
Step 8 Wait for 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check whether the disk space is insufficient.

Step 9 On FusionInsight Manager, check whether the alarm list contains "ALM-12017 Insufficient Disk Capacity".

- If yes, go to **Step 10**.
- If no, go to **Step 13**.

Step 10 Rectify the fault by following the steps provided in "ALM-12017 Insufficient Disk Capacity".

Step 11 Wait 5 minutes and check whether the "ALM-12017 Insufficient Disk Capacity" alarm is cleared.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Wait for 5 minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 14 Based on the service name obtained in **Step 1**, select the corresponding component and **NodeAgent** in the service list, and click **OK**.

Step 15 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.6 ALM-12010 Manager Heartbeat Interruption Between the Active and Standby Nodes

Alarm Description

This alarm is generated when the active Mager does not receive the heartbeat signal from the standby Manager within 7 seconds.

This alarm is cleared when the active Manager receives heartbeat signals from the standby Manager.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12010	Major	Heartbeat	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Local Manager HA Name	Specifies a local Manager HA.

Type	Parameter	Description
	Peer Manager HA Name	Specifies a peer Manager HA.

Impact on the System

When the active Manager process is abnormal, the active/standby switchover cannot be performed, affecting basic O&M functions.

Possible Causes

- The link between the active and standby Manager is abnormal.
- The node name configuration is incorrect.
- The port is disabled by the firewall.

Handling Procedure

Check whether the network between the active and standby Manager server is normal.

Step 1 In the FusionInsight Manager portal, click **O&M > Alarm > Alarms**, click ⌄ in the row containing the alarm and view the IP address of the standby Manager (Peer Manager) server in the alarm details.

Step 2 Log in to the active Manager server as user **root**.

Step 3 Run the **ping** *standby Manager heartbeat IP address* command to check whether the standby Manager server is reachable.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Step 6 Run the following command to go to the software installation directory:

cd /opt

Step 7 Run the following command to find the configuration file directory of the active and standby nodes.

find -name hacom_local.xml

Step 8 Run the following command to go to the **workspace** directory:

cd${BIGDATA_HOME}/om-server/OMS/workspace0/ha/local/hacom/conf/

Step 9 Run the **vim** command to open the **hacom_local.xml** file. Check whether the local and peer nodes are correctly configured. The local node is configured as the active node, and the peer node is configured as the standby node.

- If yes, go to **Step 12**.
- If no, go to **Step 10**.

Step 10 Modify the configuration of the active and standby nodes in the **hacom_local.xml** file and press **Esc** to return to the command mode. Run the **:wq** command to save the modification and exit.

Step 11 Check whether the alarm is cleared automatically.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check whether the port is disabled by the firewall.

Step 12 Run the **lsof -i :20012** command to check whether the heartbeat ports of the active and standby nodes are enabled. If the command output is displayed, the ports are enabled. Otherwise, the ports are disabled by the firewall.

- If yes, go to **Step 13**.
- If no, go to **Step 16**.

Step 13 Run the **iptables -P INPUT ACCEPT** command to avoid the server disconnection.

Step 14 Run the following command to clear the firewall:

iptables -F

Step 15 Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 16**.

Collect fault information.

Step 16 On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 17 Select the following nodes from the **Service** and click **OK**:

- OmmServer
- Controller
- NodeAgent

Step 18 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.7 ALM-12011 Manager Data Synchronization Exception Between the Active and Standby Nodes

Alarm Description

The system checks data synchronization between the active and standby Manager nodes every 60 seconds. This alarm is generated when the standby Manager fails to synchronize files with the active Manager.

This alarm is cleared when the standby Manager synchronizes files with the active Manager.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12011	Critical	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Local Manager HA Name	Specifies a local Manager HA.
	Peer Manager HA Name	Specifies a peer Manager HA.

Impact on the System

The configuration file of the standby Manager is not updated. When an active/standby switchover occurs, the configuration file that fails to be synchronized may be lost. Manager and some components may not run properly.

Possible Causes

- The link between the active and standby Managers is interrupted or The storage space of the **/srv/BigData/LocalBackup** directory is full.
- The synchronization file does not exist or the file permission is incorrect.

Handling Procedure

Check whether the network between the active Manager server and the standby Manager server is normal.

Step 1 In the FusionInsight Manager portal, click **O&M > Alarm > Alarms**, click ⌄ in the row where the alarm is located and obtain the standby Manager server IP address (Peer Manager IP address) in the alarm details.

Step 2 Log in to the active Manager server as user **root**.

Step 3 Run the **ping** *standby Manager IP address* command to check whether the standby Manager server is reachable.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the storage space of the /srv/BigData/LocalBackup directory is full.

Step 6 Run the following command to check whether the storage space of the **/srv/BigData/LocalBackup** directory is full:

df -hl /srv/BigData/LocalBackup

- If yes, go to **Step 7**.
- If no, go to **Step 10**.

Step 7 Run the following command to clear unnecessary backup files:

rm -rf *Directory to be cleared*

Example:

rm -rf /srv/BigData/LocalBackup/0/default-oms_20191211143443

Step 8 On FusionInsight Manager, choose **O&M** > **Backup and Restoration** > **Backup Management**.

In the **Operation** column of the backup task to be performed, click **Configure** and change the value of **Maximum Number of Backup Copies** to reduce the number of backup file sets.

Step 9 Wait about 1 minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the synchronization file exists and whether the file permission is normal.

Step 10 Run the following command to check whether the synchronization file exists.

find /srv/BigData/ -name "sed*"

find /opt -name "sed*"

- If yes, go to **Step 11**.
- If no, go to **Step 12**.

Step 11 Run the following command to view the synchronization file information and permission obtained in **Step 10**.

ll *path of the file to be found*

- If the size of the file is 0 and the permission column is **-**, the file is a junk file. Run the following command to delete it.

  rm -rf *files to be deleted*

  Wait for several minutes and check whether the alarm is cleared. If the alarm persists, go to **Step 12**.
- If the file size is not 0, go to **Step 12**.

Step 12 View the log files generated when the alarm is generated.

1. Run the following command to switch to the HA run log file path.

   cd /var/log/Bigdata/omm/oms/ha/runlog/

2. Decompress and view the log files generated when the alarm is generated.

   For example, if the name of the file to be viewed is **ha.log.2021-03-22_12-00-07.gz**, run the following command:

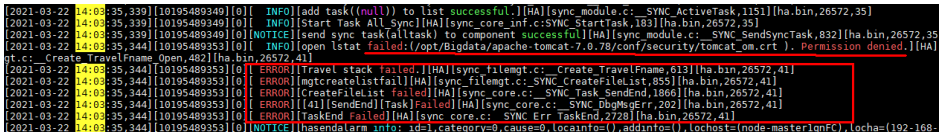
   gunzip *ha.log.2021-03-22_12-00-07.gz*

   vi *ha.log.2021-03-22_12-00-07*

   Check whether error information is reported before and after the alarm generation time.

   – If yes, rectify the fault based on the error information. Then go to **Step 13**.

   For example, if the following error information is displayed, the directory permission is insufficient. In this case, change the directory permission to be the same as that on the normal node.



- If no, go to **Step 14**.

Step 13 Wait about 10 minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Collect fault information.

Step 14 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 15 Select the following nodes from the **Service** and click **OK**:

- OmmServer
- Controller
- NodeAgent

Step 16 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 17 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.8 ALM-12014 Device Partition Lost

Alarm Description

This alarm is generated when the system detects that a partition to which service directories are mounted is lost (because the device is removed or offline, or the partition is deleted). The system checks the partition status every 60 seconds.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12014	Major	Physical resource	FusionInsight Manager	Yes (Versions earlier than MRS 3.3.0 do not support automatic clearance.)

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
	MountDirectoryName	Specifies the directory for which the alarm was generated.
	PartitionName	Specifies the device partition for which the alarm was generated.
Additional Information	Details	Specifies alarm details.
	Disk ESN	Specifies the serial number of the disk in the device partition for which the alarm was generated.

Impact on the System

- Data loss: The device partition is lost and the data stored in the partition is lost.
- System breakdown: If the system disk is lost, the system deployed on the node cannot run properly. In some cases, the system may break down and cannot be started.
- Service failure: Read and write jobs on the lost device partition fail to run or run slowly.
- Service interruption: Customers may need time to restore data and systems, and services cannot be provided.
- Security risk: Important data may be stolen or disclosed, which severely affects customer services.

Possible Causes

- The disk is removed.
- The disk is offline, or a bad sector exists on the disk.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and click ⌄ in the row that contains the alarm.

Step 2 Obtain the **HostName**, **PartitionName**, and **DirName** from the **Location** area.

Step 3 Check whether the disk of **PartitionName** on **HostName** is inserted to the correct server slot.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Contact hardware engineers to remove the faulty disk.

Step 5 Log in to the host for which the alarm is generated as user **root** and check whether the **/etc/fstab** file has a row containing the directory name.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Run the **vi /etc/fstab** command to edit the file and delete the line containing the mounting directory name.

Step 7 Contact hardware engineers to insert a new disk. For details, see the hardware product document of the relevant model. If the faulty disk is in a RAID group, configure the RAID group. For details, see the configuration methods of the relevant RAID controller card.

Step 8 Wait 20 to 30 minutes (The disk size determines the waiting time), and run the **mount** command to check whether the disk has been mounted to the specified directory.

- If yes, perform **Step 9** for MRS 3.3.0 or later. For versions earlier than MRS 3.3.0, clear the alarm. No further action is required.
- If no, go to **Step 10**.

Step 9 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, select **OmmServer** for the target cluster, and click **OK**.

Step 12 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

MRS 3.3.0 and later patch versions: After the fault is rectified, the system automatically clears the alarm.

MRS 3.3.0 and earlier versions: After the fault is rectified, the system does not automatically clear the alarm. You need to clear the alarm.

Related Information

None.

11.9 ALM-12015 Partition Filesystem Readonly

Alarm Description

The system checks the partition status every 60 seconds. This alarm is generated when the system detects that a partition to which service directories are mounted enters the read-only mode (due to a bad sector or a faulty file system). The system checks the partition status periodically.

This alarm is cleared when the system detects that the partition to which service directories are mounted exits from the read-only mode (because the file system is restored to read/write mode, the device is removed, or the device is formatted).

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12015	Major	Physical resource	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	DirName	Specifies the directory for which the alarm is generated.
	PartitionName	Specifies the device partition for which the alarm is generated.
Additional Information	Detail	Specifies the details for which the alarm is generated.

Type	Parameter	Description
	Disk serial number	Specifies the serial number of the disk of the device partition for which the alarm is generated.

Impact on the System

- Service failure: If a job needs to modify the data on the read-only device partition, the job may fail to run.
- Latency: If some components need to synchronize data to the read-only device partition, data synchronization may fail or time out, causing service delay.

Possible Causes

The hard disk is faulty, for example, a bad sector exists.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm > Alarms**, click ⌄ in the row where the alarm is located.

Step 2 Obtain **HostName** and **PartitionName** from **Location**. **HostName** is the node where the alarm is reported, and **PartitionName** is the partition of the faulty disk.

Step 3 Contact hardware engineers to check whether the disk is faulty. If the disk is faulty, remove it from the server.

Step 4 After the disk is removed, alarm **ALM-12014 Partition Lost** is reported. Handle the alarm. For details, see **ALM-12014 Device Partition Lost**. After the alarm **ALM-12014 Partition Lost** is cleared, alarm **ALM-12015 Partition Filesystem Readonly** is automatically cleared.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.10 ALM-12016 CPU Usage Exceeds the Threshold

Alarm Description

The system checks the CPU usage every 30 seconds and compares the actual CPU usage with the threshold. The CPU usage has a default threshold. This alarm is

generated when the CPU usage exceeds the threshold for several times (configurable, 10 times by default) consecutively.

The alarm is cleared in the following two scenarios: The value of **Trigger Count** is 1 and the CPU usage is smaller than or equal to the threshold; the value of **Trigger Count** is greater than 1 and the CPU usage is smaller than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12016	Major	Physical resource	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the triggering condition for which the alarm is generated.

Impact on the System

- Latency: If the CPU usage of a host is too high, service processes may run slowly and services may be delayed.
- Service failure: If the host CPU usage is too high, service processing may slow down, time out, or fail. As a result, jobs may fail to run.

Possible Causes

- The alarm threshold or alarm smoothing times are incorrect.
- The CPU configuration cannot meet service requirements, and the CPU usage reaches the upper limit. Or the service is in peak hours. As a result, the CPU usage reaches the upper limit in a short period of time.

Handling Procedure

Check whether the alarm threshold or alarm Trigger Count are correct.

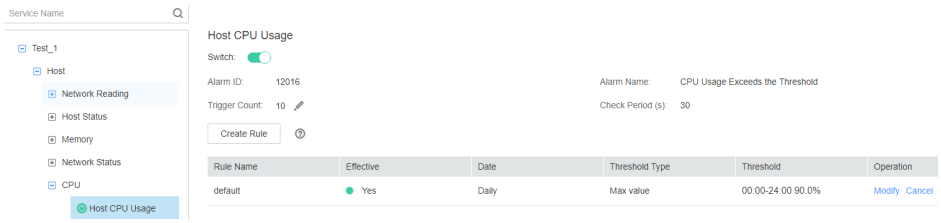
Step 1 Change the alarm threshold and alarm **Trigger Count** based on CPU usage.

On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **CPU** > **Host CPU Usage** and change the alarm smoothing times based on CPU usage, as shown in **Figure 11-1**.

NOTE

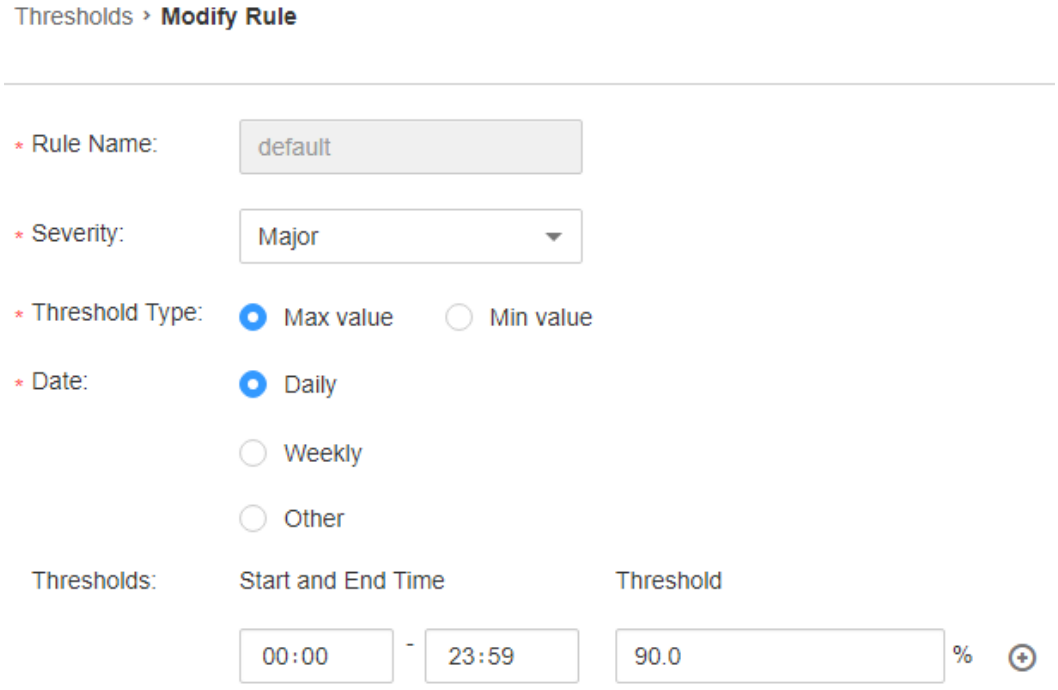
This option defines the alarm check phase. **Trigger Count** indicates the alarm check threshold. An alarm is generated when the number of check times exceeds the threshold.

Figure 11-1 Setting alarm smoothing times



On **Host CPU Usage** page and click **Modify** in the **Operation** column to change the alarm threshold, as shown in **Figure 11-2**.

Figure 11-2 Setting an alarm threshold



Step 2 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check whether the CPU usage reaches the upper limit.

Step 3 In the alarm list on FusionInsight Manager, click ⌄ in the row where the alarm is located to view the alarm host address in the alarm details.

Step 4 On the **Hosts** page, click the node on which the alarm is reported.

Step 5 View the CPU usage for 5 minutes. If the CPU usage exceeds the threshold for multiple times, contact the system administrator to add more CPUs.

Step 6 Check whether the current traffic is in peak hours. If the alarm is generated during peak hours, you are advised to expand the capacity of the node or contact the system administrator to add more CPUs.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager in the active cluster, choose **O&M** > **Log** > **Download**.

Step 9 Select **OmmServer** from the **Service** and click **OK**.

Step 10 Set **Start Date** for log collection to 10 minutes ahead of the alarm generation time and **End Date** to 10 minutes behind the alarm generation time in **Time Range** and click **Download**.

Step 11 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.11 ALM-12017 Insufficient Disk Capacity

Alarm Description

The system checks the host disk usage of the system every 30 seconds and compares the actual disk usage with the threshold. The disk usage has a default threshold, this alarm is generated when the host disk usage exceeds the specified threshold.

When the **Trigger Count** is 1, this alarm is cleared when the usage of a host disk partition is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the usage of a host disk partition is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12017	Critical (default threshold: 95%) Major (default threshold: 85%)	Physical resource	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	PartitionName	Specifies the device partition for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the triggering condition for which the alarm is generated.

Impact on the System

Service failure: If you need to modify or use data on the disk when the disk capacity is insufficient, the job may fail.

Possible Causes

- The alarm threshold is incorrect.
- Disk configuration of the server cannot meet service requirements.

Handling Procedure

Check whether the alarm threshold is appropriate.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Disk** > **Disk Usage** and check whether the threshold (configurable, 90% by default) is appropriate.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Disk** > **Disk Usage** and click **Modify** in the **Operation** column to change the alarm threshold based on site requirements.

Step 3 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the disk usage reaches the upper limit.

Step 4 In the alarm list on FusionInsight Manager, click ⌄ in the row where the alarm is located to view the alarm host name and disk partition information in the alarm details.

Step 5 Log in to the node where the alarm is generated as user **root**.

Step 6 Run the **df -lmPT | awk '$2 != "iso9660"' | grep '^/dev/' | awk '{"readlink -m "$1 | getline real }{$1=real; print $0}' | sort -u -k 1,1** command to check the system disk partition usage. Check whether the disk is mounted to the following directories based on the disk partition name obtained in **Step 4**: **/**, **/opt**, **/tmp**, **/var**, **/var/log**, and **/srv/BigData**(can be customized).

- If yes, the disk is a system disk. Then go to **Step 10**.
- If no, the disk is not a system disk. Then go to **Step 7**.

Step 7 Run the **df -lmPT | awk '$2 != "iso9660"' | grep '^/dev/' | awk '{"readlink -m "$1 | getline real }{$1=real; print $0}' | sort -u -k 1,1** command to check the system disk partition usage. Determine the role of the disk based on the disk partition name obtained in **Step 4**.

Step 8 Check the disk service.

In MRS, check whether the disk service is HDFS, Yarn, Kafka, Supervisor.

- If yes, adjust the capacity. Then go to **Step 9**.
- If no, go to **Step 12**.

Step 9 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Step 10 Run the **find / -xdev -size +500M -execls -l {} \;** command to check whether a file larger than 500 MB exists on the node and disk.

- If yes, go to **Step 11**.
- If no, go to **Step 12**.

Step 11 Handle the large file and check whether the alarm is cleared 2 minutes later.

- If yes, no further action is required.
- If no, go to **Step 12**.

Step 12 Contact the system administrator to expand the disk capacity.

Step 13 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Collect fault information.

Step 14 On FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 15 Select **OMS** from the **Service** and click **OK**.

Step 16 Click the edit button in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 17 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.12 ALM-12018 Memory Usage Exceeds the Threshold

Alarm Description

The system checks the memory usage of the system every 30 seconds and compares the actual memory usage with the threshold. The memory usage has a default threshold, this alarm is generated when the value of the memory usage exceeds the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the host memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the host memory usage is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12018	Critical (default threshold: 95%) Major (default threshold: 90%)	Physical resource	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the triggering condition for which the alarm is generated.

Impact on the System

- Latency: If the host memory usage is too high, service processes may run slowly and services may be delayed.
- Service failure: If the host memory usage is too high, memory overflow may occur in service processes and jobs may fail.

Possible Causes

Memory configuration cannot meet service requirements. The memory usage reaches the upper limit.

Handling Procedure

Expand the system.

Step 1 In the alarm list on FusionInsight Manager, click ⌄ in the row where the alarm is located to view the alarm host address in the alarm details.

Step 2 Log in to the host where the alarm is generated as user **root**.

Step 3 If the memory usage exceeds the threshold, perform memory capacity expansion.

Step 4 Run the command **free -m | grep Mem\: | awk '{printf("%s,", $3 * 100 / $2)}'** to check the system memory usage.

Step 5 Wait for 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager in the active cluster, choose **O&M** > **Log** > **Download**.

Step 7 Select **OmmServer** from the **Service** and click **OK**.

Step 8 Click the edit button in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.13 ALM-12027 Host PID Usage Exceeds the Threshold

Alarm Description

The system checks the PID usage every 30 seconds and compares the actual PID usage with the default PID usage threshold. This alarm is generated when the system detects that the PID usage exceeds the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the PID usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the PID usage is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12027	Critical (default threshold: 95%) Major (default threshold: 90%)	Environment	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the triggering condition for which the alarm is generated.

Impact on the System

Service failure: If the PID usage of the host is too high, PIDs cannot be allocated to new service processes. As a result, jobs may fail to be executed.

Possible Causes

Too many processes are running on the node. You need to increase the value of **pid_max**.

Handling Procedure

Increase the value of pid_max.

Step 1 In the alarm list on FusionInsight Manager, click ⌄ in the row where the alarm is located to view the alarm host address in the alarm details.

Step 2 Log in to the host where the alarm is generated as user **root**.

Step 3 Run the **cat /proc/sys/kernel/pid_max**command to check the value of **pid_max**.

Step 4 If the PID usage exceeds the threshold, run the command **echo** *new value* **> /proc/sys/kernel/pid_max** to enlarge the value of **pid_max**.

Example: **echo 65536 > /proc/sys/kernel/pid_max**

NOTE

The maximum value of **pid_max** is as follows:

- On 32-bit systems: 32768
- On 64-bit systems: 4194304 (2^22)

Step 5 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log > Download**.

Step 7 Select all services from the **Service** and click **OK**.

Step 8 Click the edit button in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.14 ALM-12028 Number of Processes in the D State on a Host Exceeds the Threshold

Alarm Description

The system checks the number of processes in the D state of user **omm** on the host every 30 seconds and compares the actual number with the threshold. The number of processes in the D state on the host has a default threshold range. This alarm is generated when the number of processes exceeds the threshold.

This alarm is cleared when the **Trigger Count** is **1** and the total number of processes in the D state of user **omm** on the host does not exceed the threshold. This alarm is cleared when the **Trigger Count** is greater than **1** and the total number of processes in the D state of user **omm** on the host is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12028	Major	Environment	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger condition	Specifies the alarm triggering condition.

Impact on the System

- Latency: New service processes cannot be created. Concurrent task processing may be slow and services may be delayed.
- Service failure: New service processes cannot be created, which may cause job failures.

Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state.

Handling Procedure

Check the processes in the D state.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the IP address of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**. () Then run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command as user **omm** to view the PID of the process that is in the D state:

ps -elf | grep -v "\[thread_checkio\]" | awk 'NR!=1 {print $2, $3, $4}' | grep omm | awk -F' ' '{print $1, $3}' | grep -E "Z|D" | awk '{print $2}'

Step 4 Check whether the command output is empty.

- If yes, the service process is running properly. Then go to **Step 6**.
- If no, go to **Step 5**.

Step 5 Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)

Step 6 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Select **OMS** for **Service** and click **OK**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.15 ALM-12033 Slow Disk Fault

Alarm Description

- For HDDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency reaches 1000 ms within 30 seconds in at least seven collection periods.
  - By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 150 ms within 300 seconds.
- For SSDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency reaches 1000 ms within 30 seconds in at least seven collection periods.
  - By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 20 ms within 300 seconds.

The collection period is 3 seconds, and the detection period is 30 or 300 seconds. This alarm is automatically cleared when none of the preceding conditions are met for three consecutive detection periods (30 or 300 seconds).

NOTE

The **svctm** value can be obtained as follows:

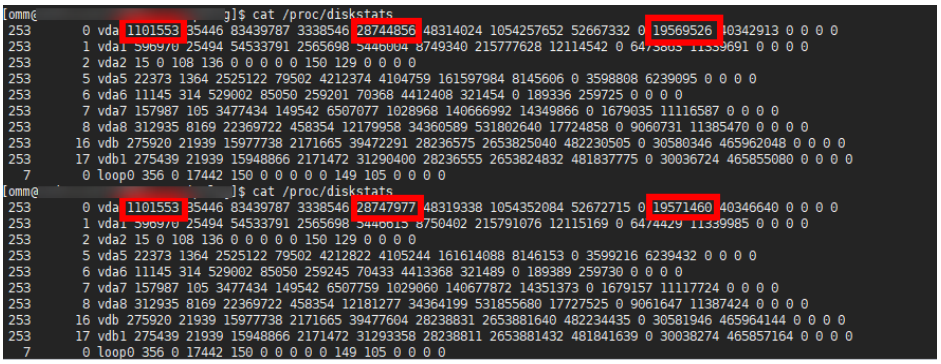
svctm = (tot_ticks_new - tot_ticks_old) / (rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old)

When the detection period is 30 seconds, if **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0**, then **svctm = 0**.

When the detection period is 300 seconds and **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0**, if **tot_ticks_new - tot_ticks_old = 0**, then **svctm = 0**; otherwise, the value of **svctm** is infinite.

The parameters can be obtained as follows:

The system runs the **cat /proc/diskstats** command every 3 seconds to collect data.



In the data collected for the first time, the number in the fourth column is the **rd_ios_old** value, the number in the eighth column is the **wr_ios_old** value, and the number in the thirteenth column is the **tot_ticks_old** value.

In the data collected for the second time, the number in the fourth column is the **rd_ios_new** value, the number in the eighth column is the **wr_ios_new** value, and the number in the thirteenth column is the **tot_ticks_new** value.

In this case, the value of **svctm** is as follows:

(19571460 - 19569526) / (1101553 + 28747977 - 1101553 - 28744856) = 0.6197

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12033	Minor	Physical resource	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
	DiskName	Specifies the disk for which the alarm was generated.
Additional Information	Disk ESN	Specified the serial number of the disk for which the alarm was generated.

Impact on the System

- The system I/O performance deteriorates, which means slow response and low throughput. For example, job submission is slow, page responds slowly, interface response times out, and the system is in error or even crash.
- System fault: Customer services may be interrupted. The system may break down and the key information stored on the faulty disk may be lost.

Possible Causes

The disk is aged or has bad sectors.

Handling Procedure

Check the disk status.

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**.

Step 2 View the detailed information about the alarm. Check the values of **HostName** and **DiskName** in the location information to obtain the information about the faulty disk for which the alarm is generated.

Step 3 Check whether the node for which the alarm is generated is in a virtualization environment.

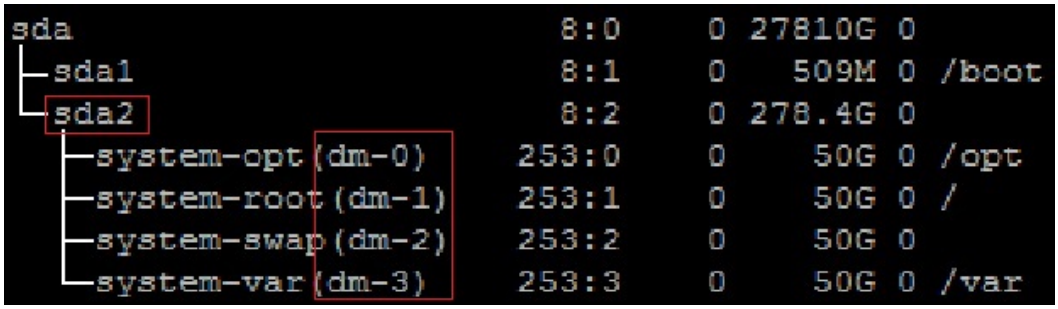
- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 Check whether the storage performance provided by the virtualization environment meets the hardware requirements. Then, go to **Step 5**.

Step 5 Log in to the alarm node as user **root**, run the **df -h** command, and check whether the command output contains the value of the **DiskName** field.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

Step 6 Run the **lsblk** command to check whether the mapping between the value of **DiskName** and the disk has been created.



- If yes, go to **Step 7**. .
- If no, go to **Step 25**.

Step 7 Log in to the alarm node as user **root**, run the **lsscsi | grep "/dev/sd[x]"** command to view the disk information, and check whether RAID has been set up.

NOTE

In the command, **/dev/sd[x]** indicates the disk name obtained in **Step 2**.

Example:

lsscsi | grep "/dev/sda"

In the command output, if **ATA**, **SATA**, or **SAS** is displayed in the third line, the disk has not been organized into a RAID group. If other information is displayed, RAID has been set up.

- If yes, go to **Step 12**.
- If no, go to **Step 8**.

Step 8 Run the **smartctl -i /dev/sd[x]** command to check whether the hardware supports the SMART tool.

Example:

smartctl -i /dev/sda

In the command output, if "SMART support is: Enabled" is displayed, the hardware supports SMART. If "Device does not support SMART" or other information is displayed, the hardware does not support SMART.

- If yes, go to **Step 9**.
- If no, go to **Step 16**.

Step 9 Run the **smartctl -H --all /dev/sd[x]** command to check basic SMART information and determine whether the disk is working properly.

Example:

smartctl -H --all /dev/sda

Check the value of **SMART overall-health self-assessment test result** in the command output. If the value is **FAILED**, the disk is faulty and needs to be replaced. If the value is **PASSED**, check the value of **Reallocated_Sector_Ct** or **Elements in grown defect list**. If the value is greater than 100, the disk is faulty and needs to be replaced.

- If yes, go to **Step 10**.
- If no, go to **Step 18**.

Step 10 Run the **smartctl -l error -H /dev/sd[x]** command to check the Glist of the disk and determine whether the disk is normal.

Example:

smartctl -l error -H /dev/sda

Check the **Command/Feature_name** column in the command output. If **READ SECTOR(S)** or **WRITE SECTOR(S)** is displayed, the disk has bad sectors. If other errors occur, the disk circuit board is faulty. Both errors indicate that the disk is abnormal and needs to be replaced.

If "No Errors Logged" is displayed, no error log exists. You can perform step 9 to trigger the disk SMART self-check.

- If yes, go to **Step 11**.
- If no, go to **Step 18**.

Step 11 Run the **smartctl -t long /dev/sd[x]** command to trigger the disk SMART self-check. After the command is executed, the time when the self-check is to be completed is displayed. After the self-check is completed, repeat **Step 9** and **Step 10** to check whether the disk is working properly.

Example:

smartctl -t long /dev/sda

- If yes, go to **Step 17**.
- If no, go to **Step 18**.

Step 12 Run the **smartctl -d [sat|scsi]+megaraid,[DID] -H --all /dev/sd[x]** command to check whether the hardware supports SMART.

NOTE

- In the command, **[sat|scsi]** indicates the disk type. Both types need to be used.
- **[DID]** indicates the slot information. Slots 0 to 15 need to be used.

For example, run the following commands in sequence:

smartctl -d sat+megaraid,0 -H --all /dev/sda

smartctl -d sat+megaraid,1 -H --all /dev/sda

smartctl -d sat+megaraid,2 -H --all /dev/sda

...

Try the command combinations of different disk types and slot information. If "SMART support is: Enabled" is displayed in the command output, the disk supports SMART. Record the parameters of the disk type and slot information when a command is successfully executed. If "SMART support is: Enabled" is not displayed in the command output, the disk does not support SMART.

- If yes, go to **Step 13**.
- If no, go to **Step 16**.

Step 13 Run the **smartctl -d [sat|scsi]+megaraid,[DID] -H --all /dev/sd[x]** command recorded in **Step 12** to check basic SMART information and determine whether the disk is normal.

Example:

smartctl -d sat+megaraid,2 -H --all /dev/sda

Check the value of **SMART overall-health self-assessment test result** in the command output. If the value is **FAILED**, the disk is faulty and needs to be replaced. If the value is **PASSED**, check the value of **Reallocated_Sector_Ct** or **Elements in grown defect list**. If the value is greater than 100, the disk is faulty and needs to be replaced.

- If yes, go to **Step 14**.
- If no, go to **Step 18**.

Step 14 Run the **smartctl -d [sat|scsi]+megaraid,[DID] -l error -H /dev/sd[x]** command to check the Glist of the disk and determine whether the hard disk is working properly.

Example:

smartctl -d sat+megaraid,2 -l error -H /dev/sda

Check the **Command/Feature_name** column in the command output. If **READ SECTOR(S)** or **WRITE SECTOR(S)** is displayed, the disk has bad sectors. If other errors occur, the disk circuit board is faulty. Both errors indicate that the disk is abnormal and needs to be replaced.

If "No Errors Logged" is displayed, no error log exists. You can trigger the disk SMART self-check.

- If yes, go to **Step 15**.
- If no, go to **Step 18**.

Step 15 Run the **smartctl -d [sat|scsi]+megaraid,[DID] -t long /dev/sd[x]** command to trigger the disk SMART self-check. After the command is executed, the time when the self-check is to be completed is displayed. After the self-check is completed, repeat **Step 13** and **Step 14** to check whether the disk is working properly.

Example:

smartctl -d sat+megaraid,2 -t long /dev/sda

- If yes, go to **Step 17**.
- If no, go to **Step 18**.

Step 16 If the configured RAID controller card does not support SMART, the disk does not support SMART. In this case, use the check tool provided by the corresponding RAID controller card vendor to rectify the fault. Then go to **Step 17**.

For example, LSI is a MegaCLI tool.

Step 17 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, click **Clear** in the **Operation** column of the alarm, and check whether the alarm is reported on the same disk again.

If the alarm is reported for three times, replace the disk.

- If yes, go to **Step 18**.
- If no, no further action is required.

Replace the disk.

Step 18 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**.

Step 19 View the detailed information about the alarm. Check the values of **HostName** and **DiskName** in the location information to obtain the information about the faulty disk for which the alarm is reported.

Step 20 Check whether the host for which the alarm is generated is the active OMS node or the active node of the instance in active/standby mode.

- If yes, go to **Step 21**.
- If no, go to **Step 23**.

Step 21 Log in to the node for which the alarm is generated as the **root** user and run the following command to check the mount point of the faulty disk:

df -h | grep "*Name of the faulty disk*"

Check whether the mount point partition of the faulty disk is the cluster software installation directory (**${BIGDATA_HOME}**) or data disk directory (**${BIGDATA_DATA_HOME}** by default).

- If yes, go to **Step 22**.
- If no, go to **Step 23**.

Step 22 Trigger an active/standby switchover to rectify the fault.

- Active OMS node

  If O&M operations cannot be performed due to slow disk faults, such as system freezing, delayed page refreshing, or slow API response, and the alarm is generated for the active OMS node, perform the following operations to trigger an active/standby switchover to restore services:

  a. Log in to the active OMS node as user **omm**.

  b. Run the following command to perform an active/standby switchover:

     - For the IPv4 network: **${OMS_RUN_PATH}/workspace/ha/module/hacom/tools/ha_client_tool --ip=127.0.0.1 --port=20013 --switchover --name=product**
     - For the IPv6 network: **${OMS_RUN_PATH}/workspace/ha/module/hacom/tools/ha_client_tool --ip=::1 --port=20013 --switchover --name=product**

  c. After the active/standby switchover is successful, the system recovers. Perform **Step 23** to replace the faulty disk.

- Active node of an active/standby instance

  If the alarm is generated for the active node of an instance in active/standby mode and the slow disk fault affects the running of the instance, trigger an active/standby switchover on FusionInsight Manager to restore services.

  a. Log in to FusionInsight Manager and choose **Cluster** > **Services** > *Name of the desired service*.

b. On the service details page, expand the **More** drop-down list and select **Perform *xxx* Switchover**.

c. In the displayed dialog box, enter the password of the current login user and click **OK**.

d. In the displayed dialog box, click **OK** to perform active/standby switchover.

e. After the active/standby switchover is successful, the system recovers. Perform **Step 23** to replace the faulty disk.

Step 23 Replace the disk.

Step 24 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 25**.

Collect the fault information.

Step 25 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 26 Select **OMS** for **Service** and click **OK**.

Step 27 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 28 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.16 ALM-12034 Periodical Backup Failure

Alarm Description

The system executes the periodic backup task every 60 minutes. This alarm is generated when a periodical backup task fails to be executed. This alarm is cleared when the next backup task is executed successfully.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12034	Major	Backup status	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	TaskName	Specifies the task.
Additional Information	Detail	Specifies the details for which the alarm is generated.

Impact on the System

The periodic backup task failed, resulting in no available backup packages during the time period when the backup failed. When a system exception occurs and you need to use the backup package to restore data, no backup package is available during the failure period. As a result, data during the failure period cannot be restored.

Possible Causes

The alarm cause depends on the task details. Handle the alarm according to the logs and alarm details.

Handling Procedure

Check whether the disk space is sufficient.

Step 1 In the FusionInsight Manager portal, click **O&M > Alarm > Alarms**.

Step 2 In the alarm list, click ⌄ in the row where the alarm is located and obtain **TaskName** from **Location**.

Step 3 Log in to the active node of the cluster as the **root** user and check whether information similar to the following is recorded in backup and restoration logs in **/var/log/Bigdata/controller/backup/**.

```
Upload backup files to *** file failed, error info: ***
```

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On FusionInsight Manager, choose **O&M** > **Backup and Restoration** > **Backup Management**. Locate the backup task based on **TaskName**, click **Configure** in the **Operation** column, and check whether all configuration items are correctly configured.

- If yes, go to **Step 7**.
- If no, modify the configuration, save the modification, and go to **Step 5**.

Step 5 Choose **More** > **Back Up Now** to start the backup task and check whether the backup task is successfully executed.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Step 7 Choose **More** > **View History** in the **Operation** column. In the displayed dialog box view the task details.

Step 8 In the displayed dialog box and click ⌄ to check whether the following message is displayed: Failed to backup xx due to insufficient disk space, move the data in the xx directory to other directories.

- If yes, go to **Step 9**.
- If no, go to **Step 16**.

Step 9 Choose **Backup Path** > **View** and obtain the **Backup Path**.

Step 10 Log in to the node as user **root** and run the following command to check the node mounting details:

df -h

Step 11 Check whether the available space of the node to which the backup path is mounted is less than 20 GB.

- If yes, go to **9**.
- If no, go to **Step 16**.

Step 12 Check whether there are many backup packages in the backup directory.

- If yes, go to **Step 13**.
- If no, go to **Step 16**.

Step 13 Enable the available space of the node to which the backup directory is mounted to be greater than 20 GB by moving backup packages out of the backup directory or delete the backup packages.

Step 14 After the problem is resolved, perform the backup task again and check whether the backup task execution is successful.

- If yes, go to **Step 15**.
- If no, go to **Step 16**.

Step 15 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Collect fault information.

Step 16 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 17 Select **Controller** from the **Service** and click **OK**.

Step 18 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.17 ALM-12035 Unknown Data Status After Recovery Task Failure

Alarm Description

After the recovery task fails, the system automatically rolls back every 60 minutes. If the rollback fails, data may be lost. If this occurs, an alarm is reported. This alarm is cleared when the next recovery task execution is successful.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12035	Critical	Backup status	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifiestheclusterorsystemforwhichthealarmis-generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	TaskName	Specifies the task.

Impact on the System

After the recovery task fails, the system automatically rolls back. If the rollback fails, data may be lost or the data status may be unknown, which may affect services.

Possible Causes

The alarm cause depends on the task details. Handle the alarm according to the logs and alarm details.

Handling Procedure

Collect fault information.

Step 1 In the FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the running status of the component meets the requirements. (The OMS and DBService must be in the normal state, and other components must be stopped.)

- If yes, go to **Step 9**.
- If no, go to **Step 2**.

Step 2 Restore the component status as required and start the recovery task again.

Step 3 Log in to the FusionInsight Manager portal and click **O&M** > **Alarm** > **Alarms**.

Step 4 In the alarm list, click ⌄ in the row where the alarm is located to obtain **TaskName**from**Location**.

Step 5 Choose **O&M**>**Backup and Restoration** > **Restoration Management**.

Step 6 Find the restoration task by **Task Name** and view the task details.

Step 7 Perform the recovery task again and check whether the recovery task execution is successful.

- If yes, go to **8**.

- If no, go to **9**.

Step 8 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M**>**Log > Download**.

Step 10 Select **Controller**from the**Service** and click **OK**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.18 ALM-12038 Monitoring Indicator Dumping Failure

Alarm Description

After monitoring indicator dumping is configured on FusionInsight Manager, the system checks the monitoring indicator dumping result at the dumping interval (60 seconds by default). This alarm is generated when the dumping fails.

This alarm is cleared when dumping is successful.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12038	Major	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The upper-layer management system cannot obtain monitoring indicators from the FusionInsight Manager system.

Possible Causes

- The server cannot be connected.
- The save path on the server cannot be accessed.
- The monitoring indicator file fails to be uploaded.

Handling Procedure

Check whether the server connection is normal.

Step 1 Check whether the network between the FusionInsight Manager system and the server is normal.

- If yes, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 Contact the network administrator to recover the network and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 Choose **System** > **Interconnection** > **Upload Performance Data** and check whether the FTP username, password, port, dump mode, and public key configured on the upload performance data page are consistent with the configuration on the server.

- If yes, go to **Step 5**.
- If no, go to **Step 4**.

Step 4 Enter the correct configuration information, click **OK**, and check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 5**.

Check the permission of the save path on the server is correct.

Step 5 Choose **System** > **Interconnection > Upload Performance Data** and check the configuration items **FTP Username**, **Save Path**, and **Dump Mode**.

- If the dump mode is FTP, go to **Step 6**.
- If the dump mode is SFTP, go to **Step 7**.

Step 6 Log in to the server in FTP mode. In the default path, check whether **FTP Username** has the read and write permission of the relative path **Save Path**.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

Step 7 Log in to the server in SFTP mode and check whether **FTP Username** has the read and write permission of the absolute path **Save Path**.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

Step 8 Add the read and write permission and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check whether the save path on the server has sufficient disk space.

Step 9 Log in to the server and check whether the save path has sufficient disk space.

- If yes, go to **Step 11**.
- If no, go to **Step 10**.

Step 10 Delete unnecessary files or go to the monitoring indicator dumping configuration page to change the save path. Then, check whether the save path has sufficient disk space.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 12 Select **OMS** from the **Service** and click **OK**.

Step 13 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.19 ALM-12039 Active/Standby OMS Databases Not Synchronized

Alarm Description

The system checks the data synchronization status between the active and standby OMS Databases every 10 seconds. This alarm is generated when the synchronization status cannot be queried for 30 consecutive times or when the synchronization status is abnormal.

This alarm is cleared when the data synchronization status becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12039	Major	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Local GaussDB HA IP	Specifies the HA IP address of the local GaussDB.
	Peer GaussDB HA IP	Specifies the HA IP address of the peer GaussDB.
	SYNC_PERCENT	Specifies the synchronization percentage.

Impact on the System

If the active/standby of the OMS database is not synchronized, data in the active database cannot be synchronized to the standby database. If the active instance is abnormal during the alarm reporting period, service data may be lost or data on the FusionInsight Manager may be abnormal.

Possible Causes

- The network between the active and standby nodes is unstable.
- The standby OMS Database is abnormal.
- The standby node disk space is full.

Handling Procedure

Check whether the network between the active and standby nodes is normal.

Step 1 Log in to FusionInsight Manager, click **O&M > Alarm > Alarms**, click ⌄ in the row where the alarm is located, and query the standby OMS Database IP address.

Step 2 Log in to the active OMS Database node as user **root**.

Step 3 Run the **ping** *Standby OMS Database heartbeat IP address* command to check whether the standby OMS Database node is reachable.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the standby OMS Database is normal.

Step 6 Log in to the standby OMS Database node as user **root**.

Step 7 Run the **su - omm** command to switch to user **omm**.

Step 8 Go to the **${BIGDATA_HOME}/om-server/om/sbin/** directory and run the **./status-oms.sh** command to check whether the OMS Database resource status of the standby DBService is normal. In the command output, check whether the following information is displayed in the row where **ResName** is **gaussDB**:

For example:

```
10_10_10_231 gaussDB Standby_normal Normal Active_standby
```

- If yes, go to **Step 9**.
- If no, go to **Step 16**.

Check whether the standby node disk space is full.

Step 9 Log in to the standby OMS Database node as user **root**.

Step 10 Run the **su - omm** command to switch to user **omm**.

Step 11 Run the **echo ${BIGDATA_DATA_HOME}/dbdata_om** command to obtain the OMS Database data directory.

Step 12 Run the **df -h** command to view the system disk partition usage information.

Step 13 Check whether the disk where the OMS Database data directory is mounted is full.

- If yes, go to **Step 14**.
- If no, go to **Step 16**.

Step 14 Expand the disk capacity.

Step 15 After the disk capacity is expanded, wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Collect fault information.

Step 16 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 17 Select **OMMServer** from the **Service** and click **OK**.

Step 18 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.20 ALM-12040 Insufficient OS Entropy

Alarm Description

The system checks whether the rng-tools or haveged tool has been enabled and correctly configured every 5 minutes. If neither tool is configured, this alarm is generated. If either is configured, the system continues to check the entropy. If the entropy is less than 100 for five consecutive times, this alarm is generated.

This alarm is cleared when rng-tools or haveged has been installed and enabled on the target node and the entropy of the OS is greater than or equal to 100 in at least one of five entropy checks.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12040	Critical	Environment	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the details for which the alarm is generated.

Impact on the System

The entropy of the operating system of the node is insufficient. As a result, commands such as encryption and decryption are executed slowly on the node. As a result, the service processing performance of each instance deteriorates, and even service processes cannot be executed properly.

Possible Causes

- rng-tools or haveged has not been installed or started.
- The entropy of the OS is smaller than 100 for multiple consecutive times.

Handling Procedure

Check whether haveged or rng-tools has been installed or started.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**.

Step 2 Check the value of **HostName** in the **Location** area to obtain the name of the host for which the alarm is generated.

Step 3 Log in to the node for which the alarm is generated as user **root**.

Step 4 Run the **/bin/rpm -qa | grep -w "haveged"** command to check the haveged installation status and check whether the command output is empty.

- If yes, go to **Step 6**.
- If no, go to **Step 5**.

Step 5 Run the **/sbin/service haveged status |grep "running"** command and check the command output.

- If the command is executed successfully, haveged has been installed and configured correctly and is running properly. Go to **Step 8**.
- If the command fails to execute, haveged is not running properly. Run the following command to manually restart haveged and go to **Step 9**:

  systemctl restart haveged.service

Step 6 Run the **/bin/rpm -qa | grep -w "rng-tools"** command to check the rng-tools installation and check whether the command output is empty.

- If yes, contact the OS vendor to install and start haveged or rng-tools. Then go to **Step 9**.
- If no, go to **Step 7**.

Step 7 Run the **ps -ef | grep -v "grep" | grep rngd | tr -d " " | grep "\-r/dev/urandom"** command and check the command output.

- If the command is executed successfully, rngd has been installed and configured correctly and is running properly. Go to **Step 8**.
- If the command fails to execute, rngd is not running properly. Run the following command to manually restart rngd and go to **Step 9**:

  systemctl restart rngd.service

Check the entropy of the OS.

Step 8 Manually check the entropy of the OS.

Log in to the target node as user **root** and run the **cat /proc/sys/kernel/random/entropy_avail** command to check whether the entropy of the OS meets cluster installation requirements (no less than 100).

- If yes, the entropy of the OS is not less than 100. Go to **Step 9**.
- If no, the entropy of the OS is less than 100. Use either of the following methods and go to **Step 9**.
  - Method 1: Use haveged (true random number mode). Contact the OS vendor to install and start haveged.
  - Method 2: Use rng-tools (pseudo-random number mode). Contact the OS vendor to install and start rng-tools and configure it based on the OS type.

Step 9 Wait until the system to check the entropy at 00:00 on the following day and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, select **NodeAgent** for the target cluster, and click **OK**.

Step 12 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.21 ALM-12041 Incorrect Permission on Key Files

Alarm Description

The system checks whether the permission, user, and user group information about critical directories or files is normal every 5 minutes. This alarm is generated when the information is abnormal.

This alarm is cleared when the information becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12041	Major	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	RoleName	Specifies the role name for which the alarm is generated.
	HostName	Specifies the object (host ID) for which the alarm is generated.

Type	Parameter	Description
	PathName	Specifies the path or name of the abnormal file.
Additional Information	Detail	Specifies the details for which the alarm is generated.

Impact on the System

System functions are unavailable.

- If the permission on the okerberos and oldap key files is abnormal, authentication fails and jobs may fail.
- If the permission on the controller and pms key files is abnormal, the process may be faulty, which may affect the elastic scaling performance.
- If the permission on key Tomcat files is abnormal, the login and viewing functions of FusionInsight Manager are affected.

Possible Causes

The file permission is abnormal or the file is lost due to a user manually modified information such as the file permission, user, and user group, or the system is powered off unexpectedly.

Handling Procedure

Check whether the abnormal file exists and whether the permission on the abnormal file is correct.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**.

Step 2 Check the value of **HostName** to obtain the host name involved in this alarm. Check the value of **PathName** to obtain the path or name of the abnormal file.

Step 3 Log in to the node for which the alarm is generated as user **root**.

Step 4 Run the **ll** *pathName* command, where *pathName* indicates the name of the abnormal file to obtain the user, permission, and user group information about the file or directory.

Step 5 Go to **${BIGDATA_HOME}/om-agent/nodeagent/etc/agent/autocheck** directory. Then run the **vi keyfile** command and search for the name of the abnormal file and check the due permission of the file.

NOTE

To ensure proper configuration synchronization between the active and standby OMS servers, files, directories, and files and sub-directories in the directories configured in **$OMS_RUN_PATH/workspace/ha/module/hasync/plugin/conf/filesync.xml** will also be monitored except files and directories in **keyfile**. User **omm** must have read and write permissions of files and read and execute permissions of directories.

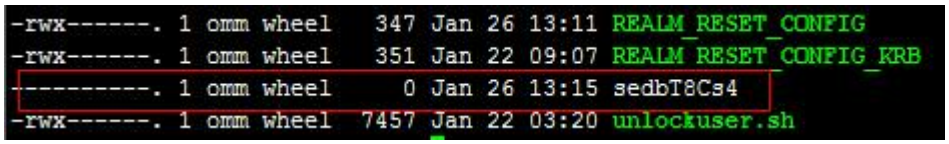
Step 6 Compare the real-world permission of the file with the due permission obtained in **Step 5** and correct the permission, user, and user group information for the file.

Step 7 Wait a hour and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

NOTE

If the disk partition where the cluster installation directory resides is used up, some temporary files will be generated in the program installation directory when running the **sed** command fails. Users do not have the read, write, and execute permissions of these temporary files. The system reports an alarm indicating that permissions of temporary files are abnormal if these files are within the monitoring range of the alarm. Perform the preceding alarm handling processes to clear the alarm. Alternatively, you can directly delete the temporary files after confirming that files with abnormal permissions are temporary. The temporary file generated after a **sed** command execution failure is similar to the following.



Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 9 Select **NodeAgent** from the **Service** and click **OK**.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.22 ALM-12042 Incorrect Configuration of Key Files

Alarm Description

The system checks whether critical configurations are correct every 5 minutes. This alarm is generated when the configurations are abnormal.

This alarm is cleared when the configurations become normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12042	Major	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	RoleName	Specifies the role name for which the alarm is generated.
	HostName	Specifies the object (host ID) for which the alarm is generated.
	PathName	Specifies the path or name of the abnormal file.

Impact on the System

Functions related to the file are abnormal.

- If the permission on the okerberos and oldap key files is abnormal, authentication fails and jobs may fail.
- If the permission on the controller and pms key files is abnormal, the process may be faulty, which may affect the elastic scaling performance.
- If the permission on key Tomcat files is abnormal, the login and viewing functions of FusionInsight Manager are affected.

Possible Causes

The file configuration is modified manually or the system is powered off unexpectedly.

Handling Procedure

Check abnormal file configuration.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**.

Step 2 Check the value of **HostName** to obtain the host name involved in this alarm. Check the value of **PathName** to obtain the path or name of the abnormal file.

Step 3 Log in to the node for which the alarm is generated as user **root**.

Step 4 View the **${BIGDATA_LOG_HOME}/nodeagent/scriptlog/checkfileconfig.log** file and analyze the cause based on the error log. Locate the check standards of the file in the **Related Information** and manually check and modify the file based on the standards.

Run the **vi** *file name* command to enter the editing mode, and then press **Insert** to start editing.

After the modification is complete, press **Esc** to exit the editing mode and enter **:wq** to save the settings and exit.

For example:

vi /etc/ssh/sshd_config

Step 5 Wait a hour and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **NodeAgent** from the **Service** and click **OK**.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

- **Check standards of /etc/fstab**

  Check whether the partitions configured in the **/etc/fstab** file can be found in **/proc/mounts**.

  Check whether the swap partitions configured in fstab correspond to those in /proc/swaps.

- **Check the /etc/hosts configuration file.**

  Run **cat /ect/hosts**. If any of the following situations occurs, the **/etc/hosts** configuration file is abnormal:

  a. The **/etc/hosts** file does not exist.

  b. The host name is not configured in the file.

  c. The host name maps to multiple IP addresses in the file.

  d. The IP address corresponding to the host name does not exist in the command output of the **ifconfig** command.

e. One IP address maps to multiple host names in the file.

- **Check standards of /etc/ssh/sshd_config**

  Run the **vi /etc/ssh/sshd_config** command to check whether configuration items are configured as follows:

  a. The value of **UseDNS** must be set to **no**.

  b. The value of **MaxStartups** must be greater than or equal to 1000.

  c. At least one of the **PasswordAuthentication** and **ChallengeResponseAuthentication** parameters must be left blank or at least one of the parameters be set to **yes**.

11.23 ALM-12045 Read Packet Dropped Rate Exceeds the Threshold

Alarm Description

The system checks the read packet dropped rate every 30 seconds. This alarm is generated when the read packet dropped rate exceeds the threshold for multiple times (the default value is **5**).

To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Packet Dropped Rate**.

This alarm is cleared when **Trigger Count** is 1 and the read packet dropped rate is less than or equal to the threshold. This alarm is cleared when **Trigger Count** is greater than 1 and the read packet dropped rate is less than or equal to 90% of the threshold.

The alarm detection is disabled by default. If you want to enable this function, check whether this function can be enabled based on Checking System Environments.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12045	Critical (default threshold: 5%) Major (default threshold: 0.5%)	Communications	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	NetworkCard Name	Specifies the network port for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

- Latency: When the read packet loss rate of the host network exceeds the threshold, request response is slowed down and services are delayed.
- Service failure: When the read packet loss rate of the host network exceeds the threshold, requests cannot be properly responded or times out, which may cause job running failures.

Risk warning: In SUSE kernel 3.0 or later or Red Hat 7.2, the system kernel modifies the mechanism for counting the number of dropped read packets. In this case, this alarm may be generated even if the network is running properly, but services are not affected. You are advised to check the system environment first.

Possible Causes

- The NICs are bonded in active/standby mode.
- The alarm threshold is improperly configured.
- The network quality is poor.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, click ⌄ in the row containing the alarm, and view the name of the host for which the alarm is generated and the NIC name.

Check whether the NICs are bonded in active/standby mode.

Step 2 Log in to the alarm node as user **omm** and run the **ls -l /proc/net/bonding** command to check whether the **/proc/net/bonding** directory exists on the node.

- If yes, the bond mode is configured for the node. Go to **Step 3**.

```
# ls -l /proc/net/bonding/
total 0
-r--r--r-- 1 root root 0 Oct 11 17:35 bond0
```

- If no, the bond mode is not configured for the node. Go to **Step 5**.

```
# ls -l /proc/net/bonding/
ls: cannot access /proc/net/bonding/: No such file or directory
```

Step 3 Run the **cat /proc/net/bonding/***bond0* command to check whether the value of **Bonding Mode** in the configuration file is **fault-tolerance**.

NOTE

In the command, **bond0** indicates the name of the bond configuration file. Use the file name obtained in **Step 2**.

```
# cat /proc/net/bonding/bond0
Ethernet Channel Bonding Driver: v3.7.1 (April 27, 2011)

Bonding Mode: fault-tolerance (active-backup)
Primary Slave: eth1 (primary_reselect always)
Currently Active Slave: eth1
MII Status: up
MII Polling Interval (ms): 100
Up Delay (ms): 0
Down Delay (ms): 0

Slave Interface: eth0
MII Status: up
Speed: 1000 Mbps
Duplex: full
Link Failure Count: 1
Slave queue ID: 0

Slave Interface: eth1
MII Status: up
Speed: 1000 Mbps
Duplex: full
Link Failure Count: 1
Slave queue ID: 0
```

- If yes, the NICs are bonded in active/standby mode. Go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Check whether the NIC specified by **NetworkCardName** in the alarm is the standby NIC.

- If yes, the alarm of the standby NIC cannot be automatically cleared. Manually clear the alarm on the alarm management page. No further action is required.
- If no, go to **Step 5**.

NOTE

To determine the standby NIC, check the **/proc/net/bonding/bond0** configuration file. If the NIC name corresponding to **NetworkCardName** is **Slave Interface** but not **Currently Active Slave** (the current active NIC), the NIC is the standby one.

Check whether the threshold is set properly.

Step 5 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Packet Dropped Rate**, and check whether the alarm threshold is configured properly. The default value is **0.5%**. You can adjust the threshold as needed.

- If yes, go to **Step 8**.

- If no, go to **Step 6**.

Step 6 Choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Packet Dropped Rate**. Click **Modify** in the **Operation** column to change the threshold.

Step 7 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the network connection is normal.

Step 8 Contact the network administrator to check whether the network is normal.

- If yes, rectify the fault and go to **Step 9**.
- If no, go to **Step 10**.

Step 9 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect the fault information.

Step 10 On FusionInsight Manager of the active cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Select **OMS** for **Service** and click **OK**.

Step 12 Expand the **Hosts** dialog box and select the alarm node and the active OMS node.

Step 13 Click the edit button in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 14 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.24 ALM-12046 Write Packet Dropped Rate Exceeds the Threshold

Alarm Description

The system checks the write packet dropped rate every 30 seconds. This alarm is generated when the write packet dropped rate exceeds the threshold for multiple times (the default value is **5**).

To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Packet Dropped Rate**.

If **Trigger Count** is **1**, this alarm is cleared when the network write packet dropped rate is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the network write packet dropped rate is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12046	Critical (default threshold: 5%) Major (default threshold: 0.5%)	Communications	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
	Port Name	Specifies the network port for which the alarm was generated.
Additional Information	Trigger condition	Specifies the alarm triggering condition.

Impact on the System

- Latency: Requests are responded slowly and services are delayed.
- Service failure: Requests cannot be responded or time out. Jobs may fail to run.

Possible Causes

- The alarm threshold is improperly configured.
- The network quality is poor.

Handling Procedure

Check whether the threshold is set properly.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Packet Dropped Rate**, and check whether the alarm threshold is configured properly. The default value is **0.5%**. You can adjust the threshold as needed.

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Packet Dropped Rate**. Click **Modify** in the **Operation** column to change the threshold.

Step 3 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the network connection is normal.

Step 4 Contact the network administrator to check whether the network is normal.

- If yes, rectify the fault and go to **Step 5**.
- If no, go to **Step 6**.

Step 5 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager of the active cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Select **OMS** for **Service** and click **OK**.

Step 8 Expand the **Hosts** dialog box and select the alarm node and the active OMS node.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.25 ALM-12047 Read Packet Error Rate Exceeds the Threshold

Alarm Description

The system checks the read packet error rate every 30 seconds. This alarm is generated when the read packet error rate exceeds the threshold for multiple times (the default value is **5**).

To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Packet Error Rate**.

If **Trigger Count** is **1**, this alarm is cleared when the read packet error rate is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the read packet error rate is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12047	Critical (default threshold: 5%) Major (default threshold: 0.5%)	Communications	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Type	Parameter	Description
	Port Name	Specifies the network port for which the alarm was generated.
Additional Information	Trigger condition	Specifies the alarm triggering condition.

Impact on the System

- Latency: Requests are responded slowly and services are delayed.
- Service failure: Requests cannot be responded or time out. Jobs may fail to run.

Possible Causes

- The alarm threshold is improperly configured.
- The network quality is poor.

Handling Procedure

Check whether the threshold is set properly.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Packet Error Rate**, and check whether the alarm threshold is configured properly. The default value is **0.5%**. You can adjust the threshold as needed.

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Packet Error Rate**. Click **Modify** in the **Operation** column to change the threshold.

Step 3 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the network connection is normal.

Step 4 Contact the network administrator to check whether the network is normal.

- If yes, rectify the fault and go to **Step 5**.
- If no, go to **Step 6**.

Step 5 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager of the active cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Select **OMS** for **Service** and click **OK**.

Step 8 Expand the **Hosts** dialog box and select the alarm node and the active OMS node.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.26 ALM-12048 Write Packet Error Rate Exceeds the Threshold

Alarm Description

The system checks the write packet error rate every 30 seconds. This alarm is generated when the write packet error rate exceeds the threshold for multiple times (the default value is **5**).

To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Packet Error Rate**.

If **Trigger Count** is **1**, this alarm is cleared when the write packet error rate is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the write packet error rate is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12048	Critical (default threshold: 5%) Major (default threshold: 0.5%)	Communications	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
	Port Name	Specifies the network port for which the alarm was generated.
Additional Information	Trigger condition	Specifies the alarm triggering condition.

Impact on the System

- Latency: Requests are responded slowly and services are delayed.
- Service failure: Requests cannot be responded or time out. Jobs may fail to run.

Possible Causes

- The alarm threshold is improperly configured.
- The network quality is poor.

Handling Procedure

Check whether the threshold is set properly.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Packet Error Rate**, and check whether the alarm threshold is configured properly. The default value is **0.5%**. You can adjust the threshold as needed.

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Packet Error Rate**. Click **Modify** in the **Operation** column to change the threshold.

Step 3 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the network connection is normal.

Step 4 Contact the network administrator to check whether the network is normal.

- If yes, rectify the fault and go to **Step 5**.
- If no, go to **Step 6**.

Step 5 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager of the active cluster, choose **O&M** > **Log** > **Download**.

Step 7 Select **OMS** for **Service** and click **OK**.

Step 8 Expand the **Hosts** dialog box and select the alarm node and the active OMS node.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.27 ALM-12049 Network Read Throughput Rate Exceeds the Threshold

Alarm Description

The system checks the network read throughput rate every 30 seconds and compares the actual throughput rate with the threshold (the default threshold is 80%). This alarm is generated when the system detects that the network read throughput rate exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Throughput Rate**.

When the **Trigger Count** is 1, this alarm is cleared when the network read throughput rate is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the network read throughput rate is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12049	Major	Communications	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	NetworkCardName	Specifies the network port for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

- Latency: When the host network read throughput exceeds the threshold, the request response slows down, causing service delay.
- Service failure: When the host network read throughput exceeds the threshold, requests cannot be properly responded or timed out, which may cause job execution failures.

Possible Causes

- The alarm threshold is set improperly.
- The network port rate cannot meet the current service requirements.

Handling Procedure

Check whether the threshold is set properly.

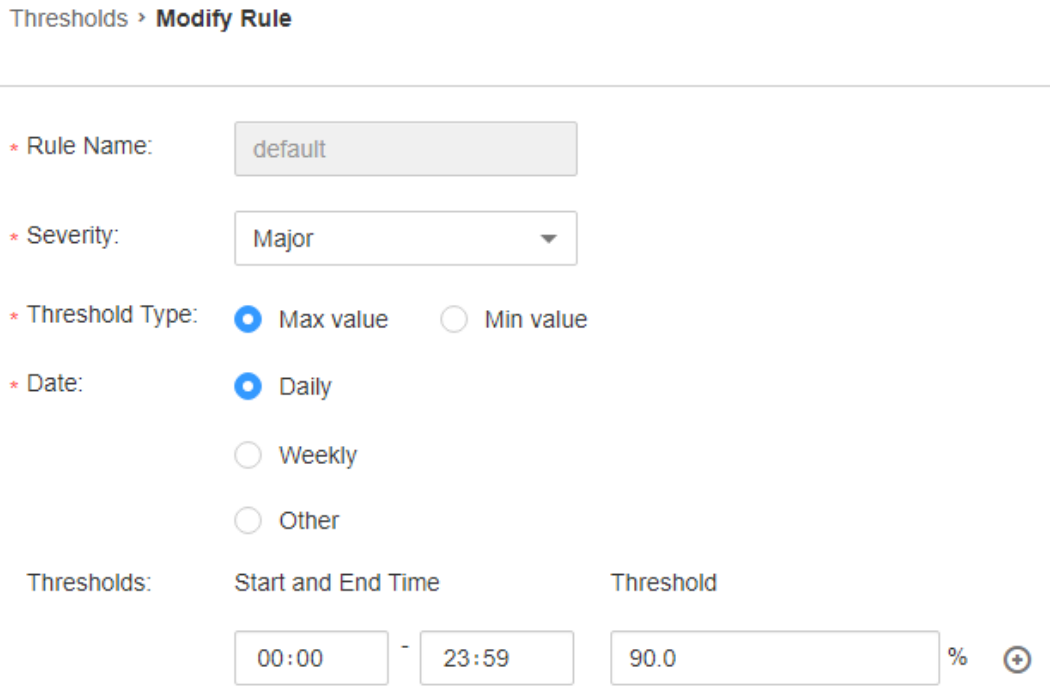
Step 1 On the FusionInsight Manager, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Throughput Rate** and check whether the alarm threshold is set properly. (By default, 80% is a proper value. However, users can configure the value as required.)

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Based on actual usage condition, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Throughput Rate** and click **Modify** in the **Operation** column to modify the alarm threshold.

For details, see **Figure 11-3**.

Figure 11-3 Setting alarm thresholds



Step 3 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the network port rate can meet the service requirements.

Step 4 On FusionInsight Manager, click ⌄ in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host and the network port name for which the alarm is generated.

Step 5 Log in to the host for which the alarm is generated as user **root**.

Step 6 Run the **ethtool** *network port name* command to check the maximum speed of the current network port.

NOTE

In the VM environment, you cannot run a command to query the network port rate. It is recommended that you contact the system administrator to confirm whether the network port rate meets the requirements.

Step 7 If the network read throughput rate exceeds the threshold, contact the system administrator to increase the network port rate.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log** > **Download**.

Step 10 Select **OMS** from the **Service** and click **OK**.

Step 11 Set **Host** to the node for which the alarm is generated and the active OMS node.

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.28 ALM-12050 Network Write Throughput Rate Exceeds the Threshold

Alarm Description

The system checks the network write throughput rate every 30 seconds and compares the actual throughput rate with the threshold (the default threshold is 80%). This alarm is generated when the system detects that the network write throughput rate exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Throughput Rate**.

When the **Trigger Count** is 1, this alarm is cleared when the network write throughput rate is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the network write throughput rate is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12050	Major	Communications	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	NetworkCardName	Specifies the network port for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

- Latency: When the host network write throughput exceeds the threshold, the request response is slowed down and services are delayed.
- Service failure: When the host network write throughput exceeds the threshold, requests cannot be responded or times out, which may cause job running failures.

Possible Causes

- The alarm threshold is set improperly.
- The network port rate cannot meet the current service requirements.

Handling Procedure

Check whether the threshold is set properly.

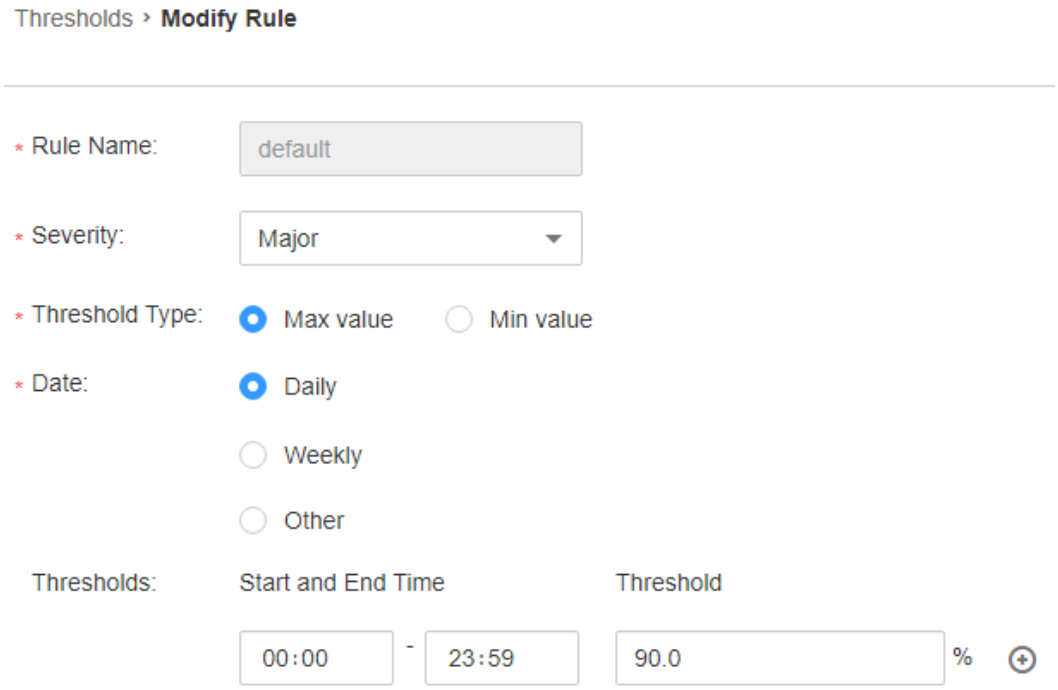
Step 1 On the FusionInsight Manager, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Throughput Rate** and check whether the alarm threshold is set properly. (By default, 80% is a proper value. However, users can configure the value as required.)

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Based on actual usage condition, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Throughput Rate** and click **Modify** in the **Operation** column to modify the alarm threshold.

For details, see **Figure 11-4**.

Figure 11-4 Setting alarm thresholds



Step 3 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the network port rate can meet the service requirements.

Step 4 On FusionInsight Manager, click ⌄ in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host and the network port name for which the alarm is generated.

Step 5 Log in to the host for which the alarm is generated as user **root**.

Step 6 Run the **ethtool***network port name* command to check the maximum speed of the current network port.

NOTE

In the VM environment, you cannot run a command to query the network port rate. It is recommended that you contact the system administrator to confirm whether the network port rate meets the requirements.

Step 7 If the network write throughput rate exceeds the threshold, contact the system administrator to increase the network port rate.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log** > **Download**.

Step 10 Select **OMS** from the **Service** and click **OK**.

Step 11 Set **Host** to the node for which the alarm is generated and the active OMS node.

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.29 ALM-12051 Disk Inode Usage Exceeds the Threshold

Alarm Description

The system checks the disk Inode usage every 30 seconds and compares the actual Inode usage with the threshold. This alarm is generated when the Inode usage exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Disk** > **Disk Inode Usage**.

When the **Trigger Count** is 1, this alarm is cleared when the disk Inode usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the disk Inode usage is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12051	Critical (default threshold: 95%) Major (default threshold: 80%)	Physical resource	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	PartitionName	Specifies the disk partition for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Service failure: If you need to modify or use data on the disk when data cannot be written to the file system, the job may fail.

Possible Causes

Massive small files are stored in the disk.

Handling Procedure

Massive small files are stored in the disk.

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Alarms** and click ⌄ in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host and the disk partition for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **df -i | grep -iE "***partition name***|**Filesystem" command to check the current disk Inode usage.

```
# df -i | grep -iE "xvda2|Filesystem"
Filesystem            Inodes   IUsed   IFree IUse% Mounted on
/dev/xvda2            2359296  207420 2151876    9% /
```

Step 4 If the Inode usage exceeds the threshold, manually check small files stored in the disk partition and confirm whether these small files can be deleted.

NOTE

Run the **for i in /*; do echo $i; find $i|wc -l; done** command to query the number of files in a partition. Replace **/*** with the specified partition.

```
# for i in /srv/*; do echo $i; find $i|wc -l; done
/srv/BigData
4284
/srv/ftp
1
/srv/www
13
```

- If yes, run the **rm -rf** *Path of the file or folder* to be deleted command to delete the file or folder and go to **Step 5**.

  NOTE

  Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

- If no, expand the capacity. Then, perform **Step 5**.

Step 5 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log** > **Download**.

Step 7 Select **OMS** from the **Service** and click **OK**.

Step 8 Set **Host** to the node for which the alarm is generated and the active OMS node.

Step 9 Click the edit button in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.30 ALM-12052 TCP Temporary Port Usage Exceeds the Threshold

Alarm Description

The system checks the TCP temporary port usage every 30 seconds and compares the actual usage with the threshold. This alarm is generated when the TCP temporary port usage exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Status** > **TCP Ephemeral Port Usage**.

When the **Trigger Count** is 1, this alarm is cleared when the TCP temporary port usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the TCP temporary port usage is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12052	Critical (default threshold: 95%) Major (default threshold: 80%)	Environment	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Type	Parameter	Description
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Services on the host cannot establish external connections, and therefore they are interrupted.

Possible Causes

- The temporary port cannot meet the current service requirements.
- The system is abnormal.

Handling Procedure

Expand the temporary port number range.

Step 1 On FusionInsight Manager, click ⌄ in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **omm**.

Step 3 Run the **cat /proc/sys/net/ipv4/ip_local_port_range |cut -f 1** command to obtain the value of the start port and run the **cat /proc/sys/net/ipv4/ip_local_port_range |cut -f 2** command to obtain the value of the end port. The total number of temporary ports is the value of the end port minus the value of the start port. If the total number of temporary ports is smaller than 28,232, the random port range of the OS is narrow. Contact the system administrator to increase the port range.

Step 4 Run the following command to calculate the number of used temporary ports.

ss -ant 2>/dev/null | grep -v LISTEN | awk 'NR > 2 {print $4}'| awk -F':' '{print $NF}' | awk '$1 >"*Value of the start port***" {print $1}' | sort -u | wc -l**

Step 5 The formula for calculating the usage of the temporary ports is: Usage of the temporary ports = (Number of used temporary ports/Total number of temporary ports) x 100%. Check whether the temporary port usage exceeds the threshold.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

Step 6 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check whether the system environment is abnormal.

Step 7 Run the following command to import the temporary file and view the frequently used ports in the **port_result.txt file**:

netstat -tnp|sort > $BIGDATA_HOME/tmp/port_result.txt

```
netstat -tnp|sort

Active Internet connections (w/o servers)

Proto Recv Send LocalAddress ForeignAddress State PID/ProgramName tcp   0   0 10-120-85-154:45433
10-120-85-154:9866 CLOSE_WAIT 94237/java
tcp   0   0 10-120-85-154:45434  10-120-85-154:9866 CLOSE_WAIT 94237/java
tcp   0   0 10-120-85-154:45435  10-120-85-154:9866 CLOSE_WAIT 94237/java
...
```

Step 8 Run the following command to view the processes that occupy a large number of ports:

ps -ef |grep *PID*

NOTE

- PID is the processes ID queried in **Step 7**.
- Run the following command to collect information about all processes and check the processes that occupy a large number of ports:

  ps -ef > $BIGDATA_HOME/tmp/ps_result.txt

Step 9 After obtaining the administrator's approval, clear the processes that occupy a large number of ports. Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log > Download**.

Step 11 Select **OMS** from the **Service** and click **OK**.

Step 12 Set **Host** to the node for which the alarm is generated and the active OMS node.

Step 13 Click the edit button in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M engineers and send the collected log information and files **port_result.txt** and **ps_result.txt**. Then, delete the two residual temporary files from the environment.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.31 ALM-12053 Host File Handle Usage Exceeds the Threshold

Alarm Description

The system checks the file handle usage every 30 seconds and compares the actual usage with the threshold. This alarm is generated when the host file handle usage exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Host Status** > **Host File Handle Usage**.

When the **Trigger Count** is 1, this alarm is cleared when the host file handle usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the host file handle usage is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12053	Critical (default threshold: 95%) Major (default threshold: 80%)	Environment	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Service failure: When the host file handle usage exceeds the threshold, system applications cannot perform I/O operations such as file opening and network operations. As a result, the program is abnormal, which may cause job running failure.

Possible Causes

- The application process is abnormal. For example, the opened file or socket is not closed.
- The number of file handles cannot meet the current service requirements.
- The system is abnormal.

Handling Procedure

Check information about files opened in processes.

Step 1 On FusionInsight Manager, click ⌄ in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **lsof -n|awk '{print $2}'|sort|uniq -c|sort -nr|more** command to check the process that occupies excessive file handles.

Step 4 Check whether the processes in which a large number of files are opened are normal. For example, check whether there are files or sockets not closed.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Release the abnormal processes that occupy too many file handles.

Step 6 Five minutes later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Increase the number of file handles.

Step 7 On FusionInsight Manager, click ⌄ in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host for which the alarm is generated.

Step 8 Log in to the host for which the alarm is generated as user **root**.

Step 9 Contact the system administrator to increase the number of system file handles.

Step 10 Run the **cat /proc/sys/fs/file-nr** command to view the used handles and the maximum number of file handles. The first value is the number of used handles, the third value is the maximum number. Please check whether the usage exceeds the threshold.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

```
# cat /proc/sys/fs/file-nr
12704 0 640000
```

Step 11 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check whether the system environment is abnormal.

Step 12 Contact the system administrator to check whether the operating system is abnormal.

- If yes, go to **Step 13** to rectify the fault.
- If no, go to **Step 14**.

Step 13 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Collect fault information.

Step 14 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log** > **Download**.

Step 15 Select **OMS** from the **Service** and click **OK**.

Step 16 Set **Host** to the node for which the alarm is generated and the active OMS node.

Step 17 Click the edit button in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.32 ALM-12054 Invalid Certificate File

Alarm Description

The system checks whether the certificate file is invalid (has expired or is not valid yet) at the beginning of each hour. This alarm is generated when the certificate file is invalid.

This alarm is cleared when a valid certificate is imported and the alarm detection mechanism is triggered on the next hour.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12054	Critical	Security	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Details	Specifies alarm details.

Impact on the System

The functions of the related modules cannot be used.

Possible Causes

No certificate (CA certificate, HA root certificate, HA user certificate, GaussDB root certificate, or GaussDB user certificate) is imported to the system, the certificate fails to be imported, or the certificate file is invalid.

Handling Procedure

Locate the alarm cause.

Step 1 On FusionInsight Manager, locate the target alarm in the real-time alarm list and click ⌄.

View **Additional Information** to obtain the additional information about the alarm.

- If **CA Certificate** is displayed in the additional alarm information, log in to the active OMS management node as user **omm** and go to **Step 2**.
- If **HA root Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to **Step 3**.

- If **HA server Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to **Step 4**.
- If **Certificate has expired** is displayed in the additional information, view **Location** to obtain the name of the host for which the alarm is generated. Then, log in to the host as user **omm** and perform **Step 2** to **Step 4** in sequence to check whether the certificates have expired. If these certificates have not expired, check whether other certificates have been imported. If yes, import the certificate files again.

Check the validity period of the certificate files in the system.

Step 2 Check whether the current system time is within the validity period of the CA certificate.

Run the **bash ${CONTROLLER_HOME}/security/cert/conf/querycertvalidity.sh** command to check the effective time and due time of the CA root certificate.

- If yes, go to **Step 7**.
- If no, go to **Step 5**.

Step 3 Check whether the current system time is within the validity period of the HA root certificate.

Run the **openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/certHA/root-ca.crt** command to check the effective time and due time of the HA root certificate.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

Step 4 Check whether the current system time is within the validity period of the HA user certificate.

Run the **openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/certHA/server.crt** command to check the effective time and due time of the HA user certificate.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

The following is an example of the effective time and due time of a CA or HA certificate:

```
Certificate:
    Data:
        Version: 3 (0x2)
        Serial Number:
            97:d5:0e:84:af:ec:34:d8
        Signature Algorithm: sha256WithRSAEncryption
        Issuer: C=CN, ST=xxx, L=yyy, O=zzz, OU=IT, CN=HADOOP.COM
        Validity
            Not Before: Dec 13 06:38:26 2016 GMT            // Effective time
            Not After : Dec 11 06:38:26 2026 GMT            // Due time
```

Import certificate files.

Step 5 Import a new CA certificate file.

Apply for or generate a new CA certificate file and import it to the system. The alarm is automatically cleared after the CA certificate is imported. Check whether this alarm is reported again during periodic check.

- If yes, go to **Step 7**.
- If no, no further action is required.

Step 6 Import a new HA certificate file.

Apply for or generate a new HA certificate file and import it to the system. The alarm is automatically cleared after the certificate is imported. Check whether this alarm is reported again during periodic check.

- If yes, go to **Step 7**.
- If no, no further action is required.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 In the **Services** area, select **Controller**, **OmmServer**, **OmmCore**, and **Tomcat**, and click **OK**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

11.33 ALM-12055 The Certificate File Is About to Expire

Alarm Description

The system checks the certificate file at the beginning of each hour. This alarm is generated if the certificate file is about to expire within 30 days.

This alarm is cleared when a certificate that is not about to expire is imported and the alarm detection mechanism is triggered on the next hour.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12055	Major	Security	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Details	Specifies alarm details.

Impact on the System

Some functions will be unavailable if the certificate expires.

Possible Causes

The remaining validity period of a system certificate (CA certificate, HA root certificate, HA user certificate, GaussDB root certificate, or GaussDB user certificate) is less than 30 days.

Handling Procedure

Locate the alarm cause.

Step 1 On FusionInsight Manager, locate the target alarm in the real-time alarm list and click ⌄.

View **Additional Information** to obtain the additional information about the alarm.

- If **CA Certificate** is displayed in the additional alarm information, log in to the active OMS management node as user **omm** and go to **Step 2**.
- If **HA root Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to **Step 3**.

- If **HA server Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to **Step 4**.

Check the validity period of the certificate files in the system.

Step 2 Check whether the remaining validity period of the CA certificate is smaller than the alarm threshold.

Run the **bash ${CONTROLLER_HOME}/security/cert/conf/querycertvalidity.sh** command to check the effective time and due time of the CA root certificate.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 3 Check whether the remaining validity period of the HA root certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/certHA/root-ca.crt** command to check the effective time and due time of the HA root certificate.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 4 Check whether the remaining validity period of the HA user certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/certHA/server.crt** command to check the effective time and due time of the HA user certificate.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

The following is an example of the effective time and due time of a CA or HA certificate:

```
Certificate:
    Data:
        Version: 3 (0x2)
        Serial Number:
            97:d5:0e:84:af:ec:34:d8
        Signature Algorithm: sha256WithRSAEncryption
        Issuer: C=CN, ST=xxx, L=yyy, O=zzz, OU=IT, CN=HADOOP.COM
        Validity
            Not Before: Dec 13 06:38:26 2016 GMT            // Effective time
            Not After : Dec 11 06:38:26 2026 GMT            // Due time
```

Import certificate files.

Step 5 Import a new CA certificate file.

Apply for or generate a new CA certificate file and import it to the system. Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to **Step 7**.
- If no, no further action is required.

Step 6 Import a new HA certificate file.

Apply for or generate a new HA certificate file and import it to the system. Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to **Step 7**.
- If no, no further action is required.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 In the **Services** area, select **Controller**, **OmmServer**, **OmmCore**, and **Tomcat**, and click **OK**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.34 ALM-12057 Metadata Not Configured with the Task to Periodically Back Up Data to a Third-Party Server

Alarm Description

After the system is installed, it checks whether the task for periodically backing up metadata to the third-party server, and then performs the check hourly. If the task for periodically backing up metadata to a third-party server is not configured, a critical alarm is generated.

This alarm is cleared when a user creates such a backup task.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12057	Major	Backup status	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the details for which the alarm is generated.

Impact on the System

If the metadata is not backed up to a third-party server, when the active/standby management nodes in the cluster are faulty and the local backup data is lost, if you want to use the backup package to restore the cluster metadata, no backup package is available.

Possible Causes

Metadata is not configured with the task to periodically back up data to a third-party server.

Handling Procedure

Step 1 On the FusionInsight Manager portal choose **O&M > Alarm > Alarms**.

Step 2 In the alarm list, click ⌄ in the row where the alarm is located and identify the data module from which the alarm is generated based on **Additional Information**.

Step 3 Choose **O&M** > **Backup and Restoration > Backup Management** > **Create**.

Step 4 Configure a backup task. The backup data to be configured is consistent with the data in Additional Information of the alarm.

Step 5 After the backup task is created successfully, wait for two minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information

Step 6 On FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 7 In the **Service** area, select **Controller** and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.35 ALM-12061 Process Usage Exceeds the Threshold

Alarm Description

The system checks the usage of the omm process every 30 seconds. Users can run the **ps -o nlwp, pid, args, -u omm | awk '{sum+=$1} END {print "", sum}'** command to obtain the number of concurrent processes of user **omm**. Run the **ulimit -u**command to obtain the maximum number of processes that can be simultaneously opened by user **omm**. Divide the number of concurrent processes by the maximum number to obtain the process usage of user **omm**. The process usage has a default threshold. This alarm is generated when the process usage exceeds the threshold.

If **Trigger Count** is **3** and the process usage is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1**and the process usage is less than or equal to 90% of the threshold, this alarm is cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12061	Critical (default threshold: 95) Major (default threshold: 90)	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the details for which the alarm is generated.

Impact on the System

Service failure: When the process usage exceeds the threshold, you cannot switch to user **omm**. A new **omm** thread cannot be created. As a result, the job may fail to run.

Possible Causes

- The alarm threshold is improperly configured.
- The maximum number of processes (including threads) that can be concurrently opened by user **omm** is inappropriate.
- An excessive number of threads are opened at the same time.

Handling Procedure

Check whether the alarm threshold or alarm hit number is properly configured.

Step 1 On the FusionInsight Manager, change the alarm threshold and **Trigger Count** based on the actual CPU usage.

Specifically, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host**> **Process** > **omm Process Usage** to change Trigger Count.

NOTE

The alarm is generated when the process usage exceeds the threshold for the times specified by **Trigger Count**.

Set the alarm threshold based on the actual process usage. To check the process usage, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host**> **Process** > **omm Process Usage**.

Step 2 2 minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 3**.

Check whether the maximum number of processes (including threads) opened by user omm is appropriate.

Step 3 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host for which the alarm is generated.

Step 4 Log in to the host where the alarm is generated as user **root**.

Step 5 Run the **su - omm** command to switch to user **omm**.

Step 6 Run the **ulimit -u** command to obtain the maximum number of threads that can be concurrently opened by user **omm** and check whether the number is greater than or equal to 60000.

- If it is, go to **Step 8**.
- If it is not, go to **Step 7**.

Step 7 Run the **ulimit -u 60000** command to change the maximum number to 60000. Two minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 12**.

Check whether an excessive number of processes are opened at the same time.

Step 8 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host for which the alarm is generated.

Step 9 Log in to the host where the alarm is generated as user **root**.

Step 10 Run the **ps -o nlwp, pid, lwp, args, -u omm|sort -n** command to check the numbers of threads used by the system. The result is sorted based on the thread number. Analyze the top 5 thread numbers and check whether the threads are incorrectly used. If they are, contact maintenance personnel to rectify the fault. If they are not, run the **ulimit -u** command to change the maximum number to be greater than 60000.

Step 11 Five minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 12**.

Collect fault information.

Step 12 On the FusionInsight Manager home page of the active clusters, choose **O&M** > **Log** > **Download**.

Step 13 Select **OmmServer** and **NodeAgent** from the **Service** and click **OK**.

Step 14 Click the edit button in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 15 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

This alarm will be automatically cleared after the fault is rectified.

Related Information

None.

11.36 ALM-12062 OMS Parameter Configurations Mismatch with the Cluster Scale

Alarm Description

The system checks whether the OMS parameter configurations match with the cluster scale at each top hour. If the OMS parameter configurations do not meet the cluster scale requirements, the system generates this alarm. This alarm is automatically cleared when the OMS parameter configurations are modified.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12062	Major	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the name of the service for which the alarm is generated.

Type	Parameter	Description
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the parameters configured for the current cluster are smaller than the configuration standard required by the cluster scale, problems such as job running delay and slow service page response may occur. In severe cases, the Agent or OMS process on the cluster node is abnormal. As a result, component jobs fail to be submitted and OMS data fails to be synchronized.

Possible Causes

The OMS parameter configurations mismatch with the cluster scale.

Handling Procedure

Check whether the OMS parameter configurations match with the cluster scale.

Step 1 Log in to the active Manager node as user **omm**.

Step 2 Run the **vi ${BIGDATA_LOG_HOME}/controller/scriptlog/modify_manager_param.log** command to open the log file and search for the log file containing the following information: Current oms configurations cannot support *xx* nodes. In the information, *xx* indicates the number of nodes in the cluster.

Step 3 Optimize the current cluster configuration by following the instructions in **Related Information**.

Step 4 One hour later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 6 Select **Controller** from the **Service** and click **OK**.

Step 7 Click the edit button in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

Optimizing Manager Configurations Based on the Number of Cluster Nodes

Step 1 Log in to the active Manager node as user **omm**.

Step 2 Run the following command to switch the directory:

cd ${BIGDATA_HOME}/om-server/om/sbin

Step 3 Run the following command to view the current Manager configurations.

sh oms_config_info.sh -q

Step 4 Run the following command to specify the number of nodes in the current cluster.

Command format: **sh oms_config_info.sh -s** *number of nodes*

Example:

sh oms_config_info.sh -s 1000

Enter **y** as prompted.

```
The following configurations will be modified:
    Module      Parameter          Current          Target
    Controller  controller.Xmx     4096m        =>  16384m
    Controller  controller.Xms     1024m        =>  8192m
    Controller  controller.node.heartbeat.error.threshold     30000                =>   60000
    Pms         pms.mem            8192m        =>  10240m
Do you really want to do this operation? (y/n):
```

The configurations are updated successfully if the following information is displayed:

```
...
Operation has been completed. Now restarting OMS server.                [done]
Restarted oms server successfully.
```

NOTE

- OMS is automatically restarted during the configuration update process.
- Clusters with similar quantities of nodes have same Manager configurations. For example, when the number of nodes is changed from 100 to 101, no configuration item needs to be updated.

----End

11.37 ALM-12063 Unavailable Disk

Alarm Description

The system checks whether the data disk of the current host is available at the top of each hour. The system creates files, writes files, and deletes files in the mount directory of the disk. If the operations fail, the alarm is generated. If the operations succeed, the disk is available, and the alarm is cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12063	Major	Physical resource	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the name of the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	Partition mount point	Specifies the disk partition for which the alarm is generated.
Additional Information	Disk serial number	Specifies the serial number of the disk for which the alarm is generated.

Impact on the System

Service failure: If you need to modify or use data on a disk that is unwritable or unreadable, the job may fail.

Possible Causes

- The permission of the disk mount directory is abnormal.
- There are disk bad sectors.

Handling Procedure

Check whether the permission of the disk mount directory is normal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host and **DiskName** for the disk for which the alarm is generated.

Step 2 Log in to the host where the alarm is generated as user **root**.

Step 3 Run the **df -h |grep DiskName** command to obtain the mount point and check whether the permission of the mount directory is unwritable or unreadable.

- If it is, go to **Step 4**.
- If it is not, go to **Step 8**.

NOTE

If the permission of the mount directory is 000 or the owner is **root**, the mount directory is unreadable and unwritable.

Step 4 Modify the directory permission.

Step 5 One hour later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Step 6 Contact hardware engineers to rectify the disk.

Step 7 One hour later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 9 Select **NodeAgent** from the **Service** and click **OK**.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.38 ALM-12064 Host Random Port Range Conflicts with Cluster Used Port

Alarm Description

The system checks whether the random port range of the host conflicts with the range of ports used by the Cluster system every hour. The alarm is generated if they conflict. The alarm is automatically cleared when the random port range of the host is changed to the normal range.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12064	Major	Environment	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifiestheclusterorsystemforwhichthealarmis-generated.
	ServiceName	Specifies the name of the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

- If ports such as okerberos and oldap are occupied, authentication fails and jobs may fail.
- If the controller and pms ports are occupied, the process is faulty, which may affect the elastic scaling performance.
- If the Tomcat port is occupied, the login and query functions of FusionInsight Manager are affected.

Possible Causes

The random port range configuration is modified.

Handling Procedure

Check the random port range of the system.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host for which the alarm is generated.

Step 2 Log in to the host where the alarm is generated as user **root**.

Step 3 Run the **cat /proc/sys/net/ipv4/ip_local_port_range** command to obtain the random port range of the host and check whether the minimum value is smaller than 32768.

- If it is, go to **Step 4**.

- If it is not, goto **Step 7**.

Step 4 Run the **vim /etc/sysctl.conf** command to change the value of **net.ipv4.ip_local_port_range** to **32768 61000**. If this parameter does not exist, add the following configuration: **net.ipv4.ip_local_port_range = 32768 61000**.

Step 5 Run the **sysctl -p /etc/sysctl.conf** command for the modification to take effect.

Step 6 One hour later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Select **NodeAgent** for **Service** and click **OK**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.39 ALM-12066 Trust Relationships Between Nodes Become Invalid

Alarm Description

The system checks whether the trust relationship between the active OMS node and other Agent nodes is normal every hour. The alarm is generated if the mutual trust fails. This alarm is automatically cleared after the fault is rectified.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12066	Major	Communications	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Failed hosts	Specifies hosts that fail to be trusted.

Impact on the System

Some operations (such as restart, configuration synchronization, and instance status query) that need to connect to the node may fail. If the trust relationships between nodes are invalid, services may be affected.

Possible Causes

- The **/etc/ssh/sshd_config** configuration file is damaged.
- The password of user **omm** has expired.

Handling Procedure

Check the status of the /etc/ssh/sshd_config configuration file.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm and click ⌄ to view the host list in the alarm details.

Step 2 Log in to the active OMS node as user **omm**.

Step 3 Run the **ssh** command, for example, **ssh *host2***, on each node in the alarm details to check whether the connection fails. (***host2*** is a node other than the OMS node in the alarm details.)

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Open the **/etc/ssh/sshd_config** configuration file on host2 and check whether **AllowUsers** or **DenyUsers** is configured for other nodes.

- If yes, go to **Step 5**.
- If no, contact OS experts.

Step 5 Modify the whitelist or blacklist to ensure that user **omm** is in the whitelist or not in the blacklist. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check the status of the password of user omm.

Step 6 Check the interaction information of the **ssh** command.

- If the password of user **omm** is required, go to **Step 7**.
- If message "Enter passphrase for key '/home/omm/.ssh/id_rsa':" is displayed, go to **Step 9**.

Step 7 Check the trust list (**/home/omm/.ssh/authorized_keys**) of user **omm** on the OMS node and host2 node. Check whether the trust list contains the public key file (**/home/omm/.ssh/id_rsa.pub**) of user **omm** on the peer host.

- If yes, contact OS experts.
- If no, add the public key of user **omm** of the peer host to the trust list of the local host.

Step 8 Add the public key of user **omm** of the peer host to the trust list of the local host. Run the **ssh** command, for example, **ssh host2**, on each node in the alarm details to check whether the connection fails. (***host2*** is a node other than the OMS node in the alarm details.)

- If yes, go to **Step 9**.
- If no, check whether the alarm is cleared. If the alarm is cleared, no further action is required; otherwise, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Select **Controller** for **Service** and click **OK**.

Step 11 Click  in the upper right corner to set the log collection time range. Generally, the time range is 10 minutes before and after the alarm generation time. Click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

Perform the following steps to handle abnormal trust relationships between nodes:

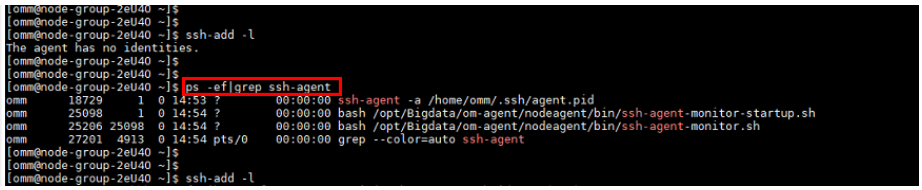
NOTICE

- Perform this operation as user **omm**.
- If the network between nodes is disconnected, rectify the network fault first. Check whether the two nodes are connected to the same security group and whether **hosts.deny** and **hosts.allow** are set.

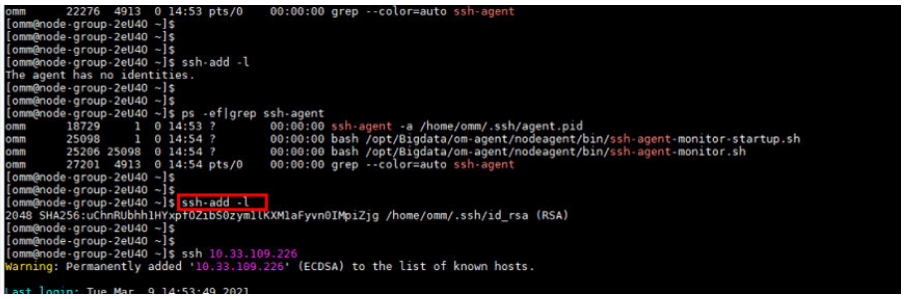
1. Run the **ssh-add -l** command on both nodes to check whether any identities exist.

   - If yes, go to **4**.
   - If no, go to **2**.

2. If no identities are displayed, run the **ps -ef|grep ssh-agent** command to find the **ssh-agent** process, stop the process, and wait for the process to automatically restart.



3. Run the **ssh-add -l** command to check whether the identities have been added. If yes, manually run the **ssh** command to check whether the trust relationship is normal.



4. If identities exist, check whether the **/home/omm/.ssh/authorized_keys** file contains the information in the **/home/omm/.ssh/id_rsa.pub** file of the peer node. If it does not, manually add the information.
5. Check whether the permissions on the files in the **/home/omm/.ssh** directory are modified.

6. Check the **/var/log/Bigdata/nodeagent/scriptlog/ssh-agent-monitor.log** file.
7. If the **/home** directory of user **omm** is deleted, contact MRS support personnel for assistance.

11.40 ALM-12067 Abnormal Tomcat Resources of Manager

Alarm Description

HA checks the Tomcat resources of Manager every 85 seconds. This alarm is generated when HA detects that the Tomcat resources are abnormal for two consecutive times.

This alarm is cleared when HA detects that the Tomcat resources become normal.

Resource Type of Tomcat is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new Tomcat resources have been enabled on the new active Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12067	Major	Quality of service	FusionInsight Manager	Yes

Alarm Changes

Change Type	Version	Description	Reason for Change
Modify	3.3.1	Alarm Name: changed from "Tomcat Resource Is Abnormal" to "Abnormal Tomcat Resources of Manager".	Alarm Name: Standardized

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

An active/standby Manager switchover may occur. The Manager and component web UIs are unavailable. The cluster management function cannot be provided for upper-layer web applications, and users may fail to log in to the Manager and component web UIs.

Possible Causes

The Tomcat directory permission is abnormal, and the Tomcat process is abnormal.

Handling Procedure

Check whether the permission on the Tomcat directory is normal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the IP address of the host for which the alarm is generated.

Step 2 Log in to the alarm host as user **root**.

Step 3 Run the **su - omm** command to switch to user **omm**.

Step 4 Run the **vi ${BIGDATA_LOG_HOME}/omm/oms/ha/scriptlog/tomcat.log** command to check whether the Tomcat resource log contains keyword **Cannot find *XXX*** and rectify the file permission based on the keyword.

Step 5 After 5 minutes, check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 In the **Services** area, select **OmmServer** and **Tomcat**, and click **OK**.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.41 ALM-12068 Abnormal ACS Resources of Manager

Alarm Description

HA checks the ACS resources of Manager every 80 seconds. This alarm is generated when HA detects that the ACS resources are abnormal for two consecutive times.

This alarm is cleared when HA detects that the ACS resources are normal.

Resource Type of ACS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new ACS resources have been enabled on the new active Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12068	Major	Quality of service	FusionInsight Manager	Yes

Alarm Changes

Change Type	Version	Description	Reason for Change
Modify	3.3.1	Alarm Name: changed from "ACS Resource Is Abnormal" to "Abnormal ACS Resources of Manager".	Alarm Name: Standardized

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

An active/standby Manager switchover may occur. The security authentication and user management functions cannot be provided for ACS upper-layer applications. As a result, you may fail to log in to Manager and component web UIs.

Possible Causes

The ACS process is abnormal.

Handling Procedure

Check whether the ACS process is normal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su - omm** command and then **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** to check whether the status of the ACS resources managed by the HA is normal. In the single-node system, the ACS resource is in the normal state. In the dual-node system, the ACS resource is in the normal state on the active node and in the stopped state on the standby node.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Run the **vi ${BIGDATA_LOG_HOME}/omm/oms/ha/scriptlog/acs.log** command to check whether the ACS resource log of HA contains the keyword **ERROR**. If yes, analyze the logs to locate the resource exception cause and fix the exception.

Step 5 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 In the **Services** area, select **Controller** and **OmmServer**, and click **OK**.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.42 ALM-12069 Abnormal AOS Resources of Manager

Alarm Description

HA checks the AOS resources of Manager every 81 seconds. This alarm is generated when HA detects that the AOS resources are abnormal for two consecutive times.

This alarm is cleared when HA detects that the AOS resources become normal.

Resource Type of AOS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new AOS resources have been enabled on the new active Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12069	Major	Quality of service	FusionInsight Manager	Yes

Alarm Changes

Change Type	Version	Description	Reason for Change
Modify	3.3.1	Alarm Name: changed from "AOS Resource Exception" to "Abnormal AOS Resources of Manager".	Alarm Name: Standardized

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

An active/standby Manager switchover may occur. Tenant and role management cannot be provided for AOS upper-layer applications. As a result, you may fail to log in to Manager and component web UIs.

Possible Causes

The AOS process is abnormal.

Handling Procedure

Check whether the AOS process is normal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run **su - omm** and then **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** to check whether the status of the AOS resources managed by the HA is normal. In the single-node system, the AOS resource is in the normal state. In the dual-node system, the AOS resource is in the normal state on the active node and in the stopped state on the standby node.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Run the **vi ${BIGDATA_LOG_HOME}/omm/oms/ha/scriptlog/aos.log** command to check whether the AOS resource log of HA contains the keyword **ERROR**. If yes, analyze the logs to locate the resource exception cause and fix the exception.

Step 5 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 In the **Services** area, select **Controller** and **OmmServer**, and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.43 ALM-12070 Controller Resource Is Abnormal

Alarm Description

HA checks the controller resources of Manager every 80 seconds. This alarm is generated when HA detects that the controller resources are abnormal for 2 consecutive times.

This alarm is cleared when the Controller resource is normal.

Resource Type of Controller is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new Controller resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12070	Major	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the name of the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The alarm persists for a long time, causing frequent active/standby switchovers of FusionInsight Manager. As a result, users cannot log in to FusionInsight Manager and perform O&M operations.
- The Controller process repeatedly restarts, which may cause the native UI of the service login failure.

Possible Causes

The Controller process is abnormal.

Handling Procedure

Check whether the controller process is normal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su - omm** command to switch to user **omm**.Run the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the Controller resources managed by the HA is normal. In the single-node system, the Controller resource is in the normal state. In the dual-node system, the Controller resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to **Step 6**.
- If it is not, go to **Step 4**.

Step 4 Run the **vi ${BIGDATA_LOG_HOME}/omm/oms/ha/scriptlog/controller.log** command to view the Controller resource logs, and run the **vi ${BIGDATA_LOG_HOME}/controller/controller.log** command to view the Controller running logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

Step 5 Five minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Select **Controller** and **OmmServe** for **Service** and click **OK**.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour before and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.44 ALM-12071 Httpd Resource Is Abnormal

Alarm Description

HA checks the httpd resources of Manager every 120 seconds. This alarm is generated when HA detects that the httpd resources are abnormal for 10 consecutive times.

This alarm is cleared when the httpd resource is normal.

Resource Type of httpd is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new httpd resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12071	Major	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The alarm persists for a long time, causing frequent active/standby switchovers of FusionInsight Manager. As a result, users cannot log in to FusionInsight Manager and perform O&M operations.
- The httpd process is repeatedly restarts, which may lead to the failure to visit the native service UI.

Possible Causes

The httpd process is abnormal.

Handling Procedure

Check whether the httpd process is abnormal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su - omm** command to switch to user **omm**.

Step 4 Run the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the httpd resources managed by the HA is normal. In the single-node system, the httpd resource is in the normal state. In the dual-node system, the httpd resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to **Step 7**.
- If it is not, go to **Step 5**.

Step 5 Run the **vi ${BIGDATA_LOG_HOME}/omm/oms/ha/scriptlog/httpd.log** command to view the httpd resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

Step 6 Five minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 9 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

This alarm will be automatically cleared after the fault is rectified.

Related Information

None.

11.45 ALM-12072 FloatIP Resource Is Abnormal

Alarm Description

HA checks the floatip resources of Manager every 9 seconds. This alarm is generated when HA detects that the floatip resources are abnormal for 3 consecutive times.

This alarm is cleared when the FloatIP resource is normal.

Resource Type of FloatIP is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new FloatIP resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12072	Major	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The alarm persists for a long time, causing frequent active/standby switchovers of FusionInsight Manager. As a result, users cannot log in to FusionInsight Manager and perform O&M operations.
- The FloatIP process is repeatedly restarts, which may lead to the failure to visit the native service UI.

Possible Causes

- The floating IP address is abnormal.

Handling Procedure

Check the floating IP address status of the active management node.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the address of the host for which the alarm is generated and the resource name.

Step 2 Log in to the active management node as user **root**.

Step 3 Run the following command, go to the **${BIGDATA_HOME}/om-server/om/sbin/** directory.

su - omm

cd ${BIGDATA_HOME}/om-server/om/sbin/

Step 4 Run the **sh status-oms.sh** command, and execute the **status-oms.sh** script to check whether the floating IP address of the active FusionInsight Manager is normal. View the command output, locate the row where **ResName** is **floatip**, and check whether the following information is displayed.

For example:

```
10-10-10-160 floatip Normal Normal Single_active
```

- If it is, go to **Step 8**.
- If it is not, go to **Step 5**.

Step 5 Run the **ifconfig** command to check whether the NIC with the floating IP address exists.

- If it does, go to **Step 8**.
- If it does not, go to **Step 6**.

Step 6 Run the **ifconfig** *NIC name Floating IPaddress* netmask *Subnet mask* command to reconfigure the NIC with the floating IP address. (For example, **ifconfig eth0 10.10.10.102 netmask 255.255.255.0**).

Step 7 Five minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 9 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 10 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 11 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

This alarm will be automatically cleared after the fault is rectified.

Related Information

None.

11.46 ALM-12073 CEP Resource Is Abnormal

Alarm Description

HA checks the cep resources of Manager every 60 seconds. This alarm is generated when HA detects that the cep resources are abnormal for 2 consecutive times.

This alarm is cleared when the CEP resource is normal.

Resource Type of CEP is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new CEP resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

NOTE

This alarm applies only to versions earlier than MRS 3.3.0.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12073	Major	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The alarm persists for a long time, causing frequent active/standby switchovers of FusionInsight Manager. As a result, users cannot log in to FusionInsight Manager and perform O&M operations.
- The CEP process repeatedly restarts. As a result, monitoring data collection fails during the alarm reporting period. In severe cases, monitoring data during the alarm reporting period may be lost.

Possible Causes

The CEP process is abnormal.

Handling Procedure

Check whether the CEP process is abnormal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su -omm** command and then the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the CEP resources managed by the HA is normal. In the single-node system, the CEP resource is in the normal state. In the dual-node system, the CEP resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to **Step 6**.
- If it is not, go to **Step 4**.

Step 4 Run the **vi ${BIGDATA_LOG_HOME}/omm/oms/cep/cep.log** and **vi ${BIGDATA_LOG_HOME}/omm/oms/cep/scriptlog/cep_ha.log** commands to view the CEP resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

Step 5 Five minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 8 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

This alarm will be automatically cleared after the fault is rectified.

Related Information

None.

11.47 ALM-12074 FMS Resource Is Abnormal

Alarm Description

HA checks the fms resources of Manager every 60 seconds. This alarm is generated when HA detects that the fms resources are abnormal for 2 consecutive times.

This alarm is cleared when the FMS resource is normal.

Resource Type of FMS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new FMS resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12074	Major	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The alarm persists for a long time, causing frequent active/standby switchovers of FusionInsight Manager. As a result, users cannot log in to FusionInsight Manager and perform O&M operations.
- The FMS process repeatedly restarts. As a result, the alarm data reported during the alarm reporting period is abnormal. In severe cases, the alarm data reported during the alarm reporting period may fail to be reported and cleared.

Possible Causes

The FMS process is abnormal.

Handling Procedure

Check whether the FMS process is abnormal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su -omm** command and then the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the FMS resources managed by the HA is normal. In the single-node system, the FMS resource is in the normal state. In the dual-node system, the FMS resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to **Step 6**.
- If it is not, go to **Step 4**.

Step 4 Run the **vi ${BIGDATA_LOG_HOME}/omm/oms/fms/fms.log** and **vi ${BIGDATA_LOG_HOME}/omm/oms/fms/scriptlog/fms_ha.log** commands to view the FMS resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

Step 5 5 minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**> **Log** > **Download**.

Step 7 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 8 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

This alarm will be automatically cleared after the fault is rectified.

Related Information

None.

11.48 ALM-12075 PMS Resource Is Abnormal

Alarm Description

HA checks the pms resources of Manager every 55 seconds. This alarm is generated when HA detects that the pms resources are abnormal for three consecutive times.

This alarm is cleared when the PMS resource is normal.

Resource Type of PMS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover

is complete and new PMS resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12075	Major	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The alarm persists for a long time, causing frequent active/standby switchovers of FusionInsight Manager. As a result, users cannot log in to FusionInsight Manager and perform O&M operations.
- The PMS process repeatedly restarts. As a result, monitoring data collection fails during the alarm reporting period. In severe cases, monitoring data may be lost during the alarm reporting period.

Possible Causes

The PMS process is abnormal.

Handling Procedure

Check whether the PMS process is abnormal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su -omm** command and then the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to

check whether the status of the PMS resources managed by the HA is normal. In the single-node system, the PMS resource is in the normal state. In the dual-node system, the PMS resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to **Step 6**.
- If it is not, go to **Step 4**.

Step 4 Run the **vi ${BIGDATA_LOG_HOME}/omm/oms/pms/pms.log** and **vi ${BIGDATA_LOG_HOME}/omm/oms/pms/scriptlog/pms_ha.log** commands to view the PMS resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

Step 5 Five minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**> **Log** > **Download**.

Step 7 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 8 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

This alarm will be automatically cleared after the fault is rectified.

Related Information

None.

11.49 ALM-12076 GaussDB Resource Is Abnormal

Alarm Description

HA checks the Manager database every 10 seconds. This alarm is generated when HA detects that the database is abnormal for 3 consecutive times.

This alarm is cleared when the database is normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12076	Major	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the database is abnormal, all core services and related service processes of Manager, such as the alarm, monitoring, and query functions, are affected.

Possible Causes

An exception occurs in the database.

Handling Procedure

Check the database status of the active and standby management nodes.

Step 1 Log in to the active and standby management nodes respectively as user **root**. Run the **su - ommdba** command to switch to user **ommdba**, and then run the **gs_ctl query** command to check whether the following information is displayed in the command output.

Command output of the active management node:

```
Ha state:
    LOCAL_ROLE: Primary
    STATIC_CONNECTIONS          : 1
    DB_STATE                    : Normal
    DETAIL_INFORMATION          : user/password invalid
Senders info:
    No information
Receiver info:
    No information
```

Command output of the standby management node:

```
Ha state:
        LOCAL_ROLE: Standby
        STATIC_CONNECTIONS          : 1
        DB_STATE                    : Normal
        DETAIL_INFORMATION          : user/password invalid
Senders info:
        No information
Receiver info:
        No information
```

- If it is, go to **Step 3**.
- If it is not, go to **Step 2**.

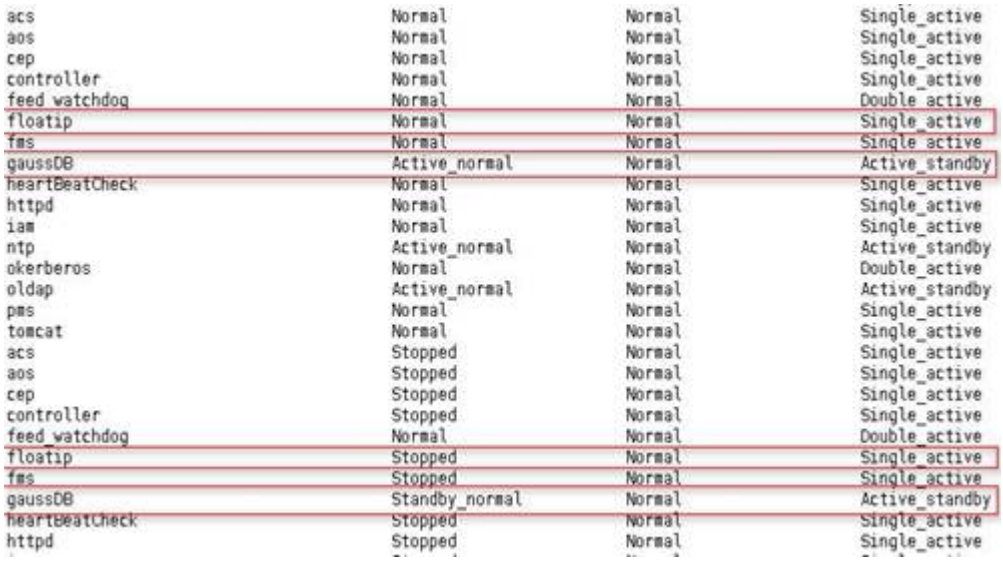
Step 2 Contact the network administrator to check whether the network is faulty.

- If it is, go to **Step 3**.
- If it is not, go to **Step 5**.

Step 3 Five minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Step 4 Log in to the active and standby management nodes, run the **su -omm** command to switch to user **omm**, go to the **${BIGDATA_HOME} /om-server/om/sbin/** directory, and run the **status-oms.sh** script to check whether the floating IP addresses and GaussDB resources of the active and standby FusionInsight Managers are in the status shown in the following figure.



acs	Normal	Normal	Single_active
aos	Normal	Normal	Single_active
cep	Normal	Normal	Single_active

- If they are, find the alarm in the alarm list and manually clear the alarm.
- If they are not, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 6 Select **OmmServer** for **Service** and click **OK**.

Step 7 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 8 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

This alarm will be automatically cleared after the fault is rectified.

11.50 ALM-12077 User omm Expired

Alarm Description

The system starts at 00:00 every day to check whether user **omm** has expired every eight hours. This alarm is generated if the user account has expired.

This alarm is cleared when the expiration time of user **omm** is changed and the user account status becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12077	Major	Security	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the details for which the alarm is generated.

Impact on the System

User **omm** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services.

Possible Causes

User **omm** has expired.

Handling Procedure

Check whether user omm in the system has expired.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l omm**command to view the information about the password of user **omm**.

Step 2 View the value of **Account expires** to check whether the user configurations have expired.

NOTE

If the parameter value is **never**, the user configurations never expire.

- If they do, go to **Step 3**.
- If they do not, go to **Step 4**.

Step 3 Run the **chage -E 'yyyy-MM-dd' omm** command to set the expiration time of user **omm**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

This alarm will be automatically cleared after the fault is rectified.

Related Information

None.

11.51 ALM-12078 Password of User omm Expired

Alarm Description

The system starts at 00:00 every day to check whether the password of user **omm** has expired every 8 hours. This alarm is generated if the password has expired.

This alarm is cleared when the expiration time of user **omm** password is changed and the user password status becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12078	Critical	Security	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the details for which the alarm is generated.

Impact on the System

The password of user **omm** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services. The **crontab** scheduled task cannot be executed, affecting the ClickHouse service.

Possible Causes

The password of user **omm** has expired.

Handling Procedure

Check whether the password of user omm in the system has expired.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l omm**command to view the information about the password of user **omm**.

Step 2 View the value of **Password expires** to check whether the user configurations have expired.

NOTE

If the parameter value is **never**, the user configurations never expire.

- If they do, go to **Step 3**.
- If they do not, go to **Step 4**.

Step 3 Run the **chage -M** '*days*' **omm** command to set the validity period of the password for user **omm**. Eight hours later, check whether the alarm is automatically cleared.

If *days* is set to **99999**, it indicates that the password never expires.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**> **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click edit icon in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

This alarm will be automatically cleared after the fault is rectified.

None.

11.52 ALM-12079 User omm Is About to Expire

Alarm Description

The system starts at 00:00 every day to check whether user **omm** is about to expire every 8 hours. This alarm is generated if the user account will expire no less than 15 days later.

This alarm is cleared when the expiration time of user **omm** is changed and the user account status becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12079	Minor	Security	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the details for which the alarm is generated.

Impact on the System

User **omm** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services.

Possible Causes

The account of user **omm** is about to expire.

Handling Procedure

Check whether user omm is about to expire.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l omm** command to view the information about the password of user **omm**.

Step 2 View the value of **Account expires** to check whether the user configurations are about to expire.

NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password are about to expire within 15 days.

- If they are, go to **Step 3**.
- If they are not, go to **Step 4**.

Step 3 Run the **chage -E** *'yyyy-MM-dd'* **omm** command to set the validity period of user **omm**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

11.57 ALM-12084 Password of User ommdba Expired

Alarm Description

The system starts at 00:00 every day to check whether the password of user **ommdba** has expired every 8 hours. This alarm is generated if the password has expired.

This alarm is cleared when the expiration time of user **ommdba** password is reset and the user password status becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12084	Major	Security	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the details for which the alarm is generated.

Impact on the System

The password of user **ommdba** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services.

Possible Causes

The password of user **ommdba** for the host has expired.

Handling Procedure

Check whether the password of user ommdba in the system has expired.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l ommdba** command to view the information about the password of user **ommdba**.

Step 2 View the value of **Password expires** to check whether the user configurations have expired.

NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password have expired.

- If they do, go to **Step 3**.
- If they do not, go to **Step 4**.

Step 3 Run the **chage -M** *'days'* **ommdba** command to set the validity period of the password for user **ommdba**. Eight hours later, check whether the alarm is automatically cleared.

If *days* is set to **99999**, it indicates that the password never expires.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

11.58 ALM-12085 Service Audit Log Dump Failure

Alarm Description

The system dumps service audit logs at 03:00 every day and stores them on the OMS node. This alarm is generated when the dump fails. This alarm is cleared when the next dump succeeds.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12085	Minor	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the details for which the alarm is generated.

Impact on the System

If the audit logs of a component fail to be dumped, the audit logs cannot be retrieved if they are aged locally. This affects service analysis and troubleshooting of the component.

Possible Causes

- The service audit logs are oversized.
- The OMS backup storage space is insufficient.
- The storage space of a host where the service is located is insufficient.

Handling Procedure

Check whether the service audit logs are oversized.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host and additional information for which the alarm is generated.

Step 2 Log in to the host where the alarm is generated as user **root**.

Step 3 Run the **vi ${BIGDATA_LOG_HOME}/controller/scriptlog/getLogs.log** command to check whether the keyword "LOG SIZE is more than 5000MB" can be searched.

- If it can, go to **Step 4**.
- If it cannot, go to **Step 5**.

Step 4 Check whether the oversized service audit logs are caused by exceptions.

The OMS backup storage space is insufficient.

Step 5 Run the **vi ${BIGDATA_LOG_HOME}/controller/scriptlog/getLogs.log** command to check whether the keyword "Collect log failed, too many logs on" can be searched.

- If it can, obtain the host IP address following the keyword "Collect log failed, too many logs on", and go to **Step 6**.
- If it cannot, go to **Step 11**.

Step 6 Log in to the host with the IP address obtained in **Step 5** as user **root**.

Step 7 Run the **vi {BIGDATA_LOG_HOME}/nodeagent/scriptlog/collectLog.log** command to check whether the keyword "log size exceeds" can be searched.

- If it can, go to **Step 9**.
- If it cannot, go to **Step 8**.

Step 8 Check whether the alarm additional information contains the keyword "no enough space".

- If yes, go to **Step 9**.
- If no, go to**Step 11**.

Step 9 Perform the following operations to expand the disk capacity or reduce the maximum number of audit log backups:

- Expand the capacity of the OMS node.
- Run the following command to edit the file and decrease the value of **MAX_NUM_BK_AUDITLOG**.

  vi ${CONTROLLER_HOME}/etc/om/componentsauditlog.properties

Step 10 In the next execution period, 03:00, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 11**.

Check whether the space of the host where the service is located is insufficient.

Step 11 Run the **vi ${BIGDATA_LOG_HOME}/controller/scriptlog/getLogs.log** command to check whether the keyword "Collect log failed, no enough space on *hostIp*" can be searched.

- If it can, obtain the IP address of the abnormal host and go to **Step 12**.
- If it cannot, go to **Step 15**.

Step 12 Log in to the host with the IP address obtained as user **root**, and run the **df "$BIGDATA_HOME/tmp" -lP | tail -1 | awk '{print ($4/1024)}'** command to obtain the remaining space of the host log directory. Check whether the value is less than 1000 MB.

- If it is, go to **Step 13**.
- If it is not, go to **Step 15**.

Step 13 Expand the capacity of the node.

Step 14 In the next execution period, 03:00, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 15**.

Collect fault information.

Step 15 On FusionInsight Manager, choose **O&M**> **Log** > **Download**.

Step 16 Select **Controller** for **Service** and click **OK**.

Step 17 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 18 Contact the O&M engineers and send the collected log information.

11.59 ALM-12087 System Is in the Upgrade Observation Period

Alarm Description

The system checks whether it is in the upgrade observation period at 00:00 every day and checks whether the duration that it has been in the upgrade observation state exceeds the preset upgrade observation period, 10 days by default. This alarm is generated when the system is in the upgrade observation period and the duration that the system has been in the upgrade observation state exceeds the preset period (10 days by default). This alarm is automatically cleared if the

system exits the upgrade observation period after the user performs a rollback or submission.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12087	Major	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the details for which the alarm is generated.

Impact on the System

During the upgrade observation period, do not add or delete users, instances, roles, services, hosts, or resource pools that affect the management topology.

Possible Causes

The upgrade task is not submitted a specified period of time (10 days by default) after the system upgrade.

Handling Procedure

Check whether the system is in the upgrade observation period.

Step 1 Log in to the active management node as user **root**.

Step 2 Run the following commands to switch to user **omm** and log in to the **omm** database:

su - omm

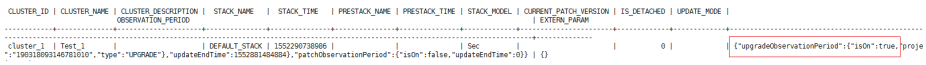
gsql -U omm -W *omm database password* **-p 20015**

Step 3 Run the **select * from OM_CLUSTERS** command to view cluster information.

Step 4 Check whether the value of **upgradObservationPeriod isON** is **true**, as shown in **Figure 11-5**.

- If it is, the system is in the upgrade observation period. Use the UpdateTool to submit the upgrade task. For details, see the upgrade guide of the corresponding version.
- If it is not, go to **Step 6**.

Figure 11-5 Cluster information



Step 5 In the early morning of the next day, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Controller** from the **Service** and click **OK**.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

This alarm will be automatically cleared after the fault is rectified.

Related Information

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger condition	Specifies the trigger condition of the alarm.

Impact on the System

- Data transmission becomes slow or interrupted. Data may be lost or incomplete.
- Task scheduling is affected. For example, Yarn tasks cannot be executed properly or fail to be executed due to timeout.
- Data processing is affected. For example, HDFS data synchronization fails or the data is inaccurate.
- System performance deteriorates. The efficiency and quality of data processing is low.

Possible Causes

- A node breaks down.
- The network is faulty.

Handling Procedure

Check the network health status.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, click ⌄, and view the description in additional information. Record the source IP address and destination IP address of the node for which the alarm is reported.

Step 2 Log in to the node for which the alarm is reported . On the node, ping the target node to check whether the network between the two nodes is normal.

- If yes, go to **6**.
- If no, go to **3**.

Check the node status.

Step 3 On FusionInsight Manager, click **Host** and check whether the host list contains the faulty node to determine whether the faulty node has been removed from the cluster.

- If yes, go to **5**.
- If no, go to **4**.

Step 4 Check whether the faulty node is powered off.

- If yes, start the node and go to **Step 2**.
- If no, contact the engineer in charge to locate the fault. If you need to remove the faulty node from the cluster, go to **5**. If you do not need, go to **6**.

Step 5 Remove the faulty node from the **$NODE_AGENT_HOME/etc/agent/hosts.ini** file on all nodes in the cluster, clear the **/var/log/Bigdata/unreachable/unreachable_ip_info.log** file, and clear the alarm.

Step 6 Wait 30 seconds, check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, select **OmmAgent** for the target cluster, and click **OK**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.61 ALM-12099 Core Dump for Cluster Processes

Alarm Description

Core files generated when applications crash are centrally managed on a cluster. This alarm is generated when a new core file is detected.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12099	Minor	Quality of service	FusionInsight Manager	No

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
	Viewing the timestamp	Timestamp
Additional Information	Details	Specifies alarm details.

Impact on the System

If a key process crashes, the cluster may be unavailable for a short period of time.

Possible Causes

Processes crash.

Handling Procedure

> **CAUTION**
>
> - The following operations for parsing and viewing core file stack information may involve sensitive user data. Developers or O&M engineers can perform these operations only after being authorized by users.
> - By default, the system keeps the core files the alarm is generated for for 72 hours. The system automatically clears the files upon expiration or if the files are too large. If this alarm is report, contact O&M engineers as soon as possible.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, view the host address for which the alarm is generated in the alarm details, and view the path for storing the core files specified by the **DumpedFilePath** attribute in the additional information.

Step 2 Log in to the host for which the alarm is generated as user **omm** and run the **gdb --version** command to check whether the gdb tool is installed on the host.

- If no, install the gdb tool and then go to **Step 3**.
- If yes, go to **Step 3**.

Step 3 Use the gdb tool to view the detailed stack information about the core files.

1. Go to the **DumpedFilePath** directory and find the core files.
2. Run the following command to obtain the symbol table of the core files:

   source $BIGDATA_HOME/mppdb/.mppdbgs_profile

   cd ${BIGDATA_HOME}/FusionInsight_MPPDB_*XXX*/install/FusionInsight-MPPDB-*XXX*/package/MPPDB_ALL_PACKAGE

   tar -xzvf GaussDB-Kernel-V300R002C00- *Operating system*-**64bit-symbol.tar.gz**

   cd symbols/bin/

   Find the symbol table file whose name is the same as the process name in the alarm. For example, the symbol table of **cm_agent** is **cm_agent.symbol**.

   Copy the symbol table to the **${GAUSSHOME}/bin** directory.
3. Run the **gdb --batch -n -ex thread -ex bt** *Core file name* command to view the detailed stack information about the core file.

Step 4 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system does not automatically clear this alarm and you need to manually clear the alarm.

Related Information

None.

11.62 ALM-12101 AZ Unhealthy

Alarm Description

After the AZ DR function is enabled, the system checks the AZ health status every 5 minutes. This alarm is generated when the system detects that the AZ is subhealthy or unhealthy. This alarm is cleared when the AZ becomes healthy.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12101	Critical	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	AZName	Specifies the AZ for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the details for which the alarm is generated.

Impact on the System

The health status of an AZ is determined by whether the health status of storage resources (HDFS), computing resources (Yarn), and key roles in the AZ exceeds the configured threshold.

An AZ is subhealthy when:

- The computing resources (Yarn) are unhealthy, but the storage resources (HDFS) are healthy. Tasks cannot be submitted to the local AZ, but data can still be read and written in the local AZ.
- The computing resources (Yarn) are healthy, but some storage resources (HDFS) are unhealthy. Tasks can be submitted to the local AZ, and some data

can be read and written in the local AZ. This depends on the locality of data detected by Spark/Hive scheduling.

An AZ is unhealthy when:

- The computing resources (Yarn) are healthy, but the storage resources (HDFS) are unhealthy. Although tasks can be submitted to the local AZ, data cannot be read or written in the local AZ. As a result, the tasks submitted to the local AZ are invalid.
- The computing resources (Yarn) and storage resources (HDFS) are unhealthy. Tasks cannot be submitted to the local AZ, and data cannot be read or written in the local AZ.
- The health status of key roles except Yarn and HDFS is lower than the configured threshold.

Possible Causes

- The computing resources (Yarn) are unhealthy.
- The storage resources (HDFS) are unhealthy.
- Some storage resources (HDFS) are unhealthy.
- Key roles except Yarn and HDFS are unhealthy.

Handling Procedure

Disable the DR drill.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Cross-AZ HA**. The Cross-AZ HA page is displayed.

Step 2 In the AZ DR list, check whether **Perform DR Drill** in the **Operation** column of the AZ whose health status is **Unhealthy** is gray.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Click **Restore** in the **Operation** column of the target AZ. Wait 2 minutes and refresh the page to view the health status of the AZ. Check whether the health status is normal.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect the fault information.

Step 4 Log in to the active management node as user **root**.

Step 5 View logs of unhealthy services.

- HDFS log files are stored in **/var/log/Bigdata/hdfs/nn/hdfs-az-state.log**.
- Yarn log files are stored in **/var/log/Bigdata/yarn/rm/yarn-az-state.log**.
- For other services, view the service health check logs in the corresponding service log directory.

Step 6 Contact O&M engineers and provide detailed log file information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.63 ALM-12102 AZ HA Component Is Not Deployed Based on DR Requirements

Alarm Description

The alarm module checks the deployment status of AZ HA components every 5 minutes. This alarm is generated when the components that support DR are not deployed based on DR requirements after AZ is enabled. This alarm is cleared when the components are deployed based on DR requirements.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12102	Major	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
Additional Information	Details	Specifies alarm details.

Impact on the System

The cross-AZ HA capability of a single cluster is affected.

Possible Causes

The roles of the components that support DR are not deployed based on DR requirements.

Handling Procedure

Obtain alarm information.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, click ⌄ in the row that contains the alarm and view the roles that are not deployed based on DR requirements in **Additional Information**.

Redeploy the role instance.

Step 3 Choose **Cluster** > **Services** > *Name of the desired service* > **Instance**. On the instance page, redeploy or adjust the role instance.

Step 4 Wait 10 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, contact O&M engineers.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.64 ALM-12110 Failed to get ECS temporary AK/SK

Alarm Description

Meta calls the ECS API to obtain the AK/SK information every 5 minutes and caches the information. Before the AK/SK expires, Meta calls the API again to update it. This alarm is generated when Meta fails to call the API for three consecutive times.

This alarm is cleared when Meta successfully calls the ECS API.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12110	Major	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the details for which the alarm is generated.

Impact on the System

The cluster cannot obtain the latest temporary AK/SK. In the storage and compute separation scenario, OBS may fail to be accessed. As a result, component services cannot be properly processed.

Possible Causes

- The meta role of the MRS cluster is abnormal.
- The cluster has been bound to an agency and accessed OBS but has been unbound from the agency. As a result, the cluster has not been bound to any agency.

Handling Procedure

Check the status of the meta role.

Step 1 On FusionInsight Manager of the cluster, choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, click ⌄ in the row containing the alarm, and determine the IP address of the host for which the alarm is generated.

Step 2 On FusionInsight Manager of the cluster, choose **Cluster** > **Services** > **meta**. On the page that is displayed, click the **Instance** tab, and check whether the meta role corresponding to the host for which the alarm is generated is normal.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Select the abnormal role, click **More**, and select **Restart Instance** to restart the abnormal meta role.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Log in to the host obtained in **Step 1** and check whether the **/var/log/Bigdata/meta/mrs-meta.log** file contains error information. If yes, rectify the fault based on the log information.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Rebind the cluster to an agency.

Step 7 Log in to the MRS management console.

Step 8 In the navigation pane on the left, choose **Clusters** > **Active Clusters**. On the page that is displayed, click the cluster name to go to its overview page. Then, check whether the cluster is bound to an agency in the O&M management area.

- If yes, go to **Step 10**.
- If no, go to **Step 9**.

Step 9 Click **Manage Agency**. On the page that is displayed, rebind the cluster to an agency. Then check whether the alarm is cleared a few minutes later.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On FusionInsight Manager of the active cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, select **meta** for the target cluster, and click **OK**.

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.65 ALM-12180 Suspended Disk I/O

Alarm Description

- For HDDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency reaches 6 seconds within 30 seconds in at least seven collection periods.

  - By default, the system collects data every 3 seconds. Disk queue depth (**avgqu-sz**) > 0 and IOPS = 0, or bandwidth = 0 and **ioutil** > 99% in at least 10 collection periods within 30 seconds.
  - By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 1000 ms within 300 seconds.
- For SSDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency reaches 3 seconds within 30 seconds in at least seven collection periods.
  - By default, the system collects data every 3 seconds. Disk queue depth (**avgqu-sz**) > 0 and IOPS = 0, or bandwidth = 0 and **ioutil** > 99% in at least 10 collection periods within 30 seconds.
  - By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 500 ms within 300 seconds.

The collection period is 3 seconds, and the detection period is 30 or 300 seconds. This alarm is automatically cleared when none of the conditions are met for three consecutive detection periods (30 or 300 seconds).

NOTE

- Run the following command in the OS to collect data:

  iostat -x -t 1 1

  Parameters in the command output are as follows:

  avgqu-sz indicates the disk queue depth.

  The sum of **r/s** and **w/s** is the IOPS.

  The sum of **rkB/s** and **wkB/s** is the bandwidth.

  %util is the **ioutil** value.

- Calculate **svctm** as follows:

  svctm = (tot_ticks_new - tot_ticks_old) / (rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old)

  When the detection period is 30 seconds, if **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0**, then **svctm = 0**.

  When the detection period is 300 seconds and **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0**, if **tot_ticks_new - tot_ticks_old = 0**, then **svctm = 0**; otherwise, the value of **svctm** is infinite.

  The parameters can be obtained as follows:

  The system runs the **cat /proc/diskstats** command every 3 seconds to collect data.

  In the data collected for the first time, the number in the fourth column is the **rd_ios_old** value, the number in the eighth column is the **wr_ios_old** value, and the number in the thirteenth column is the **tot_ticks_old** value.

  In the data collected for the second time, the number in the fourth column is the **rd_ios_new** value, the number in the eighth column is the **wr_ios_new** value, and the number in the thirteenth column is the **tot_ticks_new** value.

  In this case, the value of **svctm** is as follows:

  (19571460 - 19569526) / (1101553 + 28747977 - 1101553 - 28744856) = 0.6197

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12180	Major	Physical resource	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
	DiskName	Specifies the disk for which the alarm was generated.
Additional Information	Disk ESN	Specifies the serial number of the disk for which the alarm was generated.

Impact on the System

If the I/O usage keeps increasing, operations will be affected and services will be interrupted. The possible impacts are as follows:

- The system I/O performance deteriorates, which means slow response and low throughput. For example, job submission is slow, page responds slowly, interface response times out, and the system is in error or even crash.
- Customer services may be interrupted. The system may break down and the key information stored on the faulty disk may be lost.

Possible Causes

The disk is aged.

Handling Procedure

Replace the disk.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**.

Step 2 View the detailed information about the alarm. Check the values of **HostName** and **DiskName** in the location information to obtain the information about the faulty disk for which the alarm is reported.

Step 3 Check whether the host for which the alarm is generated is the active OMS node or the active node of the instance in active/standby mode.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Log in to the node for which the alarm is generated as the **root** user and run the following command to check the mount point of the faulty disk:

df -h | grep "*Name of the faulty disk*"

Check whether the mount point partition of the faulty disk is the cluster software installation directory (**${BIGDATA_HOME}**) or data disk directory (**${BIGDATA_DATA_HOME}** by default).

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Trigger an active/standby switchover to rectify the fault.

- Active OMS node

  If O&M operations cannot be performed due to slow disk faults, such as system freezing, delayed page refreshing, or slow API response, and the alarm is generated for the active OMS node, perform the following operations to trigger an active/standby switchover to restore services:

  a. Log in to the active OMS node as user **omm**.

  b. Run the following command to perform an active/standby switchover:

     - For the IPv4 network: **${OMS_RUN_PATH}/workspace/ha/module/hacom/tools/ha_client_tool --ip=127.0.0.1 --port=20013 --switchover --name=product**
     - For the IPv6 network: **${OMS_RUN_PATH}/workspace/ha/module/hacom/tools/ha_client_tool --ip=::1 --port=20013 --switchover --name=product**

  c. After the active/standby switchover is successful, the system recovers. Perform **Step 6** to replace the faulty disk.

- Active node of an active/standby instance

  If the alarm is generated for the active node of an instance in active/standby mode and the slow disk fault affects the running of the instance, trigger an active/standby switchover on FusionInsight Manager to restore services.

  a. Log in to FusionInsight Manager and choose **Cluster** > **Services** > *Name of the desired service*.

  b. On the service details page, expand the **More** drop-down list and select **Perform** *xxx* **Switchover**.

  c. In the displayed dialog box, enter the password of the current login user and click **OK**.

  d. In the displayed dialog box, click **OK** to perform active/standby switchover.

  e. After the active/standby switchover is successful, the system recovers. Perform **Step 6** to replace the faulty disk.

Step 6 Replace the hard disk.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Select **OMS** for **Service** and click **OK**.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.66 ALM-12190 Number of Knox Connections Exceeds the Threshold

Alarm Description

The system periodically checks the number of connections in all Knox topologies. This alarm is generated when the number of connections in a topology exceeds the threshold (90% by default). This alarm is automatically cleared when the number falls below the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12190	Major	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

	Topology	Specifies the Knox topology for which the alarm was generated.

Impact on the System

The topology may reach the upper limit of connections and fail to forward requests, adversely affecting the MRS functions.

Possible Causes

Hue or Manager is too frequently used, but the default maximum number of Knox connections is small.

Handling Procedure

Step 1 Log in to active and standby OMS nodes as user **root**, respectively.

Step 2 Add the following configuration to the **gateway-site.xml** file on the active and standby OMS nodes to increase the number of thread pools:

vi /opt/knox/conf/gateway-site.xml

```
<property>
<name>gateway.httpclient.maxConnections</name>
<value>64</value>
</property>
```

Step 3 Log in to the active OMS node as user **omm** and run the following command to restart the Knox process:

sh /opt/knox/bin/restart-knox.sh

Step 4 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Contact to rectify the fault.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.67 ALM-12191 Disk I/O Usage Exceeds the Threshold

Alarm Description

The system checks the disk I/O usage every 30 seconds and compares the actual disk I/O usage with the threshold. This alarm is generated when the disk I/O usage exceeds the threshold for multiple consecutive times (**3** by default).

If the **hit number** is **1**, this alarm is cleared when the disk I/O usage is less than or equal to the threshold. If the **hit number** is greater than **1**, this alarm is cleared when the disk I/O usage is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12191	Major	Physical resource	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

- Latency: Service processes may run slowly and there is a latency.
- Service failure: Service processing may be slow, time out, or fail. As a result, jobs may fail to run.

Possible Causes

- The alarm threshold or alarm trigger count is improperly configured.
- The disk configuration cannot meet service requirements. The disk I/O usage reaches the upper limit. Alternatively, services are in peak hours. The disk I/O usage reaches the upper limit in a short period.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Modify the alarm threshold and alarm trigger count based on the actual disk I/O usage.

1. Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Host** > **Disk** > **Disk IO Utilization**.
2. Click the edit button next to **Trigger Count** to change it to a proper value based on the actual service usage.

   NOTE

   Trigger Count indicates how many consecutive times the threshold is reached when the alarm is triggered.
3. Click **Modify** in the **Operation** column of the row that contains the rule and change the alarm threshold.

Step 2 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check whether the disk I/O usage reaches the upper limit.

Step 3 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, expand the alarm details and click the name of the host for which the alarm is generated in **Location** area.

Step 4 On the overview page of the host, observe the real-time data of the disk I/O usage for about 5 minutes. If the disk I/O usage exceeds the threshold for multiple times, contact the MRS cluster administrator to improve the disk specification.

If **Disk IO Utilization** chart is not displayed, click the drop-down arrow on the right, select **Customize**, select the desired item, and click **OK**.

Step 5 Check whether it was the peak hour. If this alarm was generated during peak hours, expand the node capacity or contact the MRS cluster administrator to improve the disk specification.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, select **NodeAgent** for the target cluster, and click **OK**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.68 ALM-12192 Host Load Exceeds the Threshold

Alarm Description

The system checks the average load every 30 seconds and compares the actual average load with the threshold. This alarm is generated when the average load exceeds the threshold for multiple consecutive times (10 by default).

This alarm is cleared when **Trigger Count** is **1** and the average load is less than or equal to the threshold. This alarm is cleared when **Trigger Count** is greater than 1 and the average load is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12192	Major	Physical resource	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.

Type	Parameter	Description
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

- Latency: Service processes may run slowly and there is a latency.
- Service failure: Service processing may be slow, time out, or fail. As a result, jobs may fail to run.

Possible Causes

- The alarm threshold or alarm trigger count is improperly configured.
- The host cannot meet service requirements. The average load reaches the upper limit. Alternatively, requirements surged during peak hours, and the average load reaches the upper limit in a short period.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Modify the alarm threshold and alarm trigger count based on the actual CPU usage.

1. To change the threshold, log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Host** > **Host Status** > **Average Host Load Information**.
2. Click the edit button next to **Trigger Count** to set it a proper value based on the actual service usage.

   NOTE

   Trigger Count indicates how many consecutive times the threshold is reached when the alarm is triggered.
3. Click **Modify** in the **Operation** column of the row that contains the rule and change the alarm threshold.

Step 2 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check whether the average load reaches the upper limit.

Step 3 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, expand the alarm details and click the name of the host for which the alarm is generated in **Location** area.

Step 4 On the overview page of the host, observe the real-time data of average host load for about 5 minutes. If the average load exceeds the threshold for multiple times, contact the MRS cluster administrator to improve the host specification.

If **Average Host Load Information** chart is not displayed, click the drop-down arrow on the right, select **Customize**, select the desired item, and click **OK**.

Step 5 Check whether it was the peak hour. If this alarm was generated during peak hours, expand the node capacity or contact the MRS cluster administrator to improve the host specification.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, select **NodeAgent** for the target cluster, and click **OK**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.69 ALM-12200 Password Is About to Expire

Alarm Description

The system checks whether a user password is about to expire at 1:00 a.m. every day. This alarm is generated when a user password is about to expire in less than 5 days by default.

This alarm is cleared when the password is about to expire in more than five days by default.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12200	Major	Security	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
Additional Information	Details	Specifies that the username of password that is about to expire.

Impact on the System

The account cannot be used.

Possible Causes

The password is about to expire.

Handling Procedure

Change the user password.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the alarm list, expand the alarm details, and view and record the name of the user whose password is about to expire in additional information.

Step 2 Change the password.

For details, see "Account Management" in .

Step 3 Check whether the alarm is automatically cleared after 1:00 a.m. the next day.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Select **Controller** for **Service** and click **OK**.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.70 ALM-12201 Process CPU Usage Exceeds the Threshold

Alarm Description

The system checks the CPU usage every 30 seconds and compares the check result with the default threshold. This alarm is generated when the CPU usage exceeds the threshold for multiple consecutive times (**10** by default).

This alarm is cleared when **Trigger Count** is **1** and the CPU usage is less than or equal to the threshold. This alarm is cleared when **Trigger Count** is greater than 1 and the CPU usage is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12201	Major	Physical resource	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.

Type	Parameter	Description
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

- Latency: Service processes may run slowly and there is a latency.
- Service failure: Service processing may be slow, time out, or fail. As a result, jobs may fail to run.

Possible Causes

- The alarm threshold or alarm trigger count is improperly configured.
- The CPU configuration cannot meet service requirements, and the CPU usage reaches the upper limit. Alternatively, services are in peak hours. The CPU usage reaches the upper limit in a short period.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Modify the alarm threshold and alarm trigger count based on the actual CPU usage.

1. Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Thresholds** > **OMS** > **OMSServices** > **CPU** > **Process Used CPU (OMS)**.
2. Click the edit button next to **Trigger Count** to set it a proper value based on the actual service usage.

   NOTE

   Trigger Count indicates how many consecutive times the threshold is reached when the alarm is triggered.
3. Click **Modify** in the **Operation** column of the row that contains the rule and change the alarm threshold.

Step 2 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check whether the CPU usage reaches the upper limit.

Step 3 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, expand the alarm details and click the name of the host for which the alarm is generated in **Location** area.

Step 4 On the overview page of the host, observe the real-time data of the host CPU usage for about 5 minutes. If the CPU usage exceeds the threshold for multiple times, contact the MRS cluster administrator to increase the CPU.

If no chart is available, click the drop-down arrow on the right, select **Customize**, select the desired item, and click **OK**.

Step 5 Check whether it was the peak hour. If this alarm was generated during peak hours, expand the node capacity or contact the MRS cluster administrator to improve the CPU specification.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, select **OmmServer** for the target cluster, and click **OK**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.71 ALM-12202 Process Memory Usage Exceeds the Threshold

Alarm Description

The system checks the memory usage of main OMS processes every 30 seconds. This alarm is generated when the memory usage of main OMS processes is greater than 90% (default value) of the maximum memory.

This alarm is cleared when the memory usage of main OMS processes is less than or equal to 90% of the maximum memory.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12202	Major	Quality of service	OMS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the memory usage of main OMS processes is too high, the performance of these processes deteriorates, and even memory overflow occurs. As a result, main OMS processes are unavailable, and OMS tasks are slow or fail to run.

Possible Causes

The memory usage of main OMS processes is too high or the memory is inappropriately allocated.

Handling Procedure

Check the memory usage of main OMS processes.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, expand the alarm details, record the process name in **Location**, click the reported host name, and record the service IP address of the host.

Step 2 Choose **System** > **OMS** to view the **OMS Process Memory Usage Ratio** chart. Check whether the memory usage of the processes reaches the threshold (90% by default) at the time when the alarm is generated.

If no chart is available, click the drop-down arrow on the right, select **Customize**, select the desired item, and click **OK**.

- If yes, go to **Step 3**.
- If the threshold is not reached, go to **Step 6**.

Step 3 Contact O&M engineers to modify the memory configurations of the processes.

Step 4 Restart the processes for which the alarm is generated.

Step 5 Check whether the alarm is cleared in 10 minutes.

- If yes, no further action is required.
- If the threshold is not reached, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **OmmServer** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.72 ALM-12203 Process Full GC Duration Exceeds the Threshold

Alarm Description

The system checks the GC duration of main OMS processes every 30 seconds. If the GC duration of an OMS process exceeds the threshold for three consecutive times, this alarm is generated. You can choose **O&M** > **Alarm** > **Thresholds** > **OMS** > **OMSServices** to change the threshold.

This alarm is cleared when the GC duration of the OMS process is shorter than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12203	Major	Quality of service	Hive	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger condition	Specifies the alarm triggering condition.

Impact on the System

Read and write performance deteriorates. As a result, the task execution may slow down and even the service may restart unexpectedly.

Possible Causes

The memory of main OMS processes is too high or inappropriately allocated, causing frequent occurrence of the full GC.

Handling Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, expand the alarm details, record the process name in **Location**, click the reported host name, and record the service IP address of the host.

Step 2 Choose **System** > **OMS**, view the Full GC Times of OMS Process chart, and check whether the GC time is longer than 12 seconds (default value).

If no chart is available, click the drop-down arrow on the right, select **Customize**, select the desired item, and click **OK**.

- If yes, go to **Step 3**.

- If no, go to **Step 6**.

Step 3 Contact O&M engineers to modify the memory configurations of the processes.

Step 4 Restart the process.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **OmmServer** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.73 ALM-12204 Wait Duration of a Disk Read Exceeds the Threshold

Alarm Description

The system checks the wait duration of a disk read every 30 seconds and compares the actual wait duration with the threshold. This alarm is generated when the wait duration exceeds the threshold (10s by default) for multiple consecutive times.

This alarm is cleared when the wait duration is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12204	Major	Physical resource	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

- Latency: Service processes may run slowly and there is a latency.
- Service failure: Service processing may be slow, time out, or fail. As a result, jobs may fail to run.

Possible Causes

- The alarm threshold or alarm trigger count is improperly configured.
- The disk configuration cannot meet service requirements. The disk I/O performance reaches the upper limit. Alternatively, services are in peak hours. The wait duration of a disk read reaches the upper limit in a short period.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Modify the alarm threshold and alarm trigger count based on the actual disk I/O usage.

1. Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Disk** > **Average Time Required for Each Read operation**.
2. Click the edit button next to **Trigger Count** to set it a proper value based on the actual service usage.

   NOTE

   Trigger Count indicates how many consecutive times the threshold is reached when the alarm is triggered.
3. Click **Modify** in the **Operation** column of the row that contains the rule and change the alarm threshold.

Step 2 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check whether the average time required for each read operation reaches the upper limit.

Step 3 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, expand the alarm details and click the name of the host for which the alarm is generated in **Location** area.

Step 4 On the overview page of the host, observe the real-time data of average time required for each read operation for about 5 minutes. If the wait duration exceeds the threshold for multiple times, contact the MRS cluster administrator to improve the disk specification.

If the **Average Time Required for Each Read Operation** chart is unavailable, click the drop-down arrow on the right, select **Customize**, select the corresponding item, and click **OK**.

Step 5 Check whether it was the peak hour. If this alarm was generated during peak hours, expand the node capacity or contact the MRS cluster administrator to improve the disk specification.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, select **NodeAgent** for the target cluster, and click **OK**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.74 ALM-12205 Wait Duration of a Disk Write Exceeds the Threshold

Alarm Description

The system checks the wait duration of a disk write every 30 seconds and compares the actual wait duration with the threshold. This alarm is generated when the wait duration exceeds the threshold (10s by default) for multiple consecutive times.

This alarm is cleared when the wait duration is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12205	Major	Physical resource	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

- Latency: Service processes may run slowly and there is a latency.
- Service failure: Service processing may be slow, time out, or fail. As a result, jobs may fail to run.

Possible Causes

- The alarm threshold or alarm trigger count is improperly configured.

- The disk configuration cannot meet service requirements. The disk I/O performance reaches the upper limit. Alternatively, services are in peak hours. The wait duration of a disk write reaches the upper limit in a short period.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Modify the alarm threshold and alarm trigger count based on the actual disk I/O usage.

1. Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Disk** > **Average Time Required for Each Write Operation**.
2. Click the edit button next to **Trigger Count** to set it a proper value based on the actual service usage.

   NOTE

   Trigger Count indicates how many consecutive times the threshold is reached when the alarm is triggered.
3. Click **Modify** in the **Operation** column of the row that contains the rule and change the alarm threshold.

Step 2 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check whether the average time required for each write operation reaches the upper limit.

Step 3 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, expand the alarm details and click the name of the host for which the alarm is generated in **Location** area.

Step 4 On the overview page of the host, observe the real-time data of average time required for each write operation for about 5 minutes. If the wait duration exceeds the threshold for multiple times, contact the MRS cluster administrator to improve the disk specification.

If the **Average Time Required for Each Write Operation** chart is not displayed, click the drop-down arrow on the right, select **Customize**, select the desired item, and click **OK**.

Step 5 Check whether it was the peak hour. If this alarm was generated during peak hours, expand the node capacity or contact the MRS cluster administrator to improve the disk specification.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, select **NodeAgent** for the target cluster, and click **OK**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.75 ALM-12206 Password Has Expired

Alarm Description

The system checks whether a user password has expired at 1:00 a.m. every day. This alarm is generated when a user password has expired.

This alarm is cleared when the user password in the system is within the validity period.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
12206	Major	Security	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
Additional Information	Details	Specifies that the username of password that has expired.

Impact on the System

The account cannot be used.

Possible Causes

The user password has expired.

Handling Procedure

Change the user password.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the alarm list, expand the alarm details, and view and record the name of the user whose password has expired in additional information.

Step 2 Change the user password that has expired.

For details, see "Account Management" in .

Step 3 Check whether the alarm is automatically cleared after 1:00 a.m. the next day.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Select **Controller** for **Service** and click **OK**.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.76 ALM-13000 ZooKeeper Service Unavailable

Alarm Description

The system checks the ZooKeeper service status every 60 seconds. This alarm is generated when the ZooKeeper service is unavailable.

This alarm is cleared when the ZooKeeper service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
13000	Critical	Quality of service	ZooKeeper	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

ZooKeeper cannot provide coordination services for upper layer components and the components (such as Yarn and Flink) that depend on ZooKeeper may not run properly.

Possible Causes

- The DNS is installed on the ZooKeeper node.
- The network is faulty.
- The KrbServer service is abnormal.
- The ZooKeeper instance is abnormal.
- The disk capacity is insufficient.

Handling Procedure

Check the DNS.

Step 1 Check whether the DNS is installed on the node where the ZooKeeper instance is located. On the Linux node where the ZooKeeper instance is located, run the **cat /etc/resolv.conf** command to check whether the file is empty.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Run the **service named status** command to check whether the DNS is started.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Run the **service named stop** command to stop the DNS service. If "Shutting down name server BIND waiting for named to shut down (28s)" is displayed, the DNS service is stopped successfully. Comment out the content (if any) in **/etc/resolv.conf**.

Step 4 On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the network status.

Step 5 On the Linux node where the ZooKeeper instance is located, run the **ping** command to check whether the host names of other nodes where the ZooKeeper instance is located can be pinged successfully.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

Step 6 Modify the IP addresses in **/etc/hosts** and add the host name and IP address mapping.

Step 7 Run the **ping** command again to check whether the host names of other nodes where the ZooKeeper instance is located can be pinged successfully.

- If yes, go to **Step 8**.
- If no, go to **Step 23**.

Step 8 On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check the KrbServer service status (Skip this step if the normal mode is used).

Step 9 On FusionInsight Manager, choose **Cluster >** *Name of the desired cluster* **> Services**.

Step 10 Check whether the KrbServer service is normal.

- If yes, go to **Step 13**.
- If no, go to **Step 11**.

Step 11 Perform operations based on "ALM-25500 KrbServer Service Unavailable" and check whether the KrbServer service is recovered.

- If yes, go to **Step 12**.
- If no, go to **Step 23**.

Step 12 On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Check the ZooKeeper service instance status.

Step 13 On FusionInsight Manager, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **quorumpeer**.

Step 14 Check whether the ZooKeeper instances are normal.

- If yes, go to **Step 18**.
- If no, go to **Step 15**.

Step 15 Select instances whose status is not good, and choose **More** > **Restart Instance**.

Step 16 Check whether the instance status is good after restart.

- If yes, go to **Step 17**.
- If no, go to **Step 18**.

Step 17 On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Check disk status.

Step 18 On FusionInsight Manager, choose **Cluster >** *Name of the desired cluster* **> Service** > **ZooKeeper** > **quorumpeer**, and check the node host information of the ZooKeeper instance.

Step 19 On FusionInsight Manager, click **Host**.

Step 20 In the **Disk** column, check whether the disk space of each node where ZooKeeper instances are located is insufficient (disk usage exceeds 80%).

- If yes, go to **Step 21**.
- If no, go to **Step 23**.

Step 21 Expand disk capacity. For details, see "ALM-12017 Insufficient Disk Capacity".

Step 22 On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 23**.

Collect fault information.

Step 23 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 24 Select the following nodes in the required cluster from the **Service**: (KrbServer logs do not need to be downloaded in normal mode.)

- ZooKeeper
- KrbServer

Step 25 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 26 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.77 ALM-13001 Available ZooKeeper Connections Are Insufficient

Alarm Description

The system checks ZooKeeper connections every 60 seconds. This alarm is generated when the system detects that the number of used ZooKeeper instance connections exceeds the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the number of used ZooKeeper instance connections is smaller than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the number of used ZooKeeper instance connections is smaller than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
13001	Critical (default threshold: 90%) Major (default threshold: 80%)	Quality of service	ZooKeeper	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.

Type	Parameter	Description
	HostName	Specifies the host name for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Available ZooKeeper connections are insufficient. When the connection usage reaches 100%, the ZooKeeper cannot process external connections. As a result, upstream components (such as Yarn and Flink) cannot run properly.

Possible Causes

The number of connections to the ZooKeeper node exceeds the threshold. Connection leakage occurs on some connection processes, or the maximum number of connections does not comply with the actual scenario.

Handling Procedure

Check connection status.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **Available ZooKeeper Connections Are Insufficient** and confirm the node IP address of the host for which the alarm is generated in the Location Information.

Step 2 Obtain the PID of the ZooKeeper process. Log in to the node involved in this alarm as user **root** and run the **pgrep -f proc_zookeeper** command.

Step 3 Check whether the PID can be correctly obtained.

- If yes, go to **Step 4**.
- If no, go to **Step 15**.

Step 4 Obtain all the IP addresses connected to the ZooKeeper instance and the number of connections and check 10 IP addresses with top connections. Run the following command based on the obtained PID: **lsof -i|grep** *$pid* **| awk '{print $9}' | cut -d : -f 2 | cut -d \>-f 2 | awk '{a[$1]++} END {for(i in a){print i,a[i] | "sort -r -g -k 2"}}' | head -10**. (The PID obtained in the preceding step is used.)

Step 5 Check whether node IP addresses and number of connections are successfully obtained.

- If yes, go to **Step 6**.
- If no, go to **Step 15**.

Step 6 Obtain the ID of the port connected to the process. Run the following command based on the obtained PID and IP address: **lsof -i|grep** *$pid* **| awk '{print $9}'|cut -d \> -f 2 |grep** *$IP*| **cut -d : -f 2**. (The PID and IP address obtained in the preceding step are used.)

Step 7 Check whether the port ID is successfully obtained.

- If yes, go to **Step 8**.
- If no, go to **Step 15**.

Step 8 Obtain the ID of the connected process. Log in to each IP address and run the following command based on the obtained port ID: **lsof -i|grep** *$port*. (The port ID obtained in the preceding step is used.)

Step 9 Check whether the process ID is successfully obtained.

- If yes, go to **Step 10**.
- If no, go to **Step 15**.

Step 10 Check whether connection leakage occurs on the process based on the obtained process ID.

- If yes, go to **Step 11**.
- If no, go to **Step 12**.

Step 11 Close the process where connection leakage occurs and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Step 12 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer** > **Performance** and increase the value of **maxCnxns** as required.

Step 13 Save the configuration and restart the ZooKeeper service.

Step 14 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect fault information.

Step 15 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 16 Select **ZooKeeper** in the required cluster from the **Service**:

Step 17 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact the O&M engineers and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.78 ALM-13002 ZooKeeper Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the ZooKeeper service every 30 seconds. The alarm is generated when the direct memory usage of a ZooKeeper instance exceeds the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the ZooKeeper Direct memory usage is less than the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the ZooKeeper Direct memory usage is less than 80% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
13002	Critical (default threshold: 90%) Major (default threshold: 80%)	Quality of service	ZooKeeper	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	RoleName	Specifies the role name for which the alarm is generated.
	HostName	Specifies the object (host ID) for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the available memory of ZooKeeper is insufficient, memory overflow may occur and services may break down. As a result, upstream services (such as HDFS and Yarn) fail to run.

Possible Causes

The direct memory of the ZooKeeper instance is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **ZooKeeper Direct Memory Usage Exceeds the Threshold**. Check the IP address of the instance that reports the alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Instance** > **quorumpeer(the IP address checked)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **CPU and Memory**, and select **ZooKeeper Heap And Direct Buffer Resource Percentage**, click **OK**.

Step 3 Check whether the used direct buffer memory of ZooKeeper reaches 80% of the maximum direct buffer memory specified for ZooKeeper.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer** > **System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC_OPTS** parameter.

- If yes, in the **GC_OPTS** parameter, delete "-XX:MaxDirectMemorySize" and go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Save the configuration and restart the ZooKeeper service.

Step 6 Check whether the **ALM-13004 ZooKeeper Heap Memory Usage Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-13004 ZooKeeper Heap Memory Usage Exceeds the Threshold**.
- If no, go to **Step 7**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 9 Select **ZooKeeper** in the required cluster from the **Service**.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.79 ALM-13003 GC Duration of the ZooKeeper Process Exceeds the Threshold

Alarm Description

The system checks the garbage collection (GC) duration of the ZooKeeper process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold.

This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
13003	Critical (default threshold: 10000 ms) Major (default threshold: 5000 ms)	Quality of service	ZooKeeper	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

The ZooKeeper process may respond slowly. Services of upper-layer components (such as Yarn, Flink, and Spark) may fail.

Possible Causes

The heap memory of the ZooKeeper process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed page, click the drop-down list of **GC Duration of the ZooKeeper Process Exceeds the Threshold**. View the IP address of the instance for which the alarm was generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** > **Instance** > **quorumpeer**. Click the drop-down list in the upper right corner of **Chart**, choose **Customize** > **GC**, select **ZooKeeper GC Duration per Minute**, and click **OK** to check the GC duration statistics of the ZooKeeper process collected every minute.

Step 3 Check whether the GC duration of the ZooKeeper process collected every minute exceeds the threshold.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 Check whether memory leakage occurs in the application.

Step 5 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer** > **System**. Increase the value of the **GC_OPTS** parameter as required.

NOTE

Generally, **-Xmx** is twice of ZooKeeper data capacity. If the capacity of ZooKeeper reaches 2 GB, set **GC_OPTS** as follows:

-Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=512M -XX:MetaspaceSize=64M -XX:MaxMetaspaceSize=64M -XX:CMSFullGCsBeforeCompaction=1

Step 6 Save the configuration and restart the ZooKeeper service.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **ZooKeeper** for the target cluster.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.80 ALM-13004 ZooKeeper Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the ZooKeeper service every 60 seconds. The alarm is generated when the heap memory usage of a ZooKeeper instance exceeds the threshold.

The alarm is cleared when the memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
13004	Critical (default threshold: 95%) Major (default threshold: 85%)	Quality of service	ZooKeeper	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	RoleName	Specifies the role name for which the alarm is generated.
	HostName	Specifies the object (host ID) for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available ZooKeeper heap memory is insufficient, memory overflow may cause service breakdown, and upstream components (such as Yarn, Flink, and Spark) may fail to run.

Possible Causes

The heap memory of the ZooKeeper instance is overused or the heap memory is inappropriately allocated.

Handling Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, On the displayed interface, click the drop-down button of **ZooKeeper Heap Memory Usage Exceeds the Threshold** and

confirm the node IP address of the host for which the alarm is generated in the Location Information.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Instance**, click **quorumpeer** in the **Role** column of the corresponding IP address. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **CPU and Memory**, and select **ZooKeeper Heap And Direct Buffer Resource Percentage**, click **OK**. Check the heap memory usage.

Step 3 Check whether the used heap memory of ZooKeeper reaches 95% of the maximum heap memory specified for ZooKeeper.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer** > **System**. Increase the value of **-Xmx** in **GC_OPTS** as required. The details are as follows:

1. On the **Instance** tab, click **quorumpeer** in the **Role** column of the corresponding IP address. Choose **Customize** > **CPU and Memory** in the upper right corner, and select **ZooKeeper Heap And Direct Buffer Resource**, click **OK** to check the heap memory used by ZooKeeper.
2. Change the value of **-Xmx** in the **GC_OPTS** parameter based on the actual heap memory usage. Generally, the value is twice the size of the ZooKeeper data volume. For example, if 2 GB ZooKeeper heap memory is used, the following configurations are recommended: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=512M -XX:MetaspaceSize=64M -XX:MaxMetaspaceSize=64M -XX:CMSFullGCsBeforeCompaction=1

Step 5 Save the configuration and restart the ZooKeeper service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **ZooKeeper** in the required cluster from the **Service**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.81 ALM-13005 Failed to Set the Quota of Top Directories of ZooKeeper Components

Alarm Description

The system sets quotas for each ZooKeeper top-level directory in the **customized.quota** configuration item and components every 5 hours. This alarm is generated when the system fails to set the quota for a directory.

This alarm is cleared when the setting succeeds after a failure.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
13005	Minor	Quality of service	ZooKeeper	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	ServiceDirectory	Specifies the directory for which the alarm is generated.
Additional Information	Trigger condition	Specifies the threshold for triggering the alarm.

Impact on the System

Components can write a large amount of data to the top-level directory of ZooKeeper. As a result, services or services of upstream components (such as Yarn, Flink, and Spark) that depend on the top-level directory are abnormal.

Possible Causes

The quota for the alarm directory is inappropriate.

Handling Procedure

Check whether the quota for the alarm directory is appropriate.

Step 1 Log in to FusionInsight Manager, and choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper**. On the displayed page, choose **Configurations** > **All Configurations** > **Quota**. Check whether the directory for which the alarm is reported and its quota exist in the **customized.quota** configuration item.

- If yes, go to **Step 5**.
- If no, go to **Step 2**.

Step 2 Check whether the alarm directory for which the alarm is reported is in the following alarm list.

Table 11-1 Component alarm directory

Component	Alarm Directory
Hbase	/hbase
Hive	/beelinesql
Yarn	/rmstore
Storm	/stormroot
Streaming	/storm
Kafka	/kafka

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 View the component of the alarm directory in the table, open the corresponding service page, and choose **Configurations** > **All Configurations**. On the displayed page, search for **zk.quota** in the upper right corner. The search result is the quota of the alarm directory.

Step 4 Check whether the quota of the alarm directory for which the alarm is reported is appropriate. The quota must be greater than or equal to the actual value, which can be obtained in **Trigger Condition**.

Step 5 Modify the **services.quota** value as prompted and save the configuration.

Step 6 After the time specified by **service.quotas.auto.check.cron.expression**, check whether the alarm is cleared.

The **service.quotas.auto.check.cron.expression** parameter indicates the scheduled expression used by ZooKeeper to set the directory quota. You can choose **Cluster > Services > ZooKeeper > Configurations > All Configurations** on FusionInsight Manager and set this parameter. The default value is */5 * * * *, indicating 5 minutes.

- If it is, no further action is required.

- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **ZooKeeper** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.82 ALM-13006 Znode Number or Capacity Exceeds the Threshold

Alarm Description

The system periodically detects the status of secondary Znode in the ZooKeeper service data directory every four hours. This alarm is generated when the number or capacity of secondary Znodes exceeds the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
13006	Critical (default threshold: 963718) Major (default threshold: 953718) Minor (default threshold: 943718)	Quality of service	ZooKeeper	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	ServiceDirectory	Specifies the directory for which the alarm is generated.
	MetricName	Specifies the name of the indicator for which the alarm is generated.
Additional Information	Trigger condition	Specifies the threshold for triggering the alarm.

Impact on the System

A large amount of data is written to the ZooKeeper data directory space. As a result, services of upstream components (such as Yarn, Flink, and Spark) that depend on this directory are abnormal. For details, see the alarm location information.

Possible Causes

A large amount of data is written to the ZooKeeper data directory. The threshold is not appropriate.

Handling Procedure

Check whether a large amount of data is written to the directory for which the alarm is generated.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **Znode Number or Capacity Exceeds the Threshold**. Confirm the Znode for which the alarm is generated in Location Information.

Step 2 Log in to FusionInsight Manager, open the ZooKeeper service interface, and select **Resource**. In the table **Used Resources (By Second-Level Znode)**, check whether a large amount of data is written to the top-level Znode for which the alarm is reported.

- If it is, go to **Step 3**.
- If it is not, go to **Step 4**.

Step 3 Log in to the ZooKeeper client and delete the data in the top-level Znode.

Step 4 Log in to FusionInsight Manager and open the ZooKeeper service interface. On the **Resource** page, choose > **By Znode quantity** in **Used Resources (By Second-Level Znode)**. **Threshold Configuration of By Znode quantity** is displayed. Click

Modify under **Operation**. Increase the threshold by referringto the value of **max.Znode.count** by choosing **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Configurations > All Configurations > Quota**.

Step 5 In the **Used Resources (By Second-Level Znode)**, choose > **By capacity**. The **Threshold Settings** page of **By Capacity** is displayed. Click **Modify** under **Operation**. Increase the threshold by referring to the value of **max.data.size** by choosing **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Configurations > All Configurations** > **Quota**.

Step 6 Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **ZooKeeper** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.83 ALM-13007 Available ZooKeeper Client Connections Are Insufficient

Alarm Description

The system periodically detects the number of active processes between the ZooKeeper client and the ZooKeeper server every 60 seconds. This alarm is generated when the number of connections exceeds the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
13007	Critical (default threshold: 2200) Major (default threshold: 2000) Minor (default threshold: 1800)	Quality of service	ZooKeeper	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	RoleName	Specifies the role name for which the alarm is generated.
	HostName	Specifies the host name for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

A large number of processes are connected to ZooKeeper, and the number of ZooKeeper connections is used up. As a result, services of upstream components (such as Yarn, Flink, and Spark) are abnormal.

Possible Causes

A large number of client processes are connected to ZooKeeper. The thresholds are not appropriate.

Handling ProcedureHandling Procedure

Check whether there are a large number of client processes connected to ZooKeeper.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **Available ZooKeeper Client Connections Are Insufficient**. Confirm the node IP address of the host for which the alarm is generated in the Location Information.

Step 2 Open the ZooKeeper service interface, click **Resource** to enter the **Resource** page, and check whether the number of connections of the client with the IP address specified by **Number of Connections (By Client IP Address)** is large.

- If it is, go to **Step 3**.
- If it is not, go to **Step 4**.

Step 3 Check whether connection leakage occurs on the client process.

Step 4 Click in the **Number of Connections (by Client IP Address)** to enter the **Thresholds** page, and click **Modify** under **Operation**. Increase the threshold by referring to the value of **maxClientCnxns** by choosing **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer**.

Step 5 Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **ZooKeeper** in the required cluster from the **Service**.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.84 ALM-13008 ZooKeeper Znode Usage Exceeds the Threshold

Alarm Description

The system checks the level-2 Znode status in the ZooKeeper data directory every hour. This alarm is generated when the system detects that the level-2 Znode usage exceeds the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
13008	Critical (default threshold: 90%) Major (default threshold: 80%)	Quality of service	ZooKeeper	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	ServiceDirectory	Specifies the directory for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

When a large amount of data is written to the ZooKeeper data directory space, ZooKeeper cannot provide services for external systems. As a result, services of upstream components (such as Yarn, Flink, and Spark) that depend on the alarm directory are abnormal.

Possible Causes

- A large amount of data is written to the ZooKeeper data directory.
- The user-defined threshold is inappropriate.

Procedure

Check whether a large amount of data is written into the directory for which the alarm is generated.

Step 1 Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper**, and click **Resource**. Click **By Znode quantity** in **Used Resources (By Second-Level Znode)**, and check whether a large amount of data is written to the top Znode.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, select **Location** from the drop-down list box next to **ALM-13008 ZooKeeper Znode Quantity Usage Exceeds Threshold**, and obtain the Znode path in **ServiceDirectory**.

Step 3 Log in to the ZooKeeper client as a cluster user and delete unnecessary data from the Znode corresponding to the alarm.

Step 4 Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** > **Configurations** > **All Configurations**, and search for **max.znode.count**, which is the maximum number of ZooKeeper directories. The alarm threshold is 80% of this parameter. Increase the value of this parameter, click **Save**, and restart the service for the configuration to take effect.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select **ZooKeeper** in the required cluster from the **Service**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.85 ALM-13009 ZooKeeper Znode Capacity Usage Exceeds the Threshold

Alarm Description

The system checks the level-2 ZNode status in the ZooKeeper data directory every hour. This alarm is generated when the system detects that the capacity usage exceeds the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
13009	Critical (default threshold: 90%) Major (default threshold: 80%)	Quality of service	ZooKeeper	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	ServiceDirectory	Specifies the directory for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

ZooKeeper cannot provide services for external systems, and the services of upstream components (such as Yarn, Flink, and Spark) that depend on the alarm directory are abnormal.

Possible Causes

- A large volume of data has been written to the ZooKeeper data directory.
- The threshold is improperly defined.

Handling Procedure

Check whether a large volume of data is written to the alarm directory.

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. Click the drop-down list in the row containing **ALM-13009 ZooKeeper ZNode Capacity Usage Exceeds the Threshold**, and find the ZNode for which the alarm is generated in the **Location** area.

Step 2 Choose **Cluster** > **Services** > **ZooKeeper**. On the page that is displayed, click the **Resource** tab. In the **Used Resources (By Second-Level ZNode)** area, click **By capacity** and check whether a large amount of data is written to the top-level ZNode directory.

- If yes, record the directory to which a large amount of data is written and go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Check whether data in the directory can be deleted.

NOTICE

Deleting data from ZooKeeper is a high-risk operation. Exercise caution when performing this operation.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Log in to the ZooKeeper client and delete unnecessary data from the directory to which a large amount of data is written.

1. Log in to the ZooKeeper client installation directory, for example, **/opt/client**, and configure environment variables.

   cd /opt/client

   source bigdata_env

2. Run the following command to authenticate the user (skip this step for a cluster in normal mode):

   kinit *Component service user*

3. Run the following command to log in to the client tool:

   zkCli.sh -server <*Service IP address of the node where any ZooKeeper instance resides*>:<*Client port*>

4. Run the following command to delete unnecessary data:

   delete *Path of the file to be deleted*

Step 5 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **ZooKeeper**. On the page that is displayed, click the **Configuration** tab then the **All Configurations** sub-tab, and search for **max.data.size**. The value of

max.data.size is the maximum capacity quota of the ZooKeeper directory. The unit is byte. Search for the **GC_OPTS** configuration item and check the value of **Xmx**.

Step 6 Compare the values of **max.data.size** and **Xmx*0.65**. The threshold is the smaller value multiplied by 80%. You can change the values of **max.data.size** and **Xmx*0.65** to increase the threshold.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **ZooKeeper** for the target cluster.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.86 ALM-13010 Znode Usage of a Directory with Quota Configured Exceeds the Threshold

Alarm Description

The system checks the Znode usage of all service directories with quota configured every hour. This alarm is generated when the system detects that the level-2 Znode usage exceeds the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
13010	Critical (default threshold: 90%) Major (default threshold: 80%)	Quality of service	ZooKeeper	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	ServiceDirectory	Specifies the directory for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

When a large amount of data is written to the ZooKeeper data directory space, ZooKeeper cannot provide services for external systems. As a result, services of upstream components (such as Yarn, Flink, and Spark) that depend on the alarm directory are abnormal.

Possible Causes

- A large amount of data is written to the ZooKeeper data directory.
- The user-defined threshold is inappropriate.

Handling Procedure

Check whether a large amount of data is written into the directory for which the alarm is generated.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm > Alarms**. Confirm the Znode for which the alarm is generated in **Location** of this alarm.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** and click **Resource**. In **Used Resources (By Second-Level Znode)**, check whether a large amount of data is written into the top Znode.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, select Location from the drop-down list box next to **ALM-13010 Znode Usage of a Directory with Quota Configured Exceeds the Threshold**, and obtain the Znode path in ServiceDirectory.

Step 4 Log in to the ZooKeeper client as a cluster user and delete unwanted data in the Znode for which the alarm is generated.

Step 5 Log in to FusionInsight Manager, and choose **Cluster** > *Name of the desired cluster* > **Services** > *Component of the top Znode for which the alarm isgenerated*. Choose **Configurations** > **All Configurations**, search for **zk.quota.number**, increase its value, click **Save**.

NOTICE

If the Component of the top Znode for which the alarm isgenerated is ClickHouse, change the value of **clickhouse.zookeeper.quota.node.count**.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **ZooKeeper** in the required cluster from the **Service**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.87 ALM-14000 HDFS Service Unavailable

Alarm Description

The system checks the NameService service status every 60 seconds. This alarm is generated when all the NameService services are abnormal and the system considers that the HDFS service is unavailable.

This alarm is cleared when at least one NameService service is normal and the system considers that the HDFS service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14000	Critical	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

HDFS fails to provide services for HDFS service-based upper-layer components, such as HBase and MapReduce. As a result, users cannot read or write files.

Possible Causes

- The ZooKeeper service is abnormal.
- All NameService services are abnormal.
- The number of service requests is too large, and the HDFS health check fails to read and write files.
- The health check fails due to HDFS FullGC.

Handling Procedure

Check the ZooKeeper service status.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the Alarm page, check whether **ALM-13000 ZooKeeper Service Unavailable** is reported.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 See **ALM-13000 ZooKeeper Service Unavailable** to rectify the health status of ZooKeeper fault and check whether the **Running Status** of the ZooKeeper service restores to **Normal**.

- If yes, go to **Step 3**.
- If no, go to **Step 13**.

Step 3 On the **O&M > Alarm > Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Handle the NameService service exception alarm.

Step 4 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the Alarms page, check whether **ALM-14010 NameService Service Unavailable** is reported.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 See **ALM-14010 NameService Service Unavailable** to handle the abnormal NameService services and check whether each NameService service exception alarm is cleared.

- If yes, go to **Step 6**.
- If no, go to **Step 13**.

Step 6 On the **O&M > Alarm > Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check whether the HDFS health check fails to read or write files due to a large number of service requests.

Step 7 On FusionInsight Manager, choose **O&M > Alarm > Alarms**, and check whether **ALM-14021 NameNode Average RPC Processing Time Exceeds the Threshold** or **ALM-14022 NameNode Average RPC Queuing Time Exceeds the Threshold** is generated.

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

Step 8 Rectify the abnormal NameServices by following the handling methods of **ALM-14021 NameNode Average RPC Processing Time Exceeds the Threshold** and **ALM-14022 NameNode Average RPC Queuing Time Exceeds the Threshold**. Then, check whether the alarms are cleared.

- If yes, go to **Step 9**.
- If no, go to **Step 13**.

Step 9 On the **O&M > Alarm > Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the health check fails due to HDFS FullGC.

Step 10 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the Alarms page, check whether **ALM-14014 NameNode GC Time Exceeds the Threshold** is reported.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 See **ALM-14014 NameNode GC Time Exceeds the Threshold** to handle the abnormal NameService services and check whether each NameService service exception alarm is cleared.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 On the **O&M > Alarm > Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 14 Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS

Step 15 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.88 ALM-14001 HDFS Disk Usage Exceeds the Threshold

Alarm Description

The system checks the HDFS disk usage every 30 seconds and compares the actual HDFS disk usage with the threshold. The HDFS disk usage indicator has a default threshold, this alarm is generated when the value of the disk usage of a Hadoop distributed file system (HDFS) indicator exceeds the threshold.

To change the threshold, choose **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* **> HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the value of the disk usage of HDFS cluster indicator is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the value of the disk usage of HDFS cluster indicator is less than or equal to 80% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14001	Critical (default threshold: 90%) Major (default threshold: 80%)	Environment	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Type	Parameter	Description
	NameService Name	Specifies the NameService for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Writing Hadoop distributed file system (HDFS) data is affected.

Possible Causes

The disk space configured for the HDFS cluster is insufficient.

Handling Procedure

Check the disk capacity and delete unnecessary files.

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**.

Step 2 Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Disk**, and select **Percentage of HDFS Capacity** to check whether the HDFS disk usage exceeds the threshold.

- If yes, go to **Step 3**.
- If no, go to **Step 11**.

Step 3 In the **Basic Information** area, click the **NameNode(Active)** of the failure NameService and the HDFS WebUI page is displayed.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 4 On the HDFS web user interface (WebUI), click **Datanodes** tab. In the **Block pool used** column, view the disk usage of all DataNodes to check whether the disk usage of any DataNode exceeds the threshold.

- If yes, go to **Step 6**.
- If no, go to **Step 11**.

Step 5 Log in to the MRS client node as user **root**.

Step 6 Run **cd /opt/client** to switch to the client installation directory, and run **source bigdata_env**. If the cluster uses the security mode, perform security authentication. Run **kinit hdfs** and enter the password as prompted. Please obtain the password from the administrator.

Step 7 Run the **hdfs dfs -rm -r** *file or directory* command to delete unnecessary files.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Expand the system.

Step 9 Expand the disk capacity.

Step 10 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 12 Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.89 ALM-14002 DataNode Disk Usage Exceeds the Threshold

Alarm Description

The system checks the DataNode disk usage every 30 seconds and compares the actual disk usage with the threshold. A default threshold range is provided for the DataNode disk usage. This alarm is generated when the DataNode disk usage exceeds the threshold.

To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **HDFS**.

If **Trigger Count** is **1**, this alarm is cleared when the DataNode disk usage is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is

cleared when the DataNode disk usage is less than or equal to 80% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14002	Critical (default threshold: 90%) Major (default threshold: 80%)	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Insufficient disk space will impact data write to HDFS.

Possible Causes

- The disk space configured for the HDFS cluster is insufficient.
- Data skew occurs among DataNodes.

Handling Procedure

Check whether the cluster disk capacity is full.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and check whether the **ALM-14001 HDFS Disk Usage Exceeds the Threshold** alarm exists.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Handle the alarm by following the instructions in **ALM-14001 HDFS Disk Usage Exceeds the Threshold** and check whether the alarm is cleared.

