE

  The used storage space is collected every hour. Therefore, the alarm indicating that the storage space exceeds the threshold is delayed.

Step 5 Click **OK**.

----End

Modify a tenant directory properties.

Step 1 On FusionInsight Manager, click **Tenant Resources**.

Step 2 In the tenant list on the left, click the tenant whose HDFS storage directory needs to be changed.

Step 3 Click **Resource**.

Step 4 In the **HDFS Storage** table, click **Modify** in the **Operation** column of the specified tenant directory.

- Set **Quota** to the quotas of file and directory quantity.
- **File Number Threshold (%)** takes effect only when **Quota** is specified. If the ratio of the number of used files to the value of **Quota** exceeds the value of this threshold, an alarm is generated. If this parameter is not specified, no alarm is reported in this scenario.
- Set **Space Quota** to storage space sizes of tenant directories.
- **Storage Space Threshold (%)**: If the ratio of used storage space to the value of **Space Quota** exceeds the value of this parameter, an alarm is generated. If this parameter is not specified, no alarm is generated in this scenario.

Step 5 Click **OK**.

----End

Delete tenant directory.

Step 1 On FusionInsight Manager, click **Tenant Resources**.

Step 2 In the tenant list on the left, click the tenant whose HDFS storage directory needs to be changed.

Step 3 Click **Resource**.

Step 4 In the **HDFS Storage** table, click **Delete** in the **Operation** column of the specified tenant directory.

NOTE

The tenant directory that is created by the system during tenant creation cannot be deleted.

Step 5 Click **OK**.

----End

10.7.3.2.2 Restoring Tenant Data

Scenario

Tenant data is stored on Manager and in cluster components. After components are recovered from faults or reinstalled, some tenant configuration data may be in the abnormal state. Administrator need to manually restore the configuration data on FusionInsight Manager.

Prerequisites

You have logged in to FusionInsight Manager.

Procedure

Step 1 On FusionInsight Manager, click **Tenant Resources**.

Step 2 In the tenant list on the left, click a tenant node.

Step 3 Check the status of the tenant data.

1. In **Summary**, check the color of the circle on the right of **Tenant Status**. Green indicates that the tenant is available and gray indicates that the tenant is unavailable.
2. Click **Resource** and check the color of the circle on the left of **Yarn** or **HDFS Storage**. Green indicates that the resource is available and gray indicates that the resource is unavailable.
3. Click **Service Association** and check the **Status** column of the associated service table. **Normal** indicates that the component can provide services for the associated tenant. **Not Available** indicates that the component cannot provide services for the tenant.
4. If any of the preceding check items is abnormal, go to **Step 4** to restore tenant data.

Step 4 Click . In the dialog box that is displayed, enter the password of the administrator who has logged in for authentication, and click **OK**.

Step 5 In the **Restore Tenant Resource Data** window, select one or multiple components whose data needs to be restored and click **OK**. The system automatically restores the tenant data.

----End

10.7.3.2.3 Deleting a Tenant

Scenario

Based on service requirements, the administrator can delete tenants that are no longer used on FusionInsight Manager to release resources occupied by tenants.

Prerequisites

- A tenant has been added.
- The tenant to be deleted has no sub-tenant.
- The role of the tenant to be deleted is not associated with any user or user group.

Procedure

Step 1 On FusionInsight Manager, click **Tenant Resources**.

Step 2 In the tenant list on the left, select the tenant to be deleted and click .

NOTE

- If you want to save the tenant data, select **Reserve the data of this tenant resource.**. Otherwise, the tenant's storage space will be deleted.
- If a user not in the supergroup group is used to delete a tenant and the tenant data is not retained, you need to log in to the HDFS client as a user in the supergroup group and manually clear the storage space of the tenant to avoid residual data.

Step 3 Click **OK** to save the settings.

It takes a few minutes to save the configuration. The tenant is deleted successfully. Roles and the storage space of the tenant are also deleted.

NOTE

After the tenant is deleted, the task queue of the tenant still exists in Yarn. The task queue of the tenant is not displayed on the role management page in Yarn.

----End

10.7.3.2.4 Clearing Unassociated Queues of a Tenant in Capacity Scheduler Mode

Scenario

In Yarn Capacity Scheduler mode, to delete a tenant, set the capacity of a tenant's queue to **0** and the state of the tenant to **STOPPED** to delete a tenant. However, queues of the tenant remain in the Yarn service. Queues cannot be automatically deleted due to the Yarn mechanism. The administrator can run the commands to manually delete the queues.

Impact on the System

- Running the script will restart the controller service, synchronize Yarn configuration, and restart instances of the active and standby ResourceManagers.
- You cannot log in to FusionInsight Manager and perform operations on FusionInsight Manager when restarting the controller service.
- After the instances of the active and standby ResourceManagers are restarted, an alarm will be reported indicating that Yarn and components that depend on Yarn will be temporarily unavailable.

Prerequisites

- You have logged in to FusionInsight Manager.
- Queues of a deleted tenant still exist.

Procedure

Step 1 Check whether queues of the deleted tenant still exist.

1. On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn**. Click **ResourceManager(Active)** to go to the ResourceManager WebUI.
2. Click **Scheduler** on the left pane, and you can see that queues of the tenant still exist. The state of the tenant is STOPPED and **Configured Capacity** is set to **0**.

Step 2 Log in to the active OMS node as user **omm**.

Step 3 Go to the **${BIGDATA_HOME}/om-server/om/sbin** directory and run the **cleanQueuesAndRestartRM.sh** script.

cd ${BIGDATA_HOME}/om-server/om/sbin

./cleanQueuesAndRestartRM.sh -c *Cluster ID*

NOTE

Replace *Cluster ID* with the ID of the cluster to be operated, which can be queried by choosing **Cluster** > *Name of the desired cluster* > **Cluster Properties** on FusionInsight Manager.

During the script execution, enter **yes** and the password.

```
Running the script will restart Controller and restart ResourceManager.
Are you sure you want to continue connecting (yes/no)?yes
Please input admin password:
Begin to backup queues ...
...
```

Step 4 After the script is successfully executed, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** on FusionInsight Manager. Click **ResourceManager(Active)** to go to the ResourceManager WebUI.

Step 5 Click **Scheduler** on the left pane and check whether queues of the deleted tenant are cleared.

----End

10.7.3.3 Managing Resources

10.7.3.3.1 Add a Resource Pool

Scenario

This section describes how to logically divide Yarn cluster nodes to combine multiple NodeManagers into a Yarn resource pool. Each NodeManager belongs to one resource pool only. The Administrator can create a customized resource pool on FusionInsight Manager and add hosts that are not added to other customized resource pools to the newly created resource pool.

The system contains a **Default** resource pool by default. All NodeManagers that are not added to customized resource pools belong to this resource pool.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Tenant Resources** > **Resource Pool**.

Step 3 Click **Add Resource Pool**.

Step 4 In **Add Resource Pool**, set the properties of the resource pool.

- **Cluster**: Select the name of the cluster to which the resource pool is to be added.
- **Name**: Enter the name of the resource pool. The resource pool name consists of 1 to 50 characters, including digits, letters, or underscores (_), but cannot start with an underscore (_).
- **Resource**: In the host list on the left, select the name of a specified host and click >> to add the selected host to the resource pool. Only hosts in the current cluster can be selected. The host list of a resource pool can be left blank.

  NOTE

  You can select the **Resource** based on the host name, CPU, memory, operating system and platform type.

Step 5 Click **OK** to save the settings.

After the resource pool is created, the system administrator can view the name, type, and members of the resource pool in the resource pool list. Hosts that are added to the customized resource pool are no longer members of the **Default** resource pool.

----End

10.7.3.3.2 Modifying a Resource Pool

Scenario

If hosts in the resource pool need to be adjusted based on service requirements, administrators can modify members in the existing resource pool on FusionInsight Manager.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Tenant Resources** > **Resource Pool**.

Step 3 Locate the row that contains the specified resource pool in the resource pool list, and click **Edit** in the **Operation** column.

Step 4 In **Edit Resource Pool**, modify Hosts.

- Adding a host: In the host list on the left, select the name of a specified host and click >> to add the selected host to the resource pool.
- Deleting a host: In the host list on the right, select the name of a specified host and click << to delete the selected host from the resource pool. The host list of a resource pool can be left blank.

Step 5 Click **OK** to save the settings.

----End

10.7.3.3.3 Deleting a Resource Pool

Scenario

This section describes how to delete an existing resource pool on FusionInsight Manager.

Prerequisites

- Any queue in the cluster cannot use the resource pool to be deleted as its default resource pool; therefore, cancel the default resource pool before deleting a resource pool. For details, see **Configuring a Queue**.
- Additionally, any queue in the cluster is not allowed to configure the resource distribution policy in the resource pool to be deleted; therefore, clear the policy before deleting a resource pool. For details, see **Clearing Queue Configurations**.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Tenant Resources** > **Resource Pool**.

Step 3 Locate the row that contains the specified resource pool in the resource pool list, and click **Delete** in the **Operation** column.

Step 4 In the window that is displayed, click **OK**.

----End

10.7.3.3.4 Configuring a Queue

Scenario

The administrator can modify queue configuration of a specific tenant on FusionInsight Manager based on service requirements.

Prerequisites

Tenants who use the Capacity scheduler have been added.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Tenant Resources** > **Dynamic Resource Plan**.

By default, the **Resource Distribution Policy** tab page is displayed.

Step 3 Click the **Queue Configuration** tab.

Step 4 Set **Cluster** to the name of the cluster to be operated. In the tenant queue table, click **Modify** in the **Operation** column of the specific tenant queue.

NOTE

- You can also open the queue modification page as follows: Click the target tenant in the tenant list on the left of the **Tenant Resources Management** tab page. In the window that is displayed, click **Resource**. On the page that is displayed, click behind the **Queue Configuration (*queue name*)**.
- One queue can be bound to only one non-Default resource pool. A newly added resource pool can be bound to only one queue, which serves as the default resource pool of the queue.

Table 10-42 Queue configuration parameters

Parameter	Description
Tenant Resources Name (Queue)	Tenant name and queue name.
Maximum Application	Specifies the maximum number of applications.
Maximum AM Resource Percent	Specifies the maximum percentage of resources that can be used to run the application master in a cluster.

Parameter	Description
Minimum User Limit Percent(%)	Specifies the minimum resource assurance (percentage) of a user. The resources for each user in a queue are limited at any time. If application programs of multiple users are running at the same time in a queue, the resource usage of each user fluctuates between the minimum value and the maximum value. The minimum value is determined by the number of running application programs, while the maximum value is determined by this parameter. For example, assume that this parameter is set to 25. If two users submit application programs to the queue, each user can use a maximum of 50% resources; if three users submit application programs to the queue, each user can use a maximum of 33% resources; if four users submit application programs to the queue, each user can use a maximum of 25% resources.
User Limit Factor	Specifies the maximum user resource usage limit factor. The maximum user resource usage percentage can be obtained by multiplying the actual resource usage percent of the current tenant in the cluster with this factor.
Status	Specifies the current status of a resource plan. **Running** indicates that the resource plan is running. **Stopped** indicates that the resource plan is stopped.
Default Resource Pool	Specifies the resource pool used by a queue. The default value is **Default**. If you want to change the resource pool, configure the queue capacity first. For details, see **Configuring the Queue Capacity Policy of a Resource Pool**.

Step 5 Click **OK**. The queue configuration is complete.

----End

10.7.3.3.5 Configuring the Queue Capacity Policy of a Resource Pool

Scenario

After a resource pool is added, the capacity policy of available resources needs to be configured for Yarn task queues to ensure proper task running in the resource pool. Each queue can be configured with the queue capacity policy of one resource pool only.

Administrators can View queues in any resource pool and configure the queue capacity policy. After the queue policies are configured, Yarn task queues are associated with resource pools.

Prerequisites

Queues are added, this is, tenants associated to compute resources are created.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Tenant Resources** > **Dynamic Resource Plan**.

By default, the **Resource Distribution Policy** tab page is displayed.

Step 3 Set **Cluster** to the name of the cluster to be operated. In **Resource Pool**, select the specified resource pool.

Step 4 Locate the specified queue in the **Resource Allocation** table, and click **Modify** in the **Operation** column.

Step 5 In **Modify Resource Allocation**, configure the resource capacity policy of the task queue in the resource pool.

- **Resource Capacity (%)**: specifies the computing resource usage percent of the current tenant.
- **Maximum Resource Capacity (%)**: specifies the maximum computing resource usage percent of the current tenant.

Step 6 Click **OK** to save the settings.

NOTE

To cancel the resource capacity policy of the task queue in the resource pool, delete the resource capacity value and save the setting. Then the queue is disassociated with the resource pool. Change the default resource pool of the queue to another resource pool. For details, see **Configuring a Queue**.

----End

10.7.3.3.6 Clearing Queue Configurations

Scenario

The system administrator can clear queue configurations on FusionInsight Manager if a queue does not need resources from a resource pool or a resource pool needs to be disassociated from a queue. Clearing queue configurations means that the resource capacity policy of a queue in the resource pool is canceled.

Prerequisites

If a queue is to be unbound from a resource pool, you have ensured that the resource pool is not the default resource pool of the queue. For details, see **Configuring a Queue**.

Procedure

Step 1 Log in to FusionInsight Manager portal.

Step 2 Choose **Tenant Resources** > **Dynamic Resource Plan**

Step 3 Set **Cluster** to the name of the cluster to be operated. In **Resource Pool**, select the specified resource pool.

Step 4 Locate the row that contains the specified queue in **Resource Allocation** and click **Clear** in the **Operation** column.

Step 5 In **Clear Queue Configuration**, click **OK** to clear the queue configurations in the current resource pool.

----End

10.7.4 Switching the Scheduler

Scenario

The newly installed MRS cluster uses the Superior scheduler by default. If the cluster is upgraded from an earlier version, the administrator can switch the Yarn scheduler from the Capacity scheduler to the Superior scheduler by one click.

Prerequisites

- The network connection for the cluster is proper and secure, and the Yarn service status is normal.
- During scheduler switching, tenants cannot be added, deleted, or modified. In addition, services cannot be started or stopped.

Impact on the System

- Because the Resource Manager is restarted during scheduler switching, submitting tasks to Yarn fails.
- During scheduler switching, tasks in a job being executed on Yarn will continue, but new tasks cannot be started.
- After scheduler switching is complete, tasks on Yarn may fail, causing service interruption.
- After scheduler switching is complete, parameters of the Superior scheduler are used for tenant management.
- After the scheduler is switched, resources in the Superior scheduler cannot be allocated to the tenant queue whose **capacity** is **0** in the Capacity scheduler. As a result, tasks submitted to the tenant queue fail to be executed. You are advised not to set **capacity** of the tenant queue to **0** in the Capacity scheduler.
- After scheduler switching is complete, you cannot add or delete resource pools, Yarn node labels, or tenants during the trial period. If resource pools, Yarn node labels, or tenants are added or deleted, rollback to the Capacity scheduler is not allowed.

  NOTE

  - The recommended trial period for scheduler switching is one week. If resource pools, Yarn node labels, or tenants are added or deleted during this period, the trial period ends immediately.

- Rollback of scheduler switching may cause the loss of partial or all Yarn task information.

Switching from the Capacity scheduler to the Superior scheduler

Step 1 Ensure that the Yarn service status is normal.

1. Log in to FusionInsight Manager as user **admin**.
2. Choose **Cluster** > *Name of the desired cluster* > **Services** and check whether the Yarn service status is normal.

Step 2 Log in to the active OMS node as **user omm**.

Step 3 Switch the scheduler.

The following switching modes are available:

0: The Capacity scheduler is switched to the Superior scheduler, and the Capacity scheduler configurations are converted into the Superior scheduler configurations.

1: Only the Capacity scheduler configurations are converted into the Superior scheduler configurations.

2: Only the Capacity scheduler is switched to the Superior scheduler.

- Mode 0 is recommended if the cluster environment is simple and the number of tenants is less than 20.

  Run the following command:

  sh ${BIGDATA_HOME}/om-server/om/sbin/switchScheduler.sh -c *Cluster ID* **-m 0**

  NOTE

  Replace *Cluster ID* with the ID of the cluster to be operated, which can be queried by choosing **Cluster** > *Name of the desired cluster* > **Cluster Properties** on FusionInsight Manager.

  ```
  Start to convert Capacity scheduler to Superior Scheduler, clusterId=1
  Start to convert Capacity scheduler configurations to Superior. Please wait...
  Convert configurations successfully. Start to switch the Yarn scheduler to Superior. Please wait...
  Switch the Yarn scheduler to Superior successfully.
  ```

- If the cluster environment or tenant information is complex and you need to retain the queue information of the Capacity scheduler on the Superior scheduler, it is recommended that you use mode 1 first to convert the Capacity scheduler configurations. After checking the converted configuration information, use mode 2 to switch the Capacity scheduler to the Superior scheduler.

  a. Run the following command to convert the Capacity scheduler configurations into the Superior scheduler configurations:

     sh ${BIGDATA_HOME}/om-server/om/sbin/switchScheduler.sh -c *Cluster ID* **-m 1**

     ```
     Start to convert Capacity scheduler to Superior Scheduler, clusterId=1
     Start to convert Capacity scheduler configurations to Superior. Please wait...
     Convert configurations successfully.
     ```

  b. Run the following command to switch the Capacity scheduler to the Superior scheduler:

sh ${BIGDATA_HOME}/om-server/om/sbin/switchScheduler.sh -c *Cluster ID* **-m 2**

```
Start to convert Capacity scheduler to Superior Scheduler, clusterId=1
Start to switch the Yarn scheduler to Superior. Please wait...
Switch the Yarn scheduler to Superior successfully.
```

- If you do not need the queue information of the Capacity scheduler, use mode 2.

  a. Log in to FusionInsight Manager and delete all tenants except the default tenant.

  b. Log in to FusionInsight Manager and delete all resource pools except the default resource pool.

  Run the following command to switch the Capacity scheduler to the Superior scheduler:

  sh ${BIGDATA_HOME}/om-server/om/sbin/switchScheduler.sh -c *Cluster ID* **-m 2**

```
Start to convert Capacity scheduler to Superior Scheduler, clusterId=1
Start to switch the Yarn scheduler to Superior. Please wait...
Switch the Yarn scheduler to Superior successfully.
```

NOTE

You can query the scheduler switching logs on the active OMS node.

- **${BIGDATA_LOG_HOME}/controller/aos/switch_scheduler.log**
- **${BIGDATA_LOG_HOME}/controller/aos/aos.log**

----End

10.8 System Configuration

10.8.1 Configuring Permissions

10.8.1.1 Managing Users

10.8.1.1.1 Creating a User

Scenarios

FusionInsight Manager supports 50000 users (including built-in users) at the maximum. By default, only user **admin** has the highest operation rights of FusionInsight Manager. You need to create users on FusionInsight Manager and assign operation rights to the user based on site requirements.

Prerequisites

You have learned service requirements and created roles required by service scenarios.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **Permission** > **User**.

Step 3 On the user list page, click **Create**.

Step 4 Set **Username**. Including digits, letters, underlines (_), hyphens(-), or spaces. It is case insensitive. It cannot be the same as the username in the system or OS.

Step 5 Set **User Type** to either **Human-Machine** or **Machine-Machine**.

- **Human-Machine** user: used in scenarios such as FusionInsight Manager O&M and component operations on a client. If you select this user type, you need to enter a password and confirm the password in **Password** and **Confirm Password** accordingly.
- **Machine-Machine** user: used for component development. If you select this user type, you do not need to enter a password, because the password is randomly generated.

Step 6 In the **User Group** area, click **Add** to add one or more user groups to the list as required.

NOTE

- If the selected user group is bound to a role or a permission policy is configured in Ranger, the user obtains the permission of the corresponding role.
- After FusionInsight Manager is installed, some user groups generated by default have special permissions. Select a correct user group based on the user group description on the GUI.
- If existing user groups cannot be used, click **Create User Group** to create a user group. For details, see **Adding a User Group**.

Step 7 Select a group from all groups added in **User Group** as the primary group for creating directories and files.

The drop-down list contains all the groups added to the **User Group** area.

NOTE

A user can belong to multiple groups (including the primary and secondary groups, only one primary group, and multiple secondary groups). The primary group of a user is set to facilitate maintenance and comply with the permission mechanism of the hadoop community. In addition, the user's primary group and other groups have the same functions in terms of rights control.

Step 8 In the **Role** area, click **Add** to bind a role for each user.

NOTE

- Adding a role when you create a user can specify the user rights.
- When you create a user, if permissions of a user group that is granted to the user cannot meet service requirements, you can assign other created roles to the user. If an existing role cannot be used, click **Create Role** to create a role. For details, see **Adding a Role**.

  The role and rights assignment takes effect about 3 minutes later. If the rights obtained from the user group meet the requirements, you do not need to add a role.
- After the Ranger authentication is enabled for a component, users are granted with all permissions except the permissions of the default user group or role.
- If the user is not added to a user group, or no role is configured for the user, no information is displayed after the user logs in to FusionInsight Manager.

Step 9 Enter information in the **Description** text box as required.

Step 10 Click **OK**. The user is created.

After a **Human-Machine** user is created, it can be used normally only after the initial password is changed. You can log in to FusionInsight Manager as the user and reset the password as prompted.

----End

10.8.1.1.2 Modifying User Information

Scenarios

You can modify user information on FusionInsight Manager, including the user group, primary group, role permission assignment, and user description.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **Permission** > **User**.

Step 3 Locate the row where the user whose information needs to be modified, click **Modify**.

Modify the parameters based on site-requirements.

NOTE

Changing the user group of a user or modifying the role rights of a user takes effect 3 minutes at most after the operation is performed.

Step 4 Click **OK**.

----End

10.8.1.1.3 Exporting User Information

Scenarios

You can export information about created users on FusionInsight Manager.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **Permission** > **User**.

Step 3 Click **Export All** to export all user information at a time.

User information contains the following fields: Username, creation time, description, user type (**0** indicates a **Human-Machine** account, **1** indicates a **Machine-Machine** account), primary group, user group list, and roles the user bound to.

Step 4 In the **Save Type** drop-down list, select **TXT** or **CSV**. Click **Export**.

----End

10.8.1.1.4 Locking a User

Scenarios

Users may be suspended for a long time due to service changes. For security purposes, you can lock such users.

You can lock a user by using either of the following methods:

- Automatic lock: You can set the number of consecutive incorrect password attempts in the password policy to lock the users who fail to log in to the system for a specified number of times. For details, see **Configuring Password Policies**.
- Manual lock: You manually lock a user.

This section describes how to lock the account manually. **Machine-Machine** users cannot be locked.

Impact on the System

After a user is locked, you cannot log in to FusionInsight Manager again or perform identity authentication again in the cluster. The locked user can be used only after you manually unlock the user or wait for the lock time to expire.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **Permission** > **User**.

Step 3 Locate the row that contains the user to be locked, and click **Lock**.

Step 4 In the displayed dialog box, select **I have read the information and understand the impact.**, and click **OK**.

----End

10.8.1.1.5 Unlocking a User

Scenarios

You can unlock a user on FusionInsight Manager if the user is locked after the number of login attempts using incorrect passwords exceeds the threshold. Only users created on FusionInsight Manager can be unlocked.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **Permission** > **User**.

Step 3 Locate the row that contains the user to be unlocked, and click **Unlock**.

Step 4 In the displayed dialog box, select **I have read the information and understand the impact.**, and click **OK**.

----End

10.8.1.1.6 Deleting a User

Scenarios

Based on service requirements, you need to delete system users who are no longer used on FusionInsight Manager.

NOTE

- After a user is deleted, the provisioned ticket granting ticket (TGT) is still valid within 24 hours. The user can use the TGT for security authentication and access the system.
- If the name of a new user is the same as that of a deleted user, all owner rights of the deleted user are inherited. You are advised to determine whether to delete the resources owned by the user based on site requirements, for example, files in the HDFS.
- The default user **admin** cannot be deleted.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **Permission** > **User**.

Step 3 Locate the row that contains the user to be deleted, choose **More** > **Delete**.

NOTE

To delete multiple users in batches, select the users to be deleted and click **Delete**.

Step 4 In the displayed dialog box, click **OK**.

----End

10.8.1.1.7 Changing a User Password

Scenarios

For security purposes, the password of a **Human-Machine** user must be changed periodically.

If users have the permission to use FusionInsight Manager, they can change their password on FusionInsight Manager.

If users do not have the permission to use FusionInsight Manager, they can change their passwords on the client.

Prerequisites

- Users have obtained the current password policies from the administrator.
- Users have installed the client on any node in the cluster and obtain the IP address of the node. Contact the administrator to obtain the password of the client installation user.

Changing Passwords Using FusionInsight Manager

Step 1 Log in to FusionInsight Manager.

Step 2 Move the cursor to the username in the upper right corner of the page.

In the displayed dialog box, click **Change Password**.

Step 3 On the displayed page, set **Old Password**, **New Password**, and **Confirm Password**, and click **OK**.

By default, the password must meet the following complexity requirements:

- It must contain at least eight characters.
- The password must contain at least four types of the following characters: Uppercase letters, lowercase letters, digits, spaces, and special characters. The following special characters are supported: `~!@#$%^&*()-_=+|[{}];',<.>/\?
- It must be different from the username or its reverse.
- The password cannot be a common password that is easy to crack.
- It cannot be the same as the password used in the latest *N* times. *N* is the value of **Repetition Rule** in **Configuring Password Policies**.

----End

Changing a Password on the Client

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

cd /opt/Bigdata/client

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 Run the following command to change the password of a system user. This operation takes effect for all servers.

kpasswd *System user name*

For example, if you want to change the password of system user **test1**, run the **kpasswd test1** command.

By default, the password must meet the following complexity requirements:

- It must contain at least eight characters.
- The password must contain at least four types of the following characters: Uppercase letters, lowercase letters, digits, spaces, and special characters. The following special characters are supported: `~!@#$%^&*()-_=+|[{}];',<.>/\?
- It must be different from the username or its reverse.
- The password cannot be a common password that is easy to crack.
- It cannot be the same as the password used in the latest *N* times. *N* is the value of **Repetition Rule** in **Configuring Password Policies**.

NOTE

If an error occurs during the running of the **kpasswd** command, try the following operations:

- Stop the SSH session and start it again.
- Run the **kdestroy** command and then run the **kpasswd** command again.

----End

10.8.1.1.8 Initializing a Password

Scenarios

If a user forgets the password or the public account password needs to be changed periodically, you can initialize the password on FusionInsight Manager. After the password is initialized, the system user needs to change the password upon first login.

NOTE

This operation applies only to **Human-Machine** users.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **Permission** > **User**.

Step 3 Locate the row that contains the user to be initialized, choose **More** > **Initialize Password**. In the displayed dialog box, enter the password of the current login administrator user and click **OK**. In the displayed confirmation dialog box, click **OK**.

Step 4 Enter a password and confirm the password in **New Password** and **Confirm Password** accordingly. Click **OK**.

By default, the password must meet the following complexity requirements:

- It must contain at least eight characters.
- The password must contain at least four types of the following characters: Uppercase letters, lowercase letters, digits, spaces, and special characters. The following special characters are supported: `~!@#$%^&*()-_=+|[{}];',<.>/\?
- It must be different from the username or its reverse.
- The password cannot be a common password that is easy to crack.
- It cannot be the same as the password used in the latest *N* times. *N* is the value of **Repetition Rule** in **Configuring Password Policies**.

----End

10.8.1.1.9 Exporting an Authentication Credential File

Scenario

If a user uses a security mode cluster to develop applications, the keytab file of the user needs to be obtained for security authentication. You can export keytab files on FusionInsight Manager.

NOTE

After a user password is changed, the exported keytab file becomes invalid, and you need to export a keytab file again.

Prerequisites

Before downloading the keytab file of a Human-Machine user, the password of the user must be changed at least once on the Manager portal or a client; otherwise, the downloaded keytab file cannot be used For details, see **Changing a User Password**.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **Permission** > **User**.

Step 3 Locate the row that contains the user whose keytab file needs to be exported, choose **More** > **Download Authentication Credential**, specify the save path after the file is automatically generated, and keep the file properly.

The authentication credential includes the **krb5.conf** file of the Kerberos service.

After the authentication credential file is decompressed, you can obtain the following two files:

- The **krb5.conf** file contains the authentication service connection information.
- The **user.keytab** file contains user authentication information.

----End

10.8.1.2 Managing User Groups

Scenarios

FusionInsight Manager supports 5000 user groups (including built-in user groups) at the maximum. You can create and manage different user groups based on service scenarios on FusionInsight Manager. A user group is bound to a role to obtain operation rights. After a user is added to a user group, the user group can obtain the operation rights of the user group. A user group can be used to classify users and manage multiple users.

Prerequisites

- You have learned service requirements and created roles required by service scenarios.
- Log in to FusionInsight Manager.

Adding a User Group

Step 1 Choose **System** > **Permission** > **User Group**.

Step 2 Above the user group list, click **Create User Group**.

Step 3 Set **Group Name** and **Description**.

A group name consists of letters, digits, underlines (_), hyphens(-), or spaces. A group name can contain 1 to 64 characters. It is case insensitive. It cannot be the same as the group name in the system.

Step 4 In the **Role** area, click **Add** to select a role and add it.

NOTE

- For components (except HDFS and Yarn) for which Ranger authorization has been enabled, the rights of non-default roles on Manager do not take effect. You need to configure Ranger policies to assign rights to user groups.
- If the policy conditions of HDFS and Yarn resource requests in Ranger are not covered, the component ACL rules still take effect.

Step 5 In the **User** area, click **Add** to select a user and add it.

Step 6 Click **OK**.

The user group is created.

----End

Viewing User Group Information

By default, all users are displayed in the user group list. Click the arrow on the left of a specified user group name to view the details about the user group, such as the number of users, users in the group, and roles bound to the user group.

Modifying Information About a User Group

Locate the row that contains the user group to be modified, click **Modify** to modify the information about the user group.

Exporting Information About a User Group

Click **Export All** to export all user groups information at a time. You can export the user group information in TXT or CSV format.

The user group information contains the following fields: user group name, description, user list, and role list

Deleting a User Group

Locate the row that contains the user group to be deleted, and click **Delete**. To delete multiple user groups in batches, select the user groups to be deleted and click **Delete** above the user group list. The user group contains users and cannot be deleted. To delete a user group, delete all users in the user group by modifying the user group, and then delete the user group.

10.8.1.3 Managing Roles

Scenarios

FusionInsight Manager supports 5000 roles (including built-in roles, excluding roles created by tenants) at the maximum. Based on different service requirements, you need to create and manage different roles on FusionInsight Manager and perform authorization management for FusionInsight Manager and components using roles.

Prerequisites

- You have learned service requirements.
- Log in to FusionInsight Manager.

Adding a Role

Step 1 Choose **System** > **Permission** > **Role**.

Step 2 On the displayed page, click **Create Role** and fill in **Role Name** and **Description**.

A role name consists of letters, digits, and underlines (_). A role name can contain 3 to 50 characters. It cannot be the same as the role name in the system.

Step 3 In the **Configure Resource Permission** list, select the cluster whose rights are to be added and select service rights for the role.

When setting rights for a component, enter a resource name in the **Search** text box in the upper right corner and click the search icon to view the search result.

The search scope covers only directories with current permissions. You cannot search subdirectories. Search by keywords supports fuzzy match and is case-insensitive.

NOTE

- For components (except HDFS and Yarn) for which Ranger authorization has been enabled, the rights of non-default roles on Manager do not take effect. You need to configure Ranger policies to assign rights to user groups.
- If the policy conditions of HDFS and Yarn resource requests in Ranger are not covered, the component ACL rules still take effect.
- A maximum of 1000 permissions can be configured for a component at a time.

Step 4 Click **OK**.

----End

Modifying the Role Information

Locate the row that contains the role to be modified and click **Modify**.

Exporting Role Information

Click **Export All** to export all roles information at a time. You can export the information to a TXT or CSV file.

The role information contains the following fields: Role name, description, and the information about whether the role is the default role.

Deleting a Role

Locate the row that contains the role to be deleted, and click **Delete**. To delete multiple roles in batches, select the roles to be deleted and click **Delete** above the role list. Roles cannot be deleted when bound by users. To delete a user group, delete all users in the user group by modifying the user group, and then delete the user group.

Task Example (Creating a Manager Role)

Step 1 Choose **System** > **Permission** > **Role**.

Step 2 On the displayed page, click **Create Role** and fill in **Role Name** and **Description**.

Step 3 In the **Configure Resource Permission** list, click **Manager**. Set the role permission as follows:

Manager permissions:

- Cluster:
  - **view**: view permission for **Cluster** page, view permission for **Alarm** and **Event** page under **O&M > Alarm**.
  - **management**: management permission for **Cluster** and **O&M** page.
- User:
  - **view**: view permission for **Permission** page under **System**.
  - **management**: management permission for **Permission** page under **System**.
- Audit:

  management: management permission for **Audit** page.

- Tenant:

  management: management permission for **Tenant** page, view permission for **Alarm** and **Event** page under **O&M > Alarm**.

- System:

  management: management permission for System page except the **Permission** page, view permission for **Alarm** and **Event** page under **O&M > Alarm**.

Step 4 Click **OK**.

----End

10.8.1.4 Security Policy

10.8.1.4.1 Configuring Password Policies

Scenarios

Based on service security requirements, you can set password security rules, user login security rules, and user locking rules on FusionInsight Manager.

NOTICE

- Modify password policies based on service security requirements, because they involve user management security. Otherwise, security risks may be caused.
- Change the user password after modifying the password policy, and then the new password policy can take effect.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **Permission** > **Security Policy** > **Password Policy**.

Step 3 For details about the parameters for modifying the password policy, see **Table 10-43**.

Table 10-43 Password policy parameters

Parameter	Description
Minimum Password Length	Indicates the minimum number of characters a password contains. The value ranges from **8** to **64**. The default value is **8**.

Parameter	Description
Character Types	Indicates how many character types in the following 5 types a password can contain: uppercase letters, lowercase letters, digits, and special characters (including ~`!?,.:;-_'() {}[]/<>@#$%^&*+|\= and spaces). The value can be **4** or **5**. The default value is **4**, which means that a password can contain uppercase letters, lowercase letters, digits, and the special characters. If you set the parameter to **5**, a password can contain all the five character types mentioned above.
Password Retries	Indicates the number of consecutive wrong password attempts allowed before the system locks the user. The value ranges from **3** to **30**. Default value is **5**.
User Lockup Time (Min)	Indicates the time period during which a user is locked when the user lockout conditions are met. The value ranges from **5** to **120**. Default value is **5**.
Password Validity Period (Day)	Indicates the validity period of a password. The value ranges from **0** to **90**. **0** indicates that the password is permanently valid. The default value is **90**.
Repetition Rule	When modifying a password, you are not allowed to use the password that has been used in the recent *N* times. *N* ranges from 1 to 5, and the default value is 1. This policy applies to only Human-machine users.
Password Expiration Notification Days	Indicates the number of days in advance users are notified that their passwords are about to expire. It is used to notify password expiration in advance. After the value is set, if the difference between the cluster time and the password expiration time is smaller than this value, the user receives password expiration notifications. When logging in to FusionInsight Manager, the user will be notified that the password is about to expire and a message is displayed asking the user to change the password. The value ranges from **0** to *X* (*X* must be set to the half of the password validity period and rounded down). The value **0** indicates that no notification is sent. The default value is **5**.
Interval for Deleting Authentication Failure Records (Min)	Indicates the interval of retaining incorrect password attempts. The value ranges from **0** to **1440**. **0** indicates that incorrect password attempts are permanently retained, and **1440** indicates that incorrect password attempts are retained for one day. Default value is **5**.

Step 4 Click **OK** to save the configurations. Change the user password after modifying the password policy, and then the new password policy can take effect.

----End

10.8.1.4.2 Configuring the Independent Attribute

Scenarios

User **admin** or administrators who are bound to the Manager_administrator role can configure the Independent attribute function on FusionInsight Manager so that common users (all service users in the cluster) can set or cancel their own Independent attributes.

After the Independent attribute switch is turned on, users need to log in and set the Independent attribute.

Restrictions

- Administrators cannot set or cancel the Independent attribute of a user.
- Administrators cannot obtain the authentication credentials of independent users.

Prerequisites

You have obtained the required administrator username and password.

Procedure

Configuring the Independent Attribute Function Switch

Step 1 Log in to FusionInsight Manager as user **admin** or a user bound to the Manager_administrator role.

Step 2 Choose **System** > **Permission** > **Security Policy** > **Configuration Independent**.

Step 3 Open or Close the **Independent Attribute**, enter the password as prompted and click **OK**.

Step 4 After the authentication succeeds, and the OMS configuration is modified, click **Finish**.

NOTE

After the Independent attribute function switch is closed:

- A user who has the attribute can cancel it by moving the cursor to the username in the upper right corner of the page and choose **Cancel Independent** from the displayed shortcut menu. After the cancellation, the user cannot set the attribute again. After the attribute is cancelled, existing independent tables will retain the attribute. However, the user cannot create independent tables again.
- Users without this attribute cannot set or cancel the attribute.

Configuring the Independent Attribute

Step 5 Log in to FusionInsight Manager as a user.

NOTICE

After the Independent attribute is set by a user, administrators cannot initialize the password of the user. If the user password is forgotten, the password cannot be retrieved.

User **admin** cannot set the Independent attribute.

Step 6 Move the cursor to the username in the upper right corner of the page.

Step 7 Choose **Set Independent** or **Cancel Independent** from the displayed shortcut menu.

NOTE

- If the Independent attribute function switch is turned on, and the attribute of the user is set, **Cancel Independent** is displayed in the shortcut menu.
- If the Independent attribute function switch is turned on, and the attribute of the user is cancelled, **Set Independent** is displayed in the shortcut menu.
- If the Independent attribute function switch is turned off, and the attribute of the user is set, **Cancel Independent** is displayed in the shortcut menu.
- If the Independent attribute function switch is turned off, and the attribute of the user is cancelled, no options are displayed in the shortcut menu.

Step 8 Enter the password as prompted and click **OK**.

Step 9 After the authentication succeeds, click **OK** in the confirmation dialog box.

----End

10.8.2 Configuring Interconnections

10.8.2.1 Configuring SNMP Northbound Parameters

Scenarios

If users need to view alarms and monitoring data of a cluster on the O&M platform, you can use the simple network management protocol (SNMP) on FusionInsight Manager to report related data to the network management system (NMS).

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **Interconnection** > **SNMP**.

Step 3 Turn on the switch on the right of **SNMP Service**.

The SNMP service is disabled by default. indicates that the service is enabled.

Step 4 Set interconnection parameters based on the information provided in **Table 10-44**.

Table 10-44 Interconnection parameters

Parameter	Description
Version	Specifies the version of the SNMP, which can be: ● **V2C**: This is an earlier version with low security. ● **V3**: This is a higher version with higher security **V3** is recommended.
Local Port	Specifies the local port. The default value is **20000**. The value ranges from **1025** to **65535**.
Read Community Name	This parameter is available only when **Version** is set to **V2C**. It is used to set the read-only community name.
Write Community Name	This parameter is available only when **Version** is set to **V2C**. It is used to set the write-only community name.
Security Username	This parameter is available only when **Version** is set to **V3**. It is used to set the protocol security username.
Authentication Protocol	This parameter is available only when **Version** is set to **V3**. It is used to set the authentication protocol. SHA is recommended.
Authentication Password	This parameter is available only when **Version** is set to **V3**. It is used to set the authentication key.
Confirm Password	This parameter is available only when **Version** is set to **V3**. It is used to confirm the authentication key.
Encryption Protocol	This parameter is available only when **Version** is set to **V3**. It is used to set the encryption protocol. AES256 is recommended.
Encryption Password	This parameter is available only when **Version** is set to **V3**. It is used to set the encryption key.
Confirm Password	This parameter is available only when **Version** is set to **V3**. It is used to confirm the encryption key.

NOTE

- The value of **Security Username** cannot contain repeated character strings with the unit length is a common factor of 64 (such as 1, 2, 4, and 8), for example, **abab** and **abcdabcd**.
- The authentication password and encryption password must contain 8 to 16 characters, including at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters. The two passwords must be different. The two passwords cannot be the same as the security username or the reverse of the security username.
- For security purposes, you need to periodically change the authentication and encryption passwords when using SNMP.
- If SNMPv3 is used, a security user will be locked after five consecutive authentication failures within 5 minutes. The user will be automatically unlocked 5 minutes later.

Step 5 Click **Create Trap Target**. On the displayed dialog box, set the following parameters:

- **Target Symbol**: specifies the trap target ID, which is the ID of the NMS or host that receives traps. The value consists of 1 to 255 characters, including letters or digits.
- **Target IP Address Mode**: specifies the IP address mode of the destination IP address. This parameter can be set to **IPV4** or **IPV6**.
- **Target IP Address**: specifies the IP address of the target trap. Destination IP address, which must be able to communicate with the management plane IP address of the management node.
- **Target Port**: specifies the port receiving traps. The port number must be consistent with the peer end and ranges from 0 to 65535.
- **Trap Community Name**: This parameter is available only when **Version** is set to **V2C** and is used to report the community name.

Click **OK**.

The **Create Trap Target** dialog box is closed.

Step 6 Click **OK** to complete the settings.

----End

10.8.2.2 Configuring Syslog Northbound Parameters

Scenarios

If users need to view alarms and events of a cluster on the unified alarm reporting platform, you can use the Syslog protocol on FusionInsight Manager to report related data to the alarm platform.

NOTICE

If the Syslog protocol is not encrypted, data may be stolen.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **Interconnection** > **Syslog**.

Step 3 Turn on the switch on the right of **Syslog Service**.

The Syslog service is disabled by default. indicates that the service is enabled.

Step 4 Set northbound parameters based on information provided in **Table 10-45**.

Table 10-45 Syslog interconnection parameters

Parameter Area	Parameter	Description
Syslog Protocol	Server IP Address Mode	Set the IP address mode of the interconnected server.The value can be IPv4 or IPv6.
	Server IP Address	Sets the IP address of the interconnection server.
	Server Port	Specifies the port number for interconnection.
	Protocol	Sets the protocol type. The available values are as follows: • **TCP** • **UDP**
	Severity Level	Specifies the severity of the reported message. The options are as follows: • **Emergency** • **Alert** • **Critical** • **Error** • **Warning** • **Notice** • **Informational** (default value) • **Debug** **NOTE** **Severity** and **Facility** determine the priority of the sent message. **Priority** = **Facility** × 8 + **Severity** For details about the values of **Severity** and **Facility**, see **Table 10-46**.
	Facility	Sets the module where the log is generated. For details about the available value of this parameter, see **Table 10-46**. The default value **local use 0 (local0)** is recommended.

Parameter Area	Parameter	Description
	Identifier	Sets the product ID. The default value is **FusionInsight Manager**. The identifier can contain a maximum of 256 characters, including letters, digits, underscores (_), spaces, |, $, {, }, periods (.), and hyphens (-).
Report Message	Report Format	Sets the message format of the alarm report. For details, see help information on the page. The packet can contain letters, digits, underscores (_), spaces, |, $, {, }, periods (.), and hyphens (-), and cannot exceed 1024 characters. **NOTE** For details about the information field in the packet format, see **Table 10-47**.
	Alarm Type	Sets the type of the alarm to be reported.
	Alarm Severities	Sets the level of the alarm to be reported.
Uncleared Alarm Reporting	Periodic Uncleared Alarm Reporting	Sets whether to report uncleared alarms in a specified period. Turn on the switch indicates that the function is enabled, and turn off the switch indicates that the function is disabled. The switch is turned off by default.
	Report Interval (min)	Sets the interval at which alarms are reported periodically. This parameter is valid only when the switch is turned on on the right of **Periodic Uncleared Alarm Reporting**. The default value is **15**, in minutes. The value ranges from 5 to 1440 (one day).
Heartbeat Settings	Heartbeat Reporting	Sets whether to periodically report Syslog heartbeat messages. Turn on the switch indicates that the function is enabled, and turn off the switch indicates that the function is disabled. The switch is turned off by default.
	Heartbeat Period (min)	Sets the interval at which heartbeat messages are periodically reported. This parameter is valid only when the switch is turned on on the right of **Heartbeat Reporting**. The default value is 15, in minutes. The value ranges from 1 to 60.
	Heartbeat Packet	Sets the heartbeat message to be reported. This parameter is enabled if the switch is turned on on the right of **Heartbeat Reporting**, and cannot be left blank. The value can contain a maximum of 256 characters, including digits, letters, underscores (_), vertical bars (|), colons (:), spaces, commas (,), and periods (.).

NOTE

After the periodic heartbeat packet function is enabled, packets may be interrupted during automatic recovery of some cluster error tolerance (for example, active/standby OMS switchover). In this case, wait for automatic recovery.

Step 5 Click **OK** to complete the settings.

----End

Related Information

Table 10-46 Numeric codes of **Severity** and **Facility**

Severity	Facility	Numeric Code
Emergency	kernel messages	0

-	log alert (note 1)	14
-	clock daemon	15
-	local use 0~7 (local0 ~ local7)	16 to 23

Table 10-47 Packet format information field

Information Field	Description
dn	Cluster name
id	Alarm ID
name	Alarm name
serialNo	Alarm serial number **NOTE** The sequence numbers of the fault alarms and the corresponding recovery alarms are the same.
category	Alarm type. The options are as follows: ● **0**: fault alarms ● **1**: cleared alarms ● **2**: event
occurTime	Time when the alarm was generated
clearTime	Time when this alarm is cleared
isAutoClear	Whether an alarm is automatically cleared. The options are as follows: ● **1**: yes ● **0**: no
locationInfo	Location where the alarm is generated
clearType	Alarm clearance type. The options are as follows: ● **-1**: not cleared ● **0**: automatic cleared ● **2**: manually cleared
level	Severity. The options are as follows: ● **1**: critical alarms ● **2**: major alarms ● **3**: minor alarms ● **4**: warning alarms
cause	Alarm cause
additionalInfo	Additional information
object	Alarm object

10.8.2.3 Configuring Monitoring Indicator Data Dump

Scenarios

The monitoring data reporting function writes the monitoring data collected in the system into a text file and uploads the file to a specified server in FTP or SFTP mode.

Before using this function, you need to perform related configurations on FusionInsight Manager.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **Interconnection** > **Upload Performance Data**.

Step 3 Click the switch on the right of **Upload Performance Data**.

Upload Performance Data is disabled by default.  indicates the function is enabled.

Step 4 Set the upload parameters based on information provided in **Table 10-48**.

Table 10-48 Uploading configuration parameters

Parameter	Description
FTP IP Address Mode	Specifies the server IP address mode. This parameter is mandatory.The value can be IPv4 or IPv6.
FTP IP Address	Specifies the FTP server for storing monitoring files after the monitoring indicator data is interconnected. This parameter is mandatory.
FTP Port	Specifies the port connected to the FTP server. This parameter is mandatory.
FTP Username	Specifies the username for logging in to the FTP server. This parameter is mandatory.
FTP Password	Specifies the password for logging in to the FTP server. This parameter is mandatory.
Save Path	Specifies the path for storing monitoring files on the FTP server. This parameter is mandatory.
Dump Interval (s)	Specifies the interval at which monitoring files are periodically stored on the FTP server, in seconds. This parameter is mandatory.
Dump Mode	Specifies the protocol used for sending monitoring files. This parameter is mandatory. The available values are **FTP** and **SFTP**. You are advised to use the SFTP mode based on SSH Version 2 (SSHv2). Otherwise, security risks may exist.

Parameter	Description
SFTP Service Public Key	Specifies the public key of the FTP server. This parameter is optional. This parameter is valid only when **Dump Mode** is set to **SFTP**.

Step 5 Click **OK** to complete the settings.

NOTE

In the scenario where the dump mode SFTP is used, if the public key of the SFTP service is empty, the system displays a security risk warning. Determine the security risk, and then save the configuration.

----End

Data Format

After the configuration is complete, the monitoring data reporting function periodically writes monitoring data in the cluster to text files and reports the files to the corresponding FTP/SFTP service based on the configured reporting period.

- Principles for Generating Monitoring Files
  - The monitoring indicators are written to files generated every 30, 60, and 300 seconds based on the indicator collection period.

    30s: indicates real-time indicators whose default collection period is 30s.

    60s: indicates real-time indicators whose default collection period is 60s.

    300s: indicates all other indicators except the ones whose period is 30s or 60s.
  - File name format: **metirc**_{*Period*}_{*File creation time YYYYMMDDHHMMSS* }**.log**

    For example: **metric_60_20160908085915.log**

    metric_300_20160908085613.log
- Monitoring File Contents
  - Format of monitoring files:

    cluster ID |cluster name |indicator ID|collection time|collection host|unit| indicator value. Separate the fields from each other using vertical bars (|), for example:

    ```
    1|xx1|Host|Host|10000413|2019/06/18 10:05:00|189-66-254-146|KB/s|309.910
    1|xx1|Host|Host|10000413|2019/06/18 10:05:00|189-66-254-152|KB/s|72.870
    2|xx2|Host|Host|10000413|2019/06/18 10:05:00|189-66-254-163|KB/s|100.650
    ```

    Note: The actual files are not in the format.
  - Interval for uploading monitoring files:

    The interval for uploading monitoring files can be set using the **Dump Interval (s)** parameter on the page. Currently, the interval can be set to 30s to 300s. After the configuration is complete, the system periodically uploads files to the corresponding FTP/SFTP server at the specified interval.
- Monitoring Indicator Description File

- Indicator set file

  The indicator set file **all-shown-metric-zh_CN** contains detailed information about all indicators. After obtaining the indicator IDs from the files reported by the third-party system, you can query details about the indicators from the indicator set file.

  Location of the indicator set file:

  Active and standby OMS nodes: {*FusionInsight installation path*} **/om-server/om/etc/om/all-shown-metric-zh_CN**

  Contents of the indicator set file:

  ```
  Real-time indicator ID, 5-minute indicator ID, indicator name, indicator collection period (second), whether to collect data by default, service to which the indicator belongs, and role to which the indicator belongs
  00101,10.000101,JobHistoryServer non-heap memory usage,30,false,Mapreduce,JobHistoryServer
  00102,10.000102,JobHistoryServer Non-heap memory allocation volume,30,false,Mapreduce,JobHistoryServer
  00103,10.000103,JobHistoryServer heap memory usage,30,false,Mapreduce,JobHistoryServer
  00104,10.000104,JobHistoryServer heap memory allocation volume,30,false,Mapreduce,JobHistoryServer
  00105, 10.000105,Number of blocked threads,30,false,Mapreduce,JobHistoryServer
  00106,10.000106,Number of running threads,30,false,Mapreduce,JobHistoryServer
  00107,10.000107,GC time,30,false,Mapreduce,JobHistoryServer
  00110,10.00011,JobHistoryServer CPU usage,30,false,Mapreduce,JobHistoryServer
  Real-Time Metric ID,5-Minute Metric ID,Metric Name,Metric Collection Period (s),Collected by Default,Service Belonged To,Role Belonged To 00101,10000101,Used Non Heap Memory of JobHistoryServer,60,false,Mapreduce,JobHistoryServer
  00102,10000102,Allocated Non Heap Memory of JobHistoryServer,60,false,Mapreduce,JobHistoryServer
  00103,10000103,Used Heap Memory of JobHistoryServer,60,false,Mapreduce,JobHistoryServer
  00104,10000104,Allocated Heap Memory of JobHistoryServer,60,false,Mapreduce,JobHistoryServer
  00105,10000105,Blocked Threads,30,false,Mapreduce,JobHistoryServer
  00106,10000106,Running Threads,30,false,Mapreduce,JobHistoryServer
  00107,10000107,GC Time,60,false,Mapreduce,JobHistoryServer
  ```

- Field description of critical indicators

  Real-Time Metric ID: indicates the ID of the indicator whose collection period is 30s or 60s.

  5-Minute Metric: The ID of a 5-minute (300s) indicator.

  Metric Collection Period (s): Real-time collection period of indicators. The value can be **30** or **60**.

  Service Belonged To: Name of the service to which an indicator belongs, indicating the service type, for example, HDFS and HBase.

  Role to which an indicator belongs: indicates the name (type) of the role to which an indicator belongs, for example, JobServer or RegionServer.

- Description

  For metrics whose collection period is 30s/60s, you can find the corresponding metric description by referring to the first column, that is, **Real-Time Metric ID**.

  For metrics whose collection period is 300s, you can find the corresponding metric description by referring to the second column, that is, **5-Minute Metric**.

10.8.3 Importing a Certificate

Scenarios

CA certificates are used to encrypt data during communication for FusionInsight Manager modules, component clients of the cluster, and component servers of the cluster to implement secure communication. CA certificates can be quickly imported to FusionInsight Manager for product security. Import CA certificates in following scenarios:

- When the cluster is installed for the first time, you need to replace the enterprise certificate.
- If the enterprise certificate has expired or security hardening is required, you need to replace it with a new certificate.

Impact on the System

- During certificate replacement, the cluster needs to be restarted. In this case, the system cannot be accessed and cannot provide services.
- After the certificate is replaced, the certificates used by all components and FusionInsight Manager modules are automatically updated.
- After the certificate is replaced, you need to reinstall the certificate in the local environment where the certificate is not trusted.

Prerequisites

- The certificate file and key file can be applied for from the enterprise certificate administrator or generated by the administrator.
- Obtain the files to be imported to the MRS cluster, including the CA certificate file (such as *.crt), key file (*.key), and file (password.property) that saves the key file password. The certificate name and key name can contain uppercase letters, lowercase letters, and digits. After the preceding files are generated, they need to be compressed into a package in TAR format.
- Prepare a password for accessing the key file.

  The password complexity requirements are as follows. If the password complexity does not meet the following requirements, security risks may exist:

  - It must contain at least eight characters.
  - It must contain at least four of the following character types: uppercase letters, lowercase letters, digits, and special characters ~`!?,.;-_'(){}[]/<>@#$%^&*+|\=.
- When applying for a certificate from the certificate administrator, provide the password for accessing the key file and apply for the certificate files in CRT, CER, CERT, and PEM formats and the key files in KEY and PEM formats. The applied certificates must have the issuing function.

Procedure

Step 1 Log in to FusionInsight Manager and choose **System** > **Certificate**.

Step 2 Click ··· on the right of **Upload Certificate**. In the File selection dialog box, view the obtained TAR package of the certificate file and select the file.

Step 3 Click **Upload**.

The system uploads the compressed package and automatically imports the package.

Step 4 After the package is imported, the system prompts you to synchronize the configuration and restart the web service for the new certificate to take effect. Click **OK**.

Step 5 In the displayed dialog box, enter the password of the current login user and click **OK**. The cluster configuration is automatically synchronized and the web service is restarted.

Step 6 After the cluster is restarted, enter the URL for accessing FusionInsight Manager in the address box of the browser and check whether the FusionInsight Manager WebUI can be successfully displayed.

Step 7 Log in to FusionInsight Manager.

Step 8 Choose **Cluster** > *Name of the desired cluster* > **Dashboard** > **More** > **Restart**.

Step 9 In the displayed dialog box, enter the password of the current login user and click **OK**.

----End

10.8.4 OMS Management

10.8.4.1 Overview of the OMS Maintenance Page

Overview

Log in to FusionInsight Manager, choose **System** > **OMS**. On the displayed OMS maintenance page, you can perform maintenance operations on the OMS, including viewing basic information, viewing the service status of OMS service modules, and manually triggering health checks.

Basic Information

OMS-associated information is displayed on FusionInsight Manager, as listed in **Table 10-49**.

Table 10-49 OMS information

Item	Description
Version	Indicates the OMS version, which is consistent with the FusionInsight Manager version.
IP Mode	Indicates the IP address mode of the current cluster network.
HA Mode	Indicates the OMS working mode, which is specified by the configuration file during FusionInsight Manager installation.

Item	Description
Current Active	Indicates the host name of the active OMS node, that is, the host name of the active management node. Click a host name to go to the host details page.
Current Standby	Indicates the host name of the standby OMS node, that is, the host name of the standby management node. Click a host name to go to the host details page.
Duration	Indicates the duration for starting the OMS process.

OMS Service Status

FusionInsight Manager displays the running status of all OMS service modules. If the status of each service module is displayed as ●, the OMS is running properly.

Health check

You can click **Health Check** on the OMS maintenance page to check the OMS status. If some check items are faulty, you can open the check description for troubleshooting.

Entering or Exiting Maintenance Mode

Configure OMS to enter or exit the maintenance mode.

System Parameters

In the large cluster scenario, connect to the DMPS cluster.

10.8.4.2 Modifying OMS Service Configuration Parameters

Scenario

Based on the security requirements of the user environment, you can modify the Kerberos and LDAP configurations in the OMS on FusionInsight Manager.

Impact on the System

After the OMS service configuration parameters are modified, the corresponding OMS module needs to be restarted. In this case, FusionInsight Manager cannot be used.

Procedure

Modifying the okerberos configuration

Step 1 Log in to FusionInsight Manager and choose **System** > **OMS**.

Step 2 Locate the row that contains the okerberos, click **Modify Configuration**.

Step 3 Modify the parameters based on information provided in **Table 10-50**.

Table 10-50 okerberos parameter configuration

Parameter	Description
KDC Timeout (ms)	Timeout duration for an application to connect to the Kerberos, in milliseconds. The value must be an integer.
Max. Retries	Maximum number of attempts for the connection between an application to the Kerberos, in seconds. Set the parameter to an integer.
LDAP Timeout (ms)	Timeout interval for the Kerberos to connect to the LDAP, in milliseconds.
LDAP Search Timeout (ms)	Timeout duration for Kerberos to query user information in the LDAP, in milliseconds.
Kadmin Listening Port	Port number of the kadmin service.
KDC Listening Port	Port number of the kinit service.
Kpasswd Listening Port	Port number of the kpasswd service.

Step 4 Click **OK**.

In the displayed dialog box, enter the password of the current login user and click **OK**. In the displayed confirmation dialog box, click **OK**.

Modifying the oldap configuration

Step 5 Locate the row that contains the on-line data processor (OLDAP), click **Modify Configuration**.

Step 6 Modify the parameters based on information provided in **Table 10-51**.

Table 10-51 OLDAP parameter configuration

Parameter	Description
LDAP Listening Port	Port number of the LDAP service.

Step 7 Click **OK**.

In the displayed dialog box, enter the password of the current login user and click **OK**. In the displayed confirmation dialog box, click **OK**.

NOTE

To reset the password of the LDAP account, you need to restart ACS. The procedure is as follows:

1. Log in to the active management node as user **omm** using PuTTY, and run the following command to update the domain configuration:

   sh ${BIGDATA_HOME}/om-server/om/sbin/restart-RealmConfig.sh

   The command is run successfully if the following information is displayed:

   ```
   Modify realm successfully. Use the new password to log into FusionInsight again.
   ```

2. Run the **sh $CONTROLLER_HOME/sbin/acs_cmd.sh stop** command to stop ACS.
3. Run the **sh $CONTROLLER_HOME/sbin/acs_cmd.sh start** command to start ACS.

