This section applies only to MRS 3.1.2 or later. For versions earlier than MRS 3.1.2, see [Changing the Password for a Component Database User](#).

##### Impact on the System

To reset passwords, you need to stop and then restart services, during which services are unavailable.

##### Procedure

**Step 1** On FusionInsight Manager, click **Cluster**, click the name of the desired cluster, and click **Services**.

**Step 2** Click the name of the service whose database user password is to be reset, for example, **Kafka**, and click **Stop Service** on the **Dashboard** page.

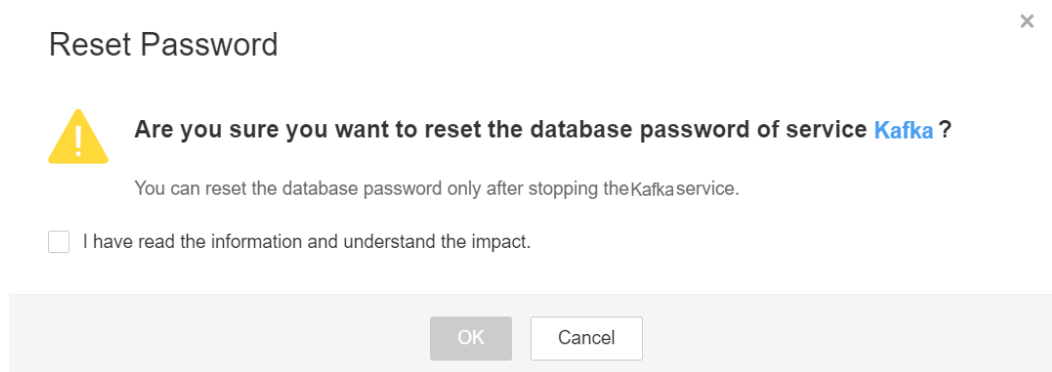

In the displayed dialog box, enter the password of the current login user and click **OK**.

After confirming the impact of stopping the service, wait until the service is stopped.

**Step 3** On the **Dashboard** page, choose **More > Reset Database Password**.

In the displayed dialog box, enter the password of the current login user and click **OK**.

Select "I have read the information and understand the impact", and click **OK**.

**Step 4** After the password is reset, click **Start Service** on the **Dashboard** page.

**Step 5** In the displayed dialog box, click **OK** and wait until the service is started.

----End

#### 8.11.2.4.5 Changing the Password for User omm in DBService

**Step 1** Log in to the active DBService node as user **root**.

 **NOTE**

The password of user **omm** for the DBService database cannot be changed on the standby DBService node. Change the password on the active DBService node only.

**Step 2** Run the following command to switch to another user:

```
su - omm
```

**Step 3** Run the following command to go to the related directory:

```
source $DBSERVER_HOME/.dbservice_profile
```

```
cd ${DBSERVICE_SOFTWARE_DIR}/sbin/
```

**Step 4** Run the following command to change the password of user **omm**:

```
sh modifyDBPwd.sh
```

**Step 5** Enter the old password of user **omm** and enter a new password twice.

The password must meet the following complexity requirements:

- Contains 8 to 32 characters.
- Contains at least three types of the following: uppercase letters, lowercase letters, numbers, and special characters (~`!@#\$%^&\*()-+\_=\\|[]{};":<.>/?).
- Cannot be the same as the username or the username spelled backwards.
- Cannot be the same as the last 20 historical passwords.

If the following information is displayed, the password is changed.

```
Successful to modify password.
```

----End

#### 8.11.2.4.6 Changing the Password for User compdbuser of the DBService Database

##### Scenario

It is recommended that the administrator periodically change the password of the OMS database administrator to improve the system O&M security.

##### Procedure

**Step 1** Log in to FusionInsight Manager, choose **Cluster > Services > DBService**, click **Instance**, and view the IP address of the active DBService node.

**Step 2** Log in to the active DBService node as user **root**.

 NOTE

The password of user **compuserdb** cannot be changed on the standby DBService node. Change the password on the active management node only.

**Step 3** Switch to the **\$DBSERVER\_HOME** directory and configure environment variables:

```
su - omm
cd $DBSERVER_HOME
source .dbservice_profile
```

**Step 4** Run the following command to change the password of user **compdbuser** as user **omm** of the DBService database:

```
gsqll -U omm -W omm Password of user omm of the DBService database -d
postgres -p 20051 -c "alter user compdbuser identified by 'New password
valid until 'Expiration time';"
```

 NOTE

- The new password must meet the following complexity requirements:
  - Contains 16 to 32 characters.
  - Contains at least three types of the following: uppercase letters, lowercase letters, numbers, and special characters (~`!@#\$%^&\*()-+\_=|[{}];:","<>/?).
  - Cannot be the same as the username or the username spelled backwards.
  - Cannot be the same as the last 20 historical passwords.
- The expiration time format is xxxx-xx-xx, for example, **2020-10-31**.

If the following information is displayed, the modification is successful:

```
ALTER ROLE
----End
```

### 8.11.2.5 Changing or Resetting the Password for User admin of Manager

User **admin** is the system administrator account of Manager. You are advised to periodically change the password on Manager to improve system security.

If the password is lost, reset the password by referring to [Resetting the Password for User admin](#).

## Changing the Password for User admin

You can change the password of user **admin** on Manager only for clusters with Kerberos authentication enabled and clusters with Kerberos authentication disabled but the EIP function enabled.

**Step 1** Log in to FusionInsight Manager.

User **admin** is required for login.

**Step 2** Move your cursor over **Hello, admin** in the upper right corner of the page.

On the user account drop-down menu, choose **Change Password**.

**Step 3** Set **Old Password**, **New Password**, and **Confirm Password**, and click **OK**.

----End

## Resetting the Password for User admin

**Step 1** Log in to the **Master1** node.

**Step 2** (Optional) To change the password as user **omm**, run the following command to switch the user:

```
sudo su - omm
```

**Step 3** Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

```
cd /opt/Bigdata/client
```

**Step 4** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 5** Run the following command to log in to the console as user **kadmin/admin**:

```
kadmin -p kadmin/admin
```

### NOTE

The default password of user **kadmin/admin** is **Admin@123**, which will expire upon your first login. Change the password as prompted and keep the new password secure.

**Step 6** Run the following command to reset the password of user **admin**:

```
cpw admin
```

----End

## 8.11.3 Certificate Management

### 8.11.3.1 Replacing the CA Certificate

#### Scenario

The MRS CA certificate is used for data encryption during the communication between the client and the server of a component to ensure communication security. You can replace the CA certificate on FusionInsight Manager to ensure product security. This operation is applicable to the following scenarios:

- After the cluster is installed for the first time, import an enterprise certificate.
- If the enterprise certificate has expired or security hardening is required, replace it with a new certificate.

After the CA certificate is replaced, the certificates that are used by HDFS, YARN, MapReduce, HBase, Loader, Hue, Flink (MRS 3.2.0 or later) Oozie, Hive, Tomcat, CAS, HTTPD, and LDAP in MRS will be automatically updated.

The certificate file and key file can be applied for from the enterprise certificate center or generated by the cluster user.

 NOTE

- Only CA certificates that can be issued and in **X.509** format can be imported in FusionInsight.
- FusionInsight requires that the OS encoding format be **en\_US.UTF-8** or **POSIX**. Otherwise, the certificate function will be abnormal.
- If an isolated faulty node exists in the current cluster, the CA certificate of the node will not be replaced. After the node is de-isolated, you need to reinstall the services running on the node to ensure that the node and the cluster use the same CA certificate.

## Impact on the System

The MRS system must be restarted during the replacement and cannot be accessed or provide services.

## Prerequisites

- You have obtained the files to be imported to the MRS cluster, including the CA certificate file (\*.cert), key file (\*.key), and file (password.property) that saves the key file password. The certificate name and key name support letters and digits.

- You have prepared a password for accessing the key file, for example, **Userpwd@123**.

To avoid potential security risks, the password must meet the following complexity requirements:

- Contains at least 8 characters.
  - Contains at least four types of the following: uppercase letters, lowercase letters, numbers, and special characters (~`!?,,:-\_'(){}/<>@#\$\$%^&\*+|\|=).
- When applying for a certificate from the certificate center, provide the password for accessing the key file and apply for the certificate files in CRT, CER, CERT, and PEM formats and the key files in KEY and PEM formats. The applied certificate must have the issuing function.

## Procedure

**Step 1** Log in to any management node in the cluster as user **omm**.

**Step 2** Select a method for generating certificate files and key files.

- If the certificate is generated by the certificate center, save the certificate file and key file to the **omm** user directory on the management node.

 NOTE

If the obtained certificate file is not in the **.cert** format and the key file is not in the **.key** format, run the following commands to change the file formats:

```
mv Certificate name.Certificate formatCertificate name.cert
```

```
mv Key name.Key format Key name.key
```

For example, run the following commands to name the certificate file **ca.cert** and name the key file **ca.key**:

```
mv server.cer ca.cert
```

```
mv server_key.pem ca.key
```

- If the certificate is generated by the cluster user, run the following commands to generate the certificate file and key file in the **omm** user directory on the management node:

- a. Generate the key file.

Run the following command to check whether the OpenSSL version is 1.1.1 or later:

```
/usr/bin/openssl version
```

- If yes, run the following command:

```
openssl genrsa -out Key name.key -aes256 3072
```

- If no, run the following command:

```
openssl genrsa -out Key name.key -aes256 3072 -sha256
```

For example, to generate the key file **ca.key**, run the following command:

```
openssl genrsa -out ca.key -aes256 3072 -sha256
```

Enter the password twice as prompted, and press **Enter**.

```
Enter pass phrase for ca.key:
Verifying - Enter pass phrase for ca.key:
```

- b. Generate the certificate file.

```
openssl req -new -x509 -days 1825 -key Key name.key -out Certificate
name.crt -subj "/C=cn/ST=guangdong/L=shenzhen/O=huawei/
OU=huawei/CN=huawei" -sha256
```

For example, to generate the certificate file **ca.crt**, run the following command:

```
openssl req -new -x509 -days 1825 -key ca.key -out ca.crt -subj "/
C=cn/ST=guangdong/L=shenzhen/O=huawei/OU=huawei/
CN=huawei" -sha256
```

Enter the password for the key file as prompted, and press **Enter**.

```
Enter pass phrase for ca.key:
```

- Step 3** Run the following command in the **omm** user directory on the management node to save the password for accessing the key file.

```
sh ${BIGDATA_HOME}/om-server/om/sbin/genPwFile.sh
```

Enter the password twice as prompted, and press **Enter**. After being encrypted, the password is saved in **password.property**.

```
Please input key password:
Please Confirm password:
```

#### NOTE

- The **password.property** file generated on the node you have logged is available only for the current cluster and cannot be used for other clusters. The file contains security information. Keep it secure and control the access permission.
- In active/standby DR scenarios, the **genPwFile.sh** script must be executed on both the active and DR cluster nodes, and the same password must be entered for the two clusters.

- Step 4** Compress the three files in the **.tar** format and save them to the local computer.

```
tar -cvf Package name Certificate name .crt Key name .key password.property
```

For example, **tar -cvf test.tar ca.crt ca.key password.property**

 **NOTE**

In active/standby DR scenarios, run this command on each cluster node.

**Step 5** Log in to FusionInsight Manager and choose **System > Certificate**.

**Step 6** In the **Upload Certificate** area, click the file selection button. In the window for selecting files, select the obtained **.tar** certificate file packages and open them and click **Upload**. The system automatically imports the certificate.

**Step 7** After the certificate is imported, the system prompts you to synchronize the cluster configuration and restart the web service for the new certificate to take effect. After you complete these operations, click **OK**.

**Step 8** In the dialog box that is displayed, enter the password and click **OK** to automatically synchronize the cluster configuration and restart the web service.

**Step 9** After the cluster is restarted, enter the URL for accessing FusionInsight Manager in the address box of the browser and check whether the FusionInsight Manager web UI can be successfully displayed.

 **NOTE**

The enterprise certificate has expired or security is hardened. After replacing the MRS certificate, replace the local certificate as well.

**Step 10** Click the wanted cluster from the **Cluster** drop-down list.

**Step 11** Choose **More > Restart**. In the displayed dialog box, enter the password of the current login user and click **OK**.

 **NOTE**

After the CA certificate is replaced, you need to restart the cluster offline to make the certificate take effect. Rolling restart is not supported.

**Step 12** In the displayed restart confirmation dialog box, click **OK**.

----End

### 8.11.3.2 Replacing HA Certificates

#### Scenario

HA certificates are used to encrypt the communication between active/standby processes and high availability processes to ensure security. Replace the HA certificates on active and standby management nodes on FusionInsight Manager to ensure product security. This operation is applicable to the following scenarios:

- After the cluster is installed for the first time, import an enterprise certificate.
- If the enterprise certificate has expired or security hardening is required, replace it with a new certificate.

 **NOTE**

but is not applicable to scenarios where active and standby management nodes are not installed.

The certificate file and key file can be applied for from the enterprise certificate center or generated by the cluster user.

## Impact on the System

FusionInsight Manager must be restarted during the replacement and cannot be accessed or provide services.

## Prerequisites

- You have obtained the **root-ca.crt** root file and the **root-ca.pem** key file of the certificate to be replaced.
- You have prepared a password, for example, **Userpwd@123**, for accessing the key file.

To avoid potential security risks, the password must meet the following complexity requirements:

- Contains at least 8 characters.
- Contains at least four types of the following: uppercase letters, lowercase letters, numbers, and special characters (`~`!?,;:_'(){}[]/<>@#$$%^&*+|\=`).
- When applying for a certificate from the certificate center, provide the password for accessing the key file and apply for the certificate files in CRT, CER, CERT, and PEM formats and the key files in KEY and PEM formats. The applied certificate must have the issuing function.

## Procedure

**Step 1** Log in to the active management node as user **omm** using the IP address of the active management node.

**Step 2** Select a method for generating certificate files and key files.

- If the certificate is generated by the certificate center, save the certificate file and key file to the **`\${OMS\_RUN\_PATH}/workspace0/ha/local/cert** directory on the active and standby management nodes.

### NOTE

If the obtained certificate file is not in the **.crt** format and the key file is not in the **.pem** format, run the following commands to change the file formats:

```
mv Certificate name.Certificate format root-ca.crt
```

```
mv Key name.Key format root-ca.pem
```

For example, run the following commands to name the certificate file **root-ca.crt** and the key file **root-ca.pem**:

```
mv server.cer root-ca.crt
```

```
mv server_key.key root-ca.pem
```

- If the certificate is generated by the cluster user, run the following command to generate **root-ca.crt** and **root-ca.pem** in the **`\${OMS\_RUN\_PATH}/workspace0/ha/local/cert** directory:

```
sh `${OMS_RUN_PATH}/workspace/ha/module/hacom/script/gen-cert.sh --
root-ca --country=CN --state=state --city=city --company=company --
organize=organize --common-name=commonname --email=Cluster user
email address
```

 NOTE

The validity period of the generated certificate file is 10 years. When the system certificate file is about to expire, the system generates the "ALM-12055 Certificate File Is About to Expire" alarm.

For example, run the following command:

```
sh ${OMS_RUN_PATH}/workspace/ha/module/hacom/script/gen-cert.sh --
root-ca --country=CN --state=guangdong --city=shenzhen --
company=huawei --organize=IT --common-name=HADOOP.COM --
email=abc@example.com
```

Enter the password as prompted and press **Enter**.

Enter pass phrase for /opt/huawei/Bigdata/om-server/OMS/workspace/ha/local/cert/root-ca.pem:

The command is executed if the following information is displayed:

Generate root-ca pair success.

- Step 3** On the active management node, run the following command as user **omm** to copy **root-ca.crt** and **root-ca.pem** to the **\${BIGDATA\_HOME}/om-server/om/security/certHA** directory:

```
cp -arp ${OMS_RUN_PATH}/workspace0/ha/local/cert/root-ca.* $
{BIGDATA_HOME}/om-server/om/security/certHA
```

- Step 4** Copy **root-ca.crt** and **root-ca.pem** generated on the active management node to the **\${BIGDATA\_HOME}/om-server/om/security/certHA** directory on the standby management node as user **omm**.

```
scp ${OMS_RUN_PATH}/workspace0/ha/local/cert/root-ca.* omm@IP address
of the standby management node:${BIGDATA_HOME}/om-server/om/security/
certHA
```

- Step 5** Run the following command to generate an HA certificate and perform the automatic replacement:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/replacehaSSLCert.sh
```

Enter the password as prompted and press **Enter**.

Please input ha ssl cert password:

The DBService HA certificate is replaced successfully if the following information is displayed:

[INFO] Succeed to replace ha ssl cert.

 NOTE

If the user wants to update the package for encrypting the HA password, add the **-u** parameter.

- Step 6** Run the following command to restart the OMS:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/restart-oms.sh
```

The following information is displayed:

start HA successfully.

- Step 7** Log in to the standby management node as user **omm** using the IP address of the standby management node, and repeat steps [Step 5](#) and [Step 6](#).

Run `sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh` to check whether **HAAllResOK** of the management node is **Normal** and whether FusionInsight Manager can be logged in to again. If yes, the operation is successful.

----End

## 8.11.4 Security Hardening

### 8.11.4.1 Hardening Policies

#### Hardening Tomcat

Tomcat is hardened as follows based on open-source software during FusionInsight Manager software installation and use:

- The Tomcat version is upgraded to the official version.
- Permissions on the directories under applications are set to **500**, and the write permission on some directories is supported.
- The Tomcat installation package is automatically deleted after the system software is installed.
- The automatic deployment function is disabled for projects in application directories. Only the **web**, **cas**, and **client** projects are deployed.
- Some unused **http** methods are disabled, preventing attacks by using the **http** methods.
- The default shutdown port and command of the Tomcat server are changed to prevent hackers from shutting down the server and attacking servers and applications.
- To ensure security, the value of **maxHttpHeaderSize** is changed, which enables server administrators to control abnormal requests of clients.
- The Tomcat version description file is modified after Tomcat is installed.
- To prevent disclosure of Tomcat information, the Server attributes of Connector are modified so that attackers cannot obtain information about the server.
- Permissions on files and directories of Tomcat, such as the configuration files, executable files, log directories, and temporary folders, are under control.
- Session facade recycling is disabled to prevent request leakage.
- LegacyCookieProcessor is used as CookieProcessor to prevent the leakage of sensitive data in cookies.

#### Hardening LDAP

LDAP is hardened as follows after a cluster is installed:

- In the LDAP configuration file, the password of the administrator account is encrypted using SHA. After the OpenLDAP is upgraded to 2.4.39 or later, data is automatically synchronized between the active and standby LDAP nodes using the SASL External mechanism, which prevents disclosure of the password.

- The LDAP service in the cluster supports the SSLv3 protocol by default, which can be used safely. When the OpenLDAP is upgraded to 2.4.39 or later, the LDAP automatically uses TLS1.0 or later to prevent unknown security risks.

## Hardening JDK

- If the client process uses the AES256 encryption algorithm, JDK security hardening is required. The operations are as follows:

Obtain the Java Cryptography Extension (JCE) package whose version matches that of JDK. The JCE package contains **local\_policy.jar** and **US\_export\_policy.jar**. Copy the JAR files to the following directory and replace the files in the directory.

- Linux: *JDK installation directory*/jre/lib/security
- Windows: *JDK installation directory*\jre\lib\security

### NOTE

Access the Open JDK open-source community to obtain the JCE file.

- If the client process uses the SM4 encryption algorithm, the JAR package needs to be updated.

Obtain **SMS4JA.jar** in the *client installation directory*/JDK/jdk/jre/lib/ext/ directory, and copy the JAR package to the following directory:

- Linux: *JDK installation directory*/jre/lib/ext/
- Windows: *JDK installation directory*\jre\lib\ext\

## 8.11.4.2 Configuring a Trusted IP Address to Access LDAP

### Scenario

By default, the LDAP service deployed in the OMS and cluster can be accessed by any IP address. To enable the LDAP service to be accessed by only trusted IP addresses, you can configure the INPUT policy in the iptables filtering list.

### Impact on the System

After the configuration, the LDAP service cannot be accessed by IP addresses that are not configured. Before the expansion, the added IP addresses need to be configured as trusted IP addresses.

### Prerequisites

- You have collected the management plane IP addresses and service plane IP addresses of all nodes in the cluster and all floating IP addresses.
- You have obtained the **root** user account for all nodes in the cluster.

### Procedure

#### Configuring trusted IP addresses for the LDAP service on the OMS

**Step 1** Log in to FusionInsight Manager.

- Step 2** Choose **System > OMS** and choose **oldap > Modify Configuration** to view the OMS LDAP port number, that is, the value of **LDAP Listening Port**. The default port number is **21750**.
- Step 3** Log in to the active management node as user **root** using the IP address of the active management node.
- Step 4** Run the following command to check the INPUT policy in the iptables filtering list:

**iptables -L**

For example, if no rule is configured, the INPUT policy is displayed as follows:

```
Chain INPUT (policy ACCEPT)
target prot opt source destination
```

- Step 5** Run the following command to configure all IP addresses used by the cluster as trusted IP addresses. Each IP address needs to be added independently.

**iptables -A INPUT -s *Trusted IP address* -p tcp --dport *Port number* -j ACCEPT**

For example, to configure **10.0.0.1** as a trusted IP address and enable it to access port **21750**, you need to run the following command:

**iptables -A INPUT -s 10.0.0.1 -p tcp --dport 21750 -j ACCEPT**

- Step 6** Run the following command to configure all IP addresses as untrusted IP addresses. The trusted IP addresses will not be affected by this rule.

**iptables -A INPUT -p tcp --dport *Port number* -j DROP**

For example, to disable all IP addresses to access port **21750**, run the following command:

**iptables -A INPUT -p tcp --dport 21750 -j DROP**

- Step 7** Run the following command to view the modified INPUT policy in the iptables filtering list:

**iptables -L**

For example, after a trusted IP address is configured, the INPUT policy is displayed as follows:

```
Chain INPUT (policy ACCEPT)
target prot opt source destination tcp dpt:21750
ACCEPT tcp -- 10.0.0.1 anywhere tcp dpt:21750
DROP tcp -- anywhere anywhere tcp dpt:21750
```

- Step 8** Run the following command to view the rules and rule numbers in the iptables filtering list:

**iptables -L -n --line-number**

```
Chain INPUT (policy ACCEPT)
num target prot opt source destination tcp dpt:21750
1 DROP tcp -- 0.0.0.0/0 0.0.0.0/0 tcp dpt:21750
```

- Step 9** Run the following command to delete the desired rule from the iptables filtering list based on site requirement:

**iptables -D INPUT *Number of the rule to be deleted***

For example, to delete rule 1, run the following command:

**iptables -D INPUT 1**

**Step 10** Log in to the standby management node as user **root** using the standby IP address. Repeat [Step 4](#) to [Step 9](#).

**Configuring trusted IP addresses for the LDAP service in the cluster**

**Step 11** Log in to FusionInsight Manager.

**Step 12** Click **Cluster**, click the name of the desired cluster, and choose **Service > LdapServer**. On the displayed page, click **Instance** to view the nodes where the LDAP services locate.

**Step 13** Go to the **Configurations** page, and view the LDAP port number of the cluster, that is, the value of **LDAP\_SERVER\_PORT**. The default value is **21780**.

**Step 14** Log in to the LDAP node as user **root** using the LDAP service IP address.

**Step 15** Run the following command to view the INPUT policy in the iptables filtering list:

**iptables -L**

For example, if no rule is configured, the INPUT policy is displayed as follows:

```
Chain INPUT (policy ACCEPT)
target prot opt source destination
```

**Step 16** Run the following command to configure all IP addresses used by the cluster as trusted IP addresses. Each IP address needs to be added independently.

**iptables -A INPUT -s Trusted IP address -p tcp --dport Port number -j ACCEPT**

For example, to configure **10.0.0.1** as a trusted IP address and enable it to access port **21780**, you need to run the following command:

**iptables -A INPUT -s 10.0.0.1 -p tcp --dport 21780 -j ACCEPT**

**Step 17** Run the following command to configure all IP addresses as untrusted IP addresses. The trusted IP addresses will not be affected by this rule.

**iptables -A INPUT -p tcp --dport Port number -j DROP**

For example, to disable all IP addresses to access port **21780**, run the following command:

**iptables -A INPUT -p tcp --dport 21780 -j DROP**

**Step 18** Run the following command to view the modified INPUT policy in the iptables filtering list:

**iptables -L**

For example, after a trusted IP address is configured, the INPUT policy is displayed as follows:

```
Chain INPUT (policy ACCEPT)
target prot opt source destination
ACCEPT tcp -- 10.0.0.1 anywhere tcp dpt:21780
DROP tcp -- anywhere anywhere tcp dpt:21780
```

**Step 19** Run the following command to view the rules and rule numbers in the iptables filtering list:

**iptables -L -n --line-number**

```
Chain INPUT (policy ACCEPT)
num target prot opt source destination
1 DROP tcp -- 0.0.0.0/0 0.0.0.0/0 tcp dpt:21780
```

**Step 20** Run the following command to delete the desired rule from the iptables filtering list based on site requirement:

**iptables -D INPUT** *Number of the rule to be deleted*

For example, to delete rule 1, run the following command:

**iptables -D INPUT 1**

**Step 21** Log in to the LDAP node as user **root** using the IP address of another LDAP service, and repeat [Step 15](#) to [Step 20](#).

----End

### 8.11.4.3 HFile and WAL Encryption

#### HFile and WAL Encryption

##### NOTICE

- Setting the HFile and WAL encryption mode to SMS4 or AES has a great impact on the system and will cause data loss in case of any misoperation. Therefore, this operation is not recommended.
- Batch data import using Bulkload does not support data encryption.

HFile and Write ahead log (WAL) in HBase are not encrypted by default. To encrypt them, perform the following operations.

**Step 1** On any HBase node, run the following commands to create a key file as user **omm**:

```
sh ${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/install/FusionInsight-
HBase-2.2.3/hbase/bin/hbase-encrypt.sh <path>/hbase.jks <type> <length>
<alias>
```

- *<path>/hbase.jks* indicates the path for storing the generated JKS file.
- *<type>* indicates the encryption type, which can be SMS4 or AES.
- *<length>* indicates the key length. SMS4 supports 16-bit and AES supports 128-bit.
- *<alias>* indicate the alias of the key file. When you create the key file for the first time, retain the default value **omm**.

For example, to generate an SMS4 encryption key, run the following command:

```
sh ${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/install/FusionInsight-
HBase-2.2.3/hbase/bin/hbase-encrypt.sh /home/hbase/conf/hbase.jks SMS4 16
omm
```

To generate an AES encryption key, run the following command:

```
sh ${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/install/FusionInsight-
HBase-2.2.3/hbase/bin/hbase-encrypt.sh /home/hbase/conf/hbase.jks AES 128
omm
```

 NOTE

- To ensure operations can be successfully performed, the `<path>/hbase.jks` directory needs to be created in advance, and the cluster operation user must have the `rw` permission of this directory.
- After running the command, enter the same `<password>` four times. The password encrypted in [Step 3](#) is the same as the password in this step.

**Step 2** Distribute the generated key files to the same directory on all nodes in the cluster and assign read and write permission to user `omm`.

 NOTE

- Administrators need to select a safe procedure to distribute keys based on the enterprise security requirements.
- If the key files of some nodes are lost, repeat the step to copy the key files from other nodes.

**Step 3** On FusionInsight Manager, set `hbase.crypto.keyprovider.parameters.encryptedtext` to the encrypted password. Set `hbase.crypto.keyprovider.parameters.uri` to the path and name of the key file.

- The format of `hbase.crypto.keyprovider.parameters.uri` is `jceks://<key_Path_Name>`.  
`<key_Path_Name>` indicates the path of the key file. For example, if the path of the key file is `/home/hbase/conf/hbase.jks`, set this parameter to `jceks:///home/hbase/conf/hbase.jks`.
- The format of `hbase.crypto.keyprovider.parameters.encryptedtext` is `<encrypted_password>`.  
`<encrypted_password>` indicates the encrypted password generated during the key file creation. The parameter value is displayed in ciphertext. Run the following command as user `omm` to obtain the related encrypted password on the nodes where HBase service is installed:

```
sh ${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/install/FusionInsight-
HBase-2.2.3/hbase/bin/hbase-encrypt.sh
```

 NOTE

After running the command, you need to enter `<password>`. The password is the same as that entered in [Step 1](#).

**Step 4** On FusionInsight Manager, set `hbase.crypto.key.algorithm` to `SMS4` or `AES` to use SMS4 or AES for HFile encryption.

**Step 5** On FusionInsight Manager, set `hbase.crypto.wal.algorithm` to `SMS4` or `AES` to use SMS4 or AES for WAL encryption.

**Step 6** On FusionInsight Manager, set `hbase.regionserver.wal.encryption` to `true`.

**Step 7** Save the settings and restart the HBase service for the settings to take effect.

**Step 8** Create an HBase table through CLI or code and configure the encryption mode to enable encryption. **<type>** indicates the encryption type, and **d** indicates the column family.

- When you create an HBase table through CLI, set the encryption mode to SMS4 or AES for the column family.

```
create '<table name>', {NAME => 'd', ENCRYPTION => '<type>'}
```

- When you create an HBase table using code, set the encryption mode to SMS4 or AES by adding the following information to the code:

```
public void testCreateTable()
{
 String tableName = "user";
 Configuration conf = getConfiguration();
 HTableDescriptor htd = new HTableDescriptor(TableName.valueOf(tableName));

 HColumnDescriptor hcd = new HColumnDescriptor("d");
 //Set the encryption mode to SMS4 or AES.
 hcd.setEncryptionType("<type>");
 htd.addFamily(hcd);

 HBaseAdmin admin = null;
 try
 {
 admin = new HBaseAdmin(conf);

 if(!admin.tableExists(tableName))
 {
 admin.createTable(htd);
 }
 }
 catch (IOException e)
 {
 e.printStackTrace();
 }
 finally
 {
 if(admin != null)
 {
 try
 {
 admin.close();
 }
 catch (IOException e)
 {
 e.printStackTrace();
 }
 }
 }
}
```

**Step 9** You can check whether the encryption configuration is successful by referring to [Verifying the Encryption Configuration](#).

**Step 10** If you have configured SMS4 or AES encryption by performing [Step 1](#) to [Step 7](#), but do not set the related encryption parameter when creating the table in [Step 8](#), the inserted data is not encrypted.

In this case, you can perform the following steps to encrypt the inserted data:

1. Run the **flush** command for the table to import the data in the memory to the HFile.

```
flush '<table_name>'
```

2. Run the following commands to modify the table properties:

```
disable '<table_name>'
```

```
alter '<table_name>';NAME=> '<column_name>';ENCRYPTION => '<type>'
enable '<table_name>'
```

3. Insert a new data record and flush the table.

 **NOTE**

A new data record must be inserted so that the HFile will generate a new HFile and the unencrypted data inserted previously will be rewritten and encrypted.

```
put '<table_name>', fd2, 'f1:c1', 'value222222222222222222222222222222222
2'
```

```
flush '<table_name>'
```

4. Perform the following step to rewrite the HFile:

```
major_compact '<table_name>'
```

---

**NOTICE**

During this step, the HBase table is disabled and cannot provide services. Exercise caution when you perform this step.

---

5. You can perform [Step 6](#) to check whether the encryption configuration is successful.

----End

## Verifying the Encryption Configuration

 **NOTE**

This operation can be performed only when test data can be written to an empty table.

- Step 1** Log in to the node where the client is installed as the client installation user. Switch to the client installation directory, for example, **/opt/client**.

```
cd /opt/client
```

- Step 2** Run the following command to set environment variables:

```
source bigdata_env
```

- Step 3** Run the following command to authenticate the current user if Kerberos authentication has been enabled for the current security cluster. The current user must have the permission to read and write HBase tables and the HDFS operation permission.

```
kinit Component service user
```

Run the following command to set the Hadoop username if Kerberos authentication is not enabled for the current normal cluster:

```
export HADOOP_USER_NAME=hbase
```

- Step 4** Run the following command to log in to the HBase client:

```
hbase shell
```

**Step 1** Run the following command to generate a new key file as user **omm**:

```
sh ${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/install/FusionInsight-
HBase-2.2.3/hbase/bin/hbase-encrypt.sh <path>/hbase.jks <type> <length>
<alias-new>
```

- *<path>/hbase.jks*: indicates the path for storing the generated **hbase.jks** file. The path and file name must be consistent with those of the key file generated in [HFile and WAL Encryption](#).
- *<alias-new>*: indicates the alias of the key file. The alias must be different with that of the old key file.
- *<type>*: indicates the encryption type, which can be SMS4 or AES.
- *<length>* indicates the key length. SMS4 supports 16-bit and AES supports 128-bit.

For example, to generate an SMS4 encryption key, run the following command:

```
sh ${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/install/FusionInsight-
HBase-2.2.3/hbase/bin/hbase-encrypt.sh /home/hbase/conf/hbase.jks SMS4 16
omm_new
```

To generate an AES encryption key, run the following command:

```
sh ${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/install/FusionInsight-
HBase-2.2.3/hbase/bin/hbase-encrypt.sh /home/hbase/conf/hbase.jks AES 128
omm_new
```

 **NOTE**

- To ensure operations can be successfully performed, the *<path>/hbase.jks* directory needs to be created in advance, and the cluster operation user must have the **rw** permission of this directory.
- After running the command, you need to enter the same *<password>* for three times. This password is the password of the key file. You can use the password of the old file without any security risk.

**Step 2** Distribute the generated key files to the same directory on all nodes in the cluster and assign read and write permission to user **omm**.

 **NOTE**

Administrators need to select a safe procedure to distribute keys based on the enterprise security requirements.

**Step 3** On the HBase service configuration page of FusionInsight Manager, add custom configuration items, set **hbase.crypto.master.key.name** to **omm\_new**, set **hbase.crypto.master.alternate.key.name** to **omm**, and save the settings.

Parameter	Value						
hadoop.config.expandor	<table border="1"><thead><tr><th>Name</th><th>Value</th></tr></thead><tbody><tr><td>hbase.crypto.master.key.na</td><td>omm_new</td></tr><tr><td>hbase.crypto.master.alterna</td><td>omm</td></tr></tbody></table>	Name	Value	hbase.crypto.master.key.na	omm_new	hbase.crypto.master.alterna	omm
	Name	Value					
hbase.crypto.master.key.na	omm_new						
hbase.crypto.master.alterna	omm						

**Step 4** Restart the HBase service for the configuration to take effect.

**Step 5** In HBase shell, run the **major compact** command to generate the HFile file based on the new encryption algorithm.

```
major_compact '<table_name>'
```

**Step 6** You can view the major compact progress from the HMaster web page.

Region Servers

ServerName	Num. Compacting Cells	Num. Compacted Cells	Remaining Cells	Compaction Progress
1659665978456	3	3	0	100.00%
1659665978332	0	0	0	
1659665980589	2725	2725	0	100.00%
1659665981123	415	415	0	100.00%
1659665979991	29	29	0	100.00%
1659665979920	0	0	0	

**Step 7** When all items in **Compaction Progress** reach **100%** and those in **Remaining KVs** are **0**, run the following command as user **omm** to destroy the old key file:

```
sh ${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/install/FusionInsight-HBase-2.2.3/hbase/bin/hbase-encrypt.sh <path>/hbase.jks <alias-old>
```

- *<path>/hbase.jks*: indicates the path for storing the generated **hbase.jks** file. The path and file name must be consistent with those of the key file generated in **HFile and WAL Encryption**.
- *<alias-old>*: indicates the alias of the old key file to be deleted.

For example:

```
sh ${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/install/FusionInsight-HBase-2.2.3/hbase/bin/hbase-encrypt.sh /home/hbase/conf/hbase.jks omm
```

#### NOTE

To ensure operations can be successfully performed, the *<path>/hbase.jks* directory needs to be created in advance, and the cluster operation user must have the **rw** permission of this directory.

**Step 8** Repeat **Step 2** and distribute the updated key files again.

**Step 9** Delete the HBase self-defined configuration item **hbase.crypto.master.alternate.key.name** added in **Step 3** from FusionInsight Manager.

**Step 10** Repeat **Step 4** for the configuration take effect.

----End

## 8.11.4.4 Configuring Hadoop Security Parameters

### Configuring Security Channel Encryption

The channels between components are not encrypted by default. You can set the following parameters to configure security channel encryption.

Page access for setting parameters: On FusionInsight Manager, click **Cluster**, click the name of the desired cluster, click **Services**, and click the target service. On the displayed page, click **Configuration** and click **All Configurations**. Enter a parameter name in the search box.

 NOTE

Restart corresponding services for the modification to take effect after you modify configuration parameters.

**Table 8-86** Parameter description

Service	Parameter	Description	Default Value
HBase	hbase.rpc.protection	<p>Indicates whether the HBase channels, including the remote procedure call (RPC) channels for HBase clients to access the HBase server and the RPC channels between the HMaster and RegionServer, are encrypted. If this parameter is set to <b>privacy</b>, the channels are encrypted and the authentication, integrity, and privacy functions are enabled. If this parameter is set to <b>integrity</b>, the channels are not encrypted and only the authentication and integrity functions are enabled. If this parameter is set to <b>authentication</b>, the channels are not encrypted, only packets are authenticated, and integrity and privacy are not required.</p> <p><b>NOTE</b> The privacy mode encrypts transmitted content, including sensitive information such as user tokens, to ensure the security of the transmitted content. However, this mode has great impact on performance. Compared with the other two modes, this mode reduces read/write performance by about 60%. Modify the configuration based on the enterprise security requirements. The configuration items on the client and server must be the same.</p>	<ul style="list-style-type: none"> <li>Security mode: <b>privacy</b></li> <li>Normal mode: <b>authentication</b></li> </ul>
HDFS	dfs.encrypt.data.transfer	<p>Indicates whether the HDFS data transfer channels and the channels for clients to access HDFS are encrypted. The HDFS data transfer channels include the data transfer channels between DataNodes and the Data Transfer (DT) channels for clients to access DataNodes. The value <b>true</b> indicates that the channels are encrypted. The channels are not encrypted by default.</p>	false

Service	Parameter	Description	Default Value
HDFS	dfs.encrypt.data.transfer.algorithm	<p>Indicates whether the HDFS data transfer channels and the channels for clients to access HDFS are encrypted. This parameter is valid only when <b>dfs.encrypt.data.transfer</b> is set to <b>true</b>.</p> <p>The default value is <b>3des</b>, indicating that 3DES algorithm is used to encrypt data. The value can also be set to <b>rc4</b>. However, to avoid security risks, you are not advised to set the parameter to this value.</p>	3des
HDFS	hadoop.rpc.protection	<p>Indicates whether the RPC channels of each module in Hadoop are encrypted. The channels include:</p> <ul style="list-style-type: none"> <li>• RPC channels for clients to access HDFS</li> <li>• RPC channels between modules in HDFS, for example, between DataNode and NameNode</li> <li>• RPC channels for clients to access YARN</li> <li>• RPC channels between NodeManager and ResourceManager</li> <li>• RPC channels for Spark to access YARN and HDFS</li> <li>• RPC channels for MapReduce to access YARN and HDFS</li> <li>• RPC channels for HBase to access HDFS</li> </ul> <p>The default value is <b>privacy</b>, indicating encrypted transmission. The value <b>authentication</b> indicates that transmission is not encrypted.</p> <p><b>NOTE</b> You can set this parameter on the HDFS component configuration page. The parameter setting is valid globally, that is, the setting of whether the RPC channel is encrypted takes effect on all modules in Hadoop.</p>	<ul style="list-style-type: none"> <li>• Security mode: <b>privacy</b></li> <li>• Normal mode: <b>authentication</b></li> </ul>

## Setting the Maximum Number of Concurrent Web Connections

To ensure web server reliability, new connections are rejected when the number of user connections reaches a specific threshold. This prevents DDOS attacks and

service unavailability caused by too many users accessing the web server at the same time.

Page access for setting parameters: On FusionInsight Manager, click **Cluster**, click the name of the desired cluster, click **Services**, and click the target service. On the displayed page, click **Configuration** and click **All Configurations**. Enter a parameter name in the search box.

**Table 8-87** Parameter description

Service	Parameter	Description	Default Value
HD FS/ Yarn	hadoop.http.server.MaxRequests	Specifies the maximum number of concurrent web connections of each component.	2000
Spark2x	spark.connection.maxRequest	Specifies the maximum number of request connections of JobHistory.	5000

#### 8.11.4.5 Configuring an IP Address Whitelist for Modification Allowed by HBase

If the Replication function is enabled for HBase clusters, a protection mechanism for data modification is added on the standby HBase cluster to ensure data consistency between the active and standby clusters. Upon receiving an RPC request for data modification, the standby HBase cluster checks the permission of the user who sends the request (only HBase manage users have the modification permission). Then it checks the validity of the source IP address of the request. Only modification requests from IP addresses in the white list are accepted. The IP address white list is configured by the **hbase.replication.allowedIPs** item.

Log in to FusionInsight Manager and choose **Cluster > Services > HBase**. Click **Configurations** and enter the parameter name in the search box.

**Table 8-88** Parameter description

Parameter	Description	Default Value
hbase.replication.allowedIPs	<p>Allows replication request processing from configured IP addresses only. It supports comma separated regex patterns. Each pattern can be any of the following:</p> <ul style="list-style-type: none"><li>• Regex pattern Example: 10.18.40.*, 10.18.*, 10.18.40.11</li><li>• Range pattern (Range can be specified only in the last octet) Example: 10.18.40.[10-20]</li></ul> <p>If this item is empty (default value), the white list contains only the IP address of the RegionServer of the cluster, indicating that only modification requests from the RegionServer of the standby HBase cluster are accepted.</p>	N/A

### 8.11.4.6 Updating a Key for a Cluster

#### Scenario

When a cluster is installed, an encryption key is generated automatically by the system so that the security information in the cluster (such as all database user passwords and key file access passwords) can be stored in encryption mode. After the cluster is installed, if the original key is accidentally disclosed or a new key is required, you can manually update the key.

#### Impact on the System

- After a cluster key is updated, a new key is generated randomly in the cluster. This key is used to encrypt and decrypt the newly stored data. The old key is not deleted, and it is used to decrypt data encrypted using the old key. After security information is modified, for example, a database user password is changed, the new password is encrypted using the new key.
- When a key is updated for a cluster, the cluster must be stopped and cannot be accessed.

#### Prerequisites

- You have obtained the IP addresses of the active and standby management nodes.
- You have stopped the upper-layer service applications that depend on the cluster.

## Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Cluster** > *Name of the desired cluster* and click **Stop**. In the dialog box that is displayed, enter the password of the current user and click **OK**. Wait for a while until a message indicating that the operation is successful is displayed.

- Step 3** Log in to the active management node as user **omm**.

- Step 4** Run the following command to disable logout upon timeout:

```
TMOUT=0
```

 **NOTE**

After the operations in this section are complete, run the **TMOUT=Timeout interval** command to restore the timeout interval in a timely manner. For example, **TMOUT=600** indicates that a user is logged out if the user does not perform any operation within 600 seconds.

- Step 5** Run the following command to go to the related directory:

```
cd ${BIGDATA_HOME}/om-server/om/tools
```

- Step 6** Run the following command to update the cluster key:

```
sh updateRootKey.sh
```

Enter **y** as prompted.

The root key update is a critical operation.  
Do you want to continue?(y/n):

If the following information is displayed, the key is updated successfully.

```
Step 4-1: The key save path is obtained successfully.
```

```
...
```

```
Step 4-4: The root key is sent successfully.
```

- Step 7** On FusionInsight Manager, click **Cluster**, click the name of the desired cluster, and click **Start**.

In the displayed dialog box, click **OK**. Wait until a message is displayed, indicating that the startup is successful.

----End

### 8.11.4.7 Hardening the LDAP

#### Configuring the LDAP Firewall Policy

In the cluster adopting the dual-plane networking, the LDAP is deployed on the service plane. To ensure the LDAP data security, you are advised to configure the firewall policy in the cluster to disable relevant LDAP ports.

- Step 1** Log in to FusionInsight Manager.
- Step 2** Click **Cluster**, click the name of the desired cluster, choose **Services** > **LdapServer**, and click **Configurations**.

**Step 3** Check the value of **LDAP\_SERVER\_PORT**, which is the service port of LdapServer.

**Step 4** To ensure data security, configure the firewall policy for the whole cluster to disable the LdapServer port based on the customer's firewall environment.

----End

## Enabling the LDAP Audit Log Output

Users can set the audit log output level of the LDAP service and output audit logs in a specified directory, for example, **/var/log/messages**. The logs output can be used to check user activities and operation commands.

### NOTE

If the function of LDAP audit log output is enabled, massive logs are generated, affecting the cluster performance. Exercise caution when enabling this function.

**Step 1** Log in to any LdapServer node.

**Step 2** Run the following command to edit the **slapd.conf.consumer** file, and set the value of **loglevel** to **256** (you can run the **man slapd.conf** command on the OS to view the log level definition).

```
cd ${BIGDATA_HOME}/FusionInsight_BASE_8.1.0.1/install/FusionInsight-
ldapserver-2.7.0/ldapserver/local/template
```

```
vi slapd.conf.consumer
```

```
...
pidfile [PID_FILE_SLAPD_PID]
argsfile [PID_FILE_SLAPD_ARGS]
loglevel 256
...
```

**Step 3** Log in to FusionInsight Manager, click **Cluster**, click the name of the desired cluster, choose **Services > LdapServer**. On the displayed page, choose **More > Restart Service**. Enter the administrator password and restart the service.

----End

## 8.11.4.8 Configuring Kafka Data Encryption During Transmission

### Scenario

Data between the Kafka client and the broker is transmitted in plain text. The Kafka client may be deployed in an untrusted network, exposing the transmitting data to leakage and tampering risks.

### Procedure

The channel between components is not encrypted by default. You can set the following parameters to enable security channel encryption.

Page access for setting parameters: On FusionInsight Manager, click **Cluster**, click the name of the desired cluster, and choose **Services > Kafka**. On the displayed page, click **Configuration** and click **All Configurations**. Enter a parameter name in the search box.

 NOTE

After the configuration, restart the corresponding service for the settings to take effect.

**Table 8-89** describes the parameters related to transmission encryption on the Kafka server.

**Table 8-89** Parameters relevant to Kafka data encryption during transmission

Parameter	Description	Default Value
ssl.mode.enable	Indicates whether to enable the Secure Sockets Layer (SSL) protocol. If this parameter is set to <b>true</b> , services relevant to the SSL protocol are started during the broker startup.	false
security.inter.broker.protocol	Indicates communication protocol between brokers. The communication protocol can be PLAINTEXT, SSL, SASL_PLAINTEXT, or SASL_SSL.	SASL_PLAINTEXT

The SSL protocol can be configured for the server or client to encrypt transmission and communication only after **ssl.mode.enable** is set to **true** and broker enables the **SSL** and **SASL\_SSL** protocols.

### 8.11.4.9 Configuring HDFS Data Encryption During Transmission

#### Configuring HDFS Security Channel Encryption

The channel between components is not encrypted by default. You can set parameters to enable security channel encryption.

Navigation path for setting parameters: On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations**. On the displayed page, click the **All Configurations** tab. Enter a parameter name in the search box.

 NOTE

After the configuration, restart the corresponding service for the settings to take effect.

**Table 8-90** Parameters

Configuration Item	Description	Default Value
hadoop.rpc.protection	<p><b>NOTICE</b></p> <ul style="list-style-type: none"> <li>The setting takes effect only after the service is restarted. Rolling restart is not supported.</li> <li>After the setting, you need to download the client configuration file again. Otherwise, HDFS cannot provide the read and write services.</li> <li>After the setting, you need to restart the executor. Otherwise, the job management and file management functions on the console become unavailable.</li> </ul> <p>Indicates whether the RPC channels of each module in Hadoop are encrypted. The channels include:</p> <ul style="list-style-type: none"> <li>RPC channels for clients to access HDFS</li> <li>RPC channels between modules in HDFS, for example, between DataNode and NameNode</li> <li>RPC channels for clients to access Yarn</li> <li>RPC channels between NodeManager and ResourceManager</li> <li>RPC channels for Spark to access Yarn and HDFS</li> <li>RPC channels for MapReduce to access Yarn and HDFS</li> <li>RPC channels for HBase to access HDFS</li> </ul> <p><b>NOTE</b> The setting takes effect globally, that is, the encryption attribute of the RPC channel of each module in the Hadoop takes effect.</p>	<ul style="list-style-type: none"> <li>Security mode: privacy</li> <li>Normal mode: authentication</li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li><b>authentication:</b> indicates that only authentication is required.</li> <li><b>integrity:</b> indicates that authentication and consistency check need to be performed.</li> <li><b>privacy:</b> indicates that authentication, consistency check, and encryption need to be performed.</li> </ul>

Configuration Item	Description	Default Value
dfs.encrypt.data.transfer	<p>Indicates whether the HDFS data transfer channels and the channels for clients to access HDFS are encrypted. The HDFS data transfer channels include the data transfer channels between DataNodes and the Data Transfer (DT) channels for clients to access DataNodes. The value <b>true</b> indicates that the channels are encrypted. The channels are not encrypted by default.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• This parameter is valid only when <b>hadoop.rpc.protection</b> is set to <b>privacy</b>.</li><li>• If a large amount of service data is transmitted, enabling encryption by default severely affects system performance.</li><li>• If data transmission encryption is configured for one cluster in the trusted cluster, the same data transmission encryption must be configured for the peer cluster.</li></ul>	false
dfs.encrypt.data.transfer.algorithm	<p>Indicates the algorithm to encrypt the HDFS data transfer channels and the channels for clients to access HDFS. This parameter is valid only when <b>dfs.encrypt.data.transfer</b> is set to <b>true</b>.</p> <p><b>NOTE</b></p> <p>The default value is <b>3des</b>, indicating that 3DES algorithm is used to encrypt data. The value can also be set to <b>rc4</b>. However, to avoid security risks, you are not advised to set the parameter to this value.</p>	3des
dfs.encrypt.data.transfer.cipher.suites	<p>This parameter can be left empty or set to <b>AES/CTR/NoPadding</b> to specify the cipher suite for data encryption. If this parameter is not specified, the encryption algorithm specified by <b>dfs.encrypt.data.transfer.algorithm</b> is used for data encryption. The default value is <b>AES/CTR/NoPadding</b>.</p>	AES/CTR/ NoPadding

## 8.11.4.10 Configuring Spark2x Data Encryption During Transmission

### Scenario

This section describes how to configure encryption for Spark2x security channels to enhance security.

### Procedure

To modify parameters, log in to FusionInsight Manager, click **Cluster** and choose **Services > Spark2x**. On the displayed page, click **Configurations** and click **All Configurations**. Enter a parameter name in the search box.

#### NOTE

After the configuration, restart the corresponding service for the settings to take effect.

**Table 8-91** Parameters

Parameter	Description	Default Value
spark.authenticate	Whether to enable Spark internal security authentication	Security mode: <b>true</b> Normal mode: <b>false</b>
spark.authenticate.enableSaslEncryption	Whether to enable encrypted communication based on Simple Authentication and Security Layer (SASL)	Security mode: <b>true</b> Normal mode: <b>false</b>
spark.network.crypto.enabled	Whether to enable RPC encryption based on Advanced Encryption Standard (AES)	Security mode: <b>true</b> Normal mode: <b>false</b>
spark.network.sasl.serverAlwaysEncrypt	Whether to disable unencrypted connections for ports with SASL authentication enabled	false
spark.network.crypto.keyLength	Length of the encryption key to be generated	256
spark.network.crypto.keyFactoryAlgorithm	Algorithm used to generate the encryption key	PBKDF2WithHmacSHA1

Parameter	Description	Default Value
spark.io.encryption.enabled	Whether to enable local disk I/O encryption	Security mode: <b>true</b> Normal mode: <b>false</b>
spark.io.encryption.keygen.algorithm	Algorithm used to generate the I/O encryption key	HmacSHA256
spark.io.encryption.keySizeBits	Size of an I/O encryption key, in bits	256
spark.ssl.ui.enabled	Whether to enable Secure Sockets Layer (SSL) authentication for the web UI connection	Security mode: <b>true</b> Normal mode: <b>false</b>

### 8.11.4.11 Configuring ZooKeeper SSL

#### Scenario

By default, SSL channel encryption transmission is disabled between the ZooKeeper client and server and between instances on the server. This section describes how to enable the ZooKeeper channel encryption transmission.

#### NOTE

This function is available only for MRS clusters of version 3.1.2 or later.

#### Impact on the System

- When SSL channel encryption transmission is enabled on the ZooKeeper server, the performance deteriorates.
- When SSL channel encryption transmission is enabled on the ZooKeeper server, ZooKeeper and dependent upper-layer components need to be restarted. During the restart, services are unavailable.
- To enable SSL channel encryption transmission on the ZooKeeper server, you need to download the client again.
- If SSL channel encryption transmission is enabled for ZooKeeper, rolling restart is not supported.

#### Procedure

**Step 1** Log in to FusionInsight Manager, click **Cluster** and choose **Services > ZooKeeper**. On the displayed page, click **Configurations** and click **All Configurations**.

**Step 2** Enter the parameter name in the search box, and change the value as follows:

**Table 8-92** Security configuration item

Parameter	Description	Default Value	New Value
ssl.enabled	Whether to enable SSL communication encryption.	false	true

**Step 3** After the modification is complete, click **Save** and then click **OK**.

**Step 4** Click **Cluster** and choose **Services > ZooKeeper**. On the ZooKeeper service page, choose **More > Restart Service**, enter the password for authentication, and confirm the operation impact on the **Restart Service** page.

You can select **Restart upper-layer services**. During the restart of all affected components, services will be unavailable. Exercise caution when performing this operation.

**Step 5** Click **OK** and wait until the services are restarted successfully.

**Step 6** Choose **Cluster > Active/Standby Cluster DR** to check whether active/standby DR is configured for the current cluster.

- If yes, go to **Step 7**.
- If no, no further action is required.

**Step 7** The **ssl.enabled** configuration of the ZooKeeper service in the active cluster must be the same as that in the DR cluster. Modify the **ssl.enabled** parameter in the cluster where no operation is performed by referring to the preceding steps.

**Step 8** Log in to the active OMS node in the active cluster as user **root** and run the following commands to restart the DR management process:

```
su - omm
```

```
${BIGDATA_HOME}/om-server/om/share/om/disaster/sbin/restart-disaster.sh
```

If the following information is displayed, the operation is successful:

```
...
disaster start with process id : 23256
End into restart-disaster.sh
```

**Step 9** Log in to the active OMS node in the DR cluster as user **root** and run the following commands to restart the DR management process:

```
su - omm
```

```
${BIGDATA_HOME}/om-server/om/share/om/disaster/sbin/restart-disaster.sh
```

```
----End
```

## 8.11.4.12 Encrypting the Communication Between the Controller and the Agent

### Scenario

After a cluster is installed, Controller and Agent need to communicate with each other. The Kerberos authentication is used during the communication. By default, the communication is not encrypted during the communication for the sake of cluster performance. Users who have demanding security requirements can use the method described in this section for encryption.

### Impact on the System

- Controller and all Agents automatically restart, which interrupts FusionInsight Manager.
- The performance of management nodes deteriorates in large clusters. You are advised to enable the encryption function for clusters with a maximum of 200 nodes.

### Prerequisites

You have obtained the IP addresses of the active and standby management nodes.

### Procedure

**Step 1** Log in to the active management node as user **omm**.

**Step 2** Run the following command to disable logout upon timeout:

```
TMOUT=0
```

#### NOTE

After the operations in this section are complete, run the **TMOUT=Timeout interval** command to restore the timeout interval in a timely manner. For example, **TMOUT=600** indicates that a user is logged out if the user does not perform any operation within 600 seconds.

**Step 3** Run the following command to go to the related directory:

```
cd ${CONTROLLER_HOME}/sbin
```

**Step 4** Run the following command to enable communication encryption:

```
./enableRPCencrypt.sh -t
```

Run the **sh \${BIGDATA\_HOME}/om-server/om/sbin/status-oms.sh** command to check whether **ResHASstatus** of the active management node Controller is **Normal** and whether you can log in to FusionInsight Manager again. If yes, the enablement is successful.

**Step 5** Run the following command to disable communication encryption when necessary:

```
./enableRPCencrypt.sh -f
```

Run the **sh \${BIGDATA\_HOME}/om-server/om/sbin/status-oms.sh** command to check whether **ResHASstatus** of the active management node Controller is **Normal**

and whether you can log in to FusionInsight Manager again. If yes, the enablement is successful.

----End

### 8.11.4.13 Updating SSH Keys for User omm

#### Scenario

During cluster installation, the system automatically generate the SSH public key and private key for user **omm** to establish the trust relationship between nodes. After the cluster is installed, if the original keys are accidentally disclosed or new keys are used, the system administrator can perform the following operations to manually change the keys.

#### Prerequisites

- The cluster has been stopped.
- No other management operations are being performed.

#### Procedure

**Step 1** Log in as user **omm** to the node whose SSH keys need to be replaced.

If the node is a Manager management node, run the following command on the active management node.

**Step 2** Run the following command to disable logout upon timeout:

```
TMOUT=0
```

#### NOTE

After the operations in this section are complete, run the **TMOUT=Timeout interval** command to restore the timeout interval in a timely manner. For example, **TMOUT=600** indicates that a user is logged out if the user does not perform any operation within 600 seconds.

**Step 3** Run the following command to generate a key for the node:

- If the node is a Manager management node, run the following command:  

```
sh ${CONTROLLER_HOME}/sbin/update-ssh-key.sh
```
- If the node is a non-Manager management node, run the following command:  

```
sh ${NODE_AGENT_HOME}/bin/update-ssh-key.sh
```

If "Succeed to update ssh private key." is displayed when the preceding command is executed, the SSH key is generated successfully.

**Step 4** Run the following command to copy the public key of the node to the active management node:

```
scp ${HOME}/.ssh/id_rsa.pub oms_ip:${HOME}/.ssh/id_rsa.pub_bak
```

*oms\_ip*: indicates the IP address of the active management node.

Enter the password of user **omm** to copy the files.

- Step 5** Log in to the active management node as user **omm**.
- Step 6** Run the following command to disable logout on system timeout:
- ```
TMOUT=0
```
- Step 7** Run the following command to go to the related directory:

```
cd ${HOME}/.ssh
```

Step 8 Run the following command to add new public keys:

```
cat id_rsa.pub_bak >> authorized_keys
```

Step 9 Run the following command to move the temporary public key file, for example, /tmp.

```
mv -f id_rsa.pub_bak /tmp
```

Step 10 Copy the **authorized_keys** file of the active management node to the other nodes in the cluster:

```
scp authorized_keys node_ip:${HOME}/.ssh/authorized_keys
```

node_ip indicates the IP address of another node in the cluster. Multiple IP addresses are not supported.

Step 11 Run the following command to confirm private key replacement without entering the password:

```
ssh node_ip
```

node_ip indicates the IP address of another node in the cluster. Multiple IP addresses are not supported.

Step 12 Log in to FusionInsight Manager. On **Homepage**, locate the desired cluster and choose **Start** to start the cluster.

----End

8.11.5 Security Maintenance

8.11.5.1 Account Maintenance Suggestions

It is recommended that the administrator conduct routine checks on the accounts. The check covers the following items:

- Check whether the accounts of the OS, FusionInsight Manager, and each component are necessary and whether temporary accounts have been deleted.
- Check whether the permissions of the accounts are appropriate. Different administrators have different rights.
- Check and audit the logins and operation records of all types of accounts.

8.11.5.2 Password Maintenance Suggestions

Accessing portal requires identity authentication. The complexity and validity period of an account password must meet your security requirements.

Refer to the following suggestions to maintain passwords:

1. Assign dedicated personnel to keep OS passwords.
2. Use passwords that meet certain strength requirements, such as minimum password length or mixing of letter cases.
3. Encrypt passwords before transferring them, and do not transfer them via email.
4. Encrypt passwords for storage.
5. Remind enterprise users to change passwords during system handover.
6. Change passwords periodically.

8.11.5.3 Log Maintenance Suggestions

Operation logs help discover exceptions such as illegal operations and login by unauthorized users. The system records important operations in logs. You can use operation logs to locate problems.

Checking Logs Regularly

Check system logs periodically and handle exceptions such as unauthorized operations or logins in a timely manner.

Backing Up Logs Regularly

The audit logs provided by FusionInsight Manager and cluster record the user activities and operations. You can export the audit logs on FusionInsight Manager. If there are too many audit logs in the system, you can configure dump parameters to dump audit logs to a specified server to ensure that the cluster nodes disk space is sufficient.

Maintenance Owner

Network monitoring engineers and system maintenance engineers

8.11.6 Security Statement

JDK Usage Statement

MRS MRS cluster is a big data cluster that provides users with distributed data analysis and computing capabilities. The built-in JDK of MRS MRS is OpenJDK, which is used in the following scenarios:

- Platform service running and maintenance
- Linux client operations, including service submission and application O&M

JDK Risk Description

The system performs permission control on the built-in JDK. Only users in the related group of the FusionInsight platform can access the JDK. In addition, the platform is deployed on a customer's intranet. Therefore, the security risk is low.

JDK Hardening

For details about how to harden the JDK, see "Hardening JDK" in [Hardening Policies](#).

Public IP Addresses in Hue

Hue uses the test cases of third-party packages, such as **ipaddress**, **requests**, and **Django**, and uses the public IP addresses in the comments of the test cases. However, these public IP addresses are not involved when Hue provides services, and the Hue configuration file does not involve these public IP addresses.

9 MRS Manager Operation Guide (Available for 2.x and Earlier Versions)

9.1 Introduction to MRS Manager

Overview

MRS manages and analyzes massive data and helps you rapidly obtain desired data from structured and unstructured data. The structure of open-source components is complex. The installation, configuration, and management processes are time- and labor-consuming. MRS Manager is a unified enterprise-level cluster management platform and provides the following functions:

- Cluster monitoring enables you to quickly view the health status of hosts and services.
- Graphical metric monitoring and customization enable you to quickly obtain key information about the system.
- Service property configurations can meet service performance requirements.
- With cluster, service, and role instance functions, you can start or stop services and clusters in one click.

Introduction to the MRS Manager GUI

MRS Manager provides a unified cluster management platform, facilitating rapid and easy O&M for clusters. For details about how to access MRS Manager, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).

[Table 9-1](#) describes the functions of each operation entry.

Figure 9-1 MRS Manager

Table 9-1 Functions of each entry on the operation bar

| Parameter | Function |
|-----------|--|
| Dashboard | Displays the status of all services, main monitoring indicators of each service, and host status in charts, such as bar charts, line charts, and tables. You can customize a dashboard for the key monitoring indicators and drag it to any position on the interface. The system dashboard page supports automatic data update. |
| Services | Provides the service monitoring, operation, and configuration guidance, which helps you manage services in a unified manner. |
| Hosts | Provides guidance on how to monitor, operate, and configure hosts, helping you manage hosts in a unified manner. |
| Alarms | Supports alarm query and provides guidance on alarm handling, helping you identify and rectify product faults and potential risks in a timely manner to ensure normal system operation. |
| Audit | Allows authorized users to query and export audit logs, helping you to view all user activities and operations. |
| Tenant | Provides a unified tenant management platform. |
| System | Provides monitoring, alarm configuration management, and backup management. |

Go to the **System** tab page, and switch to another function pages through shortcuts. See [Table 9-2](#).

The following is an example of quick redirection through shortcuts:

Step 1 On MRS Manager, click **System**.

Step 2 On the **System** tab page, click a function link. The function page is displayed.

For example, in the **Backup and Restoration** area, click **Back Up Data**. The page for backing up data is displayed.

Step 3 Move the cursor to the left border of the browser window. The **System** black shortcut menu is displayed. After you move the cursor out of the menu, the menu is collapsed.

Step 4 In the shortcut menu that is displayed, you can click a function link to go to the corresponding function page.

For example, choose **Maintenance > Export Log**. The page for exporting logs is displayed.

----End

Table 9-2 Shortcut menus on the **System** tab page

| Menu | Function Link |
|------------------------|---|
| Backup and Restoration | Back Up Data |
| | Restore Data |
| Maintenance | Export Log |
| | Export Audit Log |
| | Check Health Status |
| Monitoring and Alarm | Configure Syslog |
| | Configure Alarm Threshold |
| | Configure SNMP |
| | Configure Monitoring Metric Dump |
| | Configure Resource Contribution Ranking |
| Permission | Manage User |
| | Manage User Group |
| | Manage Role |
| | Configure Password Policy |
| | Change OMS Database Password |
| Resource Management | Static service pool |
| Patch | Manage Patch |

Reference

MapReduce Service (MRS) is a data analysis service on the public cloud. It is used to manage and analyze massive sets of data.

MRS uses MRS Manager to manage big data components, such as components in the Hadoop ecosystem. Therefore, some concepts on the MRS Console on the public cloud must be different from those on MRS Manager. For details, see [Table 9-3](#).

Table 9-3 Difference Comparison

| Concept | Public Cloud MRS | MRS Manager |
|-------------------|---|--|
| MapReduce Service | Indicates the data analysis cloud service on the public cloud, called MRS. This service includes components such as Hive, Spark, Yarn, HDFS, and ZooKeeper. | Provides a unified management platform for big data components in tenant clusters. |

9.2 Checking Running Tasks

Scenario

When you perform operations on MRS Manager to trigger a task, the task execution process and progress are displayed. After the task window is closed, you need to open the task window by using the task management function.

MRS Manager reserves 10 latest tasks by default, for example, restarting services, synchronizing service configurations, and performing health check.

Procedure

Step 1 On MRS Manager, click  to open the task list.

You can view the following information in the task list: **Name**, **Status**, **Progress**, **Start Time** and **End Time**.

Step 2 Click the target task name to view the detailed information about the running task.

----End

9.3 Monitoring Management

9.3.1 Dashboard

On MRS Manager, nodes in a cluster can be classified into management nodes, control nodes, and data nodes. The change trends of key host monitoring metrics

on each type of node can be calculated and displayed as curve charts in reports based on the customized periods. If a host belongs to multiple node types, the metric statistics will be repeatedly collected.

This section provides overview of MRS clusters and describes how to view, customize, and export node monitoring metrics on MRS Manager.

Procedure

- Step 1** Log in to MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).
- Step 2** Choose **Dashboard** on MRS Manager.
- Step 3** In **Period**, you can specify a period to view monitoring data. The options are as follows:
- Real time
 - Last 3 hours
 - Last 6 hours
 - Last 24 hours
 - Last week
 - Last month
 - Last 3 months
 - Last 6 months
 - Customize. If you select this option, you can customize the period for viewing monitoring data.
- Step 4** Click **View** to view monitoring data in a period.
- You can view **Health Status** and **Roles** of each service on the **Service Summary** page of MRS Manager.
 - Click  above the curve chart to view details about a metric.
- Step 5** Customize a monitoring report.
1. Click **Customize** and select monitoring metrics to be displayed on MRS Manager.
MRS Manager supports a maximum of 14 monitoring metrics, but at most 12 customized monitoring metrics can be displayed on the page.
 - Cluster Host Health Status
 - Cluster Network Read Speed Statistics
 - Host Network Read Speed Distribution
 - Host Network Write Speed Distribution
 - Cluster Disk Write Speed Statistics
 - Cluster Disk Usage Statistics
 - Cluster Disk Information
 - Host Disk Usage Distribution
 - Cluster Disk Read Speed Statistics

- Cluster Memory Usage Statistics
 - Host Memory Usage Distribution
 - Cluster Network Write Speed Statistics
 - Host CPU Usage Distribution
 - Cluster CPU Usage Statistics
2. Click **OK** to save the selected monitoring metrics for display.

 **NOTE**

Click **Clear** to cancel all the selected monitoring metrics in a batch.

Step 6 Set an automatic refresh interval or click  for an immediate refresh.

The following refresh interval options are supported:

- Refresh every 60 seconds
- **Refresh every 120 seconds**
- Stop refreshing

 **NOTE**

If you select **Full Screen**, the **Dashboard** window will be maximized.

Step 7 Export a monitoring report.

1. Select a period. The options are as follows:
 - Real time
 - Last 3 hours
 - Last 6 hours
 - Last 24 hours
 - Last week
 - Last month
 - Last 3 months
 - Last 6 months
 - Customize. If you select this option, you can customize a time of period to export a report.
2. Click **Export**. MRS Manager will generate a report about the selected monitoring metrics in a specified time of period. Save the report.

 **NOTE**

To view the curve charts of monitoring metrics in a specified period, click **View**.

----End

9.3.2 Managing Services and Monitoring Hosts

You can manage the following status and indicators of all services (including role instances) and hosts on the MRS Manager:

- Status information: includes operation, health, configuration, and role instance status.

- Metric information: includes key monitoring metrics for services.
- Metric export: allows you to export monitoring reports.

 **NOTE**

Set an automatic refresh interval or click  for an immediate refresh.

The following refresh interval options are supported:

- Refresh every 30 seconds
- Refresh every 60 seconds
- Stop refreshing

Managing Service Monitoring

Step 1 On MRS Manager, click **Services**.

The service list includes **Service**, **Operating Status**, **Health Status**, **Configuration Status**, **Roles**, and **Operation** are displayed in the component list.

- [Table 9-4](#) describes the service operating status.

Table 9-4 Service operating status

| Status | Description |
|-----------------|--|
| Started | The service is started. |
| Stopped | The service is stopped. |
| Failed to start | Failed to start the role instance. |
| Failed to stop | Failed to stop the role instance. |
| Unknown | Indicates initial service status after the background system restarts. |

- [Table 9-5](#) describes the service health status.

Table 9-5 Service health status

| Status | Description |
|------------|---|
| Good | Indicates that all role instances in the service are running properly. |
| Bad | Indicates that the running status of at least one role instance is Faulty or the status of the service on which the current service depends is abnormal. |
| Unknown | Indicates that all role instances in the service are in the Unknown state. |
| Concerning | Indicates that the background system is restarting the service. |

| Status | Description |
|-------------------|--|
| Partially Healthy | Indicates that the status of the service on which the service depends is abnormal, and APIs related to the abnormal service cannot be invoked by external systems. |

- **Table 9-6** describes the service health status.

Table 9-6 Service configuration status

| Status | Description |
|--------------|---|
| Synchronized | The latest configuration takes effect. |
| Expired | The latest configuration does not take effect after the parameter modification. Related services need to be restarted. |
| Failed | The communication is incorrect or data cannot be read or written during the parameter configuration. Use Synchronize Configuration to rectify the fault. |
| Configuring | Parameters are being configured. |
| Unknown | Current configuration status cannot be obtained. |

By default, the **Service** column is sorted in ascending order. You can click the icon next to **Service**, **Operating Status**, **Health Status**, or **Configuration Status** to change the sorting mode.

Step 2 Click a specified service in the list to view its status and metric information.

Step 3 Customize monitoring metrics and export customized monitoring information.

1. In the **Charts** area, click **Customize** to customize service monitoring metrics.
2. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.
3. Click **Export** to export the displayed metrics.

----End

Managing Role Instances

Step 1 On MRS Manager, click **Services** and click the target service name in the service list.

Step 2 Click **Instance** to view the role status.

The role instance list contains the **Role**, **Host Name**, **OM IP Address**, **Business IP Address**, **Rack**, **Operation Status**, **Health Status**, and **Configuration Status** of an instance.

- **Table 9-7** shows the configuration status of a role instance.

Table 9-7 Role instance status

| Status | Description |
|-----------------|--|
| Started | The role instance has been started. |
| Stopped | The role instance has been stopped. |
| Failed to start | Failed to start the role instance. |
| Failed to stop | Failed to stop the role instance. |
| Decommissioning | The role instance is being decommissioned. |
| Decommissioned | The role instance has been decommissioned. |
| Recommissioning | The role instance is being recommissioned. |
| Unknown | Indicates initial role instance status after the background system restarts. |

- **Table 9-8** shows the health status of a role instance.

Table 9-8 Role instance health status

| Status | Description |
|-------------------|--|
| Good | The role instance is running properly. |
| Restoring | The background system is restarting a role instance. |
| Bad | The role instance is abnormal. For example, the port cannot be accessed if PID does not exist. |
| Unknown | The host where a role instance resides does not connect to the background system. |
| Partially Healthy | The role instance is partially running properly. |

- **Table 9-9** shows the configuration status of a role instance.

Table 9-9 Role instance configuration status

| Status | Description |
|--------------|--|
| Synchronized | The latest configuration takes effect. |
| Expired | The latest configuration does not take effect after the parameter modification. Related services need to be restarted. |

| Status | Description |
|-------------|---|
| Failed | The communication is incorrect or data cannot be read or written during the parameter configuration. Use Synchronize Configuration to rectify the fault. |
| Configuring | Parameters are being configured. |
| Unknown | Current configuration status cannot be obtained. |

By default, the **Role** column is sorted in ascending order. You can click the sorting icon next to **Role**, **Host Name**, **OM IP Address**, **Business IP Address**, **Rack**, **Operating Status**, **Health Status**, or **Configuration Status** to change the sorting mode.