- If yes, go to **Step 3**.
- If no, go to **Step 11**.

Step 3 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the balance status of DataNodes.

Step 4 On FusionInsight Manager, choose **Hosts**. Check whether the number of DataNodes on each rack is almost the same. If the difference is large, adjust the racks to which DataNodes belong to ensure that the number of DataNodes on each rack is almost the same. Restart the HDFS service for the settings to take effect.

Step 5 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**.

Step 6 In the **Basic Information** area, click **NameNode(Active)**. The HDFS web UI is displayed.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 7 In the **Summary** area of the HDFS web UI, check whether the value of **Max** is 10% greater than that of **Median** in **DataNodes usages**.

- If yes, go to **Step 8**.
- If no, go to **Step 11**.

Step 8 Balance skewed data in the cluster. Log in to the MRSclient as user **root**. If the cluster is in normal mode, run the **su - omm** command to switch to user **omm**. Run the **cd** command to go to the client installation directory and run the **source bigdata_env** command. If the cluster uses the security mode, perform security authentication. Run **kinit hdfs** and enter the password as prompted. Obtain the password from the MRS cluster administrator.

Step 9 Run the following command to balance data distribution:

hdfs balancer -threshold 10

Step 10 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect the fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 13 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.90 ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold

Alarm Description

The system checks the lost blocks every 30 seconds and compares the actual lost blocks with the threshold. The lost blocks indicator has a default threshold. This alarm is generated when the number of lost HDFS blocks exceeds the threshold.

To change the threshold, choose **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* **> HDFS**.

If **Trigger Count** is **1**, this alarm is cleared when the value of lost HDFS blocks is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the value of lost HDFS blocks is less than or equal the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14003	Critical (default threshold: 1000) Major (default threshold: 0)	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
	NameService Name	Specifies the NameService for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Data stored in HDFS is lost. HDFS may enter the safe mode and cannot provide write services. Lost block data cannot be restored.

Possible Causes

- The DataNode instance is abnormal.
- Data is deleted.

Handling Procedure

Check the DataNode instance.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance**.

Step 2 Check whether the **Running Status** of all DataNode instance is **Normal**.

- If yes, go to **Step 11**.
- If no, go to **Step 3**.

Step 3 Restart the DataNode instance and check whether the DataNode instance restarts successfully.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Delete the damaged file.

Step 5 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **NameNode(Active)**. On the WebUI page of the HDFS, view the information about lost blocks.

NOTE

- If a block is lost, a line in red is displayed on the WebUI.
- By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 The user checks whether the file containing the lost data block is useful.

NOTE

Files generated in directories **/mr-history**, **/tmp/hadoop-yarn**, and **/tmp/logs** during MapReduce task execution are unnecessary.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 The user checks whether the file containing the lost data block is backed up.

- If yes, go to **Step 8**.
- If no, go to **Step 11**.

Step 8 Log in to the HDFS client as user **root**. The user password is defined by the user before the installation. Contact the MRS cluster administrator to obtain the password. Run the following commands:

- Security mode:

  cd *Client installation directory*

  source bigdata_env

  kinit hdfs

- Normal mode:

  su - omm

  cd *Client installation directory*

  source bigdata_env

Step 9 On the node client, run **hdfs fsck / -delete** to delete the lost file. If the file where the lost block is located is a useful file, you need to write the file again to restore the data.

NOTE

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

Step 10 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect the fault information.

Step 11 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 12 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 13 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.91 ALM-14006 Number of HDFS Files Exceeds the Threshold

Alarm Description

The system periodically checks the number of HDFS files every 30 seconds and compares the number of HDFS files with the threshold. This alarm is generated when the system detects that the number of HDFS files exceeds the threshold.

If **Trigger Count** is **1**, this alarm is cleared when the number of HDFS files is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the number of HDFS files is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14006	Major	Quality of service	HDFS	Yes

Alarm Changes

Change Type	Version	Description	Reason for Change
Modify	3.3.1	Alarm Severity: changed from minor to major.	Alarm Severity: Accuracy optimized

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
	NameService Name	Specifies the NameService for which the alarm was generated.
Additional Information	Trigger condition	Specifies the alarm triggering condition.

Impact on the System

If there are too many HDFS files, the HDFS system may respond slowly or the disk space may be used up.

Possible Causes

The number of HDFS files exceeds the threshold.

Handling Procedure

Check the number of files in the system.

Step 1 On FusionInsight Manager, check the number of HDFS files. Specifically, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **File and Block**, and select **HDFS File** and **Total Blocks**.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**, and search for the **GC_OPTS** parameter under **NameNode**.

Step 3 Configure the threshold of the number of configuration file objects. Specifically, change the value of **Xmx** (GB) in the **GC_OPTS** parameter. The threshold (specified by y) is calculated as follows: y = 0.2007 x Xmx - 0.6312, where x indicates the memory capacity Xmx (GB) and y indicates the number of files (unit: kW). Adjust the memory size as required.

Step 4 Confirm that the value of **GC_PROFILE** is **custom** so that the **GC_OPTS** configuration takes effect. Click **Save** and choose **More** > **Restart Instance** to restart the service.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether needless files exist in the system.

Step 6 Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata_env** to configure the environment variables.

If the cluster uses the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the MRS cluster administrator.

Step 7 Run **hdfs dfs -ls** *file or directory* to check whether the files in the directory can be deleted.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Run the **hdfs dfs -rm -r** *file or directory path* command. After deleting unnecessary files, wait until the files are retained in the recycle bin for a period longer than the value of **fs.trash.interval** on the NameNode. Then check whether the alarm is cleared.

NOTE

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

Configuration rules of the NameNode JVM parameter

Default value of the NameNode JVM parameter **GC_OPTS**:

-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M -XX:MetaspaceSize=128M -XX:MaxMetaspaceSize=128M -XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -XX:CMSInitiatingOccupancyFraction=65 -XX:+PrintGCDetails -Dsun.rmi.dgc.client.gcInterval=0x7FFFFFFFFFFFFE -Dsun.rmi.dgc.server.gcInterval=0x7FFFFFFFFFFFFE -XX:-OmitStackTraceInFastThrow -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M -Djdk.tls.ephemeralDHKeySize=3072 -Djdk.tls.rejectClientInitiatedRenegotiation=true -Djava.io.tmpdir=${Bigdata_tmp_dir}

The number of NameNode files is proportional to the used memory size of the NameNode. When file objects change, you need to change **-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M** in the default value. The following table lists the reference values.

Table 11-2 NameNode JVM configuration

Number of File Objects	Reference Value
10,000,000	-Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
20,000,000	-Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
50,000,000	-Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
100,000,000	-Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
200,000,000	-Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
300,000,000	-Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

11.92 ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the HDFS NameNode Heap Memory usage every 30 seconds and compares the actual Heap memory usage with the threshold. The HDFS NameNode Heap Memory usage has a default threshold. This alarm is generated when the HDFS NameNode Heap Memory usage exceeds the threshold.

You can change the threshold in **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* **> HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the HDFS NameNode Heap memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the HDFS NameNode Heap memory usage is less than or equal to 95% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14007	Critical (default threshold: 98%) Major (default threshold: 95%)	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The HDFS NameNode Heap Memory usage is too high, which affects the data read/write performance of the HDFS.

Possible Causes

The HDFS NameNode Heap Memory is insufficient.

Handling Procedure

Delete unnecessary files.

Step 1 Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata_env**.

If the cluster uses the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the **hdfs dfs -rm -r** *file or directory* command to delete unnecessary files.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the NameNode JVM memory usage and configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS**.

Step 5 In the **Basic Information** area, click **NameNode(Active)** to go to the HDFS WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 On the HDFS WebUI, click the **Overview** tab. In **Summary**, check the numbers of files, directories, and blocks in the HDFS.

Step 7 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**. In **Search**, enter **GC_OPTS** to check the **GC_OPTS** memory parameter of **HDFS->NameNode**.

Adjust the configuration in the system.

Step 8 Check whether the memory is configured properly based on the number of files in **Step 6** and the NameNode Heap Memory parameters in **Step 7**.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

NOTE

The recommended mapping between the number of HDFS file objects (filesystem objects = files + blocks) and the JVM parameters configured for NameNode is as follows:

- If the number of file objects reaches 10,000,000, you are advised to set the JVM parameters as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the number of file objects reaches 20,000,000, you are advised to set the JVM parameters as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
- If the number of file objects reaches 50,000,000, you are advised to set the JVM parameters as follows: -Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
- If the number of file objects reaches 100,000,000, you are advised to set the JVM parameters as follows: -Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
- If the number of file objects reaches 200,000,000, you are advised to set the JVM parameters as follows: -Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
- If the number of file objects reaches 300,000,000, you are advised to set the JVM parameters as follows: -Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

Step 9 Modify the heap memory parameters of the NameNode based on the mapping between the number of file objects and the memory. Click **Save** and choose **Dashboard** > **More** > **Restart Service**.

Step 10 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 12 Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS

Step 13 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.93 ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the HDFS DataNode Heap Memory usage every 30 seconds and compares the actual Heap Memory usage with the threshold. The HDFS DataNode Heap Memory usage has a default threshold. This alarm is generated when the HDFS DataNode Heap Memory usage exceeds the threshold.

You can change the threshold in **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* **> HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the HDFS DataNode Heap Memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the HDFS DataNode Heap Memory usage is less than or equal to 95% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14008	Critical (default threshold: 98%) Major (default threshold: 95%)	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Type	Parameter	Description
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The HDFS DataNode Heap Memory usage is too high, which affects the data read/write performance of the HDFS.

Possible Causes

The HDFS DataNode Heap Memory is insufficient.

Handling Procedure

Delete unnecessary files.

Step 1 Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata_env**.

If the cluster uses the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the **hdfs dfs -rm -r** *file or directory* command to delete unnecessary files.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the DataNode JVM memory usage and configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**.

Step 5 In the **Basic Information** area, click **NameNode(Active)** to go to the HDFS WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 On the HDFS WebUI, click the **DataNodes** tab, and check the number of blocks of all DataNodes related to the alarm.

Step 7 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**. In **Search**, enter **GC_OPTS** to check the GC_OPTS memory parameter of **HDFS->DataNode**.

Adjust the configuration in the system.

Step 8 Check whether the memory is configured properly based on the number of block in **Step 6** and the DataNode Heap Memory parameters in **Step 7**.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

NOTE

The mapping between the average number of blocks of a DataNode instance and the DataNode memory is as follows:

- If the average number of blocks of a DataNode instance reaches 2,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the average number of blocks of a DataNode instance reaches 5,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

Step 9 Modify the heap memory parameters of the DataNode based on the mapping between the number of blocks and the memory. Click **Save** and choose **Dashboard** > **More** > **Restart Service**.

Step 10 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 12 Select **HDFS** in the required cluster from the **Service**.

Step 13 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.94 ALM-14009 Number of Dead DataNodes Exceeds the Threshold

Alarm Description

The system periodically detects the number of dead DataNodes in the HDFS cluster every 30 seconds, and compares the number with the threshold. The

number of DataNodes in the Dead state has a default threshold. This alarm is generated when the number exceeds the threshold.

You can change the threshold in **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* **> HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the number of Dead DataNodes is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the number of Dead DataNodes is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14009	Major	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	NameService Name	Specifies the NameService for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

DataNodes that are in the Dead state cannot provide HDFS services. As a result, users cannot read or write files.

Possible Causes

- DataNodes are faulty or overloaded.
- The network between the NameNode and the DataNode is disconnected or busy.

- NameNodes are overloaded.
- The NameNodes are not restarted after the DataNode is deleted.

Handling Procedure

Check whether DataNodes are faulty.

Step 1 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS**. The **HDFS Status** page is displayed.

Step 2 In the **Basic Information** area, click **NameNode(Active)** to go to the HDFS WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 3 On the HDFS WebUI, click the **Datanodes** tab. In the **In operation** area, click **Filter** to check whether **down** is in the drop-down list.

- If yes, select **down**, record the information about the filtered DataNodes, and go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **HDFS** > **Instance** to check whether recorded DataNodes exist in the instance list.

- If all recorded DataNodes exist, go to **Step 5**.
- If none of the recorded DataNodes exists, go to **Step 6**.
- If some of the recorded DataNodes exist, go to **Step 7**.

Step 5 Locate the DataNode instance, click **More** > **Restart Instance** to restart it and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 6 Select all NameNode instances, choose **More** > **Instance Rolling Restart** to restart them and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Step 7 Select all NameNode instances, choose **More** > **Instance Rolling Restart** to restart them. Locate the DataNode instance, click **More** > **Restart Instance** to restart it and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check the status of the network between the NameNode and the DataNode.

Step 8 Log in to the faulty DataNode on the management page as user **root**, and run the **ping** *IP address of the NameNode* command to check whether the network between the DataNode and the NameNode is abnormal.

On the FusionInsight Manager page, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance**. In the instance list, view the service plane IP address of the faulty DataNode.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Rectify the network fault, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the DataNode is overloaded.

Step 10 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** and check whether the alarm **ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold** exists.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 See **ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold** to handle the alarm and check whether the alarm is cleared.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 13**.

Check whether the NameNode is overloaded.

Step 13 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** and check whether the alarm **ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold** exists.

- If yes, go to **Step 14**.
- If no, go to **Step 16**.

Step 14 See **ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold** to handle the alarm and check whether the alarm is cleared.

- If yes, go to **Step 15**.
- If no, go to **Step 16**.

Step 15 Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 16**.

Collect fault information.

Step 16 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 17 Select **HDFS** in the required cluster from the **Service**.

Step 18 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.95 ALM-14010 NameService Service Is Abnormal

Alarm Description

The system checks the NameService service status every 180 seconds. This alarm is generated when the NameService service is unavailable.

This alarm is cleared when the NameService service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14010	Major	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
	NameService Name	Specifies the NameService for which the alarm was generated.

Impact on the System

HDFS fails to provide services for upper-layer components based on the NameService service, such as HBase and MapReduce. As a result, users cannot read or write files.

Possible Causes

- The KrbServer service is abnormal.
- The JournalNode is faulty.
- The DataNode is faulty.
- The disk capacity is insufficient.
- The NameNode enters safe mode.

Handling Procedure

Check the KrbServer service status.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services**.

Step 2 Check whether the KrbServer service exists.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Click **KrbServer**.

Step 4 Click **Instances**. On the KrbServer management page, select the faulty instance, and choose **More** > **Restart Instance**. Check whether the instance successfully restarts.

- If yes, go to **Step 5**.
- If no, go to **Step 24**.

Step 5 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check the JournalNode instance status.

Step 6 On FusionInsight Manager, choose **Cluster** > **Services**.

Step 7 Choose **HDFS** > **Instances**.

Step 8 Check whether the **Running Status** of the JournalNode is **Normal**.

- If yes, go to **Step 11**.
- If no, go to **Step 9**.

Step 9 Select the faulty JournalNode, and choose **More** > **Restart Instance**. Check whether the JournalNode successfully restarts.

- If yes, go to **Step 10**.
- If no, go to **Step 24**.

Step 10 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check the DataNode instance status.

Step 11 On FusionInsight Manager, choose **Cluster** > **Services** > **HDFS**.

Step 12 Click **Instances** and check whether **Running Status** of all DataNodes is **Normal**.

- If yes, go to **Step 15**.
- If no, go to **Step 13**.

Step 13 Click **Instances**. On the DataNode management page, select the faulty instance, and choose **More** > **Restart Instance**. Check whether the DataNode successfully restarts.

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Check disk status.

Step 15 On FusionInsight Manager, choose **Hosts**.

Step 16 In the **Disk** column, check whether the disk space is insufficient.

- If yes, go to **Step 17**.
- If no, go to **Step 19**.

Step 17 Expand the disk capacity.

Step 18 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 19**.

Check whether NameNode is in the safe mode.

Step 19 On FusionInsight Manager, choose **Cluster** > **Services** > **HDFS**.

Step 20 In the **Basic Information** area on the **Dashboard** page of HDFS (or in the **NameService Summary** area on the **Dashboard** page of HDFS), check whether the value of **Safe Mode** is **ON**.

ON indicates that the safe mode is enabled.

- If yes, go to **Step 21**.
- If no, go to **Step 24**.

Step 21 Log in to the client as user **root**. Run the **cd** command to go to the client installation directory and run the **source bigdata_env** command. If the cluster uses the security mode, perform security authentication. Run the **kinit hdfs** command and enter the password as prompted. The password can be obtained from the MRS cluster administrator. If the cluster uses the non-security mode, log in as user **omm** and run the command. Ensure that user **omm** has the client execution permission.

Step 22 Run **hdfs dfsadmin -safemode leave**.

Step 23 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 24**.

Collect fault information.

Step 24 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 25 In the **Service** area, select the following nodes of the desired cluster.

- ZooKeeper
- HDFS

Step 26 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 27 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.96 ALM-14011 DataNode Data Directory Is Not Configured Properly

Alarm Description

The DataNode parameter **dfs.datanode.data.dir** specifies DataNode data directories. This alarm is generated when a configured data directory cannot be created, a data directory uses the same disk as other critical directories in the system, or multiple directories use the same disk immediately.

This alarm is cleared when the DataNode data directory is configured properly and this DataNode for which the alarm is generated is restarted.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14011	Major	Operation	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the DataNode data directory is mounted to the root directory or a critical directory, the disk space of the root directory or critical directory will be used up after long time running and the system will be faulty.

If the DataNode data directory is not configured properly, HDFS performance will deteriorate.

Possible Causes

- The DataNode data directory fails to be created.
- The DataNode data directory uses the same disk with critical directories, such as **/** or **/boot**.
- Multiple directories in the DataNode data directory use the same disk.

Handling Procedure

Check the alarm cause and information about the DataNode for which the alarm is generated.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

Step 2 In **HostName** of **Location**, obtain the host name of the DataNode for which the alarm is generated.

Delete directories that do not comply with the disk plan from the DataNode data directory.

Step 3 Choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance**. In the instance list, click the DataNode instance on the node for which the alarm is generated.

Step 4 Click **Instance Configurations** and view the value of the DataNode parameter **dfs.datanode.data.dir**.

Step 5 Check whether all DataNode data directories are consistent with the disk plan.

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 Modify the DataNode parameter **dfs.datanode.data.dir** and delete the incorrect directories.

Step 7 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance** and restart the DataNode instance.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Log in to the DataNode for which the alarm is generated as user **root**.

- If the alarm cause is "The DataNode data directory fails to be created", go to **Step 10**.
- If the alarm cause is "The DataNode data directory uses the same disk with critical directories, such **/** or **/boot**", go to **Step 17**.
- If the alarm cause is "Multiple directories in the DataNode data directory uses the same disk", go to **Step 21**.

Check whether the DataNode data directory fails to be created.

Step 10 Run the **su - omm** command to switch to user **omm**.

Step 11 Run the **ls** command to check whether the directories exist in the DataNode data directory.

- If yes, go to **Step 26**.
- If no, go to **Step 12**.

Step 12 Run the **mkdir** *data directory* command to create the directory and check whether the directory can be successfully created.

- If yes, go to **Step 24**.
- If no, go to **Step 13**.

Step 13 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** to check whether alarm **ALM-12017 Insufficient Disk Capacity** exists.

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Adjust the disk capacity and check whether alarm **ALM-12017 Insufficient Disk Capacity** is cleared. For details, see **ALM-12017 Insufficient Disk Capacity**.

- If yes, go to **Step 12**.
- If no, go to **Step 15**.

Step 15 Check whether user **omm** has the **rwx** or **x** permission of all the upper-layer directories of the directory. (For example, for **/tmp/abc/**, user **omm** has the **x** permission for directory **tmp** and the **rwx** permission for directory **abc**.)

- If yes, go to **Step 24**.
- If no, go to **Step 16**.

Step 16 Run the **chmod u+rwx** *path* or **chmod u+x** *path* command as user **root** to assign the **rwx** or **x** permission of these directories to user **omm**. Then go to **Step 12**.

Check whether the DataNode data directory use the same disk as other critical directories in the system.

Step 17 Run the **df** command to obtain the disk mounting information of each directory in the DataNode data directory.

Step 18 Check whether the directories mounted to the disk are critical directories, such as **/** or **/boot**.

- If yes, go to **Step 19**.
- If no, go to **Step 24**.

Step 19 Change the value of the DataNode parameter **dfs.datanode.data.dir** and delete the directories that use the same disk as critical directories.

Step 20 Go to **Step 24**.

Check whether multiple directories in the DataNode data directory use the same disk.

Step 21 Run the **df** command to obtain the disk mounting information of each directory in the DataNode data directory. Record the mounted directory in the command output.

Step 22 Modify the DataNode node parameters **dfs.datanode.data.dir** to reserve only one directory among the directories that mounted to the same disk directory.

Step 23 Go to **Step 24**.

Restart the DataNode and check whether the alarm is cleared.

Step 24 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** and restart the DataNode instance

Step 25 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 26**.

Collect fault information.

Step 26 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 27 Select **HDFS** in the required cluster from the **Service**.

Step 28 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 29 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.97 ALM-14012 JournalNode Is Out of Synchronization

Alarm Description

On the active NameNode, the system checks the data consistency of all JournalNodes in the cluster every 5 minutes. This alarm is generated when the data on a JournalNode is inconsistent with the data on the other JournalNodes.

This alarm is cleared in 5 minutes after the data on JournalNodes is consistent.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14012	Major	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	NameService Name	Specifies the NameService for which the alarm is generated.

Impact on the System

When a JournalNode is working incorrectly, the data on the node becomes inconsistent with that on the other JournalNodes. If data on more than half of JournalNodes is inconsistent, the NameNode cannot work correctly, making the HDFS service unavailable.

Possible Causes

- The JournalNode instance does not exist (deleted or migrated).

- The JournalNode instance has not been started or has been stopped.
- The JournalNode instance is working incorrectly.
- The network of the JournalNode is unreachable.

Handling Procedure

Check whether the JournalNode instance has been started up.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

Step 2 Check **Location** and obtain the IP address of the JournalNode for which the alarm is generated.

Step 3 Choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance**. In the instance list, check whether the JournalNode instance exists on the node for which the alarm is generated.

- If yes, go to **Step 5**.
- If no, go to **Step 4**.

Step 4 Choose **O&M** > **Alarm** > **Alarms**. In the alarm list, click **Clear** in the **Operation** column of the alarm. In the dialog box that is displayed, click **OK**. No further action is needed.

Step 5 Click the JournalNode instance and check whether its **Configuration Status** is **Synchronized**.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Select the JournalNode instance and choose **Start Instance** to start the instance.

Step 7 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Check whether the JournalNode instance is working correctly.

Step 8 Check whether **Running Status** of the JournalNode instance is **Normal**.

- If yes, go to **Step 11**.
- If no, go to **Step 9**.

Step 9 Select the JournalNode instance and choose **More** > **Restart Instance** to start the instance.

Step 10 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Check whether the network of the JournalNode is reachable.

Step 11 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** to check the service IP address of the active NameNode.

Step 12 Log in to the active NameNode as user **root**.

Step 13 Run the **ping** command to check whether a timeout occurs or the network is unreachable between the active NameNode and the JournalNode.

ping *service IP address of the JournalNode*

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Contact the network administrator to rectify the network fault and check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect fault information.

Step 15 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 16 Select **HDFS** in the required cluster from the **Service**.

Step 17 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.98 ALM-14013 Failed to Update the NameNode FsImage File

Alarm Description

HDFS metadata is stored in the FsImage file of the NameNode data directory, which is specified by the **dfs.namenode.name.dir** configuration item. The standby NameNode periodically combines existing FsImage files and Editlog files stored in the JournalNode to generate a new FsImage file, and then pushes the new FsImage file to the data directory of the active NameNode. This period is specified by the **dfs.namenode.checkpoint.period** configuration item of HDFS. The default value is 3600s, namely, one hour. If the FsImage file in the data directory of the active NameNode is not updated, the HDFS metadata combination function is abnormal and requires rectification.

On the active NameNode, the system checks the FsImage file information every five minutes. This alarm is generated when no FsImage file is generated within three combination periods.

This alarm is cleared when a new FsImage file is generated and pushed to the active NameNode, which indicates that the HDFS metadata combination function can be properly used.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14013	Major	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	NameService Name	Specifies the NameService for which the alarm is generated.

Impact on the System

If the FsImage file in the data directory of the active NameNode is not updated, the HDFS metadata combination function is abnormal and requires rectification. If it is not rectified, the Editlog files increase continuously after HDFS runs for a period. In this case, HDFS restart is time-consuming because a large number of Editlog files need to be loaded. In addition, this alarm also indicates that the standby NameNode is abnormal and the NameNode high availability (HA) mechanism becomes invalid. When the active NameNode is faulty, the HDFS service becomes unavailable.

Possible Causes

- The standby NameNode is stopped.
- The standby NameNode instance is working incorrectly.

- The standby NameNode fails to generate a new FsImage file.
- Space of the data directory on the standby NameNode is insufficient.
- The standby NameNode fails to push the FsImage file to the active NameNode.
- Space of the data directory on the active NameNode is insufficient.

Handling Procedure

Check whether the standby NameNode is stopped.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

Step 2 View **Location** and obtain the host name of the active NameNode for which the alarm is generated and name of the NameService where the active NameNode resides.

Step 3 Choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance**, find the standby NameNode instance of the NameService in the instance list, and check whether its **Configuration Status** is **Synchronized**.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Select the standby NameNode instance, choose **Start Instance**, and wait until the startup is complete.

Step 5 Wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the NameNode instance is working correctly.

Step 6 Check whether **Running Status** of the standby NameNode instance is **Normal**.

- If yes, go to **Step 9**.
- If no, go to **Step 7**.

Step 7 Select the standby NameNode instance, choose **More** > **Restart Instance**, and wait until the startup is complete.

Step 8 Wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 30**.

Check whether the standby NameNode fails to generate a new FsImage file.

Step 9 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**, and search and obtain the value of **dfs.namenode.checkpoint.period**. This value is the period of NameNode metadata combination.

Step 10 Choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** and obtain the service IP addresses of the active and standby NameNodes of the NameService for which the alarm is generated.

Step 11 Click the **NameNode(***xx***,Standy)** and **Instance Configurations** to obtain the value of **dfs.namenode.name.dir**. This value is the FsImage storage directory of the standby NameNode.

Step 12 Log in to the standby NameNode as user **root** or **omm**.

Step 13 Go to the FsImage storage directory and check the generation time of the newest FsImage file.

cd *Storage directory of the standby NameNode***/current**

stat -c %y $(ls -t | grep "fsimage_[0-9]*$" | head -1)

Step 14 Run the **date** command to obtain the current system time.

Step 15 Calculate the time difference between the generation time of the newest FsImage file and the current system time and check whether the time difference is greater than three times of the metadata combination period.

- If yes, go to **Step 16**.
- If no, go to **Step 20**.

Step 16 The metadata combination function of the standby NameNode is faulty. Run the following command to check whether the fault is caused by insufficient storage space.

Go to the FsImage storage directory and check the size of the newest FsImage file (in MB).

cd *Storage directory of the standby NameNode***/current**

du -m $(ls -t | grep "fsimage_[0-9]*$" | head -1) | awk '{print $1}'

Step 17 Run the following command to check the available disk space of the standby NameNode (in MB).

df -m ./ | awk 'END{print $4}'

Step 18 Compare the FsImage file size and the available disk space and determine whether another FsImage file can be stored on the disk.

- If yes, go to **Step 7**.
- If no, go to **Step 19**.

Step 19 Clear the redundant files on the disk where the directory resides to reserve sufficient space for metadata. After the clearance, wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 20**.

Check whether the standby NameNode fails to push the FsImage file to the active NameNode.

Step 20 Log in to the standby NameNode as user **root**.

Step 21 Run the **su - omm** command to switch to user **omm**.

Step 22 Run the following command to check whether the standby NameNode can push the file to the active NameNode.

tmpFile=/tmp/tmp_test_$(date +%s)

echo "test" > $tmpFile

scp $tmpFile *Service IP address of the active NameNode*:**/tmp**

- If yes, go to **Step 24**.
- If no, go to **Step 23**.

Step 23 When the standby NameNode fails to push data to the active NameNode as user **omm**, contact the system administrator to handle the fault. Wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 24**.

Check whether space on the data directory of the active NameNode is insufficient.

Step 24 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance**, click the active NameNode of the NameService for which the alarm is generated, and then click **Instance Configurations** to obtain the value of **dfs.namenode.name.dir**. This value is the FsImage storage directory of the active NameNode.

Step 25 Log in to the active NameNode as user **root** or **omm**.

Step 26 Go to the FsImage storage directory and check the size of the newest FsImage file (in MB).

cd *Storage directory of the active NameNode***/current**

du -m $(ls -t | grep "fsimage_[0-9]*$" | head -1) | awk '{print $1}'

Step 27 Run the following command to check the available disk space of the active NameNode (in MB).

df -m ./ | awk 'END{print $4}'

Step 28 Compare the FsImage file size and the available disk space and determine whether another FsImage file can be stored on the disk.

- If yes, go to **Step 30**.
- If no, go to **Step 29**.

Step 29 Clear the redundant files on the disk where the directory resides to reserve sufficient space for metadata. After the clearance, wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 30**.

Collect fault information.

Step 30 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 31 Select **NameNode** in the required cluster from the **Service**.

Step 32 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 33 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.99 ALM-14014 NameNode GC Time Exceeds the Threshold

Alarm Description

The system checks the garbage collection (GC) duration of the NameNode process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold.

This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14014	Critical (default threshold: 15000ms) Major (default threshold: 10000ms)	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the NameNode process may interrupt the services and users cannot read or write files.

Possible Causes

The heap memory of the NameNode instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Handling Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **ALM-14014 NameNode GC Time Exceeds the Threshold.** Then check the role name in **Location** and confirm the IP adress of the instance.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** > **NameNode (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Garbage Collection**, and select **NameNode Garbage Collection (GC)** to check the GC duration statistics of the NameNode process collected every minute.

Step 3 Check whether the GC duration of the NameNode process collected every minute exceeds the threshold.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations** > **NameNode** > **System** to increase the value of **GC_OPTS** parameter as required.

NOTE

The recommended mapping between the number of HDFS file objects (filesystem objects = files + blocks) and the JVM parameters configured for NameNode is as follows:

- If the number of file objects reaches 10,000,000, you are advised to set the JVM parameters as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the number of file objects reaches 20,000,000, you are advised to set the JVM parameters as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
- If the number of file objects reaches 50,000,000, you are advised to set the JVM parameters as follows: -Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
- If the number of file objects reaches 100,000,000, you are advised to set the JVM parameters as follows: -Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
- If the number of file objects reaches 200,000,000, you are advised to set the JVM parameters as follows: -Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
- If the number of file objects reaches 300,000,000, you are advised to set the JVM parameters as follows: -Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

Step 5 Save the configuration and restart the NameNode instance.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **NameNode** in the required cluster from the **Service**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.100 ALM-14015 DataNode GC Time Exceeds the Threshold

Alarm Description

The system checks the garbage collection (GC) duration of the DataNode process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold.

This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14015	Critical (default threshold: 20000ms) Major (default threshold: 12000ms)	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the DataNode process may interrupt the services and users cannot read or write files.

Possible Causes

The heap memory of the DataNode instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Handling Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **ALM-14015 DataNode GC Time Exceeds the Threshold**. Then check the role name in **Location** and confirm the IP adress of the instance.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** > **DataNode (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Garbage Collection**, and select **DataNode Garbage Collection (GC)** to check the GC duration statistics of the DataNode process collected every minute.

Step 3 Check whether the GC duration of the DataNode process collected every minute exceeds the threshold.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations** > **DataNode** > **System** to increase the value of **GC_OPTS** parameter as required.

NOTE

The mapping between the average number of blocks of a DataNode instance and the DataNode memory is as follows:

- If the average number of blocks of a DataNode instance reaches 2,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the average number of blocks of a DataNode instance reaches 5,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

Step 5 Save the configuration and restart the DataNode instance.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **DataNode** in the required cluster from the **Service**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.101 ALM-14016 DataNode Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of HDFS every 30 seconds. This alarm is generated when the direct memory usage of DataNode instances exceeds the threshold (90% of the maximum memory).

This alarm is automatically cleared when the direct memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14016	Critical (default threshold: 95%) Major (default threshold: 90%)	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the available direct memory of DataNode instances is insufficient, a memory overflow may occur and the service breaks down.

Possible Causes

The direct memory of DataNode instances is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

Step 1 On the **Home** page of FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, click the drop-down list in the row containing **ALM-14016 DataNode Direct Memory Usage Exceeds the Threshold**, and view the role name and IP address of the instance for which the alarm is generated in the **Location** area.

Step 2 On the **Home** page of FusionInsight Manager, choose **Cluster** > **Services** > **HDFS**. On the page that is displayed, click the **Instance** tab. In the instance list, select **DataNode** (IP address of the instance for which this alarm is generated). Click the drop-down list in the upper right corner of the chart, choose **Customize** > **Resource**, and select **DataNode Memory** to check the direct memory usage.

Step 3 Check whether the used direct memory of a DataNode instance reaches 90% (default threshold) of the maximum direct memory allocated to it.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On the **Home** page of FusionInsight Manager, choose **Cluster** > **Services** > **HDFS**. On the page that is displayed, click the **Configuration** tab then the **All Configurations** sub-tab, and select **DataNode** > **System**. Check whether **-XX:MaxDirectMemorySize** exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Adjust the value of **-XX:MaxDirectMemorySize**.

1. In **GC_OPTS**, check the value of **-Xmx** and check whether the node memory is sufficient.

   NOTE

   You can determine whether the node memory is sufficient based on the actual environment. For example, you can use the following method:

   Use the IP address to log in to the instance for which the alarm is generated as user **root** and run the **free -g** command to check the value of **Mem** in the **free** column. The value indicates the available memory of the node. In the following example, the available memory of the node is 4 GB.

   ```
                total        used        free      shared  buff/cache   available
   Mem:            112          48           4          10          58          46
   ......
   ```

   If the value of **Mem** is at least that of **-Xmx**, the node memory is sufficient. If the value of **Mem** is less than that of **-Xmx**, the node memory is insufficient.

- If yes, change the value of **-XX:MaxDirectMemorySize** to that of **-Xmx**.
- If no, increase **-XX:MaxDirectMemorySize** to a value no larger than that of **Mem**.

2. Save the configuration and restart the DataNode instances.

Step 6 Check whether **ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold** exists.

- If yes, rectify the fault by referring to **ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold**.
- If no, go to **Step 7**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **DataNode** for the target cluster.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.102 ALM-14017 NameNode Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the HDFS service every 30 seconds. This alarm is generated when the direct memory usage of a NameNode instance exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14017	Critical (default threshold: 95%) Major (default threshold: 90%)	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the HDFS service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the NameNode instance is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms.** On the displayed interface, click the drop-down button of **ALM-14017 NameNode Direct**

Memory Usage Exceeds the Threshold. Then check the role name in **Location** and confirm the IP adress of the instance.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** > **NameNode (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Resource**, and select **NameNode Memory** to check the direct memory usage.

Step 3 Check whether the used direct memory of NameNode reaches 90% of the maximum direct memory specified for NameNode by default.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations** > **NameNode** > **System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 In the **GC_OPTS** parameter, delete "-XX:MaxDirectMemorySize". Save the configuration and restart the NameNode instance.

Step 6 Check whether the **ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold**.
- If no, go to **Step 7**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 9 Select **NameNode** in the required cluster from the **Service**.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.None.

11.103 ALM-14018 NameNode Non-heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the non-heap memory usage of the HDFS NameNode every 30 seconds and compares the actual usage with the threshold. The non-heap memory usage of the HDFS NameNode has a default threshold. This alarm is generated when the non-heap memory usage of the HDFS NameNode exceeds the threshold.

Users can choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **HDFS** to change the threshold.

This alarm is cleared when the no-heap memory usage of the HDFS NameNode is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14018	Critical (default threshold: 95%) Major (default threshold: 90%)	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Type	Parameter	Description
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the memory usage of the HDFS NameNode is too high, data read/write performance of HDFS will be affected.

Possible Causes

Non-heap memory of the HDFS NameNode is insufficient.

Handling Procedure

Delete unnecessary files.

Step 1 Log in to the HDFS client as user **root**. Run the **cd** command to go to the client installation directory, and run the **source bigdata_env** command.

If the cluster adopts the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the **hdfs dfs -rm -r** *file or directory path* command to delete unnecessary files.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the NameNode JVM non-heap memory usage and configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS**. The HDFS status page is displayed.

Step 5 In the **Basic Information** area, click **NameNode(Active)**. The HDFS WebUI is displayed.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 On the HDFS WebUI, click the **Overview** tab. In **Summary**, check the numbers of files, directories, and blocks in HDFS.

Step 7 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**. In **Search**, enter **GC_OPTS** to check the **GC_OPTS** non-heap memory parameter of **HDFS->NameNode**.

Adjust system configurations.

Step 8 Check whether the non-heap memory is properly configured based on the number of file objects in **Step 6** and the non-heap parameters configured for NameNode in **Step 7**.

- If yes, go to **Step 9**.
- If no, go to **Step 12**.

NOTE

The recommended mapping between the number of HDFS file objects (filesystem objects = files + blocks) and the JVM parameters configured for NameNode is as follows:

- If the number of file objects reaches 10,000,000, you are advised to set the JVM parameters as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the number of file objects reaches 20,000,000, you are advised to set the JVM parameters as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
- If the number of file objects reaches 50,000,000, you are advised to set the JVM parameters as follows: -Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
- If the number of file objects reaches 100,000,000, you are advised to set the JVM parameters as follows: -Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
- If the number of file objects reaches 200,000,000, you are advised to set the JVM parameters as follows: -Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
- If the number of file objects reaches 300,000,000, you are advised to set the JVM parameters as follows: -Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

Step 9 Modify the **GC_OPTS** parameter of the NameNode based on the mapping between the number of file objects and non-heap memory.

Step 10 Save the configuration and click **Dashboard** > **More** > **Restart Service**.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 13 Select the following services in the required cluster from the **Service**.

- ZooKeeper
- HDFS

Step 14 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 15 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.104 ALM-14019 DataNode Non-heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the non-heap memory usage of the HDFS DataNode every 30 seconds and compares the actual usage with the threshold. The non-heap memory usage of the HDFS DataNode has a default threshold. This alarm is generated when the non-heap memory usage of the HDFS DataNode exceeds the threshold.

Users can choose **O&M > Alarm > Thresholds>** *Name of the desired cluster* **> HDFS** to change the threshold.

This alarm is cleared when the no-heap memory usage of the HDFS DataNode is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14019	Critical (default threshold: 95%) Major (default threshold: 90%)	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Type	Parameter	Description
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the memory usage of the HDFS DataNode is too high, data read/write performance of HDFS will be affected.

Possible Causes

Non-heap memory of the HDFS DataNode is insufficient.

Handling Procedure

Delete unnecessary files.

Step 1 Log in to the HDFS client as user **root**. Run the **cd** command to go to the client installation directory, and run the **source bigdata_env** command.

If the cluster adopts the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the **hdfs dfs -rm -r** *file or directory path* command to delete unnecessary files.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the DataNode JVM non-heap memory usage and configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS**.

Step 5 In the **Basic Information** area, click **NameNode(Active)**. The HDFS WebUI is displayed.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 On the HDFS WebUI, click the **Datanodes** tab to view the number of blocks of all DataNodes that report alarms.

Step 7 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**. In **Search**, enter **GC_OPTS** to check the **GC_OPTS** non-heap memory parameter of **HDFS->DataNode**.

Adjust system configurations.

Step 8 Check whether the memory is properly configured based on the number of blocks in **Step 6** and the memory parameters configured for DataNode in **Step 7**.

- If yes, go to **Step 9**.
- If no, go to **Step 12**.

NOTE

The mapping between the average number of blocks of a DataNode instance and the DataNode memory is as follows:

- If the average number of blocks of a DataNode instance reaches 2,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the average number of blocks of a DataNode instance reaches 5,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

Step 9 Modify the **GC_OPTS** parameter of the DataNode based on the mapping between the number of blocks and memory.

Step 10 Save the configuration and click **Dashboard** > **More** > **Restart Service**.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 13 Select the following services in the required cluster from the **Service**.

- ZooKeeper
- HDFS

Step 14 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 15 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.105 ALM-14020 Number of Entries in the HDFS Directory Exceeds the Threshold

Alarm Description

The system obtains the number of subfiles and subdirectories in a specified directory every hour and checks whether it reaches the percentage of the threshold (the maximum number of subfiles and subdirectories in an HDFS directory, the threshold for triggering an alarm is **90%** by default). If it exceeds the percentage of the threshold, an alarm is triggered.

When the number of subfiles and subdirectories in the directory the alarm is lower than the percentage of the threshold, the alarm is automatically cleared. When the monitoring switch is disabled, alarms corresponding to all directories are cleared. If a directory is removed from the monitoring list, alarms corresponding to the directory are cleared.

NOTE

- The **dfs.namenode.fs-limits.max-directory-items** parameter specifies the maximum number of subfiles and subdirectories in the HDFS directory. Its default value is **1048576**. If the number of subfiles and subdirectories in a directory exceeds the parameter value, subfiles and subdirectories cannot be created in the directory.
- The **dfs.namenode.directory-items.monitor** parameter specifies the list of directories to be monitored. Its default value is **/tmp,/mr-history**.
- The **dfs.namenode.directory-items.monitor.enabled** parameter is used to enable or disable the monitoring switch. Its default value is **true**, which means the monitoring switch is enabled by default.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14020	Critical (default threshold: 95%) Major (default threshold: 90%)	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	NameService Name	Specifies the NameService service for which the alarm is generated.
	Directory	Specifies the directory for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the number of entries in the monitored directory exceeds 90% of the threshold, an alarm is triggered, but entries can be added to the directory. Once the maximum threshold is exceeded, entries will fail to be added to the directory.

Possible Causes

The number of entries in the monitored directory exceeds 90% of the threshold.

Handling Procedure

Check whether unnecessary files exist in the system.

Step 1 Log in to the HDFS client as user **root**. Run the **cd** command to go to the client installation directory, and run the **source bigdata_env** command to set the environment variables.

If the cluster is in security mode, security authentication is required.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the following command to check whether files and directories in the directory with the alarm can be deleted:

hdfs dfs -ls *Directory with the alarm*

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Run the following command to delete unnecessary files.

hdfs dfs -rm -r -f *File or directory path*

NOTE

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

Step 4 Wait 1 hour and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the threshold is correctly configured.

Step 5 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**. Search for the **dfs.namenode.fs-limits.max-directory-items** parameter and check whether the parameter value is appropriate.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

Step 6 Increase the parameter value.

Step 7 Save the configuration and click **Dashboard** > **More** > **Restart Service**.

Step 8 Wait 1 hour and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **HDFS** in the required cluster from the **Service**.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.106 ALM-14021 NameNode Average RPC Processing Time Exceeds the Threshold

Alarm Description

The system checks the average RPC processing time of NameNode every 30 seconds, and compares the actual average RPC processing time with the threshold.

This alarm is generated when the system detects that the average RPC processing time exceeds the threshold for several consecutive times (10 times by default).

You can choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **HDFS** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the average RPC processing time of NameNode is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the average RPC processing time of NameNode is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14021	Critical (default threshold: 200ms) Major (default threshold: 100ms)	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	NameService Name	Specifies the NameService service for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

NameNode cannot process the RPC requests from HDFS clients, upper-layer services that depend on HDFS, and DataNode in a timely manner. Specifically, the services that access HDFS run slowly or the HDFS service is unavailable.

Possible Causes

- The CPU performance of NameNode nodes is insufficient and therefore NameNode nodes cannot process messages in a timely manner.
- The configured NameNode memory is too small and frame freezing occurs on the JVM due to frequent full garbage collection.
- NameNode parameters are not configured properly, so NameNode cannot make full use of system performance.

Handling Procedure

Obtain alarm information.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

Step 2 Check the alarm. Obtain the host name of the NameNode node involved in this alarm from the **HostName** information of **Location**. Then obtain the name of the NameService node involved in this alarm from the **NameServiceName** information of **Location**.

Check whether the threshold is too small.

Step 3 Check the status of the services that depend on HDFS. Check whether the services run slowly or task execution times out.

- If yes, go to **Step 8**.
- If no, go to **Step 4**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **RPC**, and select **Average Time of Active NameNode RPC Processing** and click **OK**.

Step 5 On the **Average Time of Active NameNode RPC Processing** monitoring page, obtain the value of the NameService node involved in this alarm.

Step 6 On the FusionInsight Manager portal, choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* **> HDFS**. Locate **Average Time of Active NameNode RPC Processing** and click the **Modify** in the **Operation** column of the default rule. The **Modify Rule** page is displayed. Change **Threshold** to 150% of the peak value within one day before and after the alarm is generated. Click **OK** to save the new threshold.

Step 7 Wait for 5 minutes and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the CPU performance of the NameNode node is sufficient.

Step 8 On the FusionInsight Manager portal, click **O&M > Alarm >Alarms** and check whether **ALM-12016 CPU Usage Exceeds the Threshold** is generated for the NameNode node.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Handle **ALM-12016 CPU Usage Exceeds the Threshold** by taking recommended actions.

Step 10 Wait for 10 minutes and check whether alarm 14021 is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check whether the memory of the NameNode node is too small.

Step 11 On the FusionInsight Manager portal, click **O&M > Alarm >Alarms** and check whether **ALM-14007 HDFS NameNode Heap Memory Usage Exceeds the Threshold** is generated for the NameNode node.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Handle **ALM-14007 HDFS NameNode Heap Memory Usage Exceeds the Threshold** by taking recommended actions.

Step 13 Wait for 10 minutes and check whether alarm 14021 is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check whether NameNode parameters are configured properly.

Step 14 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**. Search for parameter **dfs.namenode.handler.count** and view its value. If the value is less than or equal to 128, change it to **128**. If the value is greater than 128 but less than 192, change it to **192**.

Step 15 Search for parameter **ipc.server.read.threadpool.size** and view its value. If the value is less than 5, change it to **5**.

Step 16 Click **Save** and click **OK**.

Step 17 On the **Instance** page of HDFS, select the standby NameNode of NameService involved in this alarm and choose **More** > **Restart Instance**. Enter the password and click **OK**. Wait until the standby NameNode is started up.

Step 18 On the **Instance** page of HDFS, select the active NameNode of NameService involved in this alarm and choose **More** > **Restart Instance**. Enter the password and click **OK**. Wait until the active NameNode is started up.

Step 19 Wait for 1 hour and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 20**.

Collect fault information.

Step 20 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 21 Select the following node in the required cluster from the **Service**.

- HDFS

Step 22 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 23 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.107 ALM-14022 NameNode Average RPC Queuing Time Exceeds the Threshold

Alarm Description

The system checks the average RPC queuing time of NameNode every 30 seconds, and compares the actual average RPC queuing time with the threshold. This alarm is generated when the system detects that the average RPC queuing time exceeds the threshold for several consecutive times (10 times by default).

You can choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **HDFS** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the average RPC queuing time of NameNode is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the average RPC queuing time of NameNode is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14022	Critical (default threshold: 300ms) Major (default threshold: 200ms)	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	NameService Name	Specifies the NameService service for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

NameNode cannot process the RPC requests from HDFS clients, upper-layer services that depend on HDFS, and DataNode in a timely manner. Specifically, the services that access HDFS run slowly or the HDFS service is unavailable.

Possible Causes

- The CPU performance of NameNode nodes is insufficient and therefore NameNode nodes cannot process messages in a timely manner.
- The configured NameNode memory is too small and frame freezing occurs on the JVM due to frequent full garbage collection.
- NameNode parameters are not configured properly, so NameNode cannot make full use of system performance.
- The volume of services that access HDFS is too large and therefore NameNode is overloaded.

Handling Procedure

Obtain alarm information.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

Step 2 Check the alarm. Obtain the alarm generation time from **Generated**. Obtain the host name of the NameNode node involved in this alarm from the **HostName** information of **Location**. Then obtain the name of the NameService node involved in this alarm from the **NameServiceName** information of **Location**.

Check whether the threshold is too small.

Step 3 Check the status of the services that depend on HDFS. Check whether the services run slowly or task execution times out.

- If yes, go to **Step 8**.
- If no, go to **Step 4**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **RPC**, and select **Average Time of Active NameNode RPC Queuing** and click **OK**.

Step 5 On the **Average Time of Active NameNode RPC Queuing** monitoring page, obtain the value of the NameService node involved in this alarm.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **HDFS**. Locate **Average Time of Active NameNode RPC Queuing** and click the **Modify** in the **Operation** column of the default rule. The **Modify Rule** page is displayed. Change **Threshold** to 150% of the monitored value. Click **OK** to save the new threshold.

Step 7 Wait for 1 minute and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the CPU performance of the NameNode node is sufficient.

Step 8 On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms** and check whether **ALM-12016 HDFS NameNode Memory Usage Exceeds the Threshold** is generated.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Handle **ALM-12016 CPU Usage Exceeds the Threshold** by taking recommended actions.

Step 10 Wait for 10 minutes and check whether alarm 14022 is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check whether the memory of the NameNode node is too small.

Step 11 On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms** and check whether **ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold** is generated.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Handle **ALM-14007 CPU Usage Exceeds the Threshold** by taking recommended actions.

Step 13 Wait for 10 minutes and check whether alarm 14022 is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check whether NameNode parameters are configured properly.

Step 14 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**. Search for parameter **dfs.namenode.handler.count** and view its value. If the value is less than or equal to 128, change it to **128**. If the value is greater than 128 but less than 192, change it to **192**.

Step 15 Search for parameter **ipc.server.read.threadpool.size** and view its value. If the value is less than 5, change it to **5**.

Step 16 Click **Save**, and click **OK**.

Step 17 On the **Instance** page of HDFS, select the standby NameNode of NameService involved in this alarm and choose **More** > **Restart Instance**. Enter the password and click **OK**. Wait until the standby NameNode is started up.

Step 18 On the **Instance** page of HDFS, select the active NameNode of NameService involved in this alarm and choose **More** > **Restart Instance**. Enter the password and click **OK**. Wait until the active NameNode is started up.

Step 19 Wait for 1 hour and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 20**.

Check whether the HDFS workload changes and reduce the workload properly.

Step 20 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS**. Click the drop-down menu in the upper right corner of **Chart**, click **Customize**, select **Average Time of Active NameNode RPC Queuing** and click **OK**.

Step 21 Click  . The **Details** page is displayed.

Step 22 Set the monitoring data display period, from 5 days before the alarm generation time to the alarm generation time. Click **OK**.

Step 23 On the **Average RPC Queuing Time** monitoring page, check whether the point in time when the queuing time increases abruptly exists.

- If yes, go to **Step 24**.
- If no, go to **Step 27**.

Step 24 Confirm and check the point in time. Check whether a new task frequently accesses HDFS and whether the access frequency can be reduced.

Step 25 If a Balancer task starts at the point in time, stop the task or specify a node for the task to reduce the HDFS workload.

Step 26 Wait for 1 hour and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 27**.

Collect fault information.

Step 27 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 28 Select **HDFS** in the required cluster from the **Service**.

Step 29 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 30 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.108 ALM-14023 Percentage of Total Reserved Disk Space for Replicas Exceeds the Threshold

Alarm Description

The system checks the percentage of total reserved disk space for replicas (Total reserved disk space for replicas/(Total reserved disk space for replicas + Total remaining disk space)) every 30 seconds and compares the actual percentage with the threshold (**90%** by default). This alarm is generated when the percentage of total reserved disk space for replicas exceeds the threshold for multiple consecutive times (**Trigger Count**).

The alarm is cleared in the following two scenarios: The value of **Trigger Count** is **1** and the percentage of total reserved disk space for replicas is less than or equal to the threshold; the value of **Trigger Count** is greater than **1** and the percentage of total reserved disk space for replicas is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14023	Major (default threshold: 95%) Minor (default threshold: 90%)	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	NameService Name	Specifies the NameService service for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The performance of writing data to HDFS is affected. If all remaining DataNode space is reserved for replicas, writing HDFS data fails.

Possible Causes

- The alarm threshold is improperly configured.
- The disk space configured for the HDFS cluster is insufficient.
- The volume of services that access HDFS is too large and therefore DataNode is overloaded.

Handling Procedure

Check whether the alarm threshold is appropriate.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **HDFS** > **Disk** > **Percentage of Reserved Space for Replicas of Unused Space** to check whether the alarm threshold is appropriate. (The default threshold is **90%**. Users can change it as required.)

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **HDFS** > **Disk** > **Percentage of Reserved Space for Replicas of Unused Space** and Click **Modify,** change the threshold based on the actual usage.

Step 3 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 4**.

Check whether an alarm indicating insufficient disk space is generated.

Step 4 On the FusionInsight Manager portal, check whether **ALM-14001 HDFS Disk Usage Exceeds the Threshold** or **ALM-14002 DataNode Disk Usage Exceeds the Threshold** exists on the **O&M > Alarm > Alarms** page.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Handle the alarm by referring to instructions in **ALM-14001 HDFS Disk Usage Exceeds the Threshold** or **ALM-14002 DataNode Disk Usage Exceeds the Threshold** and check whether the alarm is cleared.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Expand the DataNode capacity.

Step 7 Expand the DataNode capacity.

Step 8 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **HDFS** in the required cluster from the **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.109 ALM-14024 Tenant Space Usage Exceeds the Threshold

Alarm Description

The system checks the space usage (used space of each directory/space allocated to each directory) of each directory associated with a tenant every hour and compares the space usage of each directory with the threshold set for the directory. This alarm is generated when the space usage exceeds the threshold.

This alarm is cleared when the space usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14024	Major (default threshold: 95%) Minor (default threshold: 90%)	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	TenantName	Specifies the tenant for which the alarm is generated.
	DirectoryName	Specifies the directory for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

This alarm is generated if the space usage of the tenant directory exceeds the custom threshold. File writing to the directory is not affected. If the used space exceeds the maximum storage space allocated to the directory, the HDFS fails to write data to the directory.

Possible Causes

- The alarm threshold is improperly configured.
- The space allocated to the tenant is improper.

Handling Procedure

Check whether the alarm threshold is appropriate.

Step 1 View the alarm location information to obtain the tenant name and tenant directory for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the storage space threshold configured for the tenant directory for which the alarm is generated is proper. (The default value 90% is a proper value. You can set it based on the site requirements.)

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 On the **Resources** page, click **Modify** to modify or delete the storage space threshold.

Step 4 About one minute later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the space allocated to the tenant is appropriate.

Step 5 On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the storage space quota of the tenant directory for which the alarm is generated is proper based on the actual service status of the tenant directory.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 On the **Resources** page, click **Modify** to modify the storage space quota.

Step 7 About one minute later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 9 Select **HDFS** in the required cluster and **NodeAgent** under **Manager** from the **Service**.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.110 ALM-14025 Tenant File Object Usage Exceeds the Threshold

Alarm Description

The system checks the file object usage (used file objects of each directory/number of file objects allocated to each directory) of each directory associated with a tenant every hour and compares the file object usage of each directory with the threshold set for the directory. This alarm is generated when the file object usage exceeds the threshold.

This alarm is cleared when the file object usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14025	Major (default threshold: 95%) Minor (default threshold: 90%)	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	TenantName	Specifies the tenant for which the alarm is generated.
	DirectoryName	Specifies the directory for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

This alarm is generated if the usage of file objects in a tenant directory exceeds the custom threshold. File writing to the directory is not affected. If the number of used file objects exceeds the maximum number of file objects allocated to the directory, the HDFS fails to write data to the directory.

Possible Causes

- The alarm threshold is improperly configured.
- The maximum number of file objects allocated to the tenant directory is inappropriate.

Handling Procedure

Check whether the alarm threshold is appropriate.

Step 1 View the alarm location information to obtain the tenant name and tenant directory for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the file object threshold configured for the tenant directory for which the alarm is generated is proper. (The default value 90% is a proper value. You can set it based on the site requirements.)

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 On the **Resources** page, click **Modify** to modify or delete the file object threshold of the tenant directory for which the alarm is generated.

Step 4 About one minute later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the maximum number of file objects allocated to the tenant is appropriate.

Step 5 On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the maximum number of file objects configured for the tenant directory for which the alarm is generated is proper based on the actual service status of the tenant directory.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 On the **Resources** page, click **Modify** to modify or delete the maximum number of file objects configured for the tenant directory.

Step 7 About one minute later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 9 Select **HDFS** in the required cluster and **NodeAgent** under **Manager** from the **Service**.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.111 ALM-14026 Blocks on DataNode Exceed the Threshold

Alarm Description

The system checks the number of blocks on each DataNode every 30 seconds. This alarm is generated when the number of blocks on the DataNode exceeds the threshold.

If **Trigger Count** is **1** and the number of blocks on the DataNode is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1** and the number of blocks on the DataNode is less than or equal to 90% of the threshold, this alarm is cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14026	Major	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If this alarm is reported, there are too many blocks on the DataNode. In this case, data writing into the HDFS may fail due to insufficient disk space.

Possible Causes

- The alarm threshold is improperly configured.
- Data skew occurs among DataNodes.
- The disk space configured for the HDFS cluster is insufficient.

Handling Procedure

Change the threshold.

Step 1 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **HDFS**. Then choose **Configurations** > **All Configurations**. On the displayed page, find the **GC_OPTS** parameter under **HDFS->DataNode**.

Step 2 Set the threshold of the DataNode blocks. Specifically, change the value of **Xmx** of the **GC_OPTS** parameter. **Xmx** specifies the memory, and each GB memory supports a maximum of 500,000 DataNode blocks. Set the memory as required. Confirm that **GC_PROFILE** is set to **custom** and save the configuration.

Step 3 Choose **Cluster**, click the name of the desired cluster, and choose **HDFS** > **Instance**. Select the DataNode instance whose status is **Expired**, click **More**, and select **Restart Instance** to make the **GC_OPTS** configuration take effect.

Step 4 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether associated alarms are reported.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and check whether the **ALM-14002 DataNode Disk Usage Exceeds the Threshold** alarm exists.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Handle the alarm by following the instructions in **ALM-14002 DataNode Disk Usage Exceeds the Threshold** and check whether the alarm is cleared.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Expand the DataNode capacity.

Step 8 Expand the DataNode capacity.

Step 9 On FusionInsight Manager, wait for 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

Configuration rules of the DataNode JVM parameter.

Default value of the DataNode JVM parameter **GC_OPTS**:

-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M -XX:MetaspaceSize=128M -XX:MaxMetaspaceSize=128M -XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -XX:CMSInitiatingOccupancyFraction=65 -XX:+PrintGCDetails -Dsun.rmi.dgc.client.gcInterval=0x7FFFFFFFFFFFFE -Dsun.rmi.dgc.server.gcInterval=0x7FFFFFFFFFFFFE -XX:-OmitStackTraceInFastThrow -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M -Djdk.tls.ephemeralDHKeySize=2048

The average number of blocks stored in each DataNode instance in the cluster is: Number of HDFS blocks x 3/Number of DataNodes. If the average number of blocks changes, you need to change **-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M** in the default value. The following table lists the reference values.

Table 11-3 DataNode JVM configuration

Average Number of Blocks in a DataNode Instance	Reference Value
2,000,000	-Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
5,000,000	-Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

Xmx specifies memory which corresponds to the threshold of the number of DataNode blocks, and each GB memory supports a maximum of 500,000 DataNode blocks. Set the memory as required.

11.112 ALM-14027 DataNode Disk Fault

Alarm Description

The system checks the disk status on DataNodes every 60 seconds. This alarm is generated when a disk is faulty.

After all faulty disks on the DataNode are recovered, you need to manually clear the alarm and restart the DataNode.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14027	Major	Environment	HDFS	No

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Faulty Disk	Specifies the list of faulty disks.

Impact on the System

If this alarm is reported, there are abnormal disk partitions on the DataNode. This may cause the loss of written files.

Possible Causes

- The hard disk is faulty.
- The disk permissions are configured improperly.

Handling Procedure

Check whether a disk alarm is generated.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and check whether **ALM-12014 Partition Lost** or **ALM-12033 Slow Disk Fault** exists.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Rectify the fault by referring to the handling procedure of **ALM-12014 Partition Lost** or **ALM-12033 Slow Disk Fault**. Then, check whether the alarm is cleared.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Modify disk permissions.

Step 4 Choose **O&M** > **Alarm** > **Alarms** and view **Location** and **Additional Information** of the alarm to obtain the location of the faulty disk.

Step 5 Log in to the node for which the alarm is generated as user **root**. Go to the directory where the faulty disk is located, and run the **ll** command to check whether the permission of the faulty disk is **711** and whether the user is **omm**.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Modify the permission of the faulty disk. For example, if the faulty disk is **data1**, run the following commands:

chown omm:wheel data1

chmod 711 data1

Step 7 In the alarm list on Manager, click **Clear** in the **Operation** column of the alarm to manually clear the alarm. Choose **Cluster** > **Services** > **HDFS** > **Instance**, select the DataNode, choose **More** > **Restart Instance**, wait for 5 minutes, and check whether a new alarm is reported.

- If no, no further action is required.
- If yes, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **HDFS** and **OMS** for the target cluster.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system does not automatically clear this alarm and you need to manually clear the alarm.

Related Information

None.

11.113 ALM-14028 Number of Blocks to Be Supplemented Exceeds the Threshold

Alarm Description

The system checks the number of blocks to be supplemented every 30 seconds and compares the number with the threshold. The number of blocks to be supplemented has a default threshold. This alarm is generated when the number of blocks to be supplemented exceeds the threshold.

You can change the threshold specified by **Blocks Under Replicated (NameNode)** by choosing **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **HDFS** > **File and Block**.

If **Trigger Count** is set to **1** and the number of blocks to be supplemented is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1** and the number of blocks to be supplemented is less than or equal to the threshold, this alarm is cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14028	Major (default threshold: 10000) Major (default threshold: 1000)	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
	NameService Name	Specifies the NameService for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Data stored in HDFS is lost. HDFS may enter the security mode and cannot provide write services. Lost block data cannot be restored.

Possible Causes

- The DataNode instance is abnormal.
- Data is deleted.
- The number of replicas written into the file is greater than the number of DataNodes.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, check whether alarm **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold** is generated.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Rectify the fault according to the handling procedure of **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold**. Five minutes later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 Log in to the HDFS client as user **root**. The user password is defined by the user before the installation. Contact the MRS cluster administrator to obtain the password. Run the following commands:

- Security mode:

  cd *Client installation directory*

  source bigdata_env

  kinit hdfs

- Normal mode:

  su - omm

  cd *Client installation directory*

  source bigdata_env

Step 4 Run the **hdfs fsck / >> fsck.log** command to obtain the status of the current cluster.

Step 5 Run the following command to count the number (*M*) of blocks to be replicated:

cat fsck.log | grep "Under-replicated"

Step 6 Run the following command to count the number (*N*) of blocks to be replicated in the **/tmp/hadoop-yarn/staging/** directory:

cat fsck.log | grep "Under replicated" | grep "/tmp/hadoop-yarn/staging/" | wc -l

NOTE

/tmp/hadoop-yarn/staging/ is the default directory. If the directory is modified, obtain it from the configuration item **yarn.app.mapreduce.am.staging-dir** in the **mapred-site.xml** file.

Step 7 Check whether the percentage of *N* is greater than 50% (N/M > 50%).

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Run the following command to reconfigure the number of file replicas in the directory (set the number of file replicas to the number of DataNodes or the default number of file replicas):

hdfs dfs -setrep -w ***Number of file replicas*****/tmp/hadoop-yarn/staging/**

NOTE

To obtain the default number of file replicas:

Log in to FusionInsight Manager, choose **Cluster > Services > HDFS > Configurations > All Configurations**, and search for the **dfs.replication** parameter. The value of this parameter is the default number of file replicas.

Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.114 ALM-14029 Number of Blocks in a Replica Exceeds the Threshold

Alarm Description

The system checks the number of blocks in a single replica every four hours and compares the number with the threshold. There is a threshold for the number of blocks in a single replica. This alarm is generated when the actual number of blocks in a single replica exceeds the threshold.

This alarm is cleared when the number of blocks to be supplemented is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14029	Major (default threshold: 10000) Major (default threshold: 100)	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.

Type	Parameter	Description
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
	NameService Name	Specifies the NameService for which the alarm was generated.
Additional Information	Trigger condition	Specifies the alarm triggering condition.

Impact on the System

Replica data is prone to be lost when a node is faulty. Too many files of a single replica affect the security of the HDFS file system.

Possible Causes

- The DataNode is faulty.
- The disk is faulty.
- Files are written to a single replica.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, check whether alarm **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold** is generated.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Rectify the fault according to the handling procedure of **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold**. In the next detection period, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 Check whether files of a single replica have been written into the service.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 Log in to the HDFS client as user **root**. The user password is defined by the user before the installation. Contact the MRS cluster administrator to obtain the password. Run the following commands:

- Security mode:

  cd *Client installation directory*

  source bigdata_env

  kinit hdfs

- Normal mode:

  su - omm

  cd *Client installation directory*

  source bigdata_env

Step 5 Run the following command on the client node to increase the number of replicas for a single replica file:

hdfs dfs -setrep -w *file replica number file name or file path*

Step 6 In the next detection period, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.115 ALM-14030 HDFS Allows Write of Single-Replica Data

Alarm Description

This alarm is generated when **dfs.single.replication.enable** is set to **true**, indicating that HDFS is configured to allow write of single-replica data.

This alarm is cleared when this function is disabled on HDFS.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14030	Major	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger condition	Specifies the alarm triggering condition.

Impact on the System

Data of a single replica may be lost. Therefore, the system does not allow write of single-replica data by default. If this configuration is enabled on HDFS and the number of HDFS replicas configured on the client is 1, single-replica data can be written to HDFS.

Possible Causes

The HDFS configuration item **dfs.single.replication.enable** is set to **true**.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **HDFS**. On the page that is displayed, click the **Configurations** tab then the **All Configurations** sub-tab.

Step 2 Search for **dfs.single.replication.enable** in the search box, change the value of the configuration item to **false**, and click **Save**.

Step 3 On the **Dashboard** page of the HDFS service, click **More** and select **Service Rolling Restart** in the upper right corner.

Step 4 After the HDFS service is started, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 7 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.116 ALM-14031 DataNode Process Is Abnormal

Alarm Description

The DataNode process checks the process status every 20 seconds. This alarm is generated when the process status is abnormal and does not recover for a long time.

This alarm is cleared when the process status recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14031	Major	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the process status is abnormal, the process cannot provide services properly. As a result, the entire service may become abnormal.

Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state. The process may also be suspended and enter the T state.

Handling Procedure

Check whether the process is in the D, Z, or T state.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. Wait for about 10 minutes and check whether the alarm is automatically cleared.

- If the alarm is not in the list, no further action is required.
- If the alarm is in the list, view the alarm details and record the IP address of the host where the alarm is generated. Run the command in **Step 2**.

Step 2 Log in to the host where the alarm is generated as the **root** user and run the **su - omm** command to switch to the **omm** user.

Step 3 Run the following command to check the process state:

ps ww -eo stat,cmd| grep -w org.apache.hadoop.hdfs.server.datanode.DataNode | grep -v grep | awk '{print $1}'

Step 4 Check whether the command output contains any abnormal state (D, Z, or T).

- If the output contains any abnormal state, go to **Step 5**.
- If the output does not contain abnormal states, go to **Step 7**.

Step 5 Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)

Step 6 Wait 5 minutes and check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm fails to be cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.117 ALM-14032 JournalNode Process Is Abnormal

Alarm Description

The JournalNode process checks the process status every 20 seconds. This alarm is generated when the process status is abnormal and does not recover for a long time.

This alarm is cleared when the process status recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14032	Major	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the process status is abnormal, the process cannot provide services properly. As a result, the entire service may become abnormal.

Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state. The process may also be suspended and enter the T state.

Handling Procedure

Check whether the process is in the D, Z, or T state.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. Wait for about 10 minutes and check whether the alarm is automatically cleared.

- If the alarm is not in the list, no further action is required.
- If the alarm is in the list, view the alarm details and record the IP address of the host where the alarm is generated. Run the command in **Step 2**.

Step 2 Log in to the host where the alarm is generated as the **root** user and run the **su - omm** command to switch to the **omm** user.

Step 3 Run the following command to check the process state:

ps ww -eo stat,cmd| grep -w org.apache.hadoop.hdfs.qjournal.server.JournalNode | grep -v grep | awk '{print$1}'

Step 4 Check whether the command output contains any abnormal state (D, Z, or T).

- If the output contains any abnormal state, go to **Step 5**.
- If the output does not contain abnormal states, go to **Step 7**.

Step 5 Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)

Step 6 Wait 5 minutes and check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm fails to be cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.118 ALM-14033 ZKFC Process Is Abnormal

Alarm Description

The ZKFC process checks the process status every 20 seconds. This alarm is generated when the process status is abnormal and does not recover for a long time.

This alarm is cleared when the process status recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14033	Major	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the process status is abnormal, the process cannot provide services properly. As a result, the entire service may become abnormal.

Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state. The process may also be suspended and enter the T state.

Handling Procedure

Check whether the process is in the D, Z, or T state.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. Wait for about 10 minutes and check whether the alarm is automatically cleared.

- If the alarm is not in the list, no further action is required.
- If the alarm is in the list, view the alarm details and record the IP address of the host where the alarm is generated. Run the command in **Step 2**.

Step 2 Log in to the host where the alarm is generated as the **root** user and run the **su - omm** command to switch to the **omm** user.

Step 3 Run the following command to check whether the process state is abnormal:

ps ww -eo stat,cmd| grep -w org.apache.hadoop.hdfs.tools.DFSZKFailoverController | grep -v grep | awk '{print$1}'

Step 4 Check whether the command output contains any abnormal state (D, Z, or T).

- If the output contains any abnormal state, go to **Step 5**.
- If the output does not contain abnormal states, go to **Step 7**.

Step 5 Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)

Step 6 Wait 5 minutes and check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm fails to be cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.119 ALM-14034 Router Process Is Abnormal

Alarm Description

The Router process checks the process status every 20 seconds. This alarm is generated when the process status is abnormal and does not recover for a long time.

This alarm is cleared when the process status recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14034	Major	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the process status is abnormal, the process cannot provide services properly. As a result, the entire service may become abnormal.

Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state. The process may also be suspended and enter the T state.

Handling Procedure

Check whether the process is in the D, Z, or T state.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. Wait for about 10 minutes and check whether the alarm is automatically cleared.

- If the alarm is not in the list, no further action is required.
- If the alarm is in the list, view the alarm details and record the IP address of the host where the alarm is generated. Run the command in **Step 2**.

Step 2 Log in to the host where the alarm is generated as the **root** user and run the **su - omm** command to switch to the **omm** user.

Step 3 Run the following command to check whether the process state is abnormal:

ps ww -eo stat,cmd| grep -w org.apache.hadoop.hdfs.server.federation.router.DFSRouter | grep -v grep | awk '{print$1}'

Step 4 Check whether the command output contains any abnormal state (D, Z, or T).

- If the output contains any abnormal state, go to **Step 5**.
- If the output does not contain abnormal states, go to **Step 7**.

Step 5 Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)

Step 6 Wait 5 minutes and check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm fails to be cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.120 ALM-14035 HttpFS Process Is Abnormal

Alarm Description

The HttpFS process checks the process status every 20 seconds. This alarm is generated when the process status is abnormal and does not recover for a long time.

This alarm is cleared when the process status recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
14035	Major	Quality of service	HDFS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the process status is abnormal, the process cannot provide services properly. As a result, the entire service may become abnormal.

Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state. The process may also be suspended and enter the T state.

Handling Procedure

Check whether the process is in the D, Z, or T state.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. Wait for about 10 minutes and check whether the alarm is automatically cleared.

- If the alarm is not in the list, no further action is required.
- If the alarm is in the list, view the alarm details and record the IP address of the host where the alarm is generated. Run the command in **Step 2**.

Step 2 Log in to the host where the alarm is generated as the **root** user and run the **su - omm** command to switch to the **omm** user.

Step 3 Run the following command to check whether the process state is abnormal:

ps ww -eo stat,cmd| grep -w org.apache.hadoop.fs.http.server.HttpFSServerWebServer | grep -v grep | awk '{print$1}'

Step 4 Check whether the command output contains any abnormal state (D, Z, or T).

- If the output contains any abnormal state, go to **Step 5**.
- If the output does not contain abnormal states, go to **Step 7**.

Step 5 Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)

Step 6 Wait 5 minutes and check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm fails to be cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.121 ALM-16000 Percentage of Sessions Connected to the HiveServer to Maximum Number Allowed Exceeds the Threshold

Alarm Description

The system detects the percentage of sessions connected to the HiveServer to the maximum number of allowed sessions every 30 seconds. This indicator can be viewed on the **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** > *HiveServer instance***.** This alarm is generated when the percentage exceeds the default value.

To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Hive** > **Percentage of Sessions Connected to the HiveServer to Maximum Number of Sessions Allowed by the HiveServer**.

When the **Trigger Count** is 1, this alarm is cleared when the percentage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the percentage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
16000	Versions earlier than MRS 3.3.0: minor (default threshold: 90%) MRS 3.3.0 and later versions: Critical (default threshold: 90%) Major (default threshold: 80%)	Quality of service	Hive	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If a connection number alarm is generated, the number of sessions connected to HiveServer is too large. As a result, new connections cannot be established, new tasks fail, or even services restart unexpectedly.

Possible Causes

Too many clients are connected to HiveServer.

Handling Procedure

Increase the maximum number of connections to Hive.

Step 1 On the FusionInsight Manager portal, Choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configurations >All Configurations**.

Step 2 Search for **hive.server.session.control.maxconnections** and increase the value of this parameter. If the value of this parameter is **A**, the threshold is **B**, and the number of sessions connected to the HiveServer is **C**, adjust the value of this parameter according to **A x B > C**. To view the number of sessions connected to the HiveServer, check the value of **Statistics for Sessions of the HiveServer** on the Hive monitoring page.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 5 Select **Hive** in the required cluster from the **Service**.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.122 ALM-16001 Hive Warehouse Space Usage Exceeds the Threshold

Alarm Description

The system checks the Hive warehouse space usage every 30 seconds. You can view **Percentage of HDFS Space Used by Hive to the Available Space** on the Hive service monitoring page. This alarm is generated when the Hive warehouse space usage exceeds the specified threshold.

To change the threshold, choose **O&M**. In the navigation pane on the left, click **Alarm** > **Thresholds** > Name of the desired cluster > **Hive** > **Percentage of HDFS Space Used by Hive to the Available Space**.

When the number of trigger times is 1, this alarm is cleared if the Hive warehouse space usage is less than or equal to the threshold. When the number of trigger times is greater than 1, this alarm is cleared if the Hive warehouse space usage is less than or equal to 90% of the threshold.

NOTE

The MRS cluster administrator can reduce the repository space usage by increasing the repository capacity or releasing some used space.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
16001	MRS 3.3.0 and earlier: minor (default threshold: 85%) MRS 3.3.0 and later: Critical (default threshold: 95%) Major (default threshold: 85%)	Quality of service	Hive	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Type	Parameter	Description
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

The system cannot write data properly. Some data may be lost.

Possible Causes

- The upper limit of the HDFS capacity available for Hive is too small.
- The HDFS space is insufficient.
- Some data nodes break down.

Handling Procedure

Extend system capacity.

Step 1 Analyze the cluster HDFS space usage and increase the HDFS capacity for Hive.

Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configuration**, select **All Configurations**, search for **hive.metastore.warehouse.size.percent**, and increase the value. Assume that the value of the configuration item is A, total HDFS storage space is B, the threshold is C, and HDFS space used by Hive is D. Adjust the value by complying with A x B x C > D. You can view the total HDFS storage space on the HDFS NameNode page, and the HDFS space used by Hive on the Hive monitoring page.

Step 2 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Perform capacity expansion for the system.

Step 3 Expand the system.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the data node is normal.

Step 5 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**.

Step 6 Check whether **ALM-12006 NodeAgent Process Is Abnormal**, **ALM-12007 Process Fault**, and **ALM-14002 DataNode Disk Usage Exceeds the Threshold** are reported.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Clear the alarm by following the steps provided in **ALM-12006 NodeAgent Process Is Abnormal**, **ALM-12007 Process Fault**, or **ALM-14002 DataNode Disk Usage Exceeds the Threshold**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **Hive** for the target cluster.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.123 ALM-16002 Hive SQL Execution Success Rate Is Lower Than the Threshold

Alarm Description

The system checks the percentage of the HQL statements that are executed successfully in every 30 seconds. The formula is: Percentage of HQL statements that are executed successfully = Number of HQL statements that are executed successfully by Hive in a specified period/Total number of HQL statements that are executed by Hive. This indicator can be viewed on the **Cluster** > **Services** > **Hive** > **Instance** > *HiveServer instance* **.** By default, a threshold is provided for the percentage of successful HQL executions. This alarm is generated when the percentage of successful HQL executions is less than the threshold. Users can view the name of the host where an alarm is generated in the location information about the alarm. The IP address of the host is the IP address of the HiveServer node.

Users can modify the threshold by choosing **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Hive** > **Percentage of HQL Statements That Are Executed Successfully by Hive**.

This alarm is cleared when the execution success rate is higher than 110% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
16002	Critical (default threshold: 90%) Major (default threshold: 80%)	Quality of service	Hive	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The service execution capability of the system is too low and cannot properly respond to customer requests. The Hive service is not affected. You need to check HiveServer logs to locate the SQL failure cause.

Possible Causes

- A syntax error occurs in HQL statements.
- The HBase service is abnormal when a Hive on HBase task is performed.
- The Spark service is abnormal when a Hive on Spark task is performed.
- The dependent basic services, such as HDFS, Yarn, and ZooKeeper, are abnormal.

Handling Procedure

Check whether the HQL statements comply with syntax.

Step 1 On the FusionInsight Manager page, choose **O&M** > **Alarm** to view the alarm details and obtain the node where the alarm is generated.

Step 2 Use the Hive client to log in to the HiveServer node where an alarm is reported. Query the HQL syntax provided by Apache, and check whether the HQL commands are correct.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

NOTE

To view the user who runs an incorrect statement, you can download the hiveserver audit log file of the HiveServer node where this alarm is generated. **Start Data** and **End Data** are 10 minutes before and after the alarm generation time respectively. Open the log file and search for the **Result=FAIL** keyword to filter the log information about the incorrect statement, and then view the user who runs the incorrect statement according to **UserName** in the log information.

Step 3 Enter the correct HQL statements, and check whether the command can be properly executed.

- If yes, go to **Step 12**.
- If no, go to **Step 4**.

Check whether the HBase service is abnormal.

Step 4 Check whether an Hive on HBase task is performed with the user who runs the HQL command.

- If yes, go to **Step 5**.
- If no, go to **Step 8**.

Step 5 On the FusionInsight Manager page, click **Cluster** > *Name of the desired cluster* > **Services**, check whether the HBase service is normal in the service list.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Choose **O&M** > **Alarm**, check the related alarms displayed on the alarm page and clear them according to related alarm help.

Step 7 Enter the correct HQL statements, and check whether the command can be properly executed.

- If yes, go to **Step 12**.
- If no, go to **Step 8**.

Check whether the HDFS, Yarn, and ZooKeeper are normal.

Step 8 On the FusionInsight Manager portal, click **Cluster** > *Name of the desired cluster* > **Services**.

Step 9 In the service list, check whether the services, such as HDFS, Yarn, and ZooKeeper are normal.

- If yes, go to **Step 12**.
- If no, go to **Step 10**.

Step 10 Check the related alarms displayed on the alarm page and clear them according to related alarm help.

Step 11 Enter the correct HQL statements, and check whether the command can be properly executed.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 After 1 minute, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On the FusionInsight Manager home page, choose **O&M** > **Log > Download**.

Step 14 Select the following nodes in the required cluster from the **Service**:

- MapReduce
- Hive

Step 15 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.124 ALM-16003 Background Thread Usage Exceeds the Threshold

Alarm Description

The system checks the background thread usage in every 30 seconds. This alarm is generated when the usage of the background thread pool of Hive exceeds the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
16003	Critical (default threshold: 90%) Major (default threshold: 80%)	Quality of service	Hive	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger condition	Specifies the threshold for triggering the alarm.

Impact on the System

There are too many background threads, so the newly submitted task cannot run in time.

Possible Causes

The usage of the background thread pool of Hive is excessively high when:

- There are many tasks executed in the background thread pool of HiveServer.
- The capacity of the background thread pool of HiveServer is too small.

Handling Procedure

Check the number of tasks executed in the background thread pool of HiveServer.

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive**. On the displayed page, click **HiveServer Instance** and check values of **Background Thread Count** and **Background Thread Usage**.

Step 2 Check whether the number of background threads in the latest half an hour is excessively high. (By default, the queue number is 100, and the thread number is considered as high if it is 90 or larger.)

- If it is, go to **Step 3**.
- If it is not, go to **Step 5**.

Step 3 Adjust the number of tasks submitted to the background thread pool. (For example, cancel some time-consuming tasks with low performance.)

Step 4 Check whether the values of Background Thread Count and Background Thread Usage decrease.

- If it is, go to **Step 7**.
- If it is not, go to **Step 5**.

Check the capacity of the HiveServer background thread pool.

Step 5 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive**. On the displayed page, click **HiveServer Instance** and check values of Background Thread Count and Background Thread Usage.

Step 6 Increase the value of **hive.server2.async.exec.threads** in the **${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/1_23_HiveServer/etc/hive-site.xml** file. For example, increase the value by 20%.

Step 7 Save the modification.

Step 8 Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **Hive** in the required cluster from the **Service**.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.125 ALM-16004 Hive Service Unavailable

Alarm Description

This alarm is generated when the HiveServer service is unavailable. The system checks the HiveServer service status every 60 seconds.

This alarm is cleared when the HiveServer service is normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
16004	Critical	Quality of service	Hive	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The system cannot provide data loading, query, and extraction services.

Possible Causes

- Hive service unavailability may be related to the faults of the Hive process as well as basic services, such as ZooKeeper, Hadoop distributed file system (HDFS), Yarn, and DBService.
  - The ZooKeeper service is abnormal.
  - The HDFS service is abnormal.
  - The Yarn service is abnormal.
  - The DBService service is abnormal.
  - The Hive service process is abnormal. If the alarm is caused by Hive process fault, the alarm report has a delay of about 5 minutes.

- The network communication between the Hive and basic services is interrupted.
- The permission on the HDFS temporary directory of Hive is abnormal.
- The local disk space of the Hive node is insufficient.

Handling Procedure

Check the HiveServer/MetaStore process status.

Step 1 On the FusionInsight Manager portal, click **Cluster >** *Name of the desired cluster* **> Services** > **Hive** > **Instance**. In the Hive instance list, check whether the HiveServer or MetaStore instances are in the Unknown state.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 In the Hive instance list, choose **More** > **Restart Instance** to restart the HiveServer/MetaStore process.

Step 3 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the ZooKeeper service status.

Step 4 On the FusionInsight Manager, check whether the alarm list contains **Process Fault**.

- If yes, go to **Step 5**.
- If no, go to **Step 8**.

Step 5 In the **Process Fault**, check whether **ServiceName** is **ZooKeeper**.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Rectify the fault by following the steps provided in "ALM-12007 Process Fault".

Step 7 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check the HDFS service status.

Step 8 On the FusionInsight Manager, check whether the alarm list contains **HDFS Service Unavailable**.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Rectify the fault by following the steps provided in "ALM-14000 HDFS Service Unavailable".

Step 10 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check the Yarn service status.

Step 11 In FusionInsight Manager alarm list, check whether **Yarn Service Unavailable** is generated.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Rectify the fault. For details, see "ALM-18000 Yarn Service Unavailable".

Step 13 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check the DBService service status.

Step 14 In FusionInsight Manager alarm list, check whether **DBService Service Unavailable** is generated.

- If yes, go to **Step 15**.
- If no, go to **Step 17**.

Step 15 Rectify the fault. For details, see "ALM-27001 DBService Service Unavailable".

Step 16 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 17**.

Check the network connection between the Hive and ZooKeeper, HDFS, Yarn, and DBService.

Step 17 On the FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive**.

Step 18 Click **Instance**.

The HiveServer instance list is displayed.

Step 19 Click **Host Name** in the row of **HiveServer**.

The active HiveServer host status page is displayed.

Step 20 Record the IP address under **Basic Information**.

Step 21 Use the IP address obtained in **Step 20** to log in to the host where the active HiveServer runs as user **omm**.

Step 22 Run the **ping** command to check whether communication between the host that runs the active HiveServer and the hosts that run the ZooKeeper, HDFS, Yarn, and DBService services is normal. (Obtain the IP addresses of the hosts that run the ZooKeeper, HDFS, Yarn, and DBService services in the same way as that for obtaining the IP address of the active HiveServer.)

- If yes, go to **Step 31**.
- If no, go to **Step 23**.

Step 23 Contact the administrator to restore the network.

Step 24 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 25**.

Check the permission on the HDFS temporary directory.

Step 25 Log in to the node where the HDFS client is located and run the following command to go to the HDFS client installation directory:

cd *Client installation directory*

source bigdata_env

kinit *user with the supergroup permission* (Skip this step for common clusters.)

Step 26 Run the following command to check whether the permission on the data warehouse directory is 770:

hdfs dfs -ls /tmp | grep hive-scratch

- If yes, go to **Step 29**.
- If no, go to **Step 27**.

Step 27 Run the following command to restore the default data warehouse permission:

hdfs dfs -chmod 770 /tmp/hive-scratch

Step 28 Wait for several minutes and check whether the Hive Service Unavailable alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 29**.

Check whether the local disk space is normal.

Step 29 Run the **df -h** command to check the disk usage. Check whether the disk usage of the **/**, **/srv**, **/var**, and cluster installation directory (**/opt** by default) exceeds 95%.

- If yes, go to **Step 30**.
- If no, go to **Step 31**.

Step 30 Clear unnecessary information in the corresponding directory to ensure that the available disk space is greater than 80%. Wait for several minutes and check whether the Hive Service Unavailable alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 31**.

Collect fault information.

Step 31 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 32 Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS
- Yarn
- DBService
- Hive

Step 33 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 34 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

11.126 ALM-16005 The Heap Memory Usage of the Hive Process Exceeds the Threshold

Alarm Description

The system checks the Hive service status every 30 seconds. The alarm is generated when the heap memory usage of an Hive service exceeds the threshold.

Users can choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **Hive** to change the threshold.

The alarm is cleared when the heap memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
16005	Versions earlier than MRS 3.3.0: major (default threshold: 95%) MRS 3.3.0 and later versions: Critical (default threshold: 95%) Major (default threshold: 85%)	Quality of service	Hive	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	RoleName	Specifies the role name for which the alarm is generated.
	HostName	Specifies the object (host ID) for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

When the heap memory usage of Hive is overhigh, the performance of Hive task operation is affected. In addition, a memory overflow may occur so that the Hive service is unavailable.

Possible Causes

The heap memory of the Hive instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Handling Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16005**. Then check the role name in **Location** and confirm the IP adress of the instance.

- If the role for which the alarm is generated is HiveServer, go to **Step 2**.
- If the role for which the alarm is generated is MetaStore, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **Hive** > **Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **HiveServer Memory Usage Statistics** and click **OK**, check whether the used heap memory of the HiveServer service reaches the threshold(default value: 95%) of the maximum heap memory specified for HiveServer.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **MetaStore Memory Usage Statistics** and click **OK**, check whether the used heap memory of the MetaStore service reaches the threshold(default value: 95%) of the maximum heap memory specified for MetaStore.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configurations > All Configurations**. Choose **HiveServer/MetaStore** > **JVM**. Adjust the value of **-Xmx** in **HIVE_GC_OPTS/ METASTORE_GC_OPTS** as the following rules. Click **Save**.

NOTE

Suggestions for GC parameter settings for the HiveServer:

- When the heap memory used by the HiveServer process reaches the threshold (default value: 95%) of the maximum heap memory set by the HiveServer process, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2GB by default, change the value of **-Xmx** to 4GB. You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically. On the FusionInsight Manager home page, choose **O&M**> **Alarm**> **Thresholds** > *Name of the desired cluster* **> Hive** > **CPU and Memory** > **HiveServer Heap Memory Usage Statistics (HiveServer)** to view **Threshold**.

Suggestions for GC parameter settings for the MetaServer:

- When the heap memory used by the MetaStore process reaches the threshold (default value: 95%) of the maximum heap memory set by the MetaStore process, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2GB by default, change the value of **-Xmx** to 4GB. On the FusionInsight Manager home page, choose **O&M**> **Alarm**> **Thresholds** > *Name of the desired cluster* **> Hive** > **CPU and Memory** > **MetaStore Heap Memory Usage Statistics (MetaStore)** to view **Threshold**.
- You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically.

Step 5 Click **More > Restart Service** to restart the service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Hive** in the required cluster from the **Service**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.127 ALM-16006 The Direct Memory Usage of the Hive Process Exceeds the Threshold

Alarm Description

The system checks the Hive service status every 30 seconds. The alarm is generated when the direct memory usage of an Hive service exceeds the threshold.

Users can choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* **> Hive** to change the threshold.

The alarm is cleared when the direct memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
16006	Versions earlier than MRS 3.3.0: Major (default threshold: 95%) MRS 3.3.0 and later versions: Critical (default threshold: 95%) Major (default threshold: 85%)	Quality of service	Hive	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.

Type	Parameter	Description
	RoleName	Specifies the role name for which the alarm is generated.
	HostName	Specifies the object (host ID) for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

When the direct memory usage of Hive is overhigh, the performance of Hive task operation is affected. In addition, a memory overflow may occur so that the Hive service is unavailable.

Possible Causes

The direct memory of the Hive instance on the node is overused or the direct memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Handling Procedure

Check direct memory usage.

Step 1 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16006**. Then check the role name in **Location** and confirm the IP adress of the instance.

- If the role for which the alarm is generated is HiveServer, go to **Step 2**.
- If the role for which the alarm is generated is MetaStore, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services > Hive > Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **HiveServer Memory Usage Statistics** and click **OK**, check whether the used direct memory of the HiveServer service reaches the threshold(default value: 95%) of the maximum direct memory specified for HiveServer.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **MetaStore Memory Usage Statistics** and click **OK**, check whether the used direct memory of the MetaStore service reaches the threshold(default value: 95%) of the maximum direct memory specified for MetaStore.

- If yes, go to **Step 4**.

- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** >*Name of the desired cluster* > **Services** > **Hive** > **Configurations > All Configurations**. Choose **HiveServer/MetaStore** > **JVM**. Adjust the value of **-XX:MaxDirectMemorySize** in **HIVE_GC_OPTS/METASTORE_GC_OPTS** as the following rules. Click **Save**.

NOTE

Suggestions for GC parameter settings for the HiveServer:

- It is recommended that you set the value of **-XX:MaxDirectMemorySize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 8 GB, **-XX:MaxDirectMemorySize** is set to 1024 MB. If **-Xmx** is set to 4 GB, **-XX:MaxDirectMemorySize** is set to 512 MB. It is recommended that the value of **-XX:MaxDirectMemorySize** be greater than or equal to 512 MB.

Suggestions for GC parameter settings for the MetaServer:

- It is recommended that you set the value of **-XX:MaxDirectMemorySize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 8 GB, **-XX:MaxDirectMemorySize** is set to 1024 MB. If **-Xmx** is set to 4 GB, **-XX:MaxDirectMemorySize** is set to 512 MB. It is recommended that the value of **-XX:MaxDirectMemorySize** be greater than or equal to 512 MB.

Step 5 Click **More > Restart Service** to restart the service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Hive** in the required cluster from the **Service**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected fault logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.128 ALM-16007 Hive GC Time Exceeds the Threshold

Alarm Description

The system checks the garbage collection (GC) time of the Hive service every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold

(exceeds 12 seconds for three consecutive checks.) To change the threshold, choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **Hive**. This alarm is cleared when the Hive GC time is shorter than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
16007	Major	Quality of service	Hive	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	RoleName	Specifies the role name for which the alarm is generated.
	HostName	Specifies the object (host ID) for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the GC time exceeds the threshold, Hive data read and write are affected, task execution may slow down, or services may restart unexpectedly.

Possible Causes

The memory of Hive instances is overused, the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Handling Procedure

Check the GC time.

Step 1 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16007**. Then check the role name in **Location** and confirm the IP adress of the instance.

- If the role for which the alarm is generated is HiveServer, go to **Step 2**.
- If the role for which the alarm is generated is MetaStore, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** >*Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **GC**, and select **Garbage Collection (GC) Time of HiveServer** and click **OK** to check whether the GC time is longer than 12 seconds.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** >*Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **GC**, and select **Garbage Collection (GC) Time of MetaStore** and click **OK** to check whether the GC time is longer than 12 seconds.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Check the current JVM configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster** >*Name of the desired cluster* > **Services > Hive > Configurations > All Configurations**. Choose **HiveServer/MetaStore** > **JVM**. Adjust the value of **-Xmx** in **HIVE_GC_OPTS/ METASTORE_GC_OPTS** as the following rules. Click **Save**.

NOTE

Suggestions for GC parameter settings for the HiveServer:

- When the Hive GC time exceeds the threshold, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2 GB by default, change the value of **-Xmx** to 4 GB.
- You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically.

Suggestions for GC parameter settings for the MetaServer:

- When the Meta GC time exceeds the threshold, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2 GB by default, change the value of **-Xmx** to 4 GB.
- You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically.

Step 5 Click **More > Restart Service** to restart the service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal of active and standby clusters, choose **O&M** > **Log > Download**.

Step 8 In the **Service**, select **Hive** in the required cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.129 ALM-16008 Non-Heap Memory Usage of the Hive Process Exceeds the Threshold

Alarm Description

The system checks the Hive service status every 30 seconds. The alarm is generated when the non-heap memory usage of an Hive service exceeds the threshold.

Users can choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* **> Hive** to change the threshold.

The alarm is cleared when the non-heap memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
16008	Versions earlier than MRS 3.3.0: major (default threshold: 95%) MRS 3.3.0 and later versions: Critical (default threshold: 95%) Major (default threshold: 85%)	Quality of service	Hive	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	RoleName	Specifies the role name for which the alarm is generated.
	HostName	Specifies the object (host ID) for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

When the non-heap memory usage of Hive is overhigh, the performance of Hive task operation is affected. In addition, a memory overflow may occur so that the Hive service is unavailable.

Possible Causes

The non-heap memory of the Hive instance on the node is overused or the non-heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Handling Procedure

Check non-heap memory usage.

Step 1 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16008**. Then check the role name in **Location** and confirm the IP adress of the instance.

- If the role for which the alarm is generated is HiveServer, go to **Step 2**.
- If the role for which the alarm is generated is MetaStore, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **HiveServer Memory Usage Statistics** and click **OK**, check whether the used non-heap memory of the HiveServer service reaches the threshold(default value: 95%) of the maximum non-heap memory specified for HiveServer.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the MetaStore for which the alarm

is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **MetaStore Memory Usage Statistics** and click **OK**, check whether the used non-heap memory of the MetaStore service reaches the threshold(default value: 95%) of the maximum non-heap memory specified for MetaStore.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configurations** > **All Configurations**. Choose **HiveServer/MetaStore** > **JVM**. Adjust the value of **-XX:MaxMetaspaceSize** in **HIVE_GC_OPTS/METASTORE_GC_OPTS** as the following rules. Click **Save**.

NOTE

Suggestions for GC parameter settings for the HiveServer:

- It is recommended that you set the value of **-XX:MaxMetaspaceSize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 2 GB, **-XX:**

  MaxMetaspaceSize is set to 256 MB. If **-Xmx** is set to 4 GB, **-XX:MaxMetaspaceSize** is set to 512 MB.

Suggestions for GC parameter settings for the MetaServer:

- It is recommended that you set the value of **-XX:MaxMetaspaceSize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 2 GB, **-XX:**

  MaxMetaspaceSize is set to 256 MB. If **-Xmx** is set to 4 GB, **-XX:MaxMetaspaceSize** is set to 512 MB

Step 5 Click **More** > **Restart Service** to restart the service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **Hive** in the required cluster from the **Service**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.130 ALM-16009 Map Number Exceeds the Threshold

Alarm Description

The system checks the number of HQL maps in every 30 seconds. This alarm is generated if the number exceeds the threshold. By default, **Trigger Count** is set to **3**, and the threshold is 5000.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
16009	Major	Quality of service	Hive	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the number of HQL maps executed by Hive is too large, a large number of Yarn queue resources are occupied, which may take a long time and affect other tasks running using this queue.

Possible Causes

The HQL statements are not the optimal.

Handling Procedure

Check the number of HQL maps.

Step 1 On FusionInsight Manager portal, choose **Cluster** >*Name of the desired cluster*> **Services** > **Hive** > **Resource**. Check the HQL statements with the excessively large number (5000 or more) of maps in **HQL Map Count**.

Step 2 Locate the corresponding HQL statements, optimize them and execute them again.

Step 3 Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 5 Select **Hive** in the required cluster from the **Service**.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.131 ALM-16045 Hive Data Warehouse Is Deleted

Alarm Description

The system checks the Hive data warehouse in every 60 seconds.This alarm is generated when the Hive data warehouse is deleted.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
16045	Critical	Operation	Hive	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The default Hive data warehouse is deleted. As a result, creating databases or tables in the default data warehouse fails, and services are affected.

Possible Causes

Hive periodically checks the status of the default data warehouse and finds that the default data warehouse is deleted.

Handling Procedure

Check the default Hive data warehouse.

Step 1 Log in to the node where the client is located as user **root**.

Step 2 Run the following command to check whether the **warehouse** directory exists in **hdfs://hacluster/user/***<username>***/.Trash/Current/**.

hdfs dfs -ls hdfs://hacluster/user/*<username>***/.Trash/Current/**

For example, if **user/hive/warehouse** exists:

```
host01:/opt/client # hdfs dfs -ls hdfs://hacluster/user/test/.Trash/Current/
Found 1 items
drwx------   - test hadoop          0 2019-06-17 19:53 hdfs://hacluster/user/test/.Trash/Current/user
```

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 By default, there is an automatic recovery mechanism for the data warehouse. You can wait for 5 ~10s to check whether the default data warehouse is restored. If the data warehouse is not recovered, manually run the following command to restore the data warehouse.

hdfs dfs -mv hdfs://hacluster/user/*<username>***/.Trash/Current/user/hive/warehouse /user/hive/warehouse**

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 5**.

Collect fault information.

Step 5 Collect related information in the **.Trash/Current/** directory on the client background.

Step 6 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.132 ALM-16046 Hive Data Warehouse Permission Is Modified

Alarm Description

The system checks the Hive data warehouse permission in every 60 seconds. This alarm is generated if the permission is modified.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
16046	Critical	Operation	Hive	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the permission on the Hive default data warehouse is modified, the permission for users or user groups to create databases or tables in the default data warehouse is changed.

Possible Causes

Hive periodically checks the status of the default data warehouse and finds that default data warehouse permission is changed.

Handling Procedure

Check the Hive default data warehouse permission.

Step 1 Log in to the node where the client is located as user **root**.

Step 2 Run the following command to go to the HDFS client installation directory:

cd *Client installation directory*

source bigdata_env

kinit *User who has the supergroup permission* (Skip this step for a common cluster.)

Step 3 Run the following command to restore the default data warehouse permission:

- Kerberos authentication is enabled for the cluster (the cluster is in security mode):

  hdfs dfs -chmod 770 hdfs://hacluster/user/hive/warehouse

  hdfs dfs -chown hive:hive hdfs://hacluster/user/hive/warehouse

- Kerberos authentication is disabled for the cluster (the cluster is in normal mode):

  hdfs dfs -chmod 777 hdfs://hacluster/user/hive/warehouse

  hdfs dfs -chown hive:hive hdfs://hacluster/user/hive/warehouse

Step 4 Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 5**.

Collect fault information.

Step 5 Collect related information in the **hdfs://hacluster/user/hive/warehouse** directory on the client background.

Step 6 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.133 ALM-16047 HiveServer Has Been Deregistered from ZooKeeper

Alarm Description

The system checks the Hive service every 60 seconds. This alarm is generated when Hive registration information on ZooKeeper is lost or Hive cannot connect to ZooKeeper.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
16047	Major	Quality of service	Hive	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

When a Hive client sets up a new connection, it cannot select the HiveServer node that has been deregistered from ZooKeeper. If all HiveServer nodes have been deregistered from ZooKeeper, the HiveServer service will be unavailable.

Possible Causes

- The ZooKeeper instance is abnormal.
- Some Hive configurations are incorrect.

Handling Procedure

Check the ZooKeeper service status.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and check whether **ALM-12007 Process Fault** exists in the alarm list.

- If yes, go to **Step 2**.
- If no, go to **Step 5**.

Step 2 In **Location** of **ALM-12007 Process Fault**, check whether the service name is **ZooKeeper**.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by following steps provided in **ALM-12007 Process Fault**.

Step 4 In the alarm list, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the Hive configurations are correctly modified.

Step 5 On FusionInsight Manager, choose **Audit**. On the **Audit** page, click **Advanced Search**, click ··· on the right of **Operation Type**, select **Save configuration**, click **OK**, and click **Search**.

Step 6 In the search result, check the historical configurations of Hive- and ZooKeeper-related services in the **Service** column. **Table 11-4** lists some configurations that may affect the connection between Hive and ZooKeeper.

Table 11-4 Configurations related to connection between Hive and ZooKeeper

Service	Parameter	Description
Hive	HIVE_GC_OPTS	HiveServer memory configuration. If the configuration is abnormal, HiveServer may restart repeatedly. In this case, you need to check the health status of the instance processes.
	hive.zookeeper.quorum	IP address of the node accommodating ZooKeeper that is connected to Hive.
	hive.zookeeper.client.port	Port of the ZooKeeper client connected to Hive.
	hive.zookeeper.session.timeout	Timeout interval of the session set up between Hive and ZooKeeper.
	hive.zookeeper.connection.timeout	Timeout interval for Hive to connect to ZooKeeper.

Service	Parameter	Description
	hive.zookeeper.connection.max.retries	Maximum number of retries for Hive to connect to ZooKeeper.
ZooKeeper	clientPort	Port number of the ZooKeeper client.
	ssl.enabled	Whether to enable SSL connections of ZooKeeper.

Restart related instances.

Step 7 Log in to FusionInsight Manager. Choose **O&M** > **Alarm** > **Alarms**, click the drop-down list in the row that contains the alarm, and view role and the IP address of the node for which the alarm is generated in **Location**.

Step 8 Choose **Cluster**, click the name of the desired cluster, and choose **Services** > **Hive** > **Instance**. On the page that is displayed, select the instance at the IP address for which the alarm is generated, click **More**, and select **Restart Instance**.

Step 9 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, and select **Hive** for the target cluster.

Step 12 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.134 ALM-16048 Tez or Spark Library Path Does Not Exist

Alarm Description

The system checks the Tez and Spark library paths every 180 seconds. This alarm is generated when the Tez or Spark library path does not exist.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
16048	Major	Quality of service	Hive	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Hive on Tez and Hive on Spark functions are affected.

Possible Causes

The Tez or Spark library path is deleted from the HDFS.

Handling Procedure

Check the default Hive data warehouse.

Step 1 Log in to the node where the client is located as user **root**.

Step 2 Run the following command to check whether the **tezlib** or **sparklib** directory exists in the **hdfs://hacluster/user/{User name}/.Trash/Current/** director:

hdfs dfs -ls hdfs://hacluster/user/*<username>*/.Trash/Current/

For example, the following information shows that **/user/hive/tezlib/8.1.0.1/** and **/user/hive/sparklib/8.1.0.1/** exist.

```
host01:/opt/client # hdfs dfs -ls hdfs://hacluster/user/test/.Trash/Current/
Found 1 items
drwx------   - test hadoop          0 2019-06-17 19:53 hdfs://hacluster/user/test/.Trash/Current/user
```

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Run the following command to restore **tezlib** and **sparklib**.

hdfs dfs -mv hdfs://hacluster/user/*<username>*/.Trash/Current/user/hive/tezlib/8.1.0.1/tez.tar.gz /user/hive/tezlib/8.1.0.1/tez.tar.gz

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 Collect related information in the **.Trash/Current/** directory on the client background.

Step 6 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.135 ALM-16051 Percentage of Sessions Connected to MetaStore Exceeds the Threshold

Alarm Description

The system checks the percentage of sessions connected to MetaStore to the maximum number of sessions allowed by MetaStore every 30 seconds. This alarm is generated when the percentage exceeds the threshold.

This alarm is cleared when the percentage of MetaStore sessions is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
16051	Critical (default threshold: 90%) Major (default threshold: 80%)	Quality of service	Hive	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger condition	Specifies the alarm triggering condition.

Impact on the System

If this alarm is generated, sessions connected to MetaStore are too many. As a result, new connections cannot be set up.

Possible Causes

Too many clients are connected to MetaStore.

Handling Procedure

Change the maximum number of MetaStore connections.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **Hive**, click **Configuration** and then **All Configurations**.

Step 2 In the **All Configurations** tab, search for **hive.metastore.server.max.threads** and check whether the value is the maximum **10000**.

- If yes, go to **Step 6**.
- If no, go to **Step 3**.

Step 3 Change the value of **hive.metastore.server.max.threads** to **10000** and click **Save**.

Step 4 Click **Instances**, select all MetaStore instances, and choose **More** > **Restart Instance**.

Step 5 Check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Hive** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 On FusionInsight Manager, choose **Cluster** > **Services** > **Hive**. On the displayed **Dashboard** page, click **More** > **Collect Stack Information**. On the displayed page, set the following parameters:

- Select **MetaStore** for the role where you want to collect data.
- Select **jstack** and **Enable continuous collection of jstack and jmap -histo information**.
- Set the collection interval to 10 seconds and the duration to 2 minutes.

Step 10 Click **OK**. After the collection is complete, click **Download**.

Step 11 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.136 ALM-17003 Oozie Service Unavailable

Alarm Description

The system checks the Oozie service status in every 5 seconds. This alarm is generated when Oozie or a component on which Oozie depends cannot provide services properly.

This alarm is automatically cleared when the Oozie service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
17003	Critical	Error handling	Oozie	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Details	Supplement to the alarm information.

Impact on the System

Oozie cannot be used to schedule jobs.

Possible Causes

- The DBService service is abnormal or the data of Oozie stored in DBService is damaged.
- The HDFS service is abnormal or the data of Oozie stored in HDFS is damaged.
- The Yarn service is abnormal.
- The Nodeagent process is abnormal.

Handling Procedure

Query the Oozie service health status code.

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* >**Services** > **Oozie**. Click **oozie** (any one is OK) on the **oozie WebUI**. to go to the Oozie WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 2 Add **/servicehealth** to the URL in the address box of the browser and access again. The value of **statusCode** is the current Oozie service health status code.

For example, visit **https://10.10.0.117:20026/Oozie/oozie/130/oozie/servicehealth**. The result is as follows:

```
{"beans":[{"name":"serviceStatus","statusCode":0}]}
```

If the health status code cannot be displayed or the browser does not respond, the service may be unavailable due to Oozie process fault. See **Step 13** to rectify the fault.

Step 3 Perform the operations based on the error code. For details, see **Table 11-5**.

Table 11-5 Oozie service health status code

Status Code	Description	Error Cause	Solution
0	The service is running properly.	None	None
18002	The DBService service is abnormal.	Oozie fails to connect to DBService or the data stored in DBService is damaged.	See **Step 4**.
18003	The HDFS service is abnormal.	Oozie fails to connect to HDFS or the data stored in HDFS is damaged.	See **Step 7**.
18005	The MapReduce service is abnormal.	The Yarn service is abnormal.	See **Step 11**.

Check the DBService service.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the DBService service is running properly.

- If yes, go to **Step 6**.
- If no, go to **Step 5**.

Step 5 Resolve the problem of DBService based on the alarm help and check whether the Oozie alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 18**.

Step 6 Log in to the Oozie database to check whether the data is complete.

1. Log in to the active DBService node as user **root**.

   On the FusionInsight Manager page, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService > Instance** to view the IP address of the active DBservice node.

2. Run the following command to log in to the Oozie database:

   su - omm

   source ${BIGDATA_HOME}/FusionInsight_BASE_8.1.0.1/install/FusionInsight-dbservice-2.7.0/.dbservice_profile

   gsql -U *Username* **-W** *Oozie database password* **-p 20051 -d** *Database name*

3. After the login is successful, enter **\d** to check whether there are 15 data tables.

   The Oozie service has 15 data tables by default. If these data tables are deleted or the table structure is modified, the Oozie service may be unavailable. Contact the O&M engineers to back up the data and perform restoration.

Check the HDFS service.

Step 7 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the HDFS service is running properly.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

Step 8 Resolve the problem of HDFS based on the alarm help and check whether the Oozie alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Step 9 Log in to HDFS to check whether the Oozie file directory structure is complete.

1. Download and install an HDFS client..
2. Log in to the client node as user **root** and run the following commands to check whether **/user/oozie/share** exists.

   If the cluster uses the security mode, perform security authentication.

   kinit admin

   hdfs dfs -ls /user/oozie/share

- If yes, go to **Step 18**.
- If no, go to **Step 10**.

Step 10 In the Oozie client installation directory, manually upload the share directory to **/user/oozie** in HDFS, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Check the Yarn and MapReduce service.

Step 11 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the Yarn and MapReduce services are running properly.

- If yes, go to **Step 18**.
- If no, go to **Step 12**.

Step 12 Resolve the problem of Yarn and MapReduce based on the alarm help and check whether the Oozie alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Check the Oozie process.

Step 13 Log in to each node of Oozie as user **root**.

Step 14 Run the **ps -ef | grep oozie** command to check whether the Oozie process exists.

- If yes, go to **Step 15**.
- If no, go to **Step 18**.

Step 15 Collect fault information in **prestartDetail.log**, **oozie.log**, and **catalina.out** in the Oozie log directory **/var/log/Bigdata/oozie**. If the alarm is not caused by manual misoperation, go to **Step 16**.

Check the Nodeagent process.

Step 16 Log in to each node of Oozie as user **root**. Run the **ps -ef | grep nodeagent** command to check whether the Nodeagent process exists.

- If yes, go to **Step 17**.
- If no, go to **Step 18**.

Step 17 Run the **kill -9** *The process ID of nodeagent* command, wait 10 minutes, and check whether alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Step 18 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.137 ALM-17004 Oozie Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the Oozie service every 60 seconds. The alarm is generated when the heap memory usage of a Metadata instance exceeds the threshold (95% of the maximum memory). The alarm is cleared when the heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
17004	Major	Quality of service	Oozie	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The heap memory overflow may cause a service breakdown. After the service breaks down, the Oozie service cannot be used to schedule tasks.

Possible Causes

The heap memory of the Oozie instance is overused or the heap memory is inappropriately allocated.

Handling Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **Oozie Heap Memory Usage Exceeds the Threshold** > **Location**. Check the IP address of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Oozie** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize** > **Memory** > **Oozie Heap Memory Resource Percentage**. Click **OK**.

Step 3 Check whether the used heap memory of Oozie reaches the threshold (the default value is 95% of the maximum heap memory) specified for Oozie.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Oozie** > **Configurations > All Configurations**. Set Search **GC_OPTS** in the search box. Increase the value of **-Xmx** as required, and click **Save** > **OK**.

NOTE

Suggestions on GC parameter settings for Oozie:

You are advised to set **-Xms** and **-Xmx** to the same value to prevent adverse impact on performance when JVM dynamically adjusts the heap memory size.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Oozie** in the required cluster from the **Service**.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.138 ALM-17005 Oozie Non Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the non heap memory usage of Oozie every 30 seconds. This alarm is reported if the non heap memory usage of Oozie exceeds the threshold (80%). This alarm is cleared if the non heap memory usage is lower than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
17005	Major	Quality of service	Oozie	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

The service may break down and the Oozie service cannot be used to schedule tasks.

Possible Causes

The non-heap memory of the Oozie instance is overused or the non-heap memory is inappropriately allocated.

Handling Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **Oozie Non Heap Memory Usage Exceeds the Threshold**. On the displayed page, check the location information of the alarm. Check the name of the instance host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Oozie** and click the **Instance** tab. On the displayed page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Memory** and select **Oozie Non Heap Memory Resource Percentage**. Click **OK**.

Step 3 Check whether the non-heap memory used by Oozie reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Oozie** and click the **Configurations** and then **All Configurations**. On the displayed page, search for the **GC_OPTS** parameter in the search box and check whether it contains **-XX: MaxMetaspaceSize**. If yes, increase the value of **-XX: MaxMetaspaceSize** based on the site requirements. If no, manually add **-XX: MaxMetaspaceSize** and set its value to 1/8 of the value of **-Xmx**. Click **Save**, and then click **OK**

NOTE

JDK1.8 does not support the **MaxPermSize** parameter.

Suggestions on GC parameter settings for Oozie:

Set the value of **-XX:MaxMetaspaceSize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 2 GB, **-XX:MaxMetaspaceSize** is set to 256 MB. If **-Xmx** is set to 4 GB, **-XX:MaxMetaspaceSize** is set to 512 MB.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Oozie** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.139 ALM-17006 Oozie Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the Oozie service every 30 seconds. The alarm is generated when the direct memory usage of an Oozie instance exceeds the threshold (80% of the maximum memory). The alarm is cleared when the direct memory usage of Oozie is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
17006	Major	Quality of service	Oozie	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The direct memory overflow may cause a service breakdown. After the service breaks down, the Oozie service cannot be used to schedule tasks.

Possible Causes

The direct memory of the Oozie instance is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Oozie Direct Memory Usage Exceeds the Threshold** > **Location**. Check the IP address of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Oozie** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize** > **Memory** > **Oozie Direct Buffer Resource Percentage**. Click **OK**.

Step 3 Check whether the used direct memory of Oozie reaches the threshold (the default value is 80% of the maximum direct memory) specified for Oozie.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Oozie** > **Configurations**. Click **All Configurations**. Search **GC_OPTS** in the search box. Increase the value of **-XX:MaxDirectMemorySize** as required, and click **Save**. Click **OK**.

NOTE

Suggestions on GC parameter settings for Oozie:

You are advised to set the value of **-XX:MaxDirectMemorySize** to 1/4 of the value of **-Xmx**. For example, if **-Xmx** is set to 4 GB, **-XX:MaxDirectMemorySize** is set to 1024 MB. If **-Xmx** is set to 2 GB, **-XX:MaxDirectMemorySize** is set to 512 MB. It is recommended that the value of **-XX:MaxDirectMemorySize** be greater than or equal to 512 MB.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Oozie** in the required cluster from the **Service** drop-down list.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.140 ALM-17007 Garbage Collection (GC) Time of the Oozie Process Exceeds the Threshold

Alarm Description

The system checks GC time of the Oozie process every 60 seconds. The alarm is generated when GC time of the Oozie process exceeds the threshold (default value: **12 seconds**). The alarm is cleared when GC time is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
17007	Critical (default threshold: 20000ms) Major (default threshold: 12000ms)	Quality of service	Oozie	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Oozie scheduling task responds slowly until the service is unavailable.

Possible Causes

The heap memory of the Oozie instance is overused or the heap memory is inappropriately allocated.

Handling Procedure

Check GC time.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Garbage Collection (GC) Time of the Oozie Process Exceeds the Threshold** > **Location**. Check the IP address of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Oozie** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize** > **GC** > **Garbage Collection (GC) Time of Oozie**. Click **OK**.

Step 3 Check whether GC time of the Oozie process every second exceeds the threshold (default value: **12 seconds**).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Oozie** > **Configurations**. Click **All Configurations**. Search **GC_OPTS** in the search box. Increase the value of **-Xmx** as required, and click **Save**. Click **OK**.

NOTE

Suggestions on GC parameter settings for Oozie:

You are advised to set **-Xms** and **-Xmx** to the same value to prevent adverse impact on performance when JVM dynamically adjusts the heap memory size.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Oozie** in the required cluster from the **Service** drop-down list.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.141 ALM-17008 Abnormal Connection Between Oozie and ZooKeeper

Alarm Description

In HA mode, Oozie depends on ZooKeeper. This alarm is generated when the connection between Oozie and ZooKeeper is abnormal for three consecutive times.

This alarm is cleared when the connection between Oozie and ZooKeeper becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
17008	Minor	Error handling	Oozie	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Running scheduling tasks are blocked and new scheduling tasks cannot be submitted. In HA mode, the Oozie service will restart if this alarm is reported.

Possible Causes

- The ZooKeeper service is abnormal.
- Oozie fails to connect to ZooKeeper.

Handling Procedure

Check the ZooKeeper service status.

Step 1 In the service list on FusionInsight Manager, check whether **Running Status** of ZooKeeper is **Normal**.

- If yes, go to **Step 5**.
- If no, go to **Step 2**.

Step 2 In the alarm list, check whether **ALM-13000 ZooKeeper Service Unavailable** is reported.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by performing the operations provided for **ALM-13000 ZooKeeper Service Unavailable**.

Step 4 Wait for several minutes and check whether the alarm **Abnormal Connection Between Oozie and ZooKeeper** is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the connectivity between Oozie and ZooKeeper.

Step 5 Log in to FusionInsight Manager, choose **O&M** > **Log** > **Online Search**, select the Oozie service, and search for the keyword **[Oozie Alarm Enhancement] [ZooKeeper]** in the log. View the cause in the log, and rectify the fault. In the alarm list, check whether the alarm **Abnormal Connection Between Oozie and ZooKeeper** is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Select **Oozie** for **Service** and click **OK**.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.142 ALM-17009 Abnormal Connection Between Oozie and DBService

Alarm Description

Oozie depends on DBService. After a task is submitted, the system checks DBService connectivity. This alarm is generated when the service fails the check for 10 consecutive times.

This alarm is cleared when the connection between Oozie and DBService becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
17009	Minor	Error handling	Oozie	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Running scheduling tasks are blocked and new scheduling tasks cannot be submitted.

Possible Causes

- The DBService service is abnormal.
- Oozie fails to connect to DBService.

Handling Procedure

Check the DBService status.

Step 1 In the service list on FusionInsight Manager, check whether **Running Status** of DBService is **Normal**.

- If yes, go to **Step 5**.
- If no, go to **Step 2**.

Step 2 In the alarm list, check whether **ALM-27001 DBService Service Unavailable** is reported.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by performing the operations provided for **ALM-27001 DBService Service Unavailable**.

Step 4 Wait for several minutes and check whether the alarm **Abnormal Connection Between Oozie and DBService** is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the connectivity between Oozie and DBService.

Step 5 Log in to FusionInsight Manager, choose **O&M** > **Log** > **Online Search**, select the Oozie service, and search for the keyword **[Oozie Alarm Enhancement][DB Service]** in the log. View the cause in the log, and rectify the fault. In the alarm list, check whether the alarm **Abnormal Connection Between Oozie and DBService** is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Select **Oozie** for **Service** and click **OK**.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.143 ALM-17010 Abnormal Connection Between Oozie and HDFS

Alarm Description

Oozie depends on HDFS. After a task is submitted, the system checks HDFS connectivity. This alarm is generated when the service fails the check for 3 consecutive times.

This alarm is cleared when the connection between Oozie and HDFS becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
17010	Minor	Error handling	Oozie	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Running scheduling tasks are blocked and new scheduling tasks cannot be submitted.

Possible Causes

The HDFS service restarts, there is a fault, or the network connectivity is abnormal.

Handling Procedure

Check the HDFS service status.

Step 1 In the service list on FusionInsight Manager, check whether **Running Status** of HDFS is **Normal**.

- If yes, go to **Step 5**.
- If no, go to **Step 2**.

Step 2 In the alarm list, check whether the "ALM-14000 HDFS Service Unavailable" alarm is generated.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by performing the operations provided for **ALM-14000 HDFS Service Unavailable**.

Step 4 Wait for several minutes and check whether the alarm **Abnormal Connection Between Oozie and HDFS** is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the connectivity between Oozie and HDFS.

Step 5 Log in to FusionInsight Manager, choose **O&M** > **Log** > **Online Search**, select the Oozie service, and search for the keyword **[Oozie Alarm Enhancement][HDFS]** in the log. View the cause in the log, and rectify the fault. In the alarm list, check whether the alarm **Abnormal Connection Between Oozie and HDFS** is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Select **Oozie** for **Service** and click **OK**.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

11.144 ALM-17011 Abnormal Connection Between Oozie and Yarn

Alarm Description

Oozie depends on Yarn. After a task is submitted, the system checks Yarn connectivity. This alarm is generated when the service fails the check for 5 consecutive times.

This alarm is cleared when the connection between Oozie and Yarn becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
17011	Minor	Error handling	Oozie	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Running scheduling tasks are blocked and new scheduling tasks cannot be submitted.

Possible Causes

- The Yarn service is abnormal.
- The connection between Oozie and Yarn is abnormal.

Handling Procedure

Check the YARN service status.

Step 1 In the service list on FusionInsight Manager, check whether **Running Status** of Yarn is **Normal**.

- If yes, go to **Step 5**.
- If no, go to **Step 2**.

Step 2 In the alarm list, check whether **ALM-18000 YARN Service Unavailable** is generated.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by performing the operations provided for **ALM-18000 Yarn Service Unavailable**.

Step 4 Wait for several minutes and check whether the alarm **Abnormal Connection Between Oozie and Yarn** is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the connectivity between Oozie and Yarn.

Step 5 Log in to FusionInsight Manager, choose **O&M** > **Log** > **Online Search**, select the Oozie service, and search for the keyword **[Oozie Alarm Enhancement][Yarn]** in the log. View the cause in the log, and rectify the fault. In the alarm list, check whether the alarm **Abnormal Connection Between Oozie and Yarn** is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Select **Oozie** for **Service** and click **OK**.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.145 ALM-18000 Yarn Service Unavailable

Alarm Description

This alarm is generated when the Yarn service is unavailable. The alarm module checks the Yarn service status every 60 seconds.

The alarm is cleared when the Yarn service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18000	Critical	Error handling	Yarn	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceNam	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The cluster cannot provide Yarn services. Users cannot run new applications. Submitted applications cannot be run.

Possible Causes

- The ZooKeeper service is abnormal.
- The HDFS service is abnormal.
- There is no active ResourceManager instance in the Yarn cluster.
- All the NodeManagers in the Yarn cluster are abnormal.

Handling Procedure

Check ZooKeeper service status.

Step 1 On the FusionInsight Manager, check whether the alarm list contains **ALM-13000 ZooKeeper Service Unavailable**.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check the HDFS service status.

Step 3 On the FusionInsight Manager, check whether the alarm list contains the HDFS alarms.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Choose **O&M > Alarm > Alarms**, handle HDFS alarms based on the alarm help, and check whether the Yarn alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the ResourceManager status in the Yarn cluster.

Step 5 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn**.

Step 6 In **Dashboard**, check whether there is an active ResourceManager instance in the Yarn cluster.

- If yes, go to **Step 7**.
- If no, go to **Step 10**.

Check the NodeManager node status in the Yarn cluster.

Step 7 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance**.

Step 8 Query NodeManager **Running Status**, and check whether there are unhealthy nodes.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Rectify the fault by following the steps provided in **ALM-18002 NodeManager Heartbeat Lost** or **ALM-18003 NodeManager Unhealthy**. After the fault is rectified, check whether the Yarn alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On the FusionInsight Manager portal of the active cluster, choose **O&M** > **Log** > **Download**.

Step 11 Select **Yarn** in the required cluster from the **Service**.

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.146 ALM-18002 NodeManager Heartbeat Lost

Alarm Description

The system checks the number of lost NodeManager nodes every 30 seconds, and compares the number with the threshold. The Number of Lost Nodes indicator has a default threshold. The alarm is generated when the value of Number of Lost Nodes exceeds the threshold.

To change the threshold, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn**. On the displayed page, choose **Configurations** > **All Configurations**, and change the value of **yarn.nodemanager.lost.alarm.threshold**. You do not need to restart Yarn to make the change take effect.

The default threshold is 0. The alarm is generated when the number of lost nodes exceeds the threshold, and is cleared when the number of lost nodes is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18002	Major	Error handling	Yarn	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Lost Host	Specifies the list of hosts with lost nodes.

Impact on the System

- The lost NodeManager node cannot provide the Yarn service.
- The number of containers decreases, so the cluster performance deteriorates.

Possible Causes

- NodeManager is forcibly deleted without decommission.
- All the NodeManager instances are stopped or the NodeManager process is faulty.
- The host where the NodeManager node resides is faulty.
- The network between the NodeManager and ResourceManager is disconnected or busy.

Handling Procedure

Check the NodeManager status.

Step 1 On the FusionInsight Manager, and choose **O&M** > **Alarm** > **Alarms**. Click before the alarm and obtain lost nodes in **Additional Information**.

Step 2 Check whether the lost nodes are hosts that have been manually deleted without decommission.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 After the setting, Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn**. On the displayed page, choose **Configurations** > **All Configurations**. Search for **yarn.nodemanager.lost.alarm.threshold** and change its value to the number of hosts that are not out of service and proactively deleted. After the setting, check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 4**.

Step 4 Manually clear the alarm. Note that decommission must be performed before deleting hosts.

Step 5 On the FusionInsight Manager portal, choose **Hosts**, and check whether the nodes obtained in **Step 1** are healthy.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

Step 6 Rectify the node fault based on **ALM-12006 NodeAgent Process Is Abnormal** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check the process status.

Step 7 On the FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Instance**, and check whether there are NodeManager instances whose status is not **Good**.

- If yes, go to **Step 10**.
- If no, go to **Step 8**.

Step 8 Check whether the NodeManager instance is deleted.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Restart the active and standby ResourceManager instances, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Check the instance status.

Step 10 Select NodeManager instances which running state is not **Normal** and restart them. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check the network status.

Step 11 Log in to the management node, **ping** the IP address of the lost NodeManager node to check whether the network is disconnected or busy.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Rectify the network, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On the FusionInsight Manager in the active cluster, choose **O&M** > **Log** > **Download**.

Step 14 Select **Yarn** in the required cluster from the **Service**.

Step 15 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.147 ALM-18003 NodeManager Unhealthy

Alarm Description

The system checks the number of unhealthy NodeManager nodes every 30 seconds, and compares the number with the threshold. The Unhealthy Nodes indicator has a default threshold. This alarm is generated when the value of the Unhealthy Nodes indicator exceeds the threshold.

To change the threshold, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn**. On the displayed page, choose **Configurations** > **All Configurations**, and change the value of **yarn.nodemanager.unhealthy.alarm.threshold**. You do not need to restart Yarn to make the change take effect.

The default threshold is 0. The alarm is generated when the number of unhealthy nodes exceeds the threshold, and is cleared when the number of unhealthy nodes is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18003	Major	Error handling	Yarn	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Unhealthy Host	Specifies the list of hosts with unhealthy nodes.

Impact on the System

- The faulty NodeManager node cannot provide the Yarn service.
- The number of containers decreases, so the cluster performance deteriorates.

Possible Causes

- The hard disk space of the host where the NodeManager node resides is insufficient.
- User **omm** does not have the permission to access a local directory on the NodeManager node.

Handling Procedure

Check the hard disk space of the host.

Step 1 On the FusionInsight Manager, and choose **O&M** > **Alarm > Alarms**. Click before the alarm and obtain unhealthy nodes in **Additional Information**.

Step 2 Choose **Cluster** > *Name of the desired cluster* **> Services > Yarn** > **Instance**, select the NodeManager instance corresponding to the host, choose **Instance Configurations > All Configurations** and view disks corresponding to **yarn.nodemanager.local-dirs** and **yarn.nodemanager.log-dirs**.

Step 3 Choose **O&M > Alarm > Alarms**. In the alarm list, check whether the related disk has the alarm **ALM-12017 Insufficient Disk Capacity**.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Rectify the disk fault based on **ALM-12017 Insufficient Disk Capacit** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Step 5 Choose **Hosts** > *Name of the desired host* . On the **Dashboard** page, check the disk usage of the corresponding partition. Check whether the percentage of the used space of the mounted disk exceeds the value of **yarn.nodemanager.disk-health-checker.max-disk-utilization-per-disk-percentage**

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Reduce the disk usage to less than the value of **yarn.nodemanager.disk-health-checker.max-disk-utilization-per-disk-percentage**, wait for 10 to 20 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check the access permission of the local directory on each NodeManager node.

Step 7 Obtain the NodeManager directory viewed in **Step 2**, log in to each NodeManager node as user **root**, and go to the obtained directory.

Step 8 Run the **ll** command to check whether the permission of the **localdir** and **containerlogs** folders is **755** and whether **User:Group** is **omm:ficommon**.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Run the following command to set the permission to **755** and **User:Group** to **omm:ficommon**:

chmod 755 *<folder_name>*

chown omm:ficommon *<folder_name>*

Step 10 Wait for 10 to 20 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager in the active cluster, choose **O&M** > **Log** > **Download**.

Step 12 Select **Yarn** in the required cluster from the **Service**.

Step 13 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.148 ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of Yarn ResourceManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Yarn ResourceManager exceeds the threshold.

Users can choose **O&M > Alarm > Thresholds** > *Name of the desired cluster* > **Yarn** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the heap memory usage of Yarn ResourceManager is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the heap memory usage of Yarn ResourceManager is less than or equal to 95% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18008	Critical (default threshold is 95% of the maximum memory size.) Major (default threshold is 90% of maximum memory)	Quality of service	Yarn	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.

Type	Parameter	Description
	RoleName	Specifies the role name for which the alarm is generated.
	HostName	Specifies the object (host ID) for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the heap memory usage of Yarn ResourceManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The heap memory of the Yarn ResourceManager instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Handling Procedure

Check the heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **Heap Memory Usage of Yarn ResourceManager Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **ResourceManager** (Indicates the host name of the instance for which the alarm is generated)**.** Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **ResourceManager > Percentage of Used Memory of the ResourceManager**. Check the heap memory usage.

Step 3 Check whether the used heap memory of ResourceManager reaches 95% of the maximum heap memory specified for ResourceManager.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **ResourceManager** > **System**. Increase the value of **GC_OPTS** parameter as required, click **Save**. Restart the role instance.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of ResourceManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms10G -Xmx10G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 1000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms20G -Xmx20G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 2000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms40G -Xmx40G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 3000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms60G -Xmx60G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 4000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms80G -Xmx80G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 5000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms100G -Xmx100G -XX:NewSize=3G -XX:MaxNewSize=6G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.149 ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of Mapreduce JobHistoryServer every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Mapreduce JobHistoryServer exceeds the threshold.

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **MapReduce** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the heap memory usage of MapReduce JobHistoryServer is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the heap memory usage of MapReduce JobHistoryServer is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18009	Critical (default threshold is 95% of the maximum memory size.) Major (default threshold is 90% of maximum memory)	Quality of service	MapReduce	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	RoleName	Specifies the role name for which the alarm is generated.

Type	Parameter	Description
	HostName	Specifies the object (host ID) for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the heap memory usage of Mapreduce JobHistoryServer is overhigh, the performance of Mapreduce log archiving is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The heap memory of the Mapreduce JobHistoryServer instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Handling Procedure

Check the memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18009 Heap Memory Usage of MapReduce JobHistoryServer Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **Mapreduce** > **Instance** > **JobHistoryServer.** Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **JobHistoryServer heap memory usage statistics**. JobHistoryServer indicates the corresponding HostName of the instance for which the alarm is generated. Check the heap memory usage.

Step 3 Check whether the used heap memory of JobHistoryServer reaches 95% of the maximum heap memory specified for JobHistoryServer.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **Mapreduce** > **Configurations** > **All Configurations** > **JobHistoryServer** > **System**. Increase the value of **GC_OPTS** parameter as required, click **Save**. Click **OK** and restart the role instance.

NOTE

The mapping between the number of historical tasks (10000) and the memory of JobHistoryServer is as follows:

-Xms30G -Xmx30G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Mapreduce

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.150 ALM-18010 ResourceManager GC Time Exceeds the Threshold

Alarm Description

The system checks the garbage collection (GC) duration of the ResourceManager process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold.

This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18010	Critical (default threshold: 15000ms) Major (default threshold: 10000ms)	Quality of service	Yarn	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the ResourceManager process may interrupt the services.

Possible Causes

The heap memory of the ResourceManager instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Handling Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18010 ResourceManager GC Time Exceeds the Threshold** > **Location** to check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **ResourceManager (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Garbage Collection (GC) Time of ResourceManager** to check the GC duration statistics of the Broker process collected every minute.

Step 3 Check whether the GC duration of the ResourceManager process collected every minute exceeds the threshold.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Configurations** > **All Configurations** > **ResourceManager** > **System** to increase the value of **GC_OPTS** parameter as required.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of ResourceManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms10G -Xmx10G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 1000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms20G -Xmx20G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 2000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms40G -Xmx40G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 3000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms60G -Xmx60G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 4000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms80G -Xmx80G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 5000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms100G -Xmx100G -XX:NewSize=3G -XX:MaxNewSize=6G

Step 5 Save the configuration and restart the ResourceManager instance.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **ResourceManager** in the required cluster from the **Service**.

Step 9 Click edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.151 ALM-18011 NodeManager GC Time Exceeds the Threshold

Alarm Description

The system checks the garbage collection (GC) duration of the NodeManager process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold.

This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18011	Critical (default threshold: 20000ms) Major (default threshold: 12000ms)	Quality of service	Yarn	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.

Type	Parameter	Description
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the NodeManager process may interrupt the services.

Possible Causes

The heap memory of the NodeManager instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Handling Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18011 NodeManager GC Time Exceeds the Threshold** > **Location** to check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **NodeManager (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Garbage Collection (GC) Time of NodeManager** to check the GC duration statistics of the Broker process collected every minute.

Step 3 Check whether the GC duration of the NodeManager process collected every minute exceeds the threshold.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **NodeManager** > **System** to increase the value of **GC_OPTS** parameter as required.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of NodeManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters for NodeManager instances are as follows: -Xms2G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters for NodeManager instances are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters for NodeManager instances are as follows: -Xms8G -Xmx8G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Save the configuration and restart the NodeManager instance.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **NodeManager** in the required cluster from the **Service**.

Step 9 Click edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

11.152 ALM-18012 JobHistoryServer GC Time Exceeds the Threshold

Alarm Description

The system checks the garbage collection (GC) duration of the JobHistoryServer process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold.

This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18012	Critical (default threshold: 20000ms) Major (default threshold: 12000ms)	Quality of service	MapReduce	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the JobHistoryServer process may interrupt the services.

Possible Causes

The heap memory of the JobHistoryServer instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Handling Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18012 JobHistoryServer GC Time Exceeds the Threshold** > **Location** to check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Instance** > **JobHistoryServer (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Garbage Collection (GC) Time of the JobHistoryServer** to check the GC duration statistics of the Broker process collected every minute.

Step 3 Check whether the GC duration of the JobHistoryServer process collected every minute exceeds the threshold.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Configurations** > **All Configurations** > **JobHistoryServer** > **System** to increase the value of **GC_OPTS** parameter as required.

NOTE

The mapping between the number of historical tasks (10000) and the memory of the JobHistoryServer is as follows:

-Xms30G -Xmx30G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Save the configuration and restart the JobHistoryServer instance.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **JobHistoryServer** in the required cluster from the **Service**.

Step 9 Click edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

11.153 ALM-18013 ResourceManager Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the Yarn service every 30 seconds. This alarm is generated when the direct memory usage of a ResourceManager instance exceeds the threshold.

The alarm is cleared when the direct memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18013	Critical (default threshold is 95% of the maximum memory size.) Major (default threshold is 90% of maximum memory)	Quality of service	Yarn	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the Yarn service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the ResourceManager instance is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18013 ResourceManager Direct Memory Usage Exceeds the Threshold** > **Location** to check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **ResourceManager (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Memory Usage Status of ResourceManager** to check the direct memory usage.

Step 3 Check whether the used direct memory of ResourceManager reaches 90% of the maximum direct memory specified for ResourceManager by default.

- If yes, go to **Step 4**.
- If no, go to **Step 9**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **ResourceManager** > **System** to increase the value of check whether **-XX:MaxDirectMemorySize** exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 In the **GC_OPTS** parameter, delete **-XX:MaxDirectMemorySize**.

Step 6 Save the configuration and restart the ResourceManager instance.

Step 7 Check whether the **ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold**.
- If no, go to **Step 8**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **ResourceManager** in the required cluster from the **Service**.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.154 ALM-18014 NodeManager Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the Yarn service every 30 seconds. This alarm is generated when the direct memory usage of a NodeManager instance exceeds the threshold.

The alarm is cleared when the direct memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18014	Critical (default threshold is 95% of the maximum memory size.) Major (default threshold is 90% of maximum memory)	Quality of service	Yarn	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the Yarn service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the NodeManager instance is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm > Alarms** > **ALM-18014 NodeManager Direct Memory Usage Exceeds the Threshold** > **Location** to check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **NodeManager (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Resource** > **Percentage of Used Memory of the NodeManager** to check the direct memory usage.

Step 3 Check whether the used direct memory of NodeManager reaches 90% of the maximum direct memory specified for NodeManager by default.

- If yes, go to **Step 4**.
- If no, go to **Step 9**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations**> **NodeManager** > **System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 In the **GC_OPTS** parameter, delete "-XX:MaxDirectMemorySize".

Step 6 Save the configuration and restart the NodeManager instance.

Step 7 Check whether the **ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold**.
- If no, go to **Step 8**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **NodeManager** in the required cluster from the **Service**.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.155 ALM-18015 JobHistoryServer Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the MapReduce service every 30 seconds. This alarm is generated when the direct memory usage of a JobHistoryServer instance exceeds the threshold.

The alarm is cleared when the direct memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18015	Critical (default threshold is 95% of the maximum memory size.) Major (default threshold is 90% of maximum memory)	Quality of service	MapReduce	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the MapReduce service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the JobHistoryServer instance is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18015 JobHistoryServer Direct Memory Usage Exceeds the Threshold** > **Location** to check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Instance** > **JobHistoryServer (IP address for which the alarm is generated).** Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Memory Usage Status of JobHistoryServer** to check the direct memory usage.

Step 3 Check whether the used direct memory of JobHistoryServer reaches 90% of the maximum direct memory specified for JobHistoryServer by default.

- If yes, go to **Step 4**.
- If no, go to **Step 9**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Configurations** > **All Configurations** > **JobHistoryServer** > **System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 In the **GC_OPTS** parameter, delete "-XX:MaxDirectMemorySize".

Step 6 Save the configuration and restart the JobHistoryServer instance.

Step 7 Check whether the **ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold**.
- If no, go to **Step 8**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **JobHistoryServer** in the required cluster from the **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.156 ALM-18016 Non Heap Memory Usage of ResourceManager Exceeds the Threshold

Alarm Description

The system checks the Non Heap memory usage of Yarn ResourceManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the Non Heap memory usage of Yarn ResourceManager exceeds the threshold.

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** to change the threshold.

The alarm is cleared when the Non Heap memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18016	Critical (default threshold is 95% of the maximum memory size.) Major (default threshold is 90% of maximum memory)	Quality of service	Yarn	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	RoleName	Specifies the role name for which the alarm is generated.

Type	Parameter	Description
	HostName	Specifies the object (host ID) for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the Non Heap memory usage of Yarn ResourceManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The Non Heap memory of the Yarn ResourceManager instance on the node is overused or the Non Heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Handling Procedure

Check the Non Heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18016 Non Heap Memory Usage of Yarn ResourceManager Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **ResourceManager**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Percentage of Used Memory of the ResourceManager**. ResourceManager indicates the corresponding HostName of the instance for which the alarm is generated. Check the Non Heap memory usage.

Step 3 Check whether the used Non Heap memory of ResourceManager reaches 90% of the maximum Non Heap memory specified for ResourceManager by default.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **ResourceManager** > **System**. Adjust the **GC_OPTS** memory parameter of ResourceManager. Save the configuration and restart the ResourceManager instance.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of ResourceManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms10G -Xmx10G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 1000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms20G -Xmx20G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 2000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms40G -Xmx40G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 3000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms60G -Xmx60G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 4000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms80G -Xmx80G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 5000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms100G -Xmx100G -XX:NewSize=3G -XX:MaxNewSize=6G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.157 ALM-18017 Non Heap Memory Usage of NodeManager Exceeds the Threshold

Alarm Description

The system checks the Non Heap memory usage of Yarn NodeManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the Non Heap memory usage of Yarn NodeManager exceeds the threshold.

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** to change the threshold.

The alarm is cleared when the Non Heap memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18017	Critical (default threshold is 95% of the maximum memory size.) Major (default threshold is 90% of maximum memory)	Quality of service	Yarn	Yes

Alarm Parameters

Type	Name	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	RoleName	Specifies the role name for which the alarm is generated.
	HostName	Specifies the object (host ID) for which the alarm is generated.

Type	Name	Description
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the Non Heap memory usage of Yarn NodeManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The Non Heap memory of the Yarn NodeManager instance on the node is overused or the Non Heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Handling Procedure

Check the Non Heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18017 Non Heap Memory Usage of Yarn NodeManager Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **NodeManager**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Resource** > **Percentage of Used Memory of the NodeManager**. NodeManager indicates the corresponding HostName of the instance for which the alarm is generated. Check the Non Heap memory usage.

Step 3 Check whether the used Non Heap memory of NodeManager reaches 90% of the maximum Non Heap memory specified for NodeManager by default.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **NodeManager** > **System**. Adjust the **GC_OPTS** memory parameter of NodeManager, click **Save**, and click **OK,** and restart the role instance.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of NodeManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters for NodeManager instances are as follows: -Xms2G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters for NodeManager instances are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters for NodeManager instances are as follows: -Xms8G -Xmx8G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.158 ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of Yarn NodeManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Yarn NodeManager exceeds the threshold.

The alarm is cleared when the heap memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18018	Critical (default threshold is 95% of the maximum memory size.) Major (default threshold is 90% of maximum memory)	Quality of service	Yarn	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	RoleName	Specifies the role name for which the alarm is generated.
	HostName	Specifies the object (host ID) for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the heap memory usage of Yarn NodeManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The heap memory of the Yarn NodeManager instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Handling Procedure

Check the heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **NodeManager**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Resource** > **Percentage of Used Memory of the NodeManager** to check the heap memory usage.

Step 3 Check whether the used heap memory of NodeManager reaches 95% of the maximum heap memory specified for NodeManager.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **NodeManager** > **System**. Increase the value of **GC_OPTS** parameter as required, click **Save**, and click **OK**, and restart the role instance.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of NodeManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters for NodeManager instances are as follows: -Xms2G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters for NodeManager instances are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters for NodeManager instances are as follows: -Xms8G -Xmx8G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.159 ALM-18019 Non Heap Memory Usage of JobHistoryServer Exceeds the Threshold

Alarm Description

The system checks the Non Heap memory usage of MapReduce JobHistoryServer every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the Non Heap memory usage of MapReduce JobHistoryServer exceeds the threshold.

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **MapReduce** to change the threshold.

The alarm is cleared when the Non Heap memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18019	Critical (default threshold is 95% of the maximum memory size.) Major (default threshold is 90% of maximum memory)	Quality of service	MapReduce	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	RoleName	Specifies the role name for which the alarm is generated.
	HostName	Specifies the object (host ID) for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the Non Heap memory usage of MapReduce JobHistoryServer is overhigh, the performance of MapReduce task submission and operation is affected. In addition, a memory overflow may occur so that the MapReduce service is unavailable.

Possible Causes

The Non Heap memory of the MapReduce JobHistoryServer instance on the node is overused or the Non Heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Handling Procedure

Check the Non Heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18019 Non Heap Memory Usage of MapReduce JobHistoryServer Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Instance** > **JobHistoryServer.** Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **JobHistoryServer Non Heap memory usage statistics**. JobHistoryServer indicates the corresponding HostName of the instance for which the alarm is generated. Check the Non Heap memory usage.

Step 3 Check whether the used Non Heap memory of JobHistoryServer reaches 90% of the maximum Non Heap memory specified for JobHistoryServer.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Configurations** > **All Configurations** > **JobHistoryServer** > **System**. Adjust the **GC_OPTS** memory parameter of the NodeManager, click **Save**, and click **OK,** and restart the role instance.

NOTE

The mapping between the number of historical tasks (10000) and the memory of the JobHistoryServer is as follows:

-Xms30G -Xmx30G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- MapReduce

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.160 ALM-18020 Yarn Task Execution Timeout

Alarm Description

The system checks MapReduce and Spark tasks (except for permanent JDBC tasks) submitted to Yarn every 15 minutes. This alarm is generated when the task execution time exceeds the timeout duration specified by the user. However, the task can be properly executed. The client timeout parameter of MapReduce is mapreduce.application.timeout.alarm and that of Spark is spark.application.timeout.alarm. The unit is ms.

This alarm is cleared when the task is finished or terminated.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18020	Minor	Quality of service	Yarn	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	ApplicationName	Specifies the object (application ID) for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The alarm persists after task execution times out. However, the task can still be properly executed, so this alarm does not exert any impact on the system.

Possible Causes

- The specified timeout duration is shorter than the required execution time.
- The queue resources for task running are insufficient.
- Task data skew occurs. As a result, some tasks process a large amount of data and take a long time to execute.

Handling Procedure

Check whether the timeout interval is correctly set.

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. The **Alarms** page is displayed.

Step 2 Select the alarm whose ID is **18020**. In the alarm details, view **Location** to obtain the timeout task name and timeout duration.

Step 3 Based on the task name and timeout interval, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager (Active)** to log in to the native Yarn page. Then find the task on the native page, check its **StartTime** and

calculate the task execution time based on the current system time. Check whether the task execution time exceeds the timeout duration.

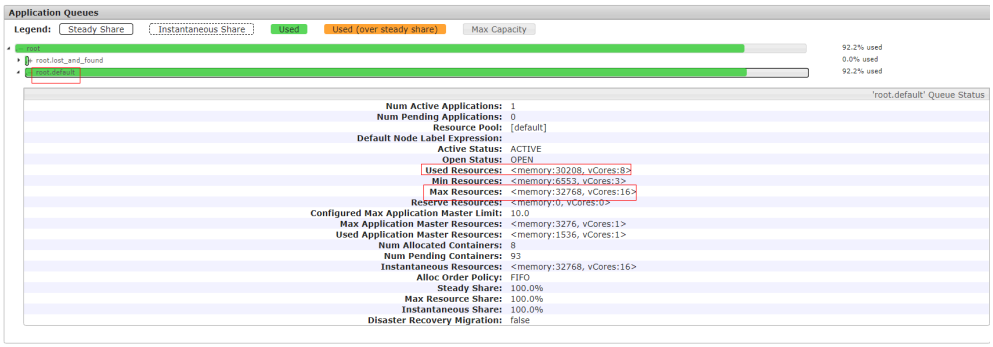
- If yes, go to **Step 4**.
- If no, go to **Step 10**.

Step 4 Evaluate the expected task execution time based on the service and compare it with the task timeout interval. If the timeout interval is too short, set the timeout interval (**mapreduce.application.timeout.alarm** or **spark.application.timeout.alarm**) of the client to the task expected execution time. Run the task again and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the queue resources are sufficient.

Step 5 Find the task on the native page and view the queue name of the task. Click **Scheduler** on the left of the native page. On the **Applications Queues** page, find the corresponding queue name and expand the queue details, as shown in the following figure.

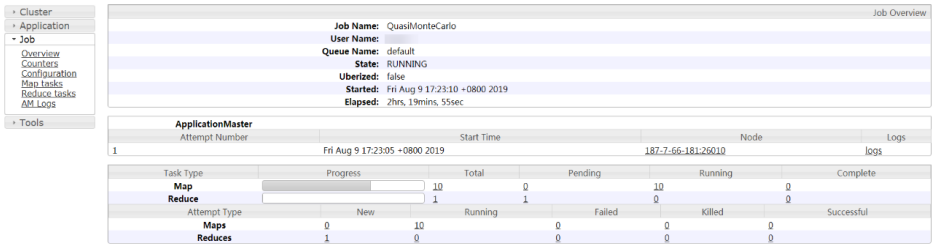


Step 6 Check whether the value of **Used Resources** in the queue details is approximately equal to the value of **Max Resources**, which indicates that the resources in the queue submitted by the task have been used up. If the queue resources are insufficient, choose **Tenant Resources** > **Dynamic Resource Plan** > **Resource Distribution Policy** on FusionInsight Manager and increase the value of **Max Resources** for the queue. Run the task again and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check whether data skew occurs.

Step 7 On the native Yarn page, click *task ID* (for example, **application_1565337919723_0002**) > **Tracking URL:ApplicationMaster** > **job_1565337919723_0002**. The following page is displayed.



Step 8 Choose **Job** > **Map tasks** or **Job** > **Reduce tasks** on the left and check whether the execution time of each Map or Reduce task differs greatly. If yes, task data skew occurs. In this case, you need to balance the task data.

Step 9 Rectify the fault based on the preceding causes and perform the tasks again. Then, check whether the alarm persists.

- If yes, go to **Step 10**.
- If no, no further action is required.

Collect the fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.161 ALM-18021 Mapreduce Service Unavailable

Alarm Description

The alarm module checks the MapReduce service status every 60 seconds. This alarm is generated when the system detects that the MapReduce service is unavailable.

The alarm is cleared when the MapReduce service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18021	Critical	Error handling	MapReduce	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The cluster cannot provide the MapReduce service. For example, MapReduce cannot be used to view task logs or the log archive function is unavailable.

Possible Causes

- The JobHistoryServer instance is abnormal.
- The KrbServer service is abnormal.
- The ZooKeeper service abnormal.
- The HDFS service abnormal.
- The Yarn service is abnormal.

Handling Procedure

Check MapReduce service JobHistoryServer instance status.

Step 1 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **MapReduce** > **Instance**.

Step 2 Check whether the running status of JobHistoryServer is **Normal**.

- If yes, go to **Step 11**.
- If no, go to **Step 3**.

Check the KrbServer service status.

Step 3 In the alarm list on FusionInsight Manager, check whether **ALM-25500 KrbServer Service Unavailable** exists.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Rectify the fault by following the steps provided in **ALM-25500 KrbServer Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the ZooKeeper service.

Step 5 In the alarm list on FusionInsight Manager, check whether **ALM-13000 ZooKeeper Service Unavailable** exists.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check the HDFS service status.

Step 7 In the alarm list on FusionInsight Manager, check whether **ALM-14000 HDFS Service Unavailable** exists.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Rectify the fault by following the steps provided in **ALM-14000 HDFS Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check the Yarn service status.

Step 9 In the alarm list on FusionInsight Manager, check whether **ALM-18000 Yarn Service Unavailable** exists.

- If yes, go to **Step 10**
- If no, go to **Step 11**.

Step 10 Rectify the fault by following the steps provided in **ALM-18000 Yarn Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log > Download.**

Step 12 Select **MapReduce** in the required cluster from the **Service.**

Step 13 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.162 ALM-18022 Insufficient YARN Queue Resources

Alarm Description

The alarm module checks YARN queue resources periodically (controlled by the **alarm.resource.lack.check.times.threshold** parameter, in minutes). When the available queue resources or ApplicationMaster (AM) queue resources are insufficient:

- If **alarm.resource.lack.enable** is set to **true** and **alarm.resource.lack.enable.queues** is left blank, all queues are allowed to trigger this alarm.
- If **alarm.resource.lack.enable** is set to **true** and **alarm.resource.lack.enable.queues** is set to a queue name, only the specified queue is allowed to report this alarm.
- If **alarm.resource.lack.enable** is set to **false**, all queues are not allowed to report this alarm.

To set the preceding parameters, choose **Cluster** > **Services** > **Yarn**. On the displayed page, click **Configurations** > **All Configurations** on FusionInsight Manager.

This alarm is cleared when available resources are sufficient.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18022	Minor	Quality of service	Yarn	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	QueueName	Identifies the queue for which the alarm is generated.
	QueueMetric	Identifies the queue indicator for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

- It takes long time to end an application.
- A new application cannot run after submission.

Possible Causes

- Alarm reporting needs to be adjusted (applicable only to MRS 3.3.1 or later).
- NodeManager node resources are insufficient.
- The maximum resource capacity of the queue is too small.
- The configured maximum ApplicationMaster resource percent is too small.

Handling Procedure

Adjusting the alarm reporting mechanism (applicable only to MRS 3.3.1 or later)

Step 1 Check whether all queues need to report this alarm.

- If no queue needs to report alarms, log in to FusionInsight Manager, choose **Cluster** > **Services** > **Yarn**. On the displayed page, click **Configurations** > **All Configurations**, search for **alarm.resource.lack.enable**, change the value to **false**, and save the configuration.
- If only some queues need to report alarms: Log in to FusionInsight Manager, choose **Cluster** > **Services** > **Yarn**. On the displayed page, click **Configurations** > **All Configurations**, search for **alarm.resource.lack.enable.queues** and change the value to the name of the queue for which this alarm needs to be reported, and save the configuration.
- If alarms need to be reported for all queues, go to **Step 3**.

Step 2 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check NodeManager resources.

Step 3 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. The **Alarms** page is displayed.

Step 4 View the **Location** in the details page of **Insufficient YARN Queue Resources**. Check whether **QueueName** is **root** and **QueueMetric** is **Memory**, or **QueueName** is **root** and **QueueMetric** is **vCores**

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 The memory or CPU of the YARN cluster is insufficient. In this case, log in to the NodeManager node and run the **free –g** and **cat /proc/cpuinfo** commands to query the available memory and available CPU of the node, respectively. On the FusionInsight Manager, increase the values of **yarn.nodemanager.resource.memory-mb** and **yarn.nodemanager.resource.cpu-vcores** for the YARN NodeManager based on the query results. Then, restart the NodeManager instance.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Checking the maximum resource capacity of a queue

Step 7 Check the **Location** of this alarm in the details page. Check whether **QueueName** is the queue name and **QueueMetric** is **Memory**, or **QueueName** is the queue name and **QueueMetric** is **vCores**. Then, check whether **Additional Information** in the alarm details contains **available Memory =** or **available vCores =**.

- If yes, go to **Step 8**.
- If no, go to **Step 11**.

Step 8 The memory or CPU of the tenant queue is insufficient. In this case, choose **Tenant Resources** > **Dynamic Resource Plan** > **Resource Distribution Policy** and increase the value of **Max Resources**. Then check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Choose **Cluster** > **Services** > **Yarn**. On the displayed page, click **Configurations** > **All Configurations**, enter the keyword **threshold**, click **ResourceManager**, and adjust the thresholds of the following parameters:

If **Additional Information** contains **available Memory =**, change the threshold of **yarn.queue.memory.alarm.threshold** to a value less than the **available Memory =** value.

If **Additional Information** contains **available vCores =**, change the threshold of **yarn.queue.vcore.alarm.threshold** to a value less than the **available vCores =** value.

Step 10 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 11**.

Checking the maximum AM resource percentage

Step 11 If **available AmMemory =** or **available AmvCores =** is included in **Additional Information**, ApplicationMaster memory or CPU of the queue is insufficient. In this case, choose **Tenant Resources** > **Dynamic Resource Plan** > **Queue Configurations**, and increase the value of **Max Master Shares**. Then, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Step 12 Choose **Cluster** > **Services** > **Yarn**. On the displayed page, click **Configurations** > **All Configurations**, enter the keyword **threshold**, click **ResourceManager**, and adjust the thresholds of the following parameters:

If **Additional Information** contains **available AmMemory =**, change the threshold of **yarn.am.memory.alarm.threshold** to a value less than the **available AmMemory =** value.

If **Additional Information** contains **available AmvCores =**, change the threshold of **yarn.am.vcore.alarm.threshold** to a value less than the **available AmvCores =** value.

Step 13 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 14**.

Collect fault information.

Step 14 On FusionInsight Manager of the active cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 15 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 16 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 17 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.163 ALM-18023 Number of Pending Yarn Tasks Exceeds the Threshold

Alarm Description

The alarm module checks the number of pending applications in the Yarn root queue every 60 seconds. The alarm is generated when the number exceeds 60.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18023	Major	Quality of service	Yarn	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the cluster service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	QueueName	Identifies the queue for which the alarm is generated.

Impact on the System

- It takes long time to end an application.
- A new application cannot run after submission.

Possible Causes

- NodeManager node resources are insufficient.
- The maximum resource capacity of the queue and the maximum AM resource percentage are too small.
- The monitoring threshold is too small.

Handling Procedure

Check NodeManager resources.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager (Active)** to access the ResourceManager web UI.

Step 2 Click **Scheduler** and check whether the root queue resources are used up in **Application Queues**.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Expand the capacity of the NodeManager instance of the Yarn service. After the capacity expansion, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check the maximum queue resource capacity and the maximum AM resource percentage.

Step 4 Check whether the resources of the queue corresponding to the pending task are used up.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On FusionInsight Manager, choose **Tenant Resources** > **Dynamic Resource Plan** and add resources as required. Check whether the alarms are cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Adjust the monitoring thresholds.

Step 6 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** > **Applications** > **Pending Applications**, and increase the thresholds as required.

Step 7 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.164 ALM-18024 Pending Yarn Memory Usage Exceeds the Threshold

Alarm Description

The alarm module checks the pending memory of Yarn every 60 seconds. The alarm is generated when the pending memory exceeds the threshold. Pending memory indicates the total memory that is not allocated to submitted Yarn applications.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18024	Major	Quality of service	Yarn	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the cluster service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	QueueName	Identifies the queue for which the alarm is generated.

Impact on the System

- It takes long time to end an application.
- A new application cannot run after submission.

Possible Causes

- NodeManager node resources are insufficient.
- The maximum resource capacity of the queue and the maximum AM resource percentage are too small.
- The monitoring threshold is too small.

Handling Procedure

Check NodeManager resources.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager (Active)** to access the ResourceManager web UI.

Step 2 Click **Scheduler** and check whether the root queue resources are used up in **Application Queues**.

- If yes, go to **Step 3**.

- If no, go to **Step 4**.

Step 3 Expand the capacity of the NodeManager instance of the Yarn service. After the capacity expansion, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check the maximum queue resource capacity and the maximum AM resource percentage.

Step 4 Check whether the resources of the queue corresponding to the pending task are used up.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On FusionInsight Manager, choose **Tenant Resources** > **Dynamic Resource Plan** and add resources as required. Check whether the alarms are cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Adjust the monitoring thresholds.

Step 6 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** > **CPU and Memory** > **Pending Memory**, and increase the threshold as required.

Step 7 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.165 ALM-18025 Number of Terminated Yarn Tasks Exceeds the Threshold

Alarm Description

The alarm module checks the number of terminated applications in the Yarn root queue every 60 seconds. The alarm is generated when the number exceeds 50 for three consecutive times.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18025	Major	Quality of service	Yarn	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the source in the cluster for which the alarm was generated.
	ServiceName	Specifies the cluster service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A large number of application tasks are forcibly terminated.

Possible Causes

- The user forcibly terminates a large number of tasks.
- The system terminates tasks due to some error.

Handling Procedure

Check the alarm details.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** to go to the alarm page.

Step 2 View **Additional Information** in the alarm details to check whether the alarm threshold is too small.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** > **Other** > **Terminated Applications of root queue** to modify the threshold. Go to **Step 6**.

Step 4 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager(Active)** to access the ResourceManager web UI.

Step 5 Click **KILLED** in **Applications** and click the task on the top. View the description of **Diagnostics** and rectify the fault based on the task termination details (for example, the task is terminated by a user).

Step 6 Wait for 3 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On the FusionInsight Manager, choose **O&M > Log > Download**.

Step 8 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.166 ALM-18026 Number of Failed Yarn Tasks Exceeds the Threshold

Alarm Description

The alarm module checks the number of failed applications in the Yarn root queue every 60 seconds. The alarm is generated when the number exceeds 50 for three consecutive times.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
18026	Major	Quality of service	Yarn	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the source in the cluster for which the alarm was generated.
	ServiceName	Specifies the cluster service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

- A large number of application tasks fail to be executed.
- Failed tasks need to be submitted again.

Possible Causes

The task fails to be executed due to some error.

Handling Procedure

Check the alarm details.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** to go to the alarm page.

Step 2 View **Additional Information** in the alarm details to check whether the alarm threshold is too small.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** > **Other** > **Failed Applications of root queue** to modify the threshold. Go to **Step 6**.

Step 4 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager(Active)** to access the ResourceManager web UI.

Step 5 Click **FAILED** in **Applications** and click the task on the top. View the description of **Diagnostics** and rectify the fault based on the task failure causes.

Step 6 Wait for 3 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On the FusionInsight Manager, choose O&M > Log > Download.

Step 8 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.167 ALM-19000 HBase Service Unavailable

Alarm Description

This alarm is generated when the HBase service is unavailable. The alarm module checks the HBase service status every 120 seconds.

This alarm is cleared when the HBase service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19000	Critical	Error handling	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

Operations, such as reading or writing data and creating tables, cannot be performed.

Possible Causes

- The ZooKeeper service is abnormal.
- The HDFS service is abnormal.
- The HBase service is abnormal.
- The network is abnormal.
- The service configuration value is incorrect.

Handling Procedure

Check the ZooKeeper service status.

Step 1 On the FusionInsight Manager, check whether the running status of ZooKeeper is **Normal** on service list.

- If yes, go to **Step 5**.
- If no, go to **Step 2**.

Step 2 In the alarm list, check whether **ALM-13000 ZooKeeper Service Unavailable** exists.

- If yes, go to **Step 3**.

- If no, go to **Step 5**.

Step 3 Rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**.

Step 4 Wait several minutes, and check whether alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the HDFS service status.

Step 5 In the alarm list, check whether **ALM-14000 HDFS Service Unavailable** exists.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Rectify the fault by following the steps provided in **ALM-14000 HDFS Service Unavailable**.

Step 7 Wait several minutes, and check whether alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 8 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**. Check whether **Safe Mode** is **ON**.

- If yes, go to **Step 9**.
- If no, go to **Step 12**.

Step 9 Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata_env**.

If the cluster uses the security mode, perform security authentication. Obtain the password of user hdfs from the administrator, run the **kinit hdfs** command and enter the password as prompted.

Step 10 Run the following command to manually exit the safe mode:

hdfs dfsadmin -safemode leave

Step 11 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check the HBase service status.

Step 12 On the FusionInsight Manager portal, click **Cluster** > *Name of the desired cluster* > **Services** > **HBase**.

Step 13 Check whether there is one active HMaster and one standby HMaster.

- If yes, go to **Step 15**.
- If no, go to **Step 14**.

Step 14 Click **Instances**, select the HMaster whose status is not **Active**, click **More**, and select **Restart Instance** to restart the HMaster. Check whether there is one active HMaster and one standby HMaster again.

- If yes, go to **Step 15**.
- If no, go to **Step 21**.

Step 15 Choose **Cluster** >*Name of the desired cluster* > **Services** > **HBase** > **HMaster(Active)** to go to the HMaster WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

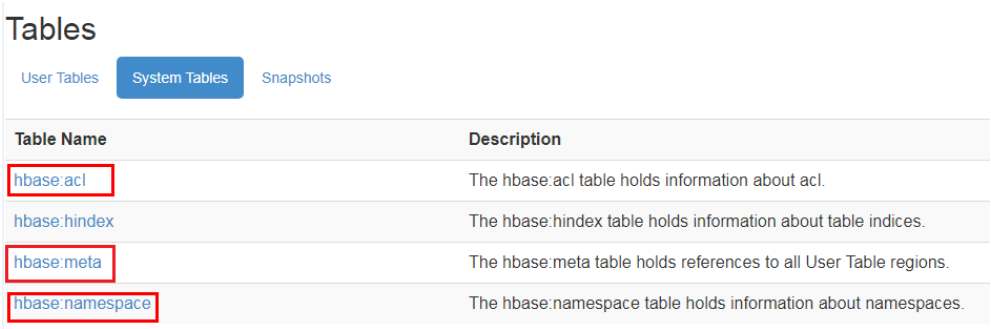
Step 16 Check whether at least one RegionServer exists under **Region Servers**.

- If yes, go to **Step 17**.
- If no, go to **Step 21**.

Step 17 Check **Tables** > **System Tables**, as shown in **Figure 11-6**. Check whether **hbase:meta**, **hbase:namespace**, and **hbase:acl** exist in the **Table Name** column.

- If yes, go to **Step 18**.
- If no, go to **Step 19**.

Figure 11-6 HBase system table



Step 18 As shown in **Figure 11-6**, click the **hbase:meta**, **hbase:namespace**, and **hbase:acl** hyperlinks and check whether the pages are properly displayed. If the pages are properly displayed, the tables are normal.

If they are, go to **Step 19**.

If they are not, go to **Step 25**.

NOTE

In normal mode, **ACL** is enabled for HBase by default. The **hbase:acl** table is generated only when **ACL** is manually enabled. In this case, check this table. In other scenarios, this table does not need to be checked.

Step 19 View the HMaster startup status.

In **Figure 11-7**, if the **RUNNING** state exists in **Tasks**, HMaster is being started. In the **State** column, you can view the time when HMaster is in the **RUNNING** state. In **Figure 11-8**, if the state is **COMPLETE**, HMaster is started.

Check whether HMaster is in the **RUNNING** state for a long time.

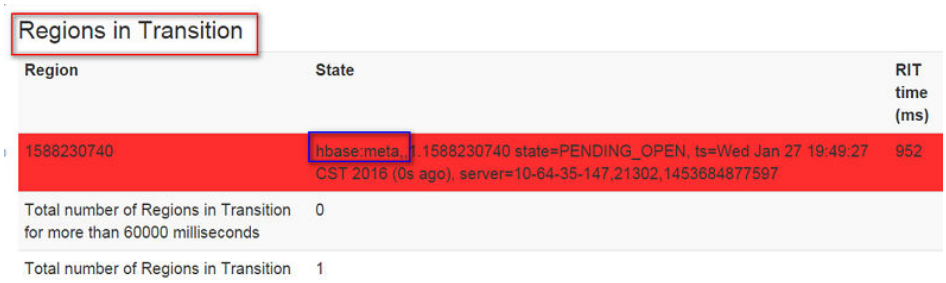
Figure 11-7 HMaster is being started

Figure 11-8 HMaster is started

- If yes, go to **Step 20**.
- If no, go to **Step 21**.

Step 20 On the HMaster WebUI, check whether any hbase:meta is in the **Region in Transition** state for a long time.

Figure 11-9 Region in Transition



- If yes, go to **Step 21**.
- If no, go to **Step 22**.

Step 21 In the precondition that services are not affected, log in to the FusionInsight Manager portal and choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **More** > **Restart Service**. Enter the administrator password and click **OK**.

- If yes, go to **Step 22**.
- If no, go to **Step 25**.

Step 22 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 25**.

Check whether the HBase configurations are correctly modified.

Step 23 On FusionInsight Manager, choose **Audit**. On the **Audit** page, click **Advanced Search**, click ··· on the right of **Operation Type**, select **Save configuration**, click **OK**, and click **Search**.

Step 24 In the search result, check whether the historical configurations of HBase-related services in the **Service** column, such as ZooKeeper, HDFS, and HBase, may affect

the HBase service status. **Table 11-6** lists some configurations that may affect the HBase service status.

Table 11-6 Configurations affecting the HBase service status

Parameter	Possible Impact
GC_OPTS	The memory configuration may be improper. You need to check the health status of instance processes.
hbase.rpc.protection	If the HBase service is not restarted offline after the value of this parameter is changed, the connection authentication fails and the HBase service becomes abnormal.
hbase.regionserver.metahandler.count	If there are too many regions in the cluster but this parameter is set to a small value, RIT may occur and regions cannot be brought online for a long time.
hbase.regionserver.thread.compaction.large	If this parameter is set to a large value, the node CPU usage may be too high.
hbase.regionserver.thread.compaction.small	If this parameter is set to a large value, the node CPU usage may be too high.
hbase.coprocessor.master.classes	If a custom coprocessor is used in the configuration, a logic error may cause the service to be unavailable.
hbase.coprocessor.region.classes	If a custom coprocessor is used in the configuration, a logic error may cause the service to be unavailable.
hbase.coprocessor.regionserver.classes	If a custom coprocessor is used in the configuration, a logic error may cause the service to be unavailable.
zookeeper.session.timeout	If this parameter is set to a small value, the connection between HBase and ZooKeeper times out too quickly. As a result, the HMaster instance and RegionServer may restart repeatedly.

Check the network connection between HMaster and dependent components.

Step 25 On the FusionInsight Manager, choose **Cluster** >*Name of the desired cluster* > **Services** > **HBase**.

Step 26 Click **Instance** and the HMaster instance list is displayed. Record the **management IP Address** in the row of **HMaster(Active)**.

Step 27 Use the IP address obtained in **Step 26** to log in to the host where the active HMaster runs as user **omm** .

Step 28 Run the **ping** command to check whether communication between the host that runs the active HMaster and the hosts that run the dependent components. (The dependent components include ZooKeeper, HDFS and Yarn. Obtain the IP addresses of the hosts that run these services in the same way as that for obtaining the IP address of the active HMaster.)

- If yes, go to **Step 31**.
- If no, go to **Step 29**.

Step 29 Contact the administrator to restore the network.

Step 30 In the alarm list, check whether **HBase Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 31**.

Collect fault information.

Step 31 On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 32 Select the following nodes in the required cluster from the **Service** drop-down list:

- ZooKeeper
- HDFS
- HBase

Step 33 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 34 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.168 ALM-19006 HBase Replication Sync Failed

Alarm Description

The alarm module checks the HBase DR data synchronization status every 30 seconds. When disaster recovery (DR) data fails to be synchronized to a standby cluster, the alarm is triggered.

When DR data synchronization succeeds, the alarm is cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19006	Critical	Error handling	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

HBase data in the cluster cannot be synchronized to the standby cluster. Synchronization data is stacked, causing a large amount of active/standby data inconsistency. As a result, the latest data cannot be read from the standby cluster after an active/standby DR switchover or dual-read. If the alarm persists, the storage space of the primary cluster and ZooKeeper nodes will be stacked, leading to service faults in the primary cluster.

Possible Causes

- The HBase service on the standby cluster is abnormal.
- A network exception occurs.

Handling Procedure

Observe whether the system automatically clears the alarm.

Step 1 On the FusionInsight Manager portal of the active cluster, click **O&M** > **Alarm** > **Alarms.**

Step 2 In the alarm list, click the alarm to obtain alarm generation time from **Generated** of the alarm. Check whether the alarm has existed for five minutes.

- If yes, go to **Step 4**.

- If no, go to **Step 3**.

Step 3 Wait five minutes and check whether the system automatically clears the alarm.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the HBase service status of the standby cluster.

Step 4 Log in to the FusionInsight Manager portal of the active cluster, and click **O&M** > **Alarm** > **Alarms.**

Step 5 In the alarm list, click the alarm to obtain **HostName** from **Location**.

Step 6 Access the node where the HBase client of the active cluster resides as user **omm**.

If the cluster uses a security mode, perform security authentication first and then access the **hbase shell** interface as user **hbase**.

cd /opt/client

source ./bigdata_env

kinit *hbaseuser*

Step 7 Run the **status 'replication', 'source'** command to check the DR synchronization status of the faulty node.

The DR synchronization status of a node is as follows.

```
10-10-10-153:
SOURCE: PeerID=abc, SizeOfLogQueue=0, ShippedBatches=2, ShippedOps=2, ShippedBytes=320,
LogReadInBytes=1636, LogEditsRead=5, LogEditsFiltered=3, SizeOfLogToReplicate=0,
TimeForLogToReplicate=0, ShippedHFiles=0, SizeOfHFileRefsQueue=0, AgeOfLastShippedOp=0,
TimeStampsOfLastShippedOp=Mon Jul 18 09:53:28 CST 2016, Replication Lag=0,
FailedReplicationAttempts=0
SOURCE: PeerID=abc1, SizeOfLogQueue=0, ShippedBatches=1, ShippedOps=1, ShippedBytes=160,
LogReadInBytes=1636, LogEditsRead=5, LogEditsFiltered=3, SizeOfLogToReplicate=0,
TimeForLogToReplicate=0, ShippedHFiles=0, SizeOfHFileRefsQueue=0, AgeOfLastShippedOp=16788,
TimeStampsOfLastShippedOp=Sat Jul 16 13:19:00 CST 2016, Replication Lag=16788,
FailedReplicationAttempts=5
```

Step 8 Obtain **PeerID** corresponding to a record whose **FailedReplicationAttempts** value is greater than 0.

In the preceding step, data on the faulty node 10-10-10-153 fails to be synchronized to a standby cluster whose **PeerID** is **abc1**.

Step 9 Run the **list_peers** command to find the cluster and the HBase instance corresponding to the **PeerID** value.

```
PEER_ID CLUSTER_KEY STATE TABLE_CFS
abc1 10.10.10.110,10.10.10.119,10.10.10.133:2181:/hbase2 ENABLED
abc 10.10.10.110,10.10.10.119,10.10.10.133:2181:/hbase ENABLED
```

In the preceding information, **/hbase2** indicates that data is synchronized to the HBase2 instance of the standby cluster.

Step 10 In the service list of FusionInsight Manager of the standby cluster, check whether the running status of the HBase instance obtained by using **Step 9** is **Normal**.

- If yes, go to **Step 14**.
- If no, go to **Step 11**.

Step 11 In the alarm list, check whether the **ALM-19000 HBase Service Unavailable** alarm is generated.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Follow troubleshooting procedures in **ALM-19000 HBase Service Unavailable** to rectify the fault.

Step 13 Wait for a few minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check network connections between RegionServers on active and standby clusters.

Step 14 Log in to the FusionInsight Manager portal of the active cluster, and click **O&M** > **Alarm** > **Alarms.**

Step 15 In the alarm list, click the alarm to obtain **HostName** from **Location**.

Step 16 Use the IP address obtained in **Step 15** to log in to a faulty RegionServer node as user **omm**.

Step 17 Run the **ping** command to check whether network connections between the faulty RegionServer node and the host where RegionServer of the standby cluster resides are in the normal state.

- If yes, go to **Step 20**.
- If no, go to **Step 18**.

Step 18 Contact the network administrator to restore the network.

Step 19 After the network is running properly, check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 20**.

Collect fault information.

Step 20 On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 21 In the **Service** drop-down list box, select **HBase** in the required cluster.

Step 22 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 23 Contact the O&M engineers and send the collected fault logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.169 ALM-19007 HBase GC Time Exceeds the Threshold

Alarm Description

The system checks the old generation garbage collection (GC) time of the HBase service every 60 seconds. This alarm is generated when the detected old generation GC time exceeds the threshold (exceeds 5 seconds for three consecutive checks by default). To change the threshold, on the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **HBase > GC > GC time for old generation**. This alarm is cleared when the old generation GC time of the HBase service is shorter than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19007	Major	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	RoleName	Specifies the role name for which the alarm is generated.
	HostName	Specifies the object (host ID) for which the alarm is generated.

Impact on the System

If the GC time of the old generation exceeds the threshold, the read and write of HBase data will slow down. In severe cases, the request times out.

Possible Causes

The memory of HBase instances is overused, the heap memory is inappropriately allocated, or a large number of I/O operations exist in HBase. As a result, GCs occur frequently.

Handling Procedure

Check the GC time.

Step 1 On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms** and select the alarm whose **ID** is **19007**. Then check the role name in **Location** and confirm the IP adress of the instance.

- If the role for which the alarm is generated is HMaster, go to **Step 2**.
- If the role for which the alarm is generated is RegionServer, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the HMaster for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **GC** > **Garbage Collection (GC) Time of HMaster** and click **OK** to check whether the value of **GC time for old generation** is greater than the threshold (exceeds 5 seconds for three consecutive checks periods by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the RegionServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **GC** > **Garbage Collection (GC) Time of RegionServer** and click **OK** to check whether the value of **GC time for old generation** is greater than the threshold (exceeds 5 seconds for three consecutive checks periods by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Check the current JVM configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations**, and click **All Configurations**. In Search, enter **GC_OPTS** to check the **GC_OPTS** memory parameter of role HMaster(HBase->HMaster), RegionServer(HBase->RegionServer). Adjust the values of **-Xmx** and **-XX:CMSInitiatingOccupancyFraction** of the GC_OPTS parameter by referring to the Note.

NOTE

1. Suggestions on GC parameter configurations for HMaster
   - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
   - Set **-XX:NewSize** to the value of **-XX:MaxNewSize**, which is one eighth of **-Xmx**.
   - For large-scale HBase clusters with a large number of regions, increase values of **GC_OPTS** parameters for HMaster. Specifically, set **-Xmx** to 4 GB if the number of regions is less than 100,000. If the number of regions is more than 100,000, set -Xmx to be greater than or equal to 6 GB. For each increased 35,000 regions, increase the value of **-Xmx** by 2 GB. The maximum value of **-Xmx** is 32 GB.
2. Suggestions on GC parameter configurations for RegionServer
   - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
   - Set **-XX:NewSize** to one eighth of **-Xmx**.
   - Set the memory for RegionServer to be greater than that for HMaster. If sufficient memory is available, increase the heap memory.
   - Set **-Xmx** based on the machine memory size. Specifically, set **-Xmx** to 32 GB if the machine memory is greater than 200 GB, to 16 GB if the machine memory is greater than 128 GB and less than 200 GB, and to 8 GB if the machine memory is less than 128 GB. When **-Xmx** is set to 32 GB, a RegionServer node supports 2000 regions and 200 hotspot regions.
   - **XX:CMSInitiatingOccupancyFraction** to be less than and equal to **85**, and it is calculated as follows: 100 x (hfile.block.cache.size + hbase.regionserver.global.memstore.size)

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 7 In the **Service** drop-down list box, select **HBase** in the required cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected fault logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.170 ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold

Alarm Description

The system checks the HBase service status every 30 seconds. The alarm is generated when the heap memory usage of an HBase service exceeds the threshold (90% of the maximum memory).

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19008	Major	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	RoleName	Specifies the role name for which the alarm is generated.
	HostName	Specifies the object (host ID) for which the alarm is generated.

Impact on the System

The available HBase memory is insufficient, which may cause node restart. During the node restart, the read/write request delay on the node increases or fails.

Possible Causes

The heap memory of the HBase service is overused or the heap memory is inappropriately allocated.

Handling Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms** and select the alarm whose **ID** is **19008**. Then check the role name in **Location** and confirm the IP adress of the instance.

- If the role for which the alarm is generated is HMaster, go to **Step 2**.
- If the role for which the alarm is generated is RegionServer, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the HMaster for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory** > **HMaster Heap Memory Usage and Direct Memory Usage Statistics** and click **OK**, check whether the used heap memory of the HBase service reaches 90% of the maximum heap memory specified for HBase.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the RegionServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory** > **RegionServer Heap Memory Usage and Direct Memory Usage Statistics** and click **OK**, check whether the used heap memory of the HBase service reaches 90% of the maximum heap memory specified for HBase.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations**, and click **All Configurations**. Choose **HMaster/RegionServer** > **System**. Increase the value of **-Xmx** in **GC_OPTS** by referring to the Note.

NOTE

1. Suggestions on GC parameter configurations for HMaster
   - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
   - Set **-XX:NewSize** to the value of **-XX:MaxNewSize**, which is one eighth of **-Xmx**.
   - For large-scale HBase clusters with a large number of regions, increase values of **GC_OPTS** parameters for HMaster. Specifically, set **-Xmx** to 4 GB if the number of regions is less than 100,000. If the number of regions is more than 100,000, set -Xmx to be greater than or equal to 6 GB. For each increased 35,000 regions, increase the value of **-Xmx** by 2 GB. The maximum value of **-Xmx** is 32 GB.
2. Suggestions on GC parameter configurations for RegionServer
   - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
   - Set **-XX:NewSize** to the value of **-XX:MaxNewSize**, which is one eighth of **-Xmx**.
   - Set the memory for RegionServer to be greater than that for HMaster. If sufficient memory is available, increase the heap memory.
   - Set **-Xmx** based on the machine memory size. Specifically, set **-Xmx** to 32 GB if the machine memory is greater than 200 GB, to 16 GB if the machine memory is greater than 128 GB and less than 200 GB, and to 8 GB if the machine memory is less than 128 GB. When **-Xmx** is set to 32 GB, a RegionServer node supports 2000 regions and 200 hotspot regions.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **HBase** in the required cluster from the **Service** drop-down list.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected fault logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.171 ALM-19009 Direct Memory Usage of the HBase Process Exceeds the Threshold

Alarm Description

The system checks the HBase service status every 30 seconds. The alarm is generated when the direct memory usage of an HBase service exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19009	Major	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	RoleName	Specifies the role name for which the alarm is generated.
	HostName	Specifies the object (host ID) for which the alarm is generated.

Impact on the System

The available HBase direct memory is insufficient, which may cause node restart. During the node restart, the read/write request delay on the node increases or fails.

Possible Causes

The direct memory of the HBase service is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check direct memory usage.

Step 1 On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms** and select the alarm whose **ID** is **19009**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

- If the role for which the alarm is generated is HMaster, go to **Step 2**.
- If the role for which the alarm is generated is RegionServer, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the HMaster for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory** > **HMaster Heap Memory Usage and Direct Memory Usage Statistics** and click **OK** to check whether the used direct memory of the HBase service reaches 90% of the maximum direct memory specified for HBase.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the RegionServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory** > **RegionServer Heap Memory Usage and Direct Memory Usage Statistics** and click **OK** to check

whether the used direct memory of the HBase service reaches 90% of the maximum direct memory specified for HBase.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations**, and click **All Configurations**. Choose **HMaster/RegionServer** > **System** and check whether **XX:MaxDirectMemorySize** exists in **GC_OPTS**.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On the FusionInsight Manager portal, choose **Cluster** > *Nameof the desired cluster* > **Services** > **HBase** > **Configurations**, and click **All Configurations**. Choose **HMaster/RegionServer** > **System** and delete **XX:MaxDirectMemorySize** from **GC_OPTS**.

