# 1 Test Method

TaurusDB is an enterprise-grade cloud-native database fully compatible with MySQL. It decouples compute from storage and supports up to 128 TB of storage per instance. With TaurusDB, there is no need to worry about data loss. It provides the high availability and superior performance of commercial databases at the price of open-source databases.

## Test Environment

The TaurusDB test environment is as follows:

- Region: AP-Singapore
- AZ: multiple AZs
- TaurusDB instance: an instance with a primary node and a read replica
- Elastic Cloud Server (ECS): general computing-plus | c7.8xlarge.4 | 32 vCPUs | 128 GB, CentOS 7.6 (64-bit). The ECS and instance nodes are in the same AZ. Bind an EIP to the ECS because additional compilation tools need to be installed on stress testing tools.

## Test Tool

**Table 1-1** Test tool

Tool	Description	Version
Sysbench	Sysbench is a multi-threaded benchmark tool based on LuaJIT. It is most frequently used for database benchmarks. With sysbench, you can quickly get an impression of database performance. For details, visit <a href="https://github.com/akopytov/sysbench">https://github.com/akopytov/sysbench</a>	<b>Sysbench 1.0.18</b>

Perform the following commands to install sysbench:

Log in to an ECS and download the sysbench software package.

```
wget https://codeload.github.com/akopytov/sysbench/zip/refs/tags/1.0.18  
yum install -y autoconf libtool mysql mysql-devel vim unzip
```

Decompress the software package.

```
unzip 1.0.18
```

Install the software package.

```
cd sysbench-1.0.18
```

```
./autogen.sh
```

```
./configure
```

```
make
```

```
make install
```

## Test Procedure

### NOTICE

The following tests are performed on an ECS. Replace the number of concurrent threads, connection IP address, connection port, username, and user password based on the site requirements.

Performance test data (including SQL) is automatically generated by the sysbench tool.

The ECS and the instance are in the same AZ.

To ensure that sysbench runs properly in high-concurrency scenarios (concurrent requests: 512-1000), increase the value of **max\_prepared\_stmt\_count**. The recommended value is **1048576**. Too many Prepare statements consume a lot of memory space, resulting in out-of-memory (OOM). For an instance with 4 vCPUs and 16 GB memory, set this parameter to **400000**.

### Testing write-only performance

#### Step 1 Import data.

1. Create the test database **sbtest**.

```
mysql -u<user>-P <port> -h <host> -p -e "create database sbtest"
```

2. Import the test background data to the **sbtest** database.

```
sysbench --db-driver=mysql --mysql-host=<host> --mysql-port=<port> --  
mysql-user=<user> --mysql-password=<password> --mysql-db=sbtest --  
table_size=25000 --tables=250 --threads=<thread_num> oltp_common  
prepare
```

#### Step 2 Test the write-only performance. The process takes about 10 minutes.

```
sysbench --db-driver=mysql --mysql-host=<host> --mysql-port=<port> --mysql-  
user=<user> --mysql-password=<password> --mysql-db=sbtest --  
table_size=25000 --tables=250 --time=600 --threads=<thread_num> --  
percentile=95 --report-interval=1 oltp_write_only run
```

**Step 3** Delete data.

```
sysbench --db-driver=mysql --mysql-host=<host> --mysql-port=<port> --mysql-user=<user> --mysql-password=<password> --mysql-db=sbtest --table_size=25000 --tables=250 --threads=<thread_num> oltp_common cleanup
```

----End

**Testing read-only performance**

**Step 1** Import data.

1. Create the test database **sbtest**.

```
mysql -u<user> -P<port> -h<host> -p -e "create database sbtest"
```

2. Import the test background data to the **sbtest** database.

```
sysbench --db-driver=mysql --mysql-host=<host> --mysql-port=<port> --mysql-user=<user> --mysql-password=<password> --mysql-db=sbtest --table_size=25000 --tables=250 --threads=<thread_num> oltp_common prepare
```

**Step 2** Test the read-only performance. The process takes about 10 minutes.

```
sysbench --db-driver=mysql --mysql-host=<host> --mysql-port=<port> --mysql-user=<user> --mysql-password=<password> --mysql-db=sbtest --table_size=25000 --tables=250 --time=600 --range_selects=0 --skip-trx=1 --threads=<thread_num> --percentile=95 --report-interval=1 oltp_read_only run
```