You can filter out all instances of the same role in the **Role** column.

You can set search criteria in the role search area by clicking **Advanced Search**, and click **Search** to view specified role information. Click **Reset** to clear the search criteria. Fuzzy search is supported.

Step 3 Click the target role instance to view its status and metric information.

Step 4 Customize monitoring metrics and export customized monitoring information.

1. In the **Charts** area, click **Customize** to customize service monitoring metrics.
2. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.
3. Click **Export** to export the displayed metrics.

----End

Managing Hosts

Step 1 On MRS Manager, click **Hosts** to view the status of all hosts.

The host list contains the host name, management IP address, service IP address, rack, network speed, operating status, health status, disk usage, memory usage, and CPU usage.

- [Table 9-10](#) shows the host operating status.

Table 9-10 Host operating status

| Status | Description |
|----------|---|
| Normal | The host and service roles on the host are running properly. |
| Isolated | The host is isolated, and the service roles on the host stop running. |

- [Table 9-11](#) describes the host health status.

Table 9-11 Host health status

| Status | Description |
|---------|---|
| Good | The host can properly send heartbeats. |
| Bad | The host fails to send heartbeats due to timeout. |
| Unknown | The host initial status is unknown during the operation of adding or deleting a host. |

By default, the **Host Name** column is sorted by host name in ascending order. You can click the sorting icon next to **Host Name**, **OM IP Address**, **Business IP Address**, **Rack**, **Network Speed**, **Operating Status**, **Health Status**, **Disk Usage**, **Memory Usage**, or **CPU Usage** to change the sorting mode.

You can set search criteria in the role search area by clicking **Advanced Search**, and click **Search** to view specified role information. Click **Reset** to clear the search criteria. Fuzzy search is supported.

Step 2 Click the target host in the host list to view its status and metric information.

Step 3 Customize monitoring metrics and export customized monitoring information.

1. In the **Charts** area, click **Customize** to customize service monitoring metrics.
2. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.
3. Click **Export** to export the displayed metrics.

----End

9.3.3 Managing Resource Distribution

On MRS Manager, you can query the top value curves, bottom value curves, or average data curves of key service and host monitoring metrics, that is, the resource distribution information. MRS Manager allows you to view the monitoring data of the last hour.

You can also modify the resource distribution on MRS Manager to display both the top and bottom value curves in service and host resource distribution figures.

Resource distribution of some monitoring metrics is not recorded.

Procedure

- View the resource distribution of service monitoring metrics.
 - a. On MRS Manager, click **Services**.
 - b. Select the target service from the service list.
 - c. Click **Resource Distribution**.
Select key metrics of the service from **Metric**. MRS Manager displays the resource distribution of the metrics in the last hour.
- View the resource distribution of host monitoring metrics.

- a. Click **Hosts**.
 - b. Click the name of the specified host in the host list.
 - c. Click **Resource Distribution**.
Select key metrics of the host from **Metrics**. MRS Manager displays the resource distribution of the metrics in the last hour.
 - Configure resource distribution.
 - a. On MRS Manager, click **System**.
 - b. In **Configuration**, click **Configure Resource Contribution Ranking** under **Monitoring and Alarm**.
 - c. Change the number of resources to be displayed.
 - Set **Number of Top Resources** to the number of top values.
 - Set **Number of Bottom Resources** to the number of bottom values.
-  **NOTE**
- The sum of the maximum value and minimum value of resource distribution cannot be greater than 5.
- d. Click **OK** to save the configurations.
The message "Number of top and bottom resources saved successfully" is displayed in the upper right corner of the page.

9.3.4 Configuring Monitoring Metric Dumping

You can configure interconnection parameters on MRS Manager to save monitoring metric data to a specified FTP server using the FTP or SFTP protocol. In this way, MRS clusters can interconnect with third-party systems. The FTP protocol does not encrypt data, which brings potential security risks. Therefore, the SFTP protocol is recommended.

MRS Manager supports the collection of all the monitoring metric data in the managed clusters. The collection period is 30 seconds, 60 seconds, or 300 seconds. The monitoring metric data is stored to different monitoring files on the FTP server by collection period. The monitoring file naming rule is in the "*Cluster name_metric_Monitoring metric data collection period_File saving time.log*" format.

Prerequisites

The ECS corresponding to the dump server must be in the same VPC as the Master node of the MRS cluster, and the Master node can access the IP address and specified port of the dump server. The FTP service on the dump server is running properly.

Procedure

- Step 1** On MRS Manager, click **System**.
- Step 2** In **Configuration**, click **Configure Monitoring Metric Dump** under **Monitoring and Alarm**.

Step 3 Table 9-12 describes dump parameters.

Table 9-12 Dump parameters

| Parameter | Description | Mandatory |
|------------------------|---|-----------|
| Dump Monitoring Metric | Whether to enable monitoring metric data interconnection.
<ul style="list-style-type: none"> : Enabled. : Disabled. | Yes |
| FTP IP Address | FTP server for storing monitoring files after monitoring metric data is interconnected. | Yes |
| FTP Port | Port for connecting to the FTP server. | Yes |
| FTP Username | Username for logging in to the FTP server. | Yes |
| FTP Password | Password for logging in to the FTP server. | Yes |
| Save Path | Path for storing monitoring files on the FTP server. | Yes |
| Dump Interval (s) | Interval at which monitoring files are periodically stored on the FTP server, in seconds. | Yes |
| Dump Mode | Protocol used for sending monitoring files. The options are FTP and SFTP . | Yes |
| SFTP Public Key | Public key of the FTP server. This parameter is available only when Dump Mode is set to SFTP . You are advised to configure a public key. Otherwise, security risks may arise. | No |

Step 4 Click **OK** to complete the settings.

----End

9.4 Alarm Management

9.4.1 Viewing and Manually Clearing an Alarm

Scenario

You can view and clear alarms on MRS Manager.

Generally, the system automatically clears an alarm when the fault is rectified. If the fault has been rectified and the alarm cannot be automatically cleared, you can manually clear the alarm.

You can view the latest 100,000 alarms (including uncleared, manually cleared, and automatically cleared alarms) on MRS Manager. If the number of cleared

alarms exceeds 100,000 and is about to reach 110,000, the system automatically dumps the earliest 10,000 cleared alarms to **`\${BIGDATA_HOME}/OMSV100R001C00x8664/workspace/data`** on the active management node. A directory is automatically generated when alarms are dumped for the first time.

NOTE

Set an automatic refresh interval or click  for an immediate refresh.

The following refresh interval options are supported:

- Refresh every 30 seconds
- Refresh every 60 seconds
- Stop refreshing

Procedure

Step 1 On MRS Manager, click **Alarms** to view the alarm information in the alarm list.

- By default, the alarm list page displays the latest 10 alarms.
- By default, alarms are displayed in descending order by **Generated**. You can click **Alarm ID**, **Alarm Name**, **Severity**, **Generated**, **Location**, **Operation** to change the display mode.
- You can filter all alarms of the same severity in **Severity**, including cleared and uncleared alarms.
- You can click , , , or  to filter out **Critical**, **Major**, **Minor**, or **Warning** alarms.

Step 2 Click **Advanced Search**. In the displayed alarm search area, set search criteria and click **Search** to view the information about specified alarms. Click **Reset** to clear the search criteria.

NOTE

You can set the **Start Time** and **End Time** to specify the time range. You can search for alarms generated within the time range.

Handle the alarm by referring to **Alarm Reference**. If the alarms in some scenarios are generated due to other cloud services that MRS depends on, you need to contact maintenance personnel of the corresponding cloud services.

Step 3 If the alarm needs to be manually cleared after errors are rectified, click **Clear Alarm**.

NOTE

If multiple alarms have been handled, you can select one or more alarms to be cleared and click **Clear Alarm** to clear the alarms in batches. A maximum of 300 alarms can be cleared in each batch.

----End

9.4.2 Configuring an Alarm Threshold

Scenario

You can configure an alarm threshold to learn the metric health status. After **Send Alarm** is selected, the system sends an alarm message when the monitored data reaches the alarm threshold. You can view the alarm information in **Alarms**.

Procedure

- Step 1** On MRS Manager, click **System**.
- Step 2** In **Configuration**, click **Configure Alarm Threshold** under **Monitoring and Alarm**, select monitoring metrics as planned, and set their baselines.
- Step 3** Click a metric, for example, **CPU Usage**, and click **Create Rule**.
- Step 4** Set the monitoring metric rule parameters on the displayed configuration page.

Table 9-13 Monitoring metric rule parameters

| Parameter | Description | Value |
|----------------|---|--|
| Rule Name | Specifies the rule name. | CPU_MAX (example) |
| Reference Date | Specifies the date on which the reference indicator history is generated. | 2014/11/06 (example) |
| Threshold Type | Specifies the maximum or minimum value of a metric. If this parameter is set to Max. Value , the system generates an alarm when the actual value of the metric is greater than the threshold. If this parameter is set to Min. Value , the system generates an alarm when the actual value of the metric is smaller than the threshold. | <ul style="list-style-type: none">• Max. value• Min. value |
| Alarm Severity | Alarm Severity | <ul style="list-style-type: none">• Critical• Major• Minor• Warning |
| Time Range | Specifies the period in which the rule takes effect. | From 00:00 to 23:59 (example) |
| Threshold | Specifies the threshold of the rule monitoring metrics. | 80 (example) |

| Parameter | Description | Value |
|-----------|---|---|
| Date | Specifies the type of date when the rule takes effect. | <ul style="list-style-type: none">• Workday• Weekend• Other |
| Add Date | This parameter is valid only when Date is set to Other . You can select multiple dates. | 11/30 (example) |

Step 5 Click **OK**. A message is displayed in the upper right corner of the page, indicating that the template is saved successfully.

Send alarm is selected by default. MRS Manager checks whether the value of each monitored metric reaches the threshold. If the number of consecutive check times is equal to the value of **Trigger Count**, and the threshold is not reached in these checks, the system sends an alarm. The value can be customized. **Check Period (s)** indicates the interval at which MRS Manager checks monitoring metrics.

Step 6 Locate the row that contains the newly added rule, and click **Apply** in the **Operation** column. A message is displayed in the upper right corner, indicating that the rule *xx* is successfully added. Click **Cancel** in the **Operation** column. A message is displayed in the upper right corner, indicating that the rule *xx* is successfully canceled.

----End

9.4.3 Configuring Syslog Northbound Interface Parameters

Scenario

You can configure the northbound interface so that alarms generated on MRS Manager can be reported to your monitoring O&M system using Syslog.

NOTICE

If the Syslog protocol is not encrypted, data may be stolen.

Prerequisites

The ECS corresponding to the server must be in the same VPC as the Master node of the MRS cluster, and the Master node can access the IP address and specified port of the server.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In **Configuration**, click **Configure Syslog** under **Monitoring and Alarm**.

The **Syslog Service** is disabled by default. Click the switch to enable the Syslog service.

Step 3 Set the interconnection parameters listed in [Table 9-14](#).

Table 9-14 Syslog parameters

| Area | Parameter | Description |
|-----------------|--------------------|---|
| Syslog Protocol | Service IP Address | Specifies the IP address of the interconnection server. |
| | Server Port | Specifies the port number for interconnection. |
| | Protocol | Specifies the protocol type. The options are as follows: <ul style="list-style-type: none">• TCP• UDP |
| | Severity | Specifies the severity of the reported message. The options are as follows: <ul style="list-style-type: none">• Informational• Emergency• Alert• Critical• Error• Warning• Notice• Debug |
| | Facility | Specifies the module where the log is generated. |
| | Identifier | Specifies the product ID. The default value is MRS Manager . |
| | Report Message | Report Format |

| Area | Parameter | Description |
|---------------------------|---------------------------------|---|
| | Alarm Status | <p>Specifies the type of the alarm to be reported.</p> <ul style="list-style-type: none"> ● Fault: indicates that the Syslog alarm message is reported when MRS Manager generates an alarm. ● Clear: indicates that a Syslog alarm message is reported when an alarm on MRS Manager is cleared. ● Event: indicates that the Syslog alarm message is reported when MRS Manager generates an event. |
| | Report Alarm Severity | <p>Specifies the level of the alarm to be reported. The value can be Suggestion, Minor, Major, and Critical.</p> |
| Uncleared Alarm Reporting | Periodic Uncleared Alarm Report | <p>Specifies whether uncleared alarms are reported periodically. By default, the switch of Periodic Uncleared Alarm Reporting is disabled. You can click the switch to enable it.</p> |
| | Report Interval (min) | <p>Specifies the interval for periodically reporting uncleared alarms to the remote Syslog service. This parameter is valid only when Periodic Uncleared Alarm Reporting switch is enabled. The unit is minute. The default value is 15. The value ranges from 5 minutes to one day (1,440 minutes).</p> |

| Area | Parameter | Description |
|--------------------|------------------------|--|
| Heartbeat Settings | Heartbeat Report | Specifies whether to periodically report Syslog heartbeat messages. By default, the switch of Periodic Uncleared Alarm Reporting is disabled. You can click the switch to enable it. |
| | Heartbeat Period (min) | Specifies the interval for periodically reporting heartbeat messages. This parameter is valid only when Heartbeat Report switch is enabled. The unit is minute. The default value is 15 . The value ranges from 1 to 60. |
| | Heartbeat Packet | Specifies the content of the reported heartbeat message. This parameter is enabled when Heartbeat Report is enabled. The value can contain a maximum of 256 characters, including digits, letters, underscores (_), vertical bars (), colons (:), spaces, commas (,), and periods (.). |

 **NOTE**

After the periodic heartbeat packet function is enabled, packets may be interrupted during automatic recovery of some cluster error tolerance (for example, active/standby management node switchover). In this case, wait for automatic recovery.

Step 4 Click **OK** to complete the settings.

----End

9.4.4 Configuring SNMP Northbound Interface Parameters

Scenario

You can configure the northbound interface so that alarms and monitoring metrics on MRS Manager can be integrated to the network management platform using SNMP.

Prerequisites

The ECS corresponding to the server must be in the same VPC as the Master node of the MRS cluster, and the Master node can access the IP address and specified port of the server.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In **Configuration**, click **Configure SNMP** under **Monitoring and Alarm**.

The **SNMP Service** is disabled by default. Click the switch to enable the SNMP service.

Step 3 Set the interconnection parameters listed in [Table 9-15](#).

Table 9-15 Syslog parameters

| Parameter | Description |
|-------------------------|---|
| Version | Specifies the version of the SNMP, which can be: <ul style="list-style-type: none">v2c: an earlier version with low securityv3: the latest version of SNMP with higher security than SNMPv2c The SNMP v3 version is recommended. |
| Local Port | Specifies the local port. The default value is 20000 . The value ranges from 1025 to 65535 . |
| Read Community Name | Specifies the read-only community name. This parameter is valid only when Version is set to v2c . |
| Write Community Name | Specifies the write community name. This parameter is valid only when Version is set to v2c . |
| Security Username | Specifies the SNMP security username. This parameter is valid only when Version is set to v3 . |
| Authentication Protocol | Specifies the authentication protocol. You are advised to set this parameter to SHA . This parameter is valid only when Version is set to v3 . |
| Authentication Password | Specifies the authentication key. This parameter is valid only when Version is set to v3 . |
| Confirm Password | Used to confirm the authentication key. This parameter is valid only when Version is set to v3 . |
| Encryption Protocol | Specifies the encryption protocol. You are advised to set this parameter to AES256 . This parameter is valid only when Version is set to v3 . |
| Encryption Password | Specifies the encryption key. This parameter is valid only when Version is set to v3 . |

| Parameter | Description |
|------------------|--|
| Confirm Password | Used to confirm the encryption key. This parameter is valid only when Version is set to v3 . |

 **NOTE**

- The **Authentication Password** and **Encryption Password** must contain 8 to 16 characters, including at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters. The two passwords must be different. The two passwords cannot be the same as the security username or the reverse of the security username.
- For security purposes, periodically change the authentication password and encryption password when the SNMP protocol is used.
- If SNMPv3 is used, a security user will be locked after five consecutive authentication failures within 5 minutes. The user will be automatically unlocked 5 minutes later.

Step 4 Click **Create Trap Target** in the **Trap Target** area. In the displayed dialog box, set the following parameters:

- **Target Symbol** specifies the trap target ID, which is the ID of the NMS or host that receives traps. The value consists of 1 to 255 characters, including letters or digits.
- **Target IP Address** specifies the IP address of the target trap. IP addresses of class A, B, and C can be used to communicate with the IP address of the management plane of the management node.
- **Target Port** specifies the port receiving traps. The port number must be consistent with the peer end and ranges from 0 to 65535.
- **Trap Community Name** is valid only when **Version** is set to **v2c**.

Click **OK**. The **Create Trap Target** dialog box is closed.

Step 5 Click **OK** to complete the settings.

----End

9.5 Alarm Reference (Applicable to MRS 2.x and Earlier Versions)

9.5.1 ALM-12001 Audit Log Dump Failure (For MRS 2.x or Earlier)

Description

Cluster audit logs need to be dumped on a third-party server due to the local historical data backup policy. Audit logs can be successfully dumped if the dump server meets the configuration conditions. This alarm is generated when the audit log dump fails because the disk space of the dump directory on the third-party server is insufficient or a user changes the username, password, or dump directory of the dump server.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12001 | Minor | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The system can only store a maximum of 50 dump files locally. If the fault persists on the dump server, the local audit log may be lost.

Possible Causes

- The network connection is abnormal.
- The username, password, or dump directory of the dump server does not meet the configuration conditions.
- The disk space of the dump directory is insufficient.

Procedure

Step 1 Check whether the username, password, and dump directory are correct.

1. Check on the dump configuration page of MRS Manager to see if they are correct.
 - If yes, go to [Step 3](#).
 - If no, go to [Step 1.2](#).
2. Change the username, password, or dump directory, and click **OK**.
3. Wait 2 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2](#).

Step 2 Reset the dump rule.

1. On MRS Manager, choose **System > Dump Audit Log**.
2. Reset dump rules, set the parameters properly, and click **OK**.

3. Wait 2 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 3](#).

Step 3 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

N/A

9.5.2 ALM-12002 HA Resource Abnormal (For MRS 2.x or Earlier)

Description

The high availability (HA) software periodically checks the Webservice floating IP addresses and databases of Manager. This alarm is generated when the HA software detects that the Webservice floating IP addresses or databases are abnormal.

This alarm is cleared when the HA software detects that the floating IP addresses or databases are normal.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12002 | Major | Yes |

Parameter

| Parameter | Description |
|-------------|--|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| RESName | Specifies the resource for which the alarm is generated. |

Impact on the System

If the Webservice floating IP addresses of Manager are abnormal, users cannot log in to or use Manager. If databases of Manager are abnormal, all core services and related service processes, such as alarms and monitoring functions, are affected.

Possible Causes

- The floating IP address is abnormal.
- The database is abnormal.

Procedure

Step 1 Check the floating IP address status of the active management node.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the host address and resource name of the alarm.
2. Log in to the active management node. Run the following commands to switch the user:

```
sudo su - root
```

```
su - omm
```

3. Go to the `/${BIGDATA_HOME}/om-0.0.1/sbin/` directory, run the `status-oms.sh` script to check whether the floating IP address of the active Manager is normal. View the command output, locate the row where **ResName** is **floatip**, and check whether the following information is displayed.

Example:

```
10-10-10-160 floatip Normal Normal Single_active
```

- If yes, go to [Step 2](#).
 - If no, go to [Step 1.4](#).
4. Contact the O&M personnel to check whether the floating IP NIC exists.
 - If yes, go to [Step 2](#).
 - If no, go to [Step 1.5](#).
 5. Contact O&M personnel to rectify the NIC fault.
Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2](#).

Step 2 Check the database status of the active and standby management nodes.

1. Log in to the active and standby management nodes, run the `sudo su - root` and `su - ommdba` commands to switch to user `ommdba`, and run the `gs_ctl query` command to check whether the following information is displayed in the command output.

Command output of the active management node:

```
Ha state:  
LOCAL_ROLE: Primary  
STATIC_CONNECTIONS: 1  
DB_STATE: Normal  
DETAIL_INFORMATION: user/password invalid
```

```
Senders info:  
No information  
Receiver info:  
No information
```

Command output of the standby management node:

```
Ha state:  
LOCAL_ROLE: Standby  
STATIC_CONNECTIONS: 1  
DB_STATE : Normal  
DETAIL_INFORMATION: user/password invalid  
Senders info:  
No information  
Receiver info:  
No information
```

- If yes, go to [Step 2.3](#).
 - If no, go to [Step 2.2](#).
2. Contact the O&M personnel to check whether a network fault occurs and rectify the fault.
 - If yes, go to [Step 2.3](#).
 - If no, go to [Step 3](#).
 3. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 3](#).

Step 3 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.3 ALM-12004 OLdap Resource Abnormal (For MRS 2.x or Earlier)

Description

This alarm is generated when the Ldap resource in Manager is abnormal.

This alarm is cleared when the Ldap resource in Manager recovers and the alarm handling is complete.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12004 | Major | Yes |

Parameter

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The Manager authentication services are unavailable and cannot provide security authentication and user management functions for web upper-layer services. Users may be unable to log in to Manager.

Possible Causes

The LdapServer process in Manager is abnormal.

Procedure

Step 1 Check whether the LdapServer process in Manager is normal.

1. Log in to the active management node.
2. Run **ps -ef | grep slapd** to check whether the LdapServer resource process in the **`\${BIGDATA_HOME}/om-0.0.1/`** directory of the configuration file is running properly.

You can determine that the resource is normal as follows:

- a. Run **sh `\${BIGDATA_HOME}/om-0.0.1/sbin/status-oms.sh** and find that **ResHAStatus** of the OLdap process is **Normal**.
- b. Run **ps -ef | grep slapd** and find that the slapd process occupies port 21750.
 - If yes, go to **Step 2**.
 - If no, go to **Step 3**.

Step 2 Run **kill -2 PID of the LdapServer process** and wait 20 seconds. The HA starts the OLdap process automatically. Check whether the status of the OLdap resource is normal.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.4 ALM-12005 OKerberos Resource Abnormal (For MRS 2.x or Earlier)

Description

The alarm module monitors the status of the Kerberos resource in Manager. This alarm is generated when the Kerberos resource is abnormal.

This alarm is cleared when the alarm handling is complete and the Kerberos resource status recovers.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12005 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The authentication services are unavailable and cannot provide security authentication functions for web upper-layer services. Users may be unable to log in to MRS Manager.

Possible Causes

The OLdap resource on which OKerberos depends is abnormal.

Procedure

Step 1 Check whether the OLdap resource on which OKerberos depends is abnormal in Manager.

1. Log in to the active management node.

2. Run the following command to check whether the OLdap resource managed by HA is normal:

```
sh ${BIGDATA_HOME}/OMSV100R001C00x8664/workspace0/ha/module/  
hacom/script/status_ha.sh
```

The OLdap resource is normal when the OLdap resource is in the **Active_normal** state on the active node and in the **Standby_normal** state on the standby node.

- If yes, go to [Step 3](#).
- If no, go to [Step 2](#).

Step 2 Resolve the problem by following the instructions in [ALM-12004 OLdap Resource Abnormal \(For MRS 2.x or Earlier\)](#). After the OLdap resource status recovers, check whether the OKerberos resource is normal.

- If yes, no further action is required.
- If no, go to [Step 3](#).

Step 3 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.5 ALM-12006 Node Fault (For MRS 2.x or Earlier)

Description

Controller checks the NodeAgent status every 30 seconds. This alarm is generated when Controller fails to receive the status report of a NodeAgent for three consecutive times.

This alarm is cleared when Controller can properly receive the status report of the NodeAgent.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12006 | Critical | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |

| Parameter | Description |
|-----------|--|
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

Services on the node are unavailable.

Possible Causes

The network is disconnected, or the hardware is faulty.

Procedure

Step 1 Check whether the network is disconnected or the hardware is faulty.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the host address of the alarm.
2. Log in to the active management node.
3. Run the following command to check whether the faulty node is reachable:
ping *IP address of the faulty host*
 - a. If yes, go to [Step 2](#).
 - b. If no, go to [Step 1.4](#).
4. Contact the O&M personnel to check whether the network is faulty.
 - If yes, go to [Step 2](#).
 - If no, go to [Step 1.6](#).
5. Rectify the network fault and check whether the alarm is cleared from the alarm list.
 - If yes, no further action is required.
 - If no, go to [Step 1.6](#).
6. Contact the O&M personnel to check whether a hardware fault (for example, a CPU or memory fault) occurs on the node.
 - If yes, go to [Step 1.7](#).
 - If no, go to [Step 2](#).
7. Repair the faulty components and restart the node. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2](#).

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.

2. Contact the O&M engineers and send the collected logs.

Reference

None

9.5.6 ALM-12007 Process Fault (For MRS 2.x or Earlier)

Description

The process health check module checks the process status every 5 seconds. This alarm is generated when the process health check module detects that the process connection status is Bad for three consecutive times.

This alarm is cleared when the process can be connected.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12007 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The service provided by the process is unavailable.

Possible Causes

- The instance process is abnormal.
- The drive space is insufficient.

Procedure

- Step 1** Check whether the instance process is abnormal.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the host name and service name of the alarm.
2. On the **Alarms** page, check whether the alarm **ALM-12006 Node Fault (For MRS 2.x or Earlier)** is generated.
If yes, go to **Step 1.3**.
If no, go to **Step 1.4**.
3. Handle the alarm by following the instructions in **ALM-12006 Node Fault (For MRS 2.x or Earlier)**.
4. Check whether the installation directory user, user group, and permission of the alarm role are correct. The correct user, user group, and the permission are **omm**, **ficommon**, and **750**, respectively.
 - If yes, go to **Step 1.6**.
 - If no, go to **Step 1.5**.
5. Run the following commands to set the permission to **750** and **User:Group** to **omm:ficommon**:
chmod 750 <folder_name>
chown omm:ficommon <folder_name>
6. Wait 5 minutes and check whether the ALM-12007 Process Fault alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 2.1**.

Step 2 Check whether the disk space is insufficient.

1. On the MRS cluster details page, click the alarm management tab and check whether ALM-12017 Insufficient Disk Capacity is generated in the alarm list.
 - If yes, go to **Step 2.2**.
 - If no, go to **Step 3**.
2. Handle the alarm by following the instructions in **ALM-12017 Insufficient Disk Capacity (For MRS 2.x or Earlier)**.
3. Wait 5 minutes and check whether the ALM-12017 Insufficient Disk Capacity alarm is cleared.
If yes, go to **Step 2.4**.
If no, go to **Step 3**.
4. Wait 5 minutes and check whether the alarm is cleared.
If yes, no further action is required.
If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.7 ALM-12010 Manager Heartbeat Interruption Between the Active and Standby Nodes (For MRS 2.x or Earlier)

Description

This alarm is generated when the active Manager does not receive any heartbeat signal from the standby Manager within 7 seconds.

This alarm is cleared when the active Manager receives heartbeat signals from the standby Manager.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12010 | Major | Yes |

Parameters

| Parameter | Description |
|-----------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Local Manager HA Name | Specifies a local Manager HA. |
| Peer Manager HA Name | Specifies a peer Manager HA. |

Impact on the System

When the active Manager process is abnormal, an active/standby failover cannot be performed, and services are affected.

Possible Causes

The link between the active and standby Manager servers is abnormal.

Procedure

- Step 1** Check whether the network between the active and standby Manager servers is normal.
1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the address of the standby Manager server.

2. Log in to the active management node.
3. Run the following command to check whether the standby Manager is reachable:
ping heartbeat IP address of the standby Manager
 - If yes, go to [Step 2](#).
 - If no, go to [Step 1.4](#).
4. Contact the O&M personnel to check whether the network is faulty.
 - If yes, go to [Step 1.5](#).
 - If no, go to [Step 2](#).
5. Rectify the network fault and check whether the alarm is cleared from the alarm list.
 - If yes, no further action is required.
 - If no, go to [Step 2](#).

Step 2 Log in to all master nodes in the cluster and run the following commands to find all **sedxxx** files and delete them:

```
find /srv/BigData/ -name "sed*"
```

```
find /opt -name "sed*"
```

Step 3 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.8 ALM-12011 Data Synchronization Exception Between the Active and Standby Manager Nodes (For MRS 2.x or Earlier)

Description

This alarm is generated when the standby Manager fails to synchronize files with the active Manager.

This alarm is cleared when the standby Manager synchronizes files with the active Manager.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12011 | Critical | Yes |

Parameters

| Parameter | Description |
|-----------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Local Manager HA Name | Specifies a local Manager HA. |
| Peer Manager HA Name | Specifies a peer Manager HA. |

Impact on the System

Because the configuration files on the standby Manager are not updated, some configurations will be lost after an active/standby switchover. Manager and some components may not run properly.

Possible Causes

The link between the active and standby Manager nodes is interrupted.

Procedure

Step 1 Check whether the network between the active and standby Manager servers is normal.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the address of the standby Manager server.
2. Log in to the active management node. Run the following command to check whether the standby Manager is reachable:
ping *IP address of the standby Manager*
 - If yes, go to [Step 2](#).
 - If no, go to [Step 1.3](#).
3. Contact the O&M personnel to check whether the network is faulty.
 - If yes, go to [Step 1.4](#).
 - If no, go to [Step 2](#).
4. Rectify the network fault and check whether the alarm is cleared from the alarm list.
 - If yes, no further action is required.
 - If no, go to [Step 2](#).

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.9 ALM-12012 NTP Service Abnormal (For MRS 2.x or Earlier)

Description

This alarm is generated when the NTP service on the current node fails to synchronize time with the NTP service on the active OMS node.

This alarm is cleared when the NTP service on the current node synchronizes time properly with the NTP service on the active OMS node.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12012 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The time on the node is inconsistent with that on other nodes in the cluster. Therefore, some MRS applications on the node may not run properly.

Possible Causes

- The NTP service on the current node cannot start properly.
- The current node fails to synchronize time with the NTP service on the active OMS node.

- The key value authenticated by the NTP service on the current node is inconsistent with that on the active OMS node.
- The time offset between the node and the NTP service on the active OMS node is large.

Procedure

Step 1 Check the NTP service on the current node.

1. Check whether the ntpd process is running on the node using the following method. Log in to the node for which the alarm is generated and run the **sudo su - root** command to switch to user **root**. Then run the following command to check whether the command output contains the ntpd process:
ps -ef | grep ntpd | grep -v grep
 - If yes, go to [Step 2.1](#).
 - If no, go to [Step 1.2](#).
2. Run **service ntp start** to start the NTP service.
3. Wait 10 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2.1](#).

Step 2 Check whether the current node can synchronize time properly with the NTP service on the active OMS node.

1. Check whether the node can synchronize time with the NTP service on the active OMS node based on additional information of the alarm.
If yes, go to [Step 2.2](#).
If no, go to [Step 3](#).
2. Check whether the synchronization with the NTP service on the active OMS node is faulty.

Log in to the node for which the alarm is generated, run the **sudo su - root** command to switch to user **root**, and run the **ntpq -np** command.

If an asterisk (*) exists before the IP address of the NTP service on the active OMS node in the command output, the synchronization is in normal state. The command output is as follows:

```
remote refid st t when poll reach delay offset jitter
```

```
=====
```

```
*10.10.10.162 .LOCL. 1 u 1 16 377 0.270 -1.562 0.014
```

If there is no asterisk (*) before the IP address of the NTP service on the active OMS node, as shown in the following command output, and the value of **refid** is **.INIT.**, the synchronization is abnormal.

```
remote refid st t when poll reach delay offset jitter
```

```
=====
```

```
10.10.10.162 .INIT. 1 u 1 16 377 0.270 -1.562 0.014
```

- If yes, go to [Step 2.3](#).
 - If no, go to [Step 3](#).
3. Rectify the fault, wait 10 minutes, and then check whether the alarm is cleared.

An NTP synchronization failure is usually related to the system firewall. If the firewall can be disabled, disable it and then check whether the fault is

rectified. If the firewall cannot be disabled, check the firewall configuration policies and ensure that port **UDP 123** is enabled (you need to follow specific firewall configuration policies of each system).

- If yes, no further action is required.
- If no, go to [Step 3](#).

Step 3 Check whether the key value authenticated by the NTP service on the current node is consistent with that on the active OMS node.

Run **cat /etc/ntp.keys** to check whether the authentication code whose key value index is 1 is the same as the value of the NTP service on the active OMS node.

- If yes, go to [Step 4.1](#).
- If no, go to [Step 5](#).

Step 4 Check whether the time offset between the node and the NTP service on the active OMS node is large.

1. Check whether the time offset is large in additional information of the alarm.
 - If yes, go to [Step 4.2](#).
 - If no, go to [Step 5](#).
2. On the **Hosts** page, select the host of the node, and choose **More > Stop All Roles** to stop all the services on the node.

If the time on the alarm node is later than that on the NTP service of the active OMS node, adjust the time of the alarm node. After adjusting the time, choose **More > Start All Roles** to start the services on the node.

If the time on the alarm node is earlier than that on the NTP service of the active OMS node, wait until the time offset is due and adjust the time of the alarm node. After adjusting the time, choose **More > Start All Roles** to start the services on the node.

NOTE

If you do not wait, data loss may occur.

3. Wait 10 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 5](#).

Step 5 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

None

9.5.10 ALM-12014 Device Partition Lost (For MRS 2.x or Earlier)

Description

This alarm is generated when the system detects that a partition to which service directories are mounted is lost (because the device is removed or goes offline, or the partition is deleted). The system checks the partition status periodically.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|---|
| 12014 | Major | <ul style="list-style-type: none">• Yes: MRS 1.9.3.10 and later patch versions• No: MRS 2.x and earlier versions |

Parameters

| Parameter | Description |
|---------------|--|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| DirName | Specifies the directory for which the alarm is generated. |
| PartitionName | Specifies the device partition for which the alarm is generated. |

Impact on the System

Service data fails to be written into the partition, and the service system runs abnormally.

Possible Causes

- The disk is removed.
- The disk is offline, or a bad sector exists on the disk.

Procedure

- Step 1** Go to the MRS cluster details page and choose **Alarms**.
- Step 2** In the real-time alarm list, click the row that contains the alarm.
- Step 3** In the **Alarm Details** area, obtain the values of **HostName**, **PartitionName**, and **DirName** from **Location**.
- Step 4** Check whether the disk corresponding to **PartitionName** on **HostName** is inserted to the correct server slot.
- If yes, go to **Step 5**.
 - If no, go to **Step 6**.
- Step 5** Contact hardware engineers to remove the faulty disk.
- Step 6** Use PuTTY to log in to the **HostName** node where an alarm is reported and check whether there is a line containing **DirName** in the **/etc/fstab** file.
- If yes, go to **Step 7**.
 - If no, go to **Step 8**.
- Step 7** Run the **vi /etc/fstab** command to edit the file and delete the line containing **DirName**.
- Step 8** Contact hardware engineers to insert a new disk. For details, see the hardware product document of the relevant model. If the faulty disk is in a RAID group, configure the RAID group. For details, see the configuration methods of the relevant RAID controller card.
- Step 9** Wait 20 to 30 minutes (The disk size determines the waiting time), and run the **mount** command to check whether the disk has been mounted to the **DirName** directory.
- If yes, perform **Step 10** for MRS 1.9.3.10 or later. For other versions, clear the alarm. No further action is required.
 - If no, perform **Step 11**.
- Step 10** Wait 2 minutes and check whether the alarm is automatically cleared.
- If yes, no further action is required.
 - If no, perform **Step 11**.
- Step 11** Collect fault information.
1. On MRS Manager, choose **System > Export Log**.
 2. Contact the O&M engineers and send the collected logs.
- End

Alarm Clearing

MRS 1.9.3.10 and later patch versions: After the fault is rectified, the system automatically clears the alarm.

MRS 2.x and earlier versions: After the fault is rectified, the system does not automatically clear the alarm. You need to clear the alarm.

Reference

None

9.5.11 ALM-12015 Device Partition File System Read-Only (For MRS 2.x or Earlier)

Description

This alarm is generated when the system detects that a partition to which service directories are mounted enters the read-only mode (due to a bad sector or a faulty file system). The system checks the partition status periodically.

This alarm is cleared when the system detects that the partition to which service directories are mounted exits from the read-only mode (because the file system is restored to read/write mode, the device is removed, or the device is formatted).

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12015 | Major | Yes |

Parameters

| Parameter | Description |
|---------------|--|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| DirName | Specifies the directory for which the alarm is generated. |
| PartitionName | Specifies the device partition for which the alarm is generated. |

Impact on the System

Service data fails to be written into the partition, and the service system runs abnormally.

Possible Causes

The disk is faulty, for example, a bad sector exists.

Procedure

- Step 1** Go to the MRS cluster details page and choose **Alarms**.
- Step 2** In the real-time alarm list, click the row that contains the alarm.
- Step 3** In the **Alarm Details** area, obtain **HostName** and **PartitionName** from **Location**. **HostName** indicates the node for which the alarm is generated, and **PartitionName** indicates the partition of the faulty disk.
- Step 4** Contact hardware engineers to check whether the disk is faulty. If the disk is faulty, remove it from the server.
- Step 5** After the disk is removed, the system reports ALM-12014 Partition Lost. Handle the alarm by following the instructions in [ALM-12014 Device Partition Lost \(For MRS 2.x or Earlier\)](#). After the handling, the alarm is automatically cleared.

9.5.12 ALM-12016 CPU Usage Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the CPU usage every 30 seconds and compares the check result with the default threshold. The CPU usage has a default threshold. This alarm is generated when the CPU usage exceeds the threshold for several times (configurable, 10 times by default) consecutively.

This alarm is cleared when the average CPU usage is less than or equal to 90% of the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12016 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |

| Parameter | Description |
|-------------------|---|
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

Processes respond slowly or do not work.

Possible Causes

- The alarm threshold or alarm hit number is improperly configured.
- The CPU configuration cannot meet service requirements. The CPU usage reaches the upper limit.

Procedure

Step 1 Check whether the alarm threshold or alarm hit number is properly configured.

1. Log in to MRS Manager and change the alarm threshold and alarm hit number based on CPU usage.
2. Choose **System > Threshold Configuration > Device > Host > CPU > CPU Usage > CPU Usage** and change the alarm threshold based on the actual CPU usage.
3. Choose **System > Threshold Configuration > Device > Host > CPU > CPU Usage > CPU Usage** and change **hit number** based on the actual CPU usage.

NOTE

This option defines the alarm check phase. **Interval** indicates the alarm check period and **hit number** indicates the number of times when the CPU usage exceeds the threshold. An alarm is generated when the CPU usage exceeds the threshold for several times consecutively.

4. Wait 2 minutes and check whether the alarm is automatically cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2](#).

Step 2 Expand the system.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the address of the node.
2. Log in to the node for which the alarm is generated.
3. Run `cat /proc/stat | awk 'NR==1|awk '{for(i=2;i<=NF;i++)j+=$i;print "" 100 - ($5+$6) * 100 / j;}'` to check the system CPU usage.
4. If the CPU usage exceeds the threshold, expand the CPU capacity.
5. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 3](#).

Step 3 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.13 ALM-12017 Insufficient Disk Capacity (For MRS 2.x or Earlier)

Description

The system checks the host disk usage every 30 seconds and compares the actual disk usage with the threshold. The disk usage has a default threshold. This alarm is generated if the disk usage exceeds the threshold.

To change the threshold, choose **System > Threshold Configuration**.

This alarm is cleared when the host disk usage is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12017 | Major | Yes |

Parameters

| Parameter | Description |
|---------------|--|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| PartitionName | Specifies the disk partition for which the alarm is generated. |

| Parameter | Description |
|-------------------|---|
| Trigger Condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

Service processes become unavailable.

Possible Causes

The disk configuration cannot meet service requirements. The disk usage reaches the upper limit.

Procedure

Step 1 Log in to MRS Manager and check whether the threshold is appropriate.

1. The default threshold is 90%. You can change the threshold to meet service requirements.
 - If yes, go to [Step 2](#).
 - If no, go to [Step 1.2](#).
2. Choose **System > Threshold Configuration** and change the alarm threshold based on the actual disk usage.
3. Wait 2 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2](#).

Step 2 Check whether the disk is a system disk.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the host name and disk partition information.
2. Log in to the node for which the alarm is generated.
3. Run the **df -h** command to check the system disk partition usage. Check whether the disk is mounted to any of the following directories by using the disk partition name obtained in [Step 2.1](#): **/**, **/boot**, **/home**, **/opt**, **/tmp**, **/var**, **/var/log**, **/boot**, and **/srv/BigData**.
 - If yes, the disk is a system disk. Then go to [Step 3.1](#).
 - If no, the disk is not a system disk. Then go to [Step 2.4](#).
4. Run the **df -h** command to check the system disk partition usage. Determine the role of the disk based on the disk partition name obtained in [Step 2.1](#).
5. Check whether the disk is used by HDFS or Yarn.
 - If yes, expand the disk capacity for the Core node. Then go to [Step 2.6](#).
 - If no, go to [Step 4](#).
6. Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 3](#).

Step 3 Check whether large files are written to the disk.

1. Run the `find / -xdev -size +500M -exec ls -l {} \;` command to view files larger than 500 MB on the node. Check whether such files are written to the disk.
 - If yes, go to [Step 3.2](#).
 - If no, go to [Step 4](#).
2. Handle the large files and check whether the alarm is cleared 2 minutes later.
 - If yes, no further action is required.
 - If no, go to [Step 4](#).
3. Expand the disk capacity.
4. Wait 2 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 4](#).

Step 4 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.14 ALM-12018 Memory Usage Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the memory usage every 30 seconds and compares the actual memory usage with the threshold. The memory usage has a default threshold. This alarm is generated when the detected memory usage exceeds the threshold.

This alarm is cleared when the host memory usage is less than or equal to 90% of the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12018 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

Processes respond slowly or do not work.

Possible Causes

Memory configuration cannot meet service requirements. The memory usage reaches the upper threshold.

Procedure

Step 1 Expand the system.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the host address of the alarm.
2. Log in to the node for which the alarm is generated.
3. Run **free -m | grep Mem\| | awk '{printf("%s", (\$3-\$6-\$7) * 100 / \$2)}'** to check the system memory usage.
4. If the memory usage exceeds the threshold, expand the memory capacity.
5. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2](#).

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.15 ALM-12027 Host PID Usage Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the PID usage every 30 seconds and compares the actual PID usage with the default threshold. This alarm is generated when the PID usage exceeds the threshold.

This alarm is cleared when the host PID usage is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12027 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

No PID is available for new processes and service processes are unavailable.

Possible Causes

Too many processes are running on the node. You need to increase the value of **pid_max**. The system is abnormal.

Procedure

Step 1 Increase the value of **pid_max**.

1. On the MRS cluster details page, click the alarm from the real-time alarm list. In the **Alarm Details** area, obtain the IP address of the host for which the alarm is generated.

2. Log in to the node for which the alarm is generated.
3. Run the `cat /proc/sys/kernel/pid_max` command to check the value of `pid_max`.
4. If the PID usage exceeds the threshold, open the `/etc/sysctl.conf` file and change the value of `kernel.pid_max` to twice the value of `pid_max` queried in [Step 1.3](#). If `kernel.pid_max` does not exist, add it to the end of the file.
For example, change the parameter value to `kernel.pid_max=65536` and run the following command to make the parameter take effect immediately:

sysctl -p

 **NOTE**

The maximum value of `kernel.pid_max` is as follows:

- 32-bit OS: **32768**
 - 64-bit OS: **4194304** (22nd power of 2)
5. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2](#).

Step 2 Check whether the system environment is abnormal.

1. Contact the O&M personnel to check whether the operating system is abnormal.
 - If yes, rectify the operating system fault and go to [Step 2.2](#).
 - If no, go to [Step 3](#).
2. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 3](#).

Step 3 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

None

9.5.16 ALM-12028 Number of Processes in the D State on the Host Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system periodically checks the number of D state processes of user `omm` on the host every 30 seconds and compares the number with the threshold. The number of processes in the D state on the host has a default threshold. This alarm is generated when the number of processes in the D state exceeds the threshold.

This alarm is cleared when the number is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12028 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

Excessive system resources are used and the service process responds slowly.

Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and a process is in the D state.

Procedure

Step 1 Check the process that is in the D state.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the address of the host.
2. Log in to the node for which the alarm is generated.
3. Run the following commands to switch the user:
sudo su - root
su - omm
4. Run the following command as user **omm** to view the PID of the process that is in the D state:
ps -elf | grep -v "\[thread_checkio\]" | awk 'NR!=1 {print \$2, \$3, \$4}' | grep omm | awk -F ' ' '{print \$1, \$3}' | grep D | awk '{print \$2}'
5. Check whether the command output is empty.

- If yes, the service process is running properly. Then go to [Step 1.7](#).
 - If no, go to [Step 1.6](#).
6. Switch to user **root** and run the **reboot** command to restart the alarm host. Restarting the host brings certain risks. Ensure that the service process runs properly after the restart.
 7. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2](#).

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.17 ALM-12031 User omm or Password Is About to Expire (For MRS 2.x or Earlier)

Description

The system starts at 00:00 every day to check whether user **omm** and the password are about to expire every eight hours. This alarm is generated if the user or password is about to expire in 15 days.

The alarm is cleared when the validity period of user **omm** is changed or the password is reset and the alarm handling is complete.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12031 | Minor | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The node trust relationship is unavailable and Manager cannot manage the services.

Possible Causes

User **omm** or the password is about to expire.

Procedure

Step 1 Check whether user **omm** and the password in the system are valid.

1. Log in to the faulty node.
2. Run the following command to view the information about user **omm** and the password:
chage -l omm
3. Check whether the user has expired based on the system message.
 - a. View the value of **Password expires** to check whether the password is about to expire.
 - b. View the value of **Account expires** to check whether the user is about to expire.

NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password are about to expire within 15 days.

- If yes, go to [Step 1.4](#).
 - If no, go to [Step 2](#).
4. Run the following command to modify the validity period configuration:
 - Run the following command to set a validity period for user **omm**:
chage -E 'specified date' omm
 - Run the following command to set the number of validity days for user **omm**:
chage -M 'number of days' omm
 5. Check whether the alarm is cleared automatically in the next periodic check.
 - If yes, no further action is required.
 - If no, go to [Step 2](#).

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.18 ALM-12032 User **ommdba** or Password Is About to Expire (For MRS 2.x or Earlier)

Description

The system starts at 00:00 every day to check whether user **ommdba** and the password are about to expire every eight hours. This alarm is generated if the user or password is about to expire in 15 days.

The alarm is cleared when the validity period of user **ommdba** is changed or the password is reset and the alarm handling is complete.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12032 | Minor | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The OMS database cannot be managed and data cannot be accessed.

Possible Causes

User **ommdba** or the password is about to expire.

Procedure

- Step 1** Check whether user **ommdba** and the password in the system are valid.
1. Log in to the faulty node.
 2. Run the following command to view the information about user **ommdba** and the password:

chage -l ommdba

3. Check whether the user has expired based on the system message.
 - a. View the value of **Password expires** to check whether the password is about to expire.
 - b. View the value of **Account expires** to check whether the user is about to expire.

 **NOTE**

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password are about to expire within 15 days.

- If yes, go to [Step 1.4](#).
 - If no, go to [Step 2](#).
4. Run the following command to modify the validity period configuration:
 - Run the following command to set a validity period for user **ommdba**:
chage -E 'specified date' ommdba
 - Run the following command to set the number of validity days for user **ommdba**:
chage -M 'number of days' ommdba
 5. Check whether the alarm is cleared automatically in the next periodic check.
 - If yes, no further action is required.
 - If no, go to [Step 2](#).

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

9.5.19 ALM-12033 Slow Disk Fault (For MRS 2.x or Earlier)**Description****For MRS 2.x or earlier:**

- For HDDs, the alarm is triggered when any of the following conditions is met:
 - The system runs the **iostat** command every 3 seconds, and detects that the **svctm** value exceeds 1000 ms for 10 consecutive periods within 30 seconds.
 - The system runs the **iostat** command every 3 seconds, and detects that more than 60% of I/O exceeds 150 ms within 300 seconds.
- For SSDs, the alarm is triggered when any of the following conditions is met:

- The system runs the **iostat** command every 3 seconds, and detects that the **svctm** value exceeds 1000 ms for 10 consecutive periods within 30 seconds.
- The system runs the **iostat** command every 3 seconds, and detects that more than 60% of I/O exceeds 20 ms within 300 seconds.

This alarm is automatically cleared when the preceding conditions have not been met for 15 minutes.

For MRS 1.9.3.10 or later:

- For HDDs, the alarm is triggered when any of the following conditions is met:
 - By default, the system collects data every 3 seconds. The svctm latency reaches 1000 ms within 30 seconds in at least seven collection periods.
 - By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 150 ms within 300 seconds.
- For SSDs, the alarm is triggered when any of the following conditions is met:
 - By default, the system collects data every 3 seconds. The svctm latency reaches 1000 ms within 30 seconds in at least seven collection periods.
 - By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 20 ms within 300 seconds.

The collection period is 3 seconds, and the detection period is 30 or 300 seconds. This alarm is automatically cleared when none of the preceding conditions are met for three consecutive detection periods (30 or 300 seconds).

 **NOTE**

For details about how to obtain the related parameters, see [Related Information](#).

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|--|------------|
| 12033 | <ul style="list-style-type: none">• Minor: MRS 1.9.3.10 and later patch versions• Major: MRS 2.x and earlier versions | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |

| Name | Meaning |
|-----------|--|
| RoleName | Specifies the role for which the alarm is generated. |
| Host Name | Specifies the host for which the alarm is generated. |
| DiskName | Specifies the disk for which the alarm is generated. |

Impact on the System

Service performance deteriorates, service processing capabilities become poor, and services may be unavailable.

Possible Causes

The disk is aged or has bad sectors.

Procedure

Check the disk status.

- Step 1** On the MRS cluster details page, click the alarm from the real-time alarm list. In the **Alarm Details** area, obtain information about the host for which the alarm is generated and information about the faulty disk.
- Step 2** Check whether the node for which the alarm is generated is in a virtualization environment.
 - If yes, go to [Step 3](#).
 - If no, go to [Step 6](#).
- Step 3** Check whether the storage performance provided by the virtualization environment meets the hardware requirements. Then, go to [Step 4](#).
- Step 4** Log in to the alarm node as user **root**, run the **df -h** command, and check whether the command output contains the value of the **DiskName** field.
 - If yes, go to [Step 6](#).
 - If no, go to [Step 5](#).
- Step 5** Run the **lsblk** command to check whether the mapping between the value of **DiskName** and the disk has been created.

```
sda                8:0    0 27810G 0
├─sda1             8:1    0   509M 0 /boot
└─sda2             8:2    0 278.4G 0
   ├─system-opt (dm-0) 253:0  0   50G 0 /opt
   ├─system-root (dm-1) 253:1  0   50G 0 /
   ├─system-swap (dm-2) 253:2  0   50G 0
   └─system-var (dm-3) 253:3  0   50G 0 /var
```

- If yes, go to [Step 6](#).
- If no, go to [Step 21](#).

Step 6 Log in to the alarm node as user **root**, run the **lsscsi | grep "/dev/sd[x]"** command to view the disk information, and check whether RAID has been set up.

 **NOTE**

In the command, **/dev/sd[x]** indicates the disk name obtained in [Step 1](#).

Example:

lsscsi | grep "/dev/sda"

In the command output, if **ATA**, **SATA**, or **SAS** is displayed in the third line, the disk has not been organized into a RAID group. If other information is displayed, RAID has been set up.

- If yes, go to [Step 11](#).
- If no, go to [Step 7](#).

Step 7 Run the **smartctl -i /dev/sd[x]** command to check whether the hardware supports the SMART tool.

Example:

smartctl -i /dev/sda

In the command output, if "SMART support is: Enabled" is displayed, the hardware supports SMART. If "Device does not support SMART" or other information is displayed, the hardware does not support SMART.

- If yes, go to [Step 8](#).
- If no, go to [Step 16](#).

Step 8 Run the **smartctl -H --all /dev/sd[x]** command to check basic SMART information and determine whether the disk is working properly.

Example:

smartctl -H --all /dev/sda

Check the value of **SMART overall-health self-assessment test result** in the command output. If the value is **FAILED**, the disk is faulty and needs to be replaced. If the value is **PASSED**, check the value of **Reallocated_Sector_Ct** or **Elements in grown defect list**. If the value is greater than 100, the disk is faulty and needs to be replaced.

- If yes, go to [Step 9](#).
- If no, go to [Step 17](#).

Step 9 Run the **smartctl -l error -H /dev/sd[x]** command to check the Glist of the disk and determine whether the disk is normal.

Example:

smartctl -l error -H /dev/sda

Check the **Command/Feature_name** column in the command output. If **READ SECTOR(S)** or **WRITE SECTOR(S)** is displayed, the disk has bad sectors. If other

errors occur, the disk circuit board is faulty. Both errors indicate that the disk is abnormal and needs to be replaced.

If "No Errors Logged" is displayed, no error log exists. You can perform step 9 to trigger the disk SMART self-check.

- If yes, go to [Step 10](#).
- If no, go to [Step 17](#).

Step 10 Run the `smartctl -t long /dev/sd[x]` command to trigger the disk SMART self-check. After the command is executed, the time when the self-check is to be completed is displayed. After the self-check is completed, repeat [Step 8](#) and [Step 9](#) to check whether the disk is working properly.

Example:

```
smartctl -t long /dev/sda
```

- If yes, go to [Step 16](#).
- If no, go to [Step 17](#).

Step 11 Run the `smartctl -d [sat|scsi]+megaraid,[DID] -H --all /dev/sd[x]` command to check whether the hardware supports SMART.

 NOTE

- In the command, `[sat|scsi]` indicates the disk type. Both types need to be used.
- `[DID]` indicates the slot information. Slots 0 to 15 need to be used.

For example, run the following commands in sequence:

```
smartctl -d sat+megaraid,0 -H --all /dev/sda
```

```
smartctl -d sat+megaraid,1 -H --all /dev/sda
```

```
smartctl -d sat+megaraid,2 -H --all /dev/sda
```

...

Try the command combinations of different disk types and slot information. If "SMART support is: Enabled" is displayed in the command output, the disk supports SMART. Record the parameters of the disk type and slot information when a command is successfully executed. If "SMART support is: Enabled" is not displayed in the command output, the disk does not support SMART.

- If yes, go to [Step 12](#).
- If no, go to [Step 15](#).

Step 12 Run the `smartctl -d [sat|scsi]+megaraid,[DID] -H --all /dev/sd[x]` command recorded in [Step 11](#) to check basic SMART information and determine whether the disk is normal.

Example:

```
smartctl -d sat+megaraid,2 -H --all /dev/sda
```

Check the value of **SMART overall-health self-assessment test result** in the command output. If the value is **FAILED**, the disk is faulty and needs to be replaced. If the value is **PASSED**, check the value of **Reallocated_Sector_Ct** or

Elements in grown defect list. If the value is greater than 100, the disk is faulty and needs to be replaced.

- If yes, go to [Step 13](#).
- If no, go to [Step 17](#).

Step 13 Run the `smartctl -d [sat|scsi]+megaraid,[DID] -l error -H /dev/sd[x]` command to check the Glist of the disk and determine whether the hard disk is working properly.

Example:

```
smartctl -d sat+megaraid,2 -l error -H /dev/sda
```

Check the **Command/Feature_name** column in the command output. If **READ SECTOR(S)** or **WRITE SECTOR(S)** is displayed, the disk has bad sectors. If other errors occur, the disk circuit board is faulty. Both errors indicate that the disk is abnormal and needs to be replaced.

If "No Errors Logged" is displayed, no error log exists. You can perform step 9 to trigger the disk SMART self-check.

- If yes, go to [Step 14](#).
- If no, go to [Step 17](#).

Step 14 Run the `smartctl -d [sat|scsi]+megaraid,[DID] -t long /dev/sd[x]` command to trigger the disk SMART self-check. After the command is executed, the time when the self-check is to be completed is displayed. After the self-check is completed, repeat [Step 12](#) and [Step 13](#) to check whether the disk is working properly.

Example:

```
smartctl -d sat+megaraid,2 -t long /dev/sda
```

- If yes, go to [Step 16](#).
- If no, go to [Step 17](#).

Step 15 If the configured RAID controller card does not support SMART, the disk does not support SMART. In this case, use the check tool provided by the corresponding RAID controller card vendor to rectify the fault. Then go to [Step 16](#).

For example, LSI is a MegaCLI tool.

Step 16 On the alarm details page, click **Clear Alarm**. Check whether the alarm is reported on the same disk again.

If the alarm is reported for more than three times, replace the disk.

- If yes, go to [Step 17](#).
- If no, no further action is required.

Replace the disk.

Step 17 On MRS Manager, choose **Alarms**.

Step 18 View the detailed information about the alarm. Check the values of **HostName** and **DiskName** in the location information to obtain the information about the faulty disk for which the alarm is reported.

Step 19 Replace a disk.

Step 20 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 21](#).

Collect the fault information.

Step 21 On MRS Manager, choose **System > Export Log**.

Step 22 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

To obtain the related parameters, perform the following steps:

- For MRS 2.x or earlier versions:

Perform the following operations to detect slow disk faults:

On the Linux platform, run the **iostat -x -t 1** command to check whether the I/O is faulty. Specifically, check the **svctm** value in the red box in the figure below.

svctm indicates the I/O service time of the disk.

```
[root@ ~]# iostat -x -t 1 1
Linux 4.18.0-147.5.1.6.el8.x86_64 (node-master1N3sn)      09/15/2022      _x86_64_      (4 CPU)

09/15/2022 10:57:11 AM

loop0               0.00    0.00    0.00    0.00    0.01    0.00    49.94    0.00    0.31    0.31    0.00    0.29    0.00
```

- For MRS 1.9.3.10 or later patch versions:

The **svctm** value can be obtained through the following expression:

$$svctm = (tot_ticks_new - tot_ticks_old) / (rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old)$$

When the detection period is 30 seconds, if **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0**, then **svctm = 0**.

When the detection period is 300 seconds and **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0**, if **tot_ticks_new - tot_ticks_old = 0**, then **svctm = 0**; otherwise, the value of **svctm** is infinite.

The parameters in the preceding expression can be obtained as follows:

Obtain the parameter values from the data collected via the **cat /proc/diskstats** command run by the system every 3 seconds. The following shows an example.

```

omm@ ~$ cat /proc/diskstats
253 0 vda 1101553 35446 83439787 3338546 28744856 48314024 1054257652 52667332 0 19569526 40342913 0 0 0 0

253 8 vda8 312935 8169 22369722 458354 12181277 34364199 531855680 17727525 0 9061647 11387424 0 0 0 0
253 16 vdb 275920 21939 15977738 2171665 39477604 28238831 2653881640 482234435 0 30581946 465964144 0 0 0 0
253 17 vdb1 275439 21939 15948866 2171472 31293358 28238811 2653881432 481841639 0 30038274 465857164 0 0 0 0
7 0 loop0 356 0 17442 150 0 0 0 0 149 105 0 0 0 0
    
```

In the data collected for the first time, the number in the fourth column is the value of **rd_ios_old**, the number in the eighth column is the value of **wr_ios_old**, and the number in the thirteenth column is the value of **tot_ticks_old**.

In the data collected for the second time, the number in the fourth column is the value of **rd_ios_new**, the number in the eighth column is the value of **wr_ios_new**, and the number in the thirteenth column is the value of **tot_ticks_new**.

In this case, the value of **svctm** is as follows:

$$(19571460 - 19569526) / (1101553 + 28747977 - 1101553 - 28744856) = 0.6197$$

9.5.20 ALM-12034 Periodic Backup Failure (For MRS 2.x or Earlier)

Description

This alarm is generated when a periodic backup task fails to be executed. This alarm is cleared when the next backup task is executed successfully.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12034 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |

| Parameter | Description |
|-----------|--|
| HostName | Specifies the host for which the alarm is generated. |
| TaskName | Specifies the task name. |

Impact on the System

No backup package is available for a long time, so the system cannot be restored in case of exceptions.

Possible Causes

The alarm cause depends on the task details. Handle the alarm according to the logs and alarm details.

Procedure

Checking whether the disk space is insufficient

- Step 1** On MRS Manager, choose **Alarms**.
- Step 2** In the alarm list, click  of the alarm and obtain the task name from the **Location** area.
- Step 3** Choose **System > Back Up Data**.
- Step 4** Search for the backup task based on the task name and choose **More > View History** in the **Operation** column to view detailed information about the backup task.
- Step 5** Choose **Details > View** and check whether message "Failed to backup xx due to insufficient disk space, move the data in the /srv/BigData/LocalBackup directory to other directories." exists.
 - If yes, go to [Step 6](#).
 - If no, go to [Step 13](#).
- Step 6** Choose **Backup Path > View** to obtain the backup path.
- Step 7** Log in to the node as user **root** and view the mounting details of the node.
df -h
- Step 8** Check whether the available space of the node to which the backup path is mounted is less than 20 GB.
 - If yes, go to [Step 9](#).
 - If no, go to [Step 13](#).
- Step 9** Check whether the backup package exists in the backup directory and whether the available space of the node to which the backup directory is mounted is less than 20 GB.
 - If yes, go to [Step 10](#).

- If no, go to [Step 13](#).

Step 10 Ensure that the available space of the node to which the backup directory is mounted to be greater than 20 GB by moving backup packages out of the backup directory or deleting the backup packages.

Step 11 Start the backup task again and check whether the backup task is executed.

- If yes, go to [Step 12](#).
- If no, go to [Step 13](#).

Step 12 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 13](#).

Collecting fault information

Step 13 On MRS Manager, choose **System > Export Log**.

Step 14 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Reference

None

9.5.21 ALM-12035 Unknown Data Status After Recovery Task Failure (For MRS 2.x or Earlier)

Description

If a recovery task fails, the system attempts to automatically roll back. If the rollback fails, data may be lost. If this occurs, an alarm is reported. This alarm is cleared when the recovery task is successfully executed later.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12035 | Critical | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |

| Parameter | Description |
|-----------|--|
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| TaskName | Specifies the task name. |

Impact on the System

The data may be lost or the data status may be unknown, which may affect services.

Possible Causes

The possible cause of this alarm is that the component status does not meet the requirements before the restoration task is executed or an error occurs in a step during the restoration task. The error depends on the task details. You can obtain logs and task details to handle the alarm.

Procedure

Checking the component status

- Step 1** Log in to MRS Manager and choose **Services**. On the page that is displayed, check whether the running status of the components meets the requirements. (OMS and DBService must be in the normal status, and other components must be stopped.)
- If yes, go to [Step 7](#).
 - If no, go to [Step 2](#).
- Step 2** Restore the component status as required and start the recovery task again.
- Step 3** Log in to MRS Manager and choose **Alarms**. In the alarm list, click the row containing the alarm and obtain the task name from the **Location** area.
- Step 4** Choose **System > Recovery Management**. Search for the restoration task based on the task name and view the task details.
- Step 5** Start the restoration task and check whether the task is executed.
- If yes, go to [Step 6](#).
 - If no, go to [Step 7](#).
- Step 6** After 2 minutes, check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 7](#).

Collecting fault information

- Step 7** On MRS Manager, choose **System > Export Log**.

Step 8 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

None

9.5.22 ALM-12037 NTP Server Abnormal (For MRS 2.x or Earlier)

Description

This alarm is generated when the NTP server is abnormal.

This alarm is cleared when the NTP server recovers.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12037 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|--|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the IP address of the NTP server for which the alarm is generated. |

Impact on the System

The NTP server configured on the active OMS node is abnormal. In this case, the active OMS node cannot synchronize time with the NTP server and a time offset may be generated in the cluster.

Possible Causes

- The NTP server network is faulty.

- The NTP server authentication fails.
- The time cannot be obtained from the NTP server.
- The time obtained from the NTP server is not continuously updated.

Procedure

Step 1 Check the NTP server network.

1. On the MRS cluster details page, click the alarm from the real-time alarm list.
2. In the **Alarm Details** area, view the additional information to check whether the NTP server fails to be pinged.
 - If yes, go to [Step 1.3](#).
 - If no, go to [Step 2](#).
3. Contact the O&M personnel to check the network configuration and ensure that the network between the NTP server and the active OMS node is in normal state. Then, check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2](#).

Step 2 Check whether the NTP server authentication fails.

1. Log in to the active management node.
2. Run **ntpq -np** to check whether the NTP server authentication fails. If **refid** of the NTP server is **.AUTH.**, the authentication fails.
 - If yes, go to [Step 5](#).
 - If no, go to [Step 3](#).

Step 3 Check whether the time can be obtained from the NTP server.

1. View the alarm additional information to check whether the time cannot be obtained from the NTP server.
 - If yes, go to [Step 3.2](#).
 - If no, go to [Step 4](#).
2. Contact the O&M personnel to rectify the NTP server fault. After the NTP server is in normal state, check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 4](#).

Step 4 Check whether the time obtained from the NTP server fails to be updated.

1. View the alarm additional information to check whether the time obtained from the NTP server fails to be updated.
 - If yes, go to [Step 4.2](#).
 - If no, go to [Step 5](#).
2. Contact the provider of the NTP server to rectify the NTP server fault. After the NTP server is in normal state, check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 5](#).

Step 5 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

None

9.5.23 ALM-12038 Monitoring Indicator Dump Failure (For MRS 2.x or Earlier)

Description

This alarm is generated when dumping fails after monitoring indicator dumping is configured on MRS Manager.

This alarm is cleared when dumping is successful.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12038 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The upper-layer management system fails to obtain monitoring indicators from the MRS Manager system.

Possible Causes

- The server cannot be connected.
- The save path on the server cannot be accessed.
- The monitoring indicator file fails to be uploaded.

Procedure

- Step 1** Contact the O&M personnel to check whether the network connection between the MRS Manager system and the server is normal.
- If yes, go to [Step 3](#).
 - If no, go to [Step 2](#).
- Step 2** Contact the O&M personnel to restore the network and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 3](#).
- Step 3** Choose **System > Monitor Dumping Configuration** and check whether the FTP username, password, port, dump mode, and public key configured on the monitoring indicator dumping configuration page are consistent with those on the server.
- If yes, go to [Step 5](#).
 - If no, go to [Step 4](#).
- Step 4** Enter the correct configuration, click **OK**, and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 5](#).
- Step 5** Choose **System > Monitor Dumping Configuration** and check the configuration items, including the FTP username, save path, and dumping mode.
- If the FTP mode is used, go to [Step 6](#).
 - If the SFTP mode is used, go to [Step 7](#).
- Step 6** Log in to the server. In the default path, check whether the save path (relative path) has the read and write permission on the FTP username.
- If yes, go to [Step 9](#).
 - If no, go to [Step 8](#).
- Step 7** Log in to the server. In the default path, check whether the save path (absolute path) has the read and write permission on the FTP username.
- If yes, go to [Step 9](#).
 - If no, go to [Step 8](#).
- Step 8** Add the read and write permission and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 9](#).
- Step 9** Log in to the server and check whether the save path has sufficient disk space.
- If yes, go to [Step 11](#).
 - If no, go to [Step 10](#).
- Step 10** Delete unnecessary files or go to the monitoring indicator dumping configuration page to change the save path. Check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 11](#).

Step 11 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.24 ALM-12039 GaussDB Data Is Not Synchronized (For MRS 2.x or Earlier)

Description

The system checks the data synchronization status between the active and standby GaussDB nodes every 10 seconds. This alarm is generated when the synchronization status cannot be queried for six consecutive times or when the synchronization status is abnormal.

This alarm is cleared when the data synchronization status is normal.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12039 | Critical | Yes |

Parameter

| Parameter | Description |
|---------------------|---|
| ServiceName | Service for which the alarm is generated. |
| RoleName | Role for which the alarm is generated. |
| HostName | Host for which the alarm is generated. |
| Local GaussDB HA IP | HA IP address of the local GaussDB. |
| Peer GaussDB HA IP | HA IP address of the peer GaussDB. |
| SYNC_PERCENT | Synchronization percentage. |

Impact on the System

When data is not synchronized between the active and standby GaussDBs, the data may be lost or abnormal if the active instance becomes abnormal.

Possible Causes

- The network between the active and standby nodes is unstable.
- The standby GaussDB is abnormal.
- The disk space of the standby node is full.

Procedure

Step 1 Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the IP address of the standby GaussDB node.

Step 2 Log in to the active management node.

Step 3 Run the following command to check whether the standby GaussDB is reachable:

```
ping heartbeat IP address of the standby GaussDB
```

If yes, go to [Step 6](#).

If no, go to [Step 4](#).

Step 4 Contact the O&M personnel to check whether the network is faulty.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Step 6 Log in to the standby GaussDB node.

Step 7 Run the following commands to switch the user:

```
sudo su - root
```

```
su - omm
```

Step 8 Go to the `$(BIGDATA_HOME)/om-0.0.1/sbin/` directory.

Run the following command to check whether the resource status of the standby GaussDB is normal:

```
sh status-oms.sh
```

In the command output, check whether the following information is displayed in the row where **ResName** is **gaussDB**:

```
10_10_10_231 gaussDB Standby_normal Normal Active_standby
```

- If yes, go to [Step 9](#).
- If no, go to [Step 15](#).

Step 9 Log in to the standby GaussDB node.

Step 10 Run the following commands to switch the user:

```
sudo su - root
```

su - omm

Step 11 Run the **echo \${BIGDATA_DATA_HOME}/dbdata_om** command to obtain the GaussDB data directory.

Step 12 Run the **df -h** command to check the system disk partition usage.

Step 13 Check whether the disk where the GaussDB data directory is mounted is full.

- If yes, go to [Step 14](#).
- If no, go to [Step 15](#).

Step 14 Contact the O&M personnel to expand the disk capacity. After capacity expansion, wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 15](#).

Step 15 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.25 ALM-12040 Insufficient System Entropy (For MRS 2.x or Earlier)

Description

The system checks the entropy at 00:00:00 every day and performs five consecutive checks each time. First, the system checks whether the rng-tools tool is enabled and correctly configured. If not, the system checks the current entropy. This alarm is generated if the entropy is less than 500 in the five checks.

This alarm is cleared if the true random number mode is configured, random numbers are configured in pseudo-random number mode, or neither the true random number mode nor the pseudo-random number mode is configured but the entropy is greater than or equal to 500 in at least one check among the five checks.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12040 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

Decryption failures occur and functions related to decryption are affected, for example, DBService installation.

Possible Causes

The rngd service is abnormal.

Procedure

- Step 1** Go to the cluster details page and choose **Alarms**.
- Step 2** View the alarm details to obtain the value of the **HostName** field in **Location**.
- Step 3** Log in to the node for which the alarm is generated and run the **sudo su - root** command to switch to user **root**.
- Step 4** Run the **/bin/rpm -qa | grep -w "rng-tools"** command. If the command is executed successfully, run the **ps -ef | grep -v "grep" | grep rngd | tr -d " " | grep "\-o/dev/random" | grep "\-r/dev/urandom"** command and view the command output.
 - If the command is executed successfully, the rngd service is installed, correctly configured, and is running properly. Go to [Step 8](#).
 - If the command is not executed successfully, the rngd service is not running properly. Then go to [Step 5](#).
- Step 5** Run the following command to start the rngd service:

```
echo 'EXTRAOPTIONS="-r /dev/urandom -o /dev/random"' >> /etc/sysconfig/rngd  
service rngd start
```
- Step 6** Run the **service rngd status** command to check whether the rngd service is in the running state.
 - If yes, go to [Step 7](#).
 - If no, go to [Step 8](#).
- Step 7** Wait until 00:00:00 when the system checks the entropy again. Check whether the alarm is cleared automatically.

- If yes, no further action is required.
- If no, go to [Step 8](#).

Step 8 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

None

9.5.26 ALM-12041 Permission of Key Files Is Abnormal (For MRS 2.x or Earlier)

Description

The system checks the permission, users, and user groups of key directories or files every hour. This alarm is generated if any of these is abnormal.

This alarm is cleared after the problem that causes abnormal permission, users, or user groups is solved.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12041 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| PathName | Specifies the file path or file name. |

Impact on the System

System functions are unavailable.

Possible Causes

The user has manually modified the file permission, user information, or user groups, or the system has experienced an unexpected power-off.

Procedure

Step 1 Check the file permission.