Step 6 Check whether the **ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold** alarm is generated.

If yes, handle the alarm by referring to **ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold**.

If no, go to **Step 8**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 9 In the **Service** in the required cluster drop-down list box, select **HBase**.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M engineers and send the collected fault logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.172 ALM-19011 RegionServer Region Number Exceeds the Threshold

Alarm Description

The system checks the number of regions on each RegionServer in each HBase service instance every 30 seconds. The region number is displayed on the HBase service monitoring page and RegionServer role monitoring page. This alarm is generated when the number of regions on a RegionServer exceeds the threshold for 20 consecutive times. The threshold can be changed by choosing **O&M** > **Alarms** > **Thresholds** > *Name of the desired cluster* > **HBase**. This alarm is cleared when the number of regions is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19011	Critical (default threshold: 5000) Major (default threshold: 2000)	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the number of RegionServer regions exceeds the threshold, too many Regions increase the load of RegionServer, causing resource bottlenecks such as memory, disk I/O, and CPU. As a result, request response becomes slow or even times out.

Possible Causes

- The RegionServer region distribution is unbalanced.
- The HBase cluster scale is too small.

Handling Procedure

View alarm location information.

Step 1 On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Alarms**, select this alarm, and view the service instance and host name in **Location**.

Step 2 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services**, click the HBase service instance for which the alarm is generated, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, check whether the region distribution on the RegionServer is balanced.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

- If yes, go to **Step 9**.
- If no, go to **Step 3**.

Figure 11-10 WebUI of HBase instance

Enable load balancing.

Step 3 Log in to the node where the HBase client is located as user **root**. Go to the client installation directory, and set environment variables.

cd *client installation directory*

source bigdata_env

If the cluster adopts the security mode, perform security authentication. Specifically, run the **kinit hbase** command and enter the password as prompted (obtain the password from the administrator).

Step 4 Run the following commands to go to the HBase shell command window and check whether the load balancing function is enabled.

hbase shell

balancer_enabled

- If yes, go to **Step 6**.

- If no, go to **Step 5**.

Step 5 On the HBase shell command window, run the following commands to enable the load balancing function and check whether the function is enabled.

balance_switch true

balancer_enabled

Step 6 On the HBase shell command window, run the **balancer** command to manually trigger the load balancing function.

NOTE

You are advised to enable and manually trigger the load balancing function during off-peak hours.

Step 7 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, refresh the page and check whether the region distribution is balanced.

- If yes, go to **Step 8**.
- If no, go to **Step 21**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Delete unwanted HBase tables.

NOTE

Exercise caution when deleting data to ensure data is deleted correctly.

Step 9 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, view tables stored in the HBase service instance and record unwanted tables that can be deleted.

Step 10 On the HBase shell command window, run the **disable** command and **drop** command to delete the table to decrease the number of regions.

disable '*name of the table to be deleted*'

drop '*name of the table to be deleted*'

Step 11 On the HBase shell command window, run the following command to check whether the load balancing function is enabled.

balancer_enabled

- If yes, go to **Step 13**.
- If no, go to **Step 12**.

Step 12 On the HBase shell command window, run the following commands to enable the load balancing function and confirm that the function is enabled.

balance_switch true

balancer_enabled

Step 13 On the HBase shell command window, run the **balancer** command to manually trigger the load balancing function.

Step 14 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, refresh the page and check whether the region distribution is balanced.

- If yes, go to **Step 15**.
- If no, go to **Step 21**.

Step 15 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Adjust the threshold.

Step 16 On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **HBase** > **Regions(RegionServer)**, select the applied rule, and click **Modify** to check whether the threshold is proper.

- If it is excessively small, increase the threshold as required and go to **Step 17**.
- If it is proper, go to **Step 18**.

Step 17 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Perform system capacity expansion.

Step 18 Add nodes to the HBase cluster and add RegionServer instances to the nodes. Then enable and manually trigger the load balancing function.

Step 19 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services**, click the HBase service instance for which the alarm is generated, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, refresh the page and check whether the region distribution is balanced.

- If yes, go to **Step 20**.
- If no, go to **Step 21**.

Step 20 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 21**.

Collect fault information.

Step 21 On the FusionInsight Manager home page of the active and standby clusters, choose **O&M**> **Log** > **Download**.

Step 22 Select **HBase** in the required cluster from the **Service**.

Step 23 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 24 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.173 ALM-19012 HBase System Table Directory or File Lost

Alarm Description

The system checks whether HBase directories and files exist on the HDFS every 120 seconds. This alarm is generated when the system detects that the files or directories do not exist. This alarm is cleared when the files or directories are restored.

The HBase directories and files are as follows:

- Directory of the namespace **hbase** on the HDFS
- **hbase.version** file
- Directory of the table **hbase:meta** on the HDFS, .tableinfo file, and .regioninfo file
- Directory of the table **hbase:namespace** on the HDFS, .tableinfo file, and .regioninfo file
- Directory of the table **hbase:hindex** on the HDFS, .tableinfo file, and .regioninfo file
- Directory of the **hbase:acl** table on the HDFS, .tableinfo, and .regioninfo file (This table does not exist in the common mode cluster by default.)

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19012	Critical	Error handling	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The HBase service fails to be restarted or started. As a result, all HBase service requests fail.

Possible Causes

Files or directories on the HDFS are missing.

Handling Procedure

Locate the alarm cause.

Step 1 On the FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Click this alarm and check whether **Alarm Cause** indicates unknown errors.

- If yes, go to **Step 4**.
- If no, go to **Step 2**

Step 2 On the FusionInsight Manager home page, choose **O&M** > **Backup and Restoration** > **Backup Management**. Check whether there are success records of the backup task named **default** or other HBase metadata backup tasks that have been successfully executed.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Use the latest backup metadata to restore the metadata of the HBase service.

Collect fault information.

Step 4 On the FusionInsight Manager page of the active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 5 In the **Service** area, select faulty HBase services in the required cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.174 ALM-19013 Duration of Regions in transaction State Exceeds the Threshold

Alarm Description

The system checks the number of regions in transaction state on HBase every 300 seconds. This alarm is generated when the system detects that the duration of regions in transaction state exceeds the threshold for two consecutive times. This alarm is cleared when all timeout regions are restored.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19013	Major	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

Some data in the service table gets lost or becomes unavailable.

Possible Causes

- Compaction is permanently blocked.
- The HDFS files are abnormal.

Handling Procedure

Locate the alarm cause.

Step 1 On the FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, select this alarm, and view the **HostName** and **RoleName** in **Location**.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services > HBase**, Click the drop-down menu in the chartarea and choose **Customize > Service** >

Region in transaction count to view **Region in transaction count over threshold**. Check whether the monitoring item detects a value in three consecutive detection periods. (The default threshold is 60 seconds.)

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **HMaster (Active)** > **Tables** to check whether the regions of only one table transaction status time out.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 Run the **hbase hbck** command on the client and check whether the error message "No table descriptor file under hdfs://hacluster/hbase/data/default/table" is displayed.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Log in to the client as user **root**. Run the following command:

cd *client installation directory*

source bigdata_env

If the cluster is in security mode, run the **kinit hbase** command

Log in to the HMaster WebUI, choose **Procedure & Locks** in the navigation tree, and check whether any process ID is in the **Waiting** state in **Procedures**. If yes, run the following command to release the procedure lock:

hbase hbck -j *client installation directory*/**HBase/hbase/tools/hbase-hbck2-*.jar bypass -o** *pid*

Check whether the state is in the **Bypass** state. If the procedure on the UI is always in **RUNNABLE(Bypass)** state, perform an active/standby switchover. Run the **assigns** command to bring the region online again.

hbase hbck -j *client installation directory*/**HBase/hbase/tools/hbase-hbck2-*.jar assigns -o** *regionName*

Step 6 Repeat **Step 4**. Run the **hbase hbck** command on the client and check whether the error message "No table descriptor file under hdfs://hacluster/hbase/data/default/table" is displayed.

- If yes, go to **Step 7**.
- If no, no further action is required.

Collect fault information.

Step 7 On the FusionInsight Manager page of the active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 8 In the **Service** area, select faulty HBase services in the required cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.175 ALM-19014 Capacity Quota Usage on ZooKeeper Exceeds the Threshold Severely

Alarm Description

The system checks the ZNode usage of the HBase service every 120 seconds. This alarm is generated when the ZNode capacity usage of the HBase service exceeds the critical alarm threshold (90% by default).

This alarm is cleared when the ZNode capacity usage is less than the critical alarm threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19014	Critical	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Threshold	Specifies the threshold for generating the alarm.

Impact on the System

This alarm indicates that the capacity usage of the ZNode of HBase has exceeded the threshold severely. As a result, the write request of the HBase service fails.

Possible Causes

- DR is configured for HBase, and data synchronization fails or is slow in DR.
- A large number of WAL files are being split in the HBase cluster.

Handling Procedure

Check the capacity configuration and usage of ZNodes.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, select the alarm whose ID is **19014**, and view the threshold in **Additional Information**.

Step 2 Log in to the HBase client as user **root**. Run the following command to go to the client installation directory:

cd *Client installation directory*

Run the following command to set environment variables:

source bigdata_env

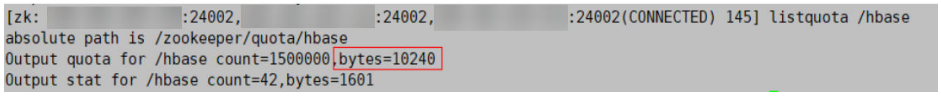
If the cluster uses the security mode, run the following command to perform security authentication:

kinit hbase

Enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 3 Run the **hbase zkcli** command to log in to the ZooKeeper client and run the **listquota /hbase** command to check the ZNode capacity quota of the HBase service. The ZNode root directory in the command is specified by the

zookeeper.znode.parent parameter of the HBase service. The marked area in the following figure shows the capacity configuration of the root ZNode of the HBase service.



Step 4 Run the **getusage /hbase/splitWAL** command to check the capacity usage of the ZNode. Check whether the ratio of **Data size** to the ZNode capacity quota is close to the alarm threshold.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose ID is **12007**, **19000**, or **19013** and the **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 6 Run the **getusage /hbase/replication** command to check the capacity usage of the ZNode. Check whether the ratio of **Data size** to the ZNode capacity quota is close to the alarm threshold.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose ID is **19006** and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether the alarm is cleared five minutes later.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

11.176 ALM-19015 Quantity Quota Usage on ZooKeeper Exceeds the Threshold

Alarm Description

The system checks the ZNode usage of the HBase service every 120 seconds. This alarm is generated when the system detects that the ZNode quantity usage of the HBase service exceeds the alarm threshold (75% by default).

This alarm is cleared when the ZNode quantity usage is less than the alarm threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19015	Major	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Threshold	Specifies the threshold for generating the alarm.

Impact on the System

This alarm indicates that the ZNode quantity usage in the HBase service has exceeded the threshold. If this alarm is not handled in a timely manner, the problem severity may be escalated to **Critical** and data fails to be written.

Possible Causes

- DR is configured for HBase, and data synchronization fails or is slow in DR.
- A large number of WAL files are being split in the HBase cluster.

Handling Procedure

Check the quantity quota and usage of ZNodes.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, select the alarm whose ID is **19015**, and view the threshold in **Additional Information**.

Step 2 Log in to the HBase client as user **root**. Run the following command to go to the client installation directory:

cd *Client installation directory*

Run the following command to set environment variables:

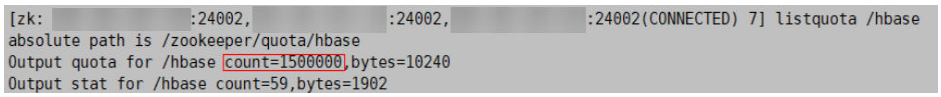
source bigdata_env

If the cluster uses the security mode, run the following command to perform security authentication:

kinit hbase

Enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 3 Run the **hbase zkcli** command to log in to the ZooKeeper client and run the **listquota /hbase** command to check the ZNode quantity quota of the HBase service. The ZNode root directory in the command is specified by the **zookeeper.znode.parent** parameter of the HBase service. The marked area in the following figure shows the quantity quota configuration of the root ZNode of the HBase service.



Step 4 Run the **getusage /hbase/splitWAL** command to check the ZNode quantity usage and check whether the ratio of **Node count** in the command output to the ZNode quantity quota is close to the alarm threshold.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose ID is **12007**, **19000**, or **19013** and the **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.

- If no, go to **Step 9**.

Step 6 Run the **getusage /hbase/replication** command to check the ZNode quantity usage and check whether the ratio of **Node count** in the command output to the ZNode quantity quota is close to the alarm threshold.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose ID is **19006** and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.177 ALM-19016 Quantity Quota Usage on ZooKeeper Exceeds the Threshold Severely

Alarm Description

The system checks the ZNode usage of the HBase service every 120 seconds. This alarm is generated when the ZNode usage of the HBase service exceeds the critical alarm threshold (90% by default).

This alarm is cleared when the quantity usage of the ZNode is less than the critical alarm threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19016	Critical	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Threshold	Specifies the threshold for generating the alarm.

Impact on the System

This alarm indicates that the quantity usage of the ZNode of HBase has exceeded the threshold severely. As a result, the write request of the HBase service fails.

Possible Causes

- DR is configured for HBase, and data synchronization fails or is slow in DR.
- A large number of WAL files are being split in the HBase cluster.

Handling Procedure

Check the quantity quota and usage of ZNodes.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, select the alarm whose ID is **19016**, and view the threshold in **Additional Information**.

Step 2 Log in to the HBase client as user **root**. Run the following command to go to the client installation directory:

cd *Client installation directory*

Run the following command to set environment variables:

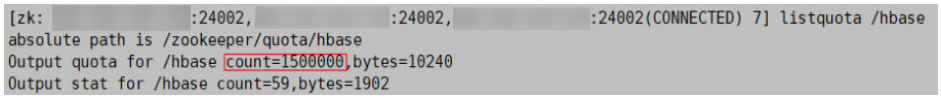
source bigdata_env

If the cluster uses the security mode, run the following command to perform security authentication:

kinit hbase

Enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 3 Run the **hbase zkcli** command to log in to the ZooKeeper client and run the **listquota /hbase** command to check the ZNode quantity quota of the HBase service. The ZNode root directory in the command is specified by the **zookeeper.znode.parent** parameter of the HBase service. The marked area in the following figure shows the quantity configuration of the root ZNode of the HBase service.



Step 4 Run the **getusage /hbase/splitWAL** command to check the ZNode usage and check whether the ratio of **Node count** in the command output to the ZNode quantity quota is close to the alarm threshold.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose ID is **12007**, **19000**, or **19013** and the **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 6 Run the **getusage /hbase/replication** command to check the ZNode usage and check whether the ratio of **Node count** in the command output to the ZNode quantity quota is close to the alarm threshold.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose ID is **19006** and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

11.178 ALM-19017 Capacity Quota Usage on ZooKeeper Exceeds the Threshold

Alarm Description

The system checks the ZNode usage of the HBase service every 120 seconds. This alarm is generated when the system detects that the ZNodes capacity usage of the HBase service exceeds the alarm threshold (75% by default).

This alarm is cleared when the capacity usage of the ZNode capacity is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19017	Major	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.

Type	Parameter	Description
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Threshold	Specifies the threshold for generating the alarm.

Impact on the System

This alarm indicates that the ZNodes capacity usage in the HBase service has exceeded the threshold. If this alarm is not handled in a timely manner, the problem severity may be escalated to **Critical**, affecting data writing.

Possible Causes

- DR is configured for HBase, and data synchronization fails or is slow in DR.
- A large number of WAL files are being split in the HBase cluster.

Handling Procedure

Check the capacity configuration and usage of ZNodes.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, select the alarm whose ID is **19017**, and view the threshold in **Additional Information**.

Step 2 Log in to the HBase client as user **root**. Run the following command to go to the client installation directory:

cd *Client installation directory*

Run the following command to set environment variables:

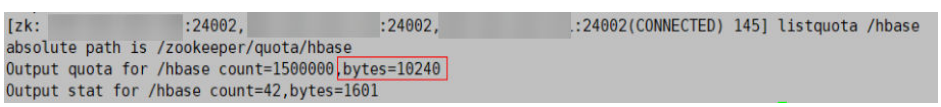
source bigdata_env

If the cluster uses the security mode, run the following command to perform security authentication:

kinit hbase

Enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 3 Run the **hbase zkcli** command to log in to the ZooKeeper client and run the **listquota /hbase** command to check the ZNode quantity quota of the HBase service. The ZNode root directory in the command is specified by the **zookeeper.znode.parent** parameter of the HBase service. The marked area in the following figure shows the quantity configuration of the root ZNode of the HBase service.



Step 4 Run the **getusage /hbase/splitWAL** command to check the capacity usage of the ZNode. Check whether the ratio of **Data size** to the ZNode capacity quota is close to the alarm threshold.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On FusionInsight Manager, check whether the alarm whose ID is **12007**, **19000**, or **19013** and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 7**.

Step 6 Run the **getusage /hbase/replication** command to check the capacity usage of the ZNode. Check whether the ratio of **Data size** to the ZNode capacity quota is close to the alarm threshold.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose ID is **19006** and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

11.179 ALM-19018 HBase Compaction Queue Size Exceeds the Threshold

Alarm Description

The system checks the HBase compaction queue size every 30 seconds. This alarm is generated when the compaction queue size exceeds the alarm threshold (**100** by default) for three consecutive times. This alarm is cleared when the compaction queue size is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19018	Minor	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Write pressure on the HBase node continues going up, and the disk I/O and CPU may be overloaded. Read and write requests are responded slowly or even time out.

Possible Causes

- The number of HBase RegionServers is too small.
- There are excessive regions on a single RegionServer of HBase.

- The HBase RegionServer heap size is small.
- Resources are insufficient.
- Related parameters are not configured properly.

Handling Procedure

Check whether related parameters are properly configured.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, check whether the alarm whose **Alarm ID** is **19008** or **19011** exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services** > **HBase**. On the page that is displayed, click the **Configuration** tab then the **All Configurations** sub-tab, search for **hbase.hstore.compaction.min**, **hbase.hstore.compaction.max**, **hbase.regionserver.thread.compaction.small**, and **hbase.regionserver.thread.compaction.throttle**, and set them to larger values.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.180 ALM-19019 Number of HBase HFiles to Be Synchronized Exceeds the Threshold

Alarm Description

The system checks the number of HFiles to be synchronized by the RegionServer of each HBase service instance every 30 seconds. This indicator can be viewed on the RegionServer role monitoring page. This alarm is generated when the number of HFiles to be synchronized on a RegionServer exceeds the threshold (exceeding 128 for 20 consecutive times by default). To change the threshold, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **HBase** . This alarm is cleared when the number of HFiles to be synchronized is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19019	Major	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

A large number of HFile files are stacked. Data is inconsistent between the active and standby nodes, and the latest data cannot be read from the standby cluster during an active/standby switchover or during HBase dual-read. If the fault persists, the storage space of the active cluster and ZooKeeper nodes will be used up. As a result, the active cluster service will be interrupted.

Possible Causes

- The network is abnormal.
- The RegionServer region distribution is unbalanced.
- The HBase service scale of the standby cluster is too small.

Handling Procedure

View alarm location information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19019**, and view the service instance and host name in **Location**.

Check the network connection between RegionServers on active and standby clusters.

Step 2 Run the **ping** command to check whether the network connection between the faulty RegionServer node and the host where RegionServer of the standby cluster resides is normal.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Contact the network administrator to restore the network.

Step 4 After the network recovers, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the RegionServer region distribution in the active cluster.

Step 5 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance and check whether regions are evenly distributed on the Region Server.

Step 6 Log in to the faulty RegionServer node as user **omm**.

Step 7 Run the following commands to go to the client installation directory and set the environment variable:

cd *Client installation directory*

source bigdata_env

If the cluster uses the security mode, perform security authentication. Run the **kinit hbase** command and enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 8 Run the following commands to check whether the load balancing function is enabled.

hbase shell

balancer_enabled

- If yes, go to **Step 10**.

- If no, go to **Step 9**.

Step 9 Run the following commands in HBase Shell to enable the load balancing function and check whether the function is enabled.

balance_switch true

balancer_enabled

Step 10 Run the **balancer** command to manually trigger the load balancing function.

NOTE

You are advised to enable and manually trigger the load balancing function during off-peak hours.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check the HBase service scale of the standby cluster.

Step 12 Expand the HBase cluster, add a node, and add a RegionServer instance on the node. Then, perform **Step 6** to **Step 10** to enable the load balancing function and manually trigger it.

Step 13 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance, refresh the page, and check whether regions are evenly distributed.

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect fault information.

Step 15 On FusionInsight Manager of the standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 16 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 17 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

11.181 ALM-19020 Number of HBase WAL Files to Be Synchronized Exceeds the Threshold

Alarm Description

The system checks the number of WAL files to be synchronized by the RegionServer of each HBase service instance every 30 seconds. This indicator can be viewed on the RegionServer role monitoring page. This alarm is generated when the number of WAL files to be synchronized on a RegionServer exceeds the threshold (exceeding 128 for 20 consecutive times by default). To change the threshold, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **HBase** . This alarm is cleared when the number of WAL files to be synchronized is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19020	Major	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

A large number of WAL files are stacked. Data is inconsistent between the active and standby nodes, and the latest data cannot be read from the standby cluster during an active/standby switchover or during HBase dual-read. If the fault persists, the storage space of the active cluster and ZooKeeper nodes will be used up. As a result, the active cluster service will be interrupted.

Possible Causes

- The network is abnormal.
- The RegionServer region distribution is unbalanced.
- The HBase service scale of the standby cluster is too small.

Handling Procedure

View alarm location information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19020**, and view the service instance and host name in **Location**.

Check the network connection between RegionServers on active and standby clusters.

Step 2 Run the **ping** command to check whether the network connection between the faulty RegionServer node and the host where RegionServer of the standby cluster resides is normal.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Contact the network administrator to restore the network.

Step 4 After the network recovers, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the RegionServer region distribution in the active cluster.

Step 5 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance and check whether regions are evenly distributed on the Region Server.

Step 6 Log in to the faulty RegionServer node as user **omm**.

Step 7 Run the following commands to go to the client installation directory and set the environment variable:

cd *Client installation directory*

source bigdata_env

If the cluster uses the security mode, perform security authentication. Run the **kinit hbase** command and enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 8 Run the following commands to check whether the load balancing function is enabled.

hbase shell

balancer_enabled

- If yes, go to **Step 10**.

- If no, go to **Step 9**.

Step 9 Run the following commands in HBase Shell to enable the load balancing function and check whether the function is enabled.

balance_switch true

balancer_enabled

Step 10 Run the **balancer** command to manually trigger the load balancing function.

NOTE

You are advised to enable and manually trigger the load balancing function during off-peak hours.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check the HBase service scale of the standby cluster.

Step 12 Expand the HBase cluster, add a node, and add a RegionServer instance on the node. Then, perform **Step 6** to **Step 10** to enable the load balancing function and manually trigger it.

Step 13 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance, refresh the page, and check whether regions are evenly distributed.

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect fault information.

Step 15 On FusionInsight Manager of the standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 16 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 17 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact O&M engineers and provide the collected logs.

11.182 ALM-19022 HBase Hotspot Detection Is Unavailable

Alarm Description

When the MetricController instance is installed for HBase, the alarm module checks the health status of the active HBase MetricController instance every 120 seconds. This alarm is generated when the active HBase MetricController instance does not exist or is unavailable and the hotspot detection function is unavailable.

This alarm is cleared when the active HBase MetricController instance recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19022	Major	Error handling	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The HBase hotspot detection function is unavailable. Services are not affected. However, if request/data skew occurs, the system cannot report alarms and automatically recovers from hotspotting. Service requests may cause node overload, slow response, and request timeout.

Possible Causes

- The ZooKeeper service is abnormal.
- The HBase service is abnormal.
- In the current HBase service, the MetricController instance on the same node as the active HMaster instance is not started.

- The network is abnormal.

Handling Procedure

Check the ZooKeeper service status.

Step 1 In the service list on FusionInsight Manager, check whether **Running Status** of ZooKeeper is **Normal**.

- If yes, go to **Step 5**.
- If no, go to **Step 2**.

Step 2 In the alarm list, check whether **ALM-13000 ZooKeeper Service Unavailable** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by performing the operations provided for **ALM-13000 ZooKeeper Service Unavailable**.

Step 4 Wait for several minutes and check whether the alarm **HBase Hotspot Detection Is Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the HBase service status.

Step 5 In the service list on FusionInsight Manager, check whether **Running Status** of HBase is **Normal**.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

Step 6 In the alarm list, check whether the alarm ALM-19000 HBase Service Unavailable exists.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Rectify the fault by following the steps provided for **ALM-19000 HBase Service Unavailable**.

Step 8 Wait for several minutes and check whether the alarm **HBase Hotspot Detection Is Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check whether the MetricController instance deployed on the same node as the active HMaster instance is started.

Step 9 On FusionInsight Manager, choose **Cluster** > **Service** > **HBase**, and click **Instances** to check whether the **MetricController(Active)** instance exists.

- If yes, go to **Step 12**.
- If no, go to **Step 10**.

Step 10 Select the MetricController instance whose management IP address is the same as that of the active HMaster instance, and click **Start Instance**.

Step 11 After the MetricController instance is restarted, check whether the alarm **HBase Hotspot Detection Is Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check the network connectivity between the started MetricController instances and the active HMaster node.

Step 12 Log in to the node where the active HMaser instance is deployed and run **ping** *IP address of the node where the standby MetricController instance is deployed* to check whether the network connection between the started MetricController instances and the host where the active HMaster instance is deployed is normal.

- If yes, go to **Step 15**.
- If no, go to **Step 13**.

Step 13 Contact the network administrator to restore the network.

Step 14 After the network recovers, check whether the alarm **HBase Hotspot Detection Is Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect fault information.

Step 15 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 16 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 17 In the **Host** area, select the host where the HMaster instance is deployed.

Step 18 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.183 ALM-19023 Region Traffic Restriction for HBase

Alarm Description

When the MetricController instance is installed for the HBase service, self-healing from hotspotting is automatically enabled. The alarm module checks whether there are regions whose request traffic is restricted due to hotspot issues in HBase every 120 seconds. This alarm is generated when the region where hotspot traffic is restricted is detected in HBase.

This alarm is cleared when the region is no longer a hotspot.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19023	Critical	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Hot Regions	Name of the region where the request traffic is restricted due to hotspotting.

Impact on the System

If the traffic of a hotspot region is restricted, the number of handlers for processing the requests in the region is limited. As a result, services requesting the region may slow down or retry upon failure.

Possible Causes

Too many requests are directed to a single region when the HBase service is accessed.

Handling Procedure

Check whether there are too many requests in a single region of HBase.

Step 1 Log in to FusionInsight Manager, and Choose **O&M** > **Alarm** > **Alarms**.

Step 2 In **Additional Information** of **Region Traffic Restriction for HBase**, view the reported table name and region information.

Step 3 On FusionInsight Manager, choose **Cluster** > **Service** > **HBase** and click the hyperlink on the right of HMaster web UI.

Step 4 Click **Table Details** and adjust service configurations in the region where the table in **Step 2** is deployed.

Step 5 Wait a moment and then check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 8 In the **Host** area, select the host where the HMaster instance is deployed.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm will be automatically cleared.

Related Information

None.

11.184 ALM-19024 RPC Requests P99 Latency on RegionServer Exceeds the Threshold

Alarm Description

The system checks P99 latency for RPC requests on each RegionServer instance of the HBase service every 30 seconds. This alarm is generated when P99 latency for RPC requests on a RegionServer exceeds the threshold for 10 consecutive times.

This alarm is cleared when P99 latency for RPC requests on a RegionServer instance is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19024	• **Critical**: The default threshold is 10 seconds. • **Major**: The default threshold is 5 seconds.	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Threshold	Specifies the threshold for generating the alarm.

Impact on the System

If RPC requests P99 latency exceeds the threshold, the RegionServer cannot deliver normal service performance externally. For latency-sensitive services, a large number of service read and write requests may time out.

Possible Causes

- RegionServer GC duration is too long.
- The HDFS RPC response is too slow.
- RegionServer request concurrency is too high.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19024**, and view the service instance and host name in **Location**.

Check the GC duration of RegionServer.

Step 2 In the alarm list on FusionInsight Manager, check whether the "HBase GC Duration Exceeds the Threshold" alarm is generated for the service instance in **Step 1**.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by following the handling procedure of "ALM-19007 HBase GC Duration Exceeds the Threshold".

Step 4 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check HDFS RPC response time.

Step 5 In the alarm list on FusionInsight Manager, check whether alarm "Average NameNode RPC Processing Time Exceeds the Threshold" is generated for the HDFS service on which the HBase service depends.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Rectify the fault by following the handling procedure of "ALM-14021 Average NameNode RPC Processing Time Exceeds the Threshold".

Step 7 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check the number of concurrent processes on a RegionServer.

Step 8 In the alarm list on FusionInsight Manager, check whether the "Handler Usage of RegionServer Exceeds the Threshold" alarm is generated for the service instance in **Step 1**.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Rectify the fault by following the handling procedure of "ALM-19021 Handler Usage of RegionServer Exceeds the Threshold".

Step 10 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.185 ALM-19025 Damaged StoreFile in HBase

Alarm Description

The system checks the **hdfs://hacluster/hbase/autocorrupt** and **hdfs://hacluster/hbase/MasterData/autocorrupt** directories on HDFS of each HBase service every 120 seconds. This alarm is generated when there are files in the directories.

This alarm is cleared when the **hdfs://hacluster/hbase/autocorrupt** and **hdfs://hacluster/hbase/MasterData/autocorrupt** directories do not exist or are empty.

NOTE

hdfs://hacluster indicates the name of the file system used by HBase, and **/hbase** indicates the root directory of HBase in the file system. You can log in to FusionInsight Manager, choose **Cluster** > **Services** > **HBase** and click **Configuration**. Search for **fs.defaultFS** and **hbase.data.rootdir**.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19025	Major	Error handling	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

Data in the file may be lost, and data queried by the service may be inconsistent.

Possible Causes

The StoreFile files are damaged.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19025**, and view the service in **Location**.

Step 2 Log in to the node where the HDFS and HBase clients are installed as the client installation user and run the following commands:

cd *Client installation directory*

source bigdata_env

kinit *Component service user* (If Kerberos authentication is disabled for the cluster (the cluster is in normal mode), skip this step.)

Step 3 Check the damaged StoreFile file.

- Run the following command to check whether the **/hbase/autocorrupt** directory of HDFS is empty. If it is not, go to **Step 4**.

  hdfs dfs -ls -R hdfs://hacluster/hbase/autocorrupt

- Run the following command to check whether the **/hbase/MasterData/autocorrupt** directory of HDFS is empty. If it is not, go to **Step 9**.

  hdfs dfs -ls -R hdfs://hacluster/hbase/MasterData/autocorrupt

Step 4 Run the following command to restore the StoreFile files in the **hdfs://hacluster/hbase/autocorrupt** directory:

hdfs debug recoverLease -path hdfs://hacluster/hbase/autocorrupt/*Name space*/Table/Region/Column family/*StoreFile files*

Step 5 Check whether the damaged StoreFile files are restored. If the following information is displayed, the restoration is successful:

```
recoverLease SUCCEEDED on hdfs://hacluster/hbase/autocorrupt/
default/h1/865665fe32db62dadada68b644359809/cf1/95f210f931ad44c99e4028470be7d292
```

If yes, go to **Step 6**.

If no, go to **Step 9**.

Step 6 Run the following command to move the files back to the **hdfs://hacluster/hbase/data** directory:

hdfs dfs -mv hdfs://hacluster/hbase/autocorrupt/*Name space*/Table/Region/Column family/*StoreFile files***hdfs://hacluster/hbase/data/***Name space*/Table/Region/Column family/*StoreFile files*

Step 7 Run the following command on HBase Shell to bring the region online again:

hbase shell

unassign'*Region*'

assign'*Region*'

Step 8 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.186 ALM-19026 Damaged WAL Files in HBase

Alarm Description

The system checks the **hdfs://hacluster/hbase/corrupt** directory on the HDFS of each HBase service every 120 seconds. This alarm is generated when there are WAL files in the **/hbase/corrupt** directory.

This alarm is cleared when the **/hbase/corrupt** directory does not exist or does not contain WAL files.

NOTE

hdfs://hacluster indicates the name of the file system used by HBase, and **/hbase** indicates the root directory of HBase in the file system. You can log in to FusionInsight Manager, choose **Cluster** > **Services** > **HBase** and click **Configuration**. Search for **fs.defaultFS** and **hbase.data.rootdir**.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19026	Major	Error handling	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the data in the damaged file is not flushed to disks, the data will be lost. As a result, some data queried by the service is inconsistent.

Possible Causes

The WAL files are damaged.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19026**, and view the service in **Location**.

Step 2 Log in to the node where the HDFS clients are installed as the client installation user and run the following commands:

cd *Client installation directory*

source bigdata_env

kinit *Component service user* (If Kerberos authentication is disabled for the cluster (the cluster is in normal mode), skip this step.)

Step 3 Run the following command to check the damaged WAL files and go to **Step 4**:

hdfs dfs -ls hdfs://hacluster/hbase/corrupt/*%2C*

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.187 ALM-19030 P99 Latency of RegionServer RPC Request Exceeds the Threshold

Alarm Description

The system checks the P99 latency for responding to RPC requests on each RegionServer instance of the HBase service every 30 seconds. This alarm is generated when P99 latency on a RegionServer instance exceeds the threshold for 10 consecutive times.

This alarm is cleared when the P99 latency on a RegionServer instance is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19030	• **Critical**: The default threshold is 10 seconds. • **Major**: The default threshold is 5 seconds.	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Threshold	Specifies the threshold for generating the alarm.

Impact on the System

The RegionServer's capability of providing services for external systems is affected. For latency-sensitive services, a large number of service read and write requests may time out.

Possible Causes

- RegionServer GC duration is too long.
- The HDFS RPC response is too slow.
- The client requests are at scale with high concurrency.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19030**, and view the service instance and host name in **Location**.

Check the GC duration of the RegionServer.

Step 2 In the alarm list on FusionInsight Manager, check whether the "HBase GC Duration Exceeds the Threshold" alarm is generated for the service instance in **Step 1**.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by following the handling procedure of "ALM-19007 HBase GC Duration Exceeds the Threshold".

Step 4 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check HDFS RPC response time.

Step 5 In the alarm list on FusionInsight Manager, check whether an alarm is generated for the DataNode instance of the HDFS service on which HBase depends, or whether the alarm "Slow Disk Fault", "Disk Unavailable", or "Average NameNode RPC Processing Time Exceeds the Threshold" is generated on the node where the alarm is generated.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Rectify the fault by following the handling procedure of the DataNode alarms: "ALM-12033 Slow Disk Fault", "ALM-12063 Disk Unavailable", or "ALM-14021 Average NameNode RPC Processing Time Exceeds the Threshold".

Step 7 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 8 Log in to the node for which the alarm is generated, run the **iostat -x 2** command to check the disk I/O. In the command output, check whether the value in the **util** column of each disk is greater than 90%.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Choose **Cluster** > **Services** > **HDFS** > **Instances**, select the DataNode instance of the node for which the alarm is generated, choose **More** > **Stop Instance**, enter the password of the current user, and click **OK** to stop the DataNode instance.

Step 10 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check the number of concurrent processes on a RegionServer.

Step 11 In the alarm list on FusionInsight Manager, check whether the "Handler Usage of RegionServer Exceeds the Threshold" alarm is generated for the service instance in **Step 1**.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Rectify the fault by following the handling procedure of "ALM-19021 Handler Usage of RegionServer Exceeds the Threshold".

Step 13 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Collect fault information.

Step 14 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 15 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 16 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 17 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.188 ALM-19031 Number of RegionServer RPC Connections Exceeds the Threshold

Alarm Description

The system checks the number of RegionServer RPC connections in each HBase service every 30 seconds. This alarm is generated when the number of RPC connections of a RegionServer instance exceeds the threshold for 10 consecutive times.

This alarm is cleared when the number of RPC connections of a RegionServer instance is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19031	• Critical (default threshold: 200) • Major (default threshold: 100)	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Threshold	Specifies the threshold for generating the alarm.

Impact on the System

There are a large amount of concurrent access requests on the RegionServer node, which imposes great pressure and causes slow response. For latency-sensitive services, a large number of service read and write requests may time out.

Possible Causes

Too many concurrent requests are sent from applications to access HBase.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19031**, and view the service instance and host name in **Location**.

Check the number of concurrent requests accessing HBase.

Step 2 Log in to the node where the HBase client is installed and check whether **hbase.client.ipc.pool.size** in the *Client installation directory*/**HBase/hbase/conf/hbase-site.xml** file is set to a large value.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Decrease the value of **hbase.client.ipc.pool.size** and save the change.

Step 4 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Check whether the number of concurrent requests accessing the HBase service is too large.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Decrease the number of concurrent requests based on the site requirements.

Step 7 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.189 ALM-19032 Number of Tasks in the RegionServer RPC Write Queue Exceeds the Threshold

Alarm Description

The system checks the number of tasks waiting in the RPC write queue for the RegionServer instances of the HBase service every 30 seconds. This alarm is

generated when the number of waiting tasks exceeds the threshold for 10 consecutive times.

This alarm is cleared when the number of waiting tasks is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19032	• Critical (default threshold: 2000) • Major (default threshold: 1600)	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Threshold	Specifies the threshold for generating the alarm.

Impact on the System

Request queues are stacked, and the RegionServer memory GC pressure increases. As a result, the response time of write requests increases. For latency-sensitive services, a large number of service write requests may time out.

Possible Causes

- The RegionServer heap memory is not properly configured.
- A slow disk fault occurred.
- The RegionServer configuration is improper.

- Regions of RegionServers are not evenly distributed and hotspotting occurred.
- The latency of WAL Sync operations is high.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19032**, and view the service instance and host name in **Location**.

Check RegionServer heap memory.

Step 2 In the alarm list on FusionInsight Manager, check whether the "Heap Memory Usage of the HBase Process Exceeds the Threshold" alarm is generated for the service instance in **Step 1**.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by following the handling procedure of "ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold".

Step 4 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 On FusionInsight Manager, choose **Cluster** > **Services** > **HBase** > **Chart**, select **GC** from the chart category, and check whether the GC times and GC monitoring period are normal.

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 Click **Configurations**, search for **GC_OPTS**, and increase the value of **Xmx** of the RegionServer within the allowed memory range. Set the value to a number less than or equal to 31 GB. Click **Save**.

Step 7 Click **Dashboard** and click **More** > **Restart Service** to restart the HBase service.

Step 8 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check for slow disk fault.

Step 9 Check whether alarm "Slow Disk Fault" or "Disk Unavailable" are generated on the node.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 Rectify the fault by following the handling procedure of "ALM-12033 Slow Disk Fault" or "ALM-12063 Disk Unavailable".

Step 11 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 12**.

Check the RegionServer configuration.

Step 12 On FusionInsight Manager, choose **Cluster** > **Service** > **HBase**, click **Configurations** > **All Configurations**, and check whether the values of **hbase.wal.hsync** and **hbase.hfile.hsync** are **true**.

- If yes, go to **Step 13**.
- If no, go to **Step 15**.

Step 13 Set both **hbase.wal.hsync** and **hbase.hfile.hsync** to **false** and click **Save**. Click **Dashboard** and click **More** > **Restart Service** to restart the HBase service.

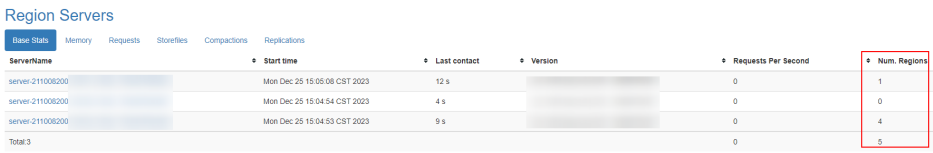
Step 14 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Check whether RegionServer regions are evenly distributed.

Step 15 On FusionInsight Manager, choose **Cluster** > **Services** > **HBase**. Click **HMaster(Active)** on the right of **HMaster Web UI** to go to the web UI of the HBase instance. View the **Base Stats** tab in the **Region Servers** area. Check whether the number of regions in the **Num.Regions** column is even.

- If yes, go to **Step 20**.
- If no, go to **Step 16**.



Step 16 Log in to the node where the HBase client is deployed as the **omm** user.

Step 17 Run the following commands to go to the client installation directory and set the environment variable:

cd *Client installation directory*

source bigdata_env

kinit *the* ***supergroup*** *user group or a user with the Global Admin permission* (If Kerberos authentication is disabled for the cluster, skip this operation.)

Step 18 Run the following commands to enable HBase load balancing and check whether the function is successfully enabled:

hbase shell

balance_switch true

balancer_enabled

If the command output is **true**, load balancing is enabled.

Run the **balancer** command to manually trigger the load balancing function.

NOTE

You are advised to enable and trigger load balancing during off-peak hours.

Step 19 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 20**.

Check the WAL sync latency.

Step 20 On FusionInsight Manager, choose **Cluster** > **Services** > **HBase** > **Chart**. In the **Chart Category** area, select **Operations**. Check whether the value of "**P99.9th Percentile of WAL Sync Operation Delay-All Instances**" exceeds 500 ms.

- If yes, go to **Step 21**.
- If no, go to **Step 22**.

Step 21 Click **Instances**, select the RegionServer instance for which the alarm is generated, and choose **More** > **Restart Instance**. You also need to perform **Step 22** and provide the logs to O&M engineers for fault locating.

Collect fault information.

Step 22 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 23 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 24 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 25 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.190 ALM-19033 Number of Tasks in the RegionServer RPC Read Queue Exceeds the Threshold

Alarm Description

The system checks the number of tasks waiting in the RPC read queue for the RegionServer instances of the HBase service every 30 seconds. This alarm is generated when the number of waiting tasks exceeds the threshold for 10 consecutive times.

This alarm is cleared when the number of waiting tasks is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19031	• Critical (default threshold: 2000) • Major (default threshold: 1600)	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Threshold	Specifies the threshold for generating the alarm.

Impact on the System

Request queues are stacked, and the response time of read requests increases. For latency-sensitive services, a large number of service read requests may time out.

Possible Causes

- The RegionServer heap memory configuration is improper.
- The RegionServer configuration is improper.
- Regions of RegionServers are unevenly distributed, and read hotspotting occurred.
- A slow disk fault occurred.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19033**, and view the service instance and host name in **Location**.

Check the heap memory configuration.

Step 2 In the alarm list on FusionInsight Manager, check whether the "Heap Memory Usage of the HBase Process Exceeds the Threshold" alarm is generated for the service instance in **Step 1**.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by following the handling procedure of "ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold".

Step 4 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 On FusionInsight Manager, choose **Cluster** > **Services** > **HBase** > **Chart**, select **GC** from the chart category, and check whether the GC times and GC monitoring period are normal.

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 Click **Configurations**, search for **GC_OPTS**, and increase the value of **Xmx** of the RegionServer within the allowed memory range. Set the value to a number less than or equal to 31 GB. Click **Save**.

Step 7 Click **Dashboard** and click **More** > **Restart Service** to restart the HBase service.

Step 8 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check the RegionServer configuration.

Step 9 On FusionInsight Manager, choose **Cluster** > **Services** > **HBase**, click **Configurations** > **All Configurations**, and check whether **hbase.bucketcache.size** is properly set. A larger value indicates a larger read cache and higher read performance. Increase the value based on the remaining memory of the node and click **Save**. Click **Dashboard** and click **More** > **Restart Service** to restart the HBase service.

Step 10 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Step 11 On the HBase dashboard, click the hyperlink on the right of **HMaster Web UI**. In the **User Tables** tab in the **Tables** area, click the name of the table hit by a large number of user read requests. In the **Table Schema** area of the **Table** tab, check whether the value of **BLOCKCACHE** is false.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Table Schema

Property \ Column Family Name	cf1	cf2
BLOOMFILTER	ROW	ROW
IN_MEMORY	false	false
VERSIONS	1	1
KEEP_DELETED_CELLS	FALSE	FALSE
DATA_BLOCK_ENCODING	NONE	NONE
COMPRESSION	NONE	NONE
TTL	2147483647	2147483647
MIN_VERSIONS	0	0
BLOCKCACHE	true	true
BLOCKSIZE	65536	65536
REPLICATION_SCOPE	0	0

Step 12 Log in to the node where the HBase client is installed as user **omm**. Run the following commands to change the value of **BLOCKCACHE** of the **Step 11** table column family to **true**:

cd *Client installation directory*

source bigdata_env

kinit *the* ***supergroup*** *user group or a user with the Global Admin permission* (If Kerberos authentication is disabled for the cluster, skip this operation.)

hbase shell

alter'*Table name***', {NAME =>'***Column family name***', BLOCKCACHE => true}**

Run the following command to check whether the value of **BLOCKCACHE** of the column family is changed to **true**:

describe'*Table name***'**

Step 13 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check whether regions of RegionServers are evenly distributed.

Step 14 On FusionInsight Manager, choose **Cluster** > **Services** > **HBase** and click **HMaster(Active)**. On the HBase web UI, check whether regions are evenly distributed in the **Num.Regions** column in the **Base Stats** tab in the **Region Servers** area.

- If yes, go to **Step 20**.
- If no, go to **Step 15**.

Region Servers

Base Stats | Memory | Requests | Storefiles | Compactions | Replications

ServerName	Start time	Last contact	Version	Requests Per Second	Num. Regions
server-211008200	Mon Dec 25 15:05:08 CST 2023	12 s		0	1
server-211008200	Mon Dec 25 15:04:54 CST 2023	4 s		0	0
server-211008200	Mon Dec 25 15:04:53 CST 2023	9 s		0	4
Total:3				0	5

Step 15 Log in to the faulty RegionServer node as user **omm**.

Step 16 Run the following commands to go to the client installation directory and set the environment variable:

cd *Client installation directory*

source bigdata_env

kinit *the* ***supergroup*** *user group or a user with the Global Admin permission* (If Kerberos authentication is disabled for the cluster, skip this operation.)

Step 17 Run the following commands to check whether the load balancing function is enabled:

hbase shell

balancer_enabled

If the command output is **true**, load balancing is enabled.

- If yes, go to **Step 20**.
- If no, go to **Step 18**.

Step 18 Run the following commands to enable load balancing and check whether the function is successfully enabled:

balance_switch true

balancer_enabled

Run the **balancer** command to manually trigger the load balancing function.

NOTE

You are advised to enable and trigger load balancing during off-peak hours.

Step 19 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 20**.

Check for slow disk fault.

Step 20 Check whether alarm "Slow Disk Fault" or "Disk Unavailable" are generated on the node in **Step 1**.

- If yes, go to **Step 21**.
- If no, go to **Step 23**.

Step 21 Rectify the fault by following the handling procedure of "ALM-12033 Slow Disk Fault" or "ALM-12063 Disk Unavailable".

Step 22 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 23**.

Collect fault information.

Step 23 On FusionInsight Manager, choose **Cluster** > **Services** > **HBase** > **Chart**, select **IO** from the **Chart Category** area, and view the values of **Maximum Pread Latency-All Instances** and **Maximum Read Latency-All Instances**. Normal values do not exceed 100 ms.

Step 24 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 25 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 26 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 27 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.191 ALM-19034 Number of RegionServer WAL Write Timesouts Exceeds the Threshold

Alarm Description

The system checks the number of RegionServer WAL write timesouts in each HBase service every 30 seconds. This alarm is generated when the number of WAL write timesouts on a RegionServer instance exceeds the threshold for 10 consecutive times.

This alarm is cleared when the number of WAL write timeouts on a RegionServer instance is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19031	• Critical (default threshold: 500) • Major (default threshold: 300)	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Threshold	Specifies the threshold for generating the alarm.

Impact on the System

The write operation latency increases. Too many WAL write timeouts may severely deteriorate the data write performance.

Possible Causes

- A slow disk fault occurred.
- RegionServer GC is abnormal.
- HBase is overloaded.
- The WAL configuration is improper.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19034**, and view the service instance and host name in **Location**.

Check whether a slow disk fault occurred.

Step 2 In the alarm list on FusionInsight Manager, check whether the "Slow Disk Fault" or "Disk Unavailable" is displayed.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by following the handling procedure of "ALM-12033 Slow Disk Fault" or "ALM-12063 Disk Unavailable".

Step 4 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether RegionServer GC is abnormal.

Step 5 In the alarm list on FusionInsight Manager, check whether "ALM-19007 HBase GC Duration Exceeds the Threshold" is displayed.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Rectify the fault by following the handling procedure of "ALM-19007 HBase GC Duration Exceeds the Threshold".

Step 7 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check the HBase load.

Step 8 In the alarm list on FusionInsight Manager, check whether "ALM-19018 HBase Compaction Queue Size Exceeds the Threshold" is displayed.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Rectify the fault by following the handling procedure of "ALM-19018 HBase Compaction Queue Size Exceeds the Threshold".

Step 10 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check the WAL configuration.

Step 11 On FusionInsight Manager, choose **Cluster** > **Service** > **HBase**, click **Configurations** > **All Configurations**, and check whether the values of **hbase.wal.hsync** and **hbase.hfile.hsync** are **true**.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Set both **hbase.wal.hsync** and **hbase.hfile.hsync** to **false** and click **Save**. Click **Dashboard** and click **More** > **Restart Service** to restart the HBase service.

Step 13 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Collect fault information.

Step 14 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 15 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 16 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 17 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.192 ALM-19035 Size of the RegionServer Call Queue Exceeds the Threshold

Alarm Description

The system checks the size of the RegionServer call queue for each HBase service every 30 seconds. This alarm is generated when the call queue of a RegionServer instance is bigger than the threshold for 10 consecutive times.

This alarm is cleared when the call queue of a RegionServer instance is no bigger than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
19035	• Critical (default threshold: 800 MB) • Major (default threshold: 600 MB)	Quality of service	HBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Type	Parameter	Description
Additional Information	Threshold	Specifies the threshold for generating the alarm.

Impact on the System

Request queues are stacked, and the RegionServer memory GC pressure increases. As a result, the response time of read requests increases. For latency-sensitive services, a large number of service read requests may time out.

Possible Causes

- The RegionServer heap memory configuration is improper.
- A slow disk fault occurred.
- The RegionServer configuration is improper.
- Regions of RegionServers are not evenly distributed and hotspotting occurred.
- The latency of WAL Sync operations is high.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19035**, and view the service instance and host name in **Location**.

Check the heap memory configuration.

Step 2 In the alarm list on FusionInsight Manager, check whether the "Heap Memory Usage of the HBase Process Exceeds the Threshold" alarm is generated for the service instance in **Step 1**.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by following the handling procedure of "ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold".

Step 4 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 On FusionInsight Manager, choose **Cluster** > **Services** > **HBase** > **Chart**, select **GC** from the chart category, and check whether the GC times and GC monitoring period are normal.

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 Click **Configurations**, search for **GC_OPTS**, and increase the value of **Xmx** of the RegionServer within the allowed memory range. Set the value to a number less than or equal to 31 GB. Click **Save**.

Step 7 Click **Dashboard** and click **More** > **Restart Service** to restart the HBase service.

Step 8 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check for slow disk fault.

Step 9 Check whether alarm "Slow Disk Fault" or "Disk Unavailable" are generated for the same node in **Step 1**.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 Rectify the fault by following the handling procedure of "ALM-12033 Slow Disk Fault" or "ALM-12063 Disk Unavailable".

Step 11 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check the RegionServer configuration.

Step 12 On FusionInsight Manager, choose **Cluster** > **Service** > **HBase**, click **Configurations** > **All Configurations**, and check whether the values of **hbase.wal.hsync** and **hbase.hfile.hsync** are **true**.

- If yes, go to **Step 13**.
- If no, go to **Step 15**.

Step 13 Set both **hbase.wal.hsync** and **hbase.hfile.hsync** to **false** and click **Save**. Click **Dashboard** and click **More** > **Restart Service** to restart the HBase service.

Step 14 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Check whether RegionServer regions are evenly distributed.

Step 15 On FusionInsight Manager, choose **Cluster** > **Services** > **HBase**. Click **HMaster(Active)** on the right of **HMaster Web UI** to go to the web UI of the HBase instance. View the **Base Stats** tab in the **Region Servers** area. Check whether the number of regions in the **Num.Regions** column is even.

- If yes, go to **Step 20**.
- If no, go to **Step 16**.

Step 16 Log in to the faulty RegionServer node as user **omm**.

Step 17 Run the following commands to go to the client installation directory and set the environment variable:

cd *Client installation directory*

source bigdata_env

kinit *the* ***supergroup*** *user group or a user with the Global Admin permission* (If Kerberos authentication is disabled for the cluster, skip this operation.)

Step 18 Run the following commands to enable load balancing and check whether the function is successfully enabled:

hbase shell

balance_switch true

balancer_enabled

If the command output is **true**, load balancing is enabled.

Run the **balancer** command to manually trigger the load balancing function.

NOTE

You are advised to enable and manually trigger the load balancing function during off-peak hours.

Step 19 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 20**.

Check the WAL sync latency.

Step 20 On FusionInsight Manager, choose **Cluster** > **Services** > **HBase** > **Chart**. In the **Chart Category** area, select **Operations**. Check whether the value of "**P99.9th Percentile of WAL Sync Operation Delay-All Instances**" exceeds 500 ms.

- If yes, go to **Step 21**.
- If no, go to **Step 22**.

Step 21 Click **Instances**, select the RegionServer instance for which the alarm is generated, and choose **More** > **Restart Instance**. You also need to perform **Step 22** and provide the logs to O&M engineers for fault locating.

Collect fault information.

Step 22 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 23 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 24 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 25 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.193 ALM-20002 Hue Service Unavailable

Alarm Description

The system checks the Hue service status every 60 seconds. This alarm is generated if the Hue service is unavailable.

This alarm is cleared when the Hue service is normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
20002	Critical	Error handling	Hue	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

Users cannot perform interactive analysis and data processing with MRS on the Hue UI.

Possible Causes

- The KrbServer service on which Hue depends is abnormal.
- The DBService service on which Hue depends is abnormal.
- The network connection to DBService is abnormal.

Handling Procedure

Check whether the KrbServer service is normal.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**. In the service list, check whether the status of KrbServer is **Normal**.

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Manually restart the KrbServer service.

Step 3 Wait for several minutes. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether DBService is normal.

Step 4 Log in to FusionInsight Manager, click **Cluster**, click the name of the desired cluster, and click **Services**.

Step 5 In the service list, check whether **Health Status** of **DBService** is **Good**.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Restart the DBService service.

NOTE

To restart the service, you need to enter the password of the FusionInsight Manager administrator.

Step 7 Wait for several minutes. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the network connection to the DBService is normal.

Step 8 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**, click **Hue**, and click the **Instances** tab. Record the IP address of the active Hue node.

Step 9 Log in to the IP address of the active Hue node.

Step 10 Run the **ping** command to check whether the network connection between the host where the active Hue is deployed and the host where DBService is deployed is normal. (The method of obtaining the DBService service IP address is the same as that of obtaining the active Hue IP address.)

- If yes, go to **Step 13**.
- If no, go to **Step 11**.

Step 11 Contact the network administrator to restore the network.

Step 12 Wait for several minutes. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 14 Select the following components for **Service**.

- Hue
- Controller

Step 15 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services** > **Hue**.

Step 17 Choose **More** > **Restart Service** and click **OK**.

Step 18 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 19**.

Step 19 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.194 ALM-23001 Loader Service Unavailable

Alarm Description

The system checks the Loader service availability every 60 seconds. This alarm is generated if the Loader service is unavailable and is cleared after the Loader service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
23001	Critical	Error handling	Loader	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

Data loading, import, and conversion are unavailable.

Possible Causes

- The services that Loader depends on are abnormal.
  - The ZooKeeper service is abnormal.
  - The HDFS service is abnormal.
  - The DBService service is abnormal.
  - The Yarn service is abnormal.
  - MapReduce is abnormal.
- The network is faulty. Loader cannot communicate with its dependent services.
- Loader is running improperly.

Handling Procedure

Check the ZooKeeper service status.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** to check whether ZooKeeper is running properly.

- If yes, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 Choose **More** > **Restart Service** to restart ZooKeeper. After ZooKeeper starts, check whether the "Loader Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 In the alarm list on the FusionInsight Manager, check whether the alarm "Process Fault" is generated.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 In **Location** of **ALM-12007 Process Fault**, check whether the service name is **ZooKeeper**.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Rectify the fault by following steps provided in **ALM-12007 Process Fault**.

Step 6 In the alarm list, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check the HDFS service status.

Step 7 In the alarm list on FusionInsight Manager, check whether an alarm is generated indicating that the HDFS service is unavailable.

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

Step 8 Rectify the fault by performing the operations provided for **ALM-14000 HDFS Service Unavailable**.

Step 9 In the alarm list, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check the DBService status.

Step 10 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService** to check whether DBService is running properly.

- If yes, go to **Step 12**.
- If no, go to **Step 11**.

Step 11 Choose **More** > **Restart Service** to restart DBService. After DBService starts, check whether the "Loader Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check the MapReduce status.

Step 12 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Mapreduce** to check whether MapReduce is running properly.

- If yes, go to **Step 16**.
- If no, go to **Step 13**.

Step 13 Choose **More** > **Restart Service** to restart MapReduce. After MapReduce starts, check whether the "Loader Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Check the Yarn service status.

Step 14 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** to check whether Yarn is running properly.

- If yes, go to **Step 16**.
- If no, go to **Step 15**.

Step 15 Choose **More** > **Restart Service** to restart Yarn. After Yarn starts, check whether the "Loader Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Step 16 In the alarm list on FusionInsight Manager, check whether an alarm is generated indicating that the Yarn service is unavailable.

- If yes, go to **Step 17**.
- If no, go to **Step 19**.

Step 17 Rectify the fault by performing the operations provided for **ALM-18000 Yarn Service Unavailable**.

Step 18 In the alarm list, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 19**.

Check the network connections between Loader and its dependent components.

Step 19 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services** > **Loader**.

Step 20 Click **Instance**. The LoaderServer instance list is displayed.

Step 21 Record the management IP address in the **LoaderServer(Active)** row.

Step 22 Log in to the host where LoaderServer resides as user **omm** using the IP address obtained in **Step 21**.

Step 23 Run the **ping** command to check whether the network connection between the hosts where the LoaderServer instances reside and the dependent components is normal. (The dependent components include ZooKeeper, DBService, HDFS, MapReduce, and Yarn. The method to obtain the IP addresses of the dependent components is the same as that used to obtain the IP addresses of the active LoaderServer instances.)

- If yes, go to **Step 26**.
- If no, go to **Step 24**.

Step 24 Contact the network administrator to restore the network.

Step 25 In the alarm list, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 26**.

Collect fault information.

Step 26 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 27 Expand the **Service** drop-down list, and select the following services for the target cluster:

- Zookeeper
- HDFS
- DBService

- Yarn
- MapReduce
- Loader

Step 28 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 29 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services** > **Loader**.

Step 30 Choose **More** > **Restart Service** and click **OK**.

Step 31 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 32**.

Step 32 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.195 ALM-23003 Loader Task Execution Failed

Alarm Description

This alarm is generated when the system detects that the Loader job fails. This alarm is cleared when the failed job is handled by a user. This alarm must be manually cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
23003	Minor	Quality of service	Loader	No

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Task ID	Identifies the failed Loader job.
	JobName	Specifies the name of the task that fails to be backed up.
	User Identification	Specifies the name of the user who submits the Loader job.
	Details	Specifies additional alarm information.

Impact on the System

This is a job-level alarm for Loader. The job execution fails, and you need to view specific logs to locate the failure cause. No execution result is returned. After the fault is rectified, you need to execute the task again. No impact on the Loader service.

Possible Causes

- Task parameters are incorrectly configured.
- Exceptions occur when Yarn is executing a task.

Handling Procedure

Check whether task parameters are incorrectly configured.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the alarm list, open the drop-down list and view the alarm cause.

Step 2 If the alarm cause is **Failed to submit the task**, view the error details in **Additional Information** and view the execution records of the task on the Loader page.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 3 Submit the task again.

Step 4 Check whether the task executed successfully.

- If yes, go to **Step 9**.
- If no, go to **Step 5**.

Check whether exceptions occur when Yarn is executing a task.

Step 5 Log in to FusionInsight Manager. In the alarm list, open the drop-down list to view the alarm cause.

Step 6 Check Yarn activities. If the alarm cause is "Yarn execution failed", the Yarn activity is abnormal.

- If yes, go to **Step 7**.
- If no, go to **Step 10**.

Step 7 Submit the task again.

Step 8 Check whether the task is executed successfully.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 In the alarm list, click **Clear** in the **Operation** column of the alarm to manually clear the alarm. No further action is required.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, and select the following services for the target cluster:

- DBService
- HDFS
- Loader
- MapReduce
- Yarn
- ZooKeeper

Step 12 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system does not automatically clear this alarm and you need to manually clear the alarm.

Related Information

None.

11.196 ALM-23004 Loader Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the Loader service every 60 seconds. This alarm is generated when the heap memory usage of the Loader instance exceeds the threshold for 10 consecutive times. The alarm is cleared when the heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
23004	Critical (default threshold: 95% of the maximum memory.) Major (default threshold: 90% of the maximum memory)	Environment	Loader	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Full GC occurs frequently in Loader. The performance deteriorates and page responses are slow. If the memory overflows, Loader may fail to provide services for external systems. The Loader page cannot be accessed, interfaces cannot be called, and active/standby switchover is frequently performed due to exceptions.

Possible Causes

The heap memory usage of the Loader instance is too high or the heap memory is inappropriately allocated.

Handling Procedure

Check heap memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **Loader Heap Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the instance host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Loader** and click the **Instance** tab. On the displayed page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Memory** and select **Loader Heap Memory Resource Percentage**. Click **OK**.

Step 3 Check whether the heap memory used by Loader reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Loader** > **Configuration**, click **All Configurations**. Search for the **GC_OPTS** parameter, increase the value of **-Xmx** as you need, click **Save**, and click **OK**.

NOTE

- If this alarm is generated, the heap memory configured for the current Loader instance is not enough for data transmission. You are advised to open the instance monitoring page, display the Loader heap memory resource status monitoring chart, and observe the change trend of the heap memory used by Loader in the monitoring chart. Then change the value of **-Xmx** to twice the current heap memory usage or to another value to meet site requirements.
- When setting the heap memory, you can set **-Xms** and **-Xmx** to approximately the same value to prevent performance deterioration caused by heap size adjustment after each GC.
- The sum of **-Xmx** and **XX:MaxPermSize** cannot be greater than the actual physical memory of the node server.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Loader** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.197 ALM-23005 Loader Non-Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the non-heap memory usage of the Loader service every 30 seconds. This alarm is generated when the non-heap memory usage of the Loader instance exceeds the threshold for 5 consecutive times. This alarm is cleared if the non-heap memory usage is lower than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
23005	Critical (default threshold: 95% of the maximum memory.) Major (default threshold: 80% of the maximum memory)	Environment	Loader	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

The Loader page may fail to be accessed and cannot provide services for external systems.

Possible Causes

The non-heap memory of the Loader instance is overused or the non-heap memory is inappropriately allocated.

Handling Procedure

Check non-heap memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **Loader Non-Heap Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the instance host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Loader** and click the **Instance** tab. On the displayed page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Memory** and select **Loader Non-Heap Memory Resource Percentage**. Click **OK**.

Step 3 Check whether the non-heap memory used by Loader reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > Name of the desired cluster > **Services** > **Loader**. Click **Configurations** and then the **All Configurations** tab. On the displayed page, search for **LOADER_GC_OPTS**. If the **-XX: MaxPermSize** parameter is not specified, you can set the initial value with **-XX: MaxPermSize=256M**. If the alarm persists, change the value again by referring to the note. Click **Save**, and then click **OK**

NOTE

Observe the change trend of the non-heap memory used by Loader in the "Loader non-heap memory resource status" monitoring chart. Then change the value of **-XX:MaxPermSize** to twice the current non-heap memory usage or to another value to meet site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Loader** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.198 ALM-23006 Loader Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the Loader service every 30 seconds. This alarm is generated when the direct memory usage of the Loader instance exceeds the threshold for five consecutive times. This alarm is cleared when the Loader direct memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
23006	Critical (default threshold: 95% of the maximum memory.) Major (default threshold: 80% of the maximum memory)	Environment	Loader	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Loader may fail to provide services for external systems. I/O or socket exceptions occur, and active/standby switchovers occur frequently.

Possible Causes

The direct memory of Loader instances is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **Loader Direct Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the instance host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Loader** and click the **Instance** tab. On the displayed page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Memory** and select **Loader Direct Memory Resource Usage Statistics**. Click **OK**.

Step 3 Check whether the direct memory used by Loader reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > Name of the desired cluster > **Services** > **Loader**. Click **Configurations** and then the **All Configurations** tab. On the displayed page, search for **LOADER_GC_OPTS**. Increase the value of **-XX:MaxDirectMemorySize** as required, click **Save**, and click **OK**.

NOTE

Observe the change trend of the direct memory used by Loader in the "Loader direct memory resource status" monitoring chart. Then change the value of **-XX:MaxDirectMemorySize** to twice the current direct memory usage or to another value to meet site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Loader** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.199 ALM-23007 GC Duration of the Loader Process Exceeds the Threshold

Alarm Description

The system checks the GC duration of the Loader process every 60 seconds. This alarm is generated when the GC duration of the Loader process exceeds the threshold for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
23007	Critical (default threshold: 20000 ms) Major (default threshold: 12000 ms)	Environment	Loader	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Full GC occurs frequently, and the Loader service responds slowly. The Loader service may even break down and cannot provide services properly.

Possible Causes

The heap memory of the Loader process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC duration.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **GC Duration of Loader Exceeds the Threshold**, and view the **Location** information. Check the name of the instance host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Loader** and click the **Instance** tab. On the displayed page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **GC** and select **GC Duration of Loader**. Click **OK**.

Step 3 Check whether the GC duration of the Loader process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > Name of the desired cluster > **Services** > **Loader**. Click **Configurations** and then the **All Configurations** tab. On the displayed page, search for **LOADER_GC_OPTS**. Increase the value of **-Xmx** as required, click **Save**, and click **OK**.

NOTE

If this alarm is generated, the heap memory configured for the current Loader instance cannot meet the heap memory requirements for data transmission. You are advised to handle this alarm by referring to **Step 4** (in **ALM-23004 Loader Heap Memory Usage Exceeds the Threshold**).

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Loader** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.200 ALM-24000 Flume Service Unavailable

Alarm Description

The alarm module checks the Flume service status every 180 seconds. This alarm is generated if the Flume service is abnormal.

This alarm is automatically cleared after the Flume service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
24000	Critical	Error handling	Flume	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

Flume cannot work and data transmission is interrupted.

Possible Causes

All Flume instances are faulty.

Handling Procedure

Step 1 Log in to a Flume node as user **omm** and run the **ps -ef|grep "flume.role=server"** command to check whether the Flume process exists on the node.

- If yes, go to **Step 3**.
- If no, restart the faulty Flume node or Flume service and go to **Step 2**.

Step 2 In the alarm list, check whether alarm "Flume Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Collect the fault information.

Step 3 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 4 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 5 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 6 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.201 ALM-24001 Flume Agent Exception

Alarm Description

The Flume agent instance for which the alarm is generated cannot be started. This alarm is generated when the Flume agent process is faulty (The system checks in every 5 seconds.) or Flume agent fails to start (The system reporting alarms immediately).

This alarm is cleared when the Flume agent process recovers, Flume agent starts successfully and the alarm handling is completed.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
24001	Major	Error handling	Flume	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	AgentId	Specifies the ID of the agent for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Flume agent instance for which the alarm is generated cannot provide services properly, and the data transmission tasks of the instance are temporarily interrupted. Real-time data is lost during real-time data transmission.

Possible Causes

- The JAVA_HOME directory does not exist or the Java permission is incorrect.
- The Flume agent directory permission is incorrect.
- Flume agent fails to start.

Handling Procedure

Check whether the JAVA_HOME directory exists or whether the JAVA permission is correct.

Step 1 Log in to the host for which the alarm is generated as user **root**.

Step 2 Run the following command to obtain the installation directory of the Flume client for which the alarm is generated: (The value of **AgentId** can be obtained from **Location** of the alarm.)

ps -ef|grep *AgentId* **| grep -v grep | awk -F 'conf-file ' '{print $2}' | awk -F 'fusioninsight' '{print $1}'**

Step 3 Run the **su -** *Flume installation user* command to switch to the Flume installation user and run the **cd** *Flume client installation directory*/**fusioninsight-flume-1.11.0/conf/** command to go to the Flume configuration directory.

Step 4 Run the **cat ENV_VARS | grep JAVA_HOME** command.

Step 5 Check whether the **JAVA_HOME** directory exists. If the command output in **Step 4** is not empty and **ll $JAVA_HOME/** is not empty, the **JAVA_HOME** directory exists.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

Step 6 Specify a correct **JAVA_HOME** directory.

Step 7 Run the **$JAVA_HOME/bin/java -version** command to check whether the Flume agent running user has the Java execution permission. If the Java version is displayed in the command output, the Java permission meets the requirement. Otherwise, the Java permission does not meet the requirement.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

NOTE

JAVA_HOME is the environment variable exported during Flume client installation. You can also go to *Flume client installation directory*/**fusioninsight-flume-1.11.0/conf** and run the **cat ENV_VARS | grep JAVA_HOME** command to view the variable value.

Step 8 Run the **chmod 750 $JAVA_HOME/bin/java** command to grant the Java execution permission to the Flume agent running user.

Check the directory permission of the Flume agent.

Step 9 Log in to the host for which the alarm is generated as user **root**.

Step 10 Run the following command to switch to the Flume agent installation directory:

cd *Flume client installation directory*/**fusioninsight-flume-1.11.0/conf/**

Step 11 Run the **ls -al * -R** command to check whether any file owner is the user who running the Flume agent.

- If yes, go to **Step 12**.
- If no, run the **chown** command to change the file owner to the user who runs the Flume agent.

Check the Flume agent configuration.

Step 12 Run the **cat properties.properties | grep spooldir** and **cat properties.properties | grep TAILDIR** commands to check whether the Flume source type is spoolDir or tailDir. If any command output is displayed, the Flume source type is spoolDir or tailDir.

- If yes, go to **Step 13**.
- If no, go to **Step 17**.

Step 13 Check whether the data monitoring directory exists.

- If yes, go to **Step 15**.
- If no, go to **Step 14**.

  NOTE

  - Run the **cat properties.properties | grep spoolDir** command to view the spoolDir monitoring directory.
  - Run the **cat properties.properties | grep parentDir** command to view the tailDir monitoring directory.

Step 14 Specify a correct data monitoring directory.

Step 15 Check whether the Flume agent user has the read, write, and execute permissions on the monitoring directory specified in **Step 13**.

- If yes, go to **Step 17**.
- If no, go to **Step 16**.

  NOTE

  Go to the monitoring directory as the Flume running user. If files can be created, the Flume running user has the read, write, and execute permissions on the monitoring directory.

Step 16 Run the **chmod 777** *Flume monitoring directory* command to grant the Flume agent running user the read, write, and execute permissions on the monitoring directory specified in **Step 13**.

Step 17 Check whether the components connected to the Flume sink are in safe mode.

- If yes, go to **Step 18**.
- If no, go to **Step 23**.

  NOTE

  If the sinks in the **properties.properties** configuration file are the HDFS sink and HBase sink, and the configuration file contains a keytab file, the components connected to the Flume sink are in safe mode.

  If the sink in the **properties.properties** configuration file is the kafka sink and ***.security.protocol** is set to **SASL_PLAINTEXT** or **SASL_SSL**, Kafka connected to the Flume sink is in safe mode.

Step 18 Run the **ll** *ketab path* command to check whether the keytab authentication path specified by the ***.kerberosKeytab** parameter in the configuration file exists.

- If yes, go to **Step 20**.
- If no, go to **Step 19**.

NOTE

To view the ketab path, run the **cat properties.properties | grep keytab** command.

Step 19 Change the value of **kerberosKeytab** in **Step 18** to the custom keytab path and go to **Step 21**.

Step 20 Perform **Step 18** to check whether the Flume agent running user has the permission to access the keytab authentication file. If the keytab path is returned, the user has the permission. Otherwise, the user does not have the permission.

- If yes, go to **Step 22**.
- If no, go to **Step 21**.

Step 21 Run the **chmod 755** *ketab file* command to grant the read permission on the keytab file specified in **Step 19**, and restart the Flume process.

Step 22 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 23**.

Collect fault information.

Step 23 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 24 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 25 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 26 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.202 ALM-24003 Flume Client Connection Interrupted

Alarm Description

The alarm module monitors the port connection status on the Flume server. This alarm is generated if the Flume server fails to receive a connection message from the Flume client in three consecutive minutes.

This alarm is cleared after the Flume server receives a connection message from the Flume client.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
24003	Major	Communications	Flume	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	Client IP Address	Specifies the IP address of the Flume client.
	Client Name	Specifies the agent name of the Flume client.
	Sink Name	Specifies the sink name of Flume Agent.

Impact on the System

The communication between the Flume client and the server fails. The Flume client cannot send data to the Flume server.

Possible Causes

- The network connection between the Flume client and the server is faulty.
- The Flume client's process is abnormal.
- The Flume client is incorrectly configured.

Handling Procedure

Check the network connection between the Flume client and the server.

Step 1 Log in to the host whose IP address is specified by **Flume ClientIP** in the alarm information as user **root**.

Step 2 Run the **ping** *Flume server IP address* command to check whether the network connection between the Flume client and the server is normal.

- If yes, go to **Step 3**.
- If no, go to **Step 11**.

Check whether the Flume client's process is normal.

Step 3 Log in to the host whose IP address is specified by **Flume ClientIP** in the alarm information as user **root**.

Step 4 Run the **ps -ef|grep flume |grep client** command to check whether the Flume client process exists.

- If yes, go to **Step 5**.
- If no, go to **Step 11**.

Check the Flume client configuration.

Step 5 Log in to the host whose IP address is specified by **Flume ClientIP** in the alarm information as user **root**.

Step 6 Run the **cd** *Flume client installation directory*/**fusioninsight-flume-1.11.0/conf/** command to go to Flume's configuration directory.

Step 7 Run the **cat properties.properties** command to query the current configuration file of the Flume client.

Step 8 Check whether the **properties.properties** file is correctly configured according to the configuration description of the Flume agent.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Modify the **properties.properties** configuration file.

Check whether the alarm is cleared.

Step 10 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect the fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Collect logs in the **/var/log/Bigdata/flume-client** directory on the Flume client using a transmission tool.

Step 15 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.203 ALM-24004 Exception Occurs When Flume Reads Data

Alarm Description

The alarm module monitors the status of Flume Source. This alarm is generated immediately when the duration in which Source fails to read the data exceeds the threshold.

The default threshold is **0**, indicating that the threshold is disabled. You can change the threshold by modifying the **properties.properties** file in the **conf** directory. Specifically, modify the **NoDatatime** parameter of required the source.

The alarm is cleared when Source reads the data and the alarm handling is complete.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
24004	Major	Error handling	Flume	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	AgentId	Specifies the ID of the agent for which the alarm is generated.

Type	Parameter	Description
	ComponentType	Specifies the component type for which the alarm is generated.
	ComponentName	Specifies the component name for which the alarm is generated.

Impact on the System

If data is found in the data source and Flume Source continuously fails to read data, the data collection is stopped.

Possible Causes

- Flume Source is faulty, so data cannot be sent.
- The network is faulty, so the data cannot be sent.

Handling Procedure

Check whether Flume Source is faulty.

Step 1 Open the **properties.properties** configuration file on the local PC, search for **keyword type = spooldir** in the file, and check whether the Flume source type is spoolDir.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 View the spoolDir directory to check whether all files are already transferred.

- If yes, no further action is required.
- If no, go to **Step 5**.

  NOTE

  The monitoring directory of spoolDir is specified by the **.spoolDir** parameter in the **properties.properties** configuration file. If all files in the monitoring directory have been transferred, the file name extension of all files in the monitoring directory is **.COMPLETED**.

Step 3 Open the **properties.properties** configuration file on the local PC, search for **org.apache.flume.source.kafka.KafkaSource** in the file, and check whether the Flume source type is Kafka.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 Check whether the topic data configured by Kafka Source has been used up.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Instance**.

Step 6 Go to the Flume instance page of the faulty node to check whether the indicator **Source Speed Metrics** in the alarm is 0.

- If yes, go to **Step 11**.
- If no, go to **Step 7**.

Check the network connection between the faulty node and the node that corresponds to the Flume Source IP address.

Step 7 Open the **properties.properties** configuration file on the local PC, search for **type = avro** in the file, and check whether the Flume source type is Avro.

- If yes, go to **Step 8**.
- If no, go to **Step 11**.

Step 8 Log in to the faulty node as user **root**, and run the **ping** *IP address of the Flume source* command to check whether the peer host can be pinged successfully.

- If yes, go to **Step 11**.
- If no, go to **Step 9**.

Step 9 Contact the network administrator to restore the network.

Step 10 In the alarm list, check whether the alarm is cleared after a period.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.204 ALM-24005 Exception Occurs When Flume Transmits Data

Alarm Description

The alarm module monitors the capacity status of Flume Channel. The alarm is generated immediately when the duration that Channel is fully occupied exceeds

the threshold or the number of times that Source fails to send data to Channel exceeds the threshold.

You can change the threshold by modifying the **properties.properties** file in the **conf** directory. Specifically, modify the **channelfullcount** parameter of required the channel.

The alarm is cleared when the space of Flume Channel is released and the alarm handling is complete.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
24005	Critical (default threshold: 10) Major (default threshold: 8)	Error handling	Flume	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	AgentId	Specifies the ID of the agent for which the alarm is generated.
	ComponentType	Specifies the type of the component for which the alarm is generated.
	ComponentName	Specifies the component for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the disk usage of Flume Channel increases continuously, the time required for importing data to a specified destination prolongs. When the disk usage of Flume Channel reaches 100%, the Flume agent process pauses.

Possible Causes

- Flume Sink is faulty, so the data cannot be sent.
- The network is faulty, so the data cannot be sent.

Handling Procedure

Check whether Flume Sink is faulty.

Step 1 Open the **properties.properties** configuration file on the local PC, search for **type = hdfs** in the file, and check whether the Flume sink type is HDFS.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 On FusionInsight Manager, check whether **HDFS Service Unavailable** alarm is generated in the alarm list and whether the HDFS service is stopped in the service list.

- If the alarm is reported, clear it according to the handling suggestions of ALM-14000 HDFS Service Unavailable; if the HDFS service is stopped, start it. Then, go to **Step 7**.
- If no, go to **Step 7**.

Step 3 Open the **properties.properties** configuration file on the local PC, search for **type = hbase** in the file, and check whether the Flume sink type is HBase.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 On FusionInsight Manager, check whether **HBase Service Unavailable** alarm is generated in the alarm list and whether the HBase service is stopped in the service list.

- If the alarm is reported, clear it according to the handling suggestions of ALM-19000 HBase Service Unavailable; if the HBase service is stopped, start it. Then, go to **Step 7**.
- If no, go to **Step 7**.

Step 5 Open the **properties.properties** configuration file on the local PC, search for **org.apache.flume.sink.kafka.KafkaSink** in the file, and check whether the Flume sink type is Kafka.

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 On FusionInsight Manager, check whether **Kafka Service Unavailable** alarm is generated in the alarm list and whether the Kafka service is stopped in the service list.

- If the alarm is reported, clear it according to the handling suggestions of ALM-38000 Kafka Service Unavailable; if the Kafka service is stopped, start it. Then, go to **Step 7**.
- If no, go to **Step 7**.

Step 7 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Instance**.

Step 8 Go to the Flume instance page of the faulty node to check whether the indicator **Sink Speed Metrics** is 0.

- If yes, go to **Step 13**.
- If no, go to **Step 9**.

Check the network connection between the faulty node and the node that corresponds to the Flume Sink IP address.

Step 9 Open the **properties.properties** configuration file on the local PC, search for **type = avro** in the file, and check whether the Flume sink type is Avro.

- If yes, go to **Step 10**.
- If no, go to **Step 13**.

Step 10 Log in to the faulty node as user **root**, and run the **ping** *IP address of the Flume sink* command to check whether the peer host can be pinged successfully.

- If yes, go to **Step 13**.
- If no, go to **Step 11**.

Step 11 Contact the network administrator to restore the network.

Step 12 In the alarm list, check whether the alarm is cleared after a period.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect the fault information.

Step 13 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 14 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 15 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.205 ALM-24006 Heap Memory Usage of Flume Server Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the Flume service every 60 seconds. This alarm is generated when the heap memory usage of the Flume instance

exceeds the threshold for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
24006	Critical (default threshold: 95%) Major (default threshold: 90%)	Quality of service	Flume	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the heap memory overflows, the service may break down and the Flume instance may be unavailable.

Possible Causes

The heap memory of the Flume instance is overused or the heap memory is inappropriately allocated.

Handling Procedure

Check the heap memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **Flume Heap Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Flume Heap Memory Resource Percentage**. Then, click **OK**.

Step 3 Check whether the heap memory used by Flume reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-Xmx** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for Flume is insufficient for data transmission. You are advised to change the heap memory to: Channel capacity x Maximum size of a single data record x Number of channels. Note that the value of **xmx** cannot exceed the remaining memory of the node.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.206 ALM-24007 Flume Server Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the Flume service every 60 seconds. This alarm is generated when the direct memory usage of the Flume instance exceeds the threshold for five consecutive times. This alarm is cleared when the Flume direct memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
24007	Critical (default threshold: 90%) Major (default threshold: 80%)	Quality of service	Flume	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the direct memory overflows, the service may break down and the Flume instance may be unavailable.

Possible Causes

The direct memory of the Flume process is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **Flume Direct Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Flume Direct Memory Resource Percentage**. Then, click **OK**.

Step 3 Check whether the direct memory used by Flume reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory size configured for Flume instance cannot meet service requirements. You are advised to change the value of **-XX:MaxDirectMemorySize** to twice the current direct memory size or change the value based on site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.207 ALM-24008 Flume Server Non Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the non-heap memory usage of the Flume service every 60 seconds. This alarm is generated when the non-heap memory usage of the Flume instance exceeds the threshold for 5 consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
24008	Critical (default threshold: 90%) Major (default threshold: 80%)	Quality of service	Flume	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the non-heap memory overflows, the service may break down and the Flume instance may be unavailable.

Possible Causes

The non-heap memory of the Flume instance is overused or the non-heap memory is inappropriately allocated.

Handling Procedure

Check non-heap memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **Flume Non-Heap Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Flume Non-Heap Memory Resource Percentage**. Then, click **OK**.

Step 3 Check whether the non-heap memory used by Flume reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for Flume instance cannot meet service requirements. You are advised to change the value of **-XX:MaxPermSize** to twice the current non-heap memory size or change the value based on site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.208 ALM-24009 Flume Server Garbage Collection (GC) Duration Exceeds the Threshold

Alarm Description

The system checks the GC duration of the Flume process every 60 seconds. This alarm is generated when the GC duration of the Flume process exceeds the threshold for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
24009	Critical (default threshold: 12 seconds) Major (default threshold: 10 seconds)	Quality of service	Flume	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Flume data transmission efficiency decreases.

Possible Causes

The heap memory of the Flume process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC duration.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **Flume Server GC Duration Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Garbage Collection (GC) Duration of Flume**. Then, click **OK**.

Step 3 Check whether the GC duration of the Flume process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-Xmx** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for the Flume instance is insufficient for data transmission. You are advised to change the heap memory to: Channel capacity x Maximum size of a single data record x Number of channels. Note that the value of **xmx** cannot exceed the remaining memory of the node.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.209 ALM-24010 Flume Certificate File Is Invalid or Damaged

Alarm Description

Flume checks whether the Flume certificate file is valid (whether the certificate exists and whether the certificate format is correct) every hour. This alarm is generated when the certificate file is invalid or damaged. This alarm is automatically cleared when the certificate file becomes valid again.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
24010	Major	Error handling	Flume	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Flume client cannot access the Flume server.

Possible Causes

The Flume certificate file is invalid or damaged.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **ALM-24010 Flume Certificate File Is Invalid or Damaged**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to go to the Flume service certificate directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf

Step 4 Run the **ls -l** command to check whether the **flume_sChat.crt** file exists.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Run the **openssl x509 -in flume_sChat.crt -text -noout** command to check whether certificate details are displayed properly.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

Step 6 Run the following command to go to the Flume script directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin

Step 7 Run the following command to generate a new certificate file. Then check whether the alarm is automatically cleared one hour later.

sh geneJKS.sh -f *Custom certificate password of the Flume role on the server* **-g** *Custom certificate password of the Flume role on the client*

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

NOTE

The custom certificate passwords must meet the following complexity requirements:

- Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
- Contain 8 to 64 characters.
- Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

Step 8 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 9**.
- If no, no further action is required.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.210 ALM-24011 Flume Certificate File Is About to Expire

Alarm Description

Flume checks whether the Flume certificate file is about to expire every hour. This alarm is generated when the remaining validity period is at most 30 days. This alarm is automatically cleared when the remaining validity period is greater than 30 days.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
24011	Major	Error handling	Flume	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

Currently, there is no impact on the system.

Possible Causes

The Flume certificate file is about to expire.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **ALM-24011 Flume Certificate Is About to Expire**, and view the

Location information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to go to the Flume service certificate directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf

Step 4 Run the following command to check the effective time and expiration time of the Flume user certificate:

openssl x509 -noout -text -in flume_sChat.crt

Step 5 Perform **Step 6** to **Step 7** during off-peak hours to update the certificate file as needed.

Step 6 Run the following command to go to the Flume script directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin

Step 7 Run the following command to generate a new certificate file. Then check whether the alarm is automatically cleared one hour later.

sh geneJKS.sh -f *Custom certificate password of the Flume role on the server* **-g** *Custom certificate password of the Flume role on the client*

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

NOTE

The custom certificate passwords must meet the following complexity requirements:

- Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
- Contain 8 to 64 characters.
- Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

Step 8 Log in to the Flume node for which the alarm is generated as user **omm** and repeat **Step 6** to **Step 7**. Then, check whether the alarm is automatically cleared one hour later.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 10**.
- If no, no further action is required.

Collect the fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 12 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.211 ALM-24012 Flume Certificate File Has Expired

Alarm Description

Flume checks whether its certificate file in the system has expired every hour. This alarm is generated when the server certificate has expired. This alarm is automatically cleared when the certificate file becomes valid again.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
24012	Major	Error handling	Flume	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Flume client cannot access the Flume server.

Possible Causes

The Flume certificate file has expired.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **ALM-24012 Flume Certificate Has Expired**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to go to the Flume service certificate directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf

Step 4 Run the following command to check the effective time and expiration time of the HA user certificate to determine whether the certificate file is still in the validity period:

openssl x509 -noout -text -in flume_sChat.crt

- If yes, go to **Step 9**.
- If no, go to **Step 5**.

Step 5 Run the following command to go to the Flume script directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin

Step 6 Run the following command to generate a new certificate file. Then check whether the alarm is automatically cleared one hour later.

sh geneJKS.sh -f *Custom certificate password of the Flume role on the server* **-g** *Custom certificate password of the Flume role on the client*

- If yes, go to **Step 8**.
- If no, go to **Step 7**.

  NOTE

  The custom certificate passwords must meet the following complexity requirements:
  - Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
  - Contain 8 to 64 characters.
  - Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

Step 7 Log in to the Flume node for which the alarm is generated as user **omm** and repeat **Step 5** to **Step 6**. Then, check whether the alarm is automatically cleared one hour later.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 9**.
- If no, no further action is required.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.212 ALM-24013 Flume MonitorServer Certificate File Is Invalid or Damaged

Alarm Description

MonitorServer checks whether its certificate file is valid (whether the certificate exists and whether the certificate format is correct) every hour. This alarm is generated when the certificate file is invalid or damaged. This alarm is automatically cleared when the certificate file becomes valid again.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
24013	Major	Error handling	MonitorServer	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Flume client cannot access the Flume server.

Possible Causes

The MonitorServer certificate file is invalid or damaged.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **ALM-24013 MonitorServer Certificate File Is Invalid or Damaged**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to go to the MonitorServer certificate file directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf

Step 4 Run the **ls -l** command to check whether the **ms_sChat.crt** file exists:

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Run the **openssl x509 -in ms_sChat.crt -text -noout** command to check whether certificate details are displayed.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

Step 6 Run the following command to go to the Flume script directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin

Step 7 Run the following command to generate a new certificate file. Then check whether the alarm is automatically cleared one hour later.

sh geneJKS.sh -m *Custom password of the MonitorServer certificate on the server* **-n** *Custom password of the MonitorServer certificate on the client*

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

  NOTE

  The custom certificate passwords must meet the following complexity requirements:
  - Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
  - Contain 8 to 64 characters.
  - Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

Step 8 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 9**.
- If no, no further action is required.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Select **MonitorServer** in the required cluster for **Service**.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.213 ALM-24014 Flume MonitorServer Certificate Is About to Expire

Alarm Description

MonitorServer checks whether its certificate file is about to expire every hour. This alarm is generated when the remaining validity period is at most 30 days. This alarm is automatically cleared when the remaining validity period is greater than 30 days.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
24014	Major	Error handling	MonitorServer	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

Currently, there is no impact on the system.

Possible Causes

The MonitorServer certificate file is about to expire.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **ALM-24014 MonitorServer Certificate Is About to Expire**, and view

the **Location** information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to go to the MonitorServer certificate file directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf

Step 4 Run the following command to check the effective time and expiration time of the MonitorServer user certificate:

openssl x509 -noout -text -in ms_sChat.crt

Step 5 Perform **Step 6** to **Step 7** during off-peak hours to update the certificate file as needed.

Step 6 Run the following command to go to the Flume script directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin

Step 7 Run the following command to generate a new certificate file. Then check whether the alarm is automatically cleared one hour later.

sh geneJKS.sh -m *Custom password of the MonitorServer certificate on the server* **-n** *Custom password of the MonitorServer certificate on the client*

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

  NOTE

  The custom certificate passwords must meet the following complexity requirements:
  - Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
  - Contain 8 to 64 characters.
  - Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

Step 8 Log in to the Flume node for which the alarm is generated as user **omm** and repeat **Step 6** to **Step 7**. Then, check whether the alarm is automatically cleared one hour later.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 10**.
- If no, no further action is required.

Collect the fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Select **MonitorServer** in the required cluster for **Service**.

Step 12 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.214 ALM-24015 Flume MonitorServer Certificate File Has Expired

Alarm Description

MonitorServer checks whether its certificate file in the system has expired every hour. This alarm is generated when the server certificate has expired. This alarm is automatically cleared when the server certificate file becomes valid again.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
24015	Major	Error handling	MonitorServer	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Flume client cannot access the Flume server.

Possible Causes

The MonitorServer certificate file has expired.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **ALM-24015 MonitorServer Certificate Has Expired**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to go to the MonitorServer certificate file directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf

Step 4 Run the following command to check the effective time and expiration time of the user certificate to determine whether the certificate file is still in the validity period:

openssl x509 -noout -text -in ms_sChat.crt

- If yes, go to **Step 9**.
- If no, go to **Step 5**.

Step 5 Run the following command to go to the Flume script directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin

Step 6 Run the following command to generate a new certificate file. Then, check whether the alarm is automatically cleared one hour later.

sh geneJKS.sh -m *Custom password of the MonitorServer certificate on the server* **-n** *Custom password of the MonitorServer certificate on the client*

- If yes, go to **Step 8**.
- If no, go to **Step 7**.

NOTE

The custom certificate passwords must meet the following complexity requirements:

- Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
- Contain 8 to 64 characters.
- Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

Step 7 Log in to the Flume node for which the alarm is generated as user **omm** and repeat **Step 5** to **Step 6**. Then, check whether the alarm is automatically cleared one hour later.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 9**.
- If no, no further action is required.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Select **MonitorServer** in the required cluster for **Service**.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.215 ALM-25000 LdapServer Service Unavailable

Alarm Description

The system checks the LdapServer service status every 30 seconds. This alarm is generated when the system detects that both the active and standby LdapServer services are abnormal.

This alarm is cleared when the system detects that one or two LdapServer services are normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
25000	Critical	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The running status of the component that depends on the LdapServer becomes faulty. As a result, Kerberos authentication fails in the cluster or OS user cache synchronization is abnormal, and component services are abnormal.

Possible Causes

- The node where the LdapServer service locates is faulty.
- The LdapServer process is abnormal.

Handling Procedure

Check whether the nodes where the two SlapdServer instances of the LdapServer service are located are faulty.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **LdapServer** > **Instance** to go to the LdapServer instance page to obtain the host name of the node where the two SlapdServer instances locates.

Step 2 Choose **O&M** > **Alarm** > **Alarms**. On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **NodeAgent Process Is Abnormal** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Check whether the host name in the alarm is consistent with the **Step 1** host name.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Handle the alarm according to "ALM-12006 NodeAgent Process Is Abnormal".

Step 5 Check whether **LdapServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the LdapServer process is normal.

Step 6 Choose **O&M > Alarm > Alarms**. On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **Process Fault** exists.

- If yes, go to **Step 7**.
- If no, go to **Step 10**.

Step 7 Check whether the service and host name in the alarm are consistent with the LdapServer service and host name.

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

Step 8 Handle the alarm according to "ALM-12007 Process Fault".

Step 9 Check whether **LdapServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 11 Select **LdapServer** in the required cluster from the **Service**.

Step 12 Click the edit button in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.216 ALM-25004 Abnormal LdapServer Data Synchronization

Alarm Description

The system checks the LdapServer data every 30 seconds. This alarm is generated when the data on the active and standby LdapServers of Manager is inconsistent for 12 consecutive times. This alarm is cleared when the data on the active and standby LdapServers is consistent.

The system checks the LdapServer data every 30 seconds. This alarm is generated when the LdapServer data in the cluster is inconsistent with that on Manager for 12 consecutive times. This alarm is cleared when the data is consistent.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
25004	Critical	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the details for which the alarm is generated.

Impact on the System

LdapServer data inconsistency occurs because the LdapServer data in Manager is damaged or the LdapServer data in the cluster is damaged. The LdapServer process with damaged data cannot provide services externally, and the authentication functions of Manager and the cluster are affected.

Possible Causes

- The network of the node where the LdapServer process locates is faulty.
- The LdapServer process is abnormal.
- The OS restart damages data on LdapServer.

Handling Procedure

Check whether the network where the LdapServer nodes reside is faulty.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. Record the IP address of HostName in the alarm locating information as IP1 (if multiple alarms exist, record the IP addresses as IP1, IP2, and IP3 respectively).

Step 2 Contact O&M engineers and log in to the nodes corresponding to IP 1. Run the ping command to check whether the IP address of the management plane of the active OMS node can be pinged.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Contact the network administrator to recover the network and check whether **Abnormal LdapServer Data Synchronization** is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the LdapServer processes are normal.

Step 4 On the **Alarm** page of FusionInsight Manager, check whether the **OLdap Resource Abnormal** exists.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Clear the alarm by following the steps provided in "ALM-12004 OLdap Resource Abnormal".

Step 6 Check whether **Abnormal LdapServer Data Synchronization** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 7**.

Step 7 On the **Alarm** page of FusionInsight Manager, check whether **Process Faul**t is generated for the LdapServer service.

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

Step 8 Handle the alarm according to "ALM-12007 Process Fault".

Step 9 Check whether **Abnormal LdapServer Data Synchronization** is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the LdapServer processes are normal.

Step 10 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Record the IP address of HostName in the alarm locating information as "IP1" (if multiple alarms exist, record the IP addresses as "IP1", "IP2", and "IP3" respectively). Choose **Cluster** > *Name of the desired cluster* > **Services** > **LdapServer** > **Configurations**. Record the port number of LdapServer as "PORT". (If the IP address in the alarm locating information is the IP address of the standby management node, choose **System** > **OMS** > **oldap** > **Modify Configuration** and record the listening port number of LdapServer.)

Step 11 Log in to the nodes corresponding to IP1 as user **omm**.

Step 12 Run the following command to check whether errors are displayed in the queried information.

ldapsearch -H ldaps://*IP1*:*PORT* **-LLL -x -D cn=root,dc=hadoop,dc=com -W -b ou=Peoples,dc=hadoop,dc=com**

After running the command, enter the **LDAP** administrator password. Contact the system administrator to obtain the password.

- If yes, go to **Step 13**.
- If no, go to **Step 15**.

Step 13 Recover the LdapServer and OMS nodes using data backed up before the alarm is generated.

NOTE

Use the OMS data and LdapServer data backed up at the same point in time to recover the data. Otherwise, the service and operation may fail. To recover data when services run properly, you are advised to manually back up the latest management data and then recover the data. Otherwise, Manager data produced between the backup point in time and the recovery point in time will be lost.

Step 14 Check whether alarm **Abnormal LdapServer Data Synchronization** is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect fault information.

Step 15 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 16 Select **LdapServer** in the required cluster and **OmsLdapServer** from the **Service**.

Step 17 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.217 ALM-25005 nscd Service Exception

Alarm Description

The system checks the status of the nscd service every 60 seconds. This alarm is generated when the nscd process fails to be queried for four consecutive times (three minutes) or users in LdapServer cannot be obtained.

This alarm is cleared when the process is restored and users in LdapServer can be obtained.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
25005	Major	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	HostName	Host for which the alarm is generated.
Additional Information	Details	Specifies alarm details.

Impact on the System

The alarmed node may not be able to synchronize data from LdapServer. The **id** command may fail to obtain the LDAP data, affecting upper-layer services.

Possible Causes

- The nscd service is not started.
- The network is faulty, and cannot access the LDAP server.
- NameService is abnormal.

- Users cannot be queried because the OS executes commands too slowly.

Handling Procedure

Check whether the nscd service is started.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. Record the IP address of **HostName** in **Location** of the alarm as **IP1** (if multiple alarms exist, record the IP addresses as **IP1**, **IP2**, and **IP3** respectively).

Step 2 Contact the O&M engineers to access the node using IP1 as user **root**. Run the **ps -ef | grep nscd** command on the node and check whether the **/usr/sbin/nscd** process is started.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Run the **service nscd restart** command as user **root** to restart the nscd service. Then run the **ps -ef | grep nscd** command to check whether the nscd service is started.

- If yes, go to **Step 4**.
- If no, go to **Step 15**.

Step 4 Wait for 5 minutes and run the ps -ef | grep nscd command again as user root. Check whether the service exists.

- If yes, go to **Step 11**.
- If no, go to **Step 15**.

Check whether the network is faulty, and whether the LDAP server can be accessed.

Step 5 Log in to the alarmed node as user **root** and run the **ping** command to check whether the network connectivity between this node and the LdapServer node. is normal.

- If yes, go to **Step 6**.
- If no, contact network administrators to troubleshoot the fault.

Check whether the NameService is normal.

Step 6 Log in to the alarmed node as user **root**. Run the **cat /etc/nsswitch.conf** command to check whether the **passwd**, **group**, **services**, **netgroup**, and **aliases** of NameService are correctly configured.

The correct parameter configurations are as follows:

passwd: **compat ldap**; **group**: **compat ldap**; **services**: **files ldap**; **netgroup**: **files ldap**; **aliases**: **files ldap**

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Log in to the alarmed node as user **root**. Run the **cat /etc/nscd.conf** command to check whether the **enable-cache passwd**, **positive-time-to-live passwd**, **enable-cache group**, and **positive-time-to-live group** in the configuration file are correctly configured.

The correct parameter configurations are as follows:

enable-cache passwd: **yes**; **positive-time-to-live passwd**: **600**; **enable-cache group**: **yes**; **positive-time-to-live group**: **3600**

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

Step 8 Run the **/usr/sbin/nscd -i group** and **/usr/sbin/nscd -i passwd** commands as user **root**. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If yes, go to **Step 11**.
- If no, go to **Step 15**.

Step 9 Run the **vi /etc/nsswitch.conf** command as user **root**. Correct the configurations in **Step 6** and save the file. Run the **service nscd restart** command to restart the nscd service. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If yes, go to **Step 11**.
- If no, go to **Step 15**.

Step 10 Run the **vi /etc/nscd.conf** command as user **root**. Correct the configurations in **Step 7** and save the file. Run the **service nscd restart** command to restart the nscd service. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If yes, go to **Step 11**.
- If no, go to **Step 15**.

Step 11 Log in to the FusionInsight Manager portal. Wait for 5 minutes and check whether the **nscd Service Exception** alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check whether frame freezing occurs when running a command in the operating system.

Step 12 Log in to the faulty node as user **root**, run the **id admin** command, and check whether the command execution takes a long time. If the command execution takes more than 3 seconds, the command execution is deemed to be slow.

- If yes, go to **Step 13**.
- If no, go to **Step 15**.

Step 13 Run the **cat /var/log/messages** command to check whether the nscd frequently restarts or the error information "Can't contact LDAP server" exists.

nscd exception example:

```
Feb 11 11:44:42 10-120-205-33 nscd: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780: Can't contact LDAP server
Feb 11 11:44:43 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780: Can't contact LDAP server
Feb 11 11:44:44 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.92:21780: Can't contact LDAP server
```

- If yes, go to **Step 14**.

- If no, go to **Step 15**.

Step 14 Run the **vi$BIGDATA_HOME/tmp/random_ldap_ip_order** command to modify the number at the end. If the original number is an odd number, change it to an even number. If the number is an even number, change it to an odd number.

Run the **vi /etc/ldap.conf** command to enter the editing mode, press **Insert** to start editing, and then change the first two IP addresses of the URI configuration item.

After the modification is complete, press **Esc** to exit the editing mode and enter **:wq!** to save the settings and exit.

Run the **service nscd restart** command to restart the nscd service. Wait 5 minutes and run the **id admin** command again. Check whether the command execution is slow.

- If yes, go to **Step 15**.
- If no, log in to other faulty nodes and repeat **Step 12** to **Step 14** to check whether the first LdapServer node in the URI before modifying **/etc/ldap.conf** is faulty. For example, check whether the service IP address is unreachable, the network delay is too long, or other abnormal software is deployed.

Collect the fault information.

Step 15 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 16 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **LdapClient** for the target cluster.

Step 17 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.218 ALM-25006 Sssd Service Exception

Alarm Description

The system checks the status of the sssd service every 60 seconds. This alarm is generated when the sssd process fails to be queried for four consecutive times (three minutes) or users in LdapServer cannot be obtained.

This alarm is cleared when the process is restored and users in LdapServer can be obtained.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
25006	Major	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	HostName	Specifies the object (host ID) for which the alarm is generated.
Additional Information	Detail	Specifies the details for which the alarm is generated.

Impact on the System

The alarmed node may not be able to synchronize data from LdapServer. The id command may fail to obtain the LDAP data, affecting upper-layer services.

Possible Causes

- The sssd service is not started or is incorrectly started.
- The network is faulty and cannot access the LDAP server.
- NameService is abnormal.
- Users cannot be queried because the OS executes commands too slowly.

Handling Procedure

Check whether the sssd service is correctly started.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. Find the IP address of **HostName** in **Location** of the alarm and record it as IP1 (if multiple alarms exist, record the IP addresses as IP1, IP2, and IP3 respectively).

Step 2 Contact the O&M engineers to access the node using IP1 as user root. Run the **ps -ef | grep sssd** command and check whether the **/usr/sbin/sssd** process is started.

- If the process is started, go to **Step 3**.
- If the process is not started, go to **Step 4**.

Step 3 Check whether the sssd process queried in **Step 2** has three subprocesses.

- If yes, go to **Step 5**.
- If no, go to **Step 4**.

Step 4 Run the **service sssd restart** command as user **roo**t to restart the sssd service. Then run the **ps -ef | grep sssd** command to check whether the sssd process is normal.

In the normal state, the **/usr/sbin/sssd** process has three subprocesses: **/usr/libexec/sssd/sssd_be**, **/usr/libexec/sssd/sssd_nss**, and **/usr/libexec/sssd/sssd_pam**.

- If it exists, go to **Step 9**.
- If it does not exist, go to **Step 13**.

Check whether the LDAP server can be accessed.

Step 5 Log in to the alarmed node as user **root**. Run the **ping** command to check the network connectivity between this node and the LdapServer node.

- If the network is normal, go to **Step 6**.
- If the network is faulty, contact network administrators to troubleshoot the fault.

Check whether NameService is normal.

Step 6 Log in to the alarmed node as user **root**. Run the **cat /etc/nsswitch.conf** command and check the **passwd** and **group** configurations of NameService.

The correct parameter configurations are as follows: **passwd: compat ldap** and **group: compat ldap**.

- If the configurations are correct, go to **Step 7**.
- If the configurations are incorrect, go to **Step 8**.

Step 7 Run the **/usr/sbin/sss_cache -G** and **/usr/sbin/sss_cache -U** commands as user **root**. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If results are queried, go to **Step 9**.
- If no result is queried, go to **Step 13**.

Step 8 Run the **vi /etc/nsswitch.conf** command as user **root**. Correct the configurations in **Step 6** and save the file. Run the **service sssd restart** command to restart the sssd service. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If results are queried, go to **Step 9**.
- If no result is queried, go to **Step 13**.

Step 9 Log in to the FusionInsight Manager portal. Wait for 5 minutes and check whether the **sssd Service Exception** alarm is cleared.

- If the alarm is cleared, no further action is required.

- If the alarm persists, go to **Step 10**.

Check whether frame freezing occurs when running a command in the operating system.

Step 10 Log in to the faulty node as user **root**, run the **id admin** command, and check whether the command execution takes a long time. If the command execution takes more than 3 seconds, the command execution is deemed to be slow.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 Run the **cat /var/log/messages** command to check whether the sssd frequently restarts or the error information **Can't contact LDAP server** exists.

sssd restart example:

```
Feb  7 11:38:16 10-132-190-105 sssd[pam]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd[be[default]]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd: Starting up
Feb  7 11:38:16 10-132-190-105 sssd[be[default]]: Starting up
Feb  7 11:38:16 10-132-190-105 sssd[nss]: Starting up
Feb  7 11:38:16 10-132-190-105 sssd[pam]: Starting up
```

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Run the **vi $BIGDATA_HOME/tmp/random_ldap_ip_order** command to modify the number at the end. If the original number is an odd number, change it to an even number. If the number is an even number, change it to an odd number.

Run the **vi /etc/sssd/sssd.conf** command to reverse the first two IP addresses of the **ldap_uri** configuration item, save the settings, and exit.

Run the **ps -ef | grep sssd** command to query the ID of the sssd process, kill it, and run the **/usr/sbin/sssd -D -f** command to restart the sssd service. Wait 5 minutes and run the **id admin** command again.

Check whether the command execution is slow.

- If yes, go to **Step 13**.
- If no, log in to other faulty nodes and run **Step 10** to **Step 12**. Collect logs and check whether the first ldapserver node in the ldap_uri before modifying **/etc/sssd/sssd.conf** is faulty. For example, check whether the service IP address is unreachable, the network latency is too long, or other abnormal software is deployed.

Collect fault information.

Step 13 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 14 Select **LdapClient** in the required cluster from the **Service**.

Step 15 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M engineers and send the collected fault logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.219 ALM-25500 KrbServer Service Unavailable

Alarm Description

The system checks the KrbServer service status every 30 seconds. This alarm is generated when the system detects that the KrbServer service is abnormal.

This alarm is cleared when the system detects that the KrbServer service is normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
25500	Critical	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The running status of the component that depends on the KrbServer becomes faulty. As a result, the Kerberos authentication of the cluster fails, and the component services are abnormal.

Possible Causes

- The node where the KrbServer service locates is faulty.
- The OLdap service is abnormal.

Handling Procedure

Check whether the node where the KrbServer service locates is faulty.

Step 1 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **KrbServer** > **Instance** to go to the KrbServer instance page to obtain the host name of the node where the KrbServer service locates.

Step 2 On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **NodeAgent Process Is Abnormal** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Check whether the host name in the alarm is consistent with the **Step 1** host name.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Handle the alarm according to "ALM-12006 NodeAgent Process Is Abnormal".

Step 5 Check whether **KrbServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the OLdap service is normal.

Step 6 On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **OLdap Resource Abnormal** exists.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Handle the alarm according to "ALM-12004 OLdap Resource Abnormal".

Step 8 Check whether **KrbServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 10 Select **KrbServer** in the required cluster from the **Service**.

Step 11 Click the edit button in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.220 ALM-25501 Too Many KerberosServer Requests

Alarm Description

The system checks the number of requests processed by the KerberosServer node every 30 seconds and compares the number with the threshold. This alarm is generated when the number of requests exceeds the threshold (10,000 by default) for multiple consecutive times (5 by default).

Its **Trigger Count** is configurable. If **Trigger Count** is set to **1**, this alarm is cleared when the number of process connections is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the number of requests is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
25501	Major	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.

Type	Parameter	Description
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Details	Specifies alarm details.

Impact on the System

KerberosServer responds slowly. As a result, Kerberos authentication times out and component services are in error.

Possible Causes

- There are too many KerberosServer requests.
- The alarm threshold or alarm trigger count is improperly configured.

Handling Procedure

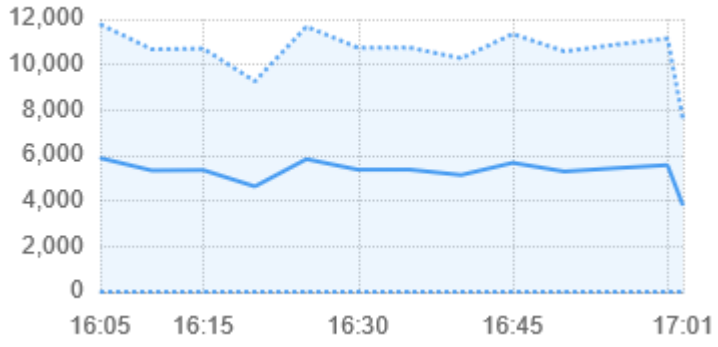
Check whether there are too many KerberosServer requests.

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **KrbServer** to go to the KrbServer overview page.

Step 2 Observe the "Total KerberosServer Requests" chart and reduce the number of KerberosServer authentication requests based on the actual service scenario.

If no chart is available, click the drop-down arrow on the right, select **Customize**, select the desired item, and click **OK**.

Figure 11-11 Total KerberosServer requests



Step 3 Wait about 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 4 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, choose **KrbServer** > **Other** > **Total KerberosServer Requests**, and check whether the alarm trigger count and alarm threshold are set properly.

- If yes, go to **Step 7**.
- If no, go to **Step 5**.

Step 5 Change the trigger count and alarm threshold based on the actual number of requests, and apply the changes.

Step 6 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **KrbServer** for the target cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.221 ALM-27001 DBService Is Unavailable

Alarm Description

The alarm module checks the DBService status every 30 seconds. This alarm is generated when the system detects that DBService is unavailable.

This alarm is cleared when DBService recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
27001	Critical	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The database service is unavailable and cannot provide data import and query functions for upper-layer services, which results in service exceptions.

Possible Causes

- The floating IP address does not exist.
- There is no active DBServer instance.
- The active and standby DBServer processes are abnormal.

Handling Procedure

Check whether the floating IP address exists in the cluster environment.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService** > **Instance**.

Step 2 Check whether the active instance exists.

- If yes, go to **Step 3**.
- If no, go to **Step 9**.

Step 3 Select the active DBServer instance and record the IP address.

Step 4 Log in to the host that corresponds to the preceding IP address as user **root**, and run the **ifconfig** command to check whether the floating IP address of DBService exists on the node.

- If yes, go to **Step 5**.
- If no, go to **Step 9**.

Step 5 Run the **ping** *floating IP address* command to check whether the DBService floating IP address can be pinged.

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 Log in to the host that corresponds to the DBService floating IP address as user **root**, and run the following command to delete the floating IP address:

ifconfig *interface* **down**

Step 7 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService**. On the displayed page, click **More** > **Restart Service** to restart DBService. Check whether DBService is started successfully.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Wait about 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check the status of the active DBServer instance.

Step 9 Select the DBServer instance whose role status is abnormal and record the IP address.

Step 10 On the **Alarms** page, check whether the **Process Fault** alarm is generated for the DBServer instance on the host corresponding to the preceding IP address.

- If yes, go to **Step 11**.
- If no, go to **Step 19**.

Step 11 Rectify the fault by following the procedure provided in **ALM-12007 Process Fault**.

Step 12 Wait about 5 minutes and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 19**.

Check the status of the active and standby DBServer processes.

Step 13 Log in to the host that corresponds to the IP address of DBService as user **root**, and run the **su - omm** command to switch to user **omm**.

Step 14 Run the **cd ${DBSERVER_HOME}** command to access the installation directory of DBService.

Step 15 Run the **sh sbin/status-dbserver.sh** command to view the status of the active and standby HA processes of DBService. Determine whether the status can be viewed successfully.

```

```

- If yes, go to **Step 16**.
- If no, go to **Step 19**.

Step 16 Check whether the active and standby HA processes are abnormal.

- If yes, go to **Step 17**.
- If no, go to **Step 19**.

Step 17 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService**. On the displayed page, click **More** > **Restart Service** to restart DBService. Check whether DBService is restarted successfully.

- If yes, go to **Step 18**.
- If no, go to **Step 19**.

Step 18 Wait about 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 19**.

Collect fault information.

Step 19 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 20 Expand the **Service** drop-down list, and select **DBService** and **NodeAgent** for the target cluster.

Step 21 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 22 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.222 ALM-27003 DBService Heartbeat Interruption Between the Active and Standby Nodes

Alarm Description

This alarm is generated when the active or standby DBService node has not received heartbeat messages from the peer node for 7 seconds.

This alarm is cleared when the heartbeat recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
27003	Major	Heartbeat	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Local DBService HA	Specifies a local DBService HA.
	Peer DBService HA	Specifies a peer DBService HA.

Impact on the System

During the DBService heartbeat interruption, only one node can provide the service. If this node is faulty, no standby node is available for failover and the service is unavailable.

Possible Causes

The link between the active and standby DBService nodes is abnormal.

Handling Procedure

Check whether the network between the active and standby DBService servers is normal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the IP address of the standby DBService server for which the alarm is generated.

Step 2 Log in to the active DBService server as user **root**.

Step 3 Run the **ping** *heartbeat IP address of the standby DBService* command to check whether the standby DBService server is reachable.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select the following services for the target cluster

- DBService
- Controller
- NodeAgent

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.223 ALM-27004 Data Inconsistency Between Active and Standby DBServices

Alarm Description

The system checks the data synchronization status between the active and standby DBServices every 10 seconds. This alarm is generated when the synchronization status cannot be queried for six consecutive times or when the synchronization status is abnormal.

This alarm is cleared when the synchronization is in normal state.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
27004	Critical	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Local DBService HA	Specifies a local DBService HA.
	Peer DBService HA	Specifies a peer DBService HA.
	Synchronization of active and standby DBServices	Synchronization rate of active and standby DBService nodes

Impact on the System

When data is not synchronized between the active and standby DBServer and the active instance becomes abnormal, the data may be lost or abnormal.

Possible Causes

- The network between the active and standby nodes is unstable.
- The standby DBService is abnormal.
- The disk space of the standby node is full.
- The CPU usage of the GaussDB process on the active DBService node is high. (You need to locate the fault based on logs.)

Handling Procedure

Check whether the network between the active and standby nodes is normal.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **DBService** > **Instances** to view the service IP address of the standby DBServer instance.

Step 2 Log in to the active DBService node as user **root**.

Step 3 Run the **ping** *heartbeat IP address of the standby DBService* command to check whether the standby DBService node is reachable.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the status of the standby DBService is normal.

Step 6 Log in to the standby DBservice node as user **root**.

Step 7 Run the **su - omm** command to switch to user **omm**.

Step 8 Go to the **${DBSERVER_HOME}/sbin** directory and run the **./status-dbserver.sh** command to check whether the GaussDB resource status of the standby DBService is in normal state. In the command output, check whether the following information is displayed in the row where **ResName** is **gaussDB**:

The following is an example:

```
10_10_10_231 gaussDB Standby_normal Normal Active_standby
```

- If yes, go to **Step 9**.
- If no, go to **Step 16**.

Check whether the disk space of the standby node is full.

Step 9 Log in to the standby DBservice node as user **root**.

Step 10 Run the **su - omm** command to switch to user **omm**.

Step 11 Go to the **${DBSERVER_HOME}** directory, and run the following commands to obtain the DBService data directory:

cd ${DBSERVER_HOME}

source .dbservice_profile

echo ${DBSERVICE_DATA_DIR}

Step 12 Run the **df -h** command to check the system disk partition usage.

Step 13 Check whether the DBService data directory space is full.

- If yes, go to **Step 14**.
- If no, go to **Step 16**.

Step 14 Expand the disk capacity of the node.

Step 15 After the disk capacity is expanded, wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Collect fault information.

Step 16 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 17 In the **Service** drop-down list, select **DBService** of the cluster to be operated, select **OS**, **OS Statistics**, and **OS Performance** in the OMS area, and click **OK**.

Step 18 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.224 ALM-27005 Database Connection Usage Exceeds the Threshold

Alarm Description

The system checks the database connection usage of the DBServer node every 30 seconds and compares the actual database connection usage with the threshold. This alarm is generated when the database connection usage exceeds the threshold for five consecutive times (configurable, five by default).

The trigger count is configurable. When the value is 1 and the data connections are no more than the threshold, the alarm is cleared. When the trigger count is greater than 1 and the data connections are no more than 90% of the threshold, the alarm is cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
27005	Critical (default threshold: 95%) Major (The default threshold: 90%)	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger condition	Specifies the alarm triggering condition.

Impact on the System

Upper-layer services may fail to connect to the DBService database, affecting services.

Possible Causes

- There are too many database connections in use.
- The maximum number of database connections is set improperly.
- The alarm threshold or alarm trigger count is improperly configured.

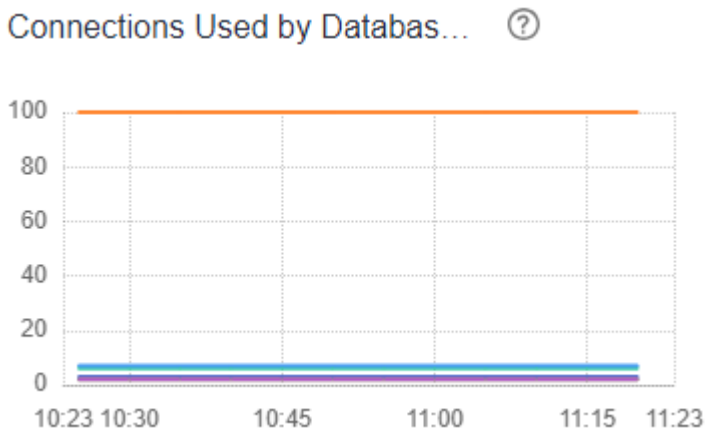
Handling Procedure

Check whether there are too many database connections in use.

Step 1 On FusionInsight Manager, click **DBService** in the service list on the left. The DBService monitoring page is displayed.

Step 2 View the number of connections used by the database user, as shown in **Figure 11-12**. You can reduce the number of connections based on service requirements.

Figure 11-12 Connections used by the database user



Step 3 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the maximum number of database connections is set properly.

Step 4 Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **DBService**, click **Configuration** and then **All Configurations**. Increase the maximum number of database connections allowed based on service requirements. After the modification, click **Save**. On the page that is displayed, click **OK**.

Figure 11-13 Setting maximum database connections

Step 5 After changing the maximum number of database connections, restart DBService (do not restart its upper-layer services).

Procedure: Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **DBService**. On the displayed page, click **More** > **Restart Service** in the upper right corner, enter the password of the current login user, and click **OK**. Do not select **Restart upper-layer services**. Click **OK**.

Step 6 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

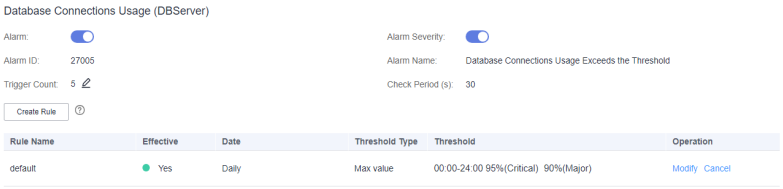
Check whether the alarm threshold or alarm trigger count is properly configured.

Step 7 Log in to FusionInsight Manager and change the alarm threshold and alarm smoothing times based on the number of database connections. Click **O&M** and choose **Alarm** > **Thresholds** in the navigation pane on the left. On the displayed page, click the name of the desired cluster > **DBService** > **Database** > **Database Connection Usage (DBServer)**. Click the pencil icon next to **Trigger Count** to change the value.

NOTE

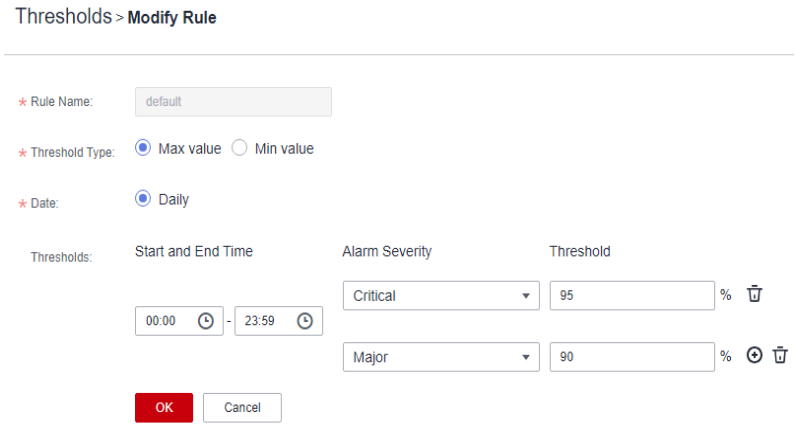
If the value of **Trigger Count** exceeds the threshold, the alarm is generated.

Figure 11-14 Setting the alarm trigger count



Click **O&M**, and choose **Alarm** > **Thresholds** in the navigation pane on the left. On the displayed page, click the name of the desired cluster > **DBService** > **Database** > **Database Connection Usage (DBServer)** in the list on the left. Click **Modify** in the **Operation** column. Modify the rule and click **OK**. The modification takes effect immediately.

Figure 11-15 Configuring the alarm threshold



Step 8 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **DBService** for the target cluster.

Step 11 Specify **Hosts** for collecting logs, which is optional. By default, all hosts are selected.

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.225 ALM-27006 Data Directory Disk Usage Exceeds the Threshold

Alarm Description

The system checks the disk space usage of the data directory on the active DBServer node every 30 seconds and compares the actual disk space usage with the threshold. This alarm is generated when the disk space usage of the data directory exceeds the threshold for five consecutive times (configurable, five by default).

The trigger count is configurable. When the value is 1 and the data directory disk usage is no greater than the threshold, the alarm is cleared. When the trigger count is greater than 1 and the data directory disk usage is smaller than 90% of the threshold, the alarm is cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
27006	Critical (default threshold: 85%) Major (default threshold: 80%)	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	PartitionName	Specifies the disk partition for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the condition for triggering the alarm.

Impact on the System

- The DBService service process cannot provide the API for data writing.
- When the disk space usage of the data directory exceeds 90%, the database enters the read-only mode and "Database Enters the Read-Only Mode" is generated. As a result, service data cannot be written to the database.

Possible Causes

- The alarm threshold is improperly configured.
- The database data volume is too large or the disk configuration cannot meet service requirements. As a result, the disk usage reaches the upper limit.

Handling Procedure

Check whether the threshold is set properly.

Step 1 On FusionInsight Manager, click **O&M** and choose **Alarm** > **Thresholds** in the navigation pane on the left. Click the name of the desired cluster, choose **DBService** > **Database** > **Data Directory Disk Usage**, and check whether the alarm threshold is **80%**.

- If yes, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 Modify the alarm threshold based on the service requirements..

Step 3 Click **Cluster** and choose the name of the desired cluster > **Service** > **DBService**. On the **Dashboard** page, view the **Data Directory Disk Usage** chart to check whether the disk usage of the data directory is less than the threshold.

- If yes, go to **Step 4**.

- If no, go to **Step 5**.

Step 4 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether large files are incorrectly written to the disk.

Step 5 Log in to the active management node as user **omm**.

Step 6 Run the following commands to check whether there are files over 500 MB in the disk of the data directory:

source $DBSERVER_HOME/.dbservice_profile

find "$DBSERVICE_DATA_DIR"/../ -type f -size +500M

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 Handle the incorrectly written files and check whether the alarm is cleared 2 minutes later.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **DBService** for the target cluster.

Step 10 Specify **Hosts** for collecting logs, which is optional. By default, all hosts are selected.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.226 ALM-27007 Database Enters the Read-Only Mode

Alarm Description

The system checks the disk space usage of the data directory on the active DBServer node every 30 seconds. This alarm is generated when the disk space usage of the data directory exceeds 90%.

This alarm is cleared when the disk space usage of the data directory falls below 80%.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
27007	Critical	Quality of service	FusionInsight Manager	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

- Service data is lost.
- Data cannot be written for upper-layer services and the data is lost.

Possible Causes

The disk configuration cannot meet service requirements. The disk usage reaches the upper limit.

Handling Procedure

Check whether the disk space usage reaches the upper limit.

Step 1 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services** > **DBService**.

Step 2 On the **Dashboard** page, view the **Disk Space Usage of the Data Directory** chart to check whether the disk usage of the data directory exceeds 90%.

- If yes, go to **Step 3**.
- If no, go to **Step 13**.

Step 3 Log in to the active management node of the DBServer as user **omm** and run the following commands to check whether the database enters the read-only mode:

source $DBSERVER_HOME/.dbservice_profile

gsql -U omm -W *password* **-d postgres -p 20051**

show default_transaction_read_only;

NOTE

In the preceding command, **password** indicates the password of user **omm** of the DBService database. You can run the **\q** command to exit the database page.

Check whether the value of **default_transaction_read_only** is **on**.

```
POSTGRES=# show default_transaction_read_only;
 default_transaction_read_only
-------------------------------
 on
(1 row)
```

- If yes, go to **Step 4**.
- If no, go to **Step 13**.

Step 4 Run the following commands to open the **dbservice.properties** file:

source $DBSERVER_HOME/.dbservice_profile

vi ${DBSERVICE_SOFTWARE_DIR}/tools/dbservice.properties

Step 5 Change the value of **gaussdb_readonly_auto** to **OFF**. (The default is **ON**.)

Step 6 Run the following command to open the **postgresql.conf** file:

vi ${DBSERVICE_DATA_DIR}/postgresql.conf

Step 7 Delete **default_transaction_read_only = on**.

Step 8 Run the following command for the configuration to take effect:

gs_ctl reload -D ${DBSERVICE_DATA_DIR}

Step 9 Log in to FusionInsight Manager, and Choose **O&M** > **Alarm** > **Alarms**. On the right of the alarm "Database Enters the Read-Only Mode", click **Clear** in the **Operation** column. In the dialog box that is displayed, click **OK** Manually clear the alarm.

Step 10 Log in to the active DBServer node as user **omm**. Run the following commands to check whether files with more than 500 MB are incorrectly written into the disk space of the data directory:

source $DBSERVER_HOME/.dbservice_profile

find "$DBSERVICE_DATA_DIR"/../ -type f -size +500M

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 Delete the incorrectly written files based on site requirements.

Step 12 Log in to FusionInsight Manager. Click **Cluster** and choose the name of the desired cluster > **Service** > **DBService**. On the **Dashboard** page, view the **Data Directory Disk Usage** chart to check whether the disk usage is less than 80% of the threshold.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 14 Expand the **Service** drop-down list, and select **DBService** for the target cluster.

Step 15 Specify **Hosts** for collecting logs, which is optional. By default, all hosts are selected.

Step 16 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 17 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.227 ALM-33004 BLU Instance Health Status of Containers Is Abnormal

Alarm Description

The system checks the health status of BLU instances every minute. This alarm is generated when over 50% of deployed BLU instances are abnormal.

This alarm is automatically cleared when the system detects that the BLU instance recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
33004	Minor	Heartbeat	Containers	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	GroupName	Specifies the name of the group for which the alarm is generated.
	BLU ID	Specifies the ID of a BLU.
	BLU Version	Specifies the BLU version.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If some BLU instances of a BLU role are unhealthy, service functions are not affected, but the service processing capability of the BLU instances may deteriorate. However, if all BLU instances of a BLU role are unhealthy, the services depend on the BLU role become unavailable.

Possible Causes

The causes need to be located by service development and maintenance personnel based on related logs.

Handling Procedure

Collect fault information.

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 2 Expand the **Service** drop-down list and select **Containers**.

Step 3 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 4 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 5 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.228 ALM-33005 Maximum Number of Concurrent Containers Requests Exceeds the Threshold

Alarm Description

The system checks the maximum number of concurrent Containers requests every 5 minutes and compares the number with the threshold. This alarm is generated when the maximum number of concurrent service requests exceeds the threshold.

This alarm is automatically cleared when the maximum number of concurrent Containers requests is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
33005	Warning	Quality of service	Containers	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.

Type	Parameter	Description
	RoleName	Specifies the role for which the alarm is generated.
	ApplicationServiceName	Specifies the name of the application for which the alarm is generated.
	Version	Specifies the version for which the alarm is generated.
	Method	Specifies the method for generating the alarm.
	IP	Specifies the IP address for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the maximum number of concurrent Containers requests is too large, the service provider rejects some requests. As a result, the service fails to be called.

Possible Causes

- It takes a long time to process the service logic code.
- The service volume is too large.

Handling Procedure

Check whether the service code processing time is too long.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **Containers**.

Step 2 Choose **SGP Management** > **App Service List**, and click the link of the service for which the alarm is generated to access the service status page.

Step 3 Check whether the provider's processing time is too long.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Check whether the processing time of user's upper-layer service logic code is too long.

- If yes, optimize the upper-layer service logic code and execute **Step 5**.
- If no, go to **Step 6**.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the service volume is too large.

Step 6 On FusionInsight Manager, choose **Cluster** > **Services** > **Containers**, click the **SGP Management** tab, and view charts **Request Number Per Second** and **Response Time** to check whether the data volume remains high.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Choose **Cluster** > **Services** > **Containers**, and click the **Business Manager** tab. Select the BLU that carries services. On the page that is displayed, click the **BLU Instance** tab and click **Add Instance** to add a BLU instance.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list and select **Containers**.

Step 11 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 12 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 15 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.229 ALM-33006 Failure Rate of Containers Calls Exceeds the Threshold

Alarm Description

The system checks the failure rate of service calls every 5 minutes and compares the rate with the threshold. This alarm is generated when the failure rate exceeds the threshold.

This alarm is automatically cleared when the failure rate is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
33006	Major	Quality of service	Containers	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	ApplicationServiceName	Specifies the name of the application for which the alarm is generated.
	Version	Specifies the version for which the alarm is generated.
	Method	Specifies the method for generating the alarm.
	Side	Specifies the side where the alarm is generated.
	IP	Specifies the IP address for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the failure rate is too high, the application service fails to be called for many times within 5 minutes. As a result, the service calls be slow or fail.

Possible Causes

- A timeout occurs due to a long network latency.
- The service volume is too large, and the number of concurrent requests exceeds the upper limit.
- The service code is incorrect.

Handling Procedure

Check whether the network latency is too long.

Step 1 Check whether the service for which the alarm is generated is a provider based on the IP address.

- If yes, go to **Step 9**.
- If no, go to **Step 2**.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Containers**, and click the **SGP Management** tab.

Step 3 Choose **App Service List** and click the link of the service for which the alarm is generated to access the service status page.

Step 4 View the processing time of the service consumer and check whether it is too long.

- If yes, go to **Step 5**.
- If no, go to **Step 9**.

Step 5 View the processing time of the service provider and compare it with that of the consumer to check whether the difference is large.

- If yes, check the network configuration, reduce the network latency, and go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Step 7 Check whether the processing time of user's upper-layer service logic code is too long.

- If yes, optimize the upper-layer service logic code and execute **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check whether the service volume is too large and the number of concurrent requests exceeds the upper limit.

Step 9 On FusionInsight Manager, choose **Cluster** > **Services** > **Containers**, and click the **SGP Management** tab.

Step 10 Click the name of the service for which the alarm is generated to access its **State** page.

Step 11 Check whether the number of concurrent requests exceeds the upper limit.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Choose **Cluster** > **Services** > **Containers**, and click the **Business Manager** tab. Select the BLU that carries services. On the page that is displayed, click the **BLU**

Instance tab and click **Add Instance** to add a BLU instance for the service provider.

Step 13 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check whether the service code is correct.

Step 14 Check whether the upper-layer service code is incorrect.

- If yes, correct the service code and go to **Step 15**.
- If no, go to **Step 16**.

Step 15 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Collect fault information.

Step 16 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 17 Expand the **Service** drop-down list and select **Containers**.

Step 18 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 19 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 20 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.230 ALM-33007 ALB TPS of Containers Exceeds the Threshold

Alarm Description

This alarm is generated when the ALB TPS exceeds the threshold (**tps.threshold**) set by the cluster administrator in ALB configuration file **alb.properties**.

This alarm is automatically cleared when the ALB TPS is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
33007	Warning	Quality of service	Containers	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	HostName	Specifies the name of the host accommodating the ALB instance for which the alarm is generated.
	Container_ID	Identifies the container accommodating the ALB instance for which the alarm is generated.
	BLU_ID	Identifies the BLU of the ALB instance for which the alarm is generated.
	BLU_Version	Specifies the BLU version of the ALB instance for which the alarm is generated.
	ServerAddress	Specifies the external socket address of the ALB instance for which the alarm is generated.
	TPS_Threshold	Specifies the TPS alarm threshold configured by the administrator.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

ALB request forwarding is slow, and service calls are responded slowly.

Possible Causes

- If the number of requests forwarded by each ALB instance is relatively even, ALB instances may be not enough for external requests.
- If the number of requests forwarded by each ALB instance differs greatly, the TPS of some ALB instances may exceed the threshold.

Handling Procedure

Check whether ALB instances are not enough for external requests if the number of requests forwarded by each ALB instance is relatively even.

Step 1 Check whether the number of requests forwarded to each ALB instance is even based on how external messages are connected to the cluster.

For example, when a forwarder is used to send messages to ALB instances, check the number of messages forwarded by the forwarder to each socket address (one socket address corresponds to one ALB instance).

- If yes, go to **Step 2**.
- If no, go to **Step 6**.

Step 2 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **Containers**, and click the **Business Manager** tab.

Step 3 Choose ALB in the navigation pane and click the ALB name. On the page that is displayed, click **BLU Instance** and check whether there are only a few ALB instances.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Click **Add Instance**, select the location of new instance, and click **OK**.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the TPS of some ALB instances exceeds the threshold if the number of requests forwarded by each ALB instance differs greatly.

Step 6 Resolve this problem based on the actual condition because the policy cannot be modified in the cluster. For example, adjust the forwarding policy of the forwarder to decrease requests sent to overloaded ALB instances (especially those that have received alarms).

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list and select **Containers**.

Step 10 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.231 ALM-33008 Average Latency of Containers Exceeds the Threshold

Alarm Description

The system checks the average latency of service calls every 5 minutes and compares the latency with the threshold. This alarm is generated when the average latency exceeds the threshold.

This alarm is automatically cleared when the average latency is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
33008	Warning	Quality of service	Containers	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	ApplicationServiceName	Specifies the name of the application for which the alarm is generated.
	Version	Specifies the version for which the alarm is generated.
	Method	Specifies the method for generating the alarm.
	Side	Specifies the side where the alarm is generated.

Type	Parameter	Description
	IP	Specifies the IP address for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The BLU service processing becomes slow. As a result, user requests may be stacked, and even upper-layer services may be blocked or unavailable.

Possible Causes

- It takes a long time to process the upper-layer service logic code.
- The service volume is too large.
- The service code is incorrect.

Handling Procedure

Check whether the processing time of the upper-layer service logic code is too long.

Step 1 Check whether the service for which the alarm is generated is a provider based on the IP address.

- If yes, go to **Step 9**.
- If no, go to **Step 2**.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Containers**, and click the **SGP Management** tab.

Step 3 Choose **App Service List** and click the link of the service for which the alarm is generated to access the service status page.

Step 4 View the processing time of the service consumer and check whether it is too long.

- If yes, go to **Step 5**.
- If no, go to **Step 9**.

Step 5 View the processing time of the service provider and compare it with that of the consumer to check whether the difference is large.

- If yes, check the network configuration, reduce the network latency, and go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Step 7 Check whether the processing time of user's upper-layer service logic code is too long.

- If yes, optimize the upper-layer service logic code and execute **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check whether the service volume is too large.

Step 9 On FusionInsight Manager, choose **Cluster** > **Services** > **Containers**, and click the **SGP Management** tab.

Step 10 Click the name of the service for which the alarm is generated to access its **State** page.

Step 11 Check whether the number of concurrent requests exceeds the upper limit.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 On FusionInsight Manager, choose **Cluster** > **Services** > **Containers**, and click the **Business Manager** tab. Select the BLU that carries services. On the page that is displayed, click the **BLU Instance** tab and click **Add Instance** to add a BLU instance for the service provider.

Step 13 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check whether the service code is correct.

Step 14 Check whether the upper-layer service code is incorrect.

- If yes, correct the service code and go to **Step 15**.
- If no, go to **Step 16**.

Step 15 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Change the alarm threshold.

Step 16 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**. On the **Thresholds** page, click the name of the desired cluster, choose **Containers** > **Other** > **Application Service Average Elapse Statistics (SGP)**, and change the alarm threshold based on the actual average latency.

Step 17 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Collect fault information.

Step 18 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 19 Expand the **Service** drop-down list and select **Containers**.

Step 20 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 21 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 22 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

11.232 ALM-33009 Containers Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of WebContainer instances every 30 seconds. This alarm is generated when the heap memory usage of a WebContainer instance exceeds the threshold (95%).

This alarm is automatically cleared when the heap memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
33009	Minor	Environment	Containers	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the heap memory of Containers is insufficient, memory overflow may occur. As a result, the container instance and the BLU deployed in the container are abnormal, and the alarm "The health status of the BLU instance of the Containers service is abnormal" is reported. This alarm is generated when some BLU instances of a BLU role are unhealthy. Service functions are not affected, but the service processing of the BLU may become slow. If all BLU instances of the BLU role are unhealthy, the service corresponding to the BLU cannot provide services.

Possible Causes

- The alarm threshold or alarm trigger count is improperly configured.
- The WebContainer heap memory is insufficient.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, click ⌄ in the row that contains the alarm, and view the host name and role of the instance for which the alarm is generated in **Location**.

Step 2 Choose **O&M** > **Alarm** > **Thresholds**. On the **Thresholds** page, click the name of the desired cluster, choose **Containers** > **Other** > **Heap Mem Usage (WebContainer_*M*)**, and check whether the trigger count and alarm threshold are set properly for the role for which the alarm is generated.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Change the trigger count and alarm threshold based on the actual heap memory usage, and apply the changes.

Step 4 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the heap memory usage of the WebContainer.

Step 5 Choose **Cluster** > **Services** > **Containers** > **Configurations** > **All Configurations**, choose **WebContainer_*N*(Role)** > **Default** of the role for which the alarm is generated, increase the value of **GC_OPTS** as required, click **Save**. Then click **OK** and restart the Containers service.

NOTE

Change the values of **-Xms** and **-Xmx** to twice the current heap memory usage (or adjust the values based on site requirements). The values cannot exceed the remaining memory of the node.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list and select **Containers**.

Step 9 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.233 ALM-33010 Containers Non-Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the non-heap memory usage of WebContainer instances every 30 seconds. This alarm is generated when the non-heap memory usage of a WebContainer instance exceeds the threshold (75%).

This alarm is automatically cleared when the non-heap memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
33010	Minor	Environment	Containers	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the non-heap memory of Containers is insufficient, memory overflow may occur. As a result, the container instance and the BLU deployed in the container are abnormal, and the alarm "The health status of the BLU instance of the Containers service is abnormal" is reported. This alarm is generated when some BLU instances of a BLU role are unhealthy. Service functions are not affected, but the service processing of the BLU may become slow. If all BLU instances of the BLU role are unhealthy, the service corresponding to the BLU cannot provide services.

Possible Causes

- The alarm threshold or alarm trigger count is improperly configured.
- The memory allocated to the WebContainer instance is improper, or the memory of the BLU deployed on the node leaks. As a result, the usage exceeds the threshold.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, click ⌄ in the row that contains the alarm, and view the host name and role of the instance for which the alarm is generated in **Location**.

Step 2 Choose **O&M** > **Alarm** > **Thresholds**. On the **Thresholds** page, click the name of the desired cluster, choose **Containers** > **Other** > **Non_Heap Mem Usage (WebContainer_*M*)**, and check whether the trigger count and alarm threshold are set properly for the role for which the alarm is generated.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Change the trigger count and alarm threshold based on the actual non-heap memory usage, and apply the changes.

Step 4 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the non-heap memory usage of the WebContainer.

Step 5 Choose **Cluster** > **Services** > **Containers** > **Configurations** > **All Configurations**, choose **WebContainer_*M*(Role)** > **Default** of the role for which the alarm is generated, and check whether the **GC_OPTS** value is set properly.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Click the **Dashboard** tab. In the upper right corner, click **More** and select **Restart Service**. In the dialog box that is displayed, enter the password to restart the Containers service. Then check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list and select **Containers**.

Step 9 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.234 ALM-33011 Containers Metaspace Usage Exceeds the Threshold

Alarm Description

The system checks the metaspace memory usage of WebContainer instances every 30 seconds. This alarm is generated when the metaspace memory usage of a WebContainer instance exceeds the threshold (75%).

This alarm is automatically cleared when the metaspace memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
33011	Minor	Environment	Containers	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the metaspace memory of Containers is insufficient, memory overflow may occur. As a result, the container instance and the BLU deployed in the container are abnormal, and the alarm "The health status of the BLU instance of the Containers service is abnormal" is reported. This alarm is generated when some BLU instances of a BLU role are unhealthy. Service functions are not affected, but the service processing of the BLU may become slow. If all BLU instances of the BLU role are unhealthy, the service corresponding to the BLU cannot provide services.

Possible Causes

- The alarm threshold or alarm trigger count is improperly configured.
- The memory allocated to the WebContainer instance is improper, or the memory of the BLU deployed on the node leaks. As a result, the usage exceeds the threshold.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, click ⌄ in the row that contains the alarm, and view the host name and role of the instance for which the alarm is generated in **Location**.

Step 2 Choose **O&M** > **Alarm** > **Thresholds**. On the **Thresholds** page, click the name of the desired cluster, choose **Containers** > **Other** > **MetaSpace Usage (WebContainer_*N*)**, and check whether the trigger count and alarm threshold are set properly for the role for which the alarm is generated.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Change the trigger count and alarm threshold based on the actual metaspace usage, and apply the changes.

Step 4 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the WebContainer metaspace usage.

Step 5 Choose **Cluster** > **Services** > **Containers** > **Configurations** > **All Configurations**, choose **WebContainer_*N*(Role)** > **Default** of the role for which the alarm is generated, and check whether the **GC_OPTS** value is set properly.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Click the **Dashboard** tab. In the upper right corner, click **More** and select **Restart Service**. In the dialog box that is displayed, enter the password to restart the Containers service. Then check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list and select **Containers**.

Step 9 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

11.235 ALM-33012 Containers' ZooKeeper Client Is Disconnected

Alarm Description

Multiple modules in the FusionInsight RTD cluster contain the ZooKeeper client. This alarm is generated when the ZooKeeper client is disconnected from the ZooKeeper server.

This alarm is automatically cleared when the connection is restored.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
33012	Minor	Communications	Containers	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	ClientLocation	Specifies the location of the ZooKeeper client.
	ServerAddress	Specifies the ZooKeeper server address.

Impact on the System

If the ZooKeeper client is disconnected, ZooKeeper-dependent functions in the FusionInsight RTD cluster may be unavailable.

Possible Causes

- ZooKeeper is faulty.
- The ZooKeeper client fails to be connected due to a network fault.

Handling Procedure

Check whether ZooKeeper is faulty.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **ZooKeeper** and check whether the ZooKeeper service is running properly.

- If yes, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 Click **More** and select **Restart Service**. In the dialog box that is displayed, enter the password to restart ZooKeeper. After the restart is successful, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check whether the ZooKeeper client fails to be connected due to a network fault.

Step 3 Check whether the network between the client and the server is normal and the time is consistent based on the client location and server address in the alarm information.

- If yes, go to **Step 5**.
- If no, go to **Step 4**.

Step 4 Restore the network and adjust the time to ensure that the time difference between the client and server is less than 5 minutes (ignore the time difference for a normal cluster). Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list and select **Containers**.

Step 7 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.236 ALM-38000 Kafka Service Unavailable

Alarm Description

The system checks the Kafka service status every 30 seconds. This alarm is generated when the Kafka service is unavailable.

This alarm is cleared when the Kafka service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
38000	Critical	Quality of service	Kafka	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The cluster cannot provide the Kafka service, and users cannot perform new Kafka tasks.

Possible Causes

- The KrbServer service is abnormal.(Skip this step if the normal mode is used.)
- The ZooKeeper service is abnormal or does not respond.
- The Broker instance in the Kafka cluster are abnormal.

Handling Procedure

Check the status of the KrbServer service. (Skip this step if the normal mode is used.)

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services > KrbServer**.

Step 2 Check whether the running status of the KrbServer service is **Normal**.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Rectify the fault by following the steps provided in **ALM-25500 KrbServer Service Unavailable**.

Step 4 Perform **Step 2** again.

Check the status of the ZooKeeper cluster.

Step 5 Check whether the running status of the ZooKeeper service is **Normal**.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 If ZooKeeper service is stopped, start it, else rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**.

Step 7 Perform **Step 5** again.

Check the Broker status.

Step 8 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance** to go to the Kafka instances page.

Step 9 Check whether all instances in **Roles** are running properly.

- If yes, go to **Step 11**.
- If no, go to **Step 10**.

Step 10 Select all Broker instances, choose **More** > **Restart Instance**, and check whether the instances restart successfully.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** to check whether the running status is **Normal**.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Wait for 30 seconds and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collecting Fault Information

Step 13 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 14 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 15 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.237 ALM-38001 Insufficient Kafka Disk Space

Alarm Description

The system checks the Kafka disk usage every 60 seconds and compares the actual disk usage with the threshold. The disk usage has a default threshold. This alarm is generated if the disk usage exceeds the threshold.

To change the threshold, choose **O&M** > **Alarm** > **Thresholds**. In the service list, choose **Kafka** > **Disk** > **Broker Disk Usage (Broker)**.

If the **Trigger Count** is **1**, this alarm is cleared when the usage of the Kafka disk is less than or equal to the threshold. If the **Trigger Count** is greater than **1**, this alarm is cleared when the disk usage is less than or equal to 80% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
38001	Major (default value: 85%) Critical (default value: 90%)	Quality of service	Kafka	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	PartitionName	Specifies the disk partition for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Kafka data write operations fail.

Possible Causes

- The Kafka disk configurations (such as disk count and disk size) are insufficient for the data volume.
- The data retention period is long and historical data occupies large space.
- Services are improperly planned. As a result, data is unevenly distributed and some disks are full.

Handling Procedure

Check the disk configuration of Kafka data.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, click the alarm and obtain the host name from the **Location** area.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **Hosts**.

Step 4 On the **Hosts** page, click the host name obtained in **Step 2**.

Step 5 Check whether the **Disk** area contains the disk partition name in the alarm.

- If yes, go to **Step 6**.
- If no, manually clear the alarm and no further action is required.

Step 6 In the **Disk** area, check whether the usage of the alarmed partition has reached 100%.

- If yes, handle the alarm by following the instructions in **Related Information**.
- If no, go to **Step 7**.

Check the Kafka data storage duration.

Step 7 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations**.

Step 8 Check whether the value of **disk.adapter.enable** is **true**.

- If yes, go to **Step 10**.
- If no, go to **Step 9**.

Step 9 Set **disk.adapter.enable** to **true**. Check whether the value of **adapter.topic.min.retention.hours** is properly set.

- If yes, go to **Step 10**.
- If no, adjust the data retention period based on service requirements.

NOTICE

If the disk adaptation function is enabled, historical data of topics may be deleted. If the retention period of some topics cannot be adjusted, click **All Configurations** and add the topics to the value of the **disk.adapter.topic.blacklist** parameter.

Step 10 Wait for 10 minutes and check whether the usage of the faulty disk decreases.

- If yes, wait until the alarm is cleared.
- If no, go to **Step 11**.

Check the Kafka data plan.

Step 11 In the **Instance** area, click **Broker**. Click the drop-down menu in the **Chart** area and choose **Customize** to customize monitoring items.

Step 12 In the displayed dialog box, choose **Disk**, select **Broker Disk Usage**, and click **OK**.

The Kafka disk usage information is displayed.

Step 13 View the information in **Step 12** to check whether there is only the disk partition for which the alarm is generated in **Step 2**.

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Perform disk planning and mount a new disk again. Go to the **Instance Configurations** page of the node for which the alarm is generated, modify **log.dirs**, add other disk directories, and restart the Kafka instance.

Step 15 Determine whether to shorten the data retention time configured on Kafka based on service requirements and service traffic.

- If yes, go to **Step 16**.
- If the alarm fails to be cleared, go to **Step 17**.

Step 16 Log in to FusionInsight Manager, select **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations**, and click **All Configurations**. In the search box on the right, enter **log.retention.hours**. The value of the parameter indicates the default data retention time of the topic. You can change the value to a smaller one.

NOTE

- For a topic whose data retention time is configured alone, the modification of the data retention time on the Kafka service configuration page does not take effect.
- To modify the data retention time for a topic, use the Kafka client command-line interface (CLI).

  For example: **kafka-topics.sh --zookeeper "***ZooKeeper* **address :2181 /kafka" --alter --topic"** *Topic name*" **--config retention.ms="***Storage duration*"

Step 17 Check whether partitions are properly configured for topics. For example, if the number of partitions for a topic with a large data volume is smaller than the number of disks, data may be unevenly distributed to the disks and the usage of some disks will reach the upper limit.

NOTE

If you do not know which topics have a large amount of service data, perform the following steps:

1. Log in to an instance node based on the host node information obtained in **2**.
2. Go to the data directory (directory specified by **log.dirs** before the modification in **14**).
3. Check whether there is a topic with partition that uses large disk space.

- If yes, go to **Step 18**.
- If no, go to **Step 19**.

Step 18 On the Kafka client, add partitions to the topics.

kafka-topics.sh --zookeeper "*ZooKeeperaddress***:2181 /kafka" --alter --topic"***Topic name*" **--partitions="***Number of new partitions*"

NOTE

- You are advised to set the new number of partitions to a multiple of the number of Kafka data disks.
- The step may not quickly clear the alarm, and you need to modify the data retention time in **Step 11** to gradually balance data allocation.

Step 19 Determine whether to perform capacity expansion.

NOTE

You are advised to perform capacity expansion for Kafka when the current disk usage exceeds 80%..

- If yes, go to **Step 20**.
- If no, go to **Step 21**.

Step 20 Expand the disk capacity and check whether the alarm is cleared after capacity expansion.

- If yes, no further action is required.
- If no, go to **Step 22**.

Step 21 Check whether the alarm is cleared.

- If yes, no further action is required.
- If yes, go to **Step 22**.

Collect fault information.

Step 22 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 23 Expand the **Service** drop-down list, and select **Kafka** for the target cluster.

Step 24 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 25 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

Step 1 Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instances**, stop the Broker instance in the **Restoring** state, and record the management IP address of the node where the instance is deployed and the corresponding **broker.id**. You can click the role name to view the value, on the **Configurations** page, select **All Configurations** and search for the **broker.id** parameter.

Step 2 Log in to the management IP address recorded as the **root** user and run the **df -lh** command to view the mount directory whose disk usage is 100%, for example, **${BIGDATA_DATA_HOME}/kafka/data1**.

Step 3 Go to the directory, run the **du -sh *** command to view the size of each file in the directory. Check whether there are files in addition to the files in the **kafka-logs** directory, and determine whether these files can be deleted or migrated.

- If yes, delete or migrate related data and go to **Step 8**.
- If no, go to **Step 4**.

Step 4 Go to the **kafka-logs** directory, run the **du -sh *** command, select a partition folder to be moved. The naming rule is **Topic name-Partition ID**. Record the topic and partition.

Step 5 Modify the **recovery-point-offset-checkpoint** and **replication-offset-checkpoint** files in the **kafka-logs** directory in the same way.

1. Decrease the number in the second line in the file. (To remove multiple directories, the number deducted is equal to the number of files to be removed.)
2. Delete the line where the partition to be removed is. (The line is in "*Topic name Partition ID Offset*" format. Save the data before deletion. The content must be added to the file of the same name in the destination directory.)

Step 6 Modify the **recovery-point-offset-checkpoint** and **replication-offset-checkpoint** files in the destination data directory (for example, **${BIGDATA_DATA_HOME}/kafka/data2/kafka-logs**) in the same way.

- Increase the number in the second line in the file. (To move multiple directories, the number added must be equal to the number of files to be moved.)
- Add the partition to the end of the file. (The line structure is "Topic name Partition ID Offset". You can copy the line data saved in **Step 5**.)

Step 7 Move the partition to the destination directory. After the partition is moved, run the **chown omm:wheel -R** *Partition directory* command to modify the directory owner group for the partition.

Step 8 Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instances** to start the stopped Broker instance.

Step 9 Wait for 5 to 10 minutes and check whether the health status of the Broker instance is **Good**.

- If yes, rectify the fault by following the handling suggestion of ALM-38001 Insufficient Kafka Disk Capacity.
- If no, contact O&M engineers.

----End

11.238 ALM-38002 Kafka Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the Kafka service status every 30 seconds. The alarm is generated when the heap memory usage of a Kafka instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the heap memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the heap memory usage is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
38002	Major (default value: 95%) Critical (default value: 100%)	Quality of service	Kafka	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service name for which the alarm is generated.
	RoleName	Specifies the role name for which the alarm is generated.
	HostName	Specifies the object (host ID) for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the Kafka service is insufficient, a memory overflow occurs and the broker instance breaks down. As a result, the broker cannot provide read and write services properly.

Possible Causes

The heap memory of the Kafka instance is overused or the heap memory is inappropriately allocated.

Handling Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Kafka Heap Memory Usage Exceeds the Threshold** > **Location**. Check the host name of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Process** > **Heap Memory Usage of Kafka**, and click **OK**.

Step 3 Check whether the used heap memory of Kafka reaches 95% of the maximum heap memory specified for Kafka.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Check the heap memory size configured for Kafka.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations**> **Broker(Role)** > **Environment**. Increase the value of **KAFKA_HEAP_OPTS** by referring to the Note.

NOTE

- It is recommended that **-Xmx** and **-Xms** be set to the same value.
- You are advised to view **Heap Memory Usage of Kafka** by referring to **Step 2**, and set the value of **KAFKA_HEAP_OPTS** to twice the value of **Heap Memory Used by Kafka.**

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.239 ALM-38004 Kafka Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the Kafka service every 30 seconds. This alarm is generated when the direct memory usage of a Kafka instance exceeds the threshold for 10 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the direct memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the direct memory usage is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
38004	Major (default value: 95%) Critical (default value: 100%)	Quality of service	Kafka	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the Kafka service is insufficient, a memory overflow occurs and the broker instance breaks down. As a result, the broker cannot provide read and write services properly.

Possible Causes

The direct memory of the Kafka instance is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Kafka Direct Memory Usage Exceeds the Threshold** > **Location** to check the host name of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the Chart area and choose **Customize** > **Process** > **Kafka Direct Memory Usage**, and click **OK**.

Step 3 Check whether the used direct memory of Kafka reaches 80% of the maximum direct memory specified for Kafka.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Check the direct memory size configured for the Kafka.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations** > **Broker(Role)** > **Environment** to increase the value of **-Xmx** configured in the **KAFKA_HEAP_OPTS** parameter by referring to the Note.

NOTE

- It is recommended that **-Xmx** and **-Xms** be set to the same value.
- You are advised to view **Kafka Direct Memory Usage** by referring to **Step 2**, and set the value of **KAFKA_HEAP_OPTS** to twice the value of **Direct Memory Used by Kafka.**

Step 5 Save the configuration and restart the Kafka service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.240 ALM-38005 GC Duration of the Broker Process Exceeds the Threshold

Alarm Description

The system checks the garbage collection (GC) duration of the Broker process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default) for 3 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the GC duration is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the GC duration is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
38005	Major (default value: 10s) Critical (default value: 12s)	Quality of service	Kafka	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the Broker process may fail to provide read and write services.

Possible Causes

The Kafka GC duration of the node is too long or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Handling Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **GC Duration of the Broker Process Exceeds the Threshold** > **Location**. Check the host name of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Process** > **Broker GC Duration per Minute**, and click **OK**.

Step 3 Check whether the GC duration of the Broker process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Check the direct memory size configured for the Kafka.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations** > **Broker(Role)** > **Environment** to increase the value of **-Xmx** configured in the **KAFKA_HEAP_OPTS** parameter by referring to the Note.

NOTE

- It is recommended that **-Xmx** and **-Xms** be set to the same value.
- You are advised to set the value of **KAFKA_HEAP_OPTS** to twice the value of **Direct Memory Used by Kafka.**

  On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **Process** > **Kafka Direct Memory Resource Status** to check the value of **Direct Memory Used by Kafka**.

Step 5 Save the configuration and restart the Kafka service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.241 ALM-38006 Percentage of Kafka Partitions That Are Not Completely Synchronized Exceeds the Threshold

Alarm Description

The system checks the percentage of Kafka partitions that are not completely synchronized to the total number of partitions every 60 seconds. This alarm is generated when the percentage exceeds the threshold for 3 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the percentage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the percentage is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
38006	Critical (default threshold: 60%) Major (default threshold: 50%)	Quality of service	Kafka	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Too many Kafka partitions that are not completely synchronized affect service reliability. In addition, data may be lost when leaders are switched.

Possible Causes

Some nodes where the Broker instance resides are abnormal or stop running. As a result, replicas of some partitions in Kafka are out of the in-sync replicas (ISR) set.

Handling Procedure

Check Broker instances.

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. The Kafka instances page is displayed.

Step 2 Check whether faulty nodes exist among all Broker nodes.

- If yes, record the host name of the node and go to **Step 3**.

- If no, go to **Step 5**.

Step 3 On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms** to check whether the fault described in **Step 2** exists in the alarm information and handle the alarm based on corresponding methods.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. The Kafka instances page is displayed.

Step 5 Check whether stopped nodes exist among all Broker instance.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Select all stopped Broker instances and click **Start Instance**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 9 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.242 ALM-38007 Status of Kafka Default User Is Abnormal

Alarm Description

The system checks the default user of Kafka every 60 seconds. This alarm is generated when the system detects that the user status is abnormal.

Trigger Count is set to **1**. This alarm is cleared when the user status becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
38007	Critical	Quality of service	Kafka	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host name for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the Kafka default user status is abnormal, metadata synchronization between Brokers and interaction between Kafka and ZooKeeper will be affected, affecting service production, consumption, and topic creation and deletion.

Possible Causes

- The Sssd service is abnormal.
- Some Broker instances stop running.

Handling Procedure

Check whether the Sssd service is abnormal.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Status of Kafka Default User Is Abnormal** > **Location** to check the host name of the instance for which the alarm is generated.

Step 2 Find the host information in the alarm information and log in to the host.

Step 3 Run the **id -Gn kafka** command and check whether "No such user" is displayed in the command output.

- If yes, record the host name of the node and go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Alarms**. Check whether there is **Sssd Service Exception** in the alarm information. If there is, handle the alarm based on alarm information.

Check the running status of the Broker instance.

Step 5 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. The Kafka instance page is displayed.

Step 6 Check whether there are stopped nodes on all Broker instances.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 Select all stopped Broker instances and click **Start Instance**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 In the **Service** area, select **Kafka** in the required cluster.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.243 ALM-38008 Abnormal Kafka Data Directory Status

Alarm Description

The system checks the Kafka data directory status every 60 seconds. This alarm is generated when the system detects that the status of a data directory is abnormal.

Trigger Count is set to **1**. This alarm is cleared when the data directory status becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
38008	Major	Quality of service	Kafka	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host name for which the alarm is generated.
	DirName	Specifies the directory name for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the Kafka data directory status is abnormal, the current replicas of all partitions in the data directory are brought offline, and the data directory status of multiple nodes is abnormal at the same time. As a result, some partitions may become unavailable.

Possible Causes

- The data directory permission is tampered with.
- The disk where the data directory is located is faulty.

ProcedureHandling Procedure

Check the permission on the faulty data directory.

Step 1 Find the host information in the alarm information and log in to the host.

Step 2 In the alarm information, check whether the data directory and its subdirectories belong to the omm:wheel group.

- If yes, record the host name of the node and go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Restore the owner group of the data directory and its subdirectories to omm:wheel.

- If yes, go to **Step 6**.
- If no, go to **Step 5**.

Check whether the disk where the data directory is located is faulty.

Step 4 In the upper-level directory of the data directory, create and delete files as user **omm**. Check whether data read/write on the disk is normal.

Step 5 Replace or repair the disk where the data directory is located to ensure that data read/write on the disk is normal.

Step 6 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. On the Kafka instance page that is displayed, restart the Broker instance on the host recorded in **Step 2**.

Step 7 After Broker is started, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 9 In the **Service** area, select **Kafka** in the required cluster.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.244 ALM-38009 Busy Broker Disk I/Os

Alarm Description

The system checks the I/O status of each Kafka disk every 60 seconds. This alarm is generated when the disk I/O of a Kafka data directory on a broker exceeds the threshold (80% by default).

Its **Trigger Count** is **3**. This alarm is cleared when the disk I/O is lower than the threshold (80% by default).

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
38009	Major	Quality of service	Kafka	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	DataDirectory Name	Specifies the name of the Kafka data directory with frequent disk I/Os.

Impact on the System

The disk partition has frequent I/Os. Data may fail to be written to the Kafka topic for which the alarm is generated.

Possible Causes

- There are many replicas configured for the topic.
- The parameter for batch writing producer's messages is inappropriately configured. The service traffic of this topic is too heavy, and the current partition configuration is inappropriate.

Handling Procedure

Check the number of topic replicas.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Locate the row that contains this alarm, click ⌄, and view the host name in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, choose **Services** > **Kafka** > **KafkaTopic Monitor**, search for the topic for which the alarm is generated, and check the number of replicas.

Step 3 Reduce the replication factors of the topic (for example, reduce to **3**) if the number of replicas is greater than 3.

Run the following command on the FusionInsight client to replan the replicas of Kafka topics:

kafka-reassign-partitions.sh --zookeeper *{zk_host}:{port}*/**kafka --reassignment-json-file** *{manual assignment json file path}* **--execute**

For example:

/opt/client/Kafka/kafka/bin/kafka-reassign-partitions.sh --zookeeper 10.149.0.90:2181,10.149.0.91:2181,10.149.0.92:2181/kafka --reassignment-json-file expand-cluster-reassignment.json --execute

NOTE

In the **expand-cluster-reassignment.json** file, describe the brokers to which the partitions of the topic are migrated in the following format: {"partitions":[{"topic": "*topicName*","partition": 1,"replicas": [1,2,3] }],"version":1}

Step 4 Observe for a period of time and check whether the alarm is cleared. If the alarm persists, go to **Step 5**.

Check the partition planning of the topic.

Step 5 On the **KafkaTopic Monitor** page, view **Topic Input Traffic** in the **Topic Traffic** area of each topic, obtain the topic with the largest value, and check the partitions of this topic as well as information about the host of these partitions.

Step 6 Log in to the host queried in **Step 5** and run the **iostat -d -x** command to check the **%util** value of each disk.

```
          :/opt/R3/FusionInsight_Manager/software/packs # iostat -d -x
Linux 3.0.76-0.11-default (189-39-172-162)      06/26/19        _x86_64_

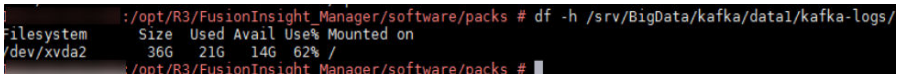
Device:         rrqm/s   wrqm/s     r/s     w/s    rsec/s    wsec/s avgrq-sz avgqu-sz   await  svctm  %util
xvda              0.04    44.44    1.26   21.94     43.62    531.02    24.78     0.03    1.44   0.56   1.30
xvde              0.16   431.84   13.78   82.51    284.32   4115.90    45.70     0.06    1.41   0.64   6.21
```

- If the **%util** value of each disk exceeds the threshold (**80%** by default), expand the Kafka disk capacity. After the capacity expansion, replan the topic partitions by referring to **Step 3**.
- If the **%util** values of the disks vary greatly, check the disk partition configuration of Kafka. For example, check the value of **log.dirs** in the **${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/1_14_Broker/etc/server.properties** file.

  Run the following command to view the **Filesystem** information:

  df -h *log.dirs value*

The command output is as follows.



- If the partition where Filesystem is located matches the partition with a high **%util** value, plan Kafka partitions on idle disks, configure **log.dirs** as an idle disk directory, and replan topic partitions by referring to **Step 3**. Ensure that the partitions of the topic are evenly distributed to each disk.

Step 7 Observe for a period of time and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, repeat **Step 5** to **Step 6** three times. Then, go to **Step 8**.

Step 8 Observe for a period of time and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **Kafka** for the target cluster.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.245 ALM-38010 Topics with Single Replica

Alarm Description

The system checks the number of replicas of each topic every 60 seconds on the node where the Kafka Controller resides. This alarm is generated when there is one replica for a topic.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
38010	Major	Quality of service	Kafka	No

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	TopicName	Specifies the list of topics for which the alarm is generated.

Impact on the System

There is the single point of failure (SPOF) risk for topics with only one replica. When the node where the replica resides becomes abnormal, the partition does not have a leader, and services on the topic are affected.

Possible Causes

- The number of replicas for the topic is incorrectly configured.

Handling Procedure

Check the number of replicas for the topic.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, click ⌄ of this alarm, and view the **TopicName** list in **Location**.

Step 2 Check whether replicas need to be added for the topic for which the alarm is generated.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 On the FusionInsight client, re-plan topic replicas and describe the partition distribution of the topic in the **add-replicas-reassignment.json** file in the following format: {"partitions":[{"topic": "*topic name*","partition": 1,"replicas": [1,2] }],"version":1}. Then, run the following command to add replicas:

kafka-reassign-partitions.sh --zookeeper *{zk_host}:{port}*/**kafka --reassignment-json-file** *{manual assignment json file path}* **--execute**

For example:

/opt/client/Kafka/kafka/bin/kafka-reassign-partitions.sh --zookeeper 192.168.0.90:2181,192.168.0.91:2181,192.168.0.92:2181/kafka --reassignment-json-file add-replicas-reassignment.json --execute

Step 4 Run the following command to check the task execution progress:

kafka-reassign-partitions.sh --zookeeper *{zk_host}:{port}*/**kafka --reassignment-json-file** *{manual assignment json file path}* **--verify**

For example:

/opt/client/Kafka/kafka/bin/kafka-reassign-partitions.sh --zookeeper 192.168.0.90:2181,192.168.0.91:2181,192.168.0.92:2181/kafka --reassignment-json-file add-replicas-reassignment.json --verify

Step 5 After completing the handling operations or confirming that the alarm has no impact, manually clear the alarm on FusionInsight Manager.

Step 6 After a period of time, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 In the **Service** area, select **Kafka** in the required cluster.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

If the alarm has no impact, manually clear the alarm.

Related Information

None.

11.246 ALM-38011 User Connection Usage on Broker Exceeds the Threshold

Alarm Description

The system checks the number of connections of each user on Broker every 30 seconds. This alarm is generated when the connection usage of a user on the Broker exceeds the thresholdfor 5 consecutive times.

The number of times that smoothing is performed is **5**. This alarm is cleared when the connection usage of a user on the Broker is less than the threshold.

The alarm can be automatically cleared. However, if the number of connections of a user suddenly becomes **0** and no connection is created, the alarm cannot be automatically cleared. You need to manually clear it.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
38011	Critical (default threshold: 90%) Major (default threshold: 85%)	Quality of service	Kafka	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
	UserName	Specifies the username for which the alarm is generated.

Impact on the System

If the number of connections of a user is excessive, the user cannot create new connections to the Broker.

Possible Causes

- The number of connections (created by a user) used by the client exceeds the preset threshold.
- The threshold for the connection usage does not meet service requirements.

Handling Procedure

Check the number of connections established by the same user on the client.

Step 1 On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Alarms** > **User Connection Usage on Broker Exceeds the Threshold**. Check the host name and username of the Broker instance for which the alarm is generated in **Location**.

Step 2 On FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area, choose **Customize > Other**, and select **User Connection Usage on Broker**, **Maximum Number of User Connections on Broker**, and **Number of User Connections on Broker** to view the number of the current user connections on the Broker.

Step 3 Observe the number of real-time connections of the current alarm user and check whether the real-time monitoring data of the current user exists.

- If yes, go to **Step 4**.
- If no, the current user has disconnected all connections. You need to clear the alarm manually, and no further action is required.

  NOTE

  After the alarm user disconnects all connections, the monitoring data of the user disappears. In this case, the alarm will not be automatically cleared. You need to manually clear it.

Step 4 Check whether the user is authorized by the service side.

If yes, go to **Step 7**.

If no, go to **Step 5**.

Step 5 Run the following command on the client to limit the number of connections of the user. There are two configuration rules based on the following commands:

1. For the specific Broker and user, run the following command:

   kafka-configs.sh --bootstrap-server *<broker ip:port>* **--alter --add-config 'max.connections.per.user.overrides=[***<username>***:***<connection.number>***]' --entity-type brokers --entity-name** *<broker.id>* **--command-config Kafka/kafka/config/producer.properties**

NOTE

For unauthorized users, confirm with the service side to reduce the maximum number of connections of an unauthorized user or set the maximum number of connections to **0**.

In the command, you need to specify the IP address and port number of Broker, set values of configuration items, and specify the **brokerId** and **username**. Here, the user refers to the authorized Kerberos user.

The configuration updated using the command line tool can take effect dynamically. The configuration becomes invalid after the service is restarted. To make the configuration take effect after the restart, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations**> **Broker** > **Server** on the FusionInsight Manager home page and update the configuration to **max.connections.per.user.overrides**.

2. For the specific use and default Broker (that is, all Broker instances in the cluster), run the following command:

   kafka-configs.sh --bootstrap-server *<broker ip:port>* **--alter --add-config 'max.connections.per.user.overrides=[***<username>***:***<connection.number>***]' --entity-type brokers ---entity-default --command-config Kafka/kafka/config/client.properties**

   Example:

   kafka-configs.sh --bootstrap-server 10.153.3.26:21007 --alter --add-config 'max.connections.per.user.overrides=[showcase:4]' --entity-type brokers --entity-name 1 --command-config Kafka/kafka/config/client.properties

Step 6 Check whether the maximum number of connections is **0** and whether the number of connections of the current user decreases or remains unchanged according to **Step 2**.

- If yes, manually clear the alarm and no further action is required.
- If no, go to **Step 7**.

Step 7 Check whether the number of real-time connections and connection usage of the current user are sharply increased when they are compared with historical data, and whether have exceeded the specified maximum number of connections.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

NOTE

If there is an obvious increase after the comparison and the maximum number of connections has reached the preset value, the connections of the user may be abnormal. You need to confirm with the service party.

Check whether the number of user connections meets service requirements.

Step 8 Check whether the number of connections of the user meets service requirements.

- If yes, go to **Step 9**.
- If no, contact the service party to rectify the fault.

NOTE

If the number of user connections is abnormal, contact the service party to rectify the fault from the following aspects:

- Check whether new services are added so that the number of user connections increases sharply.
- Check whether handle leakage occurs on the code at the service side.

Step 9 Consider whether to increase the maximum number of connections of the user.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 Increase the maximum number of connections based on the service requirements. Set the number of connections of the user on the Kafka client. For details, see **Step 5**.

Step 11 Wait for several minutes and then check whether the alarm is automatically cleared.

- If yes, go to **Step 12**.
- If no, go to **Step 2**.

Step 12 Determine whether to add the user to the whitelist based on service requirements on the service side.

- If yes, go to **Step 13**.
- If no, go to **Step 15**.

NOTE

To add a user to the whitelist, you need to restart the Kafka service. However, this operation will cause service interruption and affect service running. Therefore, you must confirm with the service side before performing this operation.

Step 13 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations** > **Broker(Role)** > **Server** to add the user to the **max.connections.per.user.whitelist** configuration item.

Step 14 Restart the service for the modification to take effect. In addition, you need to manually clear the alarm, and no further action is required.

Collect the fault information.

Step 15 On the FusionInsight Manager homepage, choose **O&M** > **Log** > **Download**.

Step 16 Expand the **Service** drop-down list, and select **Kafka** for the target cluster.

Step 17 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact the O&M engineers and send the collected fault logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.247 ALM-41007 RTDService Unavailable

Alarm Description

The system checks the RTDService service status every 60 seconds. This alarm is generated when all RTDService services are abnormal and the RTDService service is unavailable.

This alarm is cleared when the RTDService service becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
41007	Critical	Quality of service	RTDService	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	Host Name	Specifies the name of the host for which the alarm is generated.

Impact on the System

RTDService cannot provide services for external systems. The RTD console cannot be accessed, and functions such as modifying tenants and event sources are unavailable.

Possible Causes

- The disk or memory usage exceeds 90%.
- The RTDService process is faulty.

Handling Procedure

Check the disk and memory usage.

Step 1 On FusionInsight Manager, choose O&M > Alarm > RTDService Service Unavailable to view and record the host name reported in Location Info.

Step 2 Click Host, view the node corresponding to the host for which the alarm is generated, and log in to the faulty node as the **root** user.

Step 3 Run the **df -h** command to check whether the disk space usage exceeds 90%.

- If yes, clear the space and go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Wait for 10 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Run the **free -m** command to check whether the memory usage exceeds 90%.

NOTE

The memory usage is calculated as follows: Actual memory usage (values in the -/+ buffers/cache row and used column) divided by total.

```
[root@xxx FusionInsight_RTD_xxx]# free -m
              total        used        free      shared  buff/cache   available
Mem:          64263        7140       22633        5485       34490       46393
Swap:             0           0           0
```

- If yes, expand the memory capacity and go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Wait for 10 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check the RTDService process.

Step 7 Log in to the node corresponding to the host for which the alarm is generated as the **root** user.

Step 8 Perform to check whether the RTDService process exists.

ps -aux | grep tomcat | grep RTDServer

- If yes, record the PID and go to **Step 10**.
- If no, log in to FusionInsight Manager and choose **Cluster** > **Services** > **RTDService**. On the page that is displayed, choose **More** > **Restart Service** to restart the RTDService service. Then, go to **Step 9**.

Step 9 Wait for 10 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, run the **Step 8** command again to query the RTDService process. If the process still does not exist, go to **Step 12**.

Step 10 Run the following command to check whether the process status is **D**:

cat /proc/*pid*/status |grep -i state

- If yes, run the **reboot** command to restart the host. Then, go to **Step 11**.
- If no, go to **Step 12**.

Step 11 Wait for 10 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 13 Select **RTDService** for **Service** and click **OK**.

Step 14 In the **Hosts** area, select the host where the role is located.

Step 15 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M personnel/Technical support and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.248 ALM-43001 Spark Service Unavailable

Alarm Description

The system checks the Spark service status every 300 seconds. This alarm is generated when the Spark service is unavailable.

This alarm is cleared when the Spark service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43001	Critical	Error handling	Spark	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Spark tasks submitted by users fail to be executed.

Possible Causes

- The KrbServer service is abnormal.
- The LdapServer service is abnormal.
- The ZooKeeper service is abnormal.
- The HDFS service is abnormal.
- The Yarn service is abnormal.
- The corresponding Hive service is abnormal.
- The Spark assembly package is abnormal.
- The NameNode memory is insufficient.
- The memory of the Spark process is insufficient.

Handling Procedure

If the alarm is caused due to the abnormal Spark assembly package, wait about 10 minutes, and the alarm will be automatically cleared.

Check whether any service unavailability alarms have been generated for the services that Spark depends on.

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**.

Step 2 Check whether the following alarms exist in the alarm list:

- ALM-25500 KrbServer Service Unavailable
- ALM-25000 LdapServer Service Unavailable
- ALM-13000 ZooKeeper Service Unavailable
- ALM-14000 HDFS Service Unavailable
- ALM-18000 Yarn Service Unavailable

- ALM-16004 Hive Service Unavailable
- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Handle the alarms by following the instructions provided in the alarm help.

After those alarms are cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the NameNode memory is insufficient.

Step 4 Check whether the NameNode memory is insufficient.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Restart the NameNode to release the memory. Then, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the memory of the Spark process is insufficient.

Step 6 Check whether the memory of the Spark process is insufficient due to memory-related modifications.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 Ensure that the memory of the Spark process is sufficient or expand the cluster capacity. Then, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select the following services for the target cluster (Hive is determined based on **ServiceName** in the alarm location information):

- KrbServer
- LdapServer
- ZooKeeper
- HDFS
- Yarn
- Hive

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.249 ALM-43006 Heap Memory Usage of the JobHistory Process Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the JobHistory process every 30 seconds. A major alarm is reported when the heap memory usage is greater than 95% of the maximum memory. A minor alarm is reported when the usage is greater than 85% and less than 95% of the maximum memory.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43006	Major (default threshold: 95% of the maximum memory) Major (default threshold: 85% of the maximum memory)	Quality of service	Spark	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the direct memory usage of the JobHistory process is too high, the performance deteriorates, and the process even becomes unavailable due to memory overflow. When it is unavailable, execution records of Spark tasks cannot be queried.

Possible Causes

The heap memory of the JobHistory process is overused or the heap memory is inappropriately allocated.

Handling Procedure

Check the heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43006**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance**. Click the JobHistory that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **JobHistory Memory Usage Statistics** > **OK**. Check whether the heap memory used by the process reaches the maximum heap memory threshold (95% by default).

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance**. Click the JobHistory that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **Heap Memory Statistics for the heap memory of the JobHistory process** > **OK**. Based on the alarm generation time, check the values of the used heap memory of the process in the corresponding period and obtain the maximum value.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > Spark > **Configurations**, click **All Configurations**, and select **JobHistory** > **Default**. The default value of **SPARK_DAEMON_MEMORY** is **4G**. You can change the value based on the ratio of the maximum JobHistory heap memory usage to the threshold specified by **JobHistoryHeap Memory Usage Statistics (JobHistory)** in the alarm period. If the alarm persists after the parameter value is changed, increase the value by 0.5 times. If the alarm is generated frequently, increase the value by one time.

NOTE

On FusionInsight Manager, you can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark** > **Memory** > **Spark Heap Memory Usage Statistics (Spark)** to view the threshold.

Step 5 Restart all JobHistory instances.

Step 6 Check whether the alarm is cleared 10 minutes later.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault Information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Spark** for the target cluster.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.250 ALM-43007 Non-Heap Memory Usage of the JobHistory Process Exceeds the Threshold

Alarm Description

The system checks the non-heap memory usage of the JobHistory process every 30 seconds. A major alarm is reported when the non-heap memory usage is greater than 95% of the maximum memory. A minor alarm is reported when the usage is greater than 85% and less than 95% of the maximum memory.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43007	Major (default threshold: 95% of the maximum memory) Major (default threshold: 85% of the maximum memory)	Quality of service	Spark	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the non-heap memory usage of the JobHistory process is too high, the performance deteriorates, and the process even becomes unavailable due to memory overflow. When it is unavailable, execution records of Spark tasks cannot be queried.

Possible Causes

The non-heap memory of the JobHistory process is overused or the non-heap memory is inappropriately allocated.

Handling Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43007**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance**. Click the JobHistory that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **JobHistory Memory Usage Statistics** > **OK**. Check whether the non-heap memory used by the process reaches the maximum non-heap memory threshold (95% by default).

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance**. Click the JobHistory that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **Statistics for the non-heap memory of the JobHistory process** > **OK**. Based on the alarm generation time, check the values of the used non-heap memory of the process in the corresponding period and obtain the maximum value.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > Spark > **Configurations**, click **All Configurations**, select **Default**, and change the value of **-XX:MaxMetaspaceSize** in the **SPARK_DAEMON_JAVA_OPTS** parameter based on the ratio of the maximum non-heap memory usage to the threshold specified by **JobHistory Non-Heap Memory Usage Statistics (JobHistory)** in the alarm period.

NOTE

On FusionInsight Manager, you can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark** > **Memory** > **Spark Non-Heap Memory Usage Statistics (Spark)** to view the threshold.

Step 5 Restart all JobHistory instances.

Step 6 Check whether the alarm is cleared 10 minutes later.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault Information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Spark** for the target cluster.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.251 ALM-43008 Direct Memory Usage of the JobHistory Process Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the JobHistory process every 30 seconds. A major alarm is reported when the direct memory usage is greater than 95% of the maximum memory. A minor alarm is reported when the usage is greater than 85% and less than 95% of the maximum memory.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43008	Major (default threshold: 95% of the maximum memory) Major (default threshold: 85% of the maximum memory)	Quality of service	Spark	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.