**Step 3** Delete data.

```
sysbench --db-driver=mysql --mysql-host=<host> --mysql-port=<port> --mysql-user=<user> --mysql-password=<password> --mysql-db=sbtest --table_size=25000 --tables=250 --threads=<thread_num> oltp_common cleanup
```

----End

**Testing read/write performance**

**Step 1** Import data.

1. Create the test database **sbtest**.

```
mysql -u<user> -P<port> -h <host> -p -e "create database sbtest"
```

2. Import the test background data to the **sbtest** database.

```
sysbench --db-driver=mysql --mysql-host=<host> --mysql-port=<port> --mysql-user=<user> --mysql-password=<password> --mysql-db=sbtest --table_size=250000 --tables=25 --threads=<thread_num> oltp_common prepare
```

**Step 2** Test the read/write performance. The process takes about 10 minutes.

```
sysbench --db-driver=mysql --mysql-host=<host> --mysql-port=<port> --mysql-user=<user> --mysql-password=<password> --mysql-db=sbtest --table_size=250000 --tables=25 --time=600 --threads=<thread_num> --percentile=95 --report-interval=1 oltp_read_write run
```

**Step 3** Delete data.

```
sysbench --db-driver=mysql --mysql-host=<host> --mysql-port=<port> --mysql-  
user=<user> --mysql-password=<password> --mysql-db=sbtest --  
table_size=250000 --tables=25 --threads=<thread_num> oltp_common cleanup  
----End
```

## Test Metrics

- Transactions per second (TPS) indicates the number of transactions executed per second.
- Queries per second (QPS) indicates the number of SQL statements, including INSERT, SELECT, UPDATE, and DELETE statements, executed per second.

# 2 Performance Data

## 2.1 Read/Write Mode

### Dedicated DB Instance Test Data

**Table 2-1** Test data in read/write mode (x86 architecture, multi-AZ deployment)

Mode	Tables	Table Rows	Threads	Instance Specifications	TPS	QPS
Read/Write	25	250,000	64	2 vCPUs   8 GB	1,708.43	34,168.62
			64	2 vCPUs   16 GB	1,645.88	32,917.69
			128	4 vCPUs   16 GB	4,470.64	89,412.78
			128	4 vCPUs   32 GB	4,927.94	98,558.88
			64	8 vCPUs   32 GB	8,073.66	161,473.22
			64	8 vCPUs   64 GB	8,570.03	171,400.69
			256	16 vCPUs   64 GB	14,815	296,300.07
			256	16 vCPUs   128 GB	15,975.88	319,517.62
			512	32 vCPUs   128 GB	21,080.55	421,611.01
			512	32 vCPUs   256 GB	22,612.02	452,240.5
			512	60 vCPUs   256 GB	24,033.17	480,663.46
			512	64 vCPUs   512 GB	23,644.1	472,882.17

## Dedicated DB Instance Test Results

## 2.2 Read-only Mode

### Dedicated DB Instance Test Data

Table 2-2 Test data in read-only mode (x86 architecture, multi-AZ deployment)

Mode	Tables	Table Rows	Threads	Instance Specifications	TPS	QPS
Read-only	250	25,000	64	2 vCPUs   8 GB	7,892.35	78,923.54
			64	2 vCPUs   16 GB	7,989.1	79,891.04
			64	4 vCPUs   16 GB	21,694.24	216,942.43
			64	4 vCPUs   32 GB	23,513.22	235,132.23
			512	8 vCPUs   32 GB	38,033.2	380,332.04
			512	8 vCPUs   64 GB	38,101.59	381,015.86
			1,000	16 vCPUs   64 GB	68,211.25	682,112.54

			1,000	16 vCPUs   128 GB	69,562.15	695,621.54
			1,000	32 vCPUs   128 GB	102,618.26	1,026,182.57
			1,000	32 vCPUs   256 GB	103,976.9	1,039,768.98
			1,000	60 vCPUs   256 GB	103,048.51	1,030,485.11
			1,000	64 vCPUs   512 GB	102,851.45	1,028,514.55