1. Go to the MRS cluster details page and choose **Alarms**.
2. In the details of the alarm, query the **HostName** (name of the alarmed host) and **PathName** (path or name of the involved file).
3. Log in to the alarmed node.
4. Run the **ll *PathName*** command to query the current user, permission, and user group of the file or path.
5. Go to the **`\${BIGDATA_HOME}/nodeagent/etc/agent/autocheck** directory and run the **vi *keyfile*** command. Search for the name of the involved file and query the correct permission of the file.
6. Compare the actual permission of the file with the permission obtained in [Step 1.5](#). If they are different, change the actual permission, user information, and user group to the correct values.
7. Wait until the next system check is complete and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2](#).

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.27 ALM-12042 Key File Configurations Are Abnormal (For MRS 2.x or Earlier)

Description

The system checks key file configurations every hour. This alarm is generated if any key configuration is abnormal.

This alarm is cleared after the configuration becomes normal.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12042 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| PathName | Specifies the file path or file name. |

Impact on the System

Functions related to the file are abnormal.

Possible Causes

The user has manually modified the file configurations or the system has experienced an unexpected power-off.

Procedure

Step 1 Check the file configurations.

1. Go to the MRS cluster details page and choose **Alarms**.
2. In the details of the alarm, query the **HostName** (name of the alarmed host) and **PathName** (path or name of the involved file).
3. Log in to the alarmed node.
4. Manually check and modify the file configurations according to the criteria in [Related Information](#).
5. Wait until the next system check is complete and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2](#).

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.

2. Contact the O&M engineers and send the collected logs.

----End

Related Information

- **Checking /etc/fstab**

Check whether partitions configured in **/etc/fstab** exist in **/proc/mounts** and whether swap partitions configured in **/etc/fstab** match those in **/proc/swaps**.

- **Checking /etc/hosts**

Run the **cat /etc/hosts** command. If any of the following situations exists, the file configurations are abnormal.

- The **/etc/hosts** file does not exist.
- The host name is not configured in the file.
- The IP address of the host is duplicate.
- The IP address of the host does not exist in the **ipconfig** list.
- An IP address in the file is used by multiple hosts.

9.5.28 ALM-12043 DNS Parsing Duration Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the DNS parsing duration every 30 seconds. This alarm is generated when the DNS parsing duration exceeds the threshold (the default threshold is 20,000 ms) for multiple times (the default value is 2).

You can change the threshold by choosing **System > Threshold Configuration > Device > Host > Network Status > DNS Resolution Duration > DNS Resolution Duration**.

This alarm is cleared when **hit number** is **1** and the DNS resolution duration is less than or equal to the threshold. This alarm is cleared when **hit number** is not **1** and the DNS resolution duration is less than or equal to 90% of the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12043 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |

| Parameter | Description |
|-----------|--|
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

- Kerberos-based secondary authentication is slow.
- The ZooKeeper service is abnormal.
- The node is faulty.

Possible Causes

- The node is configured with the DNS client.
- The node is equipped with the DNS server and the DNS server is started.

Procedure

Check whether the node is configured with the DNS client.

Step 1 Go to the MRS cluster details page and choose **Alarms**.

Step 2 View the alarm details to obtain the value of the **HostName** field in **Location**.

Step 3 Use PuTTY to log in to the node for which the alarm is generated as user **root**.

Step 4 Run the **cat /etc/resolv.conf** command to check whether the DNS client is installed.

If information similar to the following is displayed, the DNS client is installed and started:

```
nameserver 10.2.3.4  
nameserver 10.2.3.4
```

- If yes, go to [Step 5](#).
- If no, go to [Step 7](#).

Step 5 Run the **vi /etc/resolv.conf** command to comment out the following content using the number signs (#) and save the file:

```
# nameserver 10.2.3.4  
# nameserver 10.2.3.4
```

Step 6 Check whether this alarm is cleared after 5 minutes.

- If yes, no further action is required.
- If no, go to [Step 7](#).

Check whether the node is equipped with the DNS server and the DNS server is started.

Step 7 Run the **service named status** command to check whether the DNS service is installed on the node.

If information similar to the following is displayed, the DNS server is installed and started:

```
Checking for nameserver BIND
version: 9.6-ESV-R7-P4
CPUs found: 8
worker threads: 8
number of zones: 17
debug level: 0
xfers running: 0
xfers deferred: 0
soa queries in progress: 0
query logging is ON
recursive clients: 4/0/1000
tcp clients: 0/100
server is up and running
```

- If yes, go to [Step 8](#).
- If no, go to [Step 10](#).

Step 8 Run the **service named stop** command to stop the DNS server.

Step 9 Check whether this alarm is cleared after 5 minutes.

- If yes, no further action is required.
- If no, go to [Step 10](#).

Step 10 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.29 ALM-12045 Read Packet Dropped Rate Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the read packet dropped rate every 30 seconds. This alarm is generated when the read packet dropped rate exceeds the threshold (the default threshold is 0.5%) for multiple times (the default value is 5).

You can change the threshold by choosing **System > Threshold Configuration > Device > Host > Network Reading > Network Read Packet Rate Information > Read Packet Dropped Rate**.

This alarm is cleared when **hit number** is 1 and the read packet dropped rate is less than or equal to the threshold. This alarm is cleared when **hit number** is greater than 1 and the read packet dropped rate is less than or equal to 90% of the threshold.

The alarm detection is disabled by default. If you want to enable this function, check whether this function can be enabled based on Checking System Environments.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12045 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|--|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| NetworkCardName | Specifies the network port for which the alarm is generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

The service performance deteriorates or some services time out.

Risk warning: In SUSE kernel 3.0 or later or Red Hat 7.2, the system kernel modifies the mechanism for counting the number of dropped read packets. In this case, this alarm may be generated even if the network is running properly, but services are not affected. You are advised to check the system environment first.

Possible Causes

- An OS exception occurs.
- The NICs are bonded in active/standby mode.
- The alarm threshold is improperly configured.
- The network environment is abnormal.

Procedure

View the network packet dropped rate.

- Step 1** Use PuTTY to log in to any non-alarm node in the cluster as user **omm** and run the **ping IP address of the node for which the alarm is generated -c 100** command to check whether packet drop occurs on the network.

```
# ping 10.10.10.12 -c 5
PING 10.10.10.12 (10.10.10.12) 56(84) bytes of data:
64 bytes from 10.10.10.11: icmp_seq=1 ttl=64 time=0.033 ms
64 bytes from 10.10.10.11: icmp_seq=2 ttl=64 time=0.034 ms
```

```
64 bytes from 10.10.10.11: icmp_seq=3 ttl=64 time=0.021 ms
64 bytes from 10.10.10.11: icmp_seq=4 ttl=64 time=0.033 ms
64 bytes from 10.10.10.11: icmp_seq=5 ttl=64 time=0.030 ms
--- 10.10.10.12 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 4001ms  rtt min/avg/max/mdev =
0.021/0.030/0.034/0.006 ms
```

NOTE

- *IP address of the node for which the alarm is generated.* Query the IP address of the node for which the alarm is generated on the node management page of the MRS cluster details page based on the value of **HostName** in the alarm location information. Check both the IP addresses of the management plane and service plane.
- **-c**: number of check times. The default value is **100**.
- If yes, go to [Step 11](#).
- If no, go to [Step 2](#).

Check the system environment.

Step 2 Use PuTTY to log in to the active OMS node or the node for which the alarm is generated as user **omm**.

Step 3 Run the **cat /etc/*-release** command to check the OS type.

- If the OS is EulerOS, go to [Step 4](#).

```
# cat /etc/*-release EulerOS release 2.0 (SP2)
EulerOS release 2.0 (SP2)
```
- If the OS is SUSE, go to [Step 5](#).

```
# cat /etc/*-release
SUSE Linux Enterprise Server 11 (x86_64)
VERSION = 11
PATCHLEVEL = 3
```
- Otherwise, go to [Step 11](#).

Step 4 Run the **cat /etc/euleros-release** command to check whether the OS version is EulerOS 2.2.

```
# cat/etc/euleros-release
EulerOS release 2.0 (SP2)
```

- If yes, the alarm sending function cannot be enabled. Go to [Step 6](#).
- If no, go to [Step 11](#).

Step 5 Run the **cat /proc/version** command to check whether the SUSE kernel version is 3.0 or later.

```
# cat /proc/version
Linux version 3.0.101-63-default (geeko@buildhost) (gcc version 4.3.4 [gcc-4_3-branch revision 152973]
(SUSE Linux) ) #1 SMP Tue Jun 23 16:02:31 UTC 2015 (4b89d0c)
```

- If yes, the alarm sending function cannot be enabled. Go to [Step 6](#).
- If no, go to [Step 11](#).

Step 6 Log in to MRS Manager and choose **System > Configuration > Threshold Configuration**.

Step 7 In the navigation pane of the **Threshold Configuration** page, choose **Network Reading > Network Read Packet Rate Information > Read Packet Dropped Rate**. In the right pane, check whether **Send Alarm** is selected.

- If yes, the alarm sending function is enabled. Go to [Step 8](#).
- If no, the alarm sending function is disabled. Go to [Step 10](#).

- Step 8** In the right pane, deselect **Send Alarm** to shield alarm "Network Read Packet Dropped Rate Exceeds the Threshold."
- Step 9** Go to the MRS cluster details page and choose **Alarms**.
- Step 10** Search for alarm 12045 and manually clear the alarms that are not automatically cleared. No further action is required.

Figure 9-2 Alarm Management

Alarm

Export All Clear Alarm All Objects Q All levels Advanced Search C

Alarm ID: 12045 Alarm Name:

Start Time: End Time:

Alarm Status: All Alarm Types

Search Reset

NOTE

The ID of alarm Network Read Packet Dropped Rate Exceeds the Threshold is 12045.

Check whether the NICs are bonded in active/standby mode.

- Step 11** Use PuTTY to log in to the node for which the alarm is generated as user **omm** and run the **ls -l /proc/net/bonding** command to check whether the **/proc/net/bonding** directory exists on the node.

- If yes, as shown in the following figure, the bond mode is configured for the node. Go to **Step 12**.

```
# ls -l /proc/net/bonding/  
total 0  
-r--r--r-- 1 root root 0 Oct 11 17:35 bond0
```

- If no, the bond mode is not configured for the node. Go to **Step 14**.

```
# ls -l /proc/net/bonding/  
ls: cannot access /proc/net/bonding/: No such file or directory
```

- Step 12** Run the **cat /proc/net/bonding/bond0** command to check whether the value of **Bonding Mode** in the configuration file is **fault-tolerance**.

NOTE

In the preceding command, **bond0** is the name of the bond configuration file. Use the file name obtained in **Step 11**.

```
# cat /proc/net/bonding/bond0  
Ethernet Channel Bonding Driver: v3.7.1 (April 27, 2011)
```

```
Bonding Mode: fault-tolerance (active-backup)  
Primary Slave: eth1 (primary_reselect always)  
Currently Active Slave: eth1  
MII Status: up  
MII Polling Interval (ms): 100  
Up Delay (ms): 0
```

Down Delay (ms): 0

Slave Interface: eth0
MII Status: up
Speed: 1000 Mbps
Duplex: full
Link Failure Count: 1
Slave queue ID: 0

Slave Interface: eth1
MII Status: up
Speed: 1000 Mbps
Duplex: full
Link Failure Count: 1
Slave queue ID: 0

- If yes, the NICs are bonded in active/standby mode. Go to [Step 13](#).
- If no, go to [Step 14](#).

Step 13 Check whether the NIC specified by **NetworkCardName** in the alarm details is the standby NIC.

- If yes, the alarm of the standby NIC cannot be automatically cleared. Manually clear the alarm on the alarm management page. No further action is required.
- If no, go to [Step 14](#).

 **NOTE**

To determine the standby NIC, check the `/proc/net/bonding/bond0` configuration file. If the NIC name corresponding to **NetworkCardName** is **Slave Interface** but not **Currently Active Slave** (the current active NIC), the NIC is the standby one.

Check whether the threshold is set properly.

Step 14 Log in to MRS Manager and check whether the threshold (configurable, 0.5% by default) is appropriate.

- If yes, go to [Step 17](#).
- If no, go to [Step 15](#).

Step 15 Choose **System > Threshold Configuration > Device > Host > Network Reading > Network Read Packet Rate Information > Read Packet Dropped Rate** and change the alarm threshold based on the actual service usage.

Step 16 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 17](#).

Check whether the network is normal.

Step 17 Contact the system administrator to check whether the network is normal.

- If yes, rectify the network fault and go to [Step 18](#).
- If no, go to [Step 19](#).

Step 18 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 19](#).

Step 19 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.30 ALM-12046 Write Packet Dropped Rate Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the write packet dropped rate every 30 seconds. This alarm is generated when the write packet dropped rate exceeds the threshold (the default threshold is 0.5%) for multiple times (the default value is 5).

You can change the threshold by choosing **System > Threshold Configuration > Device > Host > Network Writing > Network Write Packet Rate Information > Write Packet Dropped Rate**.

When the **hit number** is **1**, this alarm is cleared when the network write packet dropped rate is less than or equal to the threshold. When the **hit number** is greater than **1**, this alarm is cleared when the network write packet dropped rate is less than or equal to 90% of the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12046 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|--|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| NetworkCardName | Specifies the network port for which the alarm is generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

The service performance deteriorates or some services time out.

Possible Causes

- The alarm threshold is improperly configured.
- The network environment is abnormal.

Procedure

Check whether the threshold is set properly.

Step 1 Log in to MRS Manager and check whether the threshold (configurable, 0.5% by default) is appropriate.

- If yes, go to [Step 4](#).
- If no, go to [Step 2](#).

Step 2 Choose **System > Threshold Configuration > Device > Host > Network Write Information > Network Write Packet Rate > Write Packet Dropped Rate** and change the alarm threshold based on the actual service usage.

Step 3 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

Check whether the network is normal.

Step 4 Contact the system administrator to check whether the network is normal.

- If yes, rectify the network fault and go to [Step 5](#).
- If no, go to [Step 6](#).

Step 5 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Step 6 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.31 ALM-12047 Read Packet Error Rate Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the read packet error rate every 30 seconds. This alarm is generated when the read packet error rate exceeds the threshold (the default threshold is **0.5%**) for multiple times (the default value is **5**).

You can change the threshold by choosing **System > Threshold Configuration > Device > Host > Network Reading > Network Read Packet Rate Information > Read Packet Error Rate**.

If the **hit number** is **1**, this alarm is cleared when the read packet error rate is less than or equal to the threshold. If the **hit number** is greater than **1**, this alarm is cleared when the read packet error rate is less than or equal to 90% of the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12047 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|--|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| NetworkCardName | Specifies the network port for which the alarm is generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

The communication is intermittently interrupted, and services time out.

Possible Causes

- The alarm threshold is improperly configured.

- The network environment is abnormal.

Procedure

Check whether the threshold is set properly.

Step 1 Log in to MRS Manager and check whether the threshold (configurable, 0.5% by default) is appropriate.

- If yes, go to [Step 4](#).
- If no, go to [Step 2](#).

Step 2 Choose **System > Threshold Configuration > Device > Host > Network Reading > Network Read Packet Rate Information > Read Packet Error Rate** and change the alarm threshold based on the actual service usage.

Step 3 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

Check whether the network is normal.

Step 4 Contact the system administrator to check whether the network is normal.

- If yes, rectify the network fault and go to [Step 5](#).
- If no, go to [Step 6](#).

Step 5 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Step 6 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.32 ALM-12048 Write Packet Error Rate Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the write packet error rate every 30 seconds. This alarm is generated when the write packet error rate exceeds the threshold (the default threshold is **0.5%**) for multiple times (the default value is **5**).

You can change the threshold by choosing **System > Threshold Configuration > Device > Host > Network Writing > Network Write Packet Rate Information > Write Packet Error Rate**.

If **hit number** is **1**, this alarm is cleared when the write packet error rate is less than or equal to the threshold. If **hit number** is greater than **1**, this alarm is cleared when the write packet error rate is less than or equal to 90% of the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12048 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|--|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| NetworkCardName | Specifies the network port for which the alarm is generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

The communication is intermittently interrupted, and services time out.

Possible Causes

- The alarm threshold is improperly configured.
- The network environment is abnormal.

Procedure

Check whether the threshold is set properly.

- Step 1** Log in to MRS Manager and check whether the threshold (configurable, 0.5% by default) is appropriate.
- If yes, go to [Step 4](#).
 - If no, go to [Step 2](#).
- Step 2** Choose **System > Threshold Configuration > Device > Host > Network Writing > Network Write Packet Rate Information > Write Packet Error Rate** and change the alarm threshold based on the actual service usage.

Step 3 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

Check whether the network is normal.

Step 4 Contact the system administrator to check whether the network is normal.

- If yes, rectify the network fault and go to [Step 5](#).
- If no, go to [Step 6](#).

Step 5 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Step 6 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.33 ALM-12049 Read Throughput Rate Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the read throughput rate every 30 seconds. This alarm is generated when the read throughput rate exceeds the threshold (the default threshold is **80%**) for multiple times (the default value is **5**).

You can change the threshold by choosing **System > Threshold Configuration > Device > Host > Network Reading > Network Read Throughput Rate > Read Throughput Rate**.

If the **hit number** is **1**, this alarm is cleared when the read throughput rate is less than or equal to the threshold. If the **hit number** is greater than **1**, this alarm is cleared when the read throughput rate is less than or equal to 90% of the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12049 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|--|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| NetworkCardName | Specifies the network port for which the alarm is generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

The service system runs abnormally or is unavailable.

Possible Causes

- The alarm threshold is improperly configured.
- The network port rate does not meet service requirements.

Procedure

Check whether the threshold is set properly.

Step 1 Log in to MRS Manager and check whether the threshold (configurable, 80% by default) is appropriate.

- If yes, go to [Step 2](#).
- If no, go to [Step 4](#).

Step 2 Choose **System > Threshold Configuration > Device > Host > Network Reading > Network Read Throughput Rate > Read Throughput Rate** to change the alarm threshold based on the actual service usage.

Step 3 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

Check whether the network port rate meets the requirements.

Step 4 In the real-time alarm list, click the alarm. In the **Alarm Details** area, obtain the IP address and network port name of the host for which the alarm is generated.

Step 5 Use PuTTY to log in to the host for which the alarm is generated as user **root**.

Step 6 Run the **ethtool network port name** command to check the maximum network port rate **Speed**.

 NOTE

In a VM environment, you may fail to obtain the network port rate by running commands. You are advised to contact the system administrator to check whether the network port rate meets the requirements.

Step 7 If the read throughput rate exceeds the threshold, contact the system administrator to increase the network port rate.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.34 ALM-12050 Write Throughput Rate Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the write throughput rate every 30 seconds. This alarm is generated when the write throughput rate exceeds the threshold (the default threshold is **80%**) for multiple times (the default value is **5**).

You can change the threshold by choosing **System > Threshold Configuration > Device > Host > Network Writing > Network Write Throughput Rate > Write Throughput Rate**.

If the **hit number** is **1**, this alarm is cleared when the write throughput rate is less than or equal to the threshold. If the **hit number** is greater than **1**, this alarm is cleared when the write throughput rate is less than or equal to 90% of the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12050 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|--|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| NetworkCardName | Specifies the network port for which the alarm is generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

The service system runs abnormally or is unavailable.

Possible Causes

- The alarm threshold is improperly configured.
- The network port rate does not meet service requirements.

Procedure

Check whether the threshold is set properly.

Step 1 Log in to MRS Manager and check whether the threshold (configurable, 80% by default) is appropriate.

- If yes, go to [Step 4](#).
- If no, go to [Step 2](#).

Step 2 Choose **System > Threshold Configuration > Device > Host > Network Writing > Network Write Throughput Rate > Write Throughput Rate** to change the alarm threshold based on the actual service usage.

Step 3 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

Check whether the network port rate meets the requirements.

Step 4 In the real-time alarm list, click the alarm. In the **Alarm Details** area, obtain the IP address and network port of the host for which the alarm is generated.

Step 5 Use PuTTY to log in to the host for which the alarm is generated as user **root**.

Step 6 Run the **ethtool network port name** command to check the maximum network port rate **Speed**.

 NOTE

In a VM environment, you may fail to obtain the network port rate by running commands. You are advised to contact the system administrator to check whether the network port rate meets the requirements.

Step 7 If the write throughput rate exceeds the threshold, contact the system administrator to increase the network port rate.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Step 9 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.35 ALM-12051 Disk Inode Usage Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the disk inode usage every 30 seconds. This alarm is generated when the disk inode usage exceeds the threshold (the default threshold is 80%) for multiple times (the default value is 5).

You can change the threshold by choosing **System > Threshold Configuration > Device > Host > Disk > Disk Inode Usage > Disk Inode Usage**.

If the **hit number** is **1**, this alarm is cleared when the disk inode usage is less than or equal to the threshold. If the **hit number** is greater than **1**, this alarm is cleared when the disk inode usage is less than or equal to 90% of the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12051 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |

| Parameter | Description |
|-------------------|--|
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| PartitionName | Specifies the disk partition for which the alarm is generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

Data cannot be written to the file system.

Possible Causes

- There are too many small files on the disk.
- The system is abnormal.

Procedure

There are too many small files on the disk.

- Step 1** Go to the MRS cluster details page and choose **Alarms**.
- Step 2** In the real-time alarm list, click the alarm. In the **Alarm Details** area, obtain the IP address and disk partitions of the host for which the alarm is generated.
- Step 3** Use PuTTY to log in to the host for which the alarm is generated as user **root**.
- Step 4** Run the `df -i partition name` command to check the current inode usage of the disk.
- Step 5** If the inode usage exceeds the threshold, manually check whether the small files in the partition can be deleted.
- If yes, delete the files and go to [Step 6](#).
 - If no, adjust the capacity. Then go to [Step 7](#).
- Step 6** Wait 5 minutes and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 7](#).
- Check whether the system environment is normal.**
- Step 7** Contact the operating system maintenance personnel to check whether the system environment is abnormal.
- If yes, rectify the operating system fault and go to [Step 8](#).
 - If no, go to [Step 9](#).

Step 8 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Step 9 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.36 ALM-12052 Usage of Temporary TCP Ports Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the usage of temporary TCP ports every 30 seconds. This alarm is generated when the usage of temporary TCP ports exceeds the threshold (the default threshold is **80%**) for multiple times (the default value is **5**).

You can change the threshold by choosing **System > Threshold Configuration > Host > Network Status > TCP Ephemeral Port Usage > TCP Ephemeral Port Usage**.

If the **hit number** is **1**, this alarm is cleared when the usage of temporary TCP ports is less than or equal to the threshold. If the **hit number** is greater than **1**, this alarm is cleared when the usage of temporary TCP ports is less than or equal to 90% of the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12052 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

| Parameter | Description |
|-------------------|---|
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

Services on the host fail to establish connections with the external and services are interrupted.

Possible Causes

- The temporary ports do not meet service requirements.
- The system is abnormal.

Procedure

Expand the range of temporary ports.

- Step 1** Go to the MRS cluster details page and choose **Alarms**.
- Step 2** In the real-time alarm list, click the alarm. In the **Alarm Details** area, obtain the IP address of the host for which the alarm is generated.
- Step 3** Use PuTTY to log in to the host for which the alarm is generated as user **omm**.
- Step 4** Run the `cat /proc/sys/net/ipv4/ip_local_port_range |cut -f 1` command to obtain the start port number. Run the `cat /proc/sys/net/ipv4/ip_local_port_range |cut -f 2` command to obtain the end port number. Subtract the start port number from the end port number to obtain the total number of temporary ports. If the total number of temporary ports is less than 28,232, the random port range of the OS is too small. In this case, contact the system administrator to expand the port range.
- Step 5** Run the `ss -ant 2>/dev/null | grep -v LISTEN | awk 'NR > 2 {print $4}'|cut -d ':' -f 2 | awk '$1 >"start port number" {print $1}' | sort -u | wc -l` command to calculate the number of used temporary ports.
- Step 6** Calculate the usage of temporary ports using the following formula: Usage of temporary ports = (Number of used temporary ports/Total number of temporary ports) x 100. Check whether the usage exceeds the threshold.
- If yes, go to [Step 8](#).
 - If no, go to [Step 7](#).
- Step 7** Wait 5 minutes and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 8](#).

Check whether the system environment is normal.

- Step 8** Run the following command to import the temporary file and view the frequently used ports in the `port_result.txt` file:

```
netstat -tnp > $BIGDATA_HOME/tmp/port_result.txt
```

```
netstat -tnp
Active Internet connections (w/o servers)

Proto Recv Send LocalAddress ForeignAddress State PID/ProgramName tcp 0 0 10-120-85-154:45433 10-120-8:25009 CLOSE_WAIT 94237/java
tcp 0 0 10-120-85-154:45434 10-120-8:25009 CLOSE_WAIT 94237/java
tcp 0 0 10-120-85-154:45435 10-120-8:25009 CLOSE_WAIT 94237/java
...
```

Step 9 Run the following command to check the processes that occupy a large number of ports:

```
ps -ef |grep PID
```

NOTE

- *PID* indicates the process ID of the port queried in [Step 8](#).
- Run the following command to collect information about all processes in the system and check the processes that occupy a large number of ports:

```
ps -ef > $BIGDATA_HOME/tmp/ps_result.txt
```

Step 10 Contact the system administrator to clear the processes that occupy a large number of ports. Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

Step 11 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

None

9.5.37 ALM-12053 File Handle Usage Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the handler usage every 30 seconds. This alarm is generated when the handle usage exceeds the threshold (the default threshold is **80%**) for multiple times (the default value is **5**).

You can change the threshold by choosing **System > Threshold Configuration > Device > Host > Host Status > Host File Handle Usage > Host File Handle Usage**.

If the **hit number** is **1**, this alarm is cleared when the file handle usage is less than or equal to the threshold. If the **hit number** is greater than **1**, this alarm is cleared when the file handle usage is less than or equal to 90% of the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12053 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

The system applications fail to open files, access networks, and perform other I/O operations. The applications are running improperly.

Possible Causes

- The number of file handles does not meet service requirements.
- The system is abnormal.

Procedure

Increase the number of file handles.

- Step 1** Go to the MRS cluster details page and choose **Alarms**.
- Step 2** In the real-time alarm list, click the alarm. In the **Alarm Details** area, obtain the IP address of the host for which the alarm is generated.
- Step 3** Use PuTTY to log in to the host for which the alarm is generated as user **root**.
- Step 4** Run the **ulimit -n** command to check the maximum number of handles set in the system.
- Step 5** If the file handle usage exceeds the threshold, contact the system administrator to increase the number of system file handles.
- Step 6** Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 7](#).

Check whether the system environment is normal.

Step 7 Contact the system administrator to check whether the OS is abnormal.

- If yes, rectify the operating system fault and go to [Step 8](#).
- If no, go to [Step 9](#).

Step 8 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Step 9 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.38 ALM-12054 Invalid Certificate File (For MRS 2.x or Earlier)

Description

The system checks whether the certificate file is invalid (has expired or is not yet valid) on 23:00 every day. This alarm is generated when the certificate file is invalid.

This alarm is cleared when the status of the newly imported certificate is valid.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12054 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The system reminds users that the certificate file is invalid. If the certificate file is invalid, some functions are restricted and cannot be used properly.

Possible Causes

No certificate (HA root certificate or HA user certificate) is imported to the system, the certificate fails to be imported, or the certificate file is invalid.

Procedure

Check the alarm cause.

Step 1 Go to the MRS cluster details page and choose **Alarms**.

Step 2 In the real-time alarm list, click the row that contains the alarm.

In the **Alarm Details** area, view the additional information about the alarm.

- If **CA Certificate** is displayed in the additional alarm information, use PuTTY to log in to the active OMS management node as user **omm** and go to [Step 3](#).
- If **HA root Certificate** is displayed in the additional information, check **Location** to obtain the name of the host involved in this alarm. Then use PuTTY to log in to the host as user **omm** and go to [Step 4](#).
- If **HA server Certificate** is displayed in the additional information, check **Location** to obtain the name of the host involved in this alarm. Then use PuTTY to log in to the host as user **omm** and go to [Step 5](#).

Check the validity period of the certificate files in the system.

Step 3 Check whether the current system time is in the validity period of the CA certificate.

Run the `openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/cert/root/ca.crt` command to check the effective time and due time of the root certificate.

- If yes, go to [Step 8](#).
- If no, go to [Step 6](#).

Step 4 Check whether the current system time is in the validity period of the HA root certificate.

Run the `openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/certHA/root-ca.crt` command to check the effective time and due time of the HA root certificate.

- If yes, go to [Step 8](#).
- If no, go to [Step 7](#).

Step 5 Check whether the current system time is in the validity period of the HA user certificate.

Run the **openssl x509 -noout -text -in \${CONTROLLER_HOME}/security/certHA/server.crt** command to check the effective time and due time of the HA user certificate.

- If yes, go to [Step 8](#).
- If no, go to [Step 7](#).

The following is an example of the effective time and expiration time of a CA or HA certificate:

```
Certificate:
Data:
  Version: 3 (0x2)
  Serial Number:
    97:d5:0e:84:af:ec:34:d8
  Signature Algorithm: sha256WithRSAEncryption
  Issuer: C=CountryName, ST=State, L=Locality, O=Organization, OU=IT, CN=HADOOP.COM
  Validity
    Not Before: Dec 13 06:38:26 2016 GMT      // Effective time
    Not After : Dec 11 06:38:26 2026 GMT      // Expiration time
```

Import certificate files.

Step 6 Import a new CA certificate file.

Contact O&M personnel to apply for or generate a new CA certificate file and import it. Manually clear the alarm and check whether this alarm is generated again during periodic check.

NOTE

If the Ranger certificate has expired, see [How Do I Update the Ranger Certificate?](#) to rectify the fault.

- If yes, go to [Step 8](#).
- If no, no further action is required.

Step 7 Import a new HA certificate file.

Apply for or generate a new HA certificate file and import it by referring to [Replacing the HA Certificate](#). Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to [Step 8](#).
- If no, no further action is required.

Step 8 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

For details about how to handle an expired OBS certificate, see [Expired OBS Certificate in a Cluster](#).

9.5.39 ALM-12055 Certificate File Is About to Expire (For MRS 2.x or Earlier)

Description

The system checks the certificate file on 23:00 every day. This alarm is generated if the certificate file is about to expire with a validity period less than days set in the alarm threshold.

This alarm is generated if the status of the newly imported certificate is valid.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12055 | Minor | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The system reminds users that the license is about to expire. If the license expires, some functions are restricted and cannot be used properly.

Possible Causes

The remaining validity period of the CA certificate, HA root certificate, or HA user certificate is smaller than the alarm threshold.

Procedure

Check the alarm cause.

Step 1 Go to the MRS cluster details page and choose **Alarms**.

Step 2 In the real-time alarm list, click the row that contains the alarm.

In the **Alarm Details** area, view the additional information about the alarm.

- If **CA Certificate** is displayed in the additional alarm information, use PuTTY to log in to the active OMS management node as user **omm** and go to [Step 3](#).
- If **HA root Certificate** is displayed in the additional information, check **Location** to obtain the name of the host involved in this alarm. Then use PuTTY to log in to the host as user **omm** and go to [Step 4](#).
- If **HA server Certificate** is displayed in the additional information, check **Location** to obtain the name of the host involved in this alarm. Then use PuTTY to log in to the host as user **omm** and go to [Step 5](#).

Check the validity period of the certificate files in the system.

- Step 3** Check whether the remaining validity period of the CA certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in \${CONTROLLER_HOME}/security/cert/root/ca.crt** command to check the effective time and due time of the root certificate.

- If yes, go to [Step 6](#).
- If no, go to [Step 8](#).

- Step 4** Check whether the remaining validity period of the HA root certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in \${CONTROLLER_HOME}/security/certHA/root-ca.crt** command to check the effective time and due time of the HA root certificate.

- If yes, go to [Step 7](#).
- If no, go to [Step 8](#).

- Step 5** Check whether the remaining validity period of the HA user certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in \${CONTROLLER_HOME}/security/certHA/server.crt** command to check the effective time and due time of the HA user certificate.

- If yes, go to [Step 7](#).
- If no, go to [Step 8](#).

The following is an example of the effective time and expiration time of a CA or HA certificate:

```
Certificate:
Data:
  Version: 3 (0x2)
  Serial Number:
    97:d5:0e:84:af:ec:34:d8
  Signature Algorithm: sha256WithRSAEncryption
  Issuer: C=CountryName, ST=State, L=Locality, O=Organization, OU=IT, CN=HADOOP.COM
  Validity
    Not Before: Dec 13 06:38:26 2016 GMT           // Effective time
    Not After : Dec 11 06:38:26 2026 GMT           // Expiration time
```

Import certificate files.

- Step 6** Import a new CA certificate file.

Contact O&M personnel to apply for or generate a new CA certificate file and import it. Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to [Step 8](#).
- If no, no further action is required.

Step 7 Import a new HA certificate file.

Apply for or generate a new HA certificate file and import it by referring to [Replacing the HA Certificate](#). Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to [Step 8](#).
- If no, no further action is required.

Step 8 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

For details about how to handle an expired OBS certificate, see [Expired OBS Certificate in a Cluster](#).

9.5.40 ALM-12180 Disk Card I/O (For MRS 2.x or Earlier)

Description

For MRS 2.x or earlier:

- For HDDs, the alarm is triggered when any of the following conditions is met:
 - The system collects data every 3 seconds, and detects that the **svctm** value exceeds 6s for 10 consecutive periods within 30 seconds.
 - The system collects data every 3 seconds, and detects that the **avgqu-sz** value is greater than 0, the IOPS or bandwidth is 0, and the **ioutil** value is greater than **99%** for 10 consecutive periods within 30 seconds.
- For SSDs, the alarm is triggered when any of the following conditions is met:
 - The system collects data every 3 seconds, and detects that the **svctm** value exceeds 2s for 10 consecutive periods within 30 seconds.
 - The system collects data every 3 seconds, and detects that the **avgqu-sz** value is greater than 0, the IOPS or bandwidth is 0, and the **ioutil** value is greater than **99%** for 10 consecutive periods within 30 seconds.

This alarm is automatically cleared when none of the conditions are met for 90 seconds.

For MRS 1.9.3.10 or later:

- For HDDs, the alarm is triggered when any of the following conditions is met:
 - By default, the system collects data every 3 seconds. The **svctm** latency reaches 6 seconds within 30 seconds in at least seven collection periods.

- By default, the system collects data every 3 seconds. Disk queue depth (**avgqu-sz**) > 0 and IOPS = 0, or bandwidth = 0 and **ioutil** > 99% in at least 10 collection periods within 30 seconds.
- By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 1000 ms within 300 seconds.
- For SSDs, the alarm is triggered when any of the following conditions is met:
 - By default, the system collects data every 3 seconds. The svctm latency reaches 3 seconds within 30 seconds in at least seven collection periods.
 - By default, the system collects data every 3 seconds. Disk queue depth (**avgqu-sz**) > 0 and IOPS = 0, or bandwidth = 0 and **ioutil** > 99% in at least 10 collection periods within 30 seconds.
 - By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 500 ms within 300 seconds.

The collection period is 3 seconds, and the detection period is 30 or 300 seconds. This alarm is automatically cleared when none of the conditions are met for three consecutive detection periods (30 or 300 seconds).

 NOTE

For details about how to obtain related parameters, see [Related Information](#).

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12180 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| Source | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| DiskName | Specifies the disk for which the alarm is generated. |

Impact on the System

A continuously high I/O usage may adversely affect service operations and result in service loss.

Possible Causes

The disk is aged.

Procedure

Replace the disk.

Step 1 Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**.

Step 2 View the detailed information about the alarm. Check the values of **HostName** and **DiskName** in the location information to obtain the information about the faulty disk for which the alarm is reported.

Step 3 Replace the faulty disk.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, perform [Step 5](#).

Collect the fault information.

Step 5 On MRS Manager, choose **System > Export Log**.

Step 6 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

To obtain the related parameters, perform the following steps:

- Run the following command in the OS to collect data:

```
iostat -x -t 1 1
```

```

[root@ ~]# iostat -x -t 1 1
Linux 4.18.0-147.5.2.el8.x86_64 (node-master1Ceyv) 10/12/2022 _x86_64_ (8 CPU)

```

The command parameters are as follows:

avgqu-sz indicates the disk queue depth.

The sum of **r/s** and **w/s** is the IOPS.

The sum of **rkB/s** and **wkB/s** is the bandwidth.

%util is the value of **ioutil**.

- The value of **svctm** is calculated as follows:

$$\text{svctm} = (\text{tot_ticks_new} - \text{tot_ticks_old}) / (\text{rd_ios_new} + \text{wr_ios_new} - \text{rd_ios_old} - \text{wr_ios_old})$$

For MRS 2.x or earlier:

If **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old** is 0, then **svctm** is 0.

For MRS 1.9.3.10 or later:

When the detection period is 30 seconds, if **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0**, then **svctm = 0**.

When the detection period is 300 seconds and **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0**, if **tot_ticks_new - tot_ticks_old = 0**, then **svctm = 0**; otherwise, the value of **svctm** is infinite.

The parameters in the preceding expression can be obtained as follows:

Obtain the parameter values from the data collected via the **cat /proc/diskstats** command run by the system every 3 seconds. The following shows an example.

```
[omm@ ~]# cat /proc/diskstats
253 0 vda 1101553 35446 83439787 3338546 28744856 48314024 1054257652 52667332 0 19569526 10342913 0 0 0

```

In the data collected for the first time, the number in the fourth column is the value of **rd_ios_old**, the number in the eighth column is the value of **wr_ios_old**, and the number in the thirteenth column is the value of **tot_ticks_old**.

In the data collected for the second time, the number in the fourth column is the value of **rd_ios_new**, the number in the eighth column is the value of **wr_ios_new**, and the number in the thirteenth column is the value of **tot_ticks_new**.

In this case, the value of **svctm** is as follows:

$$(19571460 - 19569526) / (1101553 + 28747977 - 1101553 - 28744856) = 0.6197$$

9.5.41 ALM-12357 Failed to Export Audit Logs to OBS (For MRS 2.x or Earlier)

Description

If the user has configured audit log export to the OBS on MRS Manager, the system regularly exports audit logs to the OBS. This alarm is reported if the system fails to access the OBS.

This alarm is cleared after the system exports audit logs to the OBS successfully.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12357 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The local system saves a maximum of seven compressed service audit log files. If this alarm persists, local service audit logs may be lost.

The local system saves a maximum of 50 management audit log files (each file contains 100,000 records). If this alarm persists, local management audit logs may be lost.

Possible Causes

- Connection to the OBS server fails.
- The specified OBS file system does not exist.
- The user AK/SK information is invalid.
- The local OBS configuration cannot be obtained.

Procedure

Step 1 Log in to the OBS server and check whether the OBS server can be properly accessed.

- If yes, go to [Step 3](#).
- If no, go to [Step 2](#).

Step 2 Contact the maintenance personnel to repair OBS. Then check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 3](#).

Step 3 On MRS Manager, choose **System > Export Audit Log**. Check whether the AK/SK information, file system name, and path are correct.

- If yes, go to [Step 5](#).
- If no, go to [Step 4](#).

Step 4 Correct the information. Then check whether the alarm is cleared when the export task is executed again.

 NOTE

To check alarm clearance quickly, you can set the start time of audit log collection to 10 or 30 minutes later than the current time. After checking the result, restore the original start time.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Step 5 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Related Information

N/A

9.5.42 ALM-13000 ZooKeeper Service Unavailable (For MRS 2.x or Earlier)

Description

The system checks the ZooKeeper service status every 30 seconds. This alarm is generated when the ZooKeeper service is unavailable.

This alarm is cleared when the ZooKeeper service recovers.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 13000 | Critical | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

ZooKeeper fails to provide coordination services for upper-layer components and the components depending on ZooKeeper may not run properly.

Possible Causes

- The ZooKeeper instance is abnormal.
- The disk capacity is insufficient.
- The network is faulty.
- The DNS is installed on the ZooKeeper node.

Procedure

Check the ZooKeeper service instance status.

Step 1 On the MRS cluster details page, choose **Components > ZooKeeper > quorumpeer**.

Step 2 Check whether the ZooKeeper instances are normal.

- If yes, go to [Step 6](#).
- If no, go to [Step 3](#).

Step 3 Select instances whose status is not good and choose **More > Restart Instance**.

Step 4 Check whether the instance status is good after restart.

- If yes, go to [Step 5](#).
- If no, go to [Step 19](#).

Step 5 On the **Alarms** tab page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Check disk status.

Step 6 On the MRS cluster details page, choose **Components > ZooKeeper > quorumpeer**, and check the host information of each node housing the ZooKeeper instance.

Step 7 On the MRS cluster details page, click the **Nodes** tab and expand a node group.

Step 8 In the **Disk Usage** column, check whether the disk space of each node housing ZooKeeper instances is insufficient (disk usage exceeds 80%).

- If yes, go to [Step 9](#).
- If no, go to [Step 11](#).

Step 9 Expand the disk capacity. For details, see [ALM-12017 Insufficient Disk Capacity \(For MRS 2.x or Earlier\)](#).

Step 10 On the **Alarms** tab page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

Check network communication status.

- Step 11** On the Linux node housing the ZooKeeper instance, run the **ping** command to check whether the host names of other nodes housing the ZooKeeper instances can be pinged successfully.
- If yes, go to [Step 15](#).
 - If no, go to [Step 12](#).
- Step 12** Modify the IP addresses in **/etc/hosts** and add the mapping between host names and IP addresses.
- Step 13** Run the **ping** command again to check whether the host names of other nodes housing the ZooKeeper instances can be pinged successfully.
- If yes, go to [Step 14](#).
 - If no, go to [Step 19](#).
- Step 14** On the **Alarms** tab page, check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 15](#).
- Check the DNS.**
- Step 15** Check whether the DNS is installed on the node housing the ZooKeeper instance. On the Linux node housing the ZooKeeper instance, run the **cat /etc/resolv.conf** command to check whether the file is empty.
- If yes, go to [Step 16](#).
 - If no, go to [Step 19](#).
- Step 16** Run the **service named status** command to check whether the DNS is started.
- If yes, go to [Step 17](#).
 - If no, go to [Step 19](#).
- Step 17** Run the **service named stop** command to stop the DNS service. If "Shutting down name server BIND waiting for named to shut down (28s)" is displayed, the DNS service is stopped successfully. Comment out the content (if any) in **/etc/resolv.conf**.
- Step 18** On the **Alarms** tab page, check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 19](#).
- Step 19** Collect fault information.
1. On MRS Manager, choose **System > Export Log**.
 2. Contact the O&M engineers and send the collected logs.

----End

None

9.5.43 ALM-13001 Available ZooKeeper Connections Are Insufficient (For MRS 2.x or Earlier)

Description

The system checks ZooKeeper connections every 30 seconds. This alarm is generated when the system detects that the number of used ZooKeeper instance connections exceeds the threshold (80% of the maximum connections).

This alarm is cleared when the number of used ZooKeeper instance connections is less than the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 13001 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

Available ZooKeeper connections are insufficient. When the connection usage reaches 100%, external connections cannot be handled.

Possible Causes

The number of connections to the ZooKeeper node exceeds the threshold. Connection leakage occurs on some connection processes, or the maximum number of connections does not meet the requirement of the actual scenario.

Procedure

Step 1 Check the connection status.

1. On the MRS cluster details page, choose **Alarms > ALM-13001 Available ZooKeeper Connections Are Insufficient > Location**. Check the IP address of the node for which the alarm is generated.
2. Obtain the PID of the ZooKeeper process. Log in to the node for which this alarm is generated and run the **pgrep -f proc_zookeeper** command.
3. Check whether the PID can be successfully obtained.
 - If yes, go to **Step 1.4**.
 - If no, go to **Step 2**.
4. Obtain all the IP addresses connected to the ZooKeeper instance and the number of connections and check 10 IP addresses with top connections. Run the **lsof -i|grep \$pid | awk '{print \$9}' | cut -d : -f 2 | cut -d \> -f 2 | awk '{a[\$1]++} END {for(i in a){print i,a[i] | "sort -r -g -k 2"}}' | head -10** command based on the obtained PID value. (**\$pid** is the PID obtained in the preceding step.)
5. Check whether the node IP addresses and the number of connections are successfully obtained.
 - If yes, go to **Step 1.6**.
 - If no, go to **Step 2**.
6. Obtain the ID of the port connected to the process. Run the **lsof -i|grep \$pid | awk '{print \$9}'|cut -d \> -f 2 |grep \$IP| cut -d : -f 2** command based on the obtained PID and IP address. (**\$pid** and **\$IP** are the PID and IP address obtained in the preceding step.)
7. Check whether the port ID is successfully obtained.
 - If yes, go to **Step 1.8**.
 - If no, go to **Step 2**.
8. Obtain the ID of the connected process. Log in to each IP address and run the following command based on the obtained port ID: **lsof -i|grep \$port**. (**\$port** is the port ID obtained in the preceding step.)
9. Check whether the process ID is successfully obtained.
 - If yes, go to **Step 1.10**.
 - If no, go to **Step 2**.
10. Check whether connection leakage occurs on the process based on the obtained process ID.
 - If yes, go to **Step 1.11**.
 - If no, go to **Step 1.12**.
11. Close the process where connection leakage occurs and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 1.12**.
12. On the MRS cluster details page, choose **Components > ZooKeeper > Service Configuration**. Set **Type** to **All**, choose **quorumpeer > Performance**, and change the value of **maxCnxns** to **20000** or more.
13. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.44 ALM-13002 ZooKeeper Memory Usage Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the ZooKeeper service status every 30 seconds. The alarm is generated when the memory usage of a ZooKeeper instance exceeds the threshold (80% of the maximum memory).

The alarm is cleared when the memory usage is less than the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 13002 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

If the available ZooKeeper memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The memory usage of the ZooKeeper instance is overused or the memory is inappropriately allocated.

Procedure

Step 1 Check the memory usage.

1. On the MRS cluster details page, choose **Alarms > ALM-13002 ZooKeeper Memory Usage Exceeds the Threshold > Location**. Check the IP address of the instance for which the alarm is generated.
2. On the MRS cluster details page, choose **Components > ZooKeeper > Instances > quorumpeer** (IP address of the instance for which the alarm is generated) > **Customize > ZooKeeper Heap And Direct Buffer Resource**. Check the heap memory usage.
3. Check whether the used heap memory of ZooKeeper reaches 80% of the maximum heap memory specified for ZooKeeper.
 - If yes, go to **Step 1.4**.
 - If no, go to **Step 1.6**.
4. On MRS Manager, choose **Services > ZooKeeper > Configuration > All > quorumpeer > System**. Increase the value of **-Xmx** in **GC_OPTS** as required.
5. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 1.6**.
6. On the MRS cluster details page, choose **Components > ZooKeeper > Instances > quorumpeer** (IP address of the instance for which the alarm is generated) > **Customize > ZooKeeper Heap And Direct Buffer Resource**. Check the direct buffer memory usage.
7. Check whether the used direct buffer memory of ZooKeeper reaches 80% of the maximum direct buffer memory specified for ZooKeeper.
 - If yes, go to **Step 1.8**.
 - If no, go to **Step 2**.
8. On the MRS cluster details page, choose **Components > ZooKeeper > Service Configuration**. Set **Type** to **All** and choose **quorumpeer > System**. Increase the value of **-XX:MaxDirectMemorySize** in **GC_OPTS** as required.
9. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.45 ALM-14000 HDFS Service Unavailable (For MRS 2.x or Earlier)

Description

The system checks the service status of NameService every 30 seconds. This alarm is generated when the system considers that the HDFS service is unavailable because all the NameService services are abnormal.

This alarm is cleared when at least one NameService service is normal and the system considers that the HDFS service recovers.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 14000 | Critical | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

HDFS fails to provide services for HDFS service-based upper-layer components, such as HBase and MapReduce. As a result, users cannot read or write files.

Possible Causes

- ZooKeeper is abnormal.
- All NameService services are abnormal.

Procedure

Step 1 Check the ZooKeeper status.

1. Go to the MRS cluster details page. On the **Components** tab page, check whether the health status of the ZooKeeper service is **Good**.
 - If yes, go to [Step 1.2](#).
 - If no, go to [Step 2.1](#).

2. Rectify the health status of the ZooKeeper service. For details, see [ALM-13000 ZooKeeper Service Unavailable \(For MRS 2.x or Earlier\)](#). Then check whether the health status of the ZooKeeper service is **Good**.
 - If yes, go to [Step 1.3](#).
 - If no, go to [Step 3](#).
3. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2.1](#).

Step 2 Handle the NameService service exception alarm.

1. Go to the MRS cluster details page. On the **Alarms** page, check whether all NameService services have abnormal alarms.
 - If yes, go to [Step 2.2](#).
 - If no, go to [Step 3](#).
2. Handle the abnormal NameService services following the instructions in [ALM-14010 NameService Is Abnormal \(For MRS 2.x or Earlier\)](#) and check whether each NameService service exception alarm is cleared.
 - If yes, go to [Step 2.3](#).
 - If no, go to [Step 3](#).
3. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 3](#).

Step 3 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.46 ALM-14001 HDFS Disk Usage Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the disk usage of the HDFS cluster every 30 seconds and compares the actual disk usage with the threshold. The HDFS cluster disk usage indicator has a default threshold. This alarm is generated when the HDFS disk usage exceeds the threshold.

This alarm is cleared when the disk usage of the HDFS cluster is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 14001 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| NSName | Specifies the NameService service for which the alarm is generated. |
| Trigger condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

The performance of writing data to HDFS is affected.

Possible Causes

The disk space configured for the HDFS cluster is insufficient.

Procedure

Step 1 Check the disk capacity and delete unnecessary files.

1. On the MRS cluster details page, choose **Components** > **HDFS**. The **Service Status** page is displayed.
2. In the **Charts** area, view the value of the monitoring indicator **Percentage of HDFS Capacity** to check whether the HDFS disk usage exceeds the threshold (80% by default).
 - If yes, go to [Step 1.3](#).
 - If no, go to [Step 3](#).
3. Use the client on the cluster node and run the **hdfs dfsadmin -report** command to check whether the value of **DFS Used%** is less than 100% minus the threshold.
 - If yes, go to [Step 1.5](#).

- If no, go to [Step 3](#).
- 4. Use the client on the cluster node and run the `hdfs dfs -rm -r file or directory path` command to delete unnecessary files.
- 5. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2.1](#).

Step 2 Expand the system.

1. Expand the disk capacity.
2. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 3](#).

Step 3 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.47 ALM-14002 DataNode Disk Usage Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the DataNode disk usage every 30 seconds and compares the actual disk usage with the threshold. The **Percentage of DataNode Capacity** indicator has a default threshold. This alarm is generated when the value of the **Percentage of DataNode Capacity** indicator exceeds the threshold.

This alarm is cleared when the value of the **Percentage of DataNode Capacity** indicator is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 14002 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |

| Parameter | Description |
|-------------------|---|
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

Insufficient disk space will impact read/write to HDFS.

Possible Causes

- The disk space configured for the HDFS cluster is insufficient.
- Data skew occurs among DataNodes.

Procedure

Step 1 Check the cluster disk capacity.

1. Go to the MRS cluster details page. On the **Alarms** page, check whether the ALM-14001 HDFS Disk Usage Exceeds the Threshold alarm exists.
 - If yes, go to [Step 1.2](#).
 - If no, go to [Step 2.1](#).
2. Handle the alarm by following the instructions in ALM-14001 HDFS Disk Usage Exceeds the Threshold and check whether the alarm is cleared.
 - If yes, go to [Step 1.3](#).
 - If no, go to [Step 3](#).
3. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2.1](#).

Step 2 Check the balance status of DataNodes.

1. Use the client on the cluster node, run the **hdfs dfsadmin -report** command to view the value of **DFS Used%** on the DataNode for which the alarm is generated, and compare the value with those on other DataNodes. Check whether the difference between the values is larger than 10.
 - If yes, go to [Step 2.2](#).
 - If no, go to [Step 3](#).
2. If data skew occurs, use the client on the cluster node and run the **hdfs balancer -threshold 10** command.
3. Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 3](#).

Step 3 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.48 ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the number of lost blocks every 30 seconds and compares the number of lost blocks with the threshold. The lost blocks indicator has a default threshold. This alarm is generated when the number of lost blocks exceeds the threshold.

This alarm is cleared when the number of lost blocks is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 14003 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| NSName | Specifies the NameService service for which the alarm is generated. |
| Trigger condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

Data stored in HDFS is lost. HDFS may enter the safe mode and cannot provide write services. Lost block data cannot be restored.

Possible Causes

- The DataNode instance is abnormal.
- Data is deleted.

Procedure

Step 1 Check the DataNode instance.

1. On the MRS cluster details page, choose **Components > HDFS > Instances**.
2. Check whether the status of all DataNode instances is **Good**.
 - If yes, go to [Step 3](#).
 - If no, go to [Step 1.3](#).
3. Restart the DataNode instance and check whether the restart is successful.
 - If yes, go to [Step 2.2](#).
 - If no, go to [Step 2.1](#).

Step 2 Delete the damaged file.

1. Use the client on the cluster node. Run the **hdfs fsck / -delete** command to delete the lost file. Then rewrite the file and recover the data.
2. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 3](#).

Step 3 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.49 ALM-14004 Number of Damaged HDFS Blocks Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the number of damaged blocks every 30 seconds and compares the number of damaged blocks with the threshold. The damaged blocks indicator has a default threshold. This alarm is generated when the number of damaged blocks exceeds the threshold.

This alarm is cleared when the number of damaged blocks is less than or equal to the threshold. You are advised to run the **hdfs fsck /** command to check whether any file is completely damaged.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 14004 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| NSName | Specifies the NameService service for which the alarm is generated. |
| Trigger condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

Data is damaged and HDFS fails to read files.

Possible Causes

- The DataNode instance is abnormal.
- Data verification information is damaged.

Procedure

Step 1 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.50 ALM-14006 Number of HDFS Files Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system periodically checks the number of HDFS files every 30 seconds and compares the number of HDFS files with the threshold. This alarm is generated when the system detects that the number of HDFS files exceeds the threshold.

This alarm is cleared when the number of HDFS files is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 14006 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| NSName | Specifies the NameService service for which the alarm is generated. |
| Trigger condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

Disk storage space is insufficient, which may result in data import failure. The performance of the HDFS system is affected.

Possible Causes

The number of HDFS files exceeds the threshold.

Procedure

Step 1 Check whether unnecessary files exist in the system.

1. Use the client on the cluster node and run the `hdfs dfs -ls file or directory path` command to check whether the file or directory can be deleted.
 - If yes, go to [Step 1.2](#).
 - If no, go to [Step 2.1](#).
2. Run the `hdfs dfs -rm -r file or directory path` command. Delete unnecessary files, wait 5 minutes, and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2.1](#).

Step 2 Check the number of files in the system.

1. On MRS Manager, choose **System > Threshold Configuration**.
2. In the navigation tree on the left, choose **Services > HDFS > HDFS File > Total Number of Files**.
3. In the right pane, modify the threshold in the rule based on the number of current HDFS files.
To check the number of HDFS files, choose **Services > HDFS**, click **Customize** in the **Real-Time Statistics** area on the right, and select the **HDFS File** monitoring item.
4. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 3](#).

Step 3 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.51 ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the HDFS NameNode memory usage every 30 seconds and compares the actual memory usage with the threshold. The HDFS NameNode memory usage has a default threshold. This alarm is generated when the HDFS NameNode memory usage exceeds the threshold.

This alarm is cleared when the HDFS NameNode memory usage is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 14007 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

If the memory usage of the HDFS NameNode is too high, data read/write performance of HDFS will be affected.

Possible Causes

The HDFS NameNode memory is insufficient.

Procedure

Step 1 Delete unnecessary files.

1. Use the client on the cluster node and run the `hdfs dfs -rm -r file or directory path` command to delete unnecessary files.
2. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2](#).

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.52 ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the HDFS DataNode memory usage every 30 seconds and compares the actual memory usage with the threshold. The HDFS DataNode memory usage has a default threshold. This alarm is generated when the HDFS DataNode memory usage exceeds the threshold.

This alarm is cleared when the HDFS DataNode memory usage is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 14007 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

The HDFS DataNode memory usage is too high, which affects the data read/write performance of the HDFS.

Possible Causes

The HDFS DataNode memory is insufficient.

Procedure

Step 1 Delete unnecessary files.

1. Use the client on the cluster node and run the **hdfs dfs -rm -r file or directory path** command to delete unnecessary files.
2. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.53 ALM-14009 Number of Faulty DataNodes Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system periodically checks the number of faulty DataNodes in the HDFS cluster every 30 seconds, and compares the number with the threshold. The number of faulty DataNodes has a default threshold. This alarm is generated when the number of faulty DataNodes in the HDFS cluster exceeds the threshold.

This alarm is cleared when the number of faulty DataNodes in the HDFS cluster is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 14009 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |

| Parameter | Description |
|-------------------|---|
| HostName | Specifies the host for which the alarm is generated. |
| Trigger condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

Faulty DataNodes cannot provide HDFS services.

Possible Causes

- DataNodes are faulty or overloaded.
- The network between the NameNode and the DataNode is disconnected or busy.
- NameNodes are overloaded.

Procedure

Step 1 Check whether DataNodes are faulty.

1. Use the client on the cluster node to run the **hdfs dfsadmin -report** command to check whether DataNodes are faulty.
 - If yes, go to [Step 1.2](#).
 - If no, go to [Step 2.1](#).
2. On the MRS cluster details page, choose **Components > HDFS > Instances** to check whether the DataNode is stopped.
 - If yes, go to [Step 1.3](#).
 - If no, go to [Step 2.1](#).
3. Select the DataNode instance, and choose **More > Restart Instance** to restart it. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2.1](#).

Step 2 Check the status of the network between the NameNode and the DataNode.

1. Log in to the service IP address of the node where the faulty DataNode is located, and run the **ping IP address of the NameNode** command to check whether the network between the DataNode and the NameNode is abnormal.
 - If yes, go to [Step 2.2](#).
 - If no, go to [Step 3.1](#).
2. Rectify the network fault. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.

- If no, go to [Step 3.1](#).

Step 3 Check whether the DataNode is overloaded.

1. On the MRS cluster details page, click **Alarms** and check whether the alarm ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold exists.
 - If yes, go to [Step 3.2](#).
 - If no, go to [Step 4.1](#).
2. Follow procedures in [ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold \(For MRS 2.x or Earlier\)](#) to handle the alarm and check whether the alarm is cleared.
 - If yes, go to [Step 3.3](#).
 - If no, go to [Step 4.1](#).
3. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 4.1](#).

Step 4 Check whether the NameNode is overloaded.

1. On the MRS cluster details page, click **Alarms** and check whether the alarm ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold exists.
 - If yes, go to [Step 4.2](#).
 - If no, go to [Step 5](#).
2. Follow procedures in [ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold \(For MRS 2.x or Earlier\)](#) to handle the alarm and check whether the alarm is cleared.
 - If yes, go to [Step 4.3](#).
 - If no, go to [Step 5](#).
3. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 5](#).

Step 5 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.54 ALM-14010 NameService Is Abnormal (For MRS 2.x or Earlier)

Description

The system checks the NameService service status every 180 seconds. This alarm is generated when the NameService service is unavailable.

This alarm is cleared when the NameService service recovers.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 14010 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| NSName | Specifies the NameService service for which the alarm is generated. |

Impact on the System

HDFS fails to provide services for upper-layer components based on the NameService service, such as HBase and MapReduce. As a result, users cannot read or write files.

Possible Causes

- The JournalNode is faulty.
- The DataNode is faulty.
- The disk capacity is insufficient.
- The NameNode enters safe mode.

Procedure

Step 1 Check the status of the JournalNode instance.

1. On the MRS Manager home page, click **Components**.
2. Click **HDFS**.
3. Click **Instance**.
4. Check whether the **Health Status** of the JournalNode is **Good**.
 - If yes, go to [Step 2.1](#).
 - If no, go to [Step 1.5](#).
5. Select the faulty JournalNode, and choose **More > Restart Instance**. Check whether the JournalNode successfully restarts.

- If yes, go to [Step 1.6](#).
 - If no, go to [Step 5](#).
6. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2.1](#).

Step 2 Check the status of the DataNode instance.

1. On the MRS cluster details page, click **Components**.
2. Click **HDFS**.
3. In **Operation and Health Summary**, check whether the **Health Status** of all DataNodes is **Good**.
 - If yes, go to [Step 3.1](#).
 - If no, go to [Step 2.4](#).
4. Click **Instances**. On the DataNode management page, select the faulty DataNode, and choose **More > Restart Instance**. Check whether the DataNode successfully restarts.
 - If yes, go to [Step 2.5](#).
 - If no, go to [Step 3.1](#).
5. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 4.1](#).

Step 3 Check the disk status.

1. On the MRS cluster details page, click the **Nodes** tab and expand a node group.
2. In the **Disk Usage** column, check whether disk space is insufficient.
 - If yes, go to [Step 3.3](#).
 - If no, go to [Step 4.1](#).
3. Expand the disk capacity.
4. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 4.1](#).

Step 4 Check whether NameNode is in the safe mode.

1. Use the client on the cluster node, and run the **hdfs dfsadmin -safemode get** command to check whether **Safe mode is ON** is displayed.
Information behind **Safe mode is ON** is alarm information and is displayed based actual conditions.
 - If yes, go to [Step 4.2](#).
 - If no, go to [Step 5](#).
2. Use the client on the cluster node and run the **hdfs dfsadmin -safemode leave** command.
3. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.

- If no, go to [Step 5](#).

Step 5 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.55 ALM-14011 HDFS DataNode Data Directory Is Not Configured Properly (For MRS 2.x or Earlier)

Description

The DataNode parameter **dfs.datanode.data.dir** specifies the DataNode data directory. This alarm is generated in any of the following scenarios:

- A configured data directory cannot be created.
- A data directory uses the same disk as other critical directories in the system.
- Multiple directories use the same disk.

This alarm is cleared when the DataNode data directory is configured properly and this DataNode is restarted.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 14011 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

If the DataNode data directory is mounted on critical directories such as the root directory, the disk space of the root directory will be used up after running for a long time. This causes a system fault.

If the DataNode data directory is not configured properly, HDFS performance will deteriorate.

Possible Causes

- The DataNode data directory fails to be created.
- The DataNode data directory uses the same disk as critical directories, such as `/` or `/boot`.
- Multiple directories in the DataNode data directory use the same disk.

Procedure

Step 1 Check the alarm cause and information about the DataNode for which the alarm is generated.

1. On the MRS cluster details page, click **Alarms**. In the alarm list, click the alarm.
2. In the **Alarm Details** area, view **Alarm Cause** to obtain the cause of the alarm. In **HostName** or **Location**, obtain the host name of the DataNode for which the alarm is generated.

Step 2 Delete directories that do not comply with the disk plan from the DataNode data directory.

1. Choose **Components > HDFS > Instances**. In the instance list, click the DataNode instance on the node for which the alarm is generated.
2. Click **Instance Configuration** and view the value of the DataNode parameter **dfs.datanode.data.dir**.
3. Check whether all DataNode data directories are consistent with the disk plan.
 - If yes, go to [Step 2.4](#).
 - If no, go to [Step 2.7](#).
4. Modify the DataNode parameter **dfs.datanode.data.dir** and delete the incorrect directories.
5. Choose **Components > HDFS > Instances** to restart the DataNode instance.
6. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2.7](#).
7. Log in to the DataNode for which the alarm is generated.
 - If the alarm cause is "The DataNode data directory fails to be created", go to [Step 3.1](#).
 - If the alarm cause is "The DataNode data directory uses the same disk as critical directories, such as `/` or `/boot`", go to [Step 4.1](#).
 - If the alarm cause is "Multiple directories in the DataNode data directory use the same disk", go to [Step 5.1](#).

Step 3 Check whether the DataNode data directory fails to be created.

1. Run the following commands to switch the user:
sudo su - root
su - omm
2. Run the **ls** command to check whether the directories exist in the DataNode data directory.
 - If yes, go to [Step 7](#).
 - If no, go to [Step 3.3](#).
3. Run the **mkdir data directory** command to create a directory and check whether the directory is successfully created.
 - If yes, go to [Step 6.1](#).
 - If no, go to [Step 3.4](#).
4. Click **Alarms** to check whether alarm ALM-12017 Insufficient Disk Capacity exists.
 - If yes, go to [Step 3.5](#).
 - If no, go to [Step 3.6](#).
5. Adjust the disk capacity and check whether alarm ALM-12017 Insufficient Disk Capacity is cleared. For details, see [ALM-12017 Insufficient Disk Capacity \(For MRS 2.x or Earlier\)](#).
 - If yes, go to [ALM-12017 Insufficient Disk Capacity \(For MRS 2.x or Earlier\)](#).
 - If no, go to [Step 7](#).
6. Check whether user **omm** has the **rwX** or **X** permission of all the upper-layer directories of the directory. (For example, for **/tmp/abc/**, user **omm** has the **X** permission for directory **tmp** and the **rwX** permission for directory **abc**.)
 - If yes, go to [Step 6.1](#).
 - If no, go to [Step 3.7](#).
7. Run the **chmod u+rwX path** or **chmod u+X path** command as the **root** user to add the **rwX** or **X** permission to the paths. Then, go to [Step 3.3](#).

Step 4 Check whether the DataNode data directory uses the same disk as other critical directories in the system.

1. Run the **df** command to obtain the disk mounting information of each directory in the DataNode data directory.
2. Check whether the directories mounted to the disk are critical directories, such as **/** or **/boot**.
 - If yes, go to [Step 4.3](#).
 - If no, go to [Step 6.1](#).
3. Change the value of the DataNode parameter **dfs.datanode.data.dir** and delete the directories that use the same disk as critical directories.
4. Go to [Step 6.1](#).

Step 5 Check whether multiple directories in the DataNode data directory use the same disk.

1. Run the **df** command to obtain the disk mounting information of each directory in the DataNode data directory. Record the mounted directory in the command output.
2. Modify the DataNode node parameter **dfs.datanode.data.dir** to reserve one of the directories mounted on the same disk directory.
3. Go to [Step 6.1](#).

Step 6 Restart the DataNode and check whether the alarm is cleared.

1. Choose **Components > HDFS > Instances** to restart the DataNode instance.
2. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 7](#).

Step 7 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.56 ALM-14012 HDFS Journalnode Data Is Not Synchronized (For MRS 2.x or Earlier)

Description

On the active NameNode, the system checks data synchronization on all JournalNodes in the cluster every 5 minutes. This alarm is generated when data on a JournalNode is not synchronized with that on other JournalNodes.

This alarm is cleared in 5 minutes after data on JournalNodes is synchronized.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 14012 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |

| Parameter | Description |
|-----------|--|
| IP | Specifies the service IP address of the JournalNode instance for which the alarm is generated. |

Impact on the System

When a JournalNode is working incorrectly, data on the node is not synchronized with that on other JournalNodes. If data on more than half of JournalNodes is not synchronized, the NameNode cannot work correctly, making the HDFS service unavailable.

Possible Causes

- The JournalNode instance has not been started or has been stopped.
- The JournalNode instance is working incorrectly.
- The network of the JournalNode is unreachable.

Procedure

Step 1 Check whether the JournalNode instance has been started.

1. On the MRS cluster details page, click **Alarms**. In the alarm list, click the alarm.
2. In the **Alarm Details** area, check **Location** and obtain the IP address of the JournalNode for which the alarm is generated.
3. Choose **Components > HDFS > Instances**. In the instance list, click the JournalNode for which the alarm is generated and check whether **Operating Status** of the node is **Started**.
 - If yes, go to [Step 2.1](#).
 - If no, go to [Step 1.4](#).
4. Select the JournalNode instance and choose **More > Start Instance** to start it.
5. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 4](#).

Step 2 Check whether the JournalNode instance is working correctly.

1. Check whether **Health Status** of the JournalNode instance is **Good**.
 - If yes, go to [Step 3.1](#).
 - If no, go to [Step 2.2](#).
2. Select the JournalNode instance and choose **More > Restart Instance** to restart it.
3. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 4](#).

Step 3 Check whether the network of the JournalNode is reachable.

1. On the MRS cluster details page, choose **Components > HDFS > Instances** to check the service IP address of the active NameNode.
2. Log in to the active NameNode.
3. Run the **ping** command to check whether a timeout occurs or the network between the active NameNode and the JournalNode is unreachable.

ping *service IP address of the JournalNode*

- If yes, go to **Step 3.4**.
 - If no, go to **Step 4**.
4. Contact O&M personnel to rectify the network fault. Wait 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 4**.

Step 4 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.57 ALM-16000 Percentage of Sessions Connected to the HiveServer to the Maximum Number Allowed Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the percentage of sessions connected to the HiveServer to the maximum number allowed every 30 seconds. This indicator can be viewed on the Hive service monitoring page. This alarm is generated when the the percentage of sessions connected to the HiveServer to the maximum number allowed exceeds the specified threshold (90% by default).

This alarm can be automatically cleared when the percentage is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 16000 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

If a connection alarm is generated, too many sessions are connected to the HiveServer and new connections cannot be created.

Possible Causes

Too many clients are connected to the HiveServer.

Procedure

Step 1 Increase the maximum number of connections to Hive.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **Hive > Service Configuration** and switch **Basic** to **All**.
3. Increase the value of the **hive.server.session.control.maxconnections** configuration item. Suppose the value of the configuration item is A, the threshold is B, and sessions connected to the HiveServer is C. Adjust the value of the configuration item according to $A \times B > C$. Sessions connected to the HiveServer can be viewed on the Hive monitoring page.
4. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.58 ALM-16001 Hive Warehouse Space Usage Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the Hive warehouse space usage every 30 seconds. The indicator **Percentage of HDFS Space Used by Hive to the Available Space** can be viewed on the Hive service monitoring page. This alarm is generated when the Hive warehouse space usage exceeds the specified threshold (85% by default).

This alarm is cleared when the Hive warehouse space usage is less than or equal to the threshold. You can reduce the warehouse space usage by expanding the warehouse capacity or releasing the used space.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 16001 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

The system fails to write data, which causes data loss.

Possible Causes

- The upper limit of the HDFS capacity available for Hive is too small.
- The system disk space is insufficient.
- Some data nodes break down.

Procedure

Step 1 Expand the system configuration.

1. Analyze the cluster HDFS capacity usage and increase the upper limit of the HDFS capacity available for Hive.

Go to the MRS cluster details page, choose **Components > Hive > Service Configuration**, set **Type** to **All**, search for **hive.metastore.warehouse.size.percent**, and increase the value of this parameter. Suppose that the value of the configuration item is A, total HDFS storage space is B, the threshold is C, and HDFS space used by Hive is D. Adjust the value of the configuration item according to $A \times B \times C > D$. The total HDFS storage space can be viewed on the HDFS monitoring page, and HDFS space used by Hive can be viewed on the Hive monitoring page.

2. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2.1](#).

Step 2 Expand the system.

1. Add nodes.
2. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 3.1](#).

Step 3 Check whether the data node is normal.

1. Go to the cluster details page and choose **Alarms**.
2. Check whether ALM-12006 Node Fault, ALM-12007 Process Fault, or ALM-14002 DataNode Disk Usage Exceeds the Threshold exists.
 - If yes, go to [Step 3.3](#).
 - If no, go to [Step 4](#).
3. Clear the alarm by following the steps provided in ALM-12006 Node Fault, ALM-12007 Process Fault, or ALM-14002 DataNode Disk Usage Exceeds the Threshold.
4. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 4](#).

Step 4 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.59 ALM-16002 Hive SQL Execution Success Rate Is Lower Than the Threshold (For MRS 2.x or Earlier)

Description

The system checks the percentage of the HiveQL statements that are executed successfully every 30 seconds. Percentage of HiveQL statements that are executed successfully = Number of HiveQL statements that are executed successfully by Hive in a specified period/Total number of HiveQL statements that are executed by Hive. This indicator can be viewed on the Hive service monitoring page. This alarm is generated when the percentage of the HiveQL statements that are executed successfully exceeds the specified threshold (90% by default). The name of the host for which the alarm is generated can be obtained from the location information of the alarm. The host IP address is the IP address of the HiveServer node.

This alarm is cleared when the percentage of the HiveQL statements that are executed successfully in a test period is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 16002 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger condition | Specifies the threshold for triggering the alarm. |

Impact on the System

The system configuration and performance cannot meet service processing requirements.

Possible Causes

- A syntax error occurs in HiveQL commands.

- The HBase service is abnormal when a Hive on HBase task is being performed.
- Basic services that are depended on are abnormal, such as HDFS, Yarn, and ZooKeeper.

Procedure

Step 1 Check whether the HiveQL commands comply with syntax.

1. Use the Hive client to log in to the HiveServer node for which the alarm is generated. Query the HiveQL syntax standard provided by Apache, and check whether the HiveQL commands are correct. For details, see <https://cwiki.apache.org/confluence/display/hive/languagemanual>.
 - If yes, go to [Step 2.1](#).
 - If no, go to [Step 1.2](#).