Restarting the cluster

Step 8 Log in to FusionInsight Manager and restart the cluster by referring to **Performing a Rolling Restart of a Cluster**.

----End

10.8.5 Component Management

10.8.5.1 Viewing Component Packages

Scenarios

A complete MRS cluster consists of multiple component packages. Before installing some services on FusionInsight Manager, check whether the component packages corresponding to the services have been installed.

Procedure

Step 1 Log in to FusionInsight Manager and choose **System** > **Component**.

Step 2 On the **Installed Component** tab page, view all components.

NOTE

You can view the registered OS and platform type in the **Platform Type** column.

Step 3 Click ⌄ on the left of a component name to view the services and version numbers contained in the component.

----End

10.9 Cluster Management

10.9.1 Configuring Client

10.9.1.1 Installing a Client

Scenario

Install the clients of all services (except Flume). MRS provides shell scripts for different services for maintenance personnel to log in to related maintenance clients and implement maintenance operations.

NOTE

- Reinstall the client after server configuration is modified on the Manager portal or after the system is upgraded. Otherwise, the versions of the client and server will be inconsistent.

Prerequisites

- The client installation directory is automatically created if it does not exist. If it already exists, it must be empty. The directory cannot contain any space.
- If the node where the client is to be installed is a server outside the cluster, it must be able to communicate with the service plane. Otherwise, the client will fail to be installed.
- The client must be enabled with the NTP service and synchronize time with the server. Otherwise, the client will fail to be installed.
- The HDFS and MapReduce components are stored in the same directory (*client directory*/HDFS/) after being downloaded.
- You can install or use the client as any user. Obtain the username and password from the administrator. This section uses user **user_client** as an example. User **user_client** is the owner of the server file directory (such as **/opt/Bigdata/client**) and the client installation directory (such as **/opt/Bigdata/hadoopclient**) with the permissions of **755**.
- You have obtained the component service user (default user or new user) and password.
- If the **/var/tmp/patch** directory already exists when you install the client as non-**root** or non-**omm** user, change the permission on the directory to **777** and the permission on the logs in the directory to **666**.

Procedure

Step 1 Obtain the software package.

Log in to FusionInsight Manager. For details, see **Accessing FusionInsight Manager (MRS 3.x or Later)**. Click the wanted cluster from the **Cluster** drop-down list.

Choose **More** > **Download Client**. The **Download Cluster Client** window is displayed.

NOTE

In a single-client scenario, choose **Cluster** > *Name of the desired cluster* > **Services** > *Service name* > **More** > **Download Client**. The **Download Client** dialog box is displayed.

Step 2 Set **Select Client type** to **Complete Client**.

Configuration Files Only is to download client configuration files in the following scenario: After all clients are downloaded and installed and administrators modify server configuration on the Manager portal, development personnel need to update the configuration files during application development.

There are two client software packages:

- x86_64: client software package that can be deployed on the x86 platform.
- aarch64: client software package that can be deployed on the TaiShan platform.

NOTE

The cluster supports **x86_64** and **aarch64** clients. However, the client type must match the architecture of the target node. Otherwise, the client installation will fail.

Step 3 Determine whether to generate a client file on the cluster node?

- If yes, select **Save to Path**, and click **OK** to generate the client file. By default, the client file is generated in **/tmp/FusionInsight-Client** on the active management node. The directory can be customized and user **omm** has the read, write, and execute permission on the directory. Click **OK**, copy the software package to the file directory, for example, **/opt/Bigdata/client**, on the server where the client is to be installed as user **omm** or **root**. Then, go to **Step 5**.

  NOTE

  If you cannot obtain permissions of user **root**, use the **omm** user.

- If no, click **OK**, specify a local save path, and download the complete client. Wait until the download is complete, and go to **Step 4**.

Step 4 Upload the software package. Use WinSCP to upload the software package to the server file directory where the client is to be installed (such as **/opt/Bigdata/client**) as the user who is to install the client (any user, such as user **user_client**).

The format of the client software package name is as follows: **FusionInsight_Cluster_***<Cluster ID>*_**Services_Client.tar**. The following steps and sections use **FusionInsight_Cluster_1_Services_Client.tar** as an example.

NOTE

- The host where the client is to be installed can be a node in the cluster or outside the cluster. If the node is a server outside the cluster, it must be able to communicate with the cluster, and the NTP service must be enabled to ensure that the time is the same as that on the server.
- For example, you can configure NTP clock sources for external client servers as well as clusters. Then you can execute the **ntpq -np** command to check whether the time is synchronized.
  - If there is a ***** before the result of the NTP clock source IP address, it means time synchronization is normal, as follows:

    ```
    remote refid st t when poll reach delay offset jitter
    ==============================================================================
    *10.10.10.162 .LOCL. 1 u 1 16 377 0.270 -1.562 0.014
    ```

  - If there is no ***** before the result of the NTP clock source IP address, and the result of **refid** is **.INIT.**, or the results showed abnormal, it means synchronization is exception, please contact technical support.

    ```
    remote refid st t when poll reach delay offset jitter
    ==============================================================================
    10.10.10.162 .INIT. 1 u 1 16 377 0.270 -1.562 0.014
    ```

- You can also configure the same chrony clock source for external servers as that for the cluster. After the configuration, run the **chronyc sources** command to check whether the time is synchronized.
  - In the command output, if an asterisk (*) exists before the IP address of the chrony service on the active OMS node, the synchronization is in normal state. For example:

    ```
    MS Name/IP address         Stratum Poll Reach LastRx Last sample
    ===============================================================================
    ^* 10.10.10.162              10  10   377   626    +16us[  +15us] +/-  308us
    ```

  - If there is no asterisk (*) before the IP address of the NTP service on the active OMS node and **Reach** is "0", the synchronization is abnormal.

    ```
    MS Name/IP address         Stratum Poll Reach LastRx Last sample
    ===============================================================================
    ^? 10.1.1.1                  0  10     0     -     +0ns[   +0ns] +/-    0ns
    ```

Step 5 Log in to the server where the client software package is located as user **user_client**.

Step 6 Decompress the package.

Go to the directory where the package is stored, for example, **/opt/Bigdata/client**. Run the following command to decompress the package to a local directory:

tar -xvf FusionInsight_Cluster_1_Services_Client.tar

Step 7 Verify the software package.

Run the **sha256sum** to verify the retrieved file, for example,

sha256sum -c FusionInsight_Cluster_1_Services_ClientConfig.tar.sha256

```
FusionInsight_Cluster_1_Services_ClientConfig.tar: OK
```

Step 8 Run the following command to decompress the retrieved file:

tar -xvf FusionInsight_Cluster_1_Services_ClientConfig.tar

Step 9 Configure network connections for the client.

1. Ensure that the host where the client is installed can communicate with the hosts listed in the **hosts** file stored in the directory containing the decompressed package, for example, **/opt/Bigdata/client/FusionInsight_Cluster_***<Cluster ID>*_**Services_ClientConfig/hosts**.
2. If the host where the client is installed is not a host in the cluster, you need to set the mapping between the host name and the service plane IP address for each cluster node in **/etc/hosts**, user **root** rights are required to modify the file. Each host name uniquely maps an IP address. You can perform the following steps to import the domain name mapping of the cluster to the **hosts** file:
   a. Switch to the **root** user or a user who has permission to modify the **hosts** file.

      su - root

   b. Go to the directory where the client package is decompressed.

      cd /opt/Bigdata/client/FusionInsight_Cluster_1_Services_ClientConfig

   c. Run the **cat realm.ini >> /etc/hosts** command to import the domain name mapping to the hosts file.

NOTE

- If the host where the client is installed is not a host in the cluster, configure network connections for the client to prevent errors from occurring when you run commands on the client.
- If the Spark task is run in yarn-client mode, add the **spark.driver.host** parameter in the *Client installation directory*/**Spark/spark/conf/spark-defaults.conf** file and set the parameter value to the IP address of the client.
- When yarn-client mode is used, to ensure that the Spark WebUI can properly display information, add the mappings between the client IP addresses and host names to the hosts file on the active and standby Yarn nodes, that is, the ResourceManager nodes in the cluster.

Step 10 Go to the directory where the installation package is stored, and run the following command to install the client to the specified directory (an absolute path), for example, **/opt/hadoopclient**:

cd /opt/Bigdata/client/FusionInsight_Cluster_1_Services_ClientConfig

Run the **./install.sh /opt/hadoopclient** command and wait for the client installation to complete. The client is successfully installed if information similar to the following is displayed:

```
The component client is installed successfully
```

NOTE

- If the **/opt/hadoopclient** directory has been used by the client of all or some installed services, use another directory when another client is installed.
- Delete the client installation directory to uninstall the client.
- To ensure that the client you install can only be used by you, add the **-o** parameter. That is, run the **./install.sh /opt/hadoopclient -o** command to install the client.
- If the NTP server is to be installed in **chrony** mode, ensure that the parameter **chrony** is added in the installation process, that is, run the command **./install.sh /opt/hadoopclient -o chrony** to install the client.
- Because HBase uses the Ruby syntax, if the installed client contains the HBase client, it is recommended that the client installation directory contain only uppercase letters, lowercase letters, digits, and _**-?.@+=** characters.
- If the client node is a server outside the cluster and cannot communicate with the service plane IP address of the active OMS node or cannot access port 20029 of the active OMS node, the client can be successfully installed but cannot be registered with the cluster and cannot be displayed on the GUI.

Step 11 Log in to the client to check whether the client is successfully installed.

1. Run the **cd /opt/hadoopclient** command to go to the client installation directory.
2. Run the **source bigdata_env** command to configure the environment variables for the client.
3. If the cluster is in security mode, run the following command to set kinit authentication and enter the password for logging in to the client, In normal mode, user authentication is not required:

   kinit admin

   ```
   Password for admin@HADOOP.COM:          #Enter the login password of user admin (this password is the same as the user password for cluster login).
   ```

4. Run the **klist** command to view and confirm authentication details.

   ```
   Ticket cache: FILE:/tmp/krb5cc_0
   Default principal: admin@HADOOP.COM

   Valid starting     Expires            Service principal
   04/09/2021 18:22:35  04/10/2021 18:22:29  krbtgt/HADOOP.COM@HADOOP.COM
   ```

   NOTE

   - When kinit authentication is used, the ticket is stored in the **/tmp/krb5cc**_*uid* directory by default.

     uid indicates the ID of the user who logs in to the operating system. For example, if the UID of user **root** is **0**, the ticket generated for kinit authentication after user **root** logs in to the system is stored in the **/tmp/krb5cc_0** directory.

     If the current user does not have the read and write permission on the **/tmp** directory, the ticket generated cache path is changed to *client installation directory*/**tmp/krb5cc_uid**. For example, the client installation directory is **/opt/hadoopclient**. The kinit authentication ticket is stored in **/opt/hadoopclient/tmp/krb5cc_uid**.
   - If kinit authentication is used and the same user is used to log in to the operating system, there is a risk that tickets are overwritten. You can set the **-c cache_name** parameter to specify the ticket buffer location or set the **KRB5CCNAME** environment variable to avoid this problem.

Step 12 After the cluster is reinstalled, the client that has been installed is no longer available. Perform the following operations to reinstall the client.

1. Log in to the node where the client is located as user **root**.
2. Run the following command to check the directory where the client is located. (In the following example, the client is located in the **/opt/hadoopclient** directory.)

   ll /opt

   ```
   drwxr-x---. 6 root root      4096 Dec 11 19:00 hadoopclient
   drwxr-xr-x. 3 root root      4096 Dec  9 02:04 godi
   drwx------. 2 root root     16384 Nov  6 01:03 lost+found
   drwxr-xr-x. 2 root root      4096 Nov  7 09:49 rh
   ```

3. Run the **mv** command to remove the directory where the client program is located and all files in this directory. (For example, remove the **/opt/hadoopclient** directory and all files in it.)

   mv /opt/hadoopclient */tmp/clientbackup*

4. Reinstall the client.

----End

10.9.1.2 Using a Client

Scenario

After a client is installed, you can use shell commands on the client in an O&M scenario or service scenario, or use example projects on the client in an application development scenario.

Use a client in an O&M scenario or service scenario.

Prerequisites

- You have installed the client. For example, the installation directory is **/opt/Bigdata/client**.
- The component service user can be created by the system administrator as required.

  The keytab file must be downloaded for a **Machine-Machine** user. Change the password of the **Human-Machine** user at the first login.

Procedure

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to go to the client installation directory:

cd /opt/Bigdata/client

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 If the cluster uses the Security Mode, run the following command to perform user authentication. If the cluster uses the Normal Mode, no user authentication is required.

kinit *component service user*

Step 5 Run shell commands based on the actual service requirements.

----End

10.9.1.3 Updating the Configuration of the Installed Client

Scenario

The cluster provides a client for you to connect to a server, view task results, or manage data. If you modify service configuration parameters on FusionInsight Manager and restart the service, you need to download and install the installed client again or use the configuration file to update the client.

Prerequisites

You have installed the client.

Procedure

Method 1:

Step 1 Log in to FusionInsight Manager. Click the wanted cluster from the **Cluster** drop-down list..

Step 2 Choose **More** > **Download Client** > **Configuration Files Only**.

The generated compressed file contains the configuration files of all services.

Step 3 Determine whether a configuration file needs to be generated on the cluster node.

- If yes, select **Save to Path**, and click **OK** to generate the client file. By default, the client file is generated in **/tmp/FusionInsight-Client** on the active management node. You can also store the client file in other directories, and user **omm** has the read, write, and execute permissions on the directories. Then, go to **Step 4**.
- If no, click **OK**, specify a local save path, and download the complete client. Wait until the download is complete, and go to **Step 4**.

Step 4 Use WinSCP to save the compressed file to the installation directory of the client as the client installation user, such as **/opt/hadoopclient**.

Step 5 Decompress the software package.

Run the following commands to enter into the directory where the client is installed, and decompress the file to a local directory. For example, the downloaded client file is **FusionInsight_Cluster_1_Services_Client.tar**.

cd /opt/hadoopclient

tar -xvf FusionInsight_Cluster_1_Services_Client.tar

Step 6 Verify the software package.

Run the **sha256sum** command to verify the retrieved file. Check whether the command output is consistent with the information in the **sha256** file. Example command:

sha256sum -c FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles.tar.sha256

```
FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles.tar: OK
```

Step 7 Decompress the package to obtain the configuration file.

tar -xvf FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles.tar

Step 8 Run the following command in the client installation directory to update the client using the configuration file:

sh refreshConfig.sh *Client installation directory Directory where the configuration file is located*

For example, run the following command:

sh refreshConfig.sh /opt/hadoopclient /opt/hadoopclient/FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles

If the following information is displayed, the configurations have been updated successfully.

```
Succeed to refresh components client config.
```

----End

Method 2:

Step 1 Log in to the client installation node as user **root**.

Step 2 Go to the client installation directory, for example, **/opt/Bigdata/client** and run the following command to update the configuration file:

cd /opt/Bigdata/client

sh autoRefreshConfig.sh

Step 3 Enter the username and password of the FusionInsight Manager administrator and the floating IP address of FusionInsight Manager.

Step 4 Enter the names of the components whose configuration needs to be updated. Use commas (,) to separate the component names. Press **Enter** to update the configurations of all components if necessary.

If the following information is displayed, the configurations have been updated successfully.

```
Succeed to refresh components client config.
```

----End

10.9.2 Managing Mutual Trust Relationships Between Managers

10.9.2.1 Introduction to Mutual Trust Relationships Between Clusters

Function Description

By default, users of big data clusters in safe mode can only access resources in the cluster. In other clusters, they cannot perform identity authentication to access resources in safe mode.

Features

- **Domain**

  The usage range of users in each system is called a **domain**. Each Manager system must have a unique domain name. Cross-Manager access means users to be used across domains.

- **User Encryption**

  Cross-Manager mutual trust relationships can be configured by using FusionInsight Manager. The current Kerberos server supports only **aes256-cts-hmac-sha1-96:normal** and **aes128-cts-hmac-sha1-96:normal**. Encryption types for encrypting cross-domain users cannot be changed.

- **User Authentication**

  After cross-manager mutual trust is configured, if a user with the same name exists in the two systems and the user with the same name in the peer system has the permission to access a resource in the system, the current system user can access the remote resource.

- **Direct Mutual Trust**

  When cross-cluster mutual trust relationships are built between two clusters, the system saves the mutual-trust receipts. Users can access the remote system through the mutual-trust receipts.

10.9.2.2 Changing Manager System Domain Name

Scenario

The usage range of users in each FusionInsight Manager is called a domain. Each system must have a unique domain name. The domain name of the FusionInsight Manager is generated during installation. To change the domain name to a specific domain name, run the FusionInsight Manager command.

NOTICE

- Changing the system domain name is a high-risk operation. Before performing operations in this section, ensure that the OMS data has been backed up by referring to **Backing Up OMS Data**.

Impact on the System

- During the configuration, all of the clusters need to be restarted and are unavailable during restart.

- During the configuration, the domain names will be changed, and the passwords of Kerberos administrator and OMS Kerberos administrator will be initialized. You need to use the default passwords and change the password. If a component running user whose password is generated randomly by the system is used for identity authentication, see **Exporting an Authentication Credential File** to download the keytab file again.
- After the system domain name is changed, passwords of the **admin** user, component running user, and the **Human-machine** user added by the system administrator before the domain name is changed will be reset to the same. Change the passwords. The reset password consists of two parts: one part is generated by the system and the other is set by the user. The system generating part is Admin@123, which is the default password. For details about the user-defined part, see descriptions of **Password Suffix** in **Table 10-53**. For example, if the system generates **Admin@123** and the user sets **Test#$%@123**, the final initial password is **Admin@123Test#$%@123**.
- The new password must meet the password policies. To obtain the new **Human-machine** user password, log in to the active OMS as user **omm** and run the following script:

  sh ${BIGDATA_HOME}/om-server/om/sbin/get_reset_pwd.sh *passwd_suffix user_name*

  – *passwd_suffix* indicates the user setting part (**Admin@123** by default).

  – *user_name* is optional (**admin** by default).

  Example:

  sh ${BIGDATA_HOME}/om-server/om/sbin/get_reset_pwd.sh Test#$%@123

  ```
  To get the reset password after changing cluster domain name.
    pwd_min_len      : 8
    pwd_char_types   : 4
  The password reset after changing cluster domain name is: "Admin@123Test#$%@123"
  ```

  In this example, **pwd_min_len** and **pwd_char_types** indicate the minimum password length and number of password character types respectively defined in the password policies. **Admin@123Test#$%@123** indicates the **Human-Machine** user password after the system domain name is changed.
- The reset password after the inter-system domain name is changed consists of two parts: one part is generated by the system and the other is set by the user. The reset password must meet the password policy. In case of insufficient length, add one or multiple at-signs (@) between Admin@123 and user setting part. If there are five character types, add a space on the right of Admin@123.

  When the user setting part is **Test@123** and default user password policy is used, the new password is **Admin@123Test@123**. The password contains 17 characters of four types. If the current password policy must be met, process the password according to **Table 10-52**.

Table 10-52 Password processing

Minimum Password Length	Number of Character Types	Password Policy Satisfaction	New Password
8 to 17 characters	4	Password policies are met.	Admin@123Test@123
18 characters	4	Add an at sign (@).	Admin@123@Test@123
19 characters	4	Add two at signs (@).	Admin@123@@Test@123
8 to 18 characters	5	Add a space.	Admin@123 Test@123
19 characters	5	Add a space and an at sign (@).	Admin@123 @Test@123
20 characters	5	Add a space and two at signs (@).	Admin@123 @@Test@123

- After the system domain name is changed, download the **keytab** file for the **Machine-Machine** user added by the system administrator before the domain name is changed.
- After the system domain name is changed, download and install the client again.

Prerequisites

- The system administrator has specified service requirements and planned domain names for the systems.

  A domain name can contain only uppercase letters, digits, dots (.), and underscores (_), and must start with a letter or a digit.
- **Running Status** of all services in the Manager clusters is **Normal**.
- The **acl.compare.shortName** parameter of the ZooKeeper service of all clusters in the Manager must be set to the default value **true**. Otherwise, change the value to **true** and restart the ZooKeeper service.

Procedure

Step 1 Log in to FusionInsight Manager of a cluster.

Step 2 Choose **System** > **Permission** > **Domain and Mutual Trust**.

Step 3 Change parameters.

Table 10-53 Related Parameters

Parameter	Description
Local Domain	Set the value to the domain name of the system.

Parameter	Description
Password Suffix	The user sets part of the **Human-Machine** user after password reset. The default value is **Admin@123**. **NOTE** This parameter is only changed **Local Domain** parameters to take effect. The following conditions must be met: • The password ranges from 8 to 16 characters. • The password must contain at least three types of the following: uppercase letters, lowercase letters, numbers, and the following special characters: `~!@#$%^&*()-_=+|[{}];:',<.>/? and space.

Step 4 Click **OK**. After the modification is complete, proceed with the subsequent steps. Do not perform the subsequent steps in advance.

Step 5 Log in to the active management node as user **omm**.

Step 6 Run the following command to restart the domain update configuration:

sh ${BIGDATA_HOME}/om-server/om/sbin/restart-RealmConfig.sh

The command is run successfully if the following information is displayed:

```
Modify realm successfully. Use the new password to log into FusionInsight again.
```

NOTE

After restart, some hosts and services cannot be accessed and an alarm is generated. This problem can be automatically resolved in about 1 minute after **restart-RealmConfig.sh** is run.

Step 7 Log in to the FusionInsight Manager as the reset user **admin** and password (for example, Admin@123Admin@123). On the FusionInsight Manager home page, click ... next to the name of the cluster to be operated and select **Restart**.

In the displayed confirmation dialog box, click **OK**.

In the displayed dialog box, click **OK**. Wait for a while until a message indicating that the operation is successful is displayed. Click **Finish**.

Step 8 Log out from FusionInsight Manager and then log in to it again. If the login is successful, the configuration is successful.

Step 9 Log in to the active management node as user **omm** and run the following command to update the job submission client configuration:

sh /opt/executor/bin/refresh-client-config.sh

----End

10.9.2.3 Configuring Cross-Manager Cluster Mutual Trust Relationships

Scenario

When two clusters in different security modes need to access each other's resources, the administrator can set up a mutual trust system so that users of external systems can use the system.

The usage range of users in each system is called a **domain**. Each Manager system must have a unique domain name. Cross-Manager access means users to be used across domains.

NOTE

A maximum of 500 mutual trust clusters can be configured.

Impact on the System

- After cross-Cluster mutual trust is configured, users of an external system can be used in the local system. The system administrator needs to periodically check the user rights in the Manager system based on enterprise service and security requirements.
- When configuring cross-cluster mutual trust, you need to stop all clusters, which interrupts services.
- After cross-Cluster mutual trust is configured, each of the clusters trusting each other can add Kerberos internal users "krbtgt/*local cluster domain name*@*external cluster domain name*" and "krbtgt/*external cluster domain name*@*local cluster domain name*". The two users cannot be deleted. Based on enterprise service and security requirements, the system administrator needs to change the password periodically. The passwords of the four users in the two systems trusting each other must be the same. For details, see **Changing the Password for a Component Running User**. Connections of cross-Manager service applications may be affected during the password change.
- After configuring the cross-Cluster mutual trust relationship, download and install the client again for each cluster.
- After cross-Cluster mutual trust is configured, verify services. For information about how to access the resources in the remote system by using users in the local system, see **Assigning User Permissions After Cross-Cluster Mutual Trust Is Configured**.

Prerequisites

- The system administrator has specified service requirements and planned domain names for the systems. A domain name can contain only uppercase letters, digits, dots (.), and underscores (_), and must start with a letter or a digit.
- Before configuring cross-Cluster mutual trust, ensure that the domain names of the two Manager systems are different. When an ECS or BMS cluster is created on MRS, a unique system domain name is randomly generated. Generally, you do not need to change the system domain name.
- Before cross-Cluster mutual trust is configured, ensure that the two systems do not have the same host name or the same IP address.
- Time of two systems configured trust relationships must be consistent and the Network Time Protocol (NTP) service in the two systems must use the same time source.
- **Running Status** of all services in the Manager clusters is **Normal**.
- The **acl.compare.shortName** parameter of the ZooKeeper service of all clusters in the Manager must be set to the default value **true**. Otherwise, change the value to **true** and restart the ZooKeeper service.

Procedure

Step 1 Log in to the FusionInsight Manager of one of the two systems to be configured with mutual trust.

Click ··· > **Stop** next to the cluster to be operated. Enter the administrator password. In the **Stop Cluster** dialog box that is displayed, click **OK**. Wait until the cluster is stopped.

Step 2 Stop all clusters on the home page.

Step 3 Choose **System** > **Permission** > **Domain and Mutual Trust**.

Step 4 Change the **Peer Mutual Trust Domain** parameter

Table 10-54 Related Parameters

Parameters	Description
realm_name	Set the value to the domain name of the peer system.
ip_port	Set the value to the KDC address of the peer system. The parameter value format is *IP address of the node where the Kerberos service of the mutual trust cluster is to be configured in the peer system:port*. • In dual-plane networking, you need to enter the service IP address. • If an IPv6 address is used, the IP address must be enclosed in square brackets (**[]**). • Use a comma to separate the KDC addresses of the active and standby Kerberos services or multiple clusters in the peer system need to establish mutual trust with the local system. • You can obtain the port number by viewing the **kdc_ports** parameter of the KrbServer service. The default value is 21732. You can obtain the IP address of the node where the service is deployed by clicking the **Instances** tab on the **KrbServer** service page and viewing the **Service IP Address** of the **KerberosServer** role. For example, if the Kerberos service is deployed on 10.0.0.1 and 10.0.0.2, to establish mutual trust with the local system, the corresponding parameter value is **10.0.0.1:21732,10.0.0.2:21732**.

NOTE

If you need to configure trust relationships for multiple Manager systems, click + to add a new project and set parameters. A maximum of 16 systems can be mutually trusted. Click — to delete redundant configurations.

Step 5 Click **OK**.

Step 6 Log in to the active management node using the active management IP address as user **omm**. Run the following command to update domain configuration:

sh ${BIGDATA_HOME}/om-server/om/sbin/restart-RealmConfig.sh

The command is run successfully if the following information is displayed:

```
Modify realm successfully. Use the new password to log into FusionInsight again.
```

After restart, some hosts and services cannot be accessed and an alarm is generated. This problem can be automatically resolved in about 1 minute after **restart-RealmConfig.sh** is run.

Step 7 Log in to the FusionInsight Manager and start all clusters.

Click ⋯ > **Start** next to the cluster to be operated. In the **Start Cluster** dialog box that is displayed, click **OK**. Wait until the cluster is started.

Step 8 Log in to FusionInsight Manager of the other system and repeat the preceding operations.

----End

10.9.2.4 Assigning User Permissions After Cross-Cluster Mutual Trust Is Configured

Scenario

After cross-Cluster mutual trust is configured, assign users the access permission for the systems so that the users can perform required service operations in the systems.

Prerequisites

The mutual trust relationship between Manager systems has been configured.

Procedure

Step 1 Log in to FusionInsight Manager of local system.

Step 2 Choose **System** > **Permission** > **User** to check whether the user who performs the service operation exists.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Click ⌄ on the left of a specified user, check whether the permissions assigned for the user group where the user resides and the role meet the service requirements. If not, create a role and bind the role to the user, or modify the permissions of the user group or role. For details, see **Configuring Permissions**.

Step 4 Create the user required by the service and associate the required user group or role. For details, see **Creating a User**.

Step 5 Log in to FusionInsight Manager of remote system and repeat **Step 2** to **Step 4** to create the same user as that in cluster A and assign required permissions.

----End

10.9.3 Configuring Periodical Alarm and Audit Information Backup

Scenario

Modify the related configuration file to periodically back up the alarm, audit information of FusionInsight Manager and service audit information of to the specified storage location.

The backup can be performed using FTP or SFTP. FTP does not encrypt data, which may cause potential security risks. Therefore, SFTP is recommended.

Procedure

Step 1 Log in to the active management node using the active management IP address as user **omm**.

NOTE

Perform this operation only on the active management node. This operation is not supported on the standby management node.

Step 2 Run the following command to go to the related directory:

cd ${BIGDATA_HOME}/om-server/om/sbin

Step 3 Run the following command to configure periodically the alarm, audit information of FusionInsight Manager and service audit information backup:

./setNorthBound.sh -t *Information type* **-i** *Remote server IP address* **-p** *SFTP or FTP port used by the server* **-u** *Username* **-d** *Save path* **-c** *Interval (minute)* **-m** *Number of information records in each file* **-s** *Flag for enabling or disabling backup* **-e** *Specified protocol*

Example:

./setNorthBound.sh -t alarm -i 10.0.0.10 -p 22 -u sftpuser -d /tmp/ -c 10 -m 100 -s true -e sftp

This script will modify the alarm information backup configuration file **alarm_collect_upload.properties**. The file save path is **${BIGDATA_HOME}/om-server/tomcat/webapps/web/WEB-INF/classes/config**.

./setNorthBound.sh -t audit -i 10.0.0.10 -p 22 -u sftpuser -d /tmp/ -c 10 -m 100 -s true -e sftp

This script will modify the audit information backup configuration file **audit_collect_upload.properties**. The file save path is **${BIGDATA_HOME}/om-server/tomcat/webapps/web/WEB-INF/classes/config**.

./setNorthBound.sh -t service_audit -i 10.0.0.10 -p 22 -u sftpuser -d /tmp/ -c 10 -m 100 -s true -e sftp

This script will modify the service audit information backup configuration file **service_audit_collect_upload.properties**. The file save path is **${BIGDATA_HOME}/om-server/tomcat/webapps/web/WEB-INF/classes/config**.

Step 4 Enter the password as prompted. The password is encrypted and saved in the configuration file.

```
Please input sftp/ftp server password:
```

Step 5 If the following information is displayed, the operation is successful. The configuration file will be automatically synchronized to the standby management node.

```
execute command syncfile successfully.
Config Succeed.
```

----End

10.9.4 Modifying the Manager Routing Table

Scenario

After the FusionInsight Manager is installed, the system automatically creates two pieces of routing information on the active management node. Run the **ip rule list** command to view the routing information, as shown in the following example:

```
0:  from all lookup local
32764:  from all to 10.10.100.100 lookup ntp_rt  #FusionInsight Manager NTP routing information created by the system. The information is not displayed when no external NTP clock source is configured.
32765:  from 192.168.0.117 lookup om_rt   #OM route information created on FusionInsight Manager
32766:  from all lookup main
32767:  from all lookup default
```

NOTE

If the external NTP server has not been configured, only the OM routing information **om_rt** will be created.

When the routing information created by the FusionInsight Manager system conflicts with the routing information of the enterprise, use the **autoroute.sh** tool to disable or enable routes created by FusionInsight Manager.

Impact on the System

After the routing information created by the FusionInsight Manager system is disabled and before the new routing information is set, FusionInsight Manager cannot be accessed but operating of the cluster will not be affected.

Prerequisites

The Manager has already been installed.

The information about the WS floating IP route to be created has already obtained.

Disable the routing information created by the system.

Step 1 Log in to the active management node as user **omm**. Run the following commands to disable the routing information created by the system:

cd ${BIGDATA_HOME}/om-server/om/sbin

./autoroute.sh disable

```
Deactivating Route.
Route operation (disable) successful.
```

Step 2 Run the following command to view the execution result:

ip rule list

```
0:  from all lookup local
32766:  from all lookup main
32767:  from all lookup default
```

Step 3 Run the following command and enter the password of user **root** to switch to user **root**:

su - root

Step 4 Run the following commands to manually create *WS floating IP address* routing information:

ip route add *WS floating IP address Network segment number/WS floating IP address subnet mask* **scope link src** *WS floating IP address* **dev** *WS floating IP address NIC* **table om_rt**

ip route add default via *WS floating IP address gateway* **dev** *WS floating IP address NIC* **table om_rt**

ip rule add from *WS floating IP address* **table om_rt**

For example,

ip route add 192.168.0.0/255.255.255.0 scope link src 192.168.0.117 dev eth0:ws table om_rt

ip route add default via 192.168.0.254 dev eth0:ws table om_rt

ip rule add from 192.168.0.117 table om_rt

NOTE

If the IP address mode of the current network is IPv6, run the **ip -6 route add** command.

Step 5 Run the following commands to manually create *NTP service* routing information (Skip this step when no external NTP clock source is configured.):

ip route add default via *NtpIP address gateway* **dev** *NIC of the local host IP address* **table ntp_rt**

ip rule add to *NTP IP address* **table ntp_rt**

NIC of the local host IP address indicates the NIC that can interwork with the network segment where the NTP server is located.

For example,

ip route add default via 10.10.100.254 dev eth0 table ntp_rt

ip rule add to 10.10.100.100 table ntp_rt

Step 6 Run the following command to view the execution result. For example, if routing information of which the routing table names are **om_rt** and **ntp_rt** is generated, the operation is successful.

ip rule list

```
0:  from all lookup local
32764:  from all to 10.10.100.100 lookup ntp_rt #The information is not displayed when no external NTP clock source is configured.
32765:  from 192.168.0.117 lookup om_rt
32766:  from all lookup main
32767:  from all lookup default
```

----End

Enable the routing information created by the system.

Step 1 Log in to the active management node as user **omm**.

Step 2 Run the following commands to enable the routing information created by the system:

cd ${BIGDATA_HOME}/om-server/om/sbin

./autoroute.sh enable

```
Activating Route.
Route operation (enable) successful.
```

Step 3 Run the following command to view the execution result. For example, if routing information of which the routing table names are **ntp_rt** and **om_rt** is generated, the operation is successful.

ip rule list

```
0:  from all lookup local
32764:  from all to 10.10.100.100 lookup ntp_rt  #The information is not displayed when no external NTP clock source is configured.
32765:  from 192.168.0.117 lookup om_rt
32766:  from all lookup main
32767:  from all lookup default
```

----End

10.9.5 Switching to Maintenance Mode

Scenario

FusionInsight Manager allows you to set clusters, services, hosts, or OMSs to the maintenance mode. In this way, objects in the maintenance mode do not report alarms. This prevents the system from generating a large number of meaningless alarms during maintenance and changes such as upgrade, which affects O&M personnel's judgment on the cluster status.

- Cluster maintenance mode

  If the cluster is not officially brought online or is temporarily offline for O&M operations (for example, non-rolling upgrade), you can set the entire cluster to the maintenance mode.

- Service maintenance mode

  When maintaining a specific service (for example, performing commissioning operations that may affect services, such as restarting service instances in batches, powering on or off nodes related to the service, or repairing the service), you can configure only the involved services to the maintenance mode.

- Host maintenance mode

  When performing maintenance operations on a host (for example, powering on or off a node, isolating a host, reinstalling a host, upgrading the OS, or replacing nodes), you can set the involved hosts to the maintenance mode.

- OMS maintenance mode

  You can set the OMS node to the maintenance mode when restarting, replacing, or repairing the OMS node.

Impact on the System

In maintenance mode, the alarms that are not caused by maintenance operations are also suppressed. The alarms can be reported only after the system exits the maintenance mode. Therefore, exercise caution when setting the maintenance mode.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Set the maintenance mode.

Determine the object for which maintenance mode needs to be configured based on the actual operation scenario. For details, see **Table 10-55**.

Table 10-55 Switching to maintenance mode

Scenario	Procedure
Configuring a cluster to enter maintenance mode	1. On the home page, click ··· next to the target cluster name and click **Enter Maintenance Mode**. 2. In the dialog box that is displayed, click **OK**. After the cluster enters maintenance mode, the status of the cluster is displayed as . After maintenance is complete, click **Exit Maintenance Mode**. The cluster exits maintenance mode.
Configuring services to enter maintenance mode	1. On the management page, choose **Cluster** > *Name of the desired cluster* > **Services** > *Service name*. 2. On the service details page, choose **More** > **Enter Maintenance Mode**. 3. In the dialog box that is displayed, click **OK**. After a service enters maintenance mode, the status of the service in the service list is displayed as . After maintenance is complete, click **Exit Maintenance Mode**. The service exits the maintenance mode. **NOTE** When configuring a service to enter the maintenance mode, you are advised to set other upper-layer services that depend on the service to the maintenance mode.

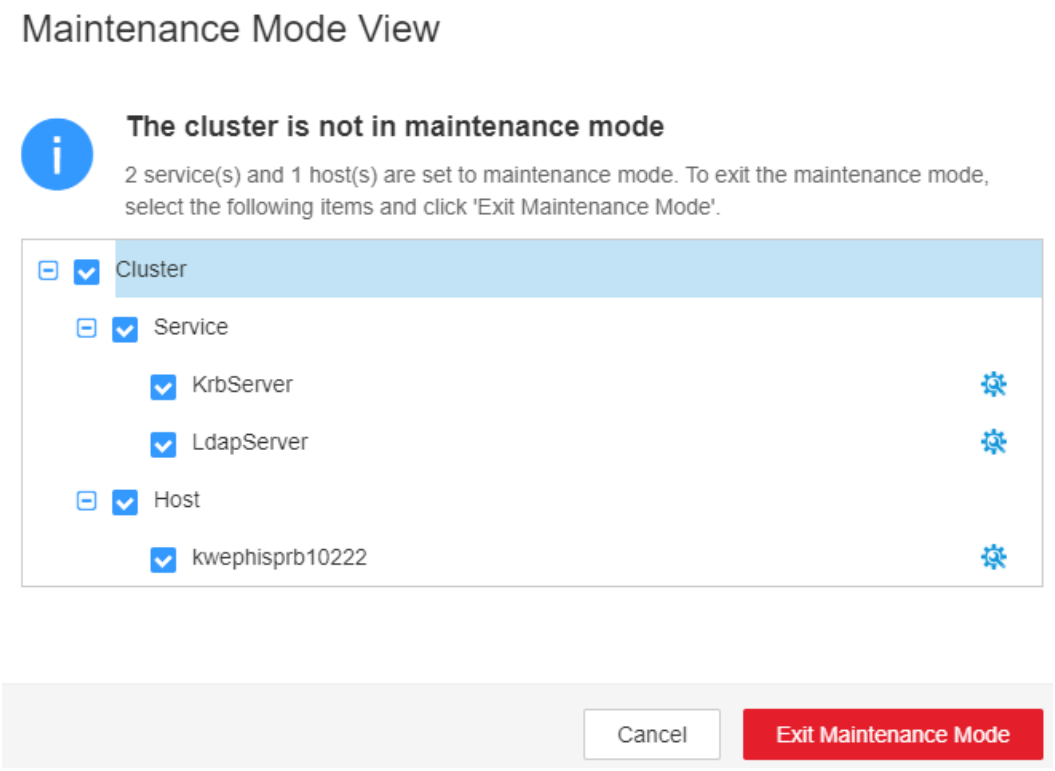
Scenario	Procedure
Configuring a host to enter maintenance mode	1. Click **Hosts** on the management page. 2. On the host page, select the target host and choose **More** > **Enter Maintenance Mode**. 3. In the dialog box that is displayed, click **OK**. After the host enters maintenance mode, the status of the host in the host list is displayed as  . After maintenance is complete, choose **More** > **Exit Maintenance Mode**. The host exits maintenance mode.
Configuring the OMS to enter maintenance mode	1. On the management page, choose **System** > **OMS** > **Enter Maintenance Mode**. 2. In the dialog box that is displayed, click **OK**. After the OMS enters maintenance state, the OMS status is displayed as  . After maintenance is complete, click **Exit Maintenance Mode**. The OMS exits maintenance mode.

Step 3 View the cluster maintenance view.

On the home page of the management page, click ··· next to the name of the target cluster and click **O&M View**. In the displayed window, view the services and hosts in maintenance mode in the cluster.

After the maintenance is complete, you can select services and hosts in batches in the maintenance mode view and click **Exit Maintenance Mode** to exit the maintenance mode in batches.

Figure 10-19 Exiting maintenance mode in batches



----End

10.9.6 Routine Maintenance

To ensure a long-term proper and stable running of the system, system administrators or maintenance engineers need to check the items listed in **Table 10-56** periodically and rectify faults based on the check results. It is recommended that system administrators record the result in each task scenario and sign off based on the enterprise management regulations.

Table 10-56 Check items

Routine Maintenance Period	Task	Routine Maintenance Content
Every day	Checking the cluster service status	• Check whether the running status, and configuration status of each service are normal and whether the status icons are in green. • Check whether the running status, and configuration status of the role instances of each service are normal and whether the status icons are in green. • Check whether the active/standby status of role instances of each service can be properly displayed. • Check whether the **Dashboard** results of services and role instances are normal.
	Checking the cluster host status	• Check whether the running status of each host is normal and whether the status icon is in green. • Check the current disk usage, memory usage, and CPU usage of each host. Check whether the current memory usage and CPU usage are ascending.
	Checking the cluster alarm information	Check whether there are alarms generated in the previous day and automatically cleared.
	Checking the cluster audit information	Check whether there are **Critical** and **Major** operations performed in the previous day and whether the operations are valid.
	Checking the cluster backup	Check whether the OMS, LDAP, DBService, and NameNodeOMS, LDAP, and DBService were automatically backed up in the previous day.
	Checking the health check results	Perform the health check on FusionInsight Manager, and download the health check report to check whether any exception exists in the current cluster. You are advised to enable the automatic health check, export the latest cluster health check result, and repair unhealthy items based on the result.

Routine Maintenance Period	Task	Routine Maintenance Content
	Checking the network communication	Check the cluster network running status and check whether delay exists in the network communication between nodes.
	Checking the storage status	Check whether the total amount of cluster data storage increases suddenly. ● Check whether the disk usage is reaching the threshold, and find the causes, such as whether there is junk data or cold data needs to be deleted. ● Check whether the services are increasing and whether the disk partitions need to be expanded.
	Checking logs	● Check whether any failed or suspended MapReduce or Spark job exists, view the **/tmp/logs/${username}/logs/${application id}** log file in HDFS, and rectify the fault. ● Check the Yarn job logs, view the logs recording failed or suspended jobs, and delete the duplicate data. ● Check the worker logs of Storm. ● Back up logs to the storage server.
Every week	Managing users	Check whether the user passwords are about to expire and notify users to change their passwords. To change the password of a **Machine-Machine** user, the keytab file needs to be downloaded again.
	Analyzing alarms	Export the alarms generated in a specified period and analyze them.
	Scanning disks	Check the disk health status. You are advised to use professional disk health check tools to perform the check.
	Collecting statistics of storage	Check the cluster node disk data in batches and check whether the data is evenly stored. Select the disks where the data amount is too large or too small and check whether the disks are normal.
	Recording changes	Arrange and record the operations on cluster configuration parameters and files to provide references for fault analysis and rectification.

Routine Maintenance Period	Task	Routine Maintenance Content
Every month	Analyzing logs	• Collect and analyze the hardware logs of cluster node servers, such as the BMC system logs. • Collect and analyze the OS logs of cluster node servers. • Collect and analyze the cluster logs.
	Diagnosing the network	Analyze the cluster network health status.
	Managing hardware	Check the equipment rooms where the devices are running and clean the devices.

10.10 Log Management

10.10.1 About Logs

Log Description

The log file path of the MRS cluster is **/var/log/Bigdata**. The following table lists the log types.

Table 10-57 Log types

Log Type	Description
Installation logs	Installation logs record information about FusionInsight Manager, cluster, and service installation to help users locate installation errors.
Run logs	Run logs record the running track information, debugging information, status changes, potential problems, and error information generated during the running of services.
Audit logs	Audit logs record information about users' activities and operation instructions, which can be used to locate fault causes in security events and determine who are responsible for these faults.

The following table lists the MRS log directories.

Table 10-58 Log directories

Directory	Log
/var/log/Bigdata/audit	Component audit log.
/var/log/Bigdata/controller	Log collecting script log. Controller process log. Controller monitoring log.
/var/log/Bigdata/dbservice	DBService log.
/var/log/Bigdata/flume	Flume log.
/var/log/Bigdata/hbase	HBase log.
/var/log/Bigdata/hdfs	HDFS log.
/var/log/Bigdata/hive	Hive log.
/var/log/Bigdata/httpd	httpd log.
/var/log/Bigdata/hue	Hue log.
/var/log/Bigdata/kerberos	Kerberos log.
/var/log/Bigdata/ldapclient	LDAP client log.
/var/log/Bigdata/ldapserver	LDAP server log.
/var/log/Bigdata/loader	Loader log.
/var/log/Bigdata/logman	logman script log management log.
/var/log/Bigdata/mapreduce	MapReduce log.
/var/log/Bigdata/nodeagent	NodeAgent log.
/var/log/Bigdata/okerberos	OMS Kerberos log.
/var/log/Bigdata/oldapserver	OMS LDAP log.
/var/log/Bigdata/metric_agent	Run log file of MetricAgent.
/var/log/Bigdata/omm	oms: complex event processing log, alarm service log, HA log, authentication and authorization management log, and monitoring service run log of the omm server. oma: installation log and run log of the omm agent. core: dump log generated when the omm agent and the HA process are suspended.
/var/log/Bigdata/spark2x	Spark2x log.
/var/log/Bigdata/sudo	Log generated when the **sudo** command is executed by user **omm**.

Directory	Log
/var/log/Bigdata/timestamp	Time synchronization management log.
/var/log/Bigdata/tomcat	Tomcat log.
/var/log/Bigdata/watchdog	Watchdog log.
/var/log/Bigdata/yarn	YARN log.
/var/log/Bigdata/zookeeper	ZooKeeper log.
/var/log/Bigdata/oozie	Oozie log.
/var/log/Bigdata/kafka	Kafka log.
/var/log/Bigdata/storm	Storm log.
/var/log/Bigdata/upgrade	OMS upgrade log file.
/var/log/Bigdata/update-service	Upgrade service logs.

NOTE

After the multi-instance function is enabled, if the system administrator adds multiple HBase, Hive, and Spark service instances, the log description, log level, and log format of the newly added service instances are the same as those of the original service logs. Service instance logs are stored separately in the **/var/log/Bigdata/***servicenameN* directory. The audit logs of the HBase and Hive service instances are stored in the **/var/log/Bigdata/audit/***servicenameN* directory. For example, the logs of HBase1 are stored in the **/var/log/Bigdata/hbase1** and **/var/log/Bigdata/audit/hbase1** directories.

Installation Logs

Table 10-59 Installation logs

Installation Log	Description
Configuration log	Records information about the configuration process before the installation.
FusionInsight Manager installation log	Records information about the two-node FusionInsight Manager installation.
Cluster installation log	Records information about the cluster installation.

Run Logs

Table 10-60 describes the running information recorded in run logs.

Table 10-60 Running information

Run Log	Description
Installation preparation log	Records information about preparations for the installation, such as the detection, configuration, and feedback operation information.
Process startup log	Records information about the commands executed during the process startup.
Process startup exception log	Records information about exceptions during process startup, such as dependent service errors and insufficient resources.
Process run log	Records information about the process running track information and debugging information, such as function entries and exits as well as cross-module interface messages.
Process running exception log	Records errors that cause process running errors, for example, the empty input objects or encoding or decoding failure.
Process running environment log	Records information about the process running environment, such as resource status and environment variables.
Script log	Records information about the script execution process.
Resource reclamation log	Records information about the resource reclaiming process.
Uninstallation clearing logs	Records information about operations performed during service uninstallation, such as directory deletion and execution time

Audit Logs

Audit information recorded in audit logs includes FusionInsight Manager audit information and component audit information.

Table 10-61 Audit information of FusionInsight Manager

Operation Type	Operation
User management	Creating a user. Modifying a user. Deleting a user. Creating a user group. Modifying a user group. Deleting a group. Adding a role. Changing the user's roles. Deleting a role. Changing a password policy. Changing a password. Resetting a password. Logging in. Logging out. Unlocking the screen. Downloading the authentication credential. Unauthorized operation. Unlocking a user account. Locking a user account. Locking the screen. Exporting a user. Exporting a user group. Exporting a role.

Operation Type	Operation
Cluster	Starting a cluster. Stopping a cluster. Restarting a cluster. Performing a rolling restart of a cluster. Restarting all expired instances. Saving configurations. Synchronizing cluster configurations. Customizing cluster monitoring indicators. Configuring monitoring dump. Saving monitoring thresholds. Downloading a client configuration file. Configuring the northbound Syslog interface. Configuring the northbound SNMP interface. Clearing alarms using SNMP. Adding a trap target using SNMP. Deleting a trap target using SNMP. Checking alarms using SNMP. Synchronizing alarms using SNMP. Creating a threshold template. Deleting a threshold template. Applying a threshold template. Saving cluster monitoring configurations. Exporting configurations. Importing cluster configurations. Exporting an installation template. Modifying a threshold template. Canceling the application of a threshold template. Masking an alarm. Sending an alarm. Changing the OMS database password. Resetting the component database password. Restarting OMM and Controller. Starting the health check of a cluster. Importing a certificate file. Configuring SSO information. Deleting historical health check reports. Modifying cluster properties.

Operation Type	Operation
	Running maintenance commands in synchronous mode. Running maintenance commands in asynchronous mode. Customizing report monitoring indicators. Exporting report monitoring data. Runing a command in asynchronous mode using SNMP. Restarting the web service. Customizing monitoring indicators for static resource pools. Exporting monitoring data of a static resource pool. Customizing dashboard monitoring indicators. Stopping a task. Restoring configurations. Modifying domain and trust relationship configurations. Modifying system parameters. Making a cluster enter the maintenance mode. Making a cluster exit the maintenance mode. Making OMS enter the maintenance mode. Making OMS exit the maintenance mode. Making services in a cluster exit the maintenance mode in batches. Modifying OMS configurations. Enabling threshold alarms. Synchronizing all cluster configurations.

Operation Type	Operation
Service	Starting a service. Stopping a service. Synchronizing service configurations. Refreshing a service queue. Customizing service monitoring indicators. Restarting a service. Performing a rolling service restart Exporting service monitoring data. Importing service configuration data. Starting the health check of a service. Configuring a service. Uploading a configuration file. Downloading a configuration file. Synchronizing instance configurations. Commissioning an instance. Decommissioning an instance. Starting an instance. Stopping an instance. Customizing instance monitoring indicators. Restarting an instance. Performing a rolling restart of an instance. Exporting instance monitoring data. Importing instance configuration data. Creating an instance group. Modifying an instance group. Deleting an instance group. Moving an instance to another instance group. Making a service enter the maintenance mode. Making a service exit the maintenance mode. Changing the name of a service. Modifying service association. Downloading monitoring data. Masking alarms. Unmasking alarms. Exporting report data of a service. Adding custom parameters for a report. Modifying custom parameters of a report. Deleting custom parameters of a report.

Operation Type	Operation
	Switching over control nodes. Adding a mount table. Modifying a mount table.
Host	Setting a node rack. Starting all roles. Stopping all roles. Isolating a host. Canceling isolation of a host. Customizing host monitoring indicators. Exporting host monitoring data. Making a host enter the maintenance mode. Making a host exit the maintenance mode. Exporting basic host information. Exporting host distribution report data. Exporting host trend report data. Exporting host cluster report data. Exporting report data of a service. Customizing host cluster monitoring indicators. Customizing host cluster trend monitoring indicators.
Alarm	Exporting alarms. Clearing alarms. Exporting events. Clearing alarms in batches.
Log collection	Collecting log files. Downloading log files. Collecting service stack information. Collecting instance stack information. Preparing service stack information. Preparing instance stack information. Clearing service stack information. Clearing instance stack information.
Audit log	Modifying audit dump configurations. Exporting audit logs.

Operation Type	Operation
Data backup and restoration	Creating a backup task. Executing a backup task. Executing backup tasks in batches. Stopping a backup task. Deleting a backup task. Modifying a backup task. Locking a backup task. Unlocking a backup task. Creating a restoration task. Executing a restoration task. Stopping a restoration task. Retrying a restoration task. Deleting a restoration task.

Operation Type	Operation
Multi-tenant	Saving static configurations. Adding a tenant. Deleting a tenant. Associating a service with a tenant. Deleting a service from a tenant. Configuring resources. Creating a resource. Deleting a resource. Adding a resource pool. Modifying a resource pool. Deleting a resource pool. Restoring tenant data. Modifying global configurations of a tenant. Modifying queue configurations of a capacity scheduler. Modifying queue configurations of a super scheduler. Modifying resource distribution of a capacity scheduler. Clearing resource distribution of a capacity scheduler. Modifying resource distribution of a super scheduler. Clearing resource distribution of a super scheduler. Adding a resource catalog. Modifying a resource catalog. Deleting a resource catalog. Customizing tenant monitoring indicators.

Operation Type	Operation
Health check	Starting the health check of a cluster. Starting the health check of a service. Starting the health check of a host. Starting the health check of OMS. Starting system health check. Updating the health check configuration. Exporting health check reports. Exporting health check results of a cluster. Exporting health check results of a service. Exporting health check results of a host. Deleting historical health check reports. Exporting historical health check reports. Downloading a health check report.

Table 10-62 Component audit information

Audit Log	Operation Type	Operation
ClickHouse audit log	Maintenance management	Granting permissions Revoking permissions Authentication and login information
	Service operation	Creating databases or tables Inserting, deleting, querying, and migrating data
DBService audit log	Maintenance management	Performing backup restoration operations.
HBase audit logs	DDL (data definition) statement	Creating a table. Deleting a table. Modifying a table. Adding a column family. Modifying a column family. Deleting a column family. Enabling a table. Disabling a table. Modifying user information. Changing a password. Logging in.

Audit Log	Operation Type	Operation
	DML (data operation) statement	Putting data (to the **hbase:meta**, **_ctmeta_**, and **hbase:acl** tables). Deleting data (from the **hbase:meta**, **_ctmeta_**, and **hbase:acl** tables) Checking and importing data (for the **hbase:meta**, **_ctmeta_**, and **hbase:acl** tables). Checking and deleting data (the **hbase:meta**, **_ctmeta_**, and **hbase:acl** tables).
	Permission control	Assigning permissions users. Canceling user authorization.
HDFS audit logs	Rights management	File/Folder access permission. File/folder owner information.
	File operation	Creating a folder. Creating a file. Opening a file. Appending file content. Changing a file name. Deleting a file or folder. Setting time property of a file. Setting the number of file copies. Merging files. Checking the file system. File link.
Hive audit logs	Metadata operation	Defining metadata, such as creating databases and tables. Deleting metadata, such as deleting databases and tables. Modifying metadata, such as adding columns and renaming tables. Importing and exporting metadata.
	Data maintenance	Loading data to a table. Inserting data into a table.
	Rights management	Creating or deleting a role. Granting/Reclaiming roles. Granting/Reclaiming permissions.
Hue audit log	Service startup	Starting Hue.

Audit Log	Operation Type	Operation
	User operation	User login. User logout.
	Task operations	Creating a task. Modifying a task. Deleting a task. Submitting a task. Saving a task. Updating the status of a task.
KrbServer audit log	Maintenance management	Changing the password of a Kerberos account. Adding a Kerberos account. Deleting a Kerberos account. Authenticating users.
LdapServer audit log	Maintenance management	Adding an operating system user. Adding a user group. Adding a user to user group. Deleting a user. Deleting a group.
Loader audit logs	Security management	User login.
	Metadata management	Querying connector information. Querying a framework. Querying step information.
	Data source connection management	Querying a data source connection. Adding a data source connection. Updating a data source connection. Deleting a data source connection. Activating a data source connection. Disabling a data source connection.

Audit Log	Operation Type	Operation
	Job management	Querying a job. Creating a job. Updating a job. Deleting a job. Activating a job. Disabling a job. Querying all execution records of a job. Querying the latest execution record of a job. Submitting a job. Stopping a job.
MapReduce audit log	Application running	Starting a Container request. Stopping a Container request. After Container request is completed, the status of the request is displayed as succeeded. After Container request is completed, the status of the request is displayed as failed. After Container request is completed, the status of the request is displayed as suspended. Submitting a task. Ending a task.
Oozie audit log	Task management	Submitting a task. Starting a task. Killing a task. Suspending a task. Resuming a task. Running a task again.
Spark2x audit logs	Metadata operations	Defining metadata, such as creating databases and tables. Deleting metadata, such as deleting databases and tables. Modifying metadata, such as adding columns and renaming tables. Importing and exporting metadata.
	Data maintenance	Loading data to a table Inserting data into a table

Audit Log	Operation Type	Operation
Storm audit log	Nimbus	Submitting a topology. Stopping a topology. Reallocating a topology. Deactivating a topology. Activating a topology.
	UI	Stopping a topology. Reallocating a topology. Deactivating a topology. Activating a topology.
Yarn audit logs	Job submission	Submits a job to a queue.
ZooKeeper audit logs	Rights management	Setting access permission to Znode.
	Znode operation	Creating Znodes. Deleting Znodes. Configuring Znode data

FusionInsight Manager audit logs are stored in the database. You can view and export the audit logs on the **Audit** page.

The following table lists the directories to store component audit logs. Audit log files of some components are stored in **/var/log/Bigdata/audit**, such as HDFS, HBase, MapReduce, Hive, Hue, Yarn, Storm, and ZooKeeper. The component audit logs are automatically compressed and backed up to **/var/log/Bigdata/audit/bk** at 03: 00 every day. A maximum of latest 90 compressed backup files are retained, and the backup time cannot be changed. Configure the number of reserved audit log files. For details, see **Configuring the Number of Local Backup Audit Log Files**.

Audit log files of other components are stored in the component log directory.

Table 10-63 Directory for storing component audit logs

Component	Audit Log Directory
DBService	/var/log/Bigdata/audit/dbservice/dbservice_audit.log

Component	Audit Log Directory
HBase	/var/log/Bigdata/audit/hbase/hm/hbase-audit-hmaster.log /var/log/Bigdata/audit/hbase/hm/hbase-ranger-audit-hmaster.log /var/log/Bigdata/audit/hbase/rs/hbase-audit-regionserver.log /var/log/Bigdata/audit/hbase/rs/hbase-ranger-audit-regionserver.log /var/log/Bigdata/audit/hbase/rt/hbase-audit-restserver.log /var/log/Bigdata/audit/hbase/ts/hbase-audit-thriftserver.log
HDFS	/var/log/Bigdata/audit/hdfs/nn/hdfs-audit-namenode.log /var/log/Bigdata/audit/hdfs/nn/ranger-plugin-audit.log /var/log/Bigdata/audit/hdfs/dn/hdfs-audit-datanode.log /var/log/Bigdata/audit/hdfs/jn/hdfs-audit-journalnode.log /var/log/Bigdata/audit/hdfs/zkfc/hdfs-audit-zkfc.log /var/log/Bigdata/audit/hdfs/httpfs/hdfs-audit-httpfs.log /var/log/Bigdata/audit/hdfs/router/hdfs-audit-router.log
Hive	/var/log/Bigdata/audit/hive/hiveserver/hive-audit.log /var/log/Bigdata/audit/hive/hiveserver/hive-rangeraudit.log /var/log/Bigdata/audit/hive/metastore/metastore-audit.log /var/log/Bigdata/audit/hive/webhcat/webhcat-audit.log
Hue	/var/log/Bigdata/audit/hue/hue-audits.log
Kafka	/var/log/Bigdata/audit/kafka/audit.log
Loader	/var/log/Bigdata/loader/audit/default.audit
MapReduce	/var/log/Bigdata/audit/mapreduce/jobhistory/mapred-audit-jobhistory.log
Oozie	/var/log/Bigdata/audit/oozie/oozie-audit.log
Spark2x	/var/log/Bigdata/audit/spark2x/jdbcserver/jdbcserver-audit.log /var/log/Bigdata/audit/spark2x/jdbcserver/ranger-audit.log /var/log/Bigdata/audit/spark2x/jobhistory/jobhistory-audit.log

10.10.2 Manager Log List

Log Description

Log path: The default storage path of Manager log files is **/var/log/Bigdata/***Manager component*.

