1 Pushing an Image

Introduction

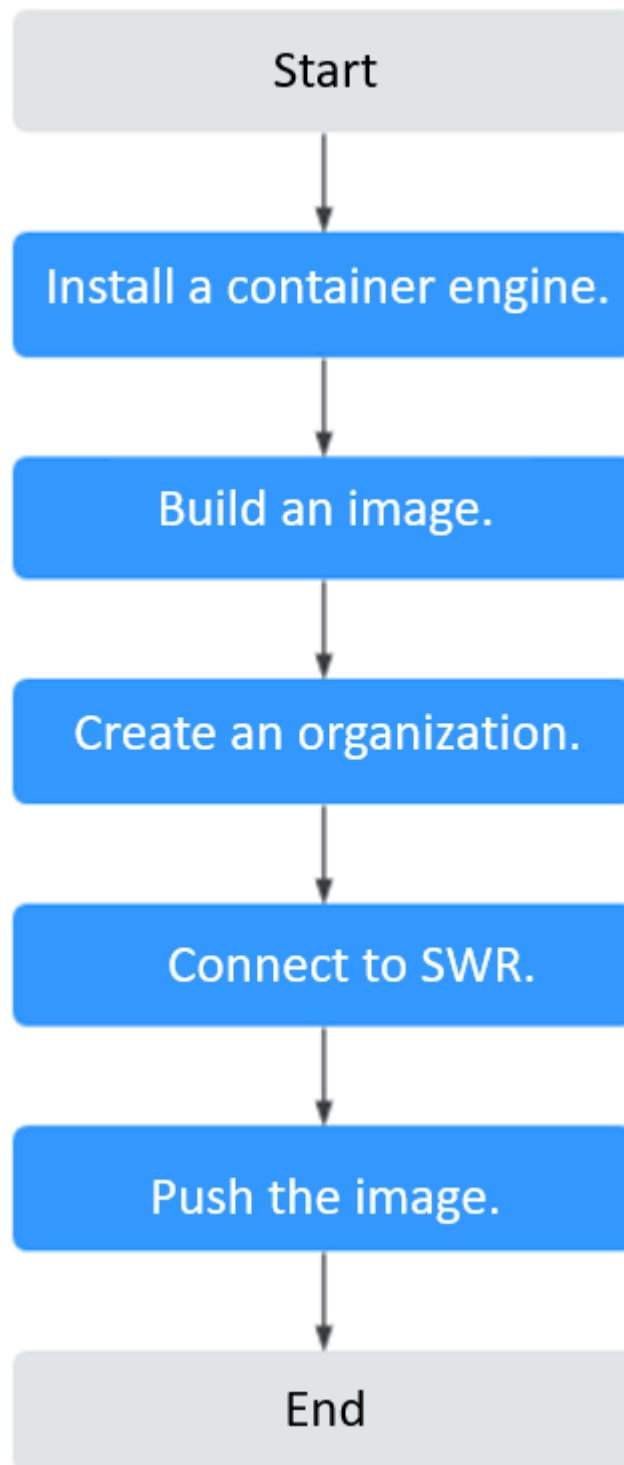

SWR provides easy, secure, and reliable management for container images throughout their lifecycles, facilitating the deployment of containerized applications. This section uses the 2048 application as an example to show how to install a container engine, build an image, and use the container engine to push the image to SWR.

NOTE

- There are two ways to push an image to SWR: using a container engine client or on the SWR console. This section uses a container engine client as an example. For details about how to upload an image on the console, see [Uploading an Image Through SWR Console](#).
- Currently, there are no SWR APIs available for pushing images.

The following shows the process of pushing an image to SWR.

Figure 1-1 Process

Prerequisites

You already have a Huawei Cloud account.

If you do not have a Huawei Cloud account, perform the following steps to create one:

1. Visit [Huawei Cloud](#) and click **Sign Up**.
2. Create an account as prompted. After you have successfully signed up, the system automatically redirects you to your personal information page.