Type	Parameter	Description
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the direct memory usage of the JobHistory process is too high, the performance deteriorates, and the process even becomes unavailable due to memory overflow. When it is unavailable, execution records of Spark tasks cannot be queried.

Possible Causes

The direct memory of the JobHistory process is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43008**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance**. Click the JobHistory that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **JobHistory Memory Usage Statistics** > **OK**. Check whether the direct memory used by the process reaches the maximum direct memory threshold (95% by default).

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance**. Click the JobHistory that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Direct Memory of JobHistory** > **OK**. Based on the alarm generation time, check the values of the used direct memory of the process in the corresponding period and obtain the maximum value.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Configurations** > **All Configurations** > **JobHistory** > **Default**. You can change the value of **XX:MaxDirectMemorySize** (the default value is 512 MB) in the **SPARK_DAEMON_JAVA_OPTS** parameter based on the ratio of the maximum direct memory used by the JobHistory process to the threshold specified by **JobHistory Direct Memory Usage Statistics (JobHistory)** in the alarm period. If the alarm persists after the parameter value is changed, increase the value by

0.5 times. If the alarm is generated frequently, double the rate. It is recommended that the rate be less than or equal to the value of the **SPARK_DAEMON_MEMORY** parameter.

NOTE

On FusionInsight Manager, you can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark** > **Memory** > **JobHistory Non-Heap Memory Usage Statistics (JobHistory)** to view the threshold.

Step 5 Restart all JobHistory instances.

Step 6 Check whether the alarm is cleared 10 minutes later.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault Information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Spark** for the target cluster.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.252 ALM-43009 JobHistory Process GC Duration Exceeds the Threshold

Alarm Description

The system checks the GC duration of JobHistory every 60 seconds. A major alarm is reported when the GC duration exceeds 12 seconds for three consecutive times. A minor alarm is reported when the duration exceeds 9.6 seconds for three consecutive times. To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark** > **GC Time** > **JobHistory Total GC time**. This alarm is cleared when the JobHistory GC duration is shorter than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43009	Minor (default threshold: 9.6 seconds for three consecutive times) Minor (default threshold: 12 seconds for three consecutive times)	Quality of service	Spark	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

The process performance deteriorates, and the process can even be unavailable. Historical execution records of Spark tasks cannot be queried.

Possible Causes

The heap memory of the JobHistory process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43009**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance** and click the JobHistory for which the alarm is generated to enter the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **GC Time** > **Garbage Collection (GC) Time of JobHistory** from the drop-down list box in the upper right corner and click **OK** to check whether the GC duration is longer than the threshold (default value: 12 seconds).

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > Spark > **Configurations**, click **All Configurations**, and select **Default**. Increase the value of **SPARK_DAEMON_MEMORY** (4 GB by default) by 0.5 times if this alarm is generated occasionally. Double the value if the alarm is reported frequently.

Step 4 Restart all JobHistory instances.

Step 5 Check whether the alarm is cleared 10 minutes later.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault Information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Spark** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.253 ALM-43010 Heap Memory Usage of the JDBCServer Process Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the JDBCServer processes every 30 seconds.

A major alarm is reported when the usage is greater than 85% and less than 95% of the maximum memory. A critical alarm is reported when the usage is greater than the 95% of the maximum memory.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43010	Major (default threshold: 85% of the maximum memory) Critical (default threshold: 95% of the maximum memory.)	Quality of service	Spark	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the heap memory usage of the JDBCServer process is too high, the performance deteriorates, and even memory overflow occurs. As a result, the JDBCServer process is unavailable, and Spark JDBC tasks are slow or fail to run.

Possible Causes

The heap memory of the JDBCServer process is overused or the heap memory is inappropriately allocated.

Handling Procedure

Check the heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43010**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance**. Click the JDBCServer that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **JDBCServer Memory Usage Statistics** > **OK**. Check whether the heap memory used by the process reaches the maximum heap memory threshold (95% by default).

- If the threshold is reached, go to **Step 3**.
- If the threshold is not reached, go to **Step 7**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance**. Click the JDBCServer that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Statistics for the heap memory of the JDBCServer process** > **OK**. Based on the alarm generation time, check the values of the used heap memory of the process in the corresponding period and obtain the maximum value.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Configurations** > **All Configurations** > **JDBCServer** > **Performance**. The default value of the **SPARK_DRIVER_MEMORY** parameter is 4 GB. You can change the value based on the ratio of the maximum heap memory used by the JDBCServer process to the threshold specified by **JDBCServer Heap Memory Usage Statistics (JDBCServer)** in the alarm period. If the alarm persists after the parameter value is changed, increase the value by 0.5 times. If the alarm is generated frequently, increase the value by one time. In the case of large service volume and high service concurrency, you are advised to add instances.

NOTE

On FusionInsight Manager, you can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark** > **Memory** > **JDBCServer Heap Memory Usage Statistics (JDBCServer)** to view the threshold.

Step 5 Restart all JDBCServer instances.

Step 6 Check whether the alarm is cleared 10 minutes later.

- If yes, no further action is required.
- If the threshold is not reached, go to **Step 7**.

Collect fault Information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Spark** for the target cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.254 ALM-43011 Non-Heap Memory Usage of the JDBCServer Process Exceeds the Threshold

Alarm Description

The system checks the non-heap memory usage of the JDBCServer process every 30 seconds.

A major alarm is reported when the usage is greater than 85% and less than 95% of the maximum memory. A critical alarm is reported when the usage is greater than 95% of the maximum memory.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43011	Major (default threshold: 85% of the maximum memory) Critical (default threshold: 95% of the maximum memory.)	Quality of service	Spark	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the non-heap memory usage of the JDBCServer process is too high, the performance deteriorates, and even memory overflow occurs. As a result, the JDBCServer process is unavailable, and Spark JDBC tasks are slow or fail to run.

Possible Causes

The non-heap memory of the JDBCServer process is overused or the non-heap memory is inappropriately allocated.

Handling Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43011**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance**. Click the JDBCServer that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **JDBCServer Memory Usage Statistics** > **OK**. Check whether the non-heap memory used by the process reaches the maximum non-heap memory threshold (95% by default).

- If yes, go to **Step 3**.
- If the threshold is not reached, go to **Step 7**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance**. Click the JDBCServer that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Statistics for the non-heap memory of the JDBCServer process** > **OK**. Based on the alarm generation time, check the values of the used non-heap memory of the process in the corresponding period and obtain the maximum value.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Configurations** > **All Configurations** > **JDBCServer** > **Performance**. You can change the value of **XX:MaxMetaspaceSize** in the **spark.driver.extraJavaOptions** parameter based on the ratio of the maximum non-heap memory used by the JDBCServer process to the threshold specified by **JDBCServerNon-Heap Memory Usage Statistics (JDBCServer)** in the alarm period.

NOTE

On FusionInsight Manager, you can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark** > **Memory** > **JDBCServer Non-Heap Memory Usage Statistics (JDBCServer)** to view the threshold.

Step 5 Restart all JDBCServer instances.

Step 6 Check whether the alarm is cleared 10 minutes later.

- If yes, no further action is required.
- If the threshold is not reached, go to **Step 7**.

Collect fault Information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Spark** for the target cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.255 ALM-43012 Direct Memory Usage of the JDBCServer Process Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the JDBCServer process every 30 seconds. A major alarm is reported if the usage is greater than 85% but less than 95% of the maximum memory. A critical alarm is reported if the usage is greater than 95% of the maximum memory.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43012	Major (default threshold: 85% of the maximum memory) Critical (default threshold: 95% of the maximum memory.)	Quality of service	Spark	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.

Type	Parameter	Description
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the direct memory usage of the JDBCServer process is too high, the performance deteriorates, and even memory overflow occurs. As a result, the JDBCServer process is unavailable, and Spark JDBC tasks are slow or fail to run.

Possible Causes

The direct memory of the JDBCServer process is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43012**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance**. Click the JDBCServer that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **JDBCServer Memory Usage Statistics** > **OK**. Check whether the direct memory used by the process reaches the maximum direct memory threshold.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance**. Click the JDBCServer that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Direct Memory of JDBCServer** > **OK**. Based on the alarm generation time, check the values of the used direct memory of the process in the corresponding period and obtain the maximum value.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Configurations** > **All Configurations** > **JDBCServer** > **Performance**. You can change the value of **XX:MaxDirectMemorySize** (the default value is 512 MB) in the **spark.driver.extraJavaOptions** parameter based on the ratio of the maximum direct memory used by the JDBCServer process to the threshold specified by **JDBCServerDirect Memory Usage Statistics (JDBCServer)** in the alarm period. If the alarm persists after the parameter value is changed, increase the value by 0.5 times. If the alarm is generated frequently, increase the value by one time. It is recommended that the parameter value be

less than or equal to the value of **SPARK_DRIVER_MEMORY**. In the case of large service volume and high service concurrency, you are advised to add instances.

NOTE

On FusionInsight Manager, you can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark** > **Memory** > **JDBCServer Non-Heap Memory Usage Statistics (JDBCServer)** to view the threshold.

Step 5 Restart all JDBCServer instances.

Step 6 Check whether the alarm is cleared 10 minutes later.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Spark** for the target cluster.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.256 ALM-43013 JDBCServer Process GC Duration Exceeds the Threshold

Alarm Description

The system checks the GC duration of JDBCServer every 60 seconds. A critical alarm is reported when the GC duration exceeds 12 seconds for three consecutive times. A major alarm is reported when the duration exceeds 9.6 seconds for three consecutive times. To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark** > **GC Time** > **JDBCServer Total GC time**. This alarm is cleared when the JDBCServer GC duration is shorter than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43013	Major (default threshold: 9.6 seconds for three consecutive times) Critical (default threshold: 12 seconds for three consecutive times)	Quality of service	Spark	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the GC duration exceeds the threshold, the performance of the JDBCServer process deteriorates, and the process can even be unavailable. As a result, Spark JDBC tasks are slow or fail to run.

Possible Causes

The heap memory of the JDBCServer process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43013**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance** and click the JDBCServer for which the alarm is generated to enter the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **GC Time** > **Garbage Collection (GC) Time of JDBCServer** from the drop-down list box in the upper right corner and click **OK** to check whether the GC time is longer than the threshold (default value: 12 seconds).

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > Spark > **Configurations**, click **All Configurations**, and select **JDBCServer** > **Default**. The default value of **SPARK_DRIVER_MEMORY** is **4G**. If the alarm persists after the parameter value is changed, increase the value by 0.5 times. Double the value if the alarm is reported frequently. In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Restart all JDBCServer instances.

Step 5 Check whether the alarm is cleared 10 minutes later.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault Information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Spark** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.257 ALM-43017 JDBCServer Process Full GC Times Exceeds the Threshold

Alarm Description

The system checks the number of JDBCServer Full GC times every 60 seconds. A critical alarm is reported when the number exceeds 12 for three consecutive times. A major alarm is reported when the number exceeds 12 x 0.8 (rounded down) for three consecutive times. You can change the threshold by choosing **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark** > **GC Number** > **Full GC Number of JDBCServer**. This alarm is cleared when the Full GC times of the JDBCServer process is less than or equal to the threshold. This alarm is cleared when the Full GC times of the JDBCServer process is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43017	Major (default threshold: 9 for three consecutive times) Critical (default threshold: 12 for three consecutive times)	Quality of service	Spark	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Type	Parameter	Description
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the full GC times exceeds the threshold, the performance of the JDBCServer process deteriorates, and the process can even be unavailable. As a result, Spark JDBC tasks are slow or fail to run.

Possible Causes

The heap memory of the JDBCServer process is overused or inappropriately allocated, causing frequent occurrence of the full GC process.

Handling Procedure

Check the Full GC times.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43017**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance** and click the JDBCServer for which the alarm is generated to enter the **Dashboard** page. Click the drop-down menu in the chart area and choose **Customize** > **Full GC Number of JDBCServer** from the drop-down list box in the upper right corner and click **OK** to check whether the full GC times is larger than the threshold (default value: 12).

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Configurations** > **All Configurations** > **JDBCServer** > **Performance**. The default value of the **SPARK_DRIVER_MEMORY** is 4 GB. You can increase the value by 0.5 times if this alarm is generated occasionally. Double the value if the alarm is reported frequently. In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Restart all JDBCServer instances.

Step 5 Check whether the alarm is cleared 10 minutes later.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Spark** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.258 ALM-43018 JobHistory Process Full GC Times Exceeds the Threshold

Alarm Description

The system checks the number of JobHistory Full GC times every 60 seconds. A major alarm is reported when the number exceeds 12 for three consecutive times. A minor alarm is reported when the number exceeds 12 x 0.8 (rounded down) for three consecutive times. You can change the threshold by choosing **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark** > **GC Number** > **Full GC Number of JobHistory**. This alarm is cleared when the Full GC times of the process is less than or equal to the threshold. This alarm is cleared when the Full GC times of the JobHistory process is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43018	Minor (default threshold: 9 for three consecutive times) Major (default threshold: 12 for three consecutive times)	Quality of service	Spark	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

The process performance deteriorates, and the process can even be unavailable. Historical execution records of Spark tasks cannot be queried.

Possible Causes

The heap memory of the JobHistory process is overused or inappropriately allocated, causing frequent occurrence of the full GC process.

Handling Procedure

Check the Full GC times.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43018**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance** and click the JobHistory for which the alarm is generated to enter the **Dashboard** page. Click the drop-down menu in the chart area and choose **Customize** > **Full GC Number of JobHistory** from the drop-down list box in the upper right corner and click **OK** to check whether the full GC times is larger than the threshold (default value: 12).

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Configurations** > **All Configurations** > **JobHistory** > **Default**. The default value of the **SPARK_DAEMON_MEMORY** is 4 GB. You can increase the value by 0.5 times if this alarm is generated occasionally. Double the value if the alarm is reported frequently.

Step 4 Restart all JobHistory instances.

Step 5 Check whether the alarm is cleared 10 minutes later.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Spark** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.259 ALM-43019 Heap Memory Usage of the IndexServer Process Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the IndexServer process every 30 seconds. A major alarm is reported if the usage is greater than 85% but less than 95% of the maximum memory. A critical alarm is reported if the usage is greater than 95% of the maximum memory.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43019	Major (default threshold: 85% of the maximum memory) Critical (default threshold: 95% of the maximum memory.)	Quality of service	Spark	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Identifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the heap memory usage of the IndexServer process is too high, the performance deteriorates, and even memory overflow occurs. As a result, the IndexServer process is unavailable, and Carbon tasks with indexing enabled are slow or fail to run.

Possible Causes

The heap memory of the IndexServer process is overused or the heap memory is inappropriately allocated.

Handling Procedure

Check the heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43019**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance**. Click the IndexServer that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **IndexServer Memory Usage Statistics** > **OK**. Check whether the heap memory used by the process reaches the maximum heap memory threshold (95% by default).

- If the threshold is reached, go to **Step 3**.
- If the threshold is not reached, go to **Step 7**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance**. Click the IndexServer that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Statistics for the heap memory of the IndexServer process** > **OK**. Based on the alarm generation time, check the values of the used heap memory of the process in the corresponding period and obtain the maximum value.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Configurations** > **All Configurations** > **IndexServer** > **Performance**. The default value of the **SPARK_DRIVER_MEMORY** parameter is 4 GB. You can change the value based on the ratio of the maximum heap memory used by the IndexServer process to the threshold specified by **IndexServer Heap Memory Usage Statistics (IndexServer)** in the alarm period. If the alarm persists after the parameter value is changed, increase the value by 0.5 times. If the alarm is generated frequently, increase the value by one time.

NOTE

On FusionInsight Manager, you can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark** > **Memory** > **IndexServer Heap Memory Usage Statistics (IndexServer)** to view the threshold.

Step 5 Restart all IndexServer instances.

Step 6 Check whether the alarm is cleared 10 minutes later.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Spark** for the target cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

11.260 ALM-43020 Non-Heap Memory Usage of the IndexServer Process Exceeds the Threshold

Alarm Description

The system checks the non-heap memory usage of the IndexServer process every 30 seconds. A major alarm is reported if the usage is greater than 85% but less than 95% of the maximum memory. A critical alarm is reported if the usage is greater than 95% of the maximum memory.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43020	Major (default threshold: 85% of the maximum memory) Critical (default threshold: 95% of the maximum memory.)	Quality of service	Spark	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Identifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.

Type	Parameter	Description
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the non-heap memory usage of the IndexServer process is too high, the performance deteriorates, and even memory overflow occurs. As a result, the IndexServer process is unavailable, and Carbon tasks with indexing enabled are slow or fail to run.

Possible Causes

The non-heap memory of the IndexServer process is overused or the non-heap memory is inappropriately allocated.

Handling Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43020**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance**. Click the IndexServer that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **IndexServer Memory Usage Statistics** > **OK**. Check whether the non-heap memory used by the process reaches the maximum non-heap memory threshold (95% by default).

- If the threshold is reached, go to **Step 3**.
- If the threshold is not reached, go to **Step 7**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance**. Click the IndexServer that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Statistics for the non-heap memory of the IndexServer process** > **OK**. Based on the alarm generation time, check the values of the used non-heap memory of the process in the corresponding period and obtain the maximum value.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Configurations** > **All Configurations** > **IndexServer** > **Performance**. You can change the value of **XX:MaxMetaspaceSize** in the **spark.driver.extraJavaOptions** parameter based on the ratio of the maximum non-heap memory used by the IndexServer process to the threshold specified by

IndexServerNon-Heap Memory Usage Statistics (IndexServer) in the alarm period.

NOTE

On FusionInsight Manager, you can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark** > **Memory** > **IndexServer Non-Heap Memory Usage Statistics (IndexServer)** to view the threshold.

Step 5 Restart all IndexServer instances.

Step 6 Check whether the alarm is cleared 10 minutes later.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Spark** for the target cluster.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

11.261 ALM-43021 Direct Memory Usage of the IndexServer Process Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the IndexServer process every 30 seconds. A major alarm is reported if the usage is greater than 85% but less than 95% of the maximum memory. A critical alarm is reported if the usage is greater than 95% of the maximum memory.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43021	Major (default threshold: 85% of the maximum memory) Critical (default threshold: 95% of the maximum memory.)	Quality of service	Spark	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Identifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the direct memory usage of the IndexServer process is too high, the performance deteriorates, and even memory overflow occurs. As a result, the IndexServer process is unavailable, and Carbon tasks with indexing enabled are slow or fail to run.

Possible Causes

The direct memory of the IndexServer process is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check direct memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43021**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance**. Click the IndexServer that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **IndexServer Memory Usage Statistics** > **OK**. Check whether the direct memory used by the process reaches the maximum direct memory threshold.

- If the threshold is reached, go to **Step 3**.
- If the threshold is not reached, go to **Step 7**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **Direct Memory of IndexServer** > **OK**. Based on the alarm generation time, check the values of the used direct memory of the process in the corresponding period and obtain the maximum value.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Configurations** > **All Configurations** > **IndexServer** > **Performance**. You can change the value of **XX:MaxDirectMemorySize** (the default value is 512 MB) in the **spark.driver.extraJavaOptions** parameter based on the ratio of the maximum direct memory used by the IndexServer process to the threshold specified by **IndexServer Direct Memory Usage Statistics (IndexServer)** in the alarm period. If the alarm persists after the parameter value is changed, increase the value by 0.5 times. If the alarm is generated frequently, increase the value by one time.

NOTE

On FusionInsight Manager, you can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark** > **Memory** > **IndexServer Non-Heap Memory Usage Statistics (IndexServer)** to view the threshold.

Step 5 Restart all IndexServer instances.

Step 6 Check whether the alarm is cleared 10 minutes later.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Spark** for the target cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.262 ALM-43022 IndexServer Process GC Time Exceeds the Threshold

Alarm Description

The system checks the GC duration of IndexServer every 60 seconds. A critical alarm is reported when the GC duration exceeds 12 seconds for three consecutive times. A major alarm is reported when the duration exceeds 12 x 0.8 seconds for three consecutive times. To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark** > **GC Time** > **IndexServer Total GC time**. This alarm is cleared when the IndexServer GC duration is shorter than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43022	Major (default threshold: 9.6 seconds for three consecutive times) Critical (default threshold: 12 seconds for three consecutive times)	Quality of service	Spark	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Identifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the GC duration exceeds the threshold, the performance of the IndexServer process deteriorates, and the process can even be unavailable. As a result, Carbon tasks with indexing enabled are slow or fail to run.

Possible Causes

The heap memory of the IndexServer process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC time.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43022**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance** and click the IndexServer for which the alarm is generated to enter the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **GC Time** > **Garbage Collection (GC) Time of IndexServer** from the drop-down list box in the upper right corner and click **OK** to check whether the GC time is longer than the threshold (default value: 12 seconds).

- If the threshold is reached, go to **Step 3**.
- If the threshold is not reached, go to **Step 6**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Configurations** > **All Configurations** > **IndexServer** > **Default**. The default value of the **SPARK_DRIVER_MEMORY** is 4 GB. You can increase the value 1.5 times to its default. If this alarm is still generated occasionally after the adjustment, increase the value by 0.5 times. Double the value if the alarm is reported frequently.

Step 4 Restart all IndexServer instances.

Step 5 Check whether the alarm is cleared 10 minutes later.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Spark** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.263 ALM-43023 IndexServer Process Full GC Number Exceeds the Threshold

Alarm Description

The system checks the number of IndexServer Full GC times every 60 seconds. A critical alarm is reported when the number exceeds 12 for three consecutive times. A major alarm is reported when the number exceeds 12 x 0.8 (rounded down) for three consecutive times. You can change the threshold by choosing **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark** > **GC Number** > **Full GC Number of IndexServer**. This alarm is cleared when the Full GC times of the JDBCServer process is less than or equal to the threshold. This alarm is cleared when the Full GC times of the IndexServer process is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43023	Minor (default threshold: 9 for three consecutive times) Critical (default threshold: 12 for three consecutive times)	Quality of service	Spark	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Identifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the GC times exceeds the threshold, the performance of the IndexServer process deteriorates, and the process can even be unavailable. As a result, Carbon tasks with indexing enabled are slow or fail to run.

Possible Causes

The heap memory of the IndexServer process is overused or inappropriately allocated, causing frequent occurrence of the full GC process.

Handling Procedure

Check the number of Full GCs.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43023**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instance** and click the IndexServer for which the alarm is generated to enter the **Dashboard** page. Click the drop-down menu in the chart area and choose **Customize** > **Full GC Number of IndexServer** from the drop-down list box in the upper right corner and click **OK** to check whether the full GC times is larger than the threshold (default value: 12).

- If the threshold is reached, go to **Step 3**.
- If the threshold is not reached, go to **Step 6**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Configurations** > **All Configurations** > **IndexServer** > **Performance**. The default value of the **SPARK_DRIVER_MEMORY** is 4 GB. You can increase the value by 0.5 times if this alarm is generated occasionally. Double the value if the alarm is reported frequently. In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Restart all IndexServer instances.

Step 5 Check whether the alarm is cleared 10 minutes later.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Spark** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.264 ALM-43200 Elasticsearch Service Unavailable

Alarm Description

The system checks the Elasticsearch service availability every 60 seconds. This alarm is generated when the system detects that the Elasticsearch service is unavailable. This alarm is cleared when the Elasticsearch service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43200	Critical	Quality of service	Elasticsearch	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Elasticsearch service is unavailable, and index data cannot be read or written.

Possible Causes

- The network connection is abnormal.
- The component service that Elasticsearch depends on is not available.
- The EsMaster instance is abnormal.

Handling Procedure

Check whether the network is normal.

Step 1 Click **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch** > **Instance** on the FusionInsight Manager to view the service plane IP address of the EsMaster instance.

Step 2 Log in to the server where any EsMaster instance resides as user **root**.

Step 3 Run the **ping** *IP address of other EsMaster instance* command to check whether the servers of other EsMaster instances are reachable.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the system administrator to rectify network faults.

Step 5 Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check Server that Elasticsearch depends on is normal.

Step 6 Choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** to check whether the health of the ZooKeeper service is normal. And check if can connect to ZooKeeper service. Specific operations can refer to the ZooKeeper operating documentation. And if the cluster is in the security mode, check the KrbServer running state is normal.

- If yes, go to **Step 8**.
- If no, please repair the failed service to make sure the service is normal.

Step 7 Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether EsMaster instances are running properly.

Step 8 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch** > **Instance** to check whether EsMaster instances are healthy.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Locate the EsMaster instance whose **Running Status** is not **Normal** and choose **More** > **Restart Instance** to restart instance.

NOTE

You need to enter the administrator password for FusionInsight Manager to restart an instance.

Step 10 Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 12 Select **Elasticsearch** in the required cluster from the **Service** list.

Step 13 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.265 ALM-43201 Heap Memory Usage of Elasticsearch Exceeds the Threshold

Alarm Description

The system checks the elasticsearch heap memory usage every 60 seconds. This alarm is generated when the heap memory usage exceeds the threshold.

When the number of smoothing times is 1, this alarm is cleared when the elasticsearch heap memory usage is less than or equal to the threshold.When the number of smoothing times is greater than 1, this alarm is cleared when the elasticsearch heap memory usage is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43201	Major (default threshold: 90%) Critical (default threshold: 95%)	Quality of service	Elasticsearch	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the Elasticsearch heap memory usage is too high, the read and write performance of Elasticsearch index data may be affected. In serious cases, the process may restart.

Possible Causes

Elasticsearch memory is insufficient.

Handling Procedure

Delete invalid indexes.

Step 1 Check whether the Elasticsearch cluster is in the security mode.

Specifically, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, click **Configurations**. Search for **ELASTICSEARCH_SECURITY_ENABLE**, and check whether the parameter can be queried and its value is **true**.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 If the security mode is used, configure the permission for running the curl command.

Step 3 Log in to a host where Elasticsearch resides as user **root**.

Step 4 Run the **curl -XGET --tlsv1.2 --negotiate -k -v -u : 'https://***ip:httpport***/_cat/indices?v'** command to query the index details in the current cluster.

NOTE

- In this command, replace **ip** with the IP address of any node in the cluster.
- Replace **httpport** with the HTTP port number of the Elasticsearch instance, which is specified by **SERVER_PORT**. To obtain the parameter value, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, choose **Configurations** > **All Configurations** and search for **SERVER_PORT**.
- In common mode, delete the security authentication parameter **--tlsv1.2 --negotiate -k -v -u**, and change **https** to **http**.
- These rules also apply to the following curl commands.

Step 5 Run the **curl -XDELETE --tlsv1.2 --negotiate -k -v -u : 'https://***ip:httpport***/***indexname***'** command to delete unnecessary indexes.

NOTE

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

Check the JVM memory usage and adjust system configurations.

Step 6 On the FusionInsight Manager portal, choose **Cluster** >*Name of the desired cluster* > **Services** > **Elasticsearch** > **Configurations > All Configurations.**

Step 7 In the upper right corner of the Configuration page, enter **GC_OPTS** in the search box and click  . The **GC_OPTS** parameters of all instances are displayed.

Step 8 Select the instance whose **GC_OPTS** value needs to be changed, and check whether the differentiated configuration icon  is displayed after the instance value configuration box.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Click  . In the displayed dialog box, click  in the right pane and click **OK** to save the settings.

Step 10 Adjust the values of **-Xms** and **-Xmx** of the **GC_OPTS** parameter by referring to the Note.

NOTE

Suggestions on configuring the GC parameter of Elasticsearch:

- It is recommended that 50% memory be reserved for the Lucence cache and 50% memory for Solr. You are advised to allocate 30 GB (no more than 31 GB) to machines with large memory. Confirm that the JVM Compressed Oops function has been enabled. You can run the following command to check:

  java -server -Xms28G -Xmx28G -XX:+UseConcMarkSweepGC -XX:+UnlockDiagnosticVMOptions -XX:+PrintCompressedOopsMode -version

  If the returned value for Compressed Oops mode is Zero based, it indicates that the JVM Compressed Oops function is enabled and you need to increase the size of the allocated memory. Change 28 GB to 29 GB and check whether the Compressed Oops function is enabled. Try until the allocated memory reaches the maximum for the Compressed Oops function to remain enabled.

  If the returned value for Compressed Oops mode is Non-zero based, it indicates that the JVM Compressed Oops function is disabled and you need to decrease the size of the allocated memory. Change 28 GB to 27 GB and check whether the Compressed Oops function is enabled. Try until the allocated memory reaches the maximum for the Compressed Oops function to remain enabled.
- It is recommended that **-Xms** and **-Xmx** be set to the same value to prevent dynamic adjustment of heap memory size by JVM from affecting the performance.
- If half of the computer memory is less than the number of instances multiplied by 30 GB, allocate the memory by referring to the following:

  Instance memory = (Computer memory x 0.5)/Number of instances on the computer

  For example, if a computer has a memory of 128 GB and has three Elasticsearch instances, the value of **GC_OPTS** is: 128 GB x 0.5/3 = 21 GB and confirm that the JVM Compressed Oops function has been enabled.

Step 11 Modify Elasticsearch memory parameters and click **Save** and **OK**.

Step 12 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, click **Instance**, select the instances whose **Configuration Status** is **Expired**, and restart the instances.

Step 13 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Collect fault information.

Step 14 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 15 Select **Elasticsearch** in the required cluster from the **Service** list.

Step 16 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 17 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.266 ALM-43202 Indices in the Yellow State Exist in Elasticsearch

Alarm Description

The system checks all indices status of all Elasticsearch every 60 seconds. This alarm is generated when an index is in the Yellow state.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43202	Major	Quality of service	Elasticsearch	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	List of indices in the yellow state	Specifies the list of indices in yellow state in Elasticsearch.

NOTE

The length of the index list is restricted by the character length. When the content exceeds 256 characters, only some index names can be displayed. To query the complete index list, perform the following steps:

On the FusionInsight Manager homepage, choose **O&M** > **Log** > **Online Search**. Enter "alarm 43202" in the **Search Content** text box. Then, select **OMS** > **Agent** for **Service**, the **pluginmonitor** file for **File**, and **ERROR** for **Lowest Log Level**. After the configuration, click **Search**.

Select the latest log in the search result and view the complete list of indices in yellow state. For example:

2020-04-01 05:05:00,550 ERROR [monitor_300_1_6_EsMaster] Send alarm 43202. The Elasticsearch cluster has indexes in the Yellow state, List of indexes in the Yellow state is [post_20200328, log_20200331] com.huawei.hadoop.elasticsearch.monitor.collector.impl.ReplicaNumCollector.sendDownStateShardAlarm(ReplicaNumCollector.java:182)

Impact on the System

The replicai shards of some Elasticsearch indexes are faulty, which may slow down the read/write performance of Elasticsearch index data.

Possible Causes

The replica shards of some Elasticsearch instances are not allocated.

Handling Procedure

Check whether all instances are normal.

Step 1 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch** > **Instance** page, check whether all instances are in normal state.

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Select instances whose **Running Status** is not **Normal**. Choose **Restart Instance** from the drop-down list of **More**.

NOTE

When restarting the instance, you need enter the password of the FusionInsight Manager administrator.

Step 3 Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If yes, go to **Step 4**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. Click **Resource**. On the displayed page, check indexes with **Health Status** set to **yellow** in the **Index Information** area. Record the index names and number of replicas.

Step 5 Check whether the Elasticsearch cluster is in the security mode.

Specifically, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, click **Configurations**.

Search for **ELASTICSEARCH_SECURITY_ENABLE**, and check whether the parameter can be queried and its value is **true**.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 If the security mode is used, configure the permission for running the curl command.

Step 7 Run the curl command to set the replica number.

curl -XPUT --tlsv1.2 --negotiate -k -v -u : 'https://*ip***:***httpport***/***index***/_settings' -H 'Content-Type: application/json' -d'{"number_of_replicas": "0"}'**

NOTE

- ip: The IP address of any node in the Elasticsearch cluster.
- httpport: The HTTP port number of the Elasticsearch instance, which is specified by **SERVER_PORT**. To obtain the parameter value, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, choose **Configurations** > **All Configurations** and search for **SERVER_PORT**.
- index: Name of the index for which the number of copies needs to be reset.
- In common mode, delete the security authentication parameter **--tlsv1.2 --negotiate -k -v -u**, and change **https** to **http**.
- These rules also apply to the following curl commands.

Step 8 10 minutes later, check whether the alarm is cleared.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Run the curl command to set the replica number to the original value. 10 minutes later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On the FusionInsight Manager choose **O&M** > **Log** > **Download**.

Step 11 Select **Elasticsearch** in the required cluster from the **Service** list.

Step 12 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.267 ALM-43203 Indices in the Red State Exist in Elasticsearch

Alarm Description

The system checks all indices status of all Elasticsearch every 60 seconds. This alarm is generated when an index is in the Red state.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43203	Critical	Quality of service	Elasticsearch	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	List of indices in the red state	Specifies the list of indices in red state in Elasticsearch.

NOTE

The length of the index list is restricted by the character length. When the content exceeds 256 characters, only some index names can be displayed. To query the complete index list, perform the following steps:

1. On the FusionInsight Manager homepage, choose **O&M** > **Log** > **Online Search**.
2. Enter "alarm 43203" in the **Search Content** text box. Then, select **OMS** > **Agent** for **Service**, the **pluginmonitor** file for **File**, and **ERROR** for **Lowest Log Level**. After the configuration, click **Search**.
3. Select the latest log in the search result and view the complete list of indices in red state. For example:
   2020-07-10 14:34:00,508 ERROR [monitor_60_1_18_EsMaster] Send alarm 43203. The Elasticsearch cluster has indexes in the Red state, List of indexes in the Red state is [**myindex292,myindex200**]

Impact on the System

The primary shards of some Elasticsearch indexes are faulty, and the faulty indexes cannot be read or written.

Possible Causes

The primary shard of Elasticsearch is missing.

Handling Procedure

Check whether all the instances are normal.

Step 1 Specifically, log in to FusionInsight Manager, and choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, click **Instance** and check whether all instances are in normal state.

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Select instances whose running status is not **Normal** and choose **Restart Instance** from the drop-down list of **More**.

NOTE

When restarting the instance, you need enter the password of the FusionInsight Manager administrator.

Step 3 Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If yes, go to **Step 4**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**.

Step 5 Click **Resource**. On the displayed page, check indexes with **Health Status** set to **red** in the **Index Information** area.

Step 6 Check whether the index is an invalid index.

- If yes, go to **Step 7**.
- If no, go to **Step 11**.

Step 7 Check whether the Elasticsearch cluster is in the security mode.

Specifically, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, click **Configurations**. Search for **ELASTICSEARCH_SECURITY_ENABLE**, and check whether the parameter can be queried and its value is **true**.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 If the security mode is used, configure the permission for running the curl command.

Step 9 Delete the invalid index.

curl -XDELETE --tlsv1.2 --negotiate -k -v -u : 'https://*ip:httpport***/ *index name*'**

NOTE

- In this command, replace **ip** with the IP address of any node in the cluster.
- Replace **httpport** with the HTTP port number of the Elasticsearch instance, which is specified by **SERVER_PORT**. To obtain the parameter value, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, choose **Configurations** > **All Configurations** and search for **SERVER_PORT**.
- Replace **index name** with the name of the index to be deleted.
- In common mode, delete the security authentication parameter **--tlsv1.2 --negotiate -k -v -u**, and change **https** to **http**.
- Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

Step 10 5 minutes later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager, choose **O&M**> **Log > Download**.

Step 12 Select **Elasticsearch** in the required cluster from the **Service** list.

Step 13 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.268 ALM-43204 GC Duration of the Elasticsearch Process Exceeds the Threshold

Alarm Description

The system checks the garbage collection (GC) duration of the Elasticsearch process every 60s. This alarm is generated when the GC duration exceeds the threshold.

If **Trigger Count** is set to **1**, and the GC duration of the Elasticsearch process is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1**, and the GC duration of the Elasticsearch process is less than or equal to 90% of the threshold, this alarm is cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43204	Major (default threshold: 30000ms) Critical (default threshold: 60000ms)	Quality of service	Elasticsearch	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the GC time of the Elasticsearch instance process is too long, the index data read/write performance of Elasticsearch may be affected, and the request may time out.

Possible Causes

Service load of the Elasticsearch instance on the node is high or the heap memory is not properly configured. As a result, GC frequently occurs.

Handling Procedure

Check the configured heap memory.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm > Alarms**, and check the location information of this alarm. Check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, click **Instance** and Click the drop-down menu in the Chart area and choose **Customize** > **Clear All** > **Garbage Collection** > **EsMaster GC Time Stats**, and click **OK**. Check whether the GC duration is greater than the threshold.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, click **Configurations**.

Step 4 In the upper right corner of the Configuration page, enter GC_OPTS in the search box and click  . The GC_OPTS parameter values of all instances are displayed.

Step 5 Select the instance whose GC_OPTS value needs to be changed, and check whether the differentiated configuration icon  is displayed after the instance value configuration box.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Click  . In the displayed dialog box, click  in the right pane and click **OK** to save the settings.

Step 7 Adjust the values of **-Xms** and **-Xmx** of the **GC_OPTS** parameter by referring to the Note.

NOTE

Suggestions on configuring the GC parameter of Elasticsearch:

- It is recommended that 50% memory be reserved for the Lucence cache and 50% memory for Solr. You are advised to allocate 30 GB (no more than 31 GB) to machines with large memory. Confirm that the JVM Compressed Oops function has been enabled. You can run the following command to check:

  java -server -Xms28G -Xmx28G -XX:+UseConcMarkSweepGC -XX:+UnlockDiagnosticVMOptions -XX:+PrintCompressedOopsMode -version

  If the returned value for Compressed Oops mode is Zero based, it indicates that the JVM Compressed Oops function is enabled and you need to increase the size of the allocated memory. Change 28 GB to 29 GB and check whether the Compressed Oops function is enabled. Try until the allocated memory reaches the maximum for the Compressed Oops function to remain enabled.

  If the returned value for Compressed Oops mode is Non-zero based, it indicates that the JVM Compressed Oops function is disabled and you need to decrease the size of the allocated memory. Change 28 GB to 27 GB and check whether the Compressed Oops function is enabled. Try until the allocated memory reaches the maximum for the Compressed Oops function to remain enabled.
- It is recommended that **-Xms** and **-Xmx** be set to the same value to prevent dynamic adjustment of heap memory size by JVM from affecting the performance.
- If half of the computer memory is less than the number of instances multiplied by 30 GB, allocate the memory by referring to the following:

  Instance memory = (Computer memory x 0.5)/Number of instances on the computer

  For example, if a computer has a memory of 128 GB and has three Elasticsearch instances, the value of **GC_OPTS** is: 128 GB x 0.5/3 = 21 GB, and Confirm that the JVM Compressed Oops function has been enabled.

Step 8 After the modification, click **Save** in the upper left corner. In the **Save Configuration** dialog box displayed, click **OK**.

Step 9 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, click **Instance**, select the instances whose **Configuration Status** is **Expired**, and restart the instances.

Step 10 Five minutes later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On FusionInsight Manager, and choose **O&M** > **Log** > **Download**.

Step 12 Select **Elasticsearch** in the required cluster for **Service**.

Step 13 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 14 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.269 ALM-43205 Elasticsearch Stored Shard Data Volume Exceeds the Threshold

Alarm Description

The system checks the volume of shard data stored in Elasticsearch every 60 seconds and compares the volume with the threshold. This alarm is generated when the system detects that the volume exceeds the threshold for multiple consecutive times (three times by default).

The threshold can be changed by choosing **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Elasticsearch** > **Shard** > **Elasticsearch Shard Data Volume (EsMaster)**.

If **Trigger Count** is set to **1**, and the volume of shard data stored in Elasticsearch is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1**, and the volume of shard data stored in Elasticsearch is less than or equal to 90% of the threshold, this alarm is cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43205	Major (default threshold: 41943040KB) Critical (default threshold: 83886080KB)	Quality of service	Elasticsearch	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.

Type	Parameter	Description
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

A large amount of data is stored in Elasticsearch shards, which may slow down the read and write performance of Elasticsearch index data. When the Elasticsearch process is restarted, the restoration of a large amount of data slows down.

Possible Causes

The number of index shards is incorrectly configured. As a result, the stored shard data volume exceeds the threshold.

Handling Procedure

Check the stored shard data volume

Step 1 Check whether the Elasticsearch cluster is in the security mode.

Specifically, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, click **Configurations**. In the upper right corner of the configuration page, search for **ELASTICSEARCH_SECURITY_ENABLE** and check whether the parameter can be queried and its value is **true**.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 If the security mode is used, configure the permission for running the **curl** command.

Step 3 Log in to any node where Elasticsearch resides as user **root**.

Step 4 Run the following command to query the stored shard data volume of the current cluster: **curl -XGET --tlsv1.2 --negotiate -k -v -u : 'https://***ip:httpport***/_cat/shards?v&s=store:desc'**

NOTE

- In this command, replace **ip** with the IP address of any node in the cluster.
- Replace **httpport** with the HTTP port number of the Elasticsearch instance, which is specified by **SERVER_PORT**. To obtain the parameter value, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, choose **Configurations** > **All Configurations** and search for **SERVER_PORT**.
- In normal mode, delete the security authentication parameter **--tlsv1.2 --negotiate -k -v -u:** and change **https** to **http**.

Step 5 Obtain the index with a large amount of shard data. You are advised to plan the index again as follows:

- Method 1: Stop writing data to the index and plan a new index to store the written data.
- Method 2: Migrate data in the index in which stored shard data volume exceeds the threshold to the planned new index, and delete the old index.

  NOTE

  Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

Step 6 After the index planning is complete, Five minutes after the index planning is complete, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, and choose **O&M** > **Log** > **Download**.

Step 8 Select **Elasticsearch** in the required cluster for **Service**.

Step 9 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.270 ALM-43206 Elasticsearch Shard Document Number Exceeds the Threshold

Alarm Description

The system checks the number of documents in Elasticsearch shards every 60 seconds and compares the number with the threshold. This alarm is generated when the system detects that the number exceeds the threshold for multiple consecutive times (three times by default).

The threshold can be changed by choosing **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Elasticsearch** > **Shard** > **Elasticsearch Shard Document Number (EsMaster)**.

If **Trigger Count** is set to **1**, and the number of documents in Elasticsearch shards is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1**, and the number of documents in Elasticsearch shards is less than or equal to 90% of the threshold, this alarm is cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43206	Major (default threshold: 100000000) Critical (default threshold: 150000000)	Quality of service	Elasticsearch	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the number of Elasticsearch shard documents is too large, the read and write performance of Elasticsearch index data may be affected. When the Elasticsearch process is restarted, the restoration speed of shards with a large amount of data may be slow.

Possible Causes

The configuration of Elasticsearch index shard number is inappropriate.

Handling Procedure

Check the number of documents in shards.

Step 1 Check whether the Elasticsearch cluster is in the security mode.

Specifically, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, click **Configurations**. Search for **ELASTICSEARCH_SECURITY_ENABLE**, and check whether the parameter can be queried and its value is **true**.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 If the security mode is used, configure the permission for running the **curl** command.

Step 3 Log in to any node where Elasticsearch resides as user **root**.

Step 4 Run the following command to query the stored shard documents volume of the current cluster: **curl -XGET --tlsv1.2 --negotiate -k -v -u : 'https://*ip:httpport*/_cat/shards?v&s=docs:desc'**

NOTE

- In this command, replace **ip** with the IP address of any node in the cluster.
- Replace **httpport** with the HTTP port number of the Elasticsearch instance, which is specified by **SERVER_PORT**. To obtain the parameter value, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, choose **Configurations** > **All Configurations** and search for **SERVER_PORT**.
- In normal mode, delete the security authentication parameter **--tlsv1.2 --negotiate -k -v -u :**, and change **https** to **http**.

Step 5 Obtain the indexes with a large number of shard documents and plan the index again as follows:

- Method 1: Stop writing data to the index and plan a new index to store the written data.
- Method 2: Migrate the data in the index whose number of shard documents exceeds the threshold to the planned index, and delete the old index.

NOTE

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

Step 6 After the index planning is complete, Five minutes after the index planning is complete, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Select **Elasticsearch** in the required cluster for **Service**.

Step 9 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.271 ALM-43207 Elasticsearch Has Indexes Without Replicas

Alarm Description

The system checks whether there are indexes without replicas in Elasticsearch every 10 minutes. This alarm is generated when there are.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43207	Major	Quality of service	Elasticsearch	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Index List	Specifies the index list without replicas.

Impact on the System

Some index data of Elasticsearch has only one copy, which affects the data reliability of Elasticsearch. If a single node is faulty, data may be lost.

Possible Causes

No replica is configured when an index is created, or the number of index replicas is modified and not restored.

Handling Procedure

Check indexes.

Step 1 Check whether the Elasticsearch cluster is in the security mode.

Specifically, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, click **Configurations**. Search for **ELASTICSEARCH_SECURITY_ENABLE**, and check whether the parameter can be queried and its value is **true**.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 If the security mode is used, configure the permission for running the **curl** command.

Step 3 Log in to any node where Elasticsearch resides as user **root**.

Step 4 Run the following command to query index information in the current cluster:

curl -XGET --tlsv1.2 --negotiate -k -v -u : 'https://*ip:httpport***/_cat/indices?v&pretty'**

```
health status index   uuid                   pri rep docs.count docs.deleted store.size pri.store.size
green  open   test    s8wOFxAARtKkhEGSc5vgEQ   3   0          0            0      1.5kb          783b
```

NOTE

- In this command, replace **ip** with the IP address of any node in the cluster.
- Replace **httpport** with the HTTP port number of the Elasticsearch instance, which is specified by **SERVER_PORT**. To obtain the parameter value, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, choose **Configurations** > **All Configurations** and search for **SERVER_PORT**.
- In normal mode, delete the security authentication parameter **--tlsv1.2 --negotiate -k -v -u:** and change **https** to **http**.
- These rules also apply to the following curl commands.

Step 5 Obtain the index not configured with replicas and configure index replicas as follows:

1. Run the following command to configure the number of index replicas:

   curl -XPUT --tlsv1.2 --negotiate -k -v -u : 'https://*ip:httpport***/***index***/_settings' -H 'Content-Type: application/json' -d'{ "number_of_replicas": 1 }'**

2. Run the following command to query indexes in the cluster and ensure that replicas are configured for the index.

curl -XGET --tlsv1.2 --negotiate -k -v -u : 'https://*ip:httpport*/_cat/indices?v&pretty'

```
health status index uuid                   pri rep docs.count docs.deleted store.size pri.store.size
green  open   test  s8wOFxAARtKkhEGSc5vgEQ   3   1          0            0      1.5kb          783b
```

NOTE

- In this command, replace **index** with the index not configured with replicas in the cluster. Regular expression match is supported, and * indicates all indexes.
- Replace **number_of_replicas** with the number of index replicas. The value **1** is recommended.

Step 6 Manually clear the alarm.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Select **Elasticsearch** in the required cluster for **Service**.

Step 9 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.272 ALM-43208 Elasticsearch Data Directory Usage Exceeds the Threshold

Alarm Description

The system checks the Elasticsearch data directory usage every 60 seconds and compares the usage with the threshold. This alarm is generated when the system detects that the usage exceeds the threshold for multiple consecutive times (three times by default).

The threshold can be changed by choosing **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Elasticsearch** > **Data Directory Usage**.

If **Trigger Count** is set to **1**, and the Elasticsearch data directory usage is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1**, and the Elasticsearch data directory usage is less than or equal to 90% of the threshold, this alarm is cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43208	Major (default threshold: 90%) Critical (default threshold: 80%)	Quality of service	Elasticsearch	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The remaining space of the Elasticsearch data directory is insufficient, and new data cannot be written.

Possible Causes

The service data volume exceeds the cluster storage capacity.

Handling Procedure

Delete invalid indexes.

Step 1 Check whether the Elasticsearch cluster is in the security mode.

>Specifically, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, click **Configurations**. Search for **ELASTICSEARCH_SECURITY_ENABLE**, and check whether the parameter can be queried and its value is **true**.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 If the security mode is used, configure the permission for running the curl command.

Step 3 Log in to any node where Elasticsearch resides as user **root**.

Step 4 Run the **curl -XGET --tlsv1.2 --negotiate -k -v -u : 'https://***ip:httpport***/_cat/indices?v&pretty'** command to query indexes in the cluster.

NOTE

- In this command, replace **ip** with the IP address of any node in the cluster.
- Replace **httpport** with the HTTP port number of the Elasticsearch instance, which is specified by **SERVER_PORT**. To obtain the parameter value, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, choose **Configurations** > **All Configurations** and search for **SERVER_PORT**.
- In normal mode, delete the security authentication parameter **--tlsv1.2 --negotiate -k -v -u :** and change **https** to **http**.
- The rules also apply to the following **curl** commands.

Step 5 Run the **curl -XDELETE --tlsv1.2 --negotiate -k -u : "https://***ip:httpport/index***"** command to delete invalid or expired indexes if there are.

NOTE

- In this command, replace **index** with the index planned to be deleted in the cluster. Regular expression match is supported, and * indicates all indexes.
- Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

Step 6 Five minutes later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Expand the cluster capacity.

Step 7 Expand the Elasticsearch cluster capacity.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 9 Select **Elasticsearch** in the required cluster for **Service**.

Step 10 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 11 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

This alarm must be manually cleared after the fault is rectified.

Related Information

None.

11.273 ALM-43209 Total Number of Elasticsearch Instance Shards Exceeds the Threshold

Alarm Description

The system checks the total number of Elasticsearch instance shards every 60 seconds and compares the number with the threshold. This alarm is generated when the system detects that the number exceeds the threshold for multiple consecutive times (three times by default).

The threshold can be changed by choosing **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Elasticsearch** > **Shard** > **Number Of Shard**.

If **Trigger Count** is set to **1**, and the total number of Elasticsearch instance shards is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1**, and the total number of Elasticsearch instance shards is less than or equal to 90% of the threshold, this alarm is cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43209	Major (default threshold: 400) Critical (default threshold: 500)	Quality of service	Elasticsearch	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.

Type	Parameter	Description
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the total number of Elasticsearch shards is too large, the index data read/write performance of Elasticsearch may be affected, and the shard restoration speed may be slow when the Elasticsearch process is restarted.

Possible Causes

The configuration of the Elasticsearch index shard number is inappropriate.

Handling Procedure

Check the total number of Elasticsearch instance shards.

Step 1 Check whether the Elasticsearch cluster is in the security mode.

Specifically, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, click **Configurations**. Search for **ELASTICSEARCH_SECURITY_ENABLE**, and check whether the parameter can be queried and its value is **true**.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 If the security mode is used, configure the permission for running the **curl** command.

Step 3 Log in to any node where Elasticsearch resides as user **root**.

Step 4 Run the **curl -XGET --tlsv1.2 --negotiate -k -v -u : 'https://*ip:httpport*/_cat/allocation?v'** command to query the total number of instance shards in the cluster.

NOTE

- In this command, replace **ip** with the IP address of any node in the cluster.
- Replace **httpport** with the HTTP port number of the Elasticsearch instance, which is specified by **SERVER_PORT**. To obtain the parameter value, on FusionInsight Manager, choose **Cluster** > **Services** > **Elasticsearch**. On the displayed page, choose **Configurations** > **All Configurations** and search for **SERVER_PORT**.
- In normal mode, delete the security authentication parameter **--tlsv1.2 --negotiate -k -v -u :** and change **https** to **http**.

Step 5 Use either of the following methods:

- Method 1: Delete the indexes that are no longer used in the cluster.

- Method 2: Change the threshold of the total number of instance shards.

NOTE

If you change the threshold to be greater than 500, modify **cluster.routing.allocation.total_shards_per_node** at the same time. The modification takes effect immediately without restarting the Elasticsearch service.

Step 6 Five minutes later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Select **Elasticsearch** in the required cluster for **Service**.

Step 9 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

This alarm will be automatically cleared after the fault is rectified.

Related Information

None.

11.274 ALM-43210 Total Number of Elasticsearch Shards Exceeds the Threshold

Alarm Description

The system checks the total number of Elasticsearch shards every 60 seconds and compares the number with the threshold. This alarm is generated when the system detects that the number exceeds the threshold for multiple consecutive times (five times by default).

The threshold can be changed by choosing **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Elasticsearch** > **Replica Quantity Statistics**> **Total shard number**.

If **Trigger Count** is set to **1**, and the total number of Elasticsearch shards is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1**, and the total number of Elasticsearch shards is less than or equal to 90% of the threshold, this alarm is cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43210	Major (default threshold: 70000) Critical (default threshold: 90000)	Quality of service	Elasticsearch	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the total number of shards in the Elasticsearch cluster is too large, the index data read/write performance of Elasticsearch may be affected, and the shard restoration speed may be slow when the Elasticsearch service is restarted.

Possible Causes

The configuration of the Elasticsearch index shard number is inappropriate.

Handling Procedure

Check the total number of Elasticsearch shards.

Step 1 Check whether the Elasticsearch cluster is in the security mode.

Specifically, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Elasticsearch**. On the displayed page, click **Configurations**.

Search for **ELASTICSEARCH_SECURITY_ENABLE**, and check whether the parameter can be queried and its value is **true**.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 If the security mode is used, configure the permission for running the **curl** command.

Step 3 Log in to any node where Elasticsearch resides as user **root**.

Step 4 Run the **curl -XGET --tlsv1.2 --negotiate -k -v -u : 'https://*ip:httpport*/_cat/indices?v'** command to query the index details in the current cluster.

NOTE

- In this command, replace **ip** with the IP address of any node in the cluster.
- Replace **httpport** with the HTTP port number of the Elasticsearch instance, which is specified by **SERVER_PORT**. To obtain the parameter value, on FusionInsight Manager, choose **Cluster** > **Services** > **Elasticsearch**. On the displayed page, choose **Configurations** > **All Configurations** and search for **SERVER_PORT**.
- In normal mode, delete the security authentication parameter **--tlsv1.2 --negotiate -k -v -u :** and change **https** to **http**.

Step 5 Use either of the following methods:

- Method 1: Delete the indexes that are no longer used in the cluster.
- Method 2: Change the threshold of the total number of shards.

Step 6 Five minutes later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Select **Elasticsearch** in the required cluster for **Service**.

Step 9 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 10 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

This alarm will be automatically cleared after the fault is rectified.

Related Information

None.

11.275 ALM-43600 GraphBase Service Unavailable

Alarm Description

The system checks the GraphBase service status every 60 seconds. This alarm is generated when LoadBalancer or GraphServer cannot provide services properly.

This alarm is cleared when either the LoadBalancer or GraphServer service is normal and the system considers that GraphBase recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43600	Critical	Error handling	GraphBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The GraphServer service cannot be used.

Possible Causes

- The LoadBalancer service is not started.
- The GraphServer service is not started.
- The LoadBalancer node is abnormal.
- The GraphServer node is abnormal.
- The service on which GraphBase depends is abnormal.

Handling Procedure

Check whether the node where GraphBase is deployed is normal.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **GraphBase** > **Instance**.

Step 2 Check whether the status of LoadBalancer and GraphServer is **Good**.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Select the faulty instance, choose **More** > **Restart Instance**, and check whether the instance is successfully started.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Check whether the value of **loadbalancer.floatip** is correct.

- If yes, go to **Step 7**.
- If no, go to **Step 5**.

Step 5 Reconfigure the parameter value and restart the GraphBase service.

Step 6 Wait for one minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check the status of DBService, Yarn, HBase, Spark, Zookeeper, Elasticsearch and Kafka.

Step 7 Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Service**.

Step 8 Check whether the status of DBService, Yarn, HBase, Spark, Zookeeper, Elasticsearch, and Kafka services is **Good**.

- If yes, go to **Step 12**.
- If no, go to **Step 9**.

Step 9 Click a component whose status is **Not started** or **Startup failed**.

Step 10 In the **Instances** tab, select the faulty instance, choose **More** > **Restart Instance**, and check whether the instance can be started successfully.

- If yes, go to **Step 11**.
- If no, go to **Step 12**.

Step 11 Wait for one minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 13 In the **Service** area, select the following nodes of the desired cluster.

- If the fault is caused by GraphBase, select GraphBase.
- If the fault is caused by services on which GraphBase depends, select the faulty services and the GraphBase service. (The corresponding hosts are automatically selected once you select the services.)

Step 14 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 15 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.276 ALM-43605 Number of Real-Time Requests on a GraphBase Node Exceeds the Threshold

Alarm Description

The system checks the status of GraphBase service every 60 seconds. This alarm is generated when the number of query requests to the GraphBase client exceeds the configured threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43605	Major	Quality of service	GraphBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

- Too many connections are maintained for the requests and the network resources are limited. As a result, the communications between services may be abnormal.
- The GraphBase service may be unavailable.

Possible Causes

- The client is requested too frequently.
- The threshold is too low.

Handling Procedure

Check the number of real-time requests on the GraphServer node.

Step 1 On FusionInsight Manager, click O&M, and choose **Alarm** > **Thresholds** in the navigation pane on the left. Click the name of the desired cluster > **GraphBase** and view the threshold of **GraphServer Real-Time Requests**.

Step 2 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43605**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 3 On the FusionInsight Manager homepage, choose **Cluster** > *Name of the desired cluster* > **Service** > **GraphBase** > **Instance**. Click the GraphServer where the alarm is reported. On the dashboard page that is displayed, expand the drop-down list box in the upper right corner of the graph area, choose **Customize** > **GraphServer Real-Time Requests**, and click **OK** to check whether the number of the requests exceeds the threshold.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, click O&M, and choose **Alarm** > **Thresholds** in the navigation pane on the left. Click the name of the desired cluster > **GraphBase** and reset the threshold of **GraphServer Real-Time Requests**.

Step 5 Wait for one minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Step 6 Stop sending any requests for creating, deleting, updating, or querying relationships.

Wait for one minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **GraphBase** for the target cluster.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.277 ALM-43607 Nginx Fault in GraphBase

Alarm Description

The system checks the Nginx service of GraphBase every 30 seconds. This alarm is generated when the Nginx service of GraphBase is abnormal during the HA health check.

This alarm is cleared when the Nginx service becomes normal during the HA health check.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43607	Major	Error handling	GraphBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active and standby LoadBalancers of GraphBase may be switched over.
- The GraphBase service may be unavailable.

Possible Causes

The Ngnix service is not running properly.

Handling Procedure

Check whether the node where GraphBase is deployed is normal.

Step 1 On FusionInsight Manager, select the alarm whose ID is **43607**, and view the IP address of the instance in location information.

Step 2 Log in to the node for which the alarm is generated as user **root**.

Step 3 Go to the **${BIGDATA_HOME}/FusionInsight_GraphBase_*/install/FusionInsight-GraphBase-*/miner/ha/module/hacom/script/** directory and run the **sh status_ha.sh** script to check whether Nginx of the active Manager is normal. Specifically, check whether the following information is displayed in the line where **ResName** of the active management node is **nginx**:

```
ngnix  Normal  Normal   Single_active
```

- If yes, go to **Step 5**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, rectify the network fault and go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Wait for 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 In the **Service** area, select the following nodes of the desired cluster.

- If the fault is caused by GraphBase, select GraphBase.
- If the fault is caused by services on which GraphBase depends, select the faulty services and the GraphBase service. (The corresponding hosts are automatically selected once you select the services.)

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.278 ALM-43608 Floating IP Address of GraphBase Is Faulty

Alarm Description

The system checks the floating IP address of GraphBase every 30 seconds. This alarm is generated when the floating IP address of GraphBase is abnormal during HA health check.

This alarm is cleared when the floating IP address of GraphBase becomes normal during HA health check.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43608	Major	Error handling	GraphBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

- If the GraphBase floating IP address is abnormal, users cannot log in to and use FusionInsight Manager.
- The active and standby LoadBalancers of GraphBase may be switched over.

- The GraphBase service may be unavailable.

Possible Causes

The floating IP address is abnormal.

Handling Procedure

Check whether the node where GraphBase is deployed is normal.

Step 1 On the FusionInsight Manager homepage, choose **Cluster** > *Name of the desired cluster* > **Service** > **GraphBase** > **Configuration** > **All Configurations**, and search for **loadbalancer.floatip**.

Step 2 Check whether the value of **loadbalancer.floatip** can be pinged.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Wait for 5 minutes, and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Step 4 On FusionInsight Manager, select the alarm whose ID is **43608**, and view the IP address of the instance in location information.

Step 5 Log in to the node for which the alarm is generated as user **root**.

Step 6 Go to the **${BIGDATA_HOME}/FusionInsight_GraphBase_*/install/FusionInsight-GraphBase-*/miner/ha/module/hacom/script/** directory and run the **sh status_ha.sh** script to check whether the floating IP address of the active Manager is normal. Specifically, check whether the following information is displayed in the line where **ResName** of the active management node is **floatip**:

The following is an example:

```
floatip  Normal  Normal   Single_active
```

- If yes, go to **Step 8**.
- If no, go to **Step 7**.

Step 7 Contact the network administrator to check whether the network is faulty.

- If yes, rectify the fault and go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Wait for 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **GraphBase** for the target cluster.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.279 ALM-43609 TaskManager of GraphBase Is Faulty

Alarm Description

The system checks TaskManager service of GraphBase every 30 seconds. This alarm is generated when the TaskManager service of GraphBase is abnormal during the HA health check.

This alarm is cleared when the TaskManager service of GraphBase becomes normal during the HA health check.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43609	Major	Error handling	GraphBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active and standby LoadBalancers of GraphBase may be switched over.
- The GraphBase service may be unavailable.

Possible Causes

The Tomcat service is abnormal.

Handling Procedure

Check whether the node where GraphBase locates is normal.

Step 1 On FusionInsight Manager, select the alarm whose ID is **43609**, and view the IP address of the instance in location information.

Step 2 Log in to the node for which the alarm is generated as user **root**.

Step 3 Go to the **${BIGDATA_HOME}/FusionInsight_GraphBase_*/install/FusionInsight-GraphBase-*/miner/ha/module/hacom/script/** directory and run the **sh status_ha.sh** script to check whether TaskManager of the active Manager is normal. Specifically, check whether the following information is displayed in the line where **ResName** of the active management node is **taskmanager**:

The following are two examples:

```
taskmanager   Normal  Normal   Single_active
```

- If yes, go to **Step 5**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, rectify the fault and go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Wait for 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 In the **Service** area, select the following nodes of the desired cluster.

- If the fault is caused by GraphBase, select GraphBase.
- If the fault is caused by services on which GraphBase depends, select the faulty services and the GraphBase service. (The corresponding hosts are automatically selected once you select the services.)

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.280 ALM-43610 GC Time of the Old-Generation GraphServer Process Exceeds the Threshold

Alarm Description

The system checks the GC time of the old-generation GraphBase service every 30 seconds. This alarm is generated when the GC time of the old-generation GraphBase service exceeds the threshold (the GC time exceeds 5 seconds for three consecutive times by default). On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **GraphBase** > **GC Time** > **GC Time of the Old-Generation GraphServer Process** to change the threshold. This alarm is cleared when the GC time of the old-generation GraphBase service is less than or equal to the threshold.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase services are installed, determine the GraphBase service for which the alarm is generated based on the value of **ServiceName** in **Location Information** of the alarm. For example, if the GraphBase1 service is unavailable, the service name displayed in **Location Information** is **GraphBase1** and the operation object in the handling procedure is changed to **GraphBase1**.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43610	Major	Quality of service	GraphBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Indicates the service for which the alarm is generated.
	RoleName	Indicates the role for which the alarm is generated.

Type	Parameter	Description
	HostName	Indicates the host for which the alarm is generated.

Impact on the System

If the GC time of the old-generation GraphServer exceeds the threshold, the GraphBase interface cannot be accessed normally.

Possible Causes

The memory of GraphBase instances on the node is overused, the heap memory is inappropriately allocated, or a large number of I/O operations exist in GraphBase. As a result, GCs occur frequently.

Handling Procedure

Check the GC time.

Step 1 On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **GraphBase** > **GC Time** > **GC Time of the Old-Generation GraphServer Process** to view the threshold.

Step 2 On the FusionInsight Manager homepage, choose **Cluster** > *Name of the Desired cluster* > **Service** > **GraphBase**. Click the drop-down list in the upper right corner of the graph area, choose **Customize** > **GC Time of the Old-Generation GraphServer Process**, and click **OK** to check whether the threshold is exceeded.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Threshold Setting** > *Name of the desired cluster* > **GraphBase** > **GC Time** > **GC Time of the Old-Generation GraphServer Process** to set the parameter to a new value.

Step 4 Wait for one minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Stop sending any requests for creating, deleting, updating, or querying relationships.

Wait for one minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On the FusionInsight Manager homepage, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **GraphBase** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.281 ALM-43611 Number of GC Times of the Old-Generation GraphServer Process Exceeds the Threshold

Alarm Description

The system checks the number of GC times of the old-generation GraphBase service every 30 seconds. This alarm is generated when the number of GC times of the old-generation GraphBase service exceeds the threshold (the number of GC times exceeds 5 seconds for three consecutive times by default). On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **GraphBase** > **GC Count** > **Number of GC Times of the Old-Generation GraphServer Process**. This alarm is cleared when the number of GC times of the old-generation GraphBase service is less than or equal to the threshold.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase services are installed, determine the GraphBase service for which the alarm is generated based on the value of **ServiceName** in **Location Information** of the alarm. For example, if the GraphBase1 service is unavailable, the service name displayed in **Location Information** is **GraphBase1** and the operation object in the handling procedure is changed to **GraphBase1**.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43611	Major	Quality of service	GraphBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Indicates the service for which the alarm is generated.
	RoleName	Indicates the role for which the alarm is generated.
	HostName	Indicates the host for which the alarm is generated.

Impact on the System

If the number of GC times of the old-generation GraphServer exceeds the threshold, the GraphBase interface cannot be accessed normally.

Possible Causes

The memory of GraphBase instances on the node is overused, the heap memory is inappropriately allocated, or a large number of I/O operations exist in GraphBase. As a result, GCs occur frequently.

Handling Procedure

Check the number of GC times.

Step 1 On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **GraphBase** > **GC Count** > **Number of GC Times of the Old-Generation GraphServer Process**.

Step 2 On the FusionInsight Manager homepage, choose **Cluster** > *Name of the Desired cluster* > **Service** > **GraphBase**. Click the drop-down list in the upper right corner of the graph area, choose **Customize** > **Number of GC Times of the Old-Generation GraphServer Process**, and click **OK** to check whether the threshold is exceeded.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **GraphBase** > **GC Count** > **Number of GC Times of the Old-Generation GraphServer Process** to reset the threshold.

Step 4 Wait for one minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Stop sending any requests for creating, deleting, updating, or querying relationships.

Wait for one minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On the FusionInsight Manager homepage, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **GraphBase** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

11.282 ALM-43612 GC Duration of the Young-Generation GraphServer Process Exceeds the Threshold

Alarm Description

The system checks the GC time of the young-generation GraphBase service every 30 seconds. This alarm is generated when the GC time of the young-generation GraphBase service exceeds the threshold (the GC time exceeds 5 seconds for three consecutive times by default). On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **GraphBase** > **GC Time** > **GC Time of the Young-Generation GraphServer Process** to change the threshold. This alarm is cleared when the GC time of the young-generation GraphBase service is less than or equal to the threshold.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase services are installed, determine the GraphBase service for which the alarm is generated based on the value of **ServiceName** in **Location Information** of the alarm. For example, if the GraphBase1 service is unavailable, the service name displayed in **Location Information** is **GraphBase1** and the operation object in the handling procedure is changed to **GraphBase1**.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43612	Major	Quality of service	GraphBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Indicates the service for which the alarm is generated.
	RoleName	Indicates the role for which the alarm is generated.
	HostName	Indicates the host for which the alarm is generated.

Impact on the System

If the GC time of the young-generation GraphServer exceeds the threshold, the GraphBase interface cannot be accessed normally.

Possible Causes

The memory of GraphBase instances on the node is overused, the heap memory is inappropriately allocated, or a large number of I/O operations exist in GraphBase. As a result, GCs occur frequently.

Handling Procedure

Check the GC time.

Step 1 On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **GraphBase** > **GC Time** > **GC Time of the Young-Generation GraphServer Process** to view the threshold.

Step 2 On the FusionInsight Manager homepage, choose **Cluster** > *Name of the Desired cluster* > **Service** > **GraphBase**. Click the drop-down list in the upper right corner of the graph area, choose **Customize** > **GC Time of the Young-Generation GraphServer Process**, and click **OK** to check whether the threshold is exceeded.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **GraphBase** > **GC Time** > **GC Time of the Young-Generation GraphServer Process** to view the threshold.

Step 4 Wait for one minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Stop sending any requests for creating, deleting, updating, or querying relationships.

Wait for one minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On the FusionInsight Manager homepage, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **GraphBase** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

11.283 ALM-43613 Number of GC Times of the Young-Generation GraphServer Process Exceeds the Threshold

Alarm Description

The system checks the number of GC times of the young-generation GraphBase service every 30 seconds. This alarm is generated when the number of GC times of the young-generation GraphBase service exceeds the threshold (the number of GC times exceeds 5 seconds for three consecutive times by default). On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **Service** > **GraphBase** > **GC Time** > **Number of GC Times of the Young-Generation GraphServer Process**. This alarm is cleared when the number of GC times of the young-generation GraphBase service is less than or equal to the threshold.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase services are installed, determine the GraphBase service for which the alarm is generated based on the value of **ServiceName** in **Location Information** of the alarm. For example, if the GraphBase1 service is unavailable, the service name displayed in **Location Information** is **GraphBase1** and the operation object in the handling procedure is changed to **GraphBase1**.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43613	Major	Quality of service	GraphBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the number of GC times of the young-generation GraphServer process exceeds the threshold, the GraphBase interface cannot be accessed normally.

Possible Causes

The memory of GraphBase instances on the node is overused, the heap memory is inappropriately allocated, or a large number of I/O operations exist in GraphBase. As a result, GCs occur frequently.

Handling Procedure

Check the number of GC times.

Step 1 On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **GraphBase** > **GC Time** > **Number of GC Times of the Young-Generation GraphServer Process**.

Step 2 On the FusionInsight Manager homepage, choose **Cluster** > *Name of the Desired cluster* > **Service** > **GraphBase**. Click the drop-down list in the upper right corner of the graph area, choose **Customize** > **Number of GC Times of the Young-Generation GraphServer Process**, and click **OK** to check whether the threshold is exceeded.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **GraphBase** > **GC Time** > **Number of GC Times of the Young-Generation GraphServer Process** to reset the threshold.

Step 4 Wait for one minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Stop sending any requests for creating, deleting, updating, or querying relationships.

Wait for one minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On the FusionInsight Manager homepage, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **GraphBase** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.284 ALM-43614 Time Spent on a GraphBase Path Query Request Exceeds the Threshold

Alarm Description

The system checks the status of GraphBase service every 30 seconds. This alarm is generated when the time Spent on a path query request on the GraphBase client from the GraphServer node exceeds the configured threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43614	Major	Quality of service	GraphBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

- If the requested content is too large or the request is frequently sent, the system is delayed. As a result, the communication between services may be abnormal.
- The GraphBase service may be unavailable.

Possible Causes

- The content requested by the client is too large or the request is frequently sent.
- The threshold is configured too low.

Handling Procedure

Check the time spent on a real-time path query request on the GraphServer node.

Step 1 On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of desired the cluster* > **GraphBase** to view the threshold of **Response Time for a Path Query on GraphServer**.

Step 2 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43614**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 3 On the FusionInsight Manager homepage, choose **Cluster** > *Name of the desired cluster* > **Service** > **GraphBase** > **Instance**. Click the GraphServer where the alarm is reported. On the dashboard page that is displayed, expand the drop-down list box in the upper right corner of the graph area, choose **Customize** > **Response Time for a Path Query on GraphServer**, and click **OK** to check whether the query time of the current path exceeds the threshold.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of desired cluster* > **GraphBase** to update the threshold of **Response Time for a Path Query on GraphServer**.

Step 5 Wait for one minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Step 6 Stop sending any requests for creating, deleting, updating, or querying relationships.

Wait for one minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On the FusionInsight Manager homepage, choose **O&M** > **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **GraphBase** for the target cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.285 ALM-43615 Time Spent on a Line Expansion Query Request in GraphBase Exceeds the Threshold

Alarm Description

The system checks the status of GraphBase service every 30 seconds. This alarm is generated when the time Spent on a line expansion query request on the GraphBase client from the GraphServer node exceeds the configured threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43615	Major	Quality of service	GraphBase	Yes

Alarm Parameters

Type	Parameter	Meaning
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

- If the requested content is too large or the request is frequently sent, the system is delayed. As a result, the communication between services may be abnormal.
- The GraphBase service may be unavailable.

Possible Causes

- The content requested by the client is too large or the request is frequently sent.

- The threshold is too low.

Handling Procedure

Check the time spent on a real-time line expansion query request on the GraphServer node.

Step 1 On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **GraphBase** to view the threshold of **Response Time for a Line Expansion Query on GraphServer**.

Step 2 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43615**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 3 On the FusionInsight Manager homepage, choose **Cluster** > *Name of the desired cluster* > **Service** > **GraphBase** > **Instance**. Click the GraphServer where the alarm is reported. On the **Dashboard** page that is displayed, expand the drop-down list box in the upper right corner of the graph area, choose **Customize** > **Response Time for a Line Expansion Query on GraphServer**, and click **OK** to check whether the query time of the current path exceeds the threshold.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **GraphBase** to update the threshold of **Response Time for a Line Expansion Query on GraphServer**.

Step 5 Wait for one minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Step 6 Stop sending any requests for creating, deleting, updating, or querying relationships.

Wait for one minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On the FusionInsight Manager homepage, choose **O&M** > **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **GraphBase** for the target cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.286 ALM-43616 GraphBase-related Yarn Jobs Are Abnormal

Alarm Description

The system checks Yarn jobs related to GraphBase every 30 seconds. This alarm is generated when a failed Yarn job is found.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43616	Minor	Error handling	GraphBase	No

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	TaskType	Specifies the job type of an asynchronous Yarn job.
	TaskId	Specifies the ID of the Yarn task that fails to be executed.

Impact on the System

- Operations performed in GraphBase may fail.
- The GraphBase service may be unavailable.
- After the fault is rectified, you need to execute the task again.

Possible Causes

Required parameter configuration for Yarn jobs is incorrect.

Handling Procedure

Check GraphBase-related Yarn jobs.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Yarn** > **ResourceManager(Active)**. On the Yarn web UI, analyze the cause of the Yarn task failure.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 2 Find the failure cause and submit Yarn jobs again to check whether new Yarn jobs can be successfully executed.

- If yes, click **Clear** in the **Operation** column of the alarm to manually clear the alarm.
- If no, go to **Step 3**.

Step 3 If the new Yarn jobs submitted fail to be executed, download the fault logs and analyze the cause.

Collect the fault information.

Step 4 On the FusionInsight Manager homepage, choose **O&M** > **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **GraphBase** for the target cluster.

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system does not automatically clear this alarm and you need to manually clear the alarm.

Related Information

None.

11.287 ALM-43617 Number of Waiting Queues for Real-Time Data Import to GraphBase Exceeds the Threshold

Alarm Description

The system checks whether the number of waiting queues imported to GraphBase in real time exceeds the threshold every 30 seconds. This alarm is generated when the number of waiting queues exceeds the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43617	Minor	Quality of service	GraphBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	TaskId	Specifies the ID of a Yarn job.

Impact on the System

- As a result, real-time data import is blocked and the import time becomes longer.
- The real-time data import may be suspended.

Possible Causes

- The imported data size is too large and the configuration for data import is improper.

- The threshold is too low. The default value is **100**.

Handling Procedure

Check whether the number of waiting queues for real-time data import exceeds the threshold.

Step 1 On the FusionInsight Manager homepage, choose **Cluster** > *Name of the desired cluster* > **Service** > **Yarn** > **ResourceManager(Active)**. On the Yarn web UI, check the GraphBase-related SparkStreaming Yarn jobs.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 2 Click **ApplicationMaster** on the Yarn job page to go to the Spark job page.

Step 3 Click **Streaming** to view the status of the suspended queues.

Step 4 Enable the client not to send other Yarn tasks that are imported in real time. After a period of time, check whether the alarm is automatically cleared. If the alarm is cleared, the blocked queue is restored.

Step 5 If the queues are still suspended, download fault logs to analyze the cause. On FusionInsight Manager, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **GraphBase** > **Threshold** to set the threshold of **graphStreaming Real-time import waiting queue**.

Step 6 Wait for one minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On the FusionInsight Manager homepage, choose **O&M** > **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **GraphBase** for the target cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm. No manual operation is required.

Related Information

None.

11.288 ALM-43618 GraphServer Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the GraphServer service every 30 seconds. This alarm is generated when the system detects that the heap memory usage of a GraphServer instance exceeds the threshold (90% of the maximum memory) for five consecutive periods (smoothing is performed for 5 times).

The alarm is cleared when the heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43618	Major	Quality of service	GraphBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the heap memory usage of the GraphServer is too high, the performance of submitting and running GraphServer jobs may be affected, or the GraphServer service may break down due to memory overflow.

Possible Causes

The heap memory of the GraphServer instance is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Handling Procedure

Check the heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarm** > **ALM-43618 GraphServer Heap Memory Usage Exceeds the Threshold** > **Location Information**. View the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager homepage, choose **Cluster** > *Name of the desired cluster* > **Service** > **GraphBase** > **Instance** > **GraphServer** (corresponding to the IP address of the instance for which this alarm is generated) > **GraphServer Heap Memory Usage Statics**. check the heap memory usage.

Step 3 Check whether the heap memory used by GraphServer reaches 90% of the maximum heap memory (default threshold) configured for GraphServer.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager homepage, choose **Cluster** > *Name of the desired cluster* > **Service** > **GraphBase** > **Configuration** > **All Configurations** > **GraphServer** > **System**. Change the value of **GC_OPTS** as described in the following note.

NOTE

Change the value of **GC_OPTS** as follows:

The default values of **-Xmx** and **-Xms** are **-Xmx30720M -Xms30720M**. When you increase the parameter values, you are advised to set **-Xmx** and **-Xms** to the same value. For example, increase them by **2048M** using **-Xmx32768M -Xms32768M**. It is recommended that the value be less than or equal to 50% of the host memory of the node and the maximum value be less than or equal to 32 GB.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **GraphBase** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.289 ALM-43619 Invalid GraphBase HA Certificate Files

Alarm Description

GraphBase checks whether the HA certificate files are valid (whether the certificate exists and whether its format is correct) in the first health check or at 01:00:00 every day. This alarm is generated when the certificate file is invalid.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43619	Major	Quality of service	GraphBase	Yes

Alarm Parameters

Type	Alarm Parameters	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The HA root certificate file or HA user certificate file has expired. As a result, functions are restricted and cannot be used.

Possible Causes

The HA root certificate file or HA user certificate file is invalid.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**, and locate the row that contains **ALM-43619 Invalid GraphBase HA Certificate Files**. Check the host name in the location information and the file name in the additional information. Use PuTTY to log in to the host where the alarm is generated as user **omm**.

- If the file name displayed in additional information is **root-ca.crt**, go to **Step 2**.
- If the file name displayed in additional information is **server.crt**, go to **Step 10**.

Check whether the HA root certificate file in the system is valid.

Step 2 Run the **cd ${BIGDATA_HOME}/FusionInsight_GraphBase_*/install/FusionInsight-GraphBase-*/miner/ha/local/cert** command to go to the directory where the HA certificate is stored.

Step 3 Run the **ls -l** command to check whether the **root-ca.crt** file exists.

- If yes, go to **Step 4**.
- If no, go to **Step 16**.

Step 4 Run the **openssl x509 -in root-ca.crt -text -noout** command and check whether the command output is normal.

- If yes, go to **Step 16**.
- If no, go to **Step 5**.

Step 5 In the alarm list on FusionInsight Manager, check whether **ALM-12054 Invalid Certificate File** is reported.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Clear the alarm according to the handling procedure of **ALM-12054 Invalid Certificate File**.

Step 7 Run the **cp ${NODE_AGENT_HOME}/security/cert/subcert/certFile/ca.crt root-ca.crt** and **cp ${NODE_AGENT_HOME}/security/cert/subcert/certFile/ca.key root-ca.pem** commands to copy the HA root certificate again. Run the **rm ${BIGDATA_HOME}/FusionInsight_GraphBase_*/install/FusionInsight-GraphBase-*/miner/bin/CHECK_FLAG** command. Wait for 1 minute and check whether the alarm with the same additional information is cleared.

- If yes, go to **Step 8**.
- If no, go to **Step 16**.

Step 8 Log in to the node where the other LoadBalancer instance is deployed as user **omm** and repeat **Step 2** to **Step 7**.

Step 9 Check whether the alarm with the same additional information is generated again during the periodic check.

- If yes, go to **Step 16**.
- If no, no further action is required.

Check whether the HA user certificate file in the system is valid.

Step 10 Run the **cd ${BIGDATA_HOME}/FusionInsight_GraphBase_*/install/FusionInsight-GraphBase-*/miner/ha/local/cert** command to go to the directory where the HA certificate is stored.

Step 11 Run the **ls -l** command to check whether the **server.crt** file exists.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Run the **openssl x509 -in server.crt -text -noout** command and check whether the command output is normal.

- If yes, go to **Step 16**.
- If no, go to **Step 13**.

Step 13 Run the **cd ${BIGDATA_HOME}/FusionInsight_GraphBase_*/install/FusionInsight-GraphBase-*/miner/bin** command to go to the directory where the miner script is stored.

Step 14 Run the **sh miner-ha-re-gencert.sh** command to generate a new HA certificate. Then, check whether the alarm with the same additional information is cleared 1 minute later.

- If yes, go to **Step 15**.
- If no, go to **Step 16**.

Step 15 Check whether the alarm with the same additional information is generated again during the periodic check.

- If yes, go to **Step 16**.
- If no, no further action is required.

Collect the fault information.

Step 16 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 17 Select **GraphBase** in the required cluster for **Service**.

Step 18 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact technical support and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.290 ALM-43620 GraphBase HA Certificates Are About to Expire

Alarm Description

GraphBase checks whether HA certificate files are about to expire in the first health check or at 01:00:00 every day. This alarm is generated when the validity period is less than 30 days.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43620	Major	Quality of service	GraphBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

Currently, there is no impact on the system.

Possible Causes

The HA root certificate file or HA user certificate file is about to expire.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**, and locate the row that contains **ALM-43620 GraphBase HA Certificates Are About to Expire** Check the host name in the

location information and the file name in additional information. Use PuTTY to log in to the host where the alarm is generated as user **omm**.

- If the file name displayed in additional information is **root-ca.crt**, go to **Step 2**.
- If the file name displayed in additional information is **server.crt**, go to **Step 10**.

Check whether the HA root certificate file in the system is valid. If it is not, generate new HA certificate files.

Step 2 Run the **cd ${BIGDATA_HOME}/FusionInsight_GraphBase_*/install/FusionInsight-GraphBase-*/miner/ha/local/cert** command to go to the HA certificate directory.

Step 3 Run the **openssl x509 -noout -text -in root-ca.crt** command to query the effective time and due time of the HA root certificate.

Step 4 Perform **Step 5** to **Step 9** during off-peak hours to update HA certificate files as needed.

Step 5 In the alarm list on FusionInsight Manager, check whether the **ALM-12055 Certificate File About to Expire** alarm is generated.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Clear the alarm according to the handling procedure of **ALM-12055 Certificate File About to Expire**.

Step 7 Run the **cp ${NODE_AGENT_HOME}/security/cert/subcert/certFile/ca.crt root-ca.crt** and **cp ${NODE_AGENT_HOME}/security/cert/subcert/certFile/ca.key root-ca.pem** commands to copy the HA root certificate again. Run the **rm ${BIGDATA_HOME}/FusionInsight_GraphBase_*/install/FusionInsight-GraphBase-*/miner/bin/CHECK_FLAG** command. Wait for 1 minute and check whether the alarm with the same additional information is cleared.

- If yes, go to **Step 8**.
- If no, go to **Step 18**.

Step 8 Log in to the node where the other LoadBalancer instance is deployed as user **omm** and repeat **Step 2** to **Step 7**.

Step 9 Check whether the alarm with the same additional information is generated again during the periodic check.

- If yes, go to **Step 18**.
- If no, no further action is required.

Check whether the HA user certificate file in the system is valid. If it is not, generate new HA certificate files.

Step 10 Use PuTTY to log in to the host for which the alarm is generated as user **omm**.

Step 11 Run the **cd ${BIGDATA_HOME}/FusionInsight_GraphBase_*/install/FusionInsight-GraphBase-*/miner/ha/local/cert** command to go to the HA certificate directory.

Step 12 Run the **openssl x509 -noout -text -in server.crt** command to query the effective time and due time of the HA user certificate.

Step 13 Perform **Step 14** to **Step 15** update the HA certificate during off-peak hours as required.

Step 14 Run the **cd ${BIGDATA_HOME}/FusionInsight_GraphBase_*/install/FusionInsight-GraphBase-*/miner/bin** command to go to the directory where the miner script is stored.

Step 15 Run the **sh miner-ha-re-gencert.sh** command to generate a new HA certificate. Then, check whether the alarm is cleared 1 minute later.

- If yes, go to **Step 17**.
- If no, go to **Step 16**.

Step 16 On the node where the standby LoadBalancer instance is located, repeat **Step 14** to **Step 15**. Then, check whether the alarm is cleared 1 minute later.

- If yes, go to **Step 17**.
- If no, go to **Step 18**.

Step 17 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 18**.
- If no, no further action is required.

Collect the fault information.

Step 18 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 19 Select **GraphBase** in the required cluster for **Service**.

Step 20 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 21 Contact technical support and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.291 ALM-43621 GraphBase HA Certificate Files Have Expired

Alarm Description

GraphBase checks whether HA certificate files have expired in the first health check or at 01:00:00 every day. This alarm is generated when the HA certificate has expired.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43621	Major	Quality of service	GraphBase	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The HA root certificate file or HA user certificate file has expired. As a result, functions are restricted and cannot be used.

Possible Causes

The HA root certificate file or HA user certificate file has expired.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**, and locate the row that contains **ALM-43621 GraphBase HA Certificate Files Have Expired** Check the host name in the location information and the file name in additional information. Use PuTTY to log in to the host where the alarm is generated as user **omm**.

- If the file name displayed in additional information is **root-ca.crt**, go to **Step 2**.
- If the file name displayed in additional information is **server.crt**, go to **Step 9**.

Check whether the HA root certificate file in the system is valid. If it is not, generate new HA certificate files.

Step 2 Run the **cd ${BIGDATA_HOME}/FusionInsight_GraphBase_*/install/FusionInsight-GraphBase-*/miner/ha/local/cert** command to go to the directory where the HA certificate is stored.

Step 3 Run the **openssl x509 -noout -text -in root-ca.crt** command to query the effective time and due time of the HA root certificate and check whether the file is valid.

- If yes, go to **Step 15**.
- If no, go to **Step 4**.

Step 4 In the alarm list on FusionInsight Manager, check whether **ALM-12054 Invalid Certificate File** is reported.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Clear the alarm according to the handling procedure of **ALM-12054 Invalid Certificate File**.

Step 6 Run the **cp ${NODE_AGENT_HOME}/security/cert/subcert/certFile/ca.crt root-ca.crt** and **cp ${NODE_AGENT_HOME}/security/cert/subcert/certFile/ca.key root-ca.pem** commands to copy the HA root certificate again. Run the **rm ${BIGDATA_HOME}/FusionInsight_GraphBase_*/install/FusionInsight-GraphBase-*/miner/bin/CHECK_FLAG** command. Wait for 1 minute and check whether the alarm with the same additional information is cleared.

- If yes, go to **Step 7**.
- If no, go to **Step 15**.

Step 7 Log in to the node where the other LoadBalancer instance is deployed as user **omm** and repeat **Step 2** to **Step 6**.

Step 8 Check whether the alarm with the same additional information is generated again during the periodic check.

- If yes, go to **Step 15**.
- If no, no further action is required.

Check whether the HA user certificate file in the system is valid. If it is not, generate new HA certificate files.

Step 9 Run the **cd ${BIGDATA_HOME}/FusionInsight_GraphBase_*/install/FusionInsight-GraphBase-*/miner/ha/local/cert** command to go to the directory where the HA certificate is stored.

Step 10 Run the **openssl x509 -noout -text -in server.crt** command to query the effective time and due time of the HA user certificate and check whether the file is valid.

- If yes, go to **Step 15**.
- If no, go to **Step 11**.

Step 11 Run the **cd ${BIGDATA_HOME}/FusionInsight_GraphBase_*/install/FusionInsight-GraphBase-*/miner/bin** command to go to the directory where the miner script is stored.

Step 12 Run the **sh miner-ha-re-gencert.sh** command to generate a new HA certificate. Then, check whether the alarm is cleared 1 minute later.

- If yes, go to **Step 14**.
- If no, go to **Step 13**.

Step 13 On the node where the standby LoadBalancer instance is located, repeat **Step 11** to **Step 12**. Then, check whether the alarm is cleared 1 minute later.

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 15**.
- If no, no further action is required.

Collect the fault information.

Step 15 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 16 Select **GraphBase** in the required cluster for **Service**.

Step 17 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact technical support and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.292 ALM-43850 KMS Service Unavailable

Alarm Description

The system checks the KMS service status every 60 seconds. This alarm is generated when the KMS service is unavailable.

This alarm is cleared when the KMS service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
43850	Critical	Quality of service	KMS	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

KMS cannot provide the encryption key management service. If you cannot obtain the key, data cannot be encrypted or decrypted, and services encrypted or decrypted using KMS fail.

Possible Causes

- The ZooKeeper service is abnormal.
- The KMSWebServer instance is abnormal.

Handling Procedure

Check the KMSWebServer status.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper**, and check whether the service running status is normal.

- If yes, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 Rectify the fault by following the instructions in the help information of "ALM-13000 ZooKeeper Service Unavailable" and check whether the ZooKeeper running status is normal.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**> **KMS**. On the**Dashboard** tab, check whether there is a node configured with the KMSWebServer role in the normal running status.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 choose **O&M** > **Alarm** > **Alarms**, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 6 In the **Service** area, select the following services of the desired cluster.

- ZooKeeper
- KrbServer

Step 7 Click **OK**.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm. You do not need to manually clear it.

Related Information

None.

11.293 ALM-45000 HetuEngine Service Unavailable

Alarm Description

The system checks the HetuEngine service status every 300 seconds. This alarm is generated when the HetuEngine service is unavailable.

This alarm is cleared when the HetuEngine service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45000	Critical	Error handling	HetuEngine	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

FusionInsight Manager cannot be used to perform operations on the HetuEngine cluster, and HetuEngine functions are unavailable.

Possible Causes

- The KrbServer service is abnormal.
- The ZooKeeper service is abnormal.
- The HDFS service is abnormal.
- The Yarn service is abnormal.
- The DBService service is abnormal.
- The Hive service is abnormal.
- There is no HetuEngine HSBroker instance that is running properly.

Handling Procedure

Check the KrbServer service status.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarm**.

Step 2 In the alarm list, check whether the "ALM-25500 KrbServer Service Unavailable" alarm is generated.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Clear "ALM-25500 KrbServer Service Unavailable" according to the alarm help.

Step 4 In the alarm list, check whether the alarm "ALM-45000 HetuEngine Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the ZooKeeper service status.

Step 5 In the alarm list, check whether the alarm "ALM-12007 Process Fault" is generated.

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 In the alarm list, click ⌄ in the row that contains the "Process Fault" alarm. Check whether the name of the service for which the alarm is generated is ZooKeeper in **Location Information**.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Clear "ALM-12007 Process Fault" according to the alarm help.

Step 8 In the alarm list, check whether the alarm "ALM-45000 HetuEngine Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check the HDFS service status.

Step 9 In the alarm list, check whether the "ALM-14000 HDFS Service Unavailable" alarm is generated.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 Clear "ALM-14000 HDFS Service Unavailable" according to the alarm help.

Step 11 In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check the YARN service status.

Step 12 In the alarm list, check whether the "ALM-18000 YARN Service Unavailable" alarm is generated.

- If yes, go to **Step 13**.
- If no, go to **Step 15**.

Step 13 Clear "ALM-18000 YARN Service Unavailable" according to the alarm help.

Step 14 In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Check the DBService service status.

Step 15 In the alarm list, check whether the "ALM-27001 DBService Service Unavailable" alarm is generated.

- If yes, go to **Step 16**.
- If no, go to **Step 18**

Step 16 Clear "ALM-27001 DBService Service Unavailable" according to the alarm help.

Step 17 In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 18**.

Check the Hive service status.

Step 18 In the alarm list, check whether the "ALM-16004 Hive Service Unavailable" alarm is generated.

- If yes, go to **Step 19**.
- If no, go to **Step 21**.

Step 19 Clear "ALM-16004 Hive Service Unavailable" according to the alarm help.

Step 20 In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 21**.

Check whether there is no HetuEngine HSBroker instance that is running properly.

Step 21 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HetuEngine**. On the page that is displayed, click the **Instance** tab.

Step 22 **Check whether there is no HSBroker instance that is running properly.**

- If yes, select the instance whose running status is not good, click **More** > **Restart Instance** in the **Operation** column to restart the instance, and go to **Step 23**.
- If no, go to **Step 24**.

Step 23 In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 24**.

Check the network connection between HetuEngine and ZooKeeper, HDFS, YARN, DBService, and Hive.

Step 24 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HetuEngine**. On the page that is displayed, click the **Instance** tab.

Step 25 Click the host name in the **HSBroker** row and record the management IP address in the **Basic Information** area.

Step 26 Log in to the host where HSBroker resides as user **omm** using the IP address obtained in **Step 25**.

Step 27 Run the **ping** command to check whether the network connection between the host where HSBroker resides and the hosts where ZooKeeper, HDFS, Yarn, DBService, and Hive reside is in the normal state.

- If yes, go to **Step 30**.
- If no, go to **Step 28**.

Step 28 Contact the network administrator to restore the network.

Step 29 In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 30**.

Collect fault information.

Step 30 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 31 Expand the **Service** drop-down list. In the **Services** dialog box that is displayed, select **HetuEngine** under the target cluster name, and click **OK**.

Step 32 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 33 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 34 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None.

11.294 ALM-45001 Faulty HetuEngine Compute Instances

Alarm Description

The system checks the HetuEngine compute instance status every 60 seconds. This alarm is generated when the HetuEngine compute instance is faulty.

This alarm is cleared when all faulty HetuEngine compute instances are restored.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45001	Critical	Quality of service	HetuEngine	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

SQL tasks submitted to the faulty compute instance of HetuEngine fail to be executed.

Possible Causes

- The HDFS service is abnormal.
- The Yarn service is abnormal.
- Yarn queue resources are insufficient.
- The process of compute instances is faulty.

Handling Procedure

Check the HDFS service status.

Step 1 In the alarm list, check whether the "ALM-14000 HDFS Service Unavailable" alarm is generated.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Clear "ALM-14000 HDFS Service Unavailable" according to the alarm help.

Step 3 In the alarm list, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the YARN service status.

Step 4 In the alarm list, check whether the "ALM-18000 YARN Service Unavailable" alarm is generated.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Clear "ALM-18000 YARN Service Unavailable" according to the alarm help.

Step 6 In the alarm list, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check the YARN queue resource status.

Step 7 In the alarm list, check whether the "ALM-18022 Insufficient YARN Queue Resources" alarm is generated.

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

Step 8 Clear "ALM-18022 Insufficient YARN Queue Resources" according to the alarm help.

Step 9 In the alarm list, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check the HetuEngine compute instance status.

Step 10 Log in to FusionInsight Manager as an administrator who can access the HetuEngine web UI and choose **Cluster** > **Services** > **HetuEngine**.

Step 11 In the **Basic Information** area on the **Dashboard** tab page, click the link next to **HSConsole WebUI** to access the HSConsole page.

Step 12 On the compute instance page, check whether any compute instances are in the **FAULT** state.

- If yes, go to **Step 13**.
- If no, go to **Step 14**.

Step 13 In the **Operation** column, click **Start** and wait until the instance is started.

Step 14 In the alarm list, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect fault information.

Step 15 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 16 Expand the **Service** drop-down list, select **HetuEngine** for the target cluster, and click **OK**.

Step 17 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 18 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.295 ALM-45003 HetuEngine QAS Disk Capacity Is Insufficient

Alarm Description

The system checks the HetuEngine QAS disk usage every 60 seconds and compares the actual disk usage with the threshold. The disk usage has a default threshold. This alarm is generated if the disk usage exceeds the threshold.

To change the threshold, choose **O&M** > **Alarm** > **Thresholds**. In the service list, choose **HetuEngine** > **Disk** > **QAS Disk Usage (QAS)**.

If the **Trigger Count** is **1**, this alarm is cleared when the usage of the HetuEngine QAS disk is less than or equal to the threshold. If the **Trigger Count** is greater than **1**, this alarm is cleared when the disk usage is less than or equal to 80% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45003	Critical (default threshold: 95%) Major (default threshold: 80%)	Quality of service	HetuEngine	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.

Type	Parameter	Description
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	PartitionName	Specifies the disk partition for which the alarm is generated.
	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Data cannot be written to the HetuEngine QAS disk. SQL diagnosis and materialized view recommendation of HetuEngine SQL O&M are unavailable.

Possible Causes

- The alarm threshold is improperly configured.
- The configuration of the HetuEngine QAS disk cannot meet service requirements. The disk usage reaches the upper limit.

Handling Procedure

Check whether the threshold is set properly.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Thresholds**. In the service list, choose **HetuEngine** > **Disk** > **QAS Disk Usage (QAS)**. Check whether the alarm threshold is set properly. The default threshold is 80% of the disk capacity. You can change the threshold as required.

- If the threshold is set properly, go to **Step 4**.
- If the threshold is not set properly, go to **Step 2**.

Step 2 Click **Modify** in the **Operation** column to modify and save the alarm threshold as required.

Step 3 Wait 2 minutes and check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 4**.

Check whether the disk usage reaches the upper limit.

Step 4 Expand the alarm information, view the information in the **Location** area, and check the role name and host name of the QAS disk where the alarm is generated.

Step 5 Choose **Cluster** > **Services** > **HetuEngine** and click **Instance**. On the displayed page, click the QAS role name in the alarm information. On the instance page that is displayed, click **Chart** and check whether the QAS disk usage in the **QAS Disk Usage** chart exceeds the threshold (80% of the disk capacity by default).

- If the disk usage reaches the upper limit, go to **Step 6**.
- If the disk usage does not reaches the upper limit, go to **Step 9**.

Step 6 Log in to the host of the node where the QAS instance reporting the alarm is located as the **root** user.

Step 7 Run the following command to go to the QAS data directory and delete temporary files as required:

cd ${BIGDATA_DATA_HOME}/hetuengine/qas

Step 8 Wait 2 minutes and check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm fails to be cleared, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, select **HetuEngine** for the target cluster, and click **OK**.

Step 11 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 12 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.296 ALM-45004 Tasks Stacked on HetuEngine Compute Instance

Alarm Description

The system checks the number of running tasks on a HetuEngine compute instance every 30 seconds. This alarm is generated when the number of running tasks is greater than 50.

This alarm is cleared when the number of tasks running on the HetuEngine compute instance is no more than 50.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45004	Major	Quality of service	HetuEngine	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Running Queries Backlog	Specifies the tenant name of the compute instance for which the alarm is generated and how much the threshold is exceeded.

Impact on the System

The performance of the compute instance deteriorates and the SQL response becomes slow.

Possible Causes

- The compute instance specification is too small.
- Large SQL tasks occupy too many compute resources. No resource is available for other tasks, and the compute instance cannot respond quickly. As a result, tasks are stacked.

Handling Procedure

Check whether compute instance resources are properly configured.

Step 1 Log in to FusionInsight Manager as an administrator who can access the HetuEngine web UI.

Step 2 Choose **O&M** > **Alarm** > **Alarms** > **Tasks Stacked on HetuEngine Compute Instance**, check the **Additional Information** of the alarm, and view and record the tenant name for which the alarm is generated.

Step 3 Choose **Cluster** > **Services** > HetuEngine. In the **Basic Information** area in the **Dashboard** tab, click the link next to **HSConsole Web UI**. The HSConsole page is displayed.

Step 4 On the **Compute Instance** page, click **Configure** in the **Operation** column of the tenant to which the compute instance belongs. Check whether the resource configured for the compute instance is proper. (The the minimum resources are used by default. You can adjust the configuration based on the site requirements.)

- If yes, go to **Step 8**.
- If no, go to **Step 5**.

Step 5 Return to the compute instance list, click **Stop Instances** in the **Operation** column, and stop instances as prompted.

NOTICE

Tasks submitted to the stopped compute instances will be interrupted.

Step 6 Click **Configure**, add resources to the target compute instance based on the site requirements, and click **OK**. Click **Start Instances** and start instances as prompted.

Step 7 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether there are large SQL tasks.

Step 8 On the **Compute Instances** page, expand the instances of the tenant and click **LINK** in the **WebUI** column of a compute instance to view the status of all tasks.

Step 9 In the **Sort** column, select **Execution Time** to sort the running tasks and check whether there are tasks that have been running for hours.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 End the tasks that have been running for a long time based on service requirement and optimize the service SQL statements.

Step 11 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 13 Expand the **Service** drop-down list, select **HetuEngine** for the target cluster, and click **OK**.

Step 14 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 15 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.297 ALM-45005 CPU Usage of HetuEngine Compute Instance Exceeded the Threshold

Alarm Description

The system checks the average CPU usage of HetuEngine compute instances every 30 seconds. This alarm is generated when the average CPU usage of the instances is greater than 90%.

This alarm is cleared when the CPU usage of the HetuEngine compute instances is no more than 90%.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45005	Major	Quality of service	HetuEngine	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.

Type	Parameter	Description
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Cpu Usage Exceeds The Threshold	Specifies the tenant name of the compute instance for which the alarm is generated and how much the threshold is exceeded.

Impact on the System

The performance of the compute instances deteriorates and the response to SQL statements becomes slow.

Possible Causes

- The compute instance specification is too small.
- Large SQL tasks occupy too many compute resources. No resource is available for other tasks, and the compute instance cannot respond quickly. As a result, tasks are stacked.

Handling Procedure

Check whether compute instance resources are properly configured.

Step 1 Log in to FusionInsight Manager as an administrator who can access the HetuEngine web UI.

Step 2 Choose **O&M** > **Alarm** > **Alarms** > **Tasks Stacked on HetuEngine Compute Instance**, check the **Additional Information** of the alarm, and view and record the tenant name for which the alarm is generated.

Step 3 Choose **Cluster** > **Services** > HetuEngine. In the **Basic Information** area in the **Dashboard** tab, click the link next to **HSConsole Web UI**. The HSConsole page is displayed.

Step 4 On the **Compute Instance** page, click **Configure** in the **Operation** column of the tenant to which the compute instance belongs. Check whether the resource configured for the compute instance is proper. (The the minimum resources are used by default. You can adjust the configuration based on the site requirements.)

- If yes, go to **Step 8**.
- If no, go to **Step 5**.

Step 5 Return to the compute instance list, click **Stop Instances** in the **Operation** column, and stop instances as prompted.

NOTICE

Tasks submitted to the stopped compute instances will be interrupted.

Step 6 Click **Configure**, add resources to the target compute instance based on the site requirements, and click **OK**. Click **Start Instances** and start instances as prompted.

Step 7 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether there are large SQL tasks.

Step 8 On the **Compute Instances** page, expand the instances of the tenant and click **LINK** in the **WebUI** column of a compute instance to view the status of all tasks.

Step 9 In the **Sort** column, select **Execution Time** to sort the running tasks and check whether there are tasks that have been running for hours.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 End the tasks that have been running for a long time based on service requirement and optimize the service SQL statements.

Step 11 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 13 Expand the **Service** drop-down list, select **HetuEngine** for the target cluster, and click **OK**.

Step 14 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 15 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.298 ALM-45006 Memory Usage of a HetuEngine Compute Instance Exceeded the Threshold

Alarm Description

The system checks the memory usage of HetuEngine compute instances every 30 seconds. This alarm is generated when the memory usage of the instance is greater than 80%.

This alarm is cleared when the memory usage of the HetuEngine compute instance is no more than 80%.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45006	Major	Quality of service	HetuEngine	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Memory Usage Exceeds The Threshold	Specifies the tenant name of the compute instance for which the alarm is generated and how much the threshold is exceeded.

Impact on the System

The performance of the compute instance deteriorates and the response to service SQL statements becomes slow.

Possible Causes

- The compute instance specification is too small.
- Large SQL tasks occupy too many compute resources. No resource is available for other tasks, and the compute instance cannot respond quickly. As a result, tasks are stacked.

Handling Procedure

Check whether compute instance resources are properly configured.

Step 1 Log in to FusionInsight Manager as an administrator who can access the HetuEngine web UI.

Step 2 Choose **O&M** > **Alarm** > **Alarms** > **Tasks Stacked on HetuEngine Compute Instance**, check the **Additional Information** of the alarm, and view and record the tenant name for which the alarm is generated.

Step 3 Choose **Cluster** > **Services** > HetuEngine. In the **Basic Information** area in the **Dashboard** tab, click the link next to **HSConsole Web UI**. The HSConsole page is displayed.

Step 4 On the **Compute Instance** page, click **Configure** in the **Operation** column of the tenant to which the compute instance belongs. Check whether the resource configured for the compute instance is proper. (The the minimum resources are used by default. You can adjust the configuration based on the site requirements.)

- If yes, go to **Step 8**.
- If no, go to **Step 5**.

Step 5 Return to the compute instance list, click **Stop Instances** in the **Operation** column, and stop instances as prompted.

NOTICE

Tasks submitted to the stopped compute instances will be interrupted.

Step 6 Click **Configure**, add resources to the target compute instance based on the site requirements, and click **OK**. Click **Start Instances** and start instances as prompted.

Step 7 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether there are large SQL tasks.

Step 8 On the **Compute Instances** page, expand the instances of the tenant and click **LINK** in the **WebUI** column of a compute instance to view the status of all tasks.

Step 9 In the **Sort** column, select **Execution Time** to sort the running tasks and check whether there are tasks that have been running for hours.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 End the tasks that have been running for a long time based on service requirement and optimize the service SQL statements.

Step 11 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 13 Expand the **Service** drop-down list, select **HetuEngine** for the target cluster, and click **OK**.

Step 14 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 15 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

11.299 ALM-45007 Number of Workers of a HetuEngine Compute Instance Is Less Than the Threshold

Alarm Description

The system checks the number of Workers of a HetuEngine compute instance every 60 seconds. This alarm is generated when the number of Workers is less than 80% of the initial value.

This alarm is cleared when the number of Workers running on the HetuEngine compute instance is no less than 80% of the initial value.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45007	Major	Quality of service	HetuEngine	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Worker Less Threshold	Specifies the tenant name of the compute instance for which the alarm is generated and how much the threshold is exceeded.

Impact on the System

The performance of the compute instance deteriorates and the SQL response becomes slow.

Possible Causes

- YARN queue resources are insufficient.
- A large number of tasks are running, causing OMM memory overflow on Worker nodes. As a result, the number of Worker nodes decreases.

Handling Procedure

Check whether YARN resource queue resources are sufficient.

Step 1 Log in to FusionInsight Manager as an administrator who can access the HetuEngine web UI.

Step 2 Choose **O&M** > **Alarm** > **Alarms** > **Number of Workers of a HetuEngine Compute Instance Is Less Than the Threshold**, check the **Additional Information** of the alarm, and view and record the tenant name for which the alarm is generated.

Step 3 Click **Tenant Resources**, select the tenant of the compute instance, and check whether the resource quota of the tenant is sufficient.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Increase the maximum percentage of the tenant's resources based on the actual usage.

Step 5 Wait 5 to 10 minutes and check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 6**.

Check whether there is a large number of running tasks.

Step 6 Choose **Cluster** > **Services** > **HetuEngine**.

Step 7 In the **Basic Information** area on the **Dashboard** tab page, click the link next to **HSConsole Web UI** to access the HSConsole page.

Step 8 On the **Compute Instances** page, expand the instances of the tenant and click **LINK** in the **WebUI** column of a compute instance to view the status of all tasks.

Step 9 Check whether the number of running tasks exceeds 50.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 Reduce the number of jobs submitted at a time or add compute instance resources based on service requirements.

Step 11 Wait 5 to 10 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 13 Expand the **Service** drop-down list, select **HetuEngine** for the target cluster, and click **OK**.

Step 14 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 15 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

11.300 ALM-45191 Failed to Obtain ECS Metadata

Alarm Description

Before calling an ECS API to obtain the AK/SK information for the first time, Meta calls an ECS API first to obtain and cache the metadata. Then, it updates the cache

every day. This alarm is generated when an API fails to be called for three consecutive times.

This alarm is cleared when Meta successfully calls the ECS API to obtain metadata.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45191	Major	Error handling	meta	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

For systems with decoupled storage and compute, the cluster cannot obtain the latest temporary AK/SK because it fails to obtain the metadata. As a result, the cluster fails to access OBS, and component services cannot be provided.

Possible Causes

- The meta role of the MRS cluster is abnormal.
- The cluster has been bound to an agency and accessed OBS, but it has been unbound from the agency currently.

Handling Procedure

Check the status of the meta role.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, click ⌄ in the row of this alarm, and view the host name of the instance for which the alarm is generated in **Location**.

Step 2 On FusionInsight Manager of the cluster, choose **Cluster** > **Services** > **meta**. On the page that is displayed, click the **Instance** tab, and check whether the meta role corresponding to the host for which the alarm is generated is normal.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Select the abnormal role, click **More**, and select **Restart Instance** to restart the abnormal meta role.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Log in to the host obtained in **Step 1** and check whether the **/var/log/Bigdata/meta/mrs-meta.log** file contains error information. If yes, rectify the fault based on the log information.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Rebind the cluster to an agency.

Step 7 Log in to the MRS console.

Step 8 In the navigation pane on the left, choose **Clusters** > **Active Clusters**. On the page that is displayed, click the cluster name to go to its dashboard. Then, check whether the cluster is bound to an agency in the O&M management area.

- If yes, go to **Step 10**.
- If no, go to **Step 9**.

Step 9 Click **Manage Agency**. On the page that is displayed, rebind the cluster to an agency. Then check whether the alarm is cleared a few minutes later.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On FusionInsight Manager of the active cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, select **meta** for the target cluster, and click **OK**.

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.301 ALM-45192 Failed to Obtain the IAM Security Token

Alarm Description

Meta calls an ECS API to obtain the AK/SK information. If permissions are set for users, Meta also needs to call an IAM API to obtain the security token. This alarm is generated when Meta fails to call the IAM API for three consecutive times.

This alarm is cleared when Meta successfully calls the IAM API.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45192	Major	Error handling	meta	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

For systems with decoupled storage and compute, the cluster cannot obtain the latest security token. Users with fine-grained permissions may fail to access OBS and cannot use component services.

Possible Causes

- The meta role of the MRS cluster is abnormal.
- The IAM service is abnormal.

Handling Procedure

Check the status of the meta role.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, click ⌄ in the row of this alarm, and view the host name of the instance for which the alarm is generated in **Location**.

Step 2 On FusionInsight Manager of the cluster, choose **Cluster** > **Services** > **meta**. On the page that is displayed, click the **Instance** tab, and check whether the meta role corresponding to the host for which the alarm is generated is normal.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Select the abnormal role, click **More**, and select **Restart Instance** to restart the abnormal meta role.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Log in to the host obtained in **Step 1** and check whether the **/var/log/Bigdata/meta/mrs-meta.log** file contains error information. If yes, rectify the fault based on the log information.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager of the active cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, select **meta** for the target cluster, and click **OK**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.302 ALM-45275 Ranger Service Unavailable

Alarm Description

The alarm module checks the Ranger service status every 180 seconds. This alarm is generated if the Ranger service is abnormal.

This alarm is cleared after the Ranger service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45275	Critical	Error handling	Ranger	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Cluster for which the alarm is generated.
	ServiceName	Service for which the alarm is generated.
	RoleName	Role for which the alarm is generated.
	HostName	Host for which the alarm is generated.

Impact on the System

The native UI of Ranger cannot be accessed, and policies cannot be created, modified, or deleted.

Possible Causes

- The DBService service on which Ranger depends is abnormal.
- The KrbServer service on which Ranger depends is abnormal.
- The LdapServer service on which Ranger depends is abnormal.
- The RangerAdmin role instance is abnormal.

Handling Procedure

Check the DBService process status.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed page, check whether the ALM-27001 DBService Service Unavailable alarm is reported.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Rectify the DBService service fault by following the handling procedure of **ALM-27001 DBService Service Unavailable**. After the DBService alarm is cleared, check whether the **Ranger Service Unavailable** alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check the KrbServer status.

Step 3 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, check whether **ALM-25500 KrbServer Service Unavailable** is reported.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Rectify the KrbServer service fault by following the handling procedure of **ALM-25500 KrbServer Service Unavailable**. After the KrbServer alarm is cleared, check whether the **Ranger Service Unavailable** alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the LdapServer status.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, check whether **ALM-12004 OLdap Resource Abnormal** is reported.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Rectify the LdapServer service fault by following the handling procedure of **ALM-12004 OLdap Resource Abnormal**. After the LdapServer alarm is cleared, check whether the **Ranger Service Unavailable** alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check all RangerAdmin instances.

Step 7 Log in to the node where the RangerAdmin instance is located as user **omm** and run the **ps -ef|grep "proc_rangeradmin"** command to check whether the RangerAdmin process exists on the current node.

- If yes, go to **Step 8**.
- If no, restart the faulty RangerAdmin instance or Ranger service and go to **Step 7**.

Step 8 In the alarm list, check whether the **Ranger Service Unavailable** alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

Related Information

None.

11.303 ALM-45276 Abnormal RangerAdmin Status

Alarm Description

The alarm module checks the RangerAdmin service status every 60 seconds. This alarm is generated if RangerAdmin is unavailable.

This alarm is automatically cleared after the RangerAdmin service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45276	Major	Error handling	Ranger	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Cluster for which the alarm is generated.
	ServiceName	Service for which the alarm is generated.
	RoleName	Role for which the alarm is generated.
	HostName	Host for which the alarm is generated.

Impact on the System

If the status of a RangerAdmin is abnormal, access to the Ranger native UI is not affected. If there are two abnormal RangerAdmin instances, the Ranger native UI

cannot be accessed and operations such as creating, modifying, and deleting policies are unavailable.

Possible Causes

The RangerAdmin port is not started.

Handling Procedure

Check the port process.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the name of the host for which the alarm is generated.

Step 2 Log in to the node where the RangerAdmin instance is located as user **omm**. Run the **ps -ef|grep "proc_rangeradmin" | grep -v grep | awk -F ' ' '{print $2}'** command to obtain ***pid*** of the RangerAdmin process, and run the **netstat -anp| grep *pid* | grep LISTEN** command to check whether the RangerAdmin process listens to port 21401 in the security mode and port 21400 in standard mode.

- If yes, go to **Step 4**.
- If no, restart the faulty RangerAdmin instance or Ranger service and go to **Step 3**.

Step 3 In the alarm list, check whether the "Abnormal RangerAdmin Status" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect the fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 6 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

Related Information

None.

11.304 ALM-45277 RangerAdmin Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the RangerAdmin service every 60 seconds. This alarm is generated when the system detects that the heap memory usage of the RangerAdmin instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45277	Major	Quality of service	Ranger	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the heap memory overflows, the service may break down. As a result, the native UI of Ranger cannot be accessed, and policies cannot be created, modified, or deleted.

Possible Causes

The heap memory usage of the RangerAdmin instance is high or the heap memory is improperly allocated.

Handling Procedure

Check the heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45277 RangerAdmin Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **RangerAdmin Heap Memory Usage**. Click **OK**.

Step 3 Check whether the heap memory used by RangerAdmin reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **RangerAdmin** > **Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for RangerAdmin cannot meet the heap memory required by the RangerAdmin process. You are advised to check the heap memory usage of RangerAdmin and change the value of **-Xmx** in **GC_OPTS** to the twice of the heap memory used by RangerAdmin. The value can be changed based on the actual service scenario. For details, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.305 ALM-45278 RangerAdmin Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the RangerAdmin service every 60 seconds. This alarm is generated when the direct memory usage of the RangerAdmin instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the direct memory usage of RangerAdmin is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45278	Major	Quality of service	Ranger	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the direct memory overflows, the service may break down. As a result, the native UI of Ranger cannot be accessed, and policies cannot be created, modified, or deleted.

Possible Causes

The direct memory of the RangerAdmin instance is overused or the direct memory is inappropriately allocated. As a result, the memory usage exceeds the threshold.

Handling Procedure

Check the direct memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45278 RangerAdmin Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **RangerAdmin Direct Memory Usage**. Click **OK**.

Step 3 Check whether the direct memory used by RangerAdmin reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **RangerAdmin** > **Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin** > **System**. Increase the value of **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory configured for RangerAdmin cannot meet the direct memory required by the RangerAdmin process. You are advised to check the direct memory usage of RangerAdmin and change the value of **-XX:MaxDirectMemorySize** in **GC_OPTS** to the twice of the direct memory used by RangerAdmin. You can change the value based on the actual service scenario. For details, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.306 ALM-45279 RangerAdmin Non-Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the non-heap memory usage of the RangerAdmin service every 60 seconds. This alarm is generated when the non-heap memory usage of the RangerAdmin instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45279	Major	Quality of service	Ranger	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the non-heap memory overflows, the service may break down. As a result, the native UI of Ranger cannot be accessed, and policies cannot be created, modified, or deleted.

Possible Causes

The non-heap memory usage of the RangerAdmin instance is high or the non-heap memory is improperly allocated.

Handling Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45279 RangerAdmin Non-Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **RangerAdmin Non Heap Memory Usage**. Click **OK**.

Step 3 Check whether the non-heap memory used by RangerAdmin reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **RangerAdmin** > **Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the RangerAdmin instance cannot meet the non-heap memory required by the RangerAdmin process. You are advised to change the value of **-XX:MaxPermSize** in **GC_OPTS** to the twice of the current non-heap memory usage or change the value based on the site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.307 ALM-45280 RangerAdmin GC Duration Exceeds the Threshold

Alarm Description

The system checks the GC duration of the RangerAdmin process every 60 seconds. This alarm is generated when the GC duration of the RangerAdmin process exceeds the threshold for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45280	Critical (default threshold: 20000ms) Major (default threshold: 12000ms)	Quality of service	Ranger	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.

Type	Parameter	Description
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

The RangerAdmin responds slowly to requests for creating, modifying, and deleting policies.

Possible Causes

The heap memory of the RangerAdmin instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Handling Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45280 RangerAdmin GC Duration Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize** > **GC** > **RangerAdmin GC Duration**. Click **OK**.

Step 3 Check whether the GC duration of the RangerAdmin process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **RangerAdmin** > **Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for RangerAdmin cannot meet the heap memory required by the RangerAdmin process. You are advised to check the heap memory usage of RangerAdmin and change the value of **-Xmx** in **GC_OPTS** to the twice of the heap memory used by RangerAdmin. The value can be changed based on the actual service scenario. For details, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.308 ALM-45281 UserSync Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the UserSync service every 60 seconds. This alarm is generated when the system detects that the heap memory usage of the UserSync instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45281	Major	Quality of service	Ranger	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

The service may break down. Ranger cannot synchronize LDAP user information.

Possible Causes

The heap memory usage of the UserSync instance is high or the heap memory is improperly allocated.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45281 UserSync Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **UserSync Heap Memory Usage**. Click **OK**.

Step 3 Check whether the heap memory used by UserSync reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **UserSync** > **Instance Configuration**. Click **All Configurations**, and choose **UserSync** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for UserSync cannot meet the heap memory required by the UserSync process. You are advised to change the **-Xmx** value of **GC_OPTS** to twice that of the heap memory used by UserSync. You can change the value based on the actual service scenario. For details about how to check the UserSync heap memory usage, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.309 ALM-45282 UserSync Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the UserSync service every 60 seconds. This alarm is generated when the direct memory usage of the UserSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the UserSync direct memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45282	Major	Quality of service	Ranger	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

The service may break down. Ranger cannot synchronize LDAP user information.

Possible Causes

The direct memory of the UserSync instance is overused or the direct memory is inappropriately allocated. As a result, the memory usage exceeds the threshold.

Handling Procedure

Check the direct memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45282 UserSync Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm. Check the name of the instance host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **UserSync Direct Memory Usage**. Click **OK**.

Step 3 Check whether the direct memory used by the UserSync reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **UserSync** > **Instance Configuration**. Click **All Configurations**, and choose **UserSync** > **System**. Increase the value of **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory configured for UserSync cannot meet the direct memory required by the UserSync process. You are advised to check the direct memory usage of UserSync and change the value of **-XX:MaxDirectMemorySize** in **GC_OPTS** to the twice of the direct memory used by UserSync. You can change the value based on the actual service scenario. For details, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.310 ALM-45283 UserSync Non-Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the non-heap memory usage of the UserSync service every 60 seconds. This alarm is generated when the non-heap memory usage of the UserSync instance exceeds the threshold (80% of the maximum memory) for five

consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45283	Major	Quality of service	Ranger	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

The service may break down. Ranger cannot synchronize LDAP user information.

Possible Causes

The non-heap memory of the UserSync process is overused or the non-heap memory is inappropriately allocated.

Handling Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45283 UserSync Non-Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and

choose **Customize** > **CPU and Memory** > **UserSync Non-Heap Memory Usage**. Click **OK**.

Step 3 Check whether the non-heap memory used by UserSync reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **UserSync** > **Instance Configuration**. Click **All Configurations**, and choose **UserSync** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and click **Save** to save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the UserSync instance cannot meet the non-heap memory required by the UserSync process. You are advised to change the **-XX:MaxPermSize** value of **GC_OPTS** to twice that of the current non-heap memory size or change the value based on the site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.311 ALM-45284 UserSync Garbage Collection (GC) Time Exceeds the Threshold

Alarm Description

The system checks the GC duration of the UserSync process every 60 seconds. This alarm is generated when the GC duration of the UserSync process exceeds the

threshold for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45284	Critical (default threshold: 20000ms) Major (default threshold: 12000ms)	Quality of service	Ranger	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If UserSync responds slowly, Ranger cannot synchronize LDAP user information quickly.

Possible Causes

The heap memory of the UserSync instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Handling Procedure

Check the GC time.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45284 UserSync Garbage Collection (GC) Time Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize** > **GC** > **UserSync GC Duration**. Click **OK**.

Step 3 Check whether the GC duration of the UserSync process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **UserSync** > **Instance Configuration**. Click **All Configurations**, and choose **UserSync** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for UserSync cannot meet the heap memory required by the UserSync process. You are advised to change the value of **-Xmx** in **GC_OPTS** to the twice that of the heap memory used by UserSync. You can change the value based on the actual service scenario. For details about how to check the UserSync heap memory usage, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

Related Information

None.

11.312 ALM-45285 TagSync Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the TagSync service every 60 seconds. This alarm is generated when the heap memory usage of the TagSync instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45285	Major	Quality of service	Ranger	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

The service may break down. TagSync is unavailable for Ranger.

Possible Causes

The heap memory usage of the TagSync instance is high or the heap memory is improperly allocated.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45285 TagSync Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **TagSync Heap Memory Usage**. Click **OK**.

Step 3 Check whether the heap memory used by TagSync reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **TagSync** > **Instance Configuration**. Click **All Configurations** and choose **TagSync** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for TagSync cannot meet the heap memory required by the TagSync process. You are advised to change the **-Xmx** value of **GC_OPTS** to twice that of the heap memory used by TagSync. You can change the value based on the actual service scenario. For details about how to check the TagSync heap memory usage, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

11.313 ALM-45286 TagSync Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the TagSync service every 60 seconds. This alarm is generated when the direct memory usage of the TagSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the TagSync direct memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45286	Major	Quality of service	Ranger	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

The service may break down. TagSync is unavailable for Ranger.

Possible Causes

The direct memory of the TagSync instance is overused or the direct memory is inappropriately allocated. As a result, the memory usage exceeds the threshold.

Handling Procedure

Check the direct memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45286 TagSync Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **TagSync Direct Memory Usage**. Click **OK**.

Step 3 Check whether the direct memory used by the TagSync reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **TagSync** > **Instance Configuration**. Click **All Configurations** and choose **TagSync** > **System**. Increase the value of **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory configured for TagSync cannot meet the direct memory required by the TagSync process. You are advised to check the direct memory usage of TagSync and change the value of **-XX:MaxDirectMemorySize** in **GC_OPTS** to the twice of the direct memory used by TagSync. You can change the value based on the actual service scenario. For details, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

None.

11.314 ALM-45287 TagSync Non-Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the non-heap memory usage of the TagSync service every 60 seconds. This alarm is generated when the non-heap memory usage of the TagSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45287	Major	Quality of service	Ranger	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

The service may break down. TagSync is unavailable for Ranger.

Possible Causes

The non-heap memory of the TagSync process is overused or the non-heap memory is inappropriately allocated.

Handling Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45287 TagSync Non-Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **TagSync Non-Heap Memory Usage**. Click **OK**.

Step 3 Check whether the non-heap memory used by TagSync reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **TagSync** > **Instance Configuration**. Click **All Configurations** and choose **TagSync** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the TagSync instance cannot meet the non-heap memory required by the TagSync process. You are advised to change the **-XX:MaxPermSize** value of **GC_OPTS** to twice that of the current non-heap memory size or change the value based on the site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

11.315 ALM-45288 TagSync Garbage Collection (GC) Time Exceeds the Threshold

Alarm Description

The system checks the GC duration of the TagSync process every 60 seconds. This alarm is generated when the GC duration of the TagSync process exceeds the threshold for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45288	Critical (default threshold: 20000ms) Major (default threshold: 12000ms)	Quality of service	Ranger	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

TagSync is unavailable for Ranger.

Possible Causes

The heap memory of the TagSync instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Handling Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45288 TagSync Garbage Collection (GC) Time Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize** > **GC** > **TagSync GC Duration**. Click **OK**.

Step 3 Check whether the GC duration of the TagSync process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **TagSync** > **Instance Configuration**. Click **All Configurations** and choose **TagSync** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for TagSync cannot meet the heap memory required by the TagSync process. You are advised to change the **-Xmx** value of **GC_OPTS** to twice that of the heap memory used by TagSync. You can change the value based on the actual service scenario. For details about how to check the TagSync heap memory usage, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.316 ALM-45289 PolicySync Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the PolicySync service every 60 seconds. This alarm is generated when the heap memory usage of the PolicySync instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45289	Major	Quality of service	Ranger	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Type	Parameter	Description
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

The service may break down. Ranger cannot connect to LakeFormation.

Possible Causes

The heap memory of the PolicySync instance is overused or the heap memory is inappropriately allocated.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms** > **ALM-45289 PolicySync Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **PolicySync Heap Memory Usage**. Click **OK**.

Step 3 Check whether the heap memory used by PolicySync reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **PolicySync**. Click **Instance Configuration** and then **All Configurations**, and choose **PolicySync** > **System**. Set **-Xmx** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for PolicySync cannot meet the heap memory required by the PolicySync process. You are advised to change the value of **-Xmx** in **GC_OPTS** to twice that of the heap memory used by PolicySync. You can change the value based on the actual service scenario. Refer to **Step 2** to view the PolicySync heap memory usage.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.317 ALM-45290 PolicySync Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the PolicySync service every 60 seconds. This alarm is generated when the direct memory usage of the PolicySync instance exceeds the threshold (90% of the maximum memory) for five consecutive times. This alarm is cleared when the PolicySync direct memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45290	Major	Quality of service	Ranger	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.

Type	Parameter	Description
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

The service may break down. Ranger cannot connect to LakeFormation.

Possible Causes

The direct memory of the PolicySync process is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms** > **ALM-45290 PolicySync Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **PolicySync Direct Memory Usage**. Click **OK**.

Step 3 Check whether the direct memory used by the PolicySync reaches the threshold (90% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **PolicySync**. Click **Instance Configuration** and then **All Configurations**, and choose **PolicySync** > **System**. Set **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory configured for PolicySync cannot meet the direct memory required by the PolicySync process. You are advised to check the direct memory usage of PolicySync and change the value of **-XX:MaxDirectMemorySize** in **GC_OPTS** to the twice of the direct memory used by PolicySync. You can change the value based on the actual service scenario. Refer to **Step 2** to view the TokenServer direct memory usage.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.318 ALM-45291 PolicySync Non-Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the non-heap memory usage of the PolicySync service every 60 seconds. This alarm is generated when the non-heap memory usage of the PolicySync instance exceeds the threshold (90% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45291	Major	Quality of service	Ranger	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

The service may break down. Ranger cannot connect to LakeFormation.

Possible Causes

The non-heap memory of the PolicySync instance is overused or the non-heap memory is inappropriately allocated.

Handling Procedure

Check non-heap memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms** > **ALM-45291 PolicySync Non-Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **PolicySync Non-Heap Memory Usage**. Click **OK**.

Step 3 Check whether the non-heap memory used by PolicySync reaches the threshold (90% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **PolicySync**. Click **Instance Configuration** and then **All Configurations**, and choose **PolicySync** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the PolicySync instance cannot meet the non-heap memory required by the PolicySync process. You are advised to change the value of **-XX:MaxPermSize** in **GC_OPTS** to twice that of the current non-heap memory size or change the value based on site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.319 ALM-45292 PolicySync GC Duration Exceeds the Threshold

Alarm Description

The system checks the GC duration of the PolicySync process every 60 seconds. This alarm is generated when the GC duration of the PolicySync process exceeds the threshold for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45292	Critical (default threshold: 20000 ms) Major (default threshold: 12000 ms)	Quality of service	Ranger	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Ranger cannot connect to LakeFormation.

Possible Causes

The heap memory of the PolicySync process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC duration.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms** > **ALM-45292 PolicySync GC Duration Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize** > **GC** > **PolicySync GC Duration**. Click **OK**.

Step 3 Check whether the GC duration of the PolicySync process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **PolicySync**. Click **Instance Configuration** and then **All Configurations**, and choose **PolicySync** > **System**. Set **-Xmx** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for PolicySync cannot meet the heap memory required by the PolicySync process. You are advised to change the value of **-Xmx** in **GC_OPTS** to twice that of the heap memory used by PolicySync. You can change the value based on the actual service scenario. Refer to **Step 2** to view the PolicySync heap memory usage.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.320 ALM-45293 Ranger User Synchronization Exception

Alarm Description

The system checks synchronization status of the UserSync process every 5 minutes. This alarm is generated when a synchronization exception occurs. This alarm is cleared when user synchronization becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45293	Major	Quality of service	Ranger	Yes

Alarm Changes

Change Type	Version	Description	Reason for Change
New	3.3.1	New alarm	New alarm

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the trigger condition, that is, an exception occurs during Ranger user synchronization.

Impact on the System

Unsynchronized users cannot access the native Ranger page and set permission policies for other users. As a result, some users may fail to access services that require Ranger permissions.

Possible Causes

The RangerAdmin instance is abnormal.

The UserSync instance is abnormal.

The LDAP service is abnormal.

Handling Procedure

Check whether the UserSync is abnormal.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms** > **ALM-45293 Ranger User Synchronization Exception**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**, select the UserSync instance on the host for which the alarm is generated, and check whether the instance status is abnormal.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger**, click **Instances**, and click **UserSync**. On the displayed page, click **More** > **Restart Instance**, or restart the Ranger service.

Step 4 Check whether the alarm is cleared in 5 to 10 minutes.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the RangerAdmin is abnormal.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** to check whether alarm "ALM-45276 Abnormal RangerAdmin Status" is reported.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Rectify the fault by following the handling procedure of "ALM-45276 Abnormal RangerAdmin Status".

Step 7 Check whether the alarm is cleared in 5 to 10 minutes.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the LDAP service is abnormal.

Step 8 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** to check whether alarm "ALM-25000 LdapServer Service Unavailable" is reported.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Clear the alarm according to the handling procedure of "ALM-25000 LdapServer Service Unavailable".

Step 10 Check whether the alarm is cleared in 5 to 10 minutes.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.321 ALM-45425 ClickHouse Service Unavailable

Alarm Description

The alarm module checks the ClickHouseServer instance status every 60 seconds. This alarm is generated when the alarm module detects that all instances of a ClickHouseServer shard are abnormal.

This alarm is cleared when the system detects that any instance of the ClickHouseServer shard is restored and the alarm is handled.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45425	Critical	Quality of service	ClickHouse	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

FusionInsight Manager cannot be used to perform cluster operations on the ClickHouse service, and ClickHouse service functions are unavailable.

Possible Causes

- The ZooKeeper service is unavailable.
- The configuration information in the **metrika.xml** file in the component configuration directory of the faulty ClickHouse instance is inconsistent with configuration of that ClickHouse instance in ZooKeeper.

Handling Procedure

The ZooKeeper service is unavailable.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the alarm list, check whether alarm **ALM-13000 ZooKeeper Service Unavailable** exists.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Handle alarm **ALM-13000 ZooKeeper Service Unavailable** according to the alarm help. In the alarm list, check whether alarm **ALM-45425 ClickHouse Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check whether the configuration in metrika.xml of the ClickHouse instance is correct.

Step 3 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**, click the **Instance** tab, and check whether there is any abnormal ClickHouse instance based on the alarm information.

- If yes, go to **Step 4**.

- If no, go to **Step 11**.

Step 4 Log in to the host where the ClickHouse service is abnormal and ping the IP address of another normal ClickHouse instance node to check whether the network connection is normal.

- If yes, go to **Step 5**.
- If no, contact the network administrator to repair the network.

Step 5 Log in to the node where the client is installed as the client installation user and run the following commands:

cd *{Client installation path}*

source bigdata_env

- For a cluster with Kerberos authentication enabled (security mode):

  kinit *Component service user*

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--port** 9440 **--secure**
- For a cluster with Kerberos authentication disabled (normal mode):

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--user** *Username* **--password --port** 9000

Run the following command to query the value of **macros.id**:

select substitution from system.macros where macro='id';

Step 6 Log in to the host where the ZooKeeper client is located and log in to the ZooKeeper client.

Switch to the client installation directory.

Example: **cd /opt/client**

Run the following command to configure environment variables:

source bigdata_env

Run the following command to authenticate the user (skip this step for a cluster in normal mode):

kinit *Component service user*

Run the following command to log in to the client tool:

zkCli.sh -server *Service IP address of the node where the ZooKeeper instance resides*:*Client port*

Step 7 Run the following command to check whether the ClickHouse cluster topology information can be obtained:

get /clickhouse/config/*macros.id* *value in **Step 5***/metrika.xml

- If yes, go to **Step 8**.
- If no, go to **Step 11**.

Step 8 Log in to the host where the ClickHouse instance is abnormal and go to the configuration directory of the ClickHouse instance.

cd ${BIGDATA_HOME}**/FusionInsight_ClickHouse_***Version***/**x_x_**ClickHouseServer/etc**

cat metrika.xml

Step 9 Check whether the cluster topology information on ZooKeeper obtained in **Step 7** is the same as that in the **metrika.xml** file in the component configuration directory in **Step 8**.

- If yes, check whether the alarm is cleared. If the alarm persists, go to **Step 11**.
- If no, go to **Step 10**.

Step 10 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**, click **More**, and select **Synchronize Configuration**. Then, check whether the service status is normal and whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 13 Expand the **Hosts** drop-down list and select the target hosts.

Step 14 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 15 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.322 ALM-45426 ClickHouse Service Quantity Quota Usage in ZooKeeper Exceeds the Threshold

Alarm Description

The alarm module checks the quota usage of the ClickHouse service in the ZooKeeper every 60 seconds. This alarm is generated when the alarm module detects that the usage exceeds the threshold (90%).

This alarm is cleared when the system detects that the usage is lower than the threshold and the alarm is cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45426	Critical (default threshold: 95%) Major (default threshold: 90%)	Quality of service	ClickHouse	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

After the ZooKeeper quantity quota of the ClickHouse service exceeds the threshold, you cannot perform cluster operations on the ClickHouse service on FusionInsight Manager. As a result, the ClickHouse service cannot be used.

Possible Causes

- When table data is created, inserted, or deleted, the ClickHouse creates znodes on ZooKeeper nodes. As the service volume increases, the number of znodes may exceed the configured threshold.
- No quota limit is set for the metadata directory **/clickhouse** of ClickHouse in ZooKeeper.

Handling Procedure

Check the number of znodes created by ClickHouse on ZooKeeper.

Step 1 Log in to the host where the ZooKeeper client is located and log in to the ZooKeeper client.

Switch to the client installation directory.

Example: **cd /opt/client**

Run the following command to configure environment variables:

source bigdata_env

Run the following command to authenticate the user (skip this step in common mode):

kinit *Component service user*

Run the following command to log in to the client tool:

zkCli.sh -server *service IP address of the node where the ZooKeeper role instance locates*:*client port*

Step 2 Run the following command to check the quota used by the ClickHouse in the ZooKeeper and check whether the quota information is correctly set:

listquota /clickhouse

```
absolute path is /zookeeper/quota/clickhouse
Quota for path /clickhouse does not exist.
```

If the preceding information indicates that the quota configuration is incorrect, go to **Step 3**.

If no, go to **Step 5**.

Step 3 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **ZooKeeper**. On the displayed page, click **Configurations** and click **All Configurations**. On this sub-tab page, search for **quotas.auto.check.enable** to check whether its value is **true**.

If the value is not **true**, change the value to **true** and click **Save**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**, click **More**, and select **Synchronize Configuration**. After the synchronization is successful, go to **Step 1**.

Step 5 Run the following command and check whether the ratio of the **count** value of **Output stat** to the **count** value of **Output quota** in the command output is greater than **0.9**:

listquota /clickhouse

```
absolute path is /zookeeper/quota/clickhouse
Output quota for /clickhouse count=200000,bytes=1000000000
Output stat for /clickhouse count=2667,bytes=60063
```

In the preceding information, the **count** value of **Output stat** is **2667**, and the **count** value of **Output quota** is **200000**.

- If yes, go to **Step 6**.
- If no, check whether the alarm is cleared 5 minutes later. If the alarm persists, go to **Step 8**.

Step 6 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**. Click **Configurations** and then **All Configurations**. Search for **clickhouse.zookeeper.quota.node.count**, set it to a value twice the **count** of **Output stat** in **Step 5**. Do not use a value larger than 6000000. Otherwise, there will be high risks. Exercise caution when setting this parameter.

Step 7 Restart the ClickHouse instance for which the alarm is generated, and check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, perform **Step 6** again, and check whether the alarm is cleared 5 minutes later. If the alarm persists, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 10 Choose the corresponding host form the host list.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.323 ALM-45427 ClickHouse Service Capacity Quota Usage in ZooKeeper Exceeds the Threshold

Alarm Description

The alarm module checks the quota usage of the ClickHouse service in the ZooKeeper every 60 seconds. This alarm is generated when the alarm module detects that the usage exceeds the threshold (90%).

This alarm is cleared when the system detects that the usage is lower than the threshold and the alarm is cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45427	Critical (default threshold: 95%) Major (default threshold: 90%)	Quality of service	ClickHouse	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

After the ZooKeeper capacity quota of the ClickHouse service exceeds the threshold, you cannot perform cluster operations on the ClickHouse service on FusionInsight Manager. As a result, the ClickHouse service cannot be used.

Possible Causes

- When table data is created, inserted, or deleted, ClickHouse creates znodes on ZooKeeper nodes. As the service volume increases, the capacity of znodes may exceed the configured threshold.
- No quota limit is set for the metadata directory **/clickhouse** of ClickHouse in ZooKeeper.

Handling Procedure

Check the znode capacity of the ClickHouse in the ZooKeeper.

Step 1 Log in to the host where the ZooKeeper client is located and log in to the ZooKeeper client.

Switch to the client installation directory.

Example: **cd /opt/client**

Run the following command to configure environment variables:

source bigdata_env

Run the following command to authenticate the user (skip this step in common mode):

kinit *Component service user*

Run the following command to log in to the client tool:

zkCli.sh -server *service IP address of the node where the ZooKeeper role instance locates*:*client port*

Step 2 Run the following command to check the quota used by the ClickHouse in the ZooKeeper and check whether the quota information is correctly set:

listquota /clickhouse

```
absolute path is /zookeeper/quota/clickhouse
Quota for path /clickhouse does not exist.
```

- If the preceding information indicates that the quota configuration is incorrect, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **ZooKeeper**. On the displayed page, click **Configurations** and click **All Configurations**. On this sub-tab page, search for **quotas.auto.check.enable** to check whether its value is **true**.

If the value is not **true**, change the value to **true** and click **Save**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**, click **More**, and select **Synchronize Configuration**. After the synchronization is successful, go to **Step 1**.

Step 5 Run the following command and check whether the ratio of the **bytes** value of **Output stat** to the **bytes** value of **Output quota** in the command output is greater than **0.9**:

listquota /clickhouse

```
absolute path is /zookeeper/quota/clickhouse
Output quota for /clickhouse count=200000,bytes=1000000000
Output stat for /clickhouse count=2667,bytes=60063
```

In the preceding information, the **bytes** value of **Output stat** is **60063**, and the **bytes** value of **Output quota** is **1000000000**.

- If yes, go to **Step 6**.
- If no, check whether the alarm is cleared 5 minutes later. If the alarm persists, go to **Step 8**.

Step 6 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**. Click **Configurations** and then **All Configurations**. Search for **clickhouse.zookeeper.quota.size**, set it to a value twice the **bytes** of **Output stat** in **Step 5**. Do not use a value larger than 6000000. Otherwise, there will be high risks. Exercise caution when setting this parameter.

Step 7 Restart the ClickHouse instance for which the alarm is generated, and check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, perform **Step 6** again, and check whether the alarm is cleared 5 minutes later. If the alarm persists, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 10 Choose the corresponding host form the host list.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.324 ALM-45428 ClickHouse Disk I/O Exception

Alarm Description

This alarm is generated when the alarm module detects EIO or EROFS errors during ClickHouse read and write every 60 seconds.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45428	Major (default)	Quality of service	ClickHouse	No

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

- ClickHouse fails to read and write data. The INSERT, SELECT, and CREATE operations on the local tables may be abnormal. Distributed tables are not affected.
- Services are affected, and I/Os fail.

Possible Causes

The disk is aged or has bad sectors.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45428 ClickHouse Disk I/O Exception**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 Use PuTTY to log in to the node for which the fault is generated as user **root**.

Step 3 Run the **df -h** command to check the mount directory and find the disk mounted to the faulty directory.

Step 4 Run the **smartctl -a /dev/sd***Faulty disk* command to check the disk. In the command, *Faulty disk* indicates the disk obtained in **Step 3**.

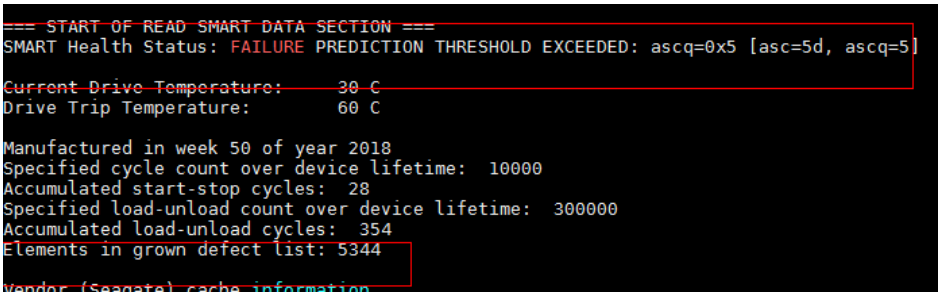
- If **SMART Health Status: OK** is displayed, as shown in the following figure, the disk is healthy. In this case, go to **Step 6**.

```
=== START OF READ SMART DATA SECTION ===
SMART Health Status: OK

Current Drive Temperature:     26 C
Drive Trip Temperature:        60 C

Manufactured in week 50 of year 2018
Specified cycle count over device lifetime:  10000
Accumulated start-stop cycles:  25
Specified load-unload count over device lifetime:  300000
Accumulated load-unload cycles:  356
Elements in grown defect list: 0
```

- If the number following **Elements in grown defect list** is not 0, as shown in the following figure, the disk may have bad sectors. If **SMART Health Status: FAILURE** is displayed, the disk is in the sub-health state.



Step 5 After the fault is rectified, manually clear the alarm on FusionInsight Manager and check whether the alarm is generated again during the periodic check.

- If yes, go to **Step 6**.
- If no, no further action is required.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 8 Expand the **Hosts** drop-down list and select the target hosts.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

If the alarm has no impact, manually clear the alarm.

Related Information

None.

11.325 ALM-45429 Table Metadata Synchronization Failed on the Added ClickHouse Node

NOTE

This section applies only to MRS 3.1.2 or later.

Alarm Description

This alarm is generated when the local table corresponding to the distributed table fails to be created during ClickHouse capacity expansion.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45429	Major	Quality of service	ClickHouse	No

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The distributed table fails to be queried.

Possible Causes

A node is stopped or faulty during capacity expansion.

Handling Procedure

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse** > **Instance**.

Step 2 Check whether an instance is stopped, decommissioned, or faulty.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Start the instance or rectify the instance fault until all instances are running properly.

Step 4 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, locate this alarm and the faulty host based on the location information.

Step 5 Log in to the faulty host as user **omm**.

Step 6 Run the following commands to initialize environment variables:

source ${BIGDATA_HOME}/FusionInsight_ClickHouse_*/*_*_ClickHouseServer/etc/ENV_VARS

source ${BIGDATA_HOME}/FusionInsight_ClickHouse_*/*_*_ClickHouseServer/etc/clickhouse-env.sh

export CLICKHOUSE_CONF_DIR=${CLICKHOUSE_CONF_DIR}

Step 7 Run the following command to run the metadata synchronization tool to synchronize metadata from the existing node to the faulty node:

sh ${BIGDATA_HOME}/FusionInsight_ClickHouse_*/install/FusionInsight-ClickHouse-*/clickhouse/sbin/clickhouse-create-meta.sh true

Step 8 Run the following command to view the log information and check whether the metadata has been synchronized:

vim /var/log/Bigdata/clickhouse/clickhouseServer/start.log

- If the synchronization is complete, go to **Step 9**.
- If the synchronization fails, go to **Step 10**.

Step 9 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the **Alarm ID** column, locate the corresponding alarm and click **Clear** in the **Operation** column. In the displayed dialog box, click **OK** to manually clear the alarm.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, select **ClickHouse** for the target cluster, and click **OK**.

Step 12 Expand the **Hosts** drop-down list and select the target hosts.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm needs to be manually cleared after the fault is rectified.

Related Information

None.

11.326 ALM-45430 Permission Metadata Synchronization Failed on the Added ClickHouse Node

NOTE

This section applies only to MRS 3.1.2 or later.

Alarm Description

This alarm is generated when user and permission information fails to be synchronized during ClickHouse capacity expansion.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45430	Major	Quality of service	ClickHouse	No

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The created user does not have operation permissions on the node.

Possible Causes

A node is stopped or faulty during capacity expansion.

Handling Procedure

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse** > **Instance**.

Step 2 Check whether an instance is stopped, decommissioned, or faulty.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Start the instance or rectify the instance fault until all instances are running properly.

Step 4 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, locate this alarm and the faulty host based on the location information.

Step 5 Log in to the faulty host as user **omm**.

Step 6 Run the following commands to initialize environment variables:

source ${BIGDATA_HOME}/FusionInsight_ClickHouse_*/*_*_ClickHouseServer/etc/ENV_VARS

source ${BIGDATA_HOME}/FusionInsight_ClickHouse_*/*_*_ClickHouseServer/etc/clickhouse-env.sh

export CLICKHOUSE_CONF_DIR=${CLICKHOUSE_CONF_DIR}

Step 7 Run the following command to run the metadata synchronization tool to synchronize metadata from the existing node to the faulty node:

sh ${BIGDATA_HOME}/FusionInsight_ClickHouse_*/install/FusionInsight-ClickHouse-*/clickhouse/sbin/clickhouse-create-meta.sh true

Step 8 Run the following command to view the log information and check whether the metadata has been synchronized:

vim /var/log/Bigdata/clickhouse/clickhouseServer/start.log

If the synchronization is complete, go to **Step 9**.

If the synchronization fails, go to **Step 10**.

Step 9 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the **Alarm ID** column, locate the corresponding alarm and click **Clear** in the **Operation** column. In the displayed dialog box, click **OK** to manually clear the alarm.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, select **ClickHouse** for the target cluster, and click **OK**.

Step 12 Expand the **Hosts** drop-down list and select the target hosts.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm needs to be manually cleared after the fault is rectified.

Related Information

None.

11.327 ALM-45434 A Single Replica Exists in the ClickHouse Data Table

NOTE

This section applies only to MRS 3.2.1 or later.

Alarm Description

This alarm is generated when a single replica is detected in a custom logical cluster after the custom logical cluster is enabled for ClickHouse.

This alarm is automatically cleared when the system detects that the custom logical cluster uses multiple replicas.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45434	Major	Quality of service	ClickHouse	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

If a hardware fault occurs, data cannot be restored.

Possible Causes

The **metrika.xml** file in the ClickHouse configuration directory contains single-replica configuration.

Handling Procedure

Check whether the configuration in metrika.xml of the ClickHouse instance is correct.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the name of the host for which the alarm is generated. On the **Hosts** page, view the host IP address based on the host name.

Step 2 Log in to the host where the ClickHouse instance is abnormal, go to the configuration directory of the ClickHouse instance, and run the following commands:

cd ${BIGDATA_HOME}**/FusionInsight_ClickHouse_***Version*/x_x_**ClickHouseServer/etc**

cat metrika.xml

Step 3 View the number of shards in each custom logical cluster and check that a single replica exists. Then, go to **Step 4**.

NOTE

If a shard contains only one node, a single replica exists in a logical cluster, as shown in the following:

```
<shard>
 <internal_replication>true</internal_replication>
 <replica>
  <host>host-name1</host>
  <port>port</port>
  <user>clickhouse</user>
  <password/>
 </replica>
</shard>
```

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 6 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.328 ALM-45440 Inconsistency Between ClickHouse Replicas

NOTE

This section applies only to MRS 3.2.1 or later.

Alarm Description

When the number of ClickHouse replicas is greater than 1, the system periodically checks the replicated table. This alarm is generated if replicated table data is not synchronized. This alarm is cleared when data in all replicated tables between replicas becomes synchronized.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45440	Minor	Quality of service	ClickHouse	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
	Table	Specifies the table name for which the alarm was generated.

Impact on the System

The data reliability of the ClickHouse replicated table is affected, causing data differences and affecting the query result of the distributed table.

Possible Causes

- The ClickHouse service is overloaded.
- The connection between the ClickHouse and ZooKeeper is abnormal.

Handling Procedure

Check whether the ClickHouse service load is heavy.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the database name, table name, role name and IP address for the hostname in **Location**.

Step 2 Log in to the node where the client is installed as the client installation user and run the following commands:

cd *{Client installation path}*

source bigdata_env

- For a cluster with Kerberos authentication enabled (security mode):

  kinit *Component service user*

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--port** 9440 **--secure**
- For a cluster with Kerberos authentication disabled (normal mode):

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--user** *Username* **--password --port** 9000

Step 3 Run the following statement to check whether data is frequently written to the system table. If yes, wait until the service execution is complete and check whether the alarm is cleared.

SELECT query_id, user, FQDN(), elapsed, query FROM system.processes ORDER BY query_id;

- If yes, no further action is required.
- If no, go to **Step 4**.

Step 4 Check whether a large amount of data is written. If yes, wait until the task is complete and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Run the following statement to check whether replicas are synchronized:

select table,absolute_delay, queue_size, inserts_in_queue, merges_in_queue from system.replicas where absolute_delay > 0 order by absolute_delay desc limit 10;

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 If **inserts_in_queue** contains a large amount of content to be inserted, run the following SQL statement to query the replica synchronization queue and locate the error cause:

SELECT database,table,type,any(last_exception),any(postpone_reason),min(create_time),max(last_attempt_time),max(last_postpone_time),max(num_postponed) AS max_postponed,max(num_tries) AS max_tries,min(num_tries) AS min_tries,countIf(last_exception != '') AS count_err,countIf(num_postponed > 0) AS count_postponed,countIf(is_currently_executing) AS count_executing,count() AS count_all FROM system.replication_queue GROUP BY database,table,type ORDER BY count_all DESC

Check whether an error message similar to the following is displayed:

```
Not executing fetch of part xxx because n fetches already executing, max n
```

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse** > **Configurations** > **All Configurations**, and check whether the value of **background_pool_size** is twice the number of cores on the node.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

Step 8 Set this parameter to twice the number of cores on the node and synchronize the configuration. Wait for a while and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check the connectivity between ClickHouse and ZooKeeper.

Step 9 Log in to the node where the ClickHouseServer instance is located, go to **${BIGDATA_HOME}/FusionInsight_ClickHouse_*/*_*_ClickHouseServer/etc**, and check whether the port numbers of the ClickHouseServer and ZooKeeper in the **config.xml** file are the same, as shown in the following information in bold:

NOTE

To view the ZooKeeper port number, choose **Cluster** > **Services** > **ZooKeeper** > **Configurations** > **All Configurations** on FusionInsight Manager, and check the value of **clientPort**.

```
<zookeeper>
  <session_timeout_ms>10000</session_timeout_ms>
  <node index="1">
    <host>server-2110082001-0019</host>
    <port>24002</port>
  </node>
  <node index="2">
    <host>server-2110082001-0018</host>
    <port>24002</port>
  </node>
  <node index="3">
    <host>server-2110082001-0017</host>
    <port>24002</port>
  </node>
</zookeeper>
```

- If yes, go to **Step 11**.
- If no, go to **Step 10**.

Step 10 Change the port number to the ZooKeeper port number, restart the ClickHouseServer instance, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 13 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 14 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 15 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.329 ALM-45441 Zookeeper Disconnected

NOTE

This section applies only to MRS 3.3.0 or later.

Alarm Description

The system checks the connection between ClickHouse and ZooKeeper every minute. This alarm is generated when the connection fails. The alarm is reported because the ZooKeeper connection is abnormal. If the connection fails for three consecutive times, the system generates an alarm.

This alarm is automatically cleared when the system detects that the connection is normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45441	Critical	Quality of service	ClickHouse	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

If ClickHouse is disconnected from ZooKeeper, the ClickHouse service cannot be used.

Possible Causes

- The ZooKeeper service is abnormal.
- The ClickHouse service is overloaded.

Handling Procedure

Check whether ZooKeeper is normal.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **ZooKeeper** > **quorumpeer**.

Step 2 Check whether ZooKeeper instances are normal.

- If yes, go to **Step 6**.
- If no, go to **Step 3**.

Step 3 Select instances whose status is not good and choose **More** > **Restart Instance**.

Step 4 Check whether the instance status is good after restart.

- If yes, go to **Step 5**.
- If no, go to **Step 10**.

Step 5 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the ClickHouse service load is heavy.

Step 6 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 7 Log in to the node where the client is installed as the client installation user and run the following commands:

cd *{Client installation path}*

source bigdata_env

- For a cluster with Kerberos authentication enabled (security mode):

  kinit *Component service user*

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--port** 9440 **--secure**

- For a cluster with Kerberos authentication disabled (normal mode):

  clickhouse client --host IP address of the ClickHouseServer instance that reports the alarm **--user** *User name* **--password --port** 9440

Step 8 Run the following statement to check whether data is frequently written to the system table. If yes, wait until the service execution is complete and check whether the alarm is cleared.

SELECT query_id, user, FQDN(), elapsed, query FROM system.processes ORDER BY query_id;

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Check whether a large amount of data is written. If yes, wait until the task is complete and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 12 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.330 ALM-45442 Too Many Concurrent SQL Statements

NOTE

This section applies only to MRS 3.3.0 or later.

Alarm Description

The alarm module checks the number of concurrent ClickHouse requests every 30 seconds. This alarm is generated when the number of concurrent ClickHouse requests exceeds the concurrency threshold configured on the UI.

This alarm is cleared when the system detects that the actual number of concurrent requests is less than concurrency threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45442	Major	Quality of service	ClickHouse	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

If there are too many concurrent SQL statements, a large number of system resources are consumed. As a result, system response becomes slow.

Possible Causes

The ClickHouse service is overloaded.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Choose **Cluster** > **ClickHouse** > **Instance**, select an instance based on the alarm information. Choose **Chart** > **Concurrency** to check whether the actual number of concurrent SQL statements is greater than SQL concurrency threshold.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Confirm with the user whether a large number of tasks were being executed during the alarming period.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 On FusionInsight Manager, choose **O&M** and click **Alarm** > **Thresholds** in the navigation pane on the left. On the displayed page, click **ClickHouse** > **Concurrency** and adjust the threshold, or wait until the task is complete. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 7 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.331 ALM-45443 Slow SQL Queries in the Cluster

NOTE

This section applies only to MRS 3.3.0 or later.

Alarm Description

The system checks slow SQL queries for ClickHouse every 1 minute. This alarm is generated when the execution time of a SQL statement is longer than or equal to the slow SQL threshold.

This alarm is automatically cleared when the system detects that the execution time of the SQL statement is shorter than the slow SQL threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45443	Major	Quality of service	ClickHouse	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

The performance of the ClickHouse service deteriorates, which slows the response of other services. If there are too many slow SQL statements, the service may be unavailable.

Possible Causes

- The ClickHouse service is overloaded.
- The execution of SQL statements takes a long time.

Handling Procedure

Check whether the ClickHouse service load is heavy.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Log in to the node where the client is installed as the client installation user and run the following commands:

cd *{Client installation path}*

source bigdata_env

- For a cluster with Kerberos authentication enabled (security mode):

  kinit *Component service user*

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--port --secure**

- For a cluster with Kerberos authentication disabled (normal mode):

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--user** *Username* **--password --port**

Step 3 Run the following statement to check whether data is frequently written to the system table. If yes, wait until the service execution is complete and check whether the alarm is cleared.

SELECT query_id, user, FQDN(), elapsed, query FROM system.processes ORDER BY query_id;

- If yes, no further action is required.
- If no, go to **Step 4**.

Checking whether the SQL statements take a long time.

Step 4 Check the logical cluster to which the alarm object belongs. Log in to FusionInsight Manager, click **Cluster**, choose **Services** > **ClickHouse**, and click **Logic Cluster**. On the displayed page, choose **Query Management** > **Ongoing Slow Queries**. Check which SQL statements take a long time on the displayed page, confirm with the user to adjust services, optimize slow SQL statements, and check whether the optimization is successful.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 After the SQL statements are complete, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 8 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.332 ALM-45444 Abnormal ClickHouse Process

NOTE

This section applies only to MRS 3.3.0 or later.

Alarm Description

The health check module checks ClickHouse instances every 30 seconds. If the number of consecutive failures exceeds the threshold, an alarm is reported. In this case, the ClickHouse process may stop responding and services cannot be properly executed.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45444	Critical	Quality of service	ClickHouse	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

If the ClickHouse process is abnormal, services cannot run properly.

Possible Causes

The ClickHouse process runs improperly.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Log in to the node where the client is installed as the client installation user and run the following commands:

cd *{Client installation path}*

source bigdata_env

- For a cluster with Kerberos authentication enabled (security mode):

  kinit *Component service user*

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--port** 9440 **--secure**

- For a cluster with Kerberos authentication disabled (normal mode):

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--user** *Username* **--password --port** 9000

Step 3 Run the following statement to check whether the result can be properly returned:

SELECT 1;

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Wait for several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 7 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.333 ALM-45445 Failed to Send Data Files to Remote Shards When ClickHouse Writes Data to a Distributed Table

NOTE

This section is available for MRS 3.3.1 or later version only.

Alarm Description

The ClickHouse instance checks the distributed table every 300 seconds. If the number of consecutive failures exceeds the threshold, an alarm is generated. In this case, the node where the ClickHouse instance writes data to the distributed table cannot send data files to remote shard nodes.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45445	Major	Quality of service	ClickHouse	Yes

Alarm Changes

Change Type	Version	Description	Reason for Change
New	3.3.1	New alarm	New alarm

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.

Type	Parameter	Description
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

The results of operations such as distributed table queries are abnormal.

Possible Causes

The status of some ClickHouse shard nodes is abnormal.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address of the hostname in **Location**.

Step 2 Log in to the node where the client is installed as the client installation user and run the following commands:

cd *{Client installation path}*

source bigdata_env

- For a cluster with Kerberos authentication enabled (security mode):

  kinit *Component service user*

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--port** 9440 **--secure**

- For a cluster with Kerberos authentication disabled (normal mode):

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--user** *Username* **--password --port** 9000

Step 3 Run the following SQL statement to obtain the shard based on the value of **data_path**. For example, if the value of **data_path** is **/srv/Bigdata/clickhouse/data1.../shard2_all_replicas**, the desired shard is **shard2**.

select database, table, data_path, data_files, error_count from system.distribution_queue where data_files != 0 and error_count != 0;

Step 4 Run the following SQL statement to obtain the node IP address (value of the **host** field in the system table **system.clusters**) of the shard where data fails to be sent to (**shard_num** obtained in **Step 3**):

select * from system.clusters;

Step 5 Log in to the ClickHouse node obtained in **Step 4**, connect to the server by referring to **Step 2**, and run the following statement to check whether the result can be properly returned:

SELECT 1;

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Wait for several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 9 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.334 ALM-45446 Mutation Task of ClickHouse Is Not Complete for a Long Time

NOTE

This section is available for MRS 3.3.1 or later version only.

Alarm Description

The system checks mutation tasks every 5 minutes. This alarm is generated when the system detects that a mutation task has been running for at least 5 minutes. This alarm is automatically cleared when the system does not detect any running mutation task or the running time of a mutation task is less than 5 minutes.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45446	Minor	Quality of service	ClickHouse	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

- Server resources are occupied, and the performance of the ClickHouse service deteriorates.
- Data is inconsistent.

Possible Causes

The data volume is too large. As a result, the mutation task runs slowly or is suspended.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Log in to the node where the client is installed and run the following commands:

cd *{Client installation path}*

source bigdata_env

- Security mode (with Kerberos enabled):

  kinit *Component service user*

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--port** 21427 **--secure**

- Normal mode (with Kerberos disabled):

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--user** *Username* **--password --port** 21423

Step 3 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**, click **Configurations** and then **All Configurations**. Search for the value of the **slow_mutation_cost_time** parameter, enter the parameter value in the following SQL statement, and run the following statement to check whether any result is returned:

SELECT * FROM system.mutations WHERE is_done = 0 AND create_time < now() - INTERVAL *The value* **SECOND**

NOTE

Add the actual value of **slow_mutation_cost_time** to the preceding statement.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

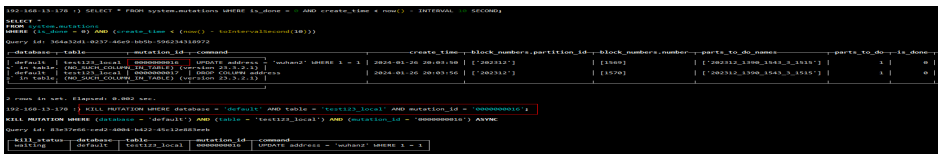
Step 4 Wait for a while and run the statement in **Step 3** again. Check whether the value of **parts_to_do** in the returned result decreases.

- If yes, wait until the mutation task is complete.
- If no, go to **Step 5**.

Step 5 If the value of **parts_to_do** remains unchanged, stop the mutation task. Run the following statement and run the statement in **Step 3** again to check whether the current mutation task is in the returned result list:

KILL MUTATION WHERE database = '*Database name***' AND table = '***Table name***' AND mutation_id ='mutation ID'**

- If yes, go to **Step 6**.
- If no, no further action is required.



Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 8 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

11.335 ALM-45585 IoTDB Service Unavailable

Alarm Description

The system checks the IoTDB service status every 300 seconds. This alarm is generated when the IoTDB service is unavailable. This alarm is cleared when the IoTDB service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45585	Critical	Error handling	IoTDB	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Details	Specifies additional alarm information.

Impact on the System

Users cannot use the IoTDB service properly.

Possible Causes

- The KrbServer service is abnormal.
- More than 50% of IoTDBServer instances are faulty.
- Failed to connect to the IoTDBServer JMX. As a result, the node status cannot be obtained.
- A disk is aged or damaged.

Handling Procedure

Check whether the KrbServer service on which the IoTDB depends is abnormal.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, view the host name and IP address in **Location** of the alarm whose ID is **45585**.

Step 2 In the alarm list, check whether ALM-25500 KrbServer Service Unavailable exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Handle the alarm by referring to **ALM-25500 KrbServer Service Unavailable**.

Step 4 After **ALM-25500** is cleared, wait several minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether IoTDBServer instances are faulty.

Step 5 On FusionInsight Manager, choose **Cluster** > **Services** > **IoTDB** > **Instance**.

Step 6 Check whether the percentage of faulty IoTDBServer instances exceeds 50%. If yes, restart the faulty IoTDBServer instances and check whether the status is restored.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check whether the IoTDBServer instance is started properly.

Step 7 Log in to the host obtained in **Step 1**, switch to user **omm**, and run the **jps** command to check whether the IoTDBServer process exists in the command output.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 8 On FusionInsight Manager, choose **Cluster** > **Services** > **IoTDB** > **Instance**, select the IoTDBServer instance for which this alarm is generated, click **More**, and select **Restart Instance**.

Step 9 After the instance is restarted, wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check disks.

Step 10 Check whether the disks of the host for which the alarm is generated exist, or check whether the disks can be used properly after being moved to another host.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.336 ALM-45586 IoTDBServer Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the IoTDBServer process status every 60 seconds. The alarm is generated when the heap memory usage of the IoTDBServer process exceeds the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45586	Critical (default threshold: 100%) Major (default threshold: 90%)	Quality of service	IoTDB	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the available IoTDBServer process heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The heap memory of the IoTDBServer process is overused or the heap memory is inappropriately allocated.

Handling Procedure

Check the heap memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **45586**, view the role name in **Location**, and check the instance IP address.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Service** > **IoTDB** > **Instance**. Click the IoTDBServer for which the alarm is generated to go to **Dashboard**. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **Memory**. In the dialog box that is displayed, select **IoTDBServer Heap Memory Resource Percentage**, and click **OK**. Check whether the used non-heap memory of the IoTDBServer process reaches 90% (by default) of the maximum non-heap memory specified for IoTDBServer.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **Service** > **IoTDB** > **Configuration**, click **All Configurations**, choose **IoTDBServer** > **System**, and increase the value of **-Xmx** in the **GC_OPTS** parameter.

NOTE

- The default value of -**Xmx** is **2G**.
- If this alarm is occasionally generated, increase the value by 0.5 times. If this alarm is frequently generated, double the value.
- In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.337 ALM-45587 IoTDBServer GC Duration Exceeds the Threshold

Alarm Description

The system checks the GC duration of the IoTDBServer process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold for three consecutive times. You can choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **IoTDB** > **GC** > **Total GC duration of IoTDBServer process (IoTDBServer)** to change the threshold. This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45587	Critical (default threshold: 30000ms) Major (default threshold: 12000ms)	Quality of service	IoTDB	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

A long GC duration of the IoTDBServer process may interrupt the services.

Possible Causes

The heap memory of the IoTDBServer process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC duration.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **45587**, view the role name in **Location**, and check the instance IP address.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Service** > **IoTDB** > **Instance**. Click the IoTDBServer for which the alarm is generated to go to **Dashboard**. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **GC**. In the dialog box that is displayed, select **Garbage Collection (GC) Time of IoTDBServer**, and click **OK**. Check whether the GC time of the IoTDBServer process is greater than 12 seconds.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **Service** > **IoTDB** > **Configuration**, click **All Configurations**, choose **IoTDBServer** > **System**, and increase the value of **-Xmx** in the **GC_OPTS** parameter.

NOTE

- The default value of -**Xmx** is **2G**.
- If this alarm is occasionally generated, increase the value by 0.5 times. If this alarm is frequently generated, double the value.
- In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.338 ALM-45588 IoTDBServer Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the IoTDBServer service every 60 seconds. This alarm is generated when the direct memory usage of the IoTDBServer instance exceeds the threshold for five consecutive times. This alarm is cleared when the IoTDBServer direct memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45588	Critical (default threshold: 100%) Major (default threshold: 90%)	Quality of service	IoTDB	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Direct memory overflow may cause service breakdown.

Possible Causes

The direct memory of the IoTDBServer process is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **45588**, view the role name in **Location**, and check the instance IP address.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Service** > **IoTDB** > **Instance**. Click the IoTDBServer for which the alarm is generated to go to **Dashboard**. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **Memory**. In the dialog box that is displayed, select **IoTDBServer Direct Buffer Resource Percentage**, and click **OK**.

Step 3 Check whether the direct memory used by the IoTDBServer reaches the threshold (90% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **IoTDB** > **Configuration**, click **All Configurations**, choose **IoTDBServer** > **System**, increase the value of **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter as required, and save the configuration.

NOTE

- If this alarm is generated, the direct memory configured for the IoTDBServer process cannot meet the requirements of the IoTDBServer process.
- You are advised to set **-XX:MaxDirectMemorySize** in **GC_OPTS** to twice the direct memory used by the IoTDBServer process. (You can change the value based on the actual service scenario.)
- To obtain the size of the direct memory used by the IoTDBServer process, choose **Customize** > **Memory** > **IoTDBServer Direct Memory Resource Status**. If **GC_OPTS** does not contain the **-XX:MaxDirectMemorySize** parameter, add it manually.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **IoTDBServer** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.339 ALM-45589 ConfigNode Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the ConfigNode process status every 60 seconds. The alarm is generated when the heap memory usage of the ConfigNode process exceeds the threshold. This alarm is cleared when the heap memory usage of the ConfigNode process is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45589	Major (default threshold: 100%) Major (default threshold: 90%)	Quality of service	IoTDB	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.

Type	Parameter	Description
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the heap memory usage of the ConfigNode process is too high, the performance of the ConfigNode process is affected, and even the ConfigNode process becomes unavailable due to memory overflow.

Possible Causes

The heap memory configured for the node is improper. As a result, the usage exceeds the threshold.

Handling Procedure

Check the heap memory configuration.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the real-time alarm list, click in front of this alarm and view the role name and instance IP address in **Location**.

Step 2 Choose **Cluster** > **Services** > **IoTDB**. Click **Instance**, click the ConfigNode corresponding to the IP address obtained in **Step 1**, and check whether **ConfigNode Heap Memory Usage** on the **Dashboard** tab page reaches the threshold specified for the ConfigNode process.

If the chart is not displayed, click the drop-down list in the upper right corner of the chart area and choose **Customize** > **Memory**. In the dialog box that is displayed, select **ConfigNode Heap Memory Usage** and click **OK**.

NOTE

You can choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **IoTDB** > **Memory** > **ConfigNode Heap Memory Usage (ConfigNode)** to view the threshold.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Choose **Cluster** > **Services** > **IoTDB**. Click **Configurations** then **All Configurations**, click **ConfigNode**, and choose **System**. Set **-Xmx** in **GC_OPTS** to a larger value and save the configuration.

NOTE

- The default value of -**Xmx** is **2G**.
- If this alarm is occasionally generated, increase the value of **-Xmx** by 0.5 times. If this alarm is frequently generated, double the value of **-Xmx**.
- In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Click **Dashboard**. Click **Restart Service** to restart the IoTDB service for the configuration to take effect.

Step 5 Wait for about 120 seconds and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.

Step 8 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.340 ALM-45590 ConfigNode GC Duration Exceeds the Threshold

Alarm Description

The system checks the GC duration of the ConfigNode process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold for three consecutive times. This alarm is cleared when the GC duration is less than the threshold.

NOTE

You can choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **IoTDB** > **GC** > **Total GC duration of ConfigNode process (ConfigNode)** to increase the threshold by 20% each time.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45590	Critical (default threshold: 30000ms) Major (default threshold: 12000ms)	Quality of service	IoTDB	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

A long GC duration of the ConfigNode process may interrupt services.

Possible Causes

The heap memory configured on the node is improper. As a result, GC occurs frequently.

Handling Procedure

Check the heap memory configuration.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the real-time alarm list, click in the row containing this alarm and view the role name and instance IP address in **Location**.

Step 2 Choose **Cluster** > **Services** > **IoTDB**. Click **Instance**, click the ConfigNode corresponding to the IP address obtained by **Step 1**. Switch to the **Dashboard** tab page, locate the **Total GC Duration of ConfigNode** chart, and check whether the GC duration of the ConfigNode process exceeds the threshold.

If the GC duration of ConfigNode is not displayed, click the drop-down list in the upper right corner of the chart area and choose **Customize** > **GC**. In the displayed dialog box, select **Total GC Duration of ConfigNode** and click **OK**.

NOTE

You can choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **IoTDB** > **GC** > **Total GC duration of ConfigNode process (ConfigNode)** to view the threshold.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Choose **Cluster** > **Services** > **IoTDB**. Click **Configurations** then **All Configurations**, click **ConfigNode**, and choose **System**. Set **-Xmx** in **GC_OPTS** to a larger value and save the configuration.

NOTE

- The default value of -**Xmx** is **2G**.
- If this alarm is occasionally generated, increase the value by 0.5 times. If this alarm is frequently generated, double the value.
- In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Click **Dashboard**. Click **Restart Service** to restart the IoTDB service for the configuration to take effect.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.

Step 8 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.341 ALM-45591 ConfigNode Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the ConfigNode process every 60 seconds. This alarm is generated when the direct memory usage of the ConfigNode exceeds the threshold for five consecutive times. That is, the direct memory configured for ConfigNode cannot meet service requirements. This alarm is cleared when the direct memory usage of ConfigNode is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45591	Critical (default threshold: 100%) Major (default threshold: 90%)	Quality of service	IoTDB	Yes

Alarm Parameters

Type	Name	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Type	Name	Description
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Direct memory overflow may cause the IoTDB instance to be unavailable.

Possible Causes

The direct memory configured for the node is improper. As a result, the usage exceeds the threshold.

Handling Procedure

Check the direct memory configuration.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the real-time alarm list, click in front of this alarm and view the role name and instance IP address in **Location**.

Step 2 Choose **Cluster** > **Services** > **IoTDB**. Click **Instance**, click the ConfigNode corresponding to the IP address obtained in **Step 1**, and check whether **ConfigNode Direct Memory Usage** on the **Dashboard** tab page reaches the threshold specified for the ConfigNode process (90% of the maximum direct memory by default).

If the chart is not displayed, click the drop-down list in the upper right corner of the chart area and choose **Customize** > **Memory**. In the dialog box that is displayed, select **ConfigNode Direct Memory Usage** and click **OK**.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **IoTDB**. Click **Configurations** then **All Configurations**. Click **ConfigNode** and select **System**. Set **-XX:MaxDirectMemorySize** in **GC_OPTS** to a larger value as required and save the configuration.

NOTE

- You are advised to set **-XX:MaxDirectMemorySize** in **GC_OPTS** to twice the direct memory used by the ConfigNode process. (You can change the value based on the actual service scenario.)
- To obtain the size of the direct memory used by the ConfigNode process, choose **Customize** > **Memory** > **ConfigNode Direct Memory Resource Status**.
- If **GC_OPTS** does not contain the **-XX:MaxDirectMemorySize** parameter, add it.

Step 4 Restart the affected IoTDB service or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **ConfigNode** for the destination cluster.

Step 7 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.342 ALM-45592 IoTDBServer RPC Execution Duration Exceeds the Threshold

Alarm Description

The system checks the RPC execution duration of the IoTDBServer process every 60 seconds. This alarm is generated when the execution duration exceeds the threshold. This alarm is cleared when the RPC execution time of the IoTDBServer process is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45592	Major	Quality of service	IoTDB	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Running performance of the IoTDBServer process is affected.

Possible Causes

The processing duration of an IoTDBServer RPC request exceeds the threshold. Logs need to be further analyzed to locate the cause.

Handling Procedure

Collect fault information.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the real-time alarm list, click in front of this alarm and view the role name and instance IP address in **Location**.

Step 2 Choose **O&M** > **Log** > **Download**.

Step 3 Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.

Step 4 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the host queried in **Step 1**, and click **OK**.

Step 5 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 6 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.343 ALM-45593 IoTDBServer Flush Execution Duration Exceeds the Threshold

Alarm Description

This alarm is generated when the data flush duration exceeds the threshold. This alarm is cleared when the flush duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45593	Major	Quality of service	IoTDB	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Data write is blocked and the write operation performance is affected.

Possible Causes

The IoTDB flushing on the node is slow. You need to further analyze logs.

Handling Procedure

Collect fault information.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the real-time alarm list, click in front of this alarm and view the role name and instance IP address in **Location**.

Step 2 Choose **O&M** > **Log** > **Download**.

Step 3 Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.

Step 4 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the host queried in **Step 1**, and click **OK**.

Step 5 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 6 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.344 ALM-45594 IoTDBServer Intra-Space Merge Duration Exceeds the Threshold

Alarm Description

This alarm is generated when the merge duration in the space exceeds the threshold. This alarm is cleared when the merge duration in the space is less than the threshold.

Alarm Attributes

Alarm Attributes	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45594	Major	Quality of service	IoTDB	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Data write is blocked and the write operation performance is affected.

Possible Causes

The merge task in the IoTDB space of the node is slow. You need to further analyze logs.

Handling Procedure

Collect fault information.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the real-time alarm list, click in front of this alarm and view the role name and instance IP address in **Location**.

Step 2 Choose **O&M** > **Log** > **Download**.

Step 3 Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.

Step 4 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the host queried in **Step 1**, and click **OK**.

Step 5 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 6 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.345 ALM-45595 IoTDBServer Cross-Space Merge Duration Exceeds the Threshold

Alarm Description

This alarm is generated when the cross-space merge duration exceeds the threshold. This alarm is cleared when the cross-space merge duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45595	Major	Quality of service	IoTDB	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Data write is blocked and the write operation performance is affected.

Possible Causes

The IoTDB cross-space merge task on the node is slow. You need to further analyze logs.

Handling Procedure

Collect fault information.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the real-time alarm list, click in front of this alarm and view the role name and instance IP address in **Location**.

Step 2 Choose **O&M** > **Log** > **Download**.

Step 3 Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.

Step 4 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the host queried in **Step 1**, and click **OK**.

Step 5 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 6 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

11.346 ALM-45596 Procedure Execution Failed

Alarm Description

Procedures are the tasks managed and executed by the ConfigNode leader. This alarm is generated when a procedure fails to be executed. This alarm is cleared when the procedure is successfully executed.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45596	Major	Error handling	IoTDB	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	ProcedureInformation	Specifies the procedure-related information.

Impact on the System

Functions associated with the procedure are adversely affected.

Possible Causes

- The task for adding IoTDB replicas fails to be executed.
- The task for deleting the storage group fails to be executed.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, locate this alarm, and click .

Step 2 Check the value of **ProcedureInformation** in **Location**. The value starts with the procedure type and contains main information about the procedure.

Check whether the task for adding replicas fails.

Step 3 Check whether the value of **ProcedureInformation** starts with **AddRegionProcedure** or **ReJoinDataNodeProcedure**.

- If yes, the task fails. Go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Wait for half an hour. If the region is successfully added, the alarm is automatically cleared. Otherwise, go to **Step 5**.

Check whether the task for deleting the storage group fails.

Step 5 Check whether the value of **ProcedureInformation** starts with **DeleteStorageGroupProcedure**.

- If yes, the storage group fails to be deleted. Go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Delete the storage group displayed in **ProcedureInformation** again on the IoTDB client. If the deletion is successful, the alarm is automatically cleared. Otherwise, go to **Step 7**.

Collect fault information.

Step 7 Choose **Cluster** > **Services** > **IoTDB** > **Instance** to view the hosts where all IoTDBServer and ConfigNode instances are located.

Step 8 Choose **O&M** > **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.

Step 10 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the host queried in **Step 7**, and click **OK**.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.347 ALM-45615 CDL Service Unavailable

Alarm Description

The system checks the CDL health status every 60 seconds. This alarm is generated when the CDL health status is **DOWN**. This alarm is cleared when the system detects that the CDL health status is **UP**.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45615	Critical	Quality of service	CDL	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

The CDL service is abnormal. You cannot use FusionInsight Manager to perform cluster operations on the CDL service. The CDL service function is unavailable.

Possible Causes

All CDLService or CDLConnector instances of the CDL service are abnormal, and the Kafka service is unavailable.

Handling Procedure

Check whether the Kafka service on which the CDL service depends is abnormal.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, check whether ALM-38000 Kafka Service Unavailable exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Handle the alarm by referring to "ALM-38000 Kafka Service Unavailable".

Step 4 After the alarm is cleared, wait a few minutes and check whether the alarm HetuServer Service Unavailable is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether CDL instances are faulty.

Step 5 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **CDL** > **Instance**.

Step 6 Check whether all CDLService and CDLConnector instances are faulty.

- If yes, restart the CDL service and choose **Cluster** > *Name of the desired cluster* > **Services** > **CDL** > **More** > **Restart Service**. If the fault persists after the restart, go to **Step 7** and contact O&M personnel to check CDL logs.

- If no, go to **Step 7**.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **CDL** for the target cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the service is restored, the system automatically clears the alarm.

Related Information

None.

11.348 ALM-45616 CDL Job Execution Exception

Alarm Description

The system checks whether a CDL job is normal every 60 seconds. This alarm is reported when the CDL job is abnormal. This alarm is cleared when the job is restored or stopped.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45616	Major	Quality of service	CDL	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.