- ControllerService: **/var/log/Bigdata/controller/** (operation & maintenance system (OMS) installation and run logs)
- Httpd: **/var/log/Bigdata/httpd** (httpd installation and run logs)
- logman: **/var/log/Bigdata/logman** (log packaging tool logs)
- NodeAgent: **/var/log/Bigdata/nodeagent** (NodeAgent installation and run logs)
- okerberos: **/var/log/Bigdata/okerberos** (okerberos installation and run logs)
- oldapserver: **/var/log/Bigdata/oldapserver** (oldapserver installation and run logs)
- MetricAgent: **/var/log/Bigdata/metric_agent** (MetricAgent run log)
- omm: **/var/log/Bigdata/omm** (omm installation and run logs)
- timestamp: **/var/log/Bigdata/timestamp** (NodeAgent startup time logs)
- tomcat: **/var/log/Bigdata/tomcat** (Web process logs)
- watchdog: **/var/log/Bigdata/watchdog** (watchdog logs)
- Upgrade: **/var/log/Bigdata/upgrade** (OMS log upgrade)
- UpdateService: **/var/log/Bigdata/update-service** (upgrade service log)
- Sudo: **/var/log/Bigdata/sudo** (sudo script execution log)
- OS: **/var/log/***message file* (OS system log)
- OS Performance: **/var/log/osperf** (OS performance statistics log)
- OS Statistics: **/var/log/osinfo/statistics** (OS parameter configuration log)

Log archive rule:

The automatic compression and archiving function is enabled for Manager logs. By default, when the size of a log file exceeds 10 MB, the log file is automatically compressed. The naming rule of a compressed log file is as follows: <*Original log name*>-<*yyyy-mm-dd_hh-mm-ss*>.[*ID*].**log.zip** A maximum of 20 latest compressed files are retained.

Table 10-64 Manager logs

Log Type	Log File Name	Description
Controller run log	controller.log	Log file that records component installation, upgrade, configuration, monitoring, alarms, and routine O&M operations
	controller_client.log	Run log file of the Representational State Transfer (REST) API
	acs.log	Acs run log file
	acs_spnego.log	spnego user logs in ACS
	aos.log	Aos run log file
	plugin.log	Aos plug-in logs
	backupplugin.log	Run log file that records the backup and restoration operations
	controller_config.log	Configuration run log file
	controller_nodesetup.log	Controller loading task log file
	controller_root.log	System log file of the Controller process
	controller_trace.log	Log file that records the remote procedure call (RPC) communication between Controller and NodeAgent
	controller_monitor.log	Monitoring logs
	controller_fsm.log	State machine log file
	controller_alarm.log	Controller alarm logs
	controller_backup.log	Controller backup and recovery logs
	install.log, restore_package.log, installPack.log, distributeAdapterFiles.log, install_os_optimization.log	OMS installation log file

Log Type	Log File Name	Description
	oms_ctl.log	OMS startup and stop logs
	preInstall_client.log	Preprocessing logs before client installation
	installntp.log	NTP installation log file
	modify_manager_param.log	Modifying Manager parameter logs
	backup.log	OMS backup script running log file
	supressionAlarm.log	Alarm script run log file
	om.log	OM certificate generation log file
	backupplugin_ctl.log	Startup logs of the backup and restoration plug-in process
	getLogs.log	Run logs of the collection log script
	backupAuditLogs.log	Audit log backup script run log
	certStatus.log	Log file that records regular certificate checks
	distribute.log	Certificate distribution log
	ficertgenetrate.log	Certificate replacement logs, including level-2 certificates, cas certificates, and httpd certificates
	genPwFile.log	Log file that records the generation of certificate password files
	modifyproxyconf.log	Log file for modifying the HTTPD proxy configuration
	importTar.log	Log file that records the process of importing certificates into the trust library.

Log Type	Log File Name	Description
Httpd	install.log	Httpd installation log file
	access_log, error_log	Httpd run log file
logman	logman.log	Log packaging tool log file
NodeAgent	install.log, install_os_optimization.log	NodeAgent installation log file
	installntp.log	NTP installation log file
	start_ntp.log	NTP startup log file
	ntpChecker.log	NTP check log file
	ntpMonitor.log	NTP monitoring log file
	heartbeat_trace.log	Log file that records heartbeats between NodeAgent and Controller
	alarm.log	Alarm log
	monitor.log	Monitoring log file
	nodeagent_ctl.log, start-agent.log	NodeAgent startup log file
	agent.log	NodeAgent run log file
	cert.log	Certificate log file
	agentplugin.log	Agent plug-in running status monitoring log file
	omaplugin.log	OMA plug-in run log file
	diskhealth.log	Disk health check log file
	supressionAlarm.log	Alarm script run log file
	updateHostFile.log	Host list update log file
	collectLog.log	Run log of the node log collection script
	host_metric_collect.log	Host index collection run log

Log Type	Log File Name	Description
	checkfileconfig.log	Run log file of file permission check
	entropycheck.log	Entropy check run log file
	timer.log	Log of scheduled node scheduling
	pluginmonitor.log	Component monitoring plug-in log
	agent_alarm_py.log	Log file that records alarms upon insufficient NodeAgent file permission
okerberos	addRealm.log, modifyKerberosRealm.log	Realm handover log file
	checkservice_detail.log	Okerberos health check log file
	genKeytab.log	keytab generation log file
	KerberosAdmin_genConfigDetail.log	Run log file of generating kadmin.conf when starting the kadmin process
	KerberosServer_genConfigDetail.log	Run log file of generating krb5kdc.conf when starting the krb5kdc process
	oms-kadmind.log	Run log file of the kadmin process
	oms_kerberos_install.log, postinstall_detail.log	Okerberos installation log file
	oms-krb5kdc.log	Run log file of the krbkdc process
	start_detail.log	Okerberos startup log file
	realmDataConfigPro-cess.log	Log file rollback for realm handover failure.
	stop_detail.log	Okerberos stop log file
oldapserver	ldapserver_backup.log	Oldapserver backup log file

Log Type	Log File Name	Description
	ldapserver_chk_service.log	Oldapserver health check log file
	ldapserver_install.log	Oldapserver installation log file
	ldapserver_start.log	Oldapserver startup log file
	ldapserver_status.log	Log file that records the status of the Oldapserver process
	ldapserver_stop.log	Oldapserver stop log file
	ldapserver_wrap.log	Oldapserver service management log file
	ldapserver_uninstall.log	Oldapserver uninstallation log file
	restart_service.log	Oldapserver restart log file
	ldapserver_unlockUser.log	Log file that records information about unlocking LDAP users and managing accounts
metric_agent	gc.log	MetricAgent JAVA VM gc log file
	metric_agent.log	Run log file of MetricAgent.
	metric_agent_qps.log	Log file that records MetricAgent Internal queue length and qps information
	metric_agent_root.log	All run logs of MetricAgent
	start.log	Log file that records information about the MetricAgent startup and stop
omm	omsconfig.log	OMS configuration log file
	check_oms_heartbeat.log	OMS heartbeat log file
	monitor.log	OMS monitoring log file

Log Type	Log File Name	Description
	ha_monitor.log	HA_Monitor operation log file
	ha.log	HA operation log file
	fms.log	Alarm log file
	fms_ha.log	HA alarm monitoring log file
	fms_script.log	Alarm control log file
	config.log	Alarm configuration log file
	iam.log	IAM log file
	iam_script.log	IAM control log file
	iam_ha.log	IAM HA monitoring log file
	config.log	IAM configuration log file
	operatelog.log	IAM operation log file
	heartbeatcheck_ha.log	OMS heartbeat HA monitoring log file
	install_oms.log	OMS installation log file
	pms_ha.log	HA monitoring log file
	pms_script.log	Monitoring control log file
	config.log	Monitoring configuration log file
	plugin.log	Monitoring plug-in run log file
	pms.log	Monitoring log file
	ha.log	HA run log file
	cep_ha.log	CEP HA monitoring log file
	cep_script.log	CEP control log file
	cep.log	CEP log file
	config.log	CEP configuration log file

Log Type	Log File Name	Description
	omm_gaussdba.log	GaussDB HA monitoring log file
	gaussdb-<SERIAL>.log	GaussDB run log file
	gs_ctl-<DATE>.log	GaussDB control log archive log file
	gs_ctl-current.log	GaussDB control log file
	gs_guc-current.log	GaussDB operation log file
	encrypt.log	Omm encryption log file
	omm_agent_ctl.log	OMA control log file
	oma_monitor.log	OMA monitoring log file
	install_oma.log	OMA installation log file
	config_oma.log	OMA configuration log file
	omm_agent.log	OMA run log file
	acs.log	ACS resource log file
	aos.log	AOS resource log file
	controller.log	Controller resource log file
	feed_watchdog.log	feed_watchdog resource log file
	floatip.log	Floating IP address resource log file
	ha_ntp.log	NTP resource log file
	httpd.log	Httpd resource log file
	okerberos.log	Okerberos resource log file
	oldap.log	OLdap resource log file
	tomcat.log	Tomcat resource log file
	send_alarm.log	Run log file of the HA alarm sending script of the management node
timestamp	restart_stamp	NodeAgent start time log file

Log Type	Log File Name	Description
tomcat	cas.log, localhost_access_cas_log.log	CAS run log file
	catalina.log, catalina.out, host-manager.log, localhost.log, manager.log	Tomcat run log file
	localhost_access_web_log.log	Log file that records the access to REST APIs of FusionInsight Manager
	web.log	Run log file of the Web process
	northbound_ftp_sftp.log, snmp.log	Northbound logs
	perfStats.log	Performance statistics log file
watchdog	watchdog.log, feed_watchdog.log	watchdog run log file
update-service	omm_upd_server.log	UPDServer run log file
	omm_upd_agent.log	UPDAgent run log file
	update-manager.log	UPDManager run log file
	install.log	Installation logs during service upgrade
	uninstall.log	Uninstallation logs during service upgrade

Log Type	Log File Name	Description
	catalina.<*Time*>.log, catalina.out, host-manager.<*Time*>.log, localhost.<*Time*>.log, manager.<*Time*>.log, manager_access_log.<*Time*>.txt, web_service_access_log.<*Time*>.txt, catalina.log, gc-update-service.log.0.current, update-manager.controller, update-web-service.controller, update-web-service.log, commit_rm_distributed.log, commit_rm_upload_package.log, common_omagent_operator.log, forbid_monitor.log, initialize_package_atoms.log, initialize_unzip_pack.log, omm-upd.log, register_patch_pack.log, resume_monitor.logrollback_clear_patch.log, unregister_patch_pack.log, update-rcommupd.log, update-rcupdatemanager.log, update-service.log	Run logs during service upgrade
upgrade	upgrade.log_<*Time*>	OMS upgrade log file
	rollback.log_<*Time*>	OMS rollback log file
sudo	sudo.log	Sudo script execution log file

Log Level

Table 10-65 describes the log levels provided by Manager. The log levels are FATAL, ERROR, WARN, INFO, and DEBUG in descending order. Logs whose levels are higher than or equal to the set level are printed by programmer. The number of printed logs decreases as the set log level increases.

Table 10-65 Log levels

Severity	Description
FATAL	Logs of this level record fatal error information about the current event processing that may result in a system crash.
ERROR	Logs of this level record error information about the current event processing, which indicates that system running is abnormal.
WARN	Logs of this level record abnormal information about the current event processing. These abnormalities will not result in system faults.
INFO	Logs of this level record normal running status information about the system and events.
DEBUG	Logs of this level record system information and system commissioning information.

Log Format

The following table lists the Manager log formats.

Table 10-66 Log format

Log Type	Component	Format	Example
Controller, Httpd, logman, NodeAgent, okerberos, oldapserver, omm, tomcat, upgrade	Controller, Httpd, logman, NodeAgent, okerberos, oldapserver, omm, tomcat, upgrade	<yyyy-MM-dd HH:mm:ss, SSS>|<Log Level>|<*Name of the thread for which the log is generated*>|<*Log message*>|<*Location where the log event occurs*>	2020-06-30 00:37:09,067 INFO [pool-1-thread-1] Completed Discovering Node. com.xxx.hadoop.om.controller.tasks.nodesetup.DiscoverNodeTask.execute(DiscoverNodeTask.java:299)

10.10.3 Configuring the Log Level and Log File Size

Scenarios

If you need to change the log level of logs, you can change the log level of FusionInsight Manager. For a specific service, you can change the log level and the log file size to prevent the failure in saving logs due to insufficient disk space.

Impact on the System

The services need to be restarted for the new configuration to take effect. During the restart, the services are unavailable.

Changing the FusionInsight Manager Log Level

1. Log in to the active management node as user **omm**.
2. Run the following command to switch to the required directory:

   cd ${BIGDATA_HOME}/om-server/om/sbin
3. Run the following command to change the log level:

   ./setLogLevel.sh*Log level parameters*

   The log level parameters are as follows and are listed in descending order by priority: FATAL, ERROR, WARN, INFO, and DEBUG. A program prints logs higher than or equal to a specified level. The higher the log level is, the fewer logs are printed.

   - **DEFAULT**: After this parameter is set, the default log level is used.
   - **FATAL**: severity of a critical error log. After this parameter is set, only logs of the FATAL level is recorded.
   - **ERROR**: error log level. After this parameter is set, logs of the ERROR and FATAL levels are displayed.
   - **WARN**: warning log level. After this parameter is set, logs of the WARN, ERROR, and FATAL levels are recorded.
   - **INFO** (default): informational log level. After this parameter is set, logs of the INFO, WARN, ERROR, and FATAL levels are displayed.
   - **DEBUG**: debugging log level. After this parameter is set, logs of the DEBUG, INFO, WARN, ERROR, and FATAL levels are displayed.
   - **TRACE**: tracing log level. After this parameter is set, logs of the TRACE, DEBUG, INFO, WARN, ERROR, and FATAL levels are displayed.

   NOTE

   The log levels of components are different as defined in open-source code.
4. Download and view logs to verify that the log level settings take effect. For details, see **Log**.

Changing the Service Log Level and Log File Size

NOTE

The KrbServer, LdapServer, and DBService do not support the modification of the service log level and log file size.

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* **> Services**.

Step 3 Click a service in the service list. On the displayed page, switch to the **Configurations** tab page.

Step 4 On the displayed page, click the **All Configurations** tab. Expand the role instance displayed on the left of the page. Click **Log** of the role to be modified.

Step 5 Search for the parameter description and select the log level to be changed, or set the log file size in configuration page. The unit of the log file size is MB.

NOTICE

- The system automatically deletes logs based on the configured log size. To save more information, set the log file size a larger value. To ensure the integrity of log files, you are advised to manually back up the log files to another directory based on the actual service traffic before the log files are cleared according to clearance rules.
- Some services do not support the function of changing the log level on the GUI.

Step 6 Click **Save**. In the **Save Configuration** dialog box, click **OK**.

Step 7 Download and view logs to verify that the log level settings take effect.

----End

10.10.4 Configuring the Number of Local Backup Audit Log Files

Scenarios

Audit logs of cluster components are classified by name and stored in the **/var/log/Bigdata/audit** directory on each cluster node. The OMS automatically backs up the audit log directories at 03:00 every day.

The audit log directory on each node is compressed and named in the <*IP address of the node*>**.tar.gz** format. All compressed files are compressed and named in the <*yyyy-MM-dd_HH-mm-ss*>**.tar.gz** format and saved in the **/var/log/Bigdata/audit/bk/** directory on the active management node. In addition, the standby management node saves a copy of it.

By default, the maximum number of files that can be backed up by the OMS is 90. System administrators can configure the maximum number.

Procedure

Step 1 Log in to the active management node as user **omm**.

NOTE

Perform this operation only on the active management node. This operation is not supported on the standby management nodes; otherwise, the cluster cannot work properly.

Step 2 Run the following command to switch to the required directory:

cd ${BIGDATA_HOME}/om-server/om/sbin

Step 3 Run the following command to change the maximum number of backup audit log files to be reserved:

./modifyLogConfig.sh -m ***Maximum number of backup files that can be reserved by OMS***

The default value is 90. The value ranges from 0 to 365. The greater the value is, the larger disk space is occupied.

If the following information is displayed, the operation is successful:

```
Modify log config successfully
```

----End

10.10.5 Viewing Role Instance Logs

Scenario

FusionInsight Manager allows you to view the logs of each role instance online,

Procedure

Step 1 Log in to FusionInsight Manager.

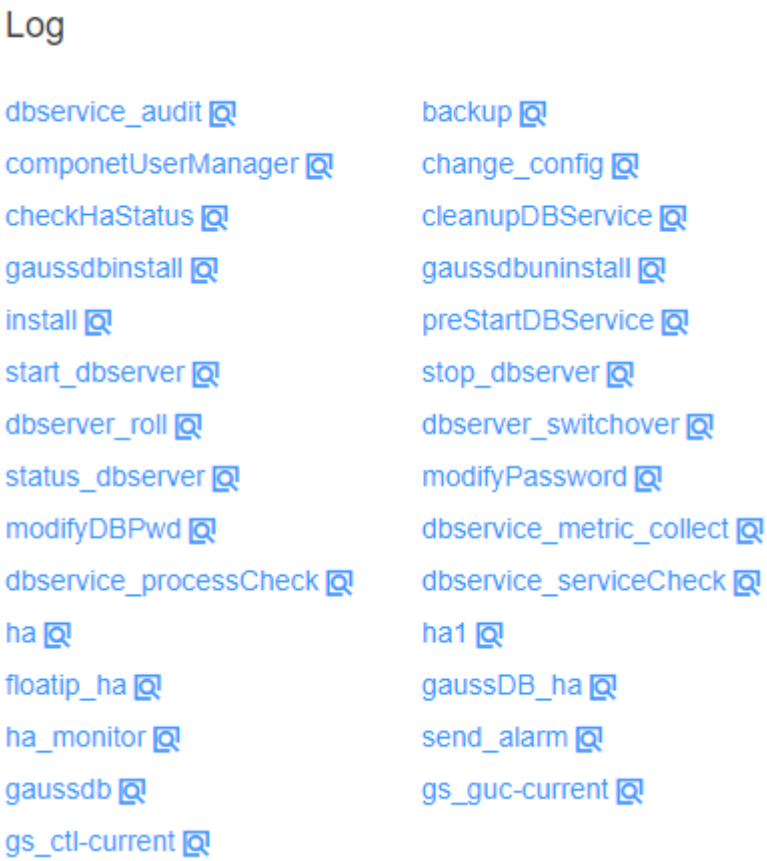
Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > *Service name* > **Instance** and click the name of the instance whose logs you want to view. The instance status page is displayed.

Step 3 In the **Log** area, click the name of the log file to be viewed to preview the log content online.

NOTE

- On the **Hosts** page, click a host name. In the **Instance** area on the host details page, you can view the log files of all role instances on the host.
- By default, a maximum of 100 lines of a log can be displayed. You can click **Load More** to view more logs. Click **Download** to download the log file to the local PC. For details about how to download service logs in batches, see **Log Downloadind**.

Figure 10-20 Viewing instance logs



----End

10.11 Backup and Recovery Management

10.11.1 Introduction

Overview

FusionInsight Manager provides backup and restoration capabilities for user data and system data in a cluster. The backup function is provided by component. The system supports backup of Manager data, component metadata (DBService, HDFS NameNode, HBase, Kafka and Yarn), and service data (HBase, HDFS, Hive).

The backup function supports data backup to the local disk, local HDFS, remote HDFS, NAS (NFS/CIFS), SFTP server and OBS. For details, see section **Backing Up Data**.

For components supporting multi-service, multiple instances of the same service can be backed up and restored. The backup and restoration operations are the same as those when there is one instance.

NOTE

MRS 3.1.0 and later versions support backing up data to OBS.

The backup and recovery tasks are performed in the following scenarios:

- Routine backup is performed to ensure the data security of the system and components.
- When the system is faulty, the data backup can be used to recover the system.
- When the active cluster is completely faulty, an image cluster same as the active cluster needs to be created, and backed up data can be used to perform restoration operations.

Table 10-67 Backing up Manager configuration data based on service requirements

Backup Type	Backup Content	Backup Directory Type
OMS	Back up database data (excluding alarm data) and configuration data in the cluster management system by default.	• LocalDir • LocalHDFS • RemoteHDFS • NFS • CIFS • SFTP • OBS

Table 10-68 Backing up component metadata or other data based on service requirements

Backup Type	Backup Content	Backup Directory Type
DBService	Back up metadata of components (including Loader, Hive, Spark, Oozie, Hue) managed by DBService. After the multi-instance function is enabled, the metadata of multiple Hive and Spark service instances is backed up.	• LocalDir • LocalHDFS • RemoteHDFS • NFS • CIFS • SFTP • OBS
Kafka	Kafka metadata.	• LocalDir • LocalHDFS • RemoteHDFS • NFS • CIFS • OBS

Backup Type	Backup Content	Backup Directory Type
NameNode	Back up HDFS metadata. For clusters enabled with multi-service, the backup and recovery function is supported for these NameServices and the backup and recovery operations are consistent with those of the default instance **hacluster**.	• LocalDir • RemoteHDFS • NFS • CIFS • SFTP • OBS
Yarn	Back up information about the Yarn service resource pool.	
HBase	**tableinfo** file and data files of HBase	

Table 10-69 Backing up service data of specific components based on service requirements

Backup Type	Backup Content	Backup Directory Type
HBase	Back up table-level user data. For clusters enabled with multi-service, the multiple HBase service instances can be backed up and restored. The backup and restoration operations are the same as those for the HBase service instance.	• RemoteHDFS • NFS • CIFS • SFTP
HDFS	Back up the directories or files that correspond to user services. **NOTE** Encrypted directories cannot be backed up or restored.	
Hive	Back up table-level user data. For clusters enabled with multi-service, the multiple Hive service instances can be backed up and restored. The backup and restoration operations are the same as those for the Hive service instance.	

Note that some components do not provide the data backup and restoration functions:

- Kafka supports copies and allows multiple copies to be specified when a topic is created.
- Mapreduce and Yarn data is stored in the HDFS. Therefore, MapReduce and Yarn depend on the HDFS to provide the backup and restoration functions.
- Backup and restoration of service data in ZooKeeper are performed by their own upper-layer components.

Principles

Task

Before backup or recovery, you need to create a backup or recovery task and set task parameters, such as the task name, backup data source, and type of backup file save path. Data backup and recovery can be performed by executing backup and recovery tasks. When the Manager is used to recover the data of HDFS, HBase, Hive, and NameNode, the cluster cannot be accessed.

Each backup task can back up data of different data sources and generates an independent backup file for each data source. All the backup files generated in each backup task form a backup file set, which can be used in recovery tasks. Backup data can be stored on Linux local disks, local cluster HDFS, and standby cluster HDFS.

The backup task provides the full backup or incremental backup policies. Metadata data backup tasks do not support incremental backup policie. If the backup path type is NFS or CIFS, incremental backup is not recommended. When an incremental backup is used for NFS or CIFS backup, the backup data of the latest full backup is updated for each incremental backup. Therefore, no new recovery point is generated.

NOTE

Task execution rules:

- If a task is being executed, the task cannot be executed repeatedly and other tasks cannot be started too.
- The interval at which a periodical task is automatically executed must be greater than 120s; otherwise, the task is postponed and executed in the next period. Manual tasks can be executed at any interval.
- When a period task is to be automatically executed, the current time cannot be 120s later than the task start time; otherwise, the task is postponed and executed in the next period.
- When a periodical task is locked, it cannot be automatically executed and needs to be manually unlocked.
- Before an OMS, LdapServer, Kafka or NameNode backup task starts, ensure that the **LocalBackup** partition on the active management node has more than 20 GB available space; otherwise, the backup task cannot be started.

When planning backup and recovery tasks, select the data to be backed up or recovered strictly based on the service logic, data store structure, and database or table association. By default, the system creates the periodic backup tasks **default-oms** and **default**-*cluster ID* at an interval of one hour, to fully back up OMS and metadata of DBService and NameNode to the local disk.

Snapshot

The system adopts snapshot technology to quickly back up data. Snapshots include HBase snapshots HDFS snapshots.

- HBase snapshot

  An HBase snapshot is a backup file of HBase tables at a specified time point. This backup file does not copy service data or affect the RegionServer. The HBase snapshot copies table metadata, including table descriptor, region info, and HFile reference information. The metadata can be used to recover data before the snapshot creation time.

- HDFS snapshot

  An HDFS snapshot is a read-only backup copy of the HDFS file system at a specified time point. The snapshot is used in data backup, misoperation protection, and disaster recovery scenarios.

  The snapshot function can be enabled for any HDFS directory to create the related snapshot file. Before creating a snapshot for a directory, the system automatically enables the snapshot function for the directory. Creating a snapshot does not affect any HDFS operation. A maximum of 65536 snapshots can be created for each HDFS directory.

  When a snapshot is being created for an HDFS directory, the directory cannot be deleted or modified before the snapshot is created. Snapshots cannot be created for the upper-layer directories or subdirectories of the directory.

DistCp

Distributed copy (DistCp) is a tool used to perform large-amount data replication in the cluster HDFS or between the HDFSs of different clusters. In an HBase, HDFS or Hive metadata backup or recovery task, if the data is backed up in the HDFS of the standby cluster, the system invokes DistCp to perform the operation. Install the MRS system of the same version on the active and standby clusters.

DistCp uses Mapreduce to implement data distribution, troubleshooting, recovery, and report. DistCp specifies different Map jobs for various source files and directories in the specified list. Each Map job copies the data in the partition that corresponds to the specified file in the list.

To use DistCp to perform data replication between the HDFS of two clusters, configure the trust relationship and cross-cluster replication function for both clusters (The mutual trust relationship does not need to be configured for clusters managed by the same FusionInsight Manager.). When backing up the cluster data to HDFS in another cluster, you need to install the Yarn component. Otherwise, the backup fails.

Local rapid recovery

After using DistCp to back up the HBase, HDFS, and Hive data of the local cluster in the HDFS of the standby cluster, the HDFS of the local cluster retains the backup data snapshots. Users can create local rapid recovery tasks to recovery day by using the snapshot files in the HDFS of the local cluster.

NAS

Network Attached Storage (NAS) is a dedicated data storage server which includes the storage device and embedded system software. It provides the cross-platform file sharing function. By using NFS (supporting NFSv3 and NFSv4) and CIFS (supporting SMBv2 and SMBv3) protocols, users can connect the FusionInsight service plane with the NAS server to back up or restore data to or from the NAS.

NOTE

- Before data is backed up to the NAS, the system automatically mounts the NAS shared address to a local partition. After the backup is complete, the system uninstalls the NAS shared partition.
- To prevent backup and restoration failures, do not access the shared address where the NAS server mounts to the local host during data backup and restoration, for example, **/srv/BigData/LocalBackup/nas**.
- When service data is backed up to the NAS, DistCp is used.

Specifications

Table 10-70 Backup and recovery feature specifications

Item	Parameter
Maximum number of backup or recovery tasks in a cluster	100
Number of concurrent running tasks	1
Maximum number of waiting tasks	199
Maximum size of backup files on a Linux local disk (GB)	600

NOTE

If service data is stored in the ZooKeeper upper-layer components, ensure that the number of znodes in a single backup or restoration task is not too large. Otherwise, the task will fail, and the ZooKeeper service performance will be affected. To check the number of znodes in a single backup or restoration task, perform as follows:

- Ensure that the number of znodes in a single backup or restoration task is less than the upper limit of OS file handles.
  1. To check the upper limit at the system level, run the **cat /proc/sys/fs/file-max** command.
  2. To check the upper limit at the user level, run the **ulimit -n** command.
- If the number of znodes in the parent directory exceeds the upper limit, back up and restore data in its sub-directories in batches. To check the number of znodes using ZooKeeper client scripts, perform as follows:
  1. On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Zookeeper** > **Instance** and view the management IP address of each ZooKeeper role.
  2. Log in to the node where the client resides and run the following command:

     zkCli.sh -server *ip*:*port*, where, the IP address can be any management IP address, and the default port number is 2181.
  3. If the following information is displayed, login to the ZooKeeper server succeeds:
     ```
     WatchedEvent state:SyncConnected type:None path:null
     [zk: ip:port(CONNECIED) 0]
     ```
  4. Run the **getusage** command to check the number of znodes in the directory to be backed up. For example:

     getusage /hbase/region. In the command output, **Node count** indicates the number of znodes stored in the **region** directory.

Table 10-71 Specifications of the **default** task

Item	OMS	HBase	Kafka	DBService	NameNode
Backup period	1 hour				
Maximum number of copies	168 (Historical records of seven days)				24 (Historical records of one day)
Maximum size of a backup file	10 MB	10 MB	512MB	100 MB	20 GB
Maximum size of disk space used	1.64 GB	1.64 GB	84GB	16.41 GB	480 GB
Save path of backup data	*Data path*/**LocalBackup/** on active and standby management nodes				

NOTE

- The administrator must regularly transfer the backup data of the default task to an external cluster based on the enterprise's O&M requirements.
- The administrator can create a DistCp backup task to store data of OMS, DBService, and NameNode to an external cluster.
- The running duration of a cluster data backup task can be calculated based on the volume of data to be backed up divided by the network bandwidth between the cluster and backup device. In actual scenarios, you are advised to multiply the calculated duration by 1.5 as a reference value.
- Performing a data backup task affects the maximum I/O performance of the cluster. Therefore, it is recommended that the backup task run time be staggered from the cluster peak hours.

10.11.2 Backing Up Data

10.11.2.1 Backing Up OMS Data

Scenario

To ensure FusionInsight Manager data security routinely or before and after a critical operation (such as capacity expansion and reduction) on Manager, Manager data needs to be backed up. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impact on services.

System administrators can create a backup task in FusionInsight Manager to back up Manager data. Both automatic backup tasks and manual backup tasks are supported.

Prerequisites

- If you want to back up data to the remote HDFS. A standby cluster for backing up data has been created. The mode of the standby cluster is the same as that of the active cluster. In other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see **Configuring Cross-Manager Cluster Mutual Trust Relationships**. If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see **Enabling Cross-Cluster Replication**.
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Based on the service requirements, plan the backup type, period, policy, and other specifications, and check whether ***Data path***/LocalBackup/ has sufficient space on active and standby management nodes.
- If you want to back up data to the NAS, you need to deploy the NAS server in advance.

- If you want to back up data to the OBS, ensure that the current cluster is connected to OBS and you have the permission to access OBS.

Procedure

Step 1 On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

Step 2 Click **Create**.

Step 3 Set **Name** to the name of the backup task.

Step 4 Set **Backup Object** to **OMS**.

Step 5 Set **Mode** to the type of the backup task.

Periodic indicates that the backup task is periodically executed and **Manual** indicates that the backup task is manually executed.

Table 10-72 Periodic backup parameters

Parameter Name	Description
Started	Indicates the time when the task is started for the first time.
Period	Indicates task execution interval. The options include **Hours** and **Days**.
Backup Policy	• **Full backup at the first time and incremental backup subsequently** • **Full backup every time** • **Full backup once every n time** **NOTE** • Incremental backup is not supported when Manager data and component metadata are backed up. Only **Full backup every time** is supported. • If **Mode** is set to **Periodic** and the **Path Type** is set to **NFS** or **CIFS**, the incremental backup function cannot be used. If incremental backup is used in this scenario, data in full backup will be updated in each incremental backup, and no recovery point will be generated.

Step 6 Set **Configuration** to **OMS**.

Step 7 Set **Path Type** of **OMS** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup file.

  The default save path is *Cluster data path*/**LocalBackup/**, for example, **/srv/BigData/LocalBackup**.

If you select this value, you need to set **Maximum Number of Backup Copies** to specify the number of backup files that can be retained in the backup directory.

- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.

  If you select this value, you need to set the following parameters:

  - **Target Path**: indicates the backup file save path in the HDFS. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **Cluster for Backup**: Enter the cluster name mapping to the backup directory.
  - **Target NameService Name**: indicates the NameService name that corresponds to the backup directory. The default value is **hacluster**.

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

  If you select this value, you need to set the following parameters:

  - **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Target NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Target Path**: indicates the HDFS directory for storing standby cluster backup data. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **Source Cluster**: Select the cluster of the Yarn queue used by the backup data from **Source Cluster**.
  - **Queue Name**: indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the source cluster.

- **NFS:** indicates that backup files are stored in the NAS over the NFS protocol.

  If you select NFS, set the following parameters:

  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: indicates the NAS server IP address.

  - **Server Shared Path**: indicates the configured shared directory on the NAS server.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
- **CIFS:** indicates that backup files are stored in the NAS over the CIFS protocol.

  If you select CIFS, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: indicates the NAS server IP address.
  - **Port**: indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username**: indicates the user name that is configured when setting the CIFS protocol.
  - **Password**: indicates the password that is configured when setting the CIFS protocol.
  - **Server Shared Path**: indicates the configured shared directory on the NAS server.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
- **SFTP:** Indicates that backup files are stored in the server using SFTP.

  If you select SFTP, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: Enter the IP address of the server where the backup data is stored.
  - **Port**: Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username**: Enter the username for connecting to the server using SFTP.
  - **Password**:Enter the password for connecting to the server using SFTP.
  - **Server Shared Path**: Enter the backup path on the SFTP server.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
- **OBS**: indicates that the backup files are stored in the OBS.

  If you select this value, you need to set the following parameters:
  - **Target Path**: indicates the OBS directory for storing backup data.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.

    NOTE

    MRS 3.1.0 and later versions support backing up data to OBS.

Step 8 Click **OK** to save the settings.

Step 9 In the **Operation** column of the created task in the backup task list, choose **More > Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory.

The format of the subdirectory name is *backup task name_task creation time*, and the subdirectory is used to save data source backup files.

The format of the backup file name is *version_data source_task execution time*.**tar.gz**.

----End

10.11.2.2 Backing Up DBService Data

Scenario

To ensure system data security routinely or before and after a critical operation (such as upgrade and migration) on DBService, DBService data needs to be backed up. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impact on services.

System administrators can create a backup task in FusionInsight Manager to back up DBService data. Both automatic backup tasks and manual backup tasks are supported.

Prerequisites

- If you want to back up data to the remote HDFS. A standby cluster for backing up data has been created. The mode of the standby cluster is the same as that of the active cluster. In other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see **Configuring Cross-Manager Cluster Mutual Trust Relationships**. If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see **Enabling Cross-Cluster Replication**.
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Based on the service requirements, plan the backup type, period, policy, and other specifications, and check whether ***Data path***/LocalBackup/ has sufficient space on active and standby management nodes.
- If you want to back up data to the NAS, you need to deploy the NAS server in advance.
- If you want to back up data to the OBS, ensure that the current cluster is connected to OBS and you have the permission to access OBS.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Backup and Restoration > Backup Management**.

Step 2 Click **Create**.

Step 3 Set **Name** to the name of the backup task.

Step 4 Select the cluster to be operated from **Backup Object**.

Step 5 Set **Mode** to the type of the backup task.

Periodic indicates that the backup task is periodically executed and **Manual** indicates that the backup task is manually executed.

Table 10-73 Periodic backup parameters

Parameter Name	Description
Started	Indicates the time when the task is started for the first time.
Period	Indicates task execution interval. The options include **Hours** and **Days**.
Backup Policy	• **Full backup at the first time and incremental backup subsequently** • **Full backup every time** • **Full backup once every n time** **NOTE** • Incremental backup is not supported when Manager data and component metadata are backed up. Only **Full backup every time** is supported. • If **Mode** is set to **Periodic** and the **Path Type** is set to **NFS** or **CIFS**, the incremental backup function cannot be used. If incremental backup is used in this scenario, data in full backup will be updated in each incremental backup, and no recovery point will be generated.

Step 6 Set **Configuration** to **DBService**.

NOTE

If there are multiple DBServices, all DBServices are backed up by default. You can click **Assign Service** to specify the DBService to be backed up.

Step 7 Set **Path Type** of **DBService** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup file.

  The default save path is *Cluster data path*/**LocalBackup/**, for example, **/srv/BigData/LocalBackup**.

  If you select this value, you need to set **Maximum Number of Backup Copies** to specify the number of backup files that can be retained in the backup directory.
- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.

If you select this value, you need to set the following parameters:

- **Target Path**: indicates the backup file save path in the HDFS. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
- **Target NameService name**: indicates the NameService name that corresponds to the backup directory. The default value is **hacluster**.

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

  If you select this value, you need to set the following parameters:

  - **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Target NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Target Path**: indicates the HDFS directory for storing standby cluster backup data. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the source cluster.

- **NFS**: indicates that backup files are stored in the NAS over the NFS protocol.

  If you select NFS, set the following parameters:

  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: indicates the NAS server IP address.
  - **Server Shared Path**: indicates the configured shared directory on the NAS server.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.

- **CIFS**: indicates that backup files are stored in the NAS over the CIFS protocol.

  If you select CIFS, set the following parameters:

  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.

  - **Server IP Address**: indicates the NAS server IP address.
  - **Port**: indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username**: indicates the user name that is configured when setting the CIFS protocol.
  - **Password**: indicates the password that is configured when setting the CIFS protocol.
  - **Server Shared Path**: indicates the configured shared directory on the NAS server.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
- **SFTP:** Indicates that backup files are stored in the server using SFTP.

  If you select SFTP, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: Enter the IP address of the server where the backup data is stored.
  - **Port**: Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username**: Enter the username for connecting to the server using SFTP.
  - **Password**:Enter the password for connecting to the server using SFTP.
  - **Server Shared Path**: Enter the backup path on the SFTP server.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
- **OBS**: indicates that the backup files are stored in the OBS.

  If you select this value, you need to set the following parameters:
  - **Target Path**: indicates the OBS directory for storing backup data.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.

    NOTE

    MRS 3.1.0 and later versions support backing up data to OBS.

Step 8 Click **OK** to save the settings.

Step 9 In the **Operation** column of the created task in the backup task list, choose **More > Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *backup task name_task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *version_data source_task execution time*.tar.gz.

----End

10.11.2.3 Backing Up HBase Metadata

Scenario

To avoid that the HBase service becomes unavailable when the HBase system table directory and files are corrupted or after a system administrator performs a critical operation (such as upgrade and migration) on HBase, HBase metadata (tableinfo and HFile) needs to be backed up to ensure security. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impact on services.

System administrators can create a backup task in FusionInsight Manager to back up HBase metadata. Both automatic backup tasks and manual backup tasks are supported.

Prerequisites

- If you want to back up data to the remote HDFS. A standby cluster for backing up data has been created. The mode of the standby cluster is the same as that of the active cluster. In other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see **Configuring Cross-Manager Cluster Mutual Trust Relationships**. If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see **Enabling Cross-Cluster Replication**.
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Based on the service requirements, plan backup policies, such as the backup task type, period, backup object, and YARN queue that required by the backup task.
- If you want to back up data to the NAS, you need to deploy the NAS server in advance.
- The **fs.defaultFS** parameter of HBase must be the same as that of Yarn and HDFS.
- If HBase data is stored in the local HDFS, HBase metadata can be backed up to OBS. If HBase data is stored on OBS, data backup is not supported.
- If you want to back up data to the OBS, ensure that the current cluster is connected to OBS and you have the permission to access OBS.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Backup and Restoration > Backup Management**.

Step 2 Click **Create**.

Step 3 Set **Name** to the name of the backup task.

Step 4 Select the cluster to be operated from **Backup Object**.

Step 5 Set **Mode** to the type of the backup task.

Periodic indicates that the backup task is periodically executed and **Manual** indicates that the backup task is manually executed.

Table 10-74 Periodic backup parameters

Parameter Name	Description
Started	Indicates the time when the task is started for the first time.
Period	Indicates task execution interval. The options include **Hours** and **Days**.
Backup Policy	• **Full backup at the first time and incremental backup subsequently** • **Full backup every time** • **Full backup once every n time** **NOTE** • Incremental backup is not supported when Manager data and component metadata are backed up. Only **Full backup every time** is supported. • If **Mode** is set to **Periodic** and the **Path Type** is set to **NFS** or **CIFS**, the incremental backup function cannot be used. If incremental backup is used in this scenario, data in full backup will be updated in each incremental backup, and no recovery point will be generated.

Step 6 In **Configuration**, select **HBase** under **Metadata and other data**.

NOTE

If there are multiple HBase services, all HBase services are backed up by default. You can click **Assign Service** to specify the HBase to be backed up.

Step 7 Set **Path Type** of **HBase** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup file.

  The default save path is *Cluster data path*/**LocalBackup/**, for example, **/srv/BigData/LocalBackup**.

  If you select this value, you need to set **Maximum Number of Backup Copies** to specify the number of backup files that can be retained in the backup directory.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster. If you select this value, you need to set the following parameters:
  - **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in

remote cluster of the cluster, or the NameService name of a configured remote cluster.

- **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Target NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Target Path**: indicates the HDFS directory for storing standby cluster backup data. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
- **Queue Name**: indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the source cluster.

- **NFS**: indicates that backup files are stored in the NAS over the NFS protocol.

  If you select NFS, set the following parameters:

  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: indicates the NAS server IP address.
  - **Server Shared Path**: indicates the configured shared directory on the NAS server.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.

- **CIFS**: indicates that backup files are stored in the NAS over the CIFS protocol.

  If you select CIFS, set the following parameters:

  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: indicates the NAS server IP address.
  - **Port**: indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username**: indicates the user name that is configured when setting the CIFS protocol.
  - **Password**: indicates the password that is configured when setting the CIFS protocol.
  - **Server Shared Path**: indicates the configured shared directory on the NAS server.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.

- **SFTP:** Indicates that backup files are stored in the server using SFTP.

  If you select SFTP, set the following parameters:

  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: Enter the IP address of the server where the backup data is stored.
  - **Port**: Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username**: Enter the username for connecting to the server using SFTP.
  - **Password**:Enter the password for connecting to the server using SFTP.
  - **Server Shared Path**: Enter the backup path on the SFTP server.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
- **OBS**: indicates that the backup files are stored in the OBS.

  If you select this value, you need to set the following parameters:
  - **Target Path**: indicates the OBS directory for storing backup data.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.

    NOTE

    MRS 3.1.0 and later versions support backing up data to OBS.

Step 8 Click **OK** to save the settings.

Step 9 In the **Operation** column of the created task in the backup task list, choose **More > Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *backup task name_task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *version_data source_task execution time*.tar.gz.

----End

10.11.2.4 Backing Up HBase Service Data

Scenario

To ensure system data security routinely or before and after a critical operation (such as upgrade and migration) on HBase, HBase data needs to be backed up. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impact on services.

System administrators can create a backup task in FusionInsight Manager to back up HBase data. Both automatic backup tasks and manual backup tasks are supported.

The following scenarios may occur when HBase backs up data:

- When a user creates an HBase table, **KEEP_DELETED_CELLS** is set to **false** by default. When the user backs up this HBase table, deleted data will be backed

up and junk data may exist after data restoration. Based on service requirements, this parameter needs to be set to **true** manually when an HBase table is created.

- When a user manually specifies the time stamp when writing data into an HBase table and the specified time is earlier than the last backup time of the HBase table, new data may not be backed up in incremental backup tasks.
- The HBase backup function does not support backing up the access control lists (ACLs) of read, write, create, execute, and administrate operations on HBase globals or namespaces. After the HBase data is restored, the administrator needs to set new permission for roles on FusionInsight Manager.
- Assume that an HBase backup task has been created and the current backup data in the standby cluster is lost. The next incremental task will fail and a new HBase backup task needs to be created. The next full backup task will be normal.

Prerequisites

- If you want to back up data to the remote HDFS. A standby cluster for backing up data has been created. The mode of the standby cluster is the same as that of the active cluster. In other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see **Configuring Cross-Manager Cluster Mutual Trust Relationships**. If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see **Enabling Cross-Cluster Replication**.
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Based on the service requirements, plan backup policies, such as the backup task type, period, backup object, and YARN queue that required by the backup task.
- Check whether HDFS of the standby cluster has sufficient space. It is recommended the directory for storing backup files be a user-defined directory.
- On the HDFS client, run **hdfs lsSnapshottableDir** as user **hdfs** to check the list of directories for which HDFS snapshots have been created in the current cluster. Ensure that the HDFS parent directory or subdirectory where data files to be backed up are stored does not have HDFS snapshots. Otherwise, the backup task cannot be created.
- If you want to back up data to the NAS, you need to deploy the NAS server in advance.
- The **fs.defaultFS** parameter of HBase must be the same as that of Yarn and HDFS.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Backup and Restoration> Backup Management**.

Step 2 Click **Create**.

Step 3 Set **Name** to the name of the backup task.

Step 4 Select the cluster to be operated from **Backup Object**.

Step 5 Set **Mode** to the type of the backup task.

Periodic indicates that the backup task is periodically executed and **Manual** indicates that the backup task is manually executed.

Table 10-75 Periodic backup parameters

Parameter Name	Description
Started	Indicates the time when the task is started for the first time.
Period	Indicates task execution interval. The options include **Hours** and **Days**.
Backup Policy	• **Full backup at the first time and incremental backup subsequently** • **Full backup every time** • **Full backup once every n time** **NOTE** • Incremental backup is not supported when Manager data and component metadata are backed up. Only **Full backup every time** is supported. • If **Mode** is set to **Periodic** and the **Path Type** is set to **NFS** or **CIFS**, the incremental backup function cannot be used. If incremental backup is used in this scenario, data in full backup will be updated in each incremental backup, and no recovery point will be generated.

Step 6 In **Configuration**, select **HBase > HBase** under **Service Data**.

Step 7 Set **Path Type** of **HBase** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

  If you select this value, you need to set the following parameters:

  – **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.

  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Target NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Target Path**: indicates the HDFS directory for storing standby cluster backup data. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **NFS**: indicates that backup files are stored in the NAS over the NFS protocol.

  If you select NFS, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **Server Shared Path**: indicates the configured shared directory on the NAS server.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **CIFS**: indicates that backup files are stored in the NAS over the CIFS protocol.

  If you select CIFS, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: indicates the NAS server IP address.
  - **Port**: indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username**: indicates the user name that is configured when setting the CIFS protocol.

  - **Password**: indicates the password that is configured when setting the CIFS protocol.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **Server Shared Path**: indicates the configured shared directory on the NAS server.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **SFTP:** Indicates that backup files are stored in the server using SFTP.

  If you select SFTP, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: Enter the IP address of the server where the backup data is stored.
  - **Port**: Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username**: Enter the username for connecting to the server using SFTP.
  - **Password**:Enter the password for connecting to the server using SFTP.
  - **Server Shared Path**: Enter the backup path on the SFTP server.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **10**

Step 8 Set **Maximum Number of Recovery Points** to the number of snapshots that can be retained in the cluster.

Step 9 Set **Backup Content** to one or multiple HBase tables to be backed up.

The following methods are supported to select backup data:

- Select directly

  Click the name of a naming space in the navigation tree to show all the tables in the naming space, and select specified tables.
- Select using regular expressions
  - Click **Query Regular Expression**.

- Enter the naming space where the HBase tables are located in the first text box as prompted. The naming space must be the same as the existing naming space, for example, **default**.
- Enter a regular expression in the second text box. Standard regular expressions are supported. For example, if all tables in the database need to be filtered, enter **([\s\S]*?)**. If tables of which the names consisting of letters and digits, such as **tb***1*, need to be filtered, enter **tb\d***.
- Click **Refresh** to view the selected tables in **Directory Name**.
- Click **Synchronize** to save the result.

NOTE

- When entering regular expressions, you can click + or − to add or delete an expression.
- If the selected table or directory is incorrect, click **Clear Selected Node** to deselect it.

Step 10 Click **Verify** to check whether the backup task is configured correctly.

The possible causes of check failure are as follows:

- Target NameNode IP address is incorrect.
- The queue name is incorrect.
- The HDFS parent directory or subdirectory where HBase table data files to be backed up are stored has HDFS snapshots.
- The directory or table to be backed up does not exist.

Step 11 Click **OK** to save the settings.

Step 12 In the **Operation** column of the created task in the backup task list, choose **More** > **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *backup task name_data source_task creation time*, and the subdirectory is used to save latest data source backup files. All the backup file sets are saved to the related snapshot directories.

----End

10.11.2.5 Backing Up NameNode Data

Scenario

To ensure system data security routinely or before and after a critical operation (such as upgrade and migration) on NameNode, NameNode data needs to be backed up. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impact on services.

System administrators can create a backup task in FusionInsight Manager to back up NameNode data. Both automatic backup tasks and manual backup tasks are supported.

Prerequisites

- If you want to back up data to the remote HDFS. A standby cluster for backing up data has been created. The mode of the standby cluster is the same as that of the active cluster. In other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see **Configuring Cross-Manager Cluster Mutual Trust Relationships**. If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see **Enabling Cross-Cluster Replication**.
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Based on the service requirements, plan the backup type, period, policy, and other specifications, and check whether ***Data path***/LocalBackup/ has sufficient space on active and standby management nodes.
- If you want to back up data to the NAS, you need to deploy the NAS server in advance.
- If you want to back up data to the OBS, ensure that the current cluster is connected to OBS and you have the permission to access OBS.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Backup and Restoration > Backup Management**.

Step 2 Click **Create**.

Step 3 Set **Name** to the name of the backup task.

Step 4 Select the cluster to be operated from **Backup Object**.

Step 5 Set **Mode** to the type of the backup task.

Periodic indicates that the backup task is periodically executed and **Manual** indicates that the backup task is manually executed.

Table 10-76 Periodic backup parameters

Parameter Name	Description
Started	Indicates the time when the task is started for the first time.
Period	Indicates task execution interval. The options include **Hours** and **Days**.

Parameter Name	Description
Backup Policy	Only **Full backup every time** is supported. **NOTE** • Incremental backup is not supported when Manager data and component metadata are backed up. Only **Full backup every time** is supported. • If **Mode** is set to **Periodic** and the **Path Type** is set to **NFS** or **CIFS**, the incremental backup function cannot be used. If incremental backup is used in this scenario, data in full backup will be updated in each incremental backup, and no recovery point will be generated.

Step 6 Set **Configuration** to **NameNode**.

Step 7 Set **Path Type** of **NameNode** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup file. The default save path is ***Data path*/LocalBackup/**.

  If you select this value, you need to set the following parameters:

  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **NameService Name**: indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

  If you select this value, you need to set the following parameters:

  - **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Target NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Target Path**: indicates the HDFS directory for storing standby cluster backup data. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.

  - **NameService Name**: indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **NFS:** indicates that backup files are stored in the NAS over the NFS protocol.

  If you select NFS, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: indicates the NAS server IP address.
  - **Server Shared Path**: indicates the configured shared directory on the NAS server.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **NameService Name**: indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **CIFS**: indicates that backup files are stored in the NAS over the CIFS protocol.

  If you select CIFS, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: indicates the NAS server IP address.
  - **Port**: indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username**: indicates the user name that is configured when setting the CIFS protocol.
  - **Password**: indicates the password that is configured when setting the CIFS protocol.
  - **Server Shared Path**: indicates the configured shared directory on the NAS server.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **NameService Name**: indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **SFTP:** Indicates that backup files are stored in the server using SFTP.

  If you select SFTP, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: Enter the IP address of the server where the backup data is stored.
  - **Port**: Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.

  - **Username**: Enter the username for connecting to the server using SFTP.
  - **Password**:Enter the password for connecting to the server using SFTP.
  - **Server Shared Path**: Enter the backup path on the SFTP server.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **NameService Name**: indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **OBS**: indicates that the backup files are stored in the OBS.

  If you select this value, you need to set the following parameters:
  - **Target Path**: indicates the OBS directory for storing backup data.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **NameService Name**: indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.

    NOTE

    MRS 3.1.0 and later versions support backing up data to OBS.

Step 8 Click **OK** to save the settings.

Step 9 In the **Operation** column of the created task in the backup task list, choose **More** > **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *backup task name_task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *version_data source_task execution time*.tar.gz.

----End

10.11.2.6 Backing Up HDFS Service Data

Scenario

To ensure system data security routinely or before and after a critical operation (such as upgrade and migration) on HDFS, HDFS data needs to be backed up. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impact on services.

System administrators can create a backup task in FusionInsight Manager to back up HDFS data. Both automatic backup tasks and manual backup tasks are supported.

NOTE

Encrypted directories cannot be backed up or restored.

Prerequisites

- If you want to back up data to the remote HDFS. A standby cluster for backing up data has been created. The mode of the standby cluster is the same as that of the active cluster. In other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see **Configuring Cross-Manager Cluster Mutual Trust Relationships**. If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see **Enabling Cross-Cluster Replication**.
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Based on the service requirements, plan backup policies, such as the backup task type, period, backup object, and YARN queue that required by the backup task.
- Check whether HDFS of the standby cluster has sufficient space. It is recommended the directory for storing backup files be a user-defined directory.
- On the HDFS client, run **hdfs lsSnapshottableDir** as user **hdfs** to check the list of directories for which HDFS snapshots have been created in the current cluster. Ensure that the HDFS parent directory or subdirectory where data files to be backed up are stored does not have HDFS snapshots. Otherwise, the backup task cannot be created.
- If you want to back up data to the NAS, you need to deploy the NAS server in advance.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Backup and Restoration > Backup Management**.

Step 2 Click **Create**.

Step 3 Set **Name** to the name of the backup task.

Step 4 Select the cluster to be operated from **Backup Object**.

Step 5 Set **Mode** to the type of the backup task.

Periodic indicates that the backup task is periodically executed and **Manual** indicates that the backup task is manually executed.

Table 10-77 Periodic backup parameters

Parameter Name	Description
Started	Indicates the time when the task is started for the first time.

Parameter Name	Description
Period	Indicates task execution interval. The options include **Hours** and **Days**.
Backup Policy	• **Full backup at the first time and incremental backup subsequently** • **Full backup every time** • **Full backup once every n time** **NOTE** • Incremental backup is not supported when Manager data and component metadata are backed up. Only **Full backup every time** is supported. • If **Mode** is set to **Periodic** and the **Path Type** is set to **NFS** or **CIFS**, the incremental backup function cannot be used. If incremental backup is used in this scenario, data in full backup will be updated in each incremental backup, and no recovery point will be generated.

Step 6 Set **Configuration** to **HDFS**.

Step 7 Set **Path Type** of **HDFS** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

  If you select this value, you need to set the following parameters:

  - **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Target NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Target Path**: indicates the HDFS directory for storing standby cluster backup data. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.

  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
  - **NameService Name**: indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **NFS**: indicates that backup files are stored in the NAS over the NFS protocol.

  If you select NFS, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: indicates the NAS server IP address.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **Server Shared Path**: indicates the configured shared directory on the NAS server.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
  - **NameService Name**: indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **CIFS**: indicates that backup files are stored in the NAS over the CIFS protocol.

  If you select CIFS, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: indicates the NAS server IP address.
  - **Port**: indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username**: indicates the user name that is configured when setting the CIFS protocol.
  - **Password**: indicates the password that is configured when setting the CIFS protocol.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **Server Shared Path**: indicates the configured shared directory on the NAS server.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.

  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
  - **NameService Name**: indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**

- **SFTP:** Indicates that backup files are stored in the server using SFTP.

  If you select SFTP, set the following parameters:

  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: Enter the IP address of the server where the backup data is stored.
  - **Port**: Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username**: Enter the username for connecting to the server using SFTP.
  - **Password**:Enter the password for connecting to the server using SFTP.
  - **Server Shared Path**: Enter the backup path on the SFTP server.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **NameService Name**: indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**

Step 8 Set **Maximum Number of Recovery Points** to the number of snapshots that can be retained in the cluster.

Step 9 Set **Backup Content** to one or multiple HDFS directories to be backed up based on service requirements.

The following methods are supported to select backup data:

- Select directly

  Click the name of a directory in the navigation tree to show all the subdirectories in the directory, and select specified directories.

- Select using regular expressions
  - Click **Query Regular Expression**.
  - Enter the parent directory full path of the directory in the first text box as prompted. The directory must be the same as the existing directory, for example, **/tmp**.
  - Enter a regular expression in the second text box. Standard regular expressions are supported. For example, if all files or subdirectories in the parent directory need to be filtered, enter **([\s\S]*?)**. If files of which the names consisting of letters and digits, such as **file***1*, need to be filtered, enter **file\d***.

  - Click **Refresh** to view the selected tables in **Directory Name**.
  - Click **Synchronize** to save the result.

  NOTE

  - When entering regular expressions, you can click + or — to add or delete an expression.
  - If the selected table or directory is incorrect, click **Clear Selected Node** to deselect it.
  - The backup directory cannot contain files that have been written for a long time. Otherwise, the backup task will fail. Therefore, you are advised not to perform operations on the top-level directory, such as **/user**, **/tmp**, and **/mr-history**.

Step 10 Click **Verify** to check whether the backup task is configured correctly.

The possible causes of check failure are as follows:

- Target NameNode IP address is incorrect.
- The queue name is incorrect.
- The HDFS parent directory or subdirectory where data files to be backed up are stored has HDFS snapshots.
- The directory or table to be backed up does not exist.
- The name of the NameService is incorrect.

Step 11 Click **OK** to save the settings.

Step 12 In the **Operation** column of the created task in the backup task list, choose **More > Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *backup task name_data source_task creation time*, and the subdirectory is used to save latest data source backup files. All the backup file sets are saved to the related snapshot directories.

----End

10.11.2.7 Backing Up Hive Service Data

Scenario

To ensure system data security routinely or before and after a critical operation (such as upgrade and migration) on Hive, Hive data needs to be backed up. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impact on services.

System administrators can create a backup task in FusionInsight Manager to back up Hive data. Both automatic backup tasks and manual backup tasks are supported.

- The Hive backup and recovery function cannot identify the service and structure relationships of objects such as Hive tables, indexes, and views. When executing backup and recovery tasks, the user needs to manage a unified recovery point based on the service scenario to ensure proper service running.

- The Hive backup and recovery function does not support Hive on RDB data tables. The original data tables need to be backed up and recovered in the external database independently.
- Assume that a Hive backup task has been created and includes Hive on HBase tables, and the current backup data in the standby cluster is lost. The next incremental task will fail and a new Hive backup task needs to be created. The next full backup task will be normal.