Step 1: Install a Container Engine

Prepare an ECS where Docker **1.11.2** or later will be installed.

Step 1 Create a Linux ECS with an EIP. For details, see [Purchasing and Logging In to a Linux ECS](#).

The ECS and EIP are for demonstration only, so they do not require high specifications. For example, select an ECS with **1 vCPU | 2 GB**, an EIP with bandwidth of **1 Mbit/s**, and an operating system of **CentOS 7.5**.

NOTE

- You can also install a container engine on other server instead of an ECS.
- If you use CentOS, you are advised to choose CentOS 7.0, CentOS 7.2, CentOS 7.3, CentOS 7.4, CentOS 7.5, or CentOS 7.6 to avoid exceptions during the installation.

Step 2 After the ECS is created, return to the ECS list and click **Remote Login** to log in to the ECS as user **root**.

Step 3 Run the following commands to quickly install Docker:

```
curl -fsSL get.docker.com -o get-docker.sh
sh get-docker.sh
sudo systemctl daemon-reload
sudo systemctl restart docker
```

----End

Step 2: Build an Image

Step 1 Run the following command on the ECS where Docker is installed to download the source code of the 2048 application:

git clone <https://gitee.com/jorgensen/2048.git>

NOTE

If the message "git: command not found" is displayed, the Git tool is not installed. Run **yum install git** to install it.

Step 2 After the download is successful, access the **2048** directory.

cd 2048

Step 3 Modify the Dockerfile file.

vim Dockerfile

```
FROM nginx
COPY . /usr/share/nginx/html

EXPOSE 80
CMD ["nginx", "-g", "daemon off;"]
```

- **FROM:** specifies **nginx** as the base image.

- **COPY**: copies the source code of the 2048 application to the directory `/usr/share/nginx/html` in the container.
- **EXPOSE**: exposes port 80 of the container.
- **CMD**: specifies the default command to run the container.

Press **Esc** and enter `:wq` to save the settings and exit.

Step 4 Run **docker build** to build an image.

docker build -t 2048 .

In the preceding command:

- **-t** is used to tag the image with a name. In this example, the image name is **2048**.
- **.** indicates the context directory. All the files in this directory will be packed and sent to the container engine to help build an image.

Step 5 Run the following command to check the **2048** image you built. The image tag is **latest** by default.

docker images

```
# docker images
REPOSITORY TAG IMAGE ID CREATED SIZE
2048 latest 8d421c503ed0 About a minute ago 134MB
nginx latest dd34e67e3371 6 days ago 133MB
```

You can also see a **nginx** image, which is pulled from the image repository and used as the base image of the **2048** image.

Step 6 (Optional) Run the container image.

After an image is built, you can run **docker run** to use it.

docker run -p 8080:80 2048

docker run starts a container. In the preceding command, **-p** indicates that port 8080 of the ECS is mapped to port 80 of the container. You can visit **http://ECS EIP:8080** to access the container. The 2048 application page will be displayed.