Type	Parameter	Description
	JobName	Specifies the job for which the alarm was generated.
	Username	Specifies the username of the job for which the alarm was generated.

Impact on the System

CDL tasks fail, and real-time data integration is interrupted.

Possible Causes

The CDL task fails to be executed due to incorrect parameter settings or other reasons. On the **Job Management** page of the CDL web UI, locate the row where the job is located and click **Failed**/**Abnormal running** in the **Status** column to view the failure cause, or view the failure cause in the logs.

Handling Procedure

Step 1 Log in to FusionInsight Manager as a user who has the CDL job creation or administrator permission.

Step 2 Choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**, click ⌄ in the row where **Alarm ID** is **45616**, and view the name of the job for which this alarm is generated in **Location**.

Step 3 Choose **Cluster** > **Services** > **CDL** and click the link next to **CDLService UI** to go to the CDL web UI.

Step 4 Locate the failed job based on the task name in **Step 2** and check whether **Source** is **Hudi**.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On Manager, choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager Web UI** to go to the Yarn web UI. Search for the ID of the latest failed task in **Step 2**, select the task ID, click **Logs**, search for **stdout**, and go to **Step 8**.

Step 6 Click **Abnormal running** or **Failed** in the **Status** column.

Step 7 On the page that is displayed, view the error information and rectify the fault. For example, **Figure 11-16** shows that the task running on Yarn is manually killed. For details, see trace error information, as shown in **Figure 11-17**.

Figure 11-16 CDL job exception

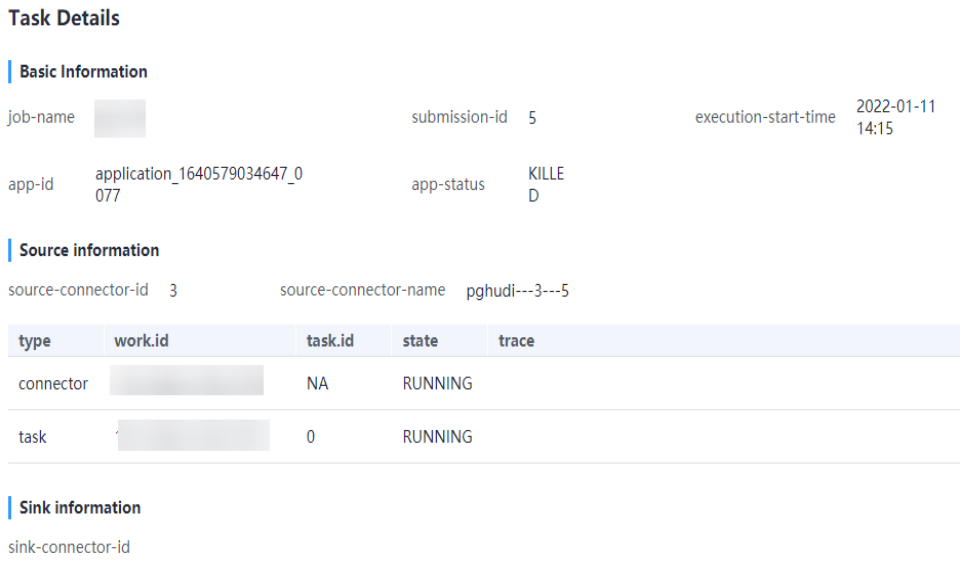

Figure 11-17 Trace error information

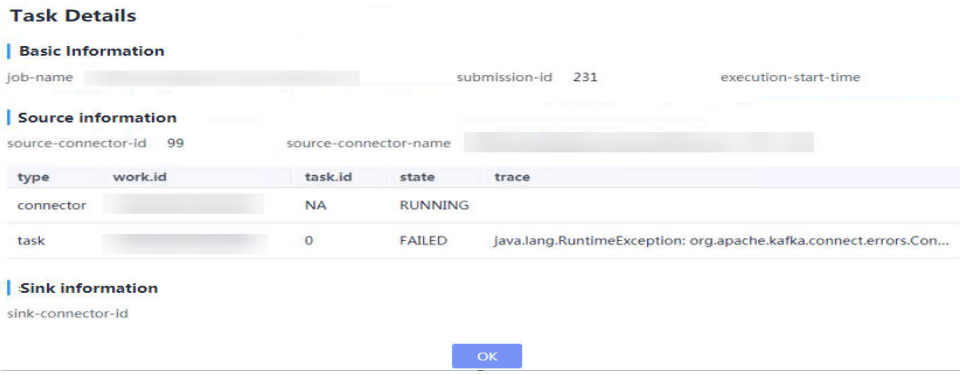


Step 8 Rectify the fault based on the error information, execute the task again, and check whether the task can be executed successfully.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Select **CDL** in the required cluster for **Service**.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

After the job is successfully restored or stopped, the alarm is cleared if it has been reported.

Related Information

None.

11.349 ALM-45617 Data Queued in the CDL Replication Slot Exceeds the Threshold

Alarm Description

If a large number of write-ahead logs (WALs) are stacked in the PostgreSQL/Opengauss database, the PostgreSQL/Opengauss disk space may be used up. The system checks whether the amount of data queued in the replication slot configured for a CDL job exceeds the threshold every 5 minutes. This alarm is generated when the amount of data queued in the replication slot exceeds the threshold. This alarm is cleared when the number of data queued in the replication slot falls below the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45617	Critical (default threshold: 5,120 MB) Major (default threshold: 4,196 MB)	Environment	CDL	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	JobName	Specifies the job for which the alarm was generated.
	DBName	Specifies the database for which the alarm was generated.

Type	Parameter	Description
	SlotName	Specifies the database replication slot for which the alarm was generated.
Additional Information	Lag	Specifies the volume of stacked data in the replication slot configured for a CDL task.

Impact on the System

Disk space of the source PostgreSQL or Opengauss database may be used up and the database cannot provide services.

Possible Causes

The CDL job is abnormal, and data processing stops; the source database is updated quickly, and CDL data processing is slow.

Handling Procedure

Step 1 Log in to FusionInsight Manager as a user who has the CDL job creation or administrator permission.

Step 2 Choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**, click ⌄ in the row where **Alarm ID** is **45617**, and view the name of the job for which this alarm is generated in **Location**.

Step 3 Check whether **ALM-45616 CDL Job Execution Exception** is displayed in the alarm list.

- If yes, handle the alarm by performing operations provided for **ALM-45616 CDL Job Execution Exception**.
- If no, go to **Step 4**.

Step 4 Choose **Cluster** > **Services** > **CDL**. Click the link next to **CDLService UI** to go to the CDL web UI and check whether the job is displayed in the job list based on its name obtained in **Step 2**.

- If yes, check whether the job is abnormal.
  - If it is abnormal, go to **Step 5**.
  - If it is not, data processing is slow. Contact O&M engineers.
- If no, go to **Step 7**.

Step 5 Click **Abnormal** or **Failed** in the row where the job is located and rectify the fault based on the error information displayed on the page.

Step 6 After rectifying the fault, run the job again and check whether the job can be executed successfully.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Select **CDL** in the required cluster for **Service**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is cleared when the amount of data queued in the replication slot is less than the threshold. You do not need to manually clear the alarm.

Related Information

None.

11.350 ALM-45635 FlinkServer Job Execution Failure

Alarm Description

The system checks whether FlinkServer jobs fail to be executed every 10 seconds. This alarm is generated when a FlinkServer job fails. This alarm is cleared when the job is successfully restarted.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45635	Major	Quality of service	Flink	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	ApplicationName	Specifies the name of the application for which the alarm was generated.

Type	Parameter	Description
	JobName	Specifies the job for which the alarm was generated.
	UserName	Specifies the username for which the alarm was generated.

Impact on the System

This alarm is a job-level alarm and does not affect FlinkServer. You need to view Flink job logs to find out the failure cause.

Possible Causes

You can view failure causes in specific logs.

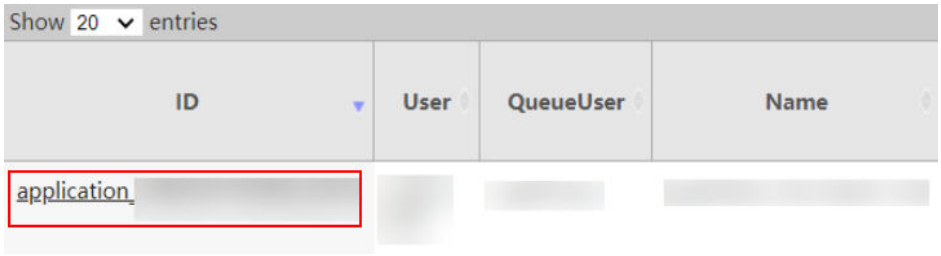
Handling Procedure

Step 1 Log in to Manager as a user who has the FlinkServer management permission.

Step 2 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 3 Locate the failed task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the native Yarn page.

Figure 11-18 Application ID of a job

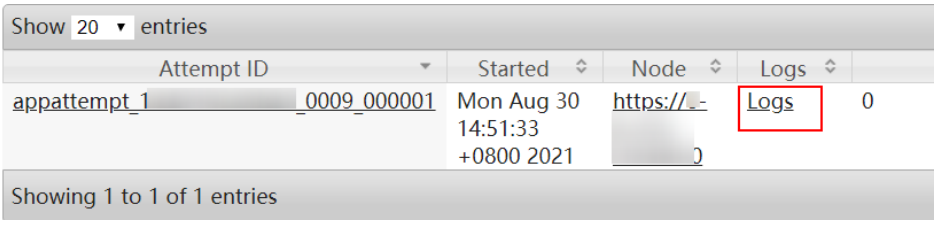


- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

Figure 11-19 Clicking Logs



2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view TaskManager logs.

Figure 11-20 Clicking the ID in the Attempt ID column

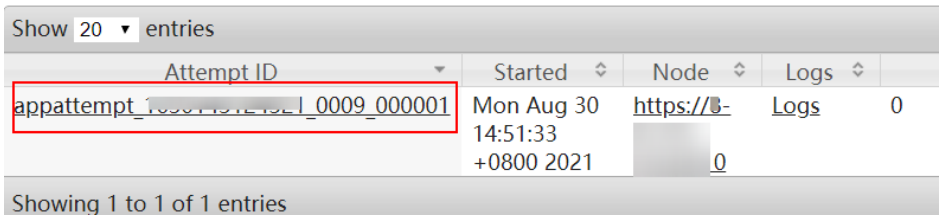


Figure 11-21 Clicking Logs

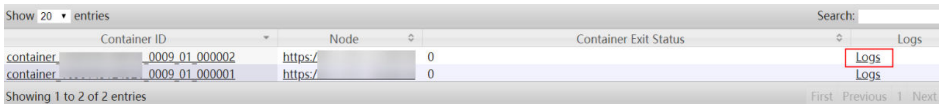


NOTE

You can also log in to Manager as a user who has the FlinkServer management permission. Choose **Cluster** > **Services** > **Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

Step 5 View the logs of the failed job to rectify the fault, or contact the O&M engineers and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 6 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***Username*/**logs/***Application ID of the failed job* directory.

Step 7 View the logs of the failed job to rectify the fault, or contact the O&M engineers and send the collected fault logs.

----End

Alarm Clearance

After the job is successfully restarted, the alarm is cleared if it has been reported.

Related Information

None.

11.351 ALM-45636 Number of Consecutive Checkpoint Failures of a Flink Job Exceeds the Threshold

Alarm Description

The system checks the number of consecutive checkpoint failures based on the configured alarm checking interval. This alarm is generated when the number of consecutive checkpoint failures of a FlinkServer job reaches the configured threshold. This alarm is cleared when checkpoints are recovered or the job is successfully restarted.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45636	Major	Quality of service	Flink	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	ApplicationName	Specifies the name of the application for which the alarm was generated.
	JobName	Specifies the job for which the alarm was generated.
	UserName	Specifies the username for which the alarm was generated.
Additional Information	ThreshHoldValue	Specifies the threshold value for triggering the alarm.
	CurrentValue	Specifies the value that triggered the alarm.

Impact on the System

The Flink job may fail. You need to check the status and logs of the Flink job to locate the fault. This is a job-level alarm and has no impact on FlinkServer.

Possible Causes

You can view failure causes in specific logs.

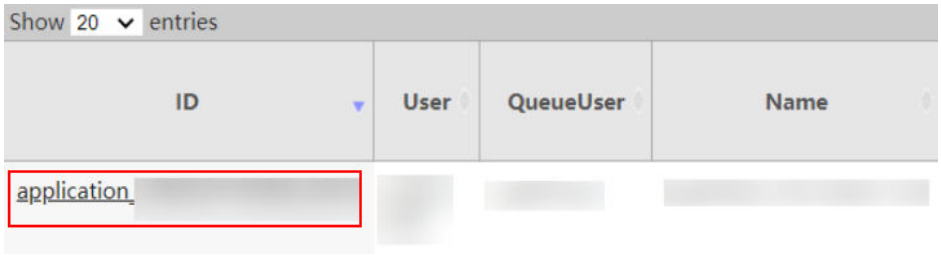
Handling Procedure

Step 1 Log in to Manager as a user who has the FlinkServer management permission.

Step 2 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 3 Locate the failed task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the native Yarn page.

Figure 11-22 Application ID of a job

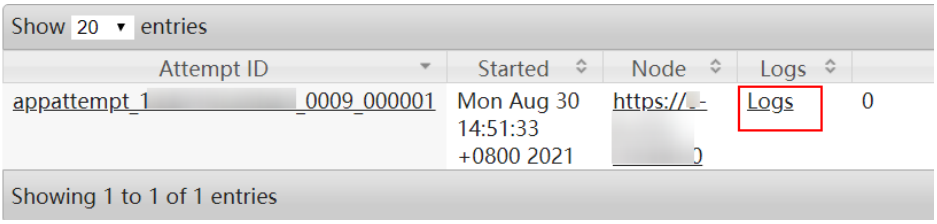


- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

Figure 11-23 Clicking Logs



2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view TaskManager logs.

Figure 11-24 Clicking the ID in the Attempt ID column

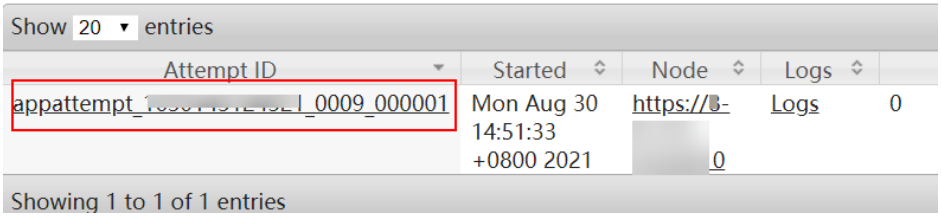


Figure 11-25 Clicking Logs

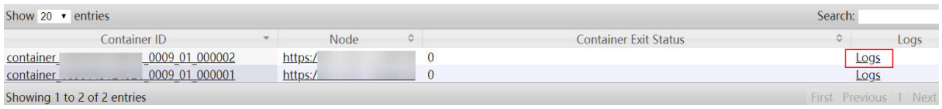


NOTE

You can also log in to Manager as a user who has the FlinkServer management permission. Choose **Cluster** > **Services** > **Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

Step 5 View the logs of the failed job to rectify the fault, or contact the O&M engineers and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 6 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***Username*/**logs/***Application ID of the failed job* directory.

Step 7 View the logs of the failed job to rectify the fault, or contact the O&M engineers and send the collected fault logs.

----End

Alarm Clearance

This alarm is cleared when FlinkServer job checkpoints are recovered or the job is successfully restarted.

Related Information

None.

11.352 ALM-45637 Continuous Back Pressure Time of a Flink Job Exceeds the Threshold

Alarm Description

The system checks the back pressure duration of FlinkServer tasks based on the configured alarm checking interval. This alarm is generated when the back pressure duration of a FlinkServer task reaches the configured threshold. This alarm is cleared when the task back pressure is recovered or the job is successfully restarted.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45637	Minor	Quality of service	Flink	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	ApplicationName	Specifies the name of the application for which the alarm was generated.
	JobName	Specifies the job for which the alarm was generated.
	UserName	Specifies the username for which the alarm was generated.
Additional Information	ThreshHoldValue	Specifies the threshold value for triggering the alarm.
	CurrentValue	Specifies the value that triggered the alarm.

Impact on the System

Continuous back pressure of Flink jobs may cause performance problems or checkpoint failures. Flink jobs fail. You need to check the status and logs of the Flink jobs to locate the cause. This is a job-level alarm and has no impact on FlinkServer.

Possible Causes

You can view the causes in the specific logs.

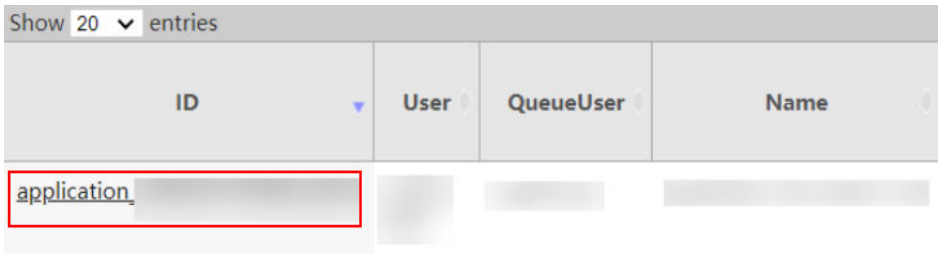
Handling Procedure

Step 1 Log in to Manager as a user who has the FlinkServer management permission.

Step 2 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 3 Locate the failed task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the native Yarn page.

Figure 11-26 Application ID of a job

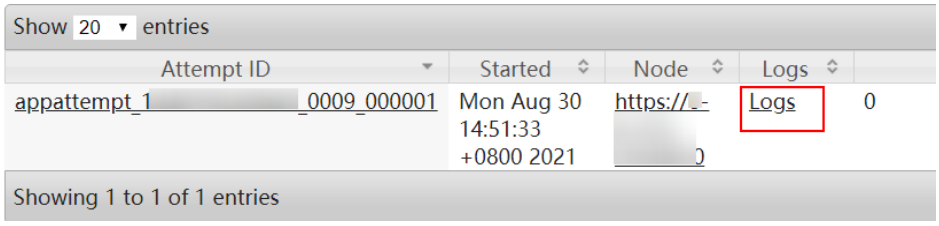


- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

   Figure 11-27 Clicking Logs

2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view TaskManager logs.

   Figure 11-28 Clicking the ID in the Attempt ID column

   
   Figure 11-29 Clicking Logs

   
   NOTE

   You can also log in to Manager as a user who has the FlinkServer management permission. Choose **Cluster** > **Services** > **Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

Step 5 View the logs of the failed job to rectify the fault, or contact the O&M engineers and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 6 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***Username*/**logs/***Application ID of the failed job* directory.

Step 7 View the logs of the failed job to rectify the fault, or contact the O&M engineers and send the collected fault logs.

----End

Alarm Clearance

This alarm is cleared when FlinkServer task back pressure is recovered or the job is successfully restarted.

Related Information

None.

11.353 ALM-45638 Number of Restarts After Flink Job Failures Exceeds the Threshold

Alarm Description

The system checks the times a FlinkServer job restarts based on the alarm checking interval. This alarm is generated when the number exceeds the configured threshold. This alarm is cleared when the job is restarted.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45638	Major	Quality of service	Flink	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	ApplicationName	Specifies the name of the application for which the alarm was generated.

Type	Parameter	Description
	JobName	Specifies the job for which the alarm was generated.
	UserName	Specifies the username for which the alarm was generated.
Additional Information	ThreshHoldValue	Specifies the threshold value for triggering the alarm.
	CurrentValue	Specifies the value that triggered the alarm.

Impact on the System

Flink jobs are frequently restarted due to the failures. You need to locate the cause. This is a job-level alarm and has no impact on FlinkServer.

Possible Causes

You can view the causes in the specific logs.

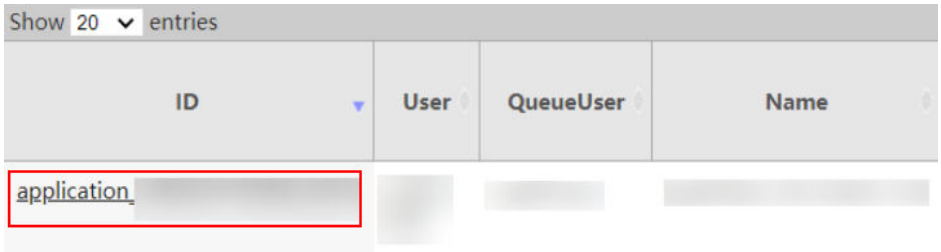
Handling Procedure

Step 1 Log in to Manager as a user who has the FlinkServer management permission.

Step 2 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 3 Locate the failed task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the native Yarn page.

Figure 11-30 Application ID of a job

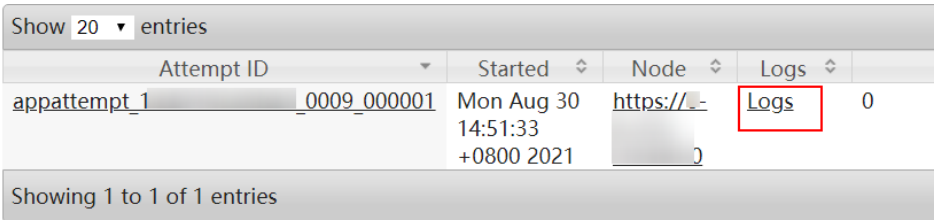


- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

Figure 11-31 Clicking Logs



2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view TaskManager logs.

Figure 11-32 Clicking the ID in the Attempt ID column

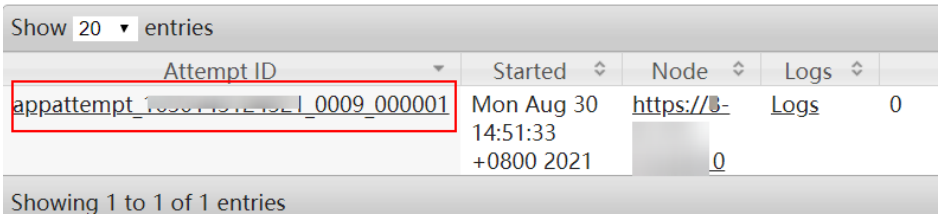


Figure 11-33 Clicking Logs

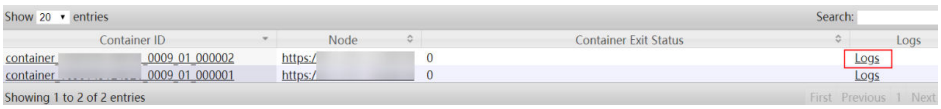


NOTE

You can also log in to Manager as a user who has the FlinkServer management permission. Choose **Cluster** > **Services** > **Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

Step 5 View the logs of the failed job to rectify the fault, or contact the O&M engineers and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 6 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***Username*/**logs/***Application ID of the failed job* directory.

Step 7 View the logs of the failed job to rectify the fault, or contact the O&M engineers and send the collected fault logs.

----End

Alarm Clearance

This alarm is cleared when the FlinkServer job is successfully restarted.

Related Information

None.

11.354 ALM-45639 Checkpointing of a Flink Job Times Out

Alarm Description

The system checks the checkpointing timeout of Flink jobs every 30 seconds. This alarm is generated if the checkpointing timeout of a Flink job is longer than the threshold (600 seconds by default). This alarm is cleared when the checkpointing timeout of a job is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45639	Minor	Quality of service	Flink	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	ApplicationName	Specifies the name of the application for which the alarm was generated.
	JobName	Specifies the job for which the alarm was generated.
	UserName	Specifies the username for which the alarm was generated.
Additional Information	ThreshHoldValue	Specifies the threshold value for triggering the alarm.
	CurrentValue	Specifies the value that triggered the alarm.

Impact on the System

The checkpointing fails. You need to locate the cause. This is a job-level alarm and has no impact on FlinkServer.

Possible Causes

The job may be in the sub-healthy state. The possible causes are as follows:

- The memory for the TaskManager of the job is insufficient.
- The state memory is too large, making checkpointing time-consuming.

Handling Procedure

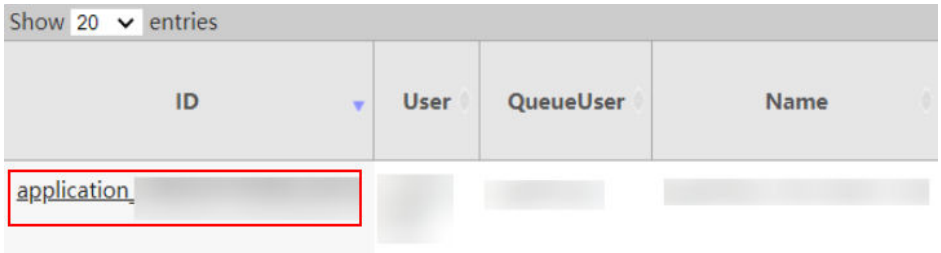
Step 1 Log in to Manager as a user who has the FlinkServer management permission.

Step 2 Choose **O&M** > **Alarm** > **Alarms** > **ALM-45639 Checkpointing of a Flink Job Times Out**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 3 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 4 Locate the failed task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

Figure 11-34 Application ID of a job

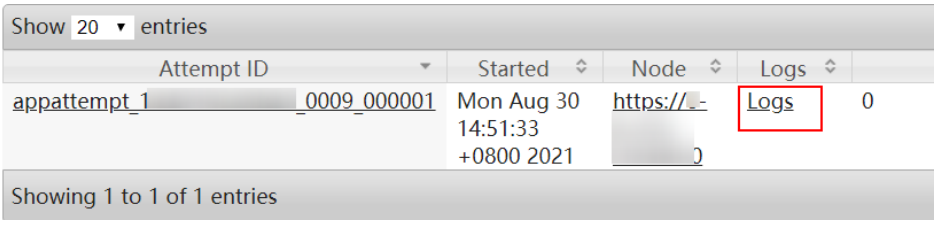


- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

   Figure 11-35 Clicking Logs

2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view TaskManager logs.

Figure 11-36 Clicking the ID in the Attempt ID column

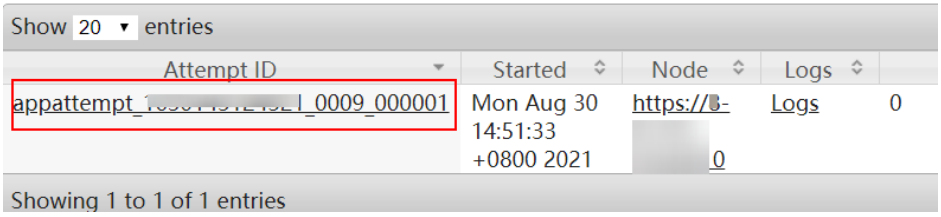


Figure 11-37 Clicking Logs

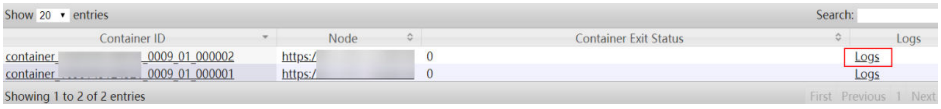


NOTE

You can also log in to Manager as a user who has the FlinkServer management permission. Choose **Cluster** > **Services** > **Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

Step 6 View the logs of the failed job to rectify the fault, or contact the O&M engineers and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 7 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***Username*/**logs/***Application ID of the failed job* directory.

Step 8 View the logs of the failed job to rectify the fault, or contact the O&M engineers and send the collected fault logs.

----End

Alarm Clearance

This alarm is cleared when the checkpointing timeout a Flink job is less than or equal to the threshold.

Related Information

None.

11.355 ALM-45640 FlinkServer Heartbeat Interruption Between the Active and Standby Nodes

Alarm Description

This alarm is generated when the FlinkServer active node or standby node does not receive heartbeat messages from the peer for 30 seconds (heartbeat interruption duration configured in keepalive).

This alarm is cleared when the heartbeat recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45640	Minor	Heartbeat	Flink	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

The impact varies depending on the cause. If the heartbeat is interrupted due to other reasons, for example, network problems, two active nodes may exist because the standby node became the active node. Data synchronization between the active and standby nodes is abnormal, but FlinkServer can still provide services.

Possible Causes

- The active or standby FlinkServer instance is in the stopped state.
- The NIC of the floating IP address of the HA system used by the FlinkServer node is incorrectly configured. FlinkServer fails to be started.
- The link between the active and standby FlinkServer nodes is abnormal.

Handling Procedure

Check the status of the active and standby FlinkServer instances.

Step 1 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **Flink** > **Instance**, and check the state of FlinkServer is normal.

- If yes, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 Select the abnormal FlinkServer instance and start the instance. After the instance is started, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check whether the link between the standby FlinkServer nodes is normal.

Step 3 Choose **Cluster** > **Services** > **Flink** > **Instance**, and check the two service IP addresses of FlinkServer.

Step 4 Log in to the server where the abnormal FlinkServer instance locates as user **root**.

Step 5 Run the following command to check whether the server of the other FlinkServer instance is reachable:

ping *IP address of the other FlinkServer instance*

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Ask the network administrator to handle the network exception.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the logs of the node where the abnormal FlinkServer instance locates contains error information.

Step 8 Log in to the server where the abnormal FlinkServer instance locates as user **root**.

Step 9 Open the log file in the default directory **/var/log/Bigdata/flink/flinkserver/prestart.log** and check whether there is error message **Float ip** *x.x.x.x* **is invalid**.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 On FusionInsight Manager, choose **Cluster** > **Services** > **Flink** > **Configurations** > **All Configurations** and search for **flink.ha.floatip**. Change the parameter value to the correct floating IP address, save the configuration, and restart the Flink service.

NOTE

Contact the network engineer to obtain the new floating IP address.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 13 Select the Flink service in the required cluster for **Service**.

Step 14 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 15 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.356 ALM-45641 Data Synchronization Exception Between the Active and Standby FlinkServer Nodes

Alarm Description

The system checks data synchronization between the active and standby FlinkServer nodes every 60 seconds. This alarm is generated when the standby FlinkServer node fails to synchronize files with the active FlinkServer node.

This alarm is cleared when the standby FlinkServer synchronizes files with the active FlinkServer.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45641	Major	Quality of service	Flink	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.

Type	Parameter	Description
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

After an active/standby switchover, some configurations may be lost. Some jobs and connections of the FlinkServer are interrupted, but the FlinkServer can still provide services properly.

Possible Causes

- The link between the active and standby FlinkServer nodes is interrupted.
- The synchronization file does not exist or the file permission is required.

Handling Procedure

Check whether the network between the active and standby FlinkServer is in normal state.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse** > **Instance**. View and record the IP addresses of active and standby FlinkServer.

Step 2 Log in to the active FlinkServer node as user **root**.

Step 3 Run the following command to check whether the standby FlinkServer is reachable:

ping *IP address of the standby FlinkServer*

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the storage space of the /srv/BigData/LocalBackup directory is full.

Step 6 Run the following command to check whether the storage space of the **/srv/BigData/LocalBackup** directory is full:

df -hl /srv/BigData/LocalBackup

- If yes, go to **Step 7**.
- If no, go to **Step 10**.

Step 7 Run the following command to clear unnecessary backup files:

rm -rf *Directory to be cleared*

The following are two examples:

rm -rf /srv/BigData/LocalBackup/0/default-oms_20191211143443

Step 8 On FusionInsight Manager, choose **O&M** > **Backup and Restoration** > **Backup Management**.

In the **Operation** column of the backup task, click **Configure** and change the value of **Maximum Number of Backup Copies** to reduce the number of backup file sets.

Step 9 Wait for 1 minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the synchronization file exists and whether the file permission is valid.

Step 10 Run the following command to check whether the synchronization file exists:

find /srv/BigData/ -name "sed*"

find /opt -name "sed*"

- If yes, go to **Step 11**.
- If no, go to **Step 12**.

Step 11 Run the following command to check the synchronization file information and permission queried in **Step 10**:

ll *Path of the file you want to search for*

- If the file size is 0 and all values in the permission column are -, the file is a junk file. Run the following command to delete it:

  rm -rf *Files to be deleted*

  Wait for several minutes and check whether the alarm is cleared. If the alarm persists, go to **Step 12**.
- If the file size is not 0, go to **Step 12**.

Step 12 View the log file generated when the alarm is reported.

1. Run the following command to go to the HA run log file path of the current cluster:

   cd /var/log/Bigdata/flink/flinkserver/ha/runlog

2. Decompress log file and view the logs generated when the alarm is reported.

   For example, if the name of the file is **ha.log.2021-03-22_12-00-07.gz**, run the following command:

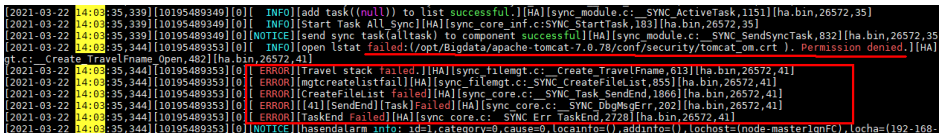
   gunzip *ha.log.2021-03-22_12-00-07.gz*

   vi *ha.log.2021-03-22_12-00-07*

   Check whether error information is displayed before and after the alarm generation time in the logs.

- If it is displayed, rectify the fault based on the error information. Go to **Step 13**.

  For example, if the following error information is displayed, the directory permission is required. In this case, obtain the directory permission that is the same as the permission on a normal node.



- If no, go to **Step 14**.

Step 13 Wait for about 10 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Collect fault information.

Step 14 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 15 Select FlinkServer information from **Services** and click **OK**.

Step 16 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 17 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.357 ALM-45642 RocksDB Continuously Triggers Write Traffic Limiting

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when RocksDB for a job continuously triggers write traffic limiting, that is, the RocksDB write rate is not 0. This alarm is cleared when the RocksDB write rate of the job becomes 0.

The **rocksdb.actual-delayed-write-rate** parameter specifies the RocksDB write rate of a job. Value **0** indicates that the rate is not limited, and other values indicate traffic limiting.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45642	Minor	Quality of service	Flink	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	ApplicationName	Specifies the name of the application for which the alarm was generated.
	JobName	Specifies the job for which the alarm was generated.
	UserName	Specifies the username for which the alarm was generated.

Impact on the System

The checkpoint performance of Flink jobs are affected. There is no impact on the FlinkServer.

Possible Causes

When the rate at which Flink jobs write data to RocksDB is not 0, write traffic limiting is triggered. The possible causes are as follows:

- There are too many MemTables. As a result, write traffic is limited or write stops, and **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold** is generated.
- The size of SST files at level 0 is too large, and **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** is generated.
- The estimated compaction size exceeds the threshold, and **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** is generated.

Handling Procedure

Check whether write traffic limiting or write stop is caused due to too many MemTables.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, check whether **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Handle the alarm by following the instructions provided in section **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold**.

Step 4 After ALM-45643 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether write traffic limiting or write stop is caused due to too many SST files at level 0.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 6 In the alarm list, check whether **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Handle the alarm by following the instructions provided in section **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold**.

Step 8 After ALM-45644 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check whether write traffic limiting or write stop is caused because the estimated compaction size exceeds the threshold.

Step 9 In the alarm list, check whether **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 Handle the alarm by following the instructions provided in section **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold**.

Step 11 After ALM-45647 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 12**.

Collect fault information.

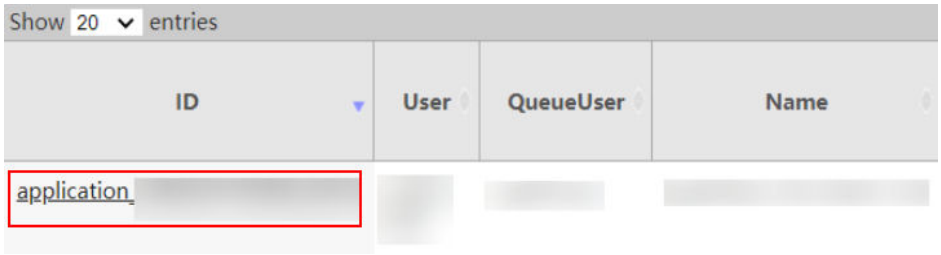
Step 12 Log in to FusionInsight Manager as a user who has the FlinkServer management permission.

Step 13 Choose **O&M** > **Alarm** > **Alarms** > **ALM-45642 RocksDB Continuously Triggers Write Traffic Limiting**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 14 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 15 Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the native Yarn page.

Figure 11-38 Application ID of a job

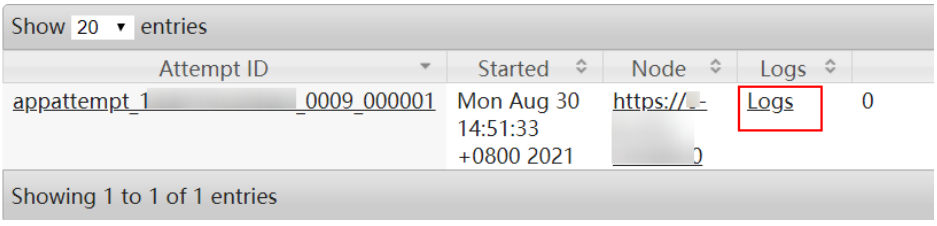


- If yes, go to **Step 16**.
- If no, go to **Step 18**.

Step 16 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

   Figure 11-39 Clicking Logs

2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view and save TaskManager logs.

   Figure 11-40 Clicking the ID in the Attempt ID column

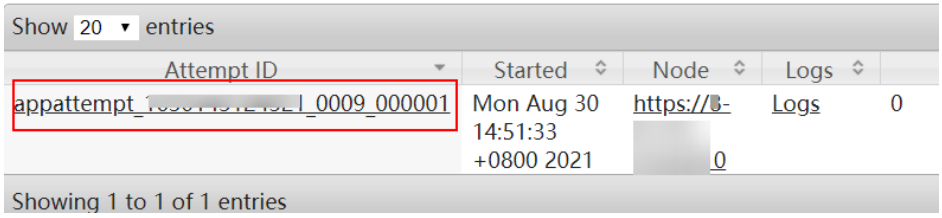
   


Figure 11-41 Clicking Logs

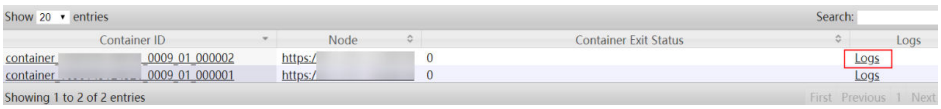


NOTE

You can also log in to Manager as a user who has the FlinkServer management permission. Choose **Cluster** > **Services** > **Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

Step 17 View the job logs to rectify the fault, or contact the O&M personnel and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 18 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***Username*/**bucket-logs-tfile/***Last four digits of the task application ID/Application ID of the task* directory.

Step 19 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.358 ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when the MemTable size of RocksDB for a job continuously exceeds the threshold (**metrics.reporter.alarm.job.alarm.rocksdb.get.micros.threshold**, 50000 microseconds by default). This alarm is cleared when the MemTable size of RocksDB for the job is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45643	Minor	Quality of service	Flink	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	ApplicationName	Specifies the name of the application for which the alarm was generated.
	JobName	Specifies the job for which the alarm was generated.
	UserName	Specifies the username for which the alarm was generated.
Additional Information	ThreshHoldValue	Specifies the threshold value for triggering the alarm.
	CurrentValue	Specifies the value that triggered the alarm.

Impact on the System

The checkpoint performance of Flink jobs are affected. There is no impact on the FlinkServer.

Possible Causes

The write pressure of RocksDB is high.

Handling Procedure

Check TaskManager logs for the write pressure of RocksDB and collect logs.

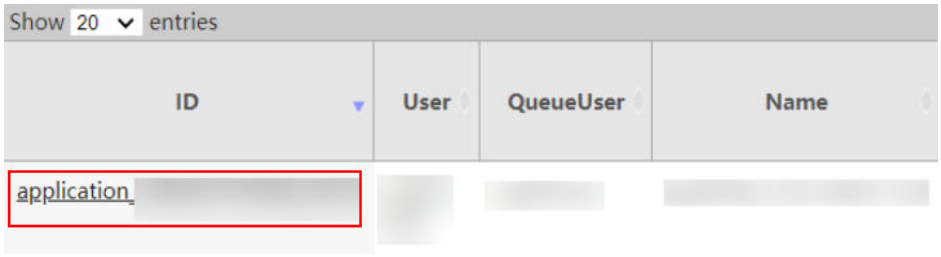
Step 1 Log in to FusionInsight Manager as a user who has the FlinkServer management permission.

Step 2 Choose **O&M** > **Alarm** > **Alarms** > **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 3 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 4 Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

Figure 11-42 Application ID of a job

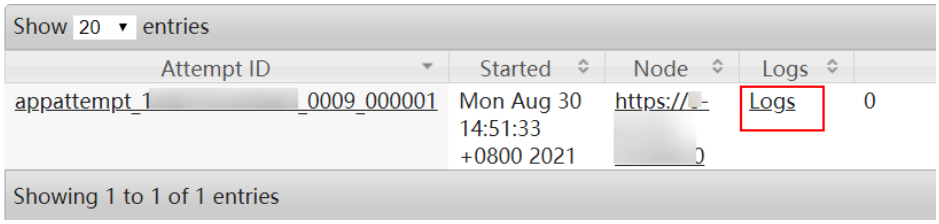


- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

Figure 11-43 Clicking Logs



2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view and save TaskManager logs. Then go to **Step 7**.

Figure 11-44 Clicking the ID in the Attempt ID column

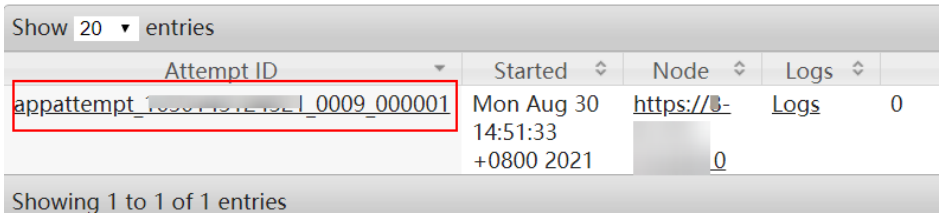


Figure 11-45 Clicking Logs

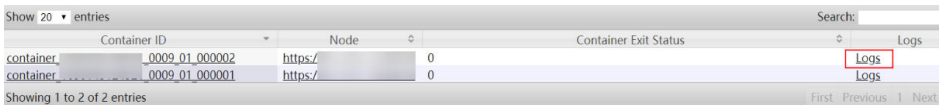


NOTE

You can also log in to Manager as a user who has the management permission for the current Flink job. Choose **Cluster** > **Services** > **Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 6 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***Username*/**bucket-logs-tfile/***Last four digits of the task application ID/Application ID of the task* directory.

Check whether the write pressure of RocksDB is high.

Step 7 Check whether the value of **rocksdb.size-all-mem-tables** (unit: byte) in the TaskManager monitoring logs (keyword **RocksDBMetricPrint**) is greater than or equal to the total write buffer size (Total write buffer = **write_buffer_size** x **max_write_buffer_number**).

- If yes, adjust the values of the following custom parameters on the job development page of the Flink web UI, save the settings, and go to **Step 8**.

  Table 11-7 Custom parameters

Parameter	Default Value	Description
state.backend.rocksdb.writebuffer.count	– **2** – **4**: enables **SPINNING_DISK_OPTIMIZED_HIGH_MEM**.	– Number of buffers – **2** to **10** are recommended. Adjust the value based on service requirements.
state.backend.rocksdb.writebuffer.size	**64MB**	– Buffer size – **64MB** to **256MB** are recommended.
state.backend.rocksdb.thread.num	– **2** – **4**: enables **SPINNING_DISK_OPTIMIZED_HIGH_MEM**.	– Number of flush threads. Increase the number of threads to quickly flush memory data to disks. – When the number of threads is increased, the number of vCores also needs to be increased. – **2** to **10** are recommended.

- If no, go to **Step 9**.

Step 8 Restart the job and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Contact O&M personnel and send the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.359 ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when the number of SST files at level 0 of RocksDB for a job continuously exceeds the threshold (**state.backend.rocksdb.level0_slowdown_writes_trigger**, 20 by default). This alarm is cleared when the number of SST files at level 0 of RocksDB for the job is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45644	Minor	Quality of service	Flink	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	ApplicationName	Specifies the name of the application for which the alarm was generated.
	JobName	Specifies the job for which the alarm was generated.

Type	Parameter	Description
	UserName	Specifies the username for which the alarm was generated.
Additional Information	ThreshHoldValue	Specifies the threshold value for triggering the alarm.
	CurrentValue	Specifies the value that triggered the alarm.

Impact on the System

The checkpoint performance of Flink jobs are affected. There is no impact on the FlinkServer.

Possible Causes

Possible causes are as follows:

- The compaction pressure of RocksDB is too high, and **ALM-45646 Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** and **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** are generated.
- There are too many SST files at level 0.

Handling Procedure

Check whether the compaction pressure of RocksDB is too high and ALM-45646 is generated.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, check whether **ALM-45646 Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Handle the alarm by following the instructions provided in section **ALM-45646 Pending Compaction Size of RocksDB Continuously Exceeds the Threshold**.

Step 4 After ALM-45646 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the compaction pressure of RocksDB is too high and ALM-45647 is generated.

Step 5 In the alarm list, check whether **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 6**.

- If no, go to **Step 8**.

Step 6 Handle the alarm by following the instructions provided in section **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold**.

Step 7 After ALM-45647 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check TaskManager logs for the number of SST files at level 0 and collect logs.

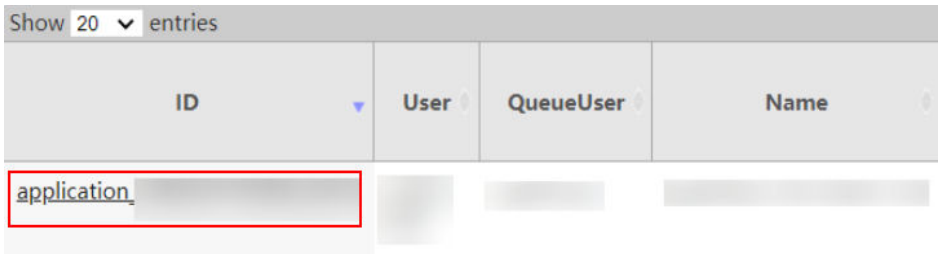
Step 8 Log in to FusionInsight Manager as a user who has the FlinkServer management permission.

Step 9 Choose **O&M** > **Alarm** > **Alarms** > **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 10 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 11 Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

Figure 11-46 Application ID of a job

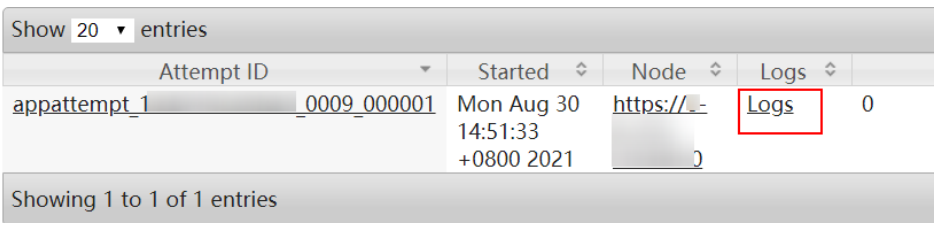


- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

   Figure 11-47 Clicking Logs

2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view and save TaskManager logs. Then go to **Step 14**.

Figure 11-48 Clicking the ID in the Attempt ID column

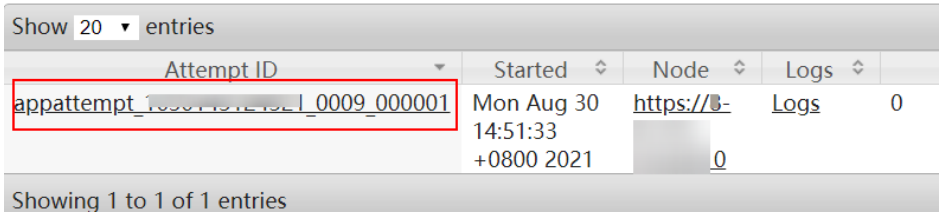


Figure 11-49 Clicking Logs

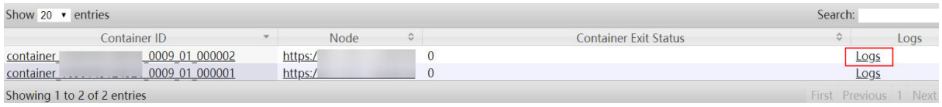


NOTE

You can also log in to Manager as a user who has the management permission for the current Flink job. Choose **Cluster** > **Services** > **Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 13 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***Username*/**bucket-logs-tfile/***Last four digits of the task application ID/Application ID of the task* directory.

Check whether the number of SST files at level 0 is too large.

Step 14 Check whether the value of **rocksdb.num-files-at-level0** in TaskManager monitoring logs (keyword **RocksDBMetricPrint**) is greater than or equal to the value of **state.backend.rocksdb.level0_slowdown_writes_trigger** or **state.backend.rocksdb.level0_stop_writes_trigger**.

- If yes, adjust the values of the following custom parameters on the job development page of the Flink web UI, save the settings, and go to **Step 15**.

  Table 11-8 Custom parameters

Parameter	Default Value	Description
state.backend.rocksdb.level0_slowdown_writes_trigger	20	– Number of files that trigger slowdown at level 0 – **20** to **30** are recommended.
state.backend.rocksdb.level0_stop_writes_trigger	36	– Maximum number of files that trigger stop at level 0 – **36** to **46** are recommended.

- If no, go to **Step 16**.

Step 15 Restart the job and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Step 16 Contact O&M personnel and send the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.360 ALM-45645 Pending Flush Size of RocksDB Continuously Exceeds the Threshold

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when the number of pending flush requests of RocksDB for a job continuously reaches *n* times the number of flush/compaction threads. This alarm is cleared when the number of pending flush requests of RocksDB for the job is less than or equal to the threshold.

- The number of flush/compaction threads is the value of **state.backend.rocksdb.thread.num**. The default value is **2**. If **SPINNING_DISK_OPTIMIZED_HIGH_MEM** is enabled, the default value is **4**.
- The **metrics.reporter.alarm.job.alarm.rocksdb.background.jobs.multiplier** parameter specifies *n* times the number of flush/compaction threads. The default value is **2**.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45645	Minor	Quality of service	Flink	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm was generated.
	ApplicationName	Specifies the name of the application for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	JobName	Specifies the job for which the alarm was generated.
Additional Information	ThreshHoldValue	Specifies the threshold value for triggering the alarm.
	CurrentValue	Specifies the value that triggered the alarm.

Impact on the System

The checkpoint performance of Flink jobs are affected. There is no impact on the FlinkServer.

Possible Causes

The number of pending flush requests of RocksDB for the Flink job is too large.

Handling Procedure

Check TaskManager logs for the number of pending flush requests and collect logs.

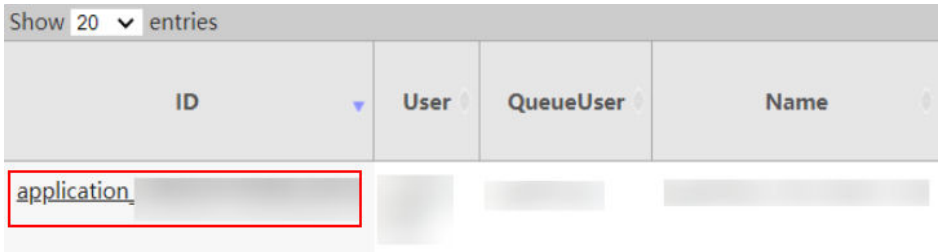
Step 1 Log in to FusionInsight Manager as a user who has the FlinkServer management permission.

Step 2 Choose **O&M** > **Alarm** > **Alarms** > **ALM-45645 Pending Flush Size of RocksDB Continuously Exceeds the Threshold**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 3 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 4 Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

Figure 11-50 Application ID of a job

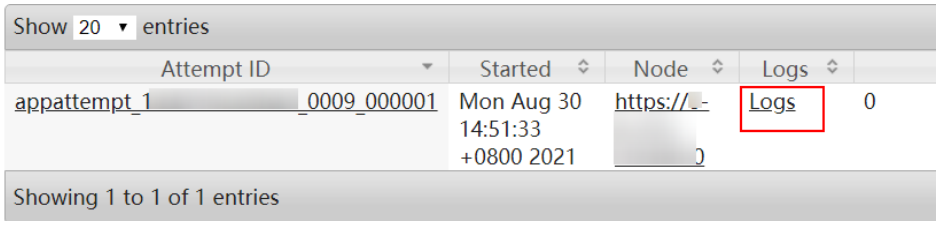


- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

   Figure 11-51 Clicking Logs

2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view and save TaskManager logs. Then go to **Step 7**.

11.362 ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when the estimated pending compaction size of RocksDB for a job continuously exceeds the threshold. This alarm is cleared when the estimated pending compaction size of RocksDB for the job is less than or equal to the threshold.

The threshold of the estimated pending compaction size is the smaller value of the following two parameters:

- **state.backend.rocksdb.soft-pending-compaction-bytes-limit**. The default value is **64GB**.
- **state.backend.rocksdb.hard-pending-compaction-bytes-limit**. The default value is **256GB**.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45647	Minor	Quality of service	Flink	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	ApplicationName	Specifies the name of the application for which the alarm was generated.
	JobName	Specifies the job for which the alarm was generated.
	UserName	Specifies the username for which the alarm was generated.

Type	Parameter	Description
Additional Information	ThreshHoldValue	Specifies the threshold value for triggering the alarm.
	CurrentValue	Specifies the value that triggered the alarm.

Impact on the System

The checkpoint performance of Flink jobs are affected. There is no impact on the FlinkServer.

Possible Causes

The estimated compaction data size of RocksDB is too large.

Handling Procedure

Check TaskManager logs for the estimated compaction data size and collect logs.

Step 1 Log in to FusionInsight Manager as a user who has the FlinkServer management permission.

Step 2 Choose **O&M** > **Alarm** > **Alarms** > **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 3 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 4 Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

11.363 ALM-45648 RocksDB Frequently Encounters Write-Stopped

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when RocksDB for a job continuously encounters the **is-write-stopped** state. This alarm is cleared when RocksDB for the job no longer or does not continuously encounter the **is-write-stopped** state within an alarm reporting interval.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45648	Minor	Quality of service	Flink	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	ApplicationName	Specifies the name of the application for which the alarm was generated.
	JobName	Specifies the job for which the alarm was generated.
	UserName	Specifies the username for which the alarm was generated.

Impact on the System

The checkpoint performance of Flink jobs are affected. There is no impact on the FlinkServer.

Possible Causes

The possible causes are as follows:

- There are too many MemTables and **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold** is generated.
- There are too many SST files at level 0, and **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** is generated.
- The estimated compaction size exceeds the threshold, and **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** is generated.

Handling Procedure

Check whether there are too many MemTables.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, check whether **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Handle the alarm by following the instructions provided in section **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold**.

Step 4 After ALM-45643 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the number of SST files at level 0 is too large.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 6 In the alarm list, check whether **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Handle the alarm by following the instructions provided in section **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold**.

Step 8 After ALM-45644 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check whether the estimated compaction size exceeds the threshold.

Step 9 In the alarm list, check whether **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 Handle the alarm by following the instructions provided in section **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold**.

Step 11 After ALM-45647 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

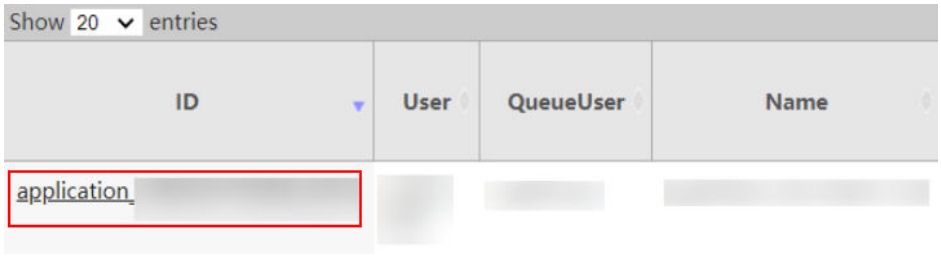
Step 12 Log in to Manager as a user who has the management permission for the current Flink job.

Step 13 Choose **O&M** > **Alarm** > **Alarms** > **ALM-45648 RocksDB Frequently Encounters Write-Stopped**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 14 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 15 Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

Figure 11-62 Application ID of a job

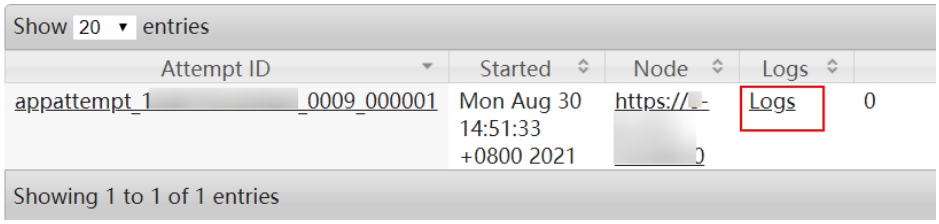


- If yes, go to **Step 16**.
- If no, go to **Step 18**.

Step 16 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

Figure 11-63 Clicking Logs



2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view and save TaskManager logs.

Figure 11-64 Clicking the ID in the Attempt ID column

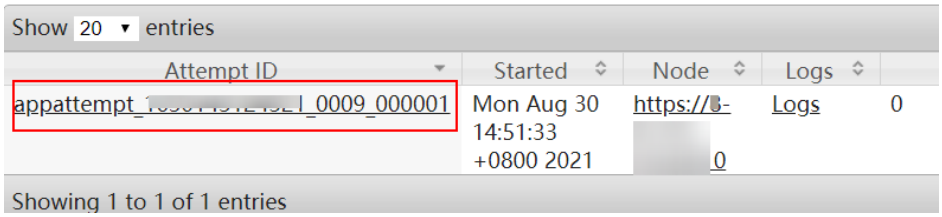


Figure 11-65 Clicking Logs

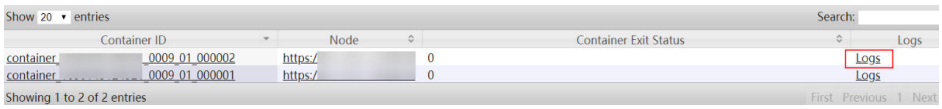

NOTE

You can also log in to Manager as a user who has the management permission for the current Flink job. Choose **Cluster** > **Services** > **Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

Step 17 View the job logs to rectify the fault, or contact the O&M personnel and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 18 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***Username*/**bucket-logs-tfile/***Last four digits of the task application ID/Application ID of the task* directory.

Step 19 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

None.

11.364 ALM-45649 P95 Latency of RocksDB Get Requests Continuously Exceeds the Threshold

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when the P95 latency of RocksDB Get requests exceeds the threshold (**metrics.reporter.alarm.job.alarm.rocksdb.get.micros.threshold**, 50000 microseconds by default). This alarm is cleared when the P95 latency of RocksDB Get requests is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45649	Minor	Quality of service	Flink	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	ApplicationName	Specifies the name of the application for which the alarm was generated.
	JobName	Specifies the job for which the alarm was generated.
	UserName	Specifies the username for which the alarm was generated.
Additional Information	ThreshHoldValue	Specifies the threshold value for triggering the alarm.
	CurrentValue	Specifies the value that triggered the alarm.

Impact on the System

The checkpoint performance of Flink jobs are affected. There is no impact on the FlinkServer.

Possible Causes

The possible causes are as follows:

- There are too many SST files at level 0, causing slow queries. In addition, **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** is generated.
- The cache hit ratio is lower than 60%, causing frequent swap-ins and swap-outs of the block cache.

Handling Procedure

Check whether the number of SST files at level 0 is too large.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, check whether **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Handle the alarm by following the instructions provided in section **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold**.

Step 4 After ALM-45644 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the cache hit ratio in TaskManager logs and collect logs.

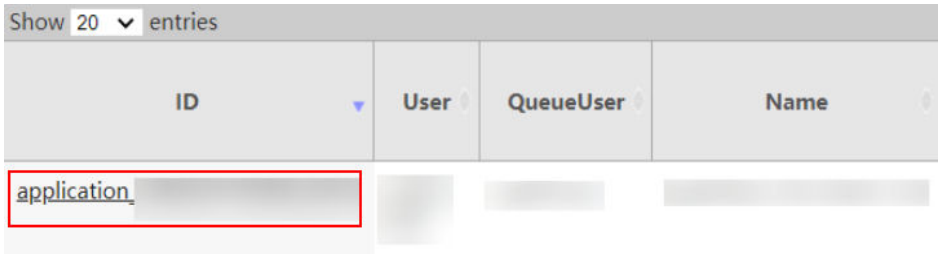
Step 5 Log in to FusionInsight Manager as a user who has the FlinkServer management permission.

Step 6 Choose **O&M** > **Alarm** > **Alarms** > **ALM-45649 P95 Latency of RocksDB Get Requests Continuously Exceeds the Threshold**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 7 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 8 Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

Figure 11-66 Application ID of a job

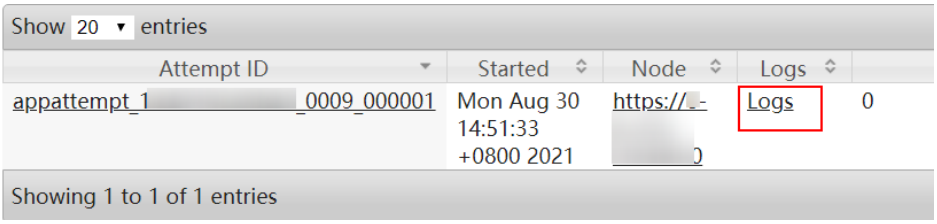


- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

   Figure 11-67 Clicking Logs

2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view and save TaskManager logs. Then go to **Step 11**.

Figure 11-68 Clicking the ID in the Attempt ID column

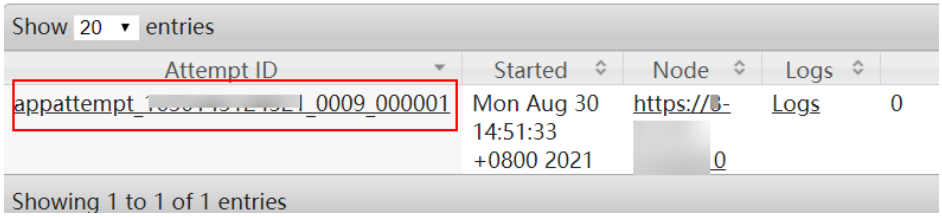


Figure 11-69 Clicking Logs

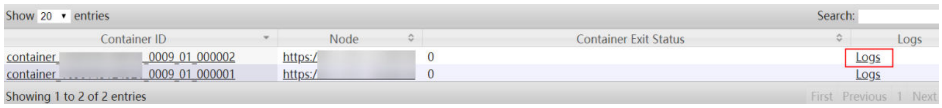


NOTE

You can also log in to Manager as a user who has the management permission for the current Flink job. Choose **Cluster** > **Services** > **Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 10 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***Username*/**bucket-logs-tfile/***Last four digits of the task application ID/Application ID of the task* directory.

Check whether the cache hit ratio is too low.

Step 11 Check the values of **rocksdb.block.cache.hit** (cache hit) and **rocksdb.block.cache.miss** (cache miss) in TaskManager monitoring logs (keyword **RocksDBMetricPrint**). Calculate the hit ratio using the following formula and check whether it is less than 60%:

rocksdb.block.cache.hit/(rocksdb.block.cache.hit+rocksdb.block.cache.miss)

- If yes, adjust the values of the following custom parameters on the job development page of the Flink web UI, save the settings, and go to **Step 12**.

Table 11-12 Custom parameters

Parameter	Default Value	Description
state.backend.rocksdb.block.cache-size	– **8MB** – **256MB**: enables **SPINNING_DISK_OPTIMIZED_HIGH_MEM**.	– Cache size – **8MB** to **1GB** are recommended.

Parameter	Default Value	Description
state.backend.rocksdb.block.blocksize	– **4KB** – **128KB**: enables **SPINNING_DISK_OPTIMIZED_HIGH_MEM**.	– Block size – **4KB** to **256KB** are recommended.
state.backend.rocksdb.use-bloom-filter	**false**	– Whether to speed up indexing. If it is **true**, each new SST file will contain a Bloom filter. – **true** is recommended.

- If no, go to **Step 13**.

Step 12 Restart the job and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Step 13 Contact O&M personnel and send the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.365 ALM-45650 P95 Latency of RocksDB Write Requests Continuously Exceeds the Threshold

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when the P95 latency of RocksDB write requests exceeds the threshold (**metrics.reporter.alarm.job.alarm.rocksdb.write.micros.threshold**, 50000 microseconds by default). This alarm is cleared when the P95 latency of RocksDB write requests is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45650	Minor	Quality of service	Flink	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	ApplicationName	Specifies the name of the application for which the alarm is generated.
	JobName	Specifies the job for which the alarm was generated.
	UserName	Specifies the username for which the alarm was generated.
Additional Information	ThreshHoldValue	Specifies the threshold value for triggering the alarm.
	CurrentValue	Specifies the value that triggered the alarm.

Impact on the System

The checkpoint performance of Flink jobs are affected. There is no impact on the FlinkServer.

Possible Causes

The possible causes are as follows:

- There are too many MemTables. As a result, write traffic is limited or write stops, and **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold** is generated.
- There are too many SST files at level 0, and **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** is generated.
- The estimated compaction size exceeds the threshold, and **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** is generated.

Handling Procedure

Check whether write traffic limiting or write stop is caused due to too many MemTables.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, check whether **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Handle the alarm by following the instructions provided in section **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold**.

Step 4 After ALM-45643 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the number of SST files at level 0 is too large.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 6 In the alarm list, check whether **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Handle the alarm by following the instructions provided in section **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold**.

Step 8 After ALM-45644 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check whether the estimated compaction size exceeds the threshold.

Step 9 In the alarm list, check whether **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 Handle the alarm by following the instructions provided in section **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold**.

Step 11 After ALM-45647 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

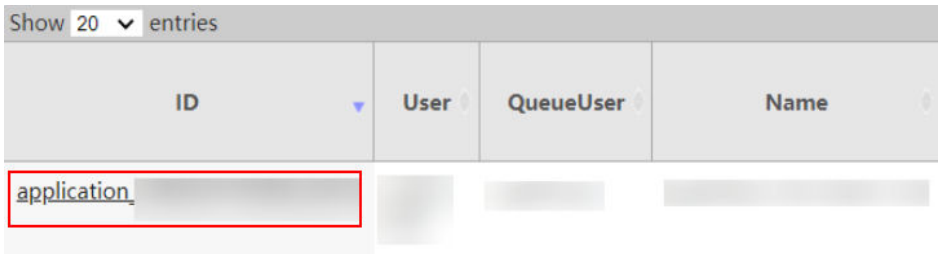
Step 12 Log in to FusionInsight Manager as a user who has the FlinkServer management permission.

Step 13 Choose **O&M** > **Alarm** > **Alarms** > **ALM-45650 P95 Latency of RocksDB Write Requests Continuously Exceeds the Threshold**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 14 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 15 Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

Figure 11-70 Application ID of a job

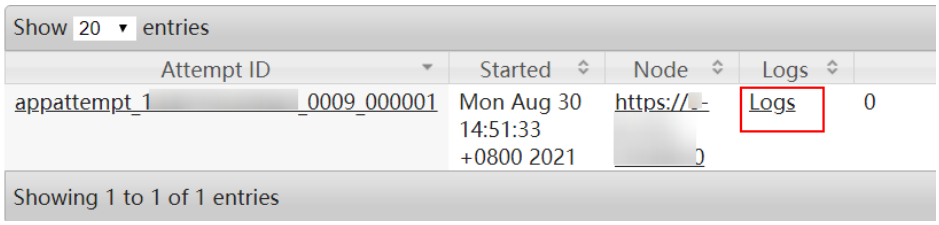


- If yes, go to **Step 16**.
- If no, go to **Step 18**.

Step 16 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

Figure 11-71 Clicking Logs



2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view and save TaskManager logs.

Figure 11-72 Clicking the ID in the Attempt ID column

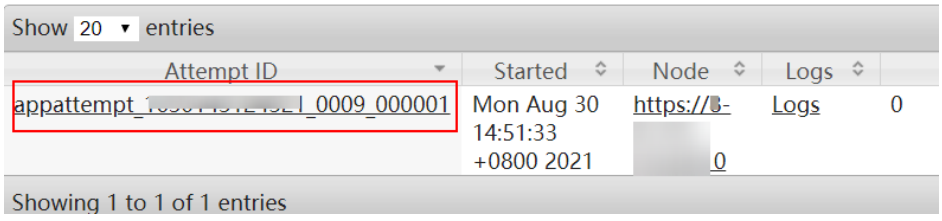


Figure 11-73 Clicking Logs

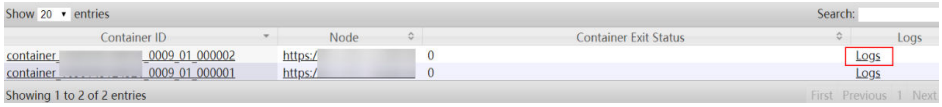

NOTE

You can also log in to Manager as a user who has the FlinkServer management permission. Choose **Cluster** > **Services** > **Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

Step 17 View the job logs to rectify the fault, or contact the O&M personnel and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 18 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***Username*/**bucket-logs-tfile/***Last four digits of the task application ID/Application ID of the task* directory.

Step 19 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs.

11.366 ALM-45652 Flink Service Unavailable

Alarm Description

The alarm module checks the Flink status every 60 seconds. This alarm is generated when the Flink service is unavailable. This alarm is cleared when the Flink service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45652	Critical	Environment	Flink	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the job for which the alarm is generated.

Impact on the System

Flink jobs cannot be submitted with FlinkServer and the Flink client.

Possible Causes

The ZooKeeper, HDFS, Yarn, KrbServer, or DBService service on which Flink depends is unavailable.

Handling Procedure

Check whether the ZooKeeper service on which Flink depends is abnormal.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, check whether "ALM-13000 ZooKeeper Service Unavailable" exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Handle the alarm by referring to "ALM-13000 ZooKeeper Service Unavailable."

Step 4 After the alarm is cleared, wait a few minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the HDFS service on which Flink depends is abnormal.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 6 In the alarm list, check whether "ALM-14000 HDFS Service Unavailable" exists.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Handle the alarm by referring to "ALM-14000 HDFS Service Unavailable."

Step 8 After the alarm is cleared, wait a few minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check whether the Yarn service on which Flink depends is abnormal.

Step 9 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 10 In the alarm list, check whether "ALM-18000 Yarn Service Unavailable" exists.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 Handle the alarm by referring to "ALM-18000 Yarn Service Unavailable."

Step 12 After the alarm is cleared, wait a few minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Check whether the KrbServer service on which Flink depends is abnormal.

Step 13 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 14 In the alarm list, check whether "ALM-25500 KrbServer Service Unavailable" exists.

- If yes, go to **Step 15**.
- If no, go to **Step 17**.

Step 15 Handle the alarm by referring to "ALM-25500 KrbServer Service Unavailable."

Step 16 After the alarm is cleared, wait a few minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 17**.

Check whether the DBService service on which Flink depends is abnormal.

Step 17 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 18 In the alarm list, check whether "ALM-27001 DBService Service Unavailable" exists.

- If yes, go to **Step 19**.
- If no, go to **Step 21**.

Step 19 Handle the alarm by referring to "ALM-27001 DBService Service Unavailable."

Step 20 After the alarm is cleared, wait a few minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 21**.

Collect fault information.

Step 21 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 22 Expand the **Service** drop-down list, and select **Flink** for the target cluster.

Step 23 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 24 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.367 ALM-45653 Invalid Flink HA Certificate File

Alarm Description

Flink checks whether the HA certificate file is valid (whether the certificate exists and whether its format is correct) in the first health check or at 01:00:00 every day. This alarm is generated when the certificate file is invalid. This alarm is automatically cleared when the certificate file becomes valid again.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45653	Major	Environment	Flink	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

FlinkServer in active/standby mode cannot provide services for external systems, and Flink jobs cannot be submitted on the FlinkServer.

Possible Causes

The HA certificate file is invalid.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45653 Invalid Flink HA Certificate File**, view **Location**, obtain the name of the host for which the alarm is generated, and click the host name to view its IP address.

Check whether the HA certificate file in the system is valid.

Step 2 Log in to the host for which the alarm is generated as user **omm**.

Step 3 Run the **cd ${BIGDATA_HOME}/FusionInsight_Flink_*/install/FusionInsight-Flink-*/ha/local/cert** command to go to the directory where the HA certificate is stored.

Step 4 Run the **ls -l** command to check whether the **server.crt** file exists.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Run the **openssl x509 -in server.crt -text -noout** command and check whether the command output is normal.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

Step 6 Run the **cd ${BIGDATA_HOME}/FusionInsight_Flink_*/install/FusionInsight-Flink-*/flink/sbin** command to go to the Flink script directory.

Step 7 Run the **sh proceed_ha_ssl_cert.sh** command to generate a new HA certificate. Then, check whether the alarm is cleared 1 minute later.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 9**.
- If no, no further action is required.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **Flink** for the target cluster.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.368 ALM-45654 Flink HA Certificate Is About to Expire

Alarm Description

Flink checks whether the HA certificate file is about to expire in the first health check or at 01:00:00 every day. This alarm is generated when the remaining validity period is less than or equal to 30 days. This alarm is automatically cleared when the remaining validity period is greater than 30 days.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45654	Major	Environment	Flink	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the certificate expires, the HA function of the FlinkServer in active/standby mode is affected. Flink jobs cannot be submitted on the FlinkServer. For FlinkServers in dual-active mode, the HA function is not affected.

Possible Causes

The HA certificate is about to expire.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45654 Flink HA Certificate Is About to Expire**, view **Location**, obtain the name of the host for which the alarm is generated, and click the host name to view its IP address.

Check whether the HA certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the host for which the alarm is generated as user **omm**.

Step 3 Run the **cd ${BIGDATA_HOME}/FusionInsight_Flink_*/install/FusionInsight-Flink-*/ha/local/cert** command to go to the directory where the HA certificate is stored.

Step 4 Run the **openssl x509 -noout -text -in server.crt** command to query the effective time and due time of the HA certificate.

Step 5 Perform **Step 6** to **Step 7** during off-peak hours to update the certificate file as needed.

Step 6 Run the **cd ${BIGDATA_HOME}/FusionInsight_Flink_*/install/FusionInsight-Flink-*/flink/sbin** command to go to the Flink script directory.

Step 7 Run the **sh proceed_ha_ssl_cert.sh** command to generate a new HA certificate. Then, check whether the alarm is cleared 1 minute later.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

Step 8 On the node where the standby FlinkServer instance is located, repeat **Step 6** to **Step 7**. Then, check whether the alarm is cleared 1 minute later.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 10**.
- If no, no further action is required.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, and select **Flink** for the target cluster.

Step 12 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.369 ALM-45655 Flink HA Certificate File Has Expired

Alarm Description

Flink checks whether the HA certificate file has expired in the first health check or at 01:00:00 every day. This alarm is generated when the HA certificate has expired. This alarm is automatically cleared when the certificate file becomes valid again.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45655	Major	Overlimit	Flink	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

FlinkServer in active/standby mode cannot provide services for external systems, and Flink jobs cannot be submitted on the FlinkServer.

Possible Causes

The HA certificate file has expired.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45655 Flink HA Certificate File Has Expired**, view **Location**, obtain the name of the host for which the alarm is generated, and click the host name to view its IP address.

Check whether the HA certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the host for which the alarm is generated as user **omm**.

Step 3 Run the **cd ${BIGDATA_HOME}/FusionInsight_Flink_*/install/FusionInsight-Flink-*/ha/local/cert** command to go to the directory where the HA certificate is stored.

Step 4 Run the **openssl x509 -noout -text -in server.crt** command to query the effective time and due time of the HA certificate and check whether the HA certificate file is valid.

- If yes, go to **Step 9**.
- If no, go to **Step 5**.

Step 5 Run the **cd ${BIGDATA_HOME}/FusionInsight_Flink_*/install/FusionInsight-Flink-*/flink/sbin** command to go to the Flink script directory.

Step 6 Run the **sh proceed_ha_ssl_cert.sh** command to generate a new HA certificate. Then, check whether the alarm is cleared 1 minute later.

- If yes, go to **Step 8**.
- If no, go to **Step 7**.

Step 7 On the node where the standby FlinkServer instance is located, repeat **Step 5** to **Step 6**. Then, check whether the alarm is cleared 1 minute later.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 9**.
- If no, no further action is required.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **Flink** for the target cluster.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

11.370 ALM-45736 Guardian Service Unavailable

Alarm Description

The alarm module checks the Guardian service status every 60 seconds. This alarm is generated if Guardian is unavailable.

This alarm is cleared after Guardian recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45736	Critical	Error handling	Guardian	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

Guardian cannot work properly, and OBS cannot be accessed.

Possible Causes

- The HDFS or Zookeeper service on which the Guardian service depends is abnormal.
- The TokenServer role instance is abnormal.

Handling Procedure

Check the HDFS service status.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, check whether "ALM-14000 HDFS Service Unavailable" is reported.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Clear "ALM-14000 HDFS Service Unavailable" according to the alarm help.

After the alarm is cleared, wait a few minutes and check whether the alarm GuardianService Unavailable is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check the Zookeeper status.

Step 3 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, check whether "ALM-13000 ZooKeeper Service Unavailable" is reported.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Clear "ALM-13000 ZooKeeper Service Unavailable" according to the alarm help.

After those alarms are cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check all TokenServer instances.

Step 5 Log in to the node where the TokenServer instance resides as user **omm** and run the **ps -ef|grep "guardian.token.server.Server"** command to check whether the TokenServer process exists on the node.

- If yes, go to **Step 7**.
- If no, restart the faulty TokenServer instance and go to **Step 6**.

Step 6 In the alarm list, check whether the alarm "Guardian Service Unavailable" is cleared.

- If yes, no further action is required.

- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Guardian** for the destination cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.371 ALM-45737 Guardian TokenServer Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the TokenServer service every 60 seconds. This alarm is generated when the heap memory usage of the TokenServer instance exceeds the threshold for 10 consecutive times.

This alarm is automatically cleared when the system detects that the heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45737	Critical (default threshold: 95%) Major (default threshold: 85%)	Quality of service	Guardian	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the heap memory of the Guardian TokenServer instance overflows, OBS cannot be accessed.

Possible Causes

The heap memory of the TokenServer instance is overused or the heap memory is inappropriately allocated.

Handling Procedure

Check heap memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms** > **ALM-45737 TokenServer Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **TokenServer Heap Memory Usage**. Then click **OK**.

Step 3 Check whether the heap memory used by TokenServer reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, choose **TokenServer** > **Instance Configuration**. Click **All Configurations**, and choose **TokenServer** >

System. Set **-Xmx** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for TokenServer cannot meet the heap memory required by the TokenServer process. You are advised to change the value of **-Xmx** in **GC_OPTS** to twice that of the heap memory used by TokenServer. You can change the value based on the actual service scenario. Refer to **Step 2** to view the TokenServer heap memory usage.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Guardian** for the destination cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.372 ALM-45738 Guardian TokenServer Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the TokenServer service every 60 seconds. This alarm is generated when the direct memory usage of the TokenServer instance exceeds the threshold for five consecutive times.

This alarm is automatically cleared when the system detects that the TokenServer direct memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45738	Critical (default threshold: 95%) Major (default threshold: 85%)	Quality of service	Guardian	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the direct memory of the Guardian TokenServer instance overflows, OBS cannot be accessed.

Possible Causes

The direct memory of the TokenServer process is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms** > **ALM-45738 TokenServer Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **TokenServer Direct Memory Usage**. Then click **OK**.

Step 3 Check whether the direct memory used by TokenServer reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, choose **TokenServer** > **Instance Configuration**. Click **All Configurations**, and choose **TokenServer** > **System**. Set **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory configured for TokenServer cannot meet the direct memory required by the TokenServer process. You are advised to check the direct memory usage of TokenServer and change the value of **-XX:MaxDirectMemorySize** in **GC_OPTS** to the twice of the direct memory used by TokenServer. You can change the value based on the actual service scenario. Refer to **Step 2** to view the TokenServer direct memory usage.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Guardian** for the destination cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.373 ALM-45739 Guardian TokenServer Non-Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the non-heap memory usage of the TokenServer service every 60 seconds. This alarm is generated when the non-heap memory usage of the TokenServer instance exceeds the threshold for 5 consecutive times.

This alarm is automatically cleared when the system detects that the non-heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45739	Critical (default threshold: 95%) Major (default threshold: 85%)	Quality of service	Guardian	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the non-heap memory of the Guardian TokenServer instance overflows, OBS cannot be accessed.

Possible Causes

The non-heap memory of the TokenServer instance is overused or the non-heap memory is inappropriately allocated.

Handling Procedure

Check non-heap memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms** > **ALM-45739 TokenServer Non-Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **TokenServer Non-Heap Memory Usage**. Then click **OK**.

Step 3 Check whether the non-heap memory used by TokenServer reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, choose **TokenServer** > **Instance Configuration**. Click **All Configurations**, and choose **TokenServer** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the TokenServer instance cannot meet the non-heap memory required by the TokenServer process. You are advised to change the value of **-XX:MaxPermSize** in **GC_OPTS** to twice that of the current non-heap memory size or change the value based on site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Guardian** for the destination cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.374 ALM-45740 Guardian TokenServer GC Duration Exceeds the Threshold

Alarm Description

The system checks the GC duration of the TokenServer process every 60 seconds. This alarm is generated when the GC duration of the TokenServer process exceeds the threshold for five consecutive times.

This alarm is automatically cleared when the system detects that the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45740	Critical (default threshold: 15000 ms) Major (default threshold: 12000 ms)	Quality of service	Guardian	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

TokenServer responds slowly, and OBS cannot be accessed.

Possible Causes

The heap memory of the TokenServer process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC duration.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms** > **ALM-45740 TokenServer GC Duration Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize** > **GC** > **TokenServer GC Duration**. Then click **OK**.

Step 3 Check whether the GC duration of the TokenServer process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, choose **TokenServer** > **Instance Configuration**. Click **All Configurations**, and choose **TokenServer** > **System**. Set **-Xmx** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for TokenServer cannot meet the heap memory required by the TokenServer process. You are advised to change the value of **-Xmx** in **GC_OPTS** to twice that of the heap memory used by TokenServer. You can change the value based on the actual service scenario. Refer to **Step 2** to view the TokenServer heap memory usage.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Guardian** for the destination cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

None.

11.375 ALM-45741 Guardian Failed to Call the ECS securitykey API

NOTE

This section applies only to MRS 3.3.0 or later.

Alarm Description

Guardian caches the temporary AK/SK of the ECS agency. When the cache does not exist or is about to expire, Guardian calls the securitykey API of ECS to update the AK/SK. This alarm is generated when calling to the API fails.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45741	Major	Quality of service	Guardian	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The task may fail to obtain the temporary AK/SK for accessing OBS. As a result, OBS cannot be accessed.

Possible Causes

- No ECS agency is bound to the cluster.
- An underlying interface of ECS is abnormal.

Handling Procedure

Check whether an agency is bound to the cluster.

Step 1 Log in to the MRS management console.

Step 2 In the navigation pane on the left, choose **Clusters** > **Active Clusters**. On the page that is displayed, click the cluster name to go to its overview page. Then, check whether the cluster is bound to an agency in the O&M management area.

- If yes, go to **4**.
- If no, go to **3**.

Step 3 Click **Manage Agency**. On the page that is displayed, rebind the cluster to an agency. Then check whether the alarm is cleared a few minutes later.

- If yes, no further action is required.
- If no, go to **4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Guardian** for the destination cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

None.

11.376 ALM-45742 Guardian Failed to Call the ECS Metadata API

NOTE

This section applies only to MRS 3.3.0 or later.

Alarm Description

When Guardian calls an IAM API to obtain the temporary AK/SK, it needs to first obtain related metadata via the ECS Metadata API. This alarm is generated when Guardian fails to call the Metadata API.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45742	Major	Quality of service	Guardian	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The task may fail to obtain the temporary AK/SK for accessing OBS. As a result, OBS cannot be accessed.

Possible Causes

An underlying interface of ECS is abnormal.

Handling Procedure

Collect fault information.

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 2 Expand the **Service** drop-down list, and select **Guardian** for the destination cluster.

Step 3 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 4 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

None.

11.377 ALM-45743 Guardian Failed to Call the IAM API

NOTE

This section applies only to MRS 3.3.0 or later.

Alarm Description

This alarm is generated when Guardian fails to call the IAM API to obtain a temporary AK/SK.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
45743	Major	Quality of service	Guardian	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The task may fail to obtain the temporary AK/SK for accessing OBS. As a result, OBS cannot be accessed.

Possible Causes

The IAM service is abnormal.

Handling Procedure

Collect fault information.

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 2 Expand the **Service** drop-down list, and select **Guardian** for the destination cluster.

Step 3 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 4 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

11.378 ALM-46001 MOTService Unavailable

Alarm Description

The system checks the MOTService status every 30 seconds. This alarm is generated when the MOTService service is unavailable.

This alarm is automatically cleared when the MOTService service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
46001	Critical	Quality of service	MOTService	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

The MOTService database service is unavailable and cannot provide functions such as data import and query for upper-layer services.

Possible Causes

- There is no active MOTServer instance.
- The floating IP address of MOTService does not exist.
- The active and standby MOTServer processes are abnormal.

Handling Procedure

Check whether the active MOTServer instance exists in the cluster.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **MOTService**, and click the **Instance** tab.

Step 2 Check whether the **MOTServer(Active)** instance exists.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Return to the **Dashboard** tab, click **More**, and select **Restart Service**. Then enter the user password to restart the MOTService service. After the service is restarted, check whether the **MOTServer(Active)** instance exists.

- If yes, check whether the alarm is cleared. If it is, no further action is required. If it is not, go to **Step 4**.
- If no, go to **Step 15**.

Check whether the floating IP address of MOTService exists in the cluster.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **MOTService**, and click the **Instance** tab.

Step 5 Locate the **MOTServer(Active)** instance and record the service IP address.

Step 6 Log in to the host obtained in **Step 5** as user **omm** and run the **ifconfig** command to check whether the floating IP address of MOTService exists.

- If yes, record the network port name (for example, **eth0:MOT**) and go to **Step 7**.
- If no, go to **Step 15**.

Step 7 Run the **ping** *Floating IP address* command to check whether the floating IP address of MOTService can be pinged.

- If yes, go to **Step 8**.
- If no, go to **Step 15**.

Step 8 Log in to the host where the MOTService floating IP address is located as user **root** and run the following command:

ifconfig *Network port name* **down**

Example: **ifconfig eth0:MOT down**

Step 9 On FusionInsight Manager, choose **Cluster** > **Services** > **MOTService**, click **More**, and select **Restart Service**. In the dialog box that is displayed, enter the password to restart the MOTService service.

Step 10 After the service is restarted, check whether this alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check the status of the active and standby MOTServer database processes.

Step 11 Log in to the host where the floating IP address of MOTService is located as user **omm** and run the following command to go to the installation directory of MOTService:

cd ${MOTSERVER_HOME}

Step 12 Run the following command to check whether the active and standby HA processes of MOTService are in the abnormal state:

sh sbin/status-motserver.sh

- If yes, go to **Step 13**.
- If no, go to **Step 15**.

Step 13 On FusionInsight Manager, choose **Cluster** > **Services** > **MOTService**, click **More**, and select **Restart Service**. In the dialog box that is displayed, enter the password to restart the MOTService service.

Step 14 Wait about 2 minutes and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect fault information.

Step 15 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 16 Expand the **Service** drop-down list, select **MOTService** for the target cluster, and click **OK**.

Step 17 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs.

Step 18 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact O&M personnel/Technical support and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

11.379 ALM-46003 MOTService Heartbeat Interruption Between the Active and Standby Nodes

Alarm Description

This alarm is generated when the active or standby MOTService node has not received heartbeat messages from the peer node for 7 seconds.

This alarm is cleared when the heartbeat recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
46003	Major	Heartbeat	MOTService	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Local MOTService HA Name	Specifies a local MOTService HA.
	Peer MOTService HA Name	Specifies a peer MOTService HA.
	SYNC_PERCENT	Specifies the synchronization percentage of the active and standby MOTService nodes.

Impact on the System

During the MOTService heartbeat interruption, only one node provides the service. Once this node becomes faulty, the MOTService service cannot be switched to a standby node and will become unavailable.

Possible Causes

The network between the active and standby MOTService nodes is abnormal.

Handling Procedure

Check whether the network between the active and standby MOTService servers is normal.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **MOTService** > **Instance**. View and record the service IP addresses of **MOTServer(Active)** and **MOTServer(Standby)** instances.

Step 2 Log in to the **MOTServer(Active)** node as user **omm**.

Step 3 Run the following command to check whether the network connection between the active and standby MOTService nodes is normal:

ping *Service IP address of the* ***MOTServer(Standby)*** *node*

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list and select **MOTService**.

Step 8 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel/Technical support and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

11.380 ALM-46004 Data Inconsistency Between Active and Standby MOTService Nodes

Alarm Description

The system checks the data synchronization status between the active and standby MOTService nodes every 10 seconds. This alarm is generated when the synchronization status cannot be queried for six consecutive times or the synchronization status is abnormal.

This alarm is cleared when the synchronization status becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
46004	Critical	Quality of service	MOTService	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Local MOTService HA Name	Specifies a local MOTService HA.
	Peer MOTService HA Name	Specifies a peer MOTService HA.

Impact on the System

If the active instance is abnormal, data will be lost or abnormal.

Possible Causes

- The network between the active and standby nodes is unstable.
- The standby MOTService is abnormal.
- The disk space of the standby node is full.
- The CPU usage of the GaussDB process on the active MOTService node is high. (You need to locate the fault based on logs.)

Handling Procedure

Check whether the network between the active and standby nodes is normal.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **MOTService** > **Instance**. View and record the service IP addresses of **MOTServer(Active)** and **MOTServer(Standby)** instances.

Step 2 Log in to the **MOTServer(Active)** node as user **omm**.

Step 3 Run the following command to check whether the active and standby MOTService nodes are connected:

ping *Service IP address of the* ***MOTServer(Standby)*** *node*

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the standby MOTService is normal.

Step 6 Log in to the **MOTServer(Standby)** node as user **omm**.

Step 7 Run the following commands to check whether the GaussDB resource status of the standby MOTService is normal:

cd ${MOTSERVER_HOME}/sbin

./status-motserver.sh

For example, if the following information is displayed in the line where **ResName** is **gaussDB**, the service is normal:

```
10_10_10_231 gaussDB Standby_normal Normal Active_standby
```

- If yes, go to **Step 8**.
- If no, go to **Step 14**.

Check whether the disk space of the standby node is full.

Step 8 Log in to the **MOTServer(Standby)** node as user **omm**.

Step 9 Go to the **${MOTSERVER_HOME}** directory and run the following commands to obtain the MOTService data directory:

cd ${MOTSERVER_HOME}

source .motservice_profile

echo ${MOTSERVICE_DATA_DIR}

Step 10 Run the **df -h** command to check the system disk partition usage.

Step 11 Check whether the space of the MOTService data directory is full.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Expand the disk capacity of the node.

Step 13 After the disk capacity is expanded, wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Collect fault information.

Step 14 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 15 Expand the **Service** drop-down list, select **MOTService** for the target cluster, and click **OK**.

Step 16 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs.

Step 17 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact O&M personnel/Technical support and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

11.381 ALM-46005 MOTService Database Connection Usage Exceeds the Threshold

Alarm Description

The system checks the database connection usage of the MOTServer node every 30 seconds and compares the actual database connection usage with the

threshold. This alarm is generated when the database connection usage exceeds the threshold (90% by default) for five consecutive times (5 by default).

- If **Trigger Count** is **1**, this alarm is cleared when the database connection usage is less than or equal to the threshold.
- If **Trigger Count** is greater than **1**, this alarm is cleared when the database connection usage is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
46005	Major	Communications	MOTService	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If there are too many MOTService database connections, upper-layer services may fail to connect to the MOTService database.

Possible Causes

- There are too many database connections.
- The maximum number of database connections is set improperly.
- The alarm threshold or alarm trigger count is improperly configured.

Handling Procedure

Check whether there are too many database connections.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **MOTService**. The **Dashboard** page is displayed.

Step 2 In the **Chart** area, view the **Connections Used by MOT User** chart to check whether there are too many database connections.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Reduce the number of database connections based on the service scenario, that is, close some connections.

Step 4 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the maximum number of database connections is set properly.

Step 5 On FusionInsight Manager, choose **Cluster** > **Services** > **MOTService** > **Configuration** > **All Configurations** and check whether the maximum number of database connections **motservice.database.max.connections** meets service requirements.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

Step 6 Increase the maximum number of database connections based on site requirements. The maximum number of database connections must be greater than the number of service data connections.

Step 7 On the **Dashboard** page, click **More** and select **Restart Service**. Enter the user password and click **OK** to restart the MOTService service.

Step 8 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 9 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, choose **MOTService** > **Database** > **MOT Connections Usage (MOTServer)**, and check whether the alarm trigger count and alarm threshold are set properly.

- If yes, go to **Step 12**.
- If no, go to **Step 10**.

Step 10 Change the trigger count and alarm threshold based on the actual number of of database connections, and apply the changes.

Step 11 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 13 Expand the **Service** drop-down list and select **MOTService**.

Step 14 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs.

Step 15 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M personnel/Technical support and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

11.382 ALM-46006 Disk Space Usage of the MOTService Data Directory Exceeds the Threshold

Alarm Description

The system checks the disk space usage of the data directory on the active MOTServer node every 30 seconds and compares the actual disk space usage with the threshold. This alarm is generated when the disk space usage of the data directory exceeds the threshold (80% by default) for five consecutive times (5 by default).

- If **Trigger Count** is **1**, this alarm is cleared when the disk space usage of the data directory is less than or equal to the threshold.
- If **Trigger Count** is greater than **1**, this alarm is cleared when the disk space usage of the data directory is less than 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
46006	Major	Physical resource	MOTService	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
	PartitionName	Specifies the disk partition for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

- If the disk space of the MOTService data directory is insufficient, service processes may be unavailable.
- When the disk space usage of the data directory exceeds 90%, the database enters the read-only mode and **ALM-46007 MOTService Database Enters the Read-Only Mode** is generated. As a result, service data is lost.

Possible Causes

- The alarm threshold is improperly configured.
- The database data volume is too large or the disk configuration cannot meet service requirements. As a result, the disk usage reaches the upper limit.

Handling Procedure

Check whether the threshold is set properly.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, choose **MOTService** > **Database** > **MOT Disk Space Usage of the Data Directory (MOTServer)**, and check whether the alarm threshold is **80%**.

If yes, go to **Step 4**.

If no, go to **Step 2**.

Step 2 Change the alarm threshold based on the actual usage, and apply the change.

Step 3 Wait 2 minutes and check whether the alarm is automatically cleared.

If yes, no further action is required.

If no, go to **Step 4**.

Check whether large files are incorrectly written to the disk.

Step 4 Log in to the active MOTService node as user **omm**.

Step 5 Run the following commands to check whether files with more than 500 MB are incorrectly written into the disk space of the data directory:

source $MOTSERVER_HOME/.motservice_profile

find "$MOTSERVICE_DATA_DIR"/../ -type f -size +500M

If yes, go to **Step 6**.

If no, go to **Step 7**.

Step 6 Handle the incorrectly written files and check whether the alarm is cleared 2 minutes later.

If yes, no further action is required.

If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list and select **MOTService**.

Step 9 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel/Technical support and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

11.383 ALM-46007 MOTService Database Enters the Read-Only Mode

Alarm Description

The system checks the disk space usage of the data directory on the active MOTServer node every 30 seconds. This alarm is generated when the disk space usage of the data directory exceeds 70%.

This alarm is cleared when the disk space usage of the data directory falls below 70%.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
46007	Critical	Quality of service	MOTService	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The MOTService database in read-only mode cannot provide the data import function for upper-layer services.

Possible Causes

The disk configuration cannot meet service requirements. The disk usage reaches the upper limit.

Handling Procedure

Check whether the disk space usage reaches the upper limit.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **MOTService**.

Step 2 On the **Dashboard** page, view the **MOT Disk Space Usage of the Data Directory** chart to check whether the disk space usage of the data directory exceeds 70%. If the chart is not displayed, click on the right and click **Customize** to select the chart.

If yes, go to **Step 3**.

If no, go to **Step 9**.

Step 3 Click the **Instance** tab and obtain the service IP address of the active MOTService instance.

Step 4 Run the following commands to check whether the database enters the read-only mode:

source $MOTSERVER_HOME/.motservice_profile

gsql -d postgres -p 20105

*Enter the password of user **omm** for the MOTService database.*

show default_transaction_read_only;

NOTE

- Contact the cluster administrator to obtain the **omm** password of the MOTService database.
- You can run the **\q** command to exit the database.

Check whether the value of **default_transaction_read_only** is **on**.

```
openGauss=# show default_transaction_read_only;
 default_transaction_read_only
-------------------------------
 on
(1 row)
```

- If yes, go to **Step 5**.
- If no, go to **Step 9**.

Step 5 Log in to the active MOTServer node as user **omm**. Run the following commands to check whether files with more than 500 MB are incorrectly written into the disk space of the data directory:

source $MOTSERVER_HOME/.motservice_profile

find "$MOTSERVICE_DATA_DIR"/../ -type f -size +500M

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 Delete the incorrectly written files based on site requirements.

Step 7 Run the following command to disable the read-only mode of the database:

gs_guc reload -Z datanode -N all -I all -c "default_transaction_read_only=off"

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list and choose **Containers** > **CenterServer**.

Step 11 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs.

Step 12 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M personnel/Technical support and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

11.384 ALM-46008 MOTService Memory Usage Exceeds the Threshold

Alarm Description

The system checks the memory usage every 30 seconds and compares the actual memory usage with the threshold. This alarm is generated when the memory usage exceeds the threshold.

- If **Trigger Count** is **1**, this alarm is cleared when the MOTService memory usage is less than or equal to the threshold.
- If **Trigger Count** is greater than **1**, this alarm is cleared when the MOTService memory usage is less than or equal to 70% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
46008	Critical (default threshold: 80%) Major (default threshold: 75%)	Physical resource	MOTService	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Service processes respond slowly or become unavailable. As a result, the MOTService database cannot provide functions such as data import and query for upper-layer services.

Possible Causes

- The alarm threshold or alarm trigger count is improperly configured.
- The memory size cannot meet service requirements, and the memory usage reaches the upper limit.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, choose **MOTService** > **Database** > **MOT Used Memory Percentage (MOTServer)**, and check whether the alarm trigger count and alarm threshold are set properly.

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Change the trigger count and alarm threshold based on the actual memory usage, and apply the changes.

Step 3 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the memory usage.

Step 4 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the right pane, click this alarm and obtain the host name in **Location**.

Step 5 Choose **Hosts** and click the host for which the alarm is generated.

Step 6 Observe the real-time data of the MOTService memory usage for about 5 minutes. If the memory usage exceeds the threshold for multiple times, contact the MRS cluster administrator to increase the memory.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list and select **MOTService**.

Step 10 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel/Technical support and provide the collected logs.

11.385 ALM-46009 MOTService CPU Usage Exceeds the Threshold

Alarm Description

The system checks the CPU usage of the MOTService every 30 seconds and compares the actual CPU usage with the threshold. This alarm is generated when the CPU usage exceeds the threshold (80% by default) for multiple consecutive times (10 by default).

- If **Trigger Count** is **1**, this alarm is cleared when the CPU usage is less than or equal to the threshold.
- If **Trigger Count** is greater than **1**, this alarm is cleared when the CPU usage is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
46009	Major	Physical resource	MOTService	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Service processes respond slowly or become unavailable. As a result, the MOTService database cannot provide functions such as data import and query for upper-layer services.

Possible Causes

- The alarm threshold or alarm trigger count is improperly configured.
- The CPU configuration cannot meet service requirements, and the CPU usage reaches the upper limit.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, choose **MOTService** > **Database** > **MOT Used CPU Percentage (MOTServer)**, and check whether the alarm trigger count and alarm threshold are set properly.

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Change the trigger count and alarm threshold based on the actual CPU usage, and apply the changes.

Step 3 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the CPU usage reaches the upper limit.

Step 4 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the right pane, click this alarm and obtain the host name in **Location**.

Step 5 Choose **Hosts** and click the host for which the alarm is generated.

Step 6 Observe the real-time data of the host CPU usage for about 5 minutes. If the CPU usage exceeds the threshold for multiple times, contact the MRS cluster administrator to increase the CPU.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list and select **MOTService**.

Step 10 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel/Technical support and provide the collected logs.

11.386 ALM-46010 MOTService Certificate File Is About to Expire

Alarm Description

The system checks the certificate file in the system on the hour. This alarm is generated when the certificate file is about to expire in less than 30 days.

This alarm is cleared when a certificate that is not about to expire is imported and the alarm detection mechanism is triggered on the next hour.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
46010	Minor	Security	MOTService	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the MOTService certificate is about to expire, the system is not affected. If the certificate has expired, functions such as data import and query cannot be provided for upper-layer services.

Possible Causes

The remaining validity period of the MOTService certificate file (MOTService root certificate or MOTService user certificate) is less than 30 days.

Handling Procedure

Locate the alarm cause.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the right pane, locate this alarm and click ⌄.

View **Additional Information** to obtain the additional information about the alarm.

- If **MOTService HA root Certificate** is displayed in the additional information, view **Location** to obtain the name of the host for which the alarm is generated. Then, log in to the host as user **omm** and go to **Step 2**.
- If **MOTService HA server Certificate** is displayed in the additional information, view **Location** to obtain the name of the host for which the alarm is generated. Then, log in to the host as user **omm** and go to **Step 3**.
- If **MOTService root Certificate** is displayed in the additional information, view **Location** to obtain the name of the host for which the alarm is generated. Then, log in to the host as user **omm** and go to **Step 4**.
- If **MOTService server Certificate** is displayed in the additional information, view **Location** to obtain the name of the host for which the alarm is generated. Then, log in to the host as user **omm** and go to **Step 5**.

Check the validity period of the certificate files in the system.

Step 2 Check whether the remaining validity period of the MOTService HA root certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in ${MOTSERVER_HOME}/ha/local/cert/root-ca.crt** command to check the effective time and due time of the MOTService HA root certificate.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 3 Check whether the remaining validity period of the MOTService HA user certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in ${MOTSERVER_HOME}/ha/local/cert/server.crt** command to check the effective time and due time of the MOTService HA user certificate.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 4 Check whether the remaining validity period of the MOTService root certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in ${MOTSERVER_HOME}/security/root-ca.crt** command to check the effective time and due time of the MOTService root certificate.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 5 Check whether the remaining validity period of the MOTService user certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in ${MOTSERVER_HOME}/security/server.crt** command to check the effective time and due time of the MOTService user certificate.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

The following is an example of the effective time and due time of a certificate:

```
Certificate:
    Data:
        Version: 3 (0x2)
        Serial Number:
            97:d5:0e:84:af:ec:34:d8
        Signature Algorithm: sha256WithRSAEncryption
        Issuer: C=CN, ST=xxx, L=yyy, O=zzz, OU=IT, CN=HADOOP.COM
        Validity
            Not Before: Dec 13 06:38:26 2016 GMT            // Effective time
            Not After : Dec 11 06:38:26 2026 GMT            // Due time
```

Import certificate files.

Step 6 Import a new MOTService HA certificate file.

Apply for or generate a new HA certificate file and import it to the system. Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to **Step 8**.
- If no, no further action is required.

Step 7 Import a new MOTService certificate file.

Apply for or generate a new MOTService certificate file and import it to the system. Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to **Step 8**.
- If no, no further action is required.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, select **Controller**, **OmmServer**, **OmmCore**, and **Tomcat**, and click **OK**.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel/Technical support and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

11.387 ALM-46011 MOTService Certificate File Has Expired

Alarm Description

The system checks whether the certificate file in the system has expired on the hour. This alarm is generated when the certificate file has expired.

This alarm is cleared when a valid certificate is imported and the alarm detection mechanism is triggered on the next hour.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
46011	Major	Security	MOTService	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the MOTService certificate has expired, some MOTService functions such as data import and query cannot be provided for upper-layer services.

Possible Causes

The MOTService certificate file (MOTService root certificate or MOTService user certificate) has expired.

Handling Procedure

Locate the alarm cause.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the right pane, locate this alarm and click ⌄.

View **Additional Information** to obtain the additional information about the alarm.

- If **MOTService HA root Certificate** is displayed in the additional information, view **Location** to obtain the name of the host for which the alarm is generated. Then, log in to the host as user **omm** and go to **Step 2**.
- If **MOTService HA server Certificate** is displayed in the additional information, view **Location** to obtain the name of the host for which the alarm is generated. Then, log in to the host as user **omm** and go to **Step 3**.
- If **MOTService root Certificate** is displayed in the additional information, view **Location** to obtain the name of the host for which the alarm is generated. Then, log in to the host as user **omm** and go to **Step 4**.
- If **MOTService server Certificate** is displayed in the additional information, view **Location** to obtain the name of the host for which the alarm is generated. Then, log in to the host as user **omm** and go to **Step 5**.

Check the validity period of the certificate files in the system.

Step 2 Check whether the current system time is within the validity period of the MOTService HA root certificate.

Run the **openssl x509 -noout -text -in ${MOTSERVER_HOME}/ha/local/cert/root-ca.crt** command to check the effective time and due time of the MOTService HA root certificate.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 3 Check whether the current system time is within the validity period of the MOTService HA user certificate.

Run the **openssl x509 -noout -text -in ${MOTSERVER_HOME}/ha/local/cert/server.crt** command to check the effective time and due time of the MOTService HA user certificate.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 4 Check whether the current system time is within the validity period of the MOTService root certificate.

Run the **openssl x509 -noout -text -in ${MOTSERVER_HOME}/security/root-ca.crt** command to check the effective time and due time of the MOTService root certificate.

- If yes, go to **Step 8**.
- If no, go to **Step 7**.

Step 5 Check whether the current system time is within the validity period of the MOTService user certificate.

Run the **openssl x509 -noout -text -in ${MOTSERVER_HOME}/security/server.crt** command to check the effective time and due time of the MOTService user certificate.

- If yes, go to **Step 8**.
- If no, go to **Step 7**.

The following is an example of the effective time and due time of a certificate:

```
Certificate:
    Data:
        Version: 3 (0x2)
        Serial Number:
            97:d5:0e:84:af:ec:34:d8
        Signature Algorithm: sha256WithRSAEncryption
        Issuer: C=CN, ST=xxx, L=yyy, O=zzz, OU=IT, CN=HADOOP.COM
        Validity
            Not Before: Dec 13 06:38:26 2016 GMT            // Effective time
            Not After : Dec 11 06:38:26 2026 GMT            // Due time
```

Import certificate files.

Step 6 Import a new MOTService HA certificate file.

Apply for or generate a new MOTService HA certificate file and import it to the system. The alarm is automatically cleared after the MOTService HA certificate is imported. Check whether this alarm is reported again during periodic check.

- If yes, go to **Step 8**.
- If no, no further action is required.

Step 7 Import a new MOTService certificate file.

Apply for or generate a new MOTService certificate file and import it to the system. The alarm is automatically cleared after the MOTService certificate is imported. Check whether this alarm is reported again during periodic check.

- If yes, go to **Step 8**.
- If no, no further action is required.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, select **Controller**, **OmmServer**, **OmmCore**, and **Tomcat**, and click **OK**.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel/Technical support and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

11.388 ALM-46012 Abnormal Nginx of MOTService

Alarm Description

The system checks the Nginx status of MOTService every 10 seconds. This alarm is generated when the Nginx service has been detected to be abnormal for 10 consecutive times during the HA health check.

This alarm is cleared when the Nginx service becomes normal during the HA health check.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
46012	Major	Quality of service	MOTService	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

If Nginx is abnormal, services may fail to access MOTService using the floating IP address. As a result, MOTService is unavailable and cannot provide functions such as data import and query for upper-layer services.

Possible Causes

The Ngnix service is not running properly.

Handling Procedure

Check whether the Ngnix service on the node where MOTService resides is normal.

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, locate the row containing this alarm, and obtain the name of the host for which the alarm is generated in **Location**.

Step 3 Choose **Cluster** > **Services** > **MOTService**. On the page that is displayed, click the **Instance** tab and obtain the service IP address of the host for which this alarm is generated.

Step 4 Log in to the node in **Step 3** as user **omm**.

Step 5 Run the following command to check the Nginx status:

lsof -i "TCP@$*MOTService floating IP address*:**20105" | grep -q "nginx"**

If the following information is displayed, the status is normal:

```
ngnix  Normal  Normal  Single_active
```

NOTE

You can also log in to FusionInsight Manager, choose **Cluster** > **Services** > **MOTService** > **Configurations** > **All Configurations**, search for the **motservice.floatip** parameter, and obtain its value, which is the floating IP address of MOTService.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Contact the network administrator to check whether the network is faulty and whether the floating IP address is incorrect.

- If yes, repair the network, configure a correct floating IP address, and go to **Step 7**.
- If no, go to **Step 8**.

Step 7 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list and select **MOTService**.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel/Technical support and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

11.389 ALM-47000 MemArtsCC Instance Unavailable

Alarm Description

The alarm module checks the MemArtsCC instance status every 60 seconds. This alarm is generated when the alarm module detects that the MemArtsCC instance on the current node is abnormal.

This alarm is cleared when the system detects that any MemArtsCC instance is restored.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
47000	Major	Error handling	MemArtsCC	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The MemArtsCC service is abnormal. You cannot use FusionInsight Manager to perform cluster operations on the MemArtsCC service. The MemArtsCC service function is unavailable.

Possible Causes

- The cluster fails to be started due to incorrect configuration.
- The ZooKeeper service is abnormal.

Handling Procedure

Check the MemArtsCC configuration.

Step 1 Log in to any MemArtsCC installation node as user **root**, go to the CCWorker log directory **/var/log/Bigdata/memartscc/ccworker**, and view the CCWorker startup log.

Step 2 Correct the configuration items in the logs and restart the service.

Step 3 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the ZooKeeper instance status.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **ZooKeeper** > **Instance**.

Step 5 Check whether ZooKeeper instances are normal.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

Step 6 Select ZooKeeper instances whose status is not good and choose **More** > **Restart Instance**.

Step 7 Check whether the instance status is good after restart.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **MemArtsCC** for the target cluster.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and send the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

11.390 ALM-47002 MemArtsCC Disk Fault

Alarm Description

The alarm module checks the status of the local disk used by MemArtsCC every 60 seconds. This alarm is generated when the alarm module detects that the disk status is abnormal. This alarm is cleared when the disk becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
47002	Major	Error handling	MemArtsCC	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

MemArtsCC becomes abnormal or its performance deteriorates.

Possible Causes

The disk used by MemArtsCC is damaged or the permission is read-only.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, search for "ALM-47002 MemArtsCC Disk Fault", and locate the abnormal disk directory based on the alarm information.

Step 2 Contact O&M engineers to check whether the disk is faulty.

- If yes, replace the disk, restart the CCSideCar and CCWorker roles of the faulty node, and go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **MemArtsCC** for the target cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and send the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

11.391 ALM-50201 Doris Service Unavailable

Alarm Description

The alarm module checks the Doris service status every 60 seconds. This alarm is generated when the alarm module detects that all FE and BE instances are abnormal.

This alarm is cleared when any FE or BE instance recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50201	Critical	Error handling	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

FusionInsight Manager cannot be used to perform cluster operations on the Doris service, and Doris service functions are unavailable.

Possible Causes

The FE and BE instances are abnormal.

Handling Procedure

Restart the Doris service.

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Doris**.

Step 2 On the page that is displayed, click **More** and select **Restart Service**. In the displayed dialog box, verify the password and click **OK** to restart the Doris service. After the service is started, go to **Step 3**.

Step 3 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.392 ALM-50202 FE CPU Usage Exceeds the Threshold

Alarm Description

The system checks the CPU usage of the FE instance every 30 seconds. The CPU usage has a default threshold. This alarm is generated when the CPU usage exceeds the threshold for multiple consecutive times (**3** by default).

This alarm is cleared when **Trigger Count** is **1** and the CPU usage is less than or equal to the threshold. This alarm is cleared when **Trigger Count** is greater than 1 and the CPU usage is less than or equal to 80% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50202	Critical (default threshold: 95%) Major (default threshold: 90%)	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Type	Parameter	Description
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

Processes respond slowly or do not work.

Possible Causes

The alarm threshold or alarm trigger count is improperly configured.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, select the name of the desired cluster, and choose **Doris** > **CPU and Memory** > **CPU Usage of FE (FE)**.

Step 2 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

NOTE

Trigger Count specifies how many times the threshold can be hit before an alarm is generated.

Step 3 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 4 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.393 ALM-50203 FE Memory Usage Exceeds the Threshold

Alarm Description

The system checks the memory usage of the FE instance every 30 seconds. This alarm is generated when the memory usage exceeds the threshold for multiple consecutive times (**3** by default).

This alarm is cleared when **Trigger Count** is **1** and the memory usage is less than or equal to the threshold. This alarm is cleared when **Trigger Count** is greater than 1 and the memory usage is less than or equal to 80% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50203	Critical (default threshold: 90%) Major (default threshold: 85%)	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Type	Parameter	Description
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

Processes respond slowly or do not work.

Possible Causes

- The alarm threshold or alarm trigger count is improperly configured.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, select the name of the desired cluster, and choose **Doris** > **CPU and Memory** > **Memory Usage of FE (FE)**.

Step 2 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

NOTE

Trigger Count specifies how many times the threshold can be hit before an alarm is generated.

Step 3 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 4 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.394 ALM-50205 BE CPU Usage Exceeds the Threshold

Alarm Description

The system checks the CPU usage of the BE instance every 30 seconds. This alarm is generated when the CPU usage exceeds the threshold for multiple consecutive times (**3** by default).

This alarm is cleared when **Trigger Count** is **1** and the CPU usage is less than or equal to the threshold. This alarm is cleared when **Trigger Count** is greater than 1 and the CPU usage is less than or equal to 80% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50205	Critical (default threshold: 95%) Major (default threshold: 90%)	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Type	Parameter	Description
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

Processes respond slowly or do not work.

Possible Causes

The alarm threshold or alarm trigger count is improperly configured.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Doris** > **CPU and Memory** > **CPU Usage of BE (BE)**.

Step 2 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

NOTE

Trigger Count specifies how many times the threshold can be hit before an alarm is generated.

Step 3 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 4 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

None.

11.395 ALM-50206 BE Memory Usage Exceeds the Threshold

Alarm Description

The system checks the memory usage of the BE instance every 30 seconds. This alarm is generated when the memory usage exceeds the threshold for multiple consecutive times (**3** by default).

This alarm is cleared when **Trigger Count** is **1** and the memory usage is less than or equal to the threshold. This alarm is cleared when **Trigger Count** is greater than 1 and the memory usage is less than or equal to 80% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50206	Critical (default threshold: 90%) Major (default threshold: 85%)	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Type	Parameter	Description
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

Processes respond slowly or do not work.

Possible Causes

The alarm threshold or alarm trigger count is improperly configured.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Doris** > **CPU and Memory** > **Memory Usage of BE (BE)**.

Step 2 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

NOTE

Trigger Count specifies how many times the threshold can be hit before an alarm is generated.

Step 3 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 4 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.396 ALM-50207 Ratio of Connections to the FE MySQL Port to the Maximum Connections Allowed Exceeds the Threshold

Alarm Description

The system checks the number of MySQL port connections every 30 seconds. This alarm is generated when the ratio of the number of current connections to the maximum number of FE port connections exceeds the threshold (95% by default). The maximum number of FE port connections in the current cluster is specified by the **qe_max_connection** parameter. The default value is **1024**.

This alarm is cleared when the number of MySQL port connections on the FE node is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50207	Minor	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

The FE is overloaded. The FE processes client requests slowly.

Possible Causes

- After the MySQL client is connected to Doris, the connection is not closed.
- A large number of services are concurrently connected to Doris.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Log in to FusionInsight Manager, choose **O&M**, and click **Alarm** > **Thresholds** in the navigation pane on the left. Click the name of the desired cluster > **Doris** > **Connection** > **FE MySQL Port Connections (FE)**.

Step 2 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 3 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

NOTE

If there are a large number of connections, ensure there are only necessary connections. Otherwise, the service performance may be degraded or even the service may be unavailable.

Step 4 Wait for 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.397 ALM-50208 Failures to Clear Historical Metadata Image Files Exceed the Threshold

Alarm Description

The system checks the number of failures to clear historical metadata image files on the FE node every 30 seconds. This alarm is generated when the number of failures exceeds the threshold (**1** by default).

This alarm is cleared when the system detects that the number of failures is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50208	Critical	Error handling	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

Doris metadata occupies more and more disk space, which may cause service exceptions.

Possible Causes

The Doris service is abnormal.

Handling Procedure

Check whether the Doris service is normal.

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Doris**.

Step 2 Check whether **Running Status** of the Doris service is **Normal**.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 If the service process is not started, start it first and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Step 4 Check whether other Doris-related alarms are generated in the cluster. If yes, clear them by referring to the alarm help. Then, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

You need to manually clear the alarm after the fault is rectified.

Related Information

None.

11.398 ALM-50209 Failures to Generate Metadata Image Files Exceed the Threshold

Alarm Description

The system checks the number of failures to generate metadata image files on the FE node every 30 seconds. This alarm is generated when the number of failures exceeds the threshold (**1** by default).

This alarm is cleared when the system detects that the number of failures is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50209	Critical	Error handling	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

The non-master FE node cannot receive the latest metadata image file. As a result, the system reliability deteriorates.

Possible Causes

When the checkpoint thread of the Doris FE detects that the FE memory usage exceeds 75%, the thread determines that the write operation to the image file fails.

Handling Procedure

Check the Doris service status.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, view the role name and obtain the IP address of the instance in **Location** of the alarm whose ID is **50209**.

Step 2 Choose **Cluster** > **Services** > **Doris** > **Instances**, click the FE instance for which the alarm is generated, and click the **Chart** tab of the instance.

Select **CPU and Memory** from the chart categories on the left, and check whether the value of **Memory Usage of FE** exceeds 75%.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Choose **Cluster** > **Service** > **Doris**, and click the **Configurations** tab. Search for the **FE_GC_OPTS** parameter, and increase the value of **-Xmx**. The default value is 8 GB.

- If this alarm is occasionally generated, increase the value by 0.5 times. If this alarm is frequently generated, double the value.
- In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Click **Save**. Click **Instances**, select an FE instance whose configuration has expired, and choose **More** > **Restart Instance**.

Step 5 After restart, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

You need to manually clear the alarm after the fault is rectified.

Related Information

None.

11.399 ALM-50210 Maximum Compaction Score of All BE Nodes Exceeds the Threshold

Alarm Description

The system checks the maximum compaction score of all BE nodes every 30 seconds. This alarm is generated when the maximum compaction score exceeds the threshold (10 by default).

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50210	Major	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

Query or write may be delayed.

Possible Causes

The number of concurrent service requests is large in the cluster, or the compaction queue is small.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Doris** > **Performance** > **Maximum compaction score of all BE nodes (BE)**.

Step 2 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 3 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 4 Wait 2 minutes and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Choose **Cluster** > **Services** > **Doris** > **Configurations** > **All Configurations** > **BE(Role)** > **Customization**, add the **max_base_compaction_threads** parameter to **be.conf** with a value of **10**, and add the **max_cumu_compaction_threads** parameter with a value **20**.

Step 6 Click **Save**. Click **Instances**, select the BE instances whose configuration has expired, click **More**, and select **Restart Instance** to restart the Doris BE instances.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.400 ALM-50211 FE Queue Length of BE Periodic Report Tasks Exceeds the Threshold

Alarm Description

The system checks the queue length of each BE periodic report task on FE every 30 seconds. This alarm is generated when the queue length exceeds the threshold (10 by default). This value indicates the number of report tasks waiting on the master FE node. A large value indicates a poor FE processing capability.

This alarm is cleared when the system detects that the queue length of BE periodic report tasks on FE is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50211	Minor	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

The processing capability of FE is insufficient, affecting the service query speed.

Possible Causes

The processing capability of the master FE node is insufficient due to a large number of concurrent service requests in the Doris cluster or insufficient memory for FE processes.

Handling Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, view the role name and obtain the IP address of the instance in **Location** of the alarm whose ID is **50211**.

Step 2 Choose **Cluster** > **Services** > **Doris** > **Instances**, click the FE instance for which the alarm is generated, and click the **Chart** tab of the instance.

Select **JVM** from **Chart Category** on the left, and check whether **Accumulated GC duration of the old generation** of the FE process is greater than 3 seconds.

- If yes, go to **Step 3**.

- If no, go to **Step 5**.

Step 3 Choose **Cluster** > **Services** > **Doris** > **Configurations** > **All Configurations** > **FE(Role)** > **JVM**, and increase the value of **-Xmx** in **FE_GC_OPTS**. The default value is **8GB**.

- If this alarm is generated occasionally, increase the value by 0.5 times. If this alarm is generated frequently, double the parameter value.
- In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 5 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Doris** > **Queue** > **Queue Length of BE Periodic Report Tasks on the FE (FE)**.

Step 6 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 7 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 8 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.401 ALM-50212 Accumulated Old-Generation GC Duration of the FE Process Exceeds the Threshold

Alarm Description

The system checks the accumulated old-generation GC duration of the FE process every 30 seconds. This alarm is generated when the accumulated GC duration exceeds the threshold (3000 ms by default).

This alarm is cleared when the system detects that the accumulated old-generation GC duration of the FE process is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50212	Major	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

A long GC duration of the FE process may interrupt the services.

Possible Causes

The heap memory of the FE process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, view the role name and obtain the IP address of the instance in **Location** of the alarm whose ID is **50212**.

Step 2 Choose **Cluster** > **Services** > **Doris** > **Instances**, click the FE instance for which the alarm is generated, and click the **Chart** tab of the instance.

Select **JVM** from **Chart Category** on the left, and check whether **Accumulated GC duration of the old generation** of the FE process is greater than 3 seconds.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Choose **Cluster** > **Services** > **Doris** > **Configurations** > **All Configurations** > **FE(Role)** > **JVM**, and increase the value of **-Xmx** in **FE_GC_OPTS**. The default value is **8G**.

- If this alarm is occasionally generated, increase the value by 0.5 times. If this alarm is frequently generated, double the value.
- In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.402 ALM-50213 Number of Tasks Queuing in the FE Thread Pool for Interacting with BE Exceeds the Threshold

Alarm Description

The system checks the number of queuing tasks in the FE thread pool for interacting with BE every 30 seconds. This alarm is generated when the number of queuing tasks exceeds the threshold (10 by default). This FE thread pool is the working thread pool of ThriftServer. It is specified by **rpc_port** in the **fe.conf** file and is used to interact with BE.

This alarm is cleared when the system detects that the number of tasks queuing in the FE thread pool for interacting with BE is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50213	Minor	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

The read and write of the Doris service slows down.

Possible Causes

There are a large number of concurrent service requests, causing too many queuing tasks.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Doris** > **Queue** > **Number of tasks that are queuing in the thread pool for interaction between the FE and the BE (FE)**.

Step 2 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 3 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 4 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.403 ALM-50214 Number of Tasks Queuing in the FE Thread Pool for Task Processing Exceeds the Threshold

Alarm Description

The system checks the number of queuing tasks in the FE thread pool for processing tasks every 30 seconds. This alarm is generated when the number of

queuing tasks exceeds the threshold (10 by default). This thread pool is used by the NIO MySQL Server to process tasks.

This alarm is cleared when the system detects that the number of tasks queuing in the FE thread pool for processing tasks is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50214	Minor	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

The task execution of the entire system becomes slow and blocked.

Possible Causes

Large tasks may block the task execution of the queue.

Handling Procedure

Check the execution status of FE tasks.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **Doris**. Click the **Chart** tab, select **Connection** from **Chart Category** in the left pane, and view the **FE MySQL Port Connections** chart. If the number of connections is large, click **Instances**, select the FE instance, and click the **Chart** tab. Select **CPU and Memory** from **Chart Category** and view the **CPU Usage of FE** chart. If the CPU usage is high, check the **Time** field in FE audit **log /var/log/Bigdata/audit/doris/fe/fe.audit.log**

to collect statistics on the average task duration. If the value is also high, the alarm is caused by large concurrent tasks.

Step 2 After connecting to Doris, run the following command to check whether the default value of **queryTimeout** is too large. The default value is **300** seconds.

show variables like 'query_timeout';

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Run the following command to shorten the timeout period based on site requirements to block the tasks that take a long time:

set global query_timeout=*xxx***;**

Step 4 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Doris** > **Queue** > **Queue Length of Query Execution Thread Pool (BE)**.

Step 5 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 6 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 7 Wait 10 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.404 ALM-50215 Longest Duration of RPC Requests Received by Each FE Thrift Method Exceeds the Threshold

Alarm Description

The system checks the longest duration of RPC requests received by each FE Thrift method every 30 seconds. This alarm is generated when the longest duration exceeds the threshold (5000 ms by default).

This alarm is cleared when the longest duration of RPC requests received by each FE Thrift method is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50215	Major	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

A longer RPC duration indicates a higher performance load and slower network request processing, which may cause service congestion.

Possible Causes

- The network has a latency.
- There are too many concurrent large SQL tasks.

Handling Procedure

Step 1 Log in to the host where the faulty node is deployed as user **root** and run **ping** *IP addresses of all Doris nodes* to check whether the peer host can be pinged.

- If yes, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 Contact the network administrator to restore the network.

Step 3 On FusionInsight Manager, choose **Cluster** > **Services** > **Doris**. Click the **Chart** tab, select **Connection** from **Chart Category** in the left pane, and view the **FE MySQL Port Connections** chart. If the number of connections is large, click **Instances**, select the FE instance, and click the **Chart** tab. Select **CPU and Memory** from **Chart Category** and view the **CPU Usage of FE** chart. If the CPU usage is high, check the **Time** field in FE audit **log /var/log/Bigdata/audit/doris/fe/fe.audit.log** to collect statistics on the average task duration. If the value is also high, the alarm is caused by large concurrent tasks.

Step 4 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Doris** > **Performance** > **Longest duration of RPC requests received by each method of the FE thrift interface (FE)**.

Step 5 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 6 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 7 Wait 10 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.405 ALM-50216 Memory Usage of the FE Node Exceeds the Threshold

Alarm Description

The system checks the memory usage of the FE node every 30 seconds. This alarm is generated when the memory usage exceeds the threshold (95% by default).

This alarm is cleared when the memory usage of the FE node falls below the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50216	Major	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

Task execution and client connection to the FE are affected.

Possible Causes

The FE heap memory is too small.

Handling Procedure

Check the FE heap memory usage.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, select the name of the desired cluster, and choose **Doris** > **CPU and Memory** > **Memory usage of the FE node (FE)**.

1. Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.
2. Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 2 Log in to the FE node for which the alarm is generated as user **omm**, run the **top** command to check the memory usage of processes, locate the process with high memory usage, and check whether the process belongs to the current service and is running properly.

- If yes, go to **Step 3**.
- If no, isolate or stop the process, or adjust the memory size, and check whether the memory is released.

Step 3 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.406 ALM-50217 Heap Memory Usage of the FE Node Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the FE node every 30 seconds. This alarm is generated when the heap memory usage exceeds the threshold (95% by default).

This alarm is cleared when the heap memory usage of the FE node falls below the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50217	Major	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

Task execution and client connection to the FE are affected.

Possible Causes

The FE heap memory is too small.

Handling Procedure

Check heap memory usage.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, select the name of the desired cluster, and choose **Doris** > **CPU and Memory** > **Heap memory usage of the FE node (FE)**.

1. Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.
2. Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Doris** > **FE** > **Configurations** > **All Configurations**, search for the **FE_GC_OPTS** parameter, increase the value of **-Xmx** as required, click **Save**, and click **OK**.

NOTE

- If this alarm is generated, the heap memory configured for the current Doris instance is not enough for data transmission. You are advised to open the instance monitoring page, display the Doris heap memory resource status monitoring chart, and observe the change trend of the heap memory used by Doris in the monitoring chart. Then change the value of **-Xmx** to twice the current heap memory usage or to another value to meet site requirements.
- When setting the heap memory, you can set **-Xms** and **-Xmx** to approximately the same value to prevent performance deterioration caused by heap size adjustment after each GC.
- The sum of **-Xmx** and **XX:MaxPermSize** cannot be greater than the actual physical memory of the node server.

Step 3 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.407 ALM-50219 Length of the Queue in the Thread Pool for Query Execution Exceeds the Threshold

Alarm Description

The system checks the length of the waiting queue in the query execution thread pool every 30 seconds. This alarm is generated when the length exceeds the threshold (20 by default).

This alarm is cleared when the length of the waiting queue in the current query execution thread pool is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50219	Major	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

The task execution of the entire system becomes slow and blocked.

Possible Causes

Large tasks may block the task execution of the queue.

Handling Procedure

Check the execution status of tasks.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **Doris**. Click the **Chart** tab, select **Connection** from **Chart Category** in the left pane, and view the **FE MySQL Port Connections** chart. If the number of connections is large, click **Instances**, select the FE instance, and click the **Chart** tab. Select **CPU and Memory** from **Chart Category** and view the **CPU Usage of FE** chart. If the CPU usage is high, check the **Time** field in FE audit **log /var/log/Bigdata/audit/doris/fe/fe.audit.log** to collect statistics on the average task duration. If the value is also high, the alarm is caused by large concurrent tasks.

Step 2 After connecting to Doris, run the following command to check the **queryTimeout** value of the system:

show variables like 'query_timeout';

If the value is too large, run the **set global query_timeout=*xxx*;** command to shorten the timeout interval and block tasks that last for a long time.

Step 3 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Doris** > **Queue** > **Queue Length of Query Execution Thread Pool (BE)**.

Step 4 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 5 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 6 Wait 10 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.408 ALM-50220 Error Rate of TCP Packet Receiving Exceeds the Threshold

Alarm Description

The system checks the rate of TCP packet receiving errors every 30 seconds. This alarm is generated when the error rate exceeds the threshold (5% by default).

This alarm is cleared when the error rate is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50220	Critical	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

The task fails or data is lost.

Possible Causes

The network is faulty, so data cannot be sent.

Handling Procedure

Step 1 Log in to the host where the faulty node is deployed as user **root** and run **ping** *IP addresses of all Doris nodes* to check whether the peer host can be pinged.

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Contact the network administrator to restore the network.

Step 3 Wait for a while and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

11.409 ALM-50221 BE Data Disk Usage Exceeds the Threshold

Alarm Description

The system checks the usage of BE data disks every 30 seconds. This alarm is generated when the disk usage exceeds the threshold (95% by default).

This alarm is cleared when the system detects that the disk usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50221	Major	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

New data fails to be written, and the task is interrupted.

Possible Causes

- The disk space of the cluster is full.
- Data skew occurs among BE nodes.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Expand the disk capacity of the node for which the alarm is generated.

Step 3 Go to **Step 4** if the expansion fails or the alarm persists after the expansion.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 6 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.410 ALM-50222 Disk Status of a Specified Data Directory on BE Is Abnormal

Alarm Description

The system checks the disk status of a specified data directory on BE every 30 seconds. This alarm is generated when the disk status is not **1** (**1** indicates the normal state and **0** indicates the abnormal state). This alarm is cleared when the disk status of the specified data directory on BE becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50222	Critical	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.

Type	Parameter	Description
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

Service data may be unavailable, and data queries on the Doris client may fail.

Possible Causes

- The hard disk is faulty.
- The disk permissions are set incorrectly.

Handling Procedure

Check whether a disk alarm is generated.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and check whether **ALM-12014 Partition Lost** or **ALM-12033 Slow Disk Fault** exists.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Rectify the fault by referring to the handling procedure of **ALM-12014 Partition Lost** or **ALM-12033 Slow Disk Fault**. Then, check whether the alarm is cleared.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Modify disk permissions.

Step 4 Choose **O&M** > **Alarm** > **Alarms** and view **Location** and **Additional Information** of the alarm to obtain the location of the faulty disk.

Step 5 Log in to the node for which the alarm is generated as user **root**. Go to the directory where the faulty disk is located, and run the **ll** command to check whether the permission for the faulty disk is **711** and whether the user is **omm**.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

Step 6 Modify the permission of the faulty disk. For example, if the faulty disk is **data1**, run the following commands:

chown omm:wheel data1

chmod 711 data1

Step 7 Choose **Cluster** > **Services** > **Doris** > **Instances**, select this BE instance, click **More**, and select **Restart Instance**. Wait 5 minutes and check whether an alarm is generated.

- If no, no further action is required.
- If yes, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **Doris** and **OMS** for the target cluster.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.411 ALM-50223 Maximum Memory Required by BE Is Greater Than the Remaining Memory of the Machine

Alarm Description

The system checks whether the maximum memory required by BE is greater than the available memory every 30 seconds. This alarm is generated when the value is not **1** (**1** indicates that the maximum required memory is less than or equal to the available memory, and **0** indicates that the maximum required memory is greater than the available memory).

This alarm is cleared when the maximum required memory is less than or equal to the available memory.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50223	Major	Error handling	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

A task may fail to apply for memory when running.

Possible Causes

Too much BE node memory has been occupied by other processes, or the maximum memory set for the BE service is too large.

Handling Procedure

Check whether the maximum memory set for the BE node is proper.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Doris** > **CPU and Memory** > **Relationship between the maximum memory size of the BE and the remaining memory size of the machine (BE)**.

Step 2 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 3 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 4 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Log in to the BE node for which the alarm is generated as user **omm**, run the **top** command to check the memory usage of processes, locate the process with high memory usage, and check whether the process belongs to the current service and is running properly.

- If yes, go to **Step 6**.
- If no, isolate or stop the process, or adjust the memory size, and check whether the memory is released.

Step 6 Log in to the BE node for which the alarm is generated as user **omm** and run the **free -g** command to check the total memory and remaining memory in the system and estimate the memory usage.

Step 7 On FusionInsight Manager, choose **Cluster** > **Services** > **Doris** > **Configurations** > **All Configurations** > **BE(Role)** > **Memory** and decrease the value of **mem_limit**. This parameter specifies the maximum memory allowed for BE. Then save the modification and restart the BE instance.

Step 8 After the BE instance is restarted, wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.412 ALM-50224 Failures a Certain Task Type on BE Are Increasing

Alarm Description

The system checks whether the number of failed tasks of a certain type on BE is increasing every 30 seconds. This alarm is generated when the system detects that the value is not **1** (**1** indicates that the number of failed tasks of a certain type does not increase, and **0** indicates that the failed tasks of a certain type are increasing).

This alarm is cleared when the system detects that the number of failed tasks of a certain type on BE does not increase.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50224	Major	Error handling	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

A task fails to be executed repeatedly in a certain scenario.

Possible Causes

A BE exception may occur. As a result, the number of failed tasks increases in a certain scenario.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Doris** > **Exception** > **Check whether the number of failed tasks of a certain type increases (BE)**.

Step 2 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 3 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 4 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

You need to manually clear the alarm after the fault is rectified.

Related Information

None.

11.413 ALM-50225 Unavailable FE Instances

Alarm Description

The system checks the FE process status every 30 seconds. This alarm is generated when the value is greater than **0** (**0** indicates that the FE process is normal and **1** indicates that the FE process is abnormal).

This alarm is cleared when the system detects that the FE process becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50225	Critical	Error handling	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.

Type	Parameter	Description
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

The FE instance is unavailable and cannot respond to client requests.

Possible Causes

- The FE instance is faulty or restarted.
- The local disk space of FE nodes is insufficient.
- FE node memory is insufficient.

Handling Procedure

View the FE instance status.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the alarm list, view the role name and obtain the IP address of the instance in **Location** of the alarm whose ID is **50225**.

Step 2 Choose **Cluster** > **Services** > **Doris** > **Instances**, click the FE instance for which the alarm is generated, and check whether **Running Status** of the instance is **Unknown** or **Restoring**.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Return to the **Instances** page, select the FE instance, and choose **More** > **Restart Instance**.

Step 4 After the FE instance is restarted, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, check whether alarm "Unavailable FE Instances" is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

View the local disk space of FE.

Step 5 Log in to the node where the FE instance queried in **Step 1** is deployed and check the value of **meta_dir** in the **${BIGDATA_HOME}/FusionInsight_Doris_*/*_*_FE/etc/fe.conf** file.

For example, the value of **meta_dir** is as follows:

```
meta_dir = /srv/BigData/doris_fe/doris-meta
```

Step 6 Run the following command to check whether the disk usage of **meta_dir** reaches 100%:

df -h */srv/BigData/doris_fe/doris-meta*

For example, the following command output indicates that the disk usage of **meta_dir** is 40%:

```
Filesystem      Size  Used Avail Use% Mounted on
/dev/vda2        98G   37G   57G  40% /
```

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 Delete unnecessary information from the directory to ensure that the over 80% of disk space is available. Wait for several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

View the FE node memory.

Step 8 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **Doris** > **Instances**. Click the FE instance for which the alarm is generated, click **Chart**, select **CPU and Memory** from the chart category, and check whether the FE memory usage reaches 100%.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 If the FE memory usage is too high, the processes connected to the FE service will be stopped and the occupied resources will be released. Wait for several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 12 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.414 ALM-50226 Unavailable BE Instances

Alarm Description

The system checks the BE process status every 30 seconds. This alarm is generated when the value is greater than **0** (**0** indicates that the BE process is normal and **1** indicates that the BE process is abnormal).

This alarm is cleared when the system detects that the BE process becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50226	Critical	Error handling	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

The BE instance is unavailable and cannot provide the data read and write functions.

Possible Causes

- The BE instance is faulty or restarted.

- The BE node disks are abnormal.
- The local disk space of BE nodes is insufficient.

Handling Procedure

View the BE instance status.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the alarm list, view the role name and obtain the IP address of the instance in **Location** of the alarm whose ID is **50226**.

Step 2 Choose **Cluster** > **Services** > **Doris** > **Instances**, click the BE instance for which the alarm is generated, and check whether **Running Status** of the instance is **Unknown** or **Restoring**.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Return to the **Instances** page, select the BE instance, and choose **More** > **Restart Instance**.

Step 4 After the BE instance is restarted, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, check whether alarm "Unavailable BE Instances" is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check BE node disks.

Step 5 In the alarm list, check whether the BE instances listed in **Step 1** report the "Disk Status of a Specified Data Directory on BE Is Abnormal" alarm.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Contact O&M engineers to repair the disk.

Step 7 In the alarm list, check whether the "Unavailable BE Instances" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check the local disk space of BE nodes.

Step 8 In the alarm list, check whether the BE instance in **Step 1** reports the "BE Data Disk Usage Exceeds the Threshold" alarm.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Perform the following operations to increase the BE disk space:

- Check the value of **storage_root_path** in the **${BIGDATA_HOME}/FusionInsight_Doris_*/*_*_BE/etc/be.conf** file and mount more disks to the directory as you need.
- Delete data from partitions that are no longer used in the table based on service demand.
- On FusionInsight Manager, choose **Cluster** > **Service** > **Doris** > **Instances** > **Add Instance**, and add BE nodes as you need.

- After the MySQL client is connected to Doris, run the following command to reduce the number of table replicas based on service demand:

  alter table *tblName* **set ("replication_allocation" = "tag.location.default:** *xxx*"**);**

Step 10 In the alarm list, check whether the "Unavailable BE Instances" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.415 ALM-50227 Concurrent Doris Tenant Queries Exceeds the Threshold

Alarm Description

The system checks concurrent tenant queries on FE nodes every 30 seconds. This alarm is generated when the number exceeds the threshold (90% by default).

This alarm is cleared when the number of concurrent queries from the FE nodes falls below the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50227	Major	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

Too many concurrent queries consume a large number of system resources. This leads to slow response and even request rejection.

Possible Causes

There is a large amount of service requests.

Handling Procedure

Check the actual number of concurrent tenant queries on FE nodes.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the alarm list, view the role name and obtain the IP address of the instance in **Location** of the alarm whose ID is **50227**.

Step 2 Choose **Cluster** > **Services** > **Doris** > **Instances**, select the FE instance for which the alarm is generated, and click **Chart**. Click **Tenant Resource** in the **Chart Category** pane, and check whether the actual number of concurrent queries in the **Number of Concurrent Tenant Queries** chart is greater than the threshold. The default value is 90%.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Check whether a large number of tasks were being executed during the alarm period.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Doris** > **Tenant Resources**. Increase the threshold value and trigger counts based on service requirements. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 7 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.416 ALM-50228 Memory Usage of a Doris Tenant Exceeds the Threshold

Alarm Description

The system checks the memory usage of BE nodes every 30 seconds. This alarm is generated when the memory usage of a tenant exceeds the threshold.

This alarm is cleared when the system detects that the memory usage of tenant's BE nodes is lower than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50228	Critical (default threshold: 90%) Major (default threshold: 85%)	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

Processes respond slowly or do not work.

Possible Causes

The data queried by the tenant is too large, and memory soft limit is not enabled.

Handling Procedure

Check the memory used by the BE nodes of the tenant.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the alarm list, view the role name and obtain the IP address of the instance in **Location** of the alarm whose ID is **50228**.

Step 2 Click **Thresholds** and choose *Name of the desired cluster* > **Doris** > **Tenant Resources** > **Memory Usage Exceeds Threshold** to view and record the threshold.

Step 3 Choose **Cluster** > **Services** > **Doris** > **Instances**, select the BE instance for which the alarm is generated, click **Chart**. Click **Tenant Resource** from the **Chart Category** pane, and check whether the actual memory usage in the **Memory Used by Tenants** chart is greater than the threshold obtained in **Step 2**, record the name of the tenant whose memory usage exceeds the threshold.

- If yes, go to **Step 3**.
- If no, go to **Step 8**.

Step 4 Check whether a large amount of table data were being queried during the alarm period.

- If yes, go to **Step 5**.
- If no, go to **Step 8**.

Step 5 Choose **Tenant Resources** > **Tenant Resources Management**. In the tenant list, click the tenant name in **Step 2**, and then the **Resource** tab. Click the edit button on the right of **Resource Details**, and check whether **Memory Soft Limit** is enabled.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

Step 6 Enable **Soft Memory Limit** and click **OK**. Check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 7**.

Step 7 Choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Doris** > **Tenant Resources**. Increase the threshold value and trigger counts based on service requirements. Check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 10 In the Host area, select the host to which the role belongs and click OK.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.417 ALM-50229 Doris FE Failed to Connect to OBS

Alarm Description

The system checks whether the connection between the Doris FE nodes and OBS is available every 30 seconds. This alarm is generated when the connection status code is not 0.

This alarm is cleared when the connection status code is 0.

This alarm applies only to MRS 3.3.1 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50229	Critical	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

Some functions of Doris are unavailable, for example, cold-hot separation and Hive OBS Catalog.

Possible Causes

- The obtained AK/SK is invalid.
- This alarm is generated when OBS connection fails.

Handling Procedure

Determine the cause.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the alarm list, view the role name and obtain the IP address of the instance in **Location** of the alarm whose ID is **50229**, and check the **CurrentValue** in **Additional Information**.

- If **CurrentValue** is **2**, the obtained AK/SK is invalid. Go to **Step 2**.
- If **CurrentValue** is **3**, OBS fails to be connected. Go to **Step 7**.

The obtained AK/SK is invalid.

Step 2 Log in to the MRS Service console, move the cursor on the username in the upper right corner, and choose **My Credentials**.

Step 3 Click **Access Keys** and check whether **Status** of the target key is **Enabled**.

- If yes, go to **Step 4**.
- If no, click **Enable** in the **Operation** column of the row containing the key.

Step 4 Click **Delete** in the row where the key is to delete the key. Click **Create Access Key** and click **OK**. Download the new access key and obtain the AK and SK.

Step 5 Set the **obs.access_key** and **obs.secret_key** parameters to the obtained AK/SK.

Step 6 Wait for about 1 minute, log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Failed to connect to OBS.

Step 7 Check whether the network connection between the cluster and OBS is normal.

- If yes, go to **Step 8**.
- If no, go to **Step 12**.

Step 8 Log in to the MRS management console. In the service list, choose **Identity and Access Management**. Click **Agencies** in the navigation pane. In the agency list, click the agency name configured for the MRS cluster.

Step 9 Click **Permissions** and click the name of each policy in the permission list.

Step 10 In the **Content** area, search for **Action** and check whether **obs** is contained.

- If yes, go to **Step 12**.
- If no, go to **Step 11**.

Step 11 Create an OBS permission policy by following the instructions provided in the guide for configuring doris cold and hot data separation. Wait for about 15 to 20 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Step 12 Contact O&M engineers for fault diagnosis and rectification.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.418 ALM-50230 Doris BE Cannot Connect to OBS

Alarm Description

The system checks whether the connection between the Doris BE nodes and OBS is available every 30 seconds. This alarm is generated when the connection status code is not 0.

This alarm is cleared when the connection status code is 0.

This alarm applies only to MRS 3.3.1 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50230	Critical	Quality of service	Doris	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

Some functions of Doris are unavailable, for example, cold-hot separation and Hive OBS Catalog.

Possible Causes

- The obtained AK/SK is invalid.
- This alarm is generated when OBS connection fails.

Handling Procedure

Determine the cause.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the alarm list, view the role name and obtain the IP address of the instance in **Location** of the alarm whose ID is **50230**, and check the **CurrentValue** in **Additional Information**.

- If **CurrentValue** is **2**, the obtained AK/SK is invalid. Go to **Step 2**.
- If **CurrentValue** is **3**, OBS fails to be connected. Go to **Step 7**.

The obtained AK/SK is invalid.

Step 2 Log in to the MRS Service console, move the cursor on the username in the upper right corner, and choose **My Credentials**.

Step 3 Click **Access Keys** and check whether **Status** of the target key is **Enabled**.

- If yes, go to **Step 4**.
- If no, click **Enable** in the **Operation** column of the row containing the key.

Step 4 Click **Delete** in the row where the key is to delete the key. Click **Create Access Key** and click **OK**. Download the new access key and obtain the AK and SK.

Step 5 Set the **obs.access_key** and **obs.secret_key** parameters to the obtained AK/SK.

Step 6 Wait for about 1 minute, log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Failed to connect to OBS.

Step 7 Check whether the network connection between the cluster and OBS is normal.

- If yes, go to **Step 8**.
- If no, go to **Step 12**.

Step 8 Log in to the MRS management console. In the service list, choose **Identity and Access Management**. Click **Agencies** in the navigation pane. In the agency list, click the agency name configured for the MRS cluster.

Step 9 Click **Permissions** and click the name of each policy in the permission list.

Step 10 In the **Content** area, search for **Action** and check whether **obs** is contained.

- If yes, go to **Step 12**.
- If no, go to **Step 11**.

Step 11 Create an OBS permission policy by following the instructions provided in the guide for configuring doris cold and hot data separation. Wait for about 15 to 20 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Step 12 Contact O&M engineers for fault diagnosis and rectification.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.419 ALM-50401 Number of JobServer Waiting Tasks Exceeds the Threshold

Alarm Description

The system checks the number of jobs submitted to JobServer every 30 seconds. This alarm is generated when the number of jobs to be executed exceeds 800.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50401	Critical (default threshold: 900) Major (default threshold: 800)	Quality of service	JobGateway	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

Too many JobServer tasks are detected in the queue. For details about the task queue usage, see the additional information field of this alarm. The impacts are as follows:

1. When the number of JobServer tasks in the queue reaches the maximum (1000 by default), new tasks cannot be added.
2. Before the number of JobServer tasks in the queue reaches the maximum, new JobServer tasks cannot be submitted quickly. For example, it takes more time (even hours) to submit tasks in the queue or new tasks to YARN. The time for submitting a new task to the Yarn component is prolonged, which may reach the hour level.

Possible Causes

Too many jobs are submitted instantaneously.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **JobGateway**.

Step 2 Click the **Instance** tab, click **Add Instance**, and add JobServer instances based on the number of submitted jobs.

Step 3 After the instances are added, restart the JobGateway service.

Step 4 Wait 5 minutes and check whether the alarm is automatically cleared.

If yes, no further action is required.

If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **JobGateway** for the target cluster.

Step 7 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.420 ALM-50402 JobGateway Service Unavailable

Alarm Description

The system checks the JobGateway service status every 60 seconds. This alarm is generated when the JobGateway service is abnormal.

This alarm is cleared when the JobGateway service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50402	Critical	Error handling	JobGateway	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

Users cannot use the job functions related to the JobGateway component. For example, jobs cannot be submitted, terminated, or viewed on the MRS management plane, and MRS job management APIs (V2) cannot be called.

Possible Causes

The node where the JobGateway service locates is faulty.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **JobGateway**, and click the **Instance** tab. Check for JobServer or JobBalancer instances that are faulty or not started and view the host names of these instances.

Step 2 On the **Alarm** page of FusionInsight Manager, check whether the **NodeAgent Process Is Abnormal** alarm is generated.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Check whether the host name in the alarm information is the same as the host name in **Step 1**.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Clear the alarm by following the instructions provided in **ALM-12006 NodeAgent Process Is Abnormal**.

Step 5 In the alarm list, check whether alarm **JobGateway Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **JobGateway** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11.421 ALM-51201 LakeSearch Unavailable

Alarm Description

The system checks the LakeSearch service availability every 60 seconds. This alarm is generated when the system detects that the LakeSearch service is unavailable. The alarm is cleared when the LakeSearch service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
51201	Critical	Error handling	LakeSearch	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

LakeSearch cannot provide services for external systems.

Possible Causes

The component on which LakeSearch depends is unavailable.

Handling Procedure

Check the running status of DBService, KrbServer, HBase, and Elasticsearch on which LakeSearch depends.

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services**.

Step 2 Check whether **Running Status** of DBService, KrbServer, HBase, and Elasticsearch is **Normal**.

- If yes, go to **Step 6**.
- If no, go to **Step 3**.

Step 3 Click the name of a component whose **Running Status** is not **Normal**.

Step 4 In the **Instances** tab, select the faulty instance, choose **More** > **Restart Instance**, and check whether the instance can be started successfully.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Wait for one minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Select **LakeSearch** for **Service** and click **OK**.

Step 8 In the **Hosts** area, select the host where the role is located.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

11.422 ALM-51202 LakeSearch Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of LakeSearch every 60 seconds. This alarm is generated when the number of times that the heap memory usage exceeds the threshold reaches the alarm trigger count.

If **Trigger Count** is **1**, this alarm is cleared when LakeSearch heap memory usage is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when LakeSearch heap memory usage is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
51202	Critical (default threshold: 95%) Major (default threshold: 90%)	Quality of service	LakeSearch	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the available LakeSearch heap memory is insufficient, the LakeSearch semantic search performance is affected, and even memory overflow occurs. As a result, the LakeSearch instance process becomes unavailable.

Possible Causes

LakeSearch heap memory is insufficient.

Handling Procedure

Check the LakeSearch JVM memory configuration and adjust it.

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **LakeSearch**. Click **Configurations** and click **All Configurations**.

Step 2 In the upper right corner of the configuration page, enter **GC_OPTS** in the search box. The **GC_OPTS** parameters of all instances are displayed.

Step 3 Select the instance whose parameter **GC_OPTS** needs to be modified, and check whether the differentiated configuration icon is displayed next to the instance value configuration box.

- If the icon is displayed, go to **Step 4**.
- If the icon is not displayed, go to **Step 5**.

Step 4 Click . In the displayed dialog box, click on the right and click **OK**.

Step 5 Change the values of **-Xms** and **-Xmx** of the **GC_OPTS** parameter by referring to the following note.

NOTE

Suggestions on GC parameter settings for LakeSearch instances:

- Change the values of **-Xms** and **-Xmx** of the **GC_OPTS** parameter to **8G**.
- Set **-Xms** and **-Xmx** to the same value to prevent dynamic adjustment of the heap memory size, which may affect performance.

Step 6 After the modification, click **Save** in the upper left corner. In the displayed dialog box, click **OK**.

Step 7 Click **Instances**, select the instances whose configuration status is **Expired**, and choose **More** > **Restart Instance** to restart them as prompted.

Step 8 Wait for one minute and check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **LakeSearch** for the target cluster.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

11.423 ALM-51203 GC Duration of the LakeSearch Instance Exceeds the Threshold

Alarm Description

The system checks the garbage collection (GC) duration of the LakeSearch instance process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (30 seconds by default).

If **Trigger Count** is **1**, this alarm is cleared when the GC duration of the LakeSearch instance process is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the GC duration of the LakeSearch instance process is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
51203	Major	Quality of service	LakeSearch	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

A long GC duration of the LakeSearch instance process may interrupt the services.

Possible Causes

Service load of the LakeSearch instance on the node is high or the heap memory is not properly configured. As a result, GC frequently occurs.

Handling Procedure

Check the heap memory of the instance.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, expand alarm "GC Duration of the LakeSearch Instance Exceeds the Threshold", and check the **HostName** in **Location**.

Step 2 Choose **Cluster** > **Services** > **LakeSearch**, click **Instances**, and click the SearchServer and SearchFactory instance names corresponding to the host for which the alarm is generated. On the displayed page, check whether the GC duration is continuously greater than the threshold by checking **SearchServer GC Duration Statistics** and **SearchFactory GC Duration Statistics** displayed in charts. If related charts do not exist, click the triangle icon next to the time editing button in the chart area, click **Customize**. On the displayed page, click **Garbage Collection**, select the charts, and click **OK**.

- If the GC duration is continuously greater than the threshold, go to **Step 3**.
- If the GC duration threshold is properly set, go to **Step 11**.

Step 3 Choose **Cluster** > **Services** > **LakeSearch**. Click **Configurations** and click **All Configurations**.

Step 4 In the upper right corner of the configuration page, enter **GC_OPTS** in the search box. The **GC_OPTS** parameters of all instances are displayed.

Step 5 Select the instance whose parameter **GC_OPTS** needs to be modified, and check whether the differentiated configuration icon  is displayed next to the instance value configuration box.

- If the icon is displayed, go to **Step 6**.
- If the icon is not displayed, go to **Step 7**.

Step 6 Click  . In the displayed dialog box, click  on the right and click **OK**.

Step 7 Change the values of **-Xms** and **-Xmx** of the **GC_OPTS** parameter by referring to the following note.

NOTE

Suggestions on GC parameter settings for LakeSearch instances:

- Change the values of **-Xms** and **-Xmx** of the **GC_OPTS** parameter to **8G**.
- Set **-Xms** and **-Xmx** to the same value to prevent dynamic adjustment of the heap memory size, which may affect performance.

Step 8 After the modification, click **Save** in the upper left corner. In the displayed dialog box, click **OK**.

Step 9 Click **Instances**, select the instances whose configuration status is **Expired**, and choose **More** > **Restart Instance** to restart them as prompted.

Step 10 Wait for one minute and check whether the alarm is cleared.

- If it is cleared, no further action is required.
- If it persists, go to **Step 11**.

Collect fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the **Service** drop-down list, and select **LakeSearch** for the target cluster.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

None

12 Security Description

12.1 Security Configuration Suggestions for Clusters with Kerberos Authentication Disabled

The Hadoop community version provides two authentication modes: Kerberos authentication (security mode) and Simple authentication (normal mode). When creating a cluster, you can choose to enable or disable Kerberos authentication.

Clusters in security mode use the Kerberos protocol for security authentication.

In normal mode, MRS cluster components use a native open source authentication mechanism, which is typically Simple authentication. If Simple authentication is used, authentication is automatically performed by a client user (for example, user **root**) by default when a client connects to a server. The authentication is imperceptible to the administrator or service user. In addition, when being executed, the client may even pretend to be any user (including **superuser**) by injecting **UserGroupInformation**. Cluster resource management and data control APIs are not authenticated on the server and are easily exploited and attacked by hackers.

Therefore, in normal mode, network access permissions must be strictly controlled to ensure cluster security. You are advised to perform the following operations to ensure cluster security.

- Deploy service applications on ECSs in the same VPC and subnet and avoid accessing MRS clusters through an external network.
- Configure security group rules to strictly control the access scope. Do not configure access rules that allow **Any** or **0.0.0.0** for the inbound direction of MRS cluster ports.
- If you want to access the native pages of the components in the cluster from the external, follow instructions in **Creating an SSH Channel for Connecting to an MRS Cluster and Configuring the Browser** for configuration.

12.2 Security Authentication Principles and Mechanisms

Function

For clusters in security mode with Kerberos authentication enabled, security authentication is required during application development.

Kerberos adopts a client/server structure and encryption technologies such as AES, and supports mutual authentication (both the client and server can authenticate each other). Kerberos is used to prevent interception and replay attacks and protect data integrity. It is a system that manages keys by using a symmetric key mechanism.

Architecture

Kerberos architecture is shown in **Figure 12-1** and module description in **Table 12-1**.

Figure 12-1 Kerberos architecture

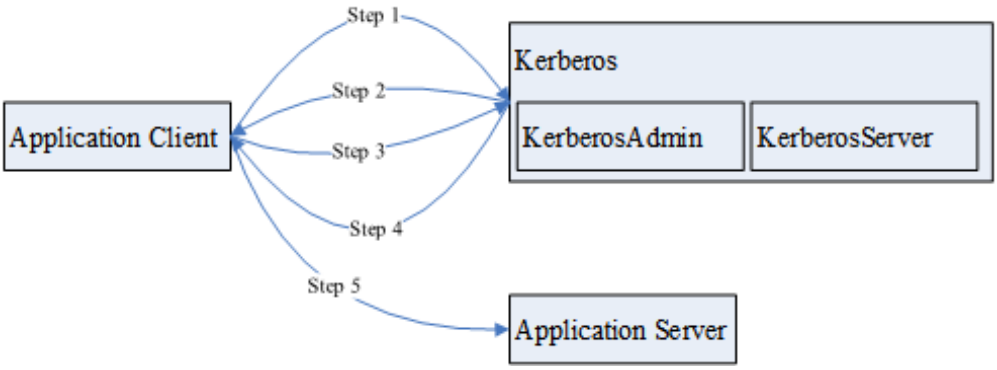

Table 12-1 Module description

Module	Description
Application Client	An application client, which is usually an application that submits tasks or jobs
Application Server	An application server, which is usually an application that an application client accesses
Kerberos	A service that provides security authentication
KerberosAdmin	A process that provides authentication user management

Module	Description
KerberosServer	A process that provides authentication ticket distribution

The process and principle are described as follows:

An application client can be a service in a cluster or a secondary development application of the customer. An application client can submit tasks or jobs to an application service.

1. Before submitting a task or job, the application client needs to apply for a ticket granting ticket (TGT) from the Kerberos service to establish a secure session with the Kerberos server.
2. After receiving the TGT request, the Kerberos service resolves parameters in the request to generate a TGT, and uses the key of the username specified by the client to encrypt the response.
3. After receiving the TGT response, the application client (based on the underlying RPC) resolves the response and obtains the TGT, and then applies for a server ticket (ST) of the application server from the Kerberos service.
4. After receiving the ST request, the Kerberos service verifies the TGT validity in the request and generates an ST of the application service, and then uses the application service key to encrypt the response.
5. After receiving the ST response, the application client packages the ST into a request and sends the request to the application server.
6. After receiving the request, the application server uses its local application service key to resolve the ST. After successful verification, the request becomes valid.

Basic Concepts

The following concepts can help users learn the Kerberos architecture quickly and understand the Kerberos service better. The following uses security authentication for HDFS as an example.

TGT

A TGT is generated by the Kerberos service and used to establish a secure session between an application and the Kerberos server. The validity period of a TGT is 24 hours. After 24 hours, the TGT expires automatically.

The following describes how to apply for a TGT (HDFS is used as an example):

1. Obtain a TGT through an API provided by HDFS.

```
/**
 * login Kerberos to get TGT, if the cluster is in security mode
 * @throws IOException if login is failed
 */
private void login() throws IOException {
// not security mode, just return
  if (! "kerberos".equalsIgnoreCase(conf.get("hadoop.security.authentication"))) {
      return;
  }
```

```
    //security mode
    System.setProperty("java.security.krb5.conf", PATH_TO_KRB5_CONF);

    UserGroupInformation.setConfiguration(conf);
    UserGroupInformation.loginUserFromKeytab(PRNCIPAL_NAME, PATH_TO_KEYTAB);
  }
```

2. Run shell commands on the client in kinit mode.

ST

An ST is generated by the Kerberos service and used to establish a secure session between an application and application service. An ST is valid only once.

In FusionInsight products, the generation of an ST is based on the Hadoop-RPC communication. The underlying RPC submits a request to the Kerberos server and the Kerberos server generates an ST.

Sample Authentication Code

```
package com.xxx.bigdata.hdfs.examples;

import java.io.IOException;

import org.apache.hadoop.conf.Configuration;
import org.apache.hadoop.fs.FileStatus;
import org.apache.hadoop.fs.FileSystem;
import org.apache.hadoop.fs.Path;
import org.apache.hadoop.security.UserGroupInformation;

public class KerberosTest {
    private static String PATH_TO_HDFS_SITE_XML = KerberosTest.class.getClassLoader().getResource("hdfs-
site.xml")
            .getPath();
    private static String PATH_TO_CORE_SITE_XML = KerberosTest.class.getClassLoader().getResource("core-
site.xml")
            .getPath();
    private static String PATH_TO_KEYTAB =
KerberosTest.class.getClassLoader().getResource("user.keytab").getPath();
    private static String PATH_TO_KRB5_CONF =
KerberosTest.class.getClassLoader().getResource("krb5.conf").getPath();
    private static String PRNCIPAL_NAME = "develop";
    private FileSystem fs;
    private Configuration conf;

    /**
     * initialize Configuration
     */
    private void initConf() {
        conf = new Configuration();

        // add configuration files
        conf.addResource(new Path(PATH_TO_HDFS_SITE_XML));
        conf.addResource(new Path(PATH_TO_CORE_SITE_XML));
    }

    /**
     * login Kerberos to get TGT, if the cluster is in security mode
     * @throws IOException if login is failed
     */
    private void login() throws IOException {
        // not security mode, just return
        if (! "kerberos".equalsIgnoreCase(conf.get("hadoop.security.authentication"))) {
            return;
        }

        //security mode
        System.setProperty("java.security.krb5.conf", PATH_TO_KRB5_CONF);
```

```
        UserGroupInformation.setConfiguration(conf);
        UserGroupInformation.loginUserFromKeytab(PRNCIPAL_NAME, PATH_TO_KEYTAB);
    }

    /**
     * initialize FileSystem, and get ST from Kerberos
     * @throws IOException
     */
    private void initFileSystem() throws IOException {
        fs = FileSystem.get(conf);
    }

    /**
     * An example to access the HDFS
     * @throws IOException
     */
    private void doSth() throws IOException {
        Path path = new Path("/tmp");
        FileStatus fStatus = fs.getFileStatus(path);
        System.out.println("Status of " + path + " is " + fStatus);
        //other thing
    }

    public static void main(String[] args) throws Exception {
        KerberosTest test = new KerberosTest();
        test.initConf();
        test.login();
        test.initFileSystem();
        test.doSth();
    }
}
```

NOTE

1. During Kerberos authentication, you need to configure the file parameters required for configuring the Kerberos authentication, including the keytab path, Kerberos authentication username, and the **krb5.conf** configuration file of the client for Kerberos authentication.
2. Method **login()** indicates calling the Hadoop API to perform Kerberos authentication and generating a TGT.
3. Method **doSth** indicates calling the Hadoop API to access the file system. In this situation, the underlying RPC automatically carries the TGT to Kerberos for verification and then an ST is generated.

13 High-Risk Operations

Forbidden Operations

Table 13-1 lists forbidden operations during the routine cluster operation and maintenance process.

Table 13-1 Forbidden operations

Item	Risk
Delete ZooKeeper data directories.	ClickHouse, HDFS, Yarn, HBase, and Hive depend on ZooKeeper, which stores metadata. This operation has adverse impact on normal operating of related components.
Frequently switch over the active and standby JDBCServer nodes.	This operation may interrupt services.
Delete Phoenix system tables and data (SYSTEM.CATALOG, SYSTEM.STATS, SYSTEM.SEQUENCE, and SYSTEM.FUNCTION).	This operation will cause service operation failures.
Manually modify data in the Hive metabase (hivemeta database).	This operation may cause Hive data parse errors. As a result, Hive cannot provide services.
Manually perform **INSERT** or **UPDATE** operations on Hive metadata tables.	This operation may cause Hive data parse errors. As a result, Hive cannot provide services.
Change permission on the Hive private file directory **hdfs:///tmp/hive-scratch**.	This operation may cause unavailable Hive services.
Modify **broker.id** in the Kafka configuration file.	This operation may cause invalid node data.

Item	Risk
Modify the host names of nodes.	Instances and upper-layer components on the host cannot provide services properly. The fault cannot be rectified.
Reinstall the OS of a node.	This operation will cause MRS cluster exceptions, leaving MRS clusters in abnormal status.
Use private images.	This operation will cause MRS cluster exceptions, leaving MRS clusters in abnormal status.

The following tables list the high-risk operations during the operation and maintenance of each component.

High-Risk Operations on a Cluster

Table 13-2 High-risk operations on a cluster

Operation	Risk	Severity	Workaround	Check Item
Modify the file directory or file permissions of user **omm** without permission.	This operation will lead to MRS service unavailability.	▲ ▲ ▲ ▲ ▲	Do not perform this operation.	Check whether the MRS cluster service is available.
Bind an EIP.	This operation exposes the Master node hosting MRS Manager of the cluster to the public network, increasing the risk of network attacks from the Internet.	▲ ▲ ▲ ▲ ▲	Ensure that the bound EIP is a trusted public IP address.	None

Operation	Risk	Severity	Workaround	Check Item
Enable security group rules for port 22 of a cluster.	This operation increases the risk of exploiting vulnerability of port 22.	▲ ▲ ▲ ▲ ▲	Configure a security group rule for port 22 to allow only trusted IP addresses to access the port. You are not advised to configure the inbound rule to allow 0.0.0.0 to access the port.	None
Delete a cluster or cluster data.	Data will get lost.	▲ ▲ ▲ ▲ ▲	Before deleting the data, confirm the necessity of the operation and ensure that the data has been backed up.	None
Scale in a cluster.	Data will get lost.	▲ ▲ ▲ ▲ ▲	Before scaling in the cluster, confirm the necessity of the operation and ensure that the data has been backed up.	None
Detach or format a data disk.	Data will get lost.	▲ ▲ ▲ ▲ ▲	Before performing this operation, confirm the necessity of the operation and ensure that the data has been backed up.	None

Manager High-Risk Operations

Table 13-3 Manager high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Change the OMS password.	This operation will restart all processes of OMSServer, which has adverse impact on cluster maintenance and management.	▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check whether there are uncleared alarms and whether the cluster management and maintenance are normal.
Import the certificate.	This operation will restart OMS processes and the entire cluster, which has adverse impact on cluster maintenance and management and services.	▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Perform an upgrade.	This operation will restart Manager and the entire cluster, affecting management, maintenance, and services of the cluster. Strictly manage the user who is eligible to assign the cluster management permission to prevent security risks.	▲ ▲ ▲	Ensure that there is no other maintenance and management operations when the operation is performed.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.

Operation	Risk	Severity	Workaround	Check Item
Restore the OMS.	This operation will restart Manager and the entire cluster, affecting management, maintenance, and services of the cluster.	▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Change an IP address.	This operation will restart Manager and the entire cluster, affecting management, maintenance, and services of the cluster.	▲ ▲ ▲	Ensure that there is no other maintenance and management operations when the operation is performed and that the new IP address is correct.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Change log levels.	If the log level is changed to **DEBUG**, Manager responds slowly.	▲ ▲	Before the modification, confirm the necessity of the operation and change it back to the default log level in time.	None

Operation	Risk	Severity	Workaround	Check Item
Replace a control node.	This operation will interrupt services deployed on the node. If the node is a management node, the operation will restart all OMS processes, affecting the cluster management and maintenance.	▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Replace a management node.	This operation will interrupt services deployed on the node. As a result, OMS processes will be restarted, affecting the cluster management and maintenance.	▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Restart the upper-layer service at the same time during the restart of a lower-layer service.	This operation will interrupt the upper-layer service, affecting the management, maintenance, and services of the cluster.	▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.

Operation	Risk	Severity	Workaround	Check Item
Modify the OLDAP port.	This operation will restart the LdapServer and Kerberos services and all associated services, affecting service running.	▲ ▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	None
Delete the **supergroup** group.	Deleting the **supergroup** group decreases user rights, affecting service access.	▲ ▲ ▲ ▲ ▲	Before the change, confirm the rights to be added. Ensure that the required rights have been added before deleting the **supergroup** rights to which the user is bound, ensuring service continuity.	None
Restart a service.	Services will be interrupted during the restart. If you select and restart the upper-layer service, the upper-layer services that depend on the service will be interrupted.	▲ ▲ ▲	Confirm the necessity of restarting the system before the operation.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.

Operation	Risk	Severity	Workaround	Check Item
Change the default SSH port No.	After the default port (22) is changed, functions such as cluster creation, service/instance adding, host adding, and host reinstallation cannot be used, and results of cluster health check items for node mutual trust, **omm**/**ommdba** user password expiration, and others are incorrect.	▲ ▲ ▲	Before performing this operation, restore the SSH port to the default value.	None

CDL High-risk Operations

Table 13-4 CDL high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Start or stop basic components independently.	This operation has adverse impact on the basic functions of some services. As a result, service failures occur.	▲ ▲ ▲	Do not start or stop basic components such as Kafka, DBService, ZooKeeper, Kerberos, and LDAP separately. To start or stop basic components, select associated services.	Check whether the service status is normal.
Restart or stop services.	This operation may interrupt services.	▲ ▲	Restart or stop services when necessary.	Check whether the service is running properly.

ClickHouse High-Risk Operations

Table 13-5 ClickHouse high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Delete data directories.	This operation may cause service information loss.	▲ ▲ ▲	Do not delete data directories manually.	Check whether data directories are normal.
Remove ClickHouseServer instances.	The ClickHouseServer instance nodes in the same shard must be removed in at the same time. Otherwise, the topology information of the logical cluster is incorrect. Before performing this operation, check the database and data table information of each node in the logical cluster and perform scale-in pre-analysis to ensure that data is successfully migrated during the scale-in process to prevent data loss	▲ ▲ ▲ ▲ ▲	Before scale-in, collect information in advance to learn the status of the ClickHouse logical cluster and instance nodes.	Check the ClickHouse logical cluster topology information, database and data table information in each ClickHouseServer instance, and data volume.
Add ClickHouseServer instances.	When performing this operation, you must check whether a database or data table with the same name as that on the old node needs to be created on the new node. Otherwise, subsequent data migration, data balancing, scale-in, and decommissioning will fail.	▲ ▲ ▲ ▲ ▲	Before scale-out, confirm the function and purpose of new ClickHouseServer instances and determine whether to create related databases and data tables.	Check the ClickHouse logical cluster topology information, database and data table information in each ClickHouseServer instance, and data volume.

Operation	Risk	Severity	Workaround	Check Item
Decommission ClickHouseServer instances.	The ClickHouseServer instance nodes in the same shard must be decommissioned in at the same time. Otherwise, the topology information of the logical cluster is incorrect. Before performing this operation, check the database and data table information of each node in the logical cluster and perform decommissioning pre-analysis to ensure that data is successfully migrated during the decommissioning process to prevent data loss	▲ ▲ ▲ ▲ ▲	Before decommissioning, collect information in advance to learn the status of the ClickHouse logical cluster and instance nodes.	Check the ClickHouse logical cluster topology information, database and data table information in each ClickHouseServer instance, and data volume.
Recommission ClickHouseServer instances.	When performing this operation, you must select all nodes in the original shard. Otherwise, the topology information of the logical cluster is incorrect.	▲ ▲ ▲ ▲ ▲	Before recommissioning, you need to confirm the home information about the shards of the node to be recommissioned.	Check the ClickHouse logical cluster topology information.
Modify data directory content (file and folder creation).	This operation may cause the ClickHouse instance of the node faults.	▲ ▲ ▲	Do not create or modify files or folders in the data directories manually.	Check whether data directories are normal.

Operation	Risk	Severity	Workaround	Check Item
Start or stop basic components independently.	This operation has adverse impact on the basic functions of some services. As a result, service failures occur.	▲ ▲ ▲	Do not start or stop ZooKeeper, Kerberos, and LDAP basic components independently. Select related services when performing this operation.	Check whether the service status is normal.
Restart or stop services.	This operation may interrupt services.	▲ ▲	Restart or stop services when necessary.	Check whether the service is running properly.

DBService High-Risk Operations

Table 13-6 DBService high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Change the DBService password.	The services need to be restarted for the password change to take effect. The services are unavailable during the restart.	▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check whether there are uncleared alarms and whether the cluster management and maintenance are normal.

Operation	Risk	Severity	Workaround	Check Item
Restore DBService data.	After the data is restored, the data generated after the data backup and before the data restoration is lost. After the data is restored, the configuration of the components that depend on DBService may expire and these components need to be restarted.	▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check whether there are uncleared alarms and whether the cluster management and maintenance are normal.
Perform active/ standby DBService switchover.	During the DBServer switchover, DBService is unavailable.	▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	None
Change the DBService floating IP address.	The DBService needs to be restarted for the change to take effect. The DBService is unavailable during the restart. If the floating IP address has been used, the configuration will fail, and the DBService will fail to be started.	▲ ▲ ▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.

Flink High-Risk Operations

Table 13-7 Flink high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Change log levels.	If the log level is modified to DEBUG, the task running performance is affected.	▲ ▲	Before the modification, confirm the necessity of the operation and change it back to the default log level in time.	None
Modify file permissions.	Tasks may fail.	▲ ▲ ▲	Confirm the necessity of the operation before the modification.	Check whether related service operations are normal.

Flume High-Risk Operations

Table 13-8 Flume high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify the Flume instance start parameter **GC_OPTS**.	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.

Operation	Risk	Severity	Workaround	Check Item
Change the default value of **dfs.replication** from **3** to **1**.	This operation will have the following impacts: 1. The storage reliability deteriorates. If the disk becomes faulty, data will be lost. 2. NameNode fails to be restarted, and the HDFS service is unavailable.	▲ ▲ ▲ ▲	When modifying related configuration items, check the parameter description carefully. Ensure that there are more than two replicas for data storage.	Check whether the default replica number is not 1 and whether the HDFS service is normal.

HBase High-Risk Operations

Table 13-9 HBase high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify encryption configuration. • hbase.regionserver.wal.encryption • hbase.crypto.keyprovider.parameters.uri • hbase.crypto.keyprovider.parameters.encryptedtext	Services cannot start properly.	▲ ▲ ▲ ▲	Strictly follow the prompt information when modifying related configuration items, which are associated. Ensure that new values are valid.	Check whether services can be started properly.

Operation	Risk	Severity	Workaround	Check Item
Change the value of **hbase.regionserver.wal.encryption** to **false** or switch encryption algorithm from AES to SMS4.	This operation may cause start failures and data loss.	▲ ▲ ▲ ▲	When HFile and WAL are encrypted using an encryption algorithm and a table is created, do not close or switch the encryption algorithm randomly. If an encryption table (ENCRYPTION=>AES/SMS4) is not created, you can only switch the encryption algorithm.	None
Modify HBase instance start parameter **GC_OPTS** and **HBASE_HEAPSIZE**.	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid. GC_OPTS does not conflict with HBASE_HEAPSIZE.	Check whether services can be started properly.
Use **OfflineMetaRepair** tool	Services cannot start properly.	▲ ▲ ▲ ▲	This tool can be used only when HBase is offline and cannot be used in data migration scenarios.	Check whether HBase services can be started properly.

HDFS High-Risk Operations

Table 13-10 HDFS high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Change HDFS NameNode data storage directory **dfs.namenode.name.dir** and data configuration directory **dfs.datanode.data.dir**.	Services cannot start properly.	▲ ▲ ▲ ▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Use the **-delete** parameter when you run the **hadoop distcp** command.	During DistCP copying, files that do not exist in the source cluster but exist in the destination cluster are deleted from the destination cluster.	▲ ▲	When using DistCP, determine whether to retain the redundant files in the destination cluster. Exercise caution when using the **-delete** parameter.	After DistCP copying is complete, check whether the data in the destination cluster is retained or deleted according to the parameter settings.

Operation	Risk	Severity	Workaround	Check Item
Modify the HDFS instance start parameter **GC_OPTS**, **HADOOP_HEAPSIZE**, and **GC_PROFILE**.	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid. GC_OPTS does not conflict with HADOOP_HEAPSIZE.	Check whether services can be started properly.
Change the default value of **dfs.replication** from **3** to **1**.	This operation will have the following impacts: 1. The storage reliability deteriorates. If the disk becomes faulty, data will be lost. 2. NameNode fails to be restarted, and the HDFS service is unavailable.	▲ ▲ ▲ ▲	When modifying related configuration items, check the parameter description carefully. Ensure that there are more than two replicas for data storage.	Check whether the default replica number is not 1 and whether the HDFS service is normal.
Change the remote procedure call (RPC) channel encryption mode (**hadoop.rpc.protection**) of each module in Hadoop.	This operation causes service faults and service exceptions.	▲ ▲ ▲ ▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether HDFS and other services that depend on HDFS can properly start and provide services.

Hive High-Risk Operations

Table 13-11 Hive high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify the Hive instance start parameter **GC_OPTS**.	This operation may cause Hive instance start failures.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Delete all MetaStore instances.	This operation may cause Hive metadata loss. As a result, Hive cannot provide services.	▲ ▲ ▲	Do not perform this operation unless ensure that Hive table information can be discarded.	Check whether services can be started properly.
Delete or modify files corresponding to Hive tables over HDFS interfaces or HBase interfaces.	This operation may cause Hive service data loss or tampering.	▲ ▲	Do not perform this operation unless ensure that the data can be discarded or that the operation meets service requirements.	Check whether Hive data is complete.

Operation	Risk	Severity	Workaround	Check Item
Delete or modify files corresponding to Hive tables or directory access permission over HDFS interfaces or HBase interfaces.	This operation may cause related service scenarios to be unavailable.	▲ ▲ ▲	Do not perform this operation.	Check whether related service operations are normal.
Delete or modify **hdfs:///apps/templeton/hive-3.1.0.tar.gz** over HDFS interfaces.	WebHCat fails to perform services due to this operation.	▲ ▲	Do not perform this operation.	Check whether related service operations are normal.
Export table data to overwrite the data at the local. For example, export the data of **t1** to **/opt/dir**. **insert overwrite local directory '/opt/dir' select * from t1;**	This operation will delete target directories. Incorrect setting may cause software or OS startup failures.	▲ ▲ ▲ ▲ ▲	Ensure that the path where the data is written does not contain any files or do not use the key word overwrite in the command.	Check whether files in the target path are lost.

Operation	Risk	Severity	Workaround	Check Item
Direct different databases, tables, or partition files to the same path, for example, default warehouse path **/user/hive/warehouse**.	The creation operation may cause disordered data. After a database, table, or partition is deleted, other object data will be lost.	▲ ▲ ▲ ▲ ▲	Do not perform this operation.	Check whether files in the target path are lost.

IoTDB High-Risk Operations

Table 13-12 IoTDB high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Delete data directories.	This operation may cause service information loss.	▲ ▲ ▲	Do not delete data directories manually.	Check whether data directories are normal.
Modify data directory content (file and folder creation).	This operation may cause the IoTDB instance of the node faults.	▲ ▲ ▲	Do not create or modify files or folders in the data directories manually.	Check whether data directories are normal.

Operation	Risk	Severity	Workaround	Check Item
Start or stop basic components independently.	This operation has adverse impact on the basic functions of some services. As a result, service failures occur.	▲ ▲ ▲	Do not start or stop Kerberos, and LDAP basic components independently. Select related services when performing this operation.	Check whether the service status is normal.
Restart or stop services.	This operation may interrupt services.	▲ ▲	Restart or stop services when necessary.	Check whether the service is running properly.

Kafka High-Risk Operations

Table 13-13 Kafka high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Delete Topic	This operation may delete existing topics and data.	▲ ▲ ▲	Kerberos authentication is used to ensure that authenticated users have operation permissions. Ensure that topic names are correct.	Check whether topics are processed properly.
Delete data directories.	This operation may cause service information loss.	▲ ▲ ▲	Do not delete data directories manually.	Check whether data directories are normal.

Operation	Risk	Severity	Workaround	Check Item
Modify data directory content (file and folder creation).	This operation may cause the Broker instance of the node faults.	▲ ▲ ▲	Do not create or modify files or folders in the data directories manually.	Check whether data directories are normal.
Modify the disk auto-adaptation function using the **disk.adapter.enable** parameter.	This operation adjusts the topic data retention period when the disk usage reaches the threshold. Historical data that does not fall within the storage retention may be deleted.	▲ ▲ ▲	If the retention period of some topics cannot be adjusted, add this topic to the value of **disk.adapter.topic.blacklist**.	Observe the data storage period on the Kafka topic monitoring page.
Modify data directory **log.dirs** configuration.	Incorrect operation may cause process faults.	▲ ▲ ▲	Ensure that the added or modified data directories are empty and that the directory permissions are right.	Check whether data directories are normal.
Reduce the capacity of the Kafka cluster.	This operation may cause quantity reduction of backups of some data duplicates of topic. As a result, some topics cannot be accessed.	▲ ▲	Perform backup operation and then reduce the capacity of the Kafka cluster.	Check whether backup nodes where partitions are located are activated to ensure data security.