NOTE

To view the user who runs an incorrect statement, download HiveServerAudit logs of the HiveServer node for which this alarm is generated. Set **Start time** and **End time** to 10 minutes before and after the alarm generation time respectively. Open the log file and search for the **Result=FAIL** keyword to filter the log information about the incorrect statement, and then view the user who runs the incorrect statement according to **UserName** in the log information.

2. Enter correct HiveQL statements, and check whether the command can be properly executed.
 - If yes, go to [Step 4.5](#).
 - If no, go to [Step 2.1](#).

Step 2 Check whether the HBase service is abnormal.

1. Check whether a Hive on HBase task is performed.
 - If yes, go to [Step 2.2](#).
 - If no, go to [Step 3.1](#).
2. Check whether the HBase service is normal in the service list.
 - If yes, go to [Step 3.1](#).
 - If no, go to [Step 2.3](#).
3. Check the alarms displayed on the alarm page and clear them according to **Alarm Help**.
4. Enter correct HiveQL statements, and check whether the command can be properly executed.
 - If yes, go to [Step 4.5](#).
 - If no, go to [Step 3.1](#).

Step 3 Check whether the Spark service is abnormal.

1. Check whether the Spark service is normal in the service list.
 - If yes, go to [Step 4.1](#).
 - If no, go to [Step 3.2](#).
2. Check the alarms displayed on the alarm page and clear them according to **Alarm Help**.

3. Enter correct HiveQL statements, and check whether the command can be properly executed.
 - If yes, go to [Step 4.5](#).
 - If no, go to [Step 4.1](#).

Step 4 Check whether HDFS, Yarn, and ZooKeeper are normal.

1. Go to the MRS cluster details page and click **Components**.
2. In the service list, check whether the services, such as HDFS, Yarn, and ZooKeeper are normal.
 - If yes, go to [Step 4.5](#).
 - If no, go to [Step 4.3](#).
3. Check the alarms displayed on the alarm page and clear them according to **Alarm Help**.
4. Enter correct HiveQL statements, and check whether the command can be properly executed.
 - If yes, go to [Step 4.5](#).
 - If no, go to [Step 5](#).
5. Wait one minute and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 5](#).

Step 5 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.60 ALM-16004 Hive Service Unavailable (For MRS 2.x or Earlier)

Description

The system checks the Hive service status every 30 seconds. This alarm is generated when the Hive service is unavailable.

This alarm is cleared when the Hive service recovers.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 16004 | Critical | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The system cannot provide data loading, query, and extraction services.

Possible Causes

- Basic services, such as ZooKeeper, HDFS, Yarn, and DBService work incorrectly, or the Hive process is faulty.
 - ZooKeeper is abnormal.
 - HDFS is abnormal.
 - Yarn is abnormal.
 - DBService is abnormal.
 - The Hive service process is faulty. If the alarm is caused by a Hive process fault, the alarm report has a delay of about 5 minutes.
- The network communication between the Hive service and basic services is interrupted.

Procedure

Step 1 Check the HiveServer/MetaStore process status.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **Hive > Instances**. In the Hive instance list, check whether the status of all HiveServer/MetaStore instances is **Unknown**.
 - If yes, go to [Step 1.3](#).
 - If no, go to [Step 2](#).
3. Above the Hive instance list, choose **More > Restart Instance** to restart the HiveServer/MetaStore process.
4. In the alarm list, check whether ALM-16004 Hive Service Unavailable is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2](#).

Step 2 Check the ZooKeeper status.

1. Go to the cluster details page and choose **Alarms**.

2. On MRS Manager, check whether the ALM-12007 Process Fault alarm is reported.
 - If yes, go to [Step 2.3](#).
 - If no, go to [Step 3](#).
3. In the **Alarm Details** area of ALM-12007 Process Fault, check whether **ServiceName** is **ZooKeeper**.
 - If yes, go to [Step 2.4](#).
 - If no, go to [Step 3](#).
4. Rectify the fault by following steps provided in ALM-12007 Process Fault.
5. In the alarm list, check whether ALM-16004 Hive Service Unavailable is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 3](#).

Step 3 Check the HDFS status.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, check whether the alarm ALM-14000 HDFS Service Unavailable exists.
 - If yes, go to [Step 3.3](#).
 - If no, go to [Step 4](#).
3. Rectify the fault by following the steps provided in ALM-14000 HDFS Service Unavailable.
4. In the alarm list, check whether ALM-16004 Hive Service Unavailable is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 4](#).

Step 4 Check the Yarn status.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list on MRS Manager, check whether the alarm ALM-18000 Yarn Service Unavailable is generated.
 - If yes, go to [Step 4.3](#).
 - If no, go to [Step 4](#).
3. Rectify the fault by following the steps provided in ALM-18000 Yarn Service Unavailable.
4. In the alarm list, check whether ALM-16004 Hive Service Unavailable is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 4](#).

Step 5 Check the DBService status.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list on MRS Manager, check whether ALM-27001 DBService Unavailable is generated.
 - If yes, go to [Step 5.3](#).

- If no, go to [Step 6](#).
- 3. Rectify the fault by following the handling procedure in [ALM-27001 DBService Unavailable \(For MRS 2.x or Earlier\)](#).
- 4. In the alarm list, check whether ALM-16004 Hive Service Unavailable is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 6](#).

Step 6 Check the network connection between Hive and ZooKeeper, HDFS, Yarn, and DBService.

1. Go to the MRS cluster details page and click **Components**.
2. Click **Hive**.
3. Click **Instances**.
The HiveServer instance list is displayed.
4. Click **Host Name** in the row of **HiveServer**.
The HiveServer host status page is displayed.
5. Record the IP address under **Summary**.
6. Use the IP address obtained in [Step 6.5](#) to log in to the host where HiveServer is located.
7. Run the **ping** command to check whether the network connection between the host that runs HiveServer and the hosts that run the ZooKeeper, HDFS, Yarn, and DBService services is normal. Methods of obtaining IP addresses of the hosts that run ZooKeeper, HDFS, Yarn, and DBService services as well as the HiveServer IP address are the same.
 - If yes, go to [Step 7](#).
 - If no, go to [Step 6.8](#).
8. Contact the O&M personnel to restore the network.
9. In the alarm list, check whether ALM-16004 Hive Service Unavailable is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 7](#).

Step 7 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

9.5.61 ALM-16005 Number of Failed Hive SQL Executions in the Last Period Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks whether the number of Hive SQL statements that fail to be executed has exceeded the threshold in the last 10-minute period. This alarm is generated when the number of failed Hive SQL statement executions in the last 10 minutes is greater than the threshold. In the next 10 minutes, if the number of failed Hive SQL statement executions is less than the threshold, the alarm is automatically cleared.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 16005 | Major | Yes |

Parameter

| Parameter | Description |
|-------------|---|
| ServiceName | Service for which the alarm is generated. |
| RoleName | Role for which the alarm is generated. |
| HostName | Host for which the alarm is generated. |

Impact on the System

None

Possible Causes

The Hive SQL syntax is incorrect. As a result, the Hive SQL statements fail to be executed.

Procedure

Check the Hive SQL statements that fail to be executed, correct the syntax, and execute the SQL statements again.

Reference

None

9.5.62 ALM-18000 Yarn Service Unavailable (For MRS 2.x or Earlier)

Description

The alarm module checks the Yarn service status every 30 seconds. This alarm is generated when the Yarn service is unavailable.

This alarm is cleared when the Yarn service recovers.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 18000 | Critical | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The cluster cannot provide the Yarn service. Users cannot run new applications. Submitted applications cannot be run.

Possible Causes

- ZooKeeper is abnormal.
- HDFS is abnormal.
- There is no active ResourceManager node in the Yarn cluster.
- All NodeManager nodes in the Yarn cluster are abnormal.

Procedure

Step 1 Check the ZooKeeper status.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, check whether the alarm ALM-13000 ZooKeeper Service Unavailable exists.

- If yes, go to [Step 1.3](#).
- If no, go to [Step 2.2](#).
- 3. Rectify the fault by following the handling procedure in [ALM-13000 ZooKeeper Service Unavailable \(For MRS 2.x or Earlier\)](#). Then, check whether this alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2.2](#).

Step 2 Check the HDFS status.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, check whether an HDFS alarm is generated.
 - If yes, go to [Step 2.3](#).
 - If no, go to [Step 3.2](#).
3. Click **Alarms**, and handle HDFS alarms according to **Alarm Help**. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 3.2](#).

Step 3 Check the ResorceManager status in the Yarn cluster.

1. Go to the MRS cluster details page and click **Components**.
2. Click **Yarn**.
3. In **Yarn Summary**, check whether there is an active ResourceManager node in the Yarn cluster.
 - If yes, go to [Step 4.2](#).
 - If no, go to [Step 5](#).

Step 4 Check the NodeManager node status in the Yarn cluster.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **Yarn > Instances**.
3. Check **Health Status** of NodeManager, and check whether there are unhealthy nodes.
 - If yes, go to [Step 4.4](#).
 - If no, go to [Step 5](#).
4. Rectify the fault by following the procedure provided in [ALM-18002 NodeManager Heartbeat Lost \(For MRS 2.x or Earlier\)](#) or [ALM-18003 NodeManager Unhealthy \(For MRS 2.x or Earlier\)](#). Then, check whether this alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 5](#).

Step 5 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

None

9.5.63 ALM-18002 NodeManager Heartbeat Lost (For MRS 2.x or Earlier)

Description

The system checks the number of lost NodeManager nodes every 30 seconds, and compares the number of lost nodes with the threshold. The **Lost Nodes** indicator has a default threshold. This alarm is generated when the value of the **Lost Nodes** indicator exceeds the threshold.

This alarm is cleared when the value of **Lost Nodes** is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 18002 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

- The lost NodeManager node cannot provide the Yarn service.
- The number of containers decreases, so the cluster performance deteriorates.

Possible Causes

- NodeManager is forcibly deleted without decommission.
- All NodeManager instances are stopped or the NodeManager process is faulty.

- The host where the NodeManager node resides is faulty.
- The network between the NodeManager and ResourceManager is disconnected or busy.

Procedure

Step 1 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

None

9.5.64 ALM-18003 NodeManager Unhealthy (For MRS 2.x or Earlier)

Description

The system checks the number of abnormal NodeManager nodes every 30 seconds, and compares the number of abnormal nodes with the threshold. The **Unhealthy Nodes** indicator has a default threshold. This alarm is generated when the value of the **Unhealthy Nodes** indicator exceeds the threshold.

This alarm is cleared when the value of **Unhealthy Nodes** is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 18003 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

| Parameter | Description |
|-------------------|---|
| Trigger condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

- The faulty NodeManager node cannot provide the Yarn service.
- The number of containers decreases, so the cluster performance deteriorates.

Possible Causes

- The disk space of the host where the NodeManager node resides is insufficient.
- User **omm** does not have the permission to access a local directory on the NodeManager node.

Procedure

Step 1 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

None

9.5.65 ALM-18004 NodeManager Disk Usability Ratio Is Lower Than the Threshold (For MRS 2.x or Earlier)

Description

The system checks the available disk space of each NodeManager node every 30 seconds and compares the disk availability rate with the threshold. A default threshold range is provided for the **NodeManager Disk Usability Ratio**. This alarm is generated when the system detects that the actual **NodeManager Disk Usability Ratio** is lower than the threshold.

This alarm is automatically cleared when the value of **NodeManager Disk Usability Ratio** is greater than the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 18004 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger condition | Specifies the threshold for triggering the alarm. |

Impact on the System

- The NodeManager node whose disk availability rate is lower than the threshold may fail to provide the Yarn service.
- The number of containers decreases, so the cluster performance may deteriorate.

Possible Causes

- The disk space of the host where the NodeManager node resides is insufficient.
- User **omm** does not have the permission to access a local directory on the NodeManager node.

Procedure

Step 1 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.66 ALM-18006 MapReduce Job Execution Timeout (For MRS 2.x or Earlier)

Description

The alarm module checks the MapReduce job execution every 30 seconds. This alarm is generated when the execution of a submitted MapReduce job times out.

This alarm must be manually cleared.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 18006 | Major | No |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

Execution of the submitted MapReduce job times out, so no execution result can be obtained. Execute the job again after rectifying the fault.

Possible Causes

It takes a long time to execute a MapReduce job. However, the specified time is less than the required execution time.

Procedure

Step 1 Check whether time is improperly set.

Set **-Dapplication.timeout.interval** to a larger value, or do not set the parameter. Check whether the MapReduce job can be executed.

- If yes, go to [Step 2.5](#).
- If no, go to [Step 2.2](#).

Step 2 Check the Yarn status.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list on MRS Manager, check whether the alarm ALM-18000 Yarn Service Unavailable is generated.
 - If yes, go to [Step 2.3](#).
 - If no, go to [Step 3](#).

3. Rectify the fault by following the handling procedure in [ALM-18000 Yarn Service Unavailable \(For MRS 2.x or Earlier\)](#).
4. Run the MapReduce job command again to check whether the MapReduce job can be executed.
 - If yes, go to [Step 2.5](#).
 - If no, go to [Step 4](#).
5. In the alarm list, click  in the **Operation** column of the alarm to manually clear the alarm. No further action is required.

Step 3 Adjust the timeout threshold.

On MRS Manager, choose **System > Threshold Configuration > Services > Yarn > Timed out Applications**, and increase the maximum number of timeout tasks allowed by the current threshold rule. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

Step 4 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

None

9.5.67 ALM-18008 Heap Memory Usage of Yarn ResourceManager Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the heap memory usage of Yarn ResourceManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Yarn ResourceManager exceeds the threshold (80% of the maximum memory by default).

To change the threshold, choose **System > Threshold Configuration > Service > Yarn**. The alarm is cleared when the heap memory usage is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 18008 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

When the heap memory usage of Yarn ResourceManager is overhigh, the performance of Yarn task submission and operation is affected. What is more, a memory overflow occurs so that the Yarn service is unavailable.

Possible Causes

The heap memory of the Yarn ResourceManager instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Step 1 Check the heap memory usage.

1. Go to the MRS cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **18008** and view the IP address and role name of the instance in **Location**.
3. Choose **Components > Yarn > Instances > ResourceManager** (IP address of the instance for which the alarm is generated) > **Customize > Percentage of Used Heap Memory of the ResourceManager**. Check the heap memory usage.
4. Check whether the heap memory usage of ResourceManager has reached the threshold (80% of the maximum memory).
 - If yes, go to **Step 1.5**.
 - If no, go to **Step 2**.
5. Choose **Components > Yarn > Service Configuration**. Set **Type** to **All** and choose **ResourceManager > System**. Change the values of **-Xmx** and **-Xms** in the **GC_OPTS** parameter based on the site requirements to ensure that the value of **-Xms** is less than that of **-Xmx**. Click **Save Configuration** and select **Restart Role Instance**. Click **OK**.
6. Check whether the alarm is cleared.
 - If yes, no further action is required.

- If no, go to [Step 2](#).

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.68 ALM-18009 Heap Memory Usage of MapReduce JobHistoryServer Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the heap memory usage of MapReduce JobHistoryServer every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of MapReduce JobHistoryServer exceeds the threshold (80% of the maximum memory by default).

To change the threshold, choose **System** > **Threshold Configuration** > **Service** > **MapReduce**. The alarm is cleared when the heap memory usage is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18009 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

When the heap memory usage of MapReduce JobHistoryServer is overhigh, the performance of MapReduce log archiving is affected. What is more, a memory overflow occurs so that the Yarn service is unavailable.

Possible Causes

The heap memory of the MapReduce JobHistoryServer instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Step 1 Check the heap memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **18009** and view the IP address and role name of the instance in **Location**.
3. Choose **Components > MapReduce > Instance > JobHistoryServer** (IP address of the instance for which the alarm is generated) > **Customize > JobHistoryServer Heap Memory Usage Statistics**. Check the heap memory usage.
4. Check whether the heap memory usage of JobHistoryServer has reached the threshold (80% of the maximum heap memory).
 - If yes, go to **Step 1.5**.
 - If no, go to **Step 2**.
5. Choose **Components > MapReduce > Service Configuration**. Set **Type** to **All** and choose **JobHistoryServer > System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter as required, click **Save Configuration**, and select **Restart the affected services or instances**. Click **OK**.
6. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.69 ALM-18010 Number of Pending Yarn Tasks Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the number of pending Yarn tasks every 30 seconds and compares the number of tasks with the threshold. This alarm is generated when the number of pending tasks exceeds the threshold.

You can change the threshold by choosing **System > Configure Alarm Threshold > Service > Yarn > Queue Root Pending Applications > Queue Root Pending Applications** on MRS Manager.

This alarm is cleared when the number of pending tasks is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18010 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

Tasks may be stacked and cannot be processed in a timely manner.

Possible Causes

The computing capability of the cluster is lower than the task submission rate. As a result, the task cannot be processed in a timely manner after being submitted.

Procedure

Step 1 Check the usage of memory and vCores on the Yarn page.

Check whether the values of **Memory Used|Memory Total** and **VCores Used|VCores Total** on the native Yarn page reach or approach the maximum values.

- If yes, go to [Step 2](#).
- If no, go to [Step 5](#).

Step 2 Check the number of submitted tasks.

Check whether the running tasks are submitted at a normal frequency.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

Step 3 Scale out the cluster.

The scale-out is based on the site requirements. For details, see [Manually Scaling Out a Cluster](#).

Step 4 After the scale-out is completed, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Step 5 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.70 ALM-18011 Memory of Pending Yarn Tasks Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the memory of pending Yarn tasks every 30 seconds and compares the memory with the threshold. This alarm is generated when the memory of pending tasks exceeds the threshold.

You can change the threshold by choosing **System > Configure Alarm Threshold > Service > Yarn > Queue Root Pending Memory > Queue Root Pending Memory** on MRS Manager.

This alarm is cleared when the memory of pending tasks is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18011 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

Tasks may be stacked and cannot be processed in a timely manner.

Possible Causes

The computing capability of the cluster is lower than the task submission rate. As a result, the task cannot be processed in a timely manner after being submitted.

Procedure

Step 1 Check the usage of memory and vCores on the Yarn page.

Check whether the values of **Memory Used|Memory Total** and **VCores Used|VCores Total** on the native Yarn page reach or approach the maximum values.

- If yes, go to [Step 2](#).
- If no, go to [Step 5](#).

Step 2 Check the number of submitted tasks.

Check whether the running tasks are submitted at a normal frequency.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

Step 3 Scale out the cluster.

The scale-out is based on the site requirements. For details, see [Manually Scaling Out a Cluster](#).

Step 4 After the scale-out is completed, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Step 5 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.71 ALM-18012 Number of Terminated Yarn Tasks in the Last Period Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the number of terminated Yarn tasks every 10 minutes. This alarm is generated when the number of terminated Yarn tasks in the last 10 minutes is greater than the threshold. This alarm is automatically cleared when the number of terminated Yarn tasks is less than the threshold in the next 10 minutes.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 18012 | Major | Yes |

Parameter

| Parameter | Description |
|-------------|---|
| ServiceName | Service for which the alarm is generated. |
| RoleName | Role for which the alarm is generated. |
| HostName | Host for which the alarm is generated. |

Impact on the System

None

Possible Causes

A user manually stops a running Yarn task.

Procedure

Check the task termination operator in the Yarn logs and audit logs, and determine the cause of the task termination.

Reference

None

9.5.72 ALM-18013 Number of Failed Yarn Tasks in the Last Period Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the number of failed Yarn tasks every 10 minutes. This alarm is generated when the number of failed Yarn tasks in the last 10 minutes is greater than the threshold. This alarm is automatically cleared when the number of failed Yarn tasks is less than the threshold in the next 10 minutes.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 18013 | Major | Yes |

Parameter

| Parameter | Description |
|-------------|---|
| ServiceName | Service for which the alarm is generated. |
| RoleName | Role for which the alarm is generated. |
| HostName | Host for which the alarm is generated. |

Impact on the System

None

Possible Causes

The submitted Yarn job program is incorrect. For example, the parameter for Spark to submit a job is incorrect.

Procedure

Check the log of the failed job, locate the failure cause, modify the job, and submit the job again.

Reference

None

9.5.73 ALM-19000 HBase Service Unavailable (For MRS 2.x or Earlier)

Description

The alarm module checks the HBase service status every 30 seconds. This alarm is generated when the HBase service is unavailable.

This alarm is cleared when the HBase service recovers.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 19000 | Critical | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

Operations cannot be performed, such as reading or writing data and creating tables.

Possible Causes

- ZooKeeper is abnormal.
- HDFS is abnormal.
- HBase is abnormal.
- The network is abnormal.

Procedure

Step 1 Check the ZooKeeper status.

1. Go to the MRS cluster details page and click **Components**.
2. In the service list, check whether the health status of ZooKeeper is **Good**.
 - If yes, go to **Step 2.1**.
 - If no, go to **Step 1.3**.
3. In the alarm list, check whether the alarm ALM-13000 ZooKeeper Service Unavailable exists.
 - If yes, go to **Step 1.4**.
 - If no, go to **Step 2.1**.
4. Rectify the fault by following the steps provided in ALM-13000 ZooKeeper Service Unavailable.
5. Wait several minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 2.1**.

Step 2 Check the HDFS status.

1. On MRS Manager, check whether the ALM-14000 HDFS Service Unavailable alarm is reported.
 - If yes, go to **Step 2.2**.
 - If no, go to **Step 3**.
2. Rectify the fault by following the steps provided in ALM-14000 HDFS Service Unavailable.
3. Wait several minutes and check whether the alarm is cleared.

Step 3 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

None

9.5.74 ALM-19006 HBase Replication Sync Failed (For MRS 2.x or Earlier)**Description**

This alarm is generated when disaster recovery (DR) data fails to be synchronized to a standby cluster.

This alarm is cleared when DR data synchronization succeeds.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 19006 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

HBase data in a cluster fails to be synchronized to the standby cluster, causing data inconsistency between active and standby clusters.

Possible Causes

- The HBase service on the standby cluster is abnormal.
- The network is abnormal.

Procedure

Step 1 Observe whether the system automatically clears the alarm.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, click the alarm to obtain alarm generation time from **Generated Time** in **Alarm Details**. Check whether the alarm has existed for over 5 minutes.
 - If yes, go to [Step 2.1](#).
 - If no, go to [Step 1.3](#).
3. Wait 5 minutes and check whether the alarm is automatically cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2.1](#).

Step 2 Check the HBase service status of the standby cluster.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, click the alarm and obtain **HostName** from **Location** in **Alarm Details**.
3. Log in to the node where the HBase client of the active cluster is located. Run the following commands to switch the user:

sudo su - root

su - omm

4. Run the **status 'replication', 'source'** command to check the synchronization status of the faulty node.

The synchronization status of a node is as follows.

10-10-10-153:

```
SOURCE: PeerID=abc, SizeOfLogQueue=0, ShippedBatches=2, ShippedOps=2, ShippedBytes=320,
LogReadInBytes=1636, LogEditsRead=5, LogEditsFiltered=3, SizeOfLogToReplicate=0,
TimeForLogToReplicate=0, ShippedHFiles=0, SizeOfHFileRefsQueue=0, AgeOfLastShippedOp=0,
TimeStampsOfLastShippedOp=Mon Jul 18 09:53:28 CST 2016, Replication Lag=0,
FailedReplicationAttempts=0
```

```
SOURCE: PeerID=abc1, SizeOfLogQueue=0, ShippedBatches=1, ShippedOps=1, ShippedBytes=160,
LogReadInBytes=1636, LogEditsRead=5, LogEditsFiltered=3, SizeOfLogToReplicate=0,
TimeForLogToReplicate=0, ShippedHFiles=0, SizeOfHFileRefsQueue=0, AgeOfLastShippedOp=16788,
TimeStampsOfLastShippedOp=Sat Jul 16 13:19:00 CST 2016, Replication Lag=16788,
FailedReplicationAttempts=5
```

5. Obtain **PeerID** corresponding to a record whose **FailedReplicationAttempts** value is greater than 0.

In the preceding step, data on the faulty node **10-10-10-153** fails to be synchronized to a standby cluster whose **PeerID** is **abc1**.

6. Run the **list_peers** command to find the cluster and the HBase instance corresponding to **PeerID**.

```
PEER_ID CLUSTER_KEY STATE TABLE_CFS
abc1 10.10.10.110,10.10.10.119,10.10.10.133:24002:/hbase2 ENABLED
abc 10.10.10.110,10.10.10.119,10.10.10.133:24002:/hbase ENABLED
```

In the preceding information, **/hbase2** indicates that data is synchronized to the HBase2 instance of the standby cluster.

7. In the service list of the standby cluster, check whether the health status of the HBase instance obtained in [Step 2.6](#) is **Good**.
 - If yes, go to [Step 3.1](#).
 - If no, go to [Step 2.8](#).
8. In the alarm list, check whether the alarm ALM-19000 HBase Service Unavailable exists.
 - If yes, go to [Step 2.9](#).
 - If no, go to [Step 3.1](#).
9. Rectify the fault by following the steps provided in ALM-19000 HBase Service Unavailable.
10. Wait several minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 3.1](#).

Step 3 Check the network connection between RegionServers on active and standby clusters.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, click the alarm and obtain **HostName** from **Location** in **Alarm Details**.
3. Log in to the faulty RegionServer node.
4. Run the **ping** command to check whether the network connection between the faulty RegionServer node and the host where RegionServer of the standby cluster resides is normal.

- If yes, go to [Step 4](#).
 - If no, go to [Step 3.5](#).
5. Contact the O&M personnel to restore the network.
 6. After the network recovers, check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 4](#).

Step 4 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

9.5.75 ALM-19007 HBase Merge Queue Exceeds the Threshold (for 2.x and Earlier Versions)

Description

The system checks the HBase compaction queue size every 30 seconds. This alarm is generated when the compaction queue size exceeds the alarm threshold (**100** by default) for three consecutive times. This alarm is cleared when the compaction queue size is less than the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 19007 | Minor | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| Host Name | Specifies the host for which the alarm is generated. |

Impact on the System

The cluster performance may deteriorate, affecting data read and write.

Possible Causes

- The number of HBase RegionServers is too small.
- There are too many regions on a RegionServer of HBase.
- The HBase RegionServer heap size is small.
- Resources are insufficient.
- Related parameters are not configured properly.

Procedure

Step 1 Check whether related HBase parameters are properly configured.

1. Log in to the MRS cluster details page, choose **Components > HBase > Service Configuration**, switch **Basic Configuration** to **All Configurations**, and search for **hbase.hstore.compaction.min** and **hbase.hstore.compaction.max**, and increase the values of **hbase.regionserver.thread.compaction.small** and **hbase.regionserver.thread.compaction.throttle**.

NOTE

If you did not synchronize IAM users, perform synchronization first. (In the **Dashboard** tab, click **Synchronize** next to **IAM User Sync**.)

2. Save the configuration, and restart the HBase service during off-peak hours or perform a rolling restart to make the configuration take effect.
3. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.5.76 ALM-20002 Hue Service Unavailable (For MRS 2.x or Earlier)

Description

The system checks the Hue service status every 60 seconds. This alarm is generated if the Hue service is unavailable.

This alarm is cleared when the Hue service is normal.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 20002 | Critical | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The system cannot provide data loading, query, and extraction services.

Possible Causes

- The KrbServer service on which Hue depends is abnormal.
- The DBService service on which Hue depends is abnormal.
- The network connection to DBService is abnormal.

Procedure

Check whether the KrbServer service is normal.

Step 1 Go to the MRS cluster details page and click **Components**.

Step 2 In the service list, check whether **Health Status** of KrbServer is **Good**.

- If yes, go to [Step 5](#).
- If no, go to [Step 3](#).

Step 3 Click **Restart** in the **Operation** column of the KrbServer service to restart the service.

Step 4 Wait for several minutes. Check whether ALM-20002 Hue Service Unavailable is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check whether DBService is normal.

Step 5 Go to the MRS cluster details page and click **Components**.

Step 6 In the service list, check whether **Health Status** of **DBService** is **Good**.

- If yes, go to [Step 9](#).
- If no, go to [Step 7](#).

Step 7 Click **Restart** in the **Operation** column of the DBService service to restart the service.

 **NOTE**

To restart the service, you need to enter the password of the MRS Manager administrator and select **Start or restart related services**.

Step 8 Wait for several minutes. Check whether ALM-20002 Hue Service Unavailable is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Check whether the network connected to DBService is normal.

Step 9 Choose **Components > Hue > Instance** and record the IP address of the active Hue node.

Step 10 Use PuTTY to log in to the active Hue.

Step 11 Run the **ping** command to check whether the network connection between the host where the active Hue is located and the host where DBService is located is normal. (The method of obtaining the DBService service IP address is the same as that of obtaining the active Hue IP address.)

- If yes, go to [Step 17](#).
- If no, go to [Step 12](#).

Step 12 Contact the network administrator to repair the network.

Step 13 Wait for several minutes. Check whether ALM-20002 Hue Service Unavailable is cleared.

- If yes, no further action is required.
- If no, go to [Step 17](#).

Collect fault information.

Step 14 On MRS Manager, choose **System > Export Log**.

Step 15 Select the following nodes from the **Services** drop-down list and click **OK**.

- Hue
- Controller

Step 16 Set **Start Time** and **End Time** for log collection to 10 minutes before and after the alarm is generated, select an export type, and click **OK** to collect the corresponding fault log information.

Restart Hue.

Step 17 Choose **Components > Hue**.

Step 18 Choose **More > Restart Service** and click **OK**.

Step 19 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 20](#).

Step 20 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.77 ALM-23001 Loader Service Unavailable (For MRS 2.x or Earlier)

Description

The system checks the Loader service availability every 60 seconds. This alarm is generated if the Loader service is unavailable and is cleared after the Loader service recovers.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 23001 | Critical | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |

| Parameter | Description |
|-----------|--|
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

Data loading, import, and conversion are unavailable.

Possible Causes

- The services that Loader depends on are abnormal.
 - ZooKeeper is abnormal.
 - HDFS is abnormal.
 - DBService is abnormal.
 - Yarn is abnormal.
 - MapReduce is abnormal.
- The network is faulty. Loader cannot communicate with its dependent services.
- Loader is running improperly.

Procedure

Step 1 Check the ZooKeeper status.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **ZooKeeper** and check whether the health status of ZooKeeper is normal.
 - If yes, go to [Step 1.4](#).
 - If no, go to [Step 1.3](#).
3. Choose **More > Restart Service** to restart ZooKeeper. After ZooKeeper starts, check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 1.4](#).
4. On MRS Manager, check whether the ALM-12007 Process Fault alarm is reported.
 - If yes, go to [Step 1.5](#).
 - If no, go to [Step 2.1](#).
5. In **Alarm Details** of the "ALM-12007 Process Fault" alarm, check whether **ServiceName** is **ZooKeeper**.
 - If yes, go to [Step 1.6](#).
 - If no, go to [Step 2.1](#).

6. Clear the alarm according to the handling suggestions of "ALM-12007 Process Fault".
7. Check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2.1](#).

Step 2 Check the HDFS status.

1. Go to the MRS cluster details page and choose **Alarms**.
2. On MRS Manager, check whether the "ALM-14000 HDFS Service Unavailable alarm" is reported.
 - If yes, go to [Step 2.3](#).
 - If no, go to [Step 3.1](#).
3. Clear the alarm according to the handling suggestions of "ALM-14000 HDFS Service Unavailable".
4. Check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 3.1](#).

Step 3 Check the DBService status.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **DBService** to check whether the health status of DBService is normal.
 - If yes, go to [Step 4.1](#).
 - If no, go to [Step 3.3](#).
3. Choose **More > Restart Service** to restart DBService. After DBService starts, check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 4.1](#).

Step 4 Check the MapReduce status.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **MapReduce** and check whether the health status of MapReduce is normal.
 - If yes, go to [Step 5.1](#).
 - If no, go to [Step 4.3](#).
3. Choose **More > Restart Service** to restart MapReduce. After MapReduce starts, check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 5.1](#).

Step 5 Check the Yarn status.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **Yarn** and check whether the health status of Yarn is normal.
 - If yes, go to [Step 5.4](#).

- If no, go to [Step 5.3](#).
- 3. Choose **More > Restart Service** to restart Yarn. After Yarn starts, check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 5.4](#).
- 4. On MRS Manager, check whether the "ALM-18000 Yarn Service Unavailable" alarm is reported.
 - If yes, go to [Step 5.5](#).
 - If no, go to [Step 6.1](#).
- 5. Clear the alarm according to the handling suggestions of "ALM-18000 Yarn Service Unavailable".
- 6. Check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 6.1](#).

Step 6 Check the network connections between Loader and its dependent components.

1. Go to the MRS cluster details page and click **Components**.
2. Click **Loader**.
3. Click **Instance**. The Sqoop instance list is displayed.
4. Record the management IP addresses of all Sqoop instances.
5. Log in to the hosts using the IP addresses obtained in [Step 6.4](#). Run the following commands to switch the user:
sudo su - root
su - omm
6. Run the **ping** command to check whether the network connection between the hosts where the Sqoop instances reside and the dependent components is normal. (The dependent components include ZooKeeper, DBService, HDFS, MapReduce, and Yarn. The method to obtain the IP addresses of the dependent components is the same as that used to obtain the IP addresses of the Sqoop instances.)
 - If yes, go to [Step 7](#).
 - If no, go to [Step 6.7](#).
7. Contact the network administrator to repair the network.
8. Check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 7](#).

Step 7 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.78 ALM-24000 Flume Service Unavailable (For MRS 2.x or Earlier)

Description

The alarm module checks the Flume service status every 180 seconds. This alarm is generated if the Flume service is abnormal.

This alarm is cleared after the Flume service recovers.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 24000 | Critical | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

Flume cannot work and data transmission is interrupted.

Possible Causes

- HDFS is unavailable.
- LdapServer is unavailable.

Procedure

Step 1 Check the HDFS status.

1. Go to the MRS cluster details page and choose **Alarms**.
2. Check whether the ALM-14000 HDFS Service Unavailable alarm is generated.
 - If yes, clear the alarm according to the handling suggestions of "ALM-14000 HDFS Service Unavailable".
 - If no, go to **Step 2**.

Step 2 Check the LdapServer status.

Check whether the ALM-25000 LdapServer Service Unavailable alarm is generated.

- If yes, clear the alarm according to the handling suggestions of "ALM-25000 LdapServer Service Unavailable".
- If no, go to [Step 3.2](#).

Step 3 Check whether the HDFS and LdapServer services are stopped.

1. Go to the MRS cluster details page and click **Components**.
2. In the service list on MRS Manager, check whether the HDFS and LdapServer services are stopped.
 - If yes, start the HDFS and LdapServer services and go to [Step 3.3](#).
 - If no, go to [Step 4](#).
3. Check whether the "ALM-24000 Flume Service Unavailable" alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 4](#).

Step 4 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.79 ALM-24001 Flume Agent Is Abnormal (For MRS 2.x or Earlier)

Description

This alarm is generated if the Flume agent monitoring module detects that the Flume agent process is abnormal.

This alarm is cleared after the Flume agent process recovers.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 24001 | Minor | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |

| Parameter | Description |
|-----------|--|
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

Functions of the alarmed Flume agent instance are abnormal. Data transmission tasks of the instance are suspended. In real-time data transmission, data will be lost.

Possible Causes

- The **JAVA_HOME** directory does not exist or the Java permission is incorrect.
- The permission of the Flume agent directory is incorrect.

Procedure

Step 1 Check the Flume agent's configuration file.

1. Log in to the host where the faulty node resides. Run the following command to switch to user **root**:
sudo su - root
2. Run the **cd Flume installation directory/fusioninsight-flume-1.6.0/conf/** command to go to Flume's configuration directory.
3. Run the **cat ENV_VARS** command. Check whether the **JAVA_HOME** directory exists and whether the Flume agent user has execute permission of Java.
 - If yes, go to [Step 2.1](#).
 - If no, go to [Step 1.4](#).
4. Specify the correct **JAVA_HOME** directory and grant the Flume agent user with the execute permission of Java. Then go to [Step 2.4](#).

Step 2 Check the permission of the Flume agent directory.

1. Log in to the host where the faulty node resides. Run the following command to switch to user **root**:
sudo su - root
2. Run the following command to access the installation directory of the Flume agent:
cd Flume agent installation directory
3. Run the **ls -al * -R** command. Check whether the owner of all files is the Flume agent user.
 - If yes, go to [Step 3](#).
 - If no, run the **chown** command and change the owner of the files to the Flume agent user. Then go to [Step 2.4](#).

4. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 3](#).

Step 3 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.80 ALM-24003 Flume Client Connection Interrupted (For MRS 2.x or Earlier)

Description

The alarm module monitors the port connection status on the Flume server. This alarm is generated if the Flume server fails to receive a connection message from the Flume client in 3 consecutive minutes.

This alarm is cleared after the Flume server receives a connection message from the Flume client.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 24003 | Major | Yes |

Parameters

| Parameter | Description |
|------------|---|
| ClientIP | Specifies the IP address of the Flume client. |
| ServerIP | Specifies the IP address of the Flume server. |
| ServerPort | Specifies the port on the Flume server. |

Impact on the System

The communication between the Flume client and server fails. The Flume client cannot send data to the Flume server.

Possible Causes

- The network between the Flume client and server is faulty.
- The Flume client's process is abnormal.
- The Flume client is incorrectly configured.

Procedure

Step 1 Check the network between the Flume client and server.

1. Log in to the host where the alarmed Flume client resides. Run the following command to switch to user **root**:

```
sudo su - root
```

2. Run the **ping *Flume server IP address*** command to check whether the network between the Flume client and server is normal.
 - If yes, go to [Step 2.1](#).
 - If no, go to [Step 4](#).

Step 2 Check whether the Flume client's process is normal.

1. Log in to the host where the alarmed Flume client resides. Run the following command to switch to user **root**:

```
sudo su - root
```

2. Run the **ps -ef|grep flume |grep client** command to check whether the Flume client process exists.
 - If yes, go to [Step 3.1](#).
 - If no, go to [Step 4](#).

Step 3 Check the Flume client configuration.

1. Log in to the host where the alarmed Flume client resides. Run the following command to switch to user **root**:

```
sudo su - root
```

2. Run the **cd *Flume installation directory*/fusioninsight-flume-1.6.0/conf/** command to go to Flume's configuration directory.
3. Run the **cat properties.properties** command to query the current configuration file of the Flume client.
4. Check whether the **properties.properties** file is correctly configured according to the configuration description of the Flume agent.
 - If yes, go to [Step 3.5](#).
 - If no, go to [Step 4](#).
5. Modify the **properties.properties** configuration file.
6. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 4](#).

Step 4 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.

2. Contact the O&M engineers and send the collected logs.

----End

9.5.81 ALM-24004 Flume Fails to Read Data (For MRS 2.x or Earlier)

Description

The alarm module monitors the Flume source status. This alarm is generated if the duration that Flume source fails to read data exceeds the threshold.

Users can modify the threshold as required.

This alarm is cleared if the source reads data successfully.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 24004 | Major | Yes |

Parameters

| Parameter | Description |
|---------------|--|
| ServiceName | Specifies the service for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| ComponentType | Specifies the component type for which the alarm is generated. |
| ComponentName | Specifies the component name for which the alarm is generated. |

Impact on the System

Data collection is stopped.

Possible Causes

- The Flume source is faulty.

- The network is faulty.

Procedure

Step 1 Check whether the Flume source is normal.

1. Check whether the Flume source is the spoolDir type.
 - If yes, go to [Step 1.2](#).
 - If no, go to [Step 1.3](#).
2. Query the **spoolDir** directory and check whether all files have been sent.
 - If yes, no further action is required.
 - If no, go to [Step 1.5](#).
3. Check whether the Flume source is the Kafka type.
 - If yes, go to [Step 1.4](#).
 - If no, go to [Step 1.5](#).
4. Log in to the Kafka client and run the following commands to check whether all topic data configured for the Kafka source has been consumed.
cd /opt/client/Kafka/kafka/bin
./kafka-consumer-groups.sh --bootstrap-server *Kafka cluster IP address:21007* --new-consumer --describe --group example-group1 --command-config
../config/consumer.properties
 - If yes, no further action is required.
 - If no, go to [Step 1.5](#).
5. Go to the cluster details page and click **Components**.
6. Choose **Flume > Instances**.
7. Click the Flume instance of the faulty node and check whether the value of the **Source Speed Metrics** is 0.
 - If yes, go to [Step 2.1](#).
 - If no, no further action is required.

Step 2 Check the status of the network between the Flume source and faulty node.

1. Check whether the Flume source is the avro type.
 - If yes, go to [Step 2.3](#).
 - If no, go to [Step 3](#).
2. Log in to the host where the faulty node resides. Run the following command to switch to user **root**:
sudo su - root
3. Run the **ping *Flume source IP address*** command to check whether the Flume source can be pinged.
 - If yes, go to [Step 3](#).
 - If no, go to [Step 2.4](#).
4. Contact the network administrator to repair the network.
5. Wait for a while and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 3](#).

Step 3 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Related Information

N/A

9.5.82 ALM-24005 Data Transmission by Flume Is Abnormal (For MRS 2.x or Earlier)

Description

The alarm module monitors the capacity of Flume channels. This alarm is generated if the duration that a channel is full or the number of times that a source fails to send data to the channel exceeds the threshold.

Users can set the threshold as required by modifying the **channelfullcount** parameter.

This alarm is cleared after the Flume channel space is released.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 24005 | Major | Yes |

Parameters

| Parameter | Description |
|---------------|--|
| ServiceName | Specifies the service for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| ComponentType | Specifies the component type for which the alarm is generated. |
| ComponentName | Specifies the component name for which the alarm is generated. |

Impact on the System

If the usage of the Flume channel continues to grow, the data transmission time increases. When the usage reaches 100%, the Flume agent process is suspended.

Possible Causes

- The Flume sink is faulty.
- The network is faulty.

Procedure

Step 1 Check whether the Flume sink is normal.

1. Check whether the Flume sink is the HDFS type.
 - If yes, go to [Step 1.2](#).
 - If no, go to [Step 1.3](#).
2. On MRS Manager, check whether the ALM-14000 HDFS Service Unavailable alarm is reported and whether the HDFS service is stopped.
 - If the alarm is reported, clear it according to the handling suggestions of ALM-14000 HDFS Service Unavailable; if the HDFS service is stopped, start it. Then go to [Step 1.7](#).
 - If no, go to [Step 1.7](#).
3. Check whether the Flume sink is the HBase type.
 - If yes, go to [Step 1.4](#).
 - If no, go to [Step 1.7](#).
4. On MRS Manager, check whether the ALM-19000 HBase Service Unavailable alarm is reported and whether the HBase service is stopped.
 - If the alarm is reported, clear it according to the handling suggestions of "ALM-19000 HBase Service Unavailable"; if the HBase service is stopped, start it. Then go to [Step 1.7](#).
 - If no, go to [Step 1.7](#).
5. Check whether the Flume sink is the Kafka type.
 - If yes, go to [Step 1.6](#).
 - If no, go to [Step 1.7](#).
6. On MRS Manager, check whether the ALM-38000 Kafka Service Unavailable alarm is reported and whether the Kafka service is stopped.
 - If the alarm is reported, clear it according to the handling suggestions of "ALM-38000 Kafka Service Unavailable"; if the Kafka service is stopped, start it. Then go to [Step 1.7](#).
 - If no, go to [Step 1.7](#).
7. Go to the MRS cluster details page and click **Components**.
8. Choose **Flume > Instances**.
9. Click the Flume instance of the faulty node and check whether the value of the **Sink Speed Metrics** is 0.
 - If yes, go to [Step 2.1](#).

- If no, no further action is required.

Step 2 Check the status of the network between the Flume sink and faulty node.

1. Check whether the Flume sink is the Avro type.
 - If yes, go to [Step 2.3](#).
 - If no, go to [Step 3](#).
2. Log in to the host where the faulty node resides. Run the following command to switch to user **root**:
sudo su - root
3. Run the **ping *Flume sink IP address*** command to check whether the Flume sink can be pinged.
 - If yes, go to [Step 3](#).
 - If no, go to [Step 2.4](#).
4. Contact the network administrator to repair the network.
5. Wait for a while and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 3](#).

Step 3 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Related Information

N/A

9.5.83 ALM-25000 LdapServer Service Unavailable (For MRS 2.x or Earlier)

Description

The system checks the LdapServer service status every 30 seconds. This alarm is generated when the active and standby LdapServer services are abnormal.

This alarm is cleared when either of the LdapServer services restores.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 25000 | Critical | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

When this alarm is generated, no operation can be performed for the KrbServer users and LdapServer users in the cluster. For example, users, user groups, or roles cannot be added, deleted, or modified, and user passwords cannot be changed on MRS Manager. The authentication for existing users in the cluster is not affected.

Possible Causes

- The node where the LdapServer service locates is faulty.
- The LdapServer process is abnormal.

Procedure

- Step 1** Check whether the nodes where the two SlapdServer instances of the LdapServer service locate are faulty.
1. Go to the MRS cluster details page and click **Components**.
 2. Choose **LdapServer > Instances**. Go to the LdapServer instance page to obtain the host name of the node where the two SlapdServer instances reside.
 3. On the **Alarms** page of MRS Manager, check whether the alarm ALM-12006 Node Fault is generated.
 - If yes, go to **Step 1.4**.
 - If no, go to **Step 2.1**.
 4. Check whether the host name in the alarm information is the same as the actual host name in **Step 1.2**.
 - If yes, go to **Step 1.5**.
 - If no, go to **Step 2.1**.
 5. Rectify the fault by following steps provided in ALM-12006 Node Fault.
 6. In the alarm list, check whether the alarm ALM-25000 LdapServer Service Unavailable is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 3**.
- Step 2** Check whether the LdapServer process is in normal state.

1. Go to the cluster details page and choose **Alarms**.
2. Check whether ALM-12007 Process Fault is generated.
 - If yes, go to [Step 2.3](#).
 - If no, go to [Step 3](#).
3. Check whether the service name and host name in the alarm are consistent with the LdapServer service and host names.
 - If yes, go to [Step 2.4](#).
 - If no, go to [Step 3](#).
4. Rectify the fault by following steps provided in ALM-12007 Process Fault.
5. In the alarm list, check whether the alarm ALM-25000 LdapServer Service Unavailable is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 3](#).

Step 3 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

None

9.5.84 ALM-25004 Abnormal LdapServer Data Synchronization (For MRS 2.x or Earlier)

Description

This alarm is generated when LdapServer data on Manager is inconsistent. This alarm is cleared when the data becomes consistent.

This alarm is generated when LdapServer data in the cluster is inconsistent with LdapServer data on Manager. This alarm is cleared when the data becomes consistent.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 25004 | Critical | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Host for which the alarm is generated. |

Impact on the System

LdapServer data inconsistency occurs because LdapServer data on Manager or in the cluster is damaged. The LdapServer process with damaged data cannot provide services externally, and the authentication functions of Manager and the cluster are affected.

Possible Causes

- The network of the node where the LdapServer process locates is faulty.
- The LdapServer process is abnormal.
- The OS restart damages data on LdapServer.

Procedure

Step 1 Check whether the network where the LdapServer nodes reside is faulty.

1. Go to the cluster details page and choose **Alarms**.
2. Record the IP address of **HostName** in **Location** of the alarm as **IP1** (if multiple alarms exist, record the IP addresses as **IP1**, **IP2**, and **IP3** respectively).
3. Contact O&M personnel and use PuTTY to log in to the node corresponding to **IP1**. Run the **ping** command on the node to check whether the IP address of the management plane of the active OMS node can be pinged.
 - If yes, go to [Step 1.4](#).
 - If no, go to [Step 2.1](#).
4. Contact O&M personnel to recover the network and check whether the alarm **ALM-25004 Abnormal LdapServer Data Synchronization** is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2.1](#).

Step 2 Check whether the LdapServer process is in normal state.

1. Go to the cluster details page and choose **Alarms**.
2. Check whether ALM-12004 OLdap Resource Is Abnormal is generated for LdapServer.
 - If yes, go to [Step 2.3](#).

- If no, go to [Step 2.5](#).
- 3. Rectify the fault by following steps provided in **ALM-12004 OLdap Resource Is Abnormal**.
- 4. Check whether the alarm ALM-25004 Abnormal LdapServer Data Synchronization is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2.5](#).
- 5. On the **Alarms** page of MRS Manager, check whether the alarm ALM-12007 Process Fault of LdapServer is generated.
 - If yes, go to [Step 2.6](#).
 - If no, go to [Step 3.1](#).
- 6. Rectify the fault by following steps provided in ALM-12007 Process Fault.
- 7. Check whether the alarm ALM-25004 Abnormal LdapServer Data Synchronization is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 3.1](#).

Step 3 Check whether the OS restart damages data on LdapServer.

1. Go to the cluster details page and choose **Alarms**.
2. Record the IP address of **HostName** in **Location** of the alarm as **IP1** (if multiple alarms exist, record the IP addresses as **IP1**, **IP2**, and **IP3** respectively). Choose **Services** > **LdapServer** > **Service Configuration** and record the LdapServer port number as **PORT**. (If the IP address in the alarm location information is the IP address of the standby OMS node, the default port number is 21750.)
3. Log in to node **IP1** as user **omm** and run the **ldapsearch -H ldaps://IP1:PORT -x -LLL -b dc=hadoop,dc=com** command (if the IP address is the IP address of the standby OMS node, run the **ldapsearch -H ldaps://IP1:PORT -x -LLL -b dc=hadoop,dc=com** command before running this command). Check whether error information is displayed in the command output.
 - If yes, go to [Step 3.4](#).
 - If no, go to [Step 4](#).
4. Recover the LdapServer and OMS nodes using backup data before the alarm is generated. For details, see section "Recovering Manager Data" in the *Administrator Guide*.

 **NOTE**

Use the OMS data and LdapServer data backed up at the same time to restore data. Otherwise, the service and operation may fail. To recover data when services run properly, you are advised to manually back up the latest management data and then recover the data. Otherwise, Manager data produced between the backup point in time and the recovery point in time will be lost.

5. Check whether the alarm ALM-25004 Abnormal LdapServer Data Synchronization is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 4](#).

Step 4 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.85 ALM-25500 KrbServer Service Unavailable (For MRS 2.x or Earlier)

Description

The system checks the KrbServer service status every 30 seconds. This alarm is generated when the KrbServer service is abnormal.

This alarm is cleared when the KrbServer service is in normal state.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 25500 | Critical | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

When this alarm is generated, no operation can be performed for the KrbServer component in the cluster. The authentication of KrbServer in other components will be affected. The health status of components that depend on KrbServer in the cluster is **Bad**.

Possible Causes

- The node where the KrbServer service locates is faulty.

- The OLdap service is unavailable.

Procedure

Step 1 Check whether the node where the KrbServer service locates is faulty.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **KrbServer > Instances**. Go to the KrbServer instance page and view the host name of the node where the KrbServer service is deployed.
3. On the **Alarms** page of MRS Manager, check whether the alarm ALM-12006 Node Fault is generated.
 - If yes, go to **Step 1.4**.
 - If no, go to **Step 2.1**.
4. Check whether the host name in the alarm information is the same as the actual host name in **Step 1.2**.
 - If yes, go to **Step 1.5**.
 - If no, go to **Step 2.1**.
5. Rectify the fault by following steps provided in ALM-12006 Node Fault.
6. In the alarm list, check whether the alarm ALM-25500 KrbServer Service Unavailable is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 3**.

Step 2 Check whether the OLdap service is unavailable.

1. Go to the cluster details page and choose **Alarms**.
2. Check whether ALM-12004 OLdap Resource Is Abnormal is generated.
 - If yes, go to **Step 2.3**.
 - If no, go to **Step 3**.
3. Rectify the fault by following steps provided in ALM-12004 OLdap Resource Is Abnormal.
4. In the alarm list, check whether the alarm ALM-25500 KrbServer Service Unavailable is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.86 ALM-26051 Storm Service Unavailable (For MRS 2.x or Earlier)

Description

The system checks the Storm service availability every 30 seconds. This alarm is generated if the Storm service becomes unavailable after all Nimbus nodes in a cluster become abnormal.

This alarm is cleared after the Storm service recovers.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 26051 | Critical | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

- The cluster cannot provide the Storm service.
- Users cannot run new Storm tasks.

Possible Causes

- The Kerberos component is faulty.
- ZooKeeper is faulty or suspended.
- The active and standby Nimbus nodes in the Storm cluster are abnormal.

Procedure

Step 1 Check the Kerberos component status. For clusters without Kerberos authentication, skip this step and go to [Step 2](#).

1. Go to the MRS cluster details page and click **Components**.
2. Check whether the health status of the Kerberos service is **Good**.

- If yes, go to [Step 2.1](#).
 - If no, go to [Step 1.3](#).
3. Rectify the fault by following instructions in ALM-25500 KrbServer Service Unavailable.
 4. Perform [Step 1.2](#) again.

Step 2 Check the ZooKeeper component status.

1. Check whether the health status of the ZooKeeper service is **Good**.
 - If yes, go to [Step 3.1](#).
 - If no, go to [Step 2.2](#).
2. If the ZooKeeper service is stopped, start it. For other problems, follow the instructions in ALM-13000 ZooKeeper Service Unavailable.
3. Perform [Step 2.1](#) again.

Step 3 Check the status of the active and standby Nimbus nodes.

1. Choose **Components > Storm > Nimbus**.
2. In **Role**, check whether only one active Nimbus node exists.
 - If yes, go to [Step 4](#).
 - If no, go to [Step 3.3](#).
3. Select the two Nimbus instances and choose **More > Restart Instance**. Check whether the restart is successful.
 - If yes, go to [Step 3.4](#).
 - If no, go to [Step 4](#).
4. Log in to MRS Manager again and choose **Components > Storm > Nimbus**. Check whether the health status of Nimbus is **Good**.
 - If yes, go to [Step 3.5](#).
 - If no, go to [Step 4](#).
5. Wait 30 seconds and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 4](#).

Step 4 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.87 ALM-26052 Number of Available Supervisors in Storm Is Lower Than the Threshold (For MRS 2.x or Earlier)

Description

The system checks the number of supervisors every 60 seconds and compares it with the threshold. This alarm is generated if the number of supervisors is lower than the threshold.

To modify the threshold, users can choose **System > Threshold Configuration** on MRS Manager.

This alarm is cleared if the number of supervisors is greater than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 26052 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

- Existing tasks in the cluster cannot be executed.
- The cluster can receive new Storm tasks but cannot execute them.

Possible Causes

Supervisors are abnormal in the cluster.

Procedure

Step 1 Check the supervisor status.

1. Go to the cluster details page and click **Components**.
2. Choose **Storm > Supervisor**.
3. In **Role**, check whether the cluster has supervisor instances that are in the **Faulty** or **Recovering** state.
 - If yes, go to **Step 1.4**.
 - If no, go to **Step 2**.
4. Select the supervisor instances that are in the **Faulty** or **Recovering** state and choose **More > Restart Instance**.
 - If yes, go to **Step 1.5**.
 - If the restart fails, go to **Step 2**.
5. Wait 30 seconds and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.88 ALM-26053 Slot Usage of Storm Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the slot usage of Storm every 60 seconds and compares it with the threshold. This alarm is generated if the slot usage exceeds the threshold.

To modify the threshold, users can choose **System > Threshold Configuration** on MRS Manager.

This alarm is cleared if the slot usage is lower than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 26053 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

Users cannot run new Storm tasks.

Possible Causes

- Supervisors are abnormal in the cluster.
- Supervisors are normal but have poor processing capability.

Procedure

Step 1 Check the supervisor status.

1. Go to the cluster details page and click **Components**.
2. Choose **Storm > Supervisor**.
3. In **Role**, check whether the cluster has supervisor instances that are in the **Faulty** or **Recovering** state.
 - If yes, go to **Step 1.4**.
 - If no, go to **Step 2.1** or **Step 3.1**.
4. Select the supervisor instances that are in the **Faulty** or **Recovering** state and choose **More > Restart Instance**.
 - If yes, go to **Step 1.5**.
 - If the restart fails, go to **Step 4**.
5. Wait a moment and then check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 2.1** or **Step 3.1**.

Step 2 Increase the number of slots for the supervisors.

1. Go to the cluster details page and click **Components**.
2. Choose **Storm > Supervisor > Service Configuration**, and set **Type** to **All**.
3. Increase the value of **supervisor.slots.ports** to increase the number of slots for each supervisor. Then restart the instances.

4. Wait a moment and then check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 4](#).

Step 3 Expand the capacity of the supervisors.

1. Add nodes.
2. Wait a moment and then check whether the alarm is cleared.
 - If yes, no further action is required.
 - If the restart fails, go to [Step 4](#).

Step 4 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.89 ALM-26054 Heap Memory Usage of Storm Nimbus Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the heap memory usage of Storm Nimbus every 30 seconds and compares it with the threshold. This alarm is generated if the heap memory usage exceeds the threshold (80% by default).

To modify the threshold, users can choose **System** > **Threshold Configuration** > **Service** > **Storm** on MRS Manager.

This alarm is cleared if the heap memory usage is lower than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 26054 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |

| Parameter | Description |
|-------------------|---|
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

Frequent memory garbage collection or memory overflow may occur, affecting submission of Storm services.

Possible Causes

The heap memory usage is high or the heap memory is improperly allocated.

Procedure

Step 1 Check the heap memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Choose **ALM-26054 Heap Memory Usage of Storm Nimbus Exceeds the Threshold > Location**. Query the **HostName** of the alarmed instance.
3. Choose **Components > Storm > Instances > Nimbus (corresponding to the HostName of the alarmed instance) > Customize > Heap Memory Usage of Nimbus**.
4. Check whether the heap memory usage of Nimbus has reached the threshold (80%).
 - If yes, go to **Step 1.5**.
 - If no, go to **Step 2**.
5. Adjust the heap memory.

Choose **Components > Storm > Service Configuration**, and set **Type** to **All**. Choose **Nimbus > System**. Increase the value of **-Xmx** in **NIMBUS_GC_OPTS**. Click **Save Configuration**. Select **Restart the affected services or instances** and click **OK**.
6. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.90 ALM-27001 DBService Unavailable (For MRS 2.x or Earlier)

Description

The alarm module checks the DBService status every 30 seconds. This alarm is generated when the system detects that DBService is unavailable.

This alarm is cleared when DBService recovers.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 27001 | Critical | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The database service is unavailable and cannot provide data import and query functions for upper-layer services, which results in service exceptions.

Possible Causes

- The floating IP address does not exist.
- There is no active DBServer instance.
- The active and standby DBServer processes are abnormal.

Procedure

Step 1 Check whether the floating IP address exists in the cluster environment.

1. Go to the MRS cluster details page and click **Components**.

2. Choose **DBService > Instances**.
3. Check whether the active instance exists.
 - If yes, go to [Step 1.4](#).
 - If no, go to [Step 2.1](#).
4. Select the active DBServer instance and record the IP address.
5. Log in to the host with the preceding IP address and run the **ifconfig** command to check whether the DBService floating IP address exists on the node.
 - If yes, go to [Step 1.6](#).
 - If no, go to [Step 2.1](#).
6. Run the **ping floating IP address** command to check whether the DBService floating IP address can be pinged.
 - If yes, go to [Step 1.7](#).
 - If no, go to [Step 2.1](#).
7. Log in to the host where the DBService floating IP address is located and run the **ifconfig interface down** command to delete the floating IP address.
8. Choose **Components > DBService > More > Restart Service** to restart DBService and check whether DBService is started successfully.
 - If yes, go to [Step 1.9](#).
 - If no, go to [Step 2.1](#).
9. Wait about 2 minutes and check whether the alarm is cleared in the alarm list.
 - If yes, no further action is required.
 - If no, go to [Step 13](#).

Step 2 Check the status of the active DBServer instance.

1. Select the DBServer instance whose role status is abnormal and record the IP address.
2. On the **Alarms** page, check whether ALM-12007 Process Fault occurs in the DBServer instance on the host that corresponds to the IP address.
 - If yes, go to [Step 2.3](#).
 - If no, go to [Step 4](#).
3. Rectify the fault by following steps provided in ALM-12007 Process Fault.
4. Wait about 5 minutes and check whether the alarm is cleared in the alarm list.
 - If yes, no further action is required.
 - If no, go to [Step 4](#).

Step 3 Check the status of the active and standby DBServers.

1. Log in to the host where the DBService floating IP address is located, run the **sudo su - root** and **su - omm** commands to switch to user **omm**, and run the **cd \${BIGDATA_HOME}/FusionInsight/dbservice/** command to go to the DBService installation directory.
2. Run the **sh sbin/status-dbserver.sh** command to view the status of the active and standby HA processes of DBService. Determine whether the status can be viewed successfully.

- If yes, go to [Step 3.3](#).
 - If no, go to [Step 4](#).
3. Check whether the active and standby HA processes are abnormal.
 - If yes, go to [Step 3.4](#).
 - If no, go to [Step 4](#).
 4. Choose **Components** > **DBService** > **More** > **Restart Service** to restart DBService and check whether DBService is started successfully.
 - If yes, go to [Step 3.5](#).
 - If no, go to [Step 4](#).
 5. Wait about 2 minutes and check whether the alarm is cleared in the alarm list.
 - If yes, no further action is required.
 - If no, go to [Step 4](#).

Step 4 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.91 ALM-27003 DBService Heartbeat Interruption Between the Active and Standby Nodes (For MRS 2.x or Earlier)

Description

This alarm is generated when the active or standby DBService node does not receive heartbeat messages from the peer node.

This alarm is cleared when the heartbeat recovers.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 27003 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |

| Parameter | Description |
|-------------------------|--|
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Local DBService HA Name | Specifies a local DBService HA. |
| Peer DBService HA Name | Specifies a peer DBService HA. |

Impact on the System

During the DBService heartbeat interruption, only one node can provide the service. If this node is faulty, no standby node is available for failover and the service is unavailable.

Possible Causes

The link between the active and standby DBService nodes is abnormal.

Procedure

Step 1 Check whether the network between the active and standby DBService servers is in normal state.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, locate the row that contains the alarm and view the IP address of the standby DBService server in the alarm details.
3. Log in to the active DBService server.
4. Run the **ping heartbeat IP address of the standby DBService** command to check whether the standby DBService server is reachable.
 - If yes, go to **Step 2**.
 - If no, go to **Step 1.5**.
5. Contact the network administrator to check whether the network is faulty.
 - If yes, go to **Step 1.6**.
 - If no, go to **Step 2**.
6. Rectify the network fault and check whether the alarm is cleared from the alarm list.
 - If yes, no further action is required.
 - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

None

9.5.92 ALM-27004 Data Inconsistency Between Active and Standby DBServices (For MRS 2.x or Earlier)

Description

The system checks the data synchronization status between the active and standby DBServices every 10 seconds. This alarm is generated when the synchronization status cannot be queried for six consecutive times or when the synchronization status is abnormal.

This alarm is cleared when the synchronization is in normal state.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 27004 | Critical | Yes |

Parameters

| Parameter | Description |
|-------------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Local DBService HA Name | Specifies a local DBService HA. |
| Peer DBService HA Name | Specifies a peer DBService HA. |
| SYNC_PERSENT | Synchronization percentage. |

Impact on the System

When data is not synchronized between the active and standby DBServices, the data may be lost or abnormal if the active instance becomes abnormal.

Possible Causes

- The network between the active and standby nodes is unstable.
- The standby DBService is abnormal.

- The disk space of the standby node is full.

Procedure

Step 1 Check whether the network between the active and standby nodes is in normal state.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, locate the row that contains the alarm and view the IP address of the standby DBService node in the alarm details.
3. Log in to the active DBService node.
4. Run the **ping heartbeat IP address of the standby DBService** command to check whether the standby DBService node is reachable.
 - If yes, go to [Step 2.1](#).
 - If no, go to [Step 1.5](#).
5. Contact the O&M personnel to check whether the network is faulty.
 - If yes, go to [Step 1.6](#).
 - If no, go to [Step 2.1](#).
6. Rectify the network fault and check whether the alarm is cleared from the alarm list.
 - If yes, no further action is required.
 - If no, go to [Step 2.1](#).

Step 2 Check whether the standby DBService is in normal state.

1. Log in to the standby DBService node.
2. Run the following commands to switch the user:
sudo su - root
su - omm
3. Go to the **`\${DBSERVER_HOME}/sbin** directory and run the **./status-dbserver.sh** command to check whether the GaussDB resource status of the standby DBService is in normal state. In the command output, check whether the following information is displayed in the row where **ResName** is **gaussDB**:
Example:

```
10_10_10_231 gaussDB Standby_normal Normal Active_standby
```

 - If yes, go to [Step 3.1](#).
 - If no, go to [Step 4](#).

Step 3 Check whether the disk space of the standby node is insufficient.

1. Log in to the standby DBService node.
2. Run the following commands to switch the user:
sudo su - root
su - omm
3. Go to the **`\${DBSERVER_HOME}** directory, and run the following commands to obtain the DBService data directory:
cd `\${DBSERVER_HOME}
source .dbservice_profile

```
echo ${DBSERVICE_DATA_DIR}
```

4. Run the **df -h** command to check the system disk partition usage.
5. Check whether the DBService data directory space is full.
 - If yes, go to [Step 3.6](#).
 - If no, go to [Step 4](#).
6. Perform upgrade and expand capacity.
7. After capacity expansion, wait 2 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 4](#).

Step 4 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.93 ALM-28001 Spark Service Unavailable (For MRS 2.x or Earlier)

Description

The system checks the Spark service status every 30 seconds. This alarm is generated when the Spark service is unavailable.

This alarm is cleared when the Spark service recovers.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 28001 | Critical | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |

| Parameter | Description |
|-----------|--|
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The Spark tasks submitted by users fail to be executed.

Possible Causes

- The KrbServer service is abnormal.
- The LdapServer service is abnormal.
- The ZooKeeper service is abnormal.
- The HDFS service is abnormal.
- The Yarn service is abnormal.
- The corresponding Hive service is abnormal.

Procedure

Step 1 Check whether service unavailability alarms exist in services that Spark depends on.

1. Go to the MRS cluster details page and choose **Alarms**.
2. Check whether the following alarms exist in the alarm list:
 - a. ALM-25500 KrbServer Service Unavailable
 - b. ALM-25000 LdapServer Service Unavailable
 - c. ALM-13000 ZooKeeper Service Unavailable
 - d. ALM-14000 HDFS Service Unavailable
 - e. ALM-18000 Yarn Service Unavailable
 - f. ALM-16004 Hive Service Unavailable
 - If yes, go to **Step 1.3**.
 - If no, go to **Step 2**.

3. Handle the alarms based on the troubleshooting methods provided in the alarm help.

After the alarm is cleared, wait a few minutes and check whether the alarm HetuServer Service Unavailable is cleared.

- If yes, no further action is required.
- If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.94 ALM-38000 Kafka Service Unavailable (For MRS 2.x or Earlier)

Description

The system checks the Kafka service availability every 30 seconds. This alarm is generated if the Kafka service becomes unavailable.

This alarm is cleared after the Kafka service recovers.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 38000 | Critical | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The cluster cannot provide the Kafka service and users cannot run new Kafka tasks.

Possible Causes

- The KrbServer component is faulty.
- The ZooKeeper component is faulty or fails to respond.
- The Broker node in the Kafka cluster is abnormal.

Procedure

- Step 1** Check the KrbServer component status. For clusters without Kerberos authentication, skip this step and go to [Step 2](#).

1. Go to the MRS cluster details page and click **Components**.
2. Check whether the health status of the KrbServer service is **Good**.
 - If yes, go to [Step 2.1](#).
 - If no, go to [Step 1.3](#).
3. Rectify the fault by following instructions in ALM-25500 KrbServer Service Unavailable.
4. Perform [Step 1.2](#) again.

Step 2 Check the ZooKeeper component status.

1. Check whether the health status of the ZooKeeper service is **Good**.
 - If yes, go to [Step 3.1](#).
 - If no, go to [Step 2.2](#).
2. If the ZooKeeper service is stopped, start it. For other problems, follow the instructions in ALM-13000 ZooKeeper Service Unavailable.
3. Perform [Step 2.1](#) again.

Step 3 Check the Broker status.

1. Choose **Components > Kafka > Broker**.
2. In **Role**, check whether all instances are normal.
 - If yes, go to [Step 3.4](#).
 - If no, go to [Step 3.3](#).
3. Select all instances of Broker and choose **More > Restart Instance**.
 - If the restart is successful, go to [Step 3.4](#).
 - If the restart fails, go to [Step 4](#).
4. Choose **Components > Kafka**. Check whether the health status of Kafka is **Good**.
 - If yes, go to [Step 3.5](#).
 - If no, go to [Step 4](#).
5. Wait 30 seconds and check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 4](#).

Step 4 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.95 ALM-38001 Insufficient Kafka Disk Capacity (For MRS 2.x or Earlier)

Description

The system checks the Kafka disk usage every 60 seconds and compares it with the threshold. This alarm is generated if the disk usage exceeds the threshold.

To modify the threshold, users can choose **System > Threshold Configuration** on MRS Manager.

This alarm is cleared if the Kafka disk usage is lower than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 38001 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| PartitionName | Specifies the disk partition where the alarm is generated. |
| Trigger Condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

Kafka fails to write data to the disks.

Possible Causes

- The Kafka disk configurations (such as disk count and disk size) are insufficient for the data volume.
- The data retention period is long and historical data occupies large space.
- Services are improperly planned. As a result, data is unevenly distributed and some disks are full.

Procedure

- Step 1** Go to the MRS cluster details page and choose **Alarms**.
- Step 2** In the alarm list, click the alarm and view the **HostName** and **PartitionName** of the alarm in **Location of Alarm Details**.
- Step 3** On the **Hosts** page, click the host name obtained in [Step 2](#).
- Step 4** Check whether the **Disk** area contains the **PartitionName** of the alarm.
- If yes, go to [Step 5](#).
 - If no, manually clear the alarm and no further action is required.
- Step 5** In the **Disk** area, check whether the usage of the alarmed partition has reached 100%.
- If yes, go to [Step 6](#).
 - If no, go to [Step 8](#).
- Step 6** In **Instance**, choose **Broker > Instance Configuration**. On the **Instance Configuration** page that is displayed, set **Type** to **All** and query the data directory parameter **log.dirs**.
- Step 7** Choose **Components > Kafka > Instances**. On the **Kafka Instance** page that is displayed, stop the Broker instance corresponding to [Step 2](#). Then log in to the alarmed node and manually delete the data directory in [Step 6](#). After all subsequent operations are complete, start the Broker instance.
- Step 8** Choose **Components > Kafka > Service Configuration**. The **Kafka Configuration** page is displayed.
- Step 9** Check whether **disk.adapter.enable** is **true**.
- If yes, go to [Step 11](#).
 - If no, change the value to **true** and go to [Step 10](#).
- Step 10** Check whether the **adapter.topic.min.retention.hours** parameter, indicating the minimum data retention period, is properly configured.
- If yes, go to [Step 12](#).
 - If no, set it to a proper value and go to [Step 12](#).
-  **NOTE**
- If the retention period cannot be adjusted for certain topics, the topics can be added to **disk.adapter.topic.blacklist**.
- Step 11** Wait 10 minutes and check whether the disk usage is reduced.
- If yes, wait until the alarm is cleared.
 - If no, go to [Step 12](#).
- Step 12** Go to the **Kafka Topic Monitor** page and query the data retention period configured for Kafka. Determine whether the retention period needs to be shortened based on service requirements and data volume.
- If yes, go to [Step 13](#).
 - If no, go to [Step 14](#).

Step 13 Find the topics with great data volumes based on the disk partition obtained in [Step 2](#). Log in to the Kafka client and manually shorten the data retention period for these topics using the following command:

```
kafka-topics.sh --zookeeper ZooKeeper address:24002/kafka --alter --topic Topic name --config retention.ms=Retention period
```

Step 14 Check whether partitions are properly configured for topics. For example, if the number of partitions for a topic with a large data volume is smaller than the number of disks, data may be unevenly distributed to the disks and the usage of some disks will reach the upper limit.

 **NOTE**

To identify topics with great data volumes, log in to the relevant nodes that are obtained in [Step 2](#), go to the data directory (the directory before `log.dirs` in [Step 6](#) is modified), and check the disk space occupied by the partitions of the topics.

- If the partitions are improperly configured, go to [Step 15](#).
- If the partitions are properly configured, go to [Step 16](#).

Step 15 On the Kafka client, add partitions to the topics.

```
kafka-topics.sh --zookeeper ZooKeeper address:24002/kafka --alter --topic Topic name --partitions=Number of new partitions
```

 **NOTE**

It is advised to set the number of new partitions to a multiple of the number of Kafka disks. This operation may not quickly clear the alarm. Data will be gradually balanced among the disks.

Step 16 Check whether the cluster capacity needs to be expanded.

- If yes, add nodes to the cluster and go to [Step 17](#).
- If no, go to [Step 17](#).