Prerequisites

- If you want to back up data to the remote HDFS. A standby cluster for backing up data has been created. The mode of the standby cluster is the same as that of the active cluster. In other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see **Configuring Cross-Manager Cluster Mutual Trust Relationships**. If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see **Enabling Cross-Cluster Replication**.
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Based on the service requirements, plan backup policies, such as the backup task type, period, backup object, and YARN queue that required by the backup task.
- Check whether HDFS of the standby cluster has sufficient space. It is recommended the directory for storing backup files be a user-defined directory.
- On the HDFS client, run **hdfs lsSnapshottableDir** as user **hdfs** to check the list of directories for which HDFS snapshots have been created in the current cluster. Ensure that the HDFS parent directory or subdirectory where data files to be backed up are stored does not have HDFS snapshots. Otherwise, the backup task cannot be created.
- If you want to back up data to the NAS, you need to deploy the NAS server in advance.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Backup and Restoration > Backup Management**.

Step 2 Click **Create**.

Step 3 Set **Name** to the name of the backup task.

Step 4 Select the cluster to be operated from **Backup Object**.

Step 5 Set **Mode** to the type of the backup task.

Periodic indicates that the backup task is periodically executed and **Manual** indicates that the backup task is manually executed.

Table 10-78 Periodic backup parameters

Parameter Name	Description
Started	Indicates the time when the task is started for the first time.
Period	Indicates task execution interval. The options include **Hours** and **Days**.
Backup Policy	• **Full backup at the first time and incremental backup subsequently** • **Full backup every time** • **Full backup once every n time** **NOTE** • Incremental backup is not supported when Manager data and component metadata are backed up. Only **Full backup every time** is supported. • If **Mode** is set to **Periodic** and the **Path Type** is set to **NFS** or **CIFS**, the incremental backup function cannot be used. If incremental backup is used in this scenario, data in full backup will be updated in each incremental backup, and no recovery point will be generated.

Step 6 Set **Configuration** to **Hive > Hive**.

Step 7 Set **Path Type** of **Hive** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

  If you select this value, you need to set the following parameters:

  - **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Target NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Target Path**: indicates the HDFS directory for storing standby cluster backup data. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.

  - **Queue Name**: indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
  - **NameService Name**: indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **NFS**: indicates that backup files are stored in the NAS over the NFS protocol.

  If you select NFS, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **Server shared Path**: indicates the configured shared directory on the NAS server.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
  - **NameService Name**: indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **CIFS**: indicates that backup files are stored in the NAS over the CIFS protocol.

  If you select CIFS, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: indicates the NAS server IP address.
  - **Port**: indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username**: indicates the user name that is configured when setting the CIFS protocol.
  - **Password**: indicates the password that is configured when setting the CIFS protocol.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **Server Shared Path**: indicates the configured shared directory on the NAS server.

  - **Queue Name**: indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
  - **NameService Name**: indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **SFTP:** Indicates that backup files are stored in the server using SFTP.

  If you select SFTP, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: Enter the IP address of the server where the backup data is stored.
  - **Port**: Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username**: Enter the username for connecting to the server using SFTP.
  - **Password**:Enter the password for connecting to the server using SFTP.
  - **Server Shared Path**: Enter the backup path on the SFTP server.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **NameService Name**: indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**

Step 8 Set **Maximum Number of Recovery Points** to the number of snapshots that can be retained in the cluster.

Step 9 Set **Backup Content** to one or multiple Hive tables to be backed up.

The following methods are supported to select backup data:

- Select directly

  Click the name of a database in the navigation tree to show all the tables in the database, and select specified tables.
- Select using regular expressions
  - Click **Query Regular Expression**.
  - Enter the database where the Hive tables are located in the first text box as prompted. The database must be the same as the existing database, for example, **default**.

- Enter a regular expression in the second text box. Standard regular expressions are supported. For example, if all tables in the database need to be filtered, enter **([\s\S]*?)**. If tables of which the names consisting of letters and digits, such as **tb***1*, need to be filtered, enter **tb\d***.
- Click **Refresh** to view the selected tables in **Directory Name**.
- Click **Synchronize** to save the result.

NOTE

- When entering regular expressions, you can click + or — to add or delete an expression.
- If the selected table or directory is incorrect, click **Clear Selected Node** to deselect it.

Step 10 Click **Verify** to check whether the backup task is configured correctly.

The possible causes of check failure are as follows:

- Target NameNode IP address is incorrect.
- The queue name is incorrect.
- The HDFS parent directory or subdirectory where data files to be backed up are stored has HDFS snapshots.
- The directory or table to be backed up does not exist.

Step 11 Click **OK** to save the settings.

Step 12 In the **Operation** column of the created task in the backup task list, choose **More > Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *backup task name_data source_task creation time*, and the subdirectory is used to save latest data source backup files. All the backup file sets are saved to the related snapshot directories.

----End

10.11.2.8 Backing Up Kafka Metadata

Scenario

To ensure Kafka metadata security or before and after a critical operation (such as upgrade and migration) on ZooKeeper, Kafka metadata needs to be backed up. The backup data can be used to recover the system in time if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impact on services.

System administrators can create a backup task in FusionInsight Manager to back up Kafka metadata. Both automatic backup tasks and manual backup tasks are supported.

Prerequisites

- If you want to back up data to the remote HDFS. A standby cluster for backing up data has been created. The mode of the standby cluster is the same as that of the active cluster. In other backup modes, you do not need to prepare the standby cluster.

- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see **Configuring Cross-Manager Cluster Mutual Trust Relationships**. If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see **Enabling Cross-Cluster Replication**.
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Based on the service requirements, plan the backup type, period, policy, and other specifications, and check whether ***Data path***/LocalBackup/ has sufficient space on active and standby management nodes.
- If you want to back up data to the NAS, you need to deploy the NAS server in advance.
- If you want to back up data to the OBS, ensure that the current cluster is connected to OBS and you have the permission to access OBS.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Backup and Restoration > Backup Management**.

Step 2 Click **Create**.

Step 3 Set **Name** to the name of the backup task.

Step 4 Select the cluster to be operated from **Backup Object**.

Step 5 Set **Mode** to the type of the backup task.

Periodic indicates that the backup task is periodically executed and **Manual** indicates that the backup task is manually executed.

Table 10-79 Periodic backup parameters

Parameter Name	Description
Started	Indicates the time when the task is started for the first time.
Period	Indicates task execution interval. The options include **Hours** and **Days**.

Parameter Name	Description
Backup Policy	• **Full backup at the first time and incremental backup subsequently** • **Full backup every time** • **Full backup once every n time** **NOTE** • Incremental backup is not supported when Manager data and component metadata are backed up. Only **Full backup every time** is supported. • If **Mode** is set to **Periodic** and the **Path Type** is set to **NFS** or **CIFS**, the incremental backup function cannot be used. If incremental backup is used in this scenario, data in full backup will be updated in each incremental backup, and no recovery point will be generated.

Step 6 Set **Configuration** to **Kafka**.

NOTE

If there are multiple Kafka services, all Kafka services are backed up by default. You can click **Assign Service** to specify the Kafka to be backed up.

Step 7 Set **Path Type** of **Kafka** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup file. The default save path is *Data path*/**LocalBackup/**.

  If you select this value, you need to set **Maximum number of backup copies** to specify the number of backup files that can be retained in the backup directory.
- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.

  If you select this value, you need to set the following parameters:

  – **Target path**: indicates the backup file save path in the HDFS. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.

  – **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.

  – **Target NameService Name**: indicates the NameService name that corresponds to the backup directory. The default value is **hacluster**.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

  If you select this value, you need to set the following parameters:

  – **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**,

haclusterX1, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.

- **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Target NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Target path**: indicates the HDFS directory for storing standby cluster backup data. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
- **Queue Name**: indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.

- **NFS**: indicates that backup files are stored in the NAS over the NFS protocol.

  If you select NFS, set the following parameters:

  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: indicates the NAS server IP address.
  - **Server Shared Path**: indicates the configured shared directory on the NAS server.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
- **CIFS**: indicates that backup files are stored in the NAS over the CIFS protocol.

  If you select CIFS, set the following parameters:

  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: indicates the NAS server IP address.
  - **Port**: indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username**: indicates the user name that is configured when setting the CIFS protocol.
  - **Password**: indicates the password that is configured when setting the CIFS protocol.
  - **Server Shared Path**: indicates the configured shared directory on the NAS server.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
- **OBS**: indicates that the backup files are stored in the OBS.

  If you select this value, you need to set the following parameters:

- **Target Path**: indicates the OBS directory for storing backup data.
- **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.

  NOTE

  MRS 3.1.0 and later versions support backing up data to OBS.

Step 8 Click **OK** to save the settings.

Step 9 In the **Operation** column of the created task in the backup task list, choose **More > Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *backup task name_task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *version_data source_task execution time*.tar.gz.

----End

10.11.3 Recovering Data

10.11.3.1 Recovering OMS Data

Scenario

Manager data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After an administrator performs critical data adjustment in FusionInsight Manager, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable.

System administrators can create a recovery task in FusionInsight Manager to recover Manager data. Only manual recovery tasks are supported.

NOTICE

- Data recovery can be performed only when the system version is consistent with that of data backup.
- To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the Manager data that is generated after the data backup and before the data recovery will be lost.

Impact on the System

- In the recovery process, the Controller needs to be restarted and FusionInsight Manager cannot be logged in or operated during the restart.
- In the recovery process, all clusters need to be restarted and cannot be accessed during the restart.

- After Manager data recovery, the data, such as system configuration, user information, alarm information, and audit information, that is generated after the data backup and before the data recovery will be lost. This may result in data query failure or cluster access failure.
- After the Manager data is recovered, the system forces the LdapServer of each cluster to synchronize data from the OLadp.

Prerequisites

- To restore data from the remote HDFS, you need to prepare the standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see **Configuring Cross-Manager Cluster Mutual Trust Relationships**. If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see **Enabling Cross-Cluster Replication**.
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- The status of the OMS resources and the LdapServer instances of each cluster is normal. If the status is abnormal, data recovery cannot be performed.
- The status of the cluster hosts and services is normal. If the status is abnormal, data recovery cannot be performed.
- The cluster host topologies during data recovery and data backup are the same. If the topologies are different, data recovery cannot be performed and you need to back up data again.
- The services added to the cluster during data recovery and data backup are the same. If the topologies are different, data recovery cannot be performed and you need to back up data again.
- The upper-layer applications that depend on the MRS cluster are stopped.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Backup and Restoration > Backup Management**.

Step 2 In the **Operation** column of a specified task in the task list, click **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.

  Select the correct item, and manually copy the full path of backup files in **Backup Path**.

Step 3 On FusionInsight Manager, choose **O&M** > **Backup and Restoration > Restoration Management > Create**.

Step 4 Set **Task Name** to the name of the recovery task.

Step 5 Set **Recovery Object** to **OMS**.

Step 6 Select **OMS**.

Step 7 Set **Path Type** of **OMS** to a backup directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node.

  If you select this value, you need to set **Source Path** to select the backup file, for example, *version_data source_task execution time*.**tar.gz**.

- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.

  If you select this value, you need to set the following parameters:

  - **Source Path**: indicates the full path of the backup file in HDFS, for example, ***backup path/backup task name_task creation time/version_data source_task execution time.tar.gz***.
  - **Cluster for Restoration**: Enter the cluster name mapping to the restoration directory.
  - **Source NameService Name**: indicates the NameService name that corresponds to the backup directory when the recovery task is executed. The default value is **hacluster**.

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

  If you select this value, you need to set the following parameters:

  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Source Path**: indicates the full path of the HDFS directory for storing standby cluster backup data. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time.tar.gz***.
  - **Source Cluster**: Select the cluster of the Yarn queue used by the recovery data from **Source Cluster**.
  - **Queue Name**: indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.

- **NFS**: indicates that backup files are stored in the NAS over the NFS protocol.

  If you select **NFS**, set the following parameters:

  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Source Path**: indicates the complete path of the backup file on the NAS server. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time*.tar.gz.**
- **CIFS**: indicates that backup files are stored in the NAS over the CIFS protocol.

  If you select **CIFS**, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Port**: indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username**: Indicates the user name that is configured when setting the CIFS protocol.
  - **Password**: indicates the password that is configured when setting the CIFS protocol.
  - **Source Path**: indicates the complete path of the backup file on the NAS server. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time*.tar.gz.**
- **SFTP**: Indicates that backup files are stored in the server using SFTP.

  If you select **SFTP**, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: Enter the IP address of the server where the backup data is stored.
  - **Port**: Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username**: Enter the username for connecting to the server using SFTP.
  - **Password**: Enter the password for connecting to the server using SFTP.
  - **Source Path**: Enter the full path of the backup file on the backup server. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time*.tar.gz.**
- **OBS**: indicates that the backup files are stored in the OBS directory.

  If you select this value, you need to set the following parameters:
  - **Source Path**: indicates the full path for storing backup data in OBS. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time.tar.gz***.

    NOTE

    MRS 3.1.0 and later versions support saving backup files to OBS.

Step 8 Click **OK** to save the settings.

Step 9 In the recovery task list, locate a created task and click **Start** in the **Operation** column to execute the recovery task.

- After the recovery is successful, the progress bar is in green.
- After the recovery is successful, the recovery task cannot be executed again.
- If the recovery task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

Step 10 Log in to the active and standby management nodes as user **omm**.

Step 11 Run the following command to restart OMS:

sh ${BIGDATA_HOME}/om-server/om/sbin/restart-oms.sh

The command is run successfully if the following information is displayed:

```
start HA successfully.
```

Run **sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh** to check whether **HAAllResOK** of the management node is **Normal** and whether FusionInsight Manager can be logged in again. If yes, the restart is successful.

Step 12 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services > KrbServer** > **More** > **Synchronize Configuration**, click **OK**, and wait for the KrbServer configuration to be synchronized and the service to be restarted.

Step 13 Choose **Cluster** > *Name of the desired cluster* > **More** > **Synchronize Configuration**s, click **OK**, and wait for the cluster configuration to be synchronized.

Step 14 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **More** > **Restart**. In the displayed dialog box, enter the password of the current login user and click **OK**. Wait for the cluster to be restarted.

----End

10.11.3.2 Recovering DBService Data

Scenario

DBService data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After an administrator performs critical data adjustment in DBService, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

System administrators can create a recovery task in FusionInsight Manager to recover DBService data. Only manual recovery tasks are supported.

NOTICE

- Data recovery can be performed only when the system version is consistent with that of data backup.
- To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the DBService data that is generated after the data backup and before the data recovery will be lost.
- By default, MRS uses DBService to store the metadata of Hive, Hue, Loader, Spark, Oozie. Recovering DBService data will recover the metadata of all these components.

Impact on the System

- After the data is recovered, the data produced between the backup time and restoration time is lost.
- After the data is recovered, the configuration of the components that depend on DBService may expire and these components need to be restarted.

Prerequisites

- To restore data from the remote HDFS, you need to prepare the standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see **Configuring Cross-Manager Cluster Mutual Trust Relationships**. If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see **Enabling Cross-Cluster Replication**.
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- The status of the active and standby DBService instances is normal. If the status is abnormal, data recovery cannot be performed.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Backup and Restoration > Backup Management**.

Step 2 In the **Operation** column of a specified task in the task list, click **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.

  Select the correct item, and manually copy the full path of backup files in **Backup Path**.

Step 3 On FusionInsight Manager, choose O&M > **> Backup and Restoration > Restoration Management**.

Step 4 Click **Create**.

Step 5 Select the cluster to be operated from **Recovery Object**.

Step 6 Set **Task Name** to the name of the recovery task.

Step 7 Select **DBService**.

NOTE

If there are multiple DBServices, you can specify the DBService to be recovered.

Step 8 Set **Path Type** of **DBService** to a backup directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node.

  If you select this value, you need to set **Source Path** to select the backup file, for example, ***version_data source_task execution time.tar.gz***.

- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.

  If you select this value, you need to set the following parameters:

  - **Source Path**: indicates the full path of the backup file in HDFS, for example, ***backup path/backup task name_task creation time/version_data source_task execution time.tar.gz***.
  - **Source NameService Name**: indicates the NameService name that corresponds to the backup directory when the recovery task is executed. The default value is **hacluster**.

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster. If you select this value, you need to set the following parameters:

  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Source Path**: indicates the full path of the HDFS directory for storing standby cluster backup data. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time.tar.gz***.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.

- **NFS**: indicates that backup files are stored in the NAS over the NFS protocol.

  If you select **NFS**, set the following parameters:

  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Source Path**: indicates the complete path of the backup file on the NAS server. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time*.tar.gz.**
- **CIFS**: indicates that backup files are stored in the NAS over the CIFS protocol.

  If you select **CIFS**, set the following parameters:

  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Port**: indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username**: Indicates the user name that is configured when setting the CIFS protocol.
  - **Password**: indicates the password that is configured when setting the CIFS protocol.
  - **Source Path**: indicates the complete path of the backup file on the NAS server. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time*.tar.gz.**
- **SFTP**: Indicates that backup files are stored in the server using SFTP.

  If you select **SFTP**, set the following parameters:

  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: Enter the IP address of the server where the backup data is stored.
  - **Port**: Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username**: Enter the username for connecting to the server using SFTP.
  - **Password**: Enter the password for connecting to the server using SFTP.
  - **Source Path**: Enter the full path of the backup file on the backup server. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time*.tar.gz.**
- **OBS**: indicates that the backup files are stored in the OBS directory.

  If you select this value, you need to set the following parameters:

  - **Source Path**: indicates the full path for storing backup data in OBS. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time.tar.gz***.

    NOTE

    MRS 3.1.0 and later versions support saving backup files to OBS.

Step 9 Click **OK** to save the settings.

Step 10 In the recovery task list, locate a created task and click **Start** in the **Operation** column to execute the recovery task.

- After the recovery is successful, the progress bar is in green.
- After the recovery is successful, the recovery task cannot be executed again.
- If the recovery task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

10.11.3.3 Recovering HBase Metadata

Scenario

To avoid that the HBase service becomes unavailable when the HBase system table directory and files are corrupted or after a system administrator performs a critical operation (such as upgrade and migration) on HBase, HBase metadata (tableinfo and HFile) needs to be backed up to ensure security. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impact on services.

System administrators can create a recovery task in FusionInsight Manager to recover HBase metadata. Only manual recovery tasks are supported.

NOTICE

- Data recovery can be performed only when the system version is consistent with that of data backup.
- To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the HBase data that is generated after the data backup and before the data recovery will be lost.
- It is recommended that a data restoration task restore the metadata of only one component to prevent the data restoration of other components from being affected by stopping a service or instance. If data of multiple components is restored at the same time, data restoration may fail.

  HBase metadata cannot be restored at the same time as NameNode metadata. As a result, data restoration fails.

Impact on the System

- Before recovering metadata, you need to stop the HBase service, during which the HBase upper-layer applications are unavailable.
- After the metadata is recovered, the data produced between the backup time and restoration time is lost.
- After the metadata is recovered, the HBase upper-layer applications need to be started.

Prerequisites

- If the active cluster employs the security mode, cross-cluster trust relationship has been configured for the active and standby clusters. For details, see **Configuring Cross-Manager Cluster Mutual Trust Relationships**. If the active cluster employs the normal mode, no cross-cluster trust relationship is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see **Enabling Cross-Cluster Replication**.
- Check the directory for saving the HBase backup file.
- Stop the HBase upper-layer applications.
- You have logged in to FusionInsight Manager. For details, see **Logging In to FusionInsight Manager**.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Backup and Restoration** > **Backup Management**.

Step 2 In the **Operation** column of a specified task in the task list, click **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.

  Select the correct item, and manually copy the full path of backup files in **Backup Path**.

Step 3 On FusionInsight Manager, choose **O&M** > **Backup and Restoration > Restoration Management**.

Step 4 Click **Create**.

Step 5 Set **Task Name** to the name of the recovery task.

Step 6 Select the cluster to be operated from **Recovery Object**.

Step 7 In **Restoration Configuration**, select **HBase** under **Metadata and other data**.

NOTE

If there are multiple HBae services, you can specify the HBase to be recovered.

Step 8 Set **Path Type** of **HBase** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node. If you select this value, you need to set **Source Path** to select the backup file, for example, ***version_data source_task execution time.tar.gz***.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster. If you select this value, you need to set the following parameters:

  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Source Path**: indicates the full path of the HDFS directory for storing standby cluster backup data. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time.tar.gz***.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution.
- **NFS**: indicates that backup files are stored in the NAS over the NFS protocol.

  If you select **NFS**, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Source Path**: indicates the complete path of the backup file on the NAS server. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time*.tar.gz.**
- **CIFS**: indicates that backup files are stored in the NAS over the CIFS protocol.

  If you select **CIFS**, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Port**: indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username**: Indicates the user name that is configured when setting the CIFS protocol.
  - **Password**: indicates the password that is configured when setting the CIFS protocol.
  - **Source Path**: indicates the complete path of the backup file on the NAS server. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time*.tar.gz.**
- **SFTP**: Indicates that backup files are stored in the server using SFTP.

  If you select **SFTP**, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.

  - **Server IP address**: Enter the IP address of the server where the backup data is stored.
  - **Port**: Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username**: Enter the username for connecting to the server using SFTP.
  - **Password**: Enter the password for connecting to the server using SFTP.
  - **Source Path**: Enter the full path of the backup file on the backup server. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time*.tar.gz.**
- **OBS**: indicates that the backup files are stored in the OBS directory.

  If you select this value, you need to set the following parameters:
  - **Source Path**: indicates the full path for storing backup data in OBS. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time.tar.gz***.

    NOTE

    MRS 3.1.0 and later versions support saving backup files to OBS.

Step 9 Click **OK** to save the settings.

Step 10 In the recovery task list, locate a created task and click **Start** in the **Operation** column to execute the recovery task.

- After the recovery is successful, the progress bar is in green.
- After the recovery is successful, the recovery task cannot be executed again.
- If the recovery task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

10.11.3.4 Recovering HBase Service Data

Scenario

HBase data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After an administrator performs critical data adjustment in HBase, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

System administrators can create a recovery task in FusionInsight Manager to recover HBase data. Only manual recovery tasks are supported.

NOTICE

- Data recovery can be performed only when the system version is consistent with that of data backup.
- To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the HBase data that is generated after the data backup and before the data recovery will be lost.

Impact on the System

- During the data recovery process, the system disables the HBase table to be recovered and the table cannot be accessed in this moment. The data recovery process takes several minutes, during which the HBase upper-layer applications are unavailable.
- During data recovery, user authentication stops and users cannot create new connections.
- After the data is recovered, the data produced between the backup time and restoration time is lost.
- After the data is recovered, the HBase upper-layer applications need to be started.

Prerequisites

- To restore data from the remote HDFS, you need to prepare the standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see **Configuring Cross-Manager Cluster Mutual Trust Relationships**. If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see **Enabling Cross-Cluster Replication**.
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Check the directory for saving the HBase backup file.
- Stop the HBase upper-layer applications.
- You have logged in to FusionInsight Manager. For details, see **Logging In to FusionInsight Manager**.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Backup and Restoration > Backup Management**.

Step 2 In the **Operation** column of a specified task in the task list, click **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.

  Select the correct item, and manually copy the full path of backup files in **Backup Path**.

Step 3 On FusionInsight Manager, choose **O&M** > **Backup and Restoration** > **Restoration Management**.

Step 4 Click **Create**.

Step 5 Set **Task Name** to the name of the recovery task.

Step 6 Select the cluster to be operated from **Recovery Object**.

Step 7 In **Restoration Configuration**, select **HBase** under **Service Data**.

Step 8 Set **Path Type** of **HBase** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster. If you select this value, you need to set the following parameters:
  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Source Path**: indicates the full path of the HDFS directory for storing standby cluster backup data. For example, ***backup path/backup task name_data source_task creation time/***.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution.
  - **Recovery Point List**: Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Maximum number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **NFS**: indicates that backup files are stored in the NAS over the NFS protocol.

  If you select **NFS**, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Source Path**: indicates the complete path of the backup file on the NAS server. For example, ***backup path/backup task name_data source_task creation time/*.**
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution.
  - **Recovery Point List**: Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.

  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **CIFS**: indicates that backup files are stored in the NAS over the CIFS protocol.

  If you select **CIFS**, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Port**: indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username**: Indicates the user name that is configured when setting the CIFS protocol.
  - **Password**: indicates the password that is configured when setting the CIFS protocol.
  - **Source Path**: indicates the complete path of the backup file on the NAS server. For example, ***backup path/backup task name_data source_task creation time/*.**
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution.
  - **Recovery Point List**: Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **SFTP**: Indicates that backup files are stored in the server using SFTP.

  If you select **SFTP**, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: Enter the IP address of the server where the backup data is stored.
  - **Port**: Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username**: Enter the username for connecting to the server using SFTP.
  - **Password**: Enter the password for connecting to the server using SFTP.
  - **Source Path**: Enter the full path of the backup file on the backup server. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time*.tar.gz.**
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution.
  - **Recovery Point List**: Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.

  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**

Step 9 Set **Backup Data** column in **Data Configuration** to one or multiple backup data sources to be recovered. In the **Target Namespace** column, specify the target naming space after backup data recovery.

You are advised to set **Target Namespace** to a location that is difference from the backup naming space.

Step 10 Set **Force recovery** to **YES**, which indicates to forcibly recover all backup data when a data table with the same name already exists. If the data table contains new data added after backup, the new data will be lost after the data recovery. If you set the parameter to **NO**, the recovery task is not executed if a data table with the same name exists.

Step 11 Click **Verify** to check whether the recovery task is configured correctly.

- If the queue name is incorrect, the verification fails.
- If the specified naming space does not exist, the verification fails.
- If the forcibly replacement conditions are not met, the verification fails.

Step 12 Click **OK** to save the settings.

Step 13 In the recovery task list, locate a created task and click **Start** in the **Operation** column to execute the recovery task.

- After the recovery is successful, the progress bar is in green.
- After the recovery is successful, the recovery task cannot be executed again.
- If the recovery task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

Step 14 Check whether HBase data is restored in an environment where HBase is newly installed or reinstalled.

- If yes, the administrator needs to set new permission for roles on FusionInsight Manager based on the original service plan.
- If no, the task is complete.

----End

10.11.3.5 Recovering NameNode Data

Scenario

NameNode data needs to be recovered in the following scenarios: HDFS metadata is modified or deleted unexpectedly and needs to be restored. After an administrator performs critical data adjustment in NameNode, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

System administrators can create a recovery task in FusionInsight Manager to recover NameNode data. Only manual recovery tasks are supported.

NOTICE

- Data recovery can be performed only when the system version is consistent with that of data backup.
- To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the NameNode data that is generated after the data backup and before the data recovery will be lost.
- It is recommended that a data restoration task restore the metadata of only one component to prevent the data restoration of other components from being affected by stopping a service or instance. If data of multiple components is restored at the same time, data restoration may fail.

  HBase metadata cannot be restored at the same time as NameNode metadata. As a result, data restoration fails.

Impact on the System

- After the data is recovered, the data produced between the backup time and restoration time is lost.
- After the data is recovered, the NameNode needs to be restarted and is unavailable during the restart.
- After data is restored, metadata and service data may not be matched, HDFS enters the security mode, and the HDFS service cannot be started.

Prerequisites

- To restore data from the remote HDFS, you need to prepare the standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see **Configuring Cross-Manager Cluster Mutual Trust Relationships**. If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see **Enabling Cross-Cluster Replication**.
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- You have logged in to FusionInsight Manager. For details, see **Logging In to FusionInsight Manager**.
- On FusionInsight Manager, all the NameNode role instances whose data is to be recovered are stopped. Other HDFS role instances must keep running. After data is recovered, the NameNode role instances need to be restarted. The NameNode role instances cannot be accessed during the restart.
- The NameNode backup files are stored ***Data path*/LocalBackup/** on the active management node.

Procedure

Step 1 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance** > **NameNode** to check whether the NameNode instances of the data to be restored are stopped. If the NameNode instances are not stopped, stop them.

Step 2 On FusionInsight Manager, choose **O&M** > **Backup and Restoration > Backup Management**.

Step 3 In the **Operation** column of a specified task in the task list, click **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.

  Select the correct item, and manually copy the full path of backup files in **Backup Path**.

Step 4 On FusionInsight Manager, choose **O&M** > **Backup and Restoration** > **Restoration Management**.

Step 5 Click **Create**.

Step 6 Set **Task Name** to the name of the recovery task.

Step 7 Select the cluster to be operated from **Recovery Object**.

Step 8 Select **NameNode**.

Step 9 Set **Path Type** of **NameNode** to a backup directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node.

  If you select this value, you need to set the following parameters:

  - **Source Path**: indicates the full path of the local disk for storing standby cluster backup data. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time.tar.gz***.
  - **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.

- **RemoteHDFS(DistCp)**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

  If you select this value, you need to set the following parameters:

  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.

  - **Source Path**: indicates the full path of the HDFS directory for storing standby cluster backup data. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time.tar.gz***.
  - **Queue Name**: indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **NFS**: indicates that backup files are stored in the NAS over the NFS protocol.

  If you select NFS, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Source Path**: indicates the complete path of the backup file on the NAS server. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time*.tar.gz.**
  - **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **CIFS**: indicates that backup files are stored in the NAS over the CIFS protocol.

  If you select **CIFS**, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Port**: indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username**: Indicates the user name that is configured when setting the CIFS protocol.
  - **Password**: indicates the password that is configured when setting the CIFS protocol.
  - **Source Path**: indicates the complete path of the backup file on the NAS server. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time*.tar.gz.**
  - **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **SFTP**: Indicates that backup files are stored in the server using SFTP.

  If you select **SFTP**, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: Enter the IP address of the server where the backup data is stored.

  - **Port**: Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username**: Enter the username for connecting to the server using SFTP.
  - **Password**: Enter the password for connecting to the server using SFTP.
  - **Source Path**: Enter the full path of the backup file on the backup server. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time*.tar.gz.**
  - **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **OBS**: indicates that the backup files are stored in the OBS directory.

  If you select this value, you need to set the following parameters:
  - **Source Path**: indicates the full path for storing backup data in OBS. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time.tar.gz***.
  - **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.

    NOTE

    MRS 3.1.0 and later versions support saving backup files to OBS.

Step 10 Click **OK** to save the settings.

Step 11 In the recovery task list, locate a created task and click **Start** in the **Operation** column to execute the recovery task.
- After the recovery is successful, the progress bar is in green.
- After the recovery is successful, the recovery task cannot be executed again.
- If the recovery task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

Step 12 On FusionInsight Manager, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **More** > **Restart Service**.

In the displayed window, enter the password of the current administrator and click **OK**. After the system displays "**Operation succeeded**", click **Finish**. The service is successfully started.

----End

10.11.3.6 Recovering HDFS Service Data

Scenario

HDFS data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After an administrator performs critical data adjustment in HDFS, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

System administrators can create a recovery task in FusionInsight Manager to recover HDFS data. Only manual recovery tasks are supported.

NOTICE

- Data recovery can be performed only when the system version is consistent with that of data backup.
- To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the HDFS data that is generated after the data backup and before the data recovery will be lost.
- The HDFS restoration operation cannot be performed for the directories used by running Yarn tasks, for example, **/tmp/logs**, **/tmp/archived**, and **/tmp/hadoop-yarn/staging**. Otherwise, data restoration using Distcp tasks fails due to file loss.

Impact on the System

- During data recovery, user authentication stops and users cannot create new connections.
- After the data is recovered, the data produced between the backup time and restoration time is lost.
- After the data is recovered, the HDFS upper-layer applications need to be started.

Prerequisites

- To restore data from the remote HDFS, you need to prepare the standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see **Configuring Cross-Manager Cluster Mutual Trust Relationships**. If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see **Enabling Cross-Cluster Replication**.
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- The HDFS backup file save path is correct.
- The HDFS upper-layer applications are stopped.
- You have logged in to FusionInsight Manager. For details, see **Logging In to FusionInsight Manager**.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Backup and Restoration > Backup Management**.

Step 2 In the **Operation** column of a specified task in the task list, click **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.

  Select the correct item, and manually copy the full path of backup files in **Backup Path**.

Step 3 On FusionInsight Manager, choose **O&M** > **Backup and Restoration > Restoration Management**.

Step 4 Click **Create**.

Step 5 Set **Task Name** to the name of the recovery task.

Step 6 Select the cluster to be operated from **Recovery Object**.

Step 7 Select **HDFS**.

Step 8 Set **Path Type** of **HDFS** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

  If you select this value, you need to set the following parameters:

  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Source Path**: indicates the full path of the HDFS directory for storing standby cluster backup data. For example, ***backup path/backup task name_data source_task creation time/***.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution.
  - **Recovery Point List**: Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **NFS**: indicates that backup files are stored in the NAS over the NFS protocol.

  If you select NFS, set the following parameters:

  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Source Path**: indicates the complete path of the backup file on the NAS server. For example, ***backup path/backup task name_data source_task creation time/***.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution.
  - **Recovery Point List**: Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **CIFS**: indicates that backup files are stored in the NAS over the CIFS protocol.

  If you select **CIFS**, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Port**: indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username**: Indicates the user name that is configured when setting the CIFS protocol.
  - **Password**: indicates the password that is configured when setting the CIFS protocol.
  - **Source Path**: indicates the complete path of the backup file on the NAS server. For example, ***backup path/backup task name_data source_task creation time/***.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution.
  - **Recovery Point List**: Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **SFTP**: Indicates that backup files are stored in the server using SFTP.

  If you select **SFTP**, set the following parameters:

  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: Enter the IP address of the server where the backup data is stored.
  - **Port**: Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username**: Enter the username for connecting to the server using SFTP.
  - **Password**: Enter the password for connecting to the server using SFTP.
  - **Source Path**: Enter the full path of the backup file on the backup server. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time*.tar.gz.**
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution.
  - **Recovery Point List**: Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**.

Step 9 Set **Backup Data** column in **Data Configuration** to one or multiple backup data sources to be recovered based on service requirements. In the **Target Path** column, specify the target location after backup data recovery.

You are advised to set **Target Path** to a new path that is difference from the backup path.

Step 10 Click **Verify** to check whether the recovery task is configured correctly.

- If the queue name is incorrect, the verification fails.
- If the specified directory to be recovered does not exist, the verification fails.

Step 11 Click **OK** to save the settings.

Step 12 In the recovery task list, locate a created task and click **Start** in the **Operation** column to execute the recovery task.

- After the recovery is successful, the progress bar is in green.
- After the recovery is successful, the recovery task cannot be executed again.
- If the recovery task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

10.11.3.7 Recovering Hive Service Data

Scenario

Hive data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After an administrator performs

critical data adjustment in Hive, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

System administrators can create a recovery task in FusionInsight Manager to recover Hive data. Only manual recovery tasks are supported.

Hive backup and recovery cannot identify the service and structure relationships of objects such as Hive tables, indexes, and views. When executing backup and recovery tasks, the user needs to manage a unified recovery point based on the service scenario to ensure proper service running.

NOTICE

- Data recovery can be performed only when the system version is consistent with that of data backup.
- To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the Hive data that is generated after the data backup and before the data recovery will be lost.

Impact on the System

- During data recovery, user authentication stops and users cannot create new connections.
- After the data is recovered, the data produced between the backup time and restoration time is lost.
- After the data is recovered, the Hive upper-layer applications need to be started.

Prerequisites

- To restore data from the remote HDFS, you need to prepare the standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see **Configuring Cross-Manager Cluster Mutual Trust Relationships**. If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see **Enabling Cross-Cluster Replication**.
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Plan the database for storing recovered data tables, the HDFS save path of data tables, and the list of users who can access recovered data.
- The Hive backup file save path is correct.
- The Hive upper-layer applications are stopped.
- You have logged in to FusionInsight Manager. For details, see **Logging In to FusionInsight Manager**.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Backup and Restoration > Backup Management**.

Step 2 In the **Operation** column of a specified task in the task list, click **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.

  Select the correct item, and manually copy the full path of backup files in **Backup Path**.

Step 3 On FusionInsight Manager, choose **O&M** > **Backup and Restoration > Restoration Management**.

Step 4 Click **Create**.

Step 5 Set **Task Name** to the name of the recovery task.

Step 6 Select the cluster to be operated from **Recovery Object**.

Step 7 Select **Hive**.

Step 8 Set **Path Type** of **Hive** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

  If you select this value, you need to set the following parameters:

  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Source Path**: indicates the full path of the HDFS directory for storing standby cluster backup data. For example, ***backup path/backup task name_data source_task creation time/***.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution.
  - **Recovery Point List**: Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.

  - **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **NFS**: indicates that backup files are stored in the NAS over the NFS protocol.

  If you select NFS, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Source Path**: indicates the complete path of the backup file on the NAS server. For example, ***backup path/backup task name_data source_task creation time/***.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution.
  - **Recovery Point List**: Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **CIFS**: indicates that backup files are stored in the NAS over the CIFS protocol.

  If you select **CIFS**, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Port**: indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username**: Indicates the user name that is configured when setting the CIFS protocol.
  - **Password**: indicates the password that is configured when setting the CIFS protocol.
  - **Source Path**: indicates the complete path of the backup file on the NAS server. For example, ***backup path/backup task name_data source_task creation time/***.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution.
  - **Recovery Point List**: Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.

  - **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
- **SFTP**: Indicates that backup files are stored in the server using SFTP.

  If you select **SFTP**, set the following parameters:
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: Enter the IP address of the server where the backup data is stored.
  - **Port**: Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username**: Enter the username for connecting to the server using SFTP.
  - **Password**: Enter the password for connecting to the server using SFTP.
  - **Source Path**: Enter the full path of the backup file on the backup server. For example, ***backup path/backup task name_data source_task creation time/***.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution.
  - **Recovery Point List**: Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **1**.

Step 9 Set **Backup Data** in the **Data Configuration** to one or multiple backup data sources to be recovered based on service requirements. In the **Target Database** and **Target Path** columns, specify the target database and file save path after backup data recovery.

Configuration restrictions:

- Data can be recovered to the original database, but data tables must be stored in a new path that is difference from the backup path.
- To recover Hive index tables, select the Hive data tables that correspond to the Hive index tables to be recovered.
- If a new recovery directory is selected to avoid affecting the current data, HDFS permission must be manually granted so that users who have permission of backup tables can access this directory.
- Data can be recovered to other databases. In this case, HDFS permission must be manually granted so that users who have permission of backup tables can access the HDFS directory that corresponds to the database.

Step 10 Set **Force recovery** to **YES**, which indicates to forcibly recover all backup data when a data table with the same name already exists. If the data table contains new data added after backup, the new data will be lost after the data recovery. If you set the parameter to **NO**, the recovery task is not executed if a data table with the same name exists.

Step 11 Click **Verify** to check whether the recovery task is configured correctly.

- If the queue name is incorrect, the verification fails.
- If the specified directory to be recovered does not exist, the verification fails.
- If the forcibly replacement conditions are not met, the verification fails.

Step 12 Click **OK** to save the settings.

Step 13 In the recovery task list, locate a created task and click **Start** in the **Operation** column to execute the recovery task.

- After the recovery is successful, the progress bar is in green.
- After the recovery is successful, the recovery task cannot be executed again.
- If the recovery task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

10.11.3.8 Recovering Kafka Metadata

Scenario

Kafka metadata needs to be recovered in the following scenarios: Data is modified or deleted unexpectedly and needs to be restored; after an administrator performs a critical operation (such as upgrade and critical data adjustment) on ZooKeeper, an exception occurs or the operation has not achieved the expected result; all Kafka modules are faulty and become unavailable; data is migrated to a new cluster.

System administrators can create a recovery task in FusionInsight Manager to recover Kafka data. Only manual recovery tasks are supported.

NOTICE

- Data recovery can be performed only when the system version is consistent with that of data backup.
- To recover Kafka metadata when the service is running properly, you are advised to manually back up the latest Kafka metadata before recovery. Otherwise, the Kafka metadata that is generated after the data backup and before the data recovery will be lost.

Impact on the System

- After the metadata is recovered, the data generated between the backup point in time and the recovery point in time is lost.

- After the metadata is recovered, the offset information stored on ZooKeeper by Kafka consumers is restored to a previous state, resulting in repeated consumption.

Prerequisites

- To restore data from the remote HDFS, you need to prepare the standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see **Configuring Cross-Manager Cluster Mutual Trust Relationships**. If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see **Enabling Cross-Cluster Replication**.
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- The Kafka service is disabled first, and then enabled upon data recovery.
- You have logged in to FusionInsight Manager. For details, see **Logging In to FusionInsight Manager**.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Backup and Restoration > Backup Management**.

Step 2 In the **Operation** column of a specified task in the task list, click **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.

  Select the correct item, and manually copy the full path of backup files in **Backup Path**.

Step 3 On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

Step 4 Click **Create**.

Step 5 Set **Task Name** to the name of the recovery task.

Step 6 Select the cluster to be operated from **Recovery Object**.

Step 7 Select **Kafka** in **Restoration Configuration**.

NOTE

If there are multiple Kafka services, you can specify the Kafka to be recovered.

Step 8 Set **Path Type** of **Kafka** to a backup directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node.

  If you select this value, you need to set **Source Path** to select the backup file, for example, ***version_data source_task execution time.tar.gz***.

- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.

  If you select this value, you need to set the following parameters:

  - **Source Path**: indicates the full path of the backup file in HDFS, for example, ***backup path/backup task name_task creation time/version_data source_task execution time.tar.gz***.
  - **Source NameService Name**: indicates the NameService name that corresponds to the backup directory when the recovery task is executed. The default value is **hacluster**.

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

  If you select this value, you need to set the following parameters:

  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Source Path**: indicates the full path of the HDFS directory for storing standby cluster backup data. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time.tar.gz***.
  - **Queue Name**: indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.

- **NFS**: indicates that backup files are stored in the NAS over the NFS protocol.

  If you select NFS, set the following parameters:

  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Source Path**: indicates the complete path of the backup file on the NAS server. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time*.tar.gz.**

- **CIFS**: indicates that backup files are stored in the NAS over the CIFS protocol.

  If you select **CIFS**, set the following parameters:

  - **IP Mode**: mode of the target IP address.The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Port**: indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username**: Indicates the user name that is configured when setting the CIFS protocol.
  - **Password**: indicates the password that is configured when setting the CIFS protocol.
  - **Source Path**: indicates the complete path of the backup file on the NAS server. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time*.tar.gz.**
- **OBS**: indicates that the backup files are stored in the OBS directory.

  If you select this value, you need to set the following parameters:

  - **Source Path**: indicates the full path for storing backup data in OBS. For example, ***backup path/backup task name_data source_task creation time/version_data source_task execution time.tar.gz***.

    NOTE

    MRS 3.1.0 and later versions support saving backup files to OBS.

Step 9 Click **OK** to save the settings.

Step 10 In the recovery task list, locate a created task and click **Start** in the **Operation** column to execute the recovery task.

- After the recovery is successful, the progress bar is in green.
- After the recovery is successful, the recovery task cannot be executed again.
- If the recovery task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

10.11.4 Enabling Cross-Cluster Replication

Scenario

DistCp is used to replicate the data stored in HDFS from a cluster to another cluster. DistCp depends on the cross-cluster replication function, which is disabled by default. You need to enable it for both clusters.

This section describes how to modify parameters on FusionInsight Manager to enable the cross-cluster replication function. After this function is enabled, you can create a backup task for backing up data to the remote HDFS (RemoteHDFS).

Impact on the System

Yarn needs to be restarted to enable the cross-cluster replication function and cannot be accessed during restart.

Prerequisites

- The **hadoop.rpc.protection** parameter of HDFS in the two clusters for data replication must use the same data transmission mode. The default value is **privacy**, indicating encrypted transmission. The value **authentication** indicates that transmission is not encrypted.
- For clusters in security mode, you need to configure mutual trust between clusters.

Procedure

Step 1 Log in to FusionInsight Manager of one of the two clusters.

Step 2 Choose **Cluster** > ***Name of the desired cluster*** **> Services** > **Yarn** > **Configurations**, and click **All Configurations**.

Step 3 In the navigation pane, choose **Yarn** > **Distcp**.

Step 4 Modify **dfs.namenode.rpc-address**, set **haclusterX.remotenn1** to the service IP address and RPC port of one NameNode instance of the peer cluster, and set **haclusterX.remotenn2** to the service IP address and RPC port number of the other NameNode instance of the peer cluster.

haclusterX.remotenn1 and **haclusterX.remotenn2** do not distinguish active and standby NameNodes. The default NameNode RPC port is 8020 and cannot be modified on Manager.

Examples of modified parameter values: **10.1.1.1:8020** and **10.1.1.2:8020**.

NOTE

- If data of the current cluster needs to be backed up to the HDFS of multiple clusters, you can configure the corresponding NameNode RPC addresses to haclusterX1, haclusterX2, haclusterX3, and haclusterX4.

Step 5 Click **Save**. In the confirmation dialog box, click **OK**.

Step 6 Restart the Yarn service.

Step 7 Log in to FusionInsight Manager of the other cluster and repeat **Step 2** to **Step 6**.

----End

10.11.5 Managing Local Quick Recovery Tasks

Scenario

When DistCp is used to back up data, the backup snapshot is saved to HDFS of the active cluster. FusionInsight Manager supports using the local snapshot for quick data recovery, requiring less time than recovering data from the standby cluster.

Use FusionInsight Manager and the snapshots on HDFS of the active cluster to create a local quick recovery task and execute the task.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Backup and Restoration** > **Backup Management**.

Step 2 In the backup task list, locate a created task and click **Restore** in the **Operation** column.

Step 3 Check whether the system displays **No data is available for quick restoration. Create a task on the restoration management page to restore data**.

- If yes, click **OK** to close the dialog box. No backup data snapshot is created in the active cluster, and no further action is required.
- If no, go to **Step 4** to create a local quick recovery task.

  NOTE

  Metadata does not support quick restoration.

Step 4 Set **Name** to the name of the local quick recovery task.

Step 5 Set **Configuration** to a data source.

Step 6 Set **Recovery Point List** to a recovery point that contains the backup data.

Step 7 Set **Queue Name** to the name of the Yarn queue used in the task execution. The name must be the same as the name of the queue that is running properly in the cluster.

Step 8 Set **Data Configuration** to the object to be recovered.

Step 9 Click **Verify**. After "The restoration task configuration is verified successfully." is displayed, click **OK**.

Step 10 Click **OK**.

Step 11 In the recovery task list, locate a created task and click **Start** in the **Operation** column to execute the recovery task.

After the task is complete, **Task Status** of the task is displayed as **Successful**.

----End

10.11.6 Modifying a Backup Task

Scenario

Modify the parameters of a created backup task on FusionInsight Manager to meet changing service requirements. The parameters of recovery tasks can only be viewed but cannot be modified.

Impact on the System

After a backup task is modified, the new parameters take effect when the task is executed next time.

Prerequisites

- A backup task has been created.
- A new backup task policy has been planned based on the actual situation.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Backup and Restoration** > **Backup Management**.

Step 2 In the task list, locate a specified task, click **Configure** in the **Operation** column to go to the configuration modification page.

On the displayed page, modify the following parameters:

- **Started**
- **Period**
- **Destination NameService Name**
- **Target NameNode IP Address**
- **Target Path**
- **Maximum Number of Backup Copies**
- **Maximum Number of Recovery Points**
- **Maximum Number of Maps**
- **Maximum Bandwidth of a Map**

NOTE

After the **Target Path** parameter of a backup task is modified, this task will be performed as a full backup task for the first time by default.

Step 3 Click **OK** to save the settings.

----End

10.11.7 Viewing Backup and Recovery Tasks

Scenario

On FusionInsight Manager, view created backup and recovery tasks and check their running status.

Prerequisites

You have logged in to FusionInsight Manager. For details, see Logging In to the Management System.

Procedure

Step 1 On FusionInsight Manager, choose **O&M > Backup and Restoration**.

Step 2 Click **Backup Management** or **Restoration Management**.

Step 3 In the task list, obtain the previous execution result in the **Task Status** and **Task Progress** column. Green indicates that the task is executed successfully, and red indicates that the execution fails.

Step 4 In the task list, locate a specified task and choose **More > View History** or **click View History** in the **Operation** column to display historical records of backup and recovery task execution.

In the displayed window, click before a specified record to display log information about the execution.

----End

Related Tasks

- Starting Backup and Recovery Tasks

  In the task list, locate a specified task and choose **More** > **Back Up Now** or click **Start** in the **Operation** column to start a backup or recovery task that is ready or fails to be executed. Executed recovery tasks cannot be repeatedly executed.

- Stopping Backup and Recovery Tasks

  In the task list, locate a specified task and choose **More** > **Stop** or click **Stop** in the **Operation** column to start a backup or recovery task that is running. After the task is successfully stopped, its **Task Status** changes to **Stopped**.

- Deleting Backup and Recovery Tasks

  In the task list, locate a specified task and choose **More** > **Delete** or click **Delete** in the **Operation** column to delete a backup or recovery task. Backup data will be reserved by default after a task is deleted.

- Suspending Backup Tasks

  In the task list, locate a specified task and choose **More** > **Suspend** in the **Operation** column to suspend a backup task. Only periodic backup tasks can be suspended. Suspended backup tasks are no longer executed automatically. When you suspend a backup task that is being executed, the task execution stops. To Resume a task, choose **More** > **Resume**.

10.12 Security Management

10.12.1 Security Overview

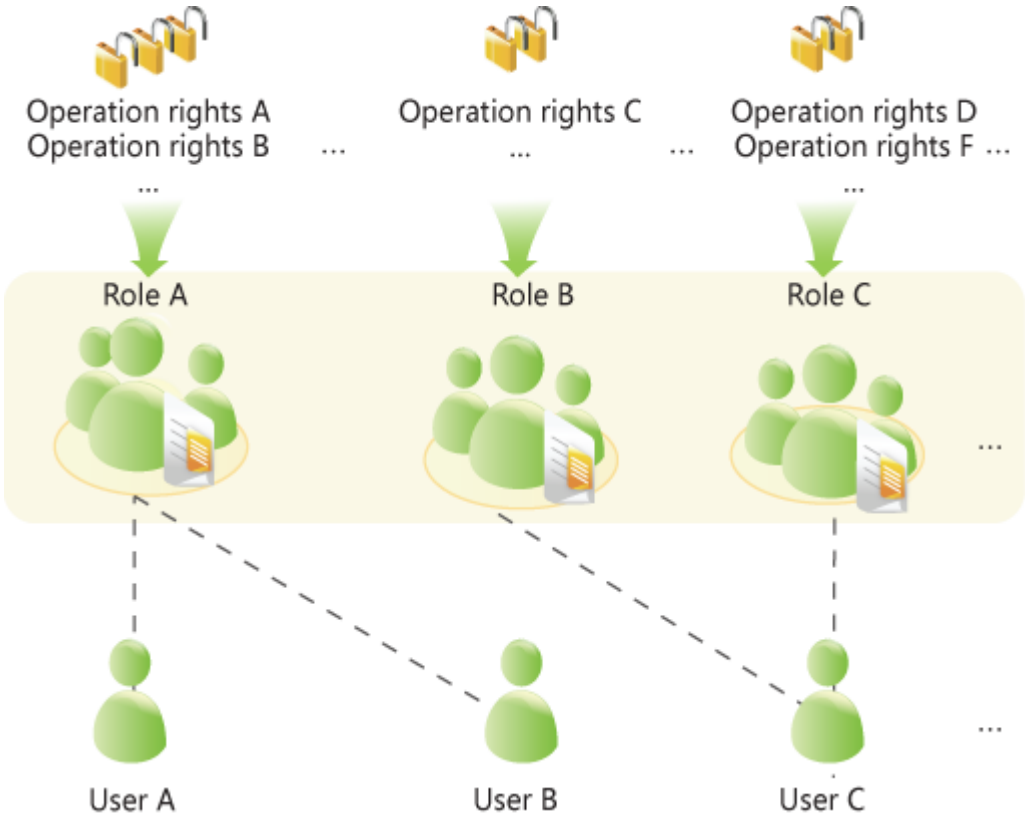
10.12.1.1 Rights Model

Role-based Access Control

FusionInsight adopts the role-based access control (RBAC) mode to perform rights management on the big data system. It integrates the rights management functions of the components to centrally manage rights. Common users are shielded from internal rights management details, and administrators' rights management operations are simplified, improving rights management usability and user experience.

The rights model of FusionInsight is "users-user groups-roles-rights".

Figure 10-21 Rights model



- **Rights**

  Rights are defined by components and allow users to access resources of components. Different components have different rights for their resources.

  Example:

  – HDFS provides read, write, and execute permissions on file resources.

  – HBase provides create, write, and read permissions on table resources.

- **Role**

  Role is a collection of component rights. Each role can have multiple rights of multiple components. Different roles can have the rights of a resource of one component.

- **User group**

  User group is a collection of users. When a user group is bound to a role, users in this group obtain the rights defined by the role.

  Different user groups can be associated with the same role, and a user group can be associated with no role. In principle, the user group does not have the rights of any component resources.

  NOTE

  In some components, the system grants related rights to specific user groups by default.

- **User**

  Users are visitors to the system. Each user has the rights of the user group and role associated with the user. Users need to be added to the user group or associated roles to obtain the corresponding rights.

Policy-based Access Control

The Ranger component uses policy-based access control (PBAC) to manage permissions and implement fine-grained data access control on components such as HDFS, Hive, and HBase.

NOTE

The component supports only one permission control mechanism. After the Ranger permission control policy is enabled for the component, the permission on the component in the role created on FusionInsight Manager becomes invalid (The ACL rules of HDFS and Yarn components still take effect). You need to add a policy on the Ranger management page to grant permissions on resources.

The ranger permission model consists of multiple permission policies. The permission policies are as follows:

- **Resource**

  Objects provided by components for users to access, such as HDFS files or folders, queues in Yarn, and databases, tables, and columns in Hive.

- **User**

  Indicates the user who accesses the system. The rights of each user are obtained based on the policy associated with the user. Information about users, user groups, and roles in the LDAP is periodically synchronized to the Ranger.

- **Permission**

  In a policy, you can configure various access conditions for resources, such as file read/write, permission conditions, rejection conditions, and exception conditions.

10.12.1.2 Rights Mechanism

FusionInsight adopts the Lightweight Directory Access Protocol (LDAP) to store data of users and user groups. Information about role definitions is stored in the relational database and the mapping between roles and rights is saved in components.

FusionInsight uses Kerberos for unified authentication.

The verification process of user rights is as follows:

1. A client (a user terminal or FusionInsight component service) invokes the FusionInsight authentication interface.
2. FusionInsight uses the login username and password for Kerberos authentication.
3. If the authentication succeeds, the client sends a request for accessing the server (a FusionInsight component service).
4. The server finds the user group and role to which the login user belongs.

5. The server obtains all rights of the user group and the role.
6. The server determines whether the client has the permission to access the resources it applies for.

Example (RBAC):

There are three files in HDFS, fileA, fileB, and fileC.

- roleA has read and write permissions for fileA and roleB has the read permission for fileB.
- groupA is bound to roleA and groupB is bound to roleB.
- userA belongs to groupA and roleB, and userB belongs to groupB.

When userA successfully logs in to the system and accesses HDFS:

1. HDFS obtains the role (roleB) to which userA is bound.
2. HDFS also obtains the role (roleA) to which the user group of userA is bound.
3. In this case, userA has all the rights of roleA and roleB.
4. As a result, userA has read and write permissions for fileA, has the read permission on fileB, and has no permission for fileC.

Similarly, when userB successfully logs in to the system and accesses HDFS:

1. userB only has the rights of roleB.
2. As a result, userB has the read permission on fileB, and has no permissions for fileA and fileC.

10.12.1.3 Authentication Policies

The big data platform performs user identity authentication to prevent invalid users from accessing the cluster. The cluster provides authentication capabilities in both Security Mode and Normal mode.

Security Mode

The cluster in Security Mode uses the Kerberos authentication protocol to perform security authentication. The Kerberos protocol supports mutual authentication between the client and the server. This improves security and eliminates the security risks causes by using the network to send user credentials to simulate authentication. In cluster, KrbServer service provides Kerberos authentication support.

Kerberos user object

In the Kerberos protocol, a user object is a principal. A complete user object consists of a username and domain name. In O&M management or application development scenarios, a user can connect to the cluster server only after the user is authenticated on the client. In O&M and service scenarios, **Human-machine** and **Machine-machine** users are used. The difference between **Human-machine** and **Machine-machine** users is that the passwords of **Machine-machine** users are randomly generated by the system.

Kerberos authentication

The Kerberos authentication supports two modes: password authentication mode and keytab authentication mode. The validity period of authentication is 24 hours by default.

- Password authentication: Identity authentication is performed by entering the correct password of a user. This mode is mainly used in O&M management scenarios where **Human-machine** users are used. The command is **kinit** *Username*.
- Keytab authentication: The keytab file includes the user principal and encryption information of user credentials. When the keytab file is used for authentication, the system automatically uses encrypted credential information to perform authentication and the user password does not need to be entered. This mode is mainly used in component application development scenarios where **Machine-machine** users are used. The keytab file can also be used in the **kinit** command.

Normal Mode

When the cluster is in Normal Mode, different components use different open-source authentication mechanisms, and the **kinit** authentication command is not supported. FusionInsight Manager (including DBService, KrbServer, and LdapServer) uses the username and password authentication mode. **Table 10-80** lists the authentication mechanisms used by components.

Table 10-80 Component authentication modes

Service	Authentication Mode
CDL	No authentication
ClickHouse	Simple authentication
Flume	No authentication
HBase	• WebUI: No authentication • Client: Simple authentication
HDFS	• WebUI: No authentication • Client: Simple authentication
Hive	Simple authentication
Hue	Username and password authentication
Kafka	No authentication
Loader	• WebUI: Username and password authentication • Client: No authentication
Mapreduce	• WebUI: No authentication • Client: No authentication
Oozie	• WebUI: Username and password authentication • Client: Simple authentication

Service	Authentication Mode
Spark2x	• WebUI: No authentication • Client: Simple authentication
Storm	No authentication
Yarn	• WebUI: No authentication • Client: Simple authentication
ZooKeeper	Simple authentication

The authentication modes are described as follows:

- **Simple authentication**: During the connection from the client to the server, the execution user on the client (such as the OS user **root** or **omm**) is used for automatic authentication by default. Administrators or service users are unaware of the authentication and do not need to run the **kinit** command to perform the authentication.
- **Username and password authentication**: The usernames and passwords of **Human-machine** users are used for authentication.
- **No authentication**: Any user can access the server by default.

10.12.1.4 Permission Verification Policies

Security Mode

After a user is authenticated by the big data platform, the system determines whether to verify the user's permission based on the actual permission management configuration to ensure that the user has limited or all permission on resources. If the user does not have sufficient permission, the user can access resources only after the system administrator grant related permission on each component to the user. The cluster provides permission verification capabilities in both Security Mode and Normal Mode. Permission on components is the same in the two modes.