Operation	Risk	Severity	Workaround	Check Item
Start or stop basic components independently.	This operation has adverse impact on the basic functions of some services. As a result, service failures occur.	▲ ▲ ▲	Do not start or stop ZooKeeper, Kerberos, and LDAP basic components independently. Select related services when performing this operation.	Check whether the service status is normal.
Restart or stop services.	This operation may interrupt services.	▲ ▲	Restart or stop services when necessary.	Check whether the service is running properly.
Modify configuration parameters.	This operation requires service restart for configuration to take effect.	▲ ▲	Modify configuration when necessary.	Check whether the service is running properly.
Delete or modify metadata.	Modifying or deleting Kafka metadata on ZooKeeper may cause the Kafka topic or service unavailability.	▲ ▲ ▲	Do not delete or modify Kafka metadata stored on ZooKeeper.	Check whether the Kafka topics or Kafka service is available.
Delete metadata backup files.	After Kafka metadata backup files are modified and used to restore Kafka metadata, Kafka topics or the Kafka service may be unavailable.	▲ ▲ ▲	Do not delete Kafka metadata backup files.	Check whether the Kafka topics or Kafka service is available.

KrbServer High-Risk Operations

Table 13-14 KrbServer high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify the **KADMIN_PORT** parameter of KrbServer.	After this parameter is modified, if the KrbServer service and its associated services are not restarted in a timely manner, the configuration of KrbClient in the cluster is abnormal and the service running is affected.	▲ ▲ ▲ ▲ ▲	After this parameter is modified, restart the KrbServer service and all its associated services.	None
Modify the **kdc_ports** parameter of KrbServer.	After this parameter is modified, if the KrbServer service and its associated services are not restarted in a timely manner, the configuration of KrbClient in the cluster is abnormal and the service running is affected.	▲ ▲ ▲ ▲ ▲	After this parameter is modified, restart the KrbServer service and all its associated services.	None
Modify the **KPASSWD_PORT** parameter of KrbServer.	After this parameter is modified, if the KrbServer service and its associated services are not restarted in a timely manner, the configuration of KrbClient in the cluster is abnormal and the service running is affected.	▲ ▲ ▲ ▲ ▲	After this parameter is modified, restart the KrbServer service and all its associated services.	None

Operation	Risk	Severity	Workaround	Check Item
Modify the domain name of Manager system.	After the domain name is modified, if the KrbServer service and its associated services are not restarted in a timely manner, the configuration of KrbClient in the cluster is abnormal and the service running is affected.	▲ ▲ ▲ ▲ ▲	After this parameter is modified, restart the KrbServer service and all its associated services.	None
Configure cross-cluster mutual trust relationships.	This operation will restart the KrbServer service and all associated services, affecting the management and maintenance and services of the cluster.	▲ ▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.

LdapServer High-Risk Operations

Table 13-15 LdapServer high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify the **LDAP_SERVER_PORT** parameter of LdapServer.	After this parameter is modified, if the LdapServer service and its associated services are not restarted in a timely manner, the configuration of LdapClient in the cluster is abnormal and the service running is affected.	▲ ▲ ▲ ▲ ▲	After this parameter is modified, restart the LdapServer service and all its associated services.	None

Operation	Risk	Severity	Workaround	Check Item
Restore LdapServer data.	This operation will restart Manager and the entire cluster, affecting management, maintenance, and services of the cluster.	▲ ▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Replace the Node where LdapServer is located.	This operation will interrupt services deployed on the node. If the node is a management node, the operation will restart all OMS processes, affecting the cluster management and maintenance.	▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Change the password of LdapServer.	The LdapServer and Kerberos services need to be restarted during the password change, affecting the management, maintenance, and services of the cluster.	▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	None

Operation	Risk	Severity	Workaround	Check Item
Restart the node where LdapServer is located.	Restarting the node without stopping the LdapServer service may cause LdapServer data damage.	▲ ▲ ▲ ▲ ▲	Restore LdapServer using LdapServer backup data	None

Loader High-Risk Operations

Table 13-16 Loader high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Change the floating IP address of a Loader instance (**loader.float.ip**).	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether the Loader UI can be connected properly.
Modify the Loader instance start parameter **LOADER_GC_OPTS**.	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Clear table contents when adding data to HBase.	This operation will clear original data in the target table.	▲ ▲	Ensure that the contents in the target table can be cleared before the operation.	Check whether the contents in the target table can be cleared before the operation.

Spark2x High-risk Operations

Table 13-17 Spark2x high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify the configuration item **spark.yarn.queue**.	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Modify the configuration item **spark.driver.extraJavaOptions**.	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Modify the configuration item **spark.yarn.cluster.driver.extraJavaOptions**.	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.

Operation	Risk	Severity	Workaround	Check Item
Modify the configuration item **spark.eventLog.dir**.	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Modify the configuration item **SPARK_DAEMON_JAVA_OPTS**.	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Delete all JobHistory2x instances.	The event logs of historical applications are lost.	▲ ▲	Reserve at least one JobHistory2x instance.	Check whether historical application information is included in JobHistory2x.
Delete or modify the **/user/spark2x/jars/8.1.0.1/spark-archive-2x.zip** file in HDFS.	JDBCServer2x fails to be started and service functions are abnormal.	▲ ▲ ▲	Delete **/user/spark2x/jars/8.1.0.1/spark-archive-2x.zip**, and wait for 10-15 minutes until the .zip package is automatically restored.	Check whether services can be started properly.

Storm High-Risk Operations

Table 13-18 Storm high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify the following plug-in related configuration items: • storm.scheduler • nimbus.authorizer • storm.thrift.transport • nimbus.blobstore.class • nimbus.topology.validator • storm.principal.tolocal	Services cannot start properly.	▲ ▲ ▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that the class names exist and are valid.	Check whether services can be started properly.

Operation	Risk	Severity	Workaround	Check Item
Modify the Storm instance **GC_OPTS** startup parameters, including: NIMBUS_GC_OPTS SUPERVISOR_GC_OPTS UI_GC_OPTS LOGVIEWER_GC_OPTS	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Modify the user resource pool configuration parameter **resource.aware.scheduler.user.pools**.	Services cannot run properly.	▲ ▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that resources allocated to each user are appropriate and valid.	Check whether services can be started and run properly
Change data directories.	If this operation is not properly performed, services may be abnormal and unavailable.	▲ ▲ ▲ ▲	Do not manually change data directories.	Check whether data directories are normal.
Restart services or instances.	The service will be interrupted for a short period of time, and ongoing operations will be interrupted.	▲ ▲ ▲	Restart services or instances when necessary.	Check whether the service is running properly and whether interrupted operations are restored.

Operation	Risk	Severity	Workaround	Check Item
Synchronize configurations (by restarting the required service).	The service will be restarted, resulting in temporary service interruption. If Supervisor is restarted, ongoing operations will be interrupted for a short period of time.	▲ ▲ ▲	Modify configuration when necessary.	Check whether the service is running properly and whether interrupted operations are restored.
Stop services or instances.	The service will be stopped, and related operations will be interrupted.	▲ ▲ ▲	Stop services when necessary.	Check whether the services are properly stopped.
Delete or modify metadata.	If Nimbus metadata is deleted, services are abnormal and ongoing operations are lost.	▲ ▲ ▲ ▲ ▲	Do not manually delete Nimbus metadata files.	Check whether Nimbus metadata files are normal.
Modify file permissions.	If permissions on the metadata and log directories are incorrectly modified, service exceptions may occur.	▲ ▲ ▲ ▲	Do not manually modify file permissions.	Check whether the permissions on the data and log directories are correct.
Delete topologies.	Topologies in use will be deleted.	▲ ▲ ▲ ▲	Delete topologies when necessary.	Check whether the topologies are successfully deleted.

Yarn High-Risk Operations

Table 13-19 Yarn high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Delete or change data directories **yarn.nodemanager.local-dirs** and **yarn.nodemanager.log-dirs**	This operation may cause service information loss.	▲ ▲ ▲	Do not delete data directories manually.	Check whether data directories are normal.

ZooKeeper High-Risk Operations

Table 13-20 ZooKeeper high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Delete or change ZooKeeper data directories.	This operation may cause service information loss.	▲ ▲ ▲	Follow the capacity expansion guide to change the ZooKeeper data directories.	Check whether services and associated components are started properly.
Modify the ZooKeeper instance start parameter **GC_OPTS**.	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.

Operation	Risk	Severity	Workaround	Check Item
Modify the znode ACL information in ZooKeeper.	If znode permission is modified in ZooKeeper, other users may have no permission to access the znode and some system functions are abnormal.	▲ ▲ ▲ ▲	During the modification, strictly follow the ZooKeeper Configuration Guide and ensure that other components can use ZooKeeper properly after ACL information modification.	Check that other components that depend on ZooKeeper can properly start and provide services.

14 Interconnecting Jupyter Notebook with MRS Using Custom Python

14.1 Overview

Configuring Jupyter Notebook in MRS to use Pyspark improves the efficiency of machine learning, data exploration, and ETL application development.

This section describes how to configure Jupyter Notebook in MRS to use Pyspark. The procedure is as follows:

1. **Installing a Client on a Node Outside the Cluster**
2. **Installing Python 3**
3. **Configuring the MRS Client**
4. **Installing Jupyter Notebook**
5. **Verifying that Jupyter Notebook Can Access MRS**

14.2 Installing a Client on a Node Outside the Cluster

Step 1 Prepare a Linux ECS outside the cluster. For details about the requirements, see **Installing a Client on a Node Outside a Cluster**.

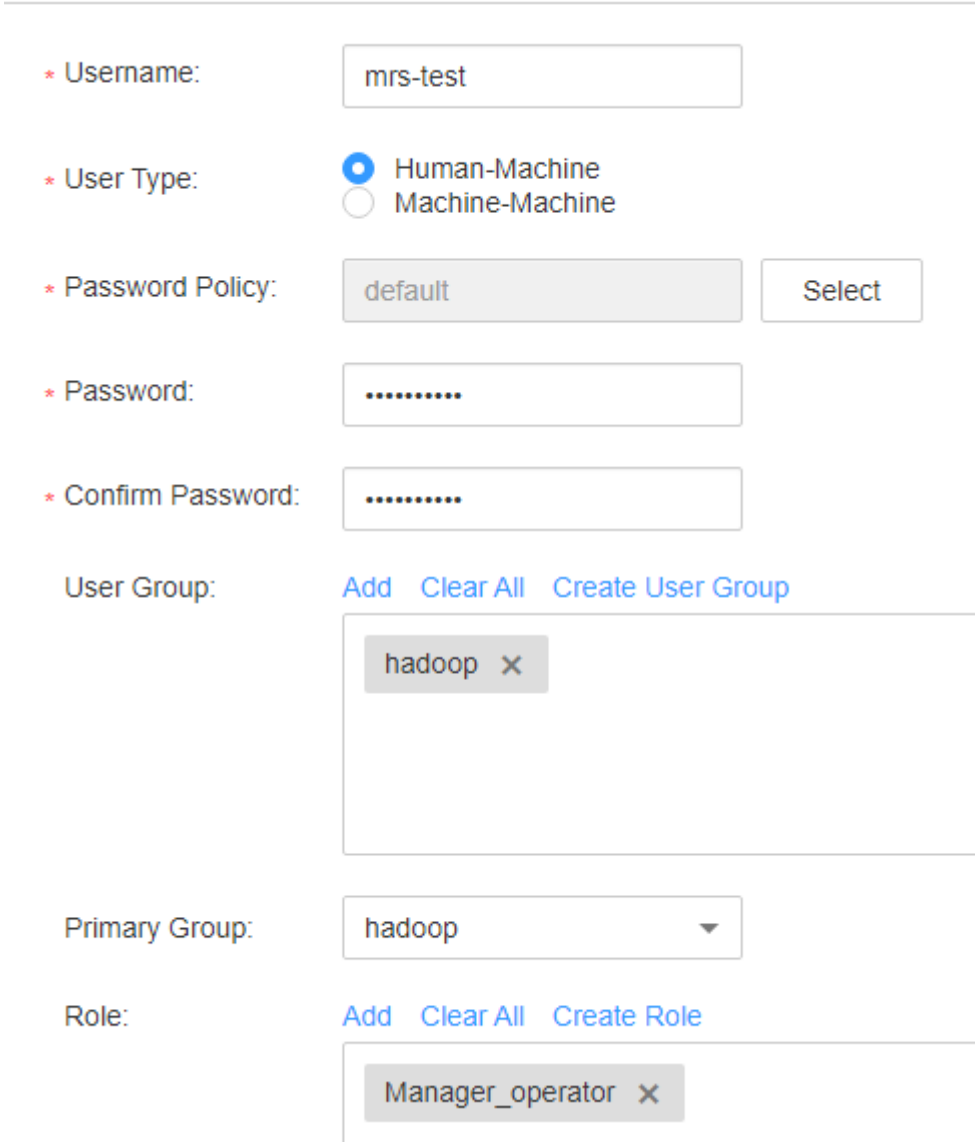
Step 2 Install the client to a directory, for example, **/opt/client**, on the node outside the cluster by referring to **Installing a Client on a Node Outside a Cluster**.

Step 3 Check whether Kerberos authentication is enabled for the cluster.

- If yes, go to **Step 4**.
- If no, go to **Installing Python 3**.

Step 4 Log in to FusionInsight Manager by referring to **Accessing FusionInsight Manager**.

Step 5 **Creating a User**, for example, **mrs-test**. Set **User Group** to **hadoop**, **Primary Group** to **hadoop**, and **Role** to **Manager_operator**.



Step 6 Log in to the client node as user **root** and run the following commands to configure environment variables for security authentication:

source /opt/client/bigdata_env

kinit *mrs-test*

NOTE

Change the password upon the first authentication.

----End

14.3 Installing Python 3

Step 1 Log in to the client node outside the cluster as user **root** and run the following command to check whether Python 3 is installed:

python3 --version

```
[root@ecs-notebook FusionInsight_Cluster_1_Services_ClientConfig]# python3 --version
-bash: python3: command not found
```

- If yes, go to **Configuring the MRS Client**.
- If no, go to **Step 2**.

Step 2 Install Python. Python 3.6.6 is used as an example.

1. Run the following commands to install dependencies:

   yum install zlib zlib-devel zip -y

   yum install gcc-c++

   yum install openssl-devel

   yum install sqlite-devel -y

   If the pandas library requires the following dependencies:

   yum install -y xz-devel

   yum install bzip2-devel

2. Run the **wget https://www.python.org/ftp/python/3.6.6/Python-3.6.6.tgz** command to download the source code of Python.
3. Run the following command to decompress the Python source code package, for example, to the **opt** directory:

   cd /opt

   tar –xvf Python-3.6.6.tgz

4. Create a Python installation directory, for example, **/opt/python36**:

   mkdir /opt/python36

5. Compile Python.

   cd /opt/python-3.6.6

   ./configure --prefix=/opt/python36

   The following information is displayed if the commands are executed successfully:

```
configure: creating ./config.status
config.status: creating Makefile.pre
config.status: creating Modules/Setup.config
config.status: creating Misc/python.pc
config.status: creating Misc/python-config.sh
config.status: creating Modules/ld_so_aix
config.status: creating pyconfig.h
creating Modules/Setup
creating Modules/Setup.local
creating Makefile

If you want a release build with all stable optimizations active (PGO, etc),
please run ./configure --enable-optimizations
```

   Run the **make -j8** command. The following information is displayed if the command is executed successfully:

```
creating build/scripts-3.6
copying and adjusting /tmp/python366/Python-3.6.6/Tools/scripts/pydoc3 -> build/scripts-3.6
copying and adjusting /tmp/python366/Python-3.6.6/Tools/scripts/idle3 -> build/scripts-3.6
copying and adjusting /tmp/python366/Python-3.6.6/Tools/scripts/2to3 -> build/scripts-3.6
copying and adjusting /tmp/python366/Python-3.6.6/Tools/scripts/pyvenv -> build/scripts-3.6
changing mode of build/scripts-3.6/pydoc3 from 644 to 755
changing mode of build/scripts-3.6/idle3 from 644 to 755
changing mode of build/scripts-3.6/2to3 from 644 to 755
changing mode of build/scripts-3.6/pyvenv from 644 to 755
renaming build/scripts-3.6/pydoc3 to build/scripts-3.6/pydoc3.6
renaming build/scripts-3.6/idle3 to build/scripts-3.6/idle3.6
renaming build/scripts-3.6/2to3 to build/scripts-3.6/2to3-3.6
renaming build/scripts-3.6/pyvenv to build/scripts-3.6/pyvenv-3.6
```

Run the **make install** command. The following information is displayed if the command is executed successfully:

```
rm -f /opt/python36/share/man/man1/python3.1

```

6. Run the following commands to configure the Python environment:

   export PYTHON_HOME=/opt/python36

   export PATH=$PYTHON_HOME/bin:$PATH

7. Run the **python3 --version** command. Python has been installed if the following information is displayed:

   ```
   [root@ecs-notebook Python-3.6.6]# python3 --version
   Python 3.6.6
   ```

Step 3 Verify Python 3.

pip3 install helloword

python3

import helloworld

helloworld.say_hello("test")

```
[root@ecs-notebook Python-3.6.6]# pip3 install helloword
Collecting helloword

six             1.16.0
sklearn         0.0
threadpoolctl   3.1.0
```

Step 6 Pack them into **Python.zip**.

cd /opt/python36/

zip -r python36.zip ./*

Step 7 Create an HDFS directory and upload the package to the directory for future use.

hdfs dfs -mkdir /user/python

hdfs dfs -put python36.zip /user/python

----End

14.4 Configuring the MRS Client

Go to **/opt/client/Spark2x/spark/conf** (Spark client installation directory) and configure the following parameters in the **spark-defaults.conf** file:

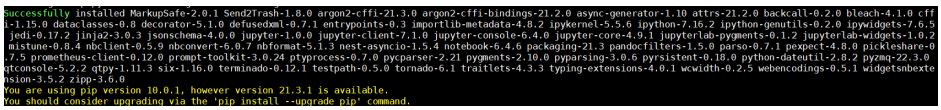
```
spark.pyspark.driver.python=/usr/bin/python3
spark.yarn.dist.archives=hdfs://hacluster/user/python/python36.zip#Python
```

14.5 Installing Jupyter Notebook

Step 1 Log in to the client node as user **root** and run the following command to install Jupyter Notebook:

pip3 install jupyter notebook

The installation is successful if the following command output is displayed:



Step 2 To ensure security, you need to generate a ciphertext password for logging in to Jupyter and place it in the configuration file of Jupyter Notebook.

Run the following command and enter the password twice (exit at Out[3]):

ipython

```
[root@ecs-notebook python36]# ipython
Python 3.6.6 (default, Dec 20 2021, 09:32:25)
Type 'copyright', 'credits' or 'license' for more information
IPython 7.16.2 -- An enhanced Interactive Python. Type '?' for help.
In [1]: from notebook.auth import passwd
In [2]: passwd()
Enter password:
Verify password:
Out[2]: 'argon2:$argon2id$v=19$m=10240,t=10,p=8$g14BqLddl927n/unsyPlLQ
$YmoKJzbUfNG7LcxylJzm90bgbKWUIiHy6ZV+ObTzdcA
```

Step 3 Run the following command to generate the Jupyter configuration file:

jupyter notebook --generate-config

Step 4 Modify the configuration file:

vi ~/.jupyter/jupyter_notebook_config.py

Add the following configurations:

```
# -*- coding: utf-8 -*-
c.NotebookApp.ip='*' #Enter the internal IP address of the ECS.
c.NotebookApp.password = u'argon2:$argon2id$v=19$m=10240,t=10,p=8$NmoAVwd8F6vFP2rX5ZbV7w
$SyueJoC0a5TbCuHYzqfSx1vQcFvOTTryR+0uk2MNNZA' # Enter the ciphertext generated at Out[2] in step 2.
c.NotebookApp.open_browser = False # Disable automatic browser opening.
c.NotebookApp.port = 9999 # Specified port number
c.NotebookApp.allow_remote_access = True
```

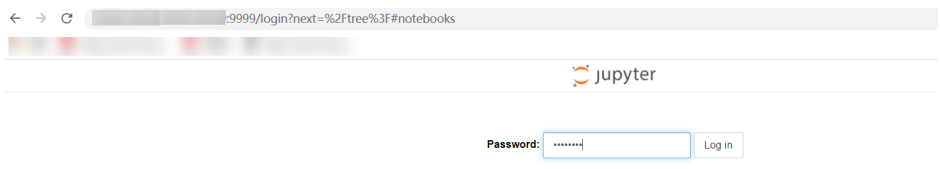
----End

14.6 Verifying that Jupyter Notebook Can Access MRS

Step 1 Run the following command on the client node to start Jupyter Notebook:

PYSPARK_PYTHON=./Python/bin/python3 PYSPARK_DRIVER_PYTHON=jupyter-notebook PYSPARK_DRIVER_PYTHON_OPTS="--allow-root" pyspark --master yarn --executor-memory 2G --driver-memory 1G

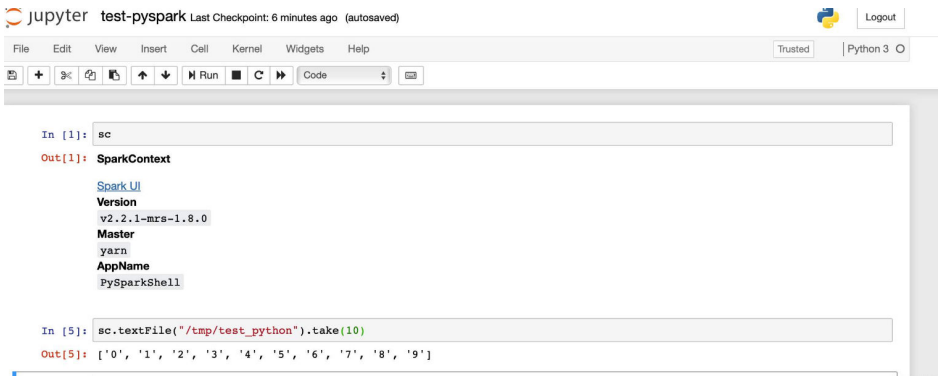
Step 2 Use *EIP*:**9999** to log in to the Jupyter web UI (ensure that the ECS security group allows the local public IP address and port 9999). The login password is the password configured in **Step 2**.



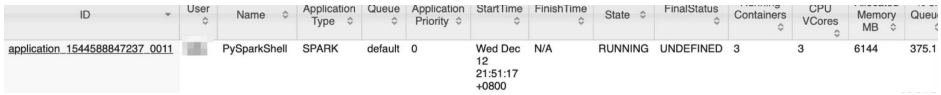
Step 3 Create code.

Create a Python 3 task and use Spark to read files.

The result is as follows:

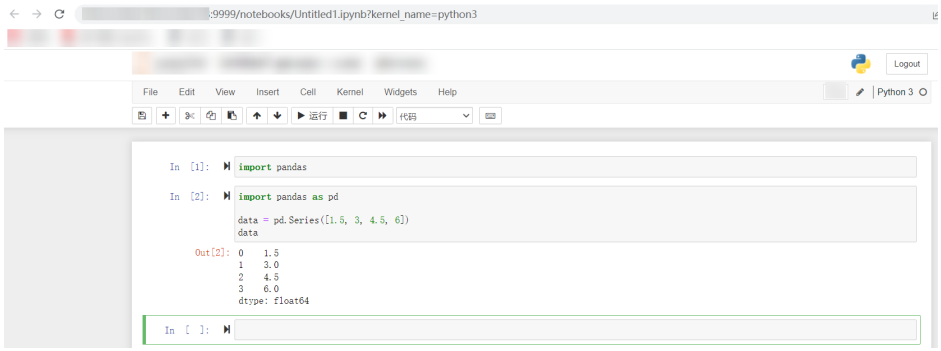


Log in to FusionInsight Manager and view the submitted PySpark application on the YARN web UI.



ID	User	Name	Application Type	Queue	Application Priority	StartTime	FinishTime	State	FinalStatus	Containers	CPU VCores	Memory MB	Queu
application_1544588847237_0011	[redacted]	PySparkShell	SPARK	default	0	Wed Dec 12 21:51:17 +0800	N/A	RUNNING	UNDEFINED	3	3	6144	375.1

Step 4 Verify that the pandas library can be called.

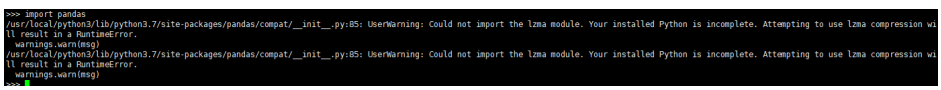


----End

14.7 FAQs

Question

When I import pandas from a local path, the following alarm is generated:



Procedure

Step 1 Run the **python -m pip install backports.lzma** command to install the LZMA module.

```
[root@master ~]# python -m pip install backports.lzma
Looking in indexes: http://mirrors.aliyun.com/pypi/simple/
Requirement already satisfied: backports.lzma in /usr/local/python3/lib/python3.7/site-packages (0.0.14)
You are using pip version 10.0.1, however version 19.3.1 is available.
You should consider upgrading via the 'pip install --upgrade pip' command.
```

Step 2 Go to the **/usr/local/python3/lib/python3.6** directory and edit the **lzma.py** file. The directory varies depending on hosts. You can run the **which** command to query the directory used by Python.

Change

```
from _lzma import *
from _lzma import _encode_filter_properties, _decode_filter_properties
```

To

```
try:
    from _lzma import *
    from _lzma import _encode_filter_properties, _decode_filter_properties
except ImportError:
    from backports.lzma import *
    from backports.lzma import _encode_filter_properties, _decode_filter_properties
```

Before modification

```
"""Interface to the liblzma compression library.

This module provides a class for reading and writing compressed files,
classes for incremental (de)compression, and convenience functions for
one-shot (de)compression.

These classes and functions support both the XZ and legacy LZMA
container formats, as well as raw compressed data streams.

>>> import pandas
>>>
```

----End

15 FAQs

15.1 Client Usage

15.1.1 How Do I Configure Environment Variables and Run Commands on a Component Client?

1. Log in to any Master node as user **root**.
2. Run the **su - omm** command to switch to user **omm**.
3. Run the **cd /opt/client** command to switch to the client.
4. Run the **source bigdata_env** command to configure environment variables.

   If Kerberos authentication is enabled for the current cluster, run the **kinit** *Component service user* command to authenticate the user. If Kerberos authentication is disabled, skip this step.
5. After the environment variables are configured, run the client command of the component. For example, to view component information, you can run the HDFS client command **hdfs dfs -ls /** to view the HDFS root directory file.

15.1.2 How Do I Disable ZooKeeper SASL Authentication?

Log in to FusionInsight Manager, choose **Cluster** > **Services** > **ZooKeeper**, click the **Configurations** tab and then **All Configurations**. In the navigation pane on the left, choose **quorumpeer(Role)** > **Customization**, add the **set zookeeper.sasl.disable** parameter, and set its value to **false**. Save the configuration and restart the ZooKeeper service.

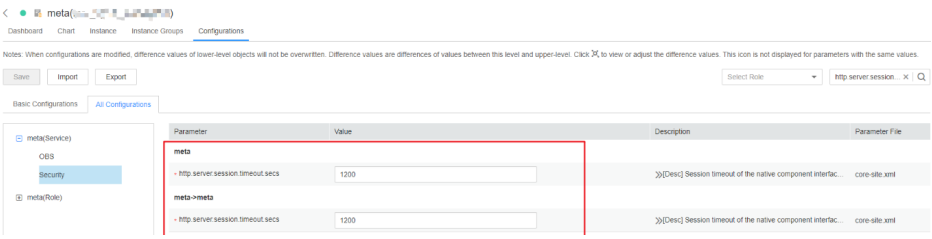
15.2 Web Page Access

15.2.1 How Do I Change the Session Timeout Duration for an Open Source Component Web UI?

You need to set a proper web session timeout duration for security purposes. To change the session timeout duration, do as follows:

Checking Whether the Cluster Supports Session Timeout Duration Adjustment

Log in to FusionInsight Manager and choose **Cluster** > **Services** > **meta**. On the displayed page, click **Configurations** and select **All Configurations**. Search for the **http.server.session.timeout.secs** configuration item. If this configuration item exists, perform the following steps to modify it. If the configuration item does not exist, the version does not support dynamic adjustment of the session duration.



You are advised to set all session timeout durations to the same value. Otherwise, the settings of some parameters may not take effect due to value conflict.

Modifying the Timeout Duration on Manager and the Authentication Center Page

1. Log in to each master node in the cluster and perform **2** to **3** on each master node.
2. Change the value of **<session-timeout>20</session-timeout>** in the **/opt/Bigdata/om-server_xxx/apache-tomcat-xxx/webapps/web/WEB-INF/web.xml** file. **<session-timeout>20</session-timeout>** indicates the session timeout duration, in minutes. Change it based on service requirements. The maximum value is 480 minutes.
3. Add **ticket.tgt.timeToKillInSeconds=28800** to the **/opt/Bigdata/om-server_xxx/apache-tomcat-8.5.63/webapps/cas/WEB-INF/classes/config/application.properties** file. **ticket.tgt.timeToKillInSeconds** indicates the validity period of the authentication center, in seconds. Change it based on service requirements. The maximum value is 28,800 seconds.
4. Restart the Tomcat node on the active master node.
   a. On the active master node, run the **netstat -anp |grep 28443 |grep LISTEN | awk '{print $7}'** command as user **omm** to query the Tomcat process ID.
   b. Run the **kill -9** *{pid}* command, in which *{pid}* indicates the Tomcat process ID obtained in **4.a**.
   c. Wait until the process automatically restarts.

      You can run the **netstat -anp |grep 28443 |grep LISTEN** command to check whether the process is successfully restarted. If the process is displayed, the process is successfully restarted. If the process is not displayed, query the process again later.

Modifying the Timeout Duration for an Open-Source Component Web UI

1. Access the **All Configurations** page.

   Log in to FusionInsight Manager and choose **Cluster** > **Services** > **meta**. On the displayed page, click **Configurations** and select **All Configurations**.

2. Change the value of **http.server.session.timeout.secs** under **meta** as required. The unit is second.
3. Save the settings, deselect **Restart the affected services or instances**, and click **OK**.

   You are advised to perform the restart during off-peak hours.
4. (Optional) If you need to use the Spark web UI, search for **spark.session.maxAge** on the **All Configurations** page of Spark and change the value (in seconds).

   Save the settings, deselect **Restart the affected services or instances**, and click **OK**.
5. Restart the meta service and components on web UI, or restart the cluster during off-peak hours.

   To prevent service interruption, restart the service during off-peak hours or perform a rolling restart.

15.2.2 Why Cannot I Refresh the Dynamic Resource Plan Page on MRS Tenant Tab?

Step 1 Log in to the Master1 and Master2 nodes as user **root**.

Step 2 Run the **ps -ef |grep aos** command to check the AOS process ID.

Step 3 Run the **kill -9** *AOS process ID* command to end the AOS process.

Step 4 Wait until the AOS process is automatically restarted.

You can run the **ps -ef |grep aos** command to check whether the AOS process restarts successfully. If the process exists, the restart is successful and the **Dynamic Resource Plan** page will be refreshed. If the process does not exist, retry later.

----End

15.2.3 What Do I Do If the Kafka Topic Monitoring Tab Is Unavailable on Manager?

Step 1 Log in to each Master node of the cluster and switch to user **omm**.

Step 2 Go to the **/opt/Bigdata/apache-tomcat-7.0.78/webapps/web/WEB-INF/lib/components/Kafka/** directory.

Step 3 Run the **cp /opt/share/zookeeper-3.5.1-mrs-2.0/zookeeper-3.5.1-mrs-2.0.jar ./** command to copy the ZooKeeper package.

Step 4 Restart the Tomcat process.

sh /opt/Bigdata/apache-tomcat-7.0.78/bin/shutdown.sh

sh /opt/Bigdata/apache-tomcat-7.0.78/bin/startup.sh

----End

15.3 Alarm Monitoring

15.3.1 In an MRS Streaming Cluster, Can the Kafka Topic Monitoring Function Send Alarm Notifications?

The Kafka topic monitoring function cannot send alarms by email or SMS message. However, you can view alarm information on Manager.

15.4 Performance Tuning

15.4.1 Does an MRS Cluster Support System Reinstallation?

An MRS cluster does not support system reinstallation.

15.4.2 Can I Change the OS of an MRS Cluster?

The OS of an MRS cluster cannot be changed.

15.4.3 How Do I Improve the Resource Utilization of Core Nodes in a Cluster?

1. On FusionInsight Manager, choose **Services** > **Yarn** > **Configurations** > **All Configurations**.
2. Search for **yarn.nodemanager.resource.memory-mb**, and increase the value based on the actual memory of the cluster nodes.
3. Save the change and restart the affected services or instances.

15.4.4 How Do I Stop the Firewall Service?

Step 1 Log in to each node of a cluster as user **root**.

Step 2 Check whether the firewall service is started.

For example, to check the firewall status on EulerOS, run the **systemctl status firewalld.service** command.

Step 3 Stop the firewall service.

For example, to stop the firewall service on EulerOS, run the **systemctl stop firewalld.service** command.

----End

15.5 Job Development

15.5.1 How Do I Get My Data into OBS or HDFS?

MRS can process data in OBS and HDFS. You can get your data into OBS or HDFS as follows:

1. Upload local data to OBS.

a. Log in to the OBS console.

b. Create a parallel file system named **userdata** on OBS and create the **program**, **input**, **output**, and **log** folders in the file system.

   i. Choose **Parallel File System** > **Create Parallel File System**, and create a file system named **userdata**.

   ii. In the OBS file system list, click the file system name **userdata**, choose **Files** > **Create Folder**, and create the **program**, **input**, **output**, and **log** folders.

c. Upload data to the **userdata** file system.

   i. Go to the **program** folder and click **Upload File**.

   ii. Click **add file** and select a user program.

   iii. Click **Upload**.

   iv. Upload the user data file to the **input** directory using the same method.

2. Import OBS data to HDFS.

   You can import OBS data to HDFS only when **Kerberos Authentication** is disabled and the cluster is running.

   a. Log in to the MRS console.

   b. Click the name of the cluster.

   c. On the page displayed, select the **Files** tab page and click **HDFS File List**.

   d. Select a data directory, for example, **bd_app1**.

      The **bd_app1** directory is only an example. You can use any directory on the page or create a new one.

   e. Click **Import Data** and click **Browse** to select an OBS path and an HDFS path.

   f. Click **OK**.

      You can view the file upload progress on the **File Operation Records** tab page.

15.5.2 What Types of Spark Jobs Can Be Submitted in a Cluster?

MRS clusters support Spark jobs submitted in Spark, Spark Script, or Spark SQL mode.

15.5.3 Can I Run Multiple Spark Tasks at the Same Time After the Minimum Tenant Resources of an MRS Cluster Is Changed to 0?

You can run only one Spark task at a time after the minimum tenant resources of an MRS cluster is changed to 0.

15.5.4 What Are the Differences Between the Client Mode and Cluster Mode of Spark Jobs?

You need to understand the concept ApplicationMaster before understanding the essential differences between Yarn-client and Yarn-cluster.

In Yarn, each application instance has an ApplicationMaster process, which is the first container started by the application. It interacts with ResourceManager and requests resources. After obtaining resources, it instructs NodeManager to start containers. The essential difference between the Yarn-cluster and Yarn-client modes lies in the ApplicationMaster process.

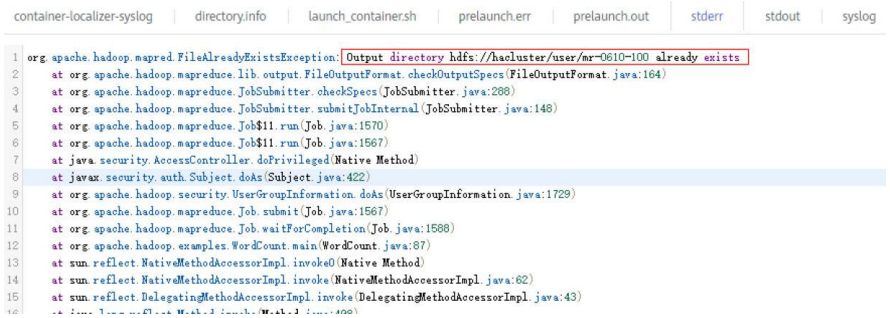
In Yarn-cluster mode, Driver runs in ApplicationMaster, which requests resources from Yarn and monitors the running status of a job. After a user submits a job, the client can be stopped and the job continues running on Yarn. Therefore, the Yarn-cluster mode is not suitable for running interactive jobs.

In Yarn-client mode, ApplicationMaster requests only Executor from Yarn. The client communicates with the requested containers to schedule tasks. Therefore, the client cannot be stopped.

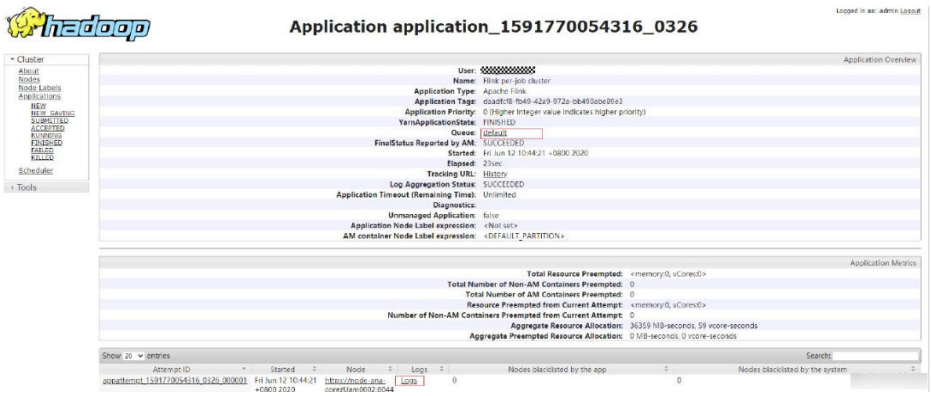
15.5.5 How Do I View MRS Job Logs?

Step 1 On the **Jobs** page of the MRS console, you can view logs of each job, including launcherJob and realJob logs.

- Generally, error logs are printed in **stderr** and **stdout** for launcherJob jobs, as shown in the following figure:



- You can view realJob logs on the ResourceManager web UI provided by the Yarn service on MRS Manager.



Step 2 Log in to the Master node of the cluster to obtain the job log files in **Step 1**. The HDFS path is **/tmp/logs/***{submit_user}*/**logs/***{application_id}*.

Step 3 After the job is submitted, if the job application ID cannot be found on the Yarn web UI, the job fails to be submitted. You can log in to the active Master node of the cluster and view the job submission process log **/var/log/executor/logs/exe.log**.

----End

15.5.6 How Do I Do If the Message "The current user does not exist on MRS Manager. Grant the user sufficient permissions on IAM and then perform IAM user synchronization on the Dashboard tab page." Is Displayed?

If IAM synchronization is not performed when a job is submitted in a security cluster, the error message "The current user does not exist on MRS Manager. Grant the user sufficient permissions on IAM and then perform IAM user synchronization on the Dashboard tab page." is displayed.

Before submitting a job, on the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.

15.5.7 LauncherJob Job Execution Is Failed And the Error Message "jobPropertiesMap is null." Is Displayed

The cause of the launcherJob failure is that the user who submits the job does not have the write permission on the **hdfs /mrs/job-properties** directory.

This problem is fixed in the 2.1.0.6 patch. You can also grant the write permission on the **/mrs/job-properties** directory to the synchronized user who submits the job on MRS Manager.

15.5.8 How Do I Do If the Flink Job Status on the MRS Console Is Inconsistent with That on Yarn?

To save storage space, the Yarn configuration item **yarn.resourcemanager.max-completed-applications** is modified to reduce the number of historical job records stored on Yarn. Flink jobs are long-term jobs. The realJob is still running on Yarn, but the launcherJob has been deleted. As a result, the launcherJob cannot be found on Yarn, and the job status fails to be updated. This problem is fixed in the 2.1.0.6 patch.

Workaround: Terminate the job whose launcherJob cannot be found. The status of the job submitted later will be updated.

15.5.9 How Do I Do If a SparkStreaming Job Fails After Being Executed Dozens of Hours and the OBS Access 403 Error is Reported?

When a user submits a job that needs to read and write OBS, the job submission program adds the temporary access key (AK) and secret key (SK) for accessing OBS by default. However, the temporary AK and SK have expiration time.

If you want to run long-term jobs such as Flink and SparkStreaming, you can enter the AK and SK in **Service Parameter** to ensure that the jobs will not fail to be executed due to key expiration.

15.5.10 How Do I Do If an Alarm Is Reported Indicating that the Memory Is Insufficient When I Execute a SQL Statement on the ClickHouse Client?

Symptom

The ClickHouse client restricts the memory used by GROUP BY statements. When a SQL statement is executed on the ClickHouse client, the following error information is displayed:

```
Progress: 1.83 billion rows, 85.31 GB (68.80 million rows/s., 3.21 GB/s.)  6%Received exception from server:
Code: 241. DB::Exception: Received from localhost:9000, 127.0.0.1.
DB::Exception: Memory limit (for query) exceeded: would use 9.31 GiB (attempt to allocate chunk of 1048576 bytes), maximum: 9.31 GiB:
(while reading column hits):
```

Solution

- Run the following command before executing an SQL statement on condition that the cluster has sufficient memory:
  ```
  SET max_memory_usage = 128000000000; #128G
  ```
- If no sufficient memory is available, ClickHouse enables you to overflow data to disk to free up the memory: You are advised to set the value of **max_memory_usage** to twice the size of **max_bytes_before_external_group_by**.
  ```
  set max_bytes_before_external_group_by=20000000000; #20G
  set max_memory_usage=40000000000; #40G
  ```

15.5.11 Why Submitted Yarn Job Cannot Be Viewed on the Web UI?

After a Yarn job is created, it cannot be viewed if you log in to the web UI as the **admin** user.

- The **admin** user is a user on the cluster management page. Check whether the user has the **supergroup** permission. Generally, only the user with the **supergroup** permission can view jobs.
- Log in to Yarn as the user who submits jobs to view jobs on Yarn. Do not view the jobs using the **admin** user.

15.5.12 How Do I Modify the HDFS NameSpace (fs.defaultFS) of an Existing Cluster?

You can modify or add the HDFS NameSpace (fs.defaultFS) of the cluster by modifying the **core-site.xml** and **hdfs-site.xml** files on the client. However, you are not advised to perform this operation on the server.

15.5.13 How Do I Do If the launcher-job Queue Is Stopped by YARN due to Insufficient Heap Size When I Submit a Flink Job on the Management Plane?

Symptom

The launcher-job queue is stopped by YARN when a Flink job is submitted on the management plane.

Solution

Increase the heap size of the launcher-job queue.

1. Log in to the active OMS node as user **omm**.
2. Change the value of **job.launcher.resource.memory.mb** in **/opt/executor/webapps/executor/WEB-INF/classes/servicebroker.xml** to **2048**.
3. Run the **sh /opt/executor/bin/restart-executor.sh** command to restart the executor process.

15.6 Cluster Upgrade/Patching

15.6.1 Can I Upgrade an MRS Cluster?

You cannot upgrade an MRS cluster. However, you can create a cluster of the target version and migrate data from the old cluster to the new cluster.

15.6.2 Can I Change the MRS Cluster Version?

You cannot change the version of an MRS cluster. However, you can terminate the current cluster and create an MRS cluster of the version you require.

15.7 Cluster Access

15.7.1 Can I Switch Between the Two Login Modes of MRS?

No. You can select the login mode when creating the cluster. You cannot change the login mode after you created the cluster.

15.7.2 How Can I Obtain the IP Address and Port Number of a ZooKeeper Instance?

You can obtain the IP address and port number of a ZooKeeper instance through the MRS console or FusionInsight Manager.

Method 1: Obtaining the IP address and port number of a ZooKeeper through the MRS console

1. On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.
2. Click the **Components** tab and choose **ZooKeeper**. On the displayed page, click **Instances** to view the business IP address of a ZooKeeper instance.
3. Click the **Service Configuration** tab. On the displayed page, search for the **clientPort** parameter to view the port number of the ZooKeeper instance.

Method 2: Obtaining the IP address and port number of a ZooKeeper through FusionInsight Manager

1. Log in to FusionInsight Manager. For details, see .
2. Perform the following operations to obtain the IP address and port number of a ZooKeeper instance.
   a. Choose **Cluster** > **Services** > **ZooKeeper**. On the displayed page, click the **Instance** tab to view the business IP address of a ZooKeeper instance.
   b. Click the **Configurations** tab. On the displayed page, search for the **clientPort** parameter to view the port number of the ZooKeeper instance.

15.8 Big Data Service Development

15.8.1 Can MRS Run Multiple Flume Tasks at a Time?

The Flume client supports multiple independent data flows. You can configure and link multiple sources, channels, and sinks in the **properties.properties** configuration file. These components can be linked to form multiple flows.

The following is an example of configuring two data flows in a configuration file:

```
server.sources = source1 source2
server.sinks = sink1 sink2
server.channels = channel1 channel2

#dataflow1
server.sources.source1.channels = channel1
server.sinks.sink1.channel = channel1

#dataflow2
server.sources.source2.channels = channel2
server.sinks.sink2.channel = channel2
```

15.8.2 How Do I Change FlumeClient Logs to Standard Logs?

1. Log in to the node where FlumeClient is running.
2. Go to the FlumeClient installation directory.

   For example, if the FlumeClient installation directory is **/opt/FlumeClient**, run the following command:

   cd /opt/FlumeClient/fusioninsight-flume-1.9.0/bin
3. Run the **./flume-manage.sh stop** command to stop FlumeClient.
4. Run the **vi /log4j.properties** command to open the **log4j.properties** file and change the value of **flume.root.logger** to **${flume.log.level},console**.
5. Run the **vim /flume-manager.sh** command to open the **flume-manager.sh** script in the **bin** directory in the Flume installation directory.

6. Comment out the following information in the **flume-manager.sh** script:

   >/dev/null 2>&1 &

7. Run the **./flume-manage.sh start** command to restart FlumeClient.
8. After the modification, check whether the Docker configuration is correct.

15.8.3 Where Are the .jar Files and Environment Variables of Hadoop Located?

- The **hadoopstreaming.jar** file is stored in the **/opt/share/hadoop-streaming-*** directory. ***** indicates the Hadoop version.
- The JDK environment variables are stored in **/opt/client/JDK/component_env**.
- The Hadoop environment variables are stored in **/opt/client/HDFS/component_env**.
- The Hadoop client path is **/opt/client/HDFS/hadoop**.

15.8.4 What Compression Algorithms Does HBase Support?

HBase supports the Snappy, LZ4, and gzip compression algorithms.

15.8.5 Can MRS Write Data to HBase Through the HBase External Table of Hive?

No. Hive on HBase supports only data query.

15.8.6 How Do I View HBase Logs?

1. Log in to the Master node in the cluster as user **root**.
2. Run the **su - omm** command to switch to user **omm**.
3. Run the **cd /var/log/Bigdata/hbase/** command to go to the **/var/log/Bigdata/hbase/** directory and view HBase logs.

15.8.7 How Do I Set the TTL for an HBase Table?

- Set the time to live (TTL) when creating a table:

  Create the **t_task_log** table, set the column family to **f**, and set the TTL to **86400** seconds.

  ```
  create 't_task_log',{NAME => 'f', TTL=>'86400'}
  ```

- Set the TTL for an existing table:

  ```
  disable "t_task_log" #Disable the table (services must be stopped).
  alter "t_task_log",NAME=>'data',TTL=>'86400' # Set the TTL value for the column family data.
  enable "t_task_log" #Restore the table.
  ```

15.8.8 How Do I Balance HDFS Data?

1. Log in to the master node of the cluster and run the corresponding command to configure environment variables. **/opt/client** indicates the client installation directory. Replace it with the actual one.

   source /opt/client/bigdata_env

kinit Component service user (If Kerberos authentication is enabled for the cluster, run this command to authenticate the user. Skip this step if the Kerberos authentication is disabled.)

2. Run the following command to start the balancer:

   /opt/client/HDFS/hadoop/sbin/start-balancer.sh -threshold 5

3. View the log.

   After you execute the balance task, the **hadoop-root-balancer-***Host name***.log** log file will be generated in the client installation directory **/opt/client/HDFS/hadoop/logs**.

4. (Optional) If you do not want to perform data balancing, run the following commands to stop the balancer:

   source /opt/client/bigdata_env

   kinit Component service user (If Kerberos authentication is enabled for the cluster, run this command to authenticate the user. Skip this step if the Kerberos authentication is disabled.)

   /opt/client/HDFS/hadoop/sbin/stop-balancer.sh -threshold 5

15.8.9 How Do I Change the Number of HDFS Replicas?

1. Log in to FusionInsight Manager, and choose **Services** > **HDFS** > **Configurations** > **All Configurations**.
2. Search for **dfs.replication**, change the value (value range: 1 to 16), and restart the HDFS instance.

15.8.10 How Do I Modify the HDFS Active/Standby Switchover Class?

If the **org.apache.hadoop.hdfs.server.namenode.ha.AdaptiveFailoverProxyProvider** class is unavailable when a cluster connects to NameNodes using HDFS, the cause is that the HDFS active/standby switchover class of the cluster is configured improperly. To solve the problem, perform the following operations:

- Method 1: Add the **hadoop-plugins-*xxx*.jar** package to the **classpath** or **lib** directory of your program.

  The **hadoop-plugins-*xxx*.jar** package is stored in the HDFS client directory, for example, **$HADOOP_HOME/share/hadoop/common/lib/hadoop-plugins-8.0.2-302023.jar**.

- Method 2: Change the configuration item of HDFS to the corresponding open source class, as shown in the follows:

  dfs.client.failover.proxy.provider.hacluster=org.apache.hadoop.hdfs.server.namenode.ha.ConfiguredFailoverProxyProvider

15.8.11 What Is the Recommended Number Type of DynamoDB in Hive Tables?

smallint is recommended.

15.8.12 Can the Hive Driver Be Interconnected with DBCP2?

The Hive driver cannot be interconnected with the DBCP2 database connection pool. The DBCP2 database connection pool invokes the **isValid** method to check whether a connection is available. However, Hive directly throws an exception when implementing this method.

15.8.13 Can I Export the Query Result of Hive Data?

Run the following statement to export the query result of Hive data:

```
insert overwrite local directory "/tmp/out/" row format delimited fields terminated by "\t" select * from table;
```

15.8.14 How Do I Do If an Error Occurs When Hive Runs the beeline -e Command to Execute Multiple Statements?

When Hive runs the **beeline -e " use default;show tables;"** command, the following error message is displayed: Error while compiling statement: FAILED: ParseException line 1:11 missing EOF at ';' near 'default' (state=42000,code=40000).

Solutions:

- Method 1: Replace the **beeline -e " use default;show tables;"** command with **beeline --entirelineascommand=false -e "use default;show tables;"**.
- Method 2:
  a. In the **/opt/Bigdata/client/Hive** directory on the Hive client, change **export CLIENT_HIVE_ENTIRELINEASCOMMAND=true** in the **component_env** file to **export CLIENT_HIVE_ENTIRELINEASCOMMAND=false**.

  Figure 15-1 Changing the **component_env** file

  b. Run the following command to verify the configuration:

  source /opt/Bigdata/client/bigdata_env

  beeline -e " use default;show tables;"

15.8.15 How Do I Do If a "hivesql/hivescript" Job Fails to Submit After Hive Is Added?

This issue occurs because the **MRS CommonOperations** permission bound to the user group to which the user who submits the job belongs does not include the Hive permission after being synchronized to Manager. To solve this issue, perform the following operations:

1. Add the Hive service.

2. Log in to the IAM console and create a user group. The policy bound to the user group is the same as that of the user group to which the user who submits the job belongs.
3. Add the user who submits the job to the new user group.
4. Refresh the cluster details page on the MRS console. The status of IAM user synchronization is **Not synchronized**.
5. Click **Synchronize** on the right of **IAM User Sync**. Go back to the previous page. In the navigation pane on the left, choose **Operation Logs** and check whether the user is changed.
   - If yes, submit the Hive job again.
   - If no, check whether all the preceding operations are complete.
     - If yes, contact the O&M personnel.
     - If no, submit the Hive job after the preceding operations are complete.

15.8.16 How Do I Reset Kafka Data?

You can reset Kafka data by deleting Kafka topics.

- Delete a topic: **kafka-topics.sh --delete --zookeeper** *ZooKeeper Cluster service IP address*:**2181/kafka --topic *topicname***
- Query all topics: **kafka-topics.sh --zookeeper** *ZooKeeper cluster service IP address*:**2181/kafka --list**

After the deletion command is executed, empty topics will be deleted immediately. If a topic has data, the topic will be marked for deletion and will be deleted by Kafka later.

15.8.17 How Do I Obtain the Client Version of MRS Kafka?

Run the **--bootstrap-server** command to query the information about the client.

15.8.18 What Access Protocols Are Supported by Kafka?

Kafka supports PLAINTEXT, SSL, SASL_PLAINTEXT, and SASL_SSL.

15.8.19 How Do I Do If Error Message "Not Authorized to access group xxx" Is Displayed When a Kafka Topic Is Consumed?

This issue is caused by the conflict between the Ranger authentication and ACL authentication of a cluster. If a Kafka cluster uses ACL for permission access control and Ranger authentication is enabled for the Kafka component, all authentications of the component are managed by Ranger. The permissions set by the original authentication plug-in are invalid. As a result, ACL authorization does not take effect. You can disable Ranger authentication of Kafka and restart the Kafka service to rectify the fault. The procedure is as follows:

1. Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Kafka**.

2. In the upper right corner of the **Dashboard** page, click **More** and choose **Disable Ranger**. In the displayed dialog box, enter the password and click **OK**. After the operation is successful, click **Finish**.
3. In the upper right corner of the **Dashboard** page, click **More** and choose **Restart Service** to restart the Kafka service.

15.8.20 What Are the Differences Between Sample Project Building and Application Development? Is Python Code Supported?

- The sample project and application development in MRS are the same. You can select either of them.
- MRS supports Python code.

15.8.21 How Do I Connect to Spark Shell from MRS?

1. Log in to the Master node in the cluster as user **root**.
2. Run the following command to configure environment variables:

   source /opt/client/bigdata_env
3. If Kerberos authentication is enabled for the cluster, authenticate the user. If Kerberos authentication is disabled, skip this step.

   Command: **kinit** *MRS cluster user*

   Example:

   - If the user is a machine-machine user, run **kinit -kt user.keytab sparkuser**.
   - If the user is a human-machine user, run **kinit sparkuser**.
4. Run the following command to connect to Spark shell:

   spark-shell

15.8.22 How Do I Connect to Spark Beeline from MRS?

1. Log in to the master node in the cluster as user **root**.
2. Run the following command to configure environment variables:

   source /opt/client/bigdata_env
3. If Kerberos authentication is enabled for the cluster, authenticate the user. If Kerberos authentication is disabled, skip this step.

   Command: **kinit** *MRS cluster user*

   Example:

   - If the user is a machine-machine user, run **kinit -kt user.keytab sparkuser**.
   - If the user is a human-machine user, run **kinit sparkuser**.
4. Run the following command to connect to Spark Beeline:

   spark-beeline
5. Run commands on Spark Beeline. For example, create the table **test** in the **obs://mrs-word001/table/** directory.

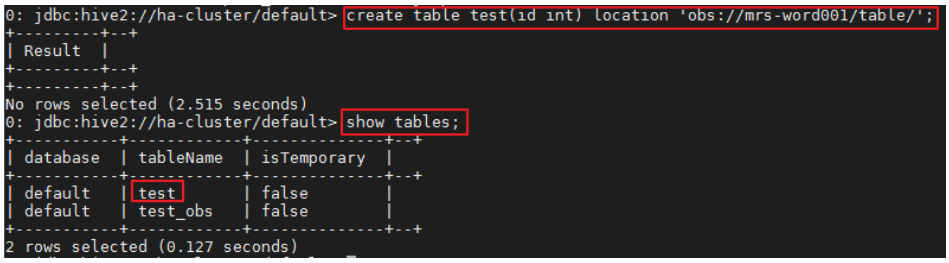
   create table test(id int) location 'obs://mrs-word001/table/';

6. Query all tables.

   show tables;

   If the table **test** is displayed in the command output, OBS is successfully accessed.

   Figure 15-2 Returned table name



7. Press **Ctrl+C** to exit the Spark Beeline.

15.8.23 Where Are the Execution Logs of Spark Jobs Stored?

- Logs of unfinished Spark jobs are stored in the **/srv/BigData/hadoop/data1/nm/containerlogs/** directory on the Core node.
- Logs of finished Spark jobs are stored in the **/tmp/logs/***username*/**logs** directory of HDFS.

15.8.24 How Do I Specify a Log Path When Submitting a Task in an MRS Storm Cluster?

You can modify the **/opt/Bigdata/MRS_***XXX* **/1_***XX* **_Supervisor/etc/worker.xml** file on the streaming Core node of MRS, set the value of **filename** to the path, and restart the corresponding instance on Manager.

You are advised not to modify the default log configuration of MRS. Otherwise, the log system may become abnormal.

15.8.25 How Do I Check Whether the ResourceManager Configuration of Yarn Is Correct?

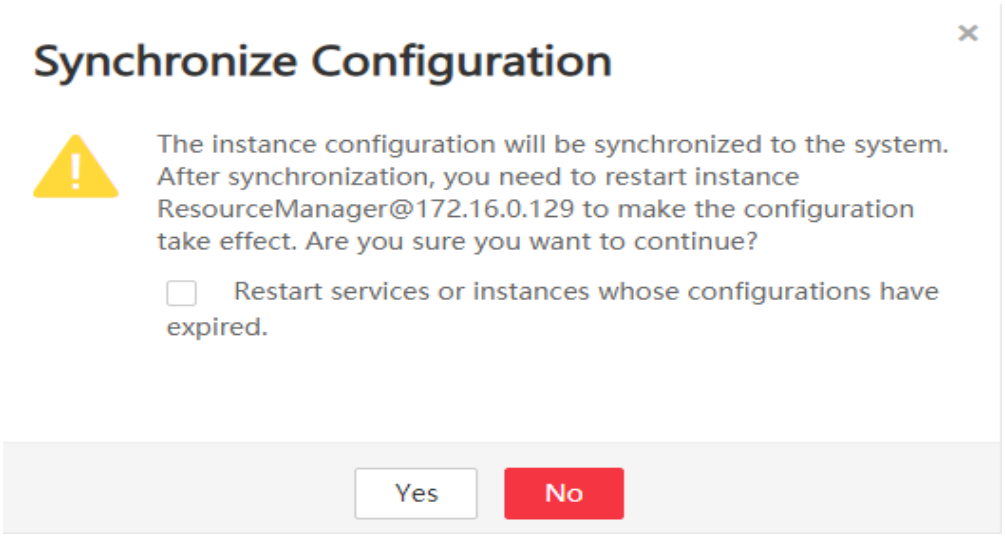
Step 1 Log in to MRS Manager and choose **Services** > **Yarn** > **Instance**.

Step 2 Synchronize the configuration between the two ResourceManager nodes.

Perform the following steps on each ResourceManager node:

1. Click the name of the ResourceManager node, and choose **More** > **Synchronize Configuration**.
2. In the dialog box displayed, deselect **Restart services or instances whose configurations have expired** and click **Yes**.

Figure 15-3 Synchronization configurations



Step 3 Log in to the Master nodes as user **root**.

Step 4 Run the **cd /opt/Bigdata/MRS_Current/*_*_ResourceManager/etc_UPDATED/** command to go to the **etc_UPDATED** directory.

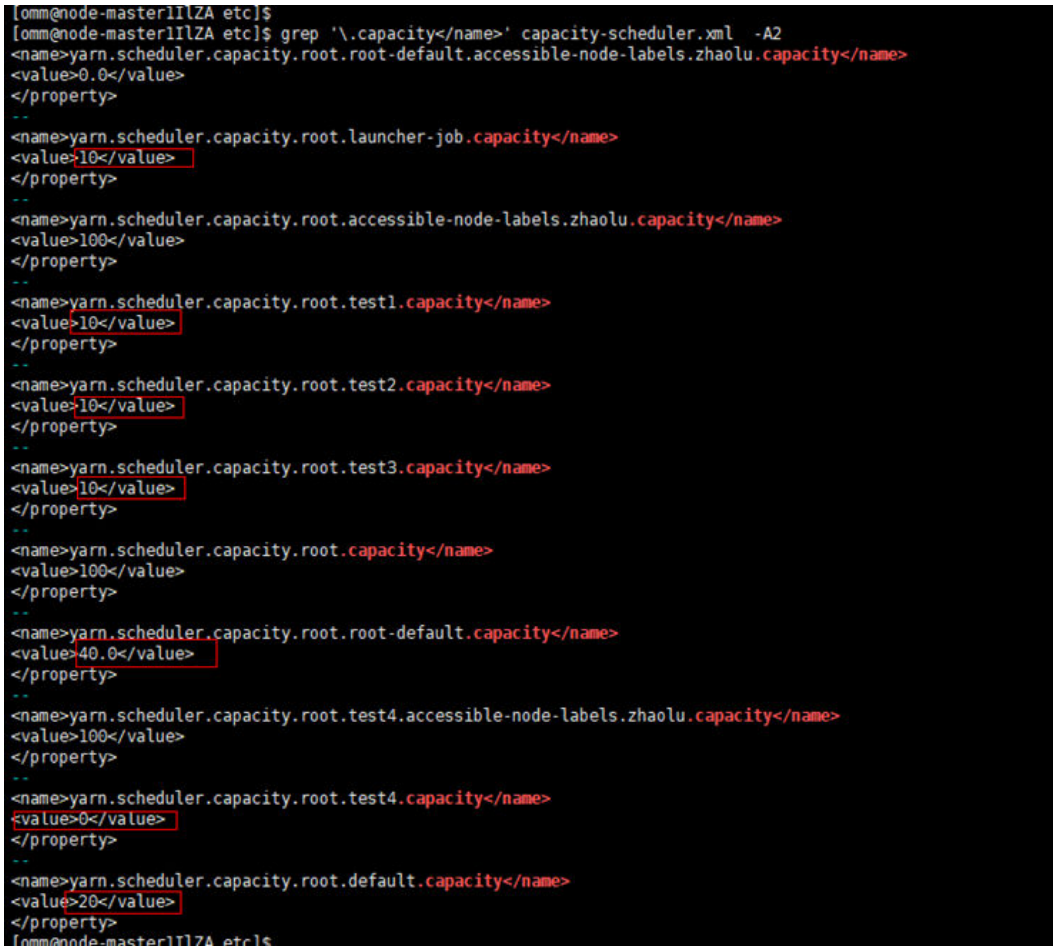
Step 5 Run the **grep '\.queues' capacity-scheduler.xml -A2** command to display all configured queues and check whether the queues are consistent with those displayed on Manager.

root-default is hidden on the Manager page.

```
[omm@node-master1IlZA etc]$
[omm@node-master1IlZA etc]$ grep '\.queues' capacity-scheduler.xml  -A2
<name>yarn.scheduler.capacity.root.queues</name>
<value>default,root-default,launcher-job,test1,test2,test3,test4</value>
</property>
[omm@node-master1IlZA etc]$
[omm@node-master1IlZA etc]$
```

Step 6 Run the **grep '\.capacity</name>' capacity-scheduler.xml -A2** command to display the value of each queue and check whether the value of each queue is the same as that displayed on Manager. Check whether the sum of the values configured for all queues is **100**.

- If the sum is **100**, the configuration is correct.
- If the sum is not **100**, the configuration is incorrect. Perform the following steps to rectify the fault.



Step 7 Log in to MRS Manager, and select **Hosts**.

Step 8 Determine the active Master node. The host name of the active Master node starts with a solid pentagon.

Step 9 Log in to the active Master node as user **root**.

Step 10 Run the **su - omm** command to switch to user **omm**.

Step 11 Run the **sh /opt/Bigdata/om-0.0.1/sbin/restart-controller.sh** command to restart the controller when no operation is being performed on Manager.

Restarting the controller will not affect the big data component services.

Step 12 Repeat **Step 1** to **Step 6** to synchronize ResourceManager configurations and check whether the configurations are correct.

If the latest configuration has not been loaded after the configuration synchronization is complete, a message will be displayed on the Manager page indicating that the configuration has expired. However, this will not affect services. The latest configuration will be automatically loaded when the component restarts.

----End

15.8.26 How Do I Modify the allow_drop_detached Parameter of ClickHouse?

Step 1 Log in to the node where the ClickHouse client is located as user **root**.

Step 2 Run the following commands to go to the client installation directory and set the environment variables:

cd /opt/*Client installation directory*

source bigdata_env

Step 3 If Kerberos authentication is enabled for the cluster, run the following command to authenticate the user. If Kerberos authentication is disabled, skip this step.

kinit *MRS cluster user*

NOTE

The user must have the ClickHouse administrator permissions.

Step 4 Run the **clickhouse client --host** *192.168.42.90* **--secure -m** command, in which *192.168.42.90* indicates the IP address of the ClickHouseServer instance node. The command output is as follows:

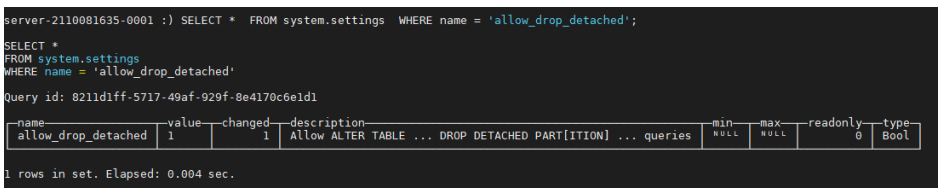
```
[root@server-2110082001-0017 hadoopclient]# clickhouse client --host 192.168.42.90 --secure -m
ClickHouse client version 21.3.4.25.
Connecting to 192.168.42.90:21427.
Connected to ClickHouse server version 21.3.4 revision 54447.
```

Step 5 Run the following command to set the value of the **allow_drop_detached** parameter, for example, **1**:

set allow_drop_detached=1;

Step 6 Run the following command to query the value of the **allow_drop_detached** parameter:

SELECT * FROM system.settings WHERE name = 'allow_drop_detached';



Step 7 Run the **q;** command to exit the ClickHouse client.

----End

15.9 API

15.9.1 How Do I Configure the node_id Parameter When Using the API for Adjusting Cluster Nodes?

When you use the API for adjusting cluster nodes, the value of **node_id** is fixed to **node_orderadd**.

15.10 Cluster Management

15.10.1 How Do I View All Clusters?

You can view all MRS clusters on the **Clusters** page. You can view clusters in different status.

- **Active Clusters**: all clusters except clusters in **Failed** and **Terminated** states.
- **Cluster History**: clusters in the **Terminated** state. Only the clusters terminated within the last six months are displayed. If you want to view clusters terminated more than six months ago, contact technical support engineers.
- **Failed Tasks**: tasks in **Failed** state. The failed tasks include the following:
  - Tasks failed to create clusters
  - Tasks failed to terminate clusters
  - Tasks failed to scale out clusters
  - Tasks failed to scale in clusters

15.10.2 How Do I View Log Information?

You can view operation logs of clusters and jobs on the **Operation Logs** page. The MRS operation logs record the following operations:

- Cluster operations
  - Create, terminate, and scale out or in clusters
  - Create directories and delete directories or files
- Job operations: Create, stop, and delete jobs
- Data operations: IAM user tasks, add users, and add user groups

Figure 15-4 shows the operation logs.

Figure 15-4 Log information

Operation Type	Operator IP Address	Operation Description	Time
Cluster	10.63.167.82	Create id is: 0bb2a919-666d-40c0-8cb1-a3486431aae6 and name as: bigdata_xq318 cluster	2016-03-18 17:17:46
Cluster	10.57.99.128	Delete the id for e92e5dc7-34c1-449d-b353-3651853e7631 name for bigdata_DVwu cluster	2016-03-10 16:45:24
Job	10.63.167.82	createJob,jobId:f591520b-c632-4f33-9d2f-063e942c93a2,jobName:distcp,clusterId:e92e5dc7-34c1-449d-b353-3651853e7631	2016-03-10 10:26:28

Cluster	10.63.195.73	Create id is: e92e5dc7-34c1-449d-b353-3651853e7631 and name as: bigdata_DVwu cluster	2016-02-23 11:05:24

15.10.3 How Do I View Cluster Configuration Information?

- After a cluster is created, click the cluster name on the MRS console. On the page displayed, you can view basic configuration information about the cluster. The instance specifications and node capacity determine the data analysis and processing capability. Higher instance specifications and larger capacity enable faster data processing at a higher cost.
- On the basic information page, click **Access Manager** to access the MRS cluster management page. On MRS Manager, you can view and handle alarms, and modify cluster configuration.

15.10.4 How Do I Install Kafka and Flume in an MRS Cluster?

You cannot install the Kafka and Flume components for a created cluster of MRS 3.1.0 or earlier. Kafka and Flume are components for a streaming cluster. To install Kafka and Flume, create a streaming or hybrid cluster, and install Kafka and Flume.

15.10.5 How Do I Stop an MRS Cluster?

To stop an MRS cluster, stop each node in the cluster on the ECS. Click the name of each node on the **Nodes** tab page to go to the **Elastic Cloud Server** page and click **Stop**.

15.10.6 Can I Change MRS Cluster Nodes on the MRS Console?

You cannot change MRS cluster nodes on the MRS console. You are also advised not to change MRS cluster nodes on the ECS console. Manually stopping or deleting an ECS, modifying or reinstalling the ECS OS, or modifying ECS specifications for a cluster node on the ECS console will affect the cluster stability.

If an ECS is deleted, the ECS OS is modified or reinstalled, or the ECS specifications are modified on the ECS console, MRS will automatically identify and delete the node. You can log in to the MRS console and restore the deleted node through scale-out. Do not perform operations on the nodes that are being scaled out.

15.10.7 How Do I Shield Cluster Alarm/Event Notifications?

1. Log in to the MRS console.
2. Click the name of the cluster.
3. On the page displayed, choose **Alarms** > **Notification Rules**.
4. Locate the row that contains the rule you want to modify, click **Edit** in the **Operation** column, and deselect the alarm or event severity levels.
5. Click **OK**.

15.10.8 Why Is the Resource Pool Memory Displayed in the MRS Cluster Smaller Than the Actual Cluster Memory?

In an MRS cluster, MRS allocates 50% of the cluster memory to Yarn by default. You manage Yarn nodes logically by resource pool. Therefore, the total memory of the resource pool displayed in the cluster is only 50% of the total memory of the cluster.

15.10.9 How Do I Configure the knox Memory?

Step 1 Log in to a Master node of the cluster as user **root**.

Step 2 Run the following command on the Master node to open the **gateway.sh** file:

su omm

vim /opt/knox/bin/gateway.sh

Step 3 Change **APP_MEM_OPTS=""** to **APP_MEM_OPTS="-Xms256m -Xmx768m"**, save the file, and exit.

Step 4 Run the following command on the Master node to restart the knox process:

sh /opt/knox/bin/gateway.sh stop

sh /opt/knox/bin/gateway.sh start

Step 5 Repeat the preceding steps on each Master node.

Step 6 Run the **ps -ef |grep knox** command to check the configured memory.

Figure 15-5 knox memory

----End

15.10.10 What Is the Python Version Installed for an MRS Cluster?

Log in to a Master node as user **root** and run the **Python3** command to query the Python version.

15.10.11 How Do I View the Configuration File Directory of Each Component?

The configuration file paths of commonly used components are as follows:

Component	Configuration File Directory
ClickHouse	*Client installation directory*/**ClickHouse/clickhouse/config**
Flink	*Client installation directory*/**Flink/flink/conf**
Flume	*Client installation directory*/**fusioninsight-flume-***xxx*/**conf**
HBase	*Client installation directory*/**HBase/hbase/conf**
HDFS	*Client installation directory*/**HDFS/hadoop/logs/hadoop.log**
Hive	*Client installation directory*/**Hive/config**

Component	Configuration File Directory
Hudi	*Client installation directory*/**Hudi/hudi/conf**
Kafka	*Client installation directory*/**Kafka/kafka/config**
Loader	• *Client installation directory*/**Loader/loader-tools-xxx/loader-tool/conf** • *Client installation directory*/**Loader/loader-tools-xxx/schedule-tool/conf** • *Client installation directory*/**Loader/loader-tools-xxx/shell-client/conf** • *Client installation directory*/**Loader/loader-tools-xxx/sqoop-shell/conf**
Oozie	*Client installation directory*/**Oozie/oozie-client-***xxx*/**conf**
Spark2x	*Client installation directory/Spark2x/spark/conf*
Yarn	*Client installation directory/Yarn/config*
ZooKeeper	*Client installation directory/Zookeeper/zookeeper/conf*

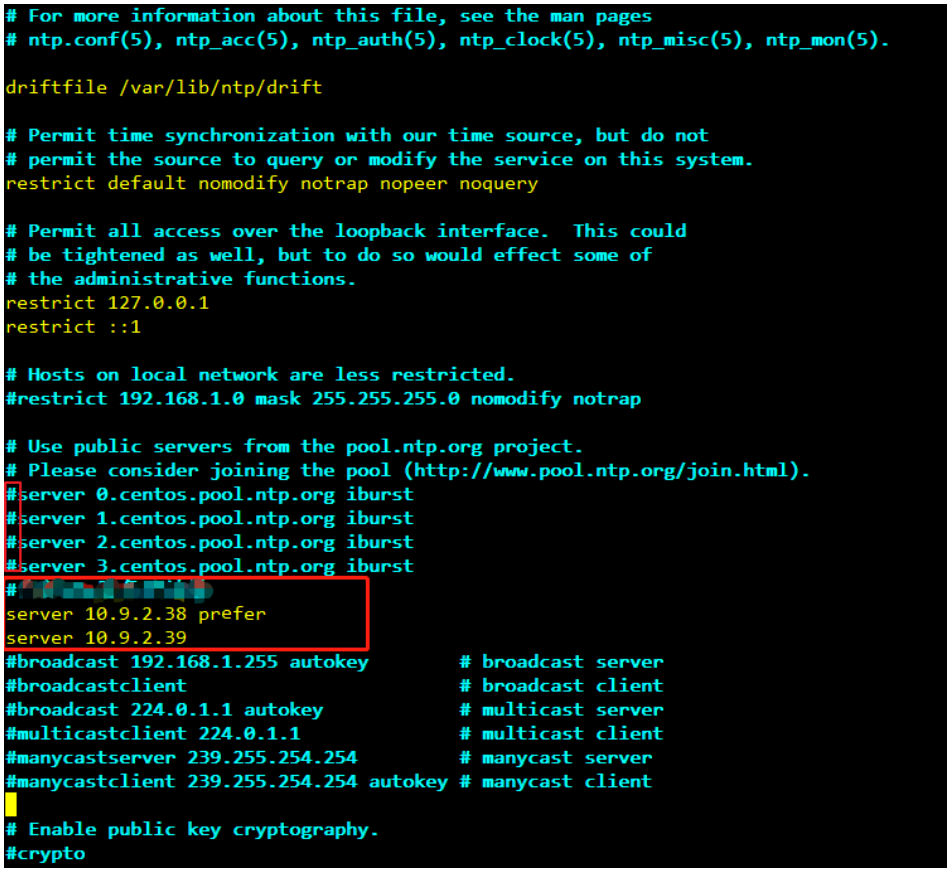
15.10.12 How Do I Do If the Time on MRS Nodes Is Incorrect?

- If the time on a node inside the cluster is incorrect, log in to the node and rectify the fault from 2.
- If the time on a node inside the cluster is different from that on a node outside the cluster, log in to the node and rectify the fault from 1.

1. Run the **vi /etc/ntp.conf** command to edit the NTP client configuration file, add the IP addresses of the master node in the MRS cluster, and comment out the IP address of other servers.

```
server master1_ip prefer
server master2_ip
```

Figure 15-6 Adding the master node IP addresses



2. Run the **service ntpd stop** command to stop the NTP service.
3. Run the **/usr/sbin/ntpdate** *IP address of the active master node* command to manually synchronize time.
4. Run the **service ntpd start** or **systemctl restart ntpd** command to start the NTP service.
5. Run the **ntpstat** command to check the time synchronization result:

15.10.13 How Do I Do If Trust Relationships Between Nodes Are Abnormal?

If "ALM-12066 Inter-Node Mutual Trust Fails" is reported on Manager or there is no SSH trust relationship between nodes, rectify the fault by performing the following operations:

1. Run the **ssh-add -l** command on both nodes of the trusted cluster to check whether there are identities.

```
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ll .ssh/
total 32
srw-------. 1 omm wheel     0 Dec 29 14:17 agent.pid
-rw-------. 1 omm wheel 12901 Mar  9 14:48 authorized_keys
-rw-------. 1 omm wheel    54 Sep 24 11:42 config
-rw-------. 1 omm wheel  1766 Sep 24 11:43 id_rsa
-rw-------. 1 omm wheel   402 Sep 24 11:42 id_rsa.pub
-rw-------. 1 omm wheel    88 Jun  8  2020 id_rsa.sha256
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ssh-add -l
The agent has no identities.
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ vim /var/log/Bigdata/nodeagent/
agentlog/   alarmlog/   monitorlog/ scriptlog/
[omm@node-group-2eU40 ~]$ vim /var/log/Bigdata/nodeagent/scriptlog/
agent_alarm_py.log                      install.log
agent_alarm_py.log.1                    installntp.log
```

2. If no identities are displayed, run the **ps -ef|grep ssh-agent** command to find the ssh-agent process, kill the process, and wait for the process to automatically restart.

```
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ssh-add -l
The agent has no identities.
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ps -ef|grep ssh-agent
omm      18729     1  0 14:53 ?        00:00:00 ssh-agent -a /home/omm/.ssh/agent.pid
omm      25098     1  0 14:54 ?        00:00:00 bash /opt/Bigdata/om-agent/nodeagent/bin/ssh-agent-monitor-startup.sh
omm      25206 25098  0 14:54 ?        00:00:00 bash /opt/Bigdata/om-agent/nodeagent/bin/ssh-agent-monitor.sh
omm      27201  4913  0 14:54 pts/0    00:00:00 grep --color=auto ssh-agent
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ssh-add -l
```

3. Run the **ssh-add -l** command to check whether the identities have been added. If yes, manually run the **ssh** command to check whether the trust relationship is normal.

```
omm      22276  4913  0 14:53 pts/0    00:00:00 grep --color=auto ssh-agent
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ssh-add -l
The agent has no identities.
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ps -ef|grep ssh-agent
omm      18729     1  0 14:53 ?        00:00:00 ssh-agent -a /home/omm/.ssh/agent.pid
omm      25098     1  0 14:54 ?        00:00:00 bash /opt/Bigdata/om-agent/nodeagent/bin/ssh-agent-monitor-startup.sh
omm      25206 25098  0 14:54 ?        00:00:00 bash /opt/Bigdata/om-agent/nodeagent/bin/ssh-agent-monitor.sh
omm      27201  4913  0 14:54 pts/0    00:00:00 grep --color=auto ssh-agent
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ssh-add -l
2048 SHA256:uChnRUbhh1HYxpfOZibS0zym1lKXM1aFyvn0IMpiZjg /home/omm/.ssh/id_rsa (RSA)
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ssh 10.33.109.226
Warning: Permanently added '10.33.109.226' (ECDSA) to the list of known hosts.
```

4. If identities exist, check whether the **authorized_keys** file in the **/home/omm/.ssh** directory contains the information in the **id_rsa.pub** file in the **/home/omm/.ssh** of the peer node. If no, manually add the information about the peer node.
5. Check whether the permissions on the files in **/home/omm/.ssh** directory are correct.
6. Check the **/var/log/Bigdata/nodeagent/scriptlog/ssh-agent-monitor.log** file.
7. If the **home** directory of user **omm** is deleted, contact MRS support personnel.

15.10.14 How Do I Adjust the Memory Size of the manager-executor Process?

Symptom

The **manager-executor** process runs either on the Master1 or Master2 node in the MRS cluster in active/standby mode. This process is used to encapsulate the MRS management and control plane's operations on the MRS cluster, such as job submission, heartbeat reporting, certain alarm reporting, as well as cluster creation, scale-out, and scale-in. When you submit jobs on the MRS management and control plane, the Executor memory may become insufficient as the tasks increase or the number of concurrent tasks increases. As a result, the CPU usage is high and the Executor process experiences out-of-memory (OOM) errors.

Procedure

1. Log in to either the Master1 or Master2 node as user **root** and run the following command to switch to user **omm**:

   su - omm

2. Run the following command to modify the **catalina.sh** script. Specifically, search for **JAVA_OPTS** in the script, find the configuration items similar to **JAVA_OPTS="-Xms1024m -Xmx4096m**, and change the values of the items to desired ones, and save the modification.

   vim /opt/executor/bin/catalina.sh

   ```
   JAVA_OPTS="-Xms1024m -Xmx4096m"
   JAVA_OPTS="$JAVA_OPTS $JSSE_OPTS"
   LOG4J_PROPERTIES_PATH="${CATALINA_HOME}/lib/log4j.properties"
   CATALINA_OPTS="-XX:+PrintGC -XX:+PrintGCDetails -XX:+PrintGCTimeStamps -XX:+PrintGCApplicationStoppedTime \
   -XX:+PrintHeapAtGC -Xloggc:/var/log/executor/logs/gc.log -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=10 \
   -XX:GCLogFileSize=20M -XX:OnOutOfMemoryError=\"kill -9 %p\" -XX:+HeapDumpOnOutOfMemoryError \
   -XX:HeapDumpPath=/var/log/executor/logs/executor-dump.hprof"
   ```

3. The **manager-executor** process only runs on either the Master1 or Master2 node in active/standby mode. Check whether it exists on the node before restarting it.

   a. Log in to the Master1 and Master2 nodes and run the following command to check whether the process exists. If any command output is displayed, the process exists.

      ps -ef | grep "/opt/executor" | grep -v grep

   b. Run the following command to restart the process:

      sh /opt/executor/bin/shutdown.shsh /opt/executor/bin/startup.sh

15.11 Kerberos Usage

15.11.1 How Do I Change the Kerberos Authentication Status of a Created MRS Cluster?

You cannot change the Kerberos service after an MRS cluster is created.

15.11.2 What Are the Ports of the Kerberos Authentication Service?

The Kerberos authentication service uses ports 21730 (TCP), 21731 (TCP/UDP), and 21732 (TCP/UDP).

15.11.3 How Do I Deploy the Kerberos Service in a Running Cluster?

The MRS cluster does not support customized Kerberos installation and deployment, and the Kerberos authentication cannot be set up between components. To enable Kerberos authentication, you need to create a cluster with Kerberos enabled and migrate data.

15.11.4 How Do I Access Hive in a Cluster with Kerberos Authentication Enabled?

1. Log in to the master node in the cluster as user **root**.
2. Run the following command to configure environment variables:

   source /opt/client/bigdata_env
3. If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user:

   kinit *MRS cluster user*

   Example: **kinit hiveuser**

   The current user must have the permission to create Hive tables..
4. Run the client command of the Hive component.

   beeline
5. Run the Hive command in Beeline, for example:

   create table test_obs(a int, b string) row format delimited fields terminated by "," stored as textfile location "obs://test_obs";
6. Press **Ctrl+C** to exit the Hive Beeline.

15.11.5 How Do I Access Spark in a Cluster with Kerberos Authentication Enabled?

1. Log in to the master node in the cluster as user **root**.
2. Run the following command to configure environment variables:

   source /opt/client/bigdata_env
3. If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user.

   kinit *MRS cluster user*

   Example:

   If the development user is a machine-machine user, run **kinit -kt user.keytab sparkuser**.

   If the development user is a human-machine user, run **kinit sparkuser**.

4. Run the following command to connect to Spark Beeline:

   spark-beeline

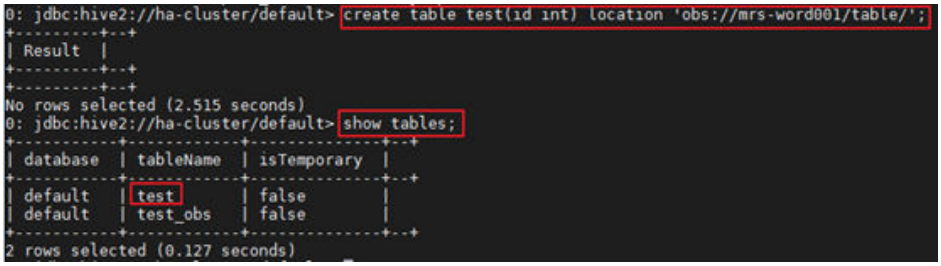
5. Run commands on Spark Beeline. For example, create the table **test** in the **obs://mrs-word001/table/** directory.

   create table test(id int) location 'obs://mrs-word001/table/';

6. Run the following command to query all tables. If table **test** is displayed in the command output, OBS access is successful.

   show tables;

   Figure 15-7 Returned table name



7. Press **Ctrl+C** to exit Spark Beeline.

15.11.6 How Do I Prevent Kerberos Authentication Expiration?

- Java applications:

  Before connecting to HBase, HDFS, or other big data components, call loginUserFromKeytab() to create a UGI. Then, start a scheduled thread to periodically check whether the Kerberos Authentication expires. Log in to the system again before the Kerberos Authentication expires.

```
private static void startCheckKeytabTgtAndReloginJob() {
//The credential is checked every 10 minutes, and updated before the expiration time.
      ThreadPool.updateConfigThread.scheduleWithFixedDelay(() -> {
         try {
            UserGroupInformation.getLoginUser().checkTGTAndReloginFromKeytab();
            logger.warn("get tgt:{}", UserGroupInformation.getLoginUser().getTGT());
            logger.warn("Check Kerberos Tgt And Relogin From Keytab Finish.");
         } catch (IOException e) {
            logger.error("Check Kerberos Tgt And Relogin From Keytab Error", e);
         }
      }, 0, 10, TimeUnit.MINUTES);
      logger.warn("Start Check Keytab TGT And Relogin Job Success.");
   }
```

- Tasks executed in shell mode:

  a. Run the **kinit** command to authenticate the user.

  b. Create a scheduled task of the operating system or any other scheduled task to run the **kinit** command to authenticate the user periodically.

  c. Submit jobs to execute big data tasks.

- Spark jobs:

  If you submit jobs using spark-shell, spark-submit, or spark-sql, you can specify **Keytab** and **Principal** in the command to perform authentication and periodically update the login credential and authorization tokens to prevent authentication expiration.

  Example:

spark-shell --principal spark2x/hadoop.<*System domain name*>@<*System domain name*> **--keytab ${BIGDATA_HOME}/FusionInsight_Spark2x_8.1.0.1/install/FusionInsight-Spark2x-2.4.5/keytab/spark2x/SparkResource/spark2x.keytab --master yarn**

15.12 Metadata Management

15.12.1 Where Can I View Hive Metadata?

- If Hive metadata is stored in GaussDB of an MRS cluster, log in to the master DBServer node of the cluster, switch to user **omm**, and run the **gsql -p 20051 -U {USER} -W {PASSWD} -d hivemeta** command to view the metadata.
- If Hive metadata is stored in an external relational database, perform the following steps:
  a. On the cluster **Dashboard** page, click **Manage** on the right of **Data Connection**.
  b. On the displayed page, obtain the value of **Data Connection ID**.
  c. On the MRS console, click **Data Connections**.
  d. In the data connection list, locate the data connection based on the data connection ID obtained in **b**.
  e. Click **Edit** in the **Operation** column of the data connection.

     The **RDS Instance** and **Database** indicate the relational database in which the Hive metadata is stored.

16 Troubleshooting

16.1 Accessing the Web Pages

16.1.1 Failed to Log In to MRS Manager After the Python Upgrade

Issue

Failed to log in to MRS Manager after Python is upgraded.

Symptom

After Python is upgraded, MRS Manager fails to be accessed using the **admin** account and the correct password.

Possible Cause

When upgrading Python to Python 3.*x*, the user modifies the file directory permission of **openssl**. As a result, the LdapServer service cannot be started, causing a login authentication failure.

Procedure

Step 1 Log in to the Master node in the cluster as user **root**.

Step 2 Run the **chmod 755 /usr/bin/openssl** command to modify the file directory permission of **/usr/bin/openssl** to **755**.

Step 3 Run the **su omm** command to switch to user **omm**.

Step 4 Run the **openssl** command to check whether the **openssl** mode can be entered.

If it can be entered, the permission has been modified successfully. If it cannot be entered, the permission fails to be modified.

If the permission fails to be modified, check whether the command is correct or contact O&M personnel.

Step 5 After the permission is modified, the LdapServer service will be restarted. After the LdapServer service is restarted, log in to MRS Manager again.

----End

Summary and Suggestions

It is recommended that software installed by the user be separated from system software. A system software upgrade may cause compatibility problems.

16.1.2 Failed to Log In to MRS Manager After Changing the Domain Name

Symptom

After changing the domain name, the user cannot log in to MRS Manager through the console, or fails to log in to MRS Manager.

Possible Causes

After the domain name is changed, the **keytab** file of user **executor** is not updated. As a result, the executor process repeatedly performs authentication after the authentication fails, causing memory overflow of the ACS process.

Solution

Step 1 Restart the acs process.

1. Log in to the active management node (master node marked a solid star on the **Nodes** tab of the MRS cluster) as user **root**.
2. Run the following commands to restart the acs process:

   su - omm

   ps -ef|grep =acs (Query the PID of the acs process.)

   kill -9 *PID* (Replace *PID* with the acs process ID to kill the acs process.)
3. Wait for several minutes and run the **ps -ef|grep =acs** command to check whether the acs process is automatically started.

Step 2 Replace the **keytab** file of user **executor**.

1. Log in to MRS Manager and choose **System** > **User**. In the **Operation** column where user **executor** resides, click **Download Authentication Credential**. Decompress the package to obtain the **keytab** file.
2. Log in to the active management node as user **root** and replace the **/opt/executor/webapps/executor/WEB-INF/classes/user.keytab** file with the file obtained in **Step 2.1**.

Step 3 Replace the **keytab** and **conf** files of user **knox**.

1. Log in to MRS Manager and choose **System** > **User**. In the **Operation** column where user **knox** resides, click **Download Authentication Credential**. Decompress the package to obtain the **keytab** and **conf** files.
2. Log in to the active management node as user **root** and replace the **/opt/knox/conf/user.keytab** with the file obtained in **Step 3.1**.

3. Change the **principal** value in the **/opt/knox/conf/krb5JAASLogin.conf** file to the new domain name.
4. Replace the **/opt/knox/conf/krb5.conf** file with the **krb5.conf** file obtained in **Step 3.1**.

Step 4 Back up the original client directory.

mv *{Client directory}* **/opt/client_init**

Step 5 Reinstall the client.

Step 6 Log in to the active and standby management nodes as user **root** and run the following commands to restart the knox process:

su - omm

ps -ef | grep gateway | grep -v grep (Search for the PID of the knox process.)

kill -9 *PID* (Replace *PID* with the ID of the knox process to kill the knox process.)

/opt/knox/bin/restart-knox.sh (Start the knox process.)

Step 7 Log in to the active and standby management nodes as user **root** and run the following commands to restart the executor process:

su - omm

netstat -anp |grep 8181 |grep LISTEN (Search for the PID of the executor process.)

kill -9 *PID* (Replace *PID* with the ID of the executor process to kill the executor process.)

/opt/executor/bin/startup.sh (Start the executor process.)

----End

16.1.3 A Blank Page Is Displayed Upon Login to Manager

Issue

After a user logs in to FusionInsight Manager, the page displayed is blank.

Symptom

After a user logs in to FusionInsight Manager, the page displayed is blank.

Cause Analysis

Login to FusionInsight Manager fails, and the browser cache needs to be cleared.

Procedure

Step 1 Open the browser (using Google Chrome as an example), and press **Ctrl+Shift +Delete**. The dialog box for clearing browsing data is displayed.

Step 2 Select the browsing records to be cleared and click **Clear Data**.

----End

16.2 Cluster Management

16.2.1 Replacing a Disk in an MRS Cluster

Issue

A disk is not accessible.

Symptom

A user created an MRS cluster with local disks. A disk of a core node in this cluster is damaged, resulting in file read failures.

Cause Analysis

The disk hardware is faulty.

Procedure

NOTE

This procedure is applicable to troubleshooting disk hardware faults of core and task nodes in MRS clusters using local disks (ECSs of D, I, IR, and KI series).

Kafka does not support disk replacement. If the node that stores Kafka data is faulty, contact technical support.

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Hosts** and click the name of the faulty host. In the **Instance** area, click **DataNode**. Then on the page that is displayed, click **More** and select **Decommission**.

NOTE

- If this host accommodates DataNode, NodeManager, RegionServer, and ClickHouseServer instances, decommission these instances by referring to this step.
- In versions later than MRS 3.1.2, the ClickHouseServer role instance can be decommissioned.

Step 3 Choose **Hosts**, select the faulty host, click **More**, and select **Stop All Instances**.

Step 4 Run the **vim /etc/fstab** command to comment out the mount point of the faulty disk.

Figure 16-1 Commenting out the mount point of the faulty disk

```
[root@node-ana-coreXZYb0001 ~]# vim /etc/fstab

#
# /etc/fstab
# Created by anaconda on Sat Feb 27 07:10:42 2021
#
# Accessible filesystems, by reference, are maintained under '/dev/disk'
# See man pages fstab(5), findfs(8), mount(8) and/or blkid(8) for more info
#
UUID=c89eca08-5da4-43de-add0-4bb58e820d78 /                       ext4    defaults,errors=panic,noatime       1 1
UUID=4b16f96b-6d16-4dbe-9517-9f63423f9f6e /tmp  ext4   defaults,noatime,nodiratime,errors=panic 1 0
UUID=e539a0fd-a639-41dc-aa88-5fdc0e4bb7b3 /var ext4    defaults,noatime,nodiratime,errors=panic 1 0
UUID=51ba7a26-67de-4762-8bea-85fc004065c2 /srv/BigData ext4   defaults,noatime,nodiratime 1 0
UUID=03ba5f78-d188-4e6b-b640-1915b858183a /var/log  ext4   defaults,noatime,nodiratime,errors=panic 1 0
# UUID=91c84554-22eb-4130-a7a1-5ceaf03c8c06 /srv/BigData/data1 ext4 defaults,noatime,nodiratime,nodev 1 0
```

Step 5 If the old disk is still accessible, migrate user data on the old disk (for example, **/srv/BigData/data1/**).

cp -r *Mount point of the old disk Temporary data storage directory*

Example: **cp -r /srv/BigData/data1 /tmp/**

Step 6 Log in to the MRS console.

Step 7 On the cluster details page, click the **Nodes** tab.

Step 8 Click the node whose disk is to be replaced to go to the ECS console. Click **Stop** to stop the node.

Step 9 Contact technical support to replace the disk in the background.

Step 10 On the ECS console, click **Start** to start the node where the disk has been replaced.

Step 11 Initialize the Linux data disk.

For details, see Step 1 to Step 9 in **Creating and Mounting a Partition** in .

Step 12 Run the **lsblk** command to view information about the new disk partition.

Figure 16-2 Viewing the new disk partition

```
[root@ecs-fcq ~]# lsblk
NAME   MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT
sda      8:0    0  1.7T  0 disk
sdb      8:16   0  1.7T  0 disk
sdc      8:32   0  1.7T  0 disk
└─sdc1   8:33   0  1.7T  0 part
sdd      8:48   0  1.7T  0 disk
└─sdd1   8:49   0  1.7T  0 part
```

Step 13 Run the **df -TH** command to obtain the file system type.

Figure 16-3 Obtaining the file system type

```
[root@node-ana-coreWQaI0001 ~]# df -TH
Filesystem     Type      Size  Used Avail Use% Mounted on
/dev/vda1      ext4      233G   44G  179G  20% /
devtmpfs       devtmpfs   34G     0   34G   0% /dev
tmpfs          tmpfs      34G     0   34G   0% /dev/shm
tmpfs          tmpfs      34G  9.3M   34G   1% /run
tmpfs          tmpfs      34G     0   34G   0% /sys/fs/cgroup
/dev/vda5      ext4       11G   40M   10G   1% /tmp
/dev/vda7      ext4       64G  152M   60G   1% /srv/BigData
/dev/vda6      ext4       11G  1.2G  8.9G  12% /var
/dev/vda8      ext4      190G  211M  180G   1% /var/log
/dev/sdc1      ext4      1.8T  1.4G  1.8T   1% /srv/BigData/data2
tmpfs          tmpfs     6.8G     0  6.8G   0% /run/user/2000
tmpfs          tmpfs     6.8G     0  6.8G   0% /run/user/0
[root@node-ana-coreWQaI0001 ~]#
```

Step 14 Format the new disk partition based on the obtained file system type.

Example: **mkfs.ext4 /dev/sdd1**

Step 15 Run the following command to mount the new disk:

mount *New disk Mount point*

Example: **mount /dev/sdd1 /srv/BigData/data1**

Step 16 Run the following command to grant the **omm** user permission to the new disk:

chown omm:wheel *Mount point*

Example: **chown -R omm:wheel /srv/BigData/data1**

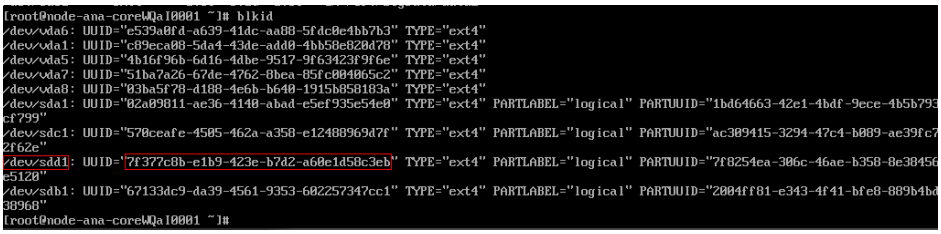
Step 17 Migrate user data from the old disk (for example, **/srv/BigData/data1/**) to the new disk.

cp -r* Temporary data storage directory Mount point of the new disk***

Example: **cp -r /tmp/data1/* /srv/BigData/data1/**

Step 18 Add the UUID of the new disk to the **fstab** file.

1. Run the **blkid** command to check the UUID of the new disk.



2. Open the **/etc/fstab** file and add the following information:
   UUID=*UUID of the new disk* /srv/BigData/data1 ext4 defaults,noatime,nodiratime,nodev 1 0

Step 19 Log in to FusionInsight Manager.

Step 20 Choose **Hosts** and click the name of the host to be recommissioned. In the **Instance** area, click **DataNode**. Then on the page that is displayed, click **More** and select **Recommission**.

NOTE

- If this host accommodates DataNode, NodeManager, RegionServer, and ClickHouseServer instances, recommission these instances by referring to this step.
- In versions later than MRS 3.1.2, the ClickHouseServer role instance can be recommissioned.

Step 21 Choose **Hosts**, select the faulty host, click **More**, and select **Start All Instances**.

Step 22 Choose **Cluster** > **HDFS**. In the **Basic Information** area on the **Dashboard** page, check whether **Missing Blocks** is **0**.

- If **Missing Blocks** is **0**, no further action is required.
- If **Missing Blocks** is not **0**, contact technical support.

----End

16.2.2 MRS Backup Failure

Issue

MRS backup keeps failing.

Symptom

MRS backup keeps failing.

Cause Analysis

The backup directory is connected to the system disk using a soft link. As a result, if the system disk is full, the backup fails.

Procedure

Step 1 Check whether the backup directory is connected to the system disk using a soft disk.

1. Log in to the active and standby Master nodes in the cluster as user **root**.
2. Run the **df -h** command to check the storage usage of the system disk.
3. Run the **ll /srv/BigData/LocalBackup** command to check whether the backup directory is connected to **/opt/Bigdata/LocalBackup** using a soft link.

   Check whether the backup file is connected to the system disk using a soft link and whether the system disk has sufficient space. If the soft link is used for connecting to the system disk and the system disk space is insufficient, go to **Step 2**. If the soft link is not used, the failure is not caused by insufficient system disk space. Contact technical support for troubleshooting.

Step 2 Move historical backup data to a new directory on the data disk.

1. Log in to the Master node as user **root**.
2. Run the **su - omm** command to switch to user **omm**.
3. Run the **rm -rf /srv/BigData/LocalBackup** command to delete the soft link of the backup directory.
4. Run the **mkdir -p /srv/BigData/LocalBackup** command to create a backup directory.
5. Run the **mv /opt/Bigdata/LocalBackup/* /srv/BigData/LocalBackup/** command to move the historical backup data to the new directory.

----End

16.2.3 Inconsistency Between df and du Command Output on the Core Node

Issue

The capacity displayed in the **df** command output on the Core node is inconsistent with that displayed in the **du** command output.

Symptom

After the **df** and **du** commands are executed, the values of the Core node capacity displayed are different.

The disk usage of the **/srv/BigData/hadoop/data1/** directory queried by running the **df -h** command differs greatly from that queried by running the **du -sh /srv/BigData/hadoop/data1/** command. The difference is greater than 10 GB.

Cause Analysis

The **lsof |grep deleted** command output indicates that a large number of log files in the directory are in the deleted state.

When some Spark tasks are running for a long time, some containers in the tasks keep running and logs are continuously generated. When printing logs, the executor of Spark uses the log4j log scrolling function to output logs to the **stdout** file. The container also monitors this file. As a result, the file is monitored by two processes at the same time. When one process scrolls according to the configuration, the earliest log file is deleted, but the other process still occupies the file handle. As a result, a file in the deleted state is generated.

Procedure

Change the output directory name for executor logs of Spark.

1. Open the log configuration file. By default, the configuration file is located in *<Client address>***/Spark/spark/conf/log4j-executor.properties**.
2. Change the name of the log output file.

   For example, change **log4j.appender.sparklog.File = ${spark.yarn.app.container.log.dir}/stdout** to **log4j.appender.sparklog.File = ${spark.yarn.app.container.log.dir}/stdout.log**.
3. Save the configuration and exit.
4. Submit the tasks again.

16.2.4 Disassociating a Subnet from the ACL Network

Scenarios

You can disassociate a subnet from the ACL network when necessary.

Procedure

Step 1 Log in to the management console.

Step 2 On the console homepage, under **Network**, click **Virtual Private Cloud**.

Step 3 In the navigation tree on the left, choose **Network ACL**.

Step 4 Locate the target network ACL in the right pane, and click the network ACL name to switch to the network ACL details page.

Step 5 On the displayed page, click the **Associated Subnets** tab.

Step 6 On the **Associated Subnets** page, locate the target network ACL and click **Disassociate** in the **Operation** column.

Step 7 Click **OK**.

----End

16.2.5 MRS Becomes Abnormal After hostname Modification

Issue

What should I do if MRS becomes abnormal after **hostname** is modified?

Symptom

MRS becomes abnormal after **hostname** is modified.

Possible Cause

The **hostname** modification causes compatibility problems and faults.

Procedure

Step 1 Log in to any node in the cluster as user **root**.

Step 2 Run the **cat /etc/hosts** command on the node to check the value of **hostname** of each node and set the **newhostname** variable based on the value.

Step 3 Run the **sudo hostnamectl set-hostname ${newhostname}** command on the node where **hostname** is modified to restore the correct hostname.

NOTE

${newhostname}: new value of **hostname**

Step 4 After the modification, log in to the node where **hostname** is modified, and check whether the new hostname takes effect.

----End

16.2.6 DataNode Restarts Unexpectedly

Symptom

A DataNode is restarted unexpectedly, but no manual restart operation is performed for the DataNode.

Cause Analysis

Possible causes:

- **OOM of the Java process is killed.**

  In general, the OMM Killer is configured for Java processes to detect and kill OOM. The OOM log is printed in the out log. In this case, you can view the run log (for example, the DataNode's log path is **/var/log/Bigdata/hdfs/dn/hadoop-omm-datanode-***hostname***.log**) to check whether OutOfMemory is printed.

- **DataNode is manually killed or killed by another process.**

  Check the DataNode run log file **/var/log/Bigdata/hdfs/dn/hadoop-omm-datanode-***hostname***.log**. It is found that the health check fails after

"RECEIVED SIGNAL 15" is received. In the following example, the DataNode is killed at 11:04:48 and then started at 11:06:52 two minutes later.

```
2018-12-06 11:04:48,433 | ERROR | SIGTERM handler | RECEIVED SIGNAL 15: SIGTERM |
LogAdapter.java:69
2018-12-06 11:04:48,436 | INFO  | Thread-1 | SHUTDOWN_MSG:
/************************************************************
SHUTDOWN_MSG: Shutting down DataNode at 192-168-235-85/192.168.235.85
************************************************************/ | LogAdapter.java:45
2018-12-06 11:06:52,744 | INFO  | main | STARTUP_MSG:
```

According to the logs, DataNode was closed and then the health check reported the exception. After 2 minutes, NodeAgent started the DataNode process.

Procedure

Add the rule for recording the kill command in the audit log of the operating system. The process that delivers the kill command will be recorded in the audit log.

Operation impact

- Printing audit logs affects operating system performance. However, analysis result shows that the impact is less than 1%.
- Printing audit log occupies some disk space. The logs to be printed are within megabytes. By default, the aging mechanism and the mechanism for checking the remaining disk space are configured. Therefore, the disk space will not be used up.

Locating Method

Perform the following operations on nodes that may restart the DataNode process:

Step 1 Log in to the node as the **root** user and run the **service auditd status** command to check the service status.

```
Checking for service auditd  running
```

If the service is not started, run the **service auditd restart** command to restart the service. The command execution takes less than 1 second and has no impact on the system.

```
Shutting down auditd done
Starting auditd done
```

Step 2 The audit rule of the **kill** command is temporarily added to audit logs.

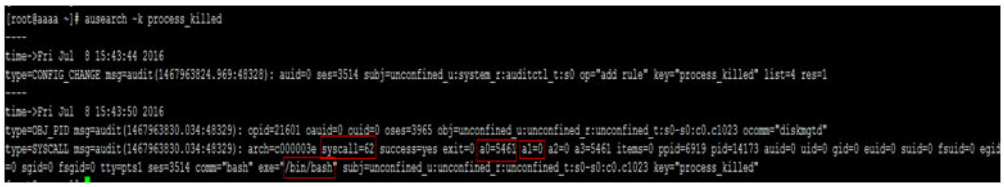
Add an audit rule:

auditctl -a exit,always -F arch=b64 -S kill -S tkill -S tgkill -F a1!=0 -k process_killed

View the rule:

auditctl -l

Step 3 If a process is killed due to an exception, you can run the **ausearch -k process_killed** command to query the kill history.



NOTE

a0 is the PID (hexadecimal) of the process that is killed, and **a1** is the semaphore of the kill command.

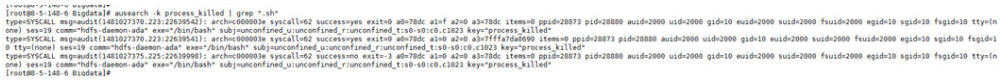
----End

Verification

Step 1 Restart an instance of the node on MRS Manager, for example, DataNode.

Step 2 Run the **ausearch -k process_killed** command to check whether logs are printed.

The following is an example of the **ausearch -k process_killed |grep ".sh"** command. The command output indicates that the **hdfs-daemon-ada*** script closed the DataNode process.



----End

Stop auditing the **kill** command.

Step 1 Run the **service auditd restart** command. The temporarily added kill command audit logs are cleared automatically.

Step 2 Run the **auditctl -l** command. If no information about killing a process is returned, the rule is cleared successfully.

----End

16.2.7 Network Is Unreachable When Using pip3 to Install the Python Package in an MRS Cluster

Issue

When the Python package is installed using pip3, an error message is displayed, indicating that the network is unreachable.

Symptom

When a user runs the pip3 install command to install the Python package, an error message is displayed, indicating that the network is unreachable. For details, see the following figure:

Cause Analysis

The customer does not bind an EIP to the Master node.

Procedure

Step 1 Log in to the MRS management console.

Step 2 Choose **Clusters** > **Active Clusters**, select the faulty cluster, and click its name to check the **Basic Information** on the **Dashboard** tab page.

Step 3 On the **Nodes** tab page, click the name of a Master node in the Master node group to log in to the ECS management console.

Step 4 Click the **EIPs** tab and click **Bind EIP** to bind an EIP to the ECS.

Step 5 Log in to the Master node and run the **pip3 install** command to install the Python package.

----End

16.2.8 Failed to Download the MRS Cluster Client

Issue

On the local Master host, a user attempts to download an MRS cluster client for another remote host. However, the system displays a message indicating that the network or parameter is abnormal.

Symptom

On the local Master host, a user attempts to download an MRS cluster client for another remote host. However, the system displays a message indicating that the network or parameter is abnormal.

Cause Analysis

- The two hosts are in different VPCs.
- The password is incorrect.
- The firewall is enabled on the remote host.

Procedure

- The two hosts are in different VPCs.

  Enable port 22 of the remote host.
- The password is incorrect.

  Check whether the password is correct. The password cannot contain special characters.
- The firewall is enabled on the remote host.

  Download the MRS cluster client to the server and run the **scp** command provided by Linux to remotely send the client to the remote host.

16.2.9 Scale-Out Failure

Issue

MRS cluster scale-out fails when the console page is normal.

Symptom

The MRS console is normal, and no alarm or error message is displayed on MRS Manager. However, an error message is displayed during cluster scale-out, indicating that the MRS cluster contains nodes that are not running and asking you to try again later.

Cause Analysis

MRS cluster scale-in and scale-out can be performed only when the cluster is running properly. Therefore, you need to check whether the cluster is normal. Currently, a message is displayed indicating that there are nodes that are not running in the cluster. However, the console and MRS Manager pages are normal. Therefore, the possible cause is that the cluster status in the database is abnormal or is not updated. As a result, the nodes in the cluster are not in the normal state, causing the failure.

Procedure

Step 1 Log in to the MRS management console and click the cluster name to go to the cluster details page. Check the cluster status and ensure that the cluster is in the **Running** state.

Step 2 Click **Nodes** to view the status of all nodes. Ensure that all nodes are in the **Running** state.

Step 3 Log in to the podMaster node in the cluster, switch to the deployer node of MRS, and view the **api-gateway.log** file.

1. Run the **kubectl get pod -n mrs** command to view the **pod** of the deployer node corresponding to MRS.
2. Run the **kubectl exec -ti ${***pod of the deployer node***} -n mrs /bin/bash** command to log in to the corresponding pod. For example, run the **kubectl exec -ti mrsdeployer-78bc8c76cf-mn9ss -n mrs /bin/bash** command to access the deployer container of MRS.
3. In the **/opt/cloud/logs/apigateway** directory, view the latest **api-gateway.log** file and search for key information (such as **ERROR**, **scaling**, **clusterScaling**, **HostState**, **state-check**, or **cluster ID**) in the file to check the error type.
4. Rectify the fault based on the error information and perform the scale-out again.
   - If the scale-out is successful, no further action is required.
   - If the scale-out fails, go to **Step 4**.

Step 4 Run the **/opt/cloud/mysql -u${***Username***} -P${***Port***} -h${***Address***} -p${***Password***}** command to log in to the database.

Step 5 Run the **select cluster_state from cluster_detail where cluster_id=*Cluster ID*";** command to check the value of **cluster_state**.

- If the value of **cluster_state** is **2**, the cluster status is normal. Go to **Step 6**.
- If the value of **cluster_state** is not **2**, the cluster status in the database is abnormal. You can run the **update cluster_detail set cluster_state=2 where cluster_id="*Cluster ID*";** command to refresh the cluster status and check the value of **cluster_state**.
  - If the value of **cluster_state** is **2**, the cluster status is normal. Go to **Step 6**.
  - If the value of **cluster_state** is not **2**, contact technical support.

Step 6 Run the **select host_status from host where cluster_di="*Cluster ID*";** command to query the cluster host status.

- If the host is in the started state, no further action is required.
- If the host is not in the started state, run the **update host set host_status='started' where cluster_id="*Cluster ID*";** command to update the host status to the database.
  - If the host is in the started state, no further action is required.
  - If the host is not in the started state, contact technical support.

----End

16.2.10 Error Occurs When MRS Executes the Insert Command Using Beeline

Issue

An error occurs when MRS executes the insert command using Beeline.

Symptom

When the **insert into** statement is executed in Beeline of Hive, the following error is reported:

```
Mapping run in Tez on Hive transactional table fails when data volume is high with error: "org.apache.hadoop.hive.ql.lockmgr.LockException Reason: Transaction... already aborted, Hive SQL state [42000]."
```

Cause Analysis

This problem is caused by improper cluster configuration and Tez resource setting.

Procedure

This problem can be solved by setting configuration parameters on Beeline.

Step 1 Set the following properties to optimize performance (you are advised to change them at the cluster level):

- Set **hive.auto.convert.sortmerge.join** to **true**.
- Set **hive.optimize.bucketmapjoin** to **true**.

- Set **hive.optimize.bucketmapjoin.sortedmerge** to **true**.

Step 2 Modify the following content to adjust the resources of Tez:

- Set **hive.tez.container.size** to the size of the Yarn container.
- Set **hive.tez.container.size** to the Yarn container size **yarn.scheduler.minimum-allocation-mb** or a smaller value (for example, a half or quarter of the Yarn container size). Ensure that the value does not exceed **yarn.scheduler.maximum-allocation-mb**.

----End

16.2.11 Using CDM to Migrate Data to HDFS

Issue

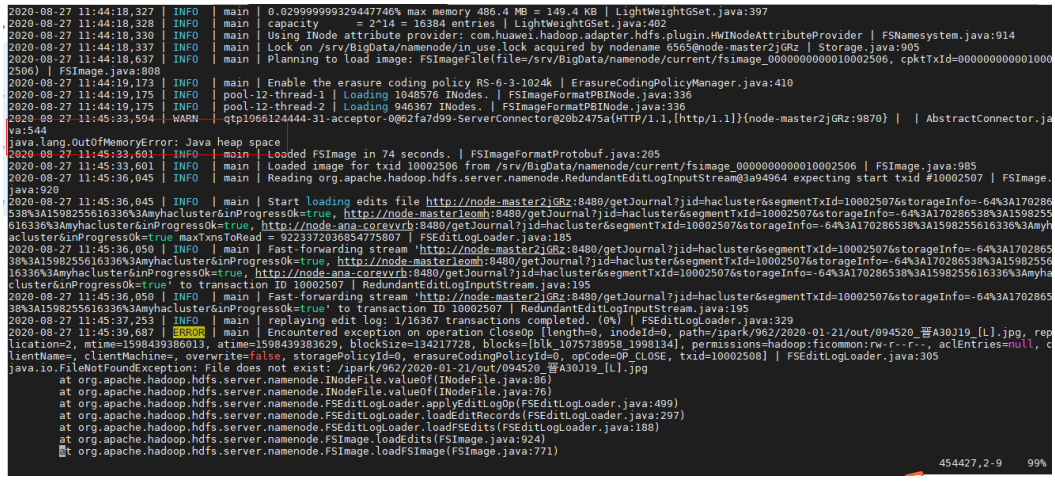
A user failed to use CDM to migrate data from an old cluster to HDFS of a new cluster.

Symptom

When CDM is used to import data from the source HDFS to the destination HDFS, the destination MRS cluster is faulty and the NameNode cannot be started.

The logs show that the **Java heap space** error is reported during the startup. The JVM parameter of the NameNode needs to be modified.

Figure 16-4 Fault logs



Cause Analysis

When the user uses CDM to migrate data, the HDFS data volume is too large. As a result, a stack exception occurs when metadata is merged.

Procedure

Step 1 Log in to FusionInsight Manager and choose **Services** > **HDFS** > **Configurations** > **All Configurations**.

Step 2 Search for the **GC_OPTS** parameter in **HDFS->NameNode** and increase the values of **-Xms512M** and **-Xmx512M** based on service requirements.

Step 3 Save the configuration and restart the affected services or instances.

----End

16.2.12 Alarms Are Frequently Generated in the MRS Cluster

Issue

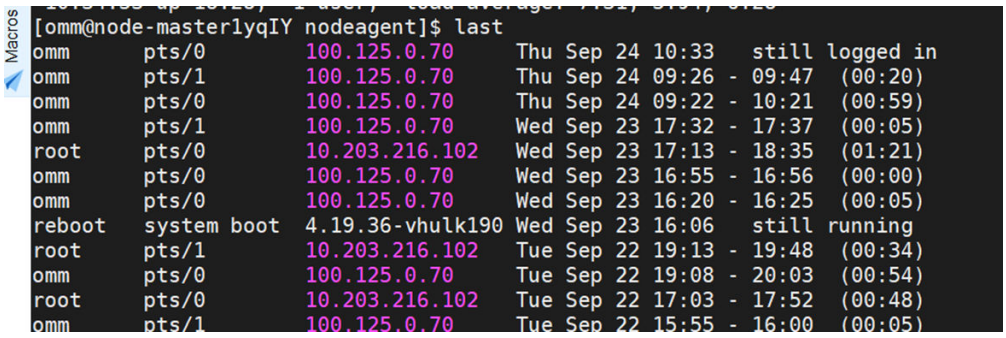
The cluster frequently reports alarms indicating that the heartbeat between the active and standby Manager nodes is interrupted, the heartbeat between the active and standby DBService nodes is interrupted, and the node is faulty. As a result, Hive is occasionally unavailable.

Symptom

The cluster frequently reports alarms indicating that the heartbeat between the active and standby Manager nodes is interrupted, the heartbeat between the active and standby DBService nodes is interrupted, and the node is faulty. As a result, Hive is occasionally unavailable, affecting customer services

Cause Analysis

1. When the alarm is generated, the VM is restarted. The alarm is generated because the VM is restarted.



```

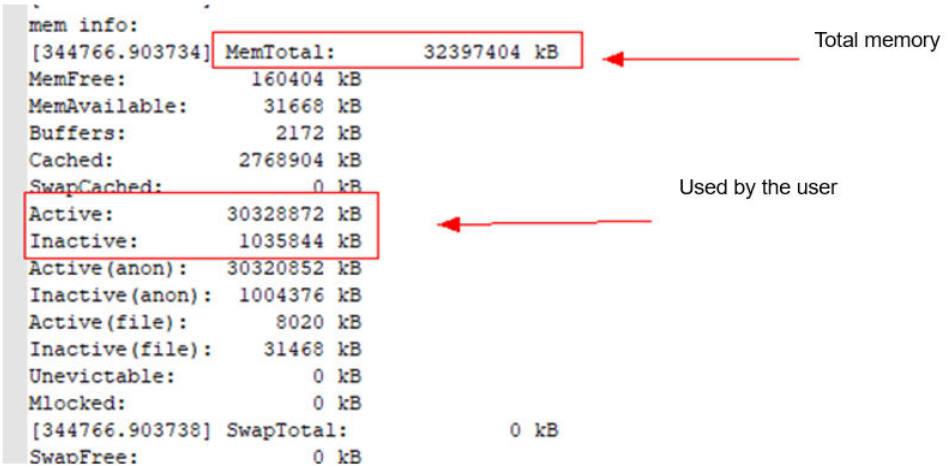
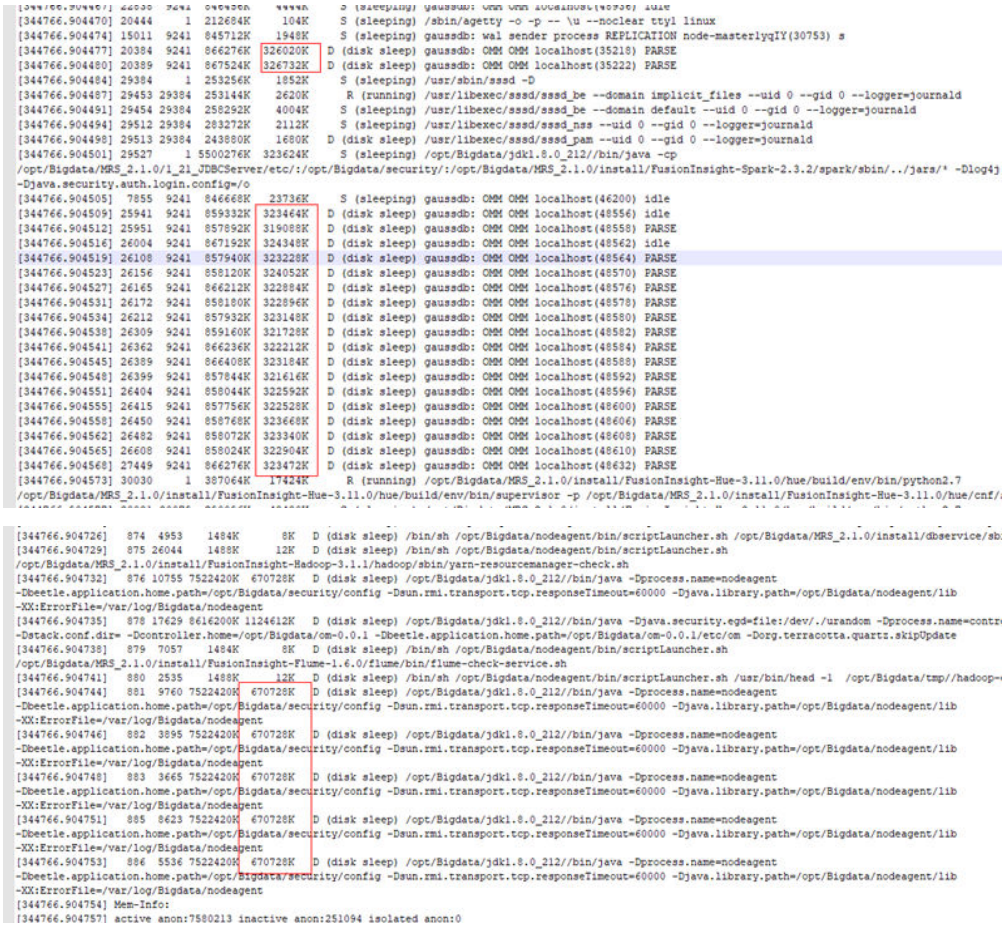
```

2. According to the OS analysis, the cause of the VM restart is that the node does not have available memory. Memory overflow triggers oom-killer. When the process is invoked, the process enters the **disk sleep** state. As a result, the VM restarts.





3. Check the processes that occupy the memory. It is found that the processes that occupy the memory are normal service processes.

Conclusion: The VM memory cannot meet service requirements.

Procedure

- You are advised to expand the node memory.
- You are advised to disable unnecessary services to avoid this problem.

16.2.13 Memory Usage of the PMS Process Is High

Issue

What can I do if the memory usage of the active Master node is high?

Symptom

The memory usage of the active Master node is high. The **top -c** command output shows that the following idle processes occupy a large amount of memory:

```
12180 ommdba    20   0 1395492 1.180g 1.082g S   0.0  3.8  23:14.29 gaussdb: OMM OMM localhost(60598) idle
14828 ommdba    20   0 1395904 1.180g 1.081g S   0.0  3.8  23:17.08 gaussdb: OMM OMM localhost(60698) idle
15016 ommdba    20   0 1395840 1.180g 1.081g S   0.0  3.8  23:11.19 gaussdb: OMM OMM localhost(60824) idle
14943 ommdba    20   0 1395900 1.180g 1.081g S   0.0  3.8  23:14.76 gaussdb: OMM OMM localhost(60764) idle
14908 ommdba    20   0 1395840 1.180g 1.081g S   0.0  3.8  23:15.18 gaussdb: OMM OMM localhost(60738) idle

```

Cause Analysis

- PostgreSQL cache: In addition to common execution plan cache and data cache, PostgreSQL provides cache mechanisms such as **catalog** and **relation** to improve the efficiency of generating execution plans. In the persistent connection scenario, some of the caches are not released. As a result, the persistent connection may occupy a large amount of memory.
- PMS is a monitoring process of MRS. This process frequently creates table partitions or new tables. The PostgreSQL caches the metadata of the objects accessed by the current session, and the connections in the database connection pool of the PMS exist for a long time. Therefore, the memory occupied by the connections gradually increases.

Procedure

Step 1 Log in to the active Master node as user **root**.

Step 2 Run the following command to query the PMS process ID:

ps -ef | grep =pmsd |grep -v grep

Step 3 Run the following command to stop the PMS process. In the command, **PID** indicates the PMS process ID obtained in **Step 2**.

kill -9 PID

Step 4 Wait for the PMS process to automatically start.

It takes 2 to 3 minutes to start PMS. PMS is a monitoring process. Restarting PMS does not affect big data services.

----End

16.2.14 High Memory Usage of the Knox Process

Issue

The memory usage of the knox process is high.

Symptom

The memory usage of the active Master node is high. The **top -c** command output shows that the memory usage of the knox process exceeds 4 GB.

Cause Analysis

The memory is not separately configured for the knox process. The process automatically allocates available memory based on the system memory size. As a result, the knox process occupies a large amount of memory.

Procedure

Step 1 Log in to the Master nodes as user **root**.

Step 2 Open the **/opt/knox/bin/gateway.sh** file. Search for **APP_MEM_OPTS**, and set its value to **-Xms3072m -Xmx4096m**.

Step 3 Log in to Manager and click **Hosts**. Find the IP address of the active Master node (that is, the node with a solid star before the hostname), and log in to the background of the node.

Step 4 Run the following commands to restart the process:

su - omm

sh /opt/knox/bin/restart-knox.sh

----End

16.2.15 It Takes a Long Time to Access HBase from a Client Installed on a Node Outside the Security Cluster

Issue

The cluster client is installed on a node outside the security cluster. When a user runs the **hbase shell** command on the client to access HBase, it is found that the access is very slow.

Symptom

A user creates a security cluster, installs a cluster client on a node outside the cluster, and runs the **hbase shell** command to access HBase. It is found that the access to HBase is very slow.

Cause Analysis

Kerberos authentication is required for a security cluster. You need to configure the **hosts** file on the client node to ensure that the access speed is not affected. An example of the **hosts** configuration is as follows:

```
1.1.1.1 hadoop.782670e3_1364_47e2_8c70_1b61bb80479c.com
1.1.1.1 hadoop.hadoop.com
1.1.1.1 hacluster
1.1.1.1 haclusterX
1.1.1.1 haclusterX1
```

```
1.1.1.1 haclusterX2
1.1.1.1 haclusterX3
1.1.1.1 haclusterX4
1.1.1.1 ClusterX
1.1.1.1 manager
ip1 hostname1
ip2 hostname2
ip3 hostname3
ip4 hostname4
```

Procedure

Copy the content of the **hosts** file on the cluster node to the **hosts** file on the node where the client is installed.

16.2.16 How Do I Locate a Job Submission Failure?

Symptom

A user cannot submit jobs through DGC or on the MRS console.

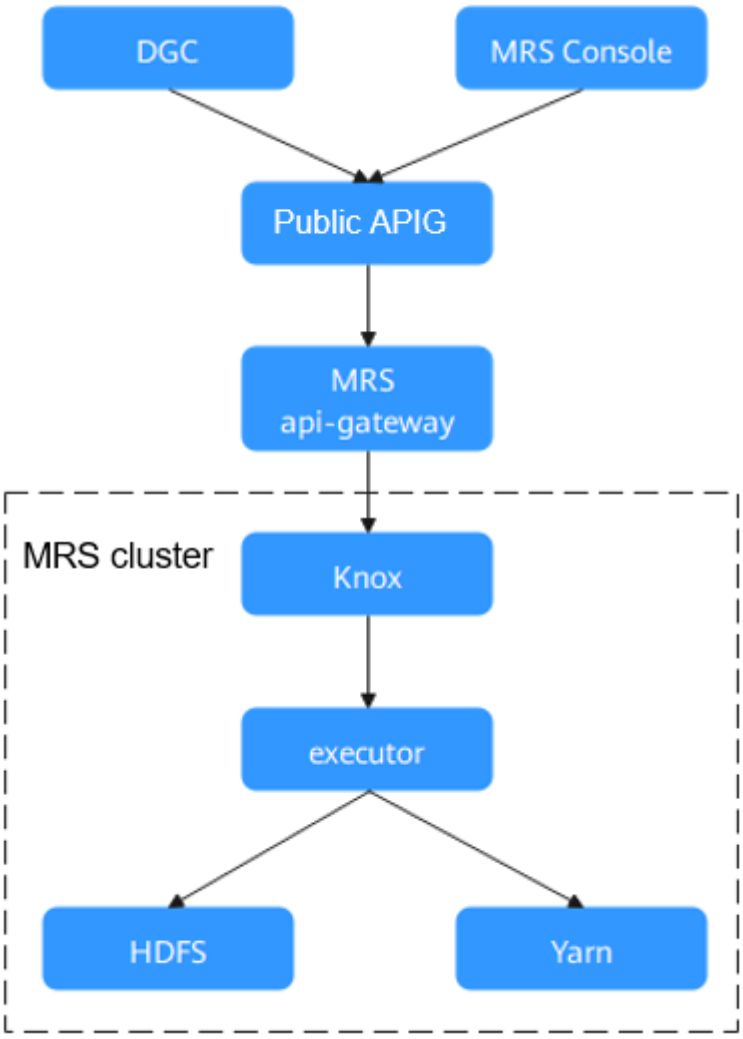
Impact

Jobs cannot be submitted, and services are interrupted.

Introduction to the Operation Process

1. All requests pass through APIG gateway and are restricted by the flow control configured on APIG.
2. APIG forwards the request to the api-gateway of the MRS management plane.
3. The API node on the MRS management plane polls the Knox of the active and standby OMS nodes to determine the Knox of the active OMS node.
4. MRS management-plane API submits a task to Knox of the active OMS.
5. Knox forwards requests to the Executor process on the current node.
6. The executor process submits a task to Yarn.

Figure 16-5 Job process



Procedure

Make preparations:

- Check whether the job is submitted through DGC or on the MRS console.
- Prepare the information listed in **Table 16-1**.

Table 16-1 Items to be prepared before the rectification

No.	Projects	Operation Mode
1	Cluster account information	Apply for **password** of user **admin** in the cluster.
2	Node account information	Apply for the passwords of users **omm** and **root** of cluster nodes.

No.	Projects	Operation Mode
3	Secure Shell (SSH) remote login tool	Prepare such tools as PuTTY or SecureCRT.
4	Client	Install the client.

Step 1 Locate the cause of the exception.

View the error code received in the job log and check whether the error code belongs to APIG or MRS.

- If the error code is a public APIG error code (starting with "APIGW"), contact public APIG maintenance personnel.
- If an error occurs on MRS, go to the next step.

Step 2 Check the running status of services and processes.

1. Log in to Manager and check whether a service fault occurs. If a job-related service fault or an underlying basic service fault occurs, rectify the fault.
2. Check whether a critical alarm is generated.
3. Log in to the active Master node.
4. Run the following command to check whether the OMS status is normal and whether the executor and knox processes on the active OMS node are normal: The knox is in active-active mode, and the executor is in single-active mode.

   /opt/Bigdata/om-0.0.1/sbin/status-oms.sh

5. Run the **jmap -heap** *PID* command as user **omm** to check the memory usage of the Knox and Executor processes. If the old-generation memory usage is 99.9%, the memory overflow occurs.

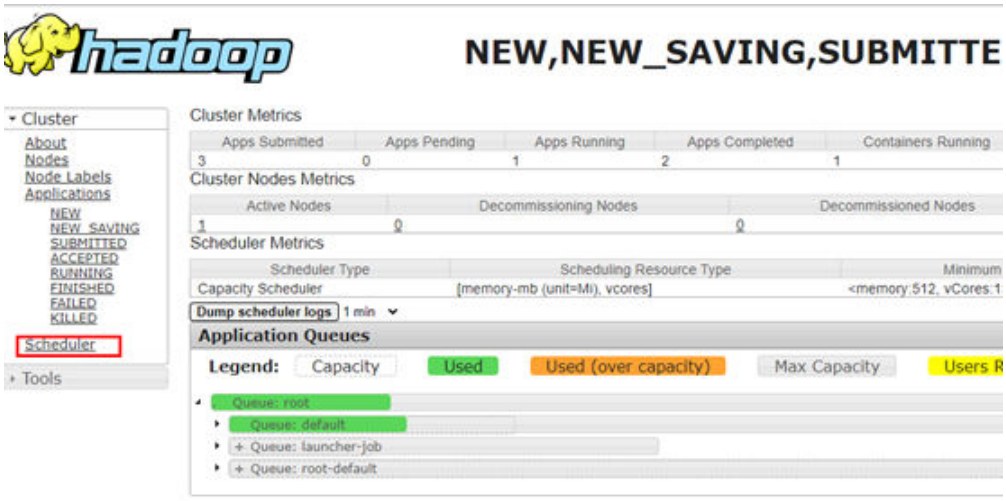
   Run the **netstat -anp | grep 8181 | grep LISTEN** command to query the PID of the executor process.

   Run the **ps -ef|grep knox | grep -v grep** command to query the PID of the knox process.

   If the memory overflows, run the **jmap -dump:format=b,file=/home/omm/temp.bin** *PID* command to export the memory information and restart the process.
6. View the native Yarn page to check the queue resource usage and whether the task is submitted to Yarn.

   On the native Yarn page: choose **Components** > **Yarn** > **ResourceManager WebUI** > **ResourceManager (Active)**.

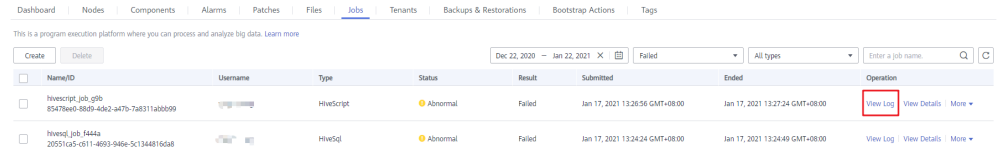
Figure 16-6 Queue resource usage on the Yarn page



Step 3 Locate the fault causing the task submission failure.

1. Log in to the MRS management console and click the cluster name to go to the cluster details page.
2. On the **Jobs** tab page, locate the row that contains the target job and click **View Log** in the **Operation** column.

   Figure 16-7 View the logs

3. If there is no log or the log information is not detailed, copy the job ID in the **Name/ID** column.
4. Run the following command on the active OMS node to check whether the task request is sent to the KNOX. If the request is not sent to the KNOX, the KNOX may be faulty. In this case, restart the KNOX to rectify the fault.

   grep "mrsjob" /var/log/Bigdata/knox/logs/gateway-audit.log | tail -10
5. Search for the job ID in the Executor log and view the error information.

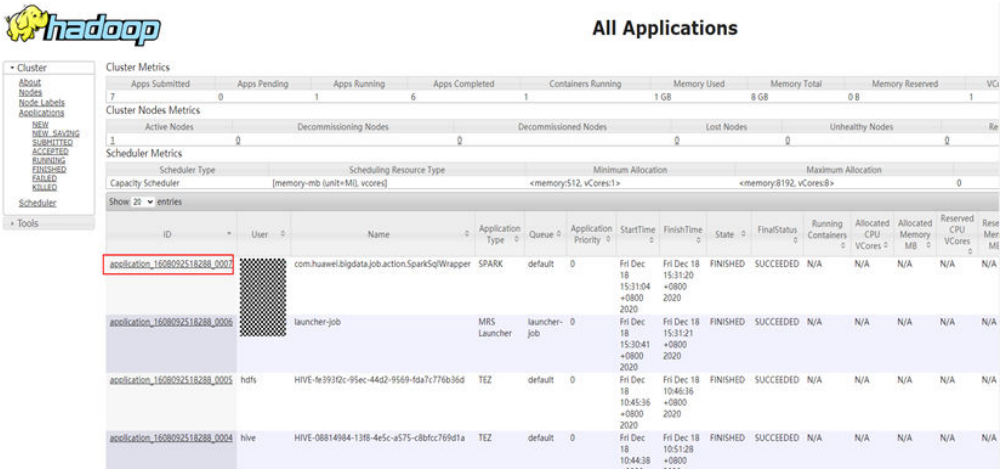
   Log file path: **/var/log/Bigdata/executor/logs/exe.log**
6. Modify the **/opt/executor/webapps/executor/WEB-INF/classes/log4j.properties** file to enable the debug log of the executor. Submit the test task and view the executor log. Confirm the error reported during job submission.

   Log file path: **/var/log/Bigdata/executor/logs/exe.log**
7. If an error occurs in the executor, run the following command to print the jstack information of the executor and check the current execution status of the thread:

   jstack PID > xxx.log
8. On the cluster details page, click the **Jobs** tab. Locate the row that contains the target job, and click **View Details** in the **Operation** column to obtain the actual job ID (**applicationID**).

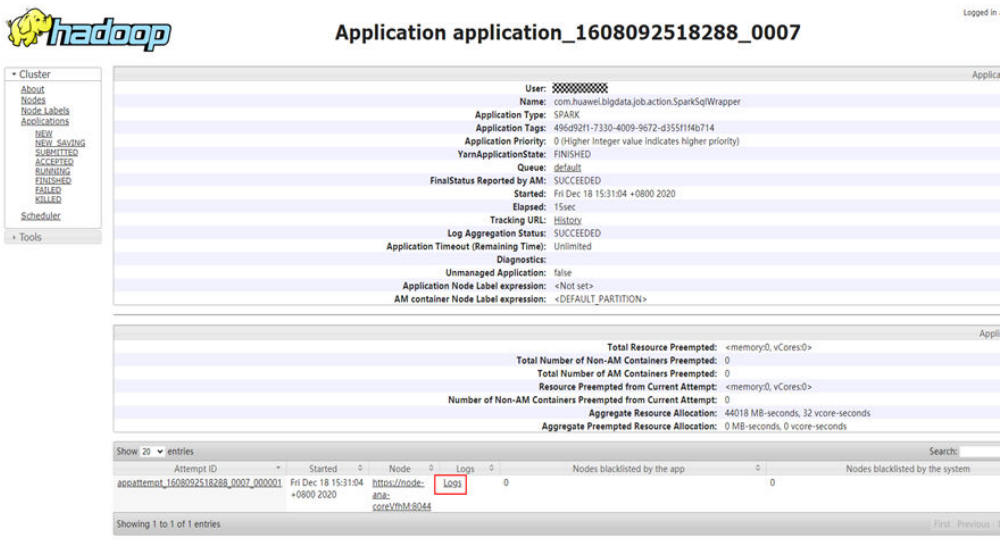
9. On the cluster details page, choose **Components** > **Yarn** > **ResourceManager WebUI** > **ResourceManager (Active)**. On the native Yarn page that is displayed, click **applicationID**.

Figure 16-8 Yarn applications



10. View logs on the task details page.

Figure 16-9 Task logs



----End

16.2.17 OS Disk Space Is Insufficient Due to Oversized HBase Log Files

Issue

The space of the **/var/log** partition on the system disk is insufficient.

Symptom

The **/var/log/Bigdata/hbase/*/hbase-omm-*.out** log file is too large, causing insufficient space of the **/var/log** partition on the system disk.

Cause Analysis

During the long-term running of HBase, the OS periodically deletes the **/tmp/.java_pid*** files created by the JVM. The HBase memory monitoring uses the **jinfo** command, which depends on the **/tmp/.java_pid*** file. If the file does not exist, the **jinfo** command runs **kill -3** to print the jstack information to the **.out** log file. As a result, the **.out** log file becomes oversize as time goes by.

Procedure

On each node hosting the HBase instance, deploy a scheduled task to periodically clear the **.out** log file. For example, log in to the HBase instance node and run the **crontab -e** command to add a scheduled task to clear the **.out** log file at 00:00:00 every day.

crontab -e

00 00 * * * for file in `ls /var/log/Bigdata/hbase/*/hbase-omm-*.out`; do echo "" > $file; done

NOTE

If large **.out** files are generated frequently, you can clear the files multiple times every day or adjust the automatic clearing policy of the OS.

16.3 Using ClickHouse

16.3.1 ClickHouse Fails to Start Due to Incorrect Data in ZooKeeper

Symptom

An instance node in the ClickHouse cluster fails to start. The startup log of the instance node contains error information similar to the following:

```
2021.03.15 21:01:19.816593 [ 11111 ] {} <Error> Application: DB::Exception:
The local set of parts of table DEFAULT.lineorder doesn't look like the set ofdoesn't look like the set of
parts in ZooKeeper: 59.99 million rows of 59.99 million total rows in
filesystem are suspicious. There are 30 unexpected parts with 59986052 rows
(14 of them is not just-written with 59986052 rows), 0 missing parts (with 0
blocks).: Cannot attach table `DEFAULT`.`lineorder` from metadata file
...
: while loading database
```

Cause Analysis

When a ClickHouse instance is abnormal, the ReplicatedMergeTree engine table is repeatedly created in the cluster, and then deleted. The creation and deletion of the ReplicatedMergeTree engine table causes data error in ZooKeeper, which causes a start failure of ClickHouse.

Solution

Step 1 Back up all data tables in the database of the faulty node to another directory.

- Back up table data:

  cd /srv/BigData/data*1*/**clickhouse/data/***Database name*

  mv *Table name Directory to be backed up*/**data***1*

  NOTE

  If there are multiple disks, back up data of **data1** to **dataN**.

- Back up metadata information:

  cd /srv/BigData/data1/**clickhouse_path/metadata**

  mv *Table name*.**sql** *Directory to be backed up*

For example, to back up the lineorder table in the default database to the **/home/backup** directory, run the following command.

cd /srv/BigData/data1/clickhouse/data/default

mv lineorder /home/backup/**data1**

cd /srv/BigData/data1/clickhouse_path/metadata

mv lineorder.sql /home/backup

Step 2 Log in to MRS Manager, choose **Cluster** > **Services** > **ClickHouse** > **Instance**, select the target instance node, and click **Start Instance**.

Step 3 After the instance is started, use the ClickHouse client to log in to the faulty node.

clickhouse client --host *Clickhouse instance IP address* **--user** *User name* **--password** *Password*

Step 4 Run the following command to obtain the ZooKeeper path **zookeeper_path** of the current table and **replica_num** of the corresponding node.

SELECT zookeeper_path FROM system.replicas WHERE database = '*Database name*' **AND table = '***Table name*'**;**

SELECT replica_num,host_name FROM system.clusters;

Step 5 Run the following command to access the ZooKeeper command line interface:

zkCli.sh -server *IP address of the ZooKeeper node*:**2181**

Step 6 Locate the ZooKeeper path corresponding to the table data of the faulty node.

ls *zookeeper_path*/**replicas/***replica_num*

NOTE

zookeeper_path indicates the value of **zookeeper_path** obtained in **Step 4**.

replica_num indicates the value of **replica_num** corresponding to the host in **Step 4**.

Step 7 Run the following command to delete the replica data from ZooKeeper:

deleteall *zookeeper_path*/**replicas/***replica_num*

Step 8 Use the ClickHouse client to log in to the node and create the ReplicatedMergeTree engine table of the cluster.

clickhouse client --host *Clickhouse instance IP address* **--multiline --user** *Username* **--password** *Password*

CREATE TABLE *Database name.Table name* **ON CLUSTER** *Cluster name*

...

ENGINE = ReplicatedMergeTree ...

The following error message is displayed on other replica nodes, which is normal and can be ignored.

```
Received exception from server (version 20.8.7):
Code: 57. DB::Exception: Received from x.x.x.x:9000. DB::Exception:
There was an error on [x.x.x.x:9000]: Code: 57, e.displayText() =
DB::Exception: Table DEFAULT.lineorder already exists. (version 20.8.11.17
(official build)).
```

After the table is successfully created, the table data on the faulty node will be automatically synchronized. The data restoration is complete.

----End

16.4 Using DBService

16.4.1 DBServer Instance Is in Abnormal Status

Symptom

A DBServer instance is in the **Concerning** state for a long period of time.

Figure 16-10 DBServer instance status

Role	Host Name	OM IP Address	Business IP Address	Rack	Operating Status	Health Status
DBServer(Active)	node-master2iMIW	192.168.0.13	192.168.0.13	/default/rack4b34	Started	Good
DBServer(Standby)	node-master1GZBS	192.168.0.53	192.168.0.53	/default/rack4b34	Started	Recovering

Cause Analysis

The permission for files or directories in the data directory is incorrect. GaussDB requires that the file permission be at least 600 and directory permission be at least 700.

Figure 16-11 Directory permission list

```
omm@192-168-234-176:/srv/BigData/dbdata_service> ll
total 4
drwx------ 19 omm wheel 4096 Dec 14 10:15 data
```

Figure 16-12 File permission list

-rw------- 1 omm wheel   105 Dec 14 10:15 postmaster.opts
-rw------- 1 omm wheel    96 Dec 14 10:15 postmaster.pid
```

Solution

Step 1 Modify the permissions on the files and directories based on the permission list in **Figure 16-11** and **Figure 16-12**.

Step 2 Restart the DBServer instance.

----End

16.4.2 DBServer Instance Remains in the Restoring State

Symptom

A DBServer instance remains in the **Restoring** state. The status cannot be recovered even after a restart.

Cause Analysis

1. DBService monitors the **${BIGDATA_HOME}/MRS_*XXX*/install/dbservice/ha/module/harm/plugin/script/gsDB/.startGS.fail** file. *XXX* indicates the product version.
2. If the value in the file is greater than 3, the startup fails. The NodeAgent keeps trying to restart the instance. In this case, the startup still fails and the value is incremented by 1 each time the startup fails.

Solution

Step 1 Log in to MRS Manager.

Step 2 Stop the DBServer instance.

Step 3 Log in to the node where the DBServer instance is abnormal as user **omm**.

Step 4 Change the value of in the **${BIGDATA_HOME}/MRS_*XXX*/install/dbservice/ha/module/harm/plugin/script/gsDB/.startGS.fail** file to **0**. *XXX* indicates the product version.

Step 5 Start the DBServer instance.

----End

16.4.3 Default Port 20050 or 20051 Is Occupied

Symptom

DBService restart fails, and information indicating that port 20050 or 20051 is occupied is displayed in the printed fault log.

Cause Analysis

1. The default port 20050 or 20051 used by DBService is occupied by another process.
2. The DBService process is not stopped, and the port used by DBService is not released.

Solution

This solution uses port 20051 as an example. The solution to the problem that port 20050 is occupied is similar.

Step 1 Log in to the node where the error is reported as user **root**, and run the **netstat -nap | grep 20051** command to check the process that occupies port 20051.

Step 2 Run the **kill** command to forcibly stop the process that uses port 20051.

Step 3 About 2 minutes later, run the **netstat -nap | grep 20051** command again to check whether any process uses the port.

Step 4 Check the service to which the process belongs and change the port for the service.

Step 5 Run the **find . -name "*20051*"** command in the **/tmp** and **/var/run/MRS-DBService/** directories, and delete all files found.

Step 6 Log in to Manager and restart DBService.

----End

16.4.4 DBServer Instance Is Always in the Restoring State Because the Incorrect /tmp Directory Permission

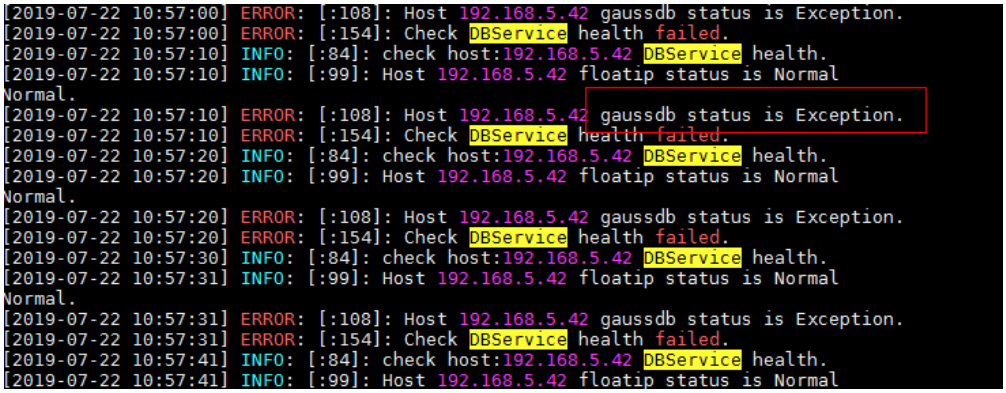
Symptom

A DBServer instance remains in the **Restoring** state. The status cannot be recovered even after a restart.

Cause Analysis

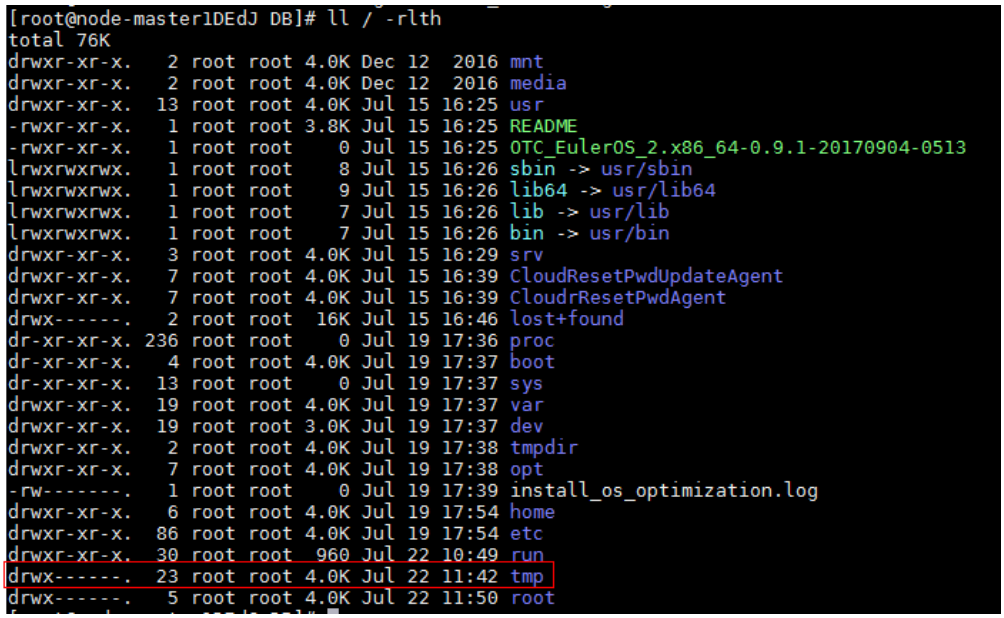
1. Check **/var/log/Bigdata/dbservice/healthCheck/dbservice_processCheck.log**. It is found that GaussDB is abnormal.

   Figure 16-13 GaussDB exception

2. The check result shows that the permission on the **/tmp** directory is incorrect.

   Figure 16-14 /tmp permission

Solution

Step 1 Run the following command to modify the **/tmp** permission:

chmod 1777 /tmp

Step 2 Wait until the instance status recovers.

----End

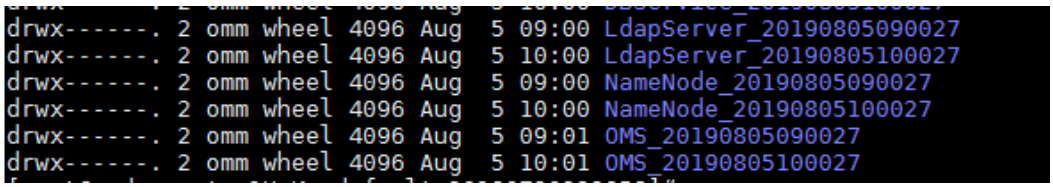
16.4.5 DBService Backup Failure

Symptom

ls /srv/BigData/LocalBackup/default_20190720222358/ -rlth

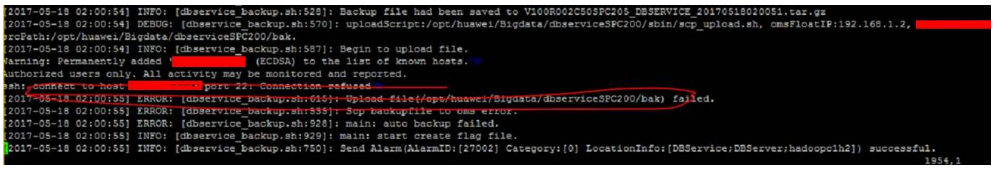
No DBService backup file exists in the backup file path.

Figure 16-15 Checking the backup file



Cause Analysis

- Check the backup log of DBService in **/var/log/Bigdata/dbservice/scriptlog/backup.log**. It is found that the backup is successful but fails to be uploaded to the OMS node.



- The failure is caused by the SSH failure.

Solution

Step 1 If the network is faulty, contact network engineers.

Step 2 Perform backup operations again after the network fault is rectified.

----End

16.4.6 Components Failed to Connect to DBService in Normal State

Symptom

Upper-layer components fail to connect to DBService. The DBService component and two instances are normal.

Figure 16-16 DBService status

Cause Analysis

1. The upper-layer component is DBService connected through **dbservice.floatip**.
2. Run the **netstat -anp | grep 20051** command on the node where DBServer resides. It is found that the Gauss process of DBService is not bound to the floating IP address during startup, and only the local IP address 127.0.0.1 is listened.

Solution

Step 1 Restart the DBService service.

Step 2 Run the **netstat -anp | grep 20051** command on the active DBServer node to check whether **dbservice.floatip** is bound.

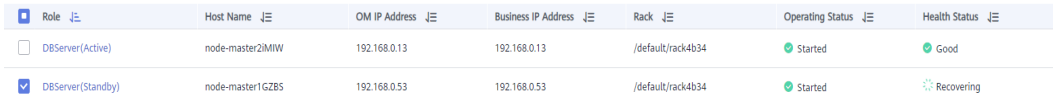
----End

16.4.7 DBServer Failed to Start

Symptom

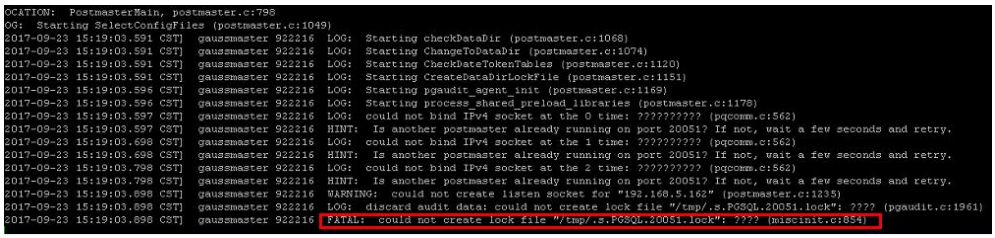
DBService fails to be started and restarts also fail. The instance keeps in the **Recovering** state.

Figure 16-17 DBService status

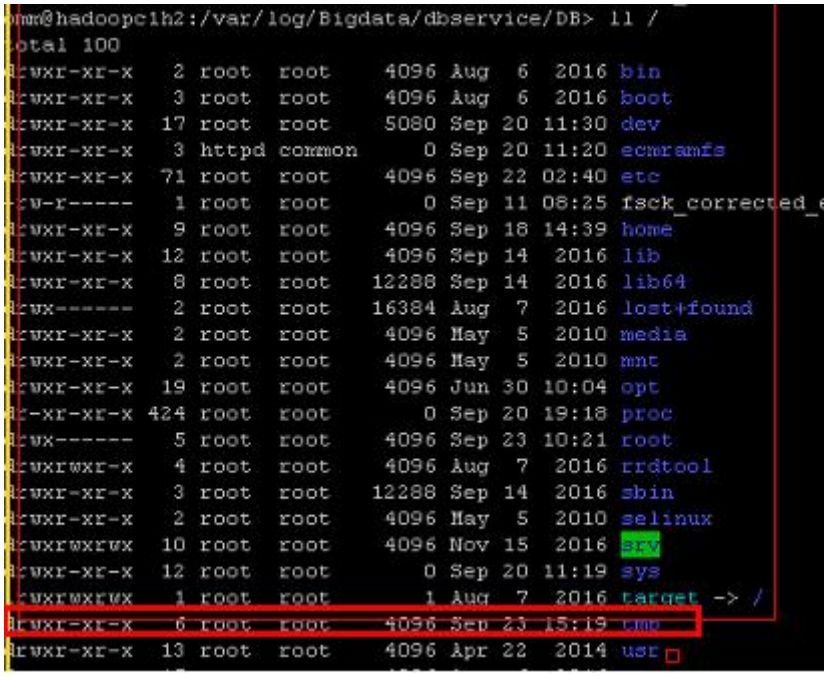


Cause Analysis

1. Check the DBService logs in **/var/log/Bigdata/dbservice/DB/gs_ctl-current.log**. The following error message is displayed:



2. It is found that the **/tmp** permission is incorrect. The correct value should be **777**.



Solution

Step 1 Modify the **/tmp** permission by changing the value to **777**.

Step 2 Restart DBService.

----End

16.4.8 DBService Backup Failed Because the Floating IP Address Is Unreachable

Symptom

The default DBService backup fails, but backups of NameNode, LdapServer, and OMS are successful.

Cause Analysis

1. Check the error information on the DBService backup page:
   Clear temporary files at backup checkpoint DBService_test_DBService_DBService_20180326155921 that fialed last time.
   Temporyary files at backup checkpoint DBService_test_DBService_DBService20180326155921 that failed last time are cleared successfully.

```
Start executing the backup task.
The backup of configuration DBService is started.
Check the backup available disk space.
Backup initialization succeeded for configuration DBService.
Clear temporary files at backup checkpoint DBService_test_DBService_DBService_20180326155921 that failed last time.
Temporary files at backup checkpoint DBService_test_DBService_DBService_20180326155921 that failed last time are cleared successfully.
Checkpoint DBService_test_DBService_DBService_20180326162235 is verified successfully before backup.
Temporary files are cleared successfully before backup checkpoint DBService_test_DBService_DBService_20180326162235.
Prestart backup succeeded for checkpoint DBService_test_DBService_DBService_20180326162235.
The snapshot is created successfully for checkpoint DBService_test_DBService_DBService_20180326162235 before backup.
Backup is being performed for checkpoint DBService_test_DBService_DBService_20180326162235.
Backup execution failed. Task ID: 2
Detail: DBService backup task failed, please view details in logs.
Temporary files are cleared successfully after backup checkpoint DBService_test_DBService_DBService_20180326162235.
checkpoint DBService_test_DBService_DBService_20180326162235 is deleted successfully after backup failure.
Failed to backup configuration DBService.
```

2. Check the **/var/log/Bigdata/dbservice/scriptlog/backup.log** file. It is found that the log printing stops and no related backup information is found.
3. Check the **/var/log/Bigdata/controller/backupplugin.log** file on the active OMS node. The following error information is found:

```
result error is ssh:connect to host 172.16.4.200 port 22: Connection refused (172.16.4.200 is the floating IP address of DBService)
DBService backup failed.
```

```

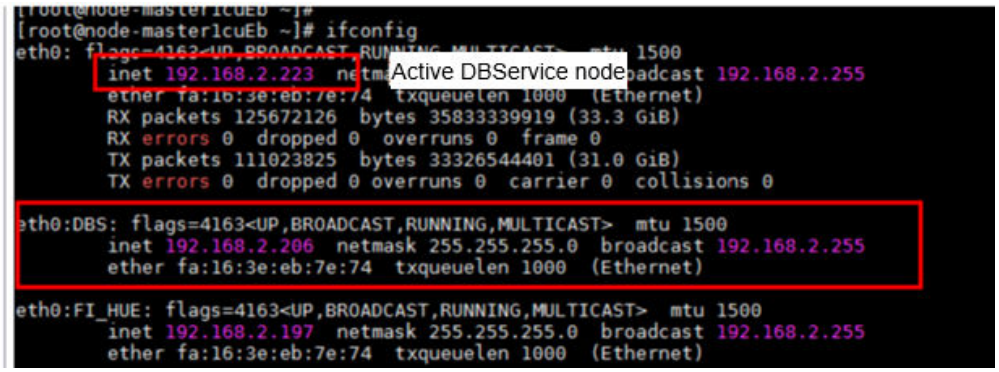
```

Solution

Step 1 Log in to the active DBService node (the Master node bound with the DBService floating IP address).



Step 2 Add the DBService floating IP address to **ListenAddress** or comment out **ListenAddress** in the **/etc/ssh/sshd_config** file.

Step 3 Run the following command to restart the SSHD service:

service sshd restart

Step 4 Check whether the next DBServie backup is successful.

----End

16.4.9 DBService Failed to Start Due to the Loss of the DBService Configuration File

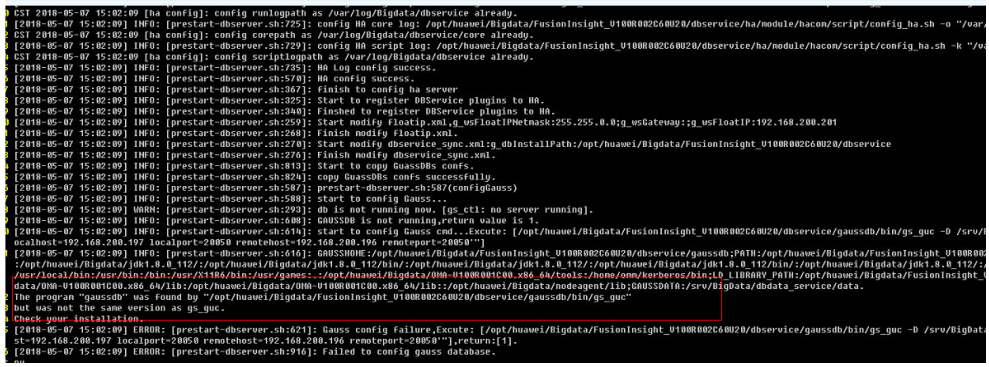
Symptom

The nodes are powered off unexpectedly, and the standby DBService node fails to be restarted.

Cause Analysis

1. The **/var/log/Bigdata/dbservice/DB/gaussdb.log** file is viewed, which contains no information.
2. The **/var/log/Bigdata/dbservice/scriptlog/preStartDBService.log** file is viewed. This file contains the following information, indicating that the configuration information is lost:

```
The program "gaussdb" was found by "
/opt/Bigdata/MRS_xxx/install/dbservice/gaussdb/bin/gs_guc)
But not was not the same version as gs_guc.
Check your installation.
```



3. The configuration file in the **/srv/BigData/dbdata_service/data** directory on the active DBServer node is compared with the configuration file in the **/srv/BigData/dbdata_service/data** directory on the standby DBServer node, which shows major difference.

```
omm@hadoopc1h3:/srv/BigData/dbdata_service/data> ll

-rw------- 1 omm wheel   134 Feb 11 10:42 postmaster.opts
```

Solution

Step 1 Copy the content in the **/srv/BigData/dbdata_service/data** directory on the active node to the standby node and ensure that the file permission and owner group are the same as those on the active node.

Step 2 Modify configuration in **postgresql.conf**. Set **localhost** to the IP of the local node and **remotehost** to the IP of the peer node.

```
#------------------------------------------------------------------------------
# CUSTOMIZED OPTIONS
#------------------------------------------------------------------------------

# Add settings for extensions here
max_files_per_process = 300
unix_socket_directory = '/var/run/FusionInsight-DBService'
replconninfo1 = 'localhost=192.168.200.197 localport=20050 remotehost=192.168.200.194 remoteport=20050'
"postgresql.conf" 382L, 15277C
```

Step 3 Log in to Manager and restart the standby DBServer node.

----End

16.5 Using Flink

16.5.1 "IllegalConfigurationException: Error while parsing YAML configuration file: "security.kerberos.login.keytab" Is Displayed When a Command Is Executed on an Installed Client

Symptom

After the client is successfully installed, an error message "IllegalConfigurationException: Error while parsing YAML configuration file:"security.kerberos.login.keytab" is displayed when the command (for example, **yarn-session.sh**) on the client is executed.

```
[root@8-5-131-10 bin]# yarn-session.sh
2018-10-25 01:22:06,454 | ERROR | [main] | Error while trying to split key and value in configuration
file /opt/flinkclient/Flink/flink/conf/flink-conf.yaml:80: "security.kerberos.login.keytab: " |
org.apache.flink.configuration.GlobalConfiguration (GlobalConfiguration.java:160)
Exception in thread "main" org.apache.flink.configuration.IllegalConfigurationException: Error while parsing
YAML configuration file :80: "security.kerberos.login.keytab: "
        at org.apache.flink.configuration.GlobalConfiguration.loadYAMLResource(GlobalConfiguration.java:161)
        at org.apache.flink.configuration.GlobalConfiguration.loadConfiguration(GlobalConfiguration.java:112)
        at org.apache.flink.configuration.GlobalConfiguration.loadConfiguration(GlobalConfiguration.java:79)
        at org.apache.flink.yarn.cli.FlinkYarnSessionCli.main(FlinkYarnSessionCli.java:482)
[root@8-5-131-10 bin]#
```

Cause Analysis

In a secure cluster environment, Flink requires security authentication. The security authentication is not configured on the current client.

1. The following two authentication modes are available for Flink.
   - Kerberos authentication: Flink Yarn client, Yarn ResourceManager, JobManager, HDFS, TaskManager, Kafka, and ZooKeeper
   - Internal authentication mechanism of Yarn: The internal authentication used between YarnResource Manager and Application Master (AM).
2. If a security cluster is required, the Kerberos authentication and security cookie authentication are mandatory. As shown in the logs, it is found that the **security.kerberos.login.keytab** setting in the configuration file is incorrect and the security configuration is not performed.

Solution

Step 1 Download the keytab file from MRS and save it in a folder on a host where the Flink client resides.

Step 2 Configure following parameters in the **flink-conf.yaml** file:

1. Keytab path
   security.kerberos.login.keytab: /home/flinkuser/keytab/abc222.keytab

   NOTE

   - **/home/flinkuser/keytab/abc222.keytab** indicates the user directory, which is the directory saves the keytab file in **Step 1**.
   - Ensure that the client user has the permission on the corresponding directory.

2. Principal name
   security.kerberos.login.principal: abc222
3. In HA mode, if Zookeeper is configured, the ZooKeeper Kerberos authentication configuration items must be configured as follows:
   zookeeper.sasl.disable: false
   security.kerberos.login.contexts: Client
4. If Kerberos authentication is required between the Kafka client and Kafka broker, configure it as follows:
   security.kerberos.login.contexts: Client,KafkaClient

----End

16.5.2 "IllegalConfigurationException: Error while parsing YAML configuration file" Is Displayed When a Command Is Executed After Configurations of the Installed Client Are Changed

Symptom

After the client is successfully installed, an error message "IllegalConfigurationException: Error while parsing YAML configuration file: 81: "security.kerberos.login.principal:pippo " is displayed when the command (for example, **yarn-session.sh**) on the client is executed.

```
[root@8-5-131-10 bin]# yarn-session.sh
2018-10-25 19:27:01,397 | ERROR | [main] | Error while trying to split key and value in configuration
file /opt/flinkclient/Flink/flink/conf/flink-conf.yaml:81: "security.kerberos.login.principal:pippo " |
org.apache.flink.configuration.GlobalConfiguration (GlobalConfiguration.java:160)
Exception in thread "main" org.apache.flink.configuration.IllegalConfigurationException: Error while parsing
YAML configuration file :81: "security.kerberos.login.principal:pippo "
        at org.apache.flink.configuration.GlobalConfiguration.loadYAMLResource(GlobalConfiguration.java:161)
        at org.apache.flink.configuration.GlobalConfiguration.loadConfiguration(GlobalConfiguration.java:112)
        at org.apache.flink.configuration.GlobalConfiguration.loadConfiguration(GlobalConfiguration.java:79)
        at org.apache.flink.yarn.cli.FlinkYarnSessionCli.main(FlinkYarnSessionCli.java:482)
```

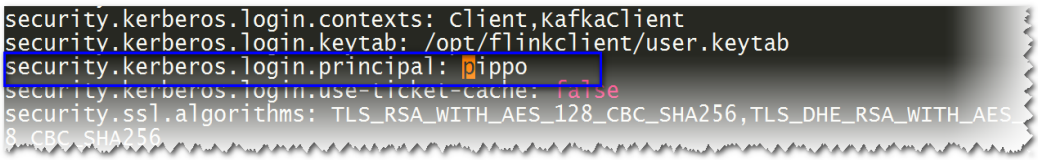
Cause Analysis

The **security.kerberos.login.principal:pippo** item in the **flink-conf.yaml** configuration file was faulty.

Solution

Modify the configuration in the **flink-conf.yaml** file.

Note: The configuration item name and value must be separated by a space.



16.5.3 The yarn-session.sh Command Fails to Be Executed When the Flink Cluster Is Created

Symptom

During the creation of the Flink cluster, an error message is displayed after the **yarn-session.sh** command execution is suspended.

```
2018-09-20 22:51:16,842 | WARN  | [main] | Unable to get ClusterClient status from Application Client | org.apache.flink.yarn.YarnClusterClient (YarnClusterClient.java:253)
org.apache.flink.util.FlinkException: Could not connect to the leading JobManager. Please check that the JobManager is running.
    at org.apache.flink.client.program.ClusterClient.getJobManagerGateway(ClusterClient.java:861)
    at org.apache.flink.yarn.YarnClusterClient.getClusterStatus(YarnClusterClient.java:248)
    at org.apache.flink.yarn.YarnClusterClient.waitForClusterToBeReady(YarnClusterClient.java:516)

    at org.apache.flink.runtime.security.HadoopSecurityContext.runSecured(HadoopSecurityContext.java:41)
    at org.apache.flink.yarn.cli.FlinkYarnSessionCli.main(FlinkYarnSessionCli.java:511)
Caused by: org.apache.flink.runtime.leaderretrieval.LeaderRetrievalException: Could not retrieve the leader gateway.
    at org.apache.flink.runtime.util.LeaderRetrievalUtils.retrieveLeaderGateway(LeaderRetrievalUtils.java:79)
    at org.apache.flink.client.program.ClusterClient.getJobManagerGateway(ClusterClient.java:856)
    ... 10 common frames omitted
Caused by: java.util.concurrent.TimeoutException: Futures timed out after [10000 milliseconds]
```

Possible Causes

The SSL communication encryption is enabled for Flink, but no correct SSL certificate is configured.

Solution

Method 1:

Run the following command to disable the Flink SSL communication encryption, and modify the client configuration file **conf/flink-conf.yaml**.

```
security.ssl.enabled: false
```

Method 2:

Enable the Flink SSL communication encryption and retain the default value of **security.ssl.enabled**. Configure the SSL as follows:

- If the KeyStore or TrustStore file is a relative path, and the Flink client directory where the command is executed can directly access this relative path.

```
security.ssl.keystore: ssl/flink.keystore
security.ssl.truststore: ssl/flink.truststore
```

Add **-t** option to the CLI **yarn-session.sh** command of Flink to transmit the KeyStore and TrustStore files to each execution node. Example:

```
yarn-session.sh -t ssl/ 2
```

- If the keystore or truststore file path is an absolute path, the keystore or truststore files must exist in the absolute path on Flink Client and all nodes.

```
security.ssl.keystore: /opt/Bigdata/client/Flink/flink/conf/flink.keystore
security.ssl.truststore: /opt/Bigdata/client/Flink/flink/conf/flink.truststore
```

16.5.4 Failed to Create a Cluster by Executing the yarn-session Command When a Different User Is Used

Symptom

Two users **testuser** and **bdpuser** with the same rights are used to create the Flink cluster.

When user **testuser** is used to create a Flink cluster, no error message is displayed. While user **bdpuser** is used to create a Flink cluster, an error message is displayed during the **yarn-session.sh** command execution:

```
2019-01-02 14:28:09,098 | ERROR | [main] | Ensure path threw exception |
org.apache.flink.shaded.curator.org.apache.curator.framework.imps.CuratorFrameworkImpl
(CuratorFrameworkImpl.java:566)
org.apache.flink.shaded.zookeeper.org.apache.zookeeper.KeeperException$NoAuthException:
KeeperErrorCode = NoAuth for /flink/application_1545397824912_0022
```

Possible Causes

The HA configuration item is not modified. In the Flink configuration file, the default value of **high-availability.zookeeper.client.acl** is **creator**, indicating that only the creator has the access permission. A new user cannot access the directory on ZooKeeper. As a result, the **yarn-session.sh** command execution fails.

Solution

Step 1 Modify the value of **high-availability.zookeeper.path.root** in the **conf/flink-conf.yaml** file. For example, run the following command:

```
high-availability.zookeeper.path.root: flink2
```

Step 2 Submit the tasks again.

----End

16.5.5 Flink Service Program Fails to Read Files on the NFS Disk

Issue

The Flink service program cannot read files on the NFS disk mounted to the cluster node.

Symptom

The Flink service program developed by a user needs to read the user-defined configuration file. The configuration file is stored on the NFS disk. The NFS disk is mounted to the cluster node and can be accessed by all nodes in the cluster. After the user submits the Flink program, the service code cannot access the user-defined configuration file. As a result, the service program fails to be started.

Cause Analysis

The root cause is that the permission on the root directory of the NFS disk is insufficient. As a result, the Flink program cannot access the directory after being started.

Flink tasks of MRS are running on Yarn. If the cluster is a common cluster, the user who runs the tasks on Yarn is **yarn_user**. If the user-defined configuration file is used after the tasks are started, **yarn_user** must be allowed to access the file and the parent directory of the file (parent directory of the file on the NFS, not the soft link on the cluster node). Otherwise, the program cannot obtain the file content. If the cluster is a cluster with Kerberos authentication enabled, the file permission must allow the user who submits the program to access the file.

Procedure

Step 1 Log in to the Master node in the cluster as user **root**.

Step 2 Run the following command to check the permission on the parent directory of the user-defined configuration file:

ll <*Parent directory of the file path***>**

Step 3 Go to the directory of the file to be accessed on the NFS disk and change the permission of the parent directory of the user-defined configuration file to 755.

chmod 755 -R /<*Path of the parent directory of the file***>**

Step 4 Check whether the Core or Task node can access the configuration file.

1. Log in to the Core or Task node as the **root** user.

   If Kerberos authentication is enabled for the current cluster, log in to the Core node as user **root**.

2. Run **su - yarn_user** to switch to user **yarn_user**.

   If Kerberos authentication is enabled for the cluster, run the **su -** *User who submits the job* command to switch the user.

3. Run the following command to check the user permission. The file path must be the absolute path of the file.

   ll <*File path***>**

----End

Summary and Suggestions

When a user-defined configuration file needs to be accessed in the submitted task, especially when the NFS disk is mounted, you need to check whether the permission of the parent directory of the file is correct in addition to the file

permission. When an NFS disk is mounted to an MRS cluster node, a soft link is created to the NFS directory. In this case, you need to check whether the directory permission on the NFS is correct.

16.6 Using Flume

16.6.1 Class Cannot Be Found After Flume Submits Jobs to Spark Streaming

Issue

After Flume submits jobs to Spark Streaming, the class cannot be found.

Symptom

After the Spark Streaming code is packed into a JAR file and submitted to the cluster, an error message is displayed indicating that the class cannot be found. The following two methods are not useful:

1. When submitting a Spark job, run the **--jars** command to reference the JAR file of the class.
2. Import the JAR file where the class resides to the JAR file of Spark Streaming.

Cause Analysis

Some JAR files cannot be loaded during Spark job execution, resulting that the class cannot be found.

Procedure

Step 1 Run the **--jars** command to load the **flume-ng-sdk-{version} .jar** dependency package.

Step 2 Modify the two configuration items in the **spark-default.conf** file:

spark.driver.extraClassPath=$PWD/*: {Add the original value}

spark.executor.extraClassPath =$PWD/*

Step 3 Run the job successfully. If an error is reported, check which JAR is not loaded and perform step 1 and step 2 again.

----End

16.6.2 Failed to Install a Flume Client

Symptom

A Flume client fails to be installed, and "JAVA_HOME is null" or "flume has been installed" is displayed.

```
CST 2016-08-31 17:02:51 [flume-client install]: JAVA_HOME is null in current user,please install the JDK and set the JAVA_HOME
```

```
CST 2016-08-31 17:02:51 [flume-client install]: check environment failed.
CST 2016-08-31 17:02:51 [flume-client install]: check param failed.
CST 2016-08-31 17:02:51 [flume-client install]: install flume client failed.
```

```
CST 2016-08-31 17:03:58 [flume-client install]: flume has been installed
CST 2016-08-31 17:03:58 [flume-client install]: check path failed.
CST 2016-08-31 17:03:58 [flume-client install]: check param failed.
CST 2016-08-31 17:03:58 [flume-client install]: install flume client failed.
```

Cause Analysis

- Environment variables are checked during Flume client installation. If no Java is available, an error message is displayed stating "JAVA_HOME is null" and the installation quits.
- If Flume has been installed in the specified directory, an error message is displayed stating "flume has been installed" during client installation and the installation quits.

Solution

Step 1 Run the following command if an error message is displayed stating "JAVA_HOME is null":

export JAVA_HOME=*Java path*

Set **JAVA_HOME** and execute the installation script again.

Step 2 If a Flume client has been installed under the specified directory, uninstall the client and use another directory.

----End

16.6.3 A Flume Client Cannot Connect to the Server

Symptom

A user installs a Flume client and sets an Avro sink to communicate with the server. However, the Flume server cannot be connected.

Cause Analysis

1. The server is incorrectly configured and the monitoring port fails to be started up. For example, an incorrect IP address or an occupied port is configured for the Avro source of the server. View Flume run logs.

   ```
   2016-08-31 17:28:42,092 | ERROR | [lifecycleSupervisor-1-9] |  Unable to start
   EventDrivenSourceRunner: { source:Avro source avro_source: { bindAddress: 10.120.205.7, port:
   21154 } } - Exception follows.  | org.apache.flume.lifecycle.LifecycleSupervisor
   $MonitorRunnable.run(LifecycleSupervisor.java:253)
   java.lang.RuntimeException: org.jboss.netty.channel.ChannelException: Failed to bind to: /
   192.168.205.7:21154
   ```

2. If encrypted transmission is used, the certificate or password is incorrect.

   ```
   2016-08-31 17:15:59,593 | ERROR | [conf-file-poller-0] |  Source avro_source has been removed due to
   an error during configuration  |
   org.apache.flume.node.AbstractConfigurationProvider.loadSources(AbstractConfigurationProvider.java:3
   88)
   org.apache.flume.FlumeException: Avro source configured with invalid keystore: /opt/Bigdata/
   MRS_XXX/install/FusionInsight-Flume-1.9.0/flume/conf/flume_sChat.jks
   ```

3. The network connection between the client and the server is abnormal.

```
PING 192.168.85.55 (10.120.85.55) 56(84) bytes of data.
From 192.168.85.50 icmp_seq=1 Destination Host Unreachable
From 192.168.85.50 icmp_seq=2 Destination Host Unreachable
From 192.168.85.50 icmp_seq=3 Destination Host Unreachable
From 192.168.85.50 icmp_seq=4 Destination Host Unreachable
```

Solution

Step 1 Set a correct IP address (an IP address of the local host). If the port has been occupied, configure another free port.

Step 2 Configure a correct certificate path.

Step 3 Contact the network administrator to restore the network.

----End

16.6.4 Flume Data Fails to Be Written to the Component

Symptom

After the Flume process is started, Flume data cannot be written to the corresponding component. (The following uses writing data from the server to HDFS as an example.)

Cause Analysis

1. HDFS is not started or is faulty. View Flume run logs.

```
2019-02-26 11:16:33,564 | ERROR | [SinkRunner-PollingRunner-DefaultSinkProcessor] |  opreation the hdfs file errors.  | org.apache.flume.sink.hdfs.HDFSEventSink.process(HDFSEventSink.java:414)
2019-02-26 11:16:33,747 | WARN  | [hdfs-CCCC-call-runner-4] |  A failover has occurred since the start of call #32795 ClientNamenodeProtocolTranslatorPB.getFileInfo over 192-168-13-88/192.168.13.88:25000  | org.apache.hadoop.io.retry.RetryInvocationHandler$ProxyDescriptor.failover(RetryInvocationHandler.java:220)
2019-02-26 11:16:33,748 | ERROR | [hdfs-CCCC-call-runner-4] |  execute hdfs error. {}  | org.apache.flume.sink.hdfs.HDFSEventSink$3.call(HDFSEventSink.java:744)
java.net.ConnectException: Call From 192-168-12-221/192.168.12.221 to 192-168-13-88:25000 failed on connection exception: java.net.ConnectException: Connection refused; For more details see:  http://wiki.apache.org/hadoop/ConnectionRefused
```

2. The HDFS sink is not started. Check the Flume run log. It is found that the Flume current metrics file does not contain sink information.