Step 17 Wait a moment and then check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 18](#).

Step 18 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.96 ALM-38002 Heap Memory Usage of Kafka Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the heap memory usage of Kafka every 30 seconds. This alarm is generated if the heap memory usage of Kafka exceeds the threshold (80%).

This alarm is cleared if the heap memory usage is lower than the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 38002 | Major | Yes |

Parameters

| Parameter | Description |
|-------------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

Impact on the System

Memory overflow may occur, causing service crashes.

Possible Causes

The heap memory usage is high or the heap memory is improperly allocated.

Procedure

Step 1 Check the heap memory usage.

1. Go to the MRS cluster details page and choose **Alarms**.
2. Choose **ALM-38002 Kafka Heap Memory Usage Exceeds the Threshold > Location**. Query the IP address of the alarmed instance.

3. Choose **Components > Kafka > Instance > Broker (corresponding to the IP address of the alarmed instance) > Customize > Kafka Heap Memory Resource Percentage** to check the heap memory usage.
4. Check whether the heap memory usage of Kafka has reached the threshold (80%).
 - If yes, go to **Step 1.5**.
 - If no, go to **Step 2**.
5. Choose **Components > Kafka > Service Configuration > All > Broker > Environment Variables**. Increase the value of **KAFKA_HEAP_OPTS** as required.
6. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.5.97 ALM-43001 Spark Service Unavailable (For MRS 2.x or Earlier)

Description

The system checks the Spark service status every 60 seconds. This alarm is generated when the Spark service is unavailable.

This alarm is cleared when the Spark service recovers.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 43001 | Critical | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |

| Parameter | Description |
|-----------|--|
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The Spark tasks submitted by users fail to be executed.

Possible Causes

- The KrbServer service is abnormal.
- The LdapServer service is abnormal.
- ZooKeeper is abnormal.
- The HDFS service is abnormal.
- The Yarn service is abnormal.
- The corresponding Hive service is abnormal.

Procedure

Step 1 Check whether service unavailability alarms exist in services that Spark depends on.

1. Go to the cluster details page and choose **Alarms**.
2. Check whether the following alarms exist in the alarm list:
 - a. ALM-25500 KrbServer Service Unavailable
 - b. ALM-25000 LdapServer Service Unavailable
 - c. ALM-13000 ZooKeeper Service Unavailable
 - d. ALM-14000 HDFS Service Unavailable
 - e. ALM-18000 Yarn Service Unavailable
 - f. ALM-16004 Hive Service Unavailable
 - If yes, go to **Step 1.3**.
 - If no, go to **Step 2**.
3. Handle the alarm according to the alarm help.

After the alarm is cleared, wait a few minutes and check whether the alarm HetuServer Service Unavailable is cleared.

 - If yes, no further action is required.
 - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.

2. Contact the O&M engineers and send the collected logs.

9.5.98 ALM-43006 Heap Memory Usage of the JobHistory Process Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the JobHistory process status every 30 seconds. The alarm is generated when the heap memory usage of the JobHistory process exceeds the threshold (90% of the maximum memory).

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 43006 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

If the available JobHistory process heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The heap memory of the JobHistory process is overused or the heap memory is inappropriately allocated.

Procedure

- Step 1** Check the heap memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43006** and view the IP address and role name of the instance in **Location**.
3. Choose **Components > Spark > Instance > JobHistory** (IP address of the instance for which the alarm is generated) > **Customize > Heap Memory Statistics of the JobHistory Process**. Click **OK** to view the heap memory usage.
4. Check whether the used heap memory of JobHistory reaches 90% of the maximum heap memory specified for JobHistory.
 - If yes, go to **Step 1.5**.
 - If no, go to **Step 2**.
5. Choose **Components > Spark > Service Configuration**. Set **Type** to **All** and choose **JobHistory > Default**. Increase the value of **SPARK_DAEMON_MEMORY** as required.
6. Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK**.
7. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.99 ALM-43007 Non-Heap Memory Usage of the JobHistory Process Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the JobHistory process status every 30 seconds. The alarm is generated when the non-heap memory usage of the JobHistory process exceeds the threshold (90% of the maximum memory).

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 43007 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

If the available JobHistory process non-heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The non-heap memory of the JobHistory process is overused or the non-heap memory is inappropriately allocated.

Procedure

Step 1 Check non-heap memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43007** and view the IP address and role name of the instance in **Location**.
3. Choose **Components > Spark > Instance > JobHistory** (IP address of the instance for which the alarm is generated) **> Customize > Non-Heap Memory Statistics of the JobHistory Process**. Click **OK** to view the non-heap memory usage.
4. Check whether the non-heap memory usage of JobHistory has reached the threshold (90% of the maximum memory).
 - If yes, go to **Step 1.5**.
 - If no, go to **Step 2**.
5. Choose **Components > Spark > Service Configuration**. Set **Type** to **All** and choose **JobHistory > Default**. Increase the value of **-XX:MaxMetaspaceSize** in **SPARK_DAEMON_JAVA_OPTS** as required.
6. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.100 ALM-43008 Direct Memory Usage of the JobHistory Process Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the JobHistory process status every 30 seconds. The alarm is generated when the direct memory usage of the JobHistory process exceeds the threshold (90% of the maximum memory).

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 43008 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

If the available JobHistory process direct memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the JobHistory process is overused or the direct memory is inappropriately allocated.

Procedure

Step 1 Check the direct memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43008** and view the IP address and role name of the instance in **Location**.

3. Choose **Components > Spark > Instance > JobHistory** (IP address of the instance for which the alarm is generated) > **Customize > Direct Memory Statistics of the JobHistory Process**. Click **OK** to view the direct memory usage.
4. Check whether the direct memory usage of the JobHistory process has reached the threshold (90% of the maximum direct memory).
 - If yes, go to **Step 1.5**.
 - If no, go to **Step 2**.
5. Choose **Components > Spark > Service Configuration**. Set **Type** to **All** and choose **JobHistory > Default**. Increase the value of - **XX:MaxDirectMemorySize** in **SPARK_DAEMON_JAVA_OPTS** as required.
6. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.101 ALM-43009 JobHistory GC Time Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the GC time of the JobHistory process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (12 seconds) for three consecutive times. You can change the threshold by choosing **System > Threshold Configuration > Service > Spark > JobHistory GC Time > Total JobHistory GC Time**. This alarm is cleared when the JobHistory GC time is shorter than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 43009 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

If the GC time exceeds the threshold, JobHistory may run in low performance.

Possible Causes

The heap memory of the JobHistory process is overused or inappropriately allocated, causing frequent GC.

Procedure

Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43009** and view the IP address and role name of the instance in **Location**.
3. Choose **Components > Spark > Instance > JobHistory** (IP address of the instance for which the alarm is generated) **> Customize > GC Time of the JobHistory Process**. Click **OK** to view the GC time.
4. Check whether the GC time of the JobHistory process is longer than 12 seconds.
 - If yes, go to **Step 1.5**.
 - If no, go to **Step 2**.
5. Choose **Components > Spark > Service Configuration**. Set **Type** to **All** and choose **JobHistory > Default**. Increase the value of the **SPARK_DAEMON_MEMORY** parameter as required.
6. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.102 ALM-43010 Heap Memory Usage of the JDBCServer Process Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the JDBCServer process status every 30 seconds. The alarm is generated when the heap memory usage of the JDBCServer process exceeds the threshold (90% of the maximum memory).

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 43010 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

If the available JDBCServer process heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The heap memory of the JDBCServer process is overused or the heap memory is inappropriately allocated.

Procedure

Step 1 Check the heap memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43010** and view the IP address and role name of the instance in **Location**.

3. Choose **Components > Spark > Instance > JDBCServer** (IP address of the instance for which the alarm is generated) > **Customize > Heap Memory Statistics of the JDBCServer Process**. Click **OK** to view the heap memory usage.
4. Check whether the heap memory usage of JDBCServer has reached the threshold (90% of the maximum heap memory).
 - If yes, go to **Step 1.5**.
 - If no, go to **Step 2**.
5. Choose **Components > Spark > Service Configuration**. Set **Type** to **All** and choose **JDBCServer > Tuning**. Increase the value of the **SPARK_DRIVER_MEMORY** parameter as required.
6. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 2**.

Step 2 Collect fault information.

9.5.103 ALM-43011 Non-Heap Memory Usage of the JDBCServer Process Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the JDBCServer process status every 30 seconds. The alarm is generated when the non-heap memory usage of the JDBCServer process exceeds the threshold (90% of the maximum memory).

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 43011 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |

| Parameter | Description |
|-----------|--|
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

If the available JDBCServer process non-heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The non-heap memory of the JDBCServer process is overused or the non-heap memory is inappropriately allocated.

Procedure

Step 1 Check non-heap memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43011** and view the IP address and role name of the instance in **Location**.
3. Choose **Components > Spark > Instance > JDBCServer** (IP address of the instance for which the alarm is generated) **> Customize > Non-heap Memory Statistics of the JDBCServer Process**. Click **OK** to view the non-heap memory usage.
4. Check whether the non-heap memory usage of JDBCServer has reached the threshold (90% of the maximum non-heap memory).
 - If yes, go to **Step 1.5**.
 - If no, go to **Step 2**.
5. Choose **Components > Spark > Service Configuration**. Set **Type** to **All** and choose **JDBCServer > Tuning**. Increase the value of **-XX:MaxMetaspaceSize** in **spark.driver.extraJavaOptions** as required.
6. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.104 ALM-43012 Direct Memory Usage of the JDBCServer Process Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the JDBCServer process status every 30 seconds. The alarm is generated when the direct memory usage of the JDBCServer process exceeds the threshold (90% of the maximum memory).

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 43012 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

If the available JDBCServer process direct memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the JDBCServer process is overused or the direct memory is inappropriately allocated.

Procedure

Step 1 Check the direct memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43012** and view the IP address and role name of the instance in **Location**.
3. Choose **Components** > **Spark** > **Instance** > **JDBCServer** (IP address of the instance for which the alarm is generated) > **Customize** > **Direct Memory Statistics of the JDBCServer Process**. Click **OK** to view the direct memory usage.

4. Check whether the direct memory usage of the JDBCServer process has reached the threshold (90% of the maximum direct memory).
 - If yes, go to [Step 1.5](#).
 - If no, go to [Step 2](#).
5. Choose **Components > Spark > Service Configuration**. Set **Type** to **All** and choose **JDBCServer > Tuning**. Increase the value of - **XX:MaxDirectMemorySize** in **spark.driver.extraJavaOptions** as required.

9.5.105 ALM-43013 JDBCServer GC Time Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system checks the GC time of the JDBCServer process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (12 seconds) for three consecutive times. You can change the threshold by choosing **System > Threshold Configuration > Service > Spark > JDBCServer GC Time > Total JDBCServer GC Time**. This alarm is cleared when the JDBCServer GC time is shorter than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 43013 | Major | Yes |

Parameters

| Parameter | Description |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |

| Parameter | Description |
|-----------|--|
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

If the GC time exceeds the threshold, JDBCServer may run in low performance.

Possible Causes

The heap memory of the JDBCServer process is overused or inappropriately allocated, causing frequent GC.

Procedure

Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43013** and view the IP address and role name of the instance in **Location**.
3. Choose **Components > Spark > Instance > JDBCServer** (IP address of the instance for which the alarm is generated) **> Customize > GC Time of the JDBCServer Process**. Click **OK** to view the GC time.
4. Check whether the GC time of the JDBCServer process is longer than 12 seconds.
 - If yes, go to **Step 1.5**.
 - If no, go to **Step 2**.
5. Choose **Components > Spark > Service Configuration**. Set **Type** to **All** and choose **JDBCServer > Tuning**. Increase the value of the **SPARK_DRIVER_MEMORY** parameter as required.
6. Check whether the alarm is cleared.
 - If yes, no further action is required.

9.5.106 ALM-44004 Presto Coordinator Resource Group Queuing Tasks Exceed the Threshold (For MRS 2.x or Earlier)

Description

This alarm is generated when the system detects that the number of queuing tasks in a resource group exceeds the threshold. The system queries the number of queuing tasks in a resource group through the JMX interface. You can choose **Components > Presto > Service Configuration** (switch **Basic** to **All**) > **Presto > resource-groups** to configure a resource group. You can choose **Components > Presto > Service Configuration** (switch **Basic** to **All**) > **Coordinator > Customize > resourceGroupAlarm** to configure the threshold of each resource group.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 44004 | Major | Yes |

Parameter

| Parameter | Description |
|-------------|---|
| ServiceName | Service for which the alarm is generated. |
| RoleName | Role for which the alarm is generated. |
| HostName | Host for which the alarm is generated. |

Impact on the System

If the number of queuing tasks in a resource group exceeds the threshold, a large number of tasks may be in the queuing state. The Presto task time exceeds the expected value. When the number of queuing tasks in a resource group exceeds the maximum number (**maxQueued**) of queuing tasks in the resource group, new tasks cannot be executed.

Possible Causes

The resource group configuration is improper or too many tasks in the resource group are submitted.

Procedure

- Step 1** Choose **Components > Presto > Service Configuration** (switch **Basic** to **All**) > **Presto > resource-groups** to adjust the resource group configuration.

Step 2 You can choose **Components > Presto > Service Configuration** (switch **Basic** to **All**) **> Coordinator > Customize > resourceGroupAlarm** to modify the threshold of each resource group.

Step 3 Collect fault information.

1. Log in to the cluster node based on the host name in the fault information and query the number of queuing tasks based on **Resource Group** in the additional information on the Presto client.
2. Log in to the cluster node based on the host name in the fault information, view the **/var/log/Bigdata/nodeagent/monitorlog/monitor.log** file, and search for resource group information to view the monitoring collection information of the resource group.
3. Contact the O&M engineers and send the collected logs.

----End

9.5.107 ALM-44005 Presto Coordinator Process GC Time Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system collects GC time of the Presto Coordinator process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). You can change the threshold by choosing **System > Configure Alarm Threshold > Service > Presto > Coordinator > Presto Process Garbage Collection Time > Garbage Collection Time of the Coordinator Process** on MRS Manager. This alarm is cleared when the Coordinator process GC time is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 44005 | Major | Yes |

Parameter

| Parameter | Description |
|-------------|---|
| ServiceName | Service for which the alarm is generated. |
| RoleName | Role for which the alarm is generated. |
| HostName | Host for which the alarm is generated. |

Impact on the System

If the GC time of the Coordinator process is too long, the Coordinator process running performance will be affected and the Coordinator process will even be unavailable.

Possible Causes

The heap memory of the Coordinator process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Procedure

Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **44005** and view the IP address and role name of the instance in **Location**.
3. Choose **Components > Presto > Instances > Coordinator** (business IP address of the instance for which the alarm is generated) **> Customize > Presto Garbage Collection Time**. Click **OK** to view the GC time.
4. Check whether the GC time of the Coordinator process is longer than 5 seconds.
 - If yes, go to **Step 1.5**.
 - If no, go to **Step 2**.
5. Choose **Components > Presto > Service Configuration**, and switch **Basic** to **All**. Choose **Presto > Coordinator**. Increase the value of **-Xmx** (maximum heap memory) in the **JAVA_OPTS** parameter based on the site requirements.
6. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.5.108 ALM-44006 Presto Worker Process GC Time Exceeds the Threshold (For MRS 2.x or Earlier)

Description

The system collects GC time of the Presto Worker process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). You can change the threshold by choosing **System >**

Configure Alarm Threshold > Service > Presto > Worker > Presto Garbage Collection Time > Garbage Collection Time of the Worker Process on MRS Manager. This alarm is cleared when the Worker process GC time is shorter than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 44006 | Major | Yes |

Parameter

| Parameter | Description |
|-------------|---|
| ServiceName | Service for which the alarm is generated. |
| RoleName | Role for which the alarm is generated. |
| HostName | Host for which the alarm is generated. |

Impact on the System

If the GC time of the Worker process is too long, the Worker process running performance will be affected and the Worker process will even be unavailable.

Possible Causes

The heap memory of the Worker process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Procedure

Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **44006**. Then check the IP address and role name of the instance in **Location**.
3. Choose **Components > Presto > Instances > Worker** (business IP address of the instance for which the alarm is generated) > **Customize > Presto Garbage Collection Time**. Click **OK** to view the GC time.
4. Check whether the GC time of the Worker process is longer than 5 seconds.
 - If yes, go to **Step 1.5**.
 - If no, go to **Step 2**.
5. Choose **Components > Presto > Service Configuration**, and switch **Basic** to **All**, and choose **Presto > Worker** Increase the value of **-Xmx** (maximum heap memory) in the **JAVA_OPTS** parameter based on the site requirements.

6. Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 2](#).

Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

None

9.5.109 ALM-45325 Presto Service Unavailable (For MRS 2.x or Earlier)

Description

The system checks the Presto service status every 60 seconds. This alarm is generated when the system detects that Presto is unavailable.

This alarm is cleared when the Presto service recovers.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 45325 | Critical | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

Presto cannot run SQL queries.

Possible Causes

- The Presto coordinator or worker process is faulty.
- The network communication between Presto coordinator and worker instances is interrupted.

Procedure

Step 1 Check the status of the coordinator and worker processes.

1. Log in to FusionInsight Manager and choose **Cluster > Services > Presto**. On the page that is displayed, click the **Instance** tab. In the Presto instance list, check whether the status of all coordinator or worker instances is **Unknown**.
 - If yes, go to **2**.
 - If no, go to **1**.
2. In the upper part of the Presto instance list, choose **More > Restart Service** to restart the coordinator and worker processes.
3. In the alarm list, check whether ALM-45325 Presto Service Unavailable is cleared.
 - If yes, no further action is required.
 - If no, go to **1** in **Step 2**.

Step 2 Collect fault information.

1. On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
2. Select **Presto** for **Service**.
3. Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
4. Contact the O&M engineers and send the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.6 Object Management

9.6.1 Managing Objects

MRS contains different types of basic objects as described in [Table 9-16](#).

Table 9-16 MRS basic object overview

| Object | Description | Example |
|------------------|---|---|
| Service | Function set that can complete specific business. | KrbServer service and LdapServer service |
| Service instance | Specific instance of a service, usually called service. | KrbServer service |
| Service role | Function entity that forms a complete service, usually called role. | KrbServer is composed of the KerberosAdmin role and KerberosServer role. |
| Role instance | Specific instance of a service role running on a host. | KerberosAdmin that is running on Host2 and KerberosServer that is running on Host3 |
| Host | An ECS running Linux OS. | Host1 to Host5 |
| Rack | Physical entity that contains multiple hosts connecting to the same switch. | Rack1 contains Host1 to Host5. |
| Cluster | Logical entity that consists of multiple hosts and provides various services. | Cluster names Cluster1 consists of five hosts (Host1 to Host5) and provides services such as KrbServer and LdapServer. |

9.6.2 Viewing Configurations

On MRS Manager, users can view the configurations of services (including roles) and role instances.

Procedure

- Query service configurations.
 - a. On MRS Manager page, click **Services**.
 - b. Select the target service from the service list.
 - c. Click **Service Configuration**.
 - d. Set **Type** to **All**. All configuration parameters of the service are displayed in the navigation tree. The root nodes from top down in the navigation tree represent the service names and role names.
 - e. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

The parameters under the service nodes and role nodes are service configuration parameters and role configuration parameters respectively.
 - f. In the **Non-default** parameter, select **Non-default**. The parameters whose values are not default values will be displayed.

- Query role instance configurations.
 - a. On MRS Manager page, click **Services**.
 - b. Select the target service from the service list.
 - c. Click the **Instances** tab.
 - d. Click the target role instance from the role instance list.
 - e. Click **Instance Configuration**.
 - f. Set **Type** to **All**. The navigation tree of all configuration parameters of the role instance is displayed.
 - g. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.
 - h. In the **Non-default** parameter, select **Non-default**. The parameters whose values are not default values will be displayed.

9.6.3 Managing Services

You can perform the following operations on MRS Manager:

- Start the service in the **Stopped**, **Stop Failed**, or **Start Failed** state to use the service.
- Stop the services or stop abnormal services.
- Restart abnormal services or configure expired services to restore or enable the services.

Procedure

Step 1 On MRS Manager page, click **Services**.

Step 2 Locate the row that contains the target service, **Start**, **Stop**, or **Restart** to start, stop, or restart the service.

Services are interrelated. If a service is started, stopped, and restarted, services dependent on it will be affected.

The services will be affected in the following ways:

- If a service is to be started, the lower-layer services dependent on it must be started first.
- If a service is stopped, the upper-layer services dependent on it are unavailable.
- If a service is restarted, the running upper-layer services dependent on it must be restarted.

----End

9.6.4 Configuring Service Parameters

On MRS Manager, you can view and modify the default service configurations based on site requirements and export or import the configurations.

Impact on the System

- You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.
- The parameters of DBService cannot be modified when only one DBService role instance exists in the cluster.

Procedure

- Modify a service.
 - a. Click **Services**.
 - b. Select the target service from the service list.
 - c. Click **Service Configuration**.
 - d. Set **Type** to **All**. All configuration parameters of the service are displayed in the navigation tree. The root nodes from top down in the navigation tree represent the service names and role names.
 - e. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

To cancel the change to a parameter value, click .

NOTE

You can also use host groups to change role instance configurations in batches. Select a role name from the **Role** drop-down list and choose < **Select Host** > in the **Host** drop-down list. Enter a name in the **Host Group Name** text box, select the hosts to be modified from the **Host** list, add them to the **Selected hosts** area, and click **OK**. The added host group can be selected from **Host** and is only valid on the current page. The page cannot be saved after being refreshed.

- f. Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the services.

After **Operation successful.** is displayed, click **Finish**. The service is started successfully.

NOTE

To update the queue configuration of the Yarn service without restarting service, choose **More** > **Refresh Queue** to update the queue for the configuration to take effect.

- Export service configuration parameters.
 - a. Click **Services**.
 - b. Select a service.
 - c. Click **Service Configuration**.
 - d. Click **Export Service Configuration**. Select a path for saving the configuration files.
- Import service configuration parameters.
 - a. Click **Services**.
 - b. Select a service.

- c. Click **Service Configuration**.
- d. Click **Import Service Configuration**.
- e. Select the target configuration file.
- f. Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK**.

After **Operation successful.** is displayed, click **Finish**. The service is started successfully.

9.6.5 Configuring Customized Service Parameters

Each component of MRS supports all open-source parameters. You can modify some parameters for key application scenarios on MRS Manager. Some component clients may not include all parameters with open-source features. For component parameters that cannot be directly modified on Manager, users can add new parameters for components by using the configuration customization function on Manager. Newly added parameters are saved in component configuration files and take effect after restart.

Impact on the System

- After the service attributes are configured, the service needs to be restarted and cannot be accessed.
- You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.

Prerequisites

You have understood the meanings of parameters to be added, configuration files that have taken effect, and the impact on components.

Procedure

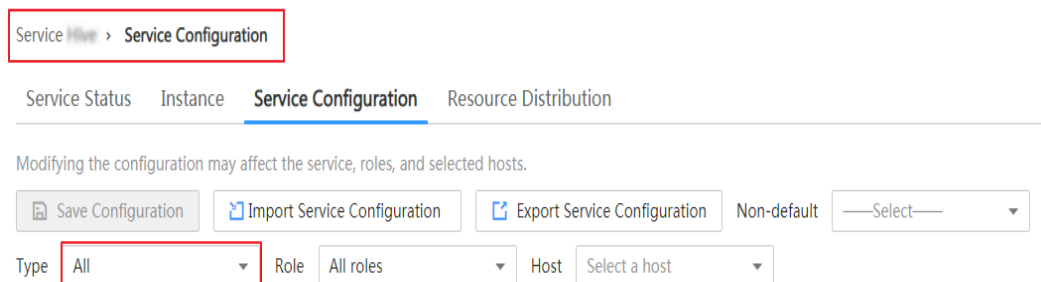

Step 1 On MRS Manager, click **Services**.

Step 2 Select the target service from the service list.

Step 3 Click **Service Configuration**.

Step 4 Set **Type** to **All**.

Figure 9-3 Service Configuration

Step 5 In the navigation tree, select **Customization**. The customized parameters of the current component are displayed on Manager.

The configuration files that save the newly added customized parameters are displayed in the **Parameter File** column. Different configuration files may have same open source parameters. After the parameters in different files are set to different values, whether the configuration takes effect depends on the loading sequence of the configuration files by components. You can customize parameters for services and roles as required. Adding customized parameters for a single role instance is not supported.

Figure 9-4 Customization configurations

Step 6 Based on the configuration files and parameter functions, locate the row where a specified parameter resides, enter the parameter name supported by the component in the **Name** column and enter the parameter value in the **Value** column.

- You can click  or  to add or delete a user-defined parameter. You can delete a customized parameter only after you click  for the first time.
- If you want to cancel the modification of a parameter value, click  to restore it.

Step 7 Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the services.

After **Operation successful.** is displayed, click **Finish**. The service is started successfully.

----End

Task Example

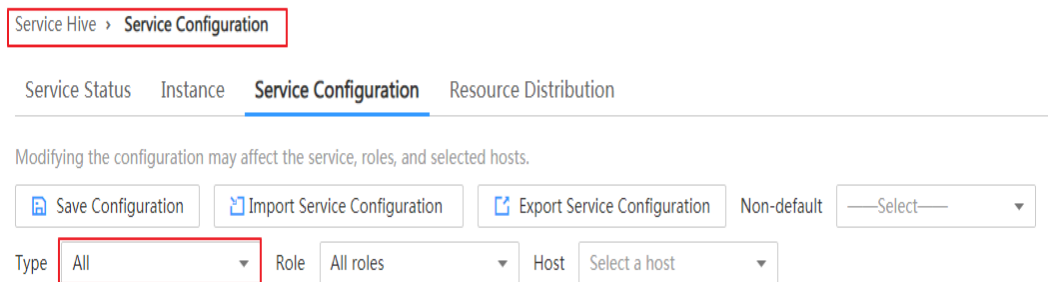

Configuring Customized Hive Parameters

Hive depends on HDFS. By default, Hive accesses the HDFS client. The configuration parameters to take effect are controlled by HDFS in a unified manner. For example, the HDFS parameter **ipc.client.rpc.timeout** affects the RPC timeout period for all clients to connect to the HDFS server. If you need to modify the timeout period for Hive to connect to HDFS, you can use the configuration customization function. After this parameter is added to the **core-site.xml** file of Hive, this parameter can be identified by the Hive service and its configuration overwrites the parameter configuration in HDFS.

Step 1 On MRS Manager, choose **Services > Hive > Service Configuration**.

Step 2 Set Type to All.

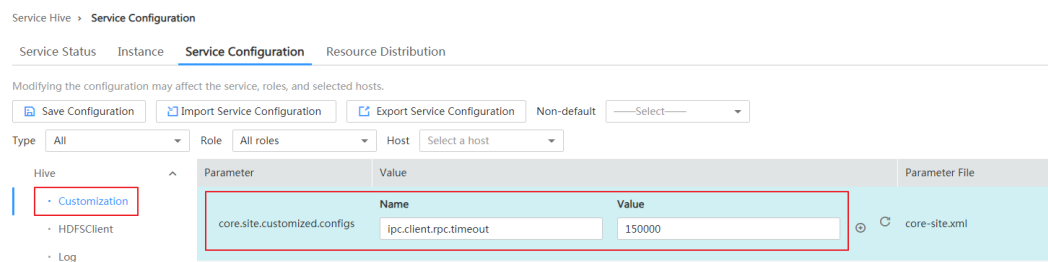

Figure 9-5 Hive Service Configuration

Step 3 In the navigation tree on the left, select **Customization** for the Hive service. The system displays the customized service parameters supported by Hive.

Step 4 In **core-site.xml**, locate the row that contains the **core.site.customized.configs** parameter, enter **ipc.client.rpc.timeout** in the **Name** column, and enter a new value in the **Value** column, for example, **150000**. The unit is millisecond.

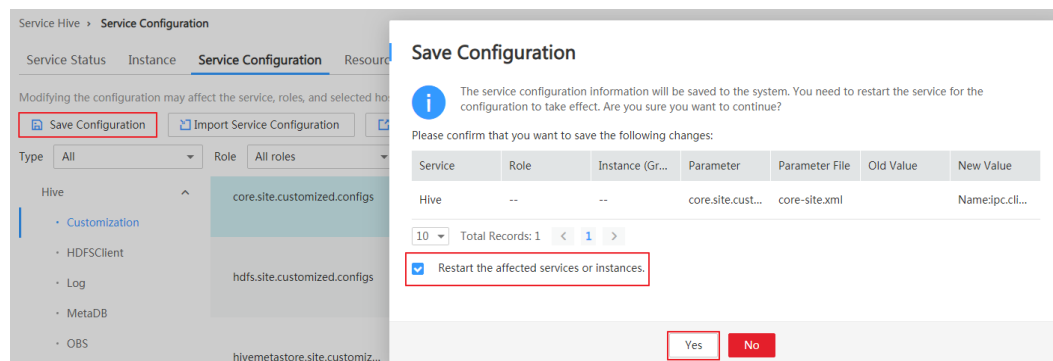

Figure 9-6 Hive customization configurations

Step 5 Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the service.

After **Operation successful.** is displayed, click **Finish**. The service is started successfully.

Figure 9-7 Saving Hive configurations

----End

9.6.6 Synchronizing Service Configurations

Scenario

If **Configuration Status** of a service is **Expired** or **Failed**, synchronize configurations for the cluster or service to restore its configuration status. If all services in the cluster are in the **Failed** state, synchronize the cluster configuration with the background configuration.

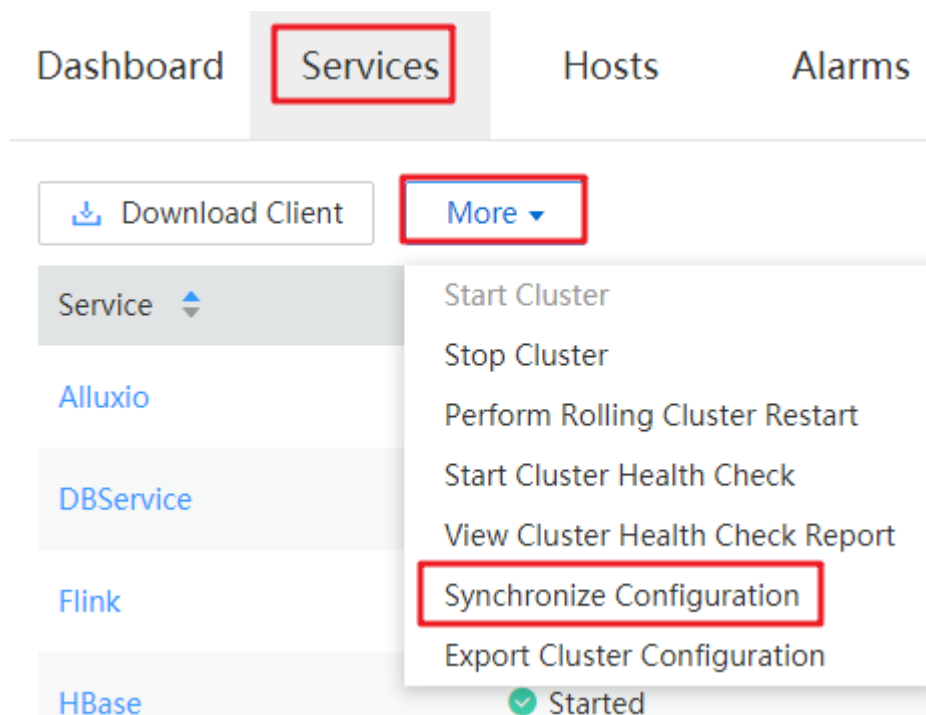

Impact on the System

After synchronizing service configurations, you need to restart the services whose configurations have expired. These services are unavailable during restart.

Procedure

- Step 1** On MRS Manager page, click **Services**.
- Step 2** Select the target service from the service list.
- Step 3** In the upper part of the service status and metric information, choose **More > Synchronize Configuration**.

Figure 9-8 Synchronization configurations

- Step 4** In the dialog box that is displayed, enter the password as prompted and click **OK**. After your identity is verified, select **Restart the service or instance whose configuration has expired**, and click **OK** to restart the service whose configuration has expired.

When **Operation successful** is displayed, click **Finish**. The service is started successfully.

----End

9.6.7 Managing Role Instances

Scenario

You can start a role instance that is in the **Stopped**, **Failed to stop** or **Failed to start** status, stop an unused or abnormal role instance or restart an abnormal role instance to recover its functions.

Procedure

- Step 1** On MRS Manager page, click **Services**.
- Step 2** Select the target service from the service list.
- Step 3** Click the **Instances** tab.
- Step 4** Select the check box on the left of the target role instance.
- Step 5** Choose **More > Start Instance**, **Stop Instance**, or **Restart Instance** accordingly.

Figure 9-9 Instance operations

----End

9.6.8 Configuring Role Instance Parameters

Scenario

You can view and modify default role instance configurations on MRS Manager based on site requirements. The configurations can be imported and exported.

Impact on the System

You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.

Procedure

- Modifying role instance configurations
 - a. Click **Services**.
 - b. Select the target service from the service list.
 - c. Click the **Instances** tab.
 - d. Click the target role instance from the role instance list.
 - e. Click **Instance Configuration**.
 - f. Set **Type** to **All**. The navigation tree of all configuration parameters of the role instance is displayed.
 - g. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

If you want to cancel the modification of a parameter value, click  to restore it.
 - h. Click **Save Configuration**, select **Restart the role instance**, and click **OK** to restart the role instance.

After **Operation successful.** is displayed, click **Finish**. The role instance is started successfully.
- Exporting Configuration Parameters of a Role Instance
 - a. Click **Services**.
 - b. Select a service.
 - c. Select a role instance or click the **Instances** tab.
 - d. Select a role instance on a specified host.
 - e. Click **Instance Configuration**.
 - f. Click **Export Instance Configuration** to export the configuration data of a specified role instance, and choose a path for saving the configuration file.
- Import configuration data of a role instance.
 - a. Click **Services**.
 - b. Select a service.
 - c. Select a role instance or click the **Instances** tab.
 - d. Select a role instance on a specified host.
 - e. Click **Instance Configuration**.
 - f. Click **Import Instance Configuration** to import the configuration data of the specified role instance.
 - g. Click **Save Configuration** and select **Restart the role instance**. Click **OK**.

After **Operation successful.** is displayed, click **Finish**. The role instance is started successfully.

9.6.9 Synchronizing Role Instance Configuration

Scenario

When **Configuration Status** of a role instance is **Expired** or **Failed**, you can synchronize the configuration data of the role instance with the background configuration.

Impact on the System

After synchronizing a role instance configuration, you need to restart the role instance whose configuration has expired. The role instance is unavailable during restart.

Procedure

- Step 1** On MRS Manager, click **Services** and select a service name.
- Step 2** Click the **Instances** tab.
- Step 3** Click the target role instance from the role instance list.
- Step 4** Choose **More > Synchronize Configuration** above the role instance status and indicator information.
- Step 5** In the displayed dialog box, select **Restart services and instances whose configuration have expired**, and click **OK** to restart the role instance.

After **Operation successful** is displayed, click **Finish**. The role instance is started successfully.

Figure 9-10 Synchronizing role instance configurations

----End

9.6.10 Decommissioning and Recommissioning a Role Instance

Scenario

If a Core or Task node is faulty, the cluster status may be displayed as **Abnormal**. In an MRS cluster, data can be stored on different Core nodes. Users can decommission the specified role instance on MRS Manager to stop the role instance from providing services. After fault rectification, you can recommission the role instance.

The following role instances can be decommissioned and recommissioned.

- DataNode role instance on HDFS
- NodeManager role instance on Yarn
- RegionServer role instance on HBase
- Broker role instance on Kafka

Restrictions:

- If the number of the DataNodes is less than or equal to that of HDFS copies, decommissioning cannot be performed. If the number of HDFS copies is three and the number of DataNodes is less than four in the system, decommissioning cannot be performed. In this case, an error will be reported and the decommissioning will be stopped 30 minutes after the decommissioning attempt is performed on Manager.
- If the number of Kafka Broker instances is less than or equal to that of copies, decommissioning cannot be performed. For example, if the number of Kafka copies is two and the number of nodes is less than three in the system, decommissioning cannot be performed. Instance decommissioning will fail on Manager and exit.
- If a role instance is out of service, you must recommission the instance to start it before using it again.

Procedure

- Step 1** On MRS Manager page, click **Services**.
- Step 2** Click a service in the service list.
- Step 3** Click the **Instances** tab.
- Step 4** Select an instance.
- Step 5** Choose **More > Decommission** or **Recommission** to perform the corresponding operation.

NOTE

During the instance decommissioning, if the service corresponding to the instance is restarted in the cluster using another browser, MRS Manager displays a message indicating that the instance decommissioning is stopped, but the **Operating Status** of the instance is displayed as **Started**. In this case, the instance has been decommissioned on the background. You need to decommission the instance again to synchronize the operating status.

----End

9.6.11 Managing a Host

Scenario

When a host is abnormal or faulty, you need to stop all roles of the host on MRS Manager to check the host. After the host fault is rectified, start all roles running on the host to recover host services.

Procedure

Step 1 Click **Hosts**.

Step 2 Select the check box of the target host.

Step 3 Choose **More > Start All Roles** or **Stop All Roles** accordingly.

----End

9.6.12 Isolating a Host

Scenario

If a host is found to be abnormal or faulty, affecting cluster performance or preventing services from being provided, you can temporarily exclude that host from the available nodes in the cluster. In this way, the client can access other available nodes. In scenarios where patches are to be installed in a cluster, you can also exclude a specified node from patch installation.

Users can isolate a host manually on MRS Manager based on the actual service requirements or O&M plan. Only non-management nodes can be isolated.

Impact on the System

- After a host is isolated, all role instances on the host will be stopped. You cannot start, stop, or configure the host and any instances on the host.
- After a host is isolated, statistics about the monitoring status and indicator data of the host hardware and instances on the host cannot be collected or displayed.

Procedure

Step 1 On MRS Manager, click **Hosts**.

Step 2 Select the check box of the host to be isolated.

Step 3 Choose **More > Isolate Host**,

Step 4 and click **OK** in the displayed dialog box.

After **Operation successful.** is displayed, click **Finish**. The host is isolated successfully, and the value of **Operating Status** becomes **Isolated**.

 NOTE

For isolated hosts, you can cancel the isolation and add them to the cluster again. For details, see [Canceling Host Isolation](#).

----End

9.6.13 Canceling Host Isolation

Scenario

After the exception or fault of a host is handled, you must cancel the isolation of the host for proper usage.

Users can cancel the isolation of a host on MRS Manager.

Prerequisites

- The host is in the **Isolated** state.
- The exception or fault of the host has been rectified.

Procedure

Step 1 On MRS Manager, click **Hosts**.

Step 2 Select the check box of the host to be de-isolated.

Step 3 Choose **More > Cancel Host Isolation**,

Step 4 and click **OK** in the displayed dialog box.

After **Operation successful.** is displayed, click **Finish**. The host is de-isolated successfully, and the value of **Operating Status** becomes **Normal**.

Step 5 Click the name of the de-isolated host to show its status, and click **Start All Roles**.

----End

9.6.14 Starting or Stopping a Cluster

Scenario

A cluster is a collection of service components. You can start or stop all services in a cluster.

Procedure

Step 1 On MRS Manager page, click **Services**.

Step 2 In the upper part of the service list, choose **More > Start Cluster** or **Stop Cluster** accordingly.

----End

9.6.15 Synchronizing Cluster Configurations

Scenario

If **Configuration Status** of all services or some services is **Expired** or **Failed**, synchronize configuration for the cluster or service to restore its configuration status.

- If all services in the cluster are in the **Failed** state, synchronize the cluster configuration with the background configuration.
- If all services in the cluster are in the **Failed** state, synchronize the service configuration with the background configuration.

Impact on the System

After synchronizing cluster configurations, you need to restart the services whose configurations have expired. These services are unavailable during restart.

Procedure

Step 1 On MRS Manager page, click **Services**.

Step 2 In the upper part of the service list, choose **More > Synchronize Configuration**.

Step 3 In the dialog box that is displayed, enter the password of the current login user for identity verification. After the verification is complete, select **Restart the service or instance whose configuration has expired**, and click **OK** to restart the service whose configuration has expired.

When **Operation successful** is displayed, click **Finish**. The service is started successfully.

----End

9.6.16 Exporting Configuration Data of a Cluster

Scenario

You can export all configuration data of a cluster on MRS Manager to meet site requirements. The exported configuration data is used to rapidly update service configuration.

Procedure

Step 1 On MRS Manager page, click **Services**.

Step 2 Choose **More > Export Cluster Configuration**.

The exported file is used to update service configurations. For details, see **Import service configuration parameters** in [Configuring Service Parameters](#).

----End

9.7 Log Management

9.7.1 About Logs

Log Description

MRS cluster logs are stored in the `/var/log/Bigdata` directory. The following table lists the log types.

Table 9-17 Log types

| Type | Description |
|------------------|---|
| Installation log | Installation logs record information about FusionInsight Manager, cluster, and service installation to help users locate installation errors. |
| Run logs | Run logs record the running track information, debugging information, status changes, potential problems, and error information generated during the running of services. |
| Audit logs | Audit logs record information about users' activities and operation instructions, which can be used to locate fault causes in security events and determine who are responsible for these faults. |

The following table lists the MRS log directories.

Table 9-18 Log directories

| File Directory | Log Content |
|--|---|
| <code>/var/log/Bigdata/audit</code> | Component audit log. |
| <code>/var/log/Bigdata/controller</code> | Log collecting script log.
Controller process log.
Controller monitoring log. |
| <code>/var/log/Bigdata/dbservice</code> | DBService log. |
| <code>/var/log/Bigdata/flume</code> | Flume log. |
| <code>/var/log/Bigdata/hbase</code> | HBase log. |
| <code>/var/log/Bigdata/hdfs</code> | HDFS log. |
| <code>/var/log/Bigdata/hive</code> | Hive log. |
| <code>/var/log/Bigdata/httpd</code> | HTTPD log. |
| <code>/var/log/Bigdata/hue</code> | Hue log. |

| File Directory | Log Content |
|------------------------------|--|
| /var/log/Bigdata/kerberos | Kerberos log. |
| /var/log/Bigdata/ldapclient | LDAP client log. |
| /var/log/Bigdata/ldapserver | LDAP server log. |
| /var/log/Bigdata/loader | Loader log. |
| /var/log/Bigdata/logman | logman script log management log. |
| /var/log/Bigdata/mapreduce | MapReduce log. |
| /var/log/Bigdata/nodeagent | NodeAgent log. |
| /var/log/Bigdata/okerberos | OMS Kerberos log. |
| /var/log/Bigdata/oldapserver | OMS LDAP log. |
| /var/log/Bigdata/omm | oms : complex event processing log, alarm service log, HA log, authentication and authorization management log, and monitoring service run log of the omm server.
oma : installation log and run log of the omm agent.
core : dump log generated when the omm agent and the HA process are suspended. |
| /var/log/Bigdata/spark | Spark log. |
| /var/log/Bigdata/sudo | Log generated when the sudo command is executed by user omm . |
| /var/log/Bigdata/timestamp | Time synchronization management log. |
| /var/log/Bigdata/tomcat | Tomcat log. |
| /var/log/Bigdata/yarn | Yarn log. |
| /var/log/Bigdata/zookeeper | ZooKeeper log. |
| /var/log/Bigdata/kafka | Kafka log. |
| /var/log/Bigdata/storm | Storm log. |
| /var/log/Bigdata/patch | Patch log. |

Run logs

[Table 9-19](#) describes the running information recorded in run logs.

Table 9-19 Running information

| Run Log | Description |
|---------------------------------|---|
| Installation preparation log | Records information about preparations for the installation, such as the detection, configuration, and feedback operation information. |
| Process startup log | Records information about the commands executed during the process startup. |
| Process startup exception log | Records information about exceptions during process startup, such as dependent service errors and insufficient resources. |
| Process run log | Records information about the process running track information and debugging information, such as function entries and exits as well as cross-module interface messages. |
| Process running exception log | Records errors that cause process running errors, for example, the empty input objects or encoding or decoding failure. |
| Process running environment log | Records information about the process running environment, such as resource status and environment variables. |
| Script logs | Records information about the script execution process. |
| Resource reclamation log | Records information about the resource reclaiming process. |
| Uninstallation clearing logs | Records information about operations performed during service uninstallation, such as directory deletion and execution time |

Audit logs

Audit information recorded in audit logs includes FusionInsight Manager audit information and component audit information.

Table 9-20 Audit information of FusionInsight Manager

| Audit Log | Operation Type | Operation |

Activating a topology |

MRS audit logs are stored in the database. You can view and export audit logs on the **Audit** page.

The following table lists the directories to store component audit logs. Audit log files of some components are stored in **/var/log/Bigdata/audit**, such as HDFS, HBase, MapReduce, Hive, Hue, Yarn, Storm, and ZooKeeper. The component audit logs are automatically compressed and backed up to **/var/log/Bigdata/audit/bk** at 03:00 every day. A maximum of latest 90 compressed backup files are retained, and the backup time cannot be changed.

Audit log files of other components are stored in the component log directory.

Table 9-22 Directory for storing component audit logs

| Component | Audit Log Directory |
|-----------|---|
| DBService | /var/log/Bigdata/audit/dbservice/dbservice_audit.log |
| HDFS | /var/log/Bigdata/audit/hdfs/nn/hdfs-audit-namenode.log
/var/log/Bigdata/audit/hdfs/dn/hdfs-audit-datanode.log
/var/log/Bigdata/audit/hdfs/jn/hdfs-audit-journalnode.log
/var/log/Bigdata/audit/hdfs/zkfc/hdfs-audit-zkfc.log
/var/log/Bigdata/audit/hdfs/httpfs/hdfs-audit-httpfs.log
/var/log/Bigdata/audit/hdfs/router/hdfs-audit-router.log |
| MapReduce | /var/log/Bigdata/audit/mapreduce/jobhistory/mapred-audit-jobhistory.log |

| Component | Audit Log Directory |
|-----------|--|
| Hive | <code>/var/log/Bigdata/audit/hive/hiveserver/hive-audit.log</code>
<code>/var/log/Bigdata/audit/hive/metastore/metastore-audit.log</code>
<code>/var/log/Bigdata/audit/hive/webhcat/webhcat-audit.log</code> |
| Loader | <code>/var/log/Bigdata/loader/audit/default.audit</code> |
| Hue | <code>/var/log/Bigdata/audit/hue/hue-audits.log</code> |

| Yarn | <code>/var/log/Bigdata/audit/yarn/rm/yarn-audit-resource-manager.log</code>
<code>/var/log/Bigdata/audit/yarn/nm/yarn-audit-nodemanager.log</code> |
| Storm | <code>/var/log/Bigdata/audit/storm/nimbus/audit.log</code>
<code>/var/log/Bigdata/audit/storm/ui/audit.log</code> |

9.7.2 Manager Log List

Log Description

Log path: The default storage path of Manager log files is `/var/log/Bigdata/Manager component`.

- ControllerService: `/var/log/Bigdata/controller/` (operation & maintenance system (OMS) installation and run logs)
- Httpd: `/var/log/Bigdata/httpd` (httpd installation and run logs)
- logman: `/var/log/Bigdata/logman` (log packaging tool logs)
- NodeAgent: `/var/log/Bigdata/nodeagent` (NodeAgent installation and run logs)
- okerberos: `/var/log/Bigdata/okerberos` (okerberos installation and run logs)
- oldapserver: `/var/log/Bigdata/oldapserver` (oldapserver installation and run logs)
- MetricAgent: `/var/log/Bigdata/metric_agent` (MetricAgent run log)
- omm: `/var/log/Bigdata/omm` (omm installation and run logs)
- timestamp: `/var/log/Bigdata/timestamp` (NodeAgent startup time logs)
- tomcat: `/var/log/Bigdata/tomcat` (Web process logs)

- Patch: **/var/log/Bigdata/patch** (patch installation log)
- Sudo: **/var/log/Bigdata/sudo** (sudo script execution log)
- OS: **/var/log/message file** (OS system log)
- OS Performance: **/var/log/osperf** (OS performance statistics log)
- OS Statistics: **/var/log/osinfo/statistics** (OS parameter configuration log)

Log archiving rule:

The automatic compression and archiving function is enabled for Manager logs. By default, when the size of a log file exceeds 10 MB, the log file is automatically compressed. The naming rule of a compressed log file is as follows: *<Original log name>-<yyyy-mm-dd_hh-mm-ss>.[ID].log.zip* A maximum of 20 latest compressed files are reserved.

Table 9-23 Manager logs

| Type | Log File Name | Description |
|--------------------|--------------------------|---|
| Controller run log | controller.log | Log that records component installation, upgrade, patch installation, configuration, monitoring, alarms, and routine O&M operations |
| | controller_client.log | Run log of the Representational State Transfer (REST) API |
| | acs.log | ACS run log file |
| | acs_spnego.log | spnego user log in ACS |
| | aos.log | AOS run log |
| | plugin.log | AOS plug-in log |
| | backupplugin.log | Log that records the backup and restoration operations |
| | controller_config.log | Configuration run log |
| | controller_nodesetup.log | Controller loading task log |
| | controller_root.log | System log of the Controller process |
| | controller_trace.log | Log that records the remote procedure call (RPC) communication between Controller and NodeAgent |

| Type | Log File Name | Description |
|------|--|--|
| | controller_monitor.log | Monitoring log |
| | controller_fsm.log | State machine log |
| | controller_alarm.log | Controller alarm log |
| | controller_backup.log | Controller backup and recovery log |
| | install.log,
distributeAdapterFiles.log,
install_os_optimization.log | OMS installation log |
| | oms_ctl.log | OMS startup and stop log |
| | installntp.log | NTP installation log |
| | modify_manager_param.l
og | Manager parameter
modification log |
| | backup.log | OMS backup script run
log |
| | supressionAlarm.log | Alarm script run log |
| | om.log | OM certificate
generation log |
| | backupplugin_ctl.log | Startup log of the
backup and restoration
plug-in process |
| | getLogs.log | Run log of the
collection log script |
| | backupAuditLogs.log | Run log of the audit log
backup script |
| | certStatus.log | Log that records regular
certificate checks |
| | distribute.log | Certificate distribution
log |
| | ficertgenenerate.log | Certificate replacement
logs, including logs of
level-2 certificates, CAS
certificates, and httpd
certificates |
| | genPwFile.log | Log that records the
generation of certificate
password files |

| Type | Log File Name | Description |
|--------------------|---|---|
| | modifyproxyconf.log | Log that records the modification of the HTTPD proxy configuration |
| | importTar.log | Log that records the process of importing certificates into the trust library |
| Httpd | install.log | Httpd installation log |
| | access_log, error_log | Httpd run log |
| logman | logman.log | Log packaging tool log |
| NodeAgent | install.log, install_os_optimization.log | NodeAgent installation log |
| | installntp.log | NTP installation log |
| | start_ntp.log | NTP startup log |
| | ntpChecker.log | NTP check log |
| | ntpMonitor.log | NTP monitoring log |
| | heartbeat_trace.log | Log that records heartbeats between NodeAgent and Controller |
| | alarm.log | Alarm log |
| | monitor.log | Monitoring log |
| | nodeagent_ctl.log, start-agent.log | NodeAgent startup log |
| | agent.log | NodeAgent run log |
| | cert.log | Certificate log |
| | agentplugin.log | Agent plug-in running status monitoring log |
| | omapplugin.log | OMA plug-in run log |
| | diskhealth.log | Disk health check log |
| | supressionAlarm.log | Alarm script run log |
| updateHostFile.log | Host list update log | |
| collectLog.log | Run log of the node log collection script | |

| Type | Log File Name | Description |
|-----------------|---|---|
| | host_metric_collect.log | Host index collection run log |
| | checkfileconfig.log | Run log file of file permission check |
| | entropycheck.log | Entropy check run log |
| | timer.log | Log of periodic node scheduling |
| | pluginmonitor.log | Component monitoring plug-in log |
| | agent_alarm_py.log | Log that records alarms upon insufficient NodeAgent file permission |
| okerberos | addRealm.log,
modifyKerberosRealm.log | Domain handover log |
| | checkservice_detail.log | Okerberos health check log |
| | genKeytab.log | keytab generation log |
| | KerberosAdmin_genConfig
Detail.log | Run log that records the generation of kadmin.conf when starting the kadmin process |
| | KerberosServer_genConfig
Detail.log | Run log that records the generation of krb5kdc.conf when starting the krb5kdc process |
| | oms-kadmind.log | Run log of the kadmin process |
| | oms_kerberos_install.log,
postinstall_detail.log | Okerberos installation log |
| | oms-krb5kdc.log | Run log of the krbkdc process |
| | start_detail.log | Okerberos startup log |
| | realmDataConfigPro-
cess.log | Log rollback for domain handover failure |
| stop_detail.log | Okerberos stop log | |
| oldapserver | ldapserver_backup.log | Oldapserver backup log |

| Type | Log File Name | Description |
|------|-----------------------------|---|
| | ldapservice_chk_service.log | Oldapservice health check log |
| | ldapservice_install.log | Oldapservice installation log |
| | ldapservice_start.log | Oldapservice startup log |
| | ldapservice_status.log | Log that records the status of the Oldapservice process |
| | ldapservice_stop.log | Oldapservice stop log |
| | ldapservice_wrap.log | Oldapservice service management log |
| | ldapservice_uninstall.log | Oldapservice uninstallation log |
| | restart_service.log | Oldapservice restart log |
| | ldapservice_unlockUser.log | Log that records information about unlocking LDAP users and managing accounts |
| omm | omsconfig.log | OMS configuration log |
| | check_oms_heartbeat.log | OMS heartbeat log |
| | monitor.log | OMS monitoring log |
| | ha_monitor.log | HA_Monitor operation log |
| | ha.log | HA operation log |
| | fms.log | Alarm log |
| | fms_ha.log | HA alarm monitoring log |
| | fms_script.log | Alarm control log |
| | config.log | Alarm configuration log |
| | iam.log | IAM log |
| | iam_script.log | IAM control log |
| | iam_ha.log | IAM HA monitoring log |
| | config.log | IAM configuration log |
| | operatelog.log | IAM operation log |

| Type | Log File Name | Description |
|------|-----------------------|---------------------------------|
| | heartbeatcheck_ha.log | OMS heartbeat HA monitoring log |
| | install_oms.log | OMS installation log |
| | pms_ha.log | HA monitoring log |
| | pms_script.log | Monitoring control log |
| | config.log | Monitoring configuration log |
| | plugin.log | Monitoring plug-in run log |
| | pms.log | Monitoring log |
| | ha.log | HA run log |
| | cep_ha.log | CEP HA monitoring log |
| | cep_script.log | CEP control log |
| | cep.log | CEP log |
| | config.log | CEP configuration log |
| | omm_gaussdba.log | GaussDB HA monitoring log |
| | gaussdb-<SERIAL>.log | GaussDB run log |
| | gs_ctl-<DATE>.log | GaussDB control log archive log |
| | gs_ctl-current.log | GaussDB control log |
| | gs_guc-current.log | GaussDB operation log |
| | encrypt.log | Omm encryption log |
| | omm_agent_ctl.log | OMA control log |
| | oma_monitor.log | OMA monitoring log |
| | install_oma.log | OMA installation log |
| | config_oma.log | OMA configuration log |
| | omm_agent.log | OMA run log |
| | acs.log | ACS resource log |
| | aos.log | AOS resource log |
| | controller.log | Controller resource log |

| Type | Log File Name | Description |
|-----------|--|---|
| | feed_watchdog.log | feed_watchdog resource log |
| | floatip.log | Floating IP address resource log |
| | ha_ntp.log | NTP resource log |
| | httpd.log | Httpd resource log |
| | okerberos.log | Okerberos resource log |
| | oldap.log | OLdap resource log |
| | tomcat.log | Tomcat resource log |
| | send_alarm.log | Run log of the HA alarm sending script of the management node |
| timestamp | restart_stamp | NodeAgent start time log |
| tomcat | cas.log, localhost_access_cas_log.log | CAS run log |
| | catalina.log, catalina.out, host-manager.log, localhost.log, manager.log | Tomcat run log |
| | localhost_access_web_log.log | Log that records the access to REST APIs of FusionInsight Manager |
| | web.log | Run log of the web process |
| | northbound_ftp_sftp.log, snmp.log | Northbound log |
| watchdog | watchdog.log, feed_watchdog.log | watchdog run log |
| patch | oms_installPatch.log | OMS patch installation log |
| | agent_installPatch.log | Agent patch installation log |
| | agent_uninstallPatch.log | Agent patch uninstallation log |
| | NODE_AGENT_restoreFile.log | Agent patch restoration log |

| Type | Log File Name | Description |
|------|---|---------------------------------------|
| | NODE_AGENT_updateFile.log | Agent patch update log |
| | OMA_restoreFile.log | OMA patch restoration file log |
| | OMA_updateFile.log | OMA patch update file log |
| | CONTROLLER_restoreFile.log | CONTROLLER patch restoration file log |
| | CONTROLLER_updateFile.log | CONTROLLER patch update file log |
| | OMS_restoreFile.log | OMS patch restoration file log |
| | oms_uninstallPatch.log | OMS patch uninstallation log |
| | OMS_updateFile.log | OMS patch update file log |
| | createStackConf.log,
decompress.log,
decompress_OMS.log,
distrExtractPatchOnOMS.log,
slimReduction.log,
switch_adapter.log | Patch installation log |
| sudo | sudo.log | Sudo script execution log |

Log Levels

Table 9-24 describes the log levels provided by Manager. The priorities of log levels are FATAL, ERROR, WARN, INFO, and DEBUG in descending order. Logs whose levels are higher than or equal to the specified level are printed. The number of printed logs decreases as the specified log level increases.

Table 9-24 Log levels

| Level | Description |
|-------|--|
| FATAL | Logs of this level record fatal error information about the current event processing that may result in a system crash. |
| ERROR | Logs of this level record error information about the current event processing, which indicates that system running is abnormal. |

| Level | Description |
|-------|--|
| WARN | Abnormal information about the current event processing. These abnormalities will not result in system faults. |
| INFO | Normal running status information about the system and events. |
| DEBUG | Logs of this level record the system information and system debugging information. |

Log Formats

The following table lists the Manager log formats.

Table 9-25 Log formats

| Type | Component | Format | Example |
|--|--|---|---|
| Controller, Httpd, logman, NodeAgent, okerberos, oldapserver, omm, tomcat, upgrade | Controller, Httpd, logman, NodeAgent, okerberos, oldapserver, omm, tomcat, upgrade | <i><yyyy-MM-dd HH:mm:ss,SSS>
<Log level>
<Name of the thread that generates the log>
<Message in the log>
<Location where the log event occurs></i> | 2015-06-30

9.7.3 Viewing and Exporting Audit Logs

Scenario

This section describes how to view and export audit logs on MRS Manager. The audit logs can be used to trace security events, locate fault causes, and determine responsibilities.

The system record the following log information:

- User activity information, such as user login and logout, system user information modification, and system user group information modification
- User operation instruction information, such as cluster startup, stop, and software upgrade.

Procedure

- Viewing audit logs

- a. On MRS Manager, click **Audit** to view the default audit logs.
If an audit log contains more than 256 characters, click the expand button to view audit log details.
 - By default, records are sorted in descending order by the **Occurred** column. You can click **Operation Type**, **Severity**, **Occurred**, **User**, **Host**, **Service**, **Instance**, or **Operation Result** to change the sorting mode.
 - All alarms of the same severity can be filtered by **Severity**. The results include cleared and uncleared alarms.Exported audit logs contain the following information:
 - **Sno**: indicates the number of audit logs generated by MRS Manager. The number is incremented by 1 when a new audit log is generated.
 - **Operation Type**: indicates the operation type of a user operation. There are nine scenarios: **Alarm**, **Auditlog**, **Backup And Restoration**, **Cluster**, **Collect Log**, **Host**, **Service**, **Tenant** and **User_Manager**. **User_Manager** is supported only in clusters with Kerberos authentication enabled. Each scenario contains different operation types. For example, **Alarm** includes **Export alarms**; **Cluster** includes **Start cluster**, and **Tenant** include **Add tenant**.
 - **Severity**: indicates the security level of each audit log, including **Critical**, **Major**, **Minor** and **Informational**.
 - **Start Time**: indicates the time when the operation starts. The time is CET or CEST.
 - **End Time**: indicates the time when the operation ends. The time is CET or CEST.
 - **User IP Address**: indicates the IP address used by a user to perform operations.
 - **User**: indicates the name of the user who performs the operation.
 - **Host**: indicates the node where the user operation is performed. The information is not saved if the operation does not involve a node.
 - **Service**: indicates the service in the cluster where the user operation is performed. The information is not saved if the operation does not involve a service.
 - **Instance**: indicates the role instance in the cluster where the user operation is performed. The information is not saved if the operation does not involve a role instance.
 - **Operation Result**: indicates the operation result, including **Successful**, **Failed** and **Unknown**.
 - **Content**: indicates execution information of the user operation.
- b. Click **Advanced Search**. In the search area, set search criteria and click **Search** to view audit logs of the specified type. Click **Reset** to clear the search criteria.

 NOTE

Start Time and **End Time** specify the start time and end time of the time range. You can search for alarms generated within the time range.

- Exporting audit logs
 - a. In the audit log list, click **Export All** to export all logs.
 - b. In the audit log list, select the check box of a log and click **Export** to export the log.

9.7.4 Exporting Service Logs

Scenario

This section describes how to export logs generated by each service role from MRS Manager.

Prerequisites

- You have obtained the access key ID (AK) and secret access key (SK) of the account.
- A parallel file system has been created in OBS.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 Click **Export Log** under **Maintenance**.

Step 3 Set a service for **Service**. Set **Host** to the IP address of the host where the service is deployed. Select the corresponding time for **Start Time** and **End Time**.

Step 4 In **Export To**, select a path for saving logs. This parameter is available only for clusters with Kerberos authentication enabled.

- **Local PC**: indicates that logs are saved to the local environment. Then go to [Step 8](#).
- **OBS**: indicates that logs are saved to OBS. This is the default option. Then go to [Step 5](#).

Step 5 Set **OBS Path** to the path for storing service logs on OBS.

The value must be a complete path and cannot start with a slash (/). The path can be nonexistent and will be automatically created by the system. The full path of OBS can contain a maximum of 900 bytes.

Step 6 In **Bucket**, enter the name of the created OBS file system.

Step 7 Set **AK** and **SK** to the access key ID and secret access key of the user.

Step 8 Click **OK**.

----End

9.7.5 Configuring Audit Log Exporting Parameters

Scenario

If MRS audit logs are stored in the system for a long time, the disk space of the data directory may be insufficient. Therefore, you can set export parameters to automatically export audit logs to a specified directory on the OBS server timely, facilitating audit log management.

NOTE

Audit logs exported to the OBS server include service audit logs and management audit logs.

- Service audit logs are automatically compressed and stored in the `/var/log/Bigdata/audit/bk/` directory on the active management node at 03:00 every day. The file name format is `<yyy-MM-dd_HH-mm-ss>.tar.gz`. By default, a maximum of seven log files can be stored. If more than seven log files are stored, the system automatically deletes the log files generated seven days ago.
- The data range of management audit logs exported to OBS each time is from the last date when the logs are successfully exported to OBS to the date when the task is executed. When the number of management audit logs reaches 100,000, the system automatically dumps the first 90,000 audit logs to a local file and retains 10,000 audit logs in the database. The dumped log files are saved in the `/${BIGDATA_DATA_HOME}/dbdata_om/dumpData/iam/operatelog` directory on the active management node. The file name format is `OperateLog_store_YY_MM_DD_HH_MM_SS.csv`. A maximum of 50 historical audit log files can be saved.

Prerequisites

- You have obtained the access key ID (AK) and secret access key (SK) of the account.
- A parallel file system has been created in OBS.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 Choose **Export Audit Log** under **Maintenance**.

Table 9-26 Parameters for exporting audit logs

| Parameter | Value | Description |
|------------------|--|--|
| Export Audit Log | <ul style="list-style-type: none">• On• Off | (Mandatory) Specifies whether to enable the audit log export function. <ul style="list-style-type: none">• On: enables audit log exporting.• Off: disables audit log exporting. |
| Start Time | 07/24/2017 09:00:00
(example) | (Mandatory) Specifies the start time for exporting audit logs. |

| Parameter | Value | Description |
|---------------|--|--|
| Period (days) | 1 day (example value) | (Mandatory) Specifies the interval for exporting audit logs. The interval ranges from 1 to 5 days. |
| Bucket | mrs-bucket (example value) | (Mandatory) Specifies the name of the OBS file system to which audit logs are exported. |
| OBS path | <code>/opt/omm/oms/auditLog</code> (example value) | (Mandatory) Specifies the OBS path to which audit logs are exported. |
| AK | XXX (example value) | (Mandatory) Specifies the user's access key ID. |
| SK | XXX (example value) | (Mandatory) Specifies the user's secret access key. |

 NOTE

Audit logs are stored in `service_auditlog` and `manager_auditlog` on OBS. They are used to store service audit logs and management audit logs, respectively.

----End

9.8 Health Check Management

9.8.1 Performing a Health Check

Scenario

To ensure that cluster parameters, configurations, and monitoring are correct and that the cluster can run stably for a long time, you can perform a health check during routine maintenance.

 NOTE

A system health check includes MRS Manager, service-level, and host-level health checks:

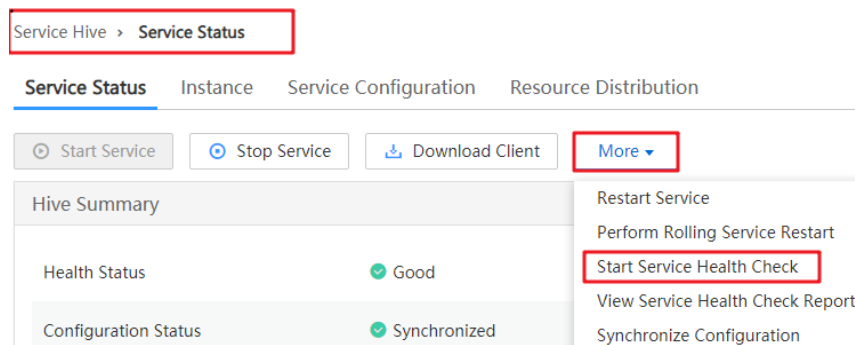

- MRS Manager health checks focus on whether the unified management platform can provide management functions.
- Service-level health checks focus on whether components can provide services properly.
- Host-level health checks focus on whether host indicators are normal.

The system health check includes three types of check items: health status, related alarms, and customized monitoring indicators for each check object. The health check results are not always the same as the **Health Status** on the portal.

Procedure

- Manually perform the health check for all services.
 - a. Click **Services**.
 - b. Choose **More** > **Start Service Health Check** to start the health check for the service.

Figure 9-11 Starting the service health check

NOTE

- The cluster health check includes Manager, service, and host status checks.
- To perform cluster health checks, you can also choose **System** > **Maintenance** > **Check Health Check** > **Start Cluster Health Check** on MRS Manager.
- To export the health check result, click **Export Report** in the upper left corner.
- Manually perform the health check for a service.
 - a. Click **Services**. In the services list, click the desired service name.
 - b. Choose **More** > **Start Service Health Check** to start the health check for the service.
- Manually perform the health check for a host.
 - a. Click **Hosts**.
 - b. Select the check box of the host for which you want to check the health status.
 - c. Choose **More** > **Start Host Health Check** to start the health check for the host.
- Automatically performing a health check
 - a. Click **System**.
 - b. Click **Check Health Status** under **Maintenance**.
 - c. Click **Configure Health Check** to configure automatic health check items.

Max. Number of Health Check Reports: maximum number of health check reports. The value must be an integer ranging from 1 to 100.

Periodic Health Check: specifies whether to enable automatic health check. The **Periodic Health Check** function is disabled by default. You can click to enable the function and select **Daily**, **Weekly**, or **Monthly** based on management requirements.
 - d. Click **OK** to save the settings. The **Health check configuration saved successfully** is displayed in the upper right corner.

9.8.2 Viewing and Exporting a Health Check Report

Scenario

You can view the health check result in MRS Manager and export the health check results for further analysis.

NOTE

A system health check includes MRS Manager, service-level, and host-level health checks:

- MRS Manager health checks focus on whether the unified management platform can provide management functions.
- Service-level health checks focus on whether components can provide services properly.
- Host-level health checks focus on whether host indicators are normal.

The system health check includes three types of check items: health status, related alarms, and customized monitoring indicators for each check object. The health check results are not always the same as the **Health Status** on the portal.

Prerequisites

You have performed a health check.

Procedure

Step 1 Click **Services**.

Step 2 Choose **More > View Cluster Health Check Report** to view the health check report of a cluster.

Step 3 Click **Export Report** on the health check report pane to export the report and view detailed information about check items.

NOTE

For details about how to rectify the faults of the check items, see [DBService Health Check Indicators](#) to [ZooKeeper Health Check Indicators](#).

----End

9.8.3 Configuring the Number of Health Check Reports to Be Reserved

Scenario

Health check reports of MRS clusters, services, and hosts may vary with the time and scenario. You can modify the number of health check reports to be reserved on MRS Manager for later comparison.

This setting is valid for health check reports of clusters, services, and hosts. Report files are saved in **\$BIGDATA_DATA_HOME/Manager/healthcheck** on the active management node by default and are automatically synchronized to the standby management node.

Prerequisites

Users have specified service requirements and planned the save time and health check frequency, and the disk space of the active and standby management nodes is sufficient.

Procedure

- Step 1** Choose **System > Maintenance > Check Health Status > Configure Health Check**.
 - Step 2** Set **Max. Number of Health Check Reports** to the number of health check reports to be reserved. The value ranges from 1 to 100. The default value is 50.
 - Step 3** Click **OK** to save the settings. Message "Health check configuration saved successfully" is displayed in the upper right corner.
- End

9.8.4 Managing Health Check Reports

Scenario

On MRS Manager, users can manage historical health check reports, for example, viewing, downloading, and deleting historical health check reports.

Procedure

- Download a specified health check report.
 - a. Choose **System > Maintenance > Check Health Status**.
 - b. Locate the row that contains the target health check report and click **Download** to download the report file.
- Download specified health check reports in batches.
 - a. Choose **System > Maintenance > Check Health Status**.
 - b. Select multiple health check reports and click **Download File** to download them.
- Delete a specified health check report.
 - a. Choose **System > Maintenance > Check Health Status**.
 - b. Locate the row that contains the target health check report and click **Delete** to delete the report file.
- Delete specified health check reports in batches.
 - a. Choose **System > Maintenance > Check Health Status**.
 - b. Select multiple health check reports and click **Delete File** to delete them.

9.8.5 DBService Health Check Indicators

Service Health Check

Indicator: Service Status

Description: This indicator is used to check whether the DBService service status is normal. If the status is abnormal, the service is unhealthy.

Handling method: If the indicator is abnormal, rectify the fault by referring to ALM-27001.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

9.8.6 Flume Health Check Indicators

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Flume service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If the indicator is abnormal, rectify the fault by referring to ALM-24000.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

9.8.7 HBase Health Check Indicators

Normal RegionServer Count

Indicator: Normal RegionServer Count

Description: This indicator is used to check the number of RegionServers that are running properly in an HBase cluster.

Recovery Guide: If the indicator is abnormal, check whether the status of RegionServer is normal. If the status is abnormal, resolve the problem and check that the network is normal.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the HBase service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If the indicator is abnormal, check whether the status of HMaster and RegionServer is normal. If the status is abnormal, resolve the problem. Then, check whether the status of the ZooKeeper service is faulty. On the HBase client, check whether the data in the HBase table can be correctly read and locate the data reading failure cause. Handle the alarm following instructions in the alarm processing document.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

9.8.8 Host Health Check Indicators

Swap Usage

Indicator: Swap Usage

Description: Swap usage of the system. The value is calculated using the following formula: $\text{Swap usage} = \text{Used swap size} / \text{Total swap size}$. Assume that the current threshold is set to 75.0%. If the usage of the file handles in the system exceeds the threshold, the system is unhealthy.

Recovery Guide:

1. Check the swap usage of the node.
Log in to the unhealthy node and run the **free -m** command to check the total swap space and used swap space. If the swap space usage exceeds the threshold, go to [2](#).
2. If the swap usage exceeds the threshold, you are advised to expand the system capacity, for example, add nodes.

Host File Handle Usage

Indicator: Host File Handle Usage

Description: This indicator indicates the file handle usage in the system. $\text{Host file handle usage} = \text{Number of used handles} / \text{Total number of handles}$. If the usage exceeds the threshold, the system is unhealthy.