By default, the Ranger service is installed and Ranger authentication is enabled for a newly installed cluster in security mode. You can set fine-grained security access policies for accessing component resources through the permission plug-in of the component. If Ranger authentication is not required, the administrator can manually disable Ranger authentication on the service page. After Ranger authentication is disabled, the system continues to perform permission control based on the role model of FusionInsight Manager when accessing component resources.

In a cluster in security mode, the following components support Ranger authentication: HDFS, Yarn, Kafka, Hive, HBase, Storm, Spark2x, Impala.

In a cluster upgraded from an earlier version, Ranger authentication is not used by default when users access component resources. The administrator can manually enable Ranger authentication after installing the Ranger service.

By default, all components in the cluster in Security Mode perform permission verification on access in a unified manner, and the permission verification function cannot be disabled.

Normal Mode

Different components in the cluster in Normal Mode use different open-source permission verification behavior. **Table 10-81** lists detailed permission verification mechanisms.

In a cluster in non-security mode, the Ranger supports permission control on component resources based on OS users. The following components support Ranger authentication: HBase, HDFS, Hive, Spark2x, and Yarn.

Table 10-81 Component permission verification modes in Normal Mode

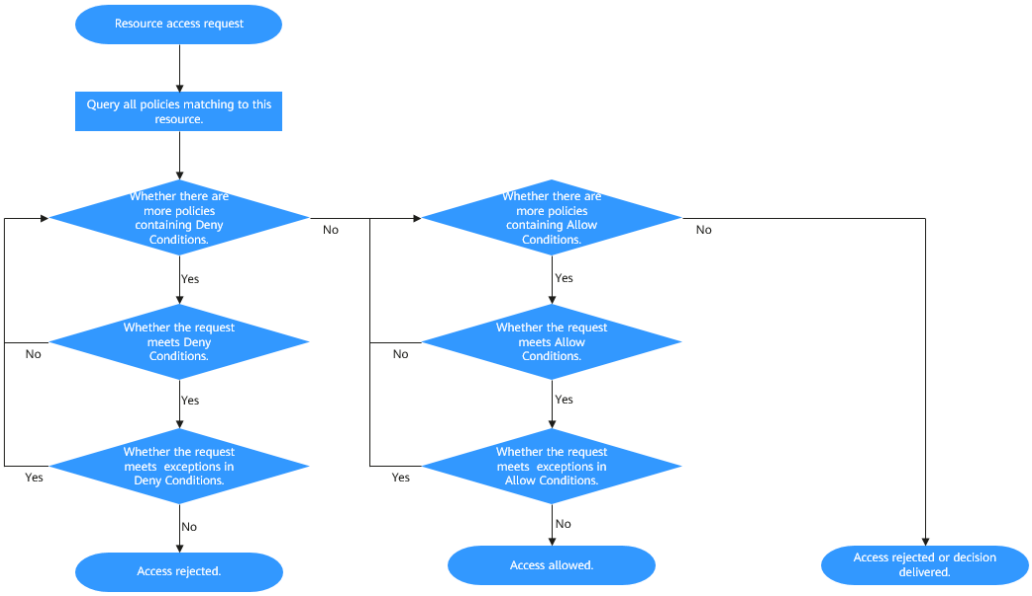
Service	Permission Verification	Permission Verification Enabling and Disabling
ClickHouse	Required	Not supported
Flume	Not required	Not supported
HBase	Not required	Supported
HDFS	Required	Supported
Hive	Not required	Not supported
Hue	Not required	Not supported
Kafka	Not required	Not supported
Loader	Not required	Not supported
Mapreduce	Not required	Not supported
Oozie	Required	Not supported
Spark2x	Not required	Not supported
Storm	Not required	Not supported
Yarn	Not required	Supported
ZooKeeper	Required	Supported

Condition Priorities of the Ranger Permission Policy

When configuring a permission policy for a resource, you can configure Allow Conditions, Exclude from Allow Conditions, Deny Conditions, and Exclude from Deny Conditions for the resource, to meet unexpected requirements in different scenarios.

The priorities of different conditions are listed in descending order: Exclude from Deny Conditions > Deny Conditions > Exclude from Allow Conditions > Allow Conditions

The following figure shows the process of determining condition priorities. If the component resource request does not match the permission policy in Ranger, the system rejects the access by default. However, for HDFS and Yarn, the system delivers the decision to the access control layer of the component for determination.



For example, if you want to grant the read and write permissions of the **FileA** folder to the **groupA** user group, but the user in the group is not **UserA**, you can add an allowed condition and an exception condition.

10.12.1.5 User Account List

User Classification

The MRS cluster provides the following three types of users. The system administrator needs to periodically change the passwords. It is not recommended to use the default passwords.

NOTE

This section describes the default users in the MRS cluster.

User Type	Description
System users	• User created on FusionInsight Manager for O&M and service scenarios. There are two types of users: – **Human-machine** user: used in scenarios such as FusionInsight Manager O&M and operations on a component client. When creating a user of this type, you need to set password and confirm password by referring to **Creating a User**. – **Machine-machine** user: used for system application development. • User who runs OMS processes

User Type	Description
Internal system users	Internal user to perform Kerberos authentication, process communications, save user group information, and associate user permissions. It is recommended that internal system users not be used in O&M scenarios. Operations can be performed as user **admin** or another user created by the system administrator based on service requirements.
Database users	• User who manages OMS database and accesses data • User who runs service components (Hue, Hive, Loader, Oozie, Ranger, and DBService) in the database.

System Users

NOTE

- User **root** of the OS is required, the password of user **root** on all nodes must be the same.
- User **ldap** of the OS is required. Do not delete this account. Otherwise, the cluster may not work properly. The OS administrator maintains the password management policies.

User Type	Username	Initial Password	Description	Password Change Method
System administrator	admin	User-defined password	FusionInsight Manager administrator. **NOTE** By default, user **admin** does not have the management permission on other components. For example, when accessing the native UI of a component, the user fails to access the complete component information due to insufficient management permission on the component.	For details, see **Changing the Password for User admin**.

User Type	Username	Initial Password	Description	Password Change Method
Node OS user	ommdba	Random password	User that creates the system database. This user is an OS user generated on the management node and does not require a unified password. This account cannot be used for remote login.	For details, see **Changing the Password for an OS User**.
	omm	Bigdata123@	Internal running user of the system. This user is an OS user generated on all nodes and does not require a unified password.	

Internal System Users

User Type	Default User	Initial Password	Description	Password Change Method
Kerberos administrator	kadmin/admin	Admin@123	Used to add, delete, modify, and query user accounts on Kerberos.	For details, see **Changing the Password for the Kerberos Administrator**.
OMS Kerberos administrator	kadmin/admin	Admin@123	Used to add, delete, modify, and query user accounts on OMS Kerberos.	For details, see **Changing the Password for the OMS Kerberos Administrator**.
LDAP administrator	cn=root,dc=hadoop,dc=com	LdapChangeMe@123	Used to add, delete, modify, and query the user account information on LDAP.	For details, see **Changing the Passwords of the LDAP Administrator and the LDAP User (Including OMS LDAP)**.

User Type	Default User	Initial Password	Description	Password Change Method
OMS LDAP administrator	cn=root,dc=hadoop,dc=com	LdapChangeMe@123	Used to add, delete, modify, and query the user account information on OMS LDAP.	
LDAP user	cn=pg_search_dn,ou=Users,dc=hadoop,dc=com	Randomly generated by the system	Used to query information about users and user groups on LDAP.	
OMS LDAP user	cn=pg_search_dn,ou=Users,dc=hadoop,dc=com	Randomly generated by the system	Used to query information about users and user groups on OMS LDAP.	
LDAP administrator account	cn=krbkdc,ou=Users,dc=hadoop,dc=com	LdapChangeMe@123	Used to query Kerberos component authentication account information.	For details, see **Changing the Password for the LDAP Administrator**.
	cn=krbadmin,ou=Users,dc=hadoop,dc=com	LdapChangeMe@123	Used to add, delete, modify, and query Kerberos component authentication account information.	

User Type	Default User	Initial Password	Description	Password Change Method
Component running user	hdfs	Hdfs@123	This user is the HDFS system administrator and has the following permissions: 1. File system operation permissions: • Views, modifies, and creates files. • Views and creates directories. • Views and modifies the groups where files belong. • Views and sets disk quotas for users. 2. HDFS management operation permissions: • Views the web UI status. • Views and sets the active and standby HDFS status. • Enters and exits the HDFS in security mode. • Checks the HDFS file system. 3. Logs in to the FTP service page.	For details, see **Changing the Password for a Component Running User**.

User Type	Default User	Initial Password	Description	Password Change Method
	hbase	Hbase@123	This user is the HBase and HBase1 to HBase4 system administrator and has the following permissions: ● Cluster management permission: Performs **Enable** and **Disable** operations on tables to trigger MajorCompact and ACL operations. ● Grants and revokes permissions, and shuts down the cluster. ● Table management permission: Creates, modifies, and deletes tables. ● Data management permission: Reads data in tables, column families, and columns. ● Logs in to the HMaster web UI. ● Logs in to the FTP service page.	

User Type	Default User	Initial Password	Description	Password Change Method
	mapred	Mapred@123	This user is the MapReduce system administrator and has the following permissions: ● Submits, stops, and views the MapReduce tasks. ● Modifies the Yarn configuration parameters. ● Logs in to the FTP service page. ● Logs in to the Yarn web UI.	
	zookeeper	ZooKeeper@123	This user is the ZooKeeper system administrator and has the following permissions: ● Adds, deletes, modifies, and queries all nodes in ZooKeeper. ● Modifies and queries quotas of all nodes in ZooKeeper.	
	rangeradmin	Rangeradmin@123	This user has the Ranger system management permissions and user permissions: ● Ranger web UI management permission ● Management permission of each component that uses Ranger authentication	
	rangeraudit	Rangerauditor@123	Default audit user of the Ranger system.	

User Type	Default User	Initial Password	Description	Password Change Method
	hive	Hive@123	This user is the Hive system administrator and has the following permissions: 1. Hive administrator permissions: ● Creates, deletes, and modifies a database. ● Creates, queries, modifies, and deletes a table. ● Queries, inserts, and uploads data. 2. HDFS file operation permissions: ● Views, modifies, and creates files. ● Views and creates directories. ● Views and modifies the groups where files belong. 3. Submits and stops the MapReduce tasks. 4. Ranger policy management permission	

User Type	Default User	Initial Password	Description	Password Change Method
	hive1	Hive1@123	This user is the Hive1 system administrator and has the following permissions: 1. Hive1 administrator permissions: ● Creates, deletes, and modifies a database. ● Creates, queries, modifies, and deletes a table. ● Queries, inserts, and uploads data. 2. HDFS file operation permissions: ● Views, modifies, and creates files. ● Views and creates directories. ● Views and modifies the groups where files belong. 3. Submits and stops the MapReduce tasks. 4. Ranger policy management permission	

User Type	Default User	Initial Password	Description	Password Change Method
	hive2	Hive2@123	This user is the Hive2 system administrator and has the following permissions: 1. Hive2 administrator permissions: ● Creates, deletes, and modifies a database. ● Creates, queries, modifies, and deletes a table. ● Queries, inserts, and uploads data. 2. HDFS file operation permissions: ● Views, modifies, and creates files. ● Views and creates directories. ● Views and modifies the groups where files belong. 3. Submits and stops the MapReduce tasks. 4. Ranger policy management permission	

User Type	Default User	Initial Password	Description	Password Change Method
	hive3	Hive3@123	This user is the Hive3 system administrator and has the following permissions: 1. Hive3 administrator permissions: ● Creates, deletes, and modifies a database. ● Creates, queries, modifies, and deletes a table. ● Queries, inserts, and uploads data. 2. HDFS file operation permissions: ● Views, modifies, and creates files. ● Views and creates directories. ● Views and modifies the groups where files belong. 3. Submits and stops the MapReduce tasks. 4. Ranger policy management permission	

User Type	Default User	Initial Password	Description	Password Change Method
	hive4	Hive4@123	This user is the Hive4 system administrator and has the following permissions: 1. Hive4 administrator permissions: ● Creates, deletes, and modifies a database. ● Creates, queries, modifies, and deletes a table. ● Queries, inserts, and uploads data. 2. HDFS file operation permissions: ● Views, modifies, and creates files. ● Views and creates directories. ● Views and modifies the groups where files belong. 3. Submits and stops the MapReduce tasks. 4. Ranger policy management permission	

User Type	Default User	Initial Password	Description	Password Change Method
	kafka	Kafka@123	This user is the Kafka system administrator and has the following permissions: ● Creates, deletes, produces, and consumes the topic; modifies the topic configuration. ● Controls the cluster metadata, modifies the configuration, migrates the replica, elects the leader, and manages ACL. ● Submits, queries, and deletes the consumer group offset. ● Queries the delegation token. ● Queries and submits the transaction.	
	storm	Admin@123	Storm system administrator User permission: Submits Storm tasks.	
	rangerusersync	Randomly generated by the system	Synchronizes users and internal users of user groups.	
	rangertagsync	Randomly generated by the system	Internal user for synchronizing tags.	

User Type	Default User	Initial Password	Description	Password Change Method
	oms/ manager	Randomly generated by the system	Controller and NodeAgent authentication user. The user has the permission on the **supergroup** group.	
	backup/ manager	Randomly generated by the system	User for running backup and restoration tasks. The user has the permission on the **supergroup**, **wheel**, and **ficommon** groups. After cross-system mutual trust is configured, the user has the permission to access data in the HDFS, HBase, Hive, and ZooKeeper systems.	

User Type	Default User	Initial Password	Description	Password Change Method
	hdfs/ hadoop.*<System domain name>*	Randomly generated by the system	This user is used to start the HDFS and has the following permissions: 1. File system operation permissions: ● Views, modifies, and creates files. ● Views and creates directories. ● Views and modifies the groups where files belong. ● Views and sets disk quotas for users. 2. HDFS management operation permissions: ● Views the web UI status. ● Views and sets the active and standby HDFS status. ● Enters and exits the HDFS in security mode. ● Checks the HDFS file system. 3. Logs in to the FTP service page.	

User Type	Default User	Initial Password	Description	Password Change Method
	mapred/hadoop.*<System domain name>*	Randomly generated by the system	This user is used to start the MapReduce and has the following permissions: ● Submits, stops, and views the MapReduce tasks. ● Modifies the Yarn configuration parameters. ● Logs in to the FTP service page. ● Logs in to the Yarn web UI.	
	mr_zk/hadoop.*<System domain name>*	Randomly generated by the system	Used for MapReduce to access ZooKeeper.	
	hbase/hadoop.*<System domain name>*	Randomly generated by the system	User for the authentication between internal components during the HBase system startup.	
	hbase/zkclient.*<System domain name>*	Randomly generated by the system	User for HBase to perform ZooKeeper authentication in a security mode cluster.	
	thrift/hadoop.*<System domain name>*	Randomly generated by the system	ThriftServer system startup user.	

User Type	Default User	Initial Password	Description	Password Change Method
	thrift/*<hostname>*	Randomly generated by the system	User for the ThriftServer system to access HBase. This user has the read, write, execution, creation, and administration permission on all NameSpaces and tables of HBase. *<hostname>* indicates the name of the host where the ThriftServer node is installed in the cluster.	

User Type	Default User	Initial Password	Description	Password Change Method
	hive/hadoop.*<System domain name>*	Randomly generated by the system	User for the authentication between internal components during the Hive system startup. The user permissions are as follows: 1. Hive administrator permissions: ● Creates, deletes, and modifies a database. ● Creates, queries, modifies, and deletes a table. ● Queries, inserts, and uploads data. 2. HDFS file operation permissions: ● Views, modifies, and creates files. ● Views and creates directories. ● Views and modifies the groups where files belong. 3. Submits and stops the MapReduce tasks.	

User Type	Default User	Initial Password	Description	Password Change Method
	hive1/ hadoop.*<System domain name>*	Randomly generated by the system	User for the authentication between internal components during the Hive1 system startup. The user permissions are as follows: 1. Hive1 administrator permissions: ● Creates, deletes, and modifies a database. ● Creates, queries, modifies, and deletes a table. ● Queries, inserts, and uploads data. 2. HDFS file operation permissions: ● Views, modifies, and creates files. ● Views and creates directories. ● Views and modifies the groups where files belong. 3. Submits and stops the MapReduce tasks.	

User Type	Default User	Initial Password	Description	Password Change Method
	hive2/hadoop.*<System domain name>*	Randomly generated by the system	User for the authentication between internal components during the Hive2 system startup. The user permissions are as follows: 1. Hive2 administrator permissions: ● Creates, deletes, and modifies a database. ● Creates, queries, modifies, and deletes a table. ● Queries, inserts, and uploads data. 2. HDFS file operation permissions: ● Views, modifies, and creates files. ● Views and creates directories. ● Views and modifies the groups where files belong. 3. Submits and stops the MapReduce tasks.	

User Type	Default User	Initial Password	Description	Password Change Method
	hive3/hadoop.*<System domain name>*	Randomly generated by the system	User for the authentication between internal components during the Hive3 system startup. The user permissions are as follows: 1. Hive3 administrator permissions: ● Creates, deletes, and modifies a database. ● Creates, queries, modifies, and deletes a table. ● Queries, inserts, and uploads data. 2. HDFS file operation permissions: ● Views, modifies, and creates files. ● Views and creates directories. ● Views and modifies the groups where files belong. 3. Submits and stops the MapReduce tasks.	

User Type	Default User	Initial Password	Description	Password Change Method
	hive4/hadoop.*<System domain name>*	Randomly generated by the system	User for the authentication between internal components during the Hive4 system startup. The user permissions are as follows: 1. Hive4 administrator permissions: ● Creates, deletes, and modifies a database. ● Creates, queries, modifies, and deletes a table. ● Queries, inserts, and uploads data. 2. HDFS file operation permissions: ● Views, modifies, and creates files. ● Views and creates directories. ● Views and modifies the groups where files belong. 3. Submits and stops the MapReduce tasks.	
	loader/hadoop.*<System domain name>*	Randomly generated by the system	User for Loader system startup and Kerberos authentication	

User Type	Default User	Initial Password	Description	Password Change Method
	HTTP/*<hostname>*	Randomly generated by the system	Used to connect to the HTTP interface of each component. *<hostname>* indicates the host name of a node in the cluster.	
	hue	Randomly generated by the system	User for Hue system startup, Kerberos authentication, and HDFS and Hive access	
	flume	Randomly generated by the system	User for Flume system startup and HDFS and Kafka access. The user has read and write permission of the HDFS directory **/flume**.	
	flume_server	Randomly generated by the system	User for Flume system startup and HDFS and Kafka access. The user has read and write permission of the HDFS directory **/flume**.	
	spark2x/hadoop.*<System domain name>*	Randomly generated by the system	This user is the Spark2x system administrator and has the following user permissions: 1. Starts the Spark2x service. 2. Submits Spark2x tasks.	
	spark_zk/hadoop.*<System domain name>*	Randomly generated by the system	Used for Spark2x to access ZooKeeper.	

User Type	Default User	Initial Password	Description	Password Change Method
	spark2x1/hadoop.*<System domain name>*	Randomly generated by the system	This user is the Spark2x1 system administrator and has the following user permissions: 1. Starts the Spark2x1 service. 2. Submits Spark2x tasks.	
	spark2x2/hadoop.*<System domain name>*	Randomly generated by the system	This user is the Spark2x2 system administrator and has the following user permissions: 1. Starts the Spark2x2 service. 2. Submits Spark2x tasks.	
	spark2x3/hadoop.*<System domain name>*	Randomly generated by the system	This user is the Spark2x3 system administrator and has the following user permissions: 1. Starts the Spark2x3 service. 2. Submits Spark2x tasks.	
	spark2x4/hadoop.*<System domain name>*	Randomly generated by the system	This user is the Spark2x4 system administrator and has the following user permissions: 1. Starts the Spark2x4 service. 2. Submits Spark2x tasks.	
	zookeeper/hadoop.*<System domain name>*	Randomly generated by the system	ZooKeeper system startup user.	

User Type	Default User	Initial Password	Description	Password Change Method
	zkcli/hadoop.*<System domain name>*	Randomly generated by the system	ZooKeeper server login user.	
	oozie	Randomly generated by the system	User for Oozie system startup and Kerberos authentication.	
	kafka/hadoop.*<System domain name>*	Randomly generated by the system	Used for security authentication of Kafka.	
	storm/hadoop.*<System domain name>*	Randomly generated by the system	Storm system startup user.	
	storm_zk/hadoop.*<System domain name>*	Randomly generated by the system	Used for the Worker process to access ZooKeeper.	
	flink/hadoop.*<System domain name>*	Randomly generated by the system	Internal user of the Flink service.	
	check_ker_M	Randomly generated by the system	User who performs a system internal test about whether the Kerberos service is normal.	
	tez	Randomly generated by the system	User for TezUI system startup, Kerberos authentication, and access to Yarn	

User Type	Default User	Initial Password	Description	Password Change Method
	K/M	Randomly generated by the system	Kerberos internal functional user. This user cannot be deleted, and its password cannot be changed. This internal account can only be used on nodes where Kerberos service is installed.	None
	kadmin/changepw	Randomly generated by the system		
	kadmin/history	Randomly generated by the system		
	krbtgt<*System domain name*>	Randomly generated by the system		
LDAP user	admin	None	FusionInsight Manager administrator. The primary group is **compcommon**, which does not have the group permission but has the permission of the **Manager_administrator** role.	The LDAP user cannot log in to the system, and the password cannot be changed.
	backup		The primary group is **compcommon**.	
	backup/manager		The primary group is **compcommon**.	
	oms		The primary group is **compcommon**.	
	oms/manager		The primary group is **compcommon**.	
	clientregister		The primary group is **compcommon**.	

User Type	Default User	Initial Password	Description	Password Change Method
	zookeeper		The primary group is **hadoop**.	
	zookeeper/hadoop.*<System domain name>*		The primary group is **hadoop**.	
	zkcli		The primary group is **hadoop**.	
	zkcli/hadoop.*<System domain name>*		The primary group is **hadoop**.	
	flume		The primary group is **hadoop**.	
	flume_server		The primary group is **hadoop**.	
	hdfs		The primary group is **hadoop**.	
	hdfs/hadoop.*<System domain name>*		The primary group is **hadoop**.	
	mapred		The primary group is **hadoop**.	
	mapred/hadoop.*<System domain name>*		The primary group is **hadoop**.	
	mr_zk		The primary group is **hadoop**.	
	mr_zk/hadoop.*<System domain name>*		The primary group is **hadoop**.	

User Type	Default User	Initial Password	Description	Password Change Method
	hue		The primary group is **supergroup**.	
	hive		The primary group is **hive**.	
	hive/hadoop.*<System domain name>*		The primary group is **hive**.	
	hive1		The primary group is **hive1**.	
	hive1/hadoop.*<System domain name>*		The primary group is **hive1**.	
	hive2		The primary group is **hive2**.	
	hive2/hadoop.*<System domain name>*		The primary group is **hive2**.	
	hive3		The primary group is **hive3**.	
	hive3/hadoop.*<System domain name>*		The primary group is **hive3**.	
	hive4		The primary group is **hive4**.	
	hive4/hadoop.*<System domain name>*		The primary group is **hive4**.	
	hbase		The primary group is **hadoop**.	

User Type	Default User	Initial Password	Description	Password Change Method
	hbase/hadoop.*<System domain name>*		The primary group is **hadoop**.	
	thrift		The primary group is **hadoop**.	
	thrift/hadoop.*<System domain name>*		The primary group is **hadoop**.	
	oozie		The primary group is **hadoop**.	
	hbase/zkclient.*<System domain name>*		The primary group is **hadoop**.	
	loader		The primary group is **hadoop**.	
	loader/hadoop.*<System domain name>*		The primary group is **hadoop**.	
	spark2x		The primary group is **hadoop**.	
	spark2x/hadoop.*<System domain name>*		The primary group is **hadoop**.	
	spark_zk		The primary group is **hadoop**.	
	spark2x1		The primary group is **hadoop**.	

User Type	Default User	Initial Password	Description	Password Change Method
	spark2x1/hadoop.*<System domain name>*		The primary group is **hadoop**.	
	spark2x2		The primary group is **hadoop**.	
	spark2x2/hadoop.*<System domain name<*		The primary group is **hadoop**.	
	spark2x3		The primary group is **hadoop**.	
	spark2x3/hadoop.*<System domain name>*		The primary group is **hadoop**.	
	spark2x4		The primary group is **hadoop**.	
	spark2x4/hadoop.*<System domain name>*		The primary group is **hadoop**.	
	kafka		The primary group is **kafkaadmin**.	
	kafka/hadoop.*<System domain name>*		The primary group is **kafkaadmin**.	
	storm		The primary group is **stormadmin**.	
	storm/hadoop.*<System domain name>*		The primary group is **stormadmin**.	

User Type	Default User	Initial Password	Description	Password Change Method
	storm_zk		The primary group is **storm**.	
	storm_zk/hadoop.*<System domain name>*		The primary group is **storm**.	
	kms/hadoop		The primary group is **kmsadmin**.	
	knox		The primary group is **compcommon**.	
	executor		The primary group is **compcommon**.	

NOTE

Log in to FusionInsight Manager, choose **System** > **Permission** > **Domain and Mutual Trust**, and check the value of **Local Domain**. In the preceding table, all letters in the system domain name contained in the username of the system internal user are lowercase letters.

For example, if **Local Domain** is set to **9427068F-6EFA-4833-B43E-60CB641E5B6C.COM**, the username of default HDFS startup user is **hdfs/hadoop.9427068f-6efa-4833-b43e-60cb641e5b6c.com**.

Database Users

The system database users include OMS database users and DBService database users.

Database Type	Default User	Initial Password	Description	Password Change Method
OMS database	ommdba	dbChangeMe@123456	OMS database administrator who performs maintenance operations, such as creating, starting, and stopping.	For details, see **Changing the Password for the OMS Database Administrator**.

Database Type	Default User	Initial Password	Description	Password Change Method
	omm	ChangeMe@123456	User for accessing OMS database data	For details, see **Changing the Password for the OMS Database Data Access User**.
DBService database	omm	dbserverAdmin@123	Administrator of the GaussDB database in the DBService component	For details, see **Changing the Password for a Component Database User**.
	hive	HiveUser@	User for Hive to connect to the DBService database **hivemeta**.	
	hive1	HiveUser@	User for Hive1 to connect to the DBService database **hivemeta1**.	
	hive2	HiveUser@	User for Hive2 to connect to the DBService database **hivemeta2**.	
	hive3	HiveUser@	User for Hive3 to connect to the DBService database **hivemeta3**.	
	hive4	HiveUser@	User for Hive4 to connect to the DBService database **hivemeta4**.	
	hive*NN*	HiveUser@	User for **Hive-***N* to connect to the DBService database **hive***N***meta** when multiple services are installed. For example, the user for **Hive-1** to connect to the DBService database **hive1meta** is **hive11**.	
	hue	HueUser@123	User for Hue to connect to the DBService database **hue**.	

Database Type	Default User	Initial Password	Description	Password Change Method
	sqoop	SqoopUser@	User for Loader to connect to the DBService database **sqoop**.	
	sqoop*N*	SqoopUser@	User for **Loader-***N* to connect to the DBService database **sqoop***N* when multiple services are installed. For example, the user for **Loader-1** to connect to the DBService database **sqoop1** is **sqoop1**.	
	oozie	OozieUser@	User for Oozie to connect to the DBService database **oozie**.	
	oozie*N*	OozieUser@	User for **Oozie-***N* to connect to the DBService database **oozie***N* when multiple services are installed. For example, the user for **Oozie-1** to connect to the DBService database **oozie1** is **oozie1**.	
	rangeradmin	Admin12!	User for Ranger to connect to the DBService database **ranger**.	

10.12.1.6 Default Permission Information

Role

Default Role	Description
Manager_administrator	Manager administrator who has all permissions for Manager. Manager administrators can create first-level tenants, create and modify user groups, and specify user permissions.

Default Role	Description
Manager_operator	Manager operator who has all the permissions on the **Homepage**, **Cluster**, **Hosts**, and **O&M** tab pages.
Manager_auditor	Manager auditor who has all permissions on the **Audit** tab page. Manager auditors can view and manage Manager system audit logs.
Manager_viewer	Manager viewer who has the permission to view information about **Homepage**, **Cluster**, **Hosts**, **Alarm**, **Event**, and **System > Permission**.
Manager_tenant	Manager tenant administrator. This role can create and manage sub-tenants for the non-leaf tenants to which the current user belongs. It has the permission to view alarms and events on **O&M > Alarm**.
System_administrator	System administrator, this role has Manager system administrator rights and all services administrator rights.
default	This role is the default role created for the **default** tenant. It has the management permissions on the Yarn component and the default queue. The default role of the default tenant that is not the first cluster to be installed is **c***<cluster ID>*_**default**.
Manager_administrator_180	FusionInsight Manager System administrator group. Internal system user group, which is used only between components.
Manager_auditor_181	FusionInsight Manager system auditor group. Internal system user group, which is used only between components.
Manager_operator_182	FusionInsight Manager system operator group. Internal system user group, which is used only between components.
Manager_viewer_183	FusionInsight Manager system viewer group. Internal system user group, which is used only between components.
System_administrator_186	System administrator group. Internal system user group, which is used only between components.
Manager_tenant_187	Tenant system user group. Internal system user group, which is used only between components.
default_1000	This group is created for tenant. Internal system user group, which is used only between components.

User group

Type	Default User Group	Description
OS User Group	hadoop	Users added to this group are granted the permission to submit all Yarn queue tasks.
	hadoopmanager	Users added to this user group can have the O&M manager rights of HDFS and Yarn. The O&M manager of HDFS can access the NameNode WebUI and perform active to standby switchover manually. The O&M manager of Yarn can access the ResourceManager WebUI, operate NodeManager nodes, refresh queues, and set node labels, but cannot submit tasks.
	hive	Common user group. Hive users must belong to this user group.
	hive1	Common user group. Hive1 users must belong to this user group.
	hive2	Common user group. Hive2 users must belong to this user group.
	hive3	Common user group. Hive3 users must belong to this user group.
	hive4	Common user group. Hive4 users must belong to this user group.
	kafka	Kafka common user group. A user in this group can access a topic only when a user in the kafkaadmin group grants the read and write permission of the topic to the user.
	kafkaadmin	Kafka administrator group. Users in this group have the rights to create, delete, authorize, read, and write all topics.
	kafkasuperuser	Topic read/write user group of Kafka. Users added to this group have the read and write permissions on all topics.
	storm	Users who are added to the storm user group can submit topologies and manage their own topologies.
	stormadmin	Users who are added to the stormadmin user group can have the storm administrator rights and can submit topologies and manage all topologies.
	supergroup	Users added to this user group can have the administrator rights of HBase, HDFS and Yarn and can use Hive.
	yarnviewgroup	Indicates the read-only user group of the Yarn task. Users in this user group can have the view permission on Yarn and MapReduce tasks.

Type	Default User Group	Description
	check_sec_ldap	Perform internal test on the active LDAP to see whether it works properly. This user group is generated randomly in a test and automatically deleted after the test is complete. Internal system user group, which is used only between components.
	compcommon	System internal group for accessing cluster system resources. All system users and system running users are added to this user group by default.
OS User Group	wheel	Primary group of the FusionInsight internal running user omm.
	ficommon	System common group that corresponds to **compcommon** for accessing cluster common resource files stored in the OS.

NOTE

If the current cluster is not the cluster that is installed for the first time in FusionInsight Manager, the default user group name of all components except Manager in the cluster is **c***<cluster ID>_ default user group name*, for example, **c2_hadoop**.

User

For details, see **User Account List**.

Service-related User Security Parameters

- **HDFS**

  The **dfs.permissions.superusergroup** parameter specifies the administrator group with the highest permission on the HDFS. The default value is **supergroup**.

- **Spark2x and Corresponding Multi-Instances**

  The **spark.admin.acls** parameter specifies the administrator list of the Spark2x. Members in the list are authorized to manage all Spark tasks. Users not added in the list cannot manage all Spark tasks. The default value is **admin**.

10.12.1.7 FusionInsight Manager Security Functions

You can query and set user rights data through the following FusionInsight Manager modules:

- User management: Users can be added, deleted, modified, queried, bound to user groups, and assigned with roles. For details, see **Managing Users**.
- User group management: User groups can be added, deleted, modified, queried, and bound to roles. For details, see **Managing User Groups**.

- Role management: Roles can be added, deleted, modified, queried, and assigned with the resource access rights of one or multiple components. For details, see **Managing Roles**.
- Tenant management: Tenants can be added, deleted, modified, queried, and bound to component resources. The system generates a role for each tenant to facilitate management. If a tenant is assigned with the rights of some resources, its corresponding role also has these rights. For details, see **Tenant Resources**.

10.12.2 Account Management

10.12.2.1 Account Security Settings

10.12.2.1.1 Unlocking LDAP Users and Management Accounts

Scenario

If the LDAP user cn=pg_search_dn,ou=Users,dc=hadoop,dc=com and LDAP management accounts cn=krbkdc,ou=Users,dc=hadoop,dc=com and cn=krbadmin,ou=Users,dc=hadoop,dc=com are locked, the administrator must unlock these accounts.

NOTE

If you input an incorrect password for the LDAP user or management account for five consecutive times, the LDAP user or management account is locked. The account is automatically unlocked after 5 minutes.

Procedure

Step 1 Log in to the active management node as user **omm** using the management IP address.

Step 2 Run the following command to switch the specified directory:

cd ${BIGDATA_HOME}/om-server/om/ldapserver/ldapserver/local/script

Step 3 Run the following command to unlock the LDAP user or management account:

./ldapserver_unlockUsers.sh *USER_NAME*

In the command, *USER_NAME* indicates the name of the user to be unlocked.

For example, to unlock the LDAP management **account cn=krbkdc,ou=Users,dc=hadoop,dc=com**, run the following command:

./ldapserver_unlockUsers.sh krbkdc

After the script is executed, enter the password of user **krbkdc** behind **ROOT_DN_PASSWORD**. If the following information is displayed, the account is successfully unlocked.

```
Unlock user krbkdc successfully.
```

----End

10.12.2.1.2 Unlocking an Internal System User

Scenario

If the service is abnormal, the internal user of the system may be locked. Please unlock the user promptly. Otherwise, the proper running of the cluster will be affected. For the list of system internal users, see **User Account List**. The internal user of the system cannot be unlocked using FusionInsight Manager.

Prerequisites

Obtain the default passwords of LDAP administrators **cn=root, dc=hadoop, and dc=com** based on the **User Account List** information list.

Procedure

Step 1 Use the following method to confirm whether the internal system username is locked:

1. oldap port number obtaining method:
   a. Log in to the FusionInsight Manager, select **System > OMS > oldap > Modify Configuration.**
   b. The **LDAP Listening Port** parameter value is **oldap port.**
2. Query domain name obtaining method:
   a. Log in to the FusionInsight Manager, select **System > Permission > Domain and Mutual Trust**.
   b. The **Local Domain** parameter value is the domain name.

      For example, the current system domain name is **9427068F-6EFA-4833-B43E-60CB641E5B6C.COM**.
3. Run the following command on each node in the cluster as user **omm** to query the number of password authentication failures:

   ldapsearch -H ldaps://*OMS_FLOAT_IP address:OLdap port* **-LLL -x -D cn=root,dc=hadoop,dc=com -b krbPrincipalName=***internal system username***@***domain name*,cn=*domain name*,**cn=krbcontainer,dc=hadoop,dc=com -w** *Password of LDAP administrator cn=root,dc=hadoop,dc=com* **-e ppolicy | grep krbLoginFailedCount**

   For example, query the number of password authentication failures for user **oms/manager**.

   ldapsearch -H ldaps://10.5.146.118:21750 -LLL -x -D cn=root,dc=hadoop,dc=com -b krbPrincipalName=oms/manager@9427068F-6EFA-4833-B43E-60CB641E5B6C.COM,cn=9427068F-6EFA-4833-B43E-60CB641E5B6C.COM,cn=krbcontainer,dc=hadoop,dc=com -w *cn=root,dc=hadoop,dc=com User Password* **-e ppolicy | grep krbLoginFailedCount**

   ```
   krbLoginFailedCount: 5
   ```
4. Log in to the FusionInsight Manager, select **System > Permission > Security Policy > Password Policy**.

5. View the Number of **Password Retries** parameter value, if the value is smaller than or equal to **krbLoginFailedCount,** the user is locked.

   NOTE

   You can also check whether internal users are locked by viewing operations logs.

Step 2 Log in to active management node as user omm, run the following command to unlock the user.

sh ${BIGDATA_HOME}/om-server/om/share/om/acs/config/unlockuser.sh --userName *internal system username*

For example,

sh ${BIGDATA_HOME}/om-server/om/share/om/acs/config/unlockuser.sh --userName oms/manager

----End

10.12.2.1.3 Enabling and Disabling Permission Verification on Cluster Components

Scenario

When the cluster is deployed in Security Mode or Normal Mode, HDFS and ZooKeeper verify the permission of users who attempt to access the services by default. Users without related permission cannot access resources in HDFS and ZooKeeper. When the cluster is deployed in Normal Mode, HBase and Yarn do not verify the permission of users who attempt to access the services by default. All users can access resources in HBase and Yarn.

Based on actual service requirements, the system administrator can enable permission verification on HBase and Yarn in the cluster in Normal Mode or disable permission verification on HDFS and ZooKeeper.

Impact on the System

After the permission verification is modified, the service configuration will expire. You need to restart the corresponding service for the configuration to take effect.

Procedure

Enable permission verification on HBase.

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster >** *Name of the desired cluster* **> Services > HBase** > **Configurations**.

Step 3 Click **All Configurations**.

Step 4 Search for parameters **hbase.coprocessor.region.classes**, **hbase.coprocessor.master.classes**, and **hbase.coprocessor.regionserver.classes**.

Add the coprocessor parameter value **org.apache.hadoop.hbase.security.access.AccessController** to the end of the values of the preceding parameters, and separate the value from the original coprocessor parameter values by using a comma (,).

Step 5 Click **Save** and click **OK.**

When **Operation succeeded** is displayed, click **Finish**.

----End

Disable permission verification on HBase.

NOTE

After HBase permission verification is disabled, the existing permission data will be retained. If you want to delete permission information, disable permission verification, enter the HBase shell, and delete table **hbase:acl**.

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations**.

Step 3 Click **All Configurations**.

Step 4 Search for parameters **hbase.coprocessor.region.classes**, **hbase.coprocessor.master.classes**, and **hbase.coprocessor.regionserver.classes**.

Delete the coprocessor parameter value **org.apache.hadoop.hbase.security.access.AccessController**.

Step 5 Click **Save** and click **OK**.

When **Operation succeeded** is displayed, click **Finish**.

----End

Disable permission verification on HDFS.

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations**.

Step 3 Click **All Configurations**.

Step 4 Search for parameters **dfs.namenode.acls.enabled** and **dfs.permissions.enabled**.

- **dfs.namenode.acls.enabled** specifies whether the HDFS ACL is enabled. The default value is **true**, which indicates that the ACL is enabled. Change the value to **false**.
- **dfs.permissions.enabled** specifies whether the permission check is enabled on HDFS. The default value is **true**, which indicates that the permission check is enabled. Change the value to **false**. After the parameters are modified, the directories, owners and groups of files, and permission information in HDFS retain the same.

Step 5 Click **Save Configuration** and click **OK.**

When **Operation succeeded** is displayed, click **Finish**.

----End

Enable permission verification on Yarn.

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster >** *Name of the desired cluster* **> Services > Yarn** > **Configurations**.

Step 3 Click **All Configurations**.

Step 4 Search for the parameter **yarn.acl.enable**.

yarn.acl.enable specifies whether the permission check is enabled on Yarn.

- In normal mode, the value is set to **false** by default to disable permission check. To enable permission check, change the value to **true**.
- In security mode, the value is set to **true** by default to enable authentication.

Step 5 Click **Save** and click **OK**.

When **Operation succeeded** is displayed, click **Finish**.

----End

Disable permission verification on ZooKeeper.

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster >** *Name of the desired cluster* **> Services > ZooKeeper** > **Configurations**.

Step 3 Click **All Configurations**.

Step 4 Search for the parameter **skipACL**.

skipACL specifies whether the ZooKeeper permission check is skipped. The default value is **no**, which indicates that the permission check is used. Change the value to **yes**.

Step 5 Click **Save** and click **OK**.

When **Operation succeeded** is displayed, click **Finish**.

----End

10.12.2.1.4 Logging In to a Non-Cluster Node Using a Cluster User in Normal Mode

Scenario

When the cluster is installed in normal mode, the component clients do not support Kerberos authentication and cannot use the **kinit** command. Therefore, nodes outside the cluster cannot use users in the cluster by default. This may result in a user authentication failure when one of these nodes access a component server.

The node administrator can configure a user who has the same name as that of a user for a node outside the cluster, allow the user to log in to the node using the SSH protocol, and connect to the servers of components in the cluster by using the user who logs in to the OS.

Prerequisites

- The node outside the cluster can connect to the cluster service plane.

- The KrbServer service of the cluster is running properly.
- You have obtained the password of user **root** of the node outside the cluster.
- A **Human-machine** user has been planned and added to the cluster, and you have obtained the authentication credential file. For details, see **Creating a User** and **Exporting an Authentication Credential File**.

Procedure

Step 1 Log in to the node where a user is to be added as user **root**.

Step 2 Run the following commands:

rpm -qa | grep pam and **rpm -qa| grepkrb5-client**

The following RPM packages are displayed:

```
pam_krb5-32bit-2.3.1-47.12.1
pam-modules-32bit-11-1.22.1
yast2-pam-2.17.3-0.5.211
pam-32bit-1.1.5-0.10.17
pam_mount-32bit-0.47-13.16.1
pam-config-0.79-2.5.58
pam_krb5-2.3.1-47.12.1
pam-doc-1.1.5-0.10.17
pam-modules-11-1.22.1
pam_mount-0.47-13.16.1
pam_ldap-184-147.20
pam-1.1.5-0.10.17
krb5-client-1.6.3
```

Step 3 Check whether the RPM packages in the list are installed in the OS.

- If yes, go to **Step 5**.
- If no, go to **Step 4**.

Step 4 Obtain the lacked RPM packages from the OS image, upload the files to the current directory, and run the following command to install the RPM packages:

rpm -ivh *.rpm

NOTE

The RPM packages to be installed may bring security risks. The risks that may be brought by the installation of these RPM packages must be taken into consideration during OS hardening.

After the RPM packages are installed, go to **Step 5**.

Step 5 Run the following command to configure Kerberos authentication on PAM:

pam-config --add --krb5

NOTE

If you need to cancel Kerberos authentication and system user login on a non-cluster node, run the **pam-config --delete --krb5** command as user **root**.

Step 6 Decompress the authentication credential file to obtain **krb5.conf**, use WinSCP to upload this configuration file to the **/etc** directory on the node outside the cluster, and run the following command to configure related permission to enable other users to access the file, such as permission **604**:

chmod 604 /etc/krb5.conf

Step 7 Run the following command in the connection session as user **root** to add the corresponding OS user to the **Human-machine** user, and specify **root** as the primary group.

The OS user password is the same as the initial password when the **Human-machine** user is created on Manager.

useradd *Username* **-m-d /home/admin_test -g root -s /bin/bash**

For example, if the name of the **Human-machine** user is **admin_test**, run the following command:

useradd admin_test -m -d /home/admin_test -g root -s /bin/bash

NOTE

When you use the newly added OS user to log in to the node by using the SSH protocol for the first time, the system prompts that the password has expired after you enter the user password, and the system prompts that the password needs to be changed after you enter the user password again. You need to enter a new password that meets the password complexity requirements of both the node OS and the cluster.

----End

10.12.2.2 Changing the Password for a System User

10.12.2.2.1 Changing the Password for User admin

Scenario

The user **admin** is the system administrator account of FusionInsight Manager, periodically change the password for user **admin** to improve system security.

Procedure

Step 1 Log in to FusionInsight Manager.

Log in to the system as user **admin**.

Step 2 Move the cursor to **Hello, admin** in the upper right corner of the page.

In the displayed menu, click **Change Password**.

Step 3 Set **Old Password**, **New Password**, and **Confirm Password**, and click **OK**.

The password complexity requirements are as follows by default:

- The password ranges from 8 to 64 characters.
- The password must contain at least four types of the following: lowercase letters, uppercase letters, digits, spaces, and special characters which can only be ~`!?,.;-_'(){}[]/<>@#$%^&*+|\=.
- The password cannot be the same as the username or reverse username.
- The password cannot be a common password that is easy to crack.

- The password cannot be the same as the password that used in latest *N* times. *N* indicates the value of **Repetition Rule** in **Configuring Password Policies**.

----End

10.12.2.2.2 Changing the Password for an OS User

Scenario

During FusionInsight Manager installation, the system automatically creates user **omm** and **ommdba** on each node in the cluster. Periodically change the login passwords of the OS users **omm** and **ommdba** of the cluster node to improve the system O&M security.

The passwords of users **omm** and **ommdba** of the nodes can be different.

Prerequisites

- Obtain the IP address of the node where the passwords of users **omm** and **ommdba** are to be changed.
- You need to obtain the password of user **root** before modifying user **ommdba** and **omm**.

Change the password of an OS User

Step 1 Log in to the node where the password is to be changed as user **root**.

Step 2 Run the following command to change the user password:

passwd *ommdba*

Red Hat system displays the following information:

```
Changing password for user ommdba.
New password:
```

Step 3 Enter a new password. The policy for changing the password of an OS user varies according to the OS that is actually used.

```
Retype New Password:
Password changed.
```

----End

10.12.2.3 Changing the Password for a System Internal User

10.12.2.3.1 Changing the Password for the Kerberos Administrator

Scenario

Periodically change the password for the Kerberos administrator **kadmin** to improve the system O&M security.

If the user password is changed, the OMS Kerberos administrator password is changed as well.

Prerequisites

You have installed the client on any node in the cluster and obtain the IP address of the node.

Procedure

Step 1 Log in to the node where the client is installed as user root.

Step 2 Run the following command to go to the client directory, such as **/opt/hadoopclient**:

cd /opt/hadoopclient

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 Run the following command to change the password for kadmin/admin. The password changing takes effect on all servers.

kpasswd kadmin/admin

The password complexity requirements are as follows by default:

- The password contains at least 8 characters.
- The password must contain at least four types of the following: lowercase letters, uppercase letters, digits, spaces, and special characters which can only be ~`!?,.;-_'(){}[]/<>@#$%^&*+|\=.
- The password cannot be the same as the username or reverse username.
- The password cannot be a common password that is easy to crack, for example, **Admin@12345**.
- The password cannot be the same as the password that used in latest *N* times. *N* indicates the value of **Repetition Rule** in **Configuring Password Policies**.

----End

10.12.2.3.2 Changing the Password for the OMS Kerberos Administrator

Scenario

Periodically change the password for the OMS Kerberos administrator **kadmin** to improve the system O&M security.

If the user password is changed, the Kerberos administrator password is changed as well.

Procedure

Step 1 Log in to the management node using the management IP address as user **omm**.

Step 2 Run the following command to go to the related directory:

cd ${BIGDATA_HOME}/om-server/om/meta-0.0.1-SNAPSHOT/kerberos/scripts

Step 3 Run the following command to configure environment variables:

source component_env

Step 4 Run the following command to change the password for kadmin/admin. The password changing takes effect on all servers.

kpasswd kadmin/admin

The password complexity requirements are as follows by default:

- The password contains at least 8 characters.
- The password must contain at least four types of the following: lowercase letters, uppercase letters, digits, and special characters which can only be ~`!?,.;-_'(){}[]/<>@#$%^&*+|\=.
- The password cannot be the same as the username or reverse username.
- The password cannot be a common password that is easy to crack, for example, **Admin@12345**.
- The password cannot be the same as the password that used in latest *N* times. *N* indicates the value of **Repetition Rule** in **Configuring Password Policies**.

----End

10.12.2.3.3 Changing the Passwords of the LDAP Administrator and the LDAP User (Including OMS LDAP)

Scenario

It is recommended that the administrator periodically changes the passwords of LDAP administrator **cn=root,dc=hadoop,dc=com** and LDAP user **cn=pg_search_dn,ou=Users,dc=hadoop,dc=com** to improve the system O&M security.

If the passwords are changed, the password of the OMS LDAP administrator or user is changed as well.

NOTE

If the cluster is upgraded from an early version to a latest version, the LDAP administrator password will inherit the password policy of the old cluster. To ensure system security, you are advised to change the password after the cluster upgrade.

Impact on the System

- Changing the user password of the LdapServer service is a high-risk operation and requires restarting the KrbServer and LdapServer services. If KrbServer is restarted, users may fail to be queried by running the **id** command on nodes in the cluster temporarily. Therefore, exercise caution when restarting KrbServer.
- After the password of LDAP user **cn=pg_search_dn,ou=Users,dc=hadoop,dc=com** is changed, the user may be locked in the LDAP component. Therefore, you are advised to unlock the user after changing the password. For details about how to unlock the user, see **Unlocking LDAP Users and Management Accounts**.

Prerequisites

Before changing the password of LDAP user **cn=pg_search_dn,ou=Users,dc=hadoop,dc=com**, ensure that the user is not locked by running the following command on the active management node of the cluster:

NOTE

To query the OLDAP port number, perform the following steps:

1. Log in to FusionInsight Manager, choose **System** > **OMS** > **oldap** > **Modify Configuration**:
2. The value of **LDAP Service Listening Port** is the OLDAP port.

ldapsearch -H ldaps://*Floating IP address of OMS:OLDAP port***-LLL -x -D cn=pg_search_dn,ou=Users,dc=hadoop,dc=com -W -b cn=pg_search_dn,ou=Users,dc=hadoop,dc=com -e ppolicy**

Enter the password of the LDAP user **pg_search_dn**. If the following information is displayed, the user is locked. In this case, unlock the user. For details, see **Unlocking LDAP Users and Management Accounts**.

NOTE

The password of the LDAP user **pg_search_dn** is randomly generated by the system. You can obtain the password from the **/etc/sssd/sssd.conf or /etc/ldap.conf** file on the active node.

```
ldap_bind: Invalid credentials (49); Account locked
```

Procedure

Step 1 Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Service** > **LdapServer**.

Step 2 Choose **More** > **Change Database Password**. In the displayed dialog box, enter the password of the current login user and click **OK**.

Step 3 In the **Change Password** dialog box, select the user whose password to be modified in the **User Information** drop-down box.

Step 4 Enter the old password in the **Old Password** text box, and enter the new password in the **New Password** and **Confirm Password** text boxes.

The password must meet the following complexity requirements by default:

- Contains 16 to 32 characters.
- Contains at least three types of the following: uppercase letters, lowercase letters, digits, and special characters (`~!@#$%^&*()-_=+|[{}];,<.>/?).
- Cannot be the same as the username or the username spelled backwards.
- Cannot be the same as the current password.

Step 5 Select **I have read the information and understood the impact** and click **OK** to confirm the modification and restart the service.

----End

10.12.2.3.4 Changing the Password for the LDAP Administrator

Scenario

Periodically change the passwords of LDAP administrator accounts **cn=krbkdc**,**ou=Users**,**dc=hadoop**,**dc=com** and **cn=krbadmin**,**ou=Users**,**dc=hadoop**,**dc=com** to improve the system O&M security.If the user password is changed, the OMS LDAP administrator password is changed as well.

Impact on the System

1. You need to restart the KrbServer service after changing the password.
2. After the password is changed, check whether the LDAP management accounts cn=krbkdc,ou=Users,dc=hadoop,dc=com and cn=krbkdc,ou=Users,dc=hadoop,dc=com are locked. Run the following command on the active OMS node to check whether krbkdc is locked (similar method for krbadmin):

   NOTE

   oldap port number obtaining method:

   1. Log in to the FusionInsight Manager, select **System > OMS > oldap > Modify Configuration**.
   2. The **LDAP Listening Port** parameter value is oldap port.

   ldapsearch -H ldaps://*OMS_FLOAT_ IP address:OLdap port* **-LLL -x -D cn=krbkdc,ou=Users,dc=hadoop,dc=com -W -b cn= krbkdc,ou=Users,dc=hadoop,dc=com -e ppolicy**

   Enter the password for the LDAP management account **krbkdc**. If the following message is displayed, the account is locked. For details on how to unlock the account, see **Unlocking LDAP Users and Management Accounts**.

   ```
   ldap_bind: Invalid credentials (49); Account locked
   ```

Prerequisites

You have obtained the active management node IP address.

Procedure

Step 1 Log in to the management node using the active management IP address as user **omm**.

Step 2 Run the following command to go to the related directory:

cd ${BIGDATA_HOME}/om-server/om/meta-0.0.1-SNAPSHOT/kerberos/scripts

Step 3 Run the following command to change the password of the LDAP administrator accounts.

./okerberos_modpwd.sh

Enter the old password and enter a new password twice.

The password complexity requirements are as follows:

- The password ranges from 16 to 32 characters.
- The password must contain at least three types of the following: lowercase letters, uppercase letters, digits, and special characters which can only be `~!@#$%^&*()-_=+|[{}];,<.>/?.
- The password cannot be the same as the previous password.

If the following information is displayed, the password is changed successfully.

```
Modify kerberos server password successfully.
```

Step 4 Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **KrbServer** > **More** > **Restart Service**. Enter the password and do not select **Restart upper-layer services**. Click **OK** to restart the KrbServer service.

----End

10.12.2.3.5 Changing the Password for a Component Running User

Scenario

Periodically change the password for each component running user to improve the system O&M security.

Component running users can be classified into the following two types depending on whether their initial passwords are randomly generated by the system:

- If the initial password of a component running user is randomly generated by the system, the user is of the **Machine-Machine** type.
- If the initial password of a component running user is not randomly generated by the system, the user is of the **Human-Machine** type.

Impact on the System

All services need to be restarted for the password changing to take effect. The services are unavailable during the cluster restart.

Prerequisites

You have installed the client on any node in the cluster and obtain the IP address of the node.

Procedure

Step 1 Log in to the node where the client is installed as user **root**.

Step 2 Run the following command to go to the client directory, such as **/opt/Bigdata/client**:

cd /opt/Bigdata/client

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 Run the following command and enter the password of user kadmin/admin to log in to the kadmin console:

kadmin -p kadmin/admin

NOTE

The default password of user **kadmin/admin** is **Admin@123,** which will expire upon your first login. Change the password as prompted and keep the new password secure.

Step 5 Run the following command to change the password of an internal system user. The password changing takes effect on all servers.

cpw *internal system username*

For example: **cpw oms/manager**

The password complexity requirements are as follows by default:

- The password contains at least 8 characters.
- The password must contain at least four types of the following: lowercase letters, uppercase letters, digits, spaces, and special characters which can only be ~`!?,.;-_'(){}[]/<>@#$%^&*+|\=.
- The password cannot be the same as the username or reverse username.
- The password cannot be a common password that is easy to crack, for example, **Admin@12345**.
- The password cannot be the same as the password that used in latest *N* times. *N* indicates the value of **Repetition Rule** in **Configuring Password Policies**. The policy affects only users of the **Human-Machine** type.

NOTE

Run the following command to check user information:

getprinc *internal system username*

For example: **getprinc oms/manager**

Step 6 Determine the type of the user whose password needs to be changed.

- If the user is a **Machine-Machine** user, perform **Step 7**.
- If the user is a **Human-Machine** user, the password is changed and no further action is required.

Step 7 Log in to FusionInsight Manager.

Step 8 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **More** > **Restart**.

Step 9 In the displayed window, enter the password of the current login administrator user and click **OK**.

Step 10 In the displayed dialog box, click **OK** to restart the cluster.

Step 11 After the system displays "**Operation succeeded**", click **Finish**. The cluster is successfully started.

----End

10.12.2.4 Changing the Password for a Database User

10.12.2.4.1 Changing the Password for the OMS Database Administrator

Scenario

Periodically change the password for the OMS database administrator to ensure the system O&M security.

Procedure

Step 1 Log in to the active management node using the active management IP address as user **root**.

NOTE

The password of user **ommdba** cannot be changed on the standby management node; otherwise, the cluster cannot work properly. The password of user **ommdba** can be changed after the system administrator performs operation only on the active management node. The operation does not need to be performed on the standby management node.

Step 2 Run the following command to switch to the user:

su - omm

Step 3 Run the following command to go to the directory:

cd $OMS_RUN_PATH/tools

Step 4 Run the following command to change the password for user **ommdba**:

mod_db_passwd ommdba

Step 5 Enter the old password of user **ommdba** and enter a new password twice. The password changing takes effect on all servers.

The password complexity requirements are as follows:

- The password ranges from 16 to 32 characters.
- The password must contain at least three types of the following: lowercase letters, uppercase letters, digits, and special characters which can only be ~`! @#$%^&*()-+_=\|[{}];",<.>/?
- The password cannot be the same as the username or reverse username.
- The password cannot be the same as the last 20 historical passwords.

If the following information is displayed, the password is changed successfully.

```
Congratulations, update [ommdba] password successfully.
```

----End

10.12.2.4.2 Changing the Password for the OMS Database Data Access User

Scenario

Periodically change the password for the OMS data access user to ensure the system O&M security.

Impact on the System

The OMS service needs to be restarted for the password changing to take effect. The cluster is unavailable during the restart.

Procedure

Step 1 Choose **System** > **OMS** > **gaussDB** > **Change Password** on FusionInsight Manager.

Step 2 Locate the row that contains user **omm** and click **Change Password** in the **Operation** to change the password for the OMS database user.

Step 3 In the displayed window, enter the password of the current login administrator user and click **OK**.

Step 4 Enter the old and new passwords as prompted.

The password complexity requirements are as follows:

- The password ranges from 8 to 32 characters.
- The password must contain at least three types of the following: lowercase letters, uppercase letters, digits, and special characters which can only be ~`!@#$%^&*()-+_=\|[{}];",<.>/?
- The password cannot be the same as the username or reverse username.
- The password cannot be the same as the last 20 historical passwords.

Step 5 Click **OK**. After the system displays **Operation succeeded**, click **Finish**.

Step 6 Locate the row that contains user **omm** and click **Restart OMS Service** in the **Operation** to restart the OMS database.

Step 7 In the displayed window, enter the password of the current login administrator user and click **OK**.

Step 8 In the dialog box that is displayed, click **OK**, and then restart the OMS service.

----End

10.12.2.4.3 Changing the Password for a Component Database User

Scenario

Periodically change the password for each component database user to improve the system O&M security.

Impact on the System

The services need to be restarted for the password changing to take effect. The services are unavailable during the restart.

Procedure

Step 1 Choose **Cluster** > *Name of the desired cluster* > **Services** on FusionInsight Manager.