```
2019-02-26 11:46:05,501 | INFO  | [pool-22-thread-1] |  flume current metrics:{"CHANNEL.BBBB":{"ChannelCapacity":"10000","ChannelFillPercentage":"0.0","Type":"CHANNEL","ChannelStoreSize":"0","EventProcessTimedelta":"0","EventTakeSuccessCount":"0","ChannelSize":"0","EventTakeAttemptCount":"0","StartTime":"1551152734999","EventPutAttemptCount":"0","EventPutSuccessCount":"0","StopTime":"0"},"SOURCE.AAAA":{"AppendBatchAcceptedCount":"0","EventAcceptedCount":"0","AppendReceivedCount":"0","MonTime":"0","StartTime":"1551152735503","AppendBatchReceivedCount":"0","EventReceivedCount":"0","Type":"SOURCE","TotalFilesCount":"1001","SizeAcceptedCount":"0","UpdateTime":"605410241202740","AppendAcceptedCount":"0","OpenConnectionCount":"0","MovedFilesCount":"1001","StopTime":"0"}}  | org.apache.flume.node.Application.getRestartComps(Application.java:467)
```

Solution

Step 1 If the component to which Flume writes data is not started, start the component. If the component is abnormal, contact technical support.

Step 2 If the sink is not started, check whether the configuration file is correctly configured. If the configuration file is incorrectly configured, modify the configuration file and restart the Flume process. If the configuration file is

correctly configured, view the error information in the log and rectify the fault based on the error information.

----End

16.6.5 Flume Server Process Fault

Symptom

After Flume runs for a period of time, the Flume instance is in the faulty state on Manager.

Cause Analysis

If the Flume file or folder permission is abnormal, the following information is displayed on MRS Manager after the restart:

```
[2019-02-26 13:38:02]RoleInstance prepare to start failure [{ScriptExecutionResult=ScriptExecutionResult [exitCode=126, output=, errMsg=sh: line 1: /opt/Bigdata/MRS_XXX/install/FusionInsight-Flume-1.9.0/flume/bin/flume-manage.sh: Permission denied
```

Solution

Compare the file and folder permissions with those for the Flume node that is running properly and correct the file or folder permissions.

16.6.6 Flume Data Collection Is Slow

Symptom

After Flume is started, it takes a long time for Flume to collect data.

Cause Analysis

1. The heap memory of Flume is not properly set. As a result, the Flume process keeps in the GC state. View Flume run logs.
   ```
   2019-02-26T13:06:20.666+0800: 1085673.512: [Full GC:[CMS: 3849339k->3843458K(3853568K), 2.5817610 secs] 4153654K->3843458K(4160256K), [CMS Perm : 27335K->27335K(45592K),2.5820080 SECS] [Times: user=2.63, sys0.00, real=2.59 secs]
   ```
2. The **deletePolicy** policy configured for the Spooldir source is **immediate**.

Solution

Step 1 Increase the size of the heap memory (**xmx**).

Step 2 Change the **deletePolicy** policy of the Spooldir source to **never**.

----End

16.6.7 Failed to Start Flume

Symptom

The Flume service fails to be installed or restarted.

Cause Analysis

1. The heap memory of Flume is greater than the remaining memory of the server. The Flume startup log shows the following information:
   ```
   [CST 2019-02-26 13:31:43][INFO] [[checkMemoryValidity:124]] [GC_OPTS is invalid: Xmx(40960000MB) is bigger than the free memory(56118MB) in system.] [9928]
   ```
2. The permission on the Flume file or folder is abnormal. The following information is displayed on the GUI or in the background:
   ```
   [2019-02-26 13:38:02]RoleInstance prepare to start failure [{ScriptExecutionResult=ScriptExecutionResult [exitCode=126, output=, errMsg=sh: line 1: /opt/Bigdata/MRS_XXX/install/FusionInsight-Flume-1.9.0/flume/bin/flume-manage.sh: Permission denied
   ```
3. The **JAVA_HOME** is incorrectly configured. The Flume agent startup log shows the following information:
   ```
   Info: Sourcing environment configuration script /opt/FlumeClient/fusioninsight-flume-1.9.0/conf/flume-env.sh
   + '[' -n '' ']'
   + exec /tmp/MRS-Client/MRS_Flume_ClientConfig/JDK/jdk-8u18/bin/java '-XX:OnOutOfMemoryError=bash /opt/FlumeClient/fusioninsight-flume-1.9.0/bin/out_memory_error.sh /opt/FlumeClient/fusioninsight-flume-1.9.0/conf %p' -Xms2G -Xmx4G -XX:CMSFullGCsBeforeCompaction=1 -XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -XX:+UseCMSCompactAtFullCollection -Dkerberos.domain.name=hadoop.hadoop.com -verbose:gc -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M -XX:+PrintGCDetails -XX:+PrintGCDateStamps -Xloggc:/var/log/Bigdata//flume-client-1/flume/flume-root-20190226134231-%p-gc.log -Dproc_org.apache.flume.node.Application -Dproc_name=client -Dproc_conf_file=/opt/FlumeClient/fusioninsight-flume-1.9.0/conf/properties.properties -Djava.security.krb5.conf=/opt/FlumeClient/fusioninsight-flume-1.9.0/conf//krb5.conf -Djava.security.auth.login.config=/opt/FlumeClient/fusioninsight-flume-1.9.0/conf//jaas.conf -Dzookeeper.server.principal=zookeeper/hadoop.hadoop.com -Dzookeeper.request.timeout=120000 -Dflume.instance.id=884174180 -Dflume.agent.name=clientName1 -Dflume.role=client -Dlog4j.configuration.watch=true -Dlog4j.configuration=log4j.properties -Dflume_log_dir=/var/log/Bigdata//flume-client-1/flume/ -Dflume.service.id=flume-client-1 -Dbeetle.application.home.path=/opt/FlumeClient/fusioninsight-flume-1.9.0/conf/service -Dflume.called.from.service -Dflume.conf.dir=/opt/FlumeClient/fusioninsight-flume-1.9.0/conf -Dflume.metric.conf.dir=/opt/FlumeClient/fusioninsight-flume-1.9.0/conf -Dflume.script.home=/opt/FlumeClient/fusioninsight-flume-1.9.0/bin -cp '/opt/FlumeClient/fusioninsight-flume-1.9.0/conf:/opt/FlumeClient/fusioninsight-flume-1.9.0/lib/*:/opt/FlumeClient/fusioninsight-flume-1.9.0/conf/service/' -Djava.library.path=/opt/FlumeClient/fusioninsight-flume-1.9.0/plugins.d/native/native org.apache.flume.node.Application --conf-file /opt/FlumeClient/fusioninsight-flume-1.9.0/conf/properties.properties --name client
   /opt/FlumeClient/fusioninsight-flume-1.9.0/bin/flume-ng: line 233: /tmp/FusionInsight-Client/Flume/FusionInsight_Flume_ClientConfig/JDK/jdk-8u18/bin/java: No such file or directory
   ```

Solution

Step 1 Increase the size of the heap memory (**xmx**).

Step 2 Compare the file and folder permissions with those for node where Flume is started properly and change the incorrect file or folder permissions.

Step 3 Reconfigure **JAVA_HOME**. On the client, replace the value of **JAVA_HOME** in the **${install_home}/fusioninsight-flume-***Flume version***/conf/ENV_VARS** file. On the server, replace the value of **JAVA_HOME** in the **ENV_VARS** file in the **etc** directory.

To obtain the value of **JAVA_HOME**, log in to the node where Flume is properly started and run the **echo ${JAVA_HOME}** command.

NOTE

${install_home} is the installation path of the Flume client.

----End

16.7 Using HBase

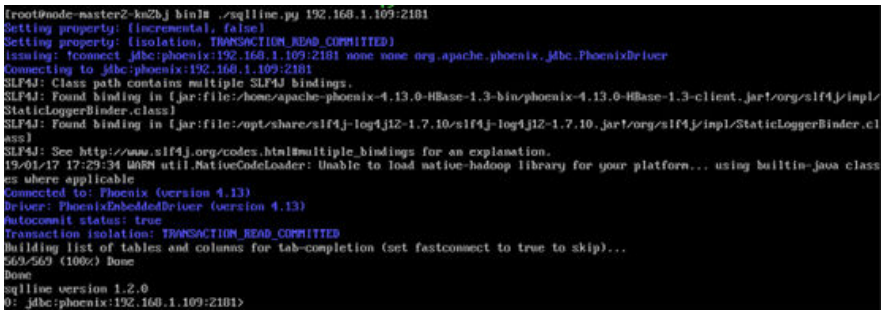
16.7.1 Slow Response to HBase Connection

Issue

Under the same VPC network, response is slow when an external cluster connects to HBase through Phoenix.

Symptom

Under the same VPC network, response is slow when an external cluster connects to HBase through Phoenix.



Possible Cause

DNS has been configured. When a client connects to HBase, DNS resolves the server first, causing slow response.

Procedure

Step 1 Log in to the Master node as user **root**.

Step 2 Run the **vi /etc/resolv.conf** command to open the **resolv.conf** file and comment out the address of the DNS server, for example, #1.1.1.1.

----End

16.7.2 RegionServer Failed to Start Because the Port Is Occupied

Symptom

RegionServer is in the **Restoring** state on Manager.

Cause Analysis

1. View the RegionServer log (**/var/log/Bigdata/hbase/rs/hbase-omm-xxx.log**).

2. Run the **lsof -i:21302** command (the port number of MRS 1.7.X and later versions is 16020) to view the PID. Based on the PID, check the process. It is found that the RegionServer port is occupied by DFSZkFailoverController.
3. The value of **/proc/sys/net/ipv4/ip_local_port_range** is **9000 65500**. The temporary port range and the MRS port range overlap. This is because the preinstall operation is not performed during installation.

Solution

Step 1 Run the **kill -9** *DFSZkFailoverController pid* command to ensure that another port is bound with after a restart and restart the RegionServer in the **Restoring** state.

----End

16.7.3 HBase Failed to Start Due to Insufficient Node Memory

Symptom

The RegionServer service of HBase is always in the **Restoring** state.

Cause Analysis

1. Check the RegionServer log (**/var/log/Bigdata/hbase/rs/hbase-omm-XXX.out**). It is found that the following information is printed:
   ```
   There is insufficient memory for the Java Runtime Environment to continue.
   ```
2. Run the **free** command to check the memory. It is found that the available memory of the node is insufficient.

Solution

Step 1 Locate why the memory is insufficient. It is found that some processes occupy too much memory or the server does not have sufficient memory.

----End

16.7.4 HBase Failed to Start Due to Inappropriate Parameter Settings

Symptom

After some parameters are modified, HBase cannot be started.

Cause Analysis

1. Check the HMaster log (**/var/log/Bigdata/hbase/hm/hbase-omm-*xxx*.log**). It is found that the total of **hbase.regionserver.global.memstore.size** and **hfile.block.cache.size** is greater than 0.8, which causes the startup failure. Therefore, adjust the parameter values to make sure that the total value is less than 0.8.

2. Check the HMaster and RegionServer out logs (**/var/log/Bigdata/hbase/hm/hbase-omm-*xxx*.out/var/log/Bigdata/hbase/rs/hbase-omm-*xxx*.out**). It is found that **Unrecognized VM option** is displayed.

   ```
   Unrecognized VM option
   Error: Could not create the Java Virtual Machine.
   Error: A fatal exception has occurred. Program will exit.
   ```

   Check the **GC_OPTS** parameters. It is found that the parameters contain unnecessary spaces, for example, **-D sun.rmi.dgc.server.gcInterval=0x7FFFFFFFFFFFFE**.

Solution

Step 1 After the **MemStore** and **cache** parameters are modified, the HBase service is restarted successfully.

Step 2 After the **GC_OPTS** parameters are modified, the HBase service is restarted successfully.

----End

16.7.5 RegionServer Failed to Start Due to Residual Processes

Symptom

The HBase service fails to start, and an error is reported during the health check.

Cause Analysis

Check detailed information about HBase startup on the MRS Manager page. It is found that **the previous process is not quit** is displayed.

Solution

Step 1 Log in to the node and run the **ps -ef | grep HRegionServer** command in the background. A residual process is found.

Step 2 After confirming that the process can be killed, kill the process. If the process cannot be stopped by running the **kill** command, run the **kill -9** command to forcibly stop the process.

Step 3 Restart the HBase service.

----End

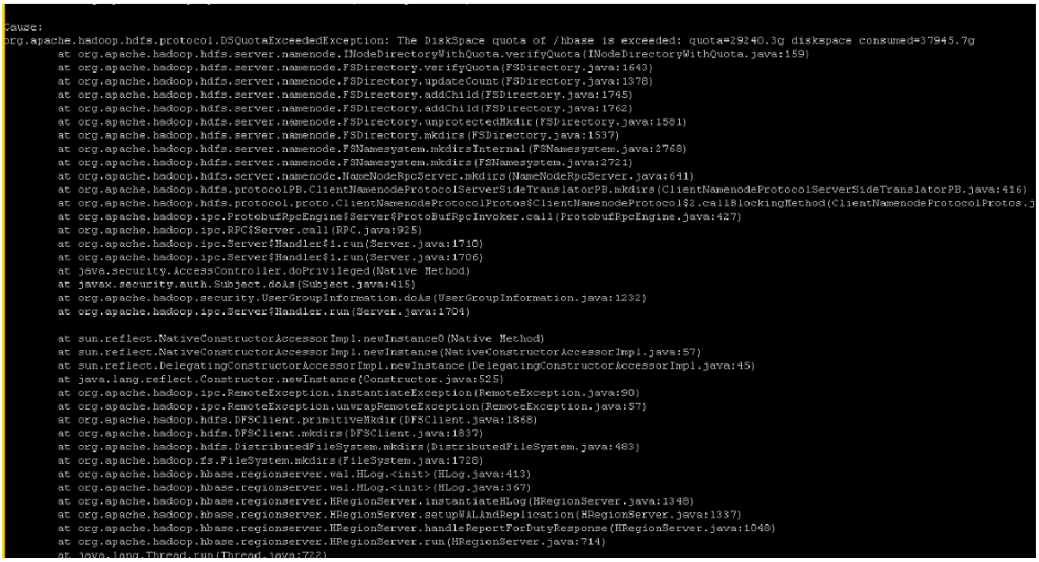
16.7.6 HBase Failed to Start Due to a Quota Set on HDFS

Symptom

HBase fails to start.

Cause Analysis

Check the HMaster log (**/var/log/Bigdata/hbase/hm/hbase-omm-*xxx*.log**). It is found that "The DiskSpace quota of /hbase is exceeded" is displayed.



Solution

Step 1 Run the **df -h** command to check data directory space. It is found that the directory space is full. Delete unnecessary data to free up space.

Step 2 Expand the node to ensure that the data directory space is sufficient.

----End

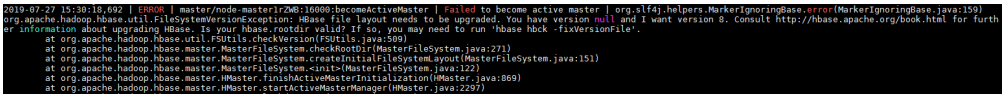
16.7.7 HBase Failed to Start Due to Corrupted Version Files

Symptom

HBase fails to start.

Cause Analysis

1. The **hbase.version** file is read during HBase startup. However, the log indicates that a reading exception occurs.



2. The file cannot be viewed by running the **hadoop fs -cat /hbase/hbase.version** command. The file is corrupted.

Solution

Step 1 Run the **hbase hbck -fixVersionFile** command to restore the file.

Step 2 If the problem persists after performing **Step 1**, obtain the **hbase.version** file from another cluster of the same version and upload the file to replace the original one.

Step 3 Restart the HBase service.

----End

16.7.8 High CPU Usage Caused by Zero-Loaded RegionServer

Symptom

The CPU usage of RegionServer is high, but there is no service running on RegionServer.

Cause Analysis

1. Run the **top** command to obtain the CPU usage of RegionServer processes and check the IDs of processes with high CPU usage.
2. Obtain the CPU usage of threads under these processes based on the RegionServer process IDs.

   Run the **top -H -p** *<PID>* (replace it with the actual RegionServer process ID). As shown in the following figure, the CPU usage of some threads reaches 80%.

   ```
   PID USER      PR  NI    VIRT    RES    SHR S %CPU %MEM     TIME+ COMMAND
   75706 omm     20   0 6879444   1.0g  25612 S  90.4  1.6   0:00.00 java
   75716 omm     20   0 6879444   1.0g  25612 S  90.4  1.6   0:04.74 java
   75720 omm     20   0 6879444   1.0g  25612 S  88.6  1.6   0:01.93 java
   75721 omm     20   0 6879444   1.0g  25612 S  86.8  1.6   0:01.99 java
   75722 omm     20   0 6879444   1.0g  25612 S  86.8  1.6   0:01.94 java
   75723 omm     20   0 6879444   1.0g  25612 S  86.8  1.6   0:01.96 java
   75724 omm     20   0 6879444   1.0g  25612 S  86.8  1.6   0:01.97 java
   75725 omm     20   0 6879444   1.0g  25612 S  81.5  1.6   0:02.06 java
   75726 omm     20   0 6879444   1.0g  25612 S  79.7  1.6   0:02.01 java
   75727 omm     20   0 6879444   1.0g  25612 S  79.7  1.6   0:01.95 java
   75728 omm     20   0 6879444   1.0g  25612 S  78.0  1.6   0:01.99 java
   ```

3. Obtain the thread stack information based on the ID of the RegionServer process.

   jstack 12345 >allstack.txt (Replace it with the actual RegionServer process ID.)

4. Convert the thread ID into the hexadecimal format:

   printf "%x\n" 30648

   In the command output, the TID is **77b8**.

5. Search the thread stack based on the hexadecimal TID. It is found that the compaction operation is performed.

   ```
   "regionserver/ahbd-hbase-dat1/12.2.168.1:21302-longCompactions-1482676601478" #1641 prio=5 os_prio=0 tid=0x00007fa614563000 nid=0x77b8 runnable [0x0
      java.lang.Thread.State: RUNNABLE
       at org.apache.hadoop.io.compress.snappy.SnappyCompressor.compressBytesDirect(Native Method)
       at org.apache.hadoop.io.compress.snappy.SnappyCompressor.compress(SnappyCompressor.java:228)
       at org.apache.hadoop.io.compress.BlockCompressorStream.compress(BlockCompressorStream.java:149)

       at java.io.DataOutputStream.write(DataOutputStream.java:107)
       - locked <0x00000004de9535c8> (a org.apache.hadoop.hdfs.client.HdfsDataOutputStream)
       at java.io.FilterOutputStream.write(FilterOutputStream.java:97)
   ```

Solution

This is a normal phenomenon.

The threads that consume a large number of CPU resources are compaction threads. Some threads invoke the Snappy compression algorithm, and some threads invoke HDFS data writing and reading. Each region has massive sets of data and numerous data files and uses the Snappy compression algorithm. For this reason, the compaction operations consume a large number of CPU resources.

Fault Locating Methods

Step 1 Run the **top** command to check the process with high CPU usage.

Step 2 Check the threads with high CPU usage in the process.

Run the **top -H -p** *<PID>* command to print CPU usage of threads under the process.

Obtain the thread with the highest CPU usage from the query result. You can also obtain the thread by running the following command:

Or run the **ps -mp** *<PID>* **-o THREAD,tid,time | sort -rn** command.

View the command output to obtain the ID of the thread with the highest CPU usage.

Step 3 Obtain the stack of the faulty thread.

The jstack tool is the most effective and reliable tool for locating Java problems.

You can obtain the jstack tool from the **java/bin** directory.

jstack <PID> > allstack.txt

Obtain the process stack and output it to a local file.

Step 4 Convert the thread ID into the hexadecimal format:

printf "%x\n" <PID>

The process ID in the command output is the TID.

Step 5 Run the following command to obtain the TID and output it to a local file:

jstack <PID> | grep <TID> > Onestack.txt

If you want to view the TID in the CLI only, run the following command:

jstack <PID> | grep <TID> -A 30

-A 30 indicates that 30 lines are displayed.

----End

16.7.9 HBase Failed to Started with "FileNotFoundException" in RegionServer Logs

Symptom

HBase fails to start, and the RegionServer stays in the **Restoring** state.

Cause Analysis

1. Check the RegionServer log (**/var/log/Bigdata/hbase/rs/hbase-omm-*XXX*.out**). It is found that the following information is printed:

```
| ERROR | RS_OPEN_REGION-ab-dn01:21302-2 | ABORTING region server ab-dn01,21302,1487663269375: The coprocessor org.apache.kylin.storage.hbase.cube.v2.coprocessor.endpoint.CubeVisitService threw java.io.FileNotFoundException: File does not exist: hdfs://hacluster/kylin/kylin_metadata/coprocessor/kylin-coprocessor-1.6.0-SNAPSHOT-0.jar |

```

2. Run the **hdfs** command on the client. It is found that the following file does not exist:

   hdfs://hacluster/kylin/kylin_metadata/coprocessor/kylin-coprocessor-1.6.0-SNAPSHOT-0.jar

3. When configuring the coprocessor for HBase, make sure that the path of the corresponding JAR package is correct. Otherwise, HBase cannot be started.

Solution

Use the Apache Kylin engine to interconnect with MRS and make sure that the JAR file of the Kylin engine exists.

16.7.10 The Number of RegionServers Displayed on the Native Page Is Greater Than the Actual Number After HBase Is Started

Symptom

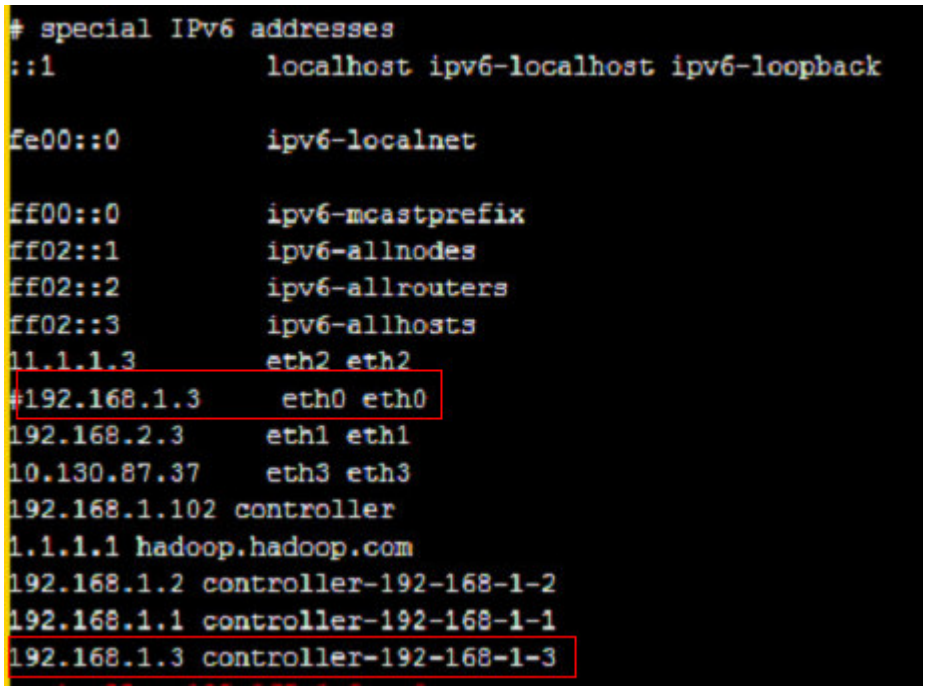
After HBase is started, the number of RegionServers displayed on the HMaster native page is greater than the actual number.

The HMaster native page shows that four RegionServers are online, as shown in the following figure.

ServerName	Start time	Requests Per Second	Num. Regions
controller-192-168-1-1,21302,1494933959261	Tue May 16 19:25:59 CST 2017	0	19
controller-192-168-1-2,21302,1494933957536	Tue May 16 19:25:57 CST 2017	0	24
controller-192-168-1-3,21302,1494933958592	Tue May 16 19:25:58 CST 2017	0	16
eth0,21302,1494933958592	Tue May 16 19:25:58 CST 2017	0	0
Total:4		0	59

Cause Analysis

As shown in the following figure, the hostname of the node in the third row is **controller-192-168-1-3** and that of the fourth row is **eth0**. The two carry the same information reported by RegionServer. Then, log in to the corresponding nodes to check the **/etc/hosts** file. It is found that the same IP address is configured for the two hostnames. For details, see the following figure:



Solution

Log in to the node where RegionServer resides, and modify the **/etc/hosts** file. Make sure that the same IP address can correspond to only one hostname.

16.7.11 RegionServer Instance Is in the Restoring State

Symptom

HBase fails to start, and the RegionServer stays in the **Restoring** state.

Cause Analysis

Check the running log (**/var/log/Bigdata/hbase/rs/hbase-omm-*XXX*.log**) of the abnormal RegionServer instance. It is found that the following information is displayed: **ClockOutOfSyncException..., Reported time is too far out of sync with master**.

```
2017-09-18 11:16:23,636 | FATAL | regionserver21302 | Master rejected startup because clock is out of sync |
org.apache.hadoop.hbase.regionserver.HRegionServer.reportForDuty(HRegionServer.java:2059)
org.apache.hadoop.hbase.ClockOutOfSyncException: org.apache.hadoop.hbase.ClockOutOfSyncException:
Server nl-bi-fi-datanode-24-65,21302,1505726180086 has been rejected; Reported time is too far out of
sync with master.  Time difference of 152109ms > max allowed of 30000ms
at org.apache.hadoop.hbase.master.ServerManager.checkClockSkew(ServerManager.java:354)
...

...
2017-09-18 11:16:23,858 | ERROR | main | Region server exiting |
org.apache.hadoop.hbase.regionserver.HRegionServerCommandLine.start(HRegionServerCommandLine.java:
70)
java.lang.RuntimeException: HRegionServer Aborted
```

This log indicates that the time difference between the abnormal RegionServer instance and the HMaster instance is greater than the allowed time difference 30s (specified by the **hbase.regionserver.maxclockskew** parameter and the default value is **30000 ms**). As a result, the RegionServer instance is abnormal.

Solution

Adjust the node time to ensure that the time difference between nodes is less than 30s.

16.7.12 HBase Failed to Start in a Newly Installed Cluster

Symptom

HBase of a newly installed cluster fails to start. The RegionServer log contains the following error information:

```
2018-02-24 16:53:03,863 | ERROR | regionserver/host3/187.6.71.69:21302 | Master passed us a different hostname to use; was=host3, but now=187-6-71-69 | org.apache.hadoop.hbase.regionserver.HRegionServer.handleReportForDutyResponse(HRegionServer.java:1386)
```

Cause Analysis

In the **/etc/hosts** file, an IP address maps multiple hostnames.

Solution

Step 1 Modify the mapping between the IP address and hostnames in the **/etc/host** file.

Step 2 Restart HBase.

----End

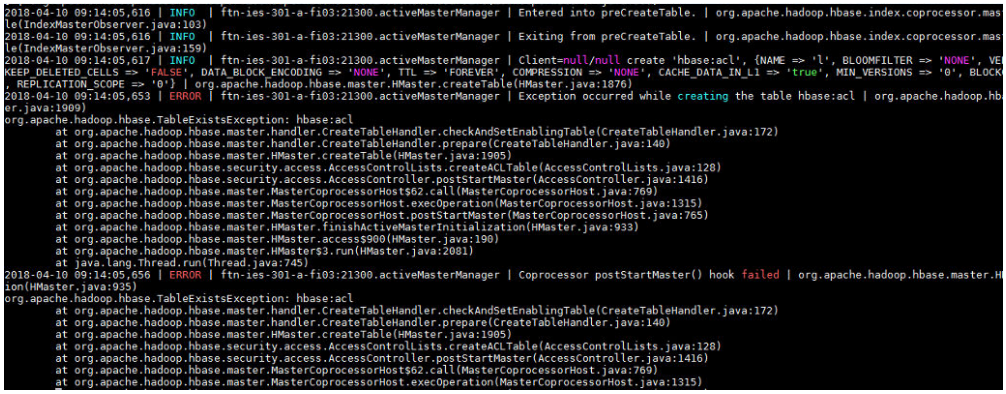
16.7.13 HBase Failed to Start Due to the Loss of the ACL Table Directory

Symptom

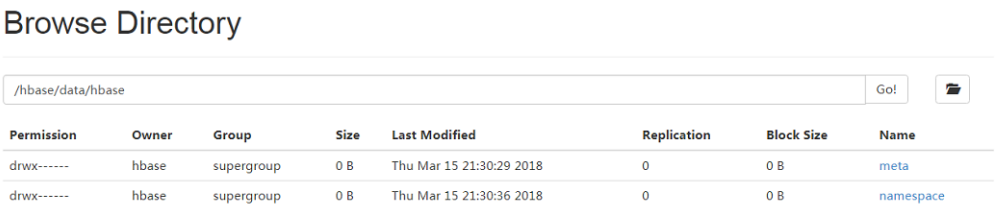
The HBase cluster fails to start.

Cause Analysis

1. Check the HMaster log of HBase. The following error information is displayed:



2. The HBase directory in HDFS is checked, which shows that the ACL table directory is lost.



Solution

Step 1 Stop HBase.

Step 2 Log in to the HBase client as the **hbase** user and run the following command.

Example:

```
hadoop03:~ # source /opt/client/bigdata_env
hadoop03:~ # kinit hbase
Password for hbase@HADOOP.COM:
hadoop03:~ # hbase zkcli
```

Step 3 Delete the ACL table information from the ZooKeeper.

Example:

```
[zk: hadoop01:24002,hadoop02:24002,hadoop03:24002(CONNECTED) 0] deleteall /hbase/table/hbase:acl
[zk: hadoop01:24002,hadoop02:24002,hadoop03:24002(CONNECTED) 0] deleteall /hbase/table-lock/
hbase:acl
```

Step 4 Start HBase.

----End

16.7.14 HBase Failed to Start After the Cluster Is Powered Off and On

Symptom

After the ECS in the cluster is stopped and restarted, HBase fails to start.

Cause Analysis

Check the HMaster run logs. A large number of errors are reported, as shown below:

```
2018-03-26 11:10:54,185 | INFO  | hadoopc1h3,21300,1522031630949_splitLogManager__ChoreService_1 |

(SplitLogManager.java:745)
```

The WAL splitting of RegionServer fails when the node is powered on and off.

Solution

Step 1 Stop HBase.

Step 2 Run the **hdfs fsck** command to check the health status of the **/hbase/WALs** file.

hdfs fsck /hbase/WALs

If the following command output is displayed, all files are normal. If any file is abnormal, rectify the fault, and then perform the subsequent operations.

```
The filesystem under path '/hbase/WALs' is HEALTHY
```

Step 3 Back up the **/hbase/WALs** file.

hdfs dfs -mv /hbase/WALs /hbase/WALs_old

Step 4 Run the following command to create the **/hbase/WALs** directory.

hdfs dfs -mkdir /hbase/WALs

Make sure that the permission on the directory is **hbase:hadoop**.

Step 5 Start HBase.

----End

16.7.15 Failed to Import HBase Data Due to Oversized File Blocks

Symptom

Error Message "NotServingRegionException" is displayed when data is imported to HBase.

Cause Analysis

When a block is greater than 2 GB, a read exception occurs during the seek operation of the HDFS. A full GC occurs when data is frequently written to the RegionServer. As a result, the heartbeat between the HMaster and RegionServer becomes abnormal, and the HMaster marks the RegionServer as dead, and the RegionServer is forcibly restarted. After the restart, the servercrash mechanism is triggered to roll back WALs. Currently, the **splitwal** file has reached 2.1 GB and has only one block. As a result, the HDFS seek operation becomes abnormal and the WAL file splitting fails. However, the RegionServer detects that the WAL needs to be split and triggers the splitwal mechanism, causing a loop between WAL splitting and the splitting failure. In this case, the regions on the RegionServer node cannot be brought online, and an exception is thrown indicating that the region is not online when a region on the RegionServer is queried.

Procedure

Step 1 Go to the HBase service page.

Log in to FusionInsight Manager and choose **Cluster**. Click the name of the desired cluster, and choose **Services** > **HBase**.

Step 2 On the right of **HMaster Web UI**, click **HMaster (Active)** to go to the HBase Web UI page.

Step 3 On the **Procedures** page, view the node where the problem occurs.

Step 4 Log in to the faulty node as user **root** and run the **hdfs dfs -ls** command to view all block information.

Step 5 Run the **hdfs dfs -mkdir** command to create a directory for storing faulty blocks.

Step 6 Run the **hdfs dfs -mv** command to move the faulty block to the new directory.

----End

Summary and Suggestions

The following is provided for your reference:

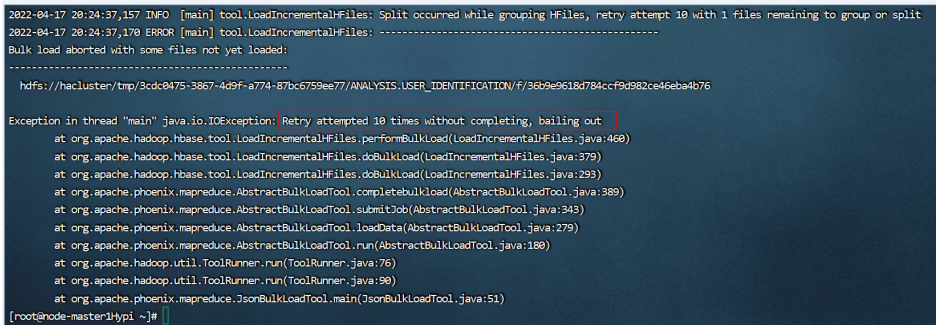
- If data blocks are corrupted, run the **hdfs fsck /tmp -files -blocks -racks** command to check the health information about data blocks.
- If you perform data operations when a region is being split, **NotServingRegionException** is thrown.

16.7.16 Failed to Load Data to the Index Table After an HBase Table Is Created Using Phoenix

Symptom

A user fails to run commands to load data to the index table after creating an HBase table using Phoenix. The following error information is displayed:

Exception in thread "main" java.io.IOException: Retry attempted 10 times without completing, bailing out



Procedure

Step 1 Log in to FusionInsight Manager as user **admin** and choose **Cluster** > **Services** > **HBase**. On the HBase page, choose **Configurations** > **All Configurations** > **RegionServer** > **Customization**. In the right pane, add a configuration item for parameter **hbase.regionserver.config.expandor** with name **hbase.regionserver.wal.codec** and value **org.apache.hadoop.hbase.regionserver.wal.IndexedWALEditCodec**.

Step 2 Choose **HMaster** > **Customization**, and add a configuration item for parameter **hbase.hmaster.config.expandor** with name **hbase.regionserver.wal.codec** and value **org.apache.hadoop.hbase.regionserver.wal.IndexedWALEditCodec**.

Step 3 Click **Save**. In the dialog box that is displayed, click **OK** to save the configuration.

Step 4 On the **Dashboard** page, click **More** and select **Restart Service**. Enter the password of the current user and click **OK** to restart the HBase service.

----End

16.8 Using HDFS

16.8.1 All NameNodes Become the Standby State After the NameNode RPC Port of HDFS Is Changed

Issue

After the NameNode RPC port is changed on the page and HDFS is restarted, all NameNodes are in the standby state, causing a cluster exception.

Symptom

All NameNodes are in the standby state, causing a cluster exception.

Cause Analysis

After the cluster is installed and started, if the NameNode RPC port is changed, the Zkfc service must be formatted to update node information on ZooKeeper.

Procedure

Step 1 Log in to Manager and stop the HDFS service.

NOTE

Do not stop related services when stopping HDFS.

Step 2 After the services are stopped, log in to the Master node whose RPC port is changed.

NOTE

If the RPC port is changed on both Master nodes, you can log in to either of the Master nodes.

Step 3 Run the **su - omm** command to switch to user **omm**.

NOTE

For a security cluster, run the **kinit hdfs** command for authentication.

Step 4 Run the following command to load the environment variable script to the environment:

cd ${BIGDATA_HOME}/*MRS_X.X.X*/*1_8*_**Zkfc/etc**

source ${BIGDATA_HOME}/*MRS_X.X.X***/install/FusionInsight-Hadoop-3.1.1/hadoop/sbin/exportENV_VARS.sh**

NOTE

In the preceding command, *MRS_X.X.X* and *1_8* vary depending on the actual version.

Step 5 After the loading is complete, run the following command to format the Zkfc:

cd ${HADOOP_HOME}/bin

./hdfs zkfc -formatZK

Step 6 After the formatting is successful, restart HDFS on Manager.

NOTE

If the RPC port of the NameNode is changed, the configuration file must be updated for all clients that have been installed.

----End

16.8.2 An Error Is Reported When the HDFS Client Is Used After the Host Is Connected Using a Public Network IP Address

Issue

When the host is connected using a public network IP address, the HDFS client cannot be used and the message "**-bash: hdfs: command not found**" is displayed when the HDFS is running.

Symptom

When the host is connected using a public network IP address, the HDFS client cannot be used and the message "**-bash: hdfs: command not found**" is displayed when the HDFS is running.

Possible Causes

The environment variables are not set before the user logs in to the Master node and runs the command.

Procedure

Step 1 Log in to any Master node as user **root**.

Step 2 Run the **source /opt/client/bigdata_env** command to configure environment variables.

Step 3 Run the **hdfs** command to use the HDFS client.

----End

16.8.3 Failed to Use Python to Remotely Connect to the Port of HDFS

Issue

Failed to use Python to remotely connect to the port of HDFS.

Symptom

Failed to use Python to remotely connect to port 50070 of HDFS.

Cause Analysis

The default port of open source HDFS is 50070 for versions earlier than 3.0.0 and is 9870 for version 3.0.0 or later. The port used by the user does not match the HDFS version.

Step 1 Log in to the active Master node in the cluster.

Step 2 Run the **su - omm** command to switch to user **omm**.

Step 3 Run the **/opt/Bigdata/om-0.0.1/sbin/queryVersion.sh** command to check the HDFS version in the cluster.

Determine the port number of the open-source component based on the version number.

Step 4 Run the **netstat -anp|grep ${port}** command to check whether the default port number of the component exists.

If it does not exist, the default port number is changed. Change the port to the default port and reconnect to HDFS.

If it exists, contact technical support.

NOTE

- **${port}**: indicates the default port number corresponding to the component version.
- If you have changed the default port number, use the new port number to connect to HDFS. You are advised not to change the default port number.

----End

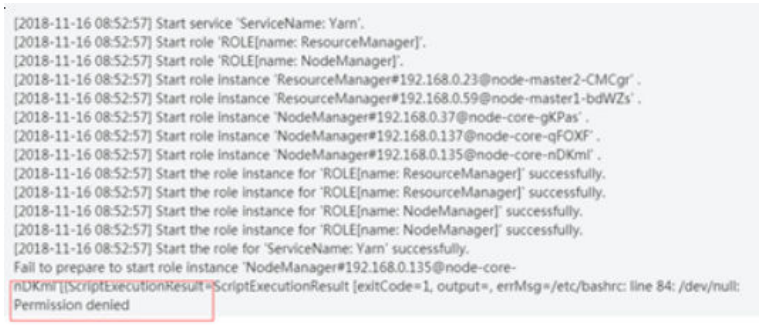
16.8.4 An Error Is Reported During HDFS and Yarn Startup

Issue

An error is reported during HDFS and Yarn startup.

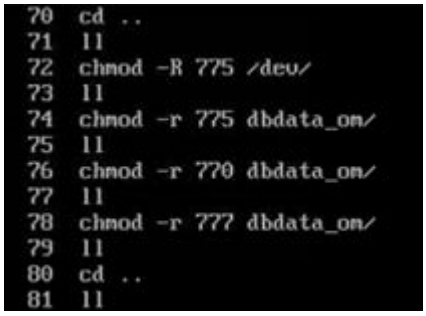
Symptom

HDFS and Yarn fail to be started. The following error information is displayed: **/dev/null Permission denied**



Cause Analysis

The customer changed the permission value of **/dev/null** of the VM system to **775**.



Procedure

Step 1 Log in to any Master node in the cluster as user **root**.

Step 2 After successful login, run the **chmod 666 /dev/null** command to modify the permission value of **/dev/null** to **666**.

Step 3 Run the **ls -al /dev/null** command to check whether the new permission value of **/dev/null** is **666**. If it is not, change the value to **666**.

Step 4 After the modification is successful, restart HDFS and Yarn.

----End

16.8.5 HDFS Permission Setting Error

Issue

When using MRS, a user has the permission to delete or create files in another user's HDFS directory.

Symptom

When using MRS, a user has the permission to delete or create files in another user's HDFS directory.

Cause Analysis

The user has the permission for the **ficommon** group and therefore can perform any operations on the HDFS. You need to remove the user's **ficommon** group permission.

Procedure

Step 1 Log in to the master node in the cluster as user **root**.

Step 2 Run the **id ${Username}** command to check whether the user has the **ficommon** group permission.

If the user has the **ficommon** group permission, go to **Step 3**. If the user does not have the **ficommon** group permission, contact technical support.

NOTE

${Username} indicates the name of the user whose HDFS permission is incorrectly set.

Step 3 Run the **gpasswd -d ${Username} ficommon** command to delete the user's **ficommon** group permission.

NOTE

${Username} indicates the name of the user whose HDFS permission is incorrectly set.

Step 4 Modify parameters on Manager.

FusionInsight Manager:

1. Log in to FusionInsight Manager. Choose **Cluster** > **Services** > **HDFS** > **Configurations** > **All Configurations**.
2. Enter **dfs.permissions.enabled** in the search box and change the value to **true**.
3. After the modification is complete, click **Save** and restart the HDFS service.

MRS console :

1. Log in to the MRS console and choose **Components** > **HDFS** > **Service Configuration**.
2. Set **Type** to **All**, enter **dfs.permissions.enabled** in the search box, and change the parameter value to **true**.
3. Click **Save Configuration** and restart the HDFS service.

----End

16.8.6 A DataNode of HDFS Is Always in the Decommissioning State

Issue

A DataNode of HDFS is in the **Decommissioning** state for a long period of time.

Symptom

A DataNode of HDFS fails to be decommissioned (or the Core node fails to be scaled in), but the DataNode remains in the Decommissioning state.

Cause Analysis

During the decommissioning of a DataNode (or scale-in of the Core node) in HDFS, the decommissioning or scale-in task fails and the blacklist is not cleared because the Master node is restarted or the NodeAgent process exits unexpectedly. In this case, the DataNode remains in the **Decommissioning** state. The blacklist needs to be cleared manually.

Procedure

Step 1 Go to the service instance page.

FusionInsight Manager:

Log in to FusionInsight Manager and choose **Cluster** > **Service** > **HDFS** > **Instance**.

Log in to the MRS console and choose **Components** > **HDFS** > **Instances**.

Step 2 Check the HDFS service instance status, locate the DataNode that is in the decommissioning state, and copy the IP address of the DataNode.

Step 3 Log in to the Master1 node and run the **cd ${BIGDATA_HOME}/MRS_*/1_*_NameNode/etc/** command to go to the blacklist directory.

Step 4 Run the **sed -i "/^*IP*$/d" excludeHosts** command to clear the faulty DataNode information from the blacklist. Replace the IP address in the command with the IP

address of the faulty DataNode queried in **Step 2**. The IP address cannot contain spaces.

Step 5 If there are two Master nodes, perform **Step 3** and **Step 4** on Master2.

Step 6 Run the following command on the Master1 node to initialize environment variables:

source /opt/client/bigdata_env

Step 7 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step:

kinit *MRS cluster user*

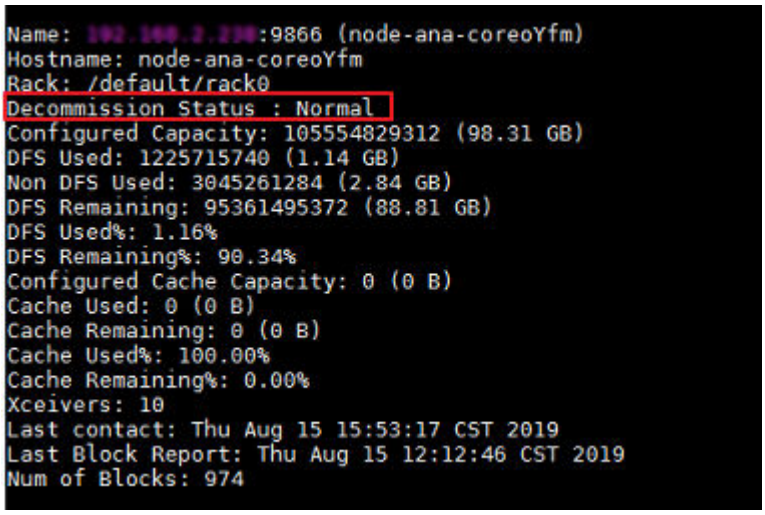
Example: **kinit admin**

Step 8 Run the following command on the Master1 node to update the HDFS blacklist:

hdfs dfsadmin -refreshNodes

Step 9 Run the **hdfs dfsadmin -report** command to check the status of each DataNode. Ensure that the DataNode corresponding to the IP address obtained in has been restored to the **Normal** state.

Figure 16-18 DataNode status



Step 10 Go to the service instance page.

FusionInsight Manager:

Log in to FusionInsight Manager and choose **Cluster** > **Service** > **HDFS** > **Instance**.

Log in to the MRS console and choose **Components** > **HDFS** > **Instances**.

Step 11 Select the DataNode instance that is in the decommissioning state and choose **More** > **Restart Instance**.

Step 12 Wait until the restart is complete and check whether the DataNode is restored.

----End

Summary and Suggestions

Do not perform high-risk operations, such as restarting nodes, during decommissioning (or scale-in).

Related Information

None

16.8.7 HDFS Failed to Start Due to Insufficient Memory

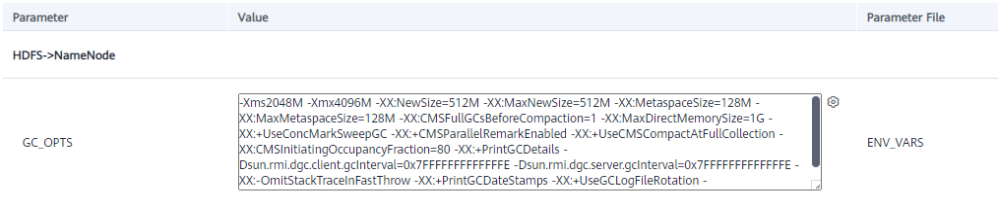
Symptom

After the HDFS service is restarted, HDFS is in the Bad state, the NameNode instance status is abnormal, and the system cannot exit the security mode for a long time.

Cause Analysis

1. In the NameNode run log (**/var/log/Bigdata/hdfs/nn/hadoop-omm-namendoe-XXX.log**), search for **WARN**. It is found that GC takes 63 seconds.
   ```
   2017-01-22 14:52:32,641 | WARN  | org.apache.hadoop.util.JvmPauseMonitor$Monitor@1b39fd82 |
   Detected pause in JVM or host machine (eg GC): pause of approximately 63750ms
   GC pool 'ParNew' had collection(s): count=1 time=0ms
   GC pool 'ConcurrentMarkSweep' had collection(s): count=1 time=63924ms | JvmPauseMonitor.java:189
   ```
2. Analyze the NameNode log **/var/log/Bigdata/hdfs/nn/hadoop-omm-namendoe-XXX.log**. It is found that the NameNode is waiting for block reporting and the total number of blocks is too large. In the following example, the total number of blocks is 36.29 million.
   ```
   2017-01-22 14:52:32,641 | INFO  | IPC Server handler 8 on 25000 | STATE* Safe mode ON.
   The reported blocks 29715437 needs additional 6542184 blocks to reach the threshold 0.9990 of total blocks 36293915.
   ```
3. On Manager, check the **GC_OPTS** parameter of the NameNode:

   Figure 16-19 Checking the GC_OPTS parameter of the NameNode

4. For details about the mapping between the NameNode memory configuration and data volume, see **Table 16-2**.

Table 16-2 Mapping between NameNode memory configuration and data volume

Number of File Objects	Reference Value
10,000,000	-Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
20,000,000	-Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
50,000,000	-Xms32G -Xmx32G -XX:NewSize=2G -XX:MaxNewSize=3G
100,000,000	-Xms64G -Xmx64G -XX:NewSize=4G -XX:MaxNewSize=6G
200,000,000	-Xms96G -Xmx96G -XX:NewSize=8G -XX:MaxNewSize=9G
300,000,000	-Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

Solution

Step 1 Modify the NameNode memory parameter based on the specifications. If the number of blocks is 36 million, change the parameter value to **-Xms32G -Xmx32G -XX:NewSize=2G -XX:MaxNewSize=3G**.

Step 2 Restart a NameNode and check that the NameNode can be started normally.

Step 3 Restart the other NameNode and check that the page status is restored.

----End

16.8.8 A Large Number of Blocks Are Lost in HDFS due to the Time Change Using ntpdate

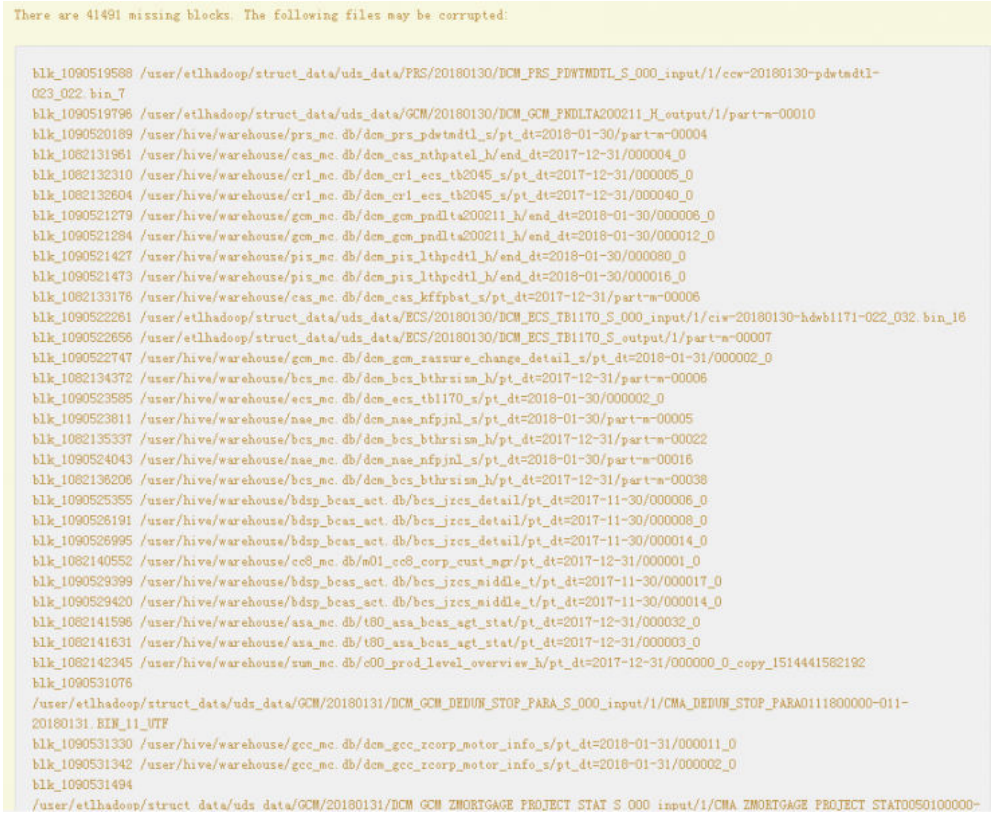
Symptom

1. A user uses **ntpdate** to change the time for a cluster that is not stopped. After the time is changed, HDFS enters the safe mode and cannot be started.
2. After the system exits the safe mode and starts, about 1 TB data is lost during the **hfck** check.

Cause Analysis

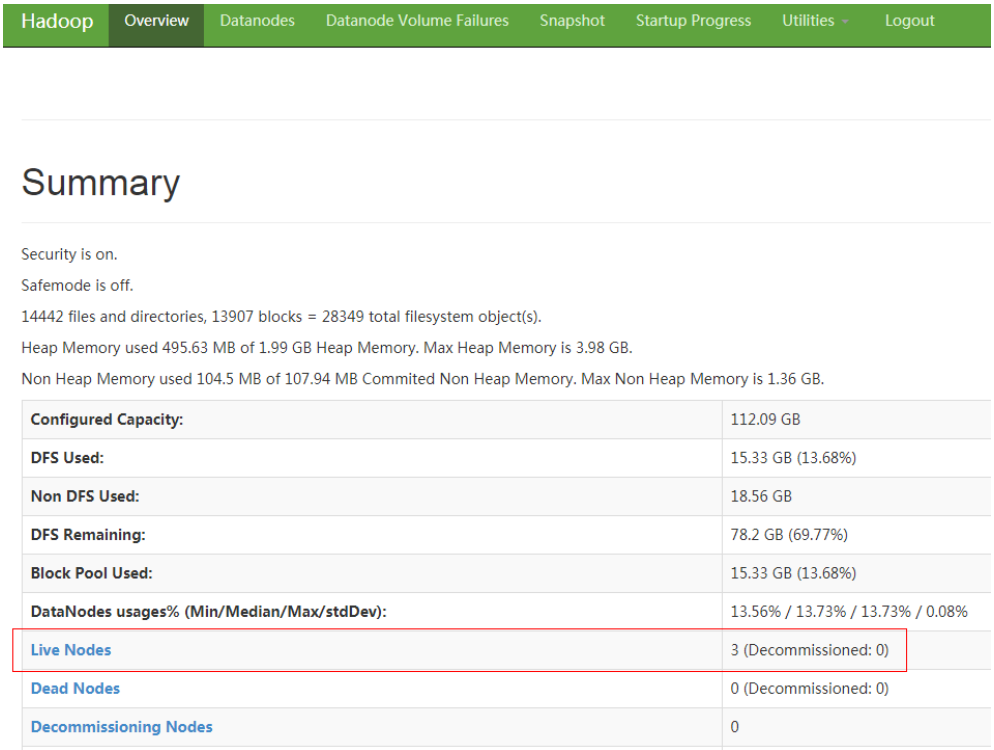
1. A large number of blocks are lost on the native NameNode page.

Figure 16-20 Block loss



2. DataNode information on the native page shows that the number of displayed DataNode nodes is 10 less than that of actual DataNode nodes.

Figure 16-21 Checking the number of DataNodes



3. Check the DataNode run log file **/var/log/Bigdata/hdfs/dn/hadoop-omm-datanode-*hostname*.log**. The following error information is displayed:

   Major error information: Clock skew too great

```

Solution

Step 1 Change the time of the 10 DataNodes that cannot be viewed on the native page.

Step 2 On Manager, restart the DataNode instances.

----End

16.8.9 CPU Usage of a DataNode Reaches 100% Occasionally, Causing Node Loss (SSH Connection Is Slow or Fails)

Symptom

The CPU usage of DataNodes is close to 100% occasionally, causing node loss.

Figure 16-23 DataNode CPU usage close to 100%

```
  PID USER      PR  NI    VIRT    RES    SHR S  %CPU %MEM     TIME+ COMMAND

```

Solution

Step 1 Check DataNode memory configuration and whether the remaining server memory is sufficient.

Step 2 Increase DataNode memory and restart the DataNode.

----End

16.8.10 Manually Performing Checkpoints When a NameNode Is Faulty for a Long Time

Symptom

If the standby NameNode is faulty for a long time, a large amount of editlog will be accumulated. In this case, if the HDFS or active NameNode is restarted, the active NameNode reads a large amount of unmerged editlog. As a result, the HDFS or active NameNode takes a long time to restart and even fails to restart.

Cause Analysis

The standby NameNode periodically combines editlog files and generates the fsimage file. This process is called checkpoint. After the fsimage file is generated, the standby NameNode transfers it to the active NameNode.

NOTE

As the standby NameNode periodically combines editlog files, it cannot combine them when it becomes abnormal. As a result, the active NameNode needs to load many editlog files during its next startup, which occupies much memory and takes a long time.

The period of metadata combination is determined by the following parameters. If the NameNode runs for 30 minutes or one million counts of operations are performed on HDFS, the checkpoint is implemented.

- **dfs.namenode.checkpoint.period**: specifies the checkpoint period. The default value is **1800s**.
- dfs.namenode.checkpoint.txns: specifies the times of operations for triggering the checkpoint execution. The default value is **1000000**.

Solution

Before restarting the HDFS or active NameNode, perform checkpoint manually to merge metadata of the active NameNode.

Step 1 Stop workloads.

Step 2 Obtain the hostname of the active NameNode.

Step 3 Run the following commands on the client:

source /opt/client/bigdata_env

kinit *Component user*

Note: Replace **/opt/client** with the actual installation path of the client.

Step 4 Run the following command to enable the safe mode for the active NameNode (replace **linux22** with the hostname of the active NameNode):

hdfs dfsadmin -fs linux22:25000 -safemode enter

```
linux16:/opt/fi_client #  hdfs dfsadmin -fs linux22:25000   -safemode enter
17/04/26 18:38:30 WARN fs.FileSystem: "linux22:25000" is a deprecated filesystem name. Use "hdfs://linux22:25000/" instead.
17/04/26 18:38:32 INFO hdfs.PeerCache: SocketCache disabled.
Safe mode is ON
```

Step 5 Run the following command to merge editlog on the active NameNode:

hdfs dfsadmin -fs linux22:25000 -saveNamespace

```
linux16:/opt/fi_client #  hdfs dfsadmin -fs linux22:25000   -saveNamespace
17/04/26 18:38:54 WARN fs.FileSystem: "linux22:25000" is a deprecated filesystem name. Use "hdfs://linux22:25000/" instead.
17/04/26 18:38:56 INFO hdfs.PeerCache: SocketCache disabled.
Save namespace successful
```

Step 6 Run the following command to make the active NameNode exit the safe mode:

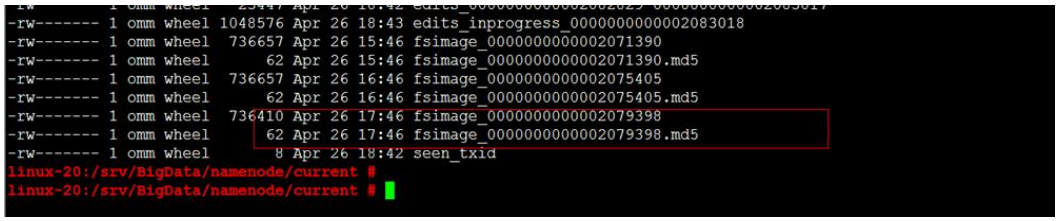
hdfs dfsadmin -fs linux22:25000 -safemode leave

```
linux16:/opt/fi_client #  hdfs dfsadmin -fs linux22:25000  -safemode leave
17/04/26 18:39:07 WARN fs.FileSystem: "linux22:25000" is a deprecated filesystem name. Use "hdfs://linux22:25000/" instead.
17/04/26 18:39:09 INFO hdfs.PeerCache: SocketCache disabled.
Safe mode is OFF
```

Step 7 Check whether the combination is complete.

cd /srv/BigData/namenode/current

Check whether the time of the first generated fsimage is the current time. If yes, the combination is complete.



----End

16.8.11 Common File Read/Write Faults

Symptom

When a user performs a write operation on HDFS, the message "Failed to place enough replicas:expected..." is displayed.

Cause Analysis

- The data receiver of the DataNode is unavailable.

  The DataNode log is as follows:

  ```
  2016-03-17 18:51:44,721 | WARN |
  org.apache.hadoop.hdfs.server.datanode.DataXceiverServer@5386659f |
  hadoopc1h2:25009:DataXceiverServer: | DataXceiverServer.java:158
  java.io.IOException: Xceiver count 4097 exceeds the limit of concurrent xcievers: 4096
  at org.apache.hadoop.hdfs.server.datanode.DataXceiverServer.run(DataXceiverServer.java:140)
  at java.lang.Thread.run(Thread.java:745)
  ```

- The disk space configured for the DataNode is insufficient.
- DataNode heartbeats are delayed.

Solution

- If the DataNode data receiver is unavailable, add the value of the HDFS parameter **dfs.datanode.max.transfer.threads** on Manager.
- If disk space or CPU resources are insufficient, add DataNodes or ensure that disk space and CPU resources are available.
- If the network is faulty, ensure that the network is available.

16.8.12 Maximum Number of File Handles Is Set to a Too Small Value, Causing File Reading and Writing Exceptions

Symptom

The maximum number of file handles is set to a too small value, causing insufficient file handles. Writing files to HDFS is slow or file writing fails.

Cause Analysis

1. The DataNode log **/var/log/Bigdata/hdfs/dn/hadoop-omm-datanode-XXX.log** contains exception information "java.io.IOException: Too many open files."

   ```
   2016-05-19 17:18:59,126 | WARN |
   org.apache.hadoop.hdfs.server.datanode.DataXceiverServer@142ff9fa |
   YSDN12:25009:DataXceiverServer: |
   ```

```
org.apache.hadoop.hdfs.server.datanode.DataXceiverServer.run(DataXceiverServer.java:160)
java.io.IOException: Too many open files
at sun.nio.ch.ServerSocketChannelImpl.accept0(Native Method)
at sun.nio.ch.ServerSocketChannelImpl.accept(ServerSocketChannelImpl.java:241)
at sun.nio.ch.ServerSocketAdaptor.accept(ServerSocketAdaptor.java:100)
at org.apache.hadoop.hdfs.net.TcpPeerServer.accept(TcpPeerServer.java:134)
at org.apache.hadoop.hdfs.server.datanode.DataXceiverServer.run(DataXceiverServer.java:137)
at java.lang.Thread.run(Thread.java:745)
```

2. The error indicates insufficient file handles. File handles cannot be opened and data is written to other DataNodes. As a result, writing files is slow or fails.

Solution

Step 1 Run the **ulimit -a** command to check the maximum number of file handles set for the involved node. If the value is small, change it to **640000**.

Figure 16-26 Check the number of file handles.

```
[omm@189-39-150-167 ~]$ ulimit -a
core file size          (blocks, -c) 0
data seg size           (kbytes, -d) unlimited
scheduling priority             (-e) 0
file size               (blocks, -f) unlimited
pending signals                 (-i) 256551
max locked memory       (kbytes, -l) 64
max memory size         (kbytes, -m) unlimited
open files                      (-n) 640000
pipe size            (512 bytes, -p) 8
POSIX message queues     (bytes, -q) 819200
real-time priority              (-r) 0
stack size              (kbytes, -s) 10240
cpu time               (seconds, -t) unlimited
max user processes              (-u) 60000
virtual memory          (kbytes, -v) unlimited
file locks                      (-x) unlimited
```

Step 2 Run the **vi /etc/security/limits.d/90-nofile.conf** command to edit this file. Set the number of file handles to **64000**. If the file does not exist, create one and modify the file as follows:

Figure 16-27 Changing the number of file handles

```
*          hard    nofile    640000
*          soft    nofile    640000
~
```

Step 3 Open another terminal. Run the **ulimit -a** command to check whether the modification is successful. If the modification fails, perform the preceding operations again.

Step 4 Restart the DataNode instance on Manager.

----End

16.8.13 File Fails to Be Uploaded to HDFS Due to File Errors

Symptom

The **hadoop dfs -put** command is used to copy local files to HDFS.

After some files are uploaded, an error occurs. The size of the temporary files no long changes on the native NameNode page.

Cause Analysis

1. Check the NameNode log **/var/log/Bigdata/hdfs/nn/hadoop-omm-namenode-*hostname*.log**. It is found that the file is being written until a failure occurs.

```
2015-07-13 10:05:07,847 | WARN  | org.apache.hadoop.hdfs.server.namenode.LeaseManager
$Monitor@36fea922 | DIR* NameSystem.internalReleaseLease: Failed to release lease for file /hive/
order/OS_ORDER._8.txt._COPYING_. Committed blocks are waiting to be minimally replicated. Try
again later. | FSNamesystem.java:3936
2015-07-13 10:05:07,847 | ERROR | org.apache.hadoop.hdfs.server.namenode.LeaseManager
$Monitor@36fea922 | Cannot release the path /hive/order/OS_ORDER._8.txt._COPYING_ in the lease
[Lease.  Holder: DFSClient_NONMAPREDUCE_-1872896146_1, pendingcreates: 1] |
LeaseManager.java:459
org.apache.hadoop.hdfs.protocol.AlreadyBeingCreatedException: DIR*
NameSystem.internalReleaseLease: Failed to release lease for file /hive/order/
OS_ORDER._8.txt._COPYING_. Committed blocks are waiting to be minimally replicated. Try again
later.
at FSNamesystem.internalReleaseLease(FSNamesystem.java:3937)
```

2. Root cause: The uploaded files are damaged.
3. Verification: The cp or scp operation fails to be performed for the copied files. Therefore, the files are damaged.

Solution

Step 1 Upload normal files.

----End

16.8.14 After dfs.blocksize Is Configured and Data Is Put, Block Size Remains Unchanged

Symptom

After **dfs.blocksize** is set to **268435456** on the interface and data is put, the original block size keeps unchanged.

Cause Analysis

The **dfs.blocksize** value in the **hdfs-site.xml** file of the client is not changed, and the value prevails.

Solution

Step 1 Ensure that the **dfs.blocksize** value is a multiple of 512.

Step 2 Download a client or modify the client configuration.

Step 3 **dfs.blocksize** is configured on the client and is subject to the client. Otherwise, the value configured on the server prevails.

----End

16.8.15 Failed to Read Files, and "FileNotFoundException" Is Displayed

Symptom

In MapReduce tasks, all Map tasks are successfully executed, but Reduce tasks fail. The error message "FileNotFoundException...No lease on...File does not exist" is displayed in the logs.

```
Error: org.apache.hadoop.ipc.RemoteException(java.io.FileNotFoundException): No lease on /user/sparkhive/warehouse/daas/dsp/output/_temporary/1/_temporary/attempt_1479799053892_17075_r_000007_0/part-r-00007 (inode 6501287): File does not exist. Holder DFSClient_attempt_1479799053892_17075_r_000007_0_-1463597952_1 does not have any open files.
at org.apache.hadoop.hdfs.server.namenode.FSNamesystem.checkLease(FSNamesystem.java:3350)
at org.apache.hadoop.hdfs.server.namenode.FSNamesystem.completeFileInternal(FSNamesystem.java:3442)
at org.apache.hadoop.hdfs.server.namenode.FSNamesystem.completeFile(FSNamesystem.java:3409)
at org.apache.hadoop.hdfs.server.namenode.NameNodeRpcServer.complete(NameNodeRpcServer.java:789)
```

Cause Analysis

"FileNotFoundException...No lease on...File does not exist" indicates that the file is deleted during the operation.

1. Search for the file name in the NameNode audit log of HDFS (**/var/log/Bigdata/audit/hdfs/nn/hdfs-audit-namenode.log** of the active NameNode) to confirm the creation time of the file.
2. Search the NameNode audit logs that are generated within the time range from the file creation to the time of exception occurrence and determine whether the file is deleted or moved to another directory.
3. If the file is not deleted or moved, the parent directory of the file may be deleted or moved. You need to search the upper-layer directory. In this example, the parent directory of the file's parent directory is deleted.

   ```
   2017-05-31 02:04:08,286 | INFO  | IPC Server handler 30 on 25000 | allowed=true ugi=appUser@HADOOP.COM (auth:TOKEN) ip=/192.168.1.22 cmd=delete src=/user/sparkhive/warehouse/daas/dsp/output/_temporary dst=null perm=null proto=rpc | FSNamesystem.java:8189
   ```

   NOTE

   - The preceding log indicates that the **appUser** user of the 192.168.1.22 node deletes **/user/sparkhive/warehouse/daas/dsp/output/_temporary**.
   - Run the **zgrep "***file name***" *.zip** command to search for the contents of the .zip package.

Solution

Step 1 Check the service to find out why the file or the parent directory of the file is deleted.

----End

16.8.16 Failed to Write Files to HDFS, and "item limit of / is exceeded" Is Displayed

Symptom

The client or upper-layer component logs indicate that a file fails to be written to a directory on HDFS. The error information is as follows:

The directory item limit of /tmp is exceeded: limit=5 items=5.

Cause Analysis

1. The run log file **/var/log/Bigdata/hdfs/nn/hadoop-omm-namenode-XXX.log** of the client or NameNode contains error information "The directory item limit of /tmp is exceeded:." The error message indicates that the number of files in the **/tmp** directory exceeds 1048576.
   ```
   2018-03-14 11:18:21,625 | WARN  | IPC Server handler 62 on 25000 | DIR* NameSystem.startFile: /tmp/test.txt The directory item limit of /tmp is exceeded: limit=1048576 items=1048577 | FSNamesystem.java:2334
   ```
2. The **dfs.namenode.fs-limits.max-directory-items** parameter specifies the maximum number of directories or files that are not in recursion relationship in a single directory. The default value is **1048576**. The value ranges from 1 to 6400000.

Solution

Step 1 Check whether it is normal that the directory contains more than one million files that are not in recursion relationship. If it is normal, increase the value of the HDFS parameter **dfs.namenode.fs-limits.max-directory-items** and restart the HDFS NameNode for the modification to take effect.

Step 2 If it is abnormal, delete unnecessary files.

----End

16.8.17 Adjusting the Log Level of the Shell Client

- **Temporary adjustment**: After the Shell client window is closed, the log is restored to the default value.
  a. Run the **export HADOOP_ROOT_LOGGER** command to adjust the log level of the client.
  b. Run the **export HADOOP_ROOT_LOGGER=***log level***,console** command to adjust the log level of the Shell client.

     Run the **export HADOOP_ROOT_LOGGER=DEBUG,console** command to adjust the log level to **Debug**.

     Run the **export HADOOP_ROOT_LOGGER=ERROR,console** command to adjust the log level to **Error**.
- **Permanent adjustment**
  a. Add **export HADOOP_ROOT_LOGGER**=*log level***,console** to the HDFS client's environment variable configuration file **/opt/client/HDFS/component_env** (replace **/opt/client** with the actual client path).

b. Run the **source /opt/client/bigdata_env** command.

c. Run the command on the client again.

16.8.18 File Read Fails, and "No common protection layer" Is Displayed

Symptom

HDFS fails to be operated on the Shell client or other clients, and the error message "No common protection layer between client and server" is displayed.

Running any **hadoop** command, such as **hadoop fs -ls /**, on a node outside the cluster fails. The bottom-layer error message is displayed stating "No common protection layer between client and server."

```
2017-05-13 19:14:19,060 | ERROR | [pool-1-thread-1] |  Server startup failure  |
org.apache.sqoop.core.SqoopServer.initializeServer(SqoopServer.java:69)

        ... 28 more
Caused by: javax.security.sasl.SaslException: No common protection layer between client and server
        at com.sun.security.sasl.gsskerb.GssKrb5Client.doFinalHandshake(GssKrb5Client.java:251)
...
        at org.apache.hadoop.ipc.Client$Connection.setupIOstreams(Client.java:720)
```

Cause Analysis

1. The RPC protocol is used for data transmission between the client and server of HDFS. The protocol has multiple encryption modes and the hadoop.rpc.protection parameter specifies the mode to use.
2. If the value of the **hadoop.rpc.protection** parameter on the client is different from that on the server, the "No common protection layer between client and server" error is reported.

   NOTE

   hadoop.rpc.protection indicates that data can be transmitted between nodes in any of the following modes:

   - **privacy**: Data is transmitted after authentication and encryption. This mode reduces the performance.
   - **authentication**: Data is transmitted after authentication without encryption. This mode ensures performance but has security risks.
   - **integrity**: Data is transmitted without encryption or authentication. To ensure data security, exercise caution when using this mode.

Solution

Step 1 Download the client again. If the client is an application, update the configuration file in the application.

----End

16.8.19 Failed to Write Files Because the HDFS Directory Quota Is Insufficient

Symptom

After quota is set for a directory, writing files to the directory fails. The "The DiskSpace quota of /tmp/tquota2 is exceeded" error message is displayed.

```
[omm@189-39-150-115 client]$ hdfs dfs -put switchuser.py  /tmp/tquota2
put: The DiskSpace quota of /tmp/tquota2 is exceeded: quota = 157286400 B = 150 MB but diskspace consumed = 402653184 B = 384 MB
```

Possible Causes

The remaining space configured for the directory is less than the space required for writing files.

Cause Analysis

1. The HDFS supports setting the quota for a specific directory, that is, the maximum space occupied by files in a directory can be set. For example, the following command is used to set a maximum of 150 MB files to be written to the **/tmp/tquota** directory. (Space = Block size x Number of copies)

   hadoop dfsadmin -setSpaceQuota 150M /tmp/tquota2

2. Run the following command to check the configured quota for the directory. **SPACE_QUOTA** is the configured space quota, and **REM_SPACE_QUOTA** is the remaining space.

   hdfs dfs -count -q -h -v /tmp/tquota2

   Figure 16-28 Viewing the quota set for a directory

   ```
   hdfs dfs -count -q -h -v /tmp/tquota2
   QUOTA REM_QUOTA SPACE_QUOTA REM_SPACE_QUOTA  DIR_COUNT   FILE_COUNT CONTENT_SIZE PATHNAME
   none  inf       150M        150M                1           0            0  /tmp/tquota2
   ```

3. Analyze logs. The following log indicates that writing the file requires 384 MB space, but the current space quota is only 150 MB. Therefore, the space is insufficient. Before a file is written, the required remaining space is as follows: Block size x Number of copies. 128 MB x 3 copies = 384 MB.

   ```
   [omm@189-39-150-115 client]$
   [omm@189-39-150-115 client]$ hdfs dfs -put switchuser.py  /tmp/tquota2
   put: The DiskSpace quota of /tmp/tquota2 is exceeded: quota = 157286400 B = 150 MB but diskspace consumed = 402653184 B = 384 MB
   ```

Solution

Step 1 Set a proper quota for the directory.

hadoop dfsadmin -setSpaceQuota 150G /*directory name*

Step 2 Run the following command to clear the quota:

hdfs dfsadmin -clrSpaceQuota /*directory name*

----End

16.8.20 Balancing Fails, and "Source and target differ in block-size" Is Displayed

Symptom

When the **distcp** command is executed to copy files across clusters, the message "Source and target differ in block-size." is displayed, indicating that some files fail to be copied. Use -pb to preserve block-sizes during copy. "

```
Caused by: java.io.IOException: Check-sum mismatch between hdfs://10.180.144.7:25000/kylin/kylin_default_instance_prod/parquet/f2e72874-f01c-45ff-b219-207f3a5b3fcb/c769cd2d-575a-4459-837b-a19dd7b20c27/339114721280/0.parquettar and hdfs://10.180.180.194:25000/kylin/kylin_default_instance_prod/parquet/f2e72874-f01c-45ff-b219-207f3a5b3fcb/.distcp.tmp.attempt_1523424430246_0004_m_000019_2. Source and target differ in block-size. Use -pb to preserve block-sizes during copy. Alternatively, skip checksum-checks altogether, using -skipCrc. (NOTE: By skipping checksums, one runs the risk of masking data-corruption during file-transfer.)        at org.apache.hadoop.tools.mapred.RetriableFileCopyCommand.compareCheckSums(RetriableFileCopyCommand.java:214)
```

Possible Causes

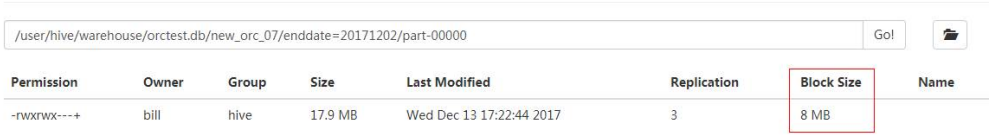
This is not a version-related problem. When you run the **distcp** command to copy files, the block size of the source file is not recorded by default. As a result, the verification fails when the block size of the source file is not 128 MB. In this case, you need to add parameter **-pb** to the **distcp** command.

Cause Analysis

1. The block size is set when data is written to HDFS. The default block size is 128 MB. The size of files written by some components or service programs may not be 128 MB, for example, 8 MB.

   ```
   <name>dfs.blocksize</name>
   <value>134217728</value>
   ```

   Figure 16-29 Size of files written by some components or service programs

2. DistCp reads the file from a source cluster and writes it to a destination cluster. By default, the value of dfs.blocksize in the MapReduce task is used as the block size, whose default value is 128 MB.
3. After DistCp finishes writing a file, the system performs verification based on the physical size of the block. Because the block size of the file in the source cluster is different from that of the file in the destination cluster, the splitting sizes are different. As a result, the verification fails.

For example, in the preceding file, there are three blocks (17.9/8 MB = 3 blocks) in the old cluster and one block (17.9/128 MB = 1 block) in the new cluster. Therefore, the verification fails because the physical size of the disk is divided.

Solution

Add parameter **-pb** in the **distcp** command. This parameter is used to reserve the block size when **distcp** is used to ensure that the block size of the new cluster is the same as that of the old cluster.

Figure 16-30 Size of the reserved block during **distcp** command execution

```
[root@189-39-235-118 clientu10]#hadoop distcp -pb  hdfs://haclusterX/user hdfs://hacluster/tmp/test
```

16.8.21 A File Fails to Be Queried or Deleted, and the File Can Be Viewed in the Parent Directory (Invisible Characters)

Symptom

A file fails to be queried or deleted using the HDFS Shell client. The file can be viewed in the parent directory.

Figure 16-31 List of files in the parent directory

```
drwxrwx---+  - datalab90020_639_w hive          0 2018-04-10 01:44 /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input_tmp
drwxrwx---+  - datalab90020_639_w hive          0 2018-04-10 16:45 /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input_tmp2
[root@dggtsp355-or FusionInsight_client]# hadoop fs -ls /user/hive/warehouse/datalake_dwi_barpsit.db
Found 4 items
drwxrwxr-x   - datalab90020_639_w hive          0 2018-04-11 12:05 /user/hive/warehouse/datalake_dwi_barpsit.db/bak_v_tp_mp_aut_input
drwxrwx---+  - datalab90020_639_w hive          0 2018-04-11 11:16 /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input
drwxrwx---+  - datalab90020_639_w hive          0 2018-04-10 01:44 /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input_tmp
drwxrwx---+  - datalab90020_639_w hive          0 2018-04-10 16:45 /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input_tmp2
[root@dggtsp355-or FusionInsight_client]# hadoop fs -rm -r /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input
rm: `/user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input': No such file or directory
[root@dggtsp355-or FusionInsight_client]# hdfs dfs -rm -r /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input
rm: `/user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input': No such file or directory
[root@dggtsp355-or FusionInsight_client]#
[root@dggtsp355-or FusionInsight_client]#
[root@dggtsp355-or FusionInsight_client]# hdfs dfs -ls /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input
ls: `/user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input': No such file or directory
[root@dggtsp355-or FusionInsight_client]#
[root@dggtsp355-or FusionInsight_client]#
```

Cause Analysis

The possible cause is that invisible characters are written to the file. You can write the file name to the local text and run the **vi** command to open the file.

hdfs dfs -ls *parent directory* **> /tmp/t.txt**

vi /tmp/t.txt

Run the **:set list** command to display invisible characters in the file name. For example, the file name contains **^M**, which is invisible.

Figure 16-32 Displaying invisible characters

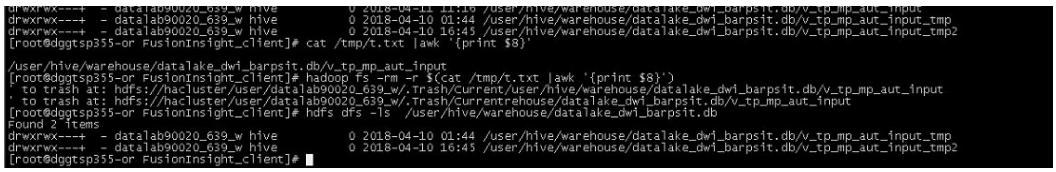
```
Found 1 items
drwxrwx---+  - datalab90020_639_w hive          0 2018-04-11 11:16 /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input^M$
~
~
~
```

Solution

Step 1 Run the Shell command to read the file name recorded in the text. Ensure that the following command output contains the full path of the file in HDFS.

cat /tmp/t.txt |awk '{print $8}'

Figure 16-33 File path



Step 2 Run the following command to delete the file:

hdfs dfs -rm $(cat /tmp/t.txt |awk '{print $8}')

Step 3 Verify that the file has been deleted.

hdfs dfs -ls *parent directory*

----End

16.8.22 Uneven Data Distribution Due to Non-HDFS Data Residuals

Symptom

Data distribution is uneven. A disk is full while other disks have sufficient space.

The data storage directory of HDFS DataNode is set to **/export/data1/dfs--/export/data12/dfs**. A large volume of data is stored to **/export/data1/dfs** but data is evenly distributed to other disks.

Cause Analysis

The customer's disk is reinstalled. However, a directory is not thoroughly deleted during disk uninstallation, that is, the added disk is unformatted and historical junk data remains.

Solution

Manually delete data residuals.

16.8.23 Uneven Data Distribution Due to the Client Installation on the DataNode

Symptom

Data is unevenly distributed on HDFS DataNodes. Disk usage of a node is high or even reaches 100% while disks on other nodes have sufficient idle space.

Cause Analysis

In the HDFS data replica mechanism, the first replica is stored to the local node where the client is stored. As a result, disks of the node run out while disks of other nodes have sufficient idle space.

Solution

Step 1 For the existing data unevenly distributed, run the following command to balance data:

/opt/client/HDFS/hadoop/sbin/start-balancer.sh -threshold 10

/opt/client indicates the actual client installation directory.

Step 2 For new data, install the client on the node without DataNode.

----End

16.8.24 Handling Unbalanced DataNode Disk Usage on Nodes

Symptom

The disk usage of each DataNode on a node is uneven.

Example:

```
189-39-235-71:~ # df -h
Filesystem  Size  Used Avail Use% Mounted on
/dev/xvda  360G  92G   250G  28% /
/dev/xvdb  700G  900G   200G  78% /srv/BigData/hadoop/data1
/dev/xvdc  700G  900G   200G  78% /srv/BigData/hadoop/data2
/dev/xvdd  700G  900G   200G  78% /srv/BigData/hadoop/data3
/dev/xvde  700G  900G   200G  78% /srv/BigData/hadoop/data4
/dev/xvdf  10G   900G   890G  2% /srv/BigData/hadoop/data5
189-39-235-71:~ #
```

Possible Causes

Some disks are faulty and are replaced with new ones. The new disk usage is low.

Disks are added. For example, the original four data disks are expanded to five disks.

Cause Analysis

There are two policies for writing data to Block disks on DataNodes: 1. Round Robin (default value) and 2. Preferentially writing data to the disk with the more available space.

Description of the **dfs.datanode.fsdataset.volume.choosing.policy** parameter

Possible values:

- Polling: **org.apache.hadoop.hdfs.server.datanode.fsdataset.RoundRobinVolumeChoosingPolicy**
- Preferentially writing data to the disk with more available space: **org.apache.hadoop.hdfs.server.datanode.fsdataset.AvailableSpaceVolumeChoosingPolicy**

Solution

Change the value of **dfs.datanode.fsdataset.volume.choosing.policy** to **org.apache.hadoop.hdfs.server.datanode.fsdataset.AvailableSpaceVolumeChoosingPolicy**, save the settings, and restart the affected services or instances.

In this way, the DataNode preferentially selects a node with the most available disk space to store data copies.

NOTE

- Data written to the DataNode will be preferentially written to the disk with more available disk space.
- The high usage of some disks can be relieved with the gradual deletion of aging data from the HDFS.

16.8.25 Locating Common Balance Problems

Problem 1: Lack of Permission to Execute the balance Task (Access denied).

Problem details: After the **start-balancer.sh** command is executed, the " hadoop-root-balancer-hostname.out" log displays "Access denied for user test1. Superuser privilege is required."

```
cat /opt/client/HDFS/hadoop/logs/hadoop-root-balancer-host2.out
Time Stamp               Iteration#  Bytes Already Moved  Bytes Left To Move  Bytes Being Moved
INFO: Watching file:/opt/client/HDFS/hadoop/etc/hadoop/log4j.properties for changes with interval : 60000
org.apache.hadoop.ipc.RemoteException(org.apache.hadoop.security.AccessControlException): Access denied for user test1.
Superuser privilege is required
at org.apache.hadoop.hdfs.server.namenode.FSPermissionChecker.checkSuperuserPrivilege(FSPermissionChecker.java:122)
at org.apache.hadoop.hdfs.server.namenode.FSNamesystem.checkSuperuserPrivilege(FSNamesystem.java:5916)
```

Cause analysis:

The administrator account is required for executing the balance task.

Solution

- Secure version

  Perform authentication for user **hdfs** or a user in the **supergroup** group and then execute the balance task.

- General version

  Run the **su - hdfs** command on the client before running the **balance** command on HDFS.

Problem 2: The balance command fails to be executed, and the /system/balancer.id file is abnormal.

Problem details:

A user starts a balance process on the HDFS client. After the process is stopped unexpectedly, the user performs the balance operation again. The operation fails.

```
org.apache.hadoop.ipc.RemoteException(org.apache.hadoop.protocol.RecoveryInProgressException): Failed to APPEND_FILE /system/balancer.id for DFSClient because lease recovery is in progress. Try again later.
```

Cause analysis:

Generally, after the balance operation is complete in HDFS, the **/system/balancer.id** file is automatically released and the balance operation can be performed again.

In the preceding scenario, the first balance operation is stopped abnormally. Therefore, when the balance operation is performed for the second time, the **/system/balancer.id** file still exists. As a result, the **append /system/balancer.id** operation is triggered and the balance operation fails.

Solution

Method 1: After the hard lease period exceeds one hour, release the lease on the original client and perform the balance operation again.

Method 2: Delete the **/system/balancer.id** file from HDFS and perform the balance operation again.

16.8.26 An Error Is Reported When the HDFS Client Is Installed on the Core Node in a Common Cluster

Issue

In a common cluster, an error message is displayed when a user is created on the Core node to install the client.

Symptom

In a common cluster, the following error message is displayed when a user is created on the Core node to install the client:

```
2020-03-14 19:16:17,166 WARN shortcircuit.DomainSocketFactory: error creating DomainSocket
java.net.ConnectException: connect(2) error: Permission denied when trying to connect to '/var/run/MRS-HDFS/dn_socket'
at org.apache.hadoop.net.unix.DomainSocket.connect0(Native Method)
at org.apache.hadoop.net.unix.DomainSocket.connect(DomainSocket.java:256)
at org.apache.hadoop.hdfs.shortcircuit.DomainSocketFactory.createSocket(DomainSocketFactory.java:168)
at org.apache.hadoop.hdfs.client.impl.BlockReaderFactory.nextDomainPeer(BlockReaderFactory.java:799)
...
```

Cause Analysis

A user runs the **useradd** command to create a user. The default user group of the user does not contain the **ficommmon** user group. As a result, the preceding error is reported when the **get** command of HDFS is executed.

Procedure

Run the **usermod -a -G ficommon username** command to add the user to the **ficommon** user group.

16.8.27 Client Installed on a Node Outside the Cluster Fails to Upload Files Using hdfs

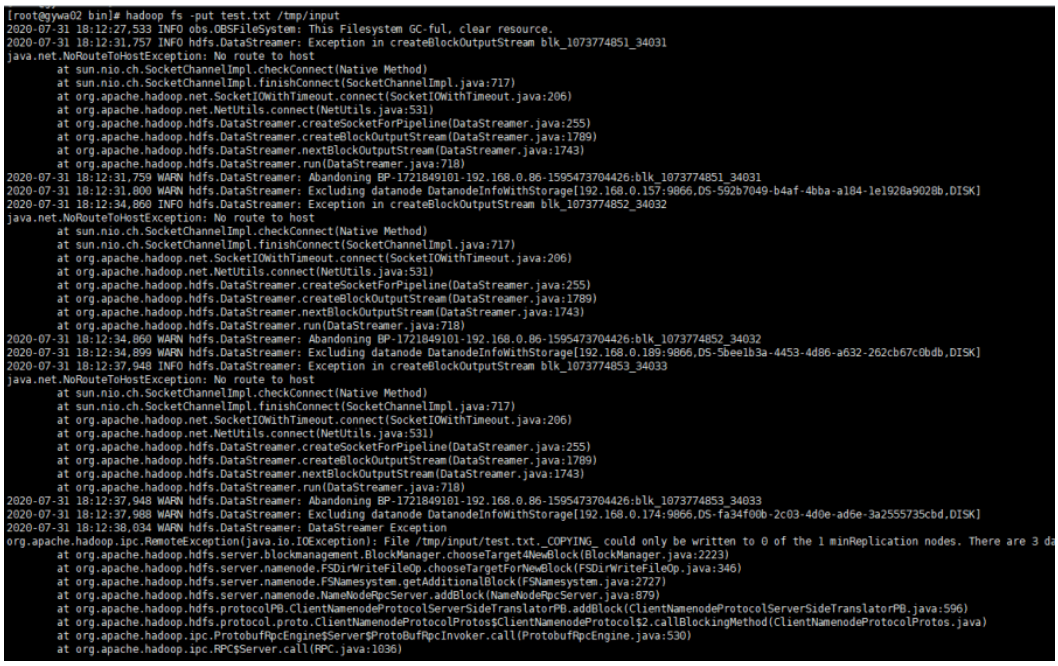
Issue

A client installed on a node outside the cluster fails to upload files using hdfs.

Symptom

After a client is installed on a cluster node and a file is uploaded using the **hdfs** command, the following error is reported:

Figure 16-34 An error is reported during file upload.



Cause Analysis

The error message "no route to host" is displayed, and the IP address 192.168 is contained in the error message. That is, the internal network route from the client node to the DataNode in the cluster is unreachable. As a result, the file fails to be uploaded.

Procedure

In the client directory of the client node, find the **hdfs-site.xml** file in the HDFS client configuration directory. Add the **dfs.client.use.datanode.hostname** configuration item to the configuration file, and set the value to **true**.

16.8.28 Insufficient Number of Replicas Is Reported During High Concurrent HDFS Writes

Symptom

File writes to HDFS fail occasionally.

The operation log is as follows:

```
105 | INFO  | IPC Server handler 23 on 25000 | IPC Server handler 23 on 25000, call
org.apache.hadoop.hdfs.protocol.ClientProtocol.addBlock from 192.168.1.96:47728 Call#1461167 Retry#0 |
Server.java:2278
java.io.IOException: File /hive/warehouse/000000_0.835bf64f-4103 could only be replicated to 0 nodes
instead of minReplication (=1).  There are 3 datanode(s) running and 3 node(s) are excluded in this
operation.
```

Cause Analysis

- HDFS has a reservation mechanism for file writing: each block to be written is 128 MB no matter whether the file is 10 MB or 1 GB. If a 10 MB file needs to be written, the file occupies 10 MB of the first block and about 118 MB space will be released. If a 1 GB file needs to be written, HDFS writes the file block by block and releases unused space after the file is written.
- If there are a large number of files to be written concurrently, the disk space for reserved write blocks is insufficient. As a result, the file fails to be written.

Solution

Step 1 Log in to the HDFS WebUI and go to the JMX page of the DataNode.

1. On the native HDFS page, choose **Datanodes**.
2. Locate the target DataNode and click the HTTP address to go to the DataNode details page.
3. Change **datanode.html** in **url** to **jmx**.

Step 2 Search for the **XceiverCount** indicator. If the value of this indicator multiplied by the block size exceeds the DataNode disk capacity, the disk space reserved for block write is insufficient.

Step 3 You can use either of the following methods to solve the problem:

Method 1: Reduce the service concurrency.

Method 2: Combine multiple files into one file to reduce the number of files to be written.

----End

16.9 Using Hive

16.9.1 Content Recorded in Hive Logs

Audit log

An audit log records at what time a user sends a request to HiveServer and MetaStore from which IP address with what statement.

The following HiveServer audit log shows that at 14:51:22 on February 1, 2016, **user_chen** sent a **show tables** request to HiveServer from the 192.168.1.18 IP address.

```
2016-02-01 14:51:22,335 | INFO  | HiveServer2-Handler-Pool: Thread-37815 | UserN
ame=user_chen  UserIP=192.168.1.18  Time=2016/02/01 14:51:22  Opertai
on=ExecuteStatement  stmt={show tables}  Resource=  Result= Detail=
| org.apache.hive.service.cli.thrift.ThriftCLIService.logAuditEvent(ThriftCLISer
vice.java:350)
```

The following MetaStore audit log shows that user **hive** sent a **shutdown** request to MetaStore from the 192.168.1.18 IP address at 11:31:15 on January 29, 2016.

```
2016-01-29 11:31:15,451 | INFO  | pool-6-thread-70648 | ugi=hive/hadoop.hadoop.c
om@HADOOP.COM  ip=/192.168.1.18  cmd=Shutting down the object store...
 | org.apache.hadoop.hive.metastore.HiveMetaStore$HMSHandler.logAuditEvent(HiveM
etaStore.java:375)
```

Generally, the audit log does not play a role in actual error location. However, the audit log must be checked to solve the following problems:

1. There is no response after a client sends a request. The audit log can be used to check whether the task suspends on the client or server. If the audit log has no related information, the task suspends on the client. If the audit log has related information, view the run log to locate where the program suspends.
2. The audit log can be used to check the number of requests in a specified period of time. You can view the number of requests in a specified period in audit logs.

HiveServer Run Log

HiveServer receives requests from a client (SQL statement), compile and execute the statement (submitted to Yarn or local MapReduce), and interact with MetaStore to obtain metadata information. The HiveServer run log records a complete SQL execution process.

Generally, if SQL statement running fails, check the HiveServer run log first.

MetaStore Run Log

Typically, if the HiveServer run log contains MetaException or MetaStore connection failure, check the MetaStore run log.

GC Log

Both HiveServer and MetaStore have GC logs. If GC-related problems occur, view the GC logs to quickly locate the cause. For example, if HiveServer or MetaStore frequently restarts, check its GC log.

16.9.2 Causes of Hive Startup Failure

The most common cause of the Hive startup failure is that the MetaStore instance cannot connect to DBService. You can view the detailed error information in the MetaStore logs. The reasons for the failure to connect to DBService are as follows:

Possible Cause 1

DBService does not properly initialize the Hive metabase hivemeta.

Procedure 1

Step 1 Run the following commands:

source /opt/Bigdata/MRS_*XXX*/install/dbservice/.dbservice_profile

gsql -h *DBservice floating IP* **-p 20051 -d hivemeta -U hive -W HiveUser@**

Step 2 If the interaction interface cannot be properly displayed, database initialization fails. If the following error information is displayed, the hivemeta configuration may be lost in the configuration file of the node where DBService is located.

```
org.postgresql.util.PSQLException: FATAL: no pg_hba.conf entry for host "192.168.0.146", database "HIVEMETA"
```

Step 3 Edit **/srv/BigData/dbdata_service/data/pg_hba.conf** by adding **host hivemeta hive 0.0.0.0/0 sha256** to the file.

Step 4 Run the **source /opt/Bigdata/MRS_*XXX*/install/dbservice/.dbservice_profile** command to configure environment variables.

Step 5 Run **gs_ctl -D $GAUSSDATA reload #** to make new configurations take effect.

----End

Possible Cause 2

The floating IP address of DBService is incorrect. As a result, the IP address of the MetaStore node fails to connect to or build mutual trust with the floating IP address, causing MetaStore startup failure.

Procedure 2

The floating IP address of DBService must be an IP address that is not used in the same network segment and cannot be pinged before configuration. Modify the floating IP address of DBService.

16.9.3 How to Specify a Queue When Hive Submits a Job

Symptom

How do I specify a queue when Hive submits a job?

Procedure

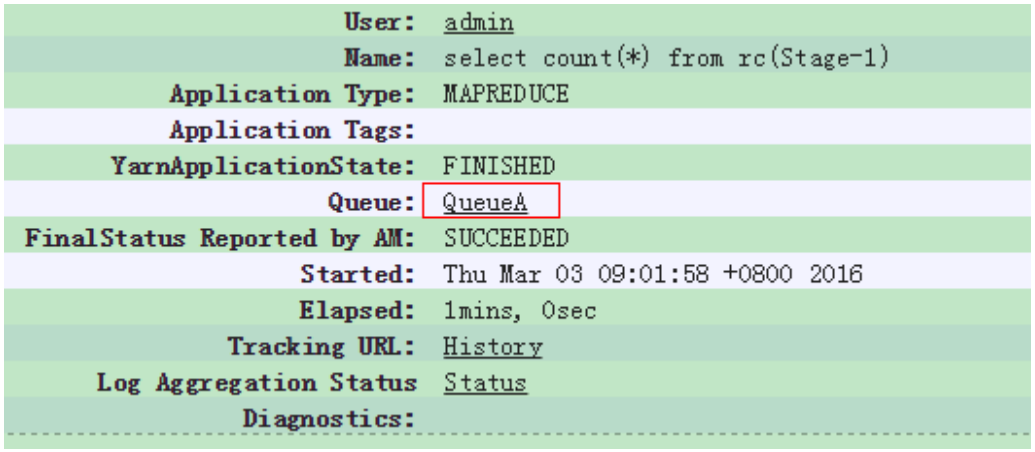
Step 1 Before submitting the job, set the job queue, for example, submitting the job to QueueA.

```
set mapred.job.queue.name=QueueA;
select count(*) from rc;
```

NOTE

The queue name is case sensitive. For example, in this example, **queueA** and **Queuea** are invalid. In addition, the queue must be a leaf queue, and jobs cannot be submitted to a non-leaf queue.

Step 2 After job submission, go to the Yarn page to check the job. The job has been submitted to QueueA.



----End

16.9.4 How to Set Map and Reduce Memory on the Client

Symptom

How do I set Map and Reduce memory on the client?

Procedure

Before SQL statement execution, run the set command to set parameters of clients related to Map/Reduce.

The following parameters are related to Map and Reduce memory:

```
set mapreduce.map.memory.mb=4096; //Memory required by each Map task
set mapreduce.map.java.opts=-Xmx3276M; //Maximum memory used by the JVM of each Map task
set mapreduce.reduce.memory.mb=4096; //Memory required by each Reduce task
set mapreduce.reduce.java.opts=-Xmx3276M; //Maximum memory used by the JVM of each Reduce task
set mapred.child.java.opts=-Xms1024M -Xmx3584M; // This parameter is a global parameter, which is used to set Map and Reduce in a unified manner.
```

NOTE

Parameter settings take effect for the current session only.

16.9.5 Specifying the Output File Compression Format When Importing a Table

Question

How do I specify an output file compression format when importing a table?

Procedure

Hive supports the following compression formats:

```
org.apache.hadoop.io.compress.BZip2Codec
org.apache.hadoop.io.compress.Lz4Codec
org.apache.hadoop.io.compress.DeflateCodec
org.apache.hadoop.io.compress.SnappyCodec
org.apache.hadoop.io.compress.GzipCodec
```

- If global settings are required, that is, all tables need to be compressed, you can perform the following global settings for Hive service configuration parameters on the Manager page:
  - Set **hive.exec.compress.output** to **true**.
  - Set **mapreduce.output.fileoutputformat.compress.codec** to **org.apache.hadoop.io.compress.BZip2Codec**.

    NOTE

    The following parameters take effect only when **hive.exec.compress.output** is set to **true**.
- If it needs to be set at the session level, configure the parameters as follows before command execution:

```
set hive.exec.compress.output=true;
set mapreduce.output.fileoutputformat.compress.codec=org.apache.hadoop.io.compress.SnappyCodec;
```

16.9.6 desc Table Cannot Be Completely Displayed

Symptom

How do I make sure that the description is completely displayed when the desc table is too long?

Procedure

Step 1 When starting Beeline of Hive, set **maxWidth** to **20000**.

```
[root@192-168-1-18 logs]# beeline --maxWidth=20000
scan complete in 3ms
Connecting to
...
Beeline version 1.1.0 by Apache Hive
```

Step 2 (Optional) Run the **beeline -help** command to view the client display settings.

```
 -u <database url>              the JDBC URL to connect to
 -n <username>                  the username to connect as
 -p <password>                  the password to connect as
 -d <driver class>              the driver class to use
 -i <init file>                 script file for initialization
 -e <query>                     query that should be executed
 -f <exec file>                 script file that should be executed
 --hiveconf property=value      Use value for given property
 --color=[true/false]           control whether color is used for display
 --showHeader=[true/false]      show column names in query results
 --headerInterval=ROWS;         the interval between which heades are displayed
 --fastConnect=[true/false]     skip building table/column list for tab-completion
 --autoCommit=[true/false]      enable/disable automatic transaction commit
 --verbose=[true/false]         show verbose error messages and debug info
 --showWarnings=[true/false]    display connection warnings
 --showNestedErrs=[true/false]  display nested errors
 --numberFormat=[pattern]       format numbers using DecimalFormat pattern
 --force=[true/false]           continue running script even after errors
```

```
 --maxWidth=MAXWIDTH          the maximum width of the terminal
 --maxColumnWidth=MAXCOLWIDTH    the maximum width to use when displaying columns
 --silent=[true/false]           be more silent
 --autosave=[true/false]         automatically save preferences
 --outputformat=[table/vertical/csv2/tsv2/dsv/csv/tsv]  format mode for result display
                                Note that csv, and tsv are deprecated - use csv2, tsv2 instead
 --truncateTable=[true/false]    truncate table column when it exceeds length
 --delimiterForDSV=DELIMITER     specify the delimiter for delimiter-separated values output format
(default: |)
 --isolation=LEVEL               set the transaction isolation level
 --nullemptystring=[true/false]  set to true to get historic behavior of printing null as empty string
 --socketTimeOut=n               socket connection timeout interval, in second. The default value is 300.
```

----End

16.9.7 NULL Is Displayed When Data Is Inserted After the Partition Column Is Added

Symptom

1. Run the following command to create a table:
   ```
   create table test_table(
   col1 string,
   col2 string
   )
   PARTITIONED BY(p1 string)
   STORED AS orc tblproperties('orc.compress'='SNAPPY');
   ```
2. Modify the table structure, add partitions, and insert data.
   ```
   alter table test_table add partition(p1='a');
   insert into test_table partition(p1='a') select col1,col2 from temp_table;
   ```
3. Modify the table structure, add columns, and insert data.
   ```
   alter table test_table add columns(col3 string);
   insert into test_table partition(p1='a') select col1,col2,col3 from temp_table;
   ```
4. Query data in the **test_table** table. In the returned result, the values in the **col3** column are all NULL.
   ```
   select * from test_table where p1='a'
   ```
5. Add a table partition and insert data.
   ```
   alter table test_table add partition(p1='b');
   insert into test_table partition(p1='b') select col1,col2,col3 from temp_table;
   ```
6. Query data in the **test_table** table. In the returned result, the value of **col3** is not all NULL.
   ```
   select * from test_table where p1='b'
   ```

Cause Analysis

RESTRICT is the default option for altering a table. In the RESTRICT mode, only the metadata is changed, while the table's partition structure created before the altering operation remains unchanged. However, new partitions created after the altering operation are changed. Therefore, when values of the old partitions are queried, they are all NULL.

Procedure

Add the **cascade** keyword when adding columns, for example:

```
alter table test_table add columns(col3 string) cascade;
```

16.9.8 A Newly Created User Has No Query Permissions

Symptom

When a user is created, an error message is displayed indicating that the user does not have permissions to query data.

```
Error: Error while compiling statement: FAILED: HiveAccessControlException Permission denied: Principal [name=hive, type=USER] does not have following privileges for operation QUERY [[SELECT] on Object [type=TABLE_OR_VIEW, name=default.t1]] (state=42000,code=40000)
```

Cause Analysis

The newly created user does not have the permission to operate the Hive component.

Solution

Step 1 Log in to FusionInsight Manager. Choose **System** > **Permission** > **Role**.

Step 2 Click **Create Role**, and set **Role name** and **Description**.

Step 3 Set **Configure Resource Permission** for the role and select **Hive Read and Write Permission** for the Hive table. All databases in the Hive column are displayed.

Step 4 Select the permissions required by the role and click **OK**.

Step 5 On FusionInsight Manager, choose **System** > **Permission** > **User**.

Step 6 Locate the row that contains the created user, and click **Modify** in the **Operation** column.

Step 7 Click **Add** on the right of **User Group**. To use the Hive service, you must add a Hive group.

Step 8 Click **Add** on the right of **Role** and select the role created in **4**.

Step 9 Click **OK**.

----End

16.9.9 An Error Is Reported When SQL Is Executed to Submit a Task to a Specified Queue

Symptom

The following error is reported when executing SQL to submit a task to Yarn:

```
Failed to submit application_1475400939788_0033 to YARN : org.apache.hadoop.security.AccessControlException: User newtest cannot submit applications to queue root.QueueA
```

Cause Analysis

The current login user does not have the permission to submit the YARN queue.

Solution

Grant the submission permission of the specified Yarn queue to the user. On Manager, choose **System** > **Permission** > **User** and bind a role with the queue submission permission to the user.

16.9.10 An Error Is Reported When the "load data inpath" Command Is Executed

Symptom

The following errors are reported when the **load data inpath** command is executed:

- Error 1:
  ```
  HiveAccessControlException Permission denied. Principal [name=user1, type=USER] does not have following privileges on Object [type=DFS_URI, name=hdfs://hacluster/tmp/input/mapdata] for operation LOAD : [OBJECT OWNERSHIP]
  ```
- Error 2:
  ```
  HiveAccessControlException Permission denied. Principal [name=user1, type=USER] does not have following privileges on Object [type=DFS_URI, name=hdfs://hacluster/tmp/input/mapdata] for operation LOAD : [INSERT, DELETE]
  ```
- Error 3:
  ```
  SemanticException [Error 10028]: Line 1:17 Path is not legal ''file:///tmp/input/mapdata'': Move from: file:/tmp/input/mapdata to: hdfs://hacluster/user/hive/warehouse/tmp1 is not valid. Please check that values for params "default.fs.name" and "hive.metastore.warehouse.dir" do not conflict.
  ```

Cause Analysis

The current login user does not have the permission to operate the directory or the file directory format is incorrect.

Solution

Hive has the following requirements on the **load data inpath** command:

- The file owner must be the user who executes the command.
- The current user must have read and write permissions for the file.
- The current user must have permissions to execute the directory of the file.
- The current user must have the write permission on the directory of the table, because the load operation moves the file to the directory.
- The file format must be the same as the storage format specified by the table. For example, if **stored as rcfile** is specified during table creation but the file format is TXT, it is unsatisfied.
- The file must be stored in HDFS. Files in the local file system cannot be specified using the **file://** form.
- The file name cannot start with an underscore (_) or period (.). A file whose name starts with an underscore (_) or period (.) will be ignored.

  The following shows permissions required when user **test_hive** loads data.

  ```
  [root@192-168-1-18 duan]# hdfs dfs -ls /tmp/input2
  16/03/21 14:45:07 INFO hdfs.PeerCache: SocketCache disabled.
  Found 1 items
  -rw-r--r--   3 test_hive hive          6 2016-03-21 14:44 /tmp/input2/input.txt
  ```

16.9.11 An Error Is Reported When the "load data local inpath" Command Is Executed

Symptom

The following errors are reported when the **load data local inpath** command is executed:

- Error 1:
  ```
  HiveAccessControlException Permission denied. Principal [name=user1, type=USER] does not have following privileges on Object [type=LOCAL_URI, name=file:/tmp/input/mapdata] for operation LOAD : [SELECT, INSERT, DELETE]
  ```
- Error 2:
  ```
  HiveAccessControlException Permission denied. Principal [name=user1, type=USER] does not have following privileges on Object [type=LOCAL_URI, name=file:/tmp/input/mapdata] for operation LOAD : [OBJECT OWNERSHIP]
  ```
- Error 3:
  ```
  SemanticException Line 1:23 Invalid path ''/tmp/input/mapdata'': No files matching path file:/tmp/input/mapdata
  ```

Cause Analysis

The current user does not have the permission to operate the directory or the directory does not exist on the node where HiveServer is located.

Solution

NOTE

Generally, you are not advised to use local files to load data to Hive tables. You are advised to store local files in HDFS and then load data from the cluster.

Hive has the following requirements on the **load data local inpath** command:

- The file must be stored on the HiveServer node, because all commands are sent to the active HiveServer for execution.
- User **omm** must have the read permission for the file and read and execution permissions for the directory where the file is located, because the HiveServer process is started by user **omm** in the OS.
- The file owner must be the user who executes the command.
- The current user must have read and write permissions for the file.
- The file format must be the same as the storage format specified by the table. For example, if **stored as rcfile** is specified during table creation but the file format is TXT, it is unsatisfied.
- The file name cannot start with an underscore (_) or period (.). A file whose name starts with an underscore (_) or period (.) will be ignored.

16.9.12 An Error Is Reported When the "create external table" Command Is Executed

Symptom

The following error is reported when the **create external table** *xx(xx int)* **stored as textfile location '/tmp/aaa/aaa'** command is executed.

```
Permission denied. Principal [name=fantasy, type=USER] does not have following privileges on Object [type=DFS_URI, name=/tmp/aaa/aaa] for operation CREATETABLE : [SELECT, INSERT, DELETE, OBJECT OWNERSHIP] (state=42000,code=40000)
```

Cause Analysis

The current login user does not have the read and write permissions for the directory or its parent directory. When an external table is created, whether the current user is checked for its read and write permissions for the specified directory and its subdirectories and subfiles. If the specified directory does not exist, permissions for the parent directory are checked, and so on. If the check results show that the user has no permissions on any directory, "insufficient permission" is reported instead of "The specified directory does not exist".

Solution

Check whether the current user has read and write permissions for the **/tmp/aaa/aaa** path. If the path does not exist, check whether the user has read and write permissions for its parent directory.

16.9.13 An Error Is Reported When the dfs -put Command Is Executed on the Beeline Client

Symptom

Run the following command:

dfs -put /opt/kv1.txt /tmp/kv1.txt

The following error is reported:

```
Permission denied. Principal [name=admin, type=USER] does not have following privileges onObject[type=COMMAND_PARAMS,name=[-put, /opt/kv1.txt, /tmp/kv1.txt]] for operation DFS : [ADMIN PRIVILEGE] (state=,code=1)
```

Cause Analysis

The current login user does not have the permissions to run the command.

Solution

If the current user has the **admin** role, run the **set role admin** command to switch to the **admin** role. If the user does not have the admin role, bind the user with the permissions of the corresponding role on the Manager page.

16.9.14 Insufficient Permissions to Execute the set role admin Command

Symptom

When a user runs the following command:

set role admin

The following error is reported:

```
0: jdbc:hive2://192.168.42.26:21066/> set role admin;
Error: Error while processing statement: FAILED: Execution Error, return code 1 from
org.apache.hadoop.hive.ql.exec.DDLTask. dmp_B doesn't belong to role admin (state=08S01,code=1)
```

Cause Analysis

The current user does not have the permissions of the **admin** role of Hive.

Solution

Step 1 Log in to Manager.

Choose **Cluster** > **Services** > **Hive**. In the upper right corner of the **Dashboard** page, click **More** and check whether **Enable Ranger** is unavailable.

- If yes, go to **Step 2**.
- If no, go to **Step 7**.

Step 2 Choose **Cluster** > **Services** > **Ranger** and click **RangerAdmin** in the **Basic Information** area. The Ranger web UI is displayed.

Step 3 Click the username in the upper right corner, select **Log Out** to log out of the system, and log in to the system as user **rangeradmin**.

Step 4 On the homepage, click **Settings** and choose **Roles**.

Step 5 Click the role with **Role Name** set to **admin**. In the **Users** area, click **Select User** and select a username.

Step 6 Click **Add Users**, select **Is Role Admin** in the row where the username is located, and click **Save**.

Step 7 Choose **System** > **Permission** > **Role** and add a role with the Hive administrator permission.

Step 8 On FusionInsight Manager, choose **System** > **Permission** > **User**.

Step 9 In the **Operation** column of the user, click **Modify**.

Step 10 Bind a role that has the Hive administrator permissions to the user and click **OK**.

----End

16.9.15 An Error Is Reported When UDF Is Created Using Beeline

Symptom

Run the following command:

create function fn_test3 as 'test.MyUDF' using jar 'hdfs:///tmp/udf2/MyUDF.jar'

The following error is reported:

```
Error: Error while compiling statement: FAILED: HiveAccessControlException Permission denied: Principal [name=admin, type=USER] does not have following privileges for operation CREATEFUNCTION [[ADMIN PRIVILEGE] on Object [type=DATABASE, name=default], [ADMIN PRIVILEGE] on Object [type=FUNCTION, name=default.fn_test3]] (state=42000,code=40000)
```

Cause Analysis

To create a permanent function in Hive, role **admin** is required.

Solution

Run the **set role admin** command before running the statement.

16.9.16 Difference Between Hive Service Health Status and Hive Instance Health Status

Question

What is the difference between Hive service health status and Hive instance health status?

Solution

The Hive service health status is displayed on the **Services** page and has four values: **Good**, **Bad**, **Partially Healthy**, and **Unknown**. It depends not only on Hive service availability but also the service status of other related components. Simple SQL is used to check Hive service availability.

Hive instances consist of HiveServer and MetaStore. Their health status is determined by communications between instances and JMX and can be **Good** (normal communications), **Concerning** (abnormal communications), or **Unknown** (no communications).

16.9.17 Hive Alarms and Triggering Conditions

Hive Alarms

Alarm ID	Alarm Severity	Auto Clear	Alarm Name	Alarm Type
16000	Minor	TRUE	Percentage of Sessions Connected to the HiveServer to Maximum Number Allowed Exceeds the Threshold	Fault alarm
16001	Minor	TRUE	Hive Warehouse Space Usage Exceeds the Threshold	Fault alarm
16002	Minor	TRUE	The Successful Hive SQL Operations Lower than The Threshold	Fault alarm
16004	Critical	TRUE	Hive Service Unavailable	Fault alarm

Alarm Triggering Scenarios

- 16000: An alarm is triggered when the ratio of the number of sessions connected to HiveServer to the allowed total number of sessions exceeds the threshold. For example, if the number of connected sessions is 9, the allowed total number of sessions is 12, and the threshold is 70%, an alarm is triggered, because 9/12 > 70%.
- 16001: An alarm is triggered when the ratio of HDFS capacities used by Hive to total HDFS capacities allocated to Hive exceeds the threshold. For example, if 500 GB is allocated to Hive, Hive uses 400 GB, and the threshold is 75%, an alarm is triggered, because 400/500 > 75%.
- 16002: An alarm is triggered when SQL execution success rate is lower than the threshold. If two out of four SQL statements are executed successfully and the threshold is 60%, an alarm is triggered, because 2/4 < 60%.
- 16004: An alarm is triggered when the health status of the Hive service changes to Bad.

NOTE

- FusionInsight Manager: Choose **O&M** > **Alarm** > **Thresholds** to set the alarm threshold, alarm severity, and alarm triggering time range.
- Metrics related to Hive running can be viewed on the Hive monitoring interface.

16.9.18 "authentication failed" Is Displayed During an Attempt to Connect to the Shell Client

Symptom

In clusters in security mode, the **beeline** command fails to be executed on the Shell client when the HiveServer service is normal, and the system prompts "authentication failed". The following information is displayed.

```
Debug is true storeKey false useTicketCache true useKeyTab false doNotPrompt false ticketCache is null isInitiator true KeyTab is null refreshKrb5Config is false principal is null tryFirstPass is false useFirstPass is false storePass is false clearPass is false
Acquire TGT from Cache
Credentials are no longer valid
Principal is null
null credentials from Ticket Cache
[Krb5LoginModule] authentication failed
No password provided
```

Cause Analysis

- The client user does not perform security authentication.
- Kerberos authentication expired.

Solution

Step 1 Log in to the node where the Hive client is installed.

Step 2 Run the **source** *Cluster client installation directory*/**bigdata_env** command.

Run the **klist** command to check whether there is a valid ticket in the local end. The following information shows that the ticket became valid at 14:11:42 on December 24, 2016, and expired at 14:11:40 on December 25, 2016. In the period of time, the ticket was available.

```
klist
Ticket cache: FILE:/tmp/krb5cc_0
Default principal: xxx@HADOOP.COM
Valid starting     Expires            Service principal
12/24/16 14:11:42  12/25/16 14:11:40  krbtgt/HADOOP.COM@HADOOP.COM
```

Step 3 Run the **kinit** ***username*** command for authentication and log in to the client again.

----End

16.9.19 Failed to Access ZooKeeper from the Client

Symptom

In clusters in security mode, when the HiveServer service is normal and SQL is executed by using the JDBC interface to connect to HiveServer, "The ZooKeeper client is AuthFailed" is reported.

```
14/05/19 10:52:00 WARN utils.HAClientUtilDummyWatcher: The ZooKeeper client is AuthFailed
 14/05/19 10:52:00 INFO utils.HiveHAClientUtil: Exception thrown while reading data from znode.The possible reason may be connectionless. This is recoverable. Retrying..
 14/05/19 10:52:16 WARN utils.HAClientUtilDummyWatcher: The ZooKeeper client is AuthFailed
 14/05/19 10:52:32 WARN utils.HAClientUtilDummyWatcher: The ZooKeeper client is AuthFailed
 14/05/19 10:52:32 ERROR st.BasicTestCase: Exception: Could not establish connection to active hiveserver
 java.sql.SQLException: Could not establish connection to active hiveserver
```

Or an error is reported stating "Unable to read HiveServer2 configs from ZooKeeper":

```
Exception in thread "main" java.sql.SQLException: org.apache.hive.jdbc.ZooKeeperHiveClientException: Unable to read HiveServer2 configs from ZooKeeper
at org.apache.hive.jdbc.HiveConnection.<init>(HiveConnection.java:144)

at org.apache.curator.framework.imps.GetChildrenBuilderImpl.forPath(GetChildrenBuilderImpl.java:38)
```

Cause Analysis

- When the client connects to HiveServer, the HiveServer address is automatically obtained from ZooKeeper. If ZooKeeper connection authentication is abnormal, the HiveServer address cannot be obtained from ZooKeeper correctly.
- During ZooKeeper connection authentication, **krb5.conf**, **principal**, **keytab**, and related information must be loaded to the client. Authentication failure causes are as follows:
  - The **user.keytab** path is incorrectly entered.
  - **user.principal** is incorrectly entered.
  - The cluster has switched the domain name. However, the old principal is used when the client combines the URL.

- The client cannot pass Kerberos authentication due to firewall settings. Ports 21730 (TCP), 21731 (TCP/UDP), and 21732 (TCP/UDP) need to be opened for Kerberos.

Solution

Step 1 Ensure that the user can properly access the **user.keytab** file in related paths on the client node.

Step 2 Ensure that the user's **user.principal** corresponds to the specified **keytab** file.

Run the **klist -kt keytabpath/user.keytab** command to check the file.

Step 3 If the cluster has switched the domain name, the **principal** field used in the URL must be the new domain name.

For example, the default value is **hive/hadoop.hadoop.com@HADOOP.COM**. If the cluster has switched the domain name, the field must be changed accordingly. For example, if the domain name is **abc.com**, enter **hive/hadoop.abc.com@ABC.COM**.

Step 4 Ensure that authentication is normal and HiveServer can be connected.

Run the following commands on the client:

source *Client installation directory*/**bigdata_env**

kinit *username*

Run the **beeline** command on the client to ensure normal running.

----End

16.9.20 "Invalid function" Is Displayed When a UDF Is Used

Symptom

When a UDF is created on the Hive client using Spark, "Error 10011" indicating "invalid function" is reported:

```
Error: Error while compiling statement: FAILED: SemanticException [Error 10011]: Line 1:7 Invalid function 'test_udf' (state=42000,code=10011)
```

The preceding problem occurs when multiple HiveServers use a UDF. For example, if metadata is not synchronized in time when the UDF created on HiveServer2 is used on HiveServer1, the preceding error is reported when clients on HiveServer1 are connected.

Cause Analysis

Metadata shared by multiple HiveServers or Hive and Spark is not synchronized, causing memory data inconsistency between different HiveServer instances and invalid UDF.

Solution

Synchronize new UDF information to HiveServer and reload the function.

16.9.21 Hive Service Status Is Unknown

Cause Analysis

The Hive service stops.

Solution

Restart the Hive service.

16.9.22 Health Status of a HiveServer or MetaStore Instance Is Unknown

Symptom

The health status of a HiveServer or MetaStore instance is unknown.

Cause Analysis

The HiveServer or MetaStore instance is stopped.

Solution

Restart the HiveServer or MetaStore instance.

16.9.23 Health Status of a HiveServer or MetaStore Instance Is Concerning

Symptom

The health status of the HiveServer or MetaStore instance is **Concerning**.

Cause Analysis

The HiveServer or MetaStore instance cannot be normally started. For example, when modifying the MetaStore/HiveServer GC parameter, you can view the startup log of the corresponding process, for example, the **hiveserver.out(hadoop-omm-jar-192-168-1-18.out)** file. The following exception occurs:

Error: Could not find or load main class Xmx2048M

The preceding information indicates that **Xmx2048M** is used as the startup parameter of the Java process instead of the JVM during the startup of the Java virtual machine. As shown in the following information, the hyphen (-) is deleted mistakenly.

```
METASTORE_GC_OPTS=Xms1024M Xmx2048M -DIgnoreReplayReqDetect
-XX\:CMSFullGCsBeforeCompaction\=1 -XX\:+UseConcMarkSweepGC
-XX\:+CMSParallelRemarkEnabled -XX\:+UseCMSCompactAtFullCollection
-XX\:+ExplicitGCInvokesConcurrent -server -XX\:MetaspaceSize\=128M
-XX\:MaxMetaspaceSize\=256M
```

Solution

Check the latest changes to detect incorrect settings.

```
METASTORE_GC_OPTS=Xms1024M -Xmx2048M -DIgnoreReplayReqDetect
-XX\:CMSFullGCsBeforeCompaction\=1 -XX\:+UseConcMarkSweepGC
-XX\:+CMSParallelRemarkEnabled -XX\:+UseCMSCompactAtFullCollection
-XX\:+ExplicitGCInvokesConcurrent -server -XX\:MetaspaceSize\=128M
-XX\:MaxMetaspaceSize\=256M
```

16.9.24 Garbled Characters Returned upon a select Query If Text Files Are Compressed Using ARC4

Symptom

If a Hive query result table is compressed and stored using the ARC4 algorithm, garbled characters are returned after the select * query is conducted in the result table.

Cause Analysis

The default Hive compression format is not ARC4 or output compression is disabled.

Solution

Step 1 If garbled characters are returned after the SETECT query, set the following in Beeline:

set mapreduce.output.fileoutputformat.compress.codec=org.apache.hadoop.io.encryption.arc4.ARC4BlockCodec;

set hive.exec.compress.output=true;

Step 2 Import the table to a new table using block decompression.

insert overwrite table tbl_result select * from tbl_source;

Step 3 Perform the query again.

select * from tbl_result;

----End

16.9.25 Hive Task Failed to Run on the Client But Successful on Yarn

Symptom

When Hive task running fails, an error similar to the following is reported on the client:

```
Error:Invalid OperationHandler:OperationHander [opType=EXECUTE_STATEMENT,getHandleIdentifier()=XXX]
(state=,code=0)
```

However, the MapReduce task that is submitted by the task to Yarn is successfully executed.

```
0: jdbc:hive2://189.120.204.104:21066/> select count(*) from test1;

INFO  : Kill Command = /opt/huawei/Bigdata/FusionInsight-Hive-1.1.0/hadoop/bin/hadoop job  -kill job_1484563934624_0003
INFO  : Hadoop job information for Stage-1: number of mappers: 1; number of reducers: 1
INFO  : 2017-01-17 11:46:12,579 Stage-1 map = 0%,  reduce = 0%
INFO  : 2017-01-17 11:46:23,243 Stage-1 map = 100%,  reduce = 0%, Cumulative CPU 2.32 sec
Error: Invalid OperationHandle: OperationHandle [opType=EXECUTE_STATEMENT, getHandleIdentifier()=386323de-dfla-4299-826e-96368d4baf80] (state=,code=0)
0: jdbc:hive2://189.120.204.215:21066/>
```

Cause Analysis

The cluster where the error occurs has two HiveServer instances. The error in the log of one HiveServer instance is the same as the error (Error: Invalid OperationHandler) reported on the client. In the log of the other HiveServer instance, **START_UP** information similar to the following is printed when the error occurs, which indicates that the process is killed and restarted during that time. Because the HiveServer instance the task process plans to connect to is killed, it connects to the other healthy one, causing the error.

```
2017-02-15 14:40:11,309 | INFO  | main | STARTUP_MSG:
/************************************************************
STARTUP_MSG: Starting HiveServer2
STARTUP_MSG:   host = XXX-120-85-154/XXX.120.85.154
STARTUP_MSG:   args = []
STARTUP_MSG:   version = 1.3.0
```

Solution

Submit the task again and ensure that the HiveServer process is not manually restarted during task execution.

16.9.26 An Error Is Reported When the select Statement Is Executed

Symptom

When the **select count(*) from XXX** statement is executed, the client reports the error "Error:Error while processing statement :FAILED:Execution Error,return code 2 from...".

return code 2 indicates that the task fails because an error is reported during the execution of the MapReduce task.

```
0: jdbc:hive2://134.160.37.21:21066/> select count(*) from src.gn_data_info_gz where day_id='18' and timenap='10';

ERROR : Ended Job = job_1482323187492_57815 with errors
Error: Error while processing statement: FAILED: Execution Error, return code 2 from org.apache.hadoop.hive.ql.exec.mr.MapRedTask (state=08S01,code=2)
0: jdbc:hive2://134.160.37.21:21066/>
```

Cause Analysis

1. Go to the native Yarn page to check the MapReduce task logs. The check result shows that the error occurs due to unidentified compression mode. The file name suffix is **.gzip** but the stack reports **.zlib**.

```
2017-01-18 16:22:07,566 INFO [main] org.apache.hadoop.hive.ql.exec.MapOperator: 4 Close done

```

2. Therefore, the HDFS file corresponding to the table that is queried may be incorrect. According to the file name printed in the map log, download the file from HDFS to the local end. The file whose name is suffixed with **.gz** fails to be decompressed by running the **tar** command because its format is incorrect. Run the **file** command to check the file property. The command output shows that the file is compressed from the FAT system instead of UNIX.

```
[root@hn0dn01 ~]# ls -l *.txt.gz
-rw-r--r-- 1 root root 101966463 Jan 18 20:13 20170118095958920074010l.txt.gz
-rw-r--r-- 1 root root  90448283 Jan 18 19:55 20170118104000000074002O.txt.gz
[root@hn0dn01 ~]# file 20170118095958920074010l.txt.gz
20170118095958920074010l.txt.gz: gzip compressed data, was "20170118095958920074010l.txt", from Unix, last modified: Wed Jan 18 09:59:52 2017
[root@hn0dn01 ~]# file  20170118104000000074002O.txt.gz
20170118104000000074002O.txt.gz: gzip compressed data, from FAT filesystem (MS-DOS, OS/2, NT)
[root@hn0dn01 ~]# tar -zxvf  20170118104000000074002O.txt.gz
tar: This does not look like a tar archive
tar: Skipping to next header

gzip: stdin: decompression OK, trailing garbage ignored
tar: Child returned status 2
tar: Error is not recoverable: exiting now
[root@hn0dn01 ~]#
```

Solution

Delete the file with an incorrect format from the HDFS directory or replace it with a correct one.

16.9.27 Failed to Drop a Large Number of Partitions

Symptom

When the **drop partition** operation is performed, the following information is displayed:

```
MetaStoreClient lost connection. Attempting to reconnect. |
org.apache.hadoop.hive.metastore.RetryingMetaStoreClient.invoke(RetryingMetaStoreClient.java:187)
org.apache.thrift.transport.TTransportException
at org.apache.thrift.transport.TIOStreamTransport.read(TIOStreamTransport.java:132)
at org.apache.thrift.transport.TTransport.xxx(TTransport.java:86)
at org.apache.thrift.transport.TSaslTransport.readLength(TSaslTransport.java:376)
at org.apache.thrift.transport.TSaslTransport.readFrame(TSaslTransport.java:453)
at org.apache.thrift.transport.TSaslTransport.read(TSaslTransport.java:435)
...
```

As indicated by the MetaStore log, StackOverFlow occurs.

```
2017-04-22 01:00:58,834 | ERROR | pool-6-thread-208 | java.lang.StackOverflowError
at org.datanucleus.store.rdbms.sql.SQLText.toSQL(SQLText.java:330)
at org.datanucleus.store.rdbms.sql.SQLText.toSQL(SQLText.java:339)
at org.datanucleus.store.rdbms.sql.SQLText.toSQL(SQLText.java:339)
at org.datanucleus.store.rdbms.sql.SQLText.toSQL(SQLText.java:339)
at org.datanucleus.store.rdbms.sql.SQLText.toSQL(SQLText.java:339)
```

Cause Analysis

The processing logic of the drop partition operation is to find all the partitions that meet the conditions, combine them, and delete them together. However, because the number of partitions is too large and the data stack for deleting metadata is deep, StackOverFlow errors occur.

Solution

Delete partitions in batches.

16.9.28 Failed to Start a Local Task

Symptom

1. When operations such as JOIN are performed for a small amount of data, a local task will be started. However, the execution fails and reports the following error:

```
jdbc:hive2://10.*.*.*:21066/> select a.name ,b.sex from student a join student1 b on (a.name = b.name);
ERROR : Execution failed with exit status: 1
ERROR : Obtaining error information

```

3. The **hs_err_pid_*****.log** file in the HiveServer log directory **/var/log/Bigdata/hive/hiveserver** contains an error about insufficient memory.

```
# There is insufficient memory for the Java Runtime Environment to continue.
# Native memory allocation (mmap) failed to map 20776943616 bytes for committing reserved memory.
  ...
```

Cause Analysis

When Hive executes JOIN for a small amount of data, MapJoin is generated. During MapJoin execution, a local task is started. JVM memory launched by the local task inherits the memory of the parent process.

When multiple JOIN operations are executed, multiple local tasks are started. If the host is out of memory, the local tasks fail to start.

Solution

Step 1 Log in to FusionInsight Manager and choose **Services** > **Hive** > **Configurations** > **All Configurations**.

Step 2 Search for the **hive.auto.convert.join** parameter and change the value of **hive.auto.convert.join** in Hive to **false**. Save the configuration and restart the service.

The value change may deteriorate service performance. You can perform the next step to avoid adverse impacts on the performance.

Step 3 Search for the **HIVE_GC_OPTS** parameter and decrease the value of **Xms** based on service requirements. The minimum value is half that of **Xmx**. After the modification, save the configuration and restart the service.

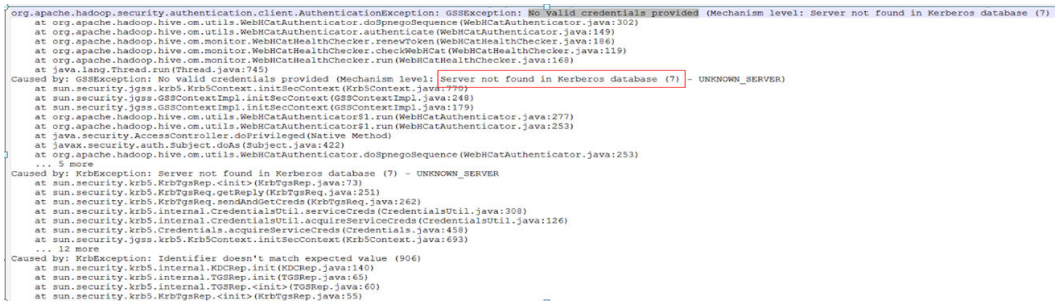
----End

16.9.29 Failed to Start WebHCat

Symptom

WebHCat fails to be started after the hostname is changed.

The following error is reported in the WebHCat startup log (**/var/log/Bigdata/hive/webhcat/hive.log**) of the corresponding node:



Cause Analysis

1. The server account of the MRS WebHCat role involves the hostname. If you change the hostname after the installation, WebHCat fails to start.
2. The one-to-many or many-to-one association between IP addresses and hostnames is configured in the **/etc/hosts** file. As a result, the IP address and hostname cannot be obtained correctly after the **hostname** and **hostname -i** commands are executed.

Solution

Step 1 Change the hostname of the modified node to the hostname before the cluster is installed.

Step 2 Check whether the **/etc/hosts** of the node where WebHCat is located is correctly configured.

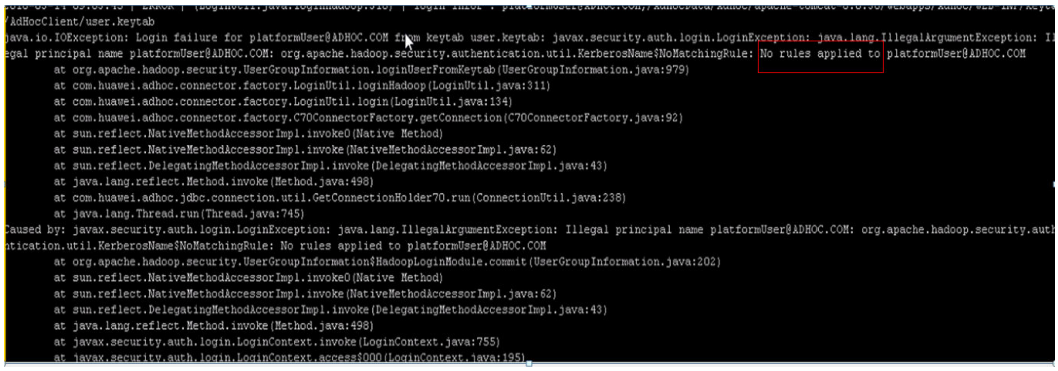
Step 3 Restart WebHCat.

----End

16.9.30 Sample Code Error for Hive Secondary Development After Domain Switching

Symptom

In the sample code for Hive secondary development, an error "No rules applied to ****" is reported:



Cause Analysis

1. The sample code for Hive secondary development loads **core-site.xml** file that is loaded through classload by default. Therefore, you need to put the configuration file to the **classpath** directory of the startup program.
2. If the domain name of the cluster is changed, the **core-site.xml** file will change. You need to download the latest **core-site.xml** file and save it to the **classpath** directory where the sample code for Hive secondary development is located.

Solution

Step 1 Download the latest client of the Hive cluster to obtain the latest **core-site.xml** file.

Step 2 Save the **core-site.xml** file to the **classpath** directory where the sample code process for Hive secondary development is located.

----End

16.9.31 MetaStore Exception Occurs When the Number of DBService Connections Exceeds the Upper Limit

Symptom

By default, the maximum number of connections to DBService is 300. If the number of connections is greater than 300 due to heavy traffic, an exception occurs in MetaStore and error "slots are reserved for non-replication superuser connections" is reported.

```
2018-04-26 14:58:55,657 | ERROR | BoneCP-pool-watch-thread | Failed to acquire connection to jdbc:postgresql://10.*.*.*:20051/hivemeta?socketTimeout=60. Sleeping for 1000 ms. Attempts left: 9 | com.jolbox.bonecp.BoneCP.obtainInternalConnection(BoneCP.java:292)
```

    at java.util.concurrent.ThreadPoolExecutor$Worker.run(ThreadPoolExecutor.java:617)
    at java.lang.Thread.run(Thread.java:745)
```

Cause Analysis

Heavy service traffic causes more than 300 connections to DBService, and the maximum number of connections to DBService needs to be increased.

Solution

Step 1 Log in to FusionInsight Manager and choose **Services** > **DBService** > **Configurations** > **All Configurations**.

Step 2 Search for **dbservice.database.max.connections** and set it to a proper value not greater than **1000**.

Step 3 Save the configuration and restart the affected services or instances.

Step 4 If the fault persists, check the service code for any connection leaks.

----End

16.9.32 "Failed to execute session hooks: over max connections" Reported by Beeline

Symptom

The default maximum connections to HiveServer are 200. When the number of connections exceeds 200, Beeline reports error "Failed to execute session hooks: over max connections."

```

    at org.apache.hive.jdbc.HiveQueryResultSet.next(HiveQueryResultSet.java:358)
Error: Error retrieving next row (state=,code=0)
```

Cause Analysis

- The data volume is excessively large.
- Users use the **select * from table_name;** statement for query in the whole table. There is a large amount of data in the table.
- The default startup memory of Beeline is 128 MB. The returned result set is too large during query, overloading Beeline.

Solution

Step 1 Before running **select count(*) from table_name;**, check the amount of data to be queried and determine whether to display data of this magnitude in Beeline.

Step 2 If a certain amount of data needs to be displayed, adjust the JVM parameter of the Hive client. Add **export HIVE_OPTS=-Xmx1024M** (change the value based on service requirements) to **component_env** in the **/Hive** directory of the Hive client. Run the **source** command to obtain the **/bigdata_env** directory on the client.

----End

16.9.34 Task Execution Fails Because the Input File Number Exceeds the Threshold

Symptom

When Hive performs a query operation, error message "Job Submission failed with exception 'java.lang.RuntimeException(input file number exceeded the limits in the conf;input file num is: 2380435,max heap memory is: 16892035072,the limit conf is: 500000/4)'" is displayed. The value in the error message varies depending on the actual situation. The error details are as follows:

```
ERROR : Job Submission failed with exception 'java.lang.RuntimeException(input file numbers exceeded the limits in the conf;
 input file num is: 2380435 ,
 max heap memory is: 16892035072 ,
 the limit conf is: 500000/4)'

    at java.util.concurrent.ThreadPoolExecutor$Worker.run(ThreadPoolExecutor.java:617)
    at java.lang.Thread.run(Thread.java:745)

Error: Error while processing statement: FAILED: Execution Error, return code 1 from
org.apache.hadoop.hive.ql.exec.mr.MapRedTask (state=08S01,code=1)
```

Cause Analysis

MRS uses the ratio of maximum files to the maximum HiveServer heap memory to determine the number of input files allowed in a MapReduce job submission.

Default value **500000/4** indicates that each 4 GB of heap memory allows a maximum of 500,000 input files. An error occurs if the number of input files exceeds this limit.

Solution

Step 1 Log in to FusionInsight Manager and choose **Services** > **Hive** > **Configurations** > **All Configurations**.

Step 2 Search for **hive.mapreduce.input.files2memory** and set it to a proper value based on the actual memory and task.

Step 3 Save the configuration and restart the affected services or instances.

Step 4 If the fault persists, adjust the GC parameter of the HiveServer based on service requirements.

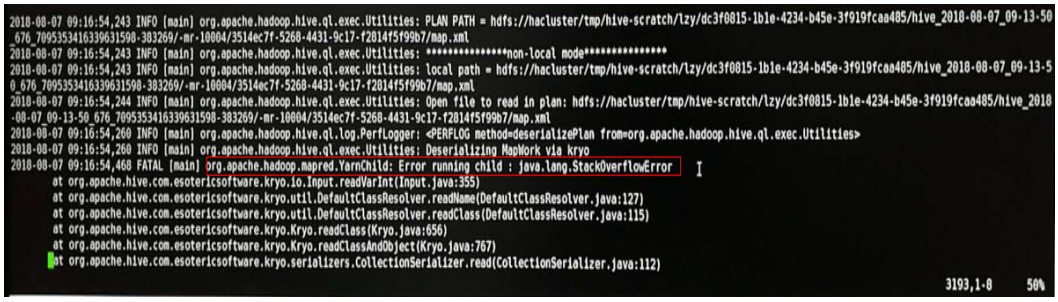
----End

16.9.35 Task Execution Fails Because of Stack Memory Overflow

Symptom

When Hive performs a query operation, error "Error running child: java.lang.StackOverflowError" is reported. The error details are as follows:

```
FATAL [main] org.apache.hadoop.mapred.YarnChild: Error running child : java.lang.StackOverflowError
at org.apache.hive.come.esotericsoftware.kryo.io.Input.readVarInt(Input.java:355)
at
org.apache.hive.come.esotericsoftware.kryo.util.DefautClassResolver.readName(DefautClassResolver.java:127)
at
org.apache.hive.come.esotericsoftware.kryo.util.DefautClassResolver.readClass(DefautClassResolver.java:115)
at org.apache.hive.come.esotericsoftware.kryo.Kryo.readClass(Kryo.java.656)
at org.apache.hive.come.esotericsoftware.kryo.kryo.readClassAnd0bject(Kryo.java:767)
at
org.apache.hive.come.esotericsoftware.kryo.serializers.collectionSerializer.read(CollectionSerializer.java:112)
```



Cause Analysis

Error "java.lang.StackOverflowError" indicates the memory overflow of the thread stack. It may occur if there are multiple levels of calls (for example, infinite recursive calls) or the thread stack is too small.

Solution

Adjust the stack memory in the JVM parameters of the Map and Reduce stages during execution of a MapReduce job, that is, **mapreduce.map.java.opts**

(adjusting the stack memory of Map) and **mapreduce.reduce.java.opts** (adjusting the stack memory of Reduce). The following uses the **mapreduce.map.java.opts** parameter as an example.

- To increase the Map memory temporarily (only valid for Beeline):

  Run the **set mapreduce.map.java.opts=-Xss8G;** command on the Beeline client. (Change the value as required.)

- To permanently increase the Map memory specified by the **mapreduce.map.memory.mb** and **mapreduce.map.java.opts** parameters:

  a. Log in to FusionInsight Manager and choose **Services** > **Hive** > **Configurations** > **All Configurations**.

  b. Add custom parameter **mapreduce.map.java.opts** and set it to a proper value.

  c. Save the configuration and restart the affected services or instances.

     Note that the modification takes effect after a service restart. During the restart, the Hive service is unavailable.

16.9.36 Task Failed Due to Concurrent Writes to One Table or Partition

Symptom

When Hive executes an INSERT statement, an error is reported indicating that a file or directory already exists or is cleared in HDFS. The error details are as follows:

```
2019-03-18 14:34:23,016 | WARN  | HiveServer2-Background-Pool: Thread-1179606 | Failed to move to trash: hdfs://hacluster/user/hive/warehouse/frpdb.db/dw_fixed_cost_xn_temp5_f/000000_0; Force to delete it. | org.apache.hadoop.hive.common.FileUtils.moveToTrash(FileUtils.java:651)
2019-03-18 14:34:23,017 | INFO  | HiveServer2-Background-Pool: Thread-1179604 | Moved to trash: hdfs://hacluster/user/hive/warehouse/frpdb.db/dw_fixed_cost_xn_temp6_f/000000_0 | org.apache.hadoop.hive.common.FileUtils.moveToTrash(FileUtils.java:644)
2019-03-18 14:34:23,017 | ERROR | HiveServer2-Background-Pool: Thread-1179606 | Failed to delete hdfs://hacluster/user/hive/warehouse/frpdb.db/dw_fixed_cost_xn_temp5_f/000000_0 | org.apache.hadoop.hive.common.FileUtils.moveToTrash(FileUtils.java:660)
2019-03-18 14:34:23,017 | ERROR | HiveServer2-Background-Pool: Thread-1179606 | Failed with exception Destination directory hdfs://hacluster/user/hive/warehouse/frpdb.db/dw_fixed_cost_xn_temp5_f has not be cleaned up.
org.apache.hadoop.hive.ql.metadata.HiveException: Destination directory hdfs://hacluster/user/hive/warehouse/frpdb.db/dw_fixed_cost_xn_temp5_f has not be cleaned up.
at org.apache.hadoop.hive.ql.metadata.Hive.replaceFiles(Hive.java:2974)
at org.apache.hadoop.hive.ql.metadata.Hive.loadTable(Hive.java:1664)
at org.apache.hadoop.hive.ql.exec.MoveTask.execute(MoveTask.java:374)
at org.apache.hadoop.hive.ql.exec.Task.executeTask(Task.java:158)
at org.apache.hadoop.hive.ql.exec.TaskRunner.runSequential(TaskRunner.java:101)
```

Cause Analysis

1. Check the start time and end time of the task based on the HiveServer audit logs.
2. Check whether data is inserted into the same table or partition in the time segment.
3. Hive does not support concurrent data insertion for a table or partition. As a result, multiple tasks perform operations on the same temporary data directory, and one task moves the data of another task, causing task failure.

Solution

The service logic is modified so that data is inserted to the same table or partition in single thread mode.

16.9.37 Failed to Load Data to Hive Tables

Symptom

After creating a table, a user runs the **LOAD** command to import data to the table. However, the following problem occurs during the import:

```
.......
> LOAD DATA INPATH '/user/tester1/hive-data/data.txt' INTO TABLE employees_info;
Error: Error while compiling statement: FAILED: SemanticException Unable to load data to destination table.
Error: The file that you are trying to load does not match the file format of the destination table.
(state=42000,code=40000)
.........
```

Cause Analysis

1. The storage format is not specified during table creation, and the default format RCFile is used.
2. However, the data to be imported is in TEXTFILE format.

Solution

This problem is caused by an application defect. You can use a proper method based on site requirements only by ensuring that the storage format specified by the table is the same as the format of the data to be imported.

- Method 1:

  Specify the storage format when creating a table as a user who has the Hive table operation permission. For example:

  CREATE TABLE IF NOT EXISTS employees_info(name STRING,age INT) ROW FORMAT DELIMITED FIELDS TERMINATED BY ',' STORED AS TEXTFILE;

  Specify the format of the data to be imported as TEXTFILE.
- Method 2:

  Import RCFile data, but not TEXTFILE data.

16.9.38 HiveServer and HiveHCat Process Faults

Issue

The HiveServer and WebHCat processes in the customer cluster are faulty.

Symptom

The HiveServer and WebHCat processes on the Master2 node in the MRS cluster are faulty. After the restart, the processes are still faulty.

Cause Analysis

On Manager, start the faulty HiveServer process. Log in to the background and search for the error information at the corresponding time point in the **hiveserver.out** log file. The error information is as follows: **error parsing conf**

mapred-site.xml and **Premature end of file**. Restart WebHCat. The same error is reported because the **mapred-site.xml** file fails to be parsed.

Procedure

1. Log in to the Master2 node as user **root**.
2. Run the **find / -name 'mapred-site.xml'** command to obtain the location of the **mapred-site.xml** file.
   - The path of HiveServer is **/opt/Bigdata/***Cluster version***/1_13_HiveServer/etc/mapred-site.xml**.
   - The path of WebHCat is **/opt/Bigdata/***Cluster version***/1_13_WebHCat/etc/mapred-site.xml**.
3. Check whether the **mapred-site.xml** file is normal. In this case, the configuration file is empty. As a result, the parsing fails.
4. Restore the **mapred-site.xml** file. Run the **scp** command to copy the configuration file in the corresponding directory on the Master1 node to the corresponding directory on the Master2 node to replace the original file.
5. Run the **chown omm:wheel mapred-site.xml** command to change the owner group and user.
6. On Manager, restart the faulty HiveServer and WebHCat processes.

16.9.39 An Error Occurs When the INSERT INTO Statement Is Executed on Hive But the Error Message Is Unclear

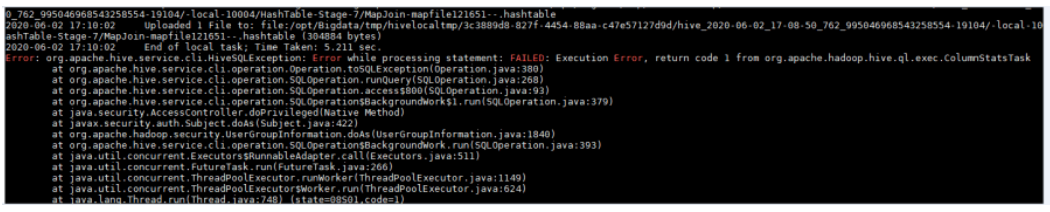
Issue

An error is reported when a user uses MRS Hive to execute a SQL statement.

Symptom

When a user uses MRS Hive to execute a SQL statement, the following error message is displayed.

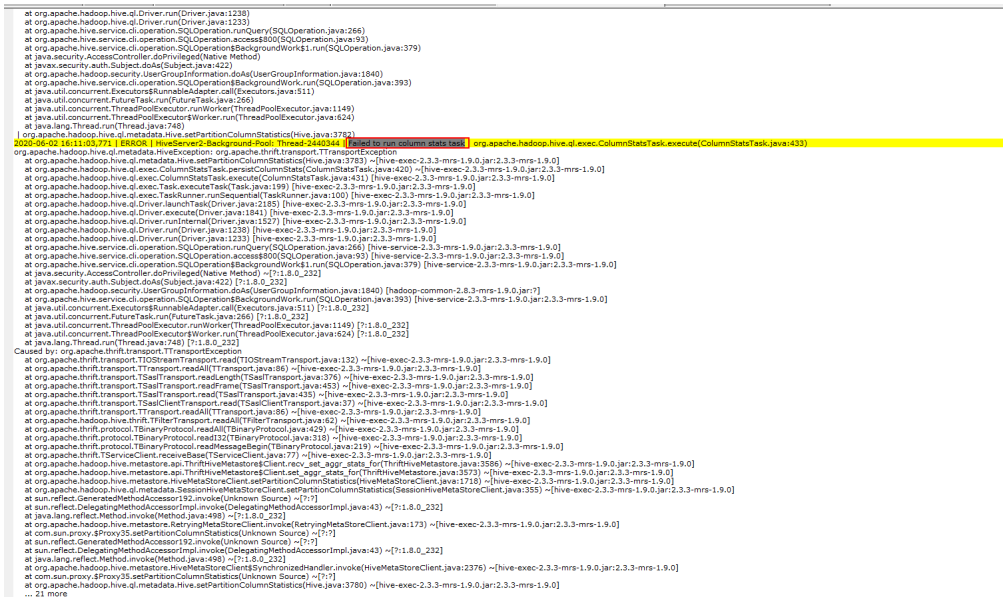
Figure 16-35 Error reported when MRS Hive executes a SQL statement



Cause Analysis

1. The HiveServer log shows the following message at the time when the error is reported.

Figure 16-36 HiveServer log



2. No important information is found in that log, but the **metadata** field is found in the stack. Therefore, the error may be related to MetaStore.

Figure 16-37 Metadata in the stack

3. The MetaStore log shows the following error information.

Figure 16-38 MetaStore log

The error context indicates that an error occurs during SQL statement execution, and the following information is displayed in the error message:

```
Caused by: org.postgresql.util.PSQLException: ERROR: value too long for type character varying(4000)
```

The SQL statement fails because the length of all columns exceeds 4000 bytes. The restriction needs to be modified.

Procedure

Step 1 Log in to any master node in the cluster as user **root** and run the **su - omm** command to switch to user **omm**.

Step 2 Run the following command to log in to GaussDB:

gsql -p 20051 -d hivemeta -U *username* -W *password*

Step 3 Run the following command to modify the restriction:

alter table PARTITION_PARAMS alter column PARAM_VALUE type varchar(6000);

----End

16.9.40 Timeout Reported When Adding the Hive Table Field

Issue

An error message is reported when adding the Hive table fields.

Symptom

Hive executes **ALTER TABLE table_name ADD COLUMNS(column_name string) CASCADE** on tables that contain more than 10,000 partitions. The error information is as follows:

```
Timeout when executing method: alter_table_with_environment_context; 600525ms exceeds 600000ms
```

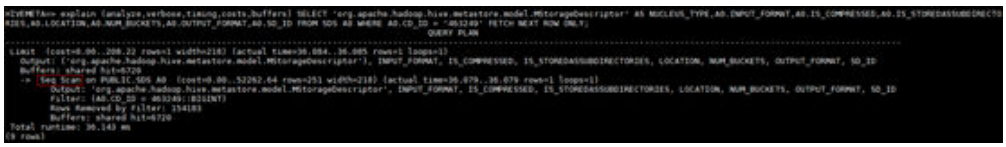
Cause Analysis

1. The MetaStore client connection times out. The default timeout interval for the connection between the MetaStore client and server is 600 seconds. On FusionInsight Manager, increase the value of **hive.metastore.client.socket.timeout** to **3600s**.
2. Another error is reported:
   ```
   Error: org.apache.hive.service.cli.HiveSQLException: Error while processing statement: FAILED: Execution Error, return code 1 from org.apache.hadoop.hive.ql.exec.DDLTask. Unable to alter table. java.net.SocketTimeoutException: Read timed out
   ```
   JDBC connection timeout interval of the MetaStore metadata. The default value is 60 ms.
3. Increase the value of **socketTimeout** in **javax.jdo.option.ConnectionURL** to **60000**. The initial error is still reported.
   ```
   Timeout when executing method: alter_table_with_environment_context;3600556ms exceeds 3600000ms
   ```
4. Increase the values of parameters such as **hive.metastore.batch.retrieve.max**, **hive.metastore.batch.retrieve.table.partition.max**, and **dbservice.database.max.connections**. The problem persists.
5. It is suspected that the problem is caused by the GaussDB because adding a field will traverse each partition to execute **getPartitionColumnStatistics** and **alterPartition**.
6. Run the **gsql -p 20051 -U omm -W dbserverAdmin@123 -d hivemeta** command as user **omm** to log in to the Hive metabase.

7. Run **select * from pg_locks**. No lock wait is found.
8. Run **select * from pg_stat_activity;**. It is found that the process execution takes a long time.

```
SELECT 'org.apache.hadoop.hive.metastore.model.MPartitionColumnStatistics'AS
NUCLEUS_TYPE,A0.AVG_COL_LEN,A0."COLUMN_NAME",A0.COLUMN_TYPE,A0.DB_NAME,A0.BIG_DECI
MAL_HIGH_VALUE,A0.BIG_DECIMAL_LOW_VALUE,A0.DOUBLE_HIGH_VALUE,A0.DOUBLE_LOW_VALUE,
A0.LAST_ANALYZED,A0.LONG_HIGH_VALUE,A0.LONG_LOW_VALUE,A0.MAX_COL_LEN,A0.NUM_DISTIN
CTS,A0.NUM_FALSES,A0.NUM_NULLS,A0.NUM_TRUES,A0.PARTITION_NAME,A0."TABLE_NAME",A0.CS_
ID,A0.PARTITION_NAMEAS NUCORDER0 FROM PART_COL_STATS A0 WHERE A0."TABLE_NAME" =
'$1' ANDA0.DB_NAME = '$2' AND A0.PARTITION_NAME = '$3' AND((((((A0."COLUMN_NAME" = '$4')
OR (A0."COLUMN_NAME" ='$5')) OR (A0."COLUMN_NAME" = '$6')) OR (A0."COLUMN_NAME"
='$7')) OR (A0."COLUMN_NAME" = '$8')) OR (A0."COLUMN_NAME" ='$9')) ORDER BY NUCORDER0;
```

9. Run the **gs_guc reload -c log_min_duration_statement=100 -D /srv/BigData/dbdata_service/data/** command to start SQL recording. It is found that the execution duration of the **Run select * from pg_sta...** statement is **700 ms**, and more than 10,000 commands are executed because there are more than 10,000 partitions.
10. Add explain (analyze, verbose, timing, costs, buffers) before the SQL statement to analyze the execution plan. It is found that the entire table needs to be scanned during execution.



11. Check the index. It is found that the index does not meet the leftmost match rule.

```
HIVEMETA=# \d+ PART_COL_STATS
                                    Table "PUBLIC.PART_COL_STATS"
        Column         |          Type          |          Modifiers          | Storage  | Stats target | Description
-----------------------+------------------------+-----------------------------+----------+--------------+-------------
 CS_ID                 | BIGINT                 | not null                    | plain    |              |

 COLUMN_TYPE           | CHARACTER VARYING(128) | default NULL::CHARACTER VARYING | extended |              |
 PART_ID               | BIGINT                 | not null                    | plain    |              |
 LONG_LOW_VALUE        | BIGINT                 |                             | plain    |              |
 LONG_HIGH_VALUE       | BIGINT                 |                             | plain    |              |
 DOUBLE_LOW_VALUE      | DOUBLE PRECISION       |                             | plain    |              |
 DOUBLE_HIGH_VALUE     | DOUBLE PRECISION       |                             | plain    |              |
 BIG_DECIMAL_LOW_VALUE | CHARACTER VARYING(4000) | default NULL::CHARACTER VARYING | extended |              |
 BIG_DECIMAL_HIGH_VALUE | CHARACTER VARYING(4000) | default NULL::CHARACTER VARYING | extended |              |
 NUM_NULLS             | BIGINT                 | not null                    | plain    |              |
 NUM_DISTINCTS         | BIGINT                 |                             | plain    |              |
 BIT_VECTOR            | BYTEA                  |                             | extended |              |
 AVG_COL_LEN           | DOUBLE PRECISION       |                             | plain    |              |
 MAX_COL_LEN           | BIGINT                 |                             | plain    |              |
 NUM_TRUES             | BIGINT                 |                             | plain    |              |
 NUM_FALSES            | BIGINT                 |                             | plain    |              |
 LAST_ANALYZED         | BIGINT                 | not null                    | plain    |              |
Indexes:
    "PART_COL_STATS_pkey" PRIMARY KEY, BTREE (CS_ID)
    "PART_COL_STATS_N49" BTREE (PART_ID)
    "PCS_STATS_IDX" BTREE (CAT_NAME, DB_NAME, TABLE_NAME, COLUMN_NAME, PARTITION_NAME)
Foreign-key constraints:
    "PART_COL_STATS_fkey" FOREIGN KEY (PART_ID) REFERENCES PARTITIONS(PART_ID) DEFERRABLE
Has OIDs: no
```

Procedure

1. Rebuild an index.

   ```
   su – omm
   gsql -p 20051 -U omm -W dbserverAdmin@123 -d hivemeta
   DROP INDEX PCS_STATS_IDX;
   CREATE INDEX PCS_STATS_IDX ON PART_COL_STATS(DB_NAME, TABLE_NAME, COLUMN_NAME, PARTITION_NAME);
   CREATE INDEX SDS_N50 ON SDS(CD_ID);
   ```

2. Check the execution plan again. It is found that the statement can be indexed and executed within 5 ms (the original execution time is 700 ms). Add fields to the Hive table again. The fields can be added successfully.

16.9.41 Failed to Restart the Hive Service

Issue

After the Hive service configuration is modified, the configuration fails to be saved. The configuration status of the Hive service on Manager is **Failed**.

Symptom

User A opens the Hive configuration file in the background of the MRS node and does not close the file. User B modifies the Hive configuration item in **Service Management** on the MRS Manager page, saves the configuration, and restarts the Hive service. However, the configuration fails to be saved and the Hive service fails to be started.

Cause Analysis

When user B modifies the configuration on the MRS Manager page, the configuration file is opened by user A in the background of an MRS node. As a

result, the configuration file cannot be replaced and the Hive service fails to be started.

Procedure

Step 1 Manually close the Hive configuration file opened in the background of the cluster node.

Step 2 Modify the Hive configuration on MRS Manager and save the configuration.

Step 3 Restart the Hive service.

----End

16.9.42 Hive Failed to Delete a Table

Issue

Hive fails to delete a table.

Symptom

Partitioning a Hive table by two columns may eventually generate over 20,000 partition files. As a result, the user fails to execute the **truncate table ${TableName}** or **drop table ${TableName}** statement to delete table data.

Cause Analysis

The file deletion operations are executed by a single thread serially. If the Hive partitioned tables have too many partition files, a large amount of metadata is stored in the metadata database. It takes a long time to delete metadata when a statement is executed to delete table data. As a result, the deletion cannot be complete within the specified timeout period, and the operation fails.

NOTE

You can log in to FusionInsight Manager and choose **Cluster** > **Services** > **Hive**. On the Hive page, choose **Configuration** > **All Configurations**, choose **ServerInit** under **MetaStore(Role)** in the navigation tree, and view the **hive.metastore.client.socket.timeout** parameter value in the right pane. This value is the timeout period. You can view the default value in the **Description** column.

Procedure

Step 1 (Optional, perform this step for an internal table) Use **alter table ${TableName} set TBLPROPERTIES('EXTERNAL'='true')** to convert it into an external table. In this way, only its metadata but not data stored on the HDFS is deleted, saving the table deletion time.

Step 2 (Optional, perform this step to use the same table name) Run the **show create table ${TableName}** command to export the table structure, and then run the **ALTER TABLE ${TableName} RENAME TO ${new_table_name};** command to rename the table. In this way, you can create a table that is the same as the original one.

Step 3 Run the **hdfs dfs –rm –r –f ${hdfs_path}** command to delete table data from the HDFS.

Step 4 Use **alter table ${Table_Name} drop partition (${PartitionName}<'XXXX', ${PartitionName}>'XXXX');** in Hive to delete partitions and reduce the number of files. The deletion conditions can be flexibly configured.

Step 5 When the number of rest partitions is smaller than 1,000, run the **drop table ${TableName}** command to delete the table.

----End

Summary and Suggestions

Hive partitioning can improve query efficiency. However, you should properly plan the partitioning policies to prevent a large number of small files from being generated.

16.9.43 An Error Is Reported When msck repair table table_name Is Run on Hive

Symptom

When **msck repair table table_name** is run on Hive, the error message "FAILED: Execution Error, return code 1 from org.apache.hadoop.hive.ql.exec.DDLTask (state=08S01,code=1)" is displayed.

Possible Causes

A directory in the HiveServer log file **/var/log/Bigdata/hive/hiveserver/hive.log** does not comply with the partition format.

```
2020-07-15 15:38:10,427 | WARN  | HiveServer2-Background-Pool: Thread-10905216 | Failed to run metacheck:  | org.apache.hadoop.hive.ql.exec.DDLTask.msck(DDLTask.java:2023)

    at java.lang.Thread.run(Thread.java:748) [?:1.8.0_232]
```

Procedure

- Method 1: Delete the incorrect file or directory.
- Method 2: Run the **set hive.msck.path.validation=skip** command to skip invalid directories.

16.10 Using Hue

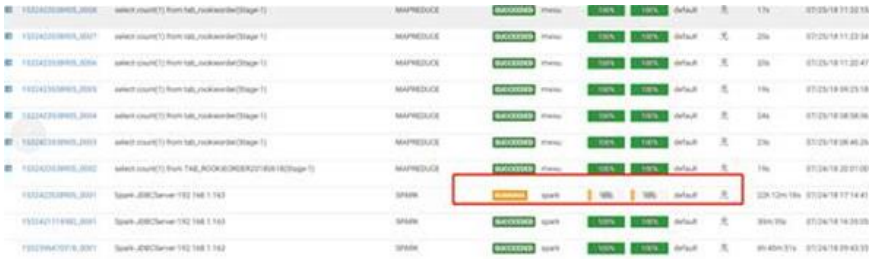
16.10.1 A Job Is Running on Hue

Issue

The customer finds that a job is running on Hue.

Symptom

After the customer's MRS is installed, the job is running on Hue but the running job is not operated by the customer.



Cause Analysis

This job is a permanent job generated when the system connects to JDBC after Spark is started.

Procedure

This is not a problem. No handling is required.

16.10.2 HQL Fails to Be Executed on Hue Using Internet Explorer

Symptom

Using Internet Explorer to access Hive Editor and execute all HQL statements on Hue fails and the system prompts "There was an error with your query".

Cause Analysis

Internet Explorer has functional problems and cannot process AJAX POST requests containing form data in 307 redirection. Use a compatible browser.

Solution

Use Google Chrome 21 or later.

16.10.3 Hue (Active) Cannot Open Web Pages

Symptom

The following information is displayed on the web UI of Hue (active):

```
Service Unavailable
The server is temporarily unable to service your request due to maintenance downtime or capacity problems. Please try again later.
```

Cause Analysis

- The Hue configuration has expired.
- The configuration of the Hue service needs to be modified manually in a single-master cluster.

Solution

- If the Hue configuration has expired, restart the Hue service.
- Manually modify the Hue service configuration for a single-master cluster.
  a. Log in to the Master node.
  b. Run the **hostname -i** command to obtain the IP address of the local host.
  c. Run the following command to obtain the value of **HUE_FLOAT_IP**:

     grep "HUE_FLOAT_IP" ${BIGDATA_HOME}/*MRS*_Current/1_*/etc*/ENV_VARS,

     Replace *MRS* with the actual file name.
  d. Check whether the local IP address is the same as the value of **HUE_FLOAT_IP**. If they are different, change the value of **HUE_FLOAT_IP** to the local IP address.
  e. Restart the Hue service.

16.10.4 Failed to Access the Hue Web UI

Issue

An error page is displayed when the Hue web UI is accessed.

Symptom

The following error information is displayed on the Hue web UI:

```
503 Service Unavailable
The server is temporarily unable to service your requster due to maintenance downtime or capacity problems.Please try again later.
```

Cause Analysis

- The Hue configuration has expired.
- The configuration of the Hue service needs to be modified manually in a single-master cluster.

Procedure

Step 1 Log in to the Master node.

Step 2 Run the **hostname -i** command to obtain the IP address of the local host.

Step 3 Run the following command to obtain the value of **HUE_FLOAT_IP**:

grep "HUE_FLOAT_IP" ${BIGDATA_HOME}/*MRS*_Current/1_*/etc*/ENV_VARS, where *MRS* is subject to the actual file name.

Step 4 Check whether the local IP address is the same as the value of **HUE_FLOAT_IP**. If they are different, change the value of **HUE_FLOAT_IP** to the local IP address.

Step 5 Restart the Hue service.

----End

16.10.5 HBase Tables Cannot Be Loaded on the Hue Web UI

Issue

After Hive data is imported to HBase on the Hue page, an error message is displayed, indicating that the HBase table cannot be detected.

Symptom

In the Kerberos cluster, the IAM sub-account does not have sufficient permissions. As a result, the HBase table cannot be loaded.

Cause Analysis

The IAM subaccount does not have sufficient permissions.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **Permission** > **User**.

Step 3 Locate the row that contains the target user, and click **Modify**.

Step 4 Add the user to the **supergroup** group.

Step 5 Click **OK**. The modification is complete.

----End

Summary and Suggestions

If Kerberos authentication is enabled for a cluster, "No data available" is displayed on the page. In this case, check the permission first.

16.11 Using Kafka

16.11.1 An Error Is Reported When Kafka Is Run to Obtain a Topic

Issue

An Error is reported when Kafka is run to obtain a topic.

Symptom

An error is reported when the Kafka is run to obtain topics. The error information is as follows:

```
ERROR org.apache.kafka.common.errors.InvalidReplicationFactorException: Replication factor: 2 larger than available brokers: 0.
```

Possible Cause

The variable for obtaining the ZooKeeper address is incorrect due to special characters.

Procedure

Step 1 Log in to any Master node.

Step 2 Run the **cat /opt/client/Kafka/kafka/config/server.properties |grep '^zookeeper.connect ='** command to check the variable of the Zookeeper address.

Step 3 Run Kafka again to obtain the topic. Do not add any character to the variables obtained in **Step 2**.

----End

16.11.2 Flume Normally Connects to Kafka But Fails to Send Messages

Symptom

An MRS cluster is installed, and ZooKeeper, Flume, and Kafka are installed in the cluster.

Flume fails to send data to Kafka.

Possible Causes

1. The Kafka service is abnormal.
2. The IP address for Flume to connect to Kafka is incorrect.
3. The size of the message sent from Flume to Kafka exceeds the upper limit.

Cause Analysis

The possible reasons why Flume fails to send data to Kafka may be related to Flume or Kafka.

1. Check the Kafka service status and monitoring metrics on Manager.
   - MRS Manager: Log in to MRS Manager and choose **Services** > **Kafka**. Check the Kafka status. The status is **Good**, and the monitoring metrics are correctly displayed.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka**.

     Check the Kafka status. It is found that the status is good and the monitoring metrics are correctly displayed.

2. Check the Flume log. The log contains **MessageSizeTooLargeException** information, as shown in the following:

```
2016-02-26 14:55:19,126 | WARN  | [SinkRunner-PollingRunner-DefaultSinkProcessor] |  Produce request with correlation id 349829 failed due to [LOG,7]: kafka.common.MessageSizeTooLargeException  | kafka.utils.Logging$class.warn(Logging.scala:83)
```

   The exception shows that the size of data written to Kafka by Flume exceeds the maximum message size specified by Kafka.

3. Check the maximum message size specified by Kafka on Manager.
   - MRS Manager portal: Log in to MRS Manager and choose **Services** > **Kafka** > **Configuration**.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka** > **Configuration**.

   On the page that is displayed, set **Type** to **All**. All Kafka configurations are displayed. Enter **message.max.bytes** in the **Search** text box to search.

   In MRS, the maximum size of a message that can be received by the Kafka server is 1000012 bytes = 977 KB by default.

Solution

After confirmation with the customer, data sent by Flume contains messages over 1 MB. Adjust parameters on Kafka to enable the messages to be written to Kafka.

Step 1 Set **message.max.bytes** to a value that is larger than the current maximum size of the message to be written so that Kafka can receive all messages.

Step 2 Set **replica.fetch.max.bytes** to a value that is equal to or larger than the value of **message.max.bytes** so that replicas of partitions on different Brokers can be synchronized to all messages.

- MRS Manager portal: Log in to MRS Manager and choose **Services** > **Kafka** > **Configuration**.
- FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka** > **Configuration**.

On the page that is displayed, set **Type** to **All**. All Kafka configurations are displayed. Enter **replica.fetch.max.bytes** in the **Search** text box to search.

Step 3 Click **Save** and restart the Kafka service to make Kafka configurations take effect.

Step 4 Set **fetch.message.max.bytes** to a value that is equal to or larger than the value of **message.max.bytes** for Consumer service applications to ensure that Consumers can consume all messages.

----End

16.11.3 Producer Failed to Send Data and Threw "NullPointerException"

Symptom

An MRS cluster has ZooKeeper and Kafka installed.

When the Producer client sends data to Kafka, it fails and throws "NullPointerException".

Possible Causes

1. The Kafka service is abnormal.
2. The **jass** and **keytab** files configured on the Producer client are incorrect.

Cause Analysis

The possible causes may be related to Producer or Kafka.

1. Check the Kafka service status and monitoring metrics on Manager.
   - MRS Manager: Log in to MRS Manager and choose **Services** > **Kafka**. Check the Kafka status. The status is **Good**, and the monitoring metrics are correctly displayed.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster**. Click the name of the target cluster and choose **Service** > **Kafka**.

     Check the Kafka status. The status is good, and the monitoring metrics are correctly displayed.
2. Check the Producer client log. The log contains "NullPointerException", as shown in **Figure 16-39**.

   Figure 16-39 Producer client log

   ```
   [2016-12-06 02:04:05,906]-[schedule-C50D0717-4643-4D4E-9D6E-B940E4BD7159]-[kafka-producer-network-thread |
   SZX1000161910-10.21.219.222-bigdata-producer-5]-[1005]-[org.apache.kafka.clients.producer.internals.Sender.run
   thread:
   java.lang.NullPointerException
       at org.apache.kafka.common.network.Selector.pollSelectionKeys(Selector.java:302)
       at org.apache.kafka.common.network.Selector.poll(Selector.java:283)
       at org.apache.kafka.clients.NetworkClient.poll(NetworkClient.java:260)
       at org.apache.kafka.clients.producer.internals.Sender.run(Sender.java:229)
       at org.apache.kafka.clients.producer.internals.Sender.run(Sender.java:134)
       at java.lang.Thread.run(Thread.java:745)
   [2016-12-06 02:04:05,921]-[schedule-C50D0717-4643-4D4E-9D6E-B940E4BD7159]-[kafka-producer-network-thread |
   SZX1000161910-10.21.219.222-bigdata-producer-3]-[1005]-[org.apache.kafka.clients.producer.internals.Sender.run
   thread:
   java.lang.NullPointerException
       at org.apache.kafka.common.network.Selector.pollSelectionKeys(Selector.java:302)
       at org.apache.kafka.common.network.Selector.poll(Selector.java:283)
       at org.apache.kafka.clients.NetworkClient.poll(NetworkClient.java:260)
       at org.apache.kafka.clients.producer.internals.Sender.run(Sender.java:229)
       at org.apache.kafka.clients.producer.internals.Sender.run(Sender.java:134)
       at java.lang.Thread.run(Thread.java:745)
   ```

   Alternatively, the log contains only "NullPointerException" but no stack information. The problem is caused by JDK self-protection. If much information is printed for the same stack, the JDK self-protection is triggered and stack information is no longer printed, as shown in **Figure 16-40**.

   Figure 16-40 Error information

   ```
   [2016-11-23 04:06:53,973] [kafka-producer-network-thread | producer-1] [ERROR] [org.apache.kafka.clients.producer.internals.Sender] (run:130)- Uncaught error in kafka producer I/O thread:
   java.lang.NullPointerException
   [2016-11-23 04:06:53,973] [kafka-producer-network-thread | producer-1] [ERROR] [org.apache.kafka.clients.producer.internals.Sender] (run:130)- Uncaught error in kafka producer I/O thread:
   java.lang.NullPointerException
   [2016-11-23 04:06:53,973] [kafka-producer-network-thread | producer-1] [ERROR] [org.apache.kafka.clients.producer.internals.Sender] (run:130)- Uncaught error in kafka producer I/O thread:
   java.lang.NullPointerException
   [2016-11-23 04:06:53,973] [kafka-producer-network-thread | producer-1] [ERROR] [org.apache.kafka.clients.producer.internals.Sender] (run:130)- Uncaught error in kafka producer I/O thread:
   java.lang.NullPointerException
   ```

3. Check the Producer client log. Error information "Failed to configure SaslClientAuthenticator" is displayed, as shown in **Figure 16-41**.

Figure 16-41 Error log

```
Caused by: org.apache.kafka.common.KafkaException: Failed to configure SaslClientAuthenticator

at org.apache.kafka.common.security.authenticator.SaslClientAuthenticator.createSaslClient(SaslClientAuthenticator.java:102)
... 11 more
```

4. The authentication failure causes the failure to create the KafkaChannel. The KafkaChannel obtained through the **channel(key)** method is empty and "NullPointerException" is excessively printed. According to the preceding log, the authentication fails due to an incorrect password which does not match the username.
5. Check the **jaas** and **keytab** files. The **principal** is set to **stream** in the **jaas** file.

Figure 16-42 Checking the jaas file

```
KafkaClient {
com.sun.security.auth.module.Krb5LoginModule required
debug=false
keyTab="/opt/client/user.keytab"
useTicketCache=false
storeKey=true
principal="stream@HADOOP.COM"
useKeyTab=true;
};
```

The **principal** is set to **zmk_kafka** in the **user.keytab** file.

Figure 16-43 Checking the user.keytab file

```
[root@8-5-148-6 client]# klist -kt user.keytab
Keytab name: FILE:user.keytab
KVNO Timestamp         Principal
---- ----------------- --------------------------------------------------------
   1 12/19/16 16:28:17 zmk_kafka@HADOOP.COM
   1 12/19/16 16:28:17 zmk_kafka@HADOOP.COM
```

The **principal** in the **jaas** file is inconsistent with that in the **user.keytab** file.

The application automatically and periodically updates the **jaas** file. However, when two processes of the application update the **jaas** file, one process writes a correct **principal** whereas the other process writes an incorrect one. As a result, the application is abnormal sometimes.

Procedure

Step 1 Modify the **jaas** file to ensure that its **principal** exists in the **keytab** file.

----End

16.11.4 Producer Fails to Send Data and "TOPIC_AUTHORIZATION_FAILED" Is Thrown

Symptom

An MRS cluster is installed, and ZooKeeper and Kafka are installed in the cluster.

When Producer sends data to Kafka, the client throws "TOPIC_AUTHORIZATION_FAILED."

Possible Causes

1. The Kafka service is abnormal.
2. The Producer client adopts non-security access and access is disabled on the server.
3. The Producer client adopts non-security access and ACL is set for Kafka topics.

Cause Analysis

The possible reasons why Producer fails to send data to Kafka may be related to Producer or Kafka.

1. Check the Kafka service status:
   - MRS Manager: Log in to MRS Manager and choose **Services** > **Kafka**. Check the Kafka status. The status is **Good**, and the monitoring metrics are correctly displayed.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka**.

     Check the Kafka status. It is found that the status is good and the monitoring metrics are correctly displayed.
2. Check the Producer client logs. The logs contain the error information "TOPIC_AUTHORIZATION_FAILED."

   ```
   [root@10-10-144-2 client]# kafka-console-producer.sh --broker-list 10.5.144.2:9092 --topic test
   1
   [2017-01-24 16:58:36,671] WARN Error while fetching metadata with correlation id 0 :
   {test=TOPIC_AUTHORIZATION_FAILED} (org.apache.kafka.clients.NetworkClient)
   [2017-01-24 16:58:36,672] ERROR Error when sending message to topic test with key: null, value: 1
   bytes with error: Not authorized to access topics: [test]
   (org.apache.kafka.clients.producer.internals.ErrorLoggingCallback)
   ```

   Producer accesses Kafka using port 9092, which is a non-security port.
3. On Manager, check the current Kafka cluster configuration. It is found that the customized configuration **allow.everyone.if.no.acl.found**=**false** is not configured.
   - MRS Manager portal: Log in to MRS Manager and choose **Services** > **Kafka** > **Configuration**.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka** > **Configuration**.
4. If ACL is set to **false**, port 9092 cannot be used for access.
5. Check the Producer client logs. The logs contain the error information "TOPIC_AUTHORIZATION_FAILED."

   ```
   [root@10-10-144-2 client]# kafka-console-producer.sh --broker-list 10.5.144.2:21005 --topic test_acl
   1
   ```

```
[2017-01-25 11:09:40,012] WARN Error while fetching metadata with correlation id 0 :
{test_acl=TOPIC_AUTHORIZATION_FAILED} (org.apache.kafka.clients.NetworkClient)
[2017-01-25 11:09:40,013] ERROR Error when sending message to topic test_acl with key: null, value:
1 bytes with error: Not authorized to access topics: [test_acl]
(org.apache.kafka.clients.producer.internals.ErrorLoggingCallback)
[2017-01-25 11:14:40,010] WARN Error while fetching metadata with correlation id 1 :
{test_acl=TOPIC_AUTHORIZATION_FAILED} (org.apache.kafka.clients.NetworkClient)
```

Producer accesses Kafka using port 21005, which is a non-security port.

6. Run the client command to check the ACL permission of the topic.

```
[root@10-10-144-2 client]# kafka-acls.sh --authorizer-properties zookeeper.connect=10.5.144.2:24002/
kafka --list --topic topic_acl
Current ACLs for resource `Topic:topic_acl`:
 User:test_user has Allow permission for operations: Describe from hosts: *
User:test_user has Allow permission for operations: Write from hosts: *
```

If ACL is set for the topic, port 9092 cannot be used for access.

7. Check the Producer client logs. The logs contain the error information "TOPIC_AUTHORIZATION_FAILED."

```
[root@10-10-144-2 client]# kafka-console-producer.sh --broker-list 10.5.144.2:21007 --topic topic_acl
--producer.config /opt/client/Kafka/kafka/config/producer.properties
1
[2017-01-25 12:43:58,506] WARN Error while fetching metadata with correlation id 0 :
{topic_acl=TOPIC_AUTHORIZATION_FAILED} (org.apache.kafka.clients.NetworkClient)
[2017-01-25 12:43:58,507] ERROR Error when sending message to topic topic_acl with key: null,
value: 1 bytes with error: Not authorized to access topics: [topic_acl]
(org.apache.kafka.clients.producer.internals.ErrorLoggingCallback)
```

Producer uses port 21007 to access Kafka.

8. Run the client command **klist** to query the current authenticated user.

```
[root@10-10-144-2 client]# klist
Ticket cache: FILE:/tmp/krb5cc_0
Default principal: test@HADOOP.COM

Valid starting     Expires            Service principal
01/25/17 11:06:48  01/26/17 11:06:45  krbtgt/HADOOP.COM@HADOOP.COM
```

The **test** user is used in this example.

9. Run the client command to check the ACL permission of the topic.

```
[root@10-10-144-2 client]# kafka-acls.sh --authorizer-properties zookeeper.connect=10.5.144.2:2181/
kafka --list --topic topic_acl
Current ACLs for resource `Topic:topic_acl`:
 User:test_user has Allow permission for operations: Describe from hosts: *
User:test_user has Allow permission for operations: Write from hosts: *
```

After ACL is set for the topic, user **test_user** has Producer permission. User **test** has no permission to perform Producer operations.

For details about the solution, see **2**.

10. Log in to Kafka Broker using SSH.

Run the **cd /var/log/Bigdata/kafka/broker** command to go to the log directory.

Check the **kafka-authorizer.log** file. It shows that the user does not belong to the **kafka** or **kafkaadmin** group.