Recovery Guide:

1. Check the file handle usage of the host.
Log in to the unhealthy node and run the **cat /proc/sys/fs/file-nr** command. In the command output, the first and third columns indicate the number of used handles and the total number of handles, respectively. If the usage exceeds the threshold, go to [2](#).
2. If the file handle usage of the host exceeds the threshold, you are advised to check the system and analyze the file handle usage.

NTP Offset

Indicator: NTP Offset

Description: This indicator indicates the NTP time offset. If the time deviation exceeds the threshold, the system is unhealthy.

Recovery Guide:

1. Check the NTP time offset.
Log in to the unhealthy node and run the `/usr/sbin/ntpq -np` command to view the information. In the command output, the **Offset** column indicates the time offset. If the time offset is greater than the threshold, go to [2](#).
2. If the indicator is abnormal, check whether the clock source configuration is correct. Contact O&M personnel.

Average Load

Indicator: Average Load

Description: Average system load, indicating the average number of processes in the running queue in a specified period. The system average load is calculated using the load value obtained by the `uptime` command. Calculation method: (Load of 1 minute + Load of 5 minutes + Load of 15 minutes)/(3 x Number of CPUs). Assume that the current threshold is set to 2. If the average load exceeds 2, the system is unhealthy.

Recovery Guide:

1. Log in to the unhealthy node and run the `uptime` command. The last three columns in the command output indicate the load in 1 minute, 5 minutes, and 15 minutes, respectively. If the average system load exceeds the threshold, go to [2](#).
2. If the system average load exceeds the threshold, you are advised to perform system capacity expansion, such as adding nodes.

D State Process

Indicator: D State Process

Description: This indicator indicates the unstopable sleep process, that is, the process in the D state. A process that is in the D state is waiting for I/O, such as disk I/O and network I/O, and experiences an I/O exception. If any process in the D state exists in the system, the system is unhealthy.

Recovery Guide: If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12028.

Hardware Status

Indicator: Hardware Status

Description: This indicator is used to check the system hardware status, including the CPU, memory, disk, power supply, and fan. This indicator obtains related hardware information using `ipmitool sdr elist`. If the hardware status is abnormal, the hardware is unhealthy.

Recovery Guide:

1. Log in to the node where the check result is unhealthy. Run the **ipmitool sdr elist** command to check system hardware status. The last column in the command output indicates the hardware status. If the status is included in the following fault description table, the check result is unhealthy.

| Module | Symptom |
|--------------|---|
| Processor | IERR
Thermal Trip
FRB1/BIST failure
FRB2/Hang in POST failure
FRB3/Processor startup/init failure
Configuration Error
SM BIOS Uncorrectable CPU-complex Error
Disabled
Throttled
Uncorrectable machine check exception |
| Power Supply | Failure detected
Predictive failure
Power Supply AC lost
AC lost or out-of-range
AC out-of-range, but present
Config Error: Vendor Mismatch
Config Error: Revision Mismatch
Config Error: Processor Missing
Config Error: Power Supply Rating Mismatch
Config Error: Voltage Rating Mismatch
Config Error |
| Power Unit | 240VA power down
Interlock power down
AC lost
Soft-power control failure
Failure detected
Predictive failure |

| Module | Symptom |
|------------|---|
| Memory | Uncorrectable ECC
Parity
Memory Scrub Failed
Memory Device Disabled
Correctable ECC logging limit reached
Configuration Error
Throttled
Critical Overtemperature |
| Drive Slot | Drive Fault
Predictive Failure
Parity Check In Progress
In Critical Array
In Failed Array
Rebuild In Progress
Rebuild Aborted |
| Battery | Low
Failed |

2. If the indicator is abnormal, contact O&M personnel.

Host Name

Indicator: Host Name

Description: This indicator is used to check whether the host name is set. If the host name is not set, the system is unhealthy. If the indicator is abnormal, you are advised to set the host name properly.

Recovery Guide:

1. Log in to the node where the check result is unhealthy.
2. Run the `hostname host name` command to change the host name to ensure that the host name is consistent with the planned host name.

hostname *host name* For example, to change the host name to **Bigdata-OM-01**, run the **hostname Bigdata-OM-01** command.

3. Modify the host name configuration file.

Run the **vi /etc/HOSTNAME** command to edit the file. Change the file content to **Bigdata-OM-01**. Save the file, and exit.

Umask

Indicator: Umask

Description: This indicator is used to check whether the umask setting of user **omm** is correct. If Umask is not 0077, the system is unhealthy.

Recovery Guide:

1. If the indicator is abnormal, you are advised to set umask of user **omm** to 0077. Log in to the unhealthy node and run the **su - omm** command to switch to user **omm**.
2. Run the **vi \${BIGDATA_HOME}/.om_profile** command and change the value of **umask** to **0077**. Save and exit.

OMS HA Status

Indicator: OMS HA Status

Description: This indicator is used to check whether the OMS two-node cluster resources are normal. You can run the **\${CONTROLLER_HOME}/sbin/status-oms.sh** command to view the detailed information about the status of the OMS two-node cluster resources. If any module is abnormal, the OMS is unhealthy.

Recovery Guide:

1. Log in to the active management node and run the **su - omm** command to switch to user **omm**. Run the **\${CONTROLLER_HOME}/sbin/status-oms.sh** command to check the OMS status.
2. If floatip, okerberos, and oldap are abnormal, handle the problems by referring to ALM-12002, ALM-12004, and ALM-12005 respectively.
3. If other resources are abnormal, you are advised to view the logs of the faulty modules.

If controller resources are abnormal, view **/var/log/Bigdata/controller/controller.log** of the faulty node.

If CEP resources are abnormal, view **/var/log/Bigdata/omm/oms/cep/cep.log** of the faulty node.

If AOS resources are abnormal, view **/var/log/Bigdata/controller/aos/aos.log** of the faulty node.

If feed_watchdog resources are abnormal, view **/var/log/Bigdata/watchdog/watchdog.log** of the abnormal node.

If HTTPD resources are abnormal, view **/var/log/Bigdata/httpd/error_log** of the abnormal node.

If FMS resources are abnormal, view **/var/log/Bigdata/omm/oms/fms/fms.log** of the abnormal node.

If PMS resources are abnormal, view **/var/log/Bigdata/omm/oms/pms/pms.log** of the abnormal node.

If IAM resources are abnormal, view **/var/log/Bigdata/omm/oms/iam/iam.log** of the abnormal node.

If the GaussDB resource is abnormal, check the **/var/log/Bigdata/omm/oms/db/omm_gaussdba.log** of the abnormal node.

If NTP resources are abnormal, view **/var/log/Bigdata/omm/oms/ha/scriptlog/ha_ntp.log** of the abnormal node.

If Tomcat resources are abnormal, view **/var/log/Bigdata/tomcat/catalina.log** of the abnormal node.

4. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

Checking the Installation Directory and Data Directory

Indicator: Installation Directory and Data Directory Check

Description: This indicator checks the **lost+found** directory in the root directory of the disk partition where the installation directory (**/opt/Bigdata** by default) is located. If the directory contains the files of user **omm**, there are exceptions. When a node is abnormal, related files are stored in the **lost+found** directory. This indicator is used to check whether files are lost in such scenarios. Check the installation directory (for example, **/opt/Bigdata**) and data directory (for example, **/srv/BigData**). If any files of non-omm users exist in the two directories, the system is unhealthy.

Recovery Guide:

1. Log in to the unhealthy node and run the **su - omm** command to switch to user **omm**. Check whether files or folders of user **omm** exist in the **lost+found** directory.

If the **omm** user file exists, you are advised to restore it and check again. If the **omm** user file does not exist, go to [2](#).

2. Check the installation directory and data directory. Check whether the files or folders of other users exist in the installation directory and data directory. If the files and folders are manually generated temporary files, you are advised to delete them and check again.

CPU Usage

Indicator: CPU Usage

Description: This indicator is used to check whether the CPU usage exceeds the threshold. If the disk usage exceeds the threshold, the system is unhealthy.

Recovery Guide: If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12016.

Memory Usage

Indicator: Memory Usage

Description: This indicator is used to check whether the memory usage exceeds the threshold. If the disk usage exceeds the threshold, the system is unhealthy.

Recovery Guide: If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12018.

Host Disk Usage

Indicator: Host Disk Usage

Description: This indicator is used to check whether the host disk usage exceeds the threshold. If the disk usage exceeds the threshold, the system is unhealthy.

Recovery Guide: If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12017.

Host Disk Write Rate

Indicator: Host Disk Write Rate

Description: This indicator is used to check the disk write rate of a host. The write rate of the host disk may vary according to the service scenario. Therefore, the value of this indicator reflects only the specified value. You need to determine whether the indicator is normal in specified service scenarios.

Recovery Guide: Determine whether the current disk write rate is normal based on the service scenario.

Host Disk Read Rate

Indicator: Host Disk Read Rate

Description: This indicator is used to check the disk read rate of a host. The read rate of the host disk may vary by service scenario. Therefore, the value of this indicator reflects only the specified value. You need to determine whether the indicator is normal in specified service scenarios.

Recovery Guide: Determine whether the current disk read rate is normal based on the service scenario.

Host Service Plane Network Status

Indicator: Host Service Plane Network Status

Description: This indicator is used to check the connectivity of the service plane network of the cluster host. If the hosts are disconnected, the cluster is unhealthy.

Recovery Guide: If the single-plane networking is used, check the IP address of the single plane. For a dual-plane network, the operation procedure is as follows:

1. Check the network connectivity between the service plane IP addresses of the active and standby management nodes.
If the network is abnormal, go to [3](#).
If the network is normal, go to [2](#).
2. Check the network connectivity between the IP address of the active management node and the IP address of the abnormal node in the cluster.
3. If the network is disconnected, contact O&M personnel to rectify the network fault to ensure that the network meets service requirements.

Host Status

Indicator: Host Status

Description: This indicator is used to check whether the host status is normal. If a node is faulty, the host is unhealthy.

Recovery Guide: If the indicator is abnormal, rectify the fault by referring to ALM-12006.

Alarm Check

Indicator: Alarm Check

Description: This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

9.8.9 HDFS Health Check Indicators

Average Packet Sending Time

Indicator: Average Packet Sending Time

Description: This indicator is used to collect statistics on the average time for the DataNode in the HDFS to execute SendPacket each time. If the average time is greater than 2,000,000 ns, the DataNode is unhealthy.

Recovery Guide: If the indicator is abnormal, check whether the network speed of the cluster is normal and whether the memory or CPU usage is too high. Check whether the HDFS load in the cluster is high.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the HDFS service status is normal. If a node is faulty, the host is unhealthy.

Recovery Guide: If the indicator is abnormal, check whether the health status of the KrbServer, LdapServer and ZooKeeper services are faulty. If yes, rectify the fault. Then, check whether the file writing failure is caused by HDFS SafeMode ON. Use the client to check whether data cannot be written into HDFS and locate the cause of the HDFS data writing failure. Handle the alarm following instructions in the alarm processing document.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

9.8.10 Hive Health Check Indicators

Maximum Number of Sessions Allowed by HiveServer

Indicator: Maximum Number of Sessions Allowed by HiveServer

Description: This indicator is used to check the maximum number of sessions that can be connected to Hive.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Number of Sessions Connected to HiveServer

Indicator: Number of Sessions Connected to HiveServer

Description: This indicator is used to check the number of Hive connections.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Hive service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

9.8.11 Kafka Health Check Indicators

Number of Available Broker Nodes

Indicator: Number of Brokers

Description: This indicator is used to check the number of available Broker nodes in a cluster. If the number of available Broker nodes in a cluster is less than 2, the cluster is unhealthy.

Recovery Guide: If the indicator is abnormal, go to the Kafka service instance page and click the host name of the unavailable Broker instance. View the host health status in the **Overview** area. If the host health status is **Good**, rectify the fault by referring to the alarm handling suggestions in **Process Fault**. If the status is not **Good**, rectify the fault by referring to the handling procedure of the **Node Fault** alarm.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Kafka service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If the indicator is abnormal, rectify the fault by referring to the alarm "Kafka Service Unavailable".

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

9.8.12 KrbServer Health Check Indicators

KerberosAdmin Service Availability

Indicator: KerberosAdmin Service Availability

Description: The system checks the KerberosAdmin service status. If the check result is abnormal, the KerberosAdmin service is unavailable.

Recovery Guide: If the indicator check result is abnormal, the possible cause is that the node where the KerberosAdmin service is located is faulty or the SlapdServer service is unavailable. During the KerberosAdmin service recovery, try the following operations:

1. Check whether the node where the KerberosAdmin service locates is faulty.
2. Check whether the SlapdServer service is unavailable.

KerberosServer Service Availability

Indicator: KerberosServer Service Availability

Description: The system checks the KerberosServer service status. If the check result is abnormal, the KerberosServer service is unavailable.

Recovery Guide: If the indicator check result is abnormal, the possible cause is that the node where the KerberosServer service is located is faulty or the SlapdServer service is unavailable. During the KerberosServer service recovery, try the following operations:

1. Check whether the node where the KerberosServer service locates is faulty.
2. Check whether the SlapdServer service is unavailable.

Service Health Status

Indicator: Service Status

Description: The system checks the KrbServer service status. If the check result is abnormal, the KrbServer service is unavailable.

Recovery Guide: If the indicator check result is abnormal, the possible cause is that the node where the KrbServer service resides is faulty or the LdapServer service is unavailable. For details, see the handling procedure of ALM-25500.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check the alarm information about the KrbServer service. If any alarms exist, the KrbServer service may be abnormal.

Recovery Guide: If this indicator check result is abnormal, see the related alarm document to handle the alarms.

9.8.13 LdapServer Health Check Indicators

SlapdServer Service Availability

Indicator: SlapdServer Service Availability

Description: The system checks the SlapdServer service status. If the status is abnormal, the SlapdServer service is unavailable.

Recovery Guide: If the indicator check result is abnormal, the possible cause is that the node where the SlapdServer service is located is faulty or the SlapdServer process is faulty. During the SlapdServer service recovery, try the following operations:

1. Check whether the node where the SlapdServer service locates is faulty. For details, see ALM-12006.
2. Check whether the SlapdServer process is normal. For details, see ALM-12007.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check the alarm information about the LdapServer service. If the status is abnormal, the LdapServer service is unavailable.

Recovery Guide: If the indicator check result is abnormal, the possible cause is that the node where the active LdapServer service resides is faulty or the active LdapServer process is faulty. For details, see ALM-25000.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check the alarm information about the LdapServer service. If any alarms exist, the LdapServer service may be abnormal.

Recovery Guide: If this indicator check result is abnormal, see the related alarm document to handle the alarms.

9.8.14 Loader Health Check Indicators

ZooKeeper Health Status

Indicator: ZooKeeper health status

Description: This indicator is used to check whether the ZooKeeper health status is normal. If the status is abnormal, the ZooKeeper service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

HDFS Health Status

Indicator: HDFS health status

Description: This indicator is used to check whether the HDFS health status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

DBService Health Status

Indicator: DBService Health Status

Description: This indicator is used to check whether the DBService health status is normal. If the status is abnormal, the DBService service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Yarn Health Status

Indicator: Yarn health status

Description: This indicator is used to check whether the Yarn health status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

MapReduce Health Status

Indicator: MapReduce Health Status

Description: This indicator is used to check whether the MapReduce health status is normal. If the status is abnormal, the MapReduce service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Loader Process Status

Indicator: Loader Process Status

Description: This indicator is used to check whether the Loader process is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Loader service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist for loader. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

9.8.15 MapReduce Health Check Indicators

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the MapReduce service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

9.8.16 OMS Health Check Indicators

OMS Status Check

Indicator: OMS Status Check

Description: The OMS status check includes the HA status check and resource status check. The HA status includes **active**, **standby**, and **NULL**, indicating the active node, standby node, and unknown, respectively. The resource status includes normal, abnormal, and NULL. If the HA status is NULL, the HA status is unhealthy. If the resource status is NULL or abnormal, the resource status is unhealthy.

Table 9-27 OMS status description

| Name | Description |
|-----------------|---|
| HA state | active: indicates the active node.
standby: indicates the standby node.
NULL: unknown |
| Resource status | normal: All resources are normal.
abnormal: indicates that abnormal resources exist.
NULL: unknown |

Recovery Guide:

1. Log in to the active management node and run the **su - omm** command to switch to user **omm**. Run the **`\${CONTROLLER_HOME}`/sbin/status-oms.sh** command to check the status of OMS.
2. If the HA status is NULL, the system may be restarting. NULL is an intermediate state, and the HA status will automatically change to a normal state.
3. If the resource status is abnormal, certain component resources of FusionInsight Manager are abnormal. Check whether the status of components such as acs, aos cep, controller, feed_watchdog, fms, gaussDB, httpd, iam, ntp, okerberos, oldap, pms, and tomcat component is normal.
4. If any Manager component resource is abnormal, see Manager component status check to rectify the fault.

Manager Component Status Check

Indicator: Manager Component Status Check

Description: This indicator is used to check the running status and HA status of Manager components. The resource running status includes **Normal** and **Abnormal**, and the resource HA status includes **Normal** and **Exception**. Manager components include Acs, Aos, Cep, Controller, feed_watchdog, Floatip, Fms, GaussDB, HeartBeatCheck, httpd, IAM, NTP, Okerberos, OLDAP, PMS, and Tomcat. If the running status and HA status is not Normal, the check result is unhealthy.

Table 9-28 Manager status description

| Name | Description |
|--------------------------|--|
| Resource running status: | Normal: The system is running properly.
Abnormal: The running is abnormal.
Stopped: The task is stopped.
Unknown: The status is unknown.
Starting: The process is being started.
Stopping: The task is being stopped.
Active_normal: The active node is running properly.
Standby_normal: The standby node is running properly.
Raising_active: The node is being promoted to be the active node.
Lowning_standby: The node is being set to be the standby node.
No_action: the action does not exist.
Repairing: The disk is being repaired.
NULL: unknown |
| Resource HA status | Normal: the status is normal.
Exception: indicates a fault.
Non_steady: indicates the non-steady state.
Unknown: unknown
NULL: unknown |

Recovery Guide:

1. Log in to the active management node and run the **su - omm** command to switch to user **omm**. Run the **`\${CONTROLLER_HOME}/sbin/status-oms.sh** command to check the status of OMS.
2. If floatip, okerberos, and oldap are abnormal, handle the problems by referring to ALM-12002, ALM-12004, and ALM-12005 respectively.
3. If other resources are abnormal, you are advised to view the logs of the faulty modules.

If controller resources are abnormal, view **/var/log/Bigdata/controller/controller.log** of the faulty node.

If CEP resources are abnormal, view **/var/log/Bigdata/omm/oms/cep/cep.log** of the faulty node.

If AOS resources are abnormal, view **/var/log/Bigdata/controller/aos/aos.log** of the faulty node.

If feed_watchdog resources are abnormal, view **/var/log/Bigdata/watchdog/watchdog.log** of the abnormal node.

If HTTPD resources are abnormal, view `/var/log/Bigdata/httpd/error_log` of the abnormal node.

If FMS resources are abnormal, view `/var/log/Bigdata/omm/oms/fms/fms.log` of the abnormal node.

If PMS resources are abnormal, view `/var/log/Bigdata/omm/oms/pms/pms.log` of the abnormal node.

If IAM resources are abnormal, view `/var/log/Bigdata/omm/oms/iam/iam.log` of the abnormal node.

If the GaussDB resource is abnormal, check the `/var/log/Bigdata/omm/oms/db/omm_gaussdba.log` of the abnormal node.

If NTP resources are abnormal, view `/var/log/Bigdata/omm/oms/ha/scriptlog/ha_ntp.log` of the abnormal node.

If Tomcat resources are abnormal, view `/var/log/Bigdata/tomcat/catalina.log` of the abnormal node.

4. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

OMA Running Status

Indicator: OMA Running Status

Description: This indicator is used to check the running status of the OMA. The status can be **Running** or **Stopped**. If the OMA is **Stopped**, the OMA is unhealthy.

Recovery Guide:

1. Log in to the unhealthy node and run the `su - omm` command to switch to user `omm`.
2. Run `${OMA_PATH}/restart_oma_app` to manually start the OMA and check again. If the check result is still unhealthy, go to [3](#).
3. If manually starting the OMA cannot resolve the problem, you are advised to check the OMA logs in `/var/log/Bigdata/omm/oma/omm_agent.log`.
4. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

SSH Trust Between Each Node and the Active Management Node

Indicator: SSH Trust Between Each Node and the Active Management Node

Description: This indicator is used to check whether the SSH mutual trust is normal. If you can switch to another node through SSH from the active OMS node as user `omm` without the need of entering the password, SSH communication is normal. Otherwise, SSH communication is abnormal. In addition, if you can switch to another node through SSH from the active OMS node but fail to switch to the active OMS node from the other nodes, SSH communication is abnormal.

Recovery Guide:

1. If the indicator check result is abnormal, the SSH trust relationships between the nodes and the active management node are abnormal. In this case, check whether the permission of the `/home/omm` directory is `omm`. If non-omm users have the directory permission, the SSH trust relationship may be

abnormal. You are advised to run **chown omm:wheel** to modify the permission and check again. If the permission on the **/home/omm** directory is normal, go to [2](#).

2. The SSH trust relationship exception may cause heartbeat exceptions between Controller and NodeAgent, resulting in node fault alarms. In this case, rectify the fault by referring to the handling procedure of ALM-12006.

Process Running Time

Indicator: Running Time of NodeAgent, Controller, and Tomcat

Description: This indicator is used to check the running time of the NodeAgent, Controller, and Tomcat processes. If the time is less than half an hour (1,800s), the process may have been restarted. You are advised to check the process after half an hour. If multiple check results indicate that the process runs for less than half an hour, the process is abnormal.

Recovery Guide:

1. Log in to the unhealthy node and run the **su - omm** command to switch to user **omm**.
2. Run the following command to check the PID based on the process name:
ps -ef | grep NodeAgent
3. Run the following command to check the process startup time based on the PID:

```
ps -p pid -o lstart
```

4. Check whether the process start time is normal. If the process restarts repeatedly, go to [5](#).
5. View the related logs and analyze restart causes.

If the runtime of NodeAgent is abnormal, check **/var/log/Bigdata/nodeagent/agentlog/agent.log**.

If the Controller running time is abnormal, check the **/var/log/Bigdata/controller/controller.log** file.

If the Tomcat running time is abnormal, check the **/var/log/Bigdata/tomcat/web.log** file.

6. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

Account and Password Expiration Check

Indicator: Account and Password Expiration Check

Description: This indicator checks the two operating system users **omm** and **ommdba** of MRS. For OS users, both the account and password expiration time must be checked. If the validity period of the account or password is not greater than 15 days, the account is abnormal.

Recovery Guide: If the validity period of the account or password is less than or equal to 15 days, contact O&M engineers.

9.8.17 Spark Health Check Indicators

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Spark service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If the indicator is abnormal, rectify the fault by referring to ALM-28001.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

9.8.18 Storm Health Check Indicators

Number of Working Nodes

Indicator: Number of Supervisors

Description: This indicator is used to check the number of available Supervisors in a cluster. If the number of available Supervisors in a cluster is less than 1, the cluster is unhealthy.

Recovery Guide: If the indicator is abnormal, go to the Streaming service instance page and click the host name of the unavailable Supervisor instance. View the host health status in the **Overview** area. If the host health status is **Good**, rectify the fault by referring to ALM-12007 Process Faults. If the status is not **Good**, rectify the fault by referring to the handling procedure of the ALM-12006 Node Faults.

Number of Idle Slots

Indicator: Number of Idle Slots

Description: This indicator is used to check the number of idle slots in a cluster. If the number of idle slots in a cluster is less than 1, the cluster is unhealthy.

Recovery Guide: If the indicator is abnormal, go to the Storm service instance page and check the health status of the Supervisor instance. If the health status of all Supervisor instances is **Good**, you need to expand the capacity of the Core node in the cluster. If not, rectify the fault by referring to ALM-12007 Process Faults.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Storm service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If the indicator is abnormal, rectify the fault by referring to the alarm "ALM-26051 Storm Service Unavailable".

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

9.8.19 Yarn Health Check Indicators

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Yarn service status is normal. If the number of NodeManager nodes cannot be obtained, the system is unhealthy.

Recovery Guide: If this indicator is abnormal, you can handle the alarm by referring to the alarm handling guide and make sure that the network is normal.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

9.8.20 ZooKeeper Health Check Indicators

Average ZooKeeper Request Processing Latency

Indicator: Average ZooKeeper Service Request Processing Latency

Description: This indicator is used to check the average delay for the ZooKeeper service to process requests. If the average delay is greater than 300 ms, the ZooKeeper service is unhealthy.

Recovery Guide: If the indicator is abnormal, check whether the network speed of the cluster is normal and whether the memory or CPU usage is too high.

ZooKeeper Connections Usage

Indicator: ZooKeeper Connections Usage

Description: This indicator is used to check whether the ZooKeeper memory usage exceeds 80%. If the disk usage exceeds the threshold, the system is unhealthy.

Recovery Guide: If the indicator is abnormal, you are advised to increase the memory available for the ZooKeeper service. The method of increasing the memory is as follows: Increase the value of `-Xmx` in the `GC_OPTS` configuration item in the ZooKeeper service. After the modification, restart the ZooKeeper service for the configuration to take effect.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether ZooKeeper service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If the indicator is abnormal, check whether the health status of the KrbServer and LdapServer services is faulty. If yes, rectify the fault. Log in to the ZooKeeper client, check whether the ZooKeeper data writing fails. If yes, find the failure cause based on the error message and handle the fault according to error message. Rectify the fault by following the procedure for handling ALM-13000.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

9.9 Static Service Pool Management

9.9.1 Viewing the Status of a Static Service Pool

Scenario

MRS Manager manages and isolates service resources that are not running on YARN through the static service resource pool. It dynamically manages the total CPU, I/O, and memory resources that can be used by HDFS and YARN on the deployment node. The system supports time-based automatic adjustment of static service resource pools. This enables the cluster to automatically adjust the parameter values at different periods to ensure more efficient resource utilization.

On MRS Manager, you can view the monitoring metrics of the resources used by each service in the static service pool. The monitoring metrics are as follows:

- Service Total CPU Usage
- Service Total Disk I/O Read Speed
- Service Total Disk I/O Write Speed

- Service Total Memory Usage

Procedure

Step 1 On MRS Manager, click **System**. In the **Resource** area, click **Configure Static Service Pool**.

Step 2 Click **Status**.

Step 3 Check the system resource adjustment base values.

- **System Resource Adjustment Base** indicates the maximum volume of resources that can be used by each node in the cluster. If a node has only one service, the service exclusively occupies the available resources on the node. If a node has multiple services, all services share the available resources on the node.
- **CPU(%)** indicates the maximum number of CPUs that can be used by services on a node.
- **Memory(%)** indicates the maximum memory that can be used by services on a node.

Step 4 Check the cluster service resource usage.

In the chart area, select **All services** from the service drop-down list box. The resource usage status of all services in the service pool is displayed.

NOTE

Effective Configuration Group indicates the resource control configuration group used by the cluster service. By default, the **default** configuration group is used at all time every day, indicating that the cluster service can use all CPUs and 70% memory of the node.

Step 5 View the resource usage of a single service.

In the chart area, select a service from the service drop-down list box. The resource usage status of the service is displayed.

Step 6 You can set the interval for automatically refreshing the page.

The following refresh interval options are supported:

- **Refresh every 30 seconds**
- **Refresh every 60 seconds**
- **Stop refreshing**

Step 7 In the **Period** area, select a time range for viewing service resources. The options are as follows:

- Real time
- Last 3 hours
- Last 6 hours
- Last 24 hours
- Last week
- Last month
- Last 3 months

- Last 6 months
- Customize: If you select this option, you can customize the period for viewing monitoring data.

Step 8 Click **View** to view the service resource data in the corresponding time range.

Step 9 Customize a service resource report.

1. Click **Customize** and select the service source indicators to be displayed.
 - Service Total Disk I/O Read Speed
 - Service Total Memory Usage
 - Service Total Disk I/O Write Speed
 - Service Total CPU Usage
2. Click **OK** to save the selected monitoring metrics for display.

 **NOTE**

Click **Clear** to cancel all the selected monitoring metrics in a batch.

Step 10 Export a monitoring report.

Click **Export**. MRS Manager will generate a report about the selected service resources in a specified time of period. Save the report.

 **NOTE**

To view the curve charts of monitoring metrics in a specified period, click **View**.

----End

9.9.2 Configuring a Static Service Pool

Scenario

If you need to control the node resources that can be used by the cluster service or the CPU usage of the node used by the cluster in different time periods, you can adjust the resource base on MRS Manager and customize the resource configuration groups.

Prerequisites

- After the static service pool is configured, the HDFS and YARN services need to be restarted. During the restart, the services are unavailable.
- After a static service pool is configured, the maximum number of resources used by each service and role instance cannot exceed the upper limit.

Procedure

Step 1 Modify the system resource adjustment base.

1. On MRS Manager, click **System**. In the **Resource** area, click **Configure Static Service Pool**.
2. Click **Configuration**. The service pool configuration group management page is displayed.

3. In the **System Resource Adjustment Base** area, change the values of **CPU(%)** and **Memory(%)**.

Modifying **System Resource Adjustment Base** limits the maximum physical CPU and memory resource percentage of nodes that can be used by the Flume, HBase, HDFS, Impala and YARN services. If multiple services are deployed on the same node, the maximum physical resource usage of all services cannot exceed the adjusted CPU or memory usage.

4. Click **Next**.

If you need to modify the parameters again, click **Previous** in the lower part of the page.

Step 2 Modify the **default** configuration group of the service pool.

1. In the **Service Pool Configuration** table, set **CPU LIMIT(%)**, **CPU SHARE(%)**, **I/O(%)**, and **Memory(%)** for the Flume, HBase, HDFS, Impala, and YARN services.

NOTE

- The sum of **CPU LIMIT(%)** used by all services can exceed 100%.
 - The sum of **CPU SHARE(%)** and **I/O(%)** used by all services must be 100%. For example, if CPU resources are allocated to the HDFS and Yarn services, the total CPU resources allocated to the two services are 100%.
 - The sum of **Memory(%)** used by all services can be greater than, smaller than, or equal to 100%.
 - **Memory(%)** cannot take effect dynamically and can only be modified in the default configuration group.
2. Click in the blank area of the page to complete the editing. MRS Manager generates the correct values of service pool parameters in the **Detailed Configuration** area based on the cluster hardware resources and allocation information.
 3. You can click the edit icon on the right of **Detailed Configuration** to modify the parameter values of the service pool based on service requirements.

In the **Service Pool Configuration** area, click the specified service name. The **Detailed Configuration** area displays only the parameters of the service. Manual changing of parameter values does not refresh the service resource usage. In added configuration groups, the configuration group numbers of the parameters that take effect dynamically will be displayed. For example, **HBase: RegionServer: dynamic-config1.RES_CPUSET_PERCENTAGE**. The parameter functions do not change.

Table 9-29 Parameters of the static service pool

| Parameter | Description |
|--|--|
| <ul style="list-style-type: none"> - RES_CPUSET_PERCENTAGE - dynamic-configX.RES_CPUSET_PERCENTAGE | Configures the service CPU percentage. |

| Parameter | Description |
|---|---|
| <ul style="list-style-type: none">- RES_CPU_SHARE- dynamic-configX.RES_CPU_SHARE | Configures the service CPU share. |
| <ul style="list-style-type: none">- RES_BLKIO_WEIGHT- dynamic-configX.RES_BLKIO_WEIGHT | Configures service I/O usage. |
| HBASE_HEAPSIZE | Configures the maximum JVM memory for RegionServer. |
| HADOOP_HEAPSIZE | Configures the maximum JVM memory of a DataNode. |
| yarn.nodemanager.resource.memory-mb | Configures the memory that can be used by NodeManager on the current node. |
| dfs.datanode.max.locked.memory | Configures the maximum memory that can be used by a DataNode as the HDFS cache. |
| FLUME_HEAPSIZE | Configures the maximum JVM memory that can be used by each Flume instance. |
| IMPALAD_MEM_LIMIT | Configures the maximum memory that can be used by an Impalad instance. |

Step 3 Add a customized resource configuration group.

1. Determine whether to automatically adjust resource configurations based on the time.
If yes, go to [Step 3.2](#).
If no, go to [Step 4](#).
2. Click  to add a resource configuration group. In the **Scheduling Time** area, click the edit icon. The time policy configuration page is displayed.
Modify the following parameters based on service requirements and click **OK**.
 - **Repeat**: If selected, the resource configuration group runs repeatedly based on the scheduling period. If not selected, set the date and time when the configuration of the group of resources can be applied.
 - **Repeat Policy**: can be set to **Daily**, **Weekly**, and **Monthly**. This parameter is valid only when **Repeat** is selected.
 - **Between**: indicates the time period between the start time and end time when the resource configuration is applied. Set a unique time range. If the time range overlaps with that of an existing group of resource configuration, the time range cannot be saved. This parameter is valid only when **Repeat** is selected.

 **NOTE**

- The **default** group of resource configuration takes effect in all undefined time segments.
 - The newly added resource group is a parameter set that takes effect dynamically in a specified time range.
 - The newly added resource group can be deleted. A maximum of four resource configuration groups that take effect dynamically can be added.
 - Select a repetition policy. If the end time is earlier than the start time, the next day is labeled by default. For example, if a validity period ranges from 22:00 to 06:00, the customized resource configuration takes effect from 22:00 on the current day to 06:00 on the next day.
 - If the repeat policy types of multiple configuration groups are different, the time ranges can overlap. The policy types are listed as follows by priority from low to high: daily, weekly, and monthly. The following is an example. There are two resource configuration groups using the monthly and daily policies, respectively. Their application time ranges in a day overlap as follows: [04:00 to 07:00] and [06:00 to 08:00]. In this case, the configuration of the group that uses the monthly policy prevails.
 - If the repeat policy types of multiple resource configuration groups are the same, the time ranges of different dates can overlap. For example, if there are two weekly scheduling groups, you can set the same time range on different day for them, such as to 04:00 to 07:00, on Monday and Wednesday, respectively.
3. On the **Service Pool Configuration** page, modify the resource configuration of each service. Click the blank area on the page to complete the editing, and go to [Step 4](#).

You can click the edit icon on the right of **Service Pool Configuration** to modify the parameters. Click the edit icon in the **Detailed Configuration** area to manually update the parameter values generated by the system based on service requirements.

Step 4 Saves the settings.

Click **Save**. In the **Save Configuration** dialog box, select **Restart the affected services or instances**. Click **OK** to save the settings and restart related services.

Operation succeeded is displayed. Click **Finish**. The service is started.

----End

9.10 Tenant Management

9.10.1 Overview

Definition

An MRS cluster provides various resources and services for multiple organizations, departments, or applications to share. The cluster provides tenants as a logical entity to use these resources and services. A mode involving different tenants is called multi-tenant mode. Currently, only the analysis cluster supports tenant management.

Principles

The MRS cluster provides the multi-tenant function. It supports a layered tenant model and allows dynamic adding or deleting of tenants to isolate resources. It dynamically manages and configures tenants' computing and storage resources.

The computing resources indicate tenants' Yarn task queue resources. The task queue quota can be modified, and the task queue usage status and statistics can be viewed.

The storage resources can be stored on HDFS. You can add and delete the HDFS storage directories of tenants, and set the quotas of file quantity and the storage space of the directories.

As the unified tenant management platform of MRS clusters, MRS Manager provides enterprises with time-tested multi-tenant management models, enabling centralized tenant and service management. Tenants can create and manage tenants in a cluster based on service requirements.

- Roles, computing resources, and storage resources are automatically created when tenants are created. By default, all permissions of the new computing resources and storage resources are allocated to a tenant's roles.
- Permissions to view the current tenant's resources, add a subtenant, and manage the subtenant's resources are granted to the tenant's roles by default.
- After you have modified the tenant's computing or storage resources, permissions of the tenant's roles are automatically updated.

MRS Manager supports a maximum of 512 tenants. The tenants that are created by default in the system contain **default**. Tenants that are in the topmost layer with the default tenant are called level-1 tenants.

Resource Pools

Yarn task queues support only the label-based scheduling policy. This policy enables Yarn task queues to associate NodeManagers that have specific node labels. In this way, Yarn tasks run on specified nodes so that tasks are scheduled and certain hardware resources are utilized. For example, Yarn tasks requiring a large memory capacity can run on nodes with a large memory capacity by means of label association, preventing poor service performance.

In an MRS cluster, the tenant logically divides Yarn cluster nodes to combine multiple NodeManagers into a resource pool. Yarn task queues can be associated with specified resource pools by configuring queue capacity policies, ensuring efficient and independent resource utilization in the resource pools.

MRS Manager supports a maximum of 50 resource pools. The system has a **Default** resource pool.

9.10.2 Creating a Tenant

Scenario

You can create a tenant on MRS Manager to specify the resource usage.

Prerequisites

- A tenant name has been planned. The name must not be the same as that of a role or Yarn queue that exists in the current cluster.
- If a tenant requires storage resources, a storage directory has been planned based on service requirements, and the planned directory does not exist under the HDFS directory.
- The resources that can be allocated to the current tenant have been planned and the sum of the resource percentages of direct sub-tenants under the parent tenant at every level does not exceed 100%.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click **Create Tenant**. On the page that is displayed, configure tenant properties.

Table 9-30 Tenant parameters

| Parameter | Description |
|---|--|
| Name | Specifies the name of the current tenant. The value consists of 1 to 20 characters, and can contain letters, numbers, and underscores (_). |
| Tenant Type | The options include Leaf and Non-leaf . If Leaf is selected, the current tenant is a leaf tenant and no sub-tenant can be added. If Non-leaf is selected, sub-tenants can be added to the current tenant. |
| Dynamic Resources | Specifies the dynamic computing resources for the current tenant. The system automatically creates a task queue named after the tenant name in Yarn. When dynamic resources are not Yarn , the system does not automatically create a task queue. |
| Default Resource Pool Capacity (%) | Specifies the percentage of the computing resources used by the current tenant in the default resource pool. |
| Default Resource Pool Max. Capacity (%) | Specifies the maximum percentage of the computing resources used by the current tenant in the default resource pool. |
| Storage Resource | Specifies storage resources for the current tenant. The system automatically creates a file folder named after the tenant name in the /tenant directory. When a tenant is created for the first time, the system automatically creates the /tenant directory in the HDFS root directory. If storage resources are not HDFS , the system does not create a storage directory under the root directory of HDFS. |

| Parameter | Description |
|------------------|---|
| Space Quota (MB) | <p>Specifies the quota for HDFS storage space used by the current tenant. The value ranges from 1 to 8796093022208. The unit is MB. This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used. If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the oHDFS physical disk.</p> <p>NOTE</p> <p>To ensure data reliability, one copy of a file is automatically generated when the file is stored in HDFS. That is, two copies of the same file are stored by default. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value of Storage Space Quota is set to 500, the actual space for storing files is about 250 MB ($500/2 = 250$).</p> |
| Storage Path | <p>Specifies the tenant's HDFS storage directory. The system automatically creates a file folder named after the tenant name in the /tenant directory by default. For example, the default HDFS storage directory for tenant ta1 is tenant/ta1. When a tenant is created for the first time, the system automatically creates the /tenant directory in the HDFS root directory. The storage path is customizable.</p> |
| Service | <p>Specifies other service resources associated with the current tenant. HBase is supported. To configure this parameter, click Associate Services. In the dialog box that is displayed, set Service to HBase. If Association Mode is set to Exclusive, service resources are occupied exclusively. If share is selected, service resources are shared.</p> |
| Description | <p>Specifies the description of the current tenant.</p> |

Step 3 Click **OK** to save the settings.

It takes a few minutes to save the settings. If the **Tenant created successfully** is displayed in the upper-right corner, the tenant is added successfully.

NOTE

- Roles, computing resources, and storage resources are automatically created when tenants are created.
- The new role has permissions on the computing and storage resources. The role and its permissions are controlled by the system automatically and cannot be controlled manually under **Manage Role**.
- If you want to use the tenant, create a system user and assign the `Manager_tenant` role and the role corresponding to the tenant to the user. For details, see [Creating a User](#).

----End

Related Tasks

Viewing an added tenant

Step 1 On MRS Manager, click **Tenant**.

Step 2 In the tenant list on the left, click the name of the added tenant.

The **Summary** tab is displayed on the right by default.

Step 3 View **Basic Information**, **Resource Quota**, and **Statistics** of the tenant.

If HDFS is in the **Stopped** state, **Available** and **Used** of **Space** in **Resource Quota** are **unknown**.

----End

9.10.3 Creating a Sub-tenant

Scenario

You can create a sub-tenant on MRS Manager if the resources of the current tenant need to be further allocated.

Prerequisites

- A parent tenant has been added.
- A tenant name has been planned. The name must not be the same as that of a role or Yarn queue that exists in the current cluster.
- If a sub-tenant requires storage resources, a storage directory has been planned based on service requirements, and the planned directory does not exist under the storage directory of the parent tenant.
- The resources that can be allocated to the current tenant have been planned and the sum of the resource percentages of direct sub-tenants under the parent tenant at every level does not exceed 100%.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 In the tenant list on the left, move the cursor to the tenant node to which a sub-tenant is to be added. Click **Create sub-tenant**. On the displayed page, configure the sub-tenant attributes according to the following table:

Table 9-31 Sub-tenant parameters

| Parameter | Description |
|---------------|--|
| Parent tenant | Specifies the name of the parent tenant. |
| Name | Specifies the name of the current tenant. The value consists of 1 to 20 characters, and can contain letters, numbers, and underscores (_). |

| Parameter | Description |
|---|---|
| Tenant Type | The options include Leaf and Non-leaf . If Leaf is selected, the current tenant is a leaf tenant and no sub-tenant can be added. If Non-leaf is selected, sub-tenants can be added to the current tenant. |
| Dynamic Resources | Specifies the dynamic computing resources for the current tenant. The system automatically creates a task queue named after the sub-tenant name in the Yarn parent queue. When dynamic resources are not Yarn , the system does not automatically create a task queue. If the parent tenant does not have dynamic resources, the sub-tenant cannot use dynamic resources. |
| Default Resource Pool Capacity (%) | Specifies the percentage of the resources used by the current tenant. The base value is the total resources of the parent tenant. |
| Default Resource Pool Max. Capacity (%) | Specifies the maximum percentage of the computing resources used by the current tenant. The base value is the total resources of the parent tenant. |
| Storage Resource | Specifies storage resources for the current tenant. The system automatically creates a file in the HDFS parent tenant directory. The file is named the same as the name of the sub-tenant. If storage resources are not HDFS , the system does not create a storage directory under the root directory of HDFS. If the parent tenant does not have storage resources, the sub-tenant cannot use storage resources. |
| Space Quota (MB) | <p>Specifies the quota for HDFS storage space used by the current tenant. The minimum value is 1, and the maximum value is the total storage quota of the parent tenant. The unit is MB. This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used. If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the oHDFS physical disk. If the quota is greater than the quota of the parent tenant, the actual storage capacity is subject to the quota of the parent tenant.</p> <p>NOTE</p> <p>To ensure data reliability, one copy of a file is automatically generated when the file is stored in HDFS. That is, two copies of the same file are stored by default. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value is set to 500, the actual space for storing files is about 250 MB ($500/2 = 250$).</p> |

| Parameter | Description |
|--------------|---|
| Storage Path | Specifies the tenant's HDFS storage directory. The system automatically creates a file folder named after the sub-tenant name in the directory of the parent tenant by default. For example, if the sub-tenant is ta1s and the parent directory is tenant/ta1 , the system sets this parameter for the sub-tenant to tenant/ta1/ta1s . The storage path is customizable in the parent directory. The parent directory for the storage path must be the storage directory of the parent tenant. |
| Service | Specifies other service resources associated with the current tenant. HBase is supported. To configure this parameter, click Associate Services . In the dialog box that is displayed, set Service to HBase . If Association Mode is set to Exclusive , service resources are occupied exclusively. If share is selected, service resources are shared. |
| Description | Specifies the description of the current tenant. |

Step 3 Click **OK** to save the settings.

It takes a few minutes to save the settings. If the **Tenant created successfully** is displayed in the upper-right corner, the tenant is added successfully. The tenant is created successfully.

 **NOTE**

- Roles, computing resources, and storage resources are automatically created when tenants are created.
- The new role has permissions on the computing and storage resources. The role and its permissions are controlled by the system automatically and cannot be controlled manually under **Manage Role**.
- When using this tenant, create a system user and assign the user a related tenant role. For details, see [Creating a User](#).

----End

9.10.4 Deleting a tenant

Scenario

You can delete a tenant that is not required on MRS Manager.

Prerequisites

- A tenant has been added.
- You have checked whether the tenant to be deleted has sub-tenants. If the tenant has sub-tenants, delete them; otherwise, you cannot delete the tenant.

- The role of the tenant to be deleted cannot be associated with any user or user group. For details about how to cancel the binding between a role and a user, see [Modifying User Information](#).

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 In the tenant list on the left, move the cursor to the tenant node to be deleted and click **Delete**.

The **Delete Tenant** dialog box is displayed. If you want to save the tenant data, select **Reserve the data of this tenant**. Otherwise, the tenant's storage space will be deleted.

Step 3 Click OK to save the settings.

It takes a few minutes to save the configuration. After the tenant is deleted successfully, the role and storage space of the tenant are also deleted.

NOTE

- After the tenant is deleted, the task queue of the tenant still exists in Yarn.
- If you choose not to reserve data when deleting the parent tenant, data of sub-tenants is also deleted if the sub-tenants use storage resources.

----End

9.10.5 Managing a Tenant Directory

Scenario

You can manage the HDFS storage directory used by a specific tenant on MRS Manager. The management operations include adding a tenant directory, modifying the directory file quota, modifying the storage space, and deleting a directory.

Prerequisites

A tenant associated with HDFS storage resources has been added.

Procedure

- Viewing a tenant directory
 - a. On MRS Manager, click **Tenant**.
 - b. In the tenant list on the left, click the target tenant.
 - c. Click the **Resource** tab.
 - d. View the **HDFS Storage** table.
 - The Quota column indicates the quantity quotas of files and directories.
 - The **Storage Space Quota** column indicates the storage space size of the tenant directory.

- Adding a tenant directory
 - a. On MRS Manager, click **Tenant**.
 - b. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be added.
 - c. Click the **Resource** tab.
 - d. In the **HDFS Storage** table, click **Create Directory**.
 - In **Parent Directory**, select a storage directory of a parent tenant.
This parameter applies only to sub-tenants. If the parent tenant has multiple directories, select any of them.
 - Set **Path** to a tenant directory path.

 **NOTE**

- If the current tenant is not a sub-tenant, the new path is created in the HDFS root directory.
- If the current tenant is a sub-tenant, the new path is created in the specified directory.

A complete HDFS storage directory can contain a maximum of 1,023 characters. An HDFS directory name contains digits, letters, spaces, and underscores (_). The name cannot start or end with a space.

- Set **Quota** to the quotas of file and directory quantity.
Maximum Number of Files/Directories is optional. Its value ranges from **1** to **9223372036854775806**.
- Set **Storage Space Quota** to the storage space size of the tenant directory.
The value of **Storage Space Quota** ranges from **1** to **8796093022208**.

 **NOTE**

To ensure data reliability, one copy of a file is automatically generated when the file is stored in HDFS. That is, two copies of the same file are stored by default. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value of **Storage Space Quota** is set to **500**, the actual space for storing files is about 250 MB ($500/2 = 250$).

- e. Click **OK**. The system creates tenant directories in the HDFS root directory.
- Modify a tenant directory.
 - a. On MRS Manager, click **Tenant**.
 - b. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be modified.
 - c. Click the **Resource** tab.
 - d. In the **HDFS Storage** table, click **Modify** in the **Operation** column of the specified tenant directory.
 - Set **Quota** to the quotas of file and directory quantity.
Maximum Number of Files/Directories is optional. Its value ranges from **1** to **9223372036854775806**.

- Set **Storage Space Quota** to the storage space size of the tenant directory.

The value of **Storage Space Quota** ranges from **1** to **8796093022208**.

 **NOTE**

To ensure data reliability, one copy of a file is automatically generated when the file is stored in HDFS. That is, two copies of the same file are stored by default. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value of **Storage Space Quota** is set to **500**, the actual space for storing files is about 250 MB ($500/2 = 250$).

- e. Click **OK**.
- Delete a tenant directory.
 - a. On MRS Manager, click **Tenant**.
 - b. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be deleted.
 - c. Click the **Resource** tab.
 - d. In the **HDFS Storage** table, click **Delete** in the **Operation** column of the specified tenant directory.

The default HDFS storage directory set during tenant creation cannot be deleted. Only the newly added HDFS storage directory can be deleted.
 - e. Click **OK**.

9.10.6 Restoring Tenant Data

Scenario

Tenant data is stored on Manager and in cluster components by default. When components are restored from faults or reinstalled, some tenant configuration data may be abnormal. In this case, you can manually restore the tenant data.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 In the tenant list on the left, click a tenant node.

Step 3 Check the status of the tenant data.

1. In **Summary**, check the color of the circle on the left of **Basic Information**. Green indicates that the tenant is available and gray indicates that the tenant is unavailable.
2. Click **Resources** and check the circle on the left of **Yarn** or **HDFS Storage**. Green indicates that the resource is available, and gray indicates that the resource is unavailable.
3. Click **Service Association** and check the **Status** column of the associated service table. **Good** indicates that the component can provide services for the associated tenant. **Bad** indicates that the component cannot provide services for the tenant.

4. If any check result is abnormal, go to [Step 4](#) to restore tenant data.

Step 4 Click **Restore Tenant Data**.

Step 5 In the **Restore Tenant Data** window, select one or more components whose data needs to be restored. Click **OK**. The system automatically restores the tenant data.

----End

9.10.7 Creating a Resource Pool

Scenario

In an MRS cluster, users can logically divide Yarn cluster nodes to combine multiple NodeManagers into a Yarn resource pool. Each NodeManager belongs to one resource pool only. The system contains a **Default** resource pool by default. All NodeManagers that are not added to customized resource pools belong to this resource pool.

You can create a customized resource pool on MRS Manager and add hosts that have not been added to other customized resource pools to it.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click the **Resource Pools** tab.

Step 3 Click **Add Resource Pool**.

Step 4 In **Create Resource Pool**, set the properties of the resource pool.

- **Name:** Enter a name for the resource pool. The name of the newly created resource pool cannot be **Default**.

The name consists of 1 to 20 characters and can contain digits, letters, and underscores (_) but cannot start with an underscore (_).

- **Hosts:** In the host list on the left, select the name of a specified host and click

to add the selected host to the resource pool. Only hosts in the cluster can be selected. The host list of a resource pool can be left blank.

Step 5 Click **OK**.

Step 6 After a resource pool is created, users can view the **Name**, **Members**, **Type**, **vCore** and **Memory** in the resource pool list. Hosts that are added to the customized resource pool are no longer members of the **Default** resource pool.

----End

9.10.8 Modifying a Resource Pool

Scenario

You can modify members of an existing resource pool on MRS Manager.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click the **Resource Pools** tab.

Step 3 Locate the row that contains the specified resource pool, and click **Modify** in the **Operation** column.

Step 4 In **Modify Resource Pool**, modify **Added Hosts**.

- Adding a host: Select the name of a specified host in host list on the left and click  to add the selected host to the resource pool.
- Deleting a host: In the host list on the right, select the name of a specified host and click  to add the selected host to the resource pool. The host list of a resource pool can be left blank.

Step 5 Click **OK**.

----End

9.10.9 Deleting a Resource Pool

Scenario

You can delete an existing resource pool on MRS Manager.

Prerequisites

- Any queue in a cluster cannot use the resource pool to be deleted as the default resource pool. Before deleting the resource pool, cancel the default resource pool. For details, see [Configuring a Queue](#).
- Resource distribution policies of all queues have been cleared from the resource pool being deleted. For details, see [Clearing Configuration of a Queue](#).

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click the **Resource Pools** tab.

Step 3 Locate the row that contains the specified resource pool, and click **Delete** in the **Operation** column.

In the displayed dialog box, click **OK**.

----End

9.10.10 Configuring a Queue

Scenario

This section describes how to modify the queue configuration for a specified tenant on MRS Manager.

Prerequisites

A tenant associated with Yarn and allocated dynamic resources has been added.

Procedure

- Step 1** On MRS Manager, click **Tenant**.
- Step 2** Click the **Dynamic Resource Plan** tab.
- Step 3** Click the **Queue Configuration** tab.
- Step 4** In the tenant queue table, click **Modify** in the **Operation** column of the specified tenant queue.

NOTE

In the tenant list on the left of the **Tenant Management** tab, click the target tenant. In the window that is displayed, choose **Resource**. On the page that is displayed, click the edit icon to open the queue modification page.

Table 9-32 Queue configuration parameters

| Parameter | Description |
|--------------------------------|---|
| Maximum Application | Specifies the maximum number of applications. The value ranges from 1 to 2147483647. |
| Maximum AM Resource Percent | Specifies the maximum percentage of resources that can be used to run the ApplicationMaster in a cluster. The value ranges from 0 to 1. |
| Minimum User Limit Percent (%) | Specifies the minimum percentage of resources consumed by a user. The value ranges from 0 to 100. |
| User Limit Factor | Specifies the limit factor of the maximum user resource usage. The maximum user resource usage percentage can be obtained by multiplying the limit factor with the percentage of the tenant's actual resource usage in the cluster. The minimum value is 0 . |
| Status | Specifies the current status of a resource plan. The values are Running and Stopped . |
| Default Resource Pool | Specifies the resource pool used by a queue. The default value is Default . If you want to change the resource pool, configure the queue capacity first. For details, see Configuring the Queue Capacity Policy of a Resource Pool . |

----End

9.10.11 Configuring the Queue Capacity Policy of a Resource Pool

Scenario

After a resource pool is added, the capacity policies of available resources need to be configured for Yarn task queues. This ensures that tasks in the resource pool are running properly. Each queue can be configured with the queue capacity policy of only one resource pool. Users can view the queues in any resource pool and configure queue capacity policies. After the queue policies are configured, Yarn task queues and resource pools are associated.

You can configure queue policies on MRS Manager.

Prerequisites

- A resource pool has been added.
- The task queues are not associated with other resource pools. By default, all queues are associated with the **Default** resource pool.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click the **Dynamic Resource Plan** tab.

Step 3 In **Resource Pools**, select a specified resource pool.

Available Resource Quota: indicates that all resources in each resource pool are available for queues by default.

Step 4 Locate the specified queue in the **Resource Allocation** table, and click **Modify** in the **Operation** column.

Step 5 In **Modify Resource Allocation**, configure the resource capacity policy of the task queue in the resource pool.

- **Capacity (%)**: specifies the percentage of the current tenant's computing resource usage.
- **Maximum Capacity (%)**: specifies the percentage of the current tenant's maximum computing resource usage.

Step 6 Click **OK** to save the settings.

----End

9.10.12 Clearing Configuration of a Queue

Scenario

Users can clear the configuration of a queue on MRS Manager when the queue does not need resources from a resource pool or if a resource pool needs to be

disassociated from the queue. Clearing queue configurations means that the resource capacity policy of the queue is canceled.

Prerequisites

If a queue is to be unbound from a resource pool, this resource pool cannot serve as the default resource pool of the queue. Therefore, you must first change the default resource pool of the queue to another one. For details, see [Configuring a Queue](#).

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click the **Dynamic Resource Plan** tab.

Step 3 In **Resource Pools**, select a specified resource pool.

Step 4 Locate the specified queue in the **Resource Allocation** table, and click **Clear** in the **Operation** column.

In the **Clear Queue Configuration** dialog box, click **OK** to clear the queue configuration in the current resource pool.

NOTE

If no resource capacity policy is configured for a queue, the clearing function is unavailable for the queue by default.

----End

9.11 Backup and Restoration

9.11.1 Introduction

Purpose

MRS Manager provides backup and restoration for user data and system data. The backup function is provided based on components to back up Manager data (including OMS data and LdapServer data), Hive user data, component metadata saved in DBService, and HDFS metadata.

Backup and restoration tasks are performed in the following scenarios:

- Routine backup is performed to ensure the data security of the system and components.
- If the system is faulty, the data backup can be used to recover the system.
- If the active cluster is completely faulty, a mirror cluster identical to the active cluster needs to be created. You can use the backup data to restore the active cluster.

Table 9-33 Backing up metadata

| Backup Type | Backup Content |
|-------------|---|
| OMS | Database data (excluding alarm data) and configuration data in the cluster management system to be backed up by default |
| LdapServer | User information, including the username, password, key, password policy, and group information |
| DBService | Metadata of the components (Hive) managed by DBService |
| NameNode | HDFS metadata. |

Principles

Task

Before backup or restoration, you need to create a backup or restoration task and set task parameters, such as the task name, backup data source, and type of backup file save path. Data backup and restoration can be performed by executing backup and restoration tasks. When the Manager is used to recover the data of HDFS, HBase, Hive, and NameNode, no cluster can be accessed.

Each backup task can back up data of different data sources and generates an independent backup file for each data source. All the backup files generated in each backup task form a backup file set, which can be used in restoration tasks. Backup data can be stored on Linux local disks, local cluster HDFS, and standby cluster HDFS. The backup task provides the full backup or incremental backup policies. HDFS and Hive backup tasks support the incremental backup policy, while OMS, LdapServer, DBService, and NameNode backup tasks support only the full backup policy.

 NOTE

Task execution rules:

- If a task is being executed, the task cannot be executed repeatedly and other tasks cannot be started at the same time.
- The interval at which a periodical task is automatically executed must be greater than 120s; otherwise, the task is postponed and will be executed in the next period. Manual tasks can be executed at any interval.
- When a periodic task is to be automatically executed, the current time cannot be 120s later than the task start time; otherwise, the task is postponed and executed in the next period.
- When a periodic task is locked, it cannot be automatically executed and needs to be manually unlocked.
- Before an OMS, LdapServer, DBService, or NameNode backup task starts, ensure that the LocalBackup partition on the active management node has more than 20 GB available space. Otherwise, the backup task cannot be started.
- When you are planning backup and restoration tasks, select the data to be backed up or restored strictly based on the service logic, data store structure, and database or table association. The system creates a default periodic backup task **default** whose execution interval is 24 hours to perform full backup of OMS, LdapServer, DBService, and NameNode data to the Linux local disk.

Specifications

Table 9-34 Backup and restoration feature specifications

| Item | Specifications |
|---|----------------|
| Maximum number of backup or restoration tasks | 100 |
| Number of concurrent running tasks | 1 |
| Maximum number of waiting tasks | 199 |
| Maximum size of backup files on a Linux local disk (GB) | 600 |

Table 9-35 Specifications of the **default** task

| Item | OMS | LdapServer | DBService | NameNode |
|-------------------------------|--------|------------|-----------|----------|
| Backup period | 1 hour | | | |
| Maximum number of copies | 2 | | | |
| Maximum size of a backup file | 10 MB | 20 MB | 100 MB | 1.5 GB |

| Item | OMS | LdapServer | DBService | NameNode |
|---------------------------------|---|------------|-----------|----------|
| Maximum size of disk space used | 20 MB | 40 MB | 200 MB | 3 GB |
| Save path of backup data | <i>Data save path/LocalBackup/</i> of the active and standby management nodes | | | |

 NOTE

The backup data of the **default** task must be periodically transferred and saved outside the cluster based on the enterprise O&M requirements.

9.11.2 Backing Up Metadata

Scenario

To ensure the security of metadata either on a routine basis or before and after performing critical metadata operations (such as scale-out, scale-in, patch installation, upgrades, and migration), metadata must be backed up. The backup data can be used to recover the system if an exception occurs or if the operation has not achieved the expected result. This minimizes the adverse impact on services. Metadata includes data of OMS, LdapServer, DBService, and NameNode. MRS Manager data to be backed up includes OMS data and LdapServer data.

By default, metadata backup is supported by the **default** task. This section describes how to create a backup task and back up metadata on MRS Manager. Both automatic backup tasks and manual backup tasks are supported.

Prerequisites

- A standby cluster for backing up data has been created, and the network is connected. The inbound rules of the two security groups on the peer cluster have been added to the two security groups in each cluster to allow all access requests of all protocols and ports of all ECSs in the security groups.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.

Procedure

Step 1 Create a backup task.

1. On MRS Manager, choose **System > Back Up Data**.
2. Click **Create Backup Task**.

Step 2 Configure a backup policy.

1. Set **Task Name** to the name of the backup task.

2. Set **Backup Mode** to the type of the backup task. **Periodic** indicates that the backup task is periodically executed. **Manual** indicates that the backup task is manually executed.

To create a periodic backup task, set the following parameters:

- **Started**: indicates the time when the task is started for the first time.
- **Period**: indicates the task execution interval. The options include **By hour** and **By day**.
- **Backup Policy**: indicates the volume of data to be backed up in each task execution. The options include **Full backup at the first time and incremental backup later**, **Full backup every time**, and **Full backup once every n times**. If you select **Full backup once every n times**, you need to specify the value of **n**.

Step 3 Select backup sources.

In the **Configuration** area, select **OMS** and **LdapServer** under **Metadata**.

Step 4 Set backup parameters.

1. Set **Path Type** of **OMS** and **LdapServer** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files. By default, the backup files are stored in *Data storage path/LocalBackup/*. If you select **LocalDir**, you need to set the maximum number of copies to specify the number of backup files that can be retained in the backup directory.
- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster. If you select **SFTP**, set the following parameters:
 - **Target Path**: indicates the HDFS directory for storing the backup files. The save path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory.
 - **Max Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
 - **Target Instance Name**: indicates the NameService name of the backup directory. The default value is **hacluster**.

2. Click **OK**.

Step 5 Execute the backup task.

In the **Operation** column of the created task in the backup task list, click **Back Up Now** if **Backup Mode** is set to **Periodic** or click **Start** if **Backup Mode** is set to **Manual** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name_Task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *Version_Data source_Task execution time.tar.gz*.

----End

9.11.3 Restoring Metadata

Scenario

You need to restore metadata in the following scenarios: A user modifies or deletes data unexpectedly, data needs to be retrieved, system data becomes abnormal or does not achieve the expected result, all modules are faulty, and data is migrated to a new cluster.

This section describes how to restore metadata on MRS Manager. Only manual restoration tasks are supported.

NOTICE

- Data restoration can be performed only when the system version is consistent with that during data backup.
 - To restore the data when services are normal, manually back up the latest management data first and then restore the data. Otherwise, the data that is generated after the data backup and before the data restoration will be lost.
 - Use the OMS data and LdapServer data backed up at the same time to restore data. Otherwise, the service and operation may fail.
 - By default, MRS clusters use DBService to store Hive metadata.
-

Impact on the System

- After the data is restored, the data generated between the backup time and restoration time is lost.
- After the data is restored, the configuration of the components that depend on DBService may expire and these components need to be restarted.

Prerequisites

- The data in the OMS and LdapServer backup files has been backed up at the same time.
- The status of the OMS resources and the LdapServer instances is normal. If the status is abnormal, data restoration cannot be performed.
- The status of the cluster hosts and services is normal. If the status is abnormal, data restoration cannot be performed.
- The cluster host topologies during data restoration and data backup are the same. If the topologies are different, data restoration cannot be performed and you need to back up data again.
- The services added to the cluster during data restoration and data backup are the same. If the services are different, data restoration cannot be performed and you need to back up data again.
- The status of the active and standby DBService instances is normal. If the status is abnormal, data restoration cannot be performed.
- The upper-layer applications depending on the MRS cluster have been stopped.

- On MRS Manager, you have stopped all the NameNode role instances whose data is to be recovered. Other HDFS role instances are running properly. After data is recovered, the NameNode role instances need to be restarted and cannot be accessed before the restart.
- You have checked whether NameNode backup files have been stored in the *Data save path/LocalBackup/* directory on the active management node.

Procedure

Step 1 Check the location of backup data.

1. On MRS Manager, choose **System > Back Up Data**.
2. In the row where the specified backup task resides, choose **More > View History** in the **Operation** column to display the historical execution records of the backup task. In the window that is displayed, select a success record and click **View Backup Path** in the corresponding column to view its backup path information. Find the following information:
 - **Backup Object**: indicates the backup data source.
 - **Backup Path**: indicates the full path where backup files are stored.
3. Select the correct path, and manually copy the full path of backup files in **Backup Path**.

Step 2 Create a restoration task.

1. On MRS Manager, choose System > Recovery Management.
2. On the page that is displayed, click **Create Restoration Task**.
3. Set **Task Name** to the name of the restoration task.

Step 3 Select restoration sources.

In **Configuration**, select the metadata component whose data is to be restored.

Step 4 Set the restoration parameters.

1. Set **Path Type** to a backup directory type.
2. The settings vary according to backup directory types:
 - **LocalDir**: indicates that the backup files are stored on the local disk of the active management node. If you select **LocalDir**, you need to set **Source Path** to specify the full path of the backup file. For example, *Data storage path/LocalBackup/Backup task name_Task creation time/Data source_Task execution time/Version number_Data source_Task execution time.tar.gz*.
 - **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster. If you select **SFTP**, set the following parameters:
 - **Source Path**: indicates the full HDFS path of a backup file. for example, *Backup path/Backup task name_Task creation time/Version_Data source_Task execution time.tar.gz*.
 - **Source Instance Name**: indicates the name of NameService corresponding to the backup directory when a restoration task is being executed. The default value is **hacluster**.

3. Click **OK**.

Step 5 Execute the restoration task.

In the restoration task list, locate the row where the created task resides, and click **Start** in the **Operation** column.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and try to execute the task again by clicking **Start**.

Step 6 Determine what metadata has been restored.

- If the OMS and LdapServer metadata is restored, go to [Step 7](#).
- If DBService data is restored, no further action is required.
- Restore NameNode data. On MRS Manager, choose **Services > HDFS > More > Restart Service**. The task is complete.

Step 7 Restarting Manager for the recovered data to take effect

1. In MRS Manager, Choose **LdapServer > More > Restart Service** and click **OK**. Wait until the LdapServer service is restarted successfully.
2. Log in to the active management node. For details, see [Determining Active and Standby Management Nodes](#).
3. Run the following command to restart OMS:

```
sh ${BIGDATA_HOME}/om-0.0.1/sbin/restart-oms.sh
```

The command has been executed successfully if the following information is displayed:
start HA successfully.
4. On MRS Manager, choose **KrbServer > More > Synchronize Configuration**. Do not select Restart the services and instances whose configuration has expired. Click **OK** and wait until the KrbServer service configuration is synchronized and restarted successfully.
5. Choose **Services > More > Synchronize Configuration**. Do not select Restart the services and instances whose configuration has expired. Click **OK** and wait until the cluster is configured and synchronized successfully.
6. Choose **Services > More > Stop Cluster**. After the cluster is stopped, choose **Services > More > Start Cluster**.

----End

9.11.4 Modifying a Backup Task

Scenario

This section describes how to modify the parameters of a created backup task on MRS Manager to meet changing service requirements. The parameters of restoration tasks can be viewed but not modified.

Impact on the System

After a backup task is modified, the new parameters take effect when the task is executed next time.

Prerequisites

- A backup task has been created.
- A new backup task policy has been planned based on the actual situation.

Procedure

Step 1 On MRS Manager, choose **System > Back Up Data**.

Step 2 In the task list, locate a specified task, click **Modify** in the **Operation** column to go to the configuration modification page.

Step 3 Modify the following parameters on the displayed page:

- Manual backup:
 - Target Path
 - Max Number of Backup Copies
- Periodic backup:
 - Started
 - Period
 - Target Path
 - Max Number of Backup Copies

NOTE

- When **Path Type** is set to **LocalHDFS**, **Target Path** is valid for modifying a backup task.
- After you change the value of **Target Path** for a backup task, full backup is performed by default when the task is executed for the first time.

Step 4 Click **OK**.

----End

9.11.5 Viewing Backup and Restoration Tasks

Scenario

This section describes how to view created backup and restoration tasks and check their running status on MRS Manager.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 Click **Back Up Data** or **Restore Data**.

Step 3 In the task list, obtain the previous execution result in the **Task Progress** column. Green indicates that the task is executed successfully, and red indicates that the execution fails.

Step 4 In the **Operation** column of a specified task in the task list, choose **More > View History** to view the historical record of backup and restoration execution.

In the displayed window, click **View** in the **Details** column. The task execution logs and paths are displayed.

----End

Related Tasks

- Modifying a backup task
For details, see [Modifying a Backup Task](#).
- Viewing a restoration task
In the **Operation** column of the specified task in the task list, click **View Details** to view the restoration task. You can only view but cannot modify the parameters of a restoration task.
- Executing a backup or restoration task
In the task list, locate a specified task and click **Start** in the **Operation** column to start a backup or restoration task that is ready or fails to be executed. Executed restoration tasks cannot be repeatedly executed.
- Stopping backup tasks
In the task list, locate a specified task and click **More > Stop** in the **Operation** column to stop a backup task that is running.
- Deleting a backup or restoration task
In the **Operation** column of the specified task in the task list, choose **More > Delete** to delete the backup or restoration task. After a task is deleted, the backup data is retained by default.
- Suspending a backup task
In the **Operation** column of the specified task in the task list, choose **More > Suspend** to suspend the backup task. Only periodic backup tasks can be suspended. Suspended backup tasks are no longer executed automatically. When you suspend a backup task that is being executed, the task execution stops. To cancel the suspension status of a task, click **More > Resume**.

9.12 Security Management

9.12.1 Default Users of Clusters with Kerberos Authentication Disabled

User Classification

The MRS cluster provides the following two types of users. Users are advised to periodically change the passwords. It is not recommended to use the default passwords.

| User Type | Description |
|----------------|---|
| System users | User who runs OMS processes |
| Database users | <ul style="list-style-type: none"> User who manages OMS database and accesses data User who runs the database of service components (Hive, Loader, and DBService) |

System users

NOTE

- User **ldap** of the OS is required in the MRS cluster. Do not delete this account. Otherwise, the cluster may not work properly. Password management policies are maintained by the operation users.
- Reset the passwords when you change the passwords of user **ommdba** and user **omm** for the first time. Change the passwords periodically after retrieving them.

| Operation | Username | Initial Password | Description |
|---|----------|---|--|
| System administrator of the MRS cluster | admin | Specified by the user during the cluster creation | <p>MRS Manager</p> <p>This user has the following permissions:</p> <ul style="list-style-type: none"> Common HDFS and ZooKeeper user permissions. Permissions to submit and query MapReduce and Yarn tasks, manage Yarn queues, and access the Yarn web UI. Permissions to submit, query, activate, deactivate, reassign, delete topologies, and operate all topologies of the Storm service. Permissions to create, delete, authorize, reassign, consume, write, and query topics of the Kafka service. |

| Operation | Username | Initial Password | Description |
|--------------------------|----------|----------------------------------|---|
| MRS cluster node OS user | omm | Randomly generated by the system | Internal running user of the MRS cluster system. This user is an OS user generated on all node and does not require a unified password. |
| MRS cluster node OS user | root | Set by the user | User for logging in to the node in the MRS cluster. This user is an OS user generated on all nodes. |

User Group Information

| Default User Group | Description |
|----------------------|---|
| supergroup | Primary group of user admin , which has no additional permissions in the cluster with Kerberos authentication disabled. |
| check_sec_ldap | Used to test whether the active LDAP works properly. This user group is generated randomly in a test and automatically deleted after the test is complete. which is an internal system user group used only between components. |
| Manager_tenant | Tenant system user group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled. |
| System_administrator | MRS cluster system administrator group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled. |
| Manager_viewer | MRS Manager system viewer group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled. |
| Manager_operator | MRS Manager system operator group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled. |
| Manager_auditor | MRS Manager system auditor group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled. |

| Default User Group | Description |
|-----------------------|--|
| Manager_administrator | MRS Manager system administrator group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled. |
| compcommon | MRS cluster internal group, used to access public resources in the cluster. All system users and system running users are added to this user group by default. |
| default_1000 | User group created for tenants, which is an internal system user group used only between components. |
| launcher-job | MRS internal group, which is used to submit jobs using V2 APIs. |

| OS User Group | Description |
|---------------|---|
| wheel | Primary group of MRS internal running user omm . |
| ficommon | MRS cluster common group that corresponds to compcommon for accessing public resource files stored in the OS of the cluster. |

Database users

MRS cluster system database users include OMS database users and DBService database users.