Step 2 Determine the component database user whose password is to be changed.

To change the password for the other service database user, you must stop the service first, and go to **Step 3**.

Step 3 Click the service whose database user password is to be changed and choose **More** > **Change Database Password**. In the displayed window, enter the password of the current login administrator user and click **OK**.

Step 4 Enter the old and new passwords as prompted.

The password complexity requirements are as follows:

- The passwords of component databases contain 8 to 32 characters.
- The password must contain at least three types of the following: lowercase letters, uppercase letters, digits, and special characters which can only be ~`!@#$%^&*()-+_=\|[{}];",<.>/?
- The password cannot be the same as the username or reverse username.
- The password cannot be the same as the last 20 historical passwords.

Step 5 Select **I have read the information and understood the impact.** and click **OK**.

Step 6 After the password is changed, choose **More** > **Restart Service**. In the dialog box that is displayed, enter the password of the current login user, click **OK**, select **Restart upper-layer services**, and click **OK** to restart the service.

----End

10.12.2.4.4 Changing the Password for User omm in DBService

Step 1 Log in to the active DBService node as user **root**.

NOTE

The password of user **omm** for the DBService database cannot be changed on the standby DBService node. Change the password on the active DBService node only.

Step 2 Run the following command to switch the user.

su - omm

Step 3 Run the following command to switch the directory:

source $DBSERVER_HOME/.dbservice_profile

cd ${DBSERVICE_SOFTWARE_DIR}/sbin/

Step 4 Run the following command to change the password of user **omm**:

sh modifyDBPwd.sh

Step 5 Enter the old password of user **omm** and enter a new password twice.

The password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters (~`!@#$%^&*()-+_=\|[{}];",<.>/?).

- Must not be the same as the username or reverse username.
- The password cannot be the same as the last 20 historical passwords.

If the following information is displayed, the password is changed successfully:

```
Successful to modify password.
```

----End

10.12.3 Security Hardening

10.12.3.1 Hardening Policy

Hardening Tomcat

Tomcat is hardened as follows based on open-source software during FusionInsight Manager software installation and use:

- The Tomcat version is upgraded to the official version.
- Rights on directories under webapplications are set to 500. Some directories under webapplications support the write permission.
- The Tomcat installation package is automatically deleted after system software is installed.
- The automatic deployment function is disabled for projects under webapplications. Only three projects, web, cas and client-registry projects, are deployed.
- Some unused http methods are disabled, preventing attacks by using the http methods.
- The default shutdown port and command of the Tomcat server are changed to prevent hackers from shutting down the server and attacking servers and applications.
- To ensure security, the value of **maxHttpHeaderSize** is changed, which enables server administrators to control abnormal requests of clients.
- The Tomcat version description file is modified after Tomcat is installed.
- To prevent disclosure of Tomcat information, the Server attributes of Connector are modified so that attackers cannot obtain information about the server.
- Rights on files and directories of Tomcat, such as the configuration files, executable files, log directories, and temporary folders, are under control.
- Session facade recycling is disabled to prevent request leakage.
- LegacyCookieProcessor is used as CookieProcessor to prevent the leakage of sensitive data in cookies.

Hardening LDAP

LDAP is hardened as follows after a cluster is installed:

- In the LDAP configuration file, the password of the administrator account is encrypted using SHA. After the openldap is upgraded to 2.4.39 or later, data is

automatically synchronized between the active and standby LDAP nodes using the SASL External mechanism, which prevents disclosure of the password.

- The LDAP service in the cluster supports the SSLv3 protocol by default, which can be used safely. When the openldap is upgraded to 2.4.39 or later, the LDAP automatically users TLS1.0 or later to prevent unknown security risks.

Hardening JDK

- If the client process uses the AES256 encryption algorithm, JDK security hardening is required. The operations are as follows:

  Obtain the Java Cryptography Extension (JCE) package whose version matches that of JDK. The JCE package contains **local_policy.jar** and **US_export_policy.jar**. Copy the JAR files to the following directory and replace the files in the directory.

  Linux: **JDK installation directory/jre/lib/security**

  Windows: **JDK installation directory\jre\lib\security**

  NOTE

  Access the Open JDK open-source community to obtain the JCE file.

- If the client process uses the SM4 encryption algorithm, the JAR package needs to be updated.

  Obtain the **SMS4JA.jar** in **Client installation directory/JDK/jdk/jre/lib/ext/**, and copy the JAR package to the following directory:

  Linux: **JDK directory/jre/lib/ext/**

  Windows: **JDK directory\jre\lib\ext**

10.12.3.2 Configuring a Trusted IP Address to Access LDAP

Scenario

By default, the LDAP service deployed in the OMS and cluster can be accessed by any IP address. To enable the LDAP service to be accessed by only trusted IP addresses, you can configure the INPUT policy in the iptables filtering list.

Impact on the System

After the configuration, the LDAP service cannot be accessed by IP addresses that are not configured. Before the expansion, the added IP addresses need to be configured as trusted IP addresses.

Prerequisites

- You have collected the management plane IP addresses and service plane IP addresses of all nodes in the cluster and all floating IP addresses.
- You have obtained the root user account and password of all nodes in the cluster.

Procedure

Configure trusted IP addresses for the LDAP service on the OMS.

Step 1 Confirm the management node IP address. For details, see **Logging In to the Management Node**.

Step 2 Log in to FusionInsight Manager. For details, see **Logging In to FusionInsight Manager**.

Step 3 Choose **System** > **OMS**, and choose **oldap** > **Modify Configuration**, and view the OMS LDAP port number (which is the value of **LDAP Listening Port**). The default port number is **21750**.

Step 4 Log in to the active management node using the active management IP address as user **root**.

Step 5 Run the following command to view the INPUT policy in the iptables filtering list:

iptables -L

For example, when no rule is configured, the INPUT policy is displayed as follows:

```
Chain INPUT (policy ACCEPT)
target     prot opt source               destination
```

Step 6 Run the following command to configure all IP addresses used by the cluster as trusted IP addresses. Each IP address needs to be added independently.

iptables -A INPUT -s *Trusted IP address* **-p tcp --dport** *Port number* **-j ACCEPT**

For example, to configure 10.0.0.1 as a trusted IP address and enable it to access port 21750, you need to run the following command:

iptables -A INPUT -s 10.0.0.1 -p tcp --dport 21750 -j ACCEPT

Step 7 Run the following command to configure all IP addresses as untrusted IP addresses. The trusted IP addresses will not be affected by this rule.

iptables -A INPUT -p tcp --dport *Port number* **-j DROP**

For example, to disable all IP addresses to access port 21750, you need to run the following command:

iptables -A INPUT -p tcp --dport 21750 -j DROP

Step 8 Run the following command to view the modified INPUT policy in the iptables filtering list:

iptables -L

For example, after a trusted IP address is configured, the INPUT policy is displayed as follows:

```
Chain INPUT (policy ACCEPT)
target     prot opt source               destination
ACCEPT     tcp  --  10.0.0.1             anywhere            tcp dpt:21750
DROP       tcp  --  anywhere             anywhere            tcp dpt:21750
```

Step 9 Run the following command to view the rules and rule numbers in the iptables filtering list:

iptables -L -n --line-number

```
Chain INPUT (policy ACCEPT)
num target     prot opt source               destination
1 DROP       tcp  --  0.0.0.0/0            0.0.0.0/0           tcp dpt:21750
```

Step 10 Run the following command to delete the desired rule from the iptables filtering list based on site requirement:

iptables -D INPUT *number of the rule to be deleted*

For example, to delete rule 1, run the following command:

iptables -D INPUT 1

Step 11 Log in to the standby management node using the standby management IP address as user **root**, and repeat **Step 5** to **Step 10**.

Configure trusted IP addresses for the LDAP service in the cluster.

Step 12 Log in to FusionInsight Manager.

Step 13 Choose **Cluster** > *Name of the desired cluster* > **Services** > **LdapServer** > **Instance**, and view the nodes where the LDAP services locate.

Step 14 Go to the **Configurations** page, and view the cluster LDAP port number (which is the value of **LDAP_SERVER_PORT**). The default port number is **21780**.

Step 15 Log in to the LDAP node using the LDAP service IP address as user **root**.

Step 16 Run the following command to view the INPUT policy in the iptables filtering list:

iptables -L

For example, when no rule is configured, the INPUT policy is displayed as follows:

```
Chain INPUT (policy ACCEPT)
target     prot opt source               destination
```

Step 17 Run the following command to configure all IP addresses used by the cluster as trusted IP addresses. Each IP address needs to be added independently.

iptables -A INPUT -s *Trusted IP address* **-p tcp --dport** *Port number* **-j ACCEPT**

For example, to configure 10.0.0.1 as a trusted IP address and enable it to access port 21780, you need to run the following command:

iptables -A INPUT -s 10.0.0.1 -p tcp --dport 21780 -j ACCEPT

Step 18 Run the following command to configure all IP addresses as untrusted IP addresses. The trusted IP addresses will not be affected by this rule.

iptables -A INPUT -p tcp --dport *Port number* **-j DROP**

For example, to disable all IP addresses to access port 21780, you need to run the following command:

iptables -A INPUT -p tcp --dport 21780 -j DROP

Step 19 Run the following command to view the modified INPUT policy in the iptables filtering list:

iptables -L

For example, after a trusted IP address is configured, the INPUT policy is displayed as follows:

```
Chain INPUT (policy ACCEPT)
target     prot opt source               destination
```

```
ACCEPT     tcp  --  10.0.0.1            anywhere            tcp dpt:21780
DROP       tcp  --  anywhere            anywhere            tcp dpt:21780
```

Step 20 Run the following command to view the rules and rule numbers in the iptables filtering list:

iptables -L -n --line-number

```
Chain INPUT (policy ACCEPT)
num target     prot opt source               destination
1 DROP       tcp  --  0.0.0.0/0            0.0.0.0/0           tcp dpt:21750
```

Step 21 Run the following command to delete the desired rule from the iptables filtering list based on site requirement:

iptables -D INPUT *number of the rule to be deleted*

For example, to delete rule 1, run the following command:

iptables -D INPUT 1

Step 22 Log in to the LDAP node using the IP address of another LDAP service IP address as user **root**, and repeat **Step 16** to **Step 21**.

----End

10.12.3.3 HFile and WAL Encryption

HFile and WAL Encryption

NOTICE

- Setting the HFile and WAL encryption mode to SMS4 or AES has a great impact on the system and will cause data loss in case of any misoperation. Therefore, this operation is not recommended.
- Batch data import using Bulkload does not support data encryption.

HFile and Write ahead log (WAL) in HBase are not encrypted by default. To encrypt them, perform the following operations.

Step 1 On any HBase node, run the following commands to create a key file as user **omm**:

sh ${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/install/FusionInsight-HBase-2.2.3/hbase/bin/hbase-encrypt.sh *<path>/hbase.jks <type> <length> <alias>*

- *<path>/hbase.jks* indicates the path of the generated jks file.
- **<type>** indicates the encryption type, which can be SMS 4 or AES.
- **<length>** indicates the key length. SMS 4 supports 16-bit and AES supports 128-bit.
- *<alias>* indicates the alias name of key file. When you create the key file for the first time, retain the default value **omm**.

For example, to generate an SMS4 encryption key, run the following command:

sh ${BIGDATA_HOME}/FusionInsight_HD_ 8.1.0.1/install/FusionInsight-HBase-2.2.3/hbase/bin/hbase-encrypt.sh /home/hbase/conf/hbase.jks SMS4 16 omm

To generate an AES encryption key, run the following command:

sh ${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/install/FusionInsight-HBase-2.2.3/hbase/bin/hbase-encrypt.sh /home/hbase/conf/hbase.jks AES 128 omm

NOTE

- The cluster operation user must have the **rw** permission of the *<path>/hbase.jks* directory. The directory requires already exists.
- After running the command, enter the same *<password>* four times. The password encrypted in **Step 3** is the same as the password in this step.

Step 2 Distribute the generated key files to the same directory on all nodes in the cluster and assign read and write permission to user **omm**.

NOTE

- Administrators need to select a safe procedure to distribute keys based on the enterprise security requirements.
- If the key files of some nodes are lost, repeat the step to copy the key files from other nodes.

Step 3 On FusionInsight Manager, set **hbase.crypto.keyprovider.parameters.encryptedtext** to the encrypted password. Set **hbase.crypto.keyprovider.parameters.uri** to the path and name of the key file.

- Format of **hbase.crypto.keyprovider.parameters.uri**: **jceks://** *<key_Path_Name>*.

  <key_Path_Name> indicates the path of the key file. For example, if the path of the key file is **/home/hbase/conf/hbase.jks**, set this parameter to **jceks:///home/hbase/conf/hbase.jks**.

- Format of **hbase.crypto.keyprovider.parameters.encryptedtext**: *<encrypted_password>*.

  <encrypted_password> indicates the encrypted password generated during the key file creation. The parameter value is displayed in ciphertext. Run the following command as user **omm** to obtain the related encrypted password on the nodes where HBase service is installed:

  sh ${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/install/FusionInsight-HBase-2.2.3/hbase/bin/hbase-encrypt.sh

  NOTE

  After running the command, enter the **<password>**. The password is the same as that in **Step 1**.

Step 4 On FusionInsight Manager, set **hbase.crypto.key.algorithm** to **SMS4** or **AES** to use SMS4 or AES for HFile encryption.

Step 5 On FusionInsight Manager, set **hbase.crypto.wal.algorithm** to **SMS4** or **AES** to use SMS4 or AES for WAL encryption.

Step 6 On FusionInsight Manager, set **hbase.regionserver.wal.encryption** to **true**.

Step 7 Save the settings and restart the HBase service for the settings to take effect.

Step 8 Set the encryption mode when creating an HBase table. **<type>** indicates the encryption type.

- When creating a table using commands, directly set the encryption mode to SMS4 or AES.

  create '*<table name>*', {*NAME => 'd'*, ***ENCRYPTION => '***<type>**'**}

- When creating a table using code, set the encryption mode to SMS4 or AES by adding the following information to the code:

```
public void testCreateTable() { String tableName = "user"; Configuration conf = getConfiguration();
HTableDescriptor htd = new HTableDescriptor(TableName.valueOf(tableName));

   HColumnDescriptor hcd = new HColumnDescriptor("info"); //Set the encryption mode to SMS4 or
AES. hcd.setEncryptionType("<type>"); htd.addFamily(hcd);

   HBaseAdmin admin = null; try { admin = new HBaseAdmin(conf);

      if(!admin.tableExists(tableName)) { admin.createTable(htd); } } catch (IOException e)
{ e.printStackTrace(); } finally { if(admin != null) { try { admin.close(); } catch (IOException e)
{ e.printStackTrace(); } } } }
```

Step 9 If you have configured SMS4 or AES encryption by performing **Step 1** to **Step 7** but do not set the related encryption parameter when creating the table in **Step 8**, the inserted data is not encrypted.

In this case, you can perform the following steps to encrypt inserted data:

1. Run the flush command for the table to import the data in the memory to the HFile.

   flush *'<table_name>'*

2. Run the following commands to modify the table properties:

   disable *'<table_name>'*

   alter *'<table_name>'*,**NAME=>** *'<column_name>'*,**ENCRYPTION =>** *'<type>'*

   enable *'<table_name>'*

3. Insert a new data record and flush the table.

   NOTE

   A new data record must be inserted so that the HFile will generate a new HFile and the unencrypted data inserted previously will be rewritten and encrypted.

   put *'<table_name>'*, **'id2','f1:c1','value22222222222222222222222222222222'**

   flush *'<table_name>'*

4. Perform the following step to rewrite the HFile:

   major_compact *'<table_name>'*

NOTICE

During this step, the HBase table is disabled and cannot provide services. Exercise caution when you perform this step.

----End

Modifying a Key File

NOTICE

Modifying a key file has a great impact on the system and will cause data loss in case of any misoperation. Therefore, this operation is not recommended.

During the **HFile and WAL Encryption** operation, the related key file must be generated and its password must be set to ensure system security. After a period of running, you can replace the key file with a new one to encrypt HFile and WAL.

Step 1 Run the following command to generate a new key file as user **omm**:

sh ${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/install/FusionInsight-HBase-2.2.3/hbase/bin/hbase-encrypt.sh *<path>/hbase.jks <type> <length> <alias-new>*

- *<path>/hbase.jks*: indicates the path of the generated **hbase.jks** file. The path and file name must be consistent with those of the key file generated in **HFile and WAL Encryption**.
- *<alias-new>*: indicates the alias of the key file. The alias must be different with that of the old key file.
- *<type>* indicates the encryption type, which can be SMS 4 or AES.
- *<length>* indicates the key length. SMS 4 supports 16-bit and AES supports 128-bit.

For example, to generate an SMS4 encryption key, run the following command:

sh ${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/install/FusionInsight-HBase-2.2.3/hbase/bin/hbase-encrypt.sh /home/hbase/conf/hbase.jks SMS4 16 omm_new

To generate an AES encryption key, run the following command:

sh ${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/install/FusionInsight-HBase-2.2.3/hbase/bin/hbase-encrypt.sh /home/hbase/conf/hbase.jks AES 128 omm_new

NOTE

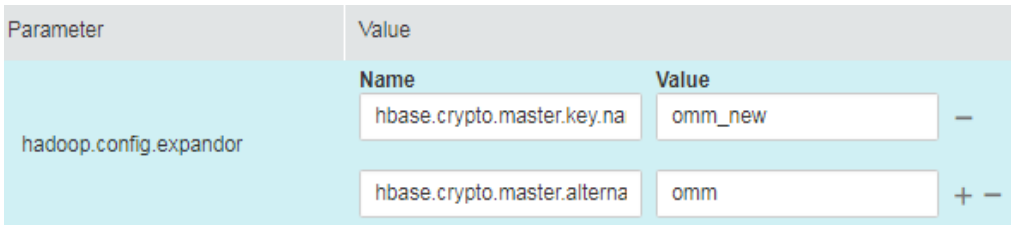
- The cluster operation user must have the **rw** permission of the *<path>/hbase.jks* directory. The directory requires already exists.
- After running the command, enter the same *<password>* three times. The password indicates the password of key files. The password of the old key file can be used, which does not cause any security risk.

Step 2 Distribute the generated key files to the same directory on all nodes in the cluster and assign read and write permission to user **omm**.

NOTE

Administrators need to select a safe procedure to distribute keys based on the enterprise security requirements.

Step 3 On the HBase service configuration page of FusionInsight Manager, add custom configuration items, set **hbase.crypto.master.key.name** to **omm_new**, set **hbase.crypto.master.alternate.key.name** to **omm**, and save the settings.

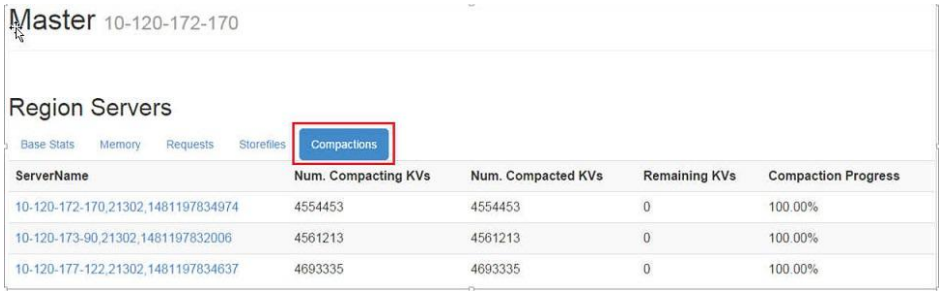


Step 4 Restart the HBase service for the configuration to take effect.

Step 5 In HBase shell, run the **major compact** command to generate the HFile file based on the new encryption algorithm.

major_compact *'<table_name>'*

Step 6 You can view the major compact progress from the HMaster web page.



Step 7 When all items in **Compaction Progress** reach **100%** and those in **Remaining KVs** are **0**, run the following command as user **omm** to destroy the old key file:

sh ${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/install/FusionInsight-HBase-2.2.3/hbase/bin/hbase-encrypt.sh *<path>/hbase.jks <alias-old>*

- *<path>/hbase.jks*: indicates the path of the generated **hbase.jks** file. The path and file name must be consistent with those of the key file generated.
- *<alias-old>*: indicates the alias of the old key file to be deleted.

For example:

sh ${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/install/FusionInsight-HBase-2.2.3/hbase/bin/hbase-encrypt.sh /home/hbase/conf/hbase.jks omm

NOTE

The cluster operation user must have the **rw** permission for the *<path>/hbase.jks* directory. The directory requires already exists.

Step 8 Repeat **Step 2** and distribute the updated key files again.

Step 9 Delete the HBase self-defined configuration item **hbase.crypto.master.alternate.key.name** added in **Step 3** from FusionInsight Manager.

Step 10 Repeat **Step 4** for the configuration to take effect.

----End

10.12.3.4 Security Configuration

Configuring Security Channel Encryption

The channels between components are not encrypted by default. You can set the following parameters to configure security channel encryption.

Page access: On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > *component* > **Configurations**. Click **All Configurations**. Enter the parameter name in the search box.

NOTE

Restart the corresponding service after configuration.

Table 10-82 Parameter description

Parameter	Description	Default Value
hbase.rpc.protection	Indicates whether the HBase channels, including the remote procedure call (RPC) channels for HBase clients to access the HBase server and the RPC channels between the HMaster and RegionServer, are encrypted. If this parameter is set to **privacy**, the channels are encrypted and the authentication, integrity, and privacy functions are enabled. If this parameter is set to **integrity**, the channels are not encrypted and only the authentication and integrity functions are enabled. If this parameter is set to **authentication**, the channels are not encrypted, only packets are authenticated, and integrity and privacy are not required. **NOTE** The privacy mode encrypts transmitted content, including sensitive information such as user tokens, to ensure the security of the transmitted content. However, this mode has great impact on performance. Compared with the other two modes, this mode reduces read/write performance by about 60%. Modify the configuration based on the enterprise security requirements. The configuration items on the client and server must be the same.	-

Parameter	Description	Default Value
dfs.encrypt.data.transfer	Indicates whether the HDFS data transfer channels and the channels for clients to access HDFS are encrypted. The HDFS data transfer channels include the data transfer channels between DataNodes and the Data Transfer (DT) channels for clients to access DataNodes. The value **true** indicates that the channels are encrypted. The channels are not encrypted by default.	**false**
dfs.encrypt.data.transfer.algorithm	Indicates whether the HDFS data transfer channels and the channels for clients to access HDFS are encrypted. This parameter is valid only when dfs.encrypt.data.transfer is set to true. The default value is **3des**, which indicates that the 3DES algorithm is used for encryption. The value can also be set to **rc4**; however, to avoid security risks, do not set the parameter to this value.	**3des**
hadoop.rpc.protection	Indicates whether the RPC channels of each module in Hadoop are encrypted. The channels include: ● RPC channels for clients to access HDFS ● RPC channels between modules in HDFS, for example, RPC channels between DataNode and NameNode ● RPC channels for clients to access YARN ● RPC channels between NodeManager and ResourceManager ● RPC channels for Spark to access YARN and HDFS ● RPC channels for MapReduce to access YARN and HDFS ● RPC channels for HBase to access HDFS The **privacy** indicates that the channels are encrypted by default. The **authentication** indicates that channels are not encrypted. **NOTE** You can set this parameter on the HDFS component configuration page. The parameter setting is valid globally, that is, the setting of whether the RPC channel is encrypted takes effect on all modules in Hadoop.	● Security mode: **privacy** ● Normal Mode: **authentication**

Setting the Maximum Number of Concurrent Web Connections

To ensure Web server security, the number of new connections is limited when the number of user connections reaches a specific threshold. This prevents DDOS attacks and service unavailability caused by too many users accessing the web server at the same time.

Page access:

Page access: On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > *component* > **Configurations**. Click **All Configurations**. Enter the parameter name in the search box.

Table 10-83 Parameter description

Parameter	Description	Default Value
hadoop.http.server.MaxRequests	Specifies the maximum number of concurrent web connections of each component. Components include HDFS and YARN.	2000
spark.connection.maxRequest	Maximum number of request connections of JobHistory.	5000

10.12.3.5 Configuring an IP Address Whitelist for Modifications Allowed by HBase

If the Replication function is enabled for HBase clusters, a protection mechanism for data modification is added on the standby HBase cluster to ensure data consistency between the active and standby clusters. Upon receiving an RPC request for data modification, the standby HBase cluster checks the permission of the user who sends the request (only HBase manage users have the modification permission). Then it checks the validity of the source IP address of the request. Only modification requests from IP addresses in the white list are accepted. The IP address white list is configured by the **hbase.replication.allowedIPs** item.

Page access: On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > *component* > **Configurations**. Click **All Configurations**. Enter the parameter name in the search box.

Table 10-84 Parameter description

Parameter	Description	Default Value
hbase.replication.allowedIPs	Allows replication request processing from configured IP addresses only. It supports comma separated regex patterns. Each pattern can be any of the following: • Regex Pattern eg: 10.18.40.* , 10.18.* , 10.18.40.11 • Range Pattern (Range can be specified only in the last octet) eg: 10.18.40.[10 to 20] If this item is empty (default value), the white list contains only the IP address of the RegionServer of the cluster, indicating that only modification requests from the RegionSever of the standby HBase cluster are accepted.	N/A

10.12.3.6 Updating a Key for a Cluster

Scenario

When a cluster is installed, an encryption key is generated automatically by the system so that the security information in the cluster (such as all database user passwords and key file access passwords) can be stored in encryption mode. After the cluster is installed, if the original key is accidentally disclosed or a new key is required, you can perform the following operations to manually update the key.

Impact on the System

- After a cluster key is updated, a new key is generated randomly in the cluster. This key is used to encrypt and decrypt the newly stored data. The old key is not deleted, and it is used to decrypt old encrypted data. After security information is modified, for example, a database user password is changed, the new password is encrypted using the new key.
- When a key is updated for a cluster, the cluster must be stopped and cannot be accessed.

Prerequisites

- You have obtained the IP addresses of the active and standby management nodes. For details, see **Logging In to the Management Node**.
- You have stopped the upper-layer service applications that depend on the cluster.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Stop**, and enter the password of the current login administrator for authentication.

In the displayed window, click **OK**. **Operation succeeded** is displayed. Click **Finish**. The cluster is stopped.

Step 3 Log in to the active management node as user **omm** with the IP address of the active management node.

Step 4 Run the following command to prevent you from being forcibly logged out when a timeout occurs:

TMOUT=0

NOTE

After the operations in this section are complete, run the **TMOUT=***Timeout interval* command to restore the timeout interval in a timely manner. For example, **TMOUT=600** indicates that a user is logged out if the user does not perform any operation within 600 seconds.

Step 5 Run the following command to switch the directory:

cd ${BIGDATA_HOME}/om-server/om/tools

Step 6 Run the following command to update the cluster key:

sh updateRootKey.sh

Enter **y** as prompted.

```
The root key update is a critical operation.
Do you want to continue?(y/n):
```

If the following information is displayed, the key is updated successfully.

```
Step 4-1: The key save path is obtained successfully.
...
Step 4-4: The root key is sent successfully.
```

Step 7 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Start**.

In the confirmation dialog box, click **OK** to start the cluster. **Operation succeeded** is displayed. Click **Finish**. The cluster is started.

----End

10.12.3.7 Hardening the LDAP

Configure the LDAP firewall policy.

In the cluster adopting the dual-plane networking, the LDAP is deployed on the service plane. To ensure the LDAP data security, you are advised to configure the firewall policy for the whole cluster to disable relevant LDAP ports.

Step 1 Log in to FusionInsight Manager.

Step 2 Click **Cluster** > *Name of the desired cluster* > **Services** > **LdapServer** > **Configurations**.

Step 3 Check the value of **LDAP_SERVER_PORT**, which is the service port of LdapServer.

Step 4 To ensure data security, configure the firewall policy for the whole cluster to disable the LdapServer port based on the customer's firewall environment.

----End

Enable the LDAP Audit Log Output.

Users can set the audit log output level of the LDAP service and output audit logs in a specified directory, for example, **/var/log/messages**. The logs output can be used to check user activities and operation commands.

NOTE

If the function of LDAP audit log output is enabled, massive logs are generated, affecting the cluster performance. Exercise caution when enabling this function.

Step 1 Log in to any LdapServer node.

Step 2 Run the following command to edit the **slapd.conf.consumer** file, and set the value of **loglevel** to **256** (You can view the log level definition by running the **man slapd.conf** command on the OS).

cd ${BIGDATA_HOME}/FusionInsight_BASE_8.1.0.1/install/FusionInsight-ldapserver-2.7.0/ldapserver/local/template

vi slapd.conf.consumer

```
...
pidfile         [PID_FILE_SLAPD_PID]
argsfile        [PID_FILE_SLAPD_ARGS]
loglevel 256
...
```

Step 3 Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **LdapServer** > **More** > **Restart Service**, enter the administrator password, and restart the service.

----End

10.12.3.8 Configuring Kafka Data Encryption During Transmission

Scenario

Data between the Kafka client and the broker is transmitted in plain text. The Kafka client may be deployed in an untrusted network, exposing the transmitting data to leakage and tampering risks.

Procedure

The channel between components is not encrypted by default. You can set the following parameters to enable security channel encryption.

Navigation path for setting parameters: On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Kafka** > **Configuration**. On the

displayed page, click the **All Configurations** tab. Enter a parameter name in the search box.

NOTE

After the configuration, restart the corresponding service for the settings to take effect.

Table 10-85 describes the parameters related to transmission encryption on the Kafka server.

Table 10-85 Parameters relevant to Kafka data encryption during transmission

Parameter	Description	Default Value
ssl.mode.enable	Indicates whether to enable the Secure Sockets Layer (SSL) protocol. If this parameter is set to **true**, services relevant to the SSL protocol are started during the broker startup.	false
security.inter.broker.protocol	Indicates communication protocol between brokers. The communication protocol can be PLAINTEXT, SSL, SASL_PLAINTEXT, or SASL_SSL.	SASL_PLAINTEXT

The SSL protocol can be configured for the server or client to encrypt transmission and communication only after **ssl.mode.enable** is set to **true** and broker enables the **SSL** and **SASL_SSL** protocols.

10.12.3.9 Configuring HDFS Data Encryption During Transmission

Configuring HDFS Security Channel Encryption

The channel between components is not encrypted by default. You can set parameters to enable security channel encryption.

Navigation path for setting parameters: On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations**. On the displayed page, click the **All Configurations** tab. Enter a parameter name in the search box.

NOTE

After the configuration, restart the corresponding service for the settings to take effect.

Table 10-86 Parameters

Configuration Item	Description	Default Value
hadoop.rpc.protection	**NOTICE** • The setting takes effect only after the service is restarted. Rolling restart is not supported. • After the setting, you need to download the client configuration file again. Otherwise, HDFS cannot provide the read and write services. Indicates whether the RPC channels of each module in Hadoop are encrypted. The channels include: • RPC channels for clients to access HDFS • RPC channels between modules in HDFS, for example, between DataNode and NameNode • RPC channels for clients to access Yarn • RPC channels between NodeManager and ResourceManager • RPC channels for Spark to access Yarn and HDFS • RPC channels for MapReduce to access Yarn and HDFS • RPC channels for HBase to access HDFS **NOTE** The setting takes effect globally, that is, the encryption attribute of the RPC channel of each module in the Hadoop takes effect.	• Security mode: privacy • Normal mode: authentication **NOTE** • **authentication**: indicates that only authentication is required. • **integrity**: indicates that authentication and consistency check need to be performed. • **privacy**: indicates that authentication, consistency check, and encryption need to be performed.

Configuration Item	Description	Default Value
dfs.encrypt.data.transfer	Indicates whether the HDFS data transfer channels and the channels for clients to access HDFS are encrypted. The HDFS data transfer channels include the data transfer channels between DataNodes and the Data Transfer (DT) channels for clients to access DataNodes. The value **true** indicates that the channels are encrypted. The channels are not encrypted by default. **NOTE** • This parameter is valid only when **hadoop.rpc.protection** is set to **privacy**. • If a large amount of service data is transmitted, enabling encryption by default severely affects system performance. • If data transmission encryption is configured for one cluster in the trusted cluster, the same data transmission encryption must be configured for the peer cluster.	false
dfs.encrypt.data.transfer.algorithm	Indicates the algorithm to encrypt the HDFS data transfer channels and the channels for clients to access HDFS. This parameter is valid only when **dfs.encrypt.data.transfer** is set to **true**. **NOTE** The default value is **3des**, indicating that 3DES algorithm is used to encrypt data. The value can also be set to **rc4**. However, to avoid security risks, you are not advised to set the parameter to this value.	3des
dfs.encrypt.data.transfer.cipher.suites	This parameter can be left empty or set to **AES/CTR/NoPadding** to specify the cipher suite for data encryption. If this parameter is not specified, the encryption algorithm specified by **dfs.encrypt.data.transfer.algorithm** is used for data encryption. The default value is **AES/CTR/NoPadding**.	AES/CTR/NoPadding

10.12.3.10 Encrypting the Communication Between Controller and Agent

Scenario

After a cluster is installed, Controller and Agent need to communicate with each other. The Kerberos authentication is used during the communication. By default, the communication is not encrypted during the communication for the sake of cluster performance. Users who have demanding security requirements can use the method described in this section for encryption.

Impact on the System

- Controller and all Agents automatically restart, which interrupts FusionInsight Manager.
- The performance of management nodes decreases in large clusters. You are advised to enable the encryption function for clusters with a maximum of 200 nodes.

Prerequisites

You have obtained the IP addresses of the active and standby management nodes.

Procedure

Step 1 Log in to the active management node as user **omm**.

Step 2 Run the following command to disable user logout on system timeout:

TMOUT=0

NOTE

After the operations in this section are complete, run the **TMOUT=***Timeout interval* command to restore the timeout interval in a timely manner. For example, **TMOUT=600** indicates that a user is logged out if the user does not perform any operation within 600 seconds.

Step 3 Run the following command to switch the directory:

cd ${CONTROLLER_HOME}/sbin

Step 4 Run the following command to enable communication encryption:

./enableRPCEncrypt.sh -t

Run the **sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh** command to check whether **ResHAStatus** of the active management node Controller is **Normal** and whether you can log in to FusionInsight Manager again. If yes, the enablement is successful.

Step 5 Run the following command to disable communication encryption when necessary:

./enableRPCEncrypt.sh -f

Run the **sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh** command to check whether **ResHAStatus** of the active management node Controller is **Normal**

and whether you can log in to FusionInsight Manager again. If yes, the disablement is successful.

----End

10.12.3.11 Updating SSH Keys for User omm

Scenario

During cluster installation, the system automatically generates the SSH public key and private key for user **omm** to establish the trust relationship between nodes. After the cluster is installed, if the original keys are accidentally disclosed or new keys are used, the system administrator can perform the following operations to manually change the keys.

Prerequisites

- The cluster has been stopped.
- No other management operations are being performed.

Procedure

Step 1 Log in as user omm to the node whose SSH keys need to be replaced.

If the node is a Manager management node, run the following command on the active management node.

Step 2 Run the following command to disable user logout upon system timeout:

TMOUT=0

NOTE

After the operations in this section are complete, run the **TMOUT=***Timeout interval* command to restore the timeout interval in a timely manner. For example, **TMOUT=600** indicates that a user is logged out if the user does not perform any operation within 600 seconds.

Step 3 Run the following command to generate a key for the node:

- If the node is a Manager management node, run the following command:

  sh ${CONTROLLER_HOME}/sbin/update-ssh-key.sh

- If the node is a non-Manager management node, run the following command:

  sh ${NODE_AGENT_HOME}/bin/update-ssh-key.sh

If **Succeed to update ssh private key.** is displayed when the preceding command is executed, the SSH key is generated successfully.

Step 4 Run the following command to copy the public key of the node to the active management node:

scp ${HOME}/.ssh/id_rsa.pub** *oms_ip*:**${HOME}/.ssh/id_rsa.pub_bak

oms_ip: indicates the IP address of the active management node.

Enter the password of user **omm** to copy the files.

Step 5 Log in to the active management node as user **omm**.

Step 6 Run the following command to disable user logout on system timeout:

TMOUT=0

Step 7 Run the following command to switch the directory:

cd ${HOME}/.ssh

Step 8 Run the following command to add new public keys:

cat id_rsa.pub_bak >> authorized_keys

Step 9 Run the following command to move the temporary public key file, for example, **/tmp**.

mv -f id_rsa.pub_bak /tmp

Step 10 Copy the **authorized_keys** file of the active management node to the other nodes in the cluster:

scp authorized_keys *node_ip*:**/${HOME}/.ssh/authorized_keys**

node_ip: indicates the IP address of another node in the cluster. Multiple IP addresses are not supported.

Step 11 Run the following command to confirm private key replacement without entering the password:

ssh *node_ip*

node_ip: indicates the IP address of another node in the cluster. Multiple IP addresses are not supported.

Step 12 Log in to the FusionInsight Manager. On the **Homepage** page, click > **Start** to start the cluster.

----End

10.12.4 Security Maintenance

10.12.4.1 Account Maintenance Suggestions

You are advised to perform routine checks on accounts. The check covers the following items:

- Check whether the accounts of the OS, FusionInsight Manager, and each component are necessary and whether temporary accounts have been deleted.
- Check whether the permissions of the accounts are appropriate. Different administrators have different rights.
- Check and audit the logins and operation records of all types of accounts.

10.12.4.2 Password Maintenance Suggestions

User identity authentication is a must for accessing the application system. The complexity and validity period of user accounts and passwords must meet customers' security requirements.

The password maintenance suggestions are as follows:

1. Dedicated personnel must be arranged to manage the OS password.
2. The passwords must meet the complexity requirements, such as minimum password length or character types.
3. Passwords must be encrypted before transfer. Generally, do not transfer passwords using emails.
4. Passwords must be encrypted in configuration files.
5. Enterprise users need to change the passwords when the system is handed over.
6. Passwords must be periodically changed.

10.12.4.3 Logs Maintenance Suggestions

Operation logs help discover exceptions such as illegal operations and login by unauthorized users. The system records important operations in logs. You can use operation logs to locate problems.

Checking Logs Regularly

Check system operation logs periodically and handle exceptions such as unauthorized operations or logins in a timely manner.

Backing Up Logs Regularly

The audit logs provided by FusionInsight Manager and cluster record the user activities and operations. You can export the audit logs on FusionInsight Manager. If there are too many audit logs in the system, you can configure dump parameters to dump audit logs to a specified server to ensure that the cluster nodes disk space is sufficient.

Maintenance Owner

Network monitoring engineers and system maintenance engineers

10.12.5 Security Statement

JDK Usage Statement

MRS is a big data cluster that provides distributed data analysis and computing capabilities for users. OpenJDK is the built-in JDK of MRS, which is mainly applied in the following scenarios:

- Performing O&M for platform services
- Running the Linux client (mostly for service request submission and application O&M)

JDK Risk Statement

The system implements permission control on the built-in JDK. Only users in related groups of the FusionInsight platform can access the JDK. In addition, the platform is deployed on a customer's intranet, which has low security risks.

JDK Hardening

For details about how to harden the JDK, see "Hardening JDK" in **Hardening Policy**.

Public IP Addresses in Hue

Hue uses the test cases of third-party packages, such as **ipadrress**, **requests**, and **Django**, and uses the public IP addresses in the comments of the test cases. However, these public IP addresses are not involved when Hue provides services, and the Hue configuration file does not involve these public IP addresses.

10.13 Alarm Reference (Applicable to MRS 3.*x*)

10.13.1 ALM-12001 Audit Log Dumping Failure

Description

Cluster audit logs need to be dumped on a third-party server due to the local historical data backup policy. The system starts to check the dump server at 3 a.m. every day. If the dump server meets the configuration conditions, audit logs can be successfully dumped. This alarm is generated when the audit log dump fails if the disk space of the dump directory on the third-party server is insufficient or a user changes the username, password, or dump directory of the dump server.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12001	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
HostName	Specifies the host for which the alarm is generated.

Impact on the System

System can store a maximum of only 50 dump files locally. If the fault persists on the dump server, the local audit logs may be lost.

Possible Causes

- The network connection is abnormal.
- The username, password, or dump directory of the dump server does not meet the configuration conditions.
- The disk space of the dump directory is insufficient.

Procedure

Check whether the network connection is normal.

Step 1 On the FusionInsight Manager home page, choose **Audit > Configurations**.

Step 2 Check whether the SFTP IP on the dump configuration page is valid.

Log in to the node where Manager is located as user **root** and run the **ping** command to check whether the network connection between the SFTP server and the cluster is normal.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Repair the network connection, reset the SFTP password, and click **OK**.

Step 4 Wait for 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the username, password, or dump directory are correct.

Step 5 On the dump configuration page, check whether the username, password, and dump directory of the third-party server are correct.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Change the username, password, or dump directory, reset the SFTP password and click **OK**.

Step 7 Wait for 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the disk space of the dump directory is sufficient.

Step 8 Log in to the third-party server as user **root** and run the **df** command to check whether the disk space of the dump directory of the third-party server exceeds 100 MB.

- If yes, go to **Step 11**.
- If no, go to **Step 9**.

Step 9 Expand disk space capacity for the third-party server, Reset the SFTP password and click **OK**

Step 10 Wait for 2 minutes, view real-time alarms and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Reset the dump rule.

Step 11 On the FusionInsight Manager home page, choose **Audit > Configurations**.

Step 12 Reset dump rules, set the parameters properly, and click **OK**.

Step 13 Wait for 2 minutes, view real-time alarms and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Collect fault information.

Step 14 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 15 Select **OmmServer** from the **Service** and click **OK**.

Step 16 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 17 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.2 ALM-12004 OLdap Resource Abnormal

Description

The system checks LDAP resources every 60 seconds. This alarm is generated when the system detects that the LDAP resources in Manager are abnormal for six consecutive times.

This alarm is cleared when the Ldap resource in the Manager recovers and the alarm handling is complete.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12004	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Manager and component WebUI authentication services are unavailable and cannot provide security authentication and user management functions for web upper-layer services. Users may be unable to log in to the WebUIs of Manager and components.

Possible Causes

The LdapServer process in the Manager is abnormal.

Procedure

Check whether the LdapServer process in the Manager is normal.

Step 1 Log in the Manager node in the cluster as user **omm**.

Log in to FusionInsight Manager using the floating IP address, and run the **sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh** command to check the information about the current Manager two-node cluster.

Step 2 Run **ps -ef | grep slapd** command to check whether the LdapServer resource process in the **${BIGDATA_HOME}/om-server/om/** in the process configuration file is running properly.

NOTE

You can determine that the resource is normal by checking the following information:

1. After the **sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh** command runs, **ResHAStatus** of the OLdap is **Normal**.
2. After the **ps -ef | grep slapd** command runs, the slapd process of port 21750 can be viewed.
   - If yes, go to **Step 3**.
   - If no, go to **Step 4**.

Step 3 Run the **kill -2** *ldap pid* command to restart the LdapServer process and wait for 20 seconds. The HA starts the OLdap process automatically. Check whether the current OLdap resource is in normal state.

- If yes, the operation is complete.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On the FusionInsight Manager home page, choose **O&M** > **Log > Download**.

Step 5 Select **OmsLdapServer** and **OmmServer** from the **Service** and click **OK**.

Step 6 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.3 ALM-12005 OKerberos Resource Abnormal

Description

The alarm module checks the status of the Kerberos resource in Manager every 80 seconds. This alarm is generated when the alarm module detects that the Kerberos resources are abnormal for six consecutive times.

This alarm is cleared when the Kerberos resource recovers and the alarm handling is complete.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12005	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The component WebUI authentication services are unavailable and cannot provide security authentication functions for web upper-layer services. Users may be unable to log in to FusionInsight Manager and the WebUIs of components.

Possible Causes

The OLdap resource on which the Okerberos depends is abnormal.

Procedure

Check whether the OLdap resource on which the Okerberos depends is abnormal in the Manager.

Step 1 Log in the Manager node in the cluster as user **omm**.

Log in to FusionInsight Manager using the floating IP address, and run the **sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh** command to check the information about the current Manager two-node cluster.

Step 2 Run the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the OLdap resource status managed by HA is normal. (In single-node mode, the OLdap resource is in the Active_normal state; in the two-node mode, the OLdap resource is in the Active_normal state on the active node and in the Standby_normal state on the standby node.)

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 See the procedure in **ALM-12004 OLdap Resource Abnormal** to resolve the problem. After the OLdap resource status recovers, check whether the OKerberos resource status is normal.

- If yes, the operation is complete.

- If no, go to **Step 4**.

Collect fault information.

Step 4 On the FusionInsight Manager home page, choose **O&M** > **Log** > **Download**.

Step 5 Select **OmsKerberos** and **OmmServer** from the **Service** and click **OK**.

Step 6 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.4 ALM-12006 Node Fault

Description

Controller checks NodeAgent heartbeat messages every 30 seconds. If Controller does not receive heartbeat messages from a NodeAgent, it attempts to restart the NodeAgent process. This alarm is generated if the NodeAgent fails to be restarted for three consecutive times.

This alarm is cleared when Controller can properly receive the status report of the NodeAgent.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Services on the node are unavailable.

Possible Causes

The network is disconnected, the hardware is faulty, or the operating system runs slowly.

Procedure

Check whether the network is disconnected, whether the hardware is faulty, or whether the operating system runs slowly.

Step 1 In the FusionInsight Manager portal, click **O&M > Alarm > Alarms**, click ⌄ in the row where the alarm is located , and click the host name to view the host address for which the alarm is generated.

Step 2 Log in to the active management node as user **root**.

Step 3 Run the **ping** *IP address of the faulty host* command to check whether the faulty node is reachable.

- If yes, go to **Step 12**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Recover the network fault and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Step 6 Contact the system administrator to check whether the node hardware (CPU or memory) is faulty.

- If yes, go to **Step 7**.
- If no, go to **Step 12**.

Step 7 Repair or replace the faulty components and restart the node. Then check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 8 If a large number of node faults are reported in the cluster, the floating IP address resource may be abnormal. As a result, the controller cannot detect the agent heartbeat.

Log in to any management node and view the **/var/log/Bigdata/omm/oms/ha/scriptlog/floatip.log** file to check whether the logs generated one to two minutes before and after the fault occurs are complete.

For example, a complete log is in the following format:

```
2017-12-09 04:10:51,000 INFO (floatip) Read from ${BIGDATA_HOME}/om-server_8.1.0.1/om/etc/om/
routeSetConf.ini,value is : yes
2017-12-09 04:10:51,000 INFO (floatip) check wsNetExport : eth0 is up.
2017-12-09 04:10:51,000 INFO (floatip) check omNetExport : eth0 is up.
2017-12-09 04:10:51,000 INFO (floatip) check wsInterface : eth0:oms, wsFloatIp: XXX.XXX.XXX.XXX.
2017-12-09 04:10:51,000 INFO (floatip) check omInterface : eth0:oms, omFloatIp: XXX.XXX.XXX.XXX.
2017-12-09 04:10:51,000 INFO (floatip) check  wsFloatIp : XXX.XXX.XXX.XXX is reachable.
2017-12-09 04:10:52,000 INFO (floatip) check  omFloatIp : XXX.XXX.XXX.XXX is reachable.
```

- If yes, go to **Step 12**.
- If no, go to **Step 9**.

Step 9 Check whether the omNetExport log is printed after the wsNetExport is detected or whether the interval for printing two logs exceeds 10 seconds or longer.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 View the /var/log/message file of the operating system. For Red hat, check whether sssd is frequently restarted; for SUSE, check whether nscd exception exists.

For example, see whether there is the exception **Can't contact LDAP server**.

sssd restart example:

```
Feb  7 11:38:16 10-132-190-105 sssd[pam]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd[be[default]]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd: Starting up
Feb  7 11:38:16 10-132-190-105 sssd[be[default]]: Starting up
Feb  7 11:38:16 10-132-190-105 sssd[nss]: Starting up
Feb  7 11:38:16 10-132-190-105 sssd[pam]: Starting up
```

nscd exception example:

```
Feb 11 11:44:42 10-120-205-33 nscd: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780:
Can't contact LDAP server
Feb 11 11:44:43 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780:
Can't contact LDAP server
Feb 11 11:44:44 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.92:21780:
Can't contact LDAP server
```

- If yes, go to **Step 11**.
- If no, go to **Step 12**.

Step 11 Check whether the ldapserver node is faulty, for example, the service IP address is unreachable or the network latency is too long. If the fault lasts periodically, locate and eliminate it and run the **top** command to check whether abnormal software exists.

Collect fault information.

Step 12 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 13 Select the following nodes from the **Service** and click **OK**:

- NodeAgent
- Controller
- OS

Step 14 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 15 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.5 ALM-12007 Process Fault

Description

This alarm is generated when the process health check module detects that the process connection status is **Bad** for three consecutive times. The process health check module checks the process status every 5 seconds.

This alarm is cleared when the process can be connected.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12007	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The service provided by the process is unavailable.

Possible Causes

- The instance process is abnormal.
- The disk space is insufficient.

NOTE

If a large number of process fault alarms exist in a time segment, files in the installation directory may be deleted mistakenly or permission on the directory may be modified.

Procedure

Check whether the instance process is abnormal.

Step 1 In the FusionInsight Manager portal, click **O&M > Alarm > Alarms**, click ⌄ in the row where the alarm is located , and click the host name to view the host address for which the alarm is generated

Step 2 On the **Alarms** page, check whether the **ALM-12006 Node Fault** is generated.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Handle the alarm according to **ALM-12006 Node Fault**.

Step 4 Log in to the host for which the alarm is generated as user **root**. Check whether the installation directory user, user group, and permission of the alarm role are correct. The user, user group, and the permission must be **omm:ficommon 750**.

For example, the NameNode installation directory is *${BIGDATA_HOME}*/**FusionInsight_Current/***1_8_NameNode*/**etc**.

- If yes, go to **Step 6**.
- If no, go to **Step 5**.

Step 5 Run the following command to set the permission to **750** and **User:Group** to **omm:ficommon**:

chmod 750 *<folder_name>*

chown omm:ficommon *<folder_name>*

Step 6 Wait for 5 minutes. In the alarm list, check whether **ALM-12007 Process Fault** is cleared.

- If yes, no further action is required.

- If no, go to **Step 7**.

Check whether disk space is sufficient.

Step 7 On the FusionInsight Manager, check whether the alarm list contains **ALM-12017 Insufficient Disk Capacity**.

- If yes, go to **Step 8**.
- If no, go to **Step 11**.

Step 8 Rectify the fault by following the steps provided in **ALM-12017 Insufficient Disk Capacity**.

Step 9 Wait for 5 minutes. In the alarm list, check whether **ALM-12017 Insufficient Disk Capacity** is cleared.

- If yes, go to **Step 10**.
- If no, go to **Step 11**.

Step 10 Wait for 5 minutes. In the alarm list, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 12 According to the service name obtained in **Step 1**, select the component and **NodeAgent** from the **Service** and click **OK**.

Step 13 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.6 ALM-12010 Manager Heartbeat Interruption Between the Active and Standby Nodes

Description

This alarm is generated when the active Mager does not receive the heartbeat signal from the standby Manager within 7 seconds.

This alarm is cleared when the active Manager receives heartbeat signals from the standby Manager.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12010	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

When the active Manager process is abnormal, an active/standby failover cannot be performed, and services are affected.

Possible Causes

- The link between the active and standby Manager is abnormal.
- The node name configuration is incorrect.
- The port is disabled by the firewall.

Procedure

Check whether the network between the active and standby Manager server is normal.

Step 1 In the FusionInsight Manager portal, click **O&M > Alarm > Alarms**, click ⌄ in the row containing the alarm and view the IP address of the standby Manager (Peer Manager) server in the alarm details.

Step 2 Log in to the active Manager server as user **root**.

Step 3 Run the **ping** *standby Manager heartbeat IP address* command to check whether the standby Manager server is reachable.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Step 6 Run the following command to go to the software installation directory:

cd /opt

Step 7 Run the following command to find the configuration file directory of the active and standby nodes.

find -name hacom_local.xml

Step 8 Run the following command to go to the **workspace** directory:

cd${BIGDATA_HOME}/om-server/OMS/workspace0/ha/local/hacom/conf/

Step 9 Run the **vim** command to open the **hacom_local.xml** file. Check whether the local and peer nodes are correctly configured. The local node is configured as the active node, and the peer node is configured as the standby node.

- If yes, go to **Step 12**.
- If no, go to **Step 10**.

Step 10 Modify the configuration of the active and standby nodes in the **hacom_local.xml** file and press **Esc** to return to the command mode. Run the **:wq** command to save the modification and exit.

Step 11 Check whether the alarm is cleared automatically.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check whether the port is disabled by the firewall.

Step 12 Run the **lsof -i :20012** command to check whether the heartbeat ports of the active and standby nodes are enabled. If the command output is displayed, the ports are enabled. Otherwise, the ports are disabled by the firewall.

- If yes, go to **Step 13**.
- If no, go to **Step 16**.

Step 13 Run the **iptables -P INPUT ACCEPT** command to avoid the server disconnection.

Step 14 Run the following command to clear the firewall:

iptables -F

Step 15 Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 16**.

Collect fault information.

Step 16 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 17 Select the following nodes from the **Service** and click **OK**:

- OmmServer
- Controller
- NodeAgent

Step 18 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.7 ALM-12011 Manager Data Synchronization Exception Between the Active and Standby Nodes

Description

The system checks data synchronization between the active and standby Manager nodes every 60 seconds. This alarm is generated when the standby Manager fails to synchronize files with the active Manager.

This alarm is cleared when the standby Manager synchronizes files with the active Manager.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12011	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Some configurations will be lost after an active/standby switchover because the configuration files on the standby Manager are not updated. Maybe Manager and some components cannot run properly.

Possible Causes

- The link between the active and standby Managers is interrupted or The storage space of the **/srv/BigData/LocalBackup** directory is full.
- The synchronization file does not exist or the file permission is incorrect.

Procedure

Check whether the network between the active Manager server and the standby Manager server is normal.

Step 1 In the FusionInsight Manager portal, click **O&M > Alarm > Alarms**, click ⌄ in the row where the alarm is located and obtain the standby Manager server IP address (Peer Manager IP address) in the alarm details.

Step 2 Log in to the active Manager server as user **root**.

Step 3 Run the **ping** *standby Manager IP address* command to check whether the standby Manager server is reachable.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the storage space of the /srv/BigData/LocalBackup directory is full.

Step 6 Run the following command to check whether the storage space of the **/srv/BigData/LocalBackup** directory is full:

df -hl /srv/BigData/LocalBackup

- If yes, go to **Step 7**.

- If no, go to **Step 10**.

Step 7 Run the following command to clear unnecessary backup files:

rm -rf *Directory to be cleared*

Example:

rm -rf /srv/BigData/LocalBackup/0/default-oms_20191211143443

Step 8 On FusionInsight Manager, choose **O&M** > **Backup and Restoration** > **Backup Management**.

In the **Operation** column of the backup task to be performed, click **Configure** and change the value of **Maximum Number of Backup Copies** to reduce the number of backup file sets.

Step 9 Wait about 1 minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the synchronization file exists and whether the file permission is normal.

Step 10 Run the following command to check whether the synchronization file exists.

find /srv/BigData/ -name "sed*"

find /opt -name "sed*"

- If yes, go to **Step 11**.
- If no, go to **Step 12**.

Step 11 Run the following command to view the synchronization file information and permission obtained in **Step 10**.

ll *path of the file to be found*

- If the size of the file is 0 and the permission column is **-**, the file is a junk file. Run the following command to delete it.

  rm -rf *files to be deleted*

  Wait for several minutes and check whether the alarm is cleared. If the alarm persists, go to **Step 12**.
- If the file size is not 0, go to **Step 12**.

Step 12 View the log files generated when the alarm is generated.

1. Run the following command to switch to the HA run log file path.

   cd /var/log/Bigdata/omm/oms/ha/runlog/
2. Decompress and view the log files generated when the alarm is generated.

   For example, if the name of the file to be viewed is **ha.log.2021-03-22_12-00-07.gz**, run the following command:

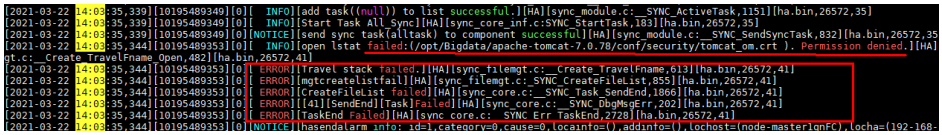
   gunzip *ha.log.2021-03-22_12-00-07.gz*

   vi *ha.log.2021-03-22_12-00-07*

   Check whether error information is reported before and after the alarm generation time.

- If yes, rectify the fault based on the error information. Then go to **Step 13**.

  For example, if the following error information is displayed, the directory permission is insufficient. In this case, change the directory permission to be the same as that on the normal node.



- If no, go to **Step 14**.

Step 13 Wait about 10 minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Collect fault information.

Step 14 On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 15 Select the following nodes from the **Service** and click **OK**:

- OmmServer
- Controller
- NodeAgent

Step 16 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 17 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.8 ALM-12014 Partition Lost

Description

The system checks the partition status every 60 seconds. This alarm is generated when the system detects that a partition to which service directories are mounted is lost (because the device is removed or goes offline, or the partition is deleted). The system checks the partition status periodically.

This alarm must be manually cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12014	Major	No

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DirName	Specifies the directory for which the alarm is generated.
PartitionName	Specifies the device partition for which the alarm is generated.

Impact on the System

Service data fails to be written into the partition, and the service system runs abnormally.

Possible Causes

- The hard disk is removed.
- The hard disk is offline, or a bad sector exists on the hard disk.

Procedure

Step 1 On FusionInsight Manager, click **O&M > Alarm > Alarms**, and click ⌄ in the row where the alarm is located.

Step 2 Obtain **HostName**, **PartitionName** and **DirName** from **Location**.

Step 3 Check whether the disk of **PartitionName** on **HostName** is inserted to the correct server slot.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Contact hardware engineers to remove the faulty disk.

Step 5 Log in to the **HostName** node where an alarm is reported and check whether there is a line containing **DirName** in the **/etc/fstab** file as user **root**.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Run the **vi /etc/fstab** command to edit the file and delete the line containing **DirName**.

Step 7 Contact hardware engineers to insert a new disk. For details, see the hardware product document of the relevant model. If the faulty disk is in a RAID group, configure the RAID group. For details, see the configuration methods of the relevant RAID controller card.

Step 8 Wait 20 to 30 minutes (The disk size determines the waiting time), and run the **mount** command to check whether the disk has been mounted to the **DirName** directory.

- If yes, manually clear the alarm. No further operation is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 10 Select the **OmmServer** from the Services drop-down list and click **OK**.

Step 11 Set Start Date for log collection to 10 minutes ahead of the alarm generation time and End Date to 10 minutes behind the alarm generation time and click **Download**.

Step 12 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system does not automatically clear this alarm, and you need to manually clear the alarm.