----End

Step 3: Create an Organization

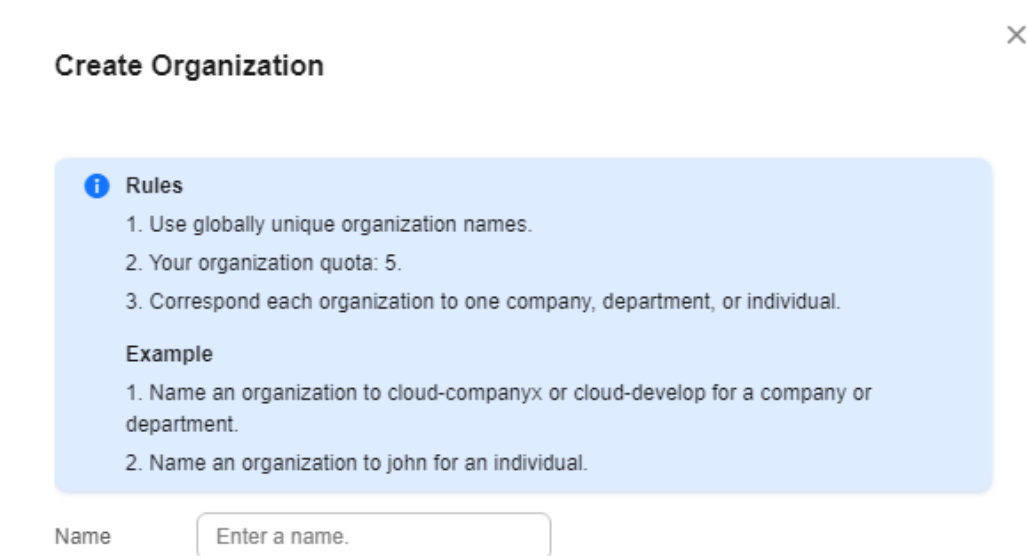

An organization is used to isolate images and grant access permissions (read, edit, and manage) to different IAM users under an account.

Step 1 Log in to the SWR console.

Step 2 In the navigation pane, choose **Organizations**. Click **Create Organization** in the upper right corner.

Step 3 Enter an organization name and click **OK**.

Figure 1-2 Creating an organization

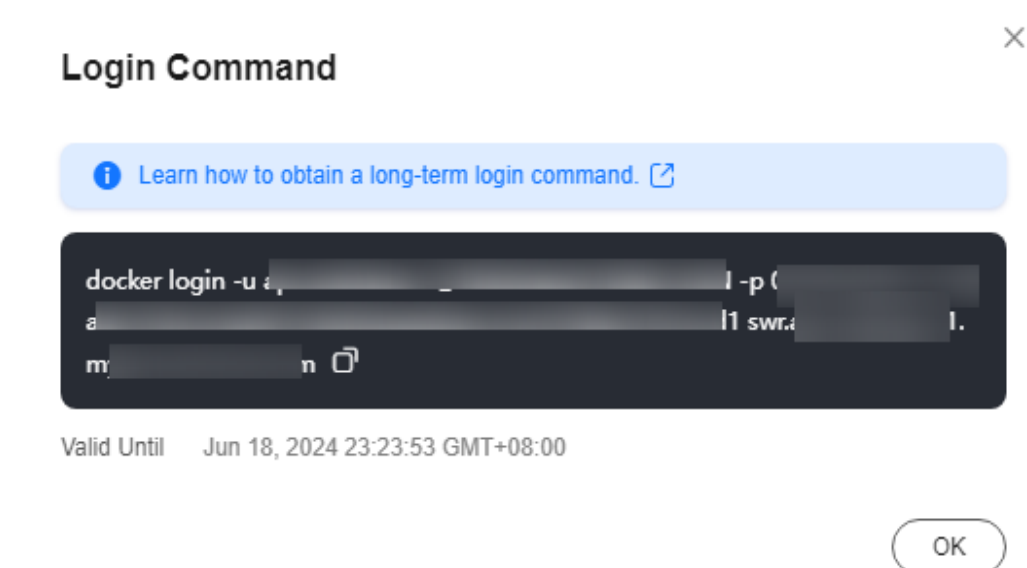

----End

Step 4: Connect to SWR

Step 1 Log in to the SWR console.

Step 2 In the navigation pane, choose **Dashboard**. Click **Generate Login Command** in the upper right corner. Then, click  to copy the login command.

Figure 1-3 Generating a login command

NOTE

The login command is only valid for 6 hours after it is generated. To obtain a long-term login command, see [Obtaining a Long-Term Login Command](#).

Step 3 Run the login command on the ECS where the container engine is installed.

The message **Login Succeeded** will be displayed upon a successful login.