NOTE

Do not delete database users. Otherwise, the cluster or components may not work properly.

| Operation | Default User | Initial Password | Description |
|--------------------|--------------|-------------------|---|
| OMS database | ommdba | dbChangeMe@123456 | OMS database administrator who performs maintenance operations, such as creating, starting, and stopping. |
| | omm | ChangeMe@123456 | User for accessing OMS database data |
| DBService database | omm | dbserverAdmin@123 | Administrator of the GaussDB database in the DBService component |

| Operation | Default User | Initial Password | Description |
|-----------|--------------|------------------|---|
| | hive | HiveUser@ | User for Hive to connect to the DBService database |
| | hue | HueUser@123 | User for Hue to connect to the DBService database |
| | sqoop | SqoopUser@ | User for Loader to connect to the DBService database. |

9.12.2 Default Users of Clusters with Kerberos Authentication Enabled

User Classification

The MRS cluster provides the following three types of users. Users are advised to periodically change the passwords. It is not recommended to use the default passwords.

| User Type | Description |
|----------------------|---|
| System user | <ul style="list-style-type: none">User created on Manager for MRS cluster O&M and service scenarios. There are two types of users:<ul style="list-style-type: none">Human-machine user: used for Manager O&M scenarios and component client operation scenarios.Machine-machine user: used for MRS cluster application development scenarios.User who runs OMS processes. |
| Internal system user | Internal user who performs process communications, saves user group information, and associates user permissions. |
| Database user | <ul style="list-style-type: none">User who manages OMS database and accesses data.User who runs the database of service components (Hive, Hue, Loader, and DBService) |

System User

NOTE

- User **ldap** of the OS is required in the MRS cluster. Do not delete this account. Otherwise, the cluster may not work properly. Password management policies are maintained by the operation users.
- Reset the passwords when you change the passwords of user **ommdba** and user **omm** for the first time. Change the passwords periodically after retrieving them.

| Type | Username | Initial Password | Description |
|---|----------|--|--|
| System administrator of the MRS cluster | admin | Specified by the user during the cluster creation. | Manager administrator with the following permissions: <ul style="list-style-type: none">• Common HDFS and ZooKeeper user permissions.• Permissions to submit and query MapReduce and Yarn tasks, manage Yarn queues, and access the Yarn web UI.• Permissions to submit, query, activate, deactivate, reassign, delete topologies, and operate all topologies of the Storm service.• Permissions to create, delete, authorize, reassign, consume, write, and query topics of the Kafka service. |
| MRS cluster node OS user | omm | Randomly generated by the system. | Internal running user of the MRS cluster system. This user is an OS user generated on all nodes and does not require a unified password. |
| MRS cluster node OS user | root | Set by the user. | User for logging in to the node in the MRS cluster. This user is an OS user generated on all nodes. |

Internal System Users

NOTE

Do not delete the following internal system users. Otherwise, the cluster or components may not work properly.

| Type | Default User | Initial Password | Description |
|------------------------|--------------|------------------|--|
| Component running user | hdfs | Hdfs@123 | This user is the HDFS system administrator and has the following permissions:
<ol style="list-style-type: none">File system operation permissions:<ul style="list-style-type: none">Views, modifies, and creates files.Views and creates directories.Views and modifies the groups where files belong.Views and sets disk quotas for users.HDFS management operation permissions:<ul style="list-style-type: none">Views the web UI status.Views and sets the active and standby HDFS status.Enters and exits the HDFS in security mode.Checks the HDFS file system. |

| Type | Default User | Initial Password | Description |
|------|--------------|------------------|---|
| | hbase | Hbase@123 | This user is the HBase system administrator and has the following permissions: <ul style="list-style-type: none">• Cluster management permission: Enable and Disable operations on tables to trigger MajorCompact and ACL operations.• Grants and revokes permissions, and shuts down the cluster.• Table management permission: Creates, modifies, and deletes tables.• Data management permission: Reads and writes data in tables, column families, and columns.• Accesses the HBase web UI. |
| | mapred | Mapred@123 | This user is the MapReduce system administrator and has the following permissions: <ul style="list-style-type: none">• Submits, stops, and views the MapReduce tasks.• Modifies the Yarn configuration parameters.• Accesses the Yarn and MapReduce web UI. |
| | spark | Spark@123 | This user is the Spark system administrator and has the following permissions: <ul style="list-style-type: none">• Accesses the Spark web UI.• Submits Spark tasks. |

User Group Information

| Default User Group | Description |
|-----------------------|--|
| hadoop | Users added to this user group have the permission to submit tasks to all Yarn queues. |
| hbase | Common user group. Users added to this user group will not have any additional permission. |
| hive | Users added to this user group can use Hive. |
| spark | Common user group. Users added to this user group will not have any additional permission. |
| supergroup | Users added to this user group can have the administrator permission of HBase, HDFS, and Yarn and can use Hive. |
| check_sec_ldap | Used to test whether the active LDAP works properly. This user group is generated randomly in a test and automatically deleted after the test is complete. This is an internal system user group used only between components. |
| Manager_tenant | Tenant system user group, which is an internal system user group used only between components. |
| System_administrator | MRS cluster system administrator group, which is an internal system user group used only between components. |
| Manager_viewer | MRS Manager system viewer group, which is an internal system user group used only between components. |
| Manager_operator | MRS Manager system operator group, which is an internal system user group used only between components. |
| Manager_auditor | MRS Manager system auditor group, which is an internal system user group used only between components. |
| Manager_administrator | MRS Manager system administrator group, which is an internal system user group used only between components. |
| compcommon | Internal system group for accessing public resources in a cluster. All system users and system running users are added to this user group by default. |
| default_1000 | User group created for tenants, which is an internal system user group used only between components. |

| Default User Group | Description |
|--------------------|---|
| kafka | Kafka common user group. Users added to this group need to be granted with read and write permission by users in the kafkaadmin group before accessing the desired topics. |
| kafkasuperuser | Users added to this group have permissions to read data from and write data to all topics. |
| kafkaadmin | Kafka administrator group. Users added to this group have the permissions to create, delete, authorize, as well as read from and write data to all topics. |
| storm | Storm common user group. Users added to this group have the permissions to submit topologies and manage their own topologies. |
| stormadmin | Storm administrator user group. Users added to this group have the permissions to submit topologies and manage their own topologies. |
| opentsdb | Common user group. Users added to this user group will not have any additional permission. |
| presto | Common user group. Users added to this user group will not have any additional permission. |
| flume | Common user group. Users added to this user group will not have any additional permission. |
| launcher-job | MRS internal group, which is used to submit jobs using V2 APIs. |

| OS User Group | Description |
|---------------|---|
| wheel | Primary group of MRS internal running user omm . |
| ficommon | MRS cluster common group that corresponds to compcommon for accessing public resource files stored in the OS of the cluster. |

Database User

MRS cluster system database users include OMS database users and DBService database users.

NOTE

Do not delete database users. Otherwise, the cluster or components may not work properly.

| Type | Default User | Initial Password | Description |
|--------------------|--------------|-------------------|--|
| OMS database | ommdba | dbChangeMe@123456 | OMS database administrator who performs maintenance operations, such as creating, starting, and stopping applications. |
| | omm | ChangeMe@123456 | User for accessing OMS database data. |
| DBService database | omm | dbserverAdmin@123 | Administrator of the GaussDB database in the DBService component. |
| | hive | HiveUser@ | User for Hive to connect to the DBService database. |
| | hue | HueUser@123 | User for Hue to connect to the DBService database. |
| | sqoop | SqoopUser@ | User for Loader to connect to the DBService database. |
| | ranger | RangerUser@ | User for Ranger to connect to the DBService database. |

9.12.3 Changing the Password of an OS User

Scenario

This section describes how to periodically change the login passwords of the OS users **omm**, **ommdba**, and **root** on MRS cluster nodes to improve the system O&M security.

Passwords of users **omm**, **ommdba**, and **root** on each node can be different.

Procedure

- Step 1** Log in to the **Master1** node and then log in to other nodes whose OS user passwords need to be changed.
- Step 2** Run the following command to switch to user **root**:

```
sudo su - root
```
- Step 3** Run the following command to change the passwords of users **omm**, **ommdba**, or **root**:

```
passwd omm  
passwd ommdba  
passwd root
```

For example, if you run the **omm:passwd** command, the system displays the following information:

```
Changing password for user omm.  
New password:
```

Enter a new password. The password change policies for an OS vary according to the OS that is used.

```
Retype new password:  
passwd: all authentication tokens updated successfully.
```

NOTE

The default password complexity requirements of the MRS cluster are as follows:

- The password must contain at least eight characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#%&^&*()-_+=+|[{}];:","<.>/?).
- The new password cannot be the same as last five historical passwords.

----End

9.12.4 Changing the password of user admin

This section describes how to periodically change the password of cluster user **admin** to improve the system O&M security.

If the password is changed, the downloaded user credential will be unavailable. Download the authentication credential again, and replace the old one.

Changing the Password of User admin on the Cluster Node

- Step 1** Update the client of the active management node. For details, see [Updating a Client \(Versions Earlier Than 3.x\)](#).
- Step 2** Log in to the active management node.
- Step 3** (Optional) To change the password as user **omm**, run the following command to switch the user:

```
sudo su - omm
```
- Step 4** Run the following command to switch to the client directory, for example, **/opt/client**.

```
cd /opt/client
```
- Step 5** Run the following command to configure environment variables:

```
source bigdata_env
```
- Step 6** Run the following command to change the password of user **admin**: This operation takes effect in the whole cluster.

```
kpasswd admin
```

Enter the old password and then enter a new password twice.

For the cluster, the default password complexity requirements are as follows:

- The password must contain at least eight characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&*()-_+=\|[{]};:","<.>/?').
- The password cannot be the username or the reverse username.

----End

Changing the Password of User admin on MRS Manager

You can change the password of user **admin** on MRS Manager only for clusters with Kerberos authentication enabled and clusters with Kerberos authentication disabled but the EIP function enabled.

Step 1 Log in to MRS Manager as user **admin**.

Step 2 Click the username in the upper right corner of the page and choose **Change Password**.

Step 3 On the **Change Password** page, set **Old Password**, **New Password**, and **Confirm Password**.

Figure 9-12 Changing the password of user **admin**

The screenshot shows a web form titled "Change Password". It contains three input fields, each with a red asterisk icon to its left. The first field is labeled "Old Password" and has a red border with the placeholder text "Enter the old password.". The second field is labeled "New Password" and has the placeholder text "Enter the new password.". The third field is labeled "Confirm Password" and has the placeholder text "Enter the new password aç". Below these fields are two buttons: "OK" and "Cancel".

NOTE

The default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&*()-_+=\|[{]};:","<.>/?').
- The password cannot be the username or the reverse username.

Step 4 Click **OK**. Log in to MRS Manager with the new password.

----End

Resetting the Password for User admin

Step 1 Log in to the **Master1** node.

Step 2 (Optional) To change the password as user **omm**, run the following command to switch the user:

```
sudo su - omm
```

Step 3 Run the following command to switch to the client directory, for example, **/opt/client**:

```
cd /opt/client
```

Step 4 Run the following command to configure environment variables:

```
source bigdata_env
```

Step 5 Run the following command to log in to the console as user **kadmin/admin**:

```
kadmin -p kadmin/admin
```

 **NOTE**

The default password of user **kadmin/admin** is **KAdmin@123**, which will expire upon your first login. Change the password as prompted. Keep the password secure because it cannot be retrieved once lost.

Step 6 Run the following command to reset the password of a component running user. This operation takes effect for all servers.

```
cpw Component running user name
```

For example, to reset the password of user admin, run the **cpw admin** command.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&*()-_+=\|[{]}:;'"<.>/?').
- The password cannot be the username or the reverse username.

----End

9.12.5 Changing the Password of the Kerberos Administrator

Scenario

This section describes how to periodically change the password of the Kerberos administrator **kadmin** of the MRS cluster to improve the system O&M security.

If the password is changed, the downloaded user credential will be unavailable. Download the authentication credential again, and replace the old one.

Prerequisites

A client has been prepared on the **Master1** node.

Procedure

Step 1 Log in to the **Master1** node.

Step 2 (Optional) To change the password as user **omm**, run the following command to switch the user:

```
sudo su - omm
```

Step 3 Run the following command to switch to the client directory, for example, **/opt/client**.

```
cd /opt/client
```

Step 4 Run the following command to configure environment variables:

```
source bigdata_env
```

Step 5 Run the following command to change the password of **kadmin/admin**. This operation takes effect for all servers. Keep the password secure because it cannot be retrieved once lost.

```
kpasswd kadmin/admin
```

For the cluster, the default password complexity requirements are as follows:

- The password must contain at least eight characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&*()-_+=\|[{]};:","<.>/?').
- The password cannot be the username or the reverse username.

----End

9.12.6 Changing the Passwords of the LDAP Administrator and the LDAP User

Scenario

This section describes how to periodically change the passwords of the LDAP administrator **rootdn:cn=root,dc=hadoop,dc=com** and the LDAP user **pg_search_dn:cn=pg_search_dn,ou=Users,dc=hadoop,dc=com** to improve the system O&M security.

Impact on the System

All services need to be restarted for the new password to take effect. The services are unavailable during the restart.

Procedure

Step 1 On MRS Manager, choose **Services > LdapServer > More**.

Step 2 Click **Change Password**.

Step 3 In the **Change Password** dialog box, select the user whose password needs to be modified in the **User Information** drop-down box.

Step 4 Enter the old password in the **Old Password** text box, and enter the new password in the **New Password** and **Confirm Password** text boxes.

The default password complexity requirements are as follows:

- The password contains 16 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters (`~!@#$$%^&*()-_+=\| [{}];:~<.>/?`).
- The password cannot be the username or the reverse username.
- The new password cannot be the same as the current password.

 **NOTE**

The default password of the LDAP administrator `rootdn:cn=root,dc=hadoop,dc=com` is `LdapChangeMe@123`, and that of the LDAP user `pg_search_dn:cn=pg_search_dn,ou=Users,dc=hadoop,dc=com` is `pg_search_dn@123`. Periodically change the passwords and keep them secure.

Step 5 Select **I have read the information and understand the impact**, and click **OK** to confirm the modification and restart the service.

----End

9.12.7 Changing the Password of a Component Running User

Scenario

This section describes how to periodically change the password of the component running user of the MRS cluster to improve the system O&M security.

If the initial password is randomly generated by the system, reset the password.

If the password is changed, the downloaded user credential will be unavailable. Download the authentication credential again, and replace the old one.

Prerequisites

A client has been prepared on the **Master1** node.

Procedure

Step 1 Log in to the **Master1** node.

Step 2 (Optional) To change the password as user **omm**, run the following command to switch the user:

```
sudo su - omm
```

Step 3 Run the following command to switch to the client directory, for example, `/opt/client`:

```
cd /opt/client
```

Step 4 Run the following command to configure environment variables:

```
source bigdata_env
```

Step 5 Run the following command to log in to the console as user **kadmin/admin**:

```
kadmin -p kadmin/admin
```

 **NOTE**

The default password of user **kadmin/admin** is **KAdmin@123**, which will expire upon your first login. Change the password as prompted. Keep the password secure because it cannot be retrieved once lost.

Step 6 Run the following command to reset the password of a component running user. This operation takes effect for all servers.

```
cpw Component running user name
```

For example, to reset the password of user admin, run the **cpw admin** command.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&*()-_+=\|[]{};:"',<.>/?).
- The password cannot be the username or the reverse username.

----End

9.12.8 Changing the Password of the OMS Database Administrator

Scenario

This section describes how to periodically change the password of the OMS database administrator to improve the system O&M security.

Procedure

Step 1 Log in to the active management node.

 **NOTE**

The password of user **ommdba** cannot be changed on the standby management node. Otherwise, the cluster may not work properly. Change the password on the active management node only.

Step 2 Run the following command to switch the user:

```
sudo su - omm
```

Step 3 Run the following command to switch the directory:

```
cd $OMS_RUN_PATH/tools
```

Step 4 Run the following command to change the password of user **ommdba**:

```
mod_db_passwd ommdba
```

Step 5 Enter the old password of user **ommdba** and enter a new password twice.

The password complexity requirements are as follows:

- The password contains 16 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters ('~!@#\$%^&*()-_+=+|[{]}:;";<.>/?').
- The password cannot be the username or the reverse username.
- The password cannot be the same as the last 20 historical passwords.

If the following information is displayed, the password is changed successfully.

```
Congratulations, update [ommdba] password successfully.
```

```
----End
```

9.12.9 Changing the Password of the Data Access User of the OMS Database

Scenario

This section describes how to periodically change the password of the data access user of the OMS database to improve the system O&M security.

Impact on the System

The OMS service needs to be restarted for the new password to take effect. The service is unavailable during the restart.

Procedure

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Change OMS Database Password**.
- Step 3** Locate the row that contains user **omm**, and click **Change password** in the **Operation** column.

The password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters ('~!@#\$%^&*()-_+=+|[{]}:;";<.>/?').
- The password cannot be the username or the reverse username.
- The password cannot be the same as the last 20 historical passwords.

- Step 4** Click **OK**. When **Operation successful** is displayed, click **Finish**.
- Step 5** Locate the row that contains user **omm**, and click **Restart the OMS service** in the **Operation** column to restart the OMS database.

NOTE

If the password is changed but the OMS database is not restarted, the status of user **omm** changes to **Waiting to restart** and the password cannot be changed until the OMS database is restarted.

Step 6 In the displayed dialog box, select **I have read the information and understand the impact**. Click **OK**, and restart the OMS service.

----End

9.12.10 Changing the Password of a Component Database User

Scenario

This section describes how to periodically change the password of the component database user to improve the system O&M security.

Impact on the System

The services need to be restarted for the new password to take effect. The services are unavailable during the restart.

Procedure

Step 1 On MRS Manager, click **Services** and click the name of the database user service to be modified.

Step 2 Determine the component database user whose password is to be changed.

- To change the password of the DBService database user, go to **Step 3**.
- To change the password of the Loader, Hive, or Hue database user, stop the service first and then execute **Step 3**.

Click **Stop Service**.

Step 3 Choose **More > Change Password**.

Step 4 Enter the old and new passwords as prompted.

The password complexity requirements are as follows:

- The password of the DBService database user contains 16 to 32 characters. The password of the Loader, Hive, or Hue database user contains 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters ('~!@#\$\$%^&*()-_+=+|[{}];:","<.>/?').
- The password cannot be the username or the reverse username.
- The password cannot be the same as the last 20 historical passwords.

Step 5 Click **OK**. The system automatically restarts the corresponding service. When **Operation successful** is displayed, click **Finish**.

----End

9.12.11 Replacing the HA Certificate

Scenario

HA certificates are used to encrypt the communication between active/standby processes and HA processes to ensure the communication security. This section describes how to replace the HA certificates on the active and standby management nodes on MRS Manager to ensure the product security.

The certificate file and key file can be generated by the user.

Impact on the System

MRS Manager needs to be restarted during the replacement and cannot be accessed or provide services at that time.

Prerequisites

- You have obtained the **root-ca.crt** HA root certificate file and the **root-ca.pem** key file to be replaced.
- You have prepared a password, such as **Userpwd@123**, for accessing the key file.

To avoid potential security risks, the password must meet the following complexity requirements:

- The password must contain at least eight characters.
- The password must contain at least four types of the following characters: uppercase letters, lowercase letters, digits, and special characters (`~`!?,,:;-'(){}[]/<>@#$$%^&*+|\=`).

Procedure

Step 1 Log in to the active management node.

Step 2 Run the following commands to switch the user:

```
sudo su - root
```

```
su - omm
```

Step 3 Run the following commands to generate **root-ca.crt** and **root-ca.pem** in the **\$(OMS_RUN_PATH)/workspace0/ha/local/cert** directory on the active management node:

```
sh ${OMS_RUN_PATH}/workspace/ha/module/hacom/script/gen-cert.sh --  
root-ca --country=country --state=state --city=city --company=company --  
organize=organize --common-name=commonname --email=Administrator email  
address --password=password
```

There can be security risks if a command contains the authentication password. You are advised to disable the command recording function (history) before running the command.

The command has been executed successfully if the following information is displayed:

```
Generate root-ca pair success.
```

- Step 4** On the active management node, run the following command as user **omm** to copy **root-ca.crt** and **root-ca.pem** to the `${BIGDATA_HOME}/om-0.0.1/security/certHA` directory:

```
cp -arp ${OMS_RUN_PATH}/workspace0/ha/local/cert/root-ca.* $  
{BIGDATA_HOME}/om-0.0.1/security/certHA
```

- Step 5** Copy **root-ca.crt** and **root-ca.pem** generated on the active management node to the `${BIGDATA_HOME}/om-0.0.1/security/certHA` directory on the standby management node as user **omm**.

- Step 6** Run the following command to generate an HA certificate and perform the automatic replacement:

```
sh ${BIGDATA_HOME}/om-0.0.1/sbin/replacehaSSLCert.sh
```

Enter the password as prompted, and press **Enter**.

```
Please input ha ssl cert password:
```

The HA certificate is replaced successfully if the following information is displayed:

```
[INFO] Succeed to replace ha ssl cert.
```

- Step 7** Run the following command to restart OMS:

```
sh ${BIGDATA_HOME}/om-0.0.1/sbin/restart-oms.sh
```

The following information is displayed:

```
start HA successfully.
```

- Step 8** Log in to the standby management node and switch to user **omm**. Repeat step [Step 6](#) to step [Step 7](#).

Run the `sh ${BIGDATA_HOME}/om-0.0.1/sbin/status-oms.sh` command to check whether **HAAllResOK** of the management node is **Normal**. Access MRS Manager again. If MRS Manager can be accessed, the operation is successful.

----End

9.12.12 Updating Cluster Keys

Scenario

When a cluster is installed, an encryption key is generated automatically to store the security information in the cluster (such as all database user passwords and key file access passwords) in encryption mode. After the cluster is successfully installed, you are advised to periodically update the encryption key based on the following procedure.

Impact on the System

- After a cluster key is updated, a new key is generated randomly in the cluster. This key is used to encrypt and decrypt the newly stored data. The old key is not deleted, and it is used to decrypt data encrypted using the old key. After security information is modified, for example, a database user password is changed, the new password is encrypted using the new key.

- When the key is updated, the cluster is stopped and cannot be accessed.

Prerequisites

The upper-layer applications depending on the cluster are stopped.

Procedure

Step 1 Log in to MRS Manager and choose **Services > More > Stop Cluster**.

In the displayed dialog box, select **I have read the information and understand the impact**. Click **OK**. Wait until the system displays a message indicating that the operation is successful. Click **Finish**. The cluster is stopped successfully.

Step 2 Log in to the active management node.

Step 3 Run the following commands to switch the user:

```
sudo su - omm
```

Step 4 Run the following command to disable logout upon timeout:

```
TMOUT=0
```

Step 5 Run the following command to switch the directory:

```
cd ${BIGDATA_HOME}/om-0.0.1/tools
```

Step 6 Run the following command to update the cluster key:

```
sh updateRootKey.sh
```

Enter **y** as prompted.

```
The root key update is a critical operation.  
Do you want to continue?(y/n):
```

The key is updated successfully if the following information is displayed:

```
...  
Step 4-1: The key save path is obtained successfully.  
...  
Step 4-4: The root key is sent successfully.
```

Step 7 On MRS Manager, choose **Services > More > Start Cluster**.

In the displayed dialog box, click **OK**. After **Operation successful** is displayed, click **Finish**. The cluster is started.

----End

9.13 Permissions Management

9.13.1 Creating a Role

Scenario

This section describes how to create a role on MRS Manager and authorize and manage Manager and components.

Up to 1,000 roles can be created on MRS Manager.

Prerequisites

You have learned service requirements.

Procedure

Step 1 On MRS Manager, choose **System > Manage Role**.

Step 2 Click **Create Role** and fill in **Role Name** and **Description**.

Role Name is mandatory and contains 3 to 30 digits, letters, and underscores (_).
Description is optional.

Step 3 In **Permission**, set role permission.

1. Click **Service Name** and select a name in **View Name**.
2. Select one or more permissions.

NOTE

- The **Permission** parameter is optional.
- If you select **View Name** to set component permissions, you can enter a resource name in the **Search** box in the upper right corner and click . The search result is displayed.
- The search scope covers only directories with current permissions. You cannot search subdirectories. Search by keywords supports fuzzy match and is case-insensitive. Results of the next page can be searched.

Table 9-36 Manager permission description

| Resource Supporting Permission Management | Permission Setting |
|---|--|
| Alarm | Authorizes the Manager alarm function. You can select View to view alarms and Management to manage alarms. |
| Audit | Authorizes the Manager audit log function. You can select View to view audit logs and Management to manage audit logs. |
| Dashboard | Authorizes the Manager overview function. You can select View to view the cluster overview. |
| Hosts | Authorizes the node management function. You can select View to view node information and Management to manage nodes. |
| Services | Authorizes the service management function. You can select View to view service information and Management to manage services. |
| System_cluster_management | Authorizes the MRS cluster management function. You can select Management to use the MRS patch management function. |

| Resource Supporting Permission Management | Permission Setting |
|---|---|
| System_configuration | Authorizes the MRS cluster configuration function. You can select Management to configure MRS clusters on Manager. |
| System_task | Authorizes the MRS cluster task function. You can select Management to manage periodic tasks of MRS clusters on Manager. |
| Tenant | Authorizes the Manager multi-tenant management function. You can select Management to manage multi-tenants. |

Table 9-37 HBase permission description

| Resource Supporting Permission Management | Permission Setting |
|---|---|
| SUPER_USER_GROUP | Grants you HBase administrator rights. |
| Global | HBase resource type, indicating the whole HBase. |
| Namespace | HBase resource type, indicating namespace, which is used to store HBase tables. It has the following permissions: <ul style="list-style-type: none"> • Admin permission to manage the namespace • Create: permission to create HBase tables in the namespace • Read: permission to access the namespace • Write: permission to write data to the namespace • Execute: permission to execute the coprocessor (Endpoint) |
| Table | HBase resource type, indicating a data table, which is used to store data. It has the following permissions: <ul style="list-style-type: none"> • Admin: permission to manage a data table • Create: permission to create column families and columns in a data table • Read: permission to read a data table • Write: permission to write data to a data table • Execute: permission to execute the coprocessor (Endpoint) |

| Resource Supporting Permission Management | Permission Setting |
|---|---|
| ColumnFamily | <p>HBase resource type, indicating a column family, which is used to store data. It has the following permissions:</p> <ul style="list-style-type: none"> • Create: permission to create columns in a column family • Read: permission to read a column family • Write: permission to write data to a column family |
| Qualifier | <p>HBase resource type, indicating a column, which is used to store data. It has the following permissions:</p> <ul style="list-style-type: none"> • Read: permission to read a column • Write: permission to write data to a column |

By default, permissions of an HBase resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if **Read** and **Write** permissions are added to the **default** namespace, they are automatically added to the tables, column families, and columns in the namespace. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

Table 9-38 HDFS permission description

| Resource Supporting Permission Management | Permission Setting |
|---|---|
| Folder | <p>HDFS resource type, indicating an HDFS directory, which is used to store files or subdirectories. It has the following permissions:</p> <ul style="list-style-type: none"> • Read: permission to access the HDFS directory • Write: permission to write data to the HDFS directory • Execute: permission to perform an operation. It must be selected when you add access or write permission. |
| Files | <p>HDFS resource type, indicating a file in HDFS. It has the following permissions:</p> <ul style="list-style-type: none"> • Read: permission to access the file • Write: permission to write data to the file • Execute: permission to perform an operation. It must be selected when you add access or write permission. |

Permissions of an HDFS directory of each level are not shared by directory types of sub-levels by default. For example, if **Read** and **Execute** permissions are added to the **tmp** directory, you must select **Recursive** at the same time to add permissions to subdirectories.

Table 9-39 Hive permission description

| Resource Supporting Permission Management | Permission Setting |
|---|---|
| Hive Admin Privilege | Grants you Hive administrator rights. |
| Database | Hive resource type, indicating a Hive database, which is used to store Hive tables. It has the following permissions: <ul style="list-style-type: none">• Select: permission to query the Hive database• Delete: permission to perform the deletion operation in the Hive database• Insert: permission to perform the insertion operation in the Hive database• Create: permission to perform the creation operation in the Hive database |
| Table | Hive resource type, indicating a Hive table, which is used to store data. It has the following permissions: <ul style="list-style-type: none">• Select: permission to query the Hive table• Delete: permission to perform the deletion operation in the Hive table• Update: grants users the Update permission of the Hive table• Insert: permission to perform the insertion operation in the Hive table• Grant of Select: permission to grant the Select permission to other users using Hive statements• Grant of Delete: permission to grant the Delete permission to other users using Hive statements• Grant of Update: permission to grant the Update permission to other users using Hive statements• Grant of Insert: permission to grant the Insert permission to other users using Hive statements |

By default, permissions of a Hive resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if **Select** and **Insert** permissions are added to the **default** database, they are automatically added to the tables and columns in the database. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

Table 9-40 Yarn permission description

| Resource Supporting Permission Management | Permission Setting |
|---|--|
| Cluster Admin Operations | Grants you Yarn administrator rights. |
| root | Root queue of Yarn. It has the following permissions: <ul style="list-style-type: none">• Submit: permission to submit jobs in the queue• Admin: permission to manage permissions of the current queue |
| Parent Queue | Yarn resource type, indicating a parent queue containing sub-queues. A root queue is a type of a parent queue. It has the following permissions: <ul style="list-style-type: none">• Submit: permission to submit jobs in the queue• Admin: permission to manage permissions of the current queue |
| Leaf Queue | Yarn resource type, indicating a leaf queue. It has the following permissions: <ul style="list-style-type: none">• Submit: permission to submit jobs in the queue• Admin: permission to manage permissions of the current queue |

By default, permissions of a Yarn resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if the **Submit** permission is added to the **root** queue, it is automatically added to the sub-queue. Permissions inherited by sub-queues will not be displayed as selected in the **Permission** table. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

Table 9-41 Hue permission description

| Resource Supporting Permission Management | Permission Setting |
|---|---|
| Storage Policy Admin | Grants you storage policy administrator rights. |

Step 4 Click **OK**. Return to **Manage Role**.

----End

Related Tasks

Modifying a role

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Manage Role**.
- Step 3** In the row of the role to be modified, click **Modify** to modify role information.

 **NOTE**

If you change permissions assigned by the role, it takes 3 minutes to make new configurations take effect.

- Step 4** Click **OK**. The modification is complete.

----End

Deleting a role

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Manage Role**.
- Step 3** In the row of the role to be deleted, click **Delete**.
- Step 4** Click **OK**. The role is deleted.

----End

9.13.2 Creating a User Group

Scenario

This section describes how to create user groups and specify their operation permissions on MRS Manager. Management of single or multiple users can be unified in the user groups. After being added to a user group, users can obtain operation permissions owned by the user group.

Up to 100 user groups can be created on MRS Manager.

Prerequisites

Administrators have learned service requirements and created roles required by service scenarios.

Procedure

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Manage User Group**.
- Step 3** Above the user group list, click **Create User Group**.
- Step 4** Input **Group Name** and **Description**.
- Group Name** is mandatory and contains 3 to 20 digits, letters, and underscores (_). **Description** is optional.
- Step 5** In **Role**, click **Select and Add Role** to select and add specified roles.
- If you do not add the roles, the user group you are creating now does not have the permission to use MRS clusters.

Step 6 Click **OK**. The user group is created.

----End

Related Tasks

Modifying a user group

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User Group**.

Step 3 In the row of the user group to be modified, click **Modify**.

NOTE

If you change role permissions assigned to the user group, it takes 3 minutes to make new configurations take effect.

Step 4 Click **OK**. The modification is complete.

----End

Deleting a user group

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User Group**.

Step 3 In the row of the user group to be deleted, click **Delete**.

Step 4 Click **OK**. The user group is deleted.

----End

9.13.3 Creating a User

Scenario

This section describes how to create users on MRS Manager based on site requirements and specify their operation permissions to meet service requirements.

Up to 1,000 users can be created on MRS Manager.

If a new password policy needs to be used for a new user's password, follow instructions in [Modifying a Password Policy](#) to modify the password policy and then perform the following operations to create a user.

Prerequisites

Administrators have learned service requirements and created roles and role groups required by service scenarios.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User**.

Step 3 Above the user list, click **Create User**.

Step 4 Configure parameters as prompted and enter a username in **User Name**.

 **NOTE**

- If a username exists, you cannot create another username that only differs from the existing username in case. For example, if **User1** has been created, you cannot create **user1**.
- When you use the user you created, enter the correct username, which is case-sensitive.
- **User Name** is mandatory and contains 3 to 20 digits, letters, and underscores (_).
- **root**, **omm**, and **ommdba** are reserved system user. Select another username.

Step 5 Set **User Type** to either **Human-Machine** or **Machine-Machine**.

- **Human-Machine** users: used for O&M on MRS Manager and operations on component clients. If you select this user type, you need to enter a password and confirm the password in **Password** and **Confirm Password** accordingly.
- **Machine-Machine** users: used for MRS application development. If you select this user type, you do not need to enter a password, because the password is randomly generated.

Step 6 In **User Group**, click **Select and Join User Group** to select user groups and add users to them.

 **NOTE**

- If roles have been added to user groups, the users can be granted with permissions of the roles.
- If you want to grant new users with Hive permissions, add the users to the Hive group.
- If a user needs to manage tenant resources, the user group must be assigned the **Manager_tenant** role and the role corresponding to the tenant.

Step 7 In **Primary Group**, select a group as the primary group for users to create directories and files. The drop-down list contains all groups selected in **User Group**.

Step 8 In **Assign Rights by Role**, click **Select and Add Role** to add roles for users based on service requirements.

 **NOTE**

- When you create a user, if permissions of a user group that is granted to the user cannot meet service requirements, you can assign other created roles to the user. It takes 3 minutes to make role permissions granted to the new user take effect.
- Adding a role when you create a user can specify the user rights.
- A new user can access WebUIs of HDFS, HBase, Yarn, Spark, and Hue even when roles are not assigned to the user.

Step 9 In **Description**, provide description based on onsite service requirements.

Description is optional.

Step 10 Click **OK**. The user is created.

If a new user is used in the MRS cluster for the first time, for example, used for logging in to MRS Manager or using the cluster client, the password must be changed. For details, see section **Changing the Password of an Operation User**.

----End

9.13.4 Modifying User Information

Scenario

This section describes how to modify user information on MRS Manager, including information about the user group, primary group, role, and description.

Procedure

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Manage User**.
- Step 3** In the row of the user to be modified, click **Modify**.

NOTE

If you change user groups for or assign role permissions to the user, it takes 3 minutes to make new configurations take effect.

- Step 4** Click **OK**. The modification is complete.

----End

9.13.5 Locking a User

This section describes how to lock users in MRS clusters. A locked user cannot log in to MRS Manager or perform security authentication in the cluster.

A locked user can be unlocked by an administrator manually or until the lock duration expires. You can lock a user by using either of the following methods:

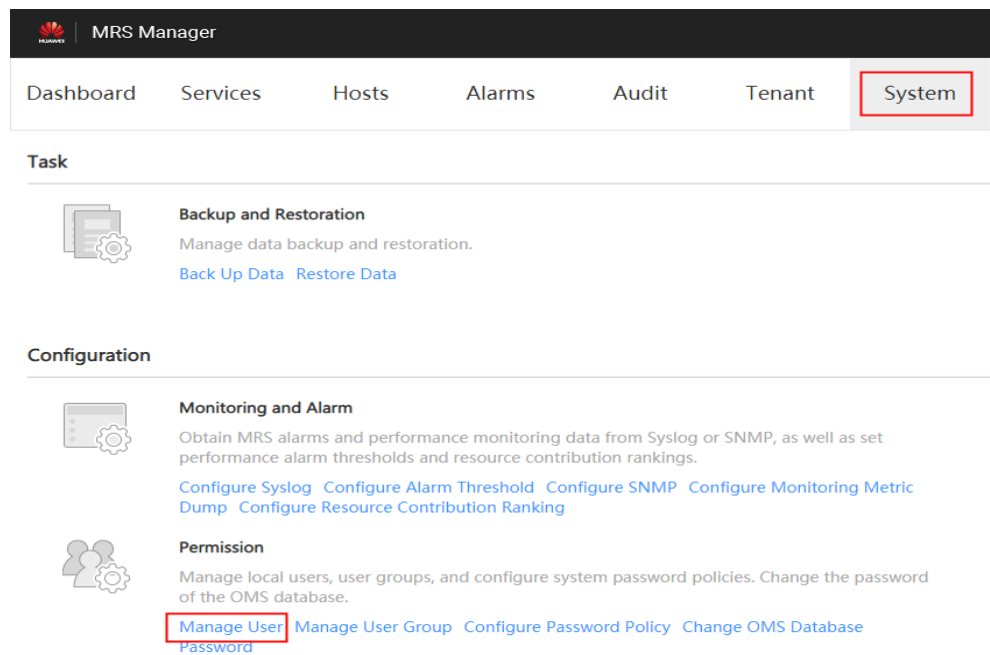

- Automatic lock: Set **Number of Password Retries** in **Configure Password Policy**. If user login attempts exceed the parameter value, the user is automatically locked. For details, see [Modifying a Password Policy](#).
- Manual lock: The administrator manually locks a user.

The following describes how to manually lock a user. **Machine-Machine** users cannot be locked.

Procedure

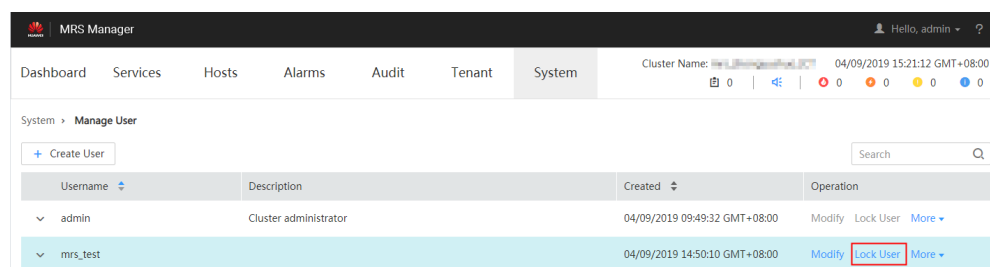

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Manage User**.

Figure 9-13 User management

Step 3 In the row of the user to be locked, click **Lock User**.

Figure 9-14 Locking a user

Step 4 In the window that is displayed, click **Yes** to lock the user.

----End

9.13.6 Unlocking a User

If a user is locked because the number of login attempts exceeds the value of **Number of Password Retries**, or the user is manually locked by the administrator, the administrator can unlock the user on MRS Manager.

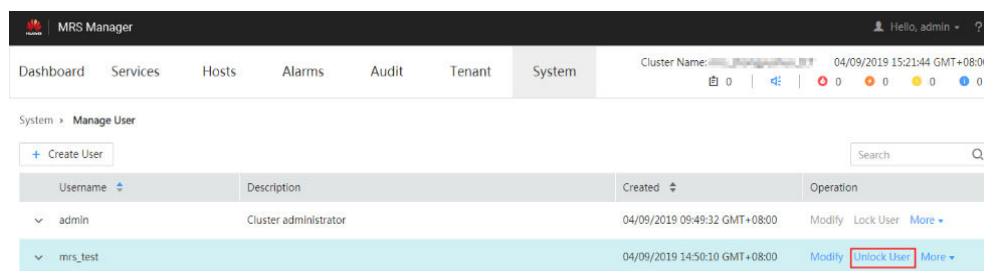

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User**.

Figure 9-15 User management

Step 3 In the row of the user to be unlocked, click **Unlock User**.

Figure 9-16 Unlocking a user

Step 4 In the window that is displayed, click **Yes** to unlock the user.

----End

9.13.7 Deleting a User

The administrator can delete an MRS cluster user that is not required on MRS Manager.

NOTE

If you want to create a new user with the same name as user A after deleting user A who has submitted a job on the client or MRS console, you need to delete user A's residual folders when deleting user A. Otherwise, the newly created user A may fail to submit a job.

To delete residual folders, log in to each Core node in the MRS cluster and run the following commands. In the following commands, **\$user** indicates the folder named after the username.

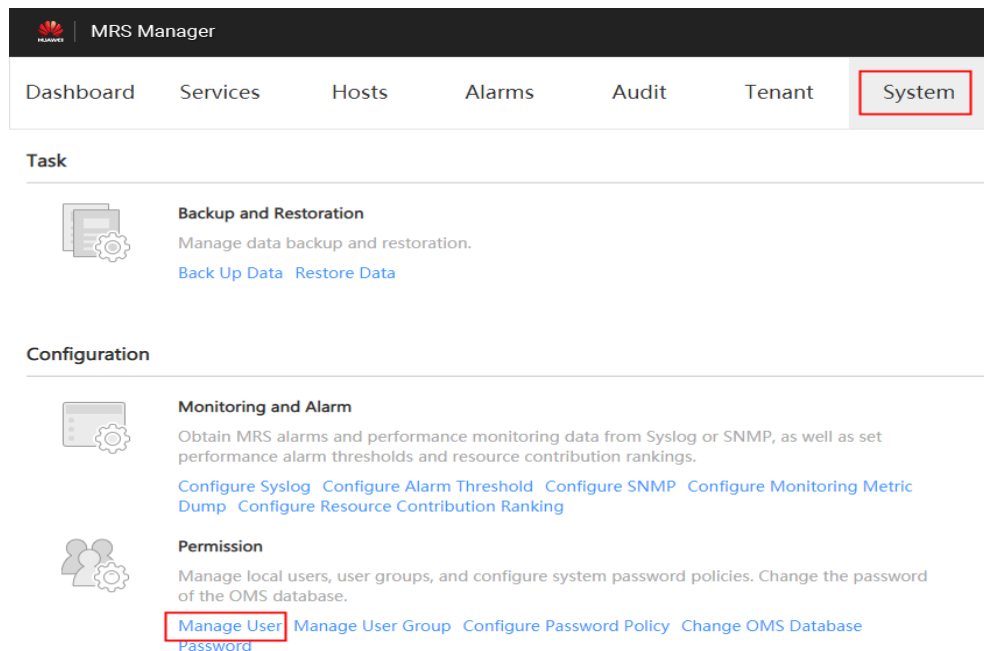

```
cd /srv/BigData/hadoop/data1/nm/localdir/usercache/  
rm -rf $user
```

Procedure

Step 1 On MRS Manager, click **System**.

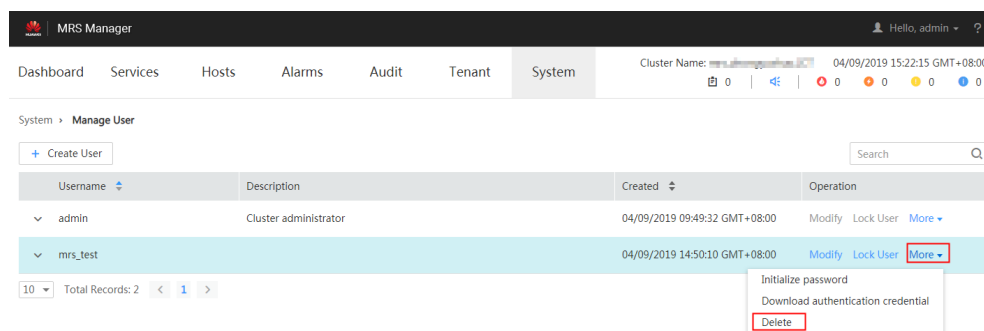

Step 2 In the **Permission** area, click **Manage User**.

Figure 9-17 User management

Step 3 In the row that contains the user to be deleted, choose **More > Delete**.

Figure 9-18 Deleting a User

Step 4 Click **OK**.

----End

9.13.8 Changing the Password of an Operation User

Scenario

Passwords of **Human-Machine** system users must be regularly changed to ensure MRS cluster security. This section describes how to change your passwords on MRS Manager.

If a new password policy needs to be used for the password modified by the user, follow instructions in [Modifying a Password Policy](#) to modify the password policy and then perform the following operations to modify the password.

Impact on the System

If you have downloaded a user authentication file, download it again and obtain the keytab file after changing the password of the MRS cluster user.

Prerequisites

- You have obtained the current password policy.
- You have obtained the URL for accessing MRS Manager.

Procedure

Step 1 On MRS Manager, move the mouse cursor to  in the upper right corner. On the menu that is displayed, select **Change Password**.

Step 2 Fill in the **Old Password**, **New Password**, and **Confirm Password**. Click **OK**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&*()-_+=\|[]{};:'",<.>/?').
- The password cannot be the username or the reverse username.

----End

9.13.9 Initializing the Password of a System User

Scenario

This section describes how to initialize a password on MRS Manager if a user forgets the password or the password of a public account needs to be changed regularly. After password initialization, the user must change the password upon the first login.

Impact on the System

If you have downloaded a user authentication file, download it again and obtain the keytab file after initializing the password of the MRS cluster user.

Initializing the Password of a Human-Machine User

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User**.

Step 3 Locate the row that contains the user whose password is to be initialized, choose **More > Initialize password**, and change the password as prompted.

In the window that is displayed, enter the password of the current administrator account and click **OK**. Then in **Initialize password**, click **OK**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&*()-_+=\|{[];:'",<.>/?').
- The password cannot be the username or the reverse username.

----End

Initializing the Password of a Machine-Machine User

Step 1 Prepare a client based on service conditions and log in to the node where the client is installed.

Step 2 Run the following command to switch the user:

```
sudo su - omm
```

Step 3 Run the following command to switch to the client directory, for example, **/opt/client**:

```
cd /opt/client
```

Step 4 Run the following command to configure environment variables:

```
source bigdata_env
```

Step 5 Run the following command to log in to the console as user **kadmin/admin**:

```
kadmin -p kadmin/admin
```

NOTE

The default password of user **kadmin/admin** is **KAdmin@123**, which will expire upon your first login. Change the password as prompted and keep the new password secure.

Step 6 Run the following command to reset the password of a component running user. This operation takes effect for all servers.

```
cpw Component running user name
```

For example, **cpw oms/manager**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&*()-_+=\|{[];:'",<.>/?').
- The password cannot be the username or the reverse username.

----End

9.13.10 Downloading a User Authentication File

Scenario

When a user develops big data applications and runs them in an MRS cluster that supports Kerberos authentication, the user needs to prepare a user authentication file for accessing the MRS cluster. The keytab file in the authentication file can be used for user authentication.

This section describes how to download a user authentication file and export the keytab file on MRS Manager.

NOTE

- Before downloading a **Human-machine** user authentication file, change the password for the user on MRS Manager to make the initial password set by the administrator invalid. Otherwise, the exported keytab file cannot be used. For details, see [Changing the Password of an Operation User](#).
- After a user password is changed, the exported keytab file becomes invalid, and you need to export a keytab file again.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User**.

Step 3 In the row of the user for whom you want to export the keytab file, choose **More > Download authentication credential** to download the authentication file. After the file is automatically generated, save it to a specified path and keep it properly.

Step 4 Open the authentication file with a decompression program.

- **user.keytab** indicates a user keytab file used for user authentication.
- **krb5.conf** indicates the configuration file of the authentication server. The application connects to the authentication server according to the configuration file information when authenticating users.

----End

9.13.11 Modifying a Password Policy

Scenario

This section describes how to set password and user login security rules as well as user lock rules. Password policies set on MRS Manager take effect for **Human-machine** users only, because the passwords of **Machine-machine** users are randomly generated.

If a new password policy needs to be used for a new user's password or the password modified by the user, perform the following operations to modify the password policy first, and then create a user or change the password by following instructions in [Creating a User](#) or [Changing the Password of an Operation User](#).

NOTICE

- Because password policies are critical to user management security, modify them based on service security requirements. Otherwise, security risks may be incurred.
- New password policies take effect only after both the password policies and user password are changed.

Procedure

- Step 1** On MRS Manager, click **System**.
- Step 2** Click **Configure Password Policy**.
- Step 3** Modify password policies as prompted. For parameter details, see the following table:

Table 9-42 Password policy parameter description

| Parameter | Description |
|--|--|
| Minimum Password Length | Indicates the minimum number of characters a password contains. The value ranges from 8 to 32. The default value is 8 . |
| Number of Character Types | Indicates the minimum number of character types a password contains. The character types are uppercase letters, lowercase letters, digits, spaces, and special characters (~`!?,,:;-'(){}[]/<>@#\$%^&*+ \=). The value can be 3 or 4 . The default value 3 indicates that the password must contain at least three types of the following characters: uppercase letters, lowercase letters, digits, special characters, and spaces. |
| Password Validity Period (days) | Indicates the validity period (days) of a password. The value ranges from 0 to 90. 0 means that the password is permanently valid. The default value is 90 . |

| Parameter | Description |
|---|---|
| Password Expiration Notification Days | Indicates the number of days in advance users are notified that their passwords are about to expire. After the value is set, if the difference between the cluster time and the password expiration time is smaller than this value, the user receives password expiration notifications. When a user logs in to MRS Manager, a message is displayed, indicating that the password is about to expire and asking the user whether to change the password. The value ranges from 0 to X (X must be set to the half of the password validity period and rounded down). Value 0 indicates that no notification is sent. The default value is 5. |
| Interval of Resetting Authentication Failure Count (min) | Indicates the interval of retaining incorrect password attempts, in minutes. The value ranges from 0 to 1440. 0 indicates that incorrect password attempts are permanently retained and 1440 indicates that incorrect password attempts are retained for one day. The default value is 5. |
| Number of Password Retries | Indicates the number of consecutive wrong passwords allowed before the system locks the user. The value ranges from 3 to 30. The default value is 5. |
| Account Lock Duration (min) | Indicates the time period for which a user is locked when the user lockout conditions are met. The value ranges from 5 to 120. The default value is 5. |

----End

9.14 MRS Multi-User Permission Management

9.14.1 Users and Permissions of MRS Clusters

Overview

- **MRS Cluster Users**

Indicate the security accounts of Manager, including usernames and passwords. These accounts are used to access resources in MRS clusters. Each MRS cluster in which Kerberos authentication is enabled can have multiple users.

- **MRS Cluster Roles**

Before using resources in an MRS cluster, users must obtain the access permission which is defined by MRS cluster objects. A cluster role is a set of one or more permissions. For example, the permission to access a directory in HDFS needs to be configured in the specified directory and saved in a role.

Manager provides the user permission management function for MRS clusters, facilitating permission and user management.

- Permission management: adopts the role-based access control (RBAC) mode. In this mode, permissions are granted by role to form a permission set. After one or more roles are allocated to a user, the user can obtain the permissions of the roles.
- User management: uses MRS Manager to uniformly manage users, adopts the Kerberos protocol for user identity verification, and employs Lightweight Directory Access Protocol (LDAP) to store user information.

Permission Management

Permissions provided by MRS clusters include the O&M permissions of Manager and components (such as HDFS, HBase, Hive, and Yarn). In actual application, permissions must be assigned to each user based on service scenarios. To facilitate permission management, Manager introduces the role function to allow administrators to select and assign specified permissions. Permissions are centrally viewed and managed in permission sets, enhancing user experience.

A role is a logical entity that contains one or more permissions. Permissions are assigned to roles, and users can be granted the permissions by obtaining the roles.

A role can have multiple permissions, and a user can be bound to multiple roles.

- Role 1: is assigned operation permissions A and B. After role 1 is allocated to users a and b, users a and b can obtain operation permissions A and B.
- Role 2: is assigned operation permission C. After role 2 is allocated to users c and d, users c and d can obtain operation permission C.
- Role 3: is assigned operation permissions D and F. After role 3 is allocated to user a, user a can obtain operation permissions D and F.

For example, if an MRS user is bound to the administrator role, the user becomes an administrator of the MRS cluster.

Table 9-43 lists the roles that are created by default on Manager.

Table 9-43 Default roles and description

| Default Role | Description |
|-----------------------|--|
| default | Tenant role |
| Manager_administrator | Manager administrator: This role has the permission to manage MRS Manager. |
| Manager_auditor | Manager auditor: This role has the permission to view and manage auditing information. |

| Default Role | Description |
|----------------------|---|
| Manager_operator | Manager operator: This role has all permissions except tenant, configuration, and cluster management permissions. |
| Manager_viewer | Manager viewer: This role has the permission to view the information about systems, services, hosts, alarms, and auditing logs. |
| System_administrator | System administrator: This role has the permissions of Manager administrators and all service administrators. |
| Manager_tenant | Manager tenant viewer: This role has the permission to view information on the Tenant page on MRS Manager. |

When creating a role on Manager, you can perform rights management for Manager and components, as shown in [Table 9-44](#).

Table 9-44 Manager and component permission management

| Permission | Description |
|------------|--|
| Manager | Manager access and login permission. |
| HBase | HBase administrator permission and permission for accessing HBase tables and column families. |
| HDFS | HDFS directory and file permission. |
| Hive | <ul style="list-style-type: none">• Hive Admin Privilege
Hive administrator permission.• Hive Read Write Privileges
Hive data table management permission to set and manage the data of created tables. |
| Hue | Storage policy administrator permissions. |
| Yarn | <ul style="list-style-type: none">• Cluster Admin Operations
Yarn administrator permission.• Scheduler Queue
Queue resource management permission. |

User Management

MRS clusters that support Kerberos authentication use the Kerberos protocol and LDAP for user management.

- Kerberos verifies the identity of the user when a user logs in to Manager or uses a component client. Identity verification is not required for clusters with Kerberos authentication disabled.

- LDAP is used to store user information, including user records, user group information, and permission information.

MRS clusters can automatically update Kerberos and LDAP user data when users are created or modified on Manager. They can also automatically perform user identity verification and authentication and obtain user information when a user logs in to Manager or uses a component client. This ensures the security of user management and simplifies the user management tasks. Manager also provides the user group function for managing one or multiple users by type:

- A user group is a set of users, which can be used to manage users by type. Users in the system can exist independently or in a user group.
- After a user is added to a user group to which roles are allocated, the role permission of the user group is assigned to the user.

Table 9-45 lists the user groups that are created by default on MRS Manager in MRS 3.x or earlier.

For details about the default user groups displayed on FusionInsight Manager of MRS 3.x or later, see [User group](#).

Table 9-45 Default user groups and description

| User Group | Description |
|----------------|---|
| hadoop | Users added to this user group have the permission to submit tasks to all Yarn queues. |
| hbase | Common user group. Users added to this user group will not have any additional permission. |
| hive | Users added to this user group can use Hive. |
| spark | Common user group. Users added to this user group will not have any additional permission. |
| supergroup | Users added to this user group can have the administrator permission of HBase, HDFS, and Yarn and can use Hive. |
| flume | Common user group. Users added to this user group will not have any additional permission. |
| kafka | Kafka common user group. Users added to this group need to be granted with read and write permission by users in the kafkaadmin group before accessing the desired topics. |
| kafkasuperuser | Users added to this group have permissions to read data from and write data to all topics. |
| kafkaadmin | Kafka administrator group. Users added to this group have the permissions to create, delete, authorize, as well as read from and write data to all topics. |

| User Group | Description |
|------------|--|
| storm | Storm common user group. Users added to this group have the permissions to submit topologies and manage their own topologies. |
| stormadmin | Storm administrator user group. Users added to this group have the permissions to submit topologies and manage their own topologies. |

User **admin** is created by default for MRS clusters with Kerberos authentication enabled and is used for administrators to maintain the clusters.

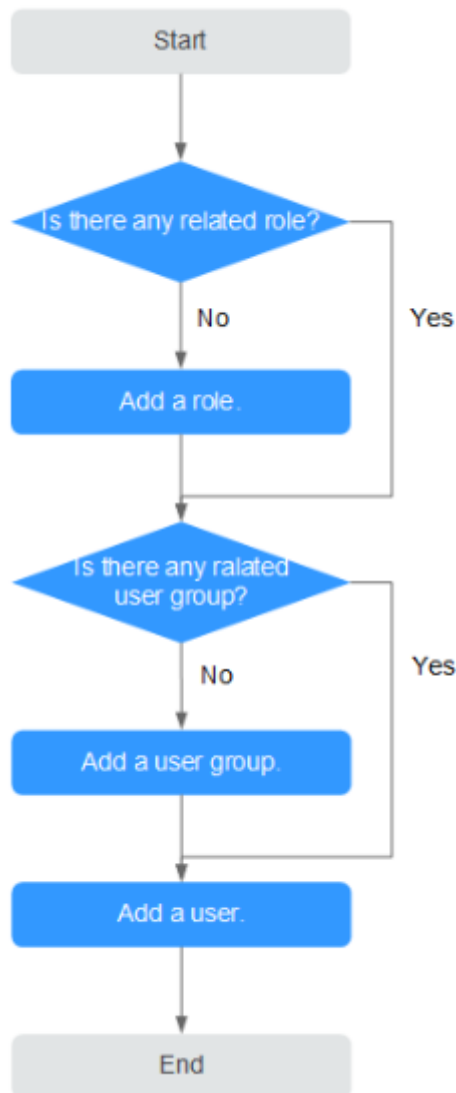

Process Overview

In practice, MRS cluster users must understand the service scenarios of big data and plan user permissions. Then, create roles and assign permissions to the roles on MRS Manager to meet service requirements. Manager provides the user group function for administrators to create user groups for managing users of one or multiple service scenarios of the same type.

NOTE

If a role has the permission of HDFS, HBase, Hive, or Yarn respectively, the role can only use the corresponding functions of the component. To use Manager, the corresponding Manager permission must be added to the role.

Figure 9-19 Process of creating a user

9.14.2 Default Users of Clusters with Kerberos Authentication Enabled

User Classification

The MRS cluster provides the following three types of users. Users are advised to periodically change the passwords. It is not recommended to use the default passwords.

| User Type | Description |
|----------------------|---|
| System user | <ul style="list-style-type: none">• User created on Manager for MRS cluster O&M and service scenarios. There are two types of users:<ul style="list-style-type: none">– Human-machine user: used for Manager O&M scenarios and component client operation scenarios.– Machine-machine user: used for MRS cluster application development scenarios.• User who runs OMS processes. |
| Internal system user | Internal user who performs process communications, saves user group information, and associates user permissions. |
| Database user | <ul style="list-style-type: none">• User who manages OMS database and accesses data.• User who runs the database of service components (Hive, Hue, Loader, and DBService) |

System User

NOTE

- User **ldap** of the OS is required in the MRS cluster. Do not delete this account. Otherwise, the cluster may not work properly. Password management policies are maintained by the operation users.
- Reset the passwords when you change the passwords of user **ommdba** and user **omm** for the first time. Change the passwords periodically after retrieving them.

| Type | Username | Initial Password | Description |
|---|----------|--|--|
| System administrator of the MRS cluster | admin | Specified by the user during the cluster creation. | Manager administrator with the following permissions: <ul style="list-style-type: none">• Common HDFS and ZooKeeper user permissions.• Permissions to submit and query MapReduce and Yarn tasks, manage Yarn queues, and access the Yarn web UI.• Permissions to submit, query, activate, deactivate, reassign, delete topologies, and operate all topologies of the Storm service.• Permissions to create, delete, authorize, reassign, consume, write, and query topics of the Kafka service. |
| MRS cluster node OS user | omm | Randomly generated by the system. | Internal running user of the MRS cluster system. This user is an OS user generated on all nodes and does not require a unified password. |
| MRS cluster node OS user | root | Set by the user. | User for logging in to the node in the MRS cluster. This user is an OS user generated on all nodes. |

Internal System Users

NOTE

Do not delete the following internal system users. Otherwise, the cluster or components may not work properly.

| Type | Default User | Initial Password | Description |
|------------------------|--------------|------------------|--|
| Component running user | hdfs | Hdfs@123 | This user is the HDFS system administrator and has the following permissions:
<ol style="list-style-type: none">File system operation permissions:<ul style="list-style-type: none">Views, modifies, and creates files.Views and creates directories.Views and modifies the groups where files belong.Views and sets disk quotas for users.HDFS management operation permissions:<ul style="list-style-type: none">Views the web UI status.Views and sets the active and standby HDFS status.Enters and exits the HDFS in security mode.Checks the HDFS file system. |

| Type | Default User | Initial Password | Description |
|------|--------------|------------------|--|
| | hbase | Hbase@123 | <p>This user is the HBase system administrator and has the following permissions:</p> <ul style="list-style-type: none"> • Cluster management permission: Enable and Disable operations on tables to trigger MajorCompact and ACL operations. • Grants and revokes permissions, and shuts down the cluster. • Table management permission: Creates, modifies, and deletes tables. • Data management permission: Reads and writes data in tables, column families, and columns. • Accesses the HBase web UI. |
| | mapred | Mapred@123 | <p>This user is the MapReduce system administrator and has the following permissions:</p> <ul style="list-style-type: none"> • Submits, stops, and views the MapReduce tasks. • Modifies the Yarn configuration parameters. • Accesses the Yarn and MapReduce web UI. |
| | spark | Spark@123 | <p>This user is the Spark system administrator and has the following permissions:</p> <ul style="list-style-type: none"> • Accesses the Spark web UI. • Submits Spark tasks. |

User Group Information

| Default User Group | Description |
|-----------------------|--|
| hadoop | Users added to this user group have the permission to submit tasks to all Yarn queues. |
| hbase | Common user group. Users added to this user group will not have any additional permission. |
| hive | Users added to this user group can use Hive. |
| spark | Common user group. Users added to this user group will not have any additional permission. |
| supergroup | Users added to this user group can have the administrator permission of HBase, HDFS, and Yarn and can use Hive. |
| check_sec_ldap | Used to test whether the active LDAP works properly. This user group is generated randomly in a test and automatically deleted after the test is complete. This is an internal system user group used only between components. |
| Manager_tenant | Tenant system user group, which is an internal system user group used only between components. |
| System_administrator | MRS cluster system administrator group, which is an internal system user group used only between components. |
| Manager_viewer | MRS Manager system viewer group, which is an internal system user group used only between components. |
| Manager_operator | MRS Manager system operator group, which is an internal system user group used only between components. |
| Manager_auditor | MRS Manager system auditor group, which is an internal system user group used only between components. |
| Manager_administrator | MRS Manager system administrator group, which is an internal system user group used only between components. |
| compcommon | Internal system group for accessing public resources in a cluster. All system users and system running users are added to this user group by default. |
| default_1000 | User group created for tenants, which is an internal system user group used only between components. |

| Default User Group | Description |
|--------------------|---|
| kafka | Kafka common user group. Users added to this group need to be granted with read and write permission by users in the kafkaadmin group before accessing the desired topics. |
| kafkasuperuser | Users added to this group have permissions to read data from and write data to all topics. |
| kafkaadmin | Kafka administrator group. Users added to this group have the permissions to create, delete, authorize, as well as read from and write data to all topics. |
| storm | Storm common user group. Users added to this group have the permissions to submit topologies and manage their own topologies. |
| stormadmin | Storm administrator user group. Users added to this group have the permissions to submit topologies and manage their own topologies. |
| opentsdb | Common user group. Users added to this user group will not have any additional permission. |
| presto | Common user group. Users added to this user group will not have any additional permission. |
| flume | Common user group. Users added to this user group will not have any additional permission. |
| launcher-job | MRS internal group, which is used to submit jobs using V2 APIs. |

| OS User Group | Description |
|---------------|---|
| wheel | Primary group of MRS internal running user omm . |
| ficommon | MRS cluster common group that corresponds to compcommon for accessing public resource files stored in the OS of the cluster. |

Database User

MRS cluster system database users include OMS database users and DBService database users.

NOTE

Do not delete database users. Otherwise, the cluster or components may not work properly.

| Type | Default User | Initial Password | Description |
|--------------------|--------------|-------------------|--|
| OMS database | ommdba | dbChangeMe@123456 | OMS database administrator who performs maintenance operations, such as creating, starting, and stopping applications. |
| | omm | ChangeMe@123456 | User for accessing OMS database data. |
| DBService database | omm | dbserverAdmin@123 | Administrator of the GaussDB database in the DBService component. |
| | hive | HiveUser@ | User for Hive to connect to the DBService database. |
| | hue | HueUser@123 | User for Hue to connect to the DBService database. |
| | sqoop | SqoopUser@ | User for Loader to connect to the DBService database. |
| | ranger | RangerUser@ | User for Ranger to connect to the DBService database. |

9.14.3 Creating a Role

Scenario

This section describes how to create a role on Manager and authorize and manage Manager and components.

Up to 1000 roles can be created on Manager.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Managing Roles](#).

Prerequisites

- You have learned service requirements.
- You have obtained a cluster with Kerberos authentication enabled or a common cluster with the EIP function enabled.

Procedure

- Step 1** Access MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).

Step 2 On MRS Manager, choose **System > Manage Role**.

Step 3 Click **Create Role** and fill in **Role Name** and **Description**.

Role Name is mandatory and contains 3 to 30 characters. Only digits, letters, and underscores (_) are allowed. **Description** is optional.

Step 4 In **Permission**, set role permission.

1. Click **Service Name** and select a name in **View Name**.
2. Select one or more permissions.

 **NOTE**

- The **Permission** parameter is optional.
- If you select **View Name** to set component permissions, you can enter a resource name in the **Search** box in the upper right corner and click . The search result is displayed.
- The search scope covers only directories with current permissions. You cannot search subdirectories. Search by keywords supports fuzzy match and is case-insensitive. Results of the next page can be searched.

Table 9-46 Manager permission description

| Resource Supporting Permission Management | Permission Setting |
|---|--|
| Alarm | Authorizes the Manager alarm function. You can select View to view alarms and Management to manage alarms. |
| Audit | Authorizes the Manager audit log function. You can select View to view audit logs and Management to manage audit logs. |
| Dashboard | Authorizes the Manager overview function. You can select View to view the cluster overview. |
| Hosts | Authorizes the node management function. You can select View to view node information and Management to manage nodes. |
| Services | Authorizes the service management function. You can select View to view service information and Management to manage services. |
| System_cluster_management | Authorizes the MRS cluster management function. You can select Management to use the MRS patch management function. |
| System_configuration | Authorizes the MRS cluster configuration function. You can select Management to configure MRS clusters on Manager. |
| System_task | Authorizes the MRS cluster task function. You can select Management to manage periodic tasks of MRS clusters on Manager. |

| Resource Supporting Permission Management | Permission Setting |
|---|--|
| Tenant | Authorizes the Manager multi-tenant management function. You can select Management to manage multi-tenants. |

Table 9-47 HBase permission description

| Resource Supporting Permission Management | Permission Setting |
|---|---|
| SUPER_USER_GROUP | Grants you HBase administrator permissions. |
| Global | HBase resource type, indicating the whole HBase. |
| Namespace | HBase resource type, indicating namespace, which is used to store HBase tables. It has the following permissions: <ul style="list-style-type: none"> • Admin permission to manage the namespace • Create: permission to create HBase tables in the namespace • Read: permission to access the namespace • Write: permission to write data to the namespace • Execute: permission to execute the coprocessor (Endpoint) |
| Table | HBase resource type, indicating a data table, which is used to store data. It has the following permissions: <ul style="list-style-type: none"> • Admin: permission to manage a data table • Create: permission to create column families and columns in a data table • Read: permission to read a data table • Write: permission to write data to a data table • Execute: permission to execute the coprocessor (Endpoint) |
| ColumnFamily | HBase resource type, indicating a column family, which is used to store data. It has the following permissions: <ul style="list-style-type: none"> • Create: permission to create columns in a column family • Read: permission to read a column family • Write: permission to write data to a column family |

| Resource Supporting Permission Management | Permission Setting |
|---|--|
| Qualifier | <p>HBase resource type, indicating a column, which is used to store data. It has the following permissions:</p> <ul style="list-style-type: none"> • Read: permission to read a column • Write: permission to write data to a column |

By default, permissions of an HBase resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if **Read** and **Write** permissions are added to the **default** namespace, they are automatically added to the tables, column families, and columns in the namespace. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

Table 9-48 HDFS permission description

| Resource Supporting Permission Management | Permission Setting |
|---|---|
| Folder | <p>HDFS resource type, indicating an HDFS directory, which is used to store files or subdirectories. It has the following permissions:</p> <ul style="list-style-type: none"> • Read: permission to access the HDFS directory • Write: permission to write data to the HDFS directory • Execute: permission to perform an operation. It must be selected when you add access or write permission. |
| Files | <p>HDFS resource type, indicating a file in HDFS. It has the following permissions:</p> <ul style="list-style-type: none"> • Read: permission to access the file • Write: permission to write data to the file • Execute: permission to perform an operation. It must be selected when you add access or write permission. |

Permissions of an HDFS directory of each level are not shared by directory types of sub-levels by default. For example, if **Read** and **Execute** permissions are added to the **tmp** directory, you must select **Recursive** for permissions to be added to subdirectories.

Table 9-49 Hive permission description

| Resource Supporting Permission Management | Permission Setting |
|---|--|
| Hive Admin Privilege | Grants you Hive administrator permissions. |
| Database | <p>Hive resource type, indicating a Hive database, which is used to store Hive tables. It has the following permissions:</p> <ul style="list-style-type: none"> • Select: permission to query the Hive database • Delete: permission to perform the deletion operation in the Hive database • Insert: permission to perform the insertion operation in the Hive database • Create: permission to perform the creation operation in the Hive database |
| Table | <p>Hive resource type, indicating a Hive table, which is used to store data. It has the following permissions:</p> <ul style="list-style-type: none"> • Select: permission to query the Hive table • Delete: permission to perform the deletion operation in the Hive table • Update: permission to perform the update operation in the Hive table • Insert: permission to perform the insertion operation in the Hive table • Grant of Select: permission to grant the Select permission to other users using Hive statements • Grant of Delete: permission to grant the Delete permission to other users using Hive statements • Grant of Update: permission to grant the Update permission to other users using Hive statements • Grant of Insert: permission to grant the Insert permission to other users using Hive statements |

By default, permissions of a Hive resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if **Select** and **Insert** permissions are added to the **default** database, they are automatically added to the tables and columns in the database. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

Table 9-50 Yarn permission description

| Resource Supporting Permission Management | Permission Setting |
|---|--|
| Cluster Admin Operations | Grants you Yarn administrator permissions. |
| root | Root queue of Yarn. It has the following permissions: <ul style="list-style-type: none">• Submit: permission to submit jobs in the queue• Admin: permission to manage permissions of the current queue |
| Parent Queue | Yarn resource type, indicating a parent queue containing sub-queues. A root queue is a type of a parent queue. It has the following permissions: <ul style="list-style-type: none">• Submit: permission to submit jobs in the queue• Admin: permission to manage permissions of the current queue |
| Leaf Queue | Yarn resource type, indicating a leaf queue. It has the following permissions: <ul style="list-style-type: none">• Submit: permission to submit jobs in the queue• Admin: permission to manage permissions of the current queue |

By default, permissions of a Yarn resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if the **Submit** permission is added to the **root** queue, it is automatically added to the sub-queue. Permissions inherited by sub-queues will not be displayed as selected in the **Permission** table. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

Table 9-51 Hue permission description

| Resource Supporting Permission Management | Permission Setting |
|---|--|
| Storage Policy Admin | Grants you storage policy administrator permissions. |

Step 5 Click **OK**. Return to **Manage Role**.

----End

Related Tasks

Modifying a role

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Manage Role**.
- Step 3** In the row of the role to be modified, click **Modify** to modify role information.

 **NOTE**

If you modify permissions assigned by the role, it takes 3 minutes to make new configurations take effect.

- Step 4** Click **OK**. The modification is complete.

----End

Deleting a role

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Manage Role**.
- Step 3** In the row of the role to be deleted, click **Delete**.
- Step 4** Click **OK**. The role is deleted.

----End

9.14.4 Creating a User Group

Scenario

This section describes how to create user groups and specify their operation permissions on Manager. Management of single or multiple users can be unified in the user groups. After being added to a user group, users can obtain operation permissions owned by the user group.

Manager supports a maximum of 100 user groups.

 **NOTE**

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Managing User Groups](#).

Prerequisites

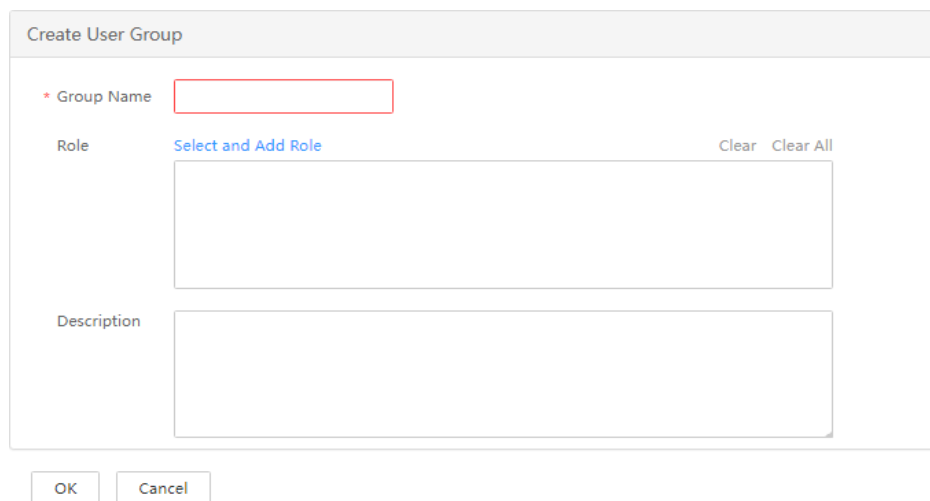

- Administrators have learned service requirements and created roles required by service scenarios.
- You have obtained a cluster with Kerberos authentication enabled or a common cluster with the EIP function enabled.