Related Information

None

10.13.9 ALM-12015 Partition Filesystem Readonly

Description

The system checks the partition status every 60 seconds. This alarm is generated when the system detects that a partition to which service directories are mounted enters the read-only mode (due to a bad sector or a faulty file system). The system checks the partition status periodically.

This alarm is cleared when the system detects that the partition to which service directories are mounted exits from the read-only mode (because the file system is restored to read/write mode, the device is removed, or the device is formatted).

Attribute

Alarm ID	Alarm Severity	Auto Clear
12015	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DirName	Specifies the directory for which the alarm is generated.
PartitionName	Specifies the device partition for which the alarm is generated.

Impact on the System

Service data fails to be written into the partition, and the service system runs abnormally.

Possible Causes

The hard disk is faulty, for example, a bad sector exists.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, click ⌄ in the row where the alarm is located.

Step 2 Obtain **HostName** and **PartitionName** from **Location**. **HostName** is the node where the alarm is reported, and **PartitionName** is the partition of the faulty disk.

Step 3 Contact hardware engineers to check whether the disk is faulty. If the disk is faulty, remove it from the server.

Step 4 After the disk is removed, alarm **ALM-12014 Partition Lost** is reported. Handle the alarm. For details, see **ALM-12014 Partition Lost**. After the alarm **ALM-12014**

Partition Lost is cleared, alarm **ALM-12015 Partition Filesystem Readonly** is automatically cleared.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.10 ALM-12016 CPU Usage Exceeds the Threshold

Description

The system checks the CPU usage every 30 seconds and compares the actual CPU usage with the threshold. The CPU usage has a default threshold. This alarm is generated when the CPU usage exceeds the threshold for several times (configurable, 10 times by default) consecutively.

The alarm is cleared in the following two scenarios: The value of **Trigger Count** is 1 and the CPU usage is smaller than or equal to the threshold; the value of **Trigger Count** is greater than 1 and the CPU usage is smaller than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12016	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Service processes respond slowly or become unavailable.

Possible Causes

- The alarm threshold or alarm smoothing times are incorrect.
- CPU configuration cannot meet service requirements. The CPU usage reaches the upper limit.

Procedure

Check whether the alarm threshold or alarm Trigger Count are correct.

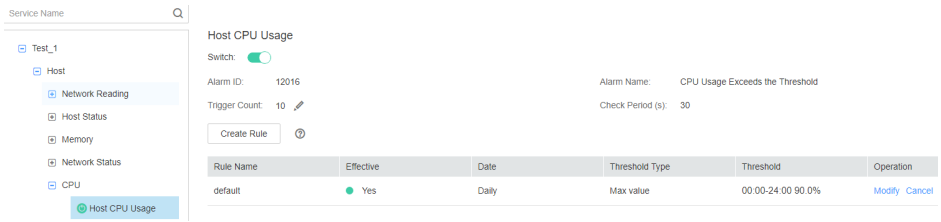
Step 1 Change the alarm threshold and alarm **Trigger Count** based on CPU usage.

On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds >** *Name of the desired cluster* > **Host** > **CPU** > **Host CPU Usage** and change the alarm smoothing times based on CPU usage, as shown in **Figure 10-22**.

NOTE

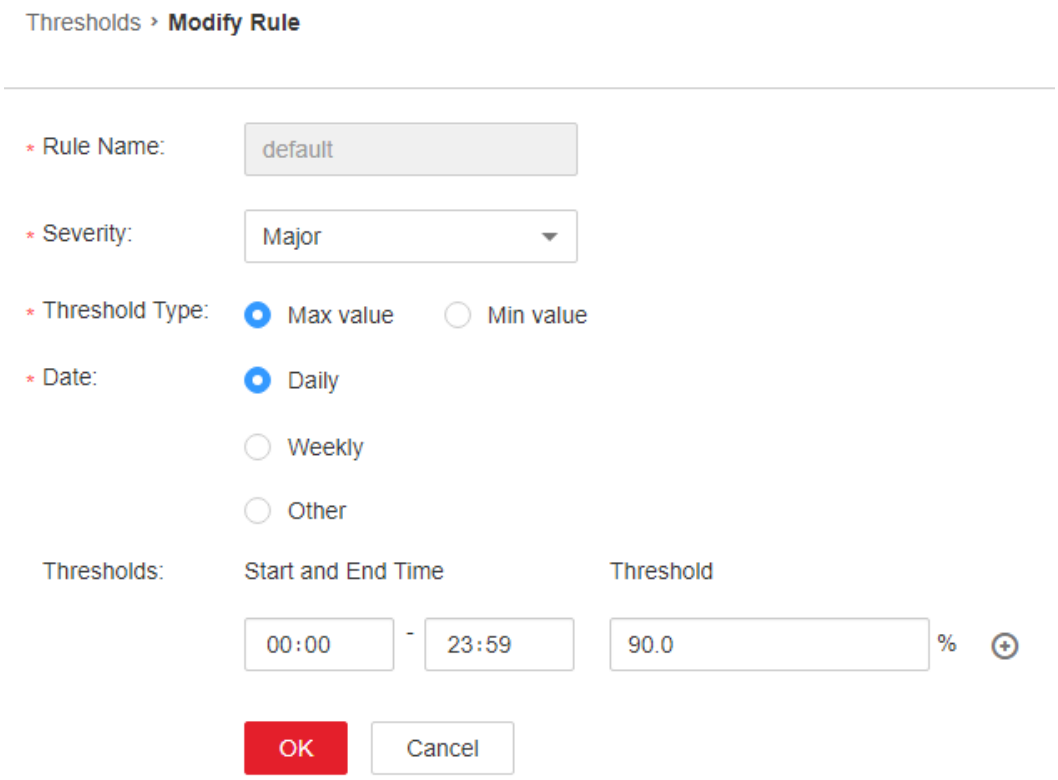
This option defines the alarm check phase. **Trigger Count** indicates the alarm check threshold. An alarm is generated when the number of check times exceeds the threshold.

Figure 10-22 Setting alarm smoothing times



On **Host CPU Usage** page and click **Modify** in the **Operation** column to change the alarm threshold, as shown in **Figure 10-23**.

Figure 10-23 Setting an alarm threshold



Step 2 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check whether the CPU usage reaches the upper limit.

Step 3 In the alarm list on FusionInsight Manager, click ⌄ in the row where the alarm is located to view the alarm host address in the alarm details.

Step 4 On the **Hosts** page, click the node on which the alarm is reported.

Step 5 View the CPU usage for 5 minutes. If the CPU usage exceeds the threshold for multiple times, contact the system administrator to add more CPUs.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager in the active cluster, choose **O&M** > **Log** > **Download**.

Step 8 Select **OmmServer** from the **Service** and click **OK**.

Step 9 Set **Start Date** for log collection to 10 minutes ahead of the alarm generation time and **End Date** to 10 minutes behind the alarm generation time in **Time Range** and click **Download**.

Step 10 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.11 ALM-12017 Insufficient Disk Capacity

Description

The system checks the host disk usage of the system every 30 seconds and compares the actual disk usage with the threshold. The disk usage has a default threshold, this alarm is generated when the host disk usage exceeds the specified threshold.

When the **Trigger Count** is 1, this alarm is cleared when the usage of a host disk partition is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the usage of a host disk partition is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12017	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PartitionName	Specifies the device partition for which the alarm is generated.

Name	Meaning
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Service processes become unavailable.

Possible Causes

- The alarm threshold is incorrect.
- Disk configuration of the server cannot meet service requirements.

Procedure

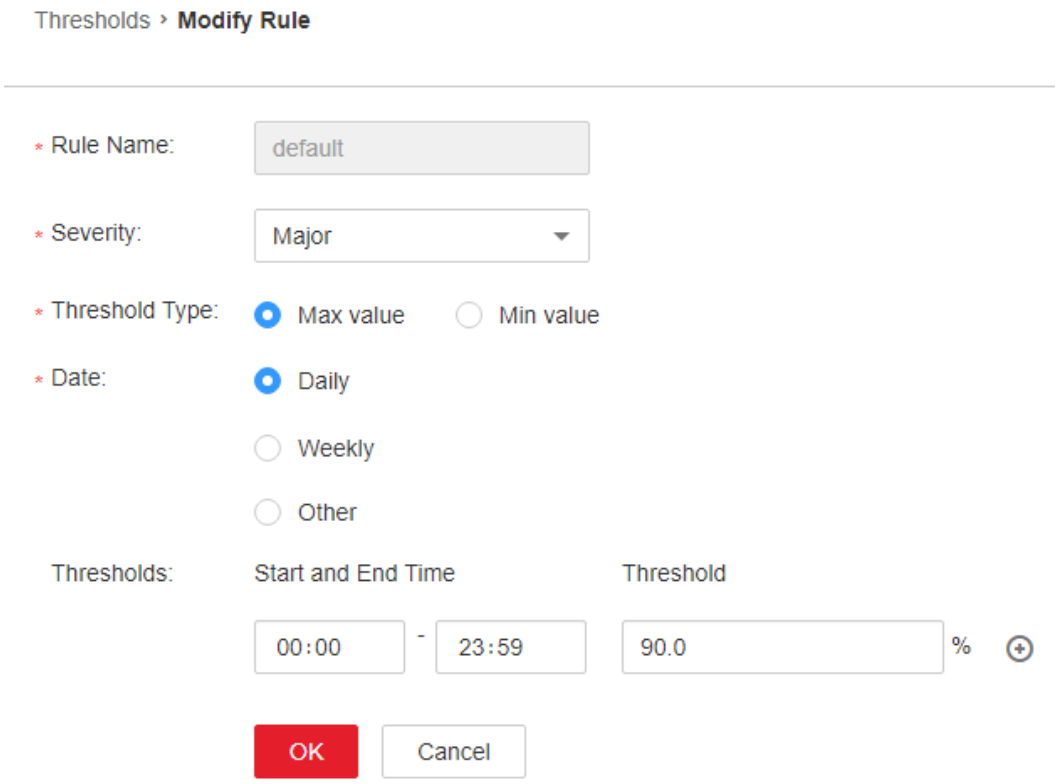
Check whether the alarm threshold is appropriate.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm > Thresholds >** *Name of the desired cluster* > **Host** > **Disk** > **Disk Usage** and check whether the threshold (configurable, 90% by default) is appropriate.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Choose **O&M** > **Alarm > Thresholds >** *Name of the desired cluster* > **Host** > **Disk** > **Disk Usage** and click **Modify** in the **Operation** column to change the alarm threshold based on site requirements. As shown in **Figure 10-24**:

Figure 10-24 Setting an alarm threshold



Step 3 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the disk usage reaches the upper limit.

Step 4 In the alarm list on FusionInsight Manager, click ⌄ in the row where the alarm is located to view the alarm host name and disk partition information in the alarm details.

Step 5 Log in to the node where the alarm is generated as user **root**.

Step 6 Run the **df -lmPT | awk '$2 != "iso9660"' | grep '^/dev/' | awk '{"readlink -m "$1 | getline real }{$1=real; print $0}' | sort -u -k 1,1** command to check the system disk partition usage. Check whether the disk is mounted to the following directories based on the disk partition name obtained in **Step 4**: **/**, **/opt**, **/tmp**, **/var**, **/var/log**, and **/srv/BigData**(can be customized).

- If yes, the disk is a system disk. Then go to **Step 10**.
- If no, the disk is not a system disk. Then go to **Step 7**.

Step 7 Run the **df -lmPT | awk '$2 != "iso9660"' | grep '^/dev/' | awk '{"readlink -m "$1 | getline real }{$1=real; print $0}' | sort -u -k 1,1** command to check the system disk partition usage. Determine the role of the disk based on the disk partition name obtained in **Step 4**.

Step 8 Check the disk service.

In MRS, check whether the disk service is HDFS, Yarn, Kafka, Supervisor.

- If yes, adjust the capacity. Then go to **Step 9**.
- If no, go to **Step 12**.

Step 9 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Step 10 Run the **find / -xdev -size +500M -execls -l {} \;** command to check whether a file larger than 500 MB exists on the node and disk.

- If yes, go to **Step 11**.
- If no, go to **Step 12**.

Step 11 Handle the large file and check whether the alarm is cleared 2 minutes later.

- If yes, no further action is required.
- If no, go to **Step 12**.

Step 12 Contact the system administrator to expand the disk capacity.

Step 13 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Collect fault information.

Step 14 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 15 Select **OMS** from the **Service** and click **OK**.

Step 16 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 17 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.12 ALM-12018 Memory Usage Exceeds the Threshold

Description

The system checks the memory usage of the system every 30 seconds and compares the actual memory usage with the threshold. The memory usage has a default threshold, this alarm is generated when the value of the memory usage exceeds the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the host memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1,

this alarm is cleared when the host memory usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12018	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Service processes respond slowly or become unavailable.

Possible Causes

- Memory configuration cannot meet service requirements. The memory usage reaches the upper limit.
- The SUSE 12.X OS has an earlier **free** command. The calculated memory usage cannot reflect the real-world memory usage.

Procedure

Perform the following operations if SUSE 12.X is used.

Step 1 Log in to any node in the cluster as user **root**, and run the **cat /etc/*-release** command to check whether the OS is SUSE 12.X as user **root**.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Run the **cat /proc/meminfo | grep Mem** command to check the real-world memory usage of the OS.

```
MemTotal: 263576192 kB
MemFree: 198283116 kB
MemAvailable: 227641452 kB
```

Step 3 Calculate the real-world memory usage: Memory usage = 1 - (Memory available/Memory total)

- If the memory usage is lower than 90%, manually disable transferring from monitoring indicators to alarms.
- If the memory usage is higher than 90%, go to **Step 4**.

Expand the system.

Step 4 In the alarm list on FusionInsight Manager, click ⌄ in the row where the alarm is located to view the alarm host address in the alarm details.

Step 5 Log in to the host where the alarm is generated as user **root**.

Step 6 If the memory usage exceeds the threshold, perform memory capacity expansion.

Step 7 Run the command **free -m | grep Mem\: | awk '{printf("%s,", ($3-$6-$7) * 100 / $2)}'** to check the system memory usage.

Step 8 Wait for 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager in the active cluster, choose **O&M** > **Log** > **Download**.

Step 10 Select **OmmServer** from the **Service** and click **OK**.

Step 11 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.13 ALM-12027 Host PID Usage Exceeds the Threshold

Description

The system checks the PID usage every 30 seconds and compares the actual PID usage with the default PID usage threshold. This alarm is generated when the system detects that the PID usage exceeds the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the PID usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the PID usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12027	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

No PID is available for new processes and service processes are unavailable.

Possible Causes

Too many processes are running on the node. You need to increase the value of **pid_max**.

Procedure

Increase the value of pid_max.

Step 1 In the alarm list on FusionInsight Manager, click ⌄ in the row where the alarm is located to view the alarm host address in the alarm details.

Step 2 Log in to the host where the alarm is generated as user **root**.

Step 3 Run the **cat /proc/sys/kernel/pid_max**command to check the value of **pid_max**.

Step 4 If the PID usage exceeds the threshold, run the command **echo** *new value* **> /proc/sys/kernel/pid_max** to enlarge the value of **pid_max**.

Example: **echo 65536 > /proc/sys/kernel/pid_max**

Step 5 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log > Download**.

Step 7 Select all services from the **Service** and click **OK**.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.14 ALM-12028 The number of processes that are in the D state on the host exceeds the threshold

Description

The system periodically checks the number of D state processes of user **omm** on the host every 30 seconds and compares the number with the threshold. The number of host D state processes has a default threshold, and this alarm is generated when the number of processes exceeds the specified threshold.

When the **Trigger Count** is 1, this alarm is cleared when the number is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the number is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12028	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Excessive system resources are used and the service process responds slowly.

Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and a process is in the D state.

Procedure

Check the process that is in the D state.

Step 1 In the alarm list on FusionInsight Manager, click ⌄ in the row where the alarm is located to view the alarm host address in the alarm details.

Step 2 Log in to the alarm host as user **root**, and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to view the PID of the process of user **omm** that is in the D state:

ps -elf | grep -v "\[thread_checkio\]" | awk 'NR!=1 {print $2, $3, $4}' | grep omm | awk -F' ' '{print $1, $3}' | grep D | awk '{print $2}'

Step 4 Check whether no command output is displayed in **Step 3**.

- If yes, the service process is running properly and no further action is required, go to **Step 6**.
- If no, go to **Step 5**.

Step 5 Switch to user **root**, Run the **reboot** command to restart the alarm host. (Restarting the host brings certain risks. Ensure that the service process runs properly after the restart).

Step 6 Wait for 5 minutes. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **OMS** from the **Service** and click **OK**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.15 ALM-12033 Slow Disk Fault

Description

The system runs the **iostat** command every 3 seconds to monitor the system indicator of disk I/O. If the **svctm** value is greater than 100 ms and greater than 1.5 times the **svctm_average** value within 300 seconds, it is considered as a slow period. If the number of slow periods within 300s is greater than 50%, the system considers that the disk is faulty and reports an alarm.

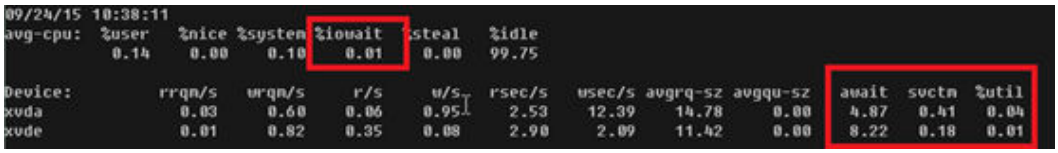
NOTE

The value of **svctm_average** is the average value of all disk **svctm** on the current node.

This alarm is automatically cleared after the disk is replaced.

The alarm detecting principle is as follows:

On the Linux platform, run the **iostat-x -t 1** command to check whether the I/O is faulty. Specifically, check values of parameters in the red box in the following figure.



- %iowait: Specifies the percentage of the time when the CPU waits for I/O to the entire CPU period. If the value exceeds 50% or is significantly greater than the value of **%system**, **%user**, and **%idle**, the I/O may be faulty.
- await: Specifies the sum of the disk I/O waiting time and I/O service time. The value of this parameter does not exceed 20. The value of this parameter for other DataNode disks can be slightly higher but cannot exceed 40.
- svctm: Specifies the time when the I/O service of the disk is changed.
- %util: Specifies the busy degree of the disk. If the value exceeds 80%, the disk maybe busy.

If the value of **%util** is greater than 10 and the value of **svctm** is greater than 100, the I/O is recorded as faulty. This alarm is generated when the I/O is recorded as faulty for 30 times in the 60 times of checks.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12033	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DiskName	Specifies the disk for which the alarm is generated.

Impact on the System

Service performance deteriorates and service processing capabilities become poor, and even the service is unavailable.

Possible Causes

The disk is aged or has bad sectors.

Procedure

Check the disk status.

Step 1 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms**.

Step 2 View the detailed information about the alarm to obtain the values of the **HostName** and the **DiskName** fields and the information about the faulty disk for which the alarm is generated.

Step 3 Check whether the node for which the alarm is generated is in the virtualization environment.

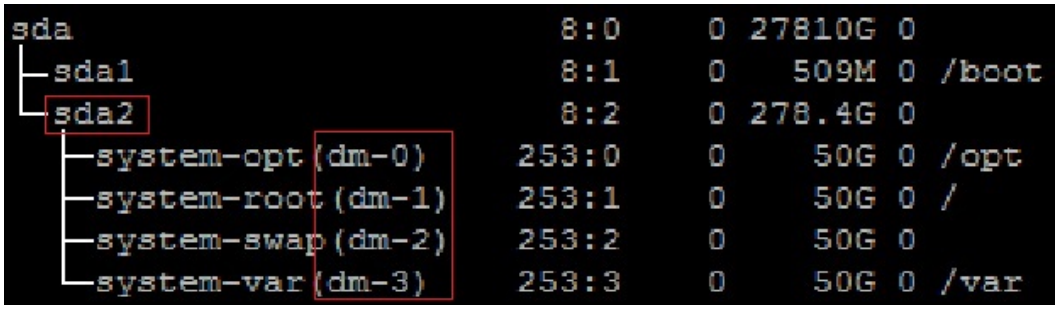
- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 Check whether the storage performance provided by the virtualization environment meets the hardware requirements. Then go to **Step 5** after the check is complete.

Step 5 Log in to the node where the alarm is generated as user **root**. Run the **df -h** command and check whether the command output contains the value of **DiskName**.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

Step 6 Run the **lsblk** command and check whether you can find out the mapping relationship between the value of **DiskName** and the disks.



- If yes, go to **Step 7**.
- If no, go to **Step 22**.

Step 7 Log in to the node for which the alarm is generated as user **root**. Run the **lsscsi | grep "/dev/sd[x]"** command to view the disk device information and determine whether the disk has been organized into a RAID group.

NOTE

The value of ***dev/sd[x]*** is the faulty disk name obtained in **Step 2**.

For example, run the following command:

lsscsi | grep "/dev/sda"

In the command output, if ATA, SATA, or SAS is displayed in the third line, the disk has not been organized into a RAID group. If other information is displayed, the disk may have been organized into a RAID group.

- If yes, go to **Step 12**.
- If no, go to **Step 8**.

Step 8 Run the **smartctl -i /dev/sd[x]** command to check whether the hardware supports SMART.

For example, run the following command:

smartctl -i /dev/sda

In the command output, if **SMART support is: Enabled** is displayed, the hardware supports SMART. If **Device does not support SMART** is displayed, the hardware does not support SMART.

- If yes, go to **Step 9**.
- If no, go to **Step 17**.

Step 9 Run the **smartctl -H --all /dev/sd[x]** command to check basic SMART information and determine whether the disk is working correctly.

For example, run the following command:

smartctl -H --all /dev/sda

Check **SMART overall-health self-assessment test result** in the command output. If the result is **FAILED**, the disk is faulty and needs to be replaced. If the result is **PASSED**, check the count of **Reallocated_Sector_Ct** or **Elements in grown defect list**. If the count is greater than 100, the disk is faulty and needs to be replaced.

- If yes, go to **Step 10**.
- If no, go to **Step 18**.

Step 10 Run the **smartctl -l error -H /dev/sd[x]** command to check the Glist of the disk and determine whether the disk is working correctly.

For example, run the following command:

smartctl -l error -H /dev/sda

Check the **Command/Featrue_name** column in the command output. If **READ SECTOR(S)** or **WRITE SECTOR(S)** is displayed, the disk has bad sectors. If other errors occur, the disk circuit is faulty. The preceding errors indicate that the disk is abnormal and needs to be replaced.

If **No Errors Logged** is displayed, no error log exists. You can perform step 9 to trigger the disk SMART self-check.

- If yes, go to **Step 11**.
- If no, go to **Step 18**.

Step 11 Run the **smartctl -t long /dev/sd[x]** command to trigger the disk SMART self-check. After the command is executed, the time when the self-check is to be completed is displayed. After the self-check is completed, repeat **Step 9** and **Step 10** to check whether the disk is working properly.

For example, run the following command:

smartctl -t long /dev/sda

- If yes, go to **Step 17**.
- If no, go to **Step 18**.

Step 12 Run the **smartctl -d [sat|scsi]+megaraid,[DID] -H --all /dev/sd[x]** command to check whether the hardware supports SMART.

NOTE

- ***[sat|scsi]*** indicates the disk type. The preceding two types need to be used.
- ***[DID]*** *indicates the slot information. Slots 0 to 15 need to be used.*

For example, run the following commands in sequence:

smartctl -d sat+megaraid,0 -H --all /dev/sda

smartctl -d sat+megaraid,1 -H --all /dev/sda

smartctl -d sat+megaraid,2 -H --all /dev/sda

...

Run the commands that combine different disk types and slots. In a command output, if **SMART support is: Enabled** is displayed, the disk supports SMART. Record the parameters of the disk type and slot combination. If **SMART support is: Enabled** is not displayed in the outputs of all the preceding command combinations, the disk does not support SMART.

- If yes, go to **Step 13**.
- If no, go to **Step 16**.

Step 13 Run the **smartctl -d [sat|scsi]+megaraid,[DID] -H --all /dev/sd[x]** command recorded in **Step 12** to check basic SMART information and determine whether the disk is working correctly.

For example, run the following command:

smartctl -d sat+megaraid,2 -H --all /dev/sda

Check **SMART overall-health self-assessment test result** in the command output. If the result is **FAILED**, the disk is faulty and needs to be replaced. If the result is **PASSED**, check the count of **Reallocated_Sector_Ct** or **Elements in grown defect list**. If the count is greater than 100, the disk is faulty and needs to be replaced.

- If yes, go to **Step 14**.
- If no, go to **Step 18**.

Step 14 Run the **smartctl -d [sat|scsi]+megaraid,[DID] -l error -H /dev/sd[x]** command to check the Glist of the disk and determine whether the disk is working correctly.

For example, run the following command:

smartctl -d sat+megaraid,2 -l error -H /dev/sda

Check the **Command/Featrue_name** column in the command output. If **READ SECTOR(S)** or **WRITE SECTOR(S)** is displayed, the disk has bad sectors. If other errors occur, the disk circuit is faulty. The preceding errors indicate that the disk is abnormal and needs to be replaced.

If **No Errors Logged** is displayed, no error log exists. You can perform step 9 to trigger the disk SMART self-check.

- If yes, go to **Step 15**.
- If no, go to **Step 18**.

Step 15 Run the **smartctl -d [sat|scsi]+megaraid,[DID] -t long /dev/sd[x]** command to trigger the disk SMART self-check. After the command is executed, the time when the self-check is to be completed is displayed. After the self-check is completed, repeat **Step 13** and **Step 14** to check whether the disk is working properly.

For example, run the following command:

smartctl -d sat+megaraid,2 -t long /dev/sda

- If yes, go to **Step 17**.
- If no, go to **Step 18**.

Step 16 If the configured RAID card does not support SMART, the disk usually does not support SMART. In this case, use the check tool provided by the corresponding RAID card vendor to solve the problem. Then go to **Step 17**.

For example, LSI is a MegaCLI tool.

Step 17 On FusionInsight Manager, choose **O&M > Alarm > Alarms**, and click **Clear** in the **Operation** column of the alarm and check whether such alarm is generated for the same disk continuously.

If the alarm is reported for three times for the current disk, you are advised to replace the disk.

- If yes, go to **Step 18**.
- If no, no further action is required.

Replace the disk.

Step 18 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms**.

Step 19 View the detailed information about the alarm to obtain the values of the **HostName** and the **DiskName** fields and the information about the faulty disk for which the alarm is generated.

Step 20 Replace the faulty disk.

Step 21 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 22**.

Collect fault information.

Step 22 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 23 Select **OMS** from the **Service** and click **OK**.

Step 24 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 25 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.16 ALM-12034 Periodical Backup Failure

Description

The system executes the periodic backup task every 60 minutes. This alarm is generated when a periodical backup task fails to be executed. This alarm is cleared when the next backup task is executed successfully.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12034	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
TaskName	Specifies the task.

Impact on the System

There are not available backup packages for a long time, so the system cannot be restored in case of exceptions.

Possible Causes

The alarm cause depends on the task details. Handle the alarm according to the logs and alarm details.

Procedure

Check whether the disk space is sufficient.

Step 1 In the FusionInsight Manager portal, click **O&M > Alarm > Alarms**.

Step 2 In the alarm list, click ⌄ in the row where the alarm is located and obtain **TaskName** from **Location**.

Step 3 Choose **O&M** > **Backup and Restoration > Backup Management**.

Step 4 Search for the backup task based on **TaskName** and click **More** in the **Operation** column. In the displayed dialog box, click **View History** and view the task details.

Step 5 In the displayed dialog box and click ⌄ to check whether the following message is displayed: Failed to backup xx due to insufficient disk space, move the data in the xx directory to other directories.

- If yes, go to **Step 6**.
- If no, go to **Step 13**.

Step 6 Choose **Backup Path** > **View** and obtain the **Backup Path**.

Step 7 Log in to the node as user **root** and run the following command to check the node mounting details:

df -h

Step 8 Check whether the available space of the node to which the backup path is mounted is less than 20 GB.

- If yes, go to **9**.
- If no, go to **Step 13**.

Step 9 Check whether there are many backup packages in the backup directory.

- If yes, go to **Step 10**.
- If no, go to **Step 13**.

Step 10 Enable the available space of the node to which the backup directory is mounted to be greater than 20 GB by moving backup packages out of the backup directory or delete the backup packages.

Step 11 After the problem is resolved, perform the backup task again and check whether the backup task execution is successful.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 14 Select **Controller** from the **Service** and click **OK**.

Step 15 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.13.17 ALM-12035 Unknown Data Status After Recovery Task Failure

Description

After the recovery task fails, the system automatically rolls back every 60 minutes. If the rollback fails, data may be lost. If this occurs, an alarm is reported. This alarm is cleared when the next recovery task execution is successful.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12035	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
TaskName	Specifies the task.

Impact on the System

After the recovery task fails, the system automatically rolls back. If the rollback fails, data may be lost or the data status may be unknown, which may affect services.

Possible Causes

The alarm cause depends on the task details. Handle the alarm according to the logs and alarm details.

Procedure

Collect fault information.

Step 1 In the FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the running status of the component meets the requirements. (The OMS and DBService must be in the normal state, and other components must be stopped.)

- If yes, go to **Step 9**.
- If no, go to **Step 2**.

Step 2 Restore the component status as required and start the recovery task again.

Step 3 Log in to the FusionInsight Manager portal and click **O&M** > **Alarm** > **Alarms**.

Step 4 In the alarm list, click ⌄ in the row where the alarm is located to obtain **TaskName** from **Location**.

Step 5 Choose **O&M** > **Backup and Restoration** > **Restoration Management**.

Step 6 Find the restoration task by **Task Name** and view the task details.

Step 7 Perform the recovery task again and check whether the recovery task execution is successful.

- If yes, go to **8**.
- If no, go to **9**.

Step 8 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 10 Select **Controller** from the **Service** and click **OK**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.18 ALM-12038 Monitoring Indicator Dumping Failure

Description

After monitoring indicator dumping is configured on FusionInsight Manager, the system checks the monitoring indicator dumping result at the dumping interval (60 seconds by default). This alarm is generated when the dumping fails.

This alarm is cleared when dumping is successful.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12038	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The upper-layer management system cannot obtain monitoring indicators from the FusionInsight Manager system.

Possible Causes

- The server cannot be connected.
- The save path on the server cannot be accessed.
- The monitoring indicator file fails to be uploaded.

Procedure

Check whether the server connection is normal.

Step 1 Check whether the network between the FusionInsight Manager system and the server is normal.

- If yes, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 Contact the network administrator to recover the network and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 Choose **System** > **Interconnection** > **Upload Performance Data** and check whether the FTP username, password, port, dump mode, and public key configured on the upload performance data page are consistent with the configuration on the server.

- If yes, go to **Step 5**.
- If no, go to **Step 4**.

Step 4 Enter the correct configuration information, click **OK**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the permission of the save path on the server is correct.

Step 5 Choose **System** > **Interconnection** > **Upload Performance Data** and check the configuration items **FTP Username**, **Save Path**, and **Dump Mode**.

- If the dump mode is FTP, go to **Step 6**.
- If the dump mode is SFTP, go to **Step 7**.

Step 6 Log in to the server in FTP mode. In the default path, check whether **FTP Username** has the read and write permission of the relative path **Save Path**.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

Step 7 Log in to the server in SFTP mode and check whether **FTP Username** has the read and write permission of the absolute path **Save Path**.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

Step 8 Add the read and write permission and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check whether the save path on the server has sufficient disk space.

Step 9 Log in to the server and check whether the save path has sufficient disk space.

- If yes, go to **Step 11**.
- If no, go to **Step 10**.

Step 10 Delete unnecessary files or go to the monitoring indicator dumping configuration page to change the save path. Then, check whether the save path has sufficient disk space.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 12 Select **OMS** from the **Service** and click **OK**.

Step 13 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.19 ALM-12039 Active/Standby OMS Databases Not Synchronized

Description

The system checks the data synchronization status between the active and standby OMS Databases every 10 seconds. This alarm is generated when the synchronization status cannot be queried for 30 consecutive times or when the synchronization status is abnormal.

This alarm is cleared when the data synchronization status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12039	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Local GaussDB HA IP	Specifies the HA IP address of the local GaussDB.
Peer GaussDB HA IP	Specifies the HA IP address of the peer GaussDB.
SYNC_PERCENT	Specifies the synchronization percentage.

Impact on the System

When data is not synchronized between the active and standby OMS Databases, data may be lost or abnormal if the active instance becomes abnormal.

Possible Causes

- The network between the active and standby nodes is unstable.
- The standby OMS Database is abnormal.
- The standby node disk space is full.

Procedure

Check whether the network between the active and standby nodes is normal.

Step 1 Log in to FusionInsight Manager, click **O&M > Alarm > Alarms**, click ⌄ in the row where the alarm is located, and query the standby OMS Database IP address.

Step 2 Log in to the active OMS Database node as user **root**.

Step 3 Run the **ping** *Standby OMS Database heartbeat IP address* command to check whether the standby OMS Database node is reachable.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the standby OMS Database is normal.

Step 6 Log in to the standby OMS Database node as user **root**.

Step 7 Run the **su - omm** command to switch to user **omm**.

Step 8 Go to the **${BIGDATA_HOME}/om-server/om/sbin/** directory and run the **./status-oms.sh** command to check whether the OMS Database resource status of the standby DBService is normal. In the command output, check whether the following information is displayed in the row where **ResName** is **gaussDB**:

For example:

```
10_10_10_231 gaussDB Standby_normal Normal Active_standby
```

- If yes, go to **Step 9**.
- If no, go to **Step 16**.

Check whether the standby node disk space is full.

Step 9 Log in to the standby OMS Database node as user **root**.

Step 10 Run the **su - omm** command to switch to user **omm**.

Step 11 Run the **echo ${BIGDATA_DATA_HOME}/dbdata_om** command to obtain the OMS Database data directory.

Step 12 Run the **df -h** command to view the system disk partition usage information.

Step 13 Check whether the disk where the OMS Database data directory is mounted is full.

- If yes, go to **Step 14**.
- If no, go to **Step 16**.

Step 14 Expand the disk capacity.

Step 15 After the disk capacity is expanded, wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Collect fault information.

Step 16 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 17 Select **OMMServer** from the **Service** and click **OK**.

Step 18 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.20 ALM-12040 Insufficient System Entropy

Description

The system checks the entropy at 00:00:00 every day, and performs five consecutive checks each time. First, the system checks whether the rng-tools or haveged tool is enabled and correctly configured. If not, the system checks the current entropy. If the entropy is smaller than 100 in the five checks, this alarm is generated.

If the true random number mode is configured, random numbers are configured in the pseudo-random number mode, or neither the true random number mode nor the pseudo-random number mode is configured but the entropy is greater than or equal to 100 in at least one check among the five checks, this alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12040	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host name for which the alarm is generated.

Impact on the System

System running is affected.

Possible Causes

The haveged service or rngd service is abnormal.

Procedure

Check and manually configure the system entropy.

Step 1 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms**.

Step 2 Obtain the value of the **HostName** field in **Location**.

Step 3 Log in to the node where the alarm is generated as user **root**.

Step 4 Run the **/bin/rpm -qa | grep -w "haveged"** command to check **haveged** installation status. Check whether the command output is empty.

- If yes, go to **Step 7**.
- If no, go to **Step 5**.

Step 5 Run the **/sbin/service haveged status |grep "running"** command, and view the command output.

- If the command is executed successfully, the haveged service is installed and correctly configured and is running properly. Go to **Step 10**.
- If the command is not executed successfully, the haveged service is not running properly. Go to **Step 7**.

Step 6 Run the **/bin/rpm -qa | grep -w "rng-tools"** command to check **rng-tools** installation status. Check whether the command output is empty.

- If yes, go to **Step 8**.
- If no, go to **Step 7**.

Step 7 Run the **ps -ef | grep -v "grep" | grep rngd | tr-d " " | grep "\-o/dev/random" | grep "\-r/dev/urandom"** command, and view the command output.

- If the command is executed successfully, the rngd service is installed and correctly configured and is running properly. Go to **Step 10**.
- If the command is not executed successfully, the rngd service is not running properly. Go to **Step 8**.

Step 8 Manually configure the system entropy. For details, see **Related Information**.

Step 9 Wait until 00:00:00 on the next day when the system checks the entropy again. Check whether the alarm is cleared automatically.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 11 Select **NodeAgent** from the **Service** and click **OK**.

Step 12 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

Manually check the system entropy.

Log in to the node as user **root** and run the **cat/proc/sys/kernel/random/entropy_avail** command to check whether the system entropy meets the cluster installation requirements (the entropy must be greater than or equal to 500). If the system entropy is smaller than 500, you can reset it by using one of the following methods:

- Using the haveged tool (true random number mode): Contact the OS provider to install the tool and then start it.
- Using the rng-tools tool (pseudo random number mode): Contact the OS provider to install the tool and then configure the system entropy based on the OS type.
  - In the Red Hat or CentOS environment, run the following commands to configure the system entropy:

    echo 'EXTRAOPTIONS="-r /dev/urandom -o /dev/random -t 1 -i"' >> /etc/sysconfig/rngd

    service rngd start

    chkconfig rngd on
  - In the SUSE environment, run the following commands to configure the system entropy:

    rngd -r /dev/urandom -o /dev/random

    echo "rngd -r /dev/urandom -o /dev/random" >> /etc/rc.d/after.local

10.13.21 ALM-12041 Incorrect Permission on Key Files

Description

The system checks whether the permission, user, and user group information about critical directories or files is normal every 5 minutes. This alarm is generated when the information is abnormal.

This alarm is cleared when the information becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12041	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
PathName	Specifies the path or name of the abnormal file.

Impact on the System

System functions are unavailable.

Possible Causes

The file permission is abnormal or the file is lost due to a user manually modified information such as the file permission, user, and user group, or the system is powered off unexpectedly.

Procedure

Check whether the abnormal file exists and whether the permission on the abnormal file is correct.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**.

Step 2 Check the value of **HostName** to obtain the host name involved in this alarm. Check the value of **PathName** to obtain the path or name of the abnormal file.

Step 3 Log in to the node for which the alarm is generated as user **root**.

Step 4 Run the **ll** *pathName* command, where *pathName* indicates the name of the abnormal file to obtain the user, permission, and user group information about the file or directory.

Step 5 Go to **${BIGDATA_HOME}/om-agent/nodeagent/etc/agent/autocheck** directory. Then run the **vi keyfile** command and search for the name of the abnormal file and check the due permission of the file.

NOTE

To ensure proper configuration synchronization between the active and standby OMS servers, files, directories, and files and sub-directories in the directories configured in **$OMS_RUN_PATH/workspace/ha/module/hasync/plugin/conf/filesync.xml** will also be monitored except files and directories in **keyfile**. User **omm** must have read and write permissions of files and read and execute permissions of directories.

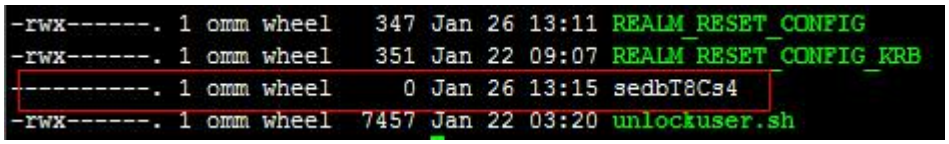
Step 6 Compare the real-world permission of the file with the due permission obtained in **Step 5** and correct the permission, user, and user group information for the file.

Step 7 Wait a hour and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

NOTE

If the disk partition where the cluster installation directory resides is used up, some temporary files will be generated in the program installation directory when running the **sed** command fails. Users do not have the read, write, and execute permissions of these temporary files. The system reports an alarm indicating that permissions of temporary files are abnormal if these files are within the monitoring range of the alarm. Perform the preceding alarm handling processes to clear the alarm. Alternatively, you can directly delete the temporary files after confirming that files with abnormal permissions are temporary. The temporary file generated after a **sed** command execution failure is similar to the following.



Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 9 Select **NodeAgent** from the **Service** and click **OK**.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.22 ALM-12042 Incorrect Configuration of Key Files

Description

The system checks whether critical configurations are correct every 5 minutes. This alarm is generated when the configurations are abnormal.

This alarm is cleared when the configurations become normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12042	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
PathName	Specifies the path or name of the abnormal file.

Impact on the System

Functions related to the file are abnormal.

Possible Causes

The file configuration is modified manually or the system is powered off unexpectedly.

Procedure

Check abnormal file configuration.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**.

Step 2 Check the value of **HostName** to obtain the host name involved in this alarm. Check the value of **PathName** to obtain the path or name of the abnormal file.

Step 3 Log in to the node for which the alarm is generated as user **root**.

Step 4 View the $BIGDATA_LOG_HOME/nodeagent/scriptlog/checkfileconfig.log file and analyze the cause based on the error log. Locate the check standards of the file in the **Related Information** and manually check and modify the file based on the standards.

Run the **vi** *file name* command to enter the editing mode, and then press **Insert** to start editing.

After the modification is complete, press **Esc** to exit the editing mode and enter **:wq** to save the settings and exit.

For example:

vi /etc/ssh/sshd_config

Step 5 Wait a hour and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **NodeAgent** from the **Service** and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

- **Check standards of /etc/fstab**

  Check whether the partitions configured in the **/etc/fstab** file can be found in **/proc/mounts**.

  Check whether the swap partitions configured in fstab correspond to those in /proc/swaps.

- **Check the /etc/hosts configuration file.**

  Run **cat /ect/hosts**. If any of the following situations occurs, the **/etc/hosts** configuration file is abnormal:

  a. The **/etc/hosts** file does not exist.

  b. The host name is not configured in the file.

  c. The host name maps to multiple IP addresses in the file.

  d. The IP address corresponding to the host name does not exist in the command output of the **ifconfig** command.

e. One IP address maps to multiple host names in the file.

- **Check standards of /etc/ssh/sshd_config**

  Run the **vi /etc/ssh/sshd_config** command to check whether configuration items are configured as follows:

  a. The value of **UseDNS** must be set to **no**.

  b. The value of **MaxStartups** must be greater than or equal to 1000.

  c. At least one of the **PasswordAuthentication** and **ChallengeResponseAuthentication** parameters must be left blank or at least one of the parameters be set to **yes**.

10.13.23 ALM-12045 Network Read Packet Dropped Rate Exceeds the Threshold

Description

The system checks the network read packet dropped rate every 30 seconds and compares the actual packet dropped rate with the threshold (the default threshold is 0.5%). This alarm is generated when the system detects that the network read packet dropped rate exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm** > **Thresholds >** *Name of the desired cluster* > **Host** > **Network Reading** > **Read Packet Dropped Rate**.

When the **Trigger Count** is 1, this alarm is cleared when the network read packet dropped rate is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the network read packet dropped rate is less than or equal to 90% of the threshold.

Alarm detection is disabled by default. If you want to enable this function, check whether alarm sending can be enabled based on section "Check the system environment."

Attribute

Alarm ID	Alarm Severity	Auto Clear
12045	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NetworkCardName	Specifies the network port for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The service performance deteriorates or services time out.

Precautions: In SUSE (kernel: 3.0 or later) or Red Hat 7.2, because the system kernel modifies the mechanism for counting read and discarded packets, this alarm may be generated even when the network is normal. Services are not adversely affected. You are advised to check whether the alarm is caused by this problem based on section "Check the system environment."

Possible Causes

- An OS exception occurs.
- The NIC has configured the active/standby bond mode.
- The alarm threshold is set improperly.
- The cluster network environment is of poor quality.

Procedure

Check the network packet dropped rate.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**, click ⌄ in the row where the alarm is located to view the alarm host name and NIC name in the alarm details.

Step 2 Log in to the node where the alarm is generated as user **omm** and run the **/sbin/ifconfig** *NIC name* command to check whether packet loss occurs on the network.

```
omm@8-5-192-4:~> /sbin/ifconfig eth2
eth2      Link encap:Ethernet  HWaddr E4:35:C8:7B:B5:48
          inet addr:192.168.192.4  Bcast:192.168.255.255  Mask:255.255.0.0
          inet6 addr: fe80::e635:c8ff:fe7b:b548/64 Scope:Link
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          RX packets:5254854 errors:0 dropped:214676 overruns:0 frame:0
          TX packets:329443 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:354839633 (338.4 Mb)  TX bytes:25083094 (23.9 Mb)
```

NOTE

- **IP address**: indicates the value of **HostName** in the alarm location information. To query the value of **OM IP** and **Business IP**, click **Host** on FusionInsight Manager.
- The formula is as follows: Packet loss rate = (Number of dropped packets/Total number of RX packets) x 100%. If the packet loss rate is greater than the system threshold (0.5% by default), packet loss occurs during packet reading on the network.

- If yes, go to **Step 11**.
- If no, go to **Step 3**.

Check the system environment.

Step 3 Log in as user **omm** to the active OMS node or the node for which the alarm is generated.

Step 4 Run the **cat /etc/*-release** command to check the OS type.

- If Red Hat is used, go to **Step 5**.
  ```
  # cat /etc/*-release
  Red Hat Enterprise Linux Server release 7.2 (Santiago)
  ```
- If SUSE is used, go to **Step 6**.
  ```
  # cat /etc/*-release
  SUSE Linux Enterprise Server 11 (x86_64)
  VERSION = 11
  PATCHLEVEL = 3
  ```
- If another OS is used, go to **Step 11**.

Step 5 Run the **cat /etc/redhat-release** command to check whether the OS version is Red Hat 7.2(x86) or Red Hat 7.4(TaiShan).

```
# cat /etc/redhat-release
Red Hat Enterprise Linux Server release 7.2 (Santiago)
```

- If yes, the alarm sending function cannot be enabled. Go to **Step 7**.
- If no, go to **Step 11**.

Step 6 Run the **cat /proc/version** command to check whether the SUSE kernel version is 3.0 or later.

```
# cat /proc/version
Linux version 3.0.101-63-default (geeko@buildhost) (gcc version 4.3.4 [gcc-4_3-branch revision 152973] (SUSE Linux) ) #1 SMP Tue Jun 23 16:02:31 UTC 2015 (4b89d0c)
```

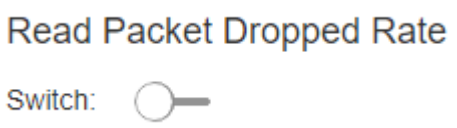
- If yes, the alarm sending function cannot be enabled. Go to **Step 7**.
- If no, go to **Step 11**.

Step 7 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Thresholds**.

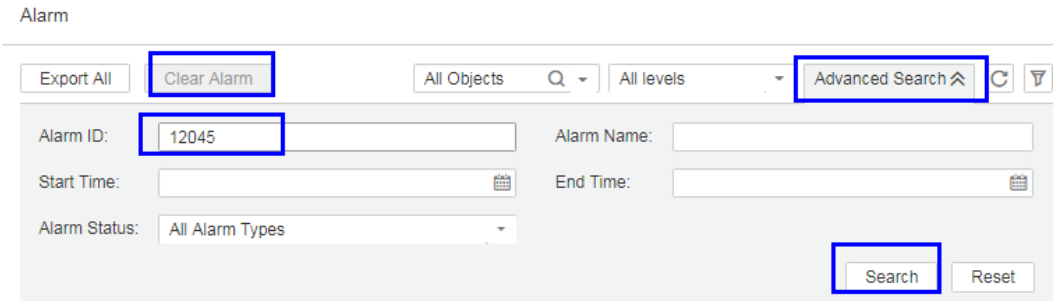
Step 8 In the navigation tree of the **Thresholds** page, choose *Name of the desired cluster* > **Host** > **Network Reading** > **Read Packet Dropped Rate**. In the area on the right, check whether the **Switch** is on.

- If yes, the alarm sending function has been enabled. Go to **Step 9**.
- If no, the alarm sending function has been disabled. Go to **Step 10**.

Step 9 In the area on the right, close **Switch** to disable the checking of **Network Read Packet Dropped Rate Exceeds the Threshold**. The following figure shows the operation result.



Step 10 On the **Alarm** page of FusionInsight Manager, search for the **12045** alarm. If the alarm is not cleared automatically, clear it manually. No further action is required.



NOTE

The ID of alarm **Network Read Packet Dropped Rate Exceeds the Threshold** is 12045.

Check whether the NIC has configured the active/standby bond mode.

Step 11 Log in to the alarm node as user **omm**. Run the **ls -l /proc/net/bonding** command to check whether directory **/proc/net/bonding** exists on the alarm node.

- If yes, the NIC has configured the active/standby bond mode, as shown in the following. Go to **Step 12**.

```
# ls -l /proc/net/bonding/
total 0
-r--r--r-- 1 root root 0 Oct 11 17:35 bond0
```

- If no, the NIC has not configured the active/standby bond mode, as shown in the following. Go to **Step 14**.

```
# ls -l /proc/net/bonding/
ls: cannot access /proc/net/bonding/: No such file or directory
```

Step 12 Run the **cat /proc/net/bonding/***bond0* command and check whether the value of **Bonding Mode** is **fault-tolerance.**

NOTE

bond0 indicates the name of the bond configuration file. Use the file name queried in **Step 11** in practice.

```
# cat /proc/net/bonding/bond0
Ethernet Channel Bonding Driver: v3.7.1 (April 27, 2011)

Bonding Mode: fault-tolerance (active-backup)
Primary Slave: eth1 (primary_reselect always)
Currently Active Slave: eth1
MII Status: up
MII Polling Interval (ms): 100
Up Delay (ms): 0
Down Delay (ms): 0

Slave Interface: eth0
MII Status: up
Speed: 1000 Mbps
Duplex: full
Link Failure Count: 1
Slave queue ID: 0

Slave Interface: eth1
MII Status: up
Speed: 1000 Mbps
Duplex: full
```

```
Link Failure Count: 1
Slave queue ID: 0
```

- If yes, the NIC has configured the active/standby bond mode. Go to **Step 13**.
- If no, the NIC has not configured the active/standby bond mode. Go to **Step 14**.

Step 13 Check whether the NIC of the **NetworkCardName** parameter is the standby NIC.

- If yes, manually clear the alarm on the Alarms page because the alarm on the standby cannot be automatically cleared. No further action is required.
- If no, go to **Step 14**.

  NOTE

  Method of determining whether an NIC is standby: In the /**proc/net/bonding/***bond0* configuration file, check whether the NIC name of the **NetworkCardName** parameter is the same as the **Slave Interface**, but is different from **Currently Active Slave** (indicating the current active NIC). If the answer is yes, the NIC is a standby one.

Check whether the threshold is set properly.

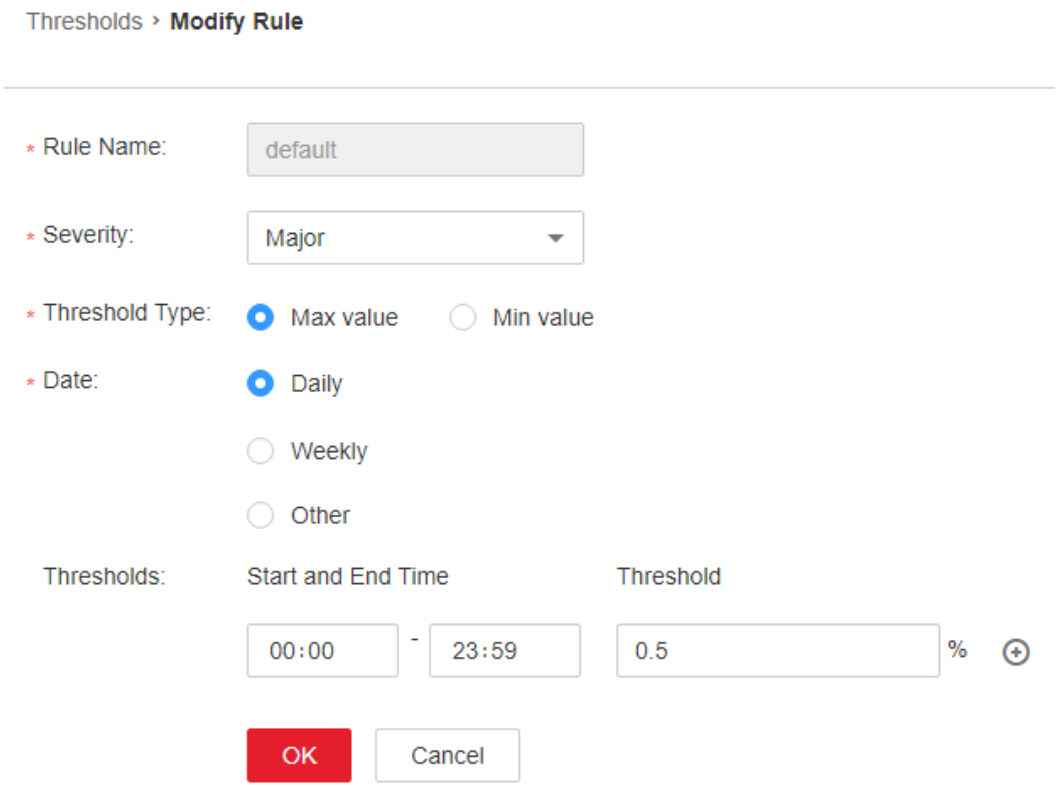
Step 14 Log in to FusionInsight Manager, choose **O&M > Alarm** > **Thresholds >** *Name of the desired cluster* > **Host** > **Network Reading** > **Read Packet Dropped Rate** and check whether the alarm threshold is set properly. (By default, 0.5% is a proper value. However, users can configure the value as required.)

- If yes, go to **Step 17**.
- If no, go to **Step 15**.

Step 15 Based on actual usage condition, choose **O&M > Alarm** > **Thresholds >** *Name of the desired cluster* > **Host** > **Network Reading** > **Read Packet Dropped Rate** and click Modify in the Operation column to modify the alarm threshold.

For details, see **Figure 10-25**.

Figure 10-25 Setting alarm thresholds



Step 16 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 17**.

Check whether the network is normal.

Step 17 Contact the system administrator to check whether the network is abnormal.

- If yes, go to **Step 18** to rectify the network fault.
- If no, go to **Step 19**.

Step 18 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 19**.

Collect fault information.

Step 19 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log** > **Download**.

Step 20 Select **OMS** from the **Service** and click **OK**.

Step 21 Set **Host** to the node for which the alarm is generated and the active OMS node.

Step 22 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 23 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.24 ALM-12046 Network Write Packet Dropped Rate Exceeds the Threshold

Description

The system checks the network write packet dropped rate every 30 seconds and compares the actual packet dropped rate with the threshold (the default threshold is 0.5%). This alarm is generated when the system detects that the network write packet dropped rate exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm** > **Thresholds >** *Name of the desired cluster* > **Host** > **Network Writing** > **Write Packet Dropped Rate**.

When the **Trigger Count** is 1, this alarm is cleared when the network write packet dropped rate is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the network write packet dropped rate is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12046	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
NetworkCardName	Specifies the network port for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The service performance deteriorates or services time out.

Possible Causes

- The alarm threshold is set improperly.
- The cluster network environment is of poor quality.

Procedure

Check whether the threshold is set properly.

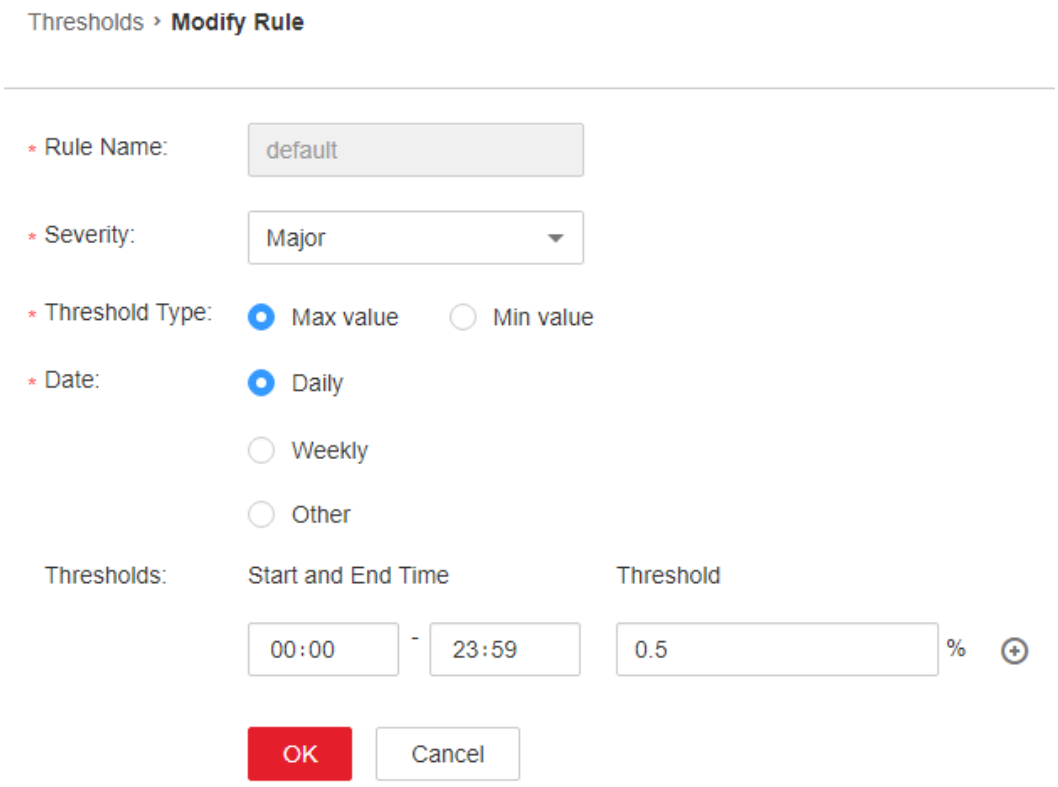
Step 1 On the FusionInsight Manager, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Packet Dropped Rate** to check whether the alarm threshold is set properly. (By default, 0.5% is a proper value. However, users can configure the value as required.)

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Based on actual usage condition, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Packet Dropped Rate** and click **Modify** in the **Operation** column to modify the alarm threshold.

For details, see **Figure 10-26**.

Figure 10-26 Setting alarm thresholds



Step 3 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the network is normal.

Step 4 Contact the system administrator to check whether the network is abnormal.

- If yes, go to **Step 5** to rectify the network fault.
- If no, go to **Step 6**.

Step 5 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log** > **Download**.

Step 7 Select **OMS** from the **Service** and click **OK**.

Step 8 Set **Host** to the node for which the alarm is generated and the active OMS node.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.25 ALM-12047 Network Read Packet Error Rate Exceeds the Threshold

Description

The system checks the network read packet error rate every 30 seconds and compares the actual packet error rate with the threshold (the default threshold is 0.5%). This alarm is generated when the system detects that the network read packet error rate exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Packet Error Rate**.

When the **Trigger Count** is 1, this alarm is cleared when the network read packet error rate is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the value of the network read packet error rate is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12047	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
NetworkCardName	Specifies the network port for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The communication interrupts intermittently and services time out.