----End

Step 5: Push the Image

Step 1 On the ECS where the container engine is installed, run the following command to tag the **2048** image:

```
docker tag [Image name 1:tag 1] [Image registry address]/[Organization name]/  
[Image name 2:tag 2]
```

In the preceding command:

- *[Image name 1:tag 1]*: name and tag of the image.
- *[Image registry address]*: The domain name at the end of the login command in [Step 4: Connect to SWR](#) is the image registry address.
- *[Organization name]*: name of the organization created in [Step 3: Create an Organization](#).
- *[Image name 2:tag 2]*: new image name and tag.

Example:

```
docker tag 2048:latest swr.ap-southeast-1.myhuaweicloud.com/cloud-  
develop/2048:v1
```

Step 2 Push the image to the SWR repository.

```
docker push [Image registry address]/[Organization name]/[Image name 2:tag 2]
```

Example:

```
docker push swr.ap-southeast-1.myhuaweicloud.com/cloud-develop/2048:v1
```

The following information will be returned upon a successful push:

```
The push refers to repository [swr.ap-southeast-1.myhuaweicloud.com/cloud-develop/2048]  
fbce26647e70: Pushed  
fb04ab8effa8: Pushed  
8f736d52032f: Pushed  
009f1d338b57: Pushed  
678bbd796838: Pushed  
d1279c519351: Pushed  
f68ef921efae: Pushed  
v1: digest: sha256:0cdfc7910db531bfa7726de4c19ec556bc9190aad9bd3de93787e8bce3385f8d size: 1780
```

To view the pushed image, go to the SWR console and refresh the **My Images** page.

Step 3 Use the pushed image to [deploy a workload in CCE](#).

----End

2 Pulling an Image to Deploy an Application in a CCE Cluster

You can use an image to quickly deploy a single-pod workload that can be accessed over the Internet. This section describes how to use an image to quickly deploy Nginx in a CCE cluster.

Prerequisites

You have a CCE cluster that contains at least one node with 4 vCPUs and 8 GiB memory. The node is bound with an EIP.

Deploying an Application

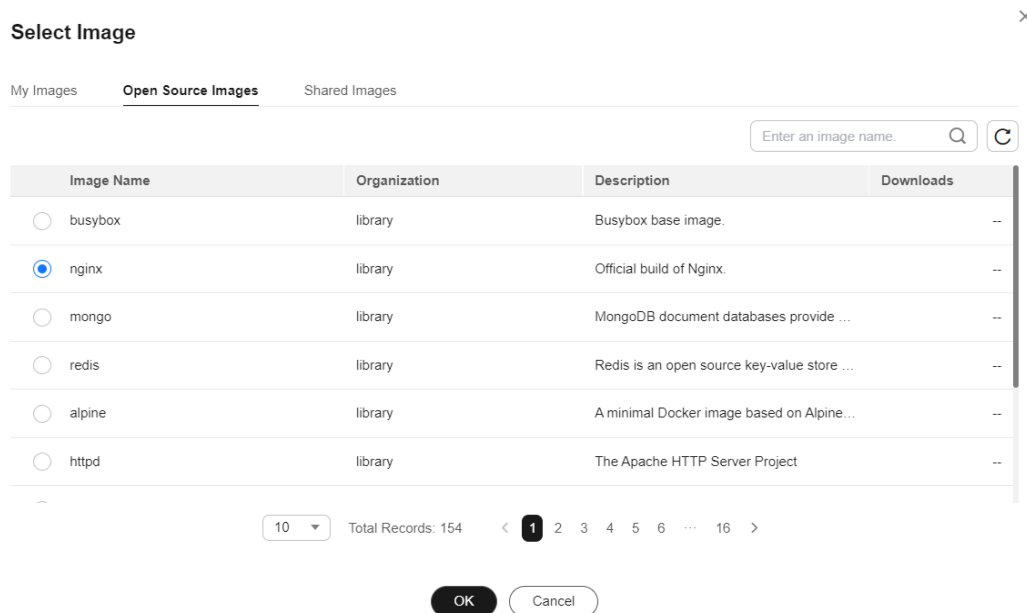

- Step 1** Log in to the [CCE console](#).
- Step 2** Click the name of the target cluster to access the cluster console.
- Step 3** In the navigation pane, choose **Workloads**. In the right pane, click **Create Workload** in the upper right corner.
- Step 4** Configure the following parameters and keep the default values for other parameters:

Basic Info

- **Workload Type:** Select **Deployment**.
- **Workload Name:** Set it to **nginx**.
- **Namespace:** Select **default**.
- **Pods:** Set the quantity of pods to **1**.

Container Settings

In the **Container Information** area, click **Basic Info** and click **Select Image**. In the dialog box displayed, click the **Open Source Images** tab, search for **nginx**, and select the **nginx** image.

Figure 2-1 Selecting the nginx image

Service Settings

Click the plus sign (+) and create a Service for accessing the workload from the external networks. This example shows how to create a LoadBalancer Service. You can configure the following parameters in the window that slides out from the right:

- **Service Name:** Enter **nginx**. The name of the Service is exposed to external networks.
- **Service Type:** Select **LoadBalancer**.
- **Service Affinity:** Retain the default value.
- **Load Balancer:** If a load balancer is available, select an existing load balancer. If not, select **Auto create** to create one.
- **Ports:**
 - **Protocol:** Select **TCP**.
 - **Service Port:** In this example, set this parameter to **8080**. Load balancer will use this port to create a listener and provide an entry for external traffic.
 - **Container Port:** listening port of the application. In this example, this parameter is set to **80**. If another application is used, the container port must be the same as the listening port provided by the application.

Figure 2-2 Creating a Service

Create Service

Service Name

nginx

Service Type

ClusterIP

Expose services through the internal IP of the cluster, which can only be accessed within the cluster

NodePort

Expose services via IP and static port (NodePort) on each node

LoadBalancer

Provide external services through ELB load balancing, high availability, ultra-high performance, stability and security

DNAT

Expose cluster node access type services through NAT gateway, support multiple nodes to share and use elastic IP

It is recommended to select the load balancing access type for out-of-cluster access

Service Affinity

Cluster-level

Node-level

Load Balancer

Dedicat...

Network (TCP/UDP/TLS)

Use exi...

cce-lb-39e16ae9-822b-4e...

Create Load Balancer

Supports only dedicated load balancers of Network type in VPC vpc-wwx610697 where the cluster resides. Constraints

Set ELB: Load balancing algorithm: Weighted round robin; Sticky session: Disable; Edit

☐ I have read Notes on Using Load Balancers.

Health Check

3 Artifact Center

SWR Artifact Center provides container developers with basic container artifacts (also called images) that are from open source communities, including OS artifacts, language artifacts, AI/big data artifacts. These artifacts support multiple system architectures, making the containerization process more convenient, efficient, secure, and reliable. Artifact repositories can be accessed through the public network.

Artifact Highlights

Ease of use

Based on SWR Shared Edition, Artifact Center allows users to host and distribute cloud native artifacts that comply with OCI standards, such as container images and Helm charts. Artifacts can be distributed to thousands of nodes, so that a good user experience can be ensured while a large number of artifacts are pulled. If your service images are also stored in SWR Shared Edition, you can download the images.

Maintenance

- For container artifacts from Huawei Cloud, Huawei Cloud provides version updates and security fixes.
- For container artifacts from the OpenContainerHub community, the OpenContainerHub community provides version updates and security fixes. You can consult the OpenContainerHub community if there are any issues.
- For container artifacts from the Ascend community, the Ascend community provides version updates and security fixes. You can consult the Ascend community if there are any issues.

Artifact Lists

The supported artifacts are listed by category.