```
2017-01-25 13:26:33,648 | INFO  | [kafka-request-handler-0] | The principal is test, belongs to Group :
[hadoop, ficommon] | kafka.authorizer.logger (SimpleAclAuthorizer.scala:169)
2017-01-25 13:26:33,648 | WARN  | [kafka-request-handler-0] | The user is not belongs to kafka or
kafkaadmin group, authorize failed! | kafka.authorizer.logger (SimpleAclAuthorizer.scala:170)
```

For details about the solution, see **3**.

Solution

Step 1 Set **allow.everyone.if.no.acl.found** to **true** and restart the Kafka service.

Step 2 Use the account with permission for login.

Example:

kinit test_user

Alternatively, grant the user with related permission.

NOTICE

This operation must be performed by the Kafka administrator (belonging to the **kafkaadmin** group).

Example:

kafka-acls.sh --authorizer-properties zookeeper.connect=10.5.144.2:2181/kafka --topic topic_acl --producer --add --allow-principal User:test

```
[root@10-10-144-2 client]# kafka-acls.sh --authorizer-properties zookeeper.connect=8.5.144.2:2181/kafka --list --topic topic_acl
Current ACLs for resource `Topic:topic_acl`:
 User:test_user has Allow permission for operations: Describe from hosts: *
 User:test_user has Allow permission for operations: Write from hosts: *
  User:test has Allow permission for operations: Describe from hosts: *
  User:test has Allow permission for operations: Write from hosts: *
```

Step 3 Add the user to the **kafka** or **kafkaadmin** group.

----End

16.11.5 Producer Occasionally Fails to Send Data and the Log Displays "Too many open files in system"

Symptom

When Producer sends data to Kafka, it is found that the client fails to send data.

Figure 16-44 Producer fails to send data.

Possible Causes

1. The Kafka service is abnormal.
2. The network is abnormal.
3. The Kafka topic is abnormal.

Cause Analysis

1. Check the Kafka service status:
   - MRS Manager: Log in to MRS Manager and choose **Services** > **Kafka**. Check the Kafka status. The status is **Good**, and the monitoring metrics are correctly displayed.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka**.

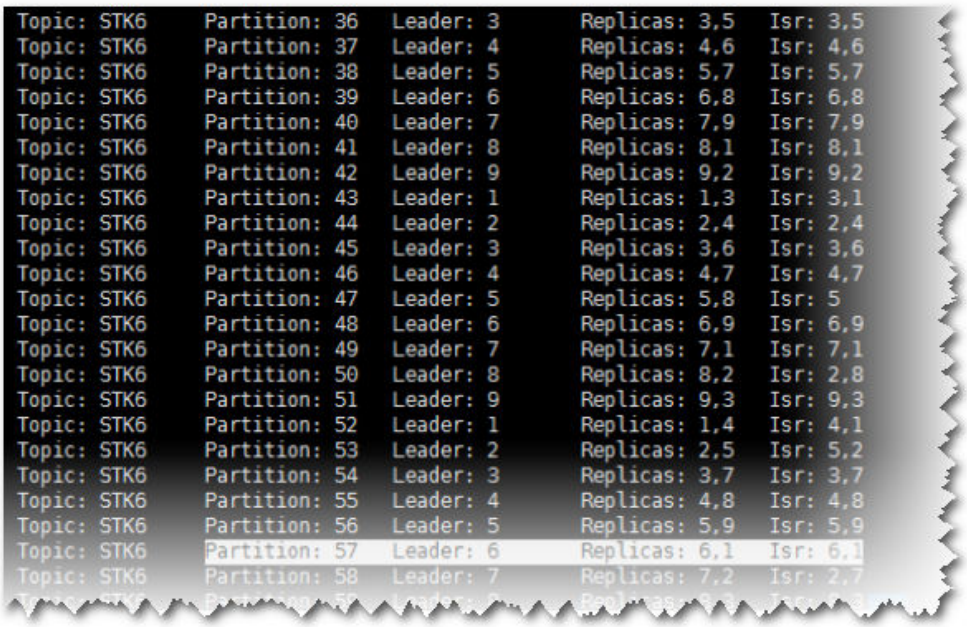
     Check the Kafka status. It is found that the status is good and the monitoring metrics are correctly displayed.
2. View the error topic information in the SparkStreaming log.

   Run the Kafka commands to obtain the topic assignment information and copy synchronization information, and check the return result.

   kafka-topics.sh --describe --zookeeper <zk_host:port/chroot>

   As shown in **Figure 16-45**, the topic status is normal. All partitions have normal leader information.

   Figure 16-45 Topic status

3. Run the **telnet** command to check whether the Kafka can be connected.

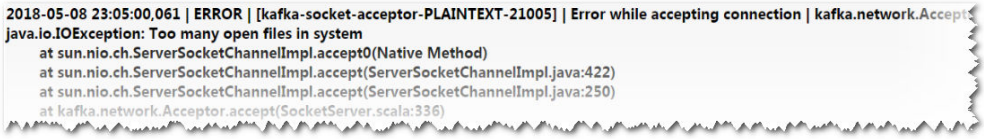
   telnet *Kafka service IP address Kafka service port*

   If telnet fails, check the network security group and ACL.
4. Log in to Kafka Broker using SSH.

   Run the **cd /var/log/Bigdata/kafka/broker** command to go to the log directory.

   Check on **server.log** indicates that the error message is displayed in the log shown in the following figure.

Figure 16-46 Log exception



5. Output of the **lsof** command used to check the handle usage of the Kafka process on the current node shows that the number of handles used by the Kafka process reaches 470,000.

Figure 16-47 Handles

6. Check the service code. It is found that the Producer object is frequently created and is not closed normally.

Solution

Step 1 Stop the current application to ensure that the number of handles on the server does not increase sharply, which affects the normal running of services.

Step 2 Optimize the application code to resolve the handle leakage problem.

Suggestion: Use one Producer object globally. After the use is complete, call the Close interface to close the handle.

----End

16.11.6 Consumer Is Initialized Successfully, But the Specified Topic Message Cannot Be Obtained from Kafka

Symptom

An MRS cluster is installed, and ZooKeeper, Flume, Kafka, Storm, and Spark are installed in the cluster.

The customer cannot consume any data using Storm, Spark, Flume or self-programmed Consumer code to consume messages of the specified Kafka topic.

Possible Causes

1. The Kafka service is abnormal.
2. The IP address for ZooKeeper connection is incorrectly set.
3. "ConsumerRebalanceFailedException" is thrown.

4. "ClosedChannelException" caused by network problems is thrown.

Cause Analysis

Storm, Spark, Flume or user-defined Consumer code can be called Consumer.

1. Check the Kafka service status:
   - MRS Manager: Log in to MRS Manager and choose **Services** > **Kafka**. Check the Kafka status. The status is **Good**, and the monitoring metrics are correctly displayed.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka**.

     Check the Kafka status. It is found that the status is good and the monitoring metrics are correctly displayed.
2. Check whether data can be normally consumed through the Kafka client.

   Suppose the client has been installed in the **/opt/client** directory, **test** is the topic name to be consumed, and the IP address of ZooKeeper is 192.168.234.231.

   ```
   cd /opt/client
   source bigdata_env
   kinit admin
   kafka-topics.sh --zookeeper 192.168.234.231:2181/kafka --describe --topic testkafka-console-consumer.sh --topic test --zookeeper 192.168.234.231:2181/kafka --from-beginning
   ```

   If data can be consumed, the cluster service is running properly.
3. Check Consumer configurations. The IP address for connecting to ZooKeeper is incorrect.
   - Flume

     ```
     server.sources.Source02.type=org.apache.flume.source.kafka.KafkaSource

     server.sources.Source02.zookeeperConnect=192.168.234.231:2181
     server.sources.Source02.topic = test
     server.sources.Source02.groupId = test_01
     ```
   - Spark

     ```
     val zkQuorum = "192.168.234.231:2181"
     ```
   - Storm

     ```
     BrokerHosts brokerHosts = new ZKHosts("192.168.234.231:2181");
     ```
   - Consumer API

     ```
     zookeeper.connect="192.168.234.231:2181"
     ```

   On MRS Manager, the root path of ZNode where Kafka is stored on ZooKeeper is **/kafka**, which is differentiated from the open source. The address for Kafka to connect to ZooKeeper is **192.168.234.231:2181/kafka**.

   However, the address for Consumer to connect to ZooKeeper is **192.168.234.231:2181**. Therefore, topic information about Kafka cannot be correctly obtained.

   For details about the solution, see **Step 1**.
4. Check Consumer logs. The logs contain "ConsumerRebalanceFailedException".

   ```
   2016-02-03 15:55:32,557 | ERROR | [ZkClient-EventThread-75- 192.168.234.231:2181/kafka] |  Error handling event ZkEvent[New session event sent to kafka.consumer.ZookeeperConsumerConnector$ZKSessionExpireListener@34b41dfe]  | org.I0Itec.zkclient.ZkEventThread.run(ZkEventThread.java:77)
   kafka.common.ConsumerRebalanceFailedException: pc-zjqbetl86-1454482884879-2ec95ed3 can't rebalance after 4 retries
   at kafka.consumer.ZookeeperConsumerConnector$ZKRebalancerListener.syncedRebalance(ZookeeperConsumerConnector.scala:633)
   ```

```
at kafka.consumer.ZookeeperConsumerConnector
$ZKSessionExpireListener.handleNewSession(ZookeeperConsumerConnector.scala:487)
at org.I0Itec.zkclient.ZkClient$4.run(ZkClient.java:472)
at org.I0Itec.zkclient.ZkEventThread.run(ZkEventThread.java:71)
```

The exception shows that the current Consumer does not complete rebalance within the specified retry times. As a result, Kafka Topic-Partition is not allocated to Consumer and Consumer cannot consume messages.

For details about the solution, see **Step 3**.

5. Check Consumer logs. The logs contain "Fetching topic metadata with correlation id 0 for topics [Set(test)] from broker [id:26,host:192-168-234-231,port:9092] failed" and "ClosedChannelException".

```
[2016-03-04 03:33:53,047] INFO Fetching metadata from broker id:26,host:
192-168-234-231,port:9092 with correlation id 0 for 1 topic(s) Set(test) (kafka.client.ClientUtils$)
[2016-03-04 03:33:55,614] INFO Connected to 192-168-234-231:21005 for producing
(kafka.producer.SyncProducer)
[2016-03-04 03:33:55,614] INFO Disconnecting from 192-168-234-231:21005
(kafka.producer.SyncProducer)
[2016-03-04 03:33:55,615] WARN Fetching topic metadata with correlation id 0 for topics [Set(test)]
from broker [id:26,host: 192-168-234-231,port:21005] failed (kafka.client.ClientUtils$)
java.nio.channels.ClosedChannelException
at kafka.network.BlockingChannel.send(BlockingChannel.scala:100)
at kafka.producer.SyncProducer.liftedTree1$1(SyncProducer.scala:73)
at kafka.producer.SyncProducer.kafka$producer$SyncProducer$$doSend(SyncProducer.scala:72)
at kafka.producer.SyncProducer.send(SyncProducer.scala:113)
at kafka.client.ClientUtils$.fetchTopicMetadata(ClientUtils.scala:58)
at kafka.client.ClientUtils$.fetchTopicMetadata(ClientUtils.scala:93)
at kafka.consumer.ConsumerFetcherManager
$LeaderFinderThread.doWork(ConsumerFetcherManager.scala:66)
at kafka.utils.ShutdownableThread.run(ShutdownableThread.scala:60)
[2016-03-04 03:33:55,615] INFO Disconnecting from 192-168-234-231:21005
(kafka.producer.SyncProducer)
```

The exception shows that the current Consumer cannot obtain metadata from the Kafka Broker 192-168-234-231 node and cannot connect to the correct Broker for obtaining messages.

6. Check the network conditions. If the network is normal, check whether mapping between the host and the IP address is configured.
   - Linux

     Run the **cat /etc/hosts** command.

     Figure 16-48 Example 1

     
   - Windows

     Open **C:\Windows\System32\drivers\etc\hosts**.

Figure 16-49 Example 2

```
# For example:
#
#      192.168.94.97     rhino.acme.com          # source server
#      192.168.63.10     x.acme.com              # x client host

# localhost name resolution is handled within DNS itself.
#       127.0.0.1       localhost
#       ::1             localhost
10.82.129.120 rms.huawei.com # modified by IrmTool at 2015-01-18 17:55:13
```

For details about the solution, see **Step 4**.

Solution

Step 1 The IP address for connecting to ZooKeeper is incorrectly configured.

Step 2 Change the IP address for connecting to ZooKeeper in the Consumer configuration and make it consistent with MRS configuration.

- Flume
  ```
  server.sources.Source02.type=org.apache.flume.source.kafka.KafkaSource
  server.sources.Source02.zookeeperConnect=192.168.234.231:2181/kafka
  server.sources.Source02.topic = test
  server.sources.Source02.groupId = test_01
  ```
- Spark
  ```
  val zkQuorum = "192.168.234.231:2181/kafka"
  ```
- Storm
  ```
  BrokerHosts brokerHosts = new ZKHosts("192.168.234.231:2181/kafka");
  ```
- Consumer API
  ```
  zookeeper.connect="192.168.234.231:2181/kafka"
  ```

Step 3 Rebalance is abnormal.

Multiple Consumers in the same consumer group are successively started and consume data of multiple partitions at the same time, load balancing is performed for Consumers when consumers are fewer than partitions.

The temporary node where the Consumer is stored on ZooKeeper determines read/write permission of which partition of which topic the Consumer has. The path is **/consumers/consumer-group-xxx/owners/topic-xxx/x**.

After the load balancing is triggered, the original Consumer will be recalculated and release occupied partitions, which takes a while. Therefore, new Consumers may fail to preempt the partitions.

Table 16-3 Parameters

Name	Function	Default Value
rebalance.max.retries	Maximum number of rebalance retries	4
rebalance.backoff.ms	Interval for each rebalance retry	2000

Name	Function	Default Value
zookeeper.session.timeout.ms	Maximum time allowed to create a session with ZooKeeper	15000

Set the preceding parameters to higher values. The following is for your reference:

```
zookeeper.session.timeout.ms = 45000
rebalance.max.retries = 10
rebalance.backoff.ms = 5000
```

Parameter setting must comply with the following rule:

rebalance.max.retries * rebalance.backoff.ms > zookeeper.session.timeout.ms

Step 4 The network is abnormal.

In the **hosts** file, mapping between the hostname and IP address is not configured. As a result, information cannot be obtained when using the hostname for access.

Step 5 Add the hostname to the **hosts** file and make it correspond to the IP address.

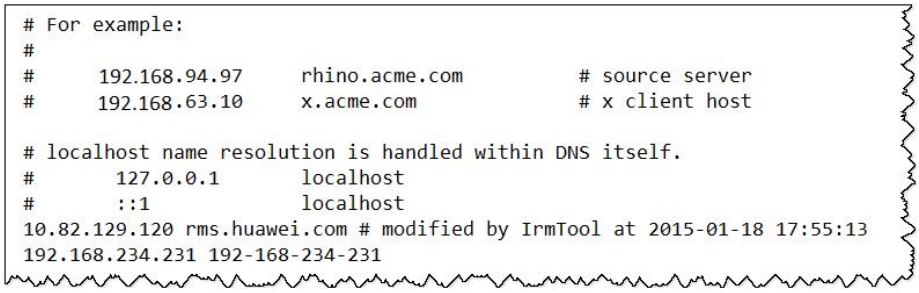
- Windows

  Figure 16-51 Example 4

----End

16.11.7 Consumer Fails to Consume Data and Remains in the Waiting State

Symptom

An MRS cluster is installed, and ZooKeeper and Kafka are installed in the cluster.

When the Consumer consumes data from Kafka, the client stays in the Waiting state.

Possible Causes

1. The Kafka service is abnormal.
2. The Consumer client adopts non-security access and access is disabled on the server.
3. The Consumer client adopts non-security access and ACL is set for Kafka topics.

Cause Analysis

The possible reasons why the Consumer fails to consume data from Kafka may be related to the Consumer or Kafka.

1. Check the Kafka service status:
   - MRS Manager: Log in to MRS Manager and choose **Services** > **Kafka**. Check the Kafka status. The status is **Good**, and the monitoring metrics are correctly displayed.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka**.

     Check the Kafka status. It is found that the status is good and the monitoring metrics are correctly displayed.
2. Check the Consumer client log. It is found that the information about the frequent connections and disconnections to the Broker node is printed, as shown in the following output.

   ```
   [root@10-10-144-2 client]# kafka-console-consumer.sh --topic test --zookeeper 10.5.144.2:2181/kafka
   --from-beginning

   [2017-03-07 09:22:00,658] INFO Fetching metadata from broker BrokerEndPoint(1,10.5.144.2,9092)
   with correlation id 26 for 1 topic(s) Set(test) (kafka.client.ClientUtils$)
   [2017-03-07 09:22:00,659] INFO Connected to 10.5.144.2:9092 for producing
   (kafka.producer.SyncProducer)
   [2017-03-07 09:22:00,659] INFO Disconnecting from 10.5.144.2:9092 (kafka.producer.SyncProducer)
   ```

   Consumer accesses Kafka using port 9092, which is a non-security port.
3. On Manager, check the current Kafka cluster configuration. It is found that the customized configuration **allow.everyone.if.no.acl.found**=**false** is not configured.
   - MRS Manager portal: Log in to MRS Manager and choose **Services** > **Kafka** > **Configuration**.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka** > **Configuration**.

4. If ACL is set to **false**, port 9092 cannot be used for access.
5. Check the Consumer client log. It is found that the information about the frequent connections and disconnections to the Broker node is printed, as shown in the following output.

```
[root@10-10-144-2 client]# kafka-console-consumer.sh --topic test_acl --zookeeper 10.5.144.2:2181/kafka --from-beginning

[2017-03-07 09:49:16,992] INFO Fetching metadata from broker BrokerEndPoint(2,10.5.144.3,9092) with correlation id 16 for 1 topic(s) Set(topic_acl) (kafka.client.ClientUtils$)
[2017-03-07 09:49:16,993] INFO Connected to 10.5.144.3:9092 for producing (kafka.producer.SyncProducer)
[2017-03-07 09:49:16,994] INFO Disconnecting from 10.5.144.3:9092 (kafka.producer.SyncProducer)
```

   The Consumer accesses Kafka using port 21005, which is a non-security port.
6. Run the client command to check the ACL permission of the topic.

```
[root@10-10-144-2 client]# kafka-acls.sh --authorizer-properties zookeeper.connect=10.5.144.2:2181/kafka --list --topic topic_acl
Current ACLs for resource `Topic:topic_acl`:
 User:test_user has Allow permission for operations: Describe from hosts: *
User:test_user has Allow permission for operations: Write from hosts: *
```

   If ACL is set for the topic, port 9092 cannot be used for access.
7. The following information is printed in the Consumer client log:

```
[root@10-10-144-2 client]# kafka-console-consumer.sh --topic topic_acl --bootstrap-server 10.5.144.2:21007 --consumer.config /opt/client/Kafka/kafka/config/consumer.properties --from-beginning --new-consumer

[2017-03-07 10:19:18,478] INFO Kafka version : 0.9.0.0 (org.apache.kafka.common.utils.AppInfoParser)
[2017-03-07 10:19:18,478] INFO Kafka commitId : unknown (org.apache.kafka.common.utils.AppInfoParser)
```

   The Consumer uses port 21007 to access Kafka.
8. Run the client command **klist** to query the current authenticated user.

```
[root@10-10-144-2 client]# klist
Ticket cache: FILE:/tmp/krb5cc_0
Default principal: test@HADOOP.COM

Valid starting     Expires            Service principal
01/25/17 11:06:48  01/26/17 11:06:45  krbtgt/HADOOP.COM@HADOOP.COM
```

   The **test** user is used in this example.
9. Run the client command to check the ACL permission of the topic.

```
[root@10-10-144-2 client]# kafka-acls.sh --authorizer-properties zookeeper.connect=10.5.144.2:24002/kafka --list --topic topic_acl
Current ACLs for resource `Topic:topic_acl`:
 User:test_user has Allow permission for operations: Describe from hosts: *
 User:test_user has Allow permission for operations: Write from hosts: *
 User:ttest_user has Allow permission for operations: Read from hosts: *
```

   If ACL is set for the topic, user **test** does not have the permission to perform the Consumer operation.

   For details about the solution, see **Step 2**.
10. Log in to Kafka Broker using SSH.

    Run the **cd /var/log/Bigdata/kafka/broker** command to go to the log directory.

    Check the **kafka-authorizer.log** file. It shows that the user does not belong to the **kafka** or **kafkaadmin** group.

```
2017-01-25 13:26:33,648 | INFO  | [kafka-request-handler-0] | The principal is test, belongs to Group : [hadoop, ficommon] | kafka.authorizer.logger (SimpleAclAuthorizer.scala:169)
2017-01-25 13:26:33,648 | WARN  | [kafka-request-handler-0] | The user is not belongs to kafka or kafkaadmin group, authorize failed! | kafka.authorizer.logger (SimpleAclAuthorizer.scala:170)
```

For details about the solution, see **Step 3**.

Solution

Step 1 Set **allow.everyone.if.no.acl.found** to **true** and restart the Kafka service.

Step 2 Use the account with permission for login.

Example:

kinit test_user

Alternatively, grant the user with related permission.

NOTICE

This operation must be performed by the Kafka administrator (belonging to the **kafkaadmin** group).

Example:

kafka-acls.sh --authorizer-properties zookeeper.connect=10.5.144.2:2181/kafka --topic topic_acl --consumer --add --allow-principal User:test --group test

```
[root@10-10-144-2 client]# kafka-acls.sh --authorizer-properties zookeeper.connect=8.5.144.2:2181/kafka --list --topic topic_acl
Current ACLs for resource `Topic:topic_acl`:
 User:test_user has Allow permission for operations: Describe from hosts: *
 User:test_user has Allow permission for operations: Write from hosts: *
  User:test has Allow permission for operations: Describe from hosts: *
  User:test has Allow permission for operations: Write from hosts: *
  User:test has Allow permission for operations: Read from hosts: *
```

Step 3 Add the user to the **kafka** or **kafkaadmin** group.

----End

16.11.8 Consumer Fails to Consume Data in a Newly Created Cluster, and the Message " GROUP_COORDINATOR_NOT_AVAILABLE" Is Displayed

Symptom

A Kafka cluster is created, and two Broker nodes are deployed. The Kafka client can be used for production but cannot be used for consumption. The Consumer fails to consume data, and the message "GROUP_COORDINATOR_NOT_AVAILABLE" is displayed. The key log is as follows:

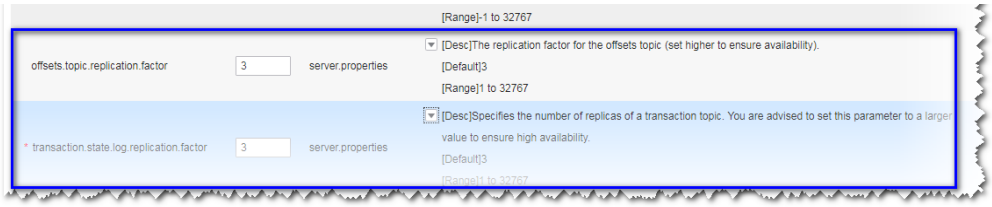
```
2018-05-12 10:58:42,561 | INFO | [kafka-request-handler-3] | [GroupCoordinator 2]: Preparing to restabilize group DemoConsumer with old generation 118 | kafka.coordinator.GroupCoordinator (Logging.scala:68)
2018-05-12 10:59:13,562 | INFO | [executor-Heartbeat] | [GroupCoordinator 2]: Preparing to restabilize group DemoConsumer with old generation 119 | kafka.coordinator.GroupCoordinator (Logging.scala:68)
```

Possible Causes

The **__consumer_offsets** cannot be created.

Cause Analysis

1. As indicated by the log, a large number of **_consumer_offset** creation operations failed.
2. The number of Brokers for the cluster is 2.
3. However, the number of replicas for the **_consumer_offset** topic is 3. Therefore, the creation fails.



Solution

Expand the cluster to at least three streaming core nodes or perform the following steps to modify service configuration parameters:

Step 1 Go to the service configuration page.

- MRS Manager: Log in to MRS Manager, choose **Services** > **Kafka** > **Service Configuration**, and select **All** from **Type**.
- FusionInsight Manager: Log in to FusionInsight Manager. Choose **Cluster** > **Services** > **Kafka**. Click **Configurations** and select **All Configurations**.

Step 2 Search for **offsets.topic.replication.factor** and **transaction.state.log.replication.factor** and change their values to **2**.

Step 3 Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the services.

----End

16.11.9 SparkStreaming Fails to Consume Kafka Messages, and the Message "Couldn't find leader offsets" Is Displayed

Symptom

When SparkStreaming is used to consume messages of a specified topic in Kafka, data cannot be obtained from Kafka. The following error message is displayed: Couldn't find leader offsets.

```
2018-05-30 12:01:17,816 | INFO  | [Driver] | Reconnect due to socket error: java.net.SocketTimeoutException | kafka.utils.Logging$class.info(Logging.scala:68)

```

Possible Causes

- The Kafka service is abnormal.
- The network is abnormal.
- The Kafka topic is abnormal.

Cause Analysis

Step 1 On Manager, check the status of the Kafka cluster. The status is **Good**, and the monitoring metrics are correctly displayed.

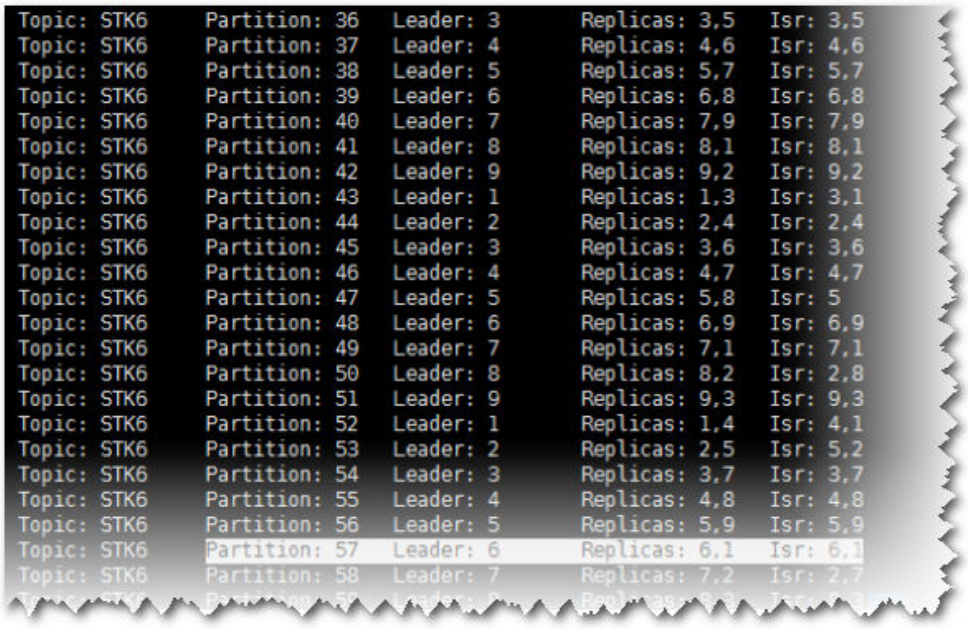
Step 2 View the error topic information in the SparkStreaming log.

Run the Kafka commands to obtain the topic assignment information and copy synchronization information, and check the return result.

kafka-topics.sh --describe --zookeeper <zk_host:port/chroot> --topic <topic name>

If information in the following figure is displayed, the topic is normal. All partitions have normal leader information.

Figure 16-52 Topic distribution information and copy synchronization information



Step 3 Check whether the network connection between the client and Kafka cluster is normal. If no, contact the network team to rectify the fault.

Step 4 Log in to Kafka Broker using SSH.

Run the **cd /var/log/Bigdata/kafka/broker** command to go to the log directory.

Check on **server.log** indicates that the error message is displayed in the log shown in the following figure.

```
2018-05-30 12:02:00,246 | ERROR | [kafka-network-thread-6-PLAINTEXT-3] | Processor got uncaught exception. | kafka.network.Processor (Logging.scala:103)
```

```
java.lang.OutOfMemoryError: Direct buffer memory
at java.nio.Bits.reserveMemory(Bits.java:694)
at java.nio.DirectByteBuffer.<init>(DirectByteBuffer.java:123)
at java.nio.ByteBuffer.allocateDirect(ByteBuffer.java:311)
at sun.nio.ch.Util.getTemporaryDirectBuffer(Util.java:241)
at sun.nio.ch.IOUtil.read(IOUtil.java:195)
at sun.nio.ch.SocketChannelImpl.read(SocketChannelImpl.java:380)
```

at
org.apache.kafka.common.network.PlaintextTransportLayer.read(PlaintextTransportLayer.java:110)

Step 5 On Manager, check the configuration of the current Kafka cluster.

- MRS Manager: Log in to MRS Manager and choose **Services** > **Kafka** > **Service Configuration**. Set **Type** to **All**. The value of **-XX:MaxDirectMemorySize** in **KAFKA_JVM_PERFORMANCE_OPTS** is **1G**.
- FusionInsight Manager: Log in to FusionInsight Manager. Choose **Cluster** > **Services** > **Kafka** > **Configurations** > **All Configurations**. The value of **-XX:MaxDirectMemorySize** in **KAFKA_JVM_PERFORMANCE_OPTS** is **1G**.

Step 6 If the direct memory is too small, an error is reported. Once the direct memory overflows, the node cannot process new requests. As a result, other nodes or clients fail to access the node due to timeout.

----End

Solution

Step 1 Log in to FusionInsight Manager and go to the Kafka configuration page.

- MRS Manager portal: Log in to MRS Manager and choose **Services** > **Kafka** > **Configuration**.
- FusionInsight Manager: Log in to FusionInsight Manager. Choose Cluster > **Services** > **Kafka** > **Configurations**.

Step 2 Set **Type** to **All**, and search for and change the value of **KAFKA_JVM_PERFORMANCE_OPTS**.

Step 3 Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the services.

----End

16.11.10 Consumer Fails to Consume Data and the Message " SchemaException: Error reading field 'brokers'" Is Displayed

Symptom

When a Consumer consumes messages of a specified topic in Kafka, the Consumer cannot obtain data from Kafka. The following error message is displayed: org.apache.kafka.common.protocol.types.SchemaException: Error reading field 'brokers': Error reading field 'host': Error reading string of length 28271, only 593 bytes available.

```
Exception in thread "Thread-0" org.apache.kafka.common.protocol.types.SchemaException: Error reading field 'brokers': Error reading field 'host': Error reading string of length 28271, only 593 bytes available
at org.apache.kafka.common.protocol.types.Schema.read(Schema.java:73)
```

at org.apache.kafka.clients.consumer.KafkaConsumer.poll(KafkaConsumer.java:937)
at KafkaNew.Consumer$ConsumerThread.run(Consumer.java:40)
```

Possible Causes

The JAR versions of the client and server are inconsistent.

Solution

Modify the Kafka JAR package in the Consumer application to ensure that it is the same as that on the server.

16.11.11 Checking Whether Data Consumed by a Customer Is Lost

Symptom

A Customer saves the consumed data to the database and finds that the data is inconsistent with the production data. Therefore, it is suspected that some of Kafka's consumed data is lost.

Possible Causes

- The customer code is incorrect.
- An exception occurs when Kafka production data is written.
- The Kafka consumption data is abnormal.

Solution

Check Kafka.

Step 1 Observe the changes of the written and consumed offset through **consumer-groups.sh**. (Produce a certain number of messages, and consume these messages on the client to observe the changes of the offset.)

```
2019-04-08 14:23:25,341] WARN [Principal=null]: TGT renewal thread has been interrupted and will exit. (org.apache.kafka.common.security.kerberos.KerberosLogin)
root@SmiBigdataCN3 kafka]# ./bin/kafka-consumer-groups.sh --describe --bootstrap-server 10.3.1.49:21007 --new-consumer --group yhdsbsj --command-config config/consum
properties
ote: This will only show information about consumers that use the Java consumer API (non-ZooKeeper-based consumers).

OPIC                          PARTITION  CURRENT-OFFSET  LOG-END-OFFSET  LAG        CONSUMER-ID                                   HOST
ENT-ID
LWSJDSB                       0          290078541       290078541       0          consumer-1-7bb54edf-9cbb-4d58-989b-1b4e6607217e   /10.2.1.180
sumer-1
LWSJDSB                       1          281608671       281608671       0          consumer-1-7bb54edf-9cbb-4d58-989b-1b4e6607217e   /10.2.1.180
sumer-1
LWSJDSB                       2          283880519       283880519       0          consumer-1-7bb54edf-9cbb-4d58-989b-1b4e6607217e   /10.2.1.180
sumer-1
```

Step 2 Create a consumption group, use the client to consume messages, and view the consumed messages.

new-consumer:

kafka-console-consumer.sh --topic <topic name> --bootstrap-server <IP1:PORT, IP2:PORT,...> --new-consumer --consumer.config <config file>

----End

Check the customer code.

Step 1 Check whether an error is reported when the offset is submitted on the client.

Step 2 If no error is reported, add a printing message to the API that is consumed, and print only the key to view the lost data.

----End

16.11.12 Kafka Broker Reports Abnormal Processes and the Log Shows "IllegalArgumentException"

Symptom

The Process Fault alarm is reported on Manager. Check whether the faulty process is Kafka Broker.

Possible Causes

Broker configuration is abnormal.

Cause Analysis

1. On Manager, obtain the host information on the alarm page.
2. Log in to Kafka Broker using SSH. Run the **cd /var/log/Bigdata/kafka/broker** command to go to the log directory.

   Check the **server.log** file. It is found that the "IllegalArgumentException" exception is thrown in the following log stating "java.lang.IllegalArgumentException: requirement failed: replica.fetch.max.bytes should be equal or greater than message.max.bytes."

   ```
   2017-01-25 09:09:14,930 | FATAL | [main] |  | kafka.Kafka$ (Logging.scala:113)
   java.lang.IllegalArgumentException: requirement failed: replica.fetch.max.bytes should be equal or greater than message.max.bytes
       at scala.Predef$.require(Predef.scala:233)
       at kafka.server.KafkaConfig.validateValues(KafkaConfig.scala:959)
       at kafka.server.KafkaConfig.<init>(KafkaConfig.scala:944)
       at kafka.server.KafkaConfig$.fromProps(KafkaConfig.scala:701)
       at kafka.server.KafkaConfig$.fromProps(KafkaConfig.scala:698)
       at kafka.server.KafkaServerStartable$.fromProps(KafkaServerStartable.scala:28)
       at kafka.Kafka$.main(Kafka.scala:60)
       at kafka.Kafka.main(Kafka.scala)
   ```

   Kafka requires that **replica.fetch.max.bytes** be greater than or equal to **message.max.bytes**.
3. On the Kafka configuration page, select **All Configurations**. All Kafka configurations are displayed. Search for **message.max.bytes** and

replica.fetch.max.bytes. It is found that the value of **replica.fetch.max.bytes** is less than that of **message.max.bytes**.

Solution

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Kafka** > **Configurations** > **All Configurations**.

Step 2 Search for and modify the **replica.fetch.max.bytes** parameter to ensure that its value is greater than or equal to that of **message.max.bytes**. In this way, replicas of partitions on different brokers can be synchronized to all messages.

Step 3 Save the configuration and check whether there is any service whose configuration has expired in the cluster. If yes, restart the corresponding service or role instance for the configuration to take effect.

Step 4 Modify **fetch.message.max.bytes** in the Consumer service application to ensure that the value of **fetch.message.max.bytes** is greater than or equal to that of **message.max.bytes**.

----End

16.11.13 Error "AdminOperationException" Is Displayed When a Kafka Topic Is Deleted

Symptom

When running the following command on the Kafka client to set the ACL for a topic, it is found that the ACL cannot be set.

```
kafka-topics.sh --delete --topic test4 --zookeeper 10.5.144.2:2181/kafka
```

The error message "ERROR kafka.admin.AdminOperationException: Error while deleting topic test4" is displayed.

Details are as follows:

```
Error while executing topic command : Error while deleting topic test4
[2017-01-25 14:00:20,750] ERROR kafka.admin.AdminOperationException: Error while deleting topic test4
at kafka.admin.TopicCommand$$anonfun$deleteTopic$1.apply(TopicCommand.scala:177)
at kafka.admin.TopicCommand$$anonfun$deleteTopic$1.apply(TopicCommand.scala:162)
at scala.collection.mutable.ResizableArray$class.foreach(ResizableArray.scala:59)
at scala.collection.mutable.ArrayBuffer.foreach(ArrayBuffer.scala:47)
at kafka.admin.TopicCommand$.deleteTopic(TopicCommand.scala:162)
at kafka.admin.TopicCommand$.main(TopicCommand.scala:68)
at kafka.admin.TopicCommand.main(TopicCommand.scala)
 (kafka.admin.TopicCommand$)
```

Possible Causes

The user does not belong to the **kafkaadmin** group. Kafka provides a secure access interface. Only users in the **kafkaadmin** group can delete topics.

Cause Analysis

1. After the client command is run, the "AdminOperationException" exception is reported.

2. Run the client command **klist** to query the current authenticated user.

```
[root@10-10-144-2 client]# klist
Ticket cache: FILE:/tmp/krb5cc_0
Default principal: test@HADOOP.COM

Valid starting     Expires            Service principal
01/25/17 11:06:48  01/26/17 11:06:45  krbtgt/HADOOP.COM@HADOOP.COM
```

   The **test** user is used in this example.

3. Run the **id** command to query the user group information.

```
[root@10-10-144-2 client]# id test
uid=20032(test) gid=10001(hadoop) groups=10001(hadoop),9998(ficommon),10003(kafka)
```

Solution

MRS Manager:

Step 1 Log in to MRS Manager.

Step 2 Choose **System** > **Manage User**.

Step 3 In the **Operation** column of the user, click **Modify**.

Step 4 Add the user to the **kafkaadmin** group. Click **OK**.

Step 5 Run the **id** command to query the user group information.

```
[root@10-10-144-2 client]# id test
uid=20032(test) gid=10001(hadoop)
groups=10001(hadoop),9998(ficommon),10002(kafkaadmin),10003(kafka)
```

----End

FusionInsight Manager:

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **Permission** > **User**.

Step 3 Locate the row that contains the target user, and click **Modify**.

Step 4 Add the user to the **kafkaadmin** group. Click **OK**.

Step 5 Run the **id** command to query the user group information.

```
[root@10-10-144-2 client]# id test
uid=20032(test) gid=10001(hadoop)
groups=10001(hadoop),9998(ficommon),10002(kafkaadmin),10003(kafka)
```

----End

16.11.14 When a Kafka Topic Fails to Be Created, "NoAuthException" Is Displayed

Symptom

When running the following command on the Kafka client to create topics, it is found that the topics cannot be created.

```
kafka-topics.sh --create --zookeeper 192.168.234.231:2181/kafka --replication-factor 1 --partitions 2 --topic test
```

Error messages "NoAuthException" and "KeeperErrorCode = NoAuth for /config/topics" are displayed.

Details are as follows:

```
Error while executing topic command org.apache.zookeeper.KeeperException$NoAuthException:
KeeperErrorCode = NoAuth for /config/topics
org.I0Itec.zkclient.exception.ZkException: org.apache.zookeeper.KeeperException$NoAuthException:
KeeperErrorCode = NoAuth for /config/topics
 at org.I0Itec.zkclient.exception.ZkException.create(ZkException.java:68)
 at org.I0Itec.zkclient.ZkClient.retryUntilConnected(ZkClient.java:685)
 at org.I0Itec.zkclient.ZkClient.create(ZkClient.java:304)
 at org.I0Itec.zkclient.ZkClient.createPersistent(ZkClient.java:213)
 at kafka.utils.ZkUtils$.createParentPath(ZkUtils.scala:215)
 at kafka.utils.ZkUtils$.updatePersistentPath(ZkUtils.scala:338)
 at kafka.admin.AdminUtils$.writeTopicConfig(AdminUtils.scala:247)
```

Possible Causes

The user does not belong to the **kafkaadmin** group. Kafka provides a secure access interface. Only users in the **kafkaadmin** group can delete topics.

Cause Analysis

1. After the client command is run, the "NoAuthException" exception is reported.

   ```
   Error while executing topic command org.apache.zookeeper.KeeperException$NoAuthException:
   KeeperErrorCode = NoAuth for /config/topics
   org.I0Itec.zkclient.exception.ZkException: org.apache.zookeeper.KeeperException$NoAuthException:
   KeeperErrorCode = NoAuth for /config/topics
    at org.I0Itec.zkclient.exception.ZkException.create(ZkException.java:68)
    at org.I0Itec.zkclient.ZkClient.retryUntilConnected(ZkClient.java:685)
    at org.I0Itec.zkclient.ZkClient.create(ZkClient.java:304)
    at org.I0Itec.zkclient.ZkClient.createPersistent(ZkClient.java:213)
    at kafka.utils.ZkUtils$.createParentPath(ZkUtils.scala:215)
    at kafka.utils.ZkUtils$.updatePersistentPath(ZkUtils.scala:338)
    at kafka.admin.AdminUtils$.writeTopicConfig(AdminUtils.scala:247)
   ```

2. Run the client command **klist** to query the current authenticated user.

   ```
   [root@10-10-144-2 client]# klist
   Ticket cache: FILE:/tmp/krb5cc_0
   Default principal: test@HADOOP.COM

   Valid starting     Expires            Service principal
   01/25/17 11:06:48  01/26/17 11:06:45  krbtgt/HADOOP.COM@HADOOP.COM
   ```

   The **test** user is used in this example.

3. Run the **id** command to query the user group information.

   ```
   [root@10-10-144-2 client]# id test
   uid=20032(test) gid=10001(hadoop) groups=10001(hadoop),9998(ficommon),10003(kafka)
   ```

Solution

MRS Manager:

Step 1 Log in to MRS Manager.

Step 2 Choose **System** > **Manage User**.

Step 3 In the **Operation** column of the user, click **Modify**.

Step 4 Add the user to the **kafkaadmin** group.

Step 5 Run the **id** command to query the user group information.

```
[root@10-10-144-2 client]# id test
uid=20032(test) gid=10001(hadoop)
groups=10001(hadoop),9998(ficommon),10002(kafkaadmin),10003(kafka)
```

----End

FusionInsight Manager:

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **Permission** > **User**.

Step 3 Locate the row that contains the target user, and click **Modify**.

Step 4 Add the user to the **kafkaadmin** group. Click **OK**.

Step 5 Run the **id** command to query the user group information.

```
[root@10-10-144-2 client]# id test
uid=20032(test) gid=10001(hadoop)
groups=10001(hadoop),9998(ficommon),10002(kafkaadmin),10003(kafka)
```

----End

16.11.15 Failed to Set an ACL for a Kafka Topic, and "NoAuthException" Is Displayed

Symptom

When running the following command on the Kafka client to set the ACL for a topic, it is found that the topic ACL cannot be set.

```
kafka-acls.sh --authorizer-properties zookeeper.connect=10.5.144.2:2181/kafka  --topic topic_acl --producer
--add --allow-principal User:test_acl
```

The error message "NoAuthException: KeeperErrorCode = NoAuth for /kafka-acl-changes/acl_changes_0000000002" is displayed.

Details are as follows:

```
Error while executing ACL command: org.apache.zookeeper.KeeperException$NoAuthException:

```

Possible Causes

The user does not belong to the **kafkaadmin** group. Kafka provides a secure access interface. Only users in the **kafkaadmin** group can perform the setting operation.

Cause Analysis

1. After the client command is run, the "NoAuthException" exception is reported.
2. Run the client command **klist** to query the current authenticated user.

   ```
   [root@10-10-144-2 client]# klist
   Ticket cache: FILE:/tmp/krb5cc_0
   Default principal: test@HADOOP.COM

   Valid starting     Expires            Service principal
   01/25/17 11:06:48  01/26/17 11:06:45  krbtgt/HADOOP.COM@HADOOP.COM
   ```

   The **test** user is used in this example.
3. Run the **id** command to query the user group information.

   ```
   [root@10-10-144-2 client]# id test
   uid=20032(test) gid=10001(hadoop) groups=10001(hadoop),9998(ficommon),10003(kafka)
   ```

Solution

MRS Manager:

Step 1 Log in to MRS Manager.

Step 2 Choose **System** > **Manage User**.

Step 3 In the **Operation** column of the user, click **Modify**.

Step 4 Add the user to the **kafkaadmin** group.

Step 5 Run the **id** command to query the user group information.

```
[root@host1 client]# id test
uid=20032(test) gid=10001(hadoop)
groups=10001(hadoop),9998(ficommon),10002(kafkaadmin),10003(kafka)
```

----End

FusionInsight Manager:

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **Permission** > **User**.

Step 3 Locate the row that contains the target user, and click **Modify**.

Step 4 Add the user to the **kafkaadmin** group. Click **OK**.

Step 5 Run the **id** command to query the user group information.

```
[root@10-10-144-2 client]# id test
uid=20032(test) gid=10001(hadoop)
groups=10001(hadoop),9998(ficommon),10002(kafkaadmin),10003(kafka)
```

----End

16.11.16 When a Kafka Topic Fails to Be Created, "replication factor larger than available brokers" Is Displayed

Symptom

When running the following command on the Kafka client to create topics, it is found that the topics cannot be created.

```
kafka-topics.sh --create  --replication-factor 2 --partitions 2 --topic test --zookeeper
192.168.234.231:2181
```

The error message "replication factor larger than available brokers" is displayed.

See the following:

```
Error while executing topic command : replication factor: 2 larger than available brokers: 0
[2017-09-17 16:44:12,396] ERROR kafka.admin.AdminOperationException: replication factor: 2 larger than
available brokers: 0
    at kafka.admin.AdminUtils$.assignReplicasToBrokers(AdminUtils.scala:117)
    at kafka.admin.AdminUtils$.createTopic(AdminUtils.scala:403)
    at kafka.admin.TopicCommand$.createTopic(TopicCommand.scala:110)
    at kafka.admin.TopicCommand$.main(TopicCommand.scala:61)
    at kafka.admin.TopicCommand.main(TopicCommand.scala)
 (kafka.admin.TopicCommand$)
```

Possible Causes

- The Kafka service is not running.
- The available Broker of the Kafka service is smaller than the configured **replication-factor**.
- The ZooKeeper address parameter in the client command is incorrectly configured.

Cause Analysis

1. After the client command is run, "replication factor larger than available brokers" is reported.

   ```
   Error while executing topic command : replication factor: 2 larger than available brokers: 0
   [2017-09-17 16:44:12,396] ERROR kafka.admin.AdminOperationException: replication factor: 2 larger
   than available brokers: 0
       at kafka.admin.AdminUtils$.assignReplicasToBrokers(AdminUtils.scala:117)
       at kafka.admin.AdminUtils$.createTopic(AdminUtils.scala:403)
       at kafka.admin.TopicCommand$.createTopic(TopicCommand.scala:110)
       at kafka.admin.TopicCommand$.main(TopicCommand.scala:61)
       at kafka.admin.TopicCommand.main(TopicCommand.scala)
    (kafka.admin.TopicCommand$)
   ```

2. Check whether the Kafka service is in the normal state on Manager and whether the current available Broker is smaller than the configured **replication-factor**.
3. Check whether the ZooKeeper address in the client command is correct. Check the Kafka information stored in ZooKeeper. The path (Znode) should be suffixed with **/kafka**. It is found that **/kafka** is missing in the configuration.

```
[root@10-10-144-2 client]#
kafka-topics.sh --create  --replication-factor 2 --partitions 2 --topic test --zookeeper
192.168.234.231:2181
```

Solution

Step 1 Ensure that the Kafka service is in the normal state and the available Broker is not less than the configured **replication-factor**.

Step 2 Add **/kafka** to the ZooKeeper address in the command.

```
[root@10-10-144-2 client]#
kafka-topics.sh --create  --replication-factor 1 --partitions 2 --topic test --zookeeper
192.168.234.231:2181/kafka
```

----End

16.11.17 Consumer Repeatedly Consumes Data

Symptom

When the data volume is large, rebalance occurs frequently, causing repeated consumption. The key logs are as follows:

```

```

In the logs, "Preparing to restabilize group DemoConsumer with old generation" indicates that rebalance occurs.

Possible Causes

The parameter settings are improper.

Cause Analysis

Cause: Due to improper parameter settings, the data processing time is too long when the data volume is large. Balance frequently occurs, and the offset cannot be submitted normally. As a result, the data is repeatedly consumed.

Principle: The offset is submitted only after the poll data is processed. If the processing duration after the poll data is processed exceeds the duration specified by **session.timeout.ms**, the rebalance occurs. As a result, the consumption fails and the offset of the consumed data cannot be submitted. Therefore, the data is consumed at the old offset next time. As a result, the data is repeatedly consumed.

Solution

Adjust the following service parameters on Manager:

request.timeout.ms=100000

session.timeout.ms=90000

max.poll.records=50

heartbeat.interval.ms=3000

Among the preceding parameters:

The value of **request.timeout.ms** is 10s greater than that of **session.timeout.ms**.

The value of **session.timeout.ms** must be within the values of **group.min.session.timeout.ms** and **group.max.session.timeout.ms** on the server.

Set the parameters as required. The **max.poll.records** parameter specifies the number of records for each poll. The purpose is to ensure that the processing time of poll data does not exceed the value of **session.timeout.ms**.

Related Information

- The post-poll data processing must be efficient and do not block the next poll.
- The poll method and data processing suggestion are processed asynchronously.

16.11.18 Leader for the Created Kafka Topic Partition Is Displayed as none

Symptom

When a user creates a topic using the Kafka client command, the leader for the created topic partition is displayed as **none**.

```
[root@10-10-144-2 client]#
kafka-topics.sh --create  --replication-factor 1 --partitions 2 --topic test --zookeeper 10.6.92.36:2181/
kafka

Created topic "test".
```

```
[root@10-10-144-2 client]#
kafka-topics.sh --describe --zookeeper 10.6.92.36:2181/kafka

Topic:test      PartitionCount:2        ReplicationFactor:2     Configs:
        Topic: test     Partition: 0    Leader: none        Replicas: 2,3   Isr:
        Topic: test     Partition: 1    Leader: none        Replicas: 3,1   Isr:
```

Possible Causes

- The Kafka service is not running.
- The user group information cannot be found.

Cause Analysis

1. Check the Kafka service status and monitoring metrics.
   - MRS Manager: Log in to MRS Manager and choose **Services** > **Kafka**. Check the Kafka status. The status is **Good**, and the monitoring metrics are correctly displayed.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka**. Check the Kafka status. The status is **Good**, and the monitoring metrics are correctly displayed.
2. Obtain the Controller node information on the Kafka overview page.
3. Log in to the node where the Controller resides, and run the **cd /var/log/Bigdata/kafka/broker** command to go to the node log directory. The **state-change.log** contains "NoAuthException", which indicates that the ZooKeeper permission is incorrect.

   ```
   2018-05-31 09:20:42,436 | ERROR | [ZkClient-
   EventThread-34-10.6.92.36:24002,10.6.92.37:24002,10.6.92.38:24002/kafka] | Controller 4 epoch 6
   initiated state change for partition [test,1] from NewPartition to OnlinePartition failed |
   state.change.logger (Logging.scala:103)

    org.I0Itec.zkclient.exception.ZkException: org.apache.zookeeper.KeeperException$NoAuthException:
   KeeperErrorCode = NoAuth for /brokers/topics/test/partitions
    at org.I0Itec.zkclient.exception.ZkException.create(ZkException.java:68)
    at org.I0Itec.zkclient.ZkClient.retryUntilConnected(ZkClient.java:1000)

user=10.6.92.39,kafka/hadoop.hadoop.com@HADOOP.COM,kafka/
hadoop.hadoop.com@HADOOP.COM    ip=10.6.92.39    operation=create znode
target=ZooKeeperServer    znode=/kafka/brokers/topics/test/partitions    result=failure
```

5. Run the **id -Gn kafka** command on each ZooKeeper instance node. It is found that user group information cannot be queried on a node.

   ```
   [root @bdpsit3ap03 ~]# id -Gn kafka
   id:  kafka: No such user
   [root @bdpsit3ap03 ~]#
   ```

6. In an MRS cluster, user management is provided by the LDAP service and depends on the SSSD (Red Hat) and NSCD (SUSE) services of OSs. The process from creating a user to synchronizing the user to the SSSD service takes some time. If the user does not take effect or the SSSD version has bugs, the user may be invalid on the ZooKeeper node in some cases, which causes topic creation failures.

Solution

Step 1 Restart the SSD/NSCD service.

- RedHat

  ```
  service sssd restart
  ```

- SUSE

  ```
  sevice nscd restart
  ```

Step 2 After restarting related services, run the **id username** command on the active ResourceManager node to check whether the user information is valid.

----End

16.11.19 Safety Instructions on Using Kafka

Brief Introduction to API for Kafka

- New Producer API

  Indicates the API defined in org.apache.kafka.clients.producer.KafkaProducer. When kafka-console-producer.sh is used, the API is used by default.

- Old Producer API

  Indicates the API defined in kafka.producer.Producer. When kafka-console-producer.sh is used, the API is invoked to add --old-producer.

- New Consumer API

  Indicates the API defined in org.apache.kafka.clients.consumer.KafkaConsumer. When kafka-console-consumer.sh is used, the API is invoked to add --new-consumer.

- Old Consumer API

  Indicates the API defined in kafka.consumer.ConsumerConnector. When **kafka-console-consumer.sh** is used, the API is used by default.

NOTE

New Producer API and new Consumer API are called new API in general in the document.

Protocol Description for Accessing Kafka

The protocols used to access Kafka are as follows: PLAINTEXT, SSL, SASL_PLAINTEXT, and SASL_SSL.

When Kafka service is started, the listeners using the PLAINTEXT and SASL_PLAINTEXT protocols are started. You can set **ssl.mode.enable** to **true** in Kafka service configuration to start listeners using SSL and SASL_SSL protocols.

The following table describes the four protocols:

Protocol Type	Description	Supported API	Default Port
PLAINTEXT	Supports plaintext access without authentication.	New and old APIs	9092
SASL_PLAINTEXT	Supports plaintext access with Kerberos authentication.	New API	21007
SSL	Supports SSL-encrypted access without authentication.	New API	9093
SASL_SSL	Supports SSL-encrypted access with Kerberos authentication.	New API	21009

ACL Settings for Topic

Kafka supports secure access. Therefore, users can set the ACL for topics to control that different users access different topics. To view and set the permission information about a topic, run the kafka-acls.sh script on the Linux client.

- Scenarios

  Assign Kafka users with specific permissions for related topics based on service requirements.

  The following table describes default Kafka user groups.

User Group	Description
kafkaadmin	Kafka administrator group. Users added to this group have the permissions to create, delete, authorize, as well as read from and write data to all topics.
kafkasuperuser	Users added to this group have permissions to read data from and write data to all topics.

User Group	Description
kafka	Kafka common user group. If users in this group want to read data from and write data to a specific topic, the users in the kafkaadmin group must grant permissions to users in this group.

- Prerequisites
  a. The system administrator has understood service requirements and prepared a Kafka administrator (belonging to the kafkaadmin group).
  b. The Kafka client has been installed.
- Procedure
  a. Log in to the node where the Kafka client is installed as the client installation user.
  b. Switch to the Kafka client installation directory, for example, **/opt/kafkaclient**.

     cd /opt/kafkaclient
  c. Run the following command to configure environment variables:

     source bigdata_env
  d. Run the following command to perform user authentication (skip this step for a cluster in common mode):

     kinit *Component service user*
  e. Run the following command to switch to the Kafka client installation directory:

     cd Kafka/kafka/bin
  f. The following describes the commands commonly used for user authorization when **kafka-acl.sh** is used:

     - View the permission control list of a topic:

       ./kafka-acls.sh --authorizer-properties zookeeper.connect=<ZooKeeper cluster service IP:2181/kafka > --list --topic <Topic name>

     - Add the Producer permission for a user:

       ./kafka-acls.sh --authorizer-properties zookeeper.connect=<ZooKeeper cluster service IP:2181/kafka > --add --allow-principal User:<username> --producer --topic <Topic name>

     - Remove the Producer permission from a user:

       ./kafka-acls.sh --authorizer-properties zookeeper.connect=<ZooKeeper cluster service IP:2181/kafka > --remove --allow-principal User:<username> --producer --topic <Topic name>

- Add the Consumer permission for a user:

  ./kafka-acls.sh --authorizer-properties zookeeper.connect=<ZooKeeper cluster service IP:2181/kafka > --add --allow-principal User:<username> --consumer --topic <Topic name> --group <consumer group name>

- Remove the Consumer permission from a user:

  ./kafka-acls.sh --authorizer-properties zookeeper.connect=<ZooKeeper cluster service IP:2181/kafka > --remove --allow-principal User:<username> --consumer --topic <Topic name> --group <consumer group name>

Use of New and Old Kafka APIs in Different Scenarios

- Scenario 1: accessing the topic with an ACL

Used API	User Group	Client Parameter	Server Parameter	Access Port
New API	Users need to meet one of the following conditions: • In the administrator group • In the **kafkaadmin** group • In the **kafkasuperuser** group • In the **kafka** group and be authorized	security.protocol=SASL_PLAINTEXT sasl.kerberos.service.name = kafka	-	sasl.port (The default number is 21007.)
		security.protocol=SASL_SSL sasl.kerberos.service.name = kafka	Set ssl.mode.enable to true.	sasl-ssl.port (The default port number is 21009.)
Old API	N/A	N/A	N/A	N/A

- Scenario 2: accessing the topic without an ACL

Used API	User Group	Client Parameter	Server Parameter	Access Port
New API	Users need to meet one of the following conditions: • In the administrator group • In the **kafkaadmin** group • In the **kafkasuperuser** group	security.protocol=SASL_PLAINTEXT sasl.kerberos.service.name = kafka	-	sasl.port (The default number is 21007.)
	Users are in the **kafka** group.		Set **allow.everyone.if.no.acl.found** to **true**.	sasl.port (The default number is 21007.)
	Users need to meet one of the following conditions: • In the administrator group • In the **kafkaadmin** group • In the **kafkasuperuser** group	security.protocol=SASL_SSLsasl.kerberos.service.name = kafka	Set **ssl-enable** to **true**.	sasl-ssl.port (The default port number is 21009.)
	Users are in the **kafka** group.		Set **allow.everyone.if.no.acl.found** to **true**. Set **ssl-enable** to **true**.	sasl-ssl.port (The default port number is 21009.)

Used API	User Group	Client Parameter	Server Parameter	Access Port
	-	security.protocol=PLAINTEXT	Set **allow.everyone.if.no.acl.found** to **true**.	port (The default number is 21005.)
	-	security.protocol=SSL	Set **allow.everyone.if.no.acl.found** to **true**. Set **ssl-enable** to **true**.	ssl.port (The default number is 21008.)
Old Producer	-	-	Set **allow.everyone.if.no.acl.found** to **true**.	port (The default number is 21005.)
Old Consumer	-	-	Set **allow.everyone.if.no.acl.found** to **true**.	ZooKeeper service port: clientPort (The default number is 24002.)

16.11.20 Obtaining Kafka Consumer Offset Information

Symptom

How do I obtain Kafka Consumer offset information when using Kafka Consumer to consume data?

Kafka APIs

- New Producer API

  Indicates the API defined in **org.apache.kafka.clients.producer.KafkaProducer**. When **kafka-console-producer.sh** is used, the API is used by default.

- Old Producer API

  Indicates the API defined in **kafka.producer.Producer**. When **kafka-console-producer.sh** is used, the API is invoked to add **--old-producer**.

- New Consumer API

  Indicates the API defined in **org.apache.kafka.clients.consumer.KafkaConsumer**. When **kafka-console-consumer.sh** is used, the API is invoked to add **--new-consumer**.

- Old Consumer API

Indicates the API defined in **kafka.consumer.ConsumerConnector**. When **kafka-console-consumer.sh** is used, the API is used by default.

NOTE

New Producer API and new Consumer API are called new API in general in the document.

Procedure

Old Consumer API

- Prerequisites
  a. The system administrator has understood service requirements and prepared a Kafka administrator (belonging to the kafkaadmin group).
  b. The Kafka client has been installed.
- Procedure
  a. Log in to the node where the Kafka client is installed as the client installation user.
  b. Switch to the Kafka client installation directory, for example, **/opt/kafkaclient**.

     cd /opt/kafkaclient
  c. Run the following command to configure environment variables:

     source bigdata_env
  d. Run the following command to perform user authentication (skip this step for a cluster in common mode):

     kinit *Component service user*
  e. Run the following command to switch to the Kafka client installation directory:

     cd Kafka/kafka/bin
  f. Run the following command to obtain Consumer offset metric information:

     ```
     bin/kafka-consumer-groups.sh --zookeeper <zookeeper_host:port>/kafka --list
     ```

     ```
     bin/kafka-consumer-groups.sh --zookeeper <zookeeper_host:port>/kafka --describe --group test-consumer-group
     ```

     Example:

     ```
     kafka-consumer-groups.sh --zookeeper 192.168.100.100:2181/kafka --list
     kafka-consumer-groups.sh --zookeeper 192.168.100.100:2181/kafka --describe --group test-consumer-group
     ```

New Consumer API

- Prerequisites
  a. The system administrator has understood service requirements and prepared a Kafka administrator (belonging to the kafkaadmin group).
  b. The Kafka client has been installed.
- Procedure
  a. Log in to the node where the Kafka client is installed as the client installation user.

b. Switch to the Kafka client installation directory, for example, **/opt/client**.

cd /opt/client

c. Run the following command to configure environment variables:

source bigdata_env

d. Run the following command to perform user authentication (skip this step for a cluster in common mode):

kinit *Component service user*

e. Run the following command to switch to the Kafka client installation directory:

cd Kafka/kafka/bin

f. Run the following command to obtain Consumer offset metric information:

kafka-consumer-groups.sh --bootstrap-server <broker_host:port> --describe --group my-group

Example:

kafka-consumer-groups.sh --bootstrap-server 192.168.100.100:9092 --describe --group my-group

16.11.21 Adding or Deleting Configurations for a Topic

Symptom

Configure or modify a specific topic when using Kafka.

Parameters that can be modified at the topic level:

```
cleanup.policy
compression.type
delete.retention.ms
file.delete.delay.ms
flush.messages
flush.ms
index.interval.bytes
max.message.bytes
min.cleanable.dirty.ratio
min.insync.replicas
preallocate
retention.bytes
retention.ms
segment.bytes
segment.index.bytes
segment.jitter.ms
segment.ms
unclean.leader.election.enable
```

Procedure

- Prerequisites

  The Kafka client has been installed.

- Procedure

  a. Log in to the node where the Kafka client is installed as the client installation user.

  b. Switch to the Kafka client installation directory, for example, **/opt/client**.

cd /opt/client

c. Run the following command to configure environment variables:

source bigdata_env

d. Run the following command to perform user authentication (skip this step for a cluster in common mode):

kinit *Component service user*

e. Run the following command to switch to the Kafka client installation directory:

cd Kafka/kafka/bin

f. Run the following commands to configure and delete a topic:

kafka-topics.sh --alter --topic <topic_name> --zookeeper <zookeeper_host:port>/kafka --config <name=value>

kafka-topics.sh --alter --topic <topic_name> --zookeeper <zookeeper_host:port>/kafka --delete-config <name>

Example:

kafka-topics.sh --alter --topic test1 --zookeeper 192.168.100.100:2181/kafka --config retention.ms=86400000

kafka-topics.sh --alter --topic test1 --zookeeper 192.168.100.100:2181/kafka --delete-config retention.ms

g. Run the following command to query topic information:

kafka-topics.sh --describe -topic <topic_name> --zookeeper <zookeeper_host:port>/kafka

16.11.22 Reading the Content of the __consumer_offsets Internal Topic

Issue

How does Kafka save the offset of a Consumer to the **__consumer_offsets** of internal topics?

Procedure

Step 1 Log in to the node where the Kafka client is installed as the client installation user.

Step 2 Switch to the Kafka client installation directory, for example, **/opt/client**.

cd /opt/client

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 Run the following command to perform user authentication (skip this step for a cluster in common mode):

kinit *Component service user*

Step 5 Run the following command to switch to the Kafka client installation directory:

cd Kafka/kafka/bin

Step 6 Run the following command to obtain Consumer offset metric information:

kafka-console-consumer.sh --topic __consumer_offsets --zookeeper <zk_host:port>/kafka --formatter "kafka.coordinator.group.GroupMetadataManager\$OffsetsMessageFormatter" --consumer.config <property file> --from-beginning

Add the following content to the <*property file*> configuration file:

```
exclude.internal.topics = false
```

Example:

kafka-console-consumer.sh --topic __consumer_offsets --zookeeper 10.5.144.2:2181/kafka --formatter "kafka.coordinator.group.GroupMetadataManager\$OffsetsMessageFormatter" --consumer.config ../config/consumer.properties --from-beginning

```
[example-group1,test2,0]::[OffsetMetadata[0,NO_METADATA],CommitTime 1487121209218,ExpirationTime 148720760
9218]
[example-group1,test2,1]::[OffsetMetadata[0,NO_METADATA],CommitTime 1487121209218,ExpirationTime 148720760
9218]
[example-group1,test2,0]::[OffsetMetadata[2,NO_METADATA],CommitTime 1487121269208,ExpirationTime 148720760
9208]
[example-group1,test2,1]::[OffsetMetadata[1,NO_METADATA],CommitTime 1487121269208,ExpirationTime 148720760
```

----End

16.11.23 Configuring Logs for Shell Commands on the Client

Issue

How do I set the log level for shell commands on the client?

Procedure

Step 1 Log in to the node where the Kafka client is installed as the client installation user.

Step 2 Switch to the Kafka client installation directory, for example, **/opt/client**.

cd /opt/client

Step 3 Run the following command to switch to the Kafka client configuration directory:

cd Kafka/kafka/config

Step 4 Open the **tools-log4j.properties** file, change **WARN** to **INFO**, and save the file.

```
log4j.rootLogger=WARN, stderr

log4j.appender.stderr=org.apache.log4j.ConsoleAppender
log4j.appender.stderr.layout=org.apache.log4j.PatternLayout
log4j.appender.stderr.layout.ConversionPattern=[%d] %p %m (%c)%n
log4j.appender.stderr.Target=System.err
```

```
log4j.rootLogger=INFO, stderr

log4j.appender.stderr=org.apache.log4j.ConsoleAppender
log4j.appender.stderr.layout=org.apache.log4j.PatternLayout
log4j.appender.stderr.layout.ConversionPattern=[%d] %p %m (%c)%n
log4j.appender.stderr.Target=System.err
```

Step 5 Switch to the Kafka client installation directory, for example, **/opt/client**.

cd /opt/client

Step 6 Run the following command to configure environment variables:

source bigdata_env

Step 7 Run the following command to perform user authentication (skip this step for a cluster in common mode):

kinit *Component service user*

Step 8 Run the following command to switch to the Kafka client installation directory:

cd Kafka/kafka/bin

Step 9 Run the following command to obtain the topic information. The log information can be viewed on the console.

```
kafka-topics.sh --list --zookeeper 10.5.144.2:2181/kafka
[2017-02-17 14:34:27,005] INFO JAAS File name: /opt/client/Kafka/./kafka/config/jaas.conf

----End

16.11.24 Obtaining Topic Distribution Information

Issue

How do I obtain topic distribution information in a Broker instance?

Preparations

- Prerequisites

  The Kafka and ZooKeeper clients have been installed.

- Procedure

  a. Log in to the node where the Kafka client is installed as the client installation user.

  b. Switch to the Kafka client installation directory, for example, **/opt/client**.

  cd /opt/client

  c. Run the following command to configure environment variables:

source bigdata_env

d. Run the following command to perform user authentication (skip this step for a cluster in common mode):

kinit *Component service user*

e. Run the following command to switch to the Kafka client installation directory:

cd Kafka/kafka/bin

f. Run the Kafka commands to obtain the topic assignment information and copy synchronization information, and check the return result.

kafka-topics.sh --describe --zookeeper <zk_host:port/chroot>

Example:

```
[root@mgtdat-sh-3-01-3 client]#kafka-topics.sh --describe --zookeeper 10.149.0.90:2181/
kafka
Topic:topic1   PartitionCount:2  ReplicationFactor:2     Configs:
Topic: topic1  Partition: 0 Leader: 26 Replicas: 23,25 Isr: 26
Topic: topic1  Partition: 1 Leader: 24 Replicas: 24,23 Isr: 24,23
```

In the preceding information, **Replicas** indicates the replica assignment information and **Isr** indicates the replica synchronization information.

Solution 1

1. Query the Broker ID mapping in ZooKeeper.

   sh zkCli.sh -server <zk_host:port>

2. Run the following command on the ZooKeeper client:

   ls /kafka/brokers/ids

   get/kafka/brokers/ids/<queried Broker ID>

   Example:

```
[root@node-master1gAMQ kafka]# zkCli.sh -server node-master1gAMQ:2181
Connecting to node-master1gAMQ:2181
Welcome to ZooKeeper!
JLine support is enabled

WATCHER::

WatchedEvent state:SyncConnected type:None path:null
[zk: node-master1gAMQ:2181(CONNECTED) 0] ls /kafka/brokers/
ids     seqid    topics
[zk: node-master1gAMQ:2181(CONNECTED) 0] ls /kafka/brokers/ids
[1]
[zk: node-master1gAMQ:2181(CONNECTED) 1] get /kafka/brokers/ids/1
{"listener_security_protocol_map":{"PLAINTEXT":"PLAINTEXT","SSL":"SSL"},"endpoints":["PLAINTEXT://
192.168.2.242:9092","SSL://192.168.2.242:9093"],"rack":"/default/
rack0","jmx_port":21006,"host":"192.168.2.242","timestamp":"1580886124398","port":9092,"version":4}
[zk: node-master1gAMQ:2181(CONNECTED) 2]
```

Solution 2

Obtain the mapping between nodes and Broker IDs.

kafka-broker-info.sh --zookeeper <zk_host:port/chroot>

Example:

```
[root@node-master1gAMQ kafka]# bin/kafka-broker-info.sh --zookeeper 192.168.2.70:2181/kafka
Broker_ID     IP_Address
```

```
---------------------------
1          192.168.2.242
```

16.11.25 Kafka HA Usage Description

Kafka High Reliability and Availability

Kafka message transmission assurance mechanism ensures message transmission after required parameters are set to meet different performance and reliability requirements.

- **Kafka high availability and high performance**

  If HA and high performance are required, configure parameters listed in the following table.

Parameter	Default Value	Description
unclean.leader.election.enable	true	Specifies whether a replica that is not in the ISR can be selected as the leader. If this parameter is set to **true**, data may be lost.
auto.leader.rebalance.enable	true	Specifies whether the leader automated balancing function is used. If this parameter is set to **true**, the controller periodically balances the leader of each partition on all nodes and assigns the leader to a replica with a higher priority.

Parameter	Default Value	Description
acks	1	The leader needs to check whether the message has been received and determine whether the required operation has been processed. This parameter affects message reliability and performance. • If this parameter is set to **0**, the Producer does not wait for any response from the server and the message is considered successful. • If this parameter is set to **1**, when the leader of the copy verifies that data has been written into the cluster, the leader makes repose quickly without waiting until all the copies are written. In this case, if the leader is abnormal when the leader makes the confirmation but replica synchronization is not complete, data will be lost. • If this parameter is set to **-1** (all), the synchronization is successful only after all synchronization copies are confirmed. If **min.insync.replicas** is also configured, multiple copies can be written successfully. In this case, as long as one copy remains active, the record is not lost. **NOTE** This parameter is configured in the Kafka client configuration file.
min.insync.replicas	1	Specifies the minimum number of replicas to which data is written when **acks** is set to **-1** for the Producer.

Impact of HA and high performance configurations:

NOTICE

After HA and high performance are configured, the data reliability decreases. Specifically, data may be lost of disks or nodes are faulty.

- **Kafka high reliability configuration**

  If high data reliability is required, configure parameters listed in the following table.

Parameter	Recommended Value	Description
unclean.leader.election.enable	false	Indicates whether a replica that is not in the ISR list can be elected as a leader.
acks	-1	The leader needs to check whether the message has been received and determine whether the required operation has been processed. If this parameter is set to **-1**, the message is successfully received only when all replicas in the ISR list have confirmed to receive the message. The **min.insync.replicas** parameter must also be set to ensure that multiple copies can be written successfully. As long as one copy is active, the record is not lost. **NOTE** This parameter is configured in the Kafka client configuration file.
min.insync.replicas	2	Specifies the minimum number of replicas to which data is written when **acks** is set to **-1** for the Producer. Ensure that the value of **Min.insync.replicas** is equal to or less than that of **replication.factor**.

Impact of high reliability configurations:

- Deteriorated performance

  All copies in the ISR list are required, and the writing of the minimum number of copies has been verified successful. As a result, the delay of a single message increases and the processing capability of the client decreases. The actual performance depends on the onsite test data.

- Reduced availability

  A replica that is not in the ISR list cannot be elected as a leader. If the leader goes offline and other replicas are not in the ISR list, the partition remains unavailable until the leader node recovers.

  All copies in the ISR list are required, and the writing of the minimum number of copies has been verified successful. When the node where a copy of a partition is located is faulty, the minimum number of successful copies cannot be met. As a result, service writing fails.

Configuration Impact

Evaluate reliability and performance requirements based on service scenarios and use proper parameter configuration.

NOTE

- For valuable data, you are advised to configure raid1 or raid5 for Kafka data directory disks to improve data reliability in case disk fault of a single disk.
- The **acks** parameter is named different for different Producer APIs.
  - New Producer API

    Indicates the interface defined in **org.apache.kafka.clients.producer.KafkaProducer**. The **acks** parameter name remains unchanged for this API.
  - Old Producer API

    Indicates the interface defined in **kafka.producer.Producer**. The **acks** parameter is named as **request.required.acks** for this API.
- For parameters that can be modified at the topic level, the service level configurations are used by default. These parameters can be separately configured based on topic reliability requirements.

  For example, you can configure the reliability parameters of the topic named **test**.

  kafka-topics.sh --zookeeper 192.168.1.205:2181/kafka --alter --topic test --config unclean.leader.election.enable=false --config min.insync.replicas=2

  192.168.1.205 indicates the ZooKeeper service IP address.
- If modification of the service-level requires the restart of Kafka, you are advised to modify the service-level configuration on the change page.

16.11.26 High Usage of Multiple Disks on a Kafka Cluster Node

Issue

The usage of multiple disks on a node in the Kafka streaming cluster is high. The Kafka service will become unavailable if the usage reaches 100%.

Symptom

A node in the MRS Kafka streaming cluster created by the customer has multiple disks. Due to improper partitioning and service reasons, the usage of some disks is high. When the usage reaches 100%, Kafka becomes unavailable.

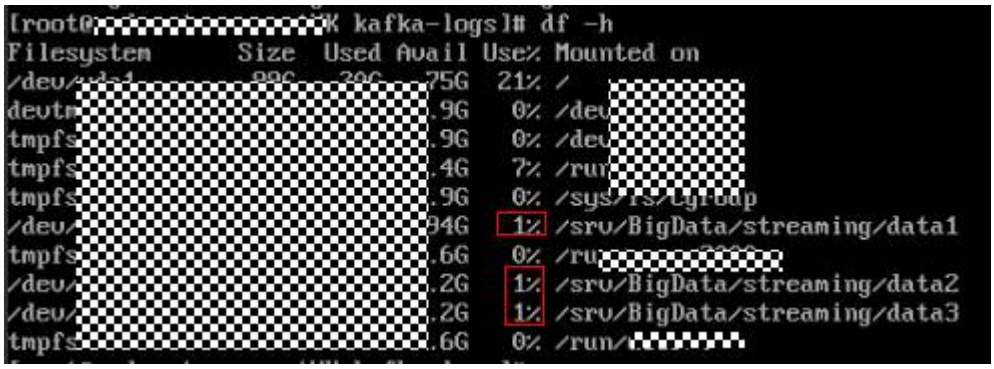
Cause Analysis

The disk data needs to be processed in a timely manner. After the value of **log.retention.hours** is changed, the service needs to be restarted. To ensure service continuity, you can shorten the aging time of a single data-intensive topic as required.

Procedure

Step 1 Log in to the core node of the Kafka streaming cluster.

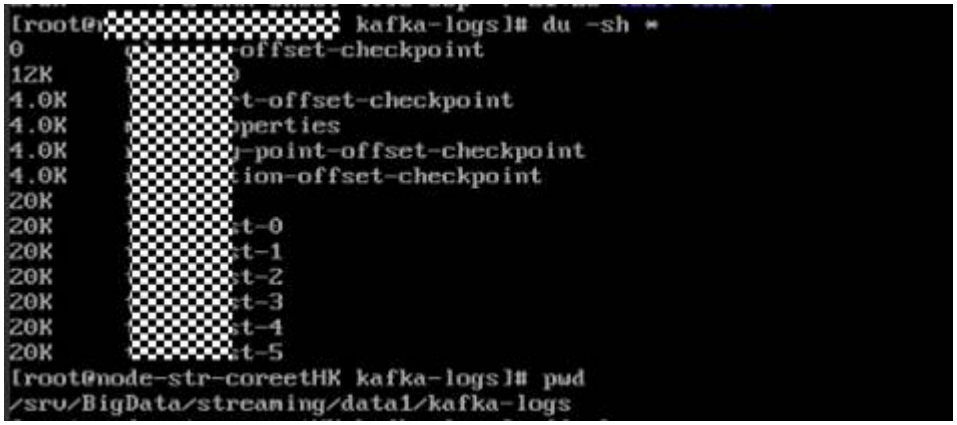
Step 2 Run the **df –h** command to check the disk usage.

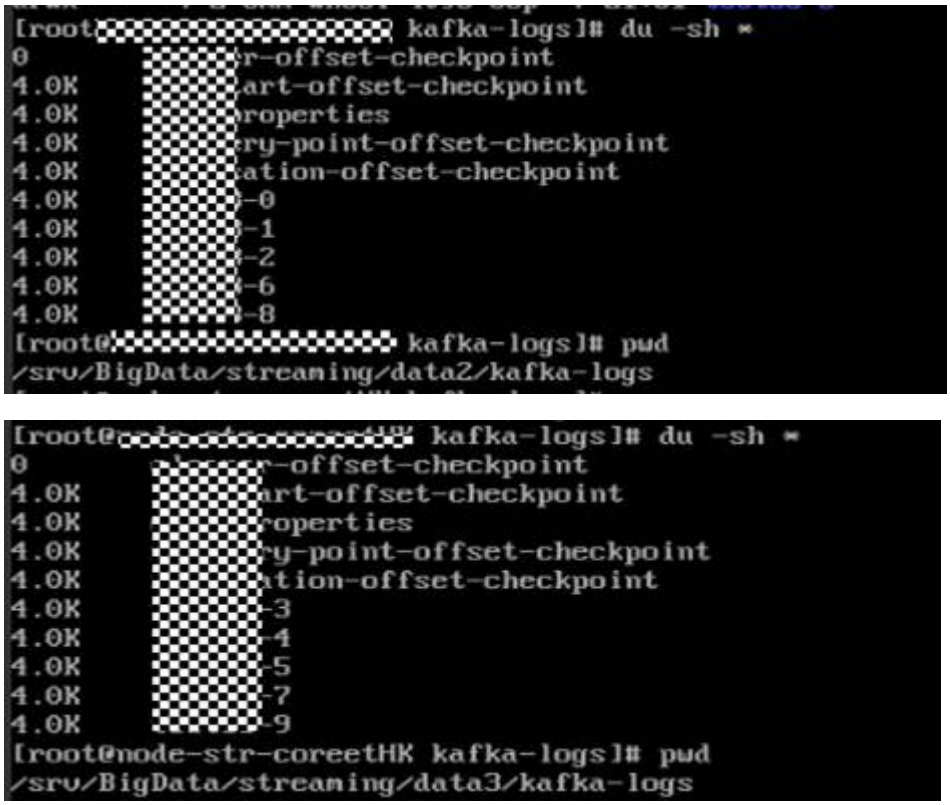


Step 3 Obtain the data storage directory from the **log.dirs** configuration item in the Kafka configuration file **opt/Bigdata/MRS_*x*/*x*_*x*_Broker/etc/server.properties**. Change the configuration file path based on the cluster version in the environment. If there are multiple disks, use commas (,) to separate multiple configuration items.

Step 4 Run the **cd** command to go to the data storage directory obtained in **Step 3** of the disk with high usage.

Step 5 Run the **du -sh *** command to print the name and size of the current topic.





Step 6 Determine the method of changing the data retention period. The default global data retention period of Kafka is seven days. A large amount of data may be written to some topics, and these topics reside on the partitions on the disk with high usage.

- You can change the global data retention period to a smaller value to release disk space. This method requires a Kafka service restart, which may affect service running. For details, see **Step 7**.
- You can change the data retention period of a single topic to a smaller value to release disk space. This configuration takes effect without a Kafka service restart. For details, see **Step 8**.

Step 7 Log in to Manager. On the Kafka service configuration page, switch to **All Configurations** and search for the **log.retention.hours** configuration item. The default value is 7 days. Change it based on the site requirements.

Step 8 Change the data retention time of the topics on these disks.

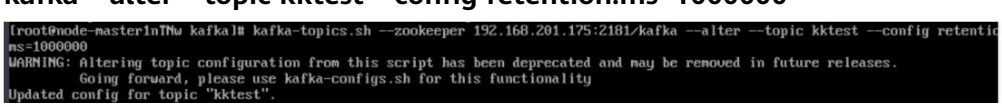
1. Check the retention time of the topic data.

   bin/kafka-topics.sh --describe --zookeeper *<ZooKeeper cluster service IP address>*:2181/kafka --topic kktest

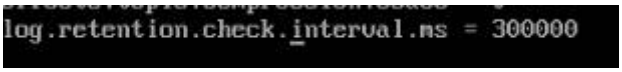
   

2. Set the topic data retention time. **--topic** indicates the topic name, and **retention.ms** indicates the data retention time, in milliseconds.

   kafka-topics.sh --zookeeper *<ZooKeeper cluster service IP address>*:2181/kafka --alter --topic kktest --config retention.ms=1000000

After the data retention time is set, the deletion operation may not be performed immediately. The deletion operation starts after the time specified by **log.retention.check.interval.ms**. You can check whether the **delete** field exists in the **server.log** file of Kafka to determine whether the deletion operation takes effect. If the **delete** field exists, the deletion operation has taken effect. You can also run the **df –h** command to check the disk usage and determine whether the setting takes effect.



----End

16.12 Using Oozie

16.12.1 Oozie Jobs Do Not Run When a Large Number of Jobs Are Submitted Concurrently

Issue

When a large number of Oozie jobs are submitted concurrently, the jobs do not run.

Symptom

When a large number of Oozie jobs are submitted concurrently, the jobs do not run.

Cause Analysis

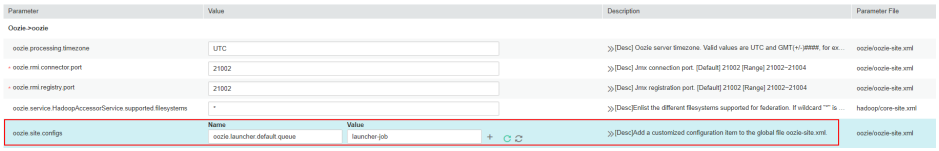
When Oozie submits a job, an oozie-launcher job is started first, and then the oozie-launcher job submits the real job for execution. By default, the oozie-launcher job and the real job are in the same queue.

When a large number of Oozie jobs are submitted concurrently, a large number of oozie-launcher jobs may be started, exhausting the resources of the queue. As a result, no more resources are available to start real jobs, and the jobs are not executed.

Procedure

Step 1 Create a queue for Oozie. For details, see **User Guide** > **Managing an Existing Cluster** > **Tenant Management** > **Creating a Tenant**. You can also use the launcher-job queue generated during MRS cluster creation.

Step 2 On Manager, choose **Cluster** > **Services** > **Oozie** > **Configurations**, search for **oozie.site.configs**, and add **oozie.launcher.default.queue** as the parameter name and **launcher-job** as the value.



----End

16.13 Using Spark

16.13.1 An Error Occurs When the Split Size Is Changed in a Spark Application

Issue

An error occurs when the split size is changed in a Spark application.

Symptom

A user needs to implement multiple mappers by changing the maximum split size to make the Spark application run faster. However, an error occurs when the user runs the **set $Parameter** command to modify the Hive configuration.

```
0: jdbc:hive2://192.168.1.18:21066/> set mapred.max.split.size=1000000;
Error: Error while processing statement: Cannot nodify mapred.max.split.size at runtime. It is not in list of params that are allowed to be modified at runtime( state=42000,code=1)
```

Cause Analysis

- Before the **hive.security.whitelist.switch** parameter is set to enable or disable the whitelist in security mode, the allowed parameters must have been configured in **hive.security.authorization.sqlstd.confwhitelist**.
- The default whitelist does not contain the **mapred.max.split.size** parameter. Therefore, the system displays a message indicating that the maximum split size cannot be changed.

Procedure

Step 1 Log in to FusionInsight Manager and choose **Services** > **Hive** > **Configurations** > **All Configurations**.

Step 2 Search for **hive.security.authorization.sqlstd.confwhitelist.append**, and add **mapred.max.split.size** to **hive.security.authorization.sqlstd.confwhitelist.append**.

Step 3 Save the configuration and restart the Hive component.

Step 4 Run the **set mapred.max.split.size=1000000;** command. If no error occurs, the modification is successful.

----End

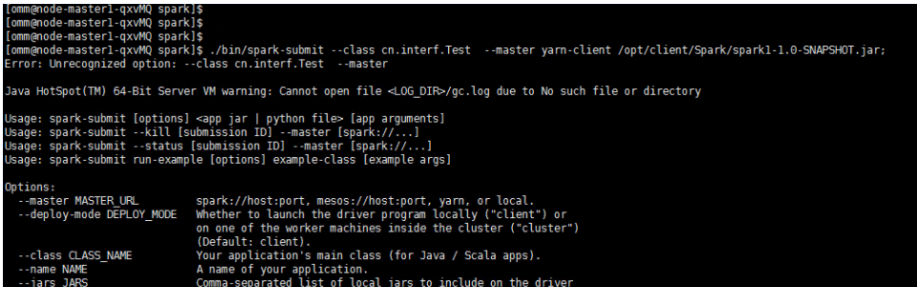
16.13.2 An Error Is Reported When Spark Is Used

Issue

When Spark is used, the cluster fails to run.

Symptom

When Spark is used, the cluster fails to run.



Cause Analysis

- Invalid characters are added during command execution.
- The owner and owner group of the uploaded JAR file is incorrect.

Procedure

Step 1 Run **./bin/spark-submit --class cn.interf.Test --master yarn-client /opt/client/Spark/spark1-1.0-SNAPSHOT.jar;** to check whether invalid characters are imported.

Step 2 If they are imported, modify the invalid characters and run the command again.

Step 3 After the command is executed again, other errors occur. Both the owner and the owner group of the JAR file are **root**.

Step 4 Change the owner and the owner group of the JAR file to **omm:wheel**.

----End

16.13.3 A Spark Job Fails to Run Due to Incorrect JAR File Import

Issue

A Spark job fails to be executed.

Symptom

A Spark job fails to be executed.

Cause Analysis

The imported JAR file is incorrect when the Spark job is executed. As a result, the Spark job fails to be executed.

Procedure

Step 1 Log in to any Master node.

Step 2 Run the **cd /opt/Bigdata/MRS_*/install/FusionInsight-Spark-*/spark/examples/jars** command to view the JAR file of the sample program.

NOTE

A JAR file name contains a maximum of 1023 characters and cannot include special characters (;|&>,<'$). In addition, it cannot be left blank or full of spaces.

Step 3 Check the executable programs in the OBS bucket. The executable programs can be stored in HDFS or OBS. The paths vary according to file systems.

NOTE

- OBS storage path: starts with **obs://**, for example, **obs://wordcount/program/hadoop-mapreduce-examples-2.7.x.jar**.
- HDFS storage path: starts with **/user**. Spark Script must end with **.sql**, and MR and Spark must end with **.jar**. The **.sql** and **.jar** are case-insensitive.

----End

16.13.4 An Error Is Reported During Spark Running

Issue

The specified class cannot be found when a Spark job is running.

Symptom

The specified class cannot be found when a Spark job is running. The error message is as follows:

```
Exception encountered | org.apache.spark.internal.Logging$class.logError(Logging.scala:91)
org.apache.hadoop.hbase.DoNotRetryIOException: java.lang.ClassNotFoundException:
org.apache.phoenix.filter.SingleCQKeyValueComparisonFilter
```

Cause Analysis

The default path configured by the user is incorrect.

Procedure

Step 1 Log in to any Master node.

Step 2 Modify the configuration file in the Spark client directory.

Run the **vim /opt/client/Spark/spark/conf/spark-defaults.conf** command to open the **spark-defaults.conf** file and set **spark.executor.extraClassPath** to **${PWD}/***.

----End

16.13.5 Executor Memory Reaches the Threshold Is Displayed in Driver

Symptom

A Spark task fails to be submitted due to excessive memory usage.

Cause Analysis

The Driver log prints that the applied Executor memory exceeds the cluster limit.

```
16/02/06 14:11:25 INFO Client: Verifying our application has not requested more than the maximum
memory capability of the cluster (6144 MB per container)
16/02/06 14:11:29 ERROR SparkContext: Error initializing SparkContext.
java.lang.IllegalArgumentException: Required executor memory (10240+1024 MB) is above the max
threshold (6144 MB) of this cluster!
```

Spark tasks are submitted to Yarn and the resources used by the Executor to run tasks are managed by Yarn. From the error message, you can see that when a user starts the Executor, 10 GB memory is specified, which exceeds the upper memory limit of each Container set by Yarn. As a result, the task cannot be started.

Solution

Modify the Yarn configuration to increase the restriction on containers. For example, you can adjust parameter **yarn.scheduler.maximum-allocation-mb** to control the resources for starting the Executor. Restart the Yarn service after the modification.

You can modify the configuration as follows:

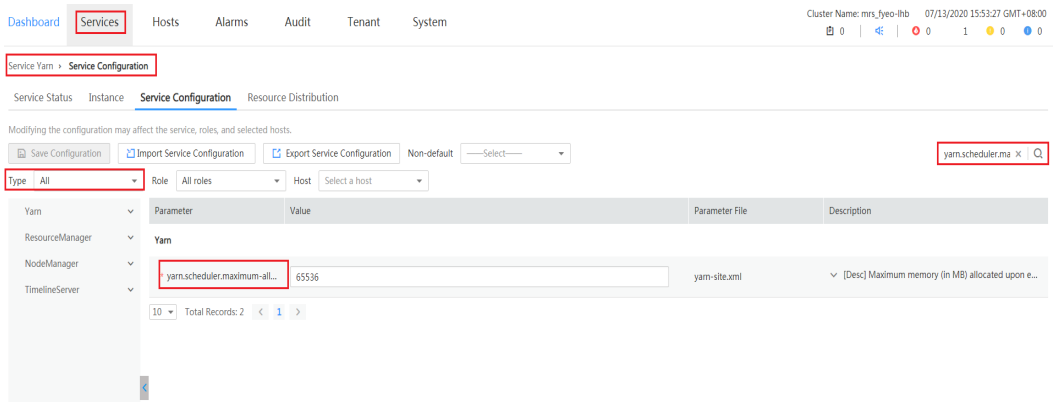
MRS Manager:

Step 1 Log in to MRS Manager.

Step 2 Choose **Services** > **Yarn** > **Service Configuration** and set **Type** to **All**.

Step 3 In **Search**, enter **yarn.scheduler.maximum-allocation-mb** to modify the parameter, save the configuration, and then restart the service. See the following figure.

Figure 16-53 Modifying Yarn service parameters



----End

FusionInsight Manager:

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > **Service** > **Yarn**. Click **Configurations** and select **All Configurations**.

Step 3 In **Search**, enter **yarn.scheduler.maximum-allocation-mb** to modify the parameter, save the configuration, and then restart the service.

----End

16.13.6 Message "Can't get the Kerberos realm" Is Displayed in Yarn-cluster Mode

Symptom

A Spark task fails to be submitted due to an authentication failure.

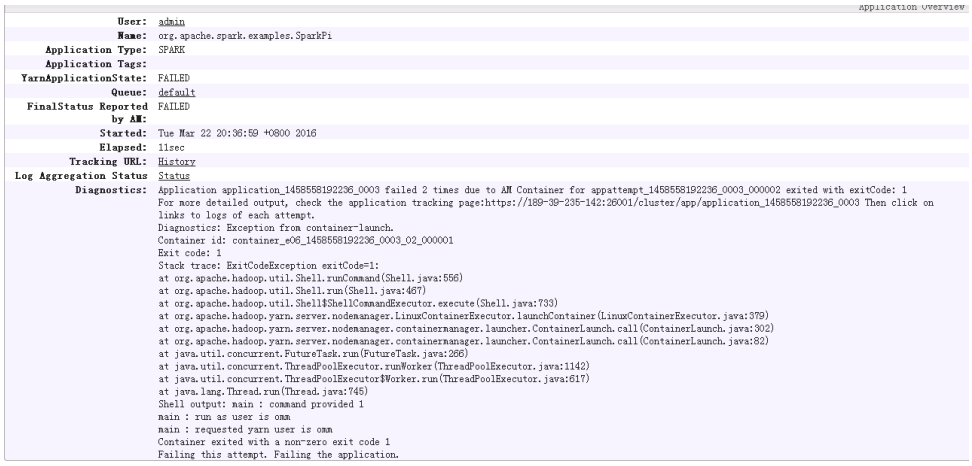
Cause Analysis

1. According to the exception printed in the driver log, the token used to connect to HDFS cannot be found.

```
16/03/22 20:37:10 WARN Client: Exception encountered while connecting to the server :
org.apache.hadoop.ipc.RemoteException(org.apache.hadoop.security.token.SecretManager
$InvalidToken): token (HDFS_DELEGATION_TOKEN token 192 for admin) can't be found in cache
16/03/22 20:37:10 WARN Client: Failed to cleanup staging dir .sparkStaging/
application_1458558192236_0003
org.apache.hadoop.ipc.RemoteException(org.apache.hadoop.security.token.SecretManager
$InvalidToken): token (HDFS_DELEGATION_TOKEN token 192 for admin) can't be found in cache
```

2. The native Yarn web UI shows that ApplicationMaster fails to be started twice and the task exits.

Figure 16-54 ApplicationMaster start failure



3. The ApplicationMaster log shows the following error information:

   ```
   Exception in thread "main" java.lang.ExceptionInInitializerError
   Caused by: org.apache.spark.SparkException: Unable to load YARN support
   Caused by: java.lang.IllegalArgumentException: Can't get Kerberos realm
   Caused by: java.lang.reflect.InvocationTargetException
   Caused by: KrbException: Cannot locate default realm
   Caused by: KrbException: Generic error (description in e-text) (60) - Unable to locate Kerberos realm
   org.apache.hadoop.hive.metastore.MetaStoreUtils.newInstance(MetaStoreUtils.java:1410)
   ... 86 more
   Caused by: javax.jdo.JDOFatalInternalException: Unexpected exception caught.
   NestedThrowables:java.lang.reflect.InvocationTargetException
   ... 110 more
   ```

4. When you execute **./spark-submit --class yourclassname --master yarn-cluster /yourdependencyjars** to submit a task in Yarn-cluster mode, the driver is enabled in the cluster. Because the client's **spark.driver.extraJavaOptions** is loaded, you cannot find the **kdc.conf** file in the target path on the cluster node and cannot obtain information required for Kerberos authentication. As a result, the ApplicationMaster fails to be started.

Solution

When submitting a task on the client, configure the **spark.driver.extraJavaOptions** parameter in the CLI. In this way, the **spark.driver.extraJavaOptions** parameter in the **spark-defaults.conf** file is not automatically loaded from the client path. When starting a Spark task, use **--conf** to specify the driver configuration as follows (note that the quotation mark after **spark.driver.extraJavaOptions=** is mandatory):

./spark-submit -class yourclassname --master yarn-cluster --conf spark.driver.extraJavaOptions="

-Dlog4j.configuration=file:/opt/client/Spark/spark/conf/log4j.properties -Djetty.version=x.y.z -Dzookeeper.server.principal=zookeeper/hadoop.794bbab6_9505_44cc_8515_b4eddc84e6c1.com -Djava.security.krb5.conf=/opt/client/KrbClient/kerberos/var/krb5kdc/krb5.conf -Djava.security.auth.login.config=/opt/client/Spark/spark/conf/jaas.conf -Dorg.xerial.snappy.tempdir=/opt/client/Spark/tmp -Dcarbon.properties.filepath=/opt/client/Spark/spark/conf/carbon.properties" ../yourdependencyjars

16.13.7 Failed to Start spark-sql and spark-shell Due to JDK Version Mismatch

Symptom

The JDK version does not match. As a result, the client fails to start spark-sql and spark-shell.

Cause Analysis

1. The following error information is displayed on the Driver:
   ```
   Exception Occurs: BadPadding 16/02/22 14:25:38 ERROR Schema: Failed initialising database. Unable to open a test connection to the given database. JDBC url = jdbc:postgresql://ip:port/sparkhivemeta, username = spark. Terminating connection pool (set lazyInit to true if you expect to start your database after your app).
   ```
2. When a SparkSQL task is used, DBService needs to be accessed to obtain metadata information. On the client, the ciphertext needs to be decrypted for access. During the use, the user does not follow the process or configure environment variables, and the default JDK version exists in the environment variables of the client. As a result, the decryption program invoked during decryption is abnormal, and the user is locked.

Solution

Step 1 Run the **which java** command to check whether the default Java command is the Java command of the client.

Step 2 If it is not, go to the next step.

source ${client_path}/bigdata_env

Run the **kinit** *username* command and enter the password corresponding to the username to start the task.

----End

16.13.8 ApplicationMaster Failed to Start Twice in Yarn-client Mode

Symptom

In Yarn-client mode, ApplicationMaster fails to start twice.

Cause Analysis

1. Driver exception:
   ```
   16/05/11 18:10:56 INFO Client:
   client token: N/A
   diagnostics: Application application_1462441251516_0024 failed 2 times due to AM Container for appattempt_1462441251516_0024_000002 exited with  exitCode: 10
   For more detailed output, check the application tracking page:https://hdnode5:26001/cluster/app/application_1462441251516_0024 Then click on links to logs of each attempt.
   Diagnostics: Exception from container-launch.
   Container id: container_1462441251516_0024_02_000001
   ```

2. The ApplicationMaster log file contains the following error information:

```
2016-05-12 10:21:23,715 | ERROR | [main] | Failed to connect to driver at 192.168.30.57:23867, retrying ... | org.apache.spark.Logging$class.logError(Logging.scala:75)
2016-05-12 10:21:24,817 | ERROR | [main] | Failed to connect to driver at 192.168.30.57:23867, retrying ... | org.apache.spark.Logging$class.logError(Logging.scala:75)
2016-05-12 10:21:24,918 | ERROR | [main] | Uncaught exception:  | org.apache.spark.Logging$class.logError(Logging.scala:96)
org.apache.spark.SparkException: Failed to connect to driver!
at org.apache.spark.deploy.yarn.ApplicationMaster.waitForSparkDriver(ApplicationMaster.scala:426)
at org.apache.spark.deploy.yarn.ApplicationMaster.runExecutorLauncher(ApplicationMaster.scala:292)
...
2016-05-12 10:21:24,925 | INFO  | [Thread-1] | Unregistering ApplicationMaster with FAILED (diag message: Uncaught exception: org.apache.spark.SparkException: Failed to connect to driver!) | org.apache.spark.Logging$class.logInfo(Logging.scala:59)
```

In Spark-client mode, the task Driver runs on a client node (usually a node outside the cluster). During the startup, the ApplicationMaster process is started in the cluster. After the process is started, information needs to be registered with the Driver process. The task can be continued only after the registration is successful. According to the ApplicationMaster log, the connection to the Driver fails, which causes the task failure.

Solution

Step 1 Check whether the IP address of the Driver process can be pinged.

Step 2 Start a SparkPI task. Information similar to the following is displayed on the console:

```
16/05/11 18:07:20 INFO Remoting: Remoting started; listening on addresses :[akka.tcp://sparkDriver@192.168.1.100:23662]
16/05/11 18:07:20 INFO Utils: Successfully started service 'sparkDriver' on port 23662.
```

Step 3 Run the **netstat - anp | grep 23662** command on the node (192.168.1.100 in **Step 2**) to check whether the port is enabled. The following information indicates that the port is enabled.

```
tcp       0      0  ip:port    :::*                    LISTEN      107274/java
tcp       0      0  ip:port    ip:port                 ESTABLISHED 107274/java
```

Step 4 Run the **telnet 192.168.1.100 23662** command on the node where ApplicationMaster is started to check whether the port can be connected. Perform this operation as both the **root** and **omm** users. If information similar to **Escape character is '^]'** is displayed, the connection is normal. If **connection refused** is displayed, the connection fails and the related port cannot be connected.

If the port is enabled but cannot be connected from other nodes, check the network configuration.

NOTE

The port (port 23662 in this example) is randomly selected each time. Therefore, you need to test the port enabled by the task.

----End

16.13.9 Submission Status of the Spark Job API Is Error

Issue

After a Spark job is submitted using an API, the job status is displayed as **error**.

Issue Type

Job management

Symptom

After the log level in **/opt/client/Spark/spark/conf/log4j.properties** is changed and a job is submitted using API V1.1, the job status is displayed as error.

Cause Analysis

The executor monitors the job log output and determines the job execution result. After the execution result is changed to **error**, the output result cannot be detected. Therefore, the executor determines that the job status is abnormal after the job expires.

Procedure

Change the log level in the **/opt/client/Spark/spark/conf/log4j.properties** file to **info**.

Summary and Suggestions

You are advised to use the V2 API to submit jobs.

16.13.10 Alarm 43006 Is Repeatedly Generated in the Cluster

Issue

The alarm "ALM-43006 Heap Memory Usage of the JobHistory Process Exceeds the Threshold" is repeatedly generated in the cluster, and the setting according to the alarm reference is invalid.

Symptom

The is generated in the cluster. The same alarm is generated again a period of time after handling measures are taken.

Cause Analysis

The JobHistory memory leakage may occur. You need to install the corresponding patch to rectify the fault.

Procedure

- Increase the heap memory of the JobHistory process.
- If the heap memory has been increased, restart the JobHistory instance.

16.13.11 Failed to Create or Delete a Table in Spark Beeline

Issue

When the customer frequently creates or deletes a large number of users in Spark Beeline, some users occasionally fail to create or delete tables.

Symptom

The procedure for creating a table is as follows:

```
CREATE TABLE wlg_test001 (start_time STRING,value INT);
```

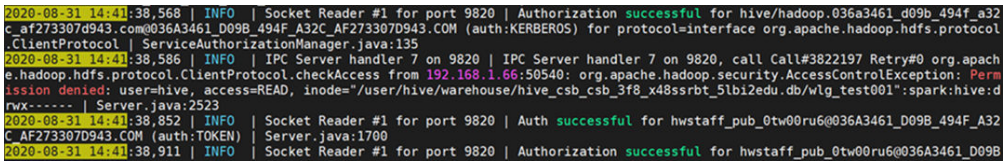
The following error message is displayed:

```
Error: org.apache.spark.sql.AnalysisException:
org.apache.hadoop.hive.ql.metadata.HiveException: MetaException(message:Failed to grant permission on
HDFSjava.lang.reflect.UndeclaredThrowableException); (state=,code=0)
```

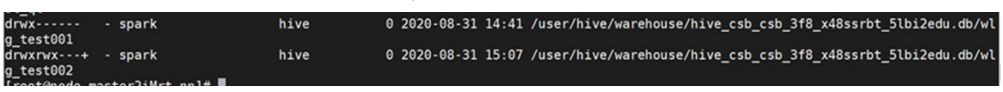
Cause Analysis

1. View metastore logs.

2. View HDFS logs.



3. Compare permission (**test001** is a table created by a user in abnormal state, and **test002** is a table created by a user in normal state).



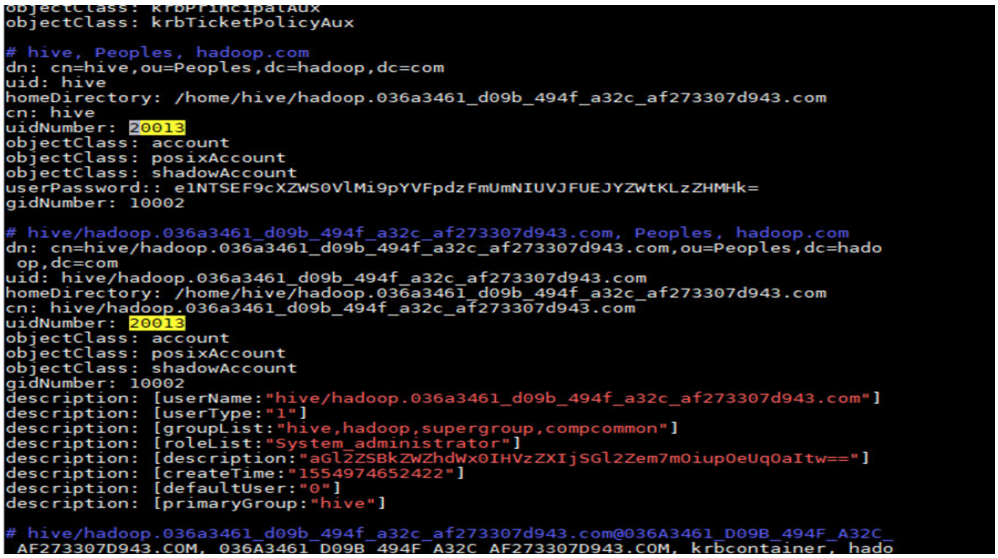
4. An error similar to the following is reported when a table is dropped:

```
0: jdbc:hive2://192.168.1.42:10000/> drop table
dataplan_modela_csbch2;
Error: Error while compiling statement: FAILED:
SemanticException Unable to fetch table dataplan_modela_csbch2.
```

```
java.security.AccessControlException: Permission denied: user=CSB_csb_3f8_x48ssrbt,
access=READ,
inode="/user/hive/warehouse/hive_csb_csb_3f8_x48ssrbt_5lbi2edu.db/
dataplan_modela_csbch2":spark:hive:drwx------
```

5. Analyze the cause.

   The default user created during cluster creation uses the same UID, causing user disorder. This problem is triggered when a large number of users are created. As a result, the Hive user does not have the permission to create tables occasionally.



Procedure

Restart the **sssd** process of the cluster.

Run the **service sssd restart** command as the **root** user to restart the **sssd** process and run the **ps -ef | grep sssd** command to check whether the **sssd** process is running properly.

In normal cases, the **/usr/sbin/sssd** process and three sub-processes **/usr/libexec/sssd/sssd_be**, **/usr/libexec/sssd/sssd_nss** and **/usr/libexec/sssd/sssd_pam** exist.

16.13.12 Failed to Connect to the Driver When a Node Outside the Cluster Submits a Spark Job to Yarn

Issue

When a node outside the cluster uses the client mode to submit a Spark task to Yarn, the task fails and an error message is displayed, indicating that the driver cannot be connected.

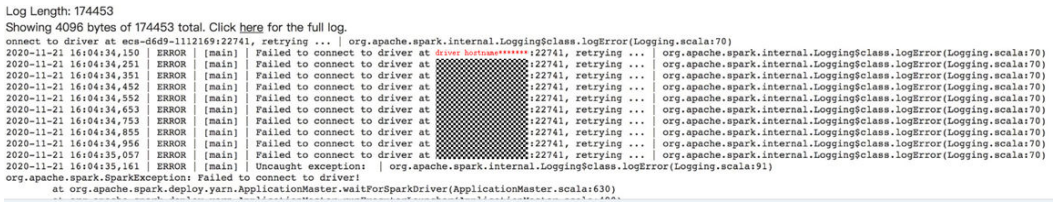
Symptom

Nodes outside the cluster can communicate with each node in the cluster. When a node outside the cluster submits a Spark task to Yarn in client mode, the task fails and an error message is displayed, indicating that the driver cannot be connected.

Cause Analysis

When a Spark task is submitted in the client mode, the driver process of Spark is on the client side, and the executor needs to interact with the driver to run the job.

If the NodeManager fails to connect to the node where the client is located, the following error is reported:



Procedure

Specify the IP address of the driver in the Spark configuration of the client.

Add **spark.driver.host=driverIP** to *<Client installation path>***/Spark/spark/conf/spark-defaults.conf** and run the Spark task again.

Summary and Suggestions

You are advised to submit jobs in cluster mode.

16.13.13 Large Number of Shuffle Results Are Lost During Spark Task Execution

Issue

Spark tasks fail to be executed. The task log shows that a large number of **shuffle** files are lost.

Symptom

Spark tasks fail to be executed. The task log shows that a large number of **shuffle** files are lost.

Cause Analysis

When Spark is running, the **shuffle** file generated temporarily is stored in the temporary directory of the executor for later use.

When an executor exits abnormally, NodeManager deletes the temporary directory of the container where the executor is located. When other executors

apply for the shuffle result of the executor, a message is displayed indicating that the file cannot be found.

Therefore, you need to check whether the executor exits abnormally. You can check whether there are executors in the **dead** state on the executors tab page on the Spark task page and view the executor logs of each **dead** state, determine the cause of abnormal exit. Some executors may exit because the **shuffle** file cannot be found. You need to find the earliest executor that exits abnormally.

Common abnormal exit causes:

- OOM occurs on the executor.
- Multiple tasks fail when the executor is running.
- The node where the executor is located is cleared.

Procedure

Adjust or modify the task parameters or code based on the actual cause of the abnormal exit of the executor, and run the Spark task again.

16.13.14 Disk Space Is Insufficient Due to Long-Term Running of JDBCServer

Issue

When the JDBCServer service connected to Spark submits a spark-sql task to the Yarn cluster, the data disk of the Core node is fully occupied after the task runs for a period of time.

Symptom

When the JDBCServer service of a customer connected to Spark submits a spark-sql task to the Yarn cluster, the data disk of the Core node is fully occupied after the task runs for a period of time.

After checking the disk usage in the background, it is found that there are too many APP temporary files (files generated by shuffle) of the JDBCServer service, and the files are not cleared, occupying a large amount of memory.

Cause Analysis

After checking the directories that contain a large number of files on the Core node, it is found that most of the directories are similar to **blockmgr-033707b6-fbbb-45b4-8e3a-128c9bcfa4bf**, which stores temporary shuffle files generated during computing.

The dynamic resource allocation function of Spark is enabled on JDBCServer, and shuffle is hosted by NodeManager. NodeManager only manages these files based on the running period of the application, and does not check whether the container where a single executor is located exists. Therefore, the temporary files are deleted only when the app is stopped. When a task runs for a long time, a large number of temporary files occupy a large amount of disk space.

Procedure

Start a scheduled task to delete shuffle files that have been stored for a specified period of time. For example, delete shuffle files that have been stored for more than 6 hours each hour.

Step 1 Create the **clean_appcache.sh** script. If there are multiple data disks, change the value of **data1** in **BASE_LOC** based on the actual situation.

- Security cluster

```
#!/bin/bash
BASE_LOC=/srv/BigData/hadoop/data1/nm/localdir/usercache/spark/appcache/application_*/blockmgr*
find $BASE_LOC/ -mmin +360 -exec rmdir {} \;
find $BASE_LOC/ -mmin +360 -exec rm {} \;
```

- Common cluster

```
#!/bin/bash
BASE_LOC=/srv/BigData/hadoop/data1/nm/localdir/usercache/omm/appcache/application_*/blockmgr*
find $BASE_LOC/ -mmin +360 -exec rmdir {} \;
find $BASE_LOC/ -mmin +360 -exec rm {} \;
```

Step 2 Run the following commands to change the permission to the script:

chmod 755 clean_appcache.sh

Step 3 Add a scheduled task to start the clearance script. Change the script path to the actual path.

Run the **crontab -l** command to view the scheduled task.

Run the **crontab -e** command to edit the scheduled task.

```
0 * * * * sh /root/clean_appcache.sh > /dev/null 2>&1
```

----End

16.13.15 Failed to Load Data to a Hive Table Across File Systems by Running SQL Statements Using Spark Shell

Issue

When the **spark-shell** command is used to execute SQL statements or the **spark-submit** command is used to submit Spark tasks, the **load** command of SQL statements exists, and the source data and target table are not stored in the same file system. An error is reported when the MapReduce task is started in the preceding two modes.

Cause Analysis

When the **load** command is used to import data to the Hive table across file systems (for example, the original data is stored in the HDFS but the Hive table data is stored in the OBS), and the file length is greater than the threshold (32 MB by default). In this case, the MapReduce job that uses DistCp is triggered to migrate data. The MapReduce task configuration is directly extracted from the Spark task configuration. However, the **net.topology.node.switch.mapping.impl** configuration item of the Spark task does not retain the default value of the Hadoop. Therefore, the JAR package of the Spark needs to be used. As a result, the MapReduce reports an error indicating that the class cannot be found.

Procedure

Solution 1:

If the file size is small, set the default file size to a value greater than the maximum file size. For example, if the maximum file size is 95 MB, run the following command:

```
hive.exec.copyfile.maxsize=104857600
```

Solution 2:

If the file size is large, use DistCp to improve the data migration efficiency. Add the following parameters when starting the Spark task:

```
--conf spark.hadoop.net.topology.node.switch.mapping.impl=org.apache.hadoop.net.ScriptBasedMapping
```

16.13.16 Spark Task Submission Failure

Symptom

- A Spark task fails to be submitted.
- Spark displays a message indicating that the Yarn JAR package cannot be obtained.
- A file is submitted for multiple times.

Cause Analysis

- Symptom 1:

  The most common cause for task submission failure is authentication failure.

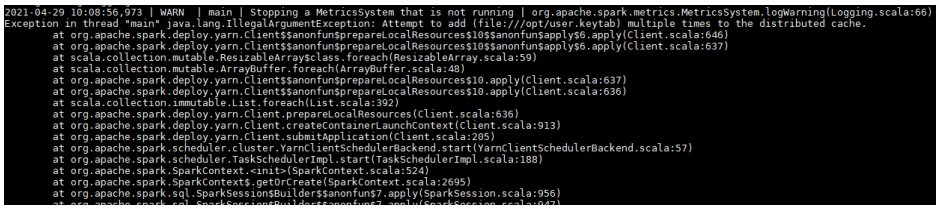
  
  The parameter settings may be incorrect.

- Symptom 2:

  By default, the cluster adds the Hadoop JAR package of the analysis node to the classpath of the task. If the system displays a message indicating that Yarn packages cannot be found, the Hadoop configuration is not set.

- Symptom 3:

  The common scenario is as follows: The **--files** option is used to upload the **user.keytab** file, and then the **--keytab** option is used to specify the same file. As a result, the same file is uploaded for multiple times.

Procedure

- Symptom 1:

  Run **kinit** *[user]* again and modify the corresponding configuration items.

- Symptom 2:

  Check that the Hadoop configuration items are correct and the **core-site.xml**, **hdfs-site.xml**, **yarn-site.xml**, and **mapred-site.xml** configuration files in the **conf** directory of Spark are correct.
- Symptom 3:

  Copy a new **user.keytab** file, for example:

  cp user.keytab user2.keytab

  spark-submit --master yarn --files user.keytab --keytab user2.keytab .....

16.13.17 Spark Task Execution Failure

Symptom

- An executor out of memory (OOM) error occurs.
- The information about the failed task shows that the failure cause is "lost task xxx."

Cause Analysis

- Symptom 1: The data volume is too large or too many tasks are running on the same executor at the same time.
- Symptom 2: Some tasks fail to be executed. When the error is reported, determine the node where the lost task is running. Generally, the error is caused by the abnormal exit of the lost task.

Procedure

- Symptom 1:
  - If the data volume is too large, adjust the memory size of the executor and use **--executor-memory** to specify the memory size.
  - If too many tasks are running at the same time, check the number of vcores specified by **--executor-cores**.
- Symptom 2: Locate the cause in the corresponding task log. If an OOM error occurs, see the solutions to symptom 1.

16.13.18 JDBCServer Connection Failure

Symptom

- The ha-cluster cannot be identified (unknowHost or port required).
- Failed to connect to JDBCServer.

Cause Analysis

- Symptom 1: The **spark-beeline** command is used to connect to JDBCServer. JDBCServer in versions earlier than MRS_3.0 adopts HA mode. Therefore, a specific URL and the JAR package provided by MRS Spark is required to connect to JDBCServer.
- Symptom 2: The JDBCServer service is not running properly or port listening is abnormal.

Procedure

- Symptom 1: Use a specific URL and the JAR package provided by MRS Spark to connect to JDBCServer.
- Symptom 2: Check that the JDBCServer service is running properly and port listening is normal, and try again.

16.13.19 Failed to View Spark Task Logs

Symptom

- A user fails to view logs when a task is running.
- A user fails to view logs when a task is complete.

Cause Analysis

- Symptom 1: The MapReduce component is abnormal.
- Symptom 2:
  - The JobHistory service of Spark is abnormal.
  - The log size is too large, and NodeManager times out during log aggregation.
  - The permission on the HDFS log storage directory (**/tmp/logs/Username/logs** by default) is abnormal.
  - Logs have been deleted. By default, Spark JobHistory stores event logs for seven days (specified by **spark.history.fs.cleaner.maxAge**). MapReduce stores task logs for 15 days (specified by **mapreduce.jobhistory.max-age-ms**).
  - If the task cannot be found on the Yarn page, it may have been cleared by Yarn. By default, Yarn stores 10,000 historical tasks (specified by **yarn.resourcemanager.max-completed-applications**).

Procedure

- Symptom 1: Check whether the MapReduce component is running properly. If it is abnormal, restart it. If the fault persists, check the JobhistoryServer log file in the background.
- Symptom 2: Perform the following checks in sequence:
  a. Check whether JobHistory of Spark is running properly.
  b. On the app details page of Yarn, check whether the log file is too large. If log aggregation fails, the value of **Log Aggregation Status** should be **Failed** or **Timeout**.
  c. Check whether the permission on the corresponding directory is normal.
  d. Check whether the corresponding **appid** file exists in the directory. The event log files are stored in the **hdfs://hacluster/spark2xJobHistory2x** directory. The task run logs are stored in the **hdfs://hacluster/tmp/logs/*Username*/logs** directory.
  e. Check whether **appid** or the current job ID exceeds the maximum value in the historical records.

16.13.20 Authentication Fails When Spark Connects to Other Services

Symptom

- When Spark connects to HBase, an authentication failure message is displayed or the HBase table cannot be connected.
- When Spark connects to HBase, a message is displayed indicating that the JAR package cannot be found.

Cause Analysis

- Symptom 1: HBase does not obtain the authentication information of the current task. As a result, the authentication fails when HBase is connected, and the corresponding data cannot be read
- Symptom 2: By default, Spark does not load the HBase JAR package. You need to use **--jars** to add the JAR package to the task.

Procedure

- Symptom 1: Enable the HBase authentication function by running the **spark.yarn.security.credentials.hbase.enabled=true** command. However, do not replace **hbase-site.xml** on the Spark client with **hbase-site.xml** on the HBase client because they are not completely consistent.
- Symptom 2: Use **--jars** to upload the HBase JAR package.

16.14 Using Sqoop

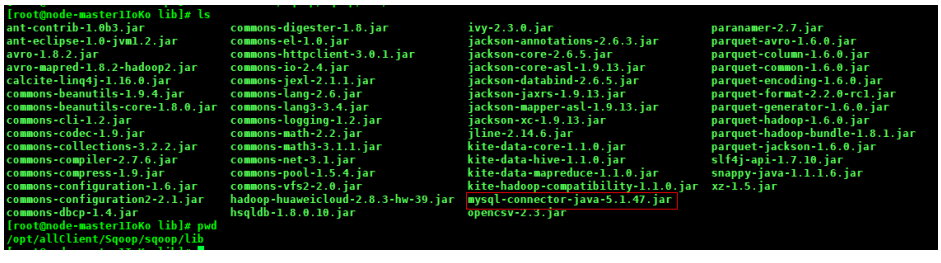
16.14.1 Connecting Sqoop to MySQL

Issue

The user does not know how to connect Sqoop to MySQL.

Procedure

Step 1 Install the client in the cluster and check whether the MySQL driver package exists in the **sqoop/lib** directory of the client.



Step 2 Load environment variables in the client directory.

source bigdata_env

Step 3 Perform the Kerberos authentication.

If Kerberos authentication is not enabled for the cluster, skip this step. If it is enabled, run the following command to authenticate the current user:

kinit *MRS cluster user*

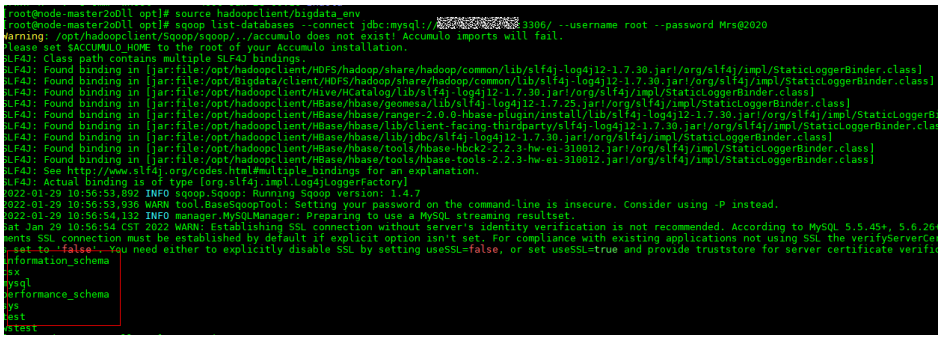
For example:

kinit admin

Step 4 Connect to the database.

sqoop list-databases --connect jdbc:mysql://IP:3306/ --username ***Username*** **--password** ***Password***

An example is as follows.



The command output shows that Sqoop is successfully connected to the MySQL database.

----End

16.14.2 An Error Is Reported When sqoop import Is Executed to Import PostgreSQL Data to Hive

Background

The **sqoop import** command is executed to extract data from open-source PostgreSQL to MRS HDFS or Hive.

Issue

The **sqoop** command can be executed to query the PostgreSQL database table, but an error is reported when the **sqoop import** command is executed to import data.

The authentication type 5 is not supported. Check that you have configured the pg_hba.conf file to include the client's IP address or subnet.

Cause Analysis

1. MD5 authentication for connecting to PostgreSQL fails. A whitelist needs to be configured in the **pg_hba.cnf** file.
2. When the **sqoop import** command is executed, a MapReduce job is started. The PostgreSQL driver package **gsjdbc4-*.jar** exists in the MRS Hadoop

installation directory **/opt/Bigdata/FusionInsight_HD_*/1_*_DataNode/install/hadoop/share/hadoop/common/lib**, which is incompatible with the open-source PostgreSQL service. As a result, an error is reported.

Procedure

1. Configure a whitelist in the **pg_hba.cnf** file.
2. Delete the **gsjdbc4-*.jar** packages from all core nodes, and add the PostgreSQL JAR package to **sqoop/lib**.

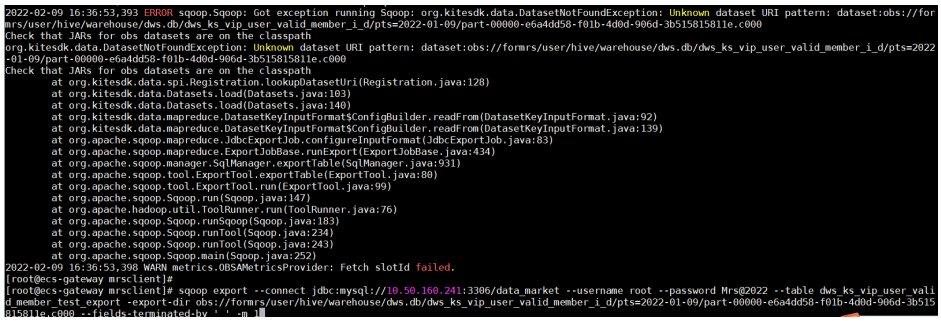
   mv /opt/Bigdata/FusionInsight_HD_*/1_*_DataNode/install/hadoop/share/hadoop/common/lib/gsjdbc4-*.jar /tmp

16.14.3 Sqoop Failed to Read Data from MySQL and Write Parquet Files to OBS

Issue

An error is reported when Sqoop reads MySQL data and writes the data to OBS in Parquet format. However, the data can be successfully written to OBS if the Parquet format is not specified.

Symptom



Cause Analysis

Parquet does not support Hive 3. Data can be written using HCatalog.

Procedure

Use HCatalog to write data: Specify the Hive database and table in parameters and modify the SQL statement in the script.

Details are as follows:

Original script:

sqoop import --connect 'jdbc:mysql://10.160.5.65/xxx_pos_online_00?zeroDateTimeBehavior=convertToNull' --username root --password Mrs@2022

--split-by id

--num-mappers 2

--query 'select * from pos_remark where 1=1 and $CONDITIONS'

--target-dir obs://za-test/dev/xxx_pos_online_00/pos_remark

--delete-target-dir

--null-string '\\N'

--null-non-string '\\N'

--as-parquetfile

Modified script:

sqoop import --connect 'jdbc:mysql://10.160.5.65/xxx_pos_online_00?zeroDateTimeBehavior=convertToNull' --username root --password Mrs@2022

--split-by id

--num-mappers 2

--query 'select id,pos_case_id,pos_transaction_id,remark,update_time,update_user,is_deleted,creator,modifier,gmt_created,gmt_modified,update_user_id,tenant_code from pos_remark where 1=1 and $CONDITIONS'

--hcatalog-database xxx_dev

--hcatalog-table ods_pos_remark

16.15 Using Storm

16.15.1 Invalid Hyperlink of Events on the Storm UI

Issue

The hyperlink of events on the Storm UI is invalid.

Symptom

After submitting a topology, a user cannot view topology data processing logs and the events hyperlink is invalid.

Cause Analysis

The function of viewing topology data processing logs is disabled by default when a topology is submitted in an MRS cluster.

Procedure

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services**.

Step 2 Log in to the Storm web UI.

Choose **Storm** > **Overview**. On the **Storm WebUI** in the **Basic Information** area, click any UI link to open the Storm web UI.

Step 3 In the **Topology Summary** area, click the desired topology to view details.

Step 4 In the **Topology actions** area, click **Kill** to delete the submitted Storm topology.

Step 5 Submit the Storm topology again and enable the function of viewing topology data processing logs. Add the **topology.eventlogger.executors** parameter and set it to a positive integer when submitting the Storm topology. Example:

storm jar ***Path of the topology package Class name of the topology Main method Topology name*** **-c topology.eventlogger.executors=X**

Step 6 In the **Topology Summary** area on the Storm UI, click the desired topology to view details.

Step 7 In the **Topology actions** area, click **Debug**, specify the data sampling percentage, and click **OK**.

Step 8 Click the **Spouts** or **Bolts** task name of the topology. In **Component summary**, click **events** to view data processing logs.

NOTE

To enable the function of viewing topology data processing logs of the specified **Spouts** or **Bolts** task, click the **Spouts** or **Bolts** task name of the topology, click **Debug** in the **Topology actions** area, and enter the data sampling percentage.

----End

16.15.2 Failed to Submit a Topology

Symptom

An MRS streaming cluster is installed, and ZooKeeper, Storm, as well as Kafka are installed in the cluster.

A topology fails to be submitted by running commands on the client.

Possible Causes

- The Storm service is abnormal.
- The client user is not authenticated or the authentication has expired.
- The **storm.yaml** file in the submitted topology conflicts with that on the server.

Cause Analysis

A user fails to submit the topology. The possible cause is that the client or Storm is faulty.

1. Check the Storm status.

   MRS Manager:

   Log in to MRS Manager. On the MRS Manager page, choose **Services** > **Storm** to check the status of Storm. The status is **Good**, and the monitoring metrics are correctly displayed.

FusionInsight Manager:

Log in to FusionInsight Manager. Choose **Cluster** > **Services** > **Storm** to check the status of Storm. It is found that the status is **Good** and the monitoring metrics are correctly displayed.

2. Check the submission logs of the client. The logs contain "KeeperExceptionSessionExpireException".

The preceding error occurs because security authentication is not performed before the topology is submitted or the TGT expires after authentication.

For details about the solution, see **Step 1**.

3. Check the client submission log. It is found that the "ExceptionInIntializerError" exception information is printed, and the message "Found multiple storm.yaml resources" is displayed. The following is an example:

This error occurs because the **storm.yaml** file in the service JAR package conflicts with that on the server.

For details about the solution, see **Step 2**.

4. If the fault is not caused by the preceding reasons, see **Topology Submission Fails and the Message "Failed to check principle for keytab" Is Displayed**.

Solution

Step 1 An authentication error occurs.

1. Log in to the node where the client resides and switch to the client directory.
2. Run the following command to submit the task again: (Replace the service JAR package and topology based on the site requirements.)

   source bigdata_env

   kinit *Username*

   storm jar storm-starter-topologies-0.10.0.jar storm.starter.WordCountTopology test

Step 2 The topology package is abnormal.

Check the service JAR package, delete the **storm.yaml** file from the service JAR package, and submit the task again.

----End

16.15.3 Topology Submission Fails and the Message "Failed to check principle for keytab" Is Displayed

Symptom

An MRS streaming cluster in security mode is installed, and ZooKeeper, Storm, and Kafka are installed in the cluster.

When a topology is defined to access components such as HDFS and HBase and the topology fails to be submitted using client commands.

Possible Causes

- The submitted topology does not contain the keytab file of the user.
- The keytab file contained in the submitted topology is inconsistent with the user who submits the topology.
- The **user.keytab** file exists in the **/tmp** directory on the client, and the owner is not the running user.

Cause Analysis

1. Check the logs. Error information "Can not found user.keytab in storm.jar" is found. Details are as follows:

   ```
   [main] INFO  b.s.StormSubmitter - Get principle for stream@HADOOP.COM success
   [main] ERROR b.s.StormSubmitter - Can not found user.keytab in storm.jar.
   Exception in thread "main" java.lang.RuntimeException: Failed to check principle for keytab
   at backtype.storm.StormSubmitter.submitTopologyAs(StormSubmitter.java:219)
   at backtype.storm.StormSubmitter.submitTopology(StormSubmitter.java:292)
   at backtype.storm.StormSubmitter.submitTopology(StormSubmitter.java:176)
   at com.xxx.streaming.storm.example.hbase.SimpleHBaseTopology.main(SimpleHBaseTopology.java:77)
   ```

   Check the JAR file of the submitted topology. It is found that the keytab file is not contained.

2. Check the logs. Error information "The submit user is invalid,the principle is" is found. Details are as follows:

   ```
   [main] INFO  b.s.StormSubmitter - Get principle for stream@HADOOP.COM success
   [main] WARN  b.s.s.a.k.ClientCallbackHandler - Could not login: the client is being asked for a password, but the  client code does not currently support obtaining a password from the user. Make sure that the client is configured to use a ticket cache (using the JAAS configuration setting 'useTicketCache=true)' and restart the client. If you still get this message after that, the TGT in the ticket cache has expired and must be manually refreshed. To do so, first determine if you are using a password or a keytab. If the former, run kinit in a Unix shell in the environment of the user who is running this client using the command 'kinit <princ>' (where <princ> is the name of the client's Kerberos principal). If the latter, do 'kinit -k -t <keytab> <princ>' (where <princ> is the name of the Kerberos principal, and <keytab> is the location of the keytab file). After manually refreshing your cache, restart this client. If you continue to see this message after manually refreshing your cache, ensure that your KDC host's clock is in sync with this host's clock.
   [main] ERROR b.s.StormSubmitter - The submit user is invalid,the principle is : stream@HADOOP.COM
   Exception in thread "main" java.lang.RuntimeException: Failed to check principle for keytab
   at backtype.storm.StormSubmitter.submitTopologyAs(StormSubmitter.java:219)
   at backtype.storm.StormSubmitter.submitTopology(StormSubmitter.java:292)
   at backtype.storm.StormSubmitter.submitTopology(StormSubmitter.java:176)
   at com.xxx.streaming.storm.example.hbase.SimpleHBaseTopology.main(SimpleHBaseTopology.java:77)
   ```

The authenticated user used to submit the topology is **stream**. However, the system displays a message indicating that the submit user is invalid during topology submission, indicating that the internal verification fails.

3. Check the JAR file of the submitted topology. It is found that the keytab file is contained.

   The principal parameter is set to **zmk_kafka** in the **user.keytab** file.

   ```
   [root@8-5-148-6 client]# klist -kt user.keytab
   Keytab name: FILE:user.keytab
   KVNO Timestamp         Principal
   ---- ----------------- --------------------------------------------------------
      1 12/19/16 16:28:17 zmk_kafka@HADOOP.COM
      1 12/19/16 16:28:17 zmk_kafka@HADOOP.COM
   ```

   It is found that the authenticated user does not match the principal in the **user.keytab** file.

4. Check the logs and find the error information "Delete the tmp keytab file failed, the keytab file is:/tmp/user.keytab". The detailed information is as follows:

   ```
   [main] WARN b.s.StormSubmitter - Delete the tmp keytab file failed, the keytab file is : /tmp/user.keytab
   [main] ERROR b.s.StormSubmitter - The submit user is invalid,the principle is : hbase1@HADOOP.COM
   Exception in thread "main" java.lang.RuntimeException: Failed to check principle for keytab
   at backtype.storm.StormSubmitter.submitTopologyAs(StormSubmitter.java:213)
   at backtype.storm.StormSubmitter.submitTopology(StormSubmitter.java:286)
   at backtype.storm.StormSubmitter.submitTopology(StormSubmitter.java:170)
   at com.touchstone.storm.cmcc.CmccDataHbaseTopology.main(CmccDataHbaseTopology.java:183)
   ```

   Check the **/tmp** directory. It is found that the **user.keytab** file exists and the file owner is not the running user.

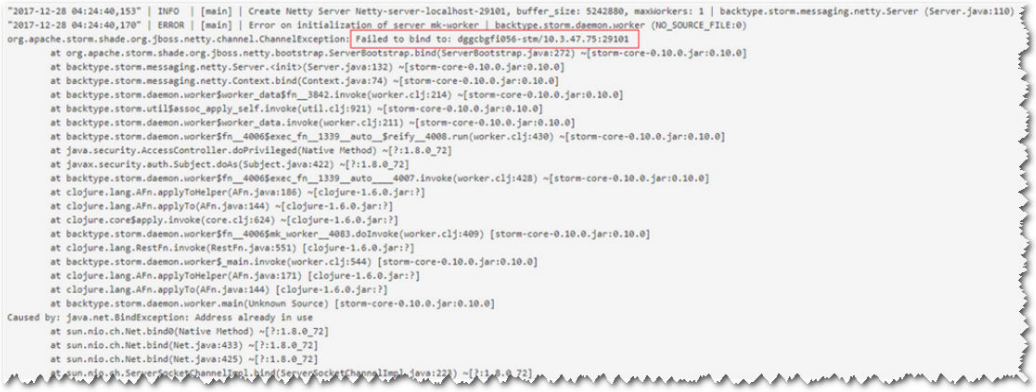
Solution

- Ensure that the **user.keytab** file is carried when the topology is submitted.
- Ensure that the user for submitting the topology is the same as that of the **user.keytab** file.
- Delete the **user.keytab** file from the **/tmp** directory.

16.15.4 Worker Runs Abnormally After a Topology Is Submitted and Error "Failed to bind to:host:ip" Is Displayed

Symptom

After the service topology is submitted, the Worker cannot be started normally. Check the Worker log. The log records "Failed to bind to: host:ip."



Possible Causes

The random port range is incorrectly configured.

Troubleshooting Process

1. Check related information in the Worker log.
2. Check the process information about the bond port.
3. Check the random port range.

Cause Analysis

1. Use SSH to log in to the host where the Worker fails to be started and run the **netstat -anp | grep** <*port*> command to check the ID of the process that occupies the port. In the preceding command, change *port* to the actual port number.
2. Run the **ps -ef | grep** <*pid*> command to view process details. In the command, *pid* indicates the actual process ID.

It is found that the worker process occupies the port. This process is another topology service process. According to the process details, port 29122 is allocated to the process.

3. Run the **lsof -i:**<*port*> command to view connection details. In the preceding command, change *port* to the actual port number.

It is found that port 29101 connects to port 21005 of the peer end, and port 21005 is the Kafka server port.

It indicates that the service layer connects to Kafka to obtain messages as a client. Service ports are allocated based on the random port range of the OS.

4. Run the **cat /proc/sys/net/ipv4/ip_local_port_range** command to check the random port range.

5. It is found that the random port range is too large and conflicts with the service port range of MRS.

NOTE

The MRS service port number ranges from 20000 to 30000.

Procedure

Step 1 Modify the random port range.

```
vi /proc/sys/net/ipv4/ip_local_port_range
32768 61000
```

Step 2 Stop the service process that occupies the service port to release the port. (Stop the service topology.)

----End

16.15.5 "well-known file is not secure" Is Displayed When the jstack Command Is Used to Check the Process Stack

Symptom

Run the **jstack** command to check the process stack information. The error message "well-known file is not secure" is displayed.

```
omm@hadoop02:~> jstack 62517
62517: well-known file is not secure
```

Cause Analysis

1. The user running the **jstack** command is inconsistent with the user submitting the process for viewing the pid information.
2. Storm uses the feature of differentiating users for implementing tasks. When the worker process is started, the process UID and GID are changed to the user submitting the task and ficommon. This way, logviewer can access logs of the worker process and only log file permission 640 is open. After the user is changed, the **jstack** and **jmap** commands fail to be executed for the worker process, because the default GID of the user is not ficommon. You need to run the ldap command to change the user GID to 9998 (ficommon).

Solution

You can use either of the following two methods to resolve the problem:

Method 1: View the process stack on the native Storm page.

Step 1 Log in to the native Storm page.

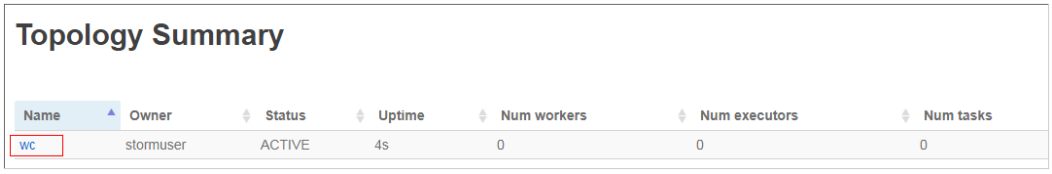
MRS Manager:

1. Access MRS Manager.
2. Choose **Services** > **Storm**. In **Storm WebUI** of **Storm Summary**, click any UI link to access the Storm WebUI.

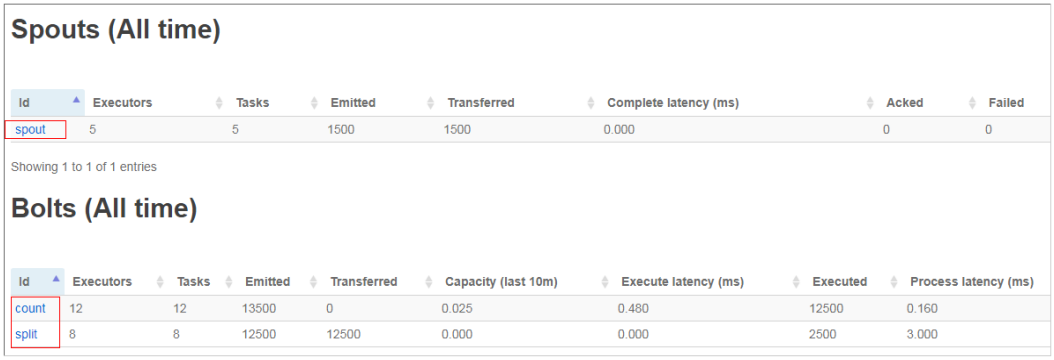
FusionInsight Manager:

1. Log in to FusionInsight Manager.
2. On Manager, choose **Cluster > Service** > **Storm**. On the **Storm WebUI** page of **Overview**, click any UI link to open the Storm WebUI.

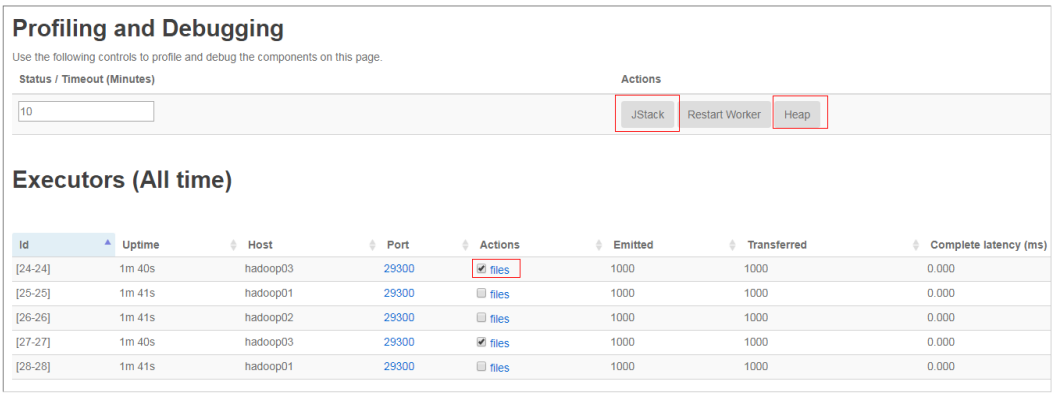
Step 2 Select the topology to be viewed.



Step 3 Select the spout or bolt to be viewed.



Step 4 Select the log file of the node to be viewed, and then click **JStack** or **Heap**. **JStack** corresponds to the stack information, and **Heap** corresponds to the heap information.



----End

Method 2: View the process stack by modifying user-defined parameters.

Step 1 Access the Storm parameter configuration page.

MRS Manager: Log in to MRS Manager, choose **Services** > **Storm** > **Service Configuration**, and select **All** from the **Type** drop-down list.

Operation on FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Yarn** > **Configurations** > **All Configurations**.

Step 2 In the navigation tree on the left, choose **supervisor** > **Customize** and add the variable **supervisor.run.worker.as.user=false**.

Step 3 Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the services.

Step 4 Submit the topology again.

Step 5 Switch to the **omm** user on the background node and run the **jps** command to view the PID of the worker process.

```
omm@hadoop02:~> jps | grep worker
22485 worker
111402 worker
```

Step 6 Run the **jstack pid** command to view the jstack information.

```
omm@hadoop02:~> jstack 22485
2018-05-26 08:46:24
Full thread dump Java HotSpot(TM) 64-Bit Server VM (25.144-b01 mixed mode):

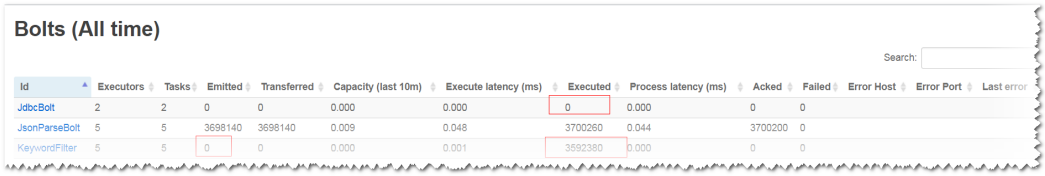
16.15.6 When the Storm-JDBC plug-in is used to develop Oracle write Bolts, data cannot be written into the Bolts.

Symptom

When the Storm-JDBC plug-in is used to develop Oracle write Bolts, the Oracle database can be connected, but data cannot be written to the Oracle database.

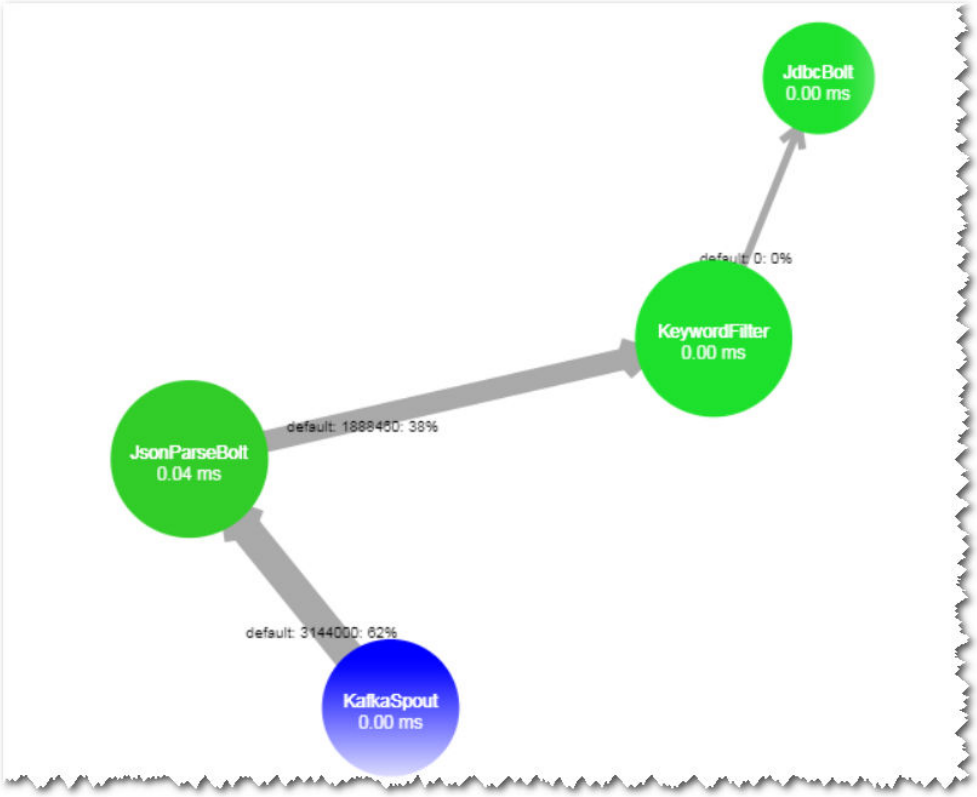


Possible Causes

- The topology definition is incorrect.
- The definition of the database table result is incorrect.

Cause Analysis

1. On the Storm web UI, check the DAG of the topology. The DAG is consistent with the topology definition.

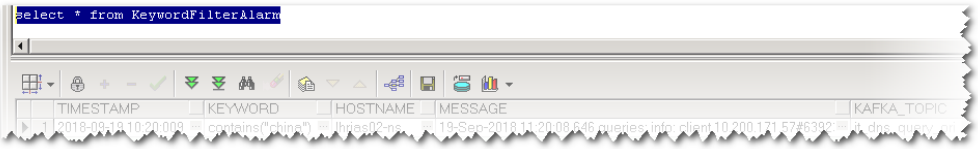


2. The definition of the KeyWordFilter Bolt is consistent with the **expParser** field.

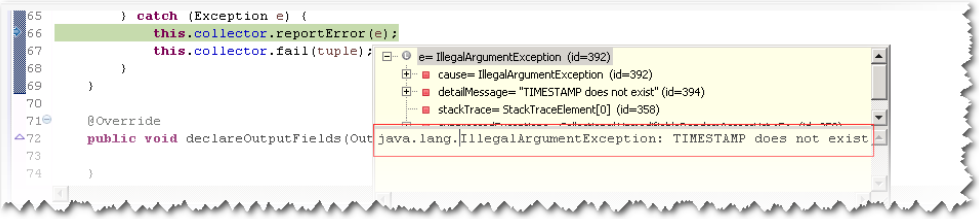
```
@Override
public void declareOutputFields(OutputFieldsDeclarer declarer)
{
    declarer.declare(new Fields("timestamp","keyword","hostname","message","kafka_topic") );
```

```
    if( flag )
    {
        String keyword = expParser.getKeyword();
        System.out.println( message );
        collector.emit(new Values( timestamp, keyword , hostname , message, kafka_topic ));
```

3. View the table definition in the Oracle database. The field name is in uppercase, which is inconsistent with flow definition field name.



4. When the execute method is debugged independently, it is found that the thrown field does not exist.



Procedure

The field name of the stream definition is changed to uppercase letters, which is the same as that defined in the database table.

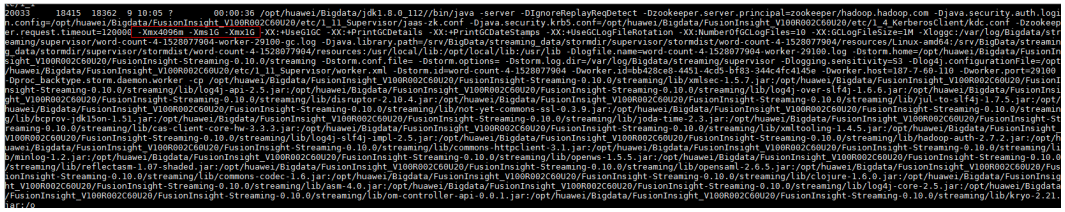
16.15.7 The GC Parameter Configured for the Service Topology Does Not Take Effect

Symptom

The **topology.worker.childopts** parameter in the service topology code does not take effect. The key log is as follows:

```
[main] INFO b.s.StormSubmitter - Uploading topology jar /opt/jar/example.jar to assigned location: /srv/
BigData/streaming/stormdir/nimbus/inbox/stormjar-8d3b778d-69ea-4fbe-ba88-01aa2036d753.jar
Start uploading file '/opt/jar/example.jar' to '/srv/BigData/streaming/stormdir/nimbus/inbox/
stormjar-8d3b778d-69ea-4fbe-ba88-01aa2036d753.jar' (65574612 bytes)
[==================================================] 65574612 / 65574612
File '/opt/jar/example.jar' uploaded to '/srv/BigData/streaming/stormdir/nimbus/inbox/
stormjar-8d3b778d-69ea-4fbe-ba88-01aa2036d753.jar' (65574612 bytes)
[main] INFO b.s.StormSubmitter - Successfully uploaded topology jar to assigned location: /srv/BigData/
streaming/stormdir/nimbus/inbox/stormjar-8d3b778d-69ea-4fbe-ba88-01aa2036d753.jar
[main] INFO b.s.StormSubmitter - Submitting topology word-count in distributed mode with conf
{"topology.worker.childopts":"-
Xmx4096m","storm.zookeeper.topology.auth.scheme":"digest","storm.zookeeper.topology.auth.payload":"-59
15065013522446406:-6421330379815193999","topology.workers":1}
[main] INFO b.s.StormSubmitter - Finished submitting topology: word-count
```

The following worker process information is displayed after the **ps -ef | grep worker** command is executed:



Cause Analysis

1. **topology.worker.gc.childopts**, **topology.worker.childopts**, and **worker.gc.childopts** (server parameters) have priorities: **topology.worker.gc.childopts** > **worker.gc.childopts** > **topology.worker.childopts**.
2. If the client parameter **topology.worker.childopts** is set, this parameter and the server parameter **worker.gc.childopts** are configured together. However, for two same parameters, one of them will be overwritten by the other parameter after it. Take parameter **-Xmx**, as shown in the red box of the preceding figure, as an example, parameter **-Xmx1G** overwrites **-Xmx4096m**.
3. If parameter **topology.worker.gc.childopts** is configured on the client, the parameter **worker.gc.childopts** on the server will be replaced.

Solution

Step 1 If you want to modify the JVM parameter of the topology, you can directly modify the **topology.worker.gc.childopts** parameter in the command or modify the

parameter on the server. When **topology.worker.gc.childopts** is set to **-Xms4096m -Xmx4096m -XX:+UseG1GC -XX:+PrintGCDetails -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M**:

```
[main-SendThread(10.7.61.88:2181)] INFO o.a.s.s.o.a.z.ClientCnxn - Socket connection established, initiating session, client: /10.7.61.88:44694, server: 10.7.61.88/10.7.61.88:2181

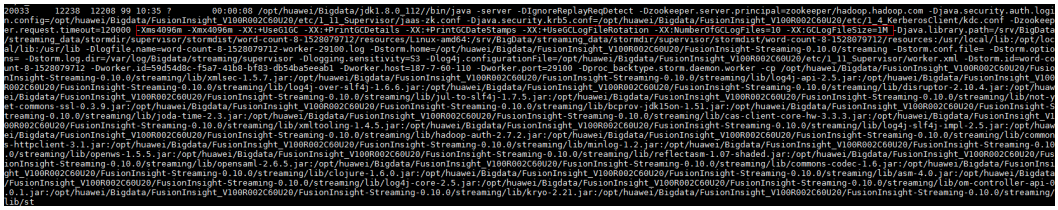
Step 2 Run the **ps -ef | grep worker** command to view the worker process information:



----End

16.15.8 Internal Server Error Is Displayed When the User Queries Information on the UI

Symptom

An MRS cluster is installed, and ZooKeeper and Storm are installed in the cluster.

"Internal Server Error" is displayed when a user accesses information from the **Storm Status** page of MRS Manager.

The detailed information is as follows:

```
Internal Server Error
org.apache.thrift7.transport.TTransportException: Frame size (306030) larger than max length (1048576)!
```

Possible Causes

- Nimbus of Storm is abnormal.
- Storm cluster information exceeds the default Thrift transmission size.

Cause Analysis

1. Check the Storm service status and monitoring metrics:
   - MRS Manager: Log in to MRS Manager and choose **Services** > **Storm**. Check the Storm status. The status is **Good**, and the monitoring metrics are correctly displayed.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Storm**.

     Check the Storm status. It is found that the status is good and the monitoring metrics are correctly displayed.
2. Click the **Instance** tab and check the status of the Nimbus instance. The status is normal.
3. Check the Thrift configuration of the Storm cluster. It is found that **nimbus.thrift.max_buffer_size** is set to **1048576** (1 MB).
4. The preceding configuration is the same as that in the exception information, indicating that the buffer size of Thrift is less than that required by the cluster information.

Procedure

Adjust the Thrift buffer size of the Storm cluster.

Step 1 Access the Storm parameter configuration page.

- MRS Manager: Log in to MRS Manager, choose **Services** > **Storm** > **Service Configuration**, and select **All** from the **Type** drop-down list.
- Operation on FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Yarn** > **Configurations** > **All Configurations**.

Step 2 Change the value of **nimbus.thrift.max_buffer_size** to **10485760** (10 MB).

Step 3 Click Save Configuration and select **Restart the affected services or instances**. Click **OK** to restart the services.

----End

16.16 Using Ranger

16.16.1 After Ranger Authentication Is Enabled for Hive, Unauthorized Tables and Databases Can Be Viewed on the Hue Page

Issue

Although Ranger authentication is enabled for Hive, unauthorized tables and databases can be still viewed on the Hue page.

Symptom

In a normal cluster with Kerberos authentication disabled, after Ranger authentication is enabled for Hive, unauthorized tables and databases can be viewed on the Hue page.

Cause Analysis

After Ranger authentication is enabled for Hive, the default Hive policies contain two public group policies about databases. All users belong to the public group. By default, the public group is granted the permission to create tables in the default database and create other databases. Therefore, all users have the **show databases** and **show tables** permissions by default. If some users do not need to have these two permissions, you can delete the default public group policies on the Ranger web UI and grant the required user permissions.

Procedure

Step 1 Log in to the Ranger web UI.

Step 2 In the **Service Manager** area, click the Hive component name to access the Hive security access policy page.

Step 3 Click in the rows containing the **all - database** and **default database tables columns** policies.

Step 4 Delete the public group policies.

Figure 16-55 all - database policy

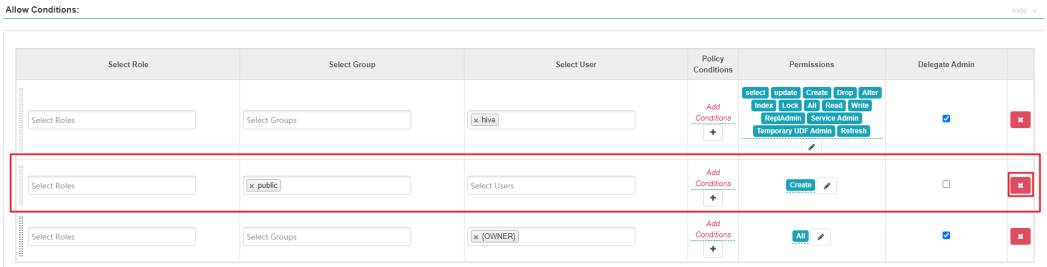


Figure 16-56 default database tables columns policy

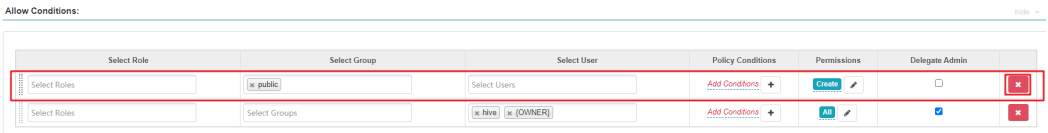

Step 5 On the Hive security access policy page, click **Add New Policy** to add resource access policies for related users or user groups.

----End

16.17 Using Yarn

16.17.1 Plenty of Jobs Are Found After Yarn Is Started

Issue

After Yarn starts in an MRS cluster (MRS 2.x or earlier), plenty of jobs occupying resources are found.

Symptom

After the customer creates an MRS cluster and starts Yarn, plenty of jobs occupying resources are found.

Cause Analysis

- It is suspected that there are hacker attacks.
- Set the Any protocol in the inbound direction of the SG to the 0.0.0.0/0.

IPv4	Any	Any	0.0.0.0/0
IPv4	Any	Any	0.0.0.0/0
IPv4	Any	Any	0.0.0.0/0

Procedure

Step 1 Log in to the MRS management console. On the **Active Clusters** page, click the cluster name. The cluster details page is displayed.

Step 2 Click **Manage** next to **Cluster Manager**. The **Access MRS Manager** page is displayed.

Step 3 Click **Manage Security Group Rule** to check the security group rule configuration.

Step 4 Check whether the source address of the Any protocol in the inbound direction is 0.0.0.0/0.

Step 5 If it is 0.0.0.0/0, change the remote end of the Any protocol in the inbound direction to a specified IP address. If it is not 0.0.0.0/0, there is no need to change the value.

Step 6 After the value is changed successfully, restart the cluster VM.

----End

Summary and Suggestions

Disable the Any protocol in the inbound direction, or specify the remote end of the Any protocol in the inbound direction as the specified IP address.

Related Information

For details, see **MapReduce Service User Guide** > **Security > Security Configuration Suggestions for Clusters with Kerberos Authentication Disabled**.

16.17.2 "GC overhead" Is Displayed on the Client When Tasks Are Submitted Using the Hadoop Jar Command

Symptom

When a user submits a task on the client, the client returns a memory overflow error.

```
main path:hdfs://hacluster/user/wangyou
17/09/18 08:29:57 INFO hdfs.DFSClient: Created HDFS_DELEGATION_TOKEN token 22890097 for wangyou on ha-hdfs:hacluster

        at org.apache.hadoop.mapreduce.Job.submit(Job.java:1287)
```

Cause Analysis

According to the error stack, the memory overflows when the HDFS files are read during task submission. Generally, the memory is insufficient because the task needs to read a large number of small files.

Solution

Step 1 Check whether multiple HDFS files need to be read for the started MapReduce tasks. If yes, reduce the file quantity by combining the small-sized files in advance or using **combineInputFormat**.

Step 2 Increase the memory when the **hadoop** command is run. The memory is set on the client. Change the value of **-Xmx** in **CLIENT_GC_OPTS** in the *Client installation directory*/**HDFS/component_env** file to a larger value, for example, 512 MB. Run the **source component_env** command for the modification to take effect.

```
export YARN_ROOT_LOGGER=INFO,console

#GC_OPTS for client operation.
CLIENT_GC_OPTS="-Xmx512m -Djava.io.tmpdir=${HADOOP_HOME}"

export HADOOP_CLIENT_OPTS="$CLIENT_GC_OPTS"
```

----End

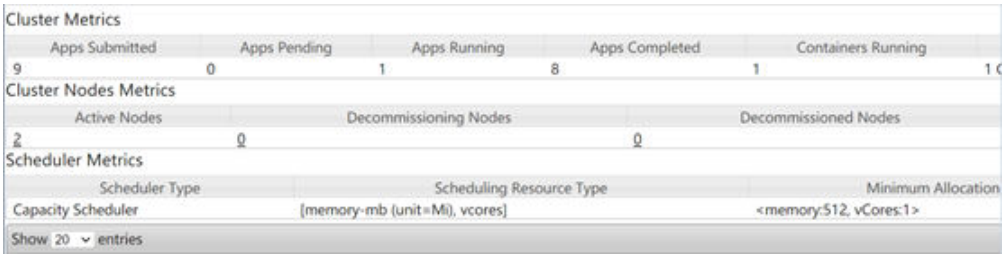
16.17.3 Disk Space Is Used Up Due to Oversized Aggregated Logs of Yarn

Issue

The disk usage of the cluster is high.

Symptom

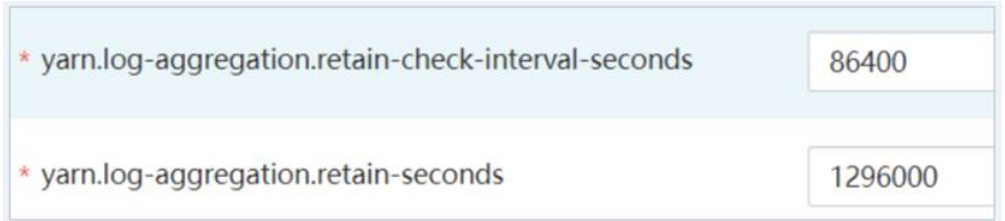
- On the host management page of Manager, the disk usage is too high.
- Only a few tasks are running on the Yarn web UI.



- After the **hdfs dfs -du -h /** command is executed on the master node of the cluster, the command output shows that the following files consume a large amount of disk space.

```
22.5 G   45.0 G   /tmp/logs/root/logs/application_1589278244866_0153
18.4 M   36.8 M   /tmp/logs/root/logs/application_1589278244866_0154
23.4 G   46.8 G   /tmp/logs/root/logs/application_1589278244866_0155
23.5 G   46.9 G   /tmp/logs/root/logs/application_1589278244866_0156
23.7 G   47.4 G   /tmp/logs/root/logs/application_1589278244866_0157
23.7 G   47.4 G   /tmp/logs/root/logs/application_1589278244866_0158
22.5 G   45.0 G   /tmp/logs/root/logs/application_1589278244866_0159
18.5 M   37.0 M   /tmp/logs/root/logs/application_1589278244866_0160
22.5 G   45.0 G   /tmp/logs/root/logs/application_1589278244866_0161
18.8 M   37.6 M   /tmp/logs/root/logs/application_1589278244866_0162
24.0 G   48.0 G   /tmp/logs/root/logs/application_1589278244866_0163
121.3 K  242.7 K  /tmp/logs/root/logs/application_1589278244866_0164
1.1 M    2.1 M    /tmp/logs/root/logs/application_1589278244866_0165
1.1 M    2.1 M    /tmp/logs/root/logs/application_1589278244866_0166
1.1 M    2.1 M    /tmp/logs/root/logs/application_1589278244866_0167
1.1 M    2.1 M    /tmp/logs/root/logs/application_1589278244866_0168
```

- The log aggregation configuration of the Yarn service is as follows.



Cause Analysis

Jobs are submitted too frequently, and the time for deleting aggregated log files is set to 1296000, that is, aggregated logs are retained for 15 days. As a result, aggregated logs cannot be released within a short period of time, exhausting the disk space.

Procedure

Step 1 Log in to Manager and navigate to the all configurations page of the MapReduce service.

- MRS Manager: Log in to MRS Manager, choose **Services** > **MapReduce** > **Service Configuration**, and select **All** from the **Type** drop-down list.
- FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > **Services** > **MapReduce**. On the MapReduce page, choose **Configurations** > **All Configurations**.

Step 2 Search for the **yarn.log-aggregation.retain-seconds** parameter and decrease its value based on site requirements, for example, to **259200**. In this case, the aggregated logs of Yarn are retained for three days, and the disk space is automatically released after the retention period expires.

Step 3 Click **Save Configuration** and deselect **Restart the affected services or instances**.

Step 4 Restart the MapReduce service during off-peak hours. The restart will interrupt upper-layer services and affect cluster management, maintenance, and services.

1. Log in to Manager.
2. Restart the MapReduce service.

----End

16.17.4 Temporary Files Are Not Deleted When a MapReduce Job Is Abnormal

Issue

Temporary files are not deleted when a MapReduce job is abnormal.

Symptom

There are too many files in the HDFS temporary directory, occupying too much memory.

Cause Analysis

When a MapReduce job is submitted, related configuration files, JAR files, and files added by running the **-files** command are stored in the temporary directory on HDFS so that the started container can obtain the files. The configuration item **yarn.app.mapreduce.am.staging-dir** specifies the storage path. The default value is **/tmp/hadoop-yarn/staging**.

After a properly running MapReduce job is complete, temporary files are deleted. However, when a Yarn task corresponding to the job exits abnormally, temporary files are not deleted. As a result, the number of files in the temporary directory increases over time, occupying more and more storage space.

Procedure

Step 1 Log in to a cluster.

1. Log in to any master node as user **root**. The user password is the one defined during cluster creation.
2. If Kerberos authentication is enabled for the cluster, run the following commands to go to the client installation directory and configure environment variables. Then, authenticate the user and enter the password as prompted. Obtain the password from an administrator.

   cd *Client installation directory*

   source bigdata_env

   kinit hdfs
3. If Kerberos authentication is not enabled for the cluster, run the following commands to switch to user **omm** and go to the client installation directory to configure environment variables:

   su - omm

   cd *Client installation directory*

   source bigdata_env

Step 2 Obtain the file list.

hdfs dfs -ls /tmp/hadoop-yarn/staging/*/.staging/ | grep "^drwx" | awk '{print $8}' > job_file_list

The **job_file_list** file contains the folder list of all jobs. The following shows an example of the file content:

```
/tmp/hadoop-yarn/staging/omm/.staging/job__<Timestamp>_<ID>
```

Step 3 Collect statistics on running jobs.

mapred job -list 2>/dev/null | grep job_ | awk '{print $1}' > run_job_list

The **run_job_list** file contains the IDs of running jobs. The content format is as follows:

```
job_<Timestamp>_<ID>
```

Step 4 Delete running jobs from the **job_file_list** file. Ensure that data of running jobs is not deleted by mistake when deleting expired data.

cat run_job_list | while read line; do sed -i "/$line/d" job_file_list; done

Step 5 Delete expired data.

cat job_file_list | while read line; do hdfs dfs -rm -r $line; done

Step 6 Delete temporary files.

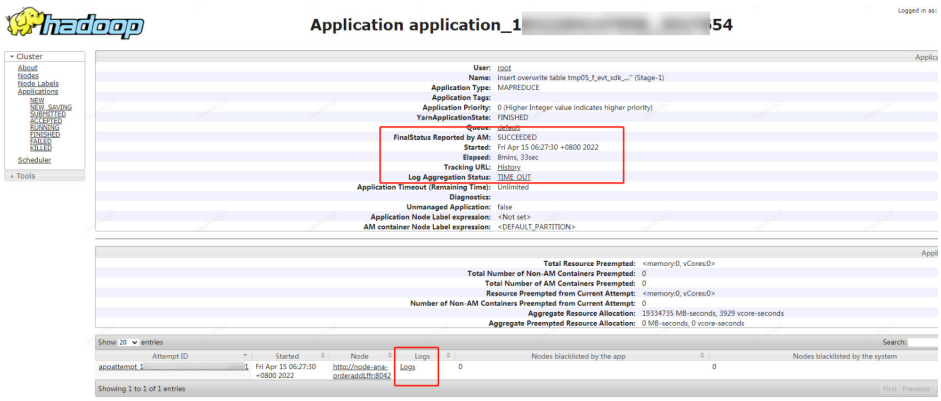
rm -rf run_job_list job_file_list

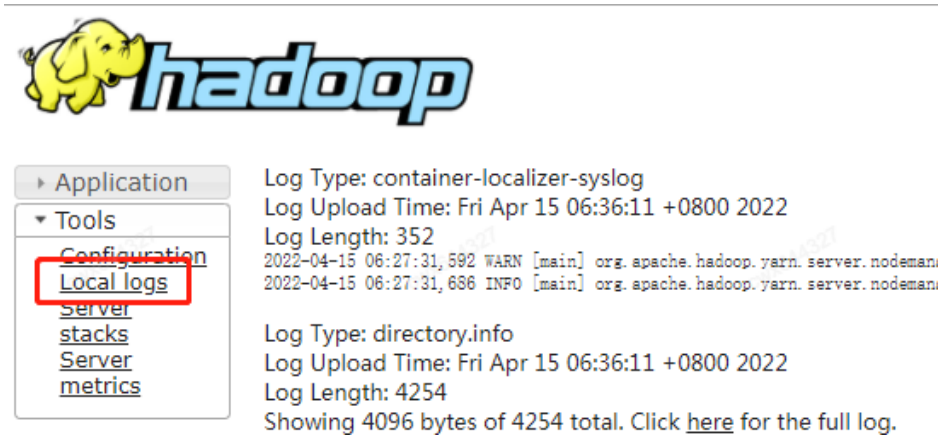
----End

16.17.5 Failed to View Job Logs on the Yarn Web UI

Symptom

When a user logs in to the Yarn web UI to view job logs and clicks **Local logs**, error message "Could not access logs page!" is displayed.





Cause Analysis

Local logs is used to access service logs. However, for security purposes, this function is inaccessible from the Yarn web UI. You can log in to the active ResourceManager node to view ResourceManager logs.

Procedure

Step 1 Log in to Manager and choose **Cluster** > **Services** > **Yarn**. On the **Yarn** page, click the **Instance** tab and take note of the service IP address of the active ResourceManager instance.

Step 2 Log in to the active ResourceManager node as user **root**.

Step 3 Go to the **/var/log/Bigdata/yarn/rm** directory and view the ResourceManager logs.

cd /var/log/Bigdata/yarn/rm

----End

16.18 Using ZooKeeper

16.18.1 Accessing ZooKeeper from an MRS Cluster

Issue

An error is reported when a user attempts to access ZooKeeper from an MRS cluster.

Symptom

The customer uses **zkcli.sh** to access ZooKeeper on the MRS Master node, but an error is reported.

Cause Analysis

The command used by the customer is incorrect. As a result, an error is reported.

Procedure

Step 1 Obtain the ZooKeeper IP address.

Step 2 Log in to the Master node as user **root**.

Step 3 Run the following command to initialize environment variables:

source /opt/client/bigdata_env

Step 4 Run the **zkCli.sh -server** *IP address of the node where ZooKeeper is located*:**2181** command to connect to ZooKeeper of the MRS cluster.

The IP address of the node where ZooKeeper is located is the one queried in **Step 1**. Use commas (,) to separate multiple IP addresses.

Step 5 Run common commands such as **ls /** to view ZooKeeper information.

----End

16.19 Accessing OBS

16.19.1 When Using the MRS Multi-user Access to OBS Function, a User Does Not Have the Permission to Access the /tmp Directory

Issue

When the MRS multi-user access to OBS function is used to execute jobs such as Spark, Hive jobs, an error message is displayed, indicating that the user does not have the permission to access the **/tmp** directory.

Symptom

When the MRS multi-user access to OBS function is used to execute jobs such as Spark, Hive jobs, an error message is displayed, indicating that the user does not have the permission to access the **/tmp** directory.

Cause Analysis

A temporary directory exists during job execution. The user who submits the job does not have permission on the temporary directory.

Procedure

Step 1 On the **Dashboard** tab page of the cluster, query and record the name of the agency bound to the cluster.

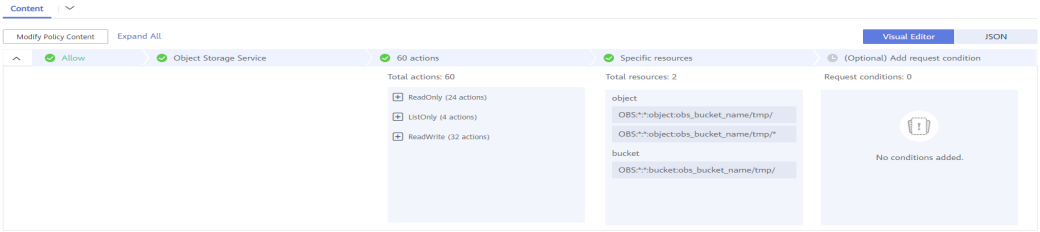
Step 2 Log in to the IAM console.

Step 3 Choose **Permissions**. On the displayed page, click **Create Custom Policy**.

- **Policy Name**: Enter a policy name.
- **Scope**: Select **Global services**.
- **Policy View**: Select **Visual editor**.
- **Policy Content**:
  a. **Allow**: Select **Allow**.
  b. **Select service**: Select **Object Storage Service (OBS)**.
  c. **Select action**: Select **WriteOnly**, **ReadOnly**, and **ListOnly**.
  d. **Specific resources**:
     i. Set **object** to **Specify resource path**, click **Add resource path**, and enter *obs_bucket_name*/**tmp/** and *obs_bucket_name*/**tmp/*** in **Path**. The **/tmp** directory is used as an example. If you need to add permissions for other directories, perform the following steps to add the directories and resource paths of all objects in the directories.
     ii. Set **bucket** to **Specify resource path**, click **Add resource path**, and enter *obs_bucket_name* in **Path**.

     Replace *obs_bucket-name* with the actual OBS bucket name. If the bucket type is Parallel File System, you need to add the *obs_bucket_name*/**tmp/** path. If the bucket type is Object Storage, you do not need to add the path.
  e. (Optional) Request condition, which does not need to be added currently.

Figure 16-57 Custom policy



Step 4 Click **OK**.

Step 5 Select **Agency** and click **Assign Permissions** in the **Operation** column of the agency queried in **Step 1**.

Step 6 Query and select the created policy in **Step 3**.

Step 7 Click **OK**.

----End

16.19.2 When the Hadoop Client Is Used to Delete Data from OBS, It Does Not Have the Permission for the .Trash Directory

Issue

When a user uses the Hadoop client to delete data from OBS, an error message is displayed indicating that the user does not have the permission on the **.Trash** directory.

Symptom

After the **hadoop fs -rm obs://<*obs_path*>** command is executed, the following error information is displayed:

```
exception [java.nio.file.AccessDeniedException: user/root/.Trash/Current/: getFileStatus on user/root/.Trash/Current/: status [403]
```

Cause Analysis

When deleting a file, Hadoop moves the file to the **.Trash** directory. If the user does not have the permission on the directory, error 403 is reported.

Procedure

Solution 1:

Run the **hadoop fs -rm -skipTrash** command to delete the file.

Solution 2:

Add the permission to access the **.Trash** directory to the agency corresponding to the cluster.

Step 1 On the **Dashboard** tab page of the cluster, query and record the name of the agency bound to the cluster.

Step 2 Log in to the IAM console.

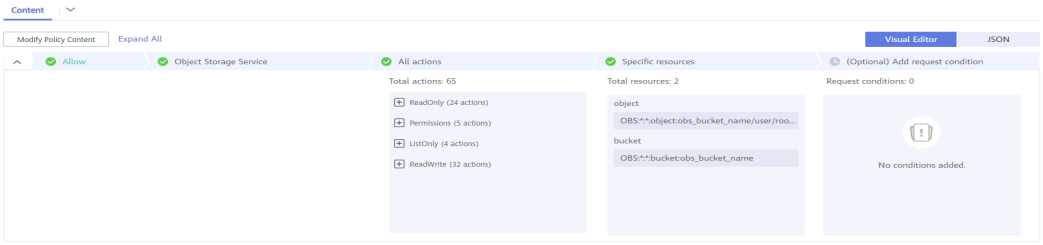
Step 3 Choose **Permissions**. On the displayed page, click **Create Custom Policy**.

- **Policy Name**: Enter a policy name.
- **Scope**: Select **Global services**.
- **Policy View**: Select **Visual editor**.
- **Policy Content**:

a. **Allow**: Select **Allow**.
b. **Select service**: Select **Object Storage Service (OBS)**.
c. Select all operation permissions.
d. **Specific resources**:
   i. Set **object** to **Specify resource path**, click **Add resource path**, and enter the **.Trash** directory, for example, **obs_bucket_name/user/root/.Trash/*** in **Path**.
   ii. Set **bucket** to **Specify resource path**, click **Add resource path**, and enter *obs_bucket_name* in **Path**.

   Replace *obs_bucket-name* with the actual OBS bucket name.
e. (Optional) Request condition, which does not need to be added currently.

Figure 16-58 Custom policy



Step 4 Click **OK**.

Step 5 Select **Agency** and click **Assign Permissions** in the **Operation** column of the agency queried in **Step 1**.

Step 6 Query and select the created policy in **Step 3**.

Step 7 Click **OK**.

Step 8 Run the **hadoop fs -rm obs://<*obs_path*>** command again.

----End

17 Appendix

17.1 Precautions

Purpose

FusionInsight Manager to manage and monitor clusters. On the Cluster Management page of the MRS management console, you can view cluster details, manage nodes, components, alarms, files, jobs, Bootstrap actions, and tags.

Accessing MRS Manager

For details about how to access FusionInsight Manager, see **Accessing FusionInsight Manager**.

Modifying MRS Cluster Service Configuration Parameters

You need to log in to FusionInsight Manager to modify service configuration parameters.

1. Log in to FusionInsight Manager.
2. Choose **Cluster** > **Services**.
3. Click the specified service name on the service management page.
4. Click **Configurations**.

   The **Basic Configurations** tab page is displayed by default. To modify more parameters, click the **All Configurations** tab. The navigation tree displays all configuration parameters of the service. The level-1 nodes in the navigation tree are service names or role names. The parameter category is displayed after the level-1 node is expanded.
5. In the navigation tree, select the specified parameter category and change the parameter values on the right.

   If you are not sure about the location of a parameter, you can enter the parameter name in search box in the upper right corner. The Manager searches for the parameter in real time and displays the result.
6. Click **Save**. In the confirmation dialog box, click **OK**.

7. Wait until the message "Operation succeeded" is displayed. Click **Finish**. The configuration is modified.

   Check whether there is any service whose configuration has expired in the cluster. If yes, restart the corresponding service or role instance for the configuration to take effect.

17.2 Installing the Flume Client

Scenario

To use Flume to collect logs, you must install the Flume client on a log host. You can create an ECS and install the Flume client on it.

This section applies to MRS 3.*x* or later.

Prerequisites

- A cluster with the Flume component has been created.
- The log host is in the same VPC and subnet with the MRS cluster.
- You have obtained the username and password for logging in to the log host.
- The installation directory is automatically created if it does not exist. If it exists, the directory must be left blank. The directory path cannot contain any space.

Procedure

Step 1 Obtain the software package.

Log in to the FusionInsight Manager. Choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the Flume service page that is displayed, choose **More** > **Download Client** in the upper right corner and set **Select Client Type** to **Complete Client** to download the Flume service client file.

The file name of the client is **FusionInsight_Cluster_**<*Cluster ID*>**_Flume_Client.tar**. This section takes the client file **FusionInsight_Cluster_1_Flume_Client.tar** as an example.

Step 2 Upload the software package.

Upload the software package to a directory, for example, **/opt/client**, on the node where the Flume client is to be installed as user **user**.

NOTE

user is the user who installs and runs the Flume client.

Step 3 Decompress the software package.

Log in to the node where the Flume service client is to be installed as user **user**. Go to the directory where the installation package is installed, for example, **/opt/client**, and run the following command to decompress the installation package to the current directory:

cd /opt/client

tar -xvf FusionInsight_Cluster_1_Flume_Client.tar

Step 4 Verify the software package.

Run the **sha256sum -c** command to verify the decompressed file. If **OK** is returned, the verification is successful. Example:

sha256sum -c FusionInsight_Cluster_1_Flume_ClientConfig.tar.sha256

```
FusionInsight_Cluster_1_Flume_ClientConfig.tar: OK
```

Step 5 Decompress the package.

tar -xvf FusionInsight_Cluster_1_Flume_ClientConfig.tar

Step 6 To install the Flume client on a node outside the cluster, perform the following steps to configure the installation environment. Skip this step if you install Flume client on a node in the cluster.

1. Run the following command to install the client running environment to a new directory, for example, **/opt/Flumeenv**. A directory is automatically generated during the client installation.

   sh /opt/client/FusionInsight_Cluster_1_Flume_ClientConfig/install.sh /opt/Flumeenv

   If the following information is displayed, the client running environment is successfully installed:

   ```
   Components client installation is complete.
   ```

2. Run the following command to set environment variables:

   source /opt/Flumeenv/bigdata_env

Step 7 Run the following command in the Flume client installation directory to install the client to a specified directory (for example, **opt/FlumeClient**): After the client is installed successfully, the installation is complete.

cd /opt/client/FusionInsight_Cluster_1_Flume_ClientConfig/Flume/FlumeClient

./install.sh -d */opt/FlumeClient* **-f** *MonitorServerService IP address or host name of the role* **-c** *User service configuration filePath for storing properties.properties* **-s** *CPU threshold* **-l /var/log/Bigdata -e** *FlumeServer service IP address or host name* **-n** *Flume*

NOTE

- **-d**: Flume client installation path
- (Optional) **-f**: IP addresses or host names of two MonitorServer roles. The IP addresses or host names are separated by commas (,). If this parameter is not configured, the Flume client does not send alarm information to MonitorServer and information about the client cannot be viewed on the FusionInsight Manager GUI.
- (Optional) **-c**: Service configuration file, which needs to be generated on the configuration tool page of the Flume server based on your service requirements. Upload the file to any directory on the node where the client is to be installed. If this parameter is not specified during the installation, you can upload the generated service configuration file **properties.properties** to the **/opt/FlumeClient/fusioninsight-flume-1.9.0/conf** directory after the installation.
- (Optional) **-s**: cgroup threshold. The value is an integer ranging from 1 to 100 x *N*. *N* indicates the number of CPU cores. The default threshold is **-1**, indicating that the processes added to the cgroup are not restricted by the CPU usage.
- (Optional) **-l**: Log path. The default value is **/var/log/Bigdata**. The user **user** must have the write permission on the directory. When the client is installed for the first time, a subdirectory named **flume-client** is generated. After the installation, subdirectories named **flume-client-***n* will be generated in sequence. The letter *n* indicates a sequence number, which starts from 1 in ascending order. In the **/conf/** directory of the Flume client installation directory, modify the **ENV_VARS** file and search for the **FLUME_LOG_DIR** attribute to view the client log path.
- (Optional) **-e**: Service IP address or host name of FlumeServer, which is used to receive statistics for the monitoring indicator reported by the client.
- (Optional) **-n**: Name of the Flume client. You can choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Flume Management** on FusionInsight Manager to view the client name on the corresponding node.
- If the following error message is displayed, run the **export JAVA_HOME=*JDK path*** command. You can run the **echo $JAVA_HOME** command to query the JDK path.
  JAVA_HOME is null in current user,please install the JDK and set the JAVA_HOME
- IBM JDK does not support **-Xloggc**. You must change **-Xloggc** to **-Xverbosegclog** in **flume/conf/flume-env.sh**. For 32-bit JDK, the value of **-Xmx** must not exceed 3.25 GB.
- When installing a cross-platform client in a cluster, go to the **/opt/client/FusionInsight_Cluster_1_Flume_ClientConfig/Flume/FusionInsight-Flume-1.9.0.tar.gz** directory to install the Flume client.

----End

17.3 Change History

Release Date	What's New
2024-11-30	This issue is the first official release.