Possible Causes

- The alarm threshold is set improperly.
- The cluster network environment is of poor quality.

Procedure

Check whether the threshold is set properly.

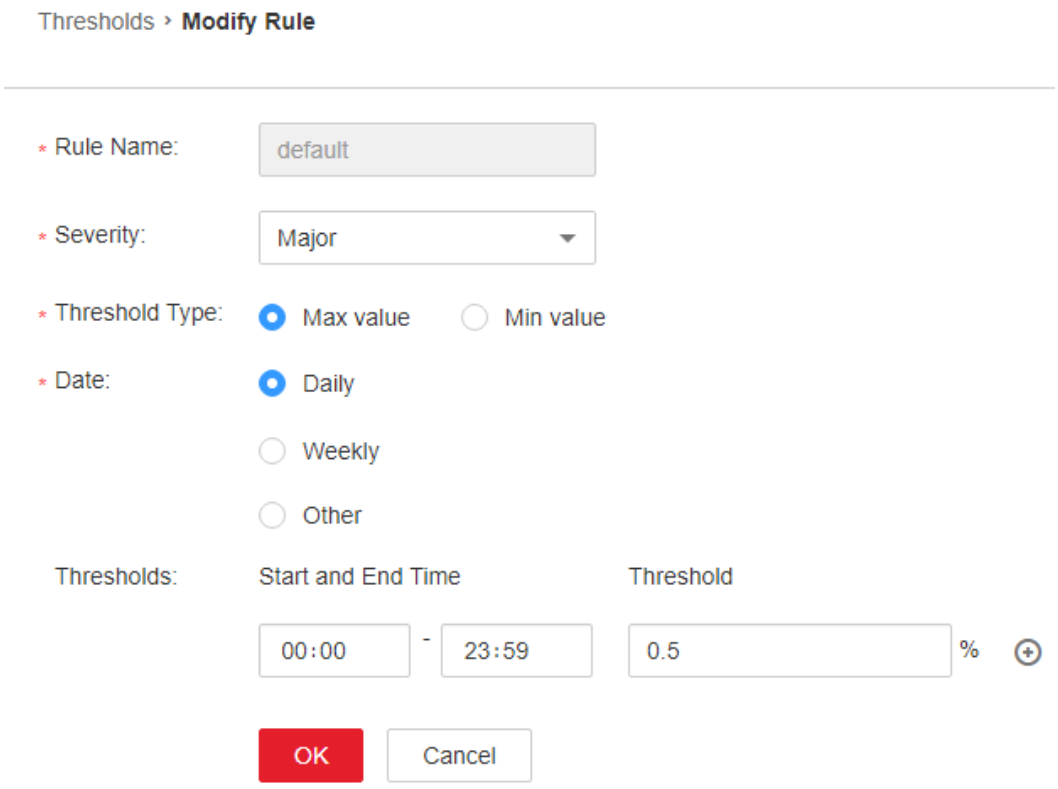
Step 1 On the FusionInsight Manager, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Packet Error Rate** and check whether the alarm threshold is set properly. (By default, 0.5% is a proper value. However, users can configure the value as required.)

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Based on actual usage condition, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Packet Error Rate** and click **Modify** in the **Operation** column to modify the alarm threshold.

For details, see **Figure 10-27**.

Figure 10-27 Setting alarm thresholds



Step 3 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the network is normal.

Step 4 Contact the system administrator to check whether the network is abnormal.

- If yes, go to **Step 5** to rectify the network fault.
- If no, go to **Step 6**.

Step 5 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log** > **Download**.

Step 7 Select **OMS** from the **Service** and click **OK**.

Step 8 Set **Host** to the node for which the alarm is generated and the active OMS node.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.26 ALM-12048 Network Write Packet Error Rate Exceeds the Threshold

Description

The system checks the network write packet error rate every 30 seconds and compares the actual packet error rate with the threshold (the default threshold is 0.5%). This alarm is generated when the system detects that the network write packet error rate exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Packet Error Rate**.

When the **Trigger Count** is 1, this alarm is cleared when the network write packet error rate is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the value of the network write packet error rate is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12048	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
NetworkCardName	Specifies the network port for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The communication interrupts intermittently and services time out.

Possible Causes

- The alarm threshold is set improperly.
- The cluster network environment is of poor quality.

Procedure

Check whether the threshold is set properly.

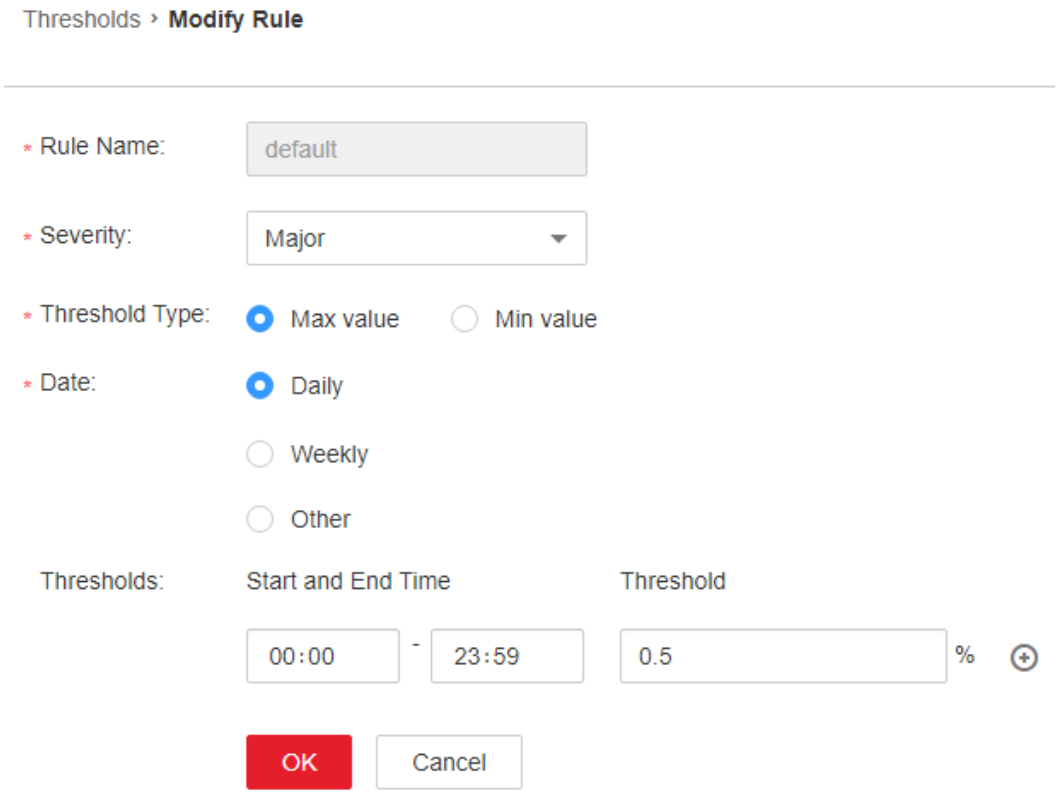
Step 1 On the FusionInsight Manager, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Packet Error Rate** and check whether the alarm threshold is set properly. (By default, 0.5% is a proper value. However, users can configure the value as required.)

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Based on actual usage condition, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Packet Error Rate** and click **Modify** in the **Operation** column to modify the alarm threshold.

For details, see **Figure 10-28**.

Figure 10-28 Setting alarm thresholds



Step 3 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the network is normal.

Step 4 Contact the system administrator to check whether the network is abnormal.

- If yes, go to **Step 5** to rectify the network fault.
- If no, go to **Step 6**.

Step 5 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log** > **Download**.

Step 7 Select **OMS** from the **Service** and click **OK**.

Step 8 Set **Host** to the node for which the alarm is generated and the active OMS node.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.27 ALM-12049 Network Read Throughput Rate Exceeds the Threshold

Description

The system checks the network read throughput rate every 30 seconds and compares the actual throughput rate with the threshold (the default threshold is 80%). This alarm is generated when the system detects that the network read throughput rate exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Throughput Rate**.

When the **Trigger Count** is 1, this alarm is cleared when the network read throughput rate is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the network read throughput rate is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12049	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
NetworkCardName	Specifies the network port for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The service system runs improperly or is unavailable.

Possible Causes

- The alarm threshold is set improperly.
- The network port rate cannot meet the current service requirements.

Procedure

Check whether the threshold is set properly.

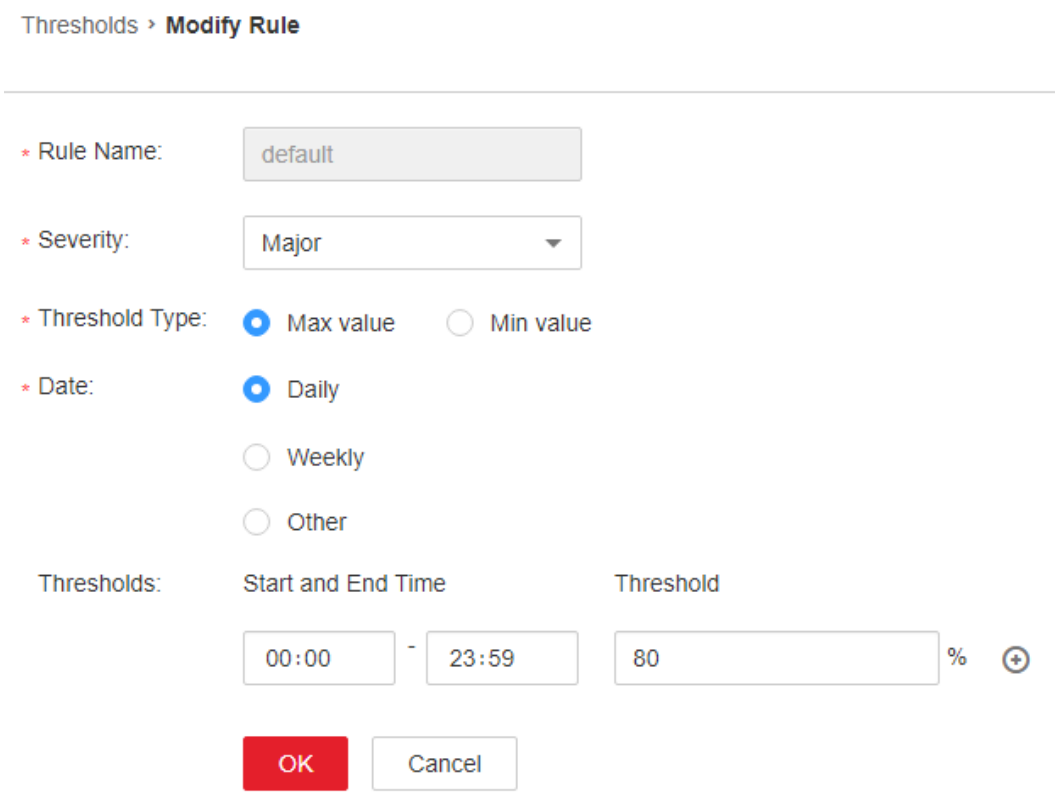
Step 1 On the FusionInsight Manager, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Throughput Rate** and check whether the alarm threshold is set properly. (By default, 80% is a proper value. However, users can configure the value as required.)

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Based on actual usage condition, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Throughput Rate** and click **Modify** in the **Operation** column to modify the alarm threshold.

For details, see **Figure 10-29**.

Figure 10-29 Setting alarm thresholds



Step 3 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the network port rate can meet the service requirements.

Step 4 On FusionInsight Manager, click ⌄ in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host and the network port name for which the alarm is generated.

Step 5 Log in to the host for which the alarm is generated as user **root**.

Step 6 Run the **ethtool** *network port name* command to check the maximum speed of the current network port.

NOTE

In the VM environment, you cannot run a command to query the network port rate. It is recommended that you contact the system administrator to confirm whether the network port rate meets the requirements.

Step 7 If the network read throughput rate exceeds the threshold, contact the system administrator to increase the network port rate.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log > Download**.

Step 10 Select **OMS** from the **Service** and click **OK**.

Step 11 Set **Host** to the node for which the alarm is generated and the active OMS node.

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.28 ALM-12050 Network Write Throughput Rate Exceeds the Threshold

Description

The system checks the network write throughput rate every 30 seconds and compares the actual throughput rate with the threshold (the default threshold is 80%). This alarm is generated when the system detects that the network write throughput rate exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Throughput Rate**.

When the **Trigger Count** is 1, this alarm is cleared when the network write throughput rate is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the network write throughput rate is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12050	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NetworkCardName	Specifies the network port for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The service system runs improperly or is unavailable.

Possible Causes

- The alarm threshold is set improperly.
- The network port rate cannot meet the current service requirements.

Procedure

Check whether the threshold is set properly.

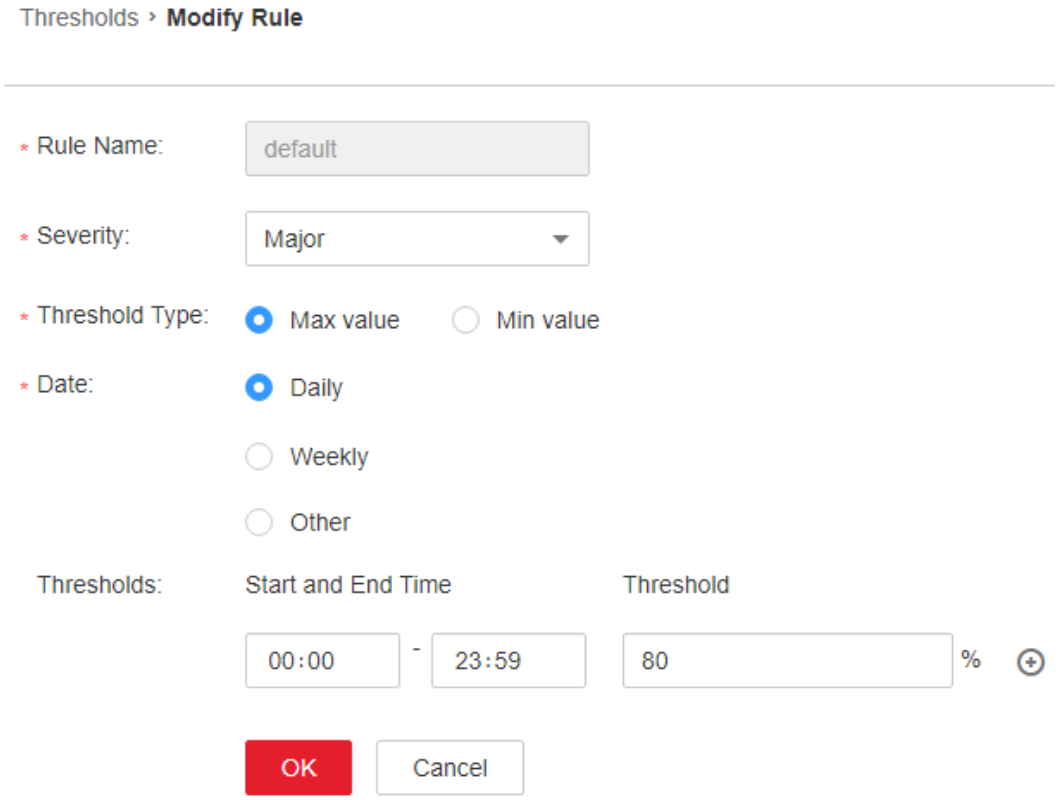
Step 1 On the FusionInsight Manager, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Throughput Rate** and check whether the alarm threshold is set properly. (By default, 80% is a proper value. However, users can configure the value as required.)

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Based on actual usage condition, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Throughput Rate** and click **Modify** in the **Operation** column to modify the alarm threshold.

For details, see **Figure 10-30**.

Figure 10-30 Setting alarm thresholds



Step 3 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the network port rate can meet the service requirements.

Step 4 On FusionInsight Manager, click ⌄ in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host and the network port name for which the alarm is generated.

Step 5 Log in to the host for which the alarm is generated as user **root**.

Step 6 Run the **ethtool***network port name* command to check the maximum speed of the current network port.

NOTE

In the VM environment, you cannot run a command to query the network port rate. It is recommended that you contact the system administrator to confirm whether the network port rate meets the requirements.

Step 7 If the network write throughput rate exceeds the threshold, contact the system administrator to increase the network port rate.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log > Download**.

Step 10 Select **OMS** from the **Service** and click **OK**.

Step 11 Set **Host** to the node for which the alarm is generated and the active OMS node.

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.29 ALM-12051 Disk Inode Usage Exceeds the Threshold

Description

The system checks the disk Inode usage every 30 seconds and compares the actual Inode usage with the threshold (the default threshold is 80%). This alarm is generated when the Inode usage exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Disk** > **Disk Inode Usage**.

When the **Trigger Count** is 1, this alarm is cleared when the disk Inode usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the disk Inode usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12051	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PartitionName	Specifies the disk partition for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Data cannot be properly written to the file system.

Possible Causes

Massive small files are stored in the disk.

Procedure

Massive small files are stored in the disk.

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Alarms** and click ⌄ in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host and the disk partition for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **df -i | grep -iE "***partition name***|**Filesystem" command to check the current disk Inode usage.

```
# df -i | grep -iE "xvda2|Filesystem"
Filesystem      Inodes  IUsed   IFree IUse% Mounted on
/dev/xvda2      2359296  207420 2151876    9% /
```

Step 4 If the Inode usage exceeds the threshold, manually check small files stored in the disk partition and confirm whether these small files can be deleted.

NOTE

Run the **for i in /*; do echo $i; find $i|wc -l; done** command to query the number of files in a partition. Replace **/*** with the specified partition.

```
# for i in /srv/*; do echo $i; find $i|wc -l; done
/srv/BigData
4284
/srv/ftp
1
/srv/www
13
```

- If yes, run the **rm -rf** *Path of the file or folder* to be deleted command to delete the file or folder and go to **Step 5**.

  NOTE

  Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

- If no, expand the capacity. Then, perform **Step 5**.

Step 5 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log > Download**.

Step 7 Select **OMS** from the **Service** and click **OK**.

Step 8 Set **Host** to the node for which the alarm is generated and the active OMS node.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.13.30 ALM-12052 TCP Temporary Port Usage Exceeds the Threshold

Description

The system checks the TCP temporary port usage every 30 seconds and compares the actual usage with the threshold (the default threshold is 80%). This alarm is generated when the TCP temporary port usage exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Status** > **TCP Ephemeral Port Usage**.

When the **Trigger Count** is 1, this alarm is cleared when the TCP temporary port usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the TCP temporary port usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12052	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Services on the host cannot establish external connections, and therefore they are interrupted.

Possible Causes

- The temporary port cannot meet the current service requirements.
- The system is abnormal.

Procedure

Expand the temporary port number range.

Step 1 On FusionInsight Manager, click ⌄ in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **omm**.

Step 3 Run the **cat /proc/sys/net/ipv4/ip_local_port_range |cut -f 1** command to obtain the value of the start port and run the **cat /proc/sys/net/ipv4/ip_local_port_range |cut -f 2** command to obtain the value of the end port. The total number of temporary ports is the value of the end port minus the value of the start port. If the total number of temporary ports is smaller than 28,232, the

random port range of the OS is narrow. Contact the system administrator to increase the port range.

Step 4 Run the **ss -ant 2>/dev/null | grep -v LISTEN | awk 'NR > 2 {print $4}'|cut -d ':' -f 2 | awk '$1 >"***Value of the start port***" {print $1}' | sort -u | wc -l** command to calculate the number of used temporary ports.

Step 5 The formula for calculating the usage of the temporary ports is: Usage of the temporary ports = (Number of used temporary ports/Total number of temporary ports) x 100%. Check whether the temporary port usage exceeds the threshold.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

Step 6 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check whether the system environment is abnormal.

Step 7 Run the following command to import the temporary file and view the frequently used ports in the **port_result.txt file**:

netstat -tnp|sort > $BIGDATA_HOME/tmp/port_result.txt

```
netstat -tnp|sort

Active Internet connections (w/o servers)

Proto Recv Send LocalAddress ForeignAddress State PID/ProgramName tcp   0   0 10-120-85-154:45433
10-120-85-154:9866 CLOSE_WAIT 94237/java
tcp   0   0 10-120-85-154:45434  10-120-85-154:9866 CLOSE_WAIT 94237/java
tcp   0   0 10-120-85-154:45435  10-120-85-154:9866 CLOSE_WAIT 94237/java
...
```

Step 8 Run the following command to view the processes that occupy a large number of ports:

ps -ef |grep *PID*

NOTE

- PID is the processes ID queried in **Step 7**.
- Run the following command to collect information about all processes and check the processes that occupy a large number of ports:

  ps -ef > $BIGDATA_HOME/tmp/ps_result.txt

Step 9 After obtaining the administrator's approval, clear the processes that occupy a large number of ports. Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log** > **Download**.

Step 11 Select **OMS** from the **Service** and click **OK**.

Step 12 Set **Host** to the node for which the alarm is generated and the active OMS node.

Step 13 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected log information and files **port_result.txt** and **ps_result.txt**. Then, delete the two residual temporary files from the environment.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.13.31 ALM-12053 Host File Handle Usage Exceeds the Threshold

Description

The system checks the file handle usage every 30 seconds and compares the actual usage with the threshold (the default threshold is 80%). This alarm is generated when the host file handle usage exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Host Status** > **Host File Handle Usage**.

When the **Trigger Count** is 1, this alarm is cleared when the host file handle usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the host file handle usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12053	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The I/O operations, such as opening a file or connecting to network, cannot be performed and programs are abnormal.

Possible Causes

- The application process is abnormal. For example, the opened file or socket is not closed.
- The number of file handles cannot meet the current service requirements.
- The system is abnormal.

Procedure

Check information about files opened in processes.

Step 1 On FusionInsight Manager, click ⌄ in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **lsof -n|awk '{print $2}'|sort|uniq -c|sort -nr|more** command to check the process that occupies excessive file handles.

Step 4 Check whether the processes in which a large number of files are opened are normal. For example, check whether there are files or sockets not closed.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Release the abnormal processes that occupy too many file handles.

Step 6 Five minutes later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Increase the number of file handles.

Step 7 On FusionInsight Manager, click ⌄ in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host for which the alarm is generated.

Step 8 Log in to the host for which the alarm is generated as user **root**.

Step 9 Contact the system administrator to increase the number of system file handles.

Step 10 Run the **cat /proc/sys/fs/file-nr** command to view the used handles and the maximum number of file handles. The first value is the number of used handles, the third value is the maximum number. Please check whether the usage exceeds the threshold.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

```
# cat /proc/sys/fs/file-nr
12704 0 640000
```

Step 11 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check whether the system environment is abnormal.

Step 12 Contact the system administrator to check whether the operating system is abnormal.

- If yes, go to **Step 13** to rectify the fault.
- If no, go to **Step 14**.

Step 13 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Collect fault information.

Step 14 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log** > **Download**.

Step 15 Select **OMS** from the **Service** and click **OK**.

Step 16 Set **Host** to the node for which the alarm is generated and the active OMS node.

Step 17 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.32 ALM-12054 Invalid Certificate File

Description

The system checks whether the certificate file is invalid (has expired or is not yet valid) on 23:00 every day. This alarm is generated when the certificate file is invalid.

This alarm is cleared when the status of the newly imported certificate is valid.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12054	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Some functions are unavailable.

Possible Causes

No certificate (CA certificate, HA root certificate, HA user certificate, Gaussdb root certificate, or Gaussdb user certificate) is imported to the system, the certificate fails to be imported, or the certificate file is invalid.

Procedure

Check the alarm cause.

Step 1 On FusionInsight Manager, locate the target alarm in the real-time alarm list and click ⌄.

View **Additional Information** to obtain the additional information about the alarm.

- If **CA Certificate** is displayed in the additional alarm information, log in to the active OMS management node as user **omm** and go to **Step 2**.
- If **HA root Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to **Step 3**.
- If **HA server Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to **Step 4**.

Check the validity period of the certificate files in the system.

Step 2 Check whether the current system time is in the validity period of the CA certificate.

Run the **bash ${CONTROLLER_HOME}/security/cert/conf/querycertvalidity.sh** command to check the effective time and due time of the CA root certificate.

- If yes, go to **Step 7**.
- If no, go to **Step 5**.

Step 3 Check whether the current system time is in the validity period of the HA root certificate.

Run the **openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/certHA/root-ca.crt** command to check the effective time and due time of the HA root certificate.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

Step 4 Check whether the current system time is in the validity period of the HA user certificate.

Run the **openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/certHA/server.crt** command to check the effective time and due time of the HA user certificate.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

The following is an example of the effective time and due time of a CA or HA certificate:

```
Certificate:
    Data:
        Version: 3 (0x2)
        Serial Number:
            97:d5:0e:84:af:ec:34:d8
        Signature Algorithm: sha256WithRSAEncryption
        Issuer: C=CN, ST=xxx, L=yyy, O=zzz, OU=IT, CN=HADOOP.COM
        Validity
            Not Before: Dec 13 06:38:26 2016 GMT          // Effective time
            Not After : Dec 11 06:38:26 2026 GMT          // Due time
```

Import certificate files.

Step 5 Import a new CA certificate file.

Apply for or generate a new CA certificate file and import it to the system. The alarm is automatically cleared after the CA certificate is imported. Check whether this alarm is reported again during periodic check.

- If yes, go to **Step 7**.
- If no, no further action is required.

Step 6 Import a new HA certificate file.

Apply for or generate a new HA certificate file and import it to the system. The alarm is automatically cleared after the CA certificate is imported. Check whether this alarm is reported again during periodic check.

- If yes, go to .**Step 7**
- If no, no further action is required.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 In the **Services** area, select **Controller**, **OmmServer**, **OmmCore**, and **Tomcat**, and click **OK**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.13.33 ALM-12055 The Certificate File Is About to Expire

Description

The system checks the certificate file on 23:00 every day. This alarm is generated if the certificate file is about to expire with a validity period less than days set in the alarm threshold.

This alarm is reported if the status of the newly imported certificate is valid.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12055	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Some functions are unavailable.

Possible Causes

The remaining validity period of a system certificate (CA certificate, HA root certificate, HA user certificate, Gaussdb root certificate, or Gaussdb user certificate) is smaller than the alarm threshold.

Procedure

Check the alarm cause.

Step 1 On FusionInsight Manager, locate the target alarm in the real-time alarm list and click ⌄.

View **Additional Information** to obtain the additional information about the alarm.

- If **CA Certificate** is displayed in the additional alarm information, log in to the active OMS management node as user **omm** and go to **Step 2**.
- If **HA root Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to **Step 3**.

- If **HA server Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to **Step 4**.

Check the validity period of the certificate files in the system.

Step 2 Check whether the remaining validity period of the CA certificate is smaller than the alarm threshold.

Run the **bash ${CONTROLLER_HOME}/security/cert/conf/querycertvalidity.sh** command to check the effective time and due time of the CA root certificate.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 3 Check whether the remaining validity period of the HA root certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/certHA/root-ca.crt** command to check the effective time and due time of the HA root certificate.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 4 Check whether the remaining validity period of the HA user certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/certHA/server.crt** command to check the effective time and due time of the HA user certificate.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

The following is an example of the effective time and due time of a CA or HA certificate:

```
Certificate:
    Data:
        Version: 3 (0x2)
        Serial Number:
            97:d5:0e:84:af:ec:34:d8
        Signature Algorithm: sha256WithRSAEncryption
        Issuer: C=CN, ST=xxx, L=yyy, O=zzz, OU=IT, CN=HADOOP.COM
        Validity
            Not Before: Dec 13 06:38:26 2016 GMT            // Effective time
            Not After : Dec 11 06:38:26 2026 GMT            // Due time
```

Import certificate files.

Step 5 Import a new CA certificate file.

Apply for or generate a new CA certificate file and import it to the system. Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to **Step 7**.
- If no, no further action is required.

Step 6 Import a new HA certificate file.

Apply for or generate a new HA certificate file and import it to the system. Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to **Step 7**.
- If no, no further action is required.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 In the **Services** area, select **Controller**, **OmmServer**, **OmmCore**, and **Tomcat**, and click **OK**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.13.34 ALM-12057 Metadata Not Configured with the Task to Periodically Back Up Data to a Third-Party Server

Description

After the system is installed, it checks whether the task for periodically backing up metadata to the third-party server, and then performs the check hourly. If the task for periodically backing up metadata to a third-party server is not configured, a critical alarm is generated.

This alarm is cleared when a user creates such a backup task.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12057	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If metadata is not backed up to a third-party server, metadata cannot be restored if both the active and standby management nodes of the cluster are faulty and local backup data is lost.

Possible Causes

Metadata is not configured with the task to periodically back up data to a third-party server.

Procedure

Step 1 On the FusionInsight Manager portal choose **O&M > Alarm > Alarms**.

Step 2 In the alarm list, click ⌄ in the row where the alarm is located and identify the data module from which the alarm is generated based on **Additional Information**.

Step 3 Choose **O&M** > **Backup and Restoration > Backup Management** > **Create**.

Step 4 Configure a backup task. The backup data to be configured is consistent with the data in Additional Information of the alarm.

Step 5 After the backup task is created successfully, wait for two minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information

Step 6 On FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 7 In the **Service** area, select **Controller** and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.35 ALM-12061 Process Usage Exceeds the Threshold

Description

The system checks the usage of the omm process every 30 seconds. Users can run the **ps -o nlwp, pid, args, -u omm | awk '{sum+=$1} END {print "", sum}'** command to obtain the number of concurrent processes of user **omm**. Run the **ulimit -u**command to obtain the maximum number of processes that can be simultaneously opened by user **omm**. Divide the number of concurrent processes by the maximum number to obtain the process usage of user **omm**. The process usage has a default threshold. This alarm is generated when the process usage exceeds the threshold.

If **Trigger Count** is **3** and the process usage is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1**and the process usage is less than or equal to 90% of the threshold, this alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12061	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

- Switch to user **omm** fails.
- New omm process cannot be created.

Possible Causes

- The alarm threshold is improperly configured.
- The maximum number of processes (including threads) that can be concurrently opened by user **omm** is inappropriate.
- An excessive number of threads are opened at the same time.

Procedure

Check whether the alarm threshold or alarm hit number is properly configured.

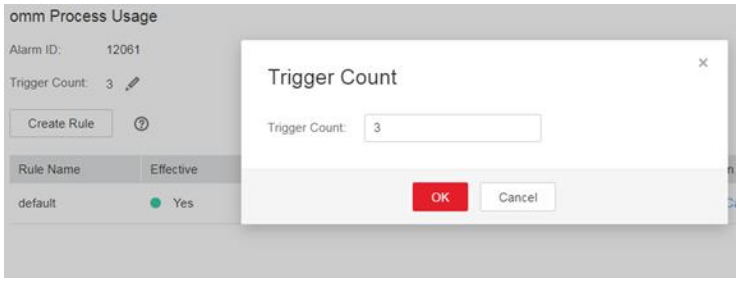
Step 1 On the FusionInsight Manager, change the alarm threshold and **Trigger Count** based on the actual CPU usage.

Specifically, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host**> **Process** > **omm Process Usage** to change Trigger Count, as shown in **Figure 10-31**.

NOTE

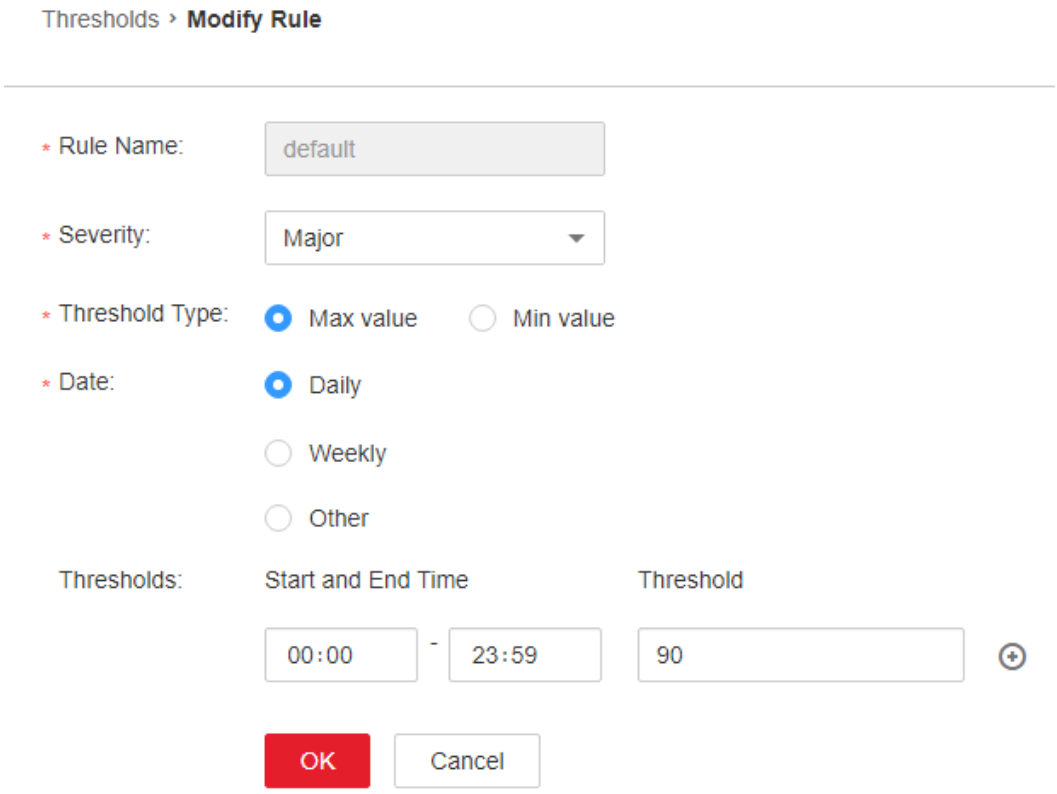
The alarm is generated when the process usage exceeds the threshold for the times specified by **Trigger Count**.

Figure 10-31 Setting Trigger Count



Set the alarm threshold based on the actual process usage. To check the process usage, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host**> **Process** > **omm Process Usage**, as shown in **Figure 10-32**.

Figure 10-32 Setting an alarm threshold



Step 2 2 minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 3**.

Check whether the maximum number of processes (including threads) opened by user omm is appropriate.

Step 3 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host for which the alarm is generated.

Step 4 Log in to the host where the alarm is generated as user **root**.

Step 5 Run the **su - omm** command to switch to user **omm**.

Step 6 Run the **ulimit -u** command to obtain the maximum number of threads that can be concurrently opened by user **omm** and check whether the number is greater than or equal to 60000.

- If it is, go to **Step 8**.
- If it is not, go to **Step 7**.

Step 7 Run the **ulimit -u 60000** command to change the maximum number to 60000. Two minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 12**.

Check whether an excessive number of processes are opened at the same time.

Step 8 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host for which the alarm is generated.

Step 9 Log in to the host where the alarm is generated as user **root**.

Step 10 Run the **ps -o nlwp, pid, lwp, args, -u omm|sort -n** command to check the numbers of threads used by the system. The result is sorted based on the thread number. Analyze the top 5 thread numbers and check whether the threads are incorrectly used. If they are, contact maintenance personnel to rectify the fault. If they are not, run the **ulimit -u** command to change the maximum number to be greater than 60000.

Step 11 Five minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 12**.

Collect fault information.

Step 12 On the FusionInsight Manager home page of the active clusters, choose **O&M** > **Log** > **Download**.

Step 13 Select **OmmServer** and **NodeAgent** from the **Service** and click **OK**.

Step 14 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 15 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

Related Information

None

10.13.36 ALM-12062 OMS Parameter Configurations Mismatch with the Cluster Scale

Description

The system checks whether the OMS parameter configurations match with the cluster scale at each top hour. If the OMS parameter configurations do not meet the cluster scale requirements, the system generates this alarm. This alarm is automatically cleared when the OMS parameter configurations are modified.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12062	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the name of the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The OMS configuration is not modified when the cluster is installed or the system capacity is expanded.

Possible Causes

The OMS parameter configurations mismatch with the cluster scale.

Procedure

Check whether the OMS parameter configurations match with the cluster scale.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host for which the alarm is generated.

Step 2 Log in to the host where the alarm is generated as user **root**.

Step 3 Run the **su - omm** command to switch to user **omm**.

Step 4 Run the **vi $BIGDATA_LOG_HOME/controller/scriptlog/modify_manager_param.log** command to open the log file and search for the log file containing the following information: Current oms configurations cannot support *xx* nodes. In the information, *xx* indicates the number of nodes in the cluster.

Step 5 Optimize the current cluster configuration by following the instructions in **Optimizing Manager Configurations Based on the Number of Cluster Nodes**.

Step 6 One hour later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Select **Controller** from the **Service** and click **OK**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

Optimizing Manager Configurations Based on the Number of Cluster Nodes

Step 1 Log in to the active Manager node as user **omm**.

Step 2 Run the following command to switch the directory:

cd ${BIGDATA_HOME}/om-server/om/sbin

Step 3 Run the following command to view the current Manager configurations.

sh oms_config_info.sh -q

Step 4 Run the following command to specify the number of nodes in the current cluster.

Command format: **sh oms_config_info.sh -s** *number of nodes*

Example:

sh oms_config_info.sh -s 1000

Enter **y** as prompted.

```
The following configurations will be modified:
    Module      Parameter         Current         Target
    Controller  controller.Xmx    4096m       =>  16384m
    Controller  controller.Xms    1024m       =>  8192m
    Controller  controller.node.heartbeat.error.threshold     30000               =>  60000
    Pms         pms.mem           8192m       =>  10240m
Do you really want to do this operation? (y/n):
```

The configurations are updated successfully if the following information is displayed:

```
...
Operation has been completed. Now restarting OMS server.                [done]
Restarted oms server successfully.
```

NOTE

- OMS is automatically restarted during the configuration update process.
- Clusters with similar quantities of nodes have same Manager configurations. For example, when the number of nodes is changed from 100 to 101, no configuration item needs to be updated.

----End

10.13.37 ALM-12063 Unavailable Disk

Description

The system checks whether the data disk of the current host is available at the top of each hour. The system creates files, writes files, and deletes files in the mount directory of the disk. If the operations fail, the alarm is generated. If the operations succeed, the disk is available, and the alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12063	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the name of the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DiskName	Specifies the disk for which the alarm is generated.

Impact on the System

Data read or write on the data disk fails, and services are abnormal.

Possible Causes

- The permission of the disk mount directory is abnormal.
- There are disk bad sectors.

Procedure

Check whether the permission of the disk mount directory is normal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host and **DiskName** for the disk for which the alarm is generated.

Step 2 Log in to the host where the alarm is generated as user **root**.

Step 3 Run the **df -h |grep DiskName** command to obtain the mount point and check whether the permission of the mount directory is unwritable or unreadable.

- If it is, go to **Step 4**.
- If it is not, go to **Step 8**.

NOTE

If the permission of the mount directory is 000 or the owner is **root**, the mount directory is unreadable and unwritable.

Step 4 Modify the directory permission.

Step 5 One hour later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Step 6 Contact hardware engineers to rectify the disk.

Step 7 One hour later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 9 Select **NodeAgent** from the **Service** and click **OK**.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.38 ALM-12064 Host Random Port Range Conflicts with Cluster Used Port

Alarm Description

The system checks whether the random port range of the host conflicts with the range of ports used by the Cluster system every hour. The alarm is generated if they conflict. The alarm is automatically cleared when the random port range of the host is changed to the normal range.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12064	Major	Yes

Parameters

Parameter	Description
Source	Specifiestheclusterorsystemforwhich-thealarmisgenerated.
ServiceName	Specifies the name of the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The default port of the Cluster system is occupied. As a result, some processes fail to be started.

Possible Causes

The random port range configuration is modified.

Procedure

Check the random port range of the system.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host for which the alarm is generated.

Step 2 Log in to the host where the alarm is generated as user **root**.

Step 3 Run the **cat /proc/sys/net/ipv4/ip_local_port_range** command to obtain the random port range of the host and check whether the minimum value is smaller than 32768.

- If it is, go to **Step 4**.
- If it is not, goto **Step 7**.

Step 4 Run the **vim /etc/sysctl.conf** command to change the value of **net.ipv4.ip_local_port_range** to **32768 61000**. If this parameter does not exist, add the following configuration: **net.ipv4.ip_local_port_range = 32768 61000**.

Step 5 Run the **sysctl -p /etc/sysctl.conf** command for the modification to take effect.

Step 6 One hour later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Select **NodeAgent** for **Service** and click **OK**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.13.39 ALM-12066 Trust Relationships Between Nodes Become Invalid

Description

The system checks whether the trust relationship between the active OMS node and other Agent nodes is normal every hour. The alarm is generated if the mutual trust fails. This alarm is automatically cleared if this problem is resolved.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12066	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Some operations on the management plane may be abnormal.

Possible Causes

- The **/etc/ssh/sshd_config** configuration file is damaged.
- The password of user **omm** has expired.

Procedure

Check the status of the /etc/ssh/sshd_config configuration file.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm and click ⌄ to view the host list in the alarm details.

Step 2 Log in to the active OMS node as user **omm**.

Step 3 Run the **ssh** command, for example, **ssh *host2***, on each node in the alarm details to check whether the connection fails. (***host2*** is a node other than the OMS node in the alarm details.)

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Open the **/etc/ssh/sshd_config** configuration file on host2 and check whether **AllowUsers** or **DenyUsers** is configured for other nodes.

- If yes, go to **Step 5**.
- If no, contact OS experts.

Step 5 Modify the whitelist or blacklist to ensure that user **omm** is in the whitelist or not in the blacklist. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check the status of the password of user omm.

Step 6 Check the interaction information of the **ssh** command.

- If the password of user **omm** is required, go to **Step 7**.
- If message "Enter passphrase for key '/home/omm/.ssh/id_rsa':" is displayed, go to **Step 9**.

Step 7 Check the trust list (**/home/omm/.ssh/authorized_keys**) of user **omm** on the OMS node and host2 node. Check whether the trust list contains the public key file (**/home/omm/.ssh/id_rsa.pub**) of user **omm** on the peer host.

- If yes, contact OS experts.
- If no, add the public key of user **omm** of the peer host to the trust list of the local host.

Step 8 Add the public key of user **omm** of the peer host to the trust list of the local host. Run the **ssh** command, for example, **ssh host2**, on each node in the alarm details to check whether the connection fails. (***host2*** is a node other than the OMS node in the alarm details.)

- If yes, go to **Step 9**.
- If no, check whether the alarm is cleared. If the alarm is cleared, no further action is required; otherwise, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Select **Controller** for **Service** and click **OK**.

Step 11 Click  in the upper right corner to set the log collection time range. Generally, the time range is 10 minutes before and after the alarm generation time. Click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

Perform the following steps to handle abnormal trust relationships between nodes:

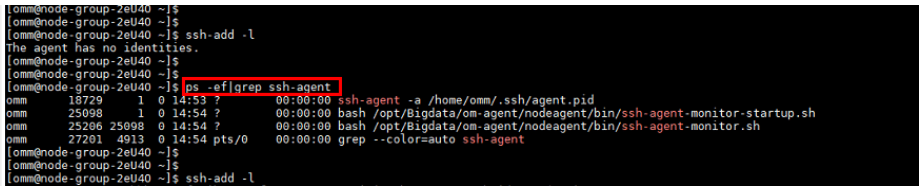
NOTICE

- Perform this operation as user **omm**.
- If the network between nodes is disconnected, rectify the network fault first. Check whether the two nodes are connected to the same security group and whether **hosts.deny** and **hosts.allow** are set.

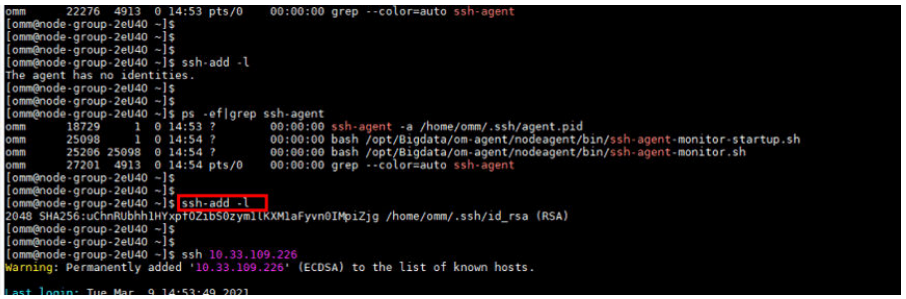
1. Run the **ssh-add -l** command on both nodes to check whether any identities exist.

  - If yes, go to **4**.
  - If no, go to **2**.

2. If no identities are displayed, run the **ps -ef|grep ssh-agent** command to find the **ssh-agent** process, stop the process, and wait for the process to automatically restart.



3. Run the **ssh-add -l** command to check whether the identities have been added. If yes, manually run the **ssh** command to check whether the trust relationship is normal.



4. If identities exist, check whether the **/home/omm/.ssh/authorized_keys** file contains the information in the **/home/omm/.ssh/id_rsa.pub** file of the peer node. If it does not, manually add the information.
5. Check whether the permissions on the files in the **/home/omm/.ssh** directory are modified.
6. Check the **/var/log/Bigdata/nodeagent/scriptlog/ssh-agent-monitor.log** file.
7. If the **/home** directory of user **omm** is deleted, contact MRS support personnel for assistance.

10.13.40 ALM-12067 Tomcat Resource Is Abnormal

Alarm Description

HA checks the Tomcat resources of Manager every 85 seconds. This alarm is generated when HA detects that the Tomcat resources are abnormal for 2 consecutive times.

This alarm is cleared when the Tomcat resource is normal.

Resource Type of Tomcat is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new Tomcat resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12067	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the name of the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby FusionInsight Manager switchover occurs.
- The Tomcat process repeatedly restarts.

Possible Causes

- The Tomcat directory permission is incorrect. The Tomcat process is abnormal.

Procedure

Check whether the Tomcat directory permission is normal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host for which the alarm is generated.

Step 2 Log in to the host where the alarm is generated as user **root**.

Step 3 Run the **su - omm** command to switch to user **omm**.

Step 4 Run the **vi $BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/tomcat.log** command to check whether the Tomcat resource log contains the keyword "Cannot find *XXX*" and rectify the file permission based on the keyword.

Step 5 5 minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Select **OmmServer** and **Tomcat** for **Service** and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.41 ALM-12068 ACS Resource Is Abnormal

Alarm Description

HA checks the acs resources of Manager every 80 seconds. This alarm is generated when HA detects that the acs resources are abnormal for two consecutive times.

This alarm is cleared when the ACS resource is normal.

Resource Type of ACS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new ACS resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12068	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the name of the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby FusionInsight Manager switchover occurs.
- The ACS process repeatedly restarts, which may cause the FusionInsight Manager login failure.

Possible Causes

The ACS process is abnormal.

Procedure

Check whether the ACS process is abnormal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su -omm** command and then the **sh ${BIGDATA_HOME} /om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the ACS resources managed by the HA is normal. In the single-node system, the ACS resource is in the normal state. In the dual-node system, the ACS resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to **Step 6**.
- If it is not, go to **Step 4**.

Step 4 Run the **vi $BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/acs.log** command to view the ACS resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

Step 5 One hour later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.42 ALM-12069 AOS Resource Is Abnormal

Alarm Description

HA checks the aos resources of Manager every 81 seconds. This alarm is generated when HA detects that the aos resources are abnormal for 2 consecutive times.

This alarm is cleared when the AOS resource is normal.

Resource Type of AOS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new AOS resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12069	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the name of the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby FusionInsight Manager switchover occurs.
- The AOS process repeatedly restarts, which may cause the FusionInsight Manager login failure.

Possible Causes

The AOS process is abnormal.

Procedure

Check the random port range of the system.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su -omm** command and then the **sh ${BIGDATA_HOME} /om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the AOS resources managed by the HA is normal. In the single-node system, the AOS resource is in the normal state. In the dual-node system, the AOS resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to **Step 6**.
- If it is not, go to **Step 4**.

Step 4 Run the **vi $BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/aos.log** command to view the AOS resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

Step 5 Five minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour before and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.43 ALM-12070 Controller Resource Is Abnormal

Alarm Description

HA checks the controller resources of Manager every 80 seconds. This alarm is generated when HA detects that the controller resources are abnormal for 2 consecutive times.

This alarm is cleared when the Controller resource is normal.

Resource Type of Controller is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new Controller resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12070	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the name of the service for which the alarm is generated.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby FusionInsight Manager switchover occurs.
- The Controller process repeatedly restarts, which may cause the FusionInsight Manager login failure.

Possible Causes

The Controller process is abnormal.

Procedure

Check whether the controller process is normal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su - omm** command to switch to user **omm**.Run the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the Controller resources managed by the HA is normal. In the single-node system, the Controller resource is in the normal state. In the dual-node system, the Controller resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to **Step 6**.
- If it is not, go to **Step 4**.

Step 4 Run the **vi $BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/controller.log** command to view the Controller resource logs, and run the **vi $BIGDATA_LOG_HOME/controller/controller.log** command to view the Controller running logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

Step 5 Five minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Select **Controller** and **OmmServe** for **Service** and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour before and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.44 ALM-12071 Httpd Resource Is Abnormal

Description

HA checks the httpd resources of Manager every 120 seconds. This alarm is generated when HA detects that the httpd resources are abnormal for 10 consecutive times.

This alarm is cleared when the httpd resource is normal.

Resource Type of httpd is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new httpd resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12071	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby FusionInsight Manager switchover occurs.
- The httpd process is repeatedly restarts, which may lead to the failure to visit the native service UI.

Possible Causes

The httpd process is abnormal.

Procedure

Check whether the httpd process is abnormal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su - omm** command to switch to user **omm**.

Step 4 Run the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the httpd resources managed by the HA is normal. In the single-node system, the httpd resource is in the normal state. In the dual-node system, the httpd resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to **Step 7**.
- If it is not, go to **Step 5**.

Step 5 Run the **vi $BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/httpd.log** command to view the httpd resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

Step 6 Five minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 9 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

Related Information

10.13.45 ALM-12072 FloatIP Resource Is Abnormal

Description

HA checks the floatip resources of Manager every 9 seconds. This alarm is generated when HA detects that the floatip resources are abnormal for 3 consecutive times.

This alarm is cleared when the FloatIP resource is normal.

Resource Type of FloatIP is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new FloatIP resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12072	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby FusionInsight Manager switchover occurs.
- The FloatIP process is repeatedly restarts, which may lead to the failure to visit the native service UI.

Possible Causes

- The floating IP address is abnormal.

Procedure

Check the floating IP address status of the active management node.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the address of the host for which the alarm is generated and the resource name.

Step 2 Log in to the active management node as user **root**.

Step 3 Run the following command, go to the **${BIGDATA_HOME}/om-server/om/sbin/** directory.

su - omm

cd ${BIGDATA_HOME}/om-server/om/sbin/

Step 4 Run the **sh status-oms.sh** command, and execute the **status-oms.sh** script to check whether the floating IP address of the active FusionInsight Manager is normal. View the command output, locate the row where **ResName** is **floatip**, and check whether the following information is displayed.

For example:

```
10-10-10-160 floatip Normal Normal Single_active
```

- If it is, go to **Step 8**.
- If it is not, go to **Step 5**.

Step 5 Run the **ifconfig** command to check whether the NIC with the floating IP address exists.

- If it does, go to **Step 8**.
- If it does not, go to **Step 6**.

Step 6 Run the **ifconfig** *NIC name Floating IPaddress* netmask *Subnet mask* command to reconfigure the NIC with the floating IP address. (For example, **ifconfig eth0 10.10.10.102 netmask 255.255.255.0**).

Step 7 Five minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 9 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 10 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

Related Information

None

10.13.46 ALM-12073 CEP Resource Is Abnormal

Description

HA checks the cep resources of Manager every 60 seconds. This alarm is generated when HA detects that the cep resources are abnormal for 2 consecutive times.

This alarm is cleared when the CEP resource is normal.

Resource Type of CEP is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new CEP resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12073	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby FusionInsight Manager switchover occurs.
- The CEP process repeatedly restarts, causing monitoring data to be abnormal.

Possible Causes

The CEP process is abnormal.

Procedure

Check whether the CEP process is abnormal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su -omm** command and then the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the CEP resources managed by the HA is normal. In the single-node system, the CEP resource is in the normal state. In the dual-node system, the CEP resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to **Step 6**.
- If it is not, go to **Step 4**.

Step 4 Run the **vi $BIGDATA_LOG_HOME/omm/oms/cep/cep.log** and **vi $BIGDATA_LOG_HOME/omm/oms/cep/scriptlog/cep_ha.log** commands to view the CEP resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

Step 5 Five minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 8 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

10.13.47 ALM-12074 FMS Resource Is Abnormal

Description

HA checks the fms resources of Manager every 60 seconds. This alarm is generated when HA detects that the fms resources are abnormal for 2 consecutive times.

This alarm is cleared when the FMS resource is normal.

Resource Type of FMS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new FMS resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12074	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby FusionInsight Manager switchover occurs.
- The FMS process repeatedly restarts. As a result, alarm information may fail to be reported.

Possible Causes

The FMS process is abnormal.

Procedure

Check whether the FMS process is abnormal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su -omm** command and then the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the FMS resources managed by the HA is normal. In the single-node system, the FMS resource is in the normal state. In the dual-node system, the FMS resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to **Step 6**.
- If it is not, go to **Step 4**.

Step 4 Run the **vi $BIGDATA_LOG_HOME/omm/oms/fms/fms.log** and **vi $BIGDATA_LOG_HOME/omm/oms/fms/scriptlog/fms_ha.log** commands to view the FMS resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

Step 5 5 minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**> **Log** > **Download**.

Step 7 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 8 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

10.13.48 ALM-12075 PMS Resource Is Abnormal

Description

HA checks the pms resources of Manager every 55 seconds. This alarm is generated when HA detects that the pms resources are abnormal for three consecutive times.

This alarm is cleared when the PMS resource is normal.

Resource Type of PMS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new PMS resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12075	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby FusionInsight Manager switchover occurs.
- The PMS process repeatedly restarts, causing monitoring information to be abnormal.

Possible Causes

The PMS process is abnormal.

Procedure

Check whether the PMS process is abnormal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su -omm** command and then the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the PMS resources managed by the HA is normal. In the single-node system, the PMS resource is in the normal state. In the dual-node system, the PMS resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to **Step 6**.
- If it is not, go to **Step 4**.

Step 4 Run the **vi $BIGDATA_LOG_HOME/omm/oms/pms/pms.log** and **vi $BIGDATA_LOG_HOME/omm/oms/pms/scriptlog/pms_ha.log** commands to view the PMS resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

Step 5 Five minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**> **Log** > **Download**.

Step 7 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 8 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

Related Information

10.13.49 ALM-12076 GaussDB Resource Is Abnormal

Description

HA checks the Manager database every 10 seconds. This alarm is generated when HA detects that the database is abnormal for 3 consecutive times.

This alarm is cleared when the database is normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12076	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If databases are abnormal, all core services and related service processes, such as alarms and monitoring functions, are affected.

Possible Causes

An exception occurs in the database.

Procedure

Check the database status of the active and standby management nodes.

Step 1 Log in to the active and standby management nodes respectively as user **root**. Run the **su - ommdba** command to switch to user **ommdba**, and then run the **gs_ctl query** command to check whether the following information is displayed in the command output.

Command output of the active management node:

```
Ha state:
    LOCAL_ROLE: Primary
    STATIC_CONNECTIONS          : 1
    DB_STATE                    : Normal
    DETAIL_INFORMATION          : user/password invalid
Senders info:

```

- If it is, go to **Step 3**.
- If it is not, go to **Step 2**.

Step 2 Contact the network administrator to check whether the network is faulty.

- If it is, go to **Step 3**.
- If it is not, go to **Step 5**.

Step 3 Five minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Step 4 Log in to the active and standby management nodes, run the **su -omm** command to switch to user **omm**, go to the **${BIGDATA_HOME} /om-server/om/sbin/** directory, and run the **status-oms.sh** script to check whether the floating IP addresses and GaussDB resources of the active and standby FusionInsight Managers are in the status shown in the following figure.

```
acs                 Normal              Normal          Single_active
aos                 Normal              Normal          Single_active
cep                 Normal              Normal          Single_active
controller          Normal              Normal          Single_active
feed_watchdog       Normal              Normal          Double_active
floatip             Normal              Normal          Single_active
fms                 Normal              Normal          Single_active
gaussDB             Active_normal       Normal          Active_standby
heartBeatCheck      Normal              Normal          Single_active

```

- If they are, find the alarm in the alarm list and manually clear the alarm.
- If they are not, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 6 Select **OmmServer** for **Service** and click **OK**.

Step 7 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 8 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

Related Information

None

10.13.50 ALM-12077 User omm Expired

Description

The system starts at 00:00 every day to check whether user **omm** has expired every eight hours. This alarm is generated if the user account has expired.

This alarm is cleared when the expiration time of user **omm** is changed and the user account status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12077	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

User **omm** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services.

Possible Causes

User **omm** has expired.

Procedure

Check whether user omm in the system has expired.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l omm**command to view the information about the password of user **omm**.

Step 2 View the value of **Account expires** to check whether the user configurations have expired.

NOTE

If the parameter value is **never**, the user configurations never expire.

- If they do, go to **Step 3**.
- If they do not, go to **Step 4**.

Step 3 Run the **chage -E 'yyyy-MM-dd' omm** command to set the expiration time of user **omm**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

10.13.51 ALM-12078 Password of User omm Expired

Description

The system starts at 00:00 every day to check whether the password of user **omm** has expired every 8 hours. This alarm is generated if the password has expired.

This alarm is cleared when the expiration time of user **omm** password is changed and the user password status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12078	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The password of user **omm** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services.

Possible Causes

The password of user **omm** has expired.

Procedure

Check whether the password of user omm in the system has expired.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l omm**command to view the information about the password of user **omm**.

Step 2 View the value of **Password expires** to check whether the user configurations have expired.

NOTE

If the parameter value is **never**, the user configurations never expire.

- If they do, go to **Step 3**.
- If they do not, go to **Step 4**.

Step 3 Run the **chage -M '*days*' omm** command to set the validity period of the password for user **omm**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**> **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

10.13.52 ALM-12079 User omm Is About to Expire

Description

The system starts at 00:00 every day to check whether user **omm** is about to expire every 8 hours. This alarm is generated if the user account will expire no less than 15 days later.

This alarm is cleared when the expiration time of user **omm** is changed and the user account status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12079	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

User **omm** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services.

Possible Causes

The account of user **omm** is about to expire.

Procedure

Check whether user omm is about to expire.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l omm** command to view the information about the password of user **omm**.

Step 2 View the value of **Account expires** to check whether the user configurations are about to expire.

NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password are about to expire within 15 days.

- If they are, go to **Step 3**.
- If they are not, go to **Step 4**.

Step 3 Run the **chage -E** *'yyyy-MM-dd'* **omm** command to set the validity period of user **omm**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.