Procedure

- Step 1** Access MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).
- Step 2** On MRS Manager, click **System**.

Step 3 In the **Permission** area, click **Manage User Group**.

Step 4 Above the user group list, click **Create User Group**.

Step 5 Input **Group Name** and **Description**.

Group Name is mandatory and contains 3 to 20 characters. Only digits, letters, and underscores (_) are allowed. **Description** is optional.

Step 6 In **Role**, click **Select and Add Role** to select and add specified roles.

If you do not add the roles, the user group you are creating now does not have the permission to use MRS clusters.

Step 7 Click **OK**.

----End

Related Tasks

Modifying a user group

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User Group**.

Step 3 In the row of a user group to be modified, click **Modify**.

NOTE

If you change role permissions assigned to the user group, it takes 3 minutes to make new configurations take effect.

Step 4 Click **OK**. The modification is complete.

----End

Deleting a user group

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User Group**.

Step 3 In the row of the user group to be deleted, click **Delete**.

Step 4 Click **OK**. The user group is deleted.

----End

9.14.5 Creating a User

Scenario

This section describes how to create users on Manager based on site requirements and specify their operation permissions to meet service requirements.

Up to 1,000 users can be created on Manager.

If a new password policy needs to be used for a new user's password, follow instructions in [Modifying a Password Policy](#) to modify the password policy and then perform the following operations to create a user.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Creating a User](#).

Prerequisites

- Administrators have learned service requirements and created roles and role groups required by service scenarios.
- You have obtained a cluster with Kerberos authentication enabled or a common cluster with the EIP function enabled.

Procedure

Step 1 Access MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).

Step 2 On MRS Manager, click **System**.

Step 3 In the **Permission** area, click **Manage User**.

Step 4 Above the user list, click **Create User**.

Create User

* Username

* User Type

* Password

* Confirm Password

* User Group [Select and Join User Group](#) Please select at least one user group. [Clear](#) [Clear All](#)

* Primary Group

Assign Rights by Role [Select and Add Role](#) [Clear](#) [Clear All](#)

Description

Step 5 Configure parameters as prompted and enter a username in **Username**.

 **NOTE**

- A username that differs only in alphabetic case from an existing username is not allowed. For example, if **User1** has been created, you cannot create **user1**.
- When you use the user you created, enter the exactly correct username, which is case-sensitive.
- **Username** is mandatory and contains 3 to 20 characters. Only digits, letters, and underscores (_) are allowed.
- **root**, **omm**, and **ommdba** are reserved system user. Select another username.

Step 6 Set **User Type** to either **Human-machine** or **Machine-machine**.

- **Human-machine** user: used for MRS Manager O&M scenarios and component client operation scenarios. If you select this user type, you need to enter a password and confirm the password in **Password** and **Confirm Password** accordingly.
- **Machine-machine** users: used for MRS application development scenarios. If you select this user type, you do not need to enter a password, because the password is randomly generated.

Step 7 In **User Group**, click **Select and Join User Group** to select user groups and add users to them.

 **NOTE**

- If roles have been added to user groups, the users can be granted with permissions of the roles.
- If you want to grant new users with Hive permissions, add the users to the Hive group.
- If a user needs to manage tenant resources, the user group must be assigned the **Manager_tenant** role and the role corresponding to the tenant.
- Users created on Manager cannot be added to the user group synchronized using the IAM user synchronization function.

Step 8 In **Primary Group**, select a group as the primary group for users to create directories and files. The drop-down list contains all groups selected in **User Group**.

Step 9 In **Assign Rights by Role**, click **Select and Add Role** to add roles for users based on onsite service requirements.

 **NOTE**

- When you create a user, if permissions of a user group that is granted to the user cannot meet service requirements, you can assign other created roles to the user. It takes 3 minutes to make role permissions granted to the new user take effect.
- Adding a role when you create a user can specify the user rights.
- A new user can access web UIs of HDFS, HBase, Yarn, Spark, and Hue even when roles are not assigned to the user.

Step 10 In **Description**, provide description based on onsite service requirements.

Description is optional.

Step 11 Click **OK**.

If a new user is used in the MRS cluster for the first time, for example, used for logging in to MRS Manager or using the cluster client, the password must be changed. For details, see [Changing the Password of an Operation User](#).

----End

9.14.6 Modifying User Information

Scenario

This section describes how to modify user information on Manager, including information about the user group, primary group, role, and description.

This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

 **NOTE**

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Modifying User Information](#).

Procedure

- Step 1** Access MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).
- Step 2** On MRS Manager, click **System**.
- Step 3** In the **Permission** area, click **Manage User**.
- Step 4** In the row of a user to be modified, click **Modify**.

| Username | Description | Created | Operation |
|--------------|------------------------|-------------------------------|---|
| ▼ [redacted] | IAM System Policy User | 09/28/2021 17:47:09 GMT+08:00 | Modify Lock User More |

NOTE

If you change user groups for a user or assign role permissions to a user, it takes 3 minutes to make new configurations take effect.

- Step 5** Click **OK**. The modification is complete.

----End

9.14.7 Locking a User

This section describes how to lock users in MRS clusters. A locked user cannot log in to Manager or perform security authentication in the cluster. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

A locked user can be unlocked by an administrator manually or until the lock duration expires. You can lock a user by using either of the following methods:

- Automatic lock: Set **Number of Password Retries** in **Configure Password Policy**. If user login attempts exceed the parameter value, the user is automatically locked. For details, see [Modifying a Password Policy](#).
- Manual lock: The administrator manually locks a user.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

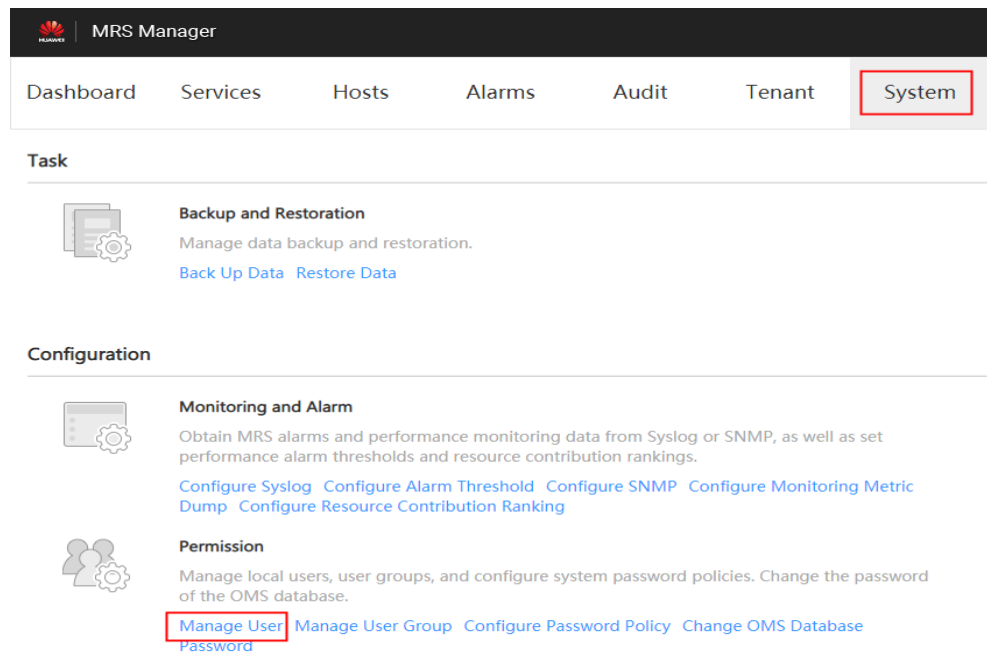

For clusters of **MRS 3.x** or later, see [Locking a User](#).

The following describes how to manually lock a user. **Machine-machine** users cannot be locked.

Procedure

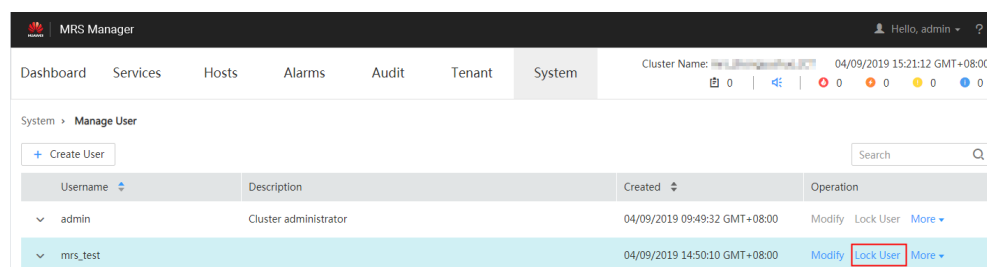

- Step 1** Access MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).
- Step 2** On MRS Manager, click **System**.
- Step 3** In the **Permission** area, click **Manage User**.

Figure 9-20 Managing a user

Step 4 In the row of a user you want to lock, click **Lock User**.

Figure 9-21 Locking a user

Step 5 In the window that is displayed, click **OK** to lock the user.

----End

9.14.8 Unlocking a User

If a user is locked because the number of login attempts exceeds the value of **Number of Password Retries**, or the user is manually locked by the administrator, the administrator can unlock the user on Manager. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

NOTE

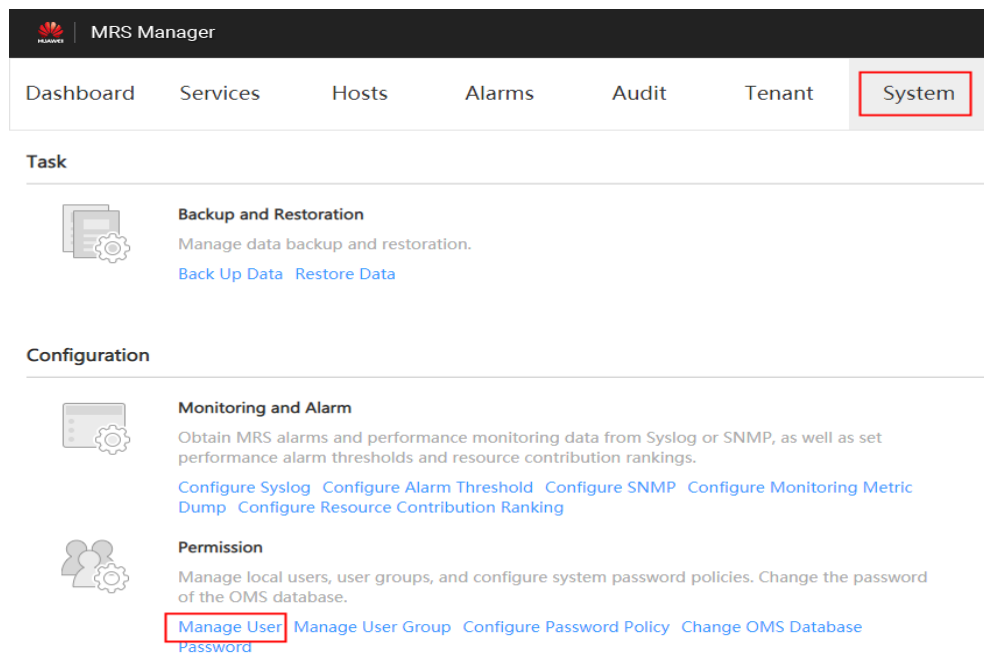

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Unlocking a User](#).

Procedure

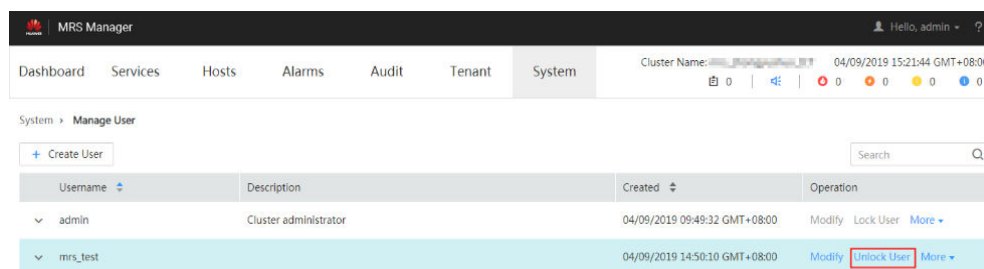

- Step 1** Access MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).
- Step 2** On MRS Manager, click **System**.
- Step 3** In the **Permission** area, click **Manage User**.

Figure 9-22 Managing a user

- Step 4** In the row of a user to be unlocked, click **Unlock User**.

Figure 9-23 Unlocking a user

- Step 5** In the window that is displayed, click **OK** to unlock the user.

----End

9.14.9 Deleting a User

The administrator can delete an MRS cluster user that is not required on MRS Manager. Deleting a user is allowed only in clusters with Kerberos authentication enabled or normal clusters with the EIP function enabled.

 NOTE

If you want to create a new user with the same name as user A after deleting user A who has submitted a job on the client or MRS console, you need to delete user A's residual folders when deleting user A. Otherwise, the newly created user A may fail to submit a job.

To delete residual folders, log in to each Core node in the MRS cluster and run the following commands. In the following commands, **\$user** indicates the folder named after the username.

```
cd /srv/BigData/hadoop/data1/nm/localdir/usercache/
```

```
rm -rf $user
```

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Deleting a User](#).

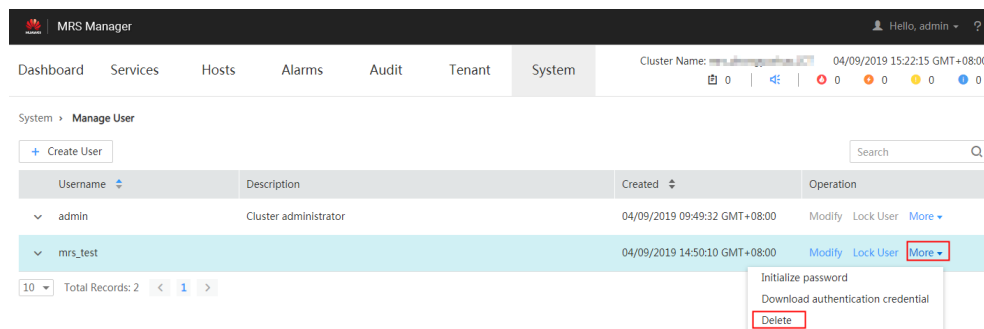

Procedure

- Step 1** Access MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).
- Step 2** On MRS Manager, click **System**.
- Step 3** In the **Permission** area, click **Manage User**.

Figure 9-24 User management

- Step 4** In the row that contains the user to be deleted, choose **More > Delete**.

Figure 9-25 Deleting a user

Step 5 Click **OK**.

----End

9.14.10 Changing the Password of an Operation User

Scenario

Passwords of **Human-machine** system users must be regularly changed to ensure MRS cluster security. This section describes how to change passwords on MRS Manager.

If a new password policy needs to be used for the password modified by the user, follow instructions in [Modifying a Password Policy](#) to modify the password policy and then perform the following operations to modify the password.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Changing a User Password](#).

Impact on the System

If you have downloaded a user authentication file, download it again and obtain the keytab file after modifying the password of the MRS cluster user.

Prerequisites

- You have obtained the current password policy.
- You have obtained the URL for accessing MRS Manager.
- You have obtained a cluster with Kerberos authentication enabled or a common cluster with the EIP function enabled.

Procedure

Step 1 Access MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).

Step 2 On MRS Manager, move the mouse cursor to  in the upper right corner. On the menu that is displayed, select **Change Password**.

Step 3 Fill in the **Old Password**, **New Password**, and **Confirm Password**. Click **OK**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&*()-_+=\|[{]};:~<.>/?').
- The password cannot be the username or the reverse username.

----End

9.14.11 Initializing the Password of a System User

Scenario

This section describes how to initialize a password on Manager if a user forgets the password or the password of a public account needs to be changed regularly. After password initialization, the user must change the password upon the first login. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Initializing a Password](#).

Impact on the System

If you have downloaded a user authentication file, download it again and obtain the keytab file after initializing the password of the MRS cluster user.

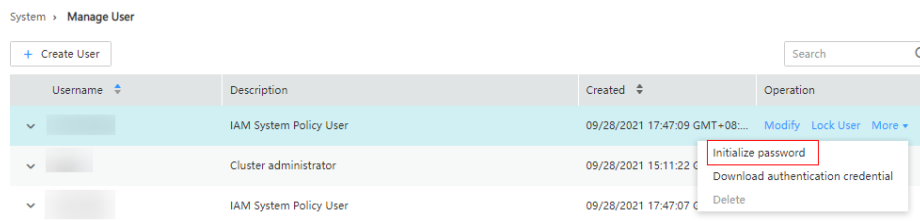

Initializing the Password of a Human-Machine User

Step 1 Access MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).

Step 2 On MRS Manager, click **System**.

Step 3 In the **Permission** area, click **Manage User**.

Step 4 Locate the row that contains the user whose password is to be initialized, choose **More > Initialize password**, and change the password as prompted.

In the window that is displayed, enter the password of the current administrator account and click **OK**. Then in **Initialize password**, click **OK**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&*()-_+=\|[{]}:;"',<.>/?).
- The password cannot be the username or the reverse username.

----End

Initializing the Password of a Machine-Machine User

Step 1 Prepare a client based on service conditions and log in to the node with the client installed.

Step 2 Run the following command to switch the user:

```
sudo su - omm
```

Step 3 Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

```
cd /opt/Bigdata/client
```

Step 4 Run the following command to configure environment variables:

```
source bigdata_env
```

Step 5 Run the following command to log in to the console as user **kadmin/admin**:

 **NOTE**

The default password of user **kadmin/admin** is **KAdmin@123**, which will expire upon your first login. Change the password as prompted and keep the new password secure.

```
kadmin -p kadmin/admin
```

Step 6 Run the following command to reset the password of a component running user. This operation takes effect on all servers:

```
cpw Component running user name
```

For example, **cpw oms/manager**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&*()-_+=\|[{]}:;"',<.>/?).
- The password cannot be the username or the reverse username.

----End

9.14.12 Downloading a User Authentication File

Scenario

When a user develops big data applications and runs them in an MRS cluster that supports Kerberos authentication, the user needs to prepare a **Machine-machine**

user authentication file for accessing the MRS cluster. The keytab file in the authentication file can be used for user authentication.

This section describes how to download a **Machine-machine** user authentication file and export the keytab file on Manager. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

NOTE

Before downloading a **Human-machine** user authentication file, change the password for the user on MRS Manager to make the initial password set by the administrator invalid. Otherwise, the exported keytab file cannot be used. For details, see [Changing the Password of an Operation User](#).

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Exporting an Authentication Credential File](#).

Procedure

- Step 1** Access MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).
- Step 2** On MRS Manager, click **System**.
- Step 3** In the **Permission** area, click **Manage User**.
- Step 4** In the row of a user for whom you want to export the keytab file, choose **More > Download authentication credential** to download the authentication file. After the file is automatically generated, save it to a specified path and keep it secure.

- Step 5** Open the authentication file with a decompression program.
 - **user.keytab** indicates a user keytab file used for user authentication.
 - **krb5.conf** indicates the configuration file of the authentication server. The application connects to the authentication server according to this configuration file information when authenticating users.

----End

9.14.13 Modifying a Password Policy

Scenario

NOTICE

Because password policies are critical to the user management security, modify them based on service security requirements. Otherwise, security risks may be incurred.

This section describes how to set password and user login security rules as well as user lock rules. Password policies set on MRS Manager take effect for **Human-machine** users only, because the passwords of **Machine-machine** users are randomly generated. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

If a new password policy needs to be used for a new user's password or the password modified by the user, perform the following operations to modify the password policy first, and then follow instructions in [Creating a User](#) or [Changing the Password of an Operation User](#).

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Configuring Password Policies](#).

Procedure

- Step 1** Access MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).
- Step 2** On MRS Manager, click **System**.
- Step 3** Click **Configure Password Policy**.

Permission

Manage local users, user groups, and roles, and configure system password policies. Change the password of the OMS database.

[Manage User](#) [Manage User Group](#) [Manage Role](#) [Configure Password Policy](#) [Change OMS Database Password](#)

- Step 4** Modify password policies as prompted. For parameter details, see [Table 9-52](#).

Table 9-52 Password policy parameter description

| Parameter | Description |
|---|---|
| Minimum Password Length | Indicates the minimum number of characters a password contains. The value ranges from 8 to 32. The default value is 8 . |
| Number of Character Types | Indicates the minimum number of character types a password contains. The character types include uppercase letters, lowercase letters, digits, spaces, and special characters (~!?,,;:_'(){}[]/<>@#\$%^&*+ \=). The value can be 3 or 4 . The default value 3 indicates that the password must contain at least three types of the following characters: uppercase letters, lowercase letters, digits, special characters, and spaces. |
| Password Validity Period (days) | Indicates the validity period (days) of a password. The value ranges from 0 to 90. Value 0 means that the password is permanently valid. The default value is 90 . |
| Password Expiration Notification Days | Indicates the number of days to notify password expiration in advance. After the value is set, if the difference between the cluster time and the password expiration time is smaller than this value, the user receives password expiration notifications. When a user logs in to MRS Manager, a message is displayed, indicating that the password is about to expire and asking the user whether to change the password. The value ranges from 0 to X (X must be set to the half of the password validity period and rounded down). Value 0 indicates that no notification is sent. The default value is 5 . |
| Interval of Resetting Authentication Failure Count (min) | Indicates the interval (minutes) of retaining incorrect password attempts. The value ranges from 0 to 1440. Value 0 indicates that the number of incorrect password attempts are permanently retained and value 1440 indicates that the number of incorrect password attempts are retained for one day. The default value is 5 . |
| Number of Password Retries | Indicates the number of consecutive wrong passwords allowed before the system locks the user. The value ranges from 3 to 30. The default value is 5 . |

| Parameter | Description |
|-----------------------------|--|
| Account Lock Duration (min) | Indicates the time period for which a user is locked when the user lockout conditions are met. The value ranges from 5 to 120. The default value is 5. |

----End

9.14.14 Configuring Cross-Cluster Mutual Trust Relationships

Scenario

If cluster A needs to access the resources of cluster B, the mutual trust relationship must be configured between these two clusters.

If no trust relationship is configured, resources of a cluster are available only for users in this cluster. MRS automatically assigns a unique **domain name** for each cluster to define the scope of resources for users.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Configuring Cross-Manager Mutual Trust Between Clusters](#).

Impact on the System

- After cross-cluster mutual trust is configured, resources of a cluster become available for users in other cluster. User permission in the clusters must be regularly checked based on service and security requirements.
- After cross-cluster mutual trust is configured, the KrbServer service needs to be restarted and the cluster becomes unavailable during the restart.
- After cross-cluster mutual trust is configured, internal users **krbtgt/Local cluster domain name@External cluster domain name** and **krbtgt/External cluster domain name@Local cluster domain name** are added to the two clusters. The internal users cannot be deleted. The default password is **Crossrealm@123**.

Prerequisites

Both clusters are in the same VPC. If they are not, create a VPC peering connection between them. For details, see [VPC Peering Connection](#).

Procedure

- Step 1** On the MRS management console, query all security groups of the two clusters.
- If the security groups of the two clusters are the same, go to [Step 3](#).
 - If the security groups of the two clusters are different, go to [Step 2](#).

Step 2 On the VPC management console, choose **Access Control > Security Groups**. On the **Security Groups** page, locate the row containing the target security group, click **Manage Rule** in the **Operation** column.

On the **Inbound Rules** tab page, click **Add Rule**. In the **Add Inbound Rule** dialog box that is displayed, configure related parameters.

- **Priority:** The value ranges from 1 to 100. The default value is **1**, which indicates the highest priority. A smaller value indicates a higher priority.
- **Action:** Select **Allow**.
- **Protocol & Port:** Choose **Protocols > All**.
- **Type:** Select **IPv4** or **IPv6**.
- **Source:** Select **Security group** and the security group of the peer cluster.
 - To add an inbound rule to the security group of cluster A, set **Source** to **Security group** and the security group of cluster B (peer cluster).
 - To add an inbound rule to the security group of cluster B, set **Source** to **Security group** and the security group of cluster A (peer cluster).

 **NOTE**

For a common cluster with Kerberos authentication disabled, perform step [Step 1](#) to [Step 2](#) to configure cross-cluster mutual trust. For a security cluster with Kerberos authentication enabled, after completing the preceding steps, proceed to the following steps for configuration.

Step 3 Log in to MRS Manager of the two clusters separately. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#). Click **Service** and check whether the **Health Status** of all components is **Good**.

- If yes, go to [Step 4](#).
- If no, contact technical support personnel for troubleshooting.

Step 4 Query configuration information.

1. On MRS Manager of the two clusters, choose **Services > KrbServer > Instance**. Query the **OM IP Address** of the two KerberosServer hosts.
2. Click **Service Configuration**. Set **Type** to **All**. Choose **KerberosServer > Port** in the navigation tree on the left. Query the value of **kdc_ports**. The default value is **21732**.
3. Click **Realm** and query the value of **default_realm**.

Step 5 On MRS Manager of either cluster, modify the **peer_realms** parameter.

Table 9-53 Parameter description

| Parameter | Description |
|------------|--|
| realm_name | Domain name of the mutual-trust cluster, that is, the value of default_realm obtained in step 4 . |

| Parameter | Description |
|-----------|--|
| ip_port | KDC address of the peer cluster. Format: <i>IP address of a KerberosServer node in the peer cluster:kdc_port</i>
The addresses of the two KerberosServer nodes are separated by a comma. For example, if the IP addresses of the KerberosServer nodes are 10.0.0.1 and 10.0.0.2 respectively, the value of this parameter is 10.0.0.1:21732,10.0.0.2:21732 . |

 NOTE

- To deploy trust relationships with multiple clusters, click  to add items and specify relevant parameters. To delete an item, click .
- A cluster can have trust relationships with a maximum of 16 clusters. By default, no trust relationship exists between different clusters that are trusted by a local cluster.

Step 6 Click **Save Configuration**. In the dialog box that is displayed, select **Restart the affected services or instances** and click **OK**. If you do not select **Restart the affected services or instances**, manually restart the affected services or instances.

After **Operation successful** is displayed, click **Finish**.

Step 7 Exit MRS Manager and log in to it again. If the login is successful, the configurations are valid.

Step 8 Log in to MRS Manager of the other cluster and repeat step [Step 5](#) to [Step 7](#).

----End

Follow-up Operations

After cross-cluster mutual trust is configured, the service configuration parameters are modified on MRS Manager and the service is restarted. Therefore, you need to prepare the client configuration file again and update the client.

Scenario 1:

Cluster A and cluster B (peer cluster and mutually trusted cluster) are the same type, for example, analysis cluster or streaming cluster. Follow instructions in [Updating a Client \(Versions Earlier Than 3.x\)](#) to update the client configuration files of cluster A and B respectively.

- Update the client configuration file of cluster A.
- Update the client configuration file of cluster B.

Scenario 2:

Cluster A and cluster B (peer cluster and mutually trusted cluster) are the different type. Perform the following steps to update the configuration files.

- Update the client configuration file of cluster A to cluster B.
- Update the client configuration file of cluster B to cluster A.

- Update the client configuration file of cluster A.
- Update the client configuration file of cluster B.

Step 1 Log in to MRS Manager of cluster A.

Step 2 Click **Services**, and then **Download Client**.

Step 3 Set **Client Type** to **Only configuration files**.

Step 4 Set **Download to** to **Remote host**.

Step 5 Set **Host IP Address** to the IP address of the active Master node of cluster B, **Host Port** to 22, and **Save Path** to **/tmp**.

- If the default port **22** for logging in to cluster B using SSH is changed, set **Host Port** to a new port.
- The value of **Save Path** contains a maximum of 256 characters.

Step 6 Set **Login User** to **root**.

If another user is used, ensure that the user has permissions to read, write, and execute the save path.

Step 7 Select **Password** or **SSH Private Key** for **Login Mode**.

- **Password**: Enter the password of user **root** set during cluster creation.
- **SSH Private Key**: Select and upload the key file used for creating the cluster.

Step 8 Click **OK** to generate a client file.

If the following information is displayed, the client file is saved. Click **Close**.

Client files downloaded to the remote host successfully.

If the following information is displayed, check the username, password, and security group configurations of the remote host. Ensure that the username and password are correct and an inbound rule of the SSH (22) port has been added to the security group of the remote host. And then, go to [Step 2](#) to download the client again.

Failed to connect to the server. Please check the network connection or parameter settings.

Step 9 Log in to the ECS of cluster B using VNC. For details, see [Logging In to a Windows ECS Using VNC](#).

All images support Cloud-Init. The preset username for Cloud-Init is **root**, and the password is the one set during cluster creation.

Step 10 Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

```
cd /opt/Bigdata/client
```

Step 11 Run the following command to update the client configuration of cluster A to cluster B:

```
sh refreshConfig.sh Client installation directory Full path of the client configuration file package
```

For example, run the following command:

```
sh refreshConfig.sh /opt/Bigdata/client /tmp/MRS_Services_Client.tar
```

If the following information is displayed, the configurations have been updated successfully.

```
ReFresh components client config is complete.  
Succeed to refresh components client config.
```

NOTE

You can also refer to method 2 in [Updating a Client \(Versions Earlier Than 3.x\)](#) to perform operations in [Step 1](#) to [Step 11](#).

Step 12 Repeat step [Step 1](#) to [Step 11](#) to update the client configuration file of cluster B to cluster A.

Step 13 Follow instructions in [Updating a Client \(Versions Earlier Than 3.x\)](#) to update the client configuration file of the local cluster.

- Update the client configuration file of cluster A.
- Update the client configuration file of cluster B.

----End

9.14.15 Configuring Users to Access Resources of a Trusted Cluster

Scenario

After cross-cluster mutual trust is configured, permission must be configured for users in the local cluster, so that the users can access the same resources in the peer cluster as the users in the peer cluster.

 NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Assigning User Permissions After Cross-Cluster Mutual Trust Is Configured](#).

Prerequisites

The mutual trust relationship has been configured between two clusters (clusters A and B). The clients of the clusters have been updated.

Procedure

- Step 1** Log in to MRS Manager of cluster A and choose **System > Manage User**. Check whether cluster A has accounts that are the same as those of cluster B.
- If yes, go to **Step 2**.
 - If no, go to **Step 3**.
- Step 2** Click  on the left side of the username to unfold the detailed user information. Check whether the user group and role to which the user belongs meet the service requirements.
- For example, user **admin** of cluster A has the permission to access and create files in the **/tmp** directory of cluster A. Then go to **Step 4**.
- Step 3** Create the accounts in cluster A and bind the accounts to the user group and roles required by the services. Then go to **Step 4**.
- Step 4** Choose **Service > HDFS > Instance**. Query the **OM IP Address of NameNode (Active)**.
- Step 5** Log in to the client of cluster B.
- For example, if you have updated the client on the Master2 node, log in to the Master2 node to use the client. For details, see [Using an MRS Client](#).
- Step 6** Run the following command to access the **/tmp** directory of cluster A.
- ```
hdfs dfs -ls hdfs://192.168.6.159:9820/tmp
```
- In the preceding command, **192.168.6.159** is the IP address of the active NameNode of cluster A; **9820** is the default port for communication between the client and the NameNode.
- Step 7** Run the following command to create a file in the **/tmp** directory of cluster A:
- ```
hdfs dfs -touchz hdfs://192.168.6.159:9820/tmp/mrstest.txt
```
- If you can query the **mrstest.txt** file in the **/tmp** directory of cluster A, the cross-cluster mutual trust is configured successfully.
- End

9.15 Patch Operation Guide

9.15.1 Patch Operation Guide for Versions

If you obtain patch information from the following sources, upgrade the patch according to actual requirements.

- You obtain information about the patch released by MRS from a message pushed by the message center service.
- You obtain information about the patch by accessing the cluster and viewing patch information.

Preparing for Patch Installation

- Follow instructions in [Performing a Health Check](#) to check cluster status. If the cluster health status is normal, install a patch.
- You need to confirm the target patch to be installed according to the patch information in the patch content.

Installing a Patch

Step 1 Log in to the MRS management console.

Step 2 On the **Active Clusters** page, click the name of your desired cluster.

Step 3 On the **Patch Information** page, click **Install** in the **Operation** column to install the target patch.

NOTE

- For details about rolling patch operations, see [Supporting Rolling Patches](#).
- For the isolated host nodes in the cluster, follow instructions in [Restoring Patches for the Isolated Hosts](#) to restore the patch.

----End

Uninstalling a Patch

Step 1 Log in to the MRS management console.

Step 2 On the **Active Clusters** page, click the name of your desired cluster.

Step 3 On the **Patch Information** page, click **Uninstall** in the **Operation** column to uninstall the target patch.

NOTE

- For details about rolling patch operations, see [Supporting Rolling Patches](#).
- For the isolated host nodes in the cluster, follow instructions in [Restoring Patches for the Isolated Hosts](#) to restore the patch.

----End

9.15.2 Supporting Rolling Patches

The rolling patch function indicates that patches are installed or uninstalled for one or more services in a cluster by performing a rolling service restart (restarting services or instances in batches), without interrupting the services or within a

minimized service interruption interval. Services in a cluster are divided into the following three types based on whether they support rolling patch:

- Services supporting rolling patch installation or uninstallation: All businesses or part of them (varying depending on different services) of the services are not interrupted during patch installation or uninstallation.
- Services not supporting rolling patch installation or uninstallation: Businesses of the services are interrupted during patch installation or uninstallation.
- Services with some roles supporting rolling patch installation or uninstallation: Some businesses of the services are not interrupted during patch installation or uninstallation.

Table 9-54 provides services and instances that support or do not support rolling restart in the MRS cluster.

Table 9-54 Services and instances that support or do not support rolling restart

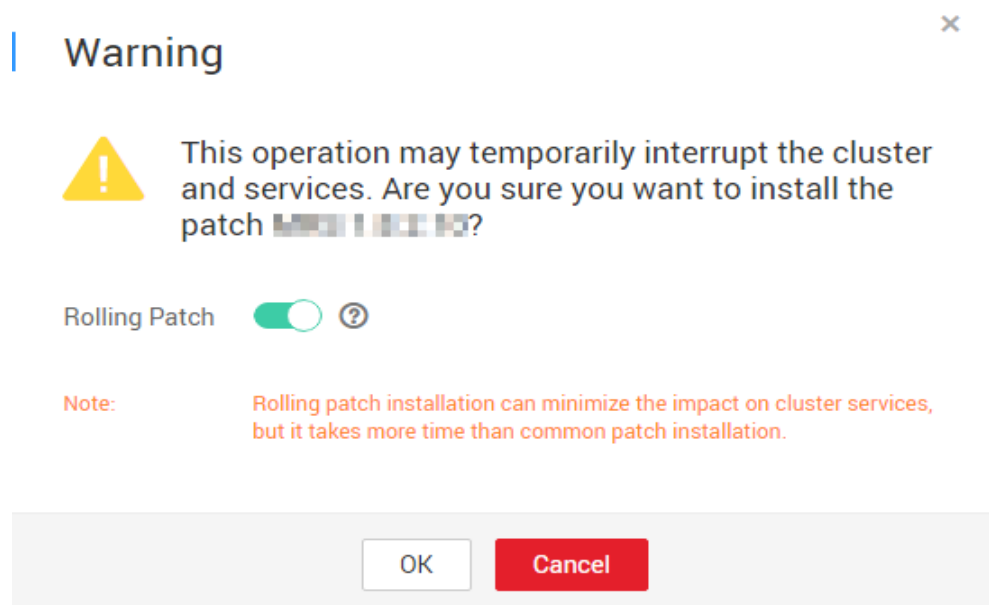

| Service | Instance | Whether to Support Rolling Restart |
|-----------|------------------|------------------------------------|
| HDFS | NameNode | Yes |
| | ZKFC | |
| | JournalNode | |
| | HttpFS | |
| | DataNode | |
| Yarn | ResourceManager | Yes |
| | NodeManager | |
| Hive | MetaStore | Yes |
| | WebHCat | |
| | HiveServer | |
| MapReduce | JobHistoryServer | Yes |
| HBase | HMaster | Yes |
| | RegionServer | |
| | ThriftServer | |
| | RETSerVer | |
| Spark | JobHistory | Yes |
| | JDBCServer | |
| | SparkResource | No |
| Hue | Hue | No |
| Tez | TezUI | No |

| Service | Instance | Whether to Support Rolling Restart |
|-----------|---------------|------------------------------------|
| Loader | Sqoop | No |
| ZooKeeper | QuorumPeer | Yes |
| Kafka | Broker | Yes |
| | MirrorMaker | No |
| Flume | Flume | Yes |
| | MonitorServer | |
| Storm | Nimbus | Yes |
| | UI | |
| | Supervisor | |
| | LogViewer | |

Installing a Patch

- Step 1** Log in to the MRS management console.
- Step 2** On the **Active Clusters** page, click the name of your desired cluster.
- Step 3** On the **Patch Information** page, click **Install** in the **Operation** column.
- Step 4** On the **Warning** page, enable or disable **Rolling Patch**.

Figure 9-26 Rolling patch installation

 **NOTE**

- Enabling the rolling patch installation function: Services are not stopped before patch installation, and rolling service restart is performed after the patch installation. This minimizes the impact on cluster services but takes more time than common patch installation.
- Disabling the rolling patch uninstallation function: All services are stopped before patch uninstallation, and all services are restarted after the patch uninstallation. This temporarily interrupts the cluster and the services but takes less time than rolling patch uninstallation.
- The rolling patch installation function is not available in clusters with less than two Master nodes and three Core nodes.

Step 5 Click **OK** to install the target patch.

Step 6 View the patch installation progress.

1. Access MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).
2. Choose **System > Manage Patch**. On the **Manage Patch** page, you can view the patch installation progress.

 **NOTE**

For the isolated host nodes in the cluster, follow instructions in [Restoring Patches for the Isolated Hosts](#) to restore the patch.

----End

Uninstalling a Patch

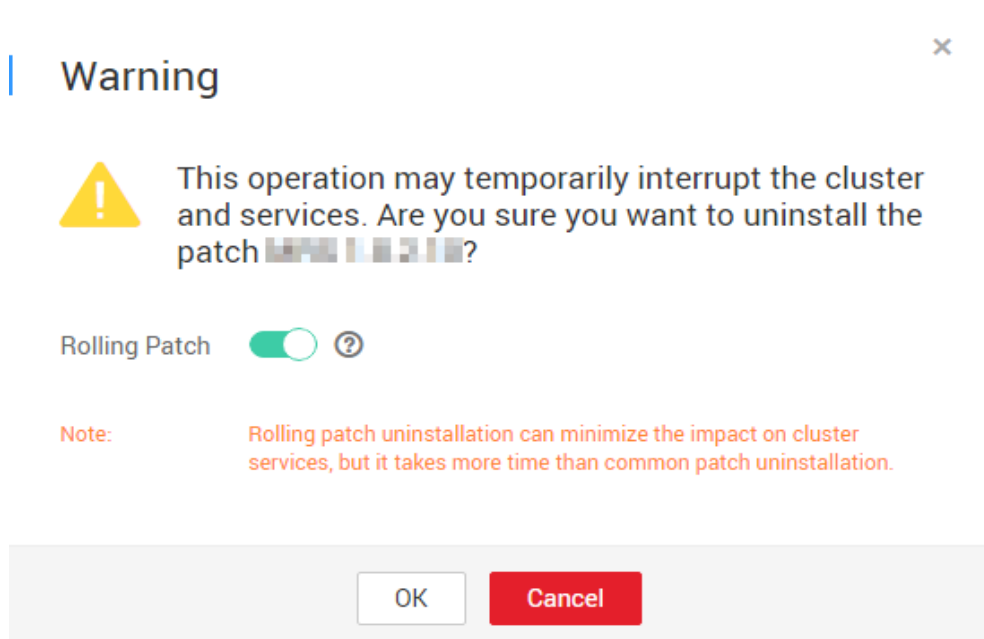

Step 1 Log in to the MRS management console.

Step 2 On the **Active Clusters** page, click the name of your desired cluster.

Step 3 On the **Patch Information** page, click **Uninstall** in the **Operation** column.

Step 4 On the **Warning** page, enable or disable **Rolling Patch**.

Figure 9-27 Rolling patch uninstallation

**NOTE**

- Enabling the rolling patch uninstallation function: Services are not stopped before patch uninstallation, and rolling service restart is performed after the patch uninstallation. This minimizes the impact on cluster services but takes more time than common patch uninstallation.
- Disabling the rolling patch uninstallation function: All services are stopped before patch uninstallation, and all services are restarted after the patch uninstallation. This temporarily interrupts the cluster and the services but takes less time than rolling patch uninstallation.
- The rolling patch uninstallation function is not available in clusters with less than two Master nodes and three Core nodes.

Step 5 Click **OK** to uninstall the target patch.

Step 6 View the patch uninstallation progress.

1. Access MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).
2. Choose **System > Manage Patch**. On the **Manage Patch** page, you can view the patch uninstallation progress.

NOTE

For the isolated host nodes in the cluster, follow instructions in [Restoring Patches for the Isolated Hosts](#) to restore the patch.

----End

9.16 Restoring Patches for the Isolated Hosts

If some hosts are isolated in a cluster, perform the following operations to restore patches for these isolated hosts after patch installation on other hosts in the

cluster. After patch restoration, versions of the isolated host nodes are consistent with those are not isolated.

- Step 1** Access MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).
- Step 2** Choose **System > Manage Patch**. The **Manage Patch** page is displayed.
- Step 3** In the **Operation** column, click **View Details**.
- Step 4** On the patch details page, select host nodes whose **Status** is **Isolated**.
- Step 5** Click **Select and Restore** to restore the isolated host nodes.

Figure 9-28 Restoring patches for the isolated hosts

----End

9.17 Rolling Restart

After modifying the configuration items of a big data component, you need to restart the corresponding service to make new configurations take effect. If you use a normal restart mode, all services or instances are restarted concurrently, which may cause service interruption. To ensure that services are not affected during service restart, you can restart services or instances in batches by rolling restart. For instances in active/standby mode, a standby instance is restarted first and then an active instance is restarted. Rolling restart takes longer than normal restart.

[Table 9-55](#) provides services and instances that support or do not support rolling restart in the MRS cluster.

Table 9-55 Services and instances that support or do not support rolling restart

| Service | Instance | Whether to Support Rolling Restart |
|---------|-------------|------------------------------------|
| HDFS | NameNode | Yes |
| | ZKFC | |
| | JournalNode | |
| | HttpFS | |
| | DataNode | |

| Service | Instance | Whether to Support Rolling Restart |
|-----------|------------------|------------------------------------|
| Yarn | ResourceManager | Yes |
| | NodeManager | |
| Hive | MetaStore | Yes |
| | WebHCat | |
| | HiveServer | |
| MapReduce | JobHistoryServer | Yes |
| HBase | HMaster | Yes |
| | RegionServer | |
| | ThriftServer | |
| | RETSerVer | |
| Spark | JobHistory | Yes |
| | JDBCServer | |
| | SparkResource | No |
| Hue | Hue | No |
| Tez | TezUI | No |
| Loader | Sqoop | No |
| ZooKeeper | Quorumpeer | Yes |
| Kafka | Broker | Yes |
| | MirrorMaker | No |
| Flume | Flume | Yes |
| | MonitorServer | |
| Storm | Nimbus | Yes |
| | UI | |
| | Supervisor | |
| | Logviewer | |

Restrictions

- Perform a rolling restart during off-peak hours.
 - Otherwise, a rolling restart failure may occur. For example, if the throughput of Kafka is high (over 100 MB/s) during the Kafka rolling restart, the Kafka rolling restart may fail.

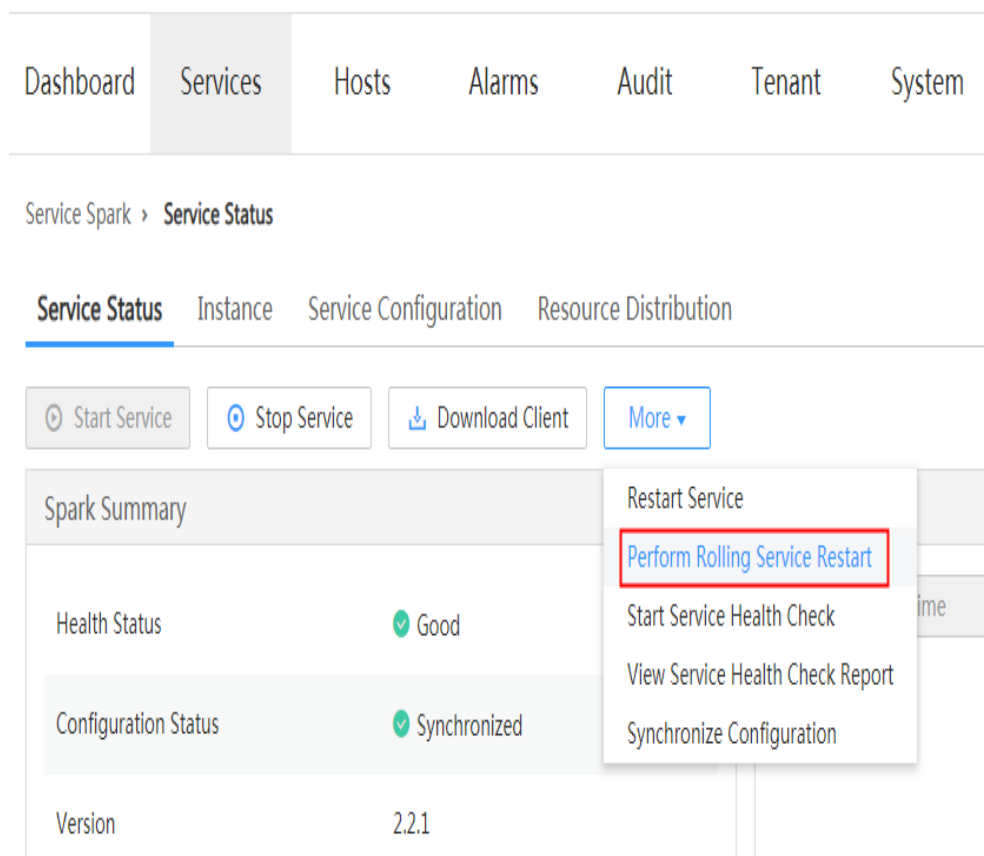

- For example, if the requests per second of each RegionServer on the native interface exceed 10,000 during the HBase rolling restart, you need to increase the number of handles to prevent a RegionServer restart failure caused by heavy loads during the restart.
- Before the restart, check the number of current requests of HBase. If requests of each RegionServer on the native interface exceed 10,000, increase the number of handles to prevent a failure.
- If the number of Core nodes in a cluster is less than six, services may be affected for a short period of time.
- Preferentially perform a rolling instance or service restart and select **Only restart instances whose configurations have expired**.

Performing a Rolling Service Restart

Step 1 On MRS Manager, click **Services** and select a service for which you want to perform a rolling restart.

Step 2 On the **Service Status** tab page, click **More** and select **Perform Rolling Service Restart**.

Figure 9-29 Service status

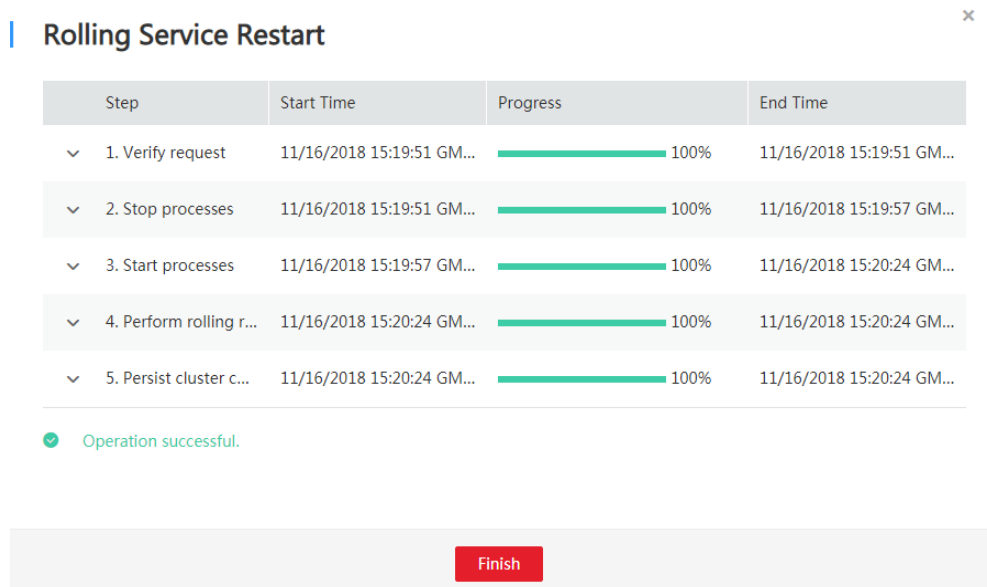

Step 3 After you enter the administrator password, the **Perform Rolling Service Restart** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the service.

Figure 9-30 Performing a rolling service restart

Step 4 After the rolling restart task is complete, click **Finish**.

Figure 9-31 Finishing the rolling service restart

----End

Performing a Rolling Instance Restart

Step 1 On MRS Manager, click **Services** and select a service for which you want to perform a rolling restart.

Step 2 On the **Instance** tab page, select the instance to be restarted. Click **More** and select **Perform Rolling Instance Restart**.

Figure 9-32 Service instance

Step 3 After you enter the administrator password, the **Perform Rolling Instance Restart** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the instance.

Step 4 After the rolling restart task is complete, click **Finish**.

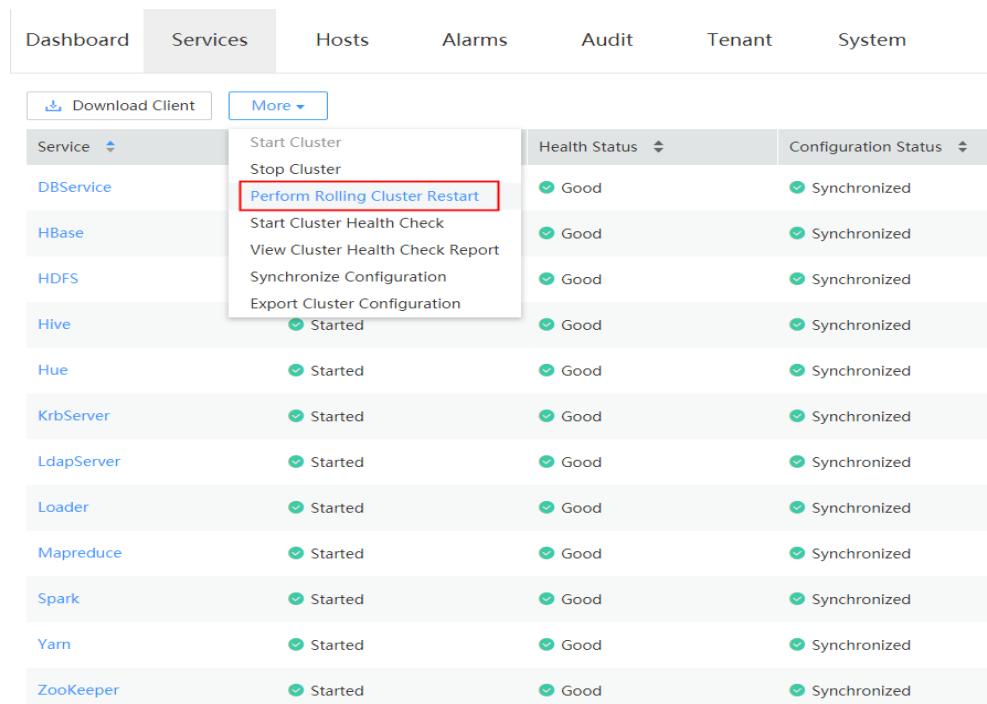

----End

Perform a Rolling Cluster Restart

Step 1 On MRS Manager, click **Services**. The **Services** page is displayed.

Step 2 Click **More** and select **Perform Rolling Cluster Restart**.

Figure 9-33 Services

Step 3 After you enter the administrator password, the **Perform Rolling Cluster Restart** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the cluster.

Step 4 After the rolling restart task is complete, click **Finish**.

----End

Rolling Restart Parameter Description

Table 9-56 describes rolling restart parameters.

Table 9-56 Rolling restart parameter description

| Parameter | Description |
|--|---|
| Only restart instances whose configurations have expired | Specifies whether to restart only the modified instances in a cluster. |
| Data Node Instances to Be Batch Restarted | Specifies the number of instances that are restarted in each batch when the batch rolling restart strategy is used. The default value is 1 . The value ranges from 1 to 20. This parameter is valid only for data nodes. |

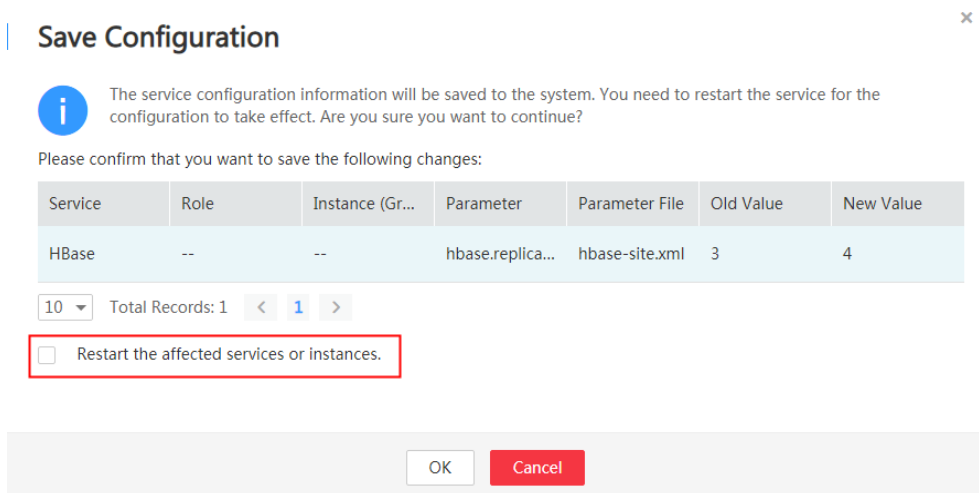

| Parameter | Description |
|---------------------------------|---|
| Batch Interval | Specifies the interval between two batches of instances for rolling restart. The default value is 0 . The value ranges from 0 to 2147483647. The unit is second.

Note: Setting the batch interval parameter can increase the stability of the big data component process during the rolling restart. You are advised to set this parameter to a non-default value, for example, 10. |
| Batch Fault Tolerance Threshold | Specifies the tolerance times when the rolling restart of instances fails to be executed in batches. The default value is 0 , which indicates that the rolling restart task ends after any batch of instances fails to be restarted. The value ranges from 0 to 214748364. |

Procedure in a Typical Scenario

- Step 1** On MRS Manager, click **Services** and select HBase. The HBase service page is displayed.
- Step 2** Click the **Service Configuration** tab, and modify an HBase parameter. After the following dialog box is displayed, click **OK** to save the configurations.

Figure 9-34 Saving configurations

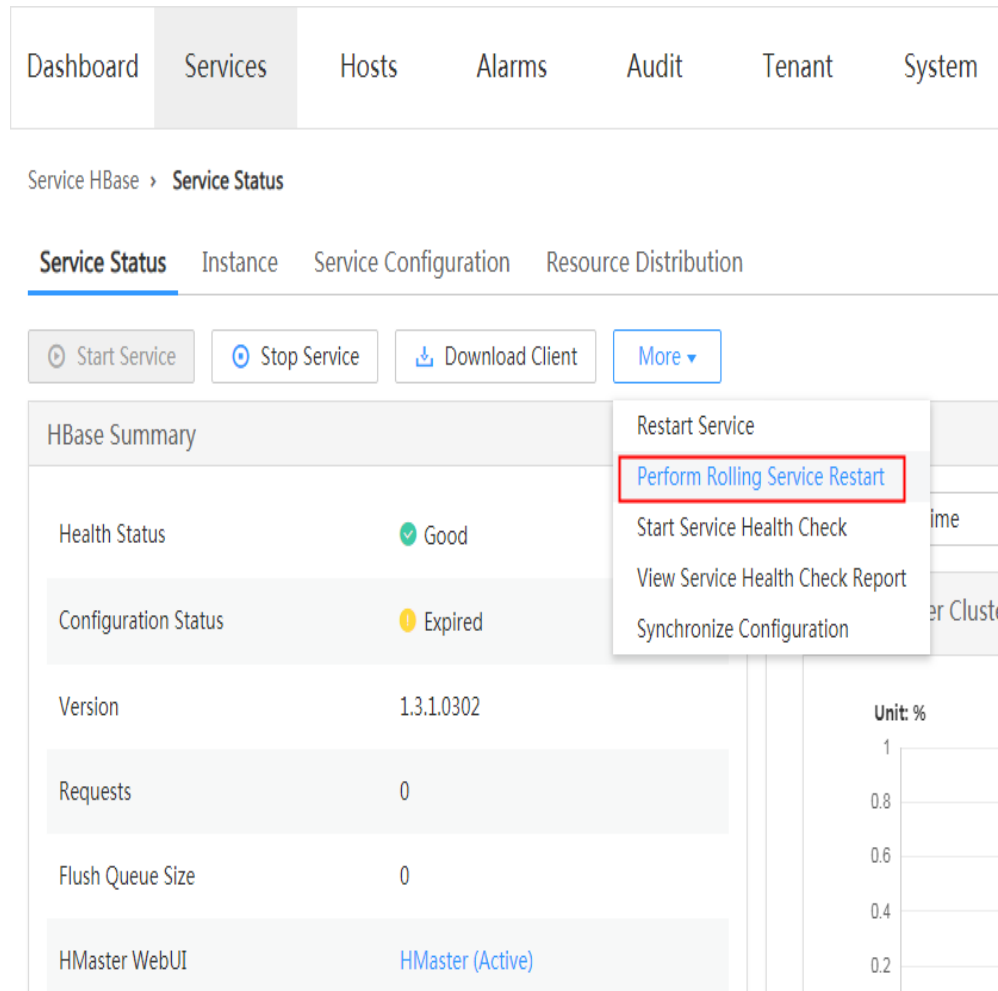

NOTE

Do not select **Restart the affected services or instances**. This option indicates a normal restart. If you select this option, all services or instances will be restarted, which may cause service interruption.

- Step 3** After saving the configurations, click **Finish**.
- Step 4** Click the **Service Status** tab.

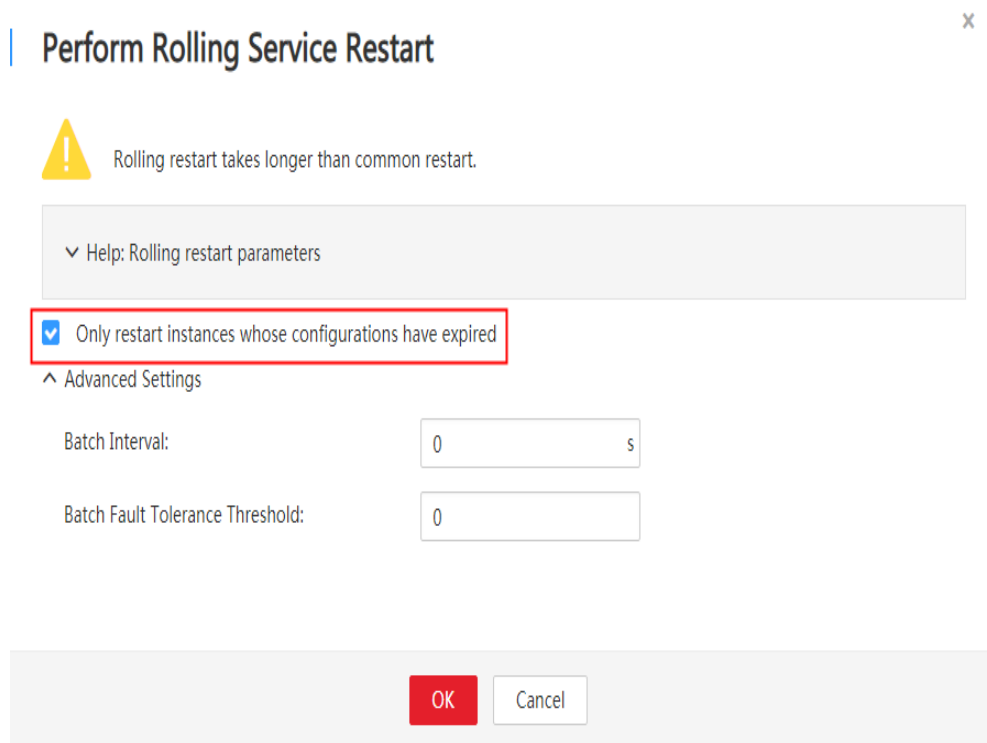

Step 5 On the **Service Status** tab page, click **More** and select **Perform Rolling Service Restart**.

Figure 9-35 Service status-rolling restart

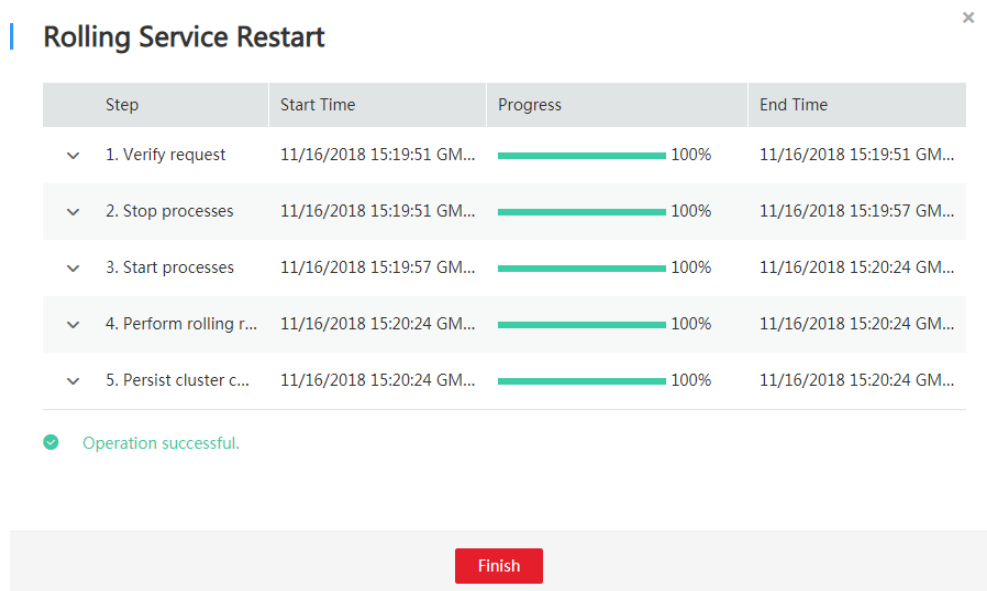

Step 6 After you enter the administrator password, the **Perform Rolling Service Restart** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the service.

Figure 9-36 Configuring the rolling service restart

Step 7 After the rolling restart task is complete, click **Finish**.

Figure 9-37 Finishing the rolling service restart

----End

10 Alarm Reference (Available for MRS 3.x)

10.1 ALM-12001 Audit Log Dumping Failure

Description

Cluster audit logs need to be dumped on a third-party server due to the local historical data backup policy. The system starts to check the dump server at 3 a.m. every day. If the dump server meets the configuration conditions, audit logs can be successfully dumped. This alarm is generated when the audit log dump fails if the disk space of the dump directory on the third-party server is insufficient or a user changes the username, password, or dump directory of the dump server.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12001 | Minor | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

System can store a maximum of only 50 dump files locally. If the fault persists on the dump server, the local audit logs may be lost.

Possible Causes

- The network connection is abnormal.
- The username, password, or dump directory of the dump server does not meet the configuration conditions.
- The disk space of the dump directory is insufficient.

Procedure

Check whether the network connection is normal.

Step 1 On the FusionInsight Manager home page, choose **Audit > Configurations**.

Step 2 Check whether the SFTP IP on the dump configuration page is valid.

Log in to the node where Manager is located as user **root** and run the **ping** command to check whether the network connection between the SFTP server and the cluster is normal.

- If yes, go to [Step 5](#).
- If no, go to [Step 3](#).

Step 3 Repair the network connection, reset the SFTP password, and click **OK**.

Step 4 Wait for 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check whether the username, password, or dump directory are correct.

Step 5 On the dump configuration page, check whether the username, password, and dump directory of the third-party server are correct.

- If yes, go to [Step 8](#).
- If no, go to [Step 6](#).

Step 6 Change the username, password, or dump directory, reset the SFTP password and click **OK**.

Step 7 Wait for 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

Check whether the disk space of the dump directory is sufficient.

Step 8 Log in to the third-party server as user **root** and run the **df** command to check whether the disk space of the dump directory of the third-party server exceeds 100 MB.

- If yes, go to [Step 11](#).
- If no, go to [Step 9](#).

Step 9 Expand disk space capacity for the third-party server, Reset the SFTP password and click **OK**

Step 10 Wait for 2 minutes, view real-time alarms and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

Reset the dump rule.

Step 11 On the FusionInsight Manager home page, choose **Audit > Configurations**.

Step 12 Reset dump rules, set the parameters properly, and click **OK**.

Step 13 Wait for 2 minutes, view real-time alarms and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 14](#).

Collect fault information.

Step 14 On the FusionInsight Manager, choose **O&M > Log > Download**.

Step 15 Select **OmmServer** from the **Service** and click **OK**.

Step 16 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 17 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.2 ALM-12004 OLdap Resource Abnormal

Description

The system checks LDAP resources every 60 seconds. This alarm is generated when the system detects that the LDAP resources in Manager are abnormal for six consecutive times.

This alarm is cleared when the Ldap resource in the Manager recovers and the alarm handling is complete.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12004 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The Manager and component WebUI authentication services are unavailable and cannot provide security authentication and user management functions for web upper-layer services. Users may be unable to log in to the WebUIs of Manager and components.

Possible Causes

The LdapServer process in the Manager is abnormal.

Procedure

Check whether the LdapServer process in the Manager is normal.

Step 1 Log in the Manager node in the cluster as user **omm**.

Log in to FusionInsight Manager using the floating IP address, and run the **sh \$ {BIGDATA_HOME}/om-server/om/sbin/status-oms.sh** command to check the information about the current Manager two-node cluster.

Step 2 Run **ps -ef | grep slapd** command to check whether the LdapServer resource process in the **\${BIGDATA_HOME}/om-server/om/** in the process configuration file is running properly.

 NOTE

You can determine that the resource is normal by checking the following information:

1. After the `sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh` command runs, **ResHAStatus** of the OLdap is **Normal**.
2. After the `ps -ef | grep slapd` command runs, the slapd process of port 21750 can be viewed.
 - If yes, go to [Step 3](#).
 - If no, go to [Step 4](#).

Step 3 Run the `kill -2 ldap pid` command to restart the LdapServer process and wait for 20 seconds. The HA starts the OLdap process automatically. Check whether the current OLdap resource is in normal state.

- If yes, the operation is complete.
- If no, go to [Step 4](#).

Collect fault information.

Step 4 On the FusionInsight Manager home page, choose **O&M > Log > Download**.

Step 5 Select **OmsLdapServer** and **OmmServer** from the **Service** and click **OK**.

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.3 ALM-12005 OKerberos Resource Abnormal

Description

The alarm module checks the status of the Kerberos resource in Manager every 80 seconds. This alarm is generated when the alarm module detects that the Kerberos resources are abnormal for six consecutive times.

This alarm is cleared when the Kerberos resource recovers and the alarm handling is complete.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12005 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The component WebUI authentication services are unavailable and cannot provide security authentication functions for web upper-layer services. Users may be unable to log in to FusionInsight Manager and the WebUIs of components.

Possible Causes

The OLdap resource on which the Okerberos depends is abnormal.

Procedure

Check whether the OLdap resource on which the Okerberos depends is abnormal in the Manager.

Step 1 Log in the Manager node in the cluster as user **omm**.

Log in to FusionInsight Manager using the floating IP address, and run the **sh \$ {BIGDATA_HOME}/om-server/om/sbin/status-oms.sh** command to check the information about the current Manager two-node cluster.

Step 2 Run the **sh \$ {BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the OLdap resource status managed by HA is normal. (In single-node mode, the OLdap resource is in the Active_normal state; in the two-node mode, the OLdap resource is in the Active_normal state on the active node and in the Standby_normal state on the standby node.)

- If yes, go to [Step 4](#).

- If no, go to [Step 3](#).

Step 3 See the procedure in [ALM-12004 OLdap Resource Abnormal](#) to resolve the problem. After the OLdap resource status recovers, check whether the OKerberos resource status is normal.

- If yes, the operation is complete.
- If no, go to [Step 4](#).

Collect fault information.

Step 4 On the FusionInsight Manager home page, choose **O&M > Log > Download**.

Step 5 Select **OmsKerberos** and **OmmServer** from the **Service** and click **OK**.

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.4 ALM-12006 Node Fault

Alarm Description

Controller checks the NodeAgent heartbeat every 30 seconds. If Controller does not receive heartbeat messages from a NodeAgent, it attempts to restart the NodeAgent process. This alarm is generated if the NodeAgent fails to be restarted for three consecutive times.

This alarm is cleared when Controller can properly receive the status report of the NodeAgent.

NOTE

In MRS 3.3.0 and later versions, the alarm name is changed to **NodeAgent Process Is Abnormal**.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12006 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster or system for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |

Impact on the System

Services on the node are unavailable.

Possible Causes

- The network is disconnected, the hardware is faulty, or the operating system runs slowly.
- The memory of the NodeAgent process is insufficient.
- The NodeAgent process is faulty.

Handling Procedure

Check whether the network is disconnected, whether the hardware is faulty, or whether the operating system runs commands slowly.

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the page that is displayed, click  in the row containing the alarm, click the host name, and view the IP address of the host for which the alarm is generated.

Step 2 Log in to the active management node as user **root**.

 **NOTE**

If the faulty node is the active management node and fails login, the network of the active management node may be faulty. In this case, go to [Step 4](#).

Step 3 Run the **ping IP address of the faulty host** command to check whether the faulty node is reachable.

- If yes, go to [Step 12](#).
- If no, go to [Step 4](#).

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Step 6 Contact the hardware administrator to check whether the hardware (CPU or memory) of the node is faulty.

- If yes, go to [Step 7](#).
- If no, go to [Step 12](#).

Step 7 Repair or replace faulty components and restart the node. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

Step 8 If a large number of node faults are reported in the cluster, the floating IP addresses may be abnormal. As a result, Controller cannot detect the NodeAgent heartbeat.

Log in to any management node and view the `/var/log/Bigdata/omm/oms/ha/scriptlog/floatip.log` log to check whether the logs generated one to two minutes before and after the faults occur are complete.

For example, a complete log is in the following format:

```
2017-12-09 04:10:51,000 INFO (floatip) Read from ${BIGDATA_HOME}/om-server_*/om/etc/om/routeSetConf.ini,value is : yes
2017-12-09 04:10:51,000 INFO (floatip) check wsNetExport : eth0 is up.
2017-12-09 04:10:51,000 INFO (floatip) check omNetExport : eth0 is up.
2017-12-09 04:10:51,000 INFO (floatip) check wsInterface : eRth0:oms, wsFloatIp: XXX.XXX.XXX.XXX.
2017-12-09 04:10:51,000 INFO (floatip) check omInterface : eth0:oms, omFloatIp: XXX.XXX.XXX.XXX.
2017-12-09 04:10:51,000 INFO (floatip) check wsFloatIp : XXX.XXX.XXX.XXX is reachable.
2017-12-09 04:10:52,000 INFO (floatip) check omFloatIp : XXX.XXX.XXX.XXX is reachable.
```

- If yes, go to [Step 12](#).
- If no, go to [Step 9](#).

Step 9 Check whether the omNetExport log is printed after the wsNetExport is detected or whether the interval for printing two logs exceeds 10 seconds or longer.

- If yes, go to [Step 10](#).
- If no, go to [Step 12](#).

Step 10 View the `/var/log/message` file of the OS to check whether sssd frequently restarts or nscd exception information is displayed when the fault occurs.

sssd restart example

```
Feb 7 11:38:16 10-132-190-105 sssd[pam]: Shutting down
Feb 7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
Feb 7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
Feb 7 11:38:16 10-132-190-105 sssd[be[default]]: Shutting down
Feb 7 11:38:16 10-132-190-105 sssd: Starting up
Feb 7 11:38:16 10-132-190-105 sssd[be[default]]: Starting up
Feb 7 11:38:16 10-132-190-105 sssd[nss]: Starting up
Feb 7 11:38:16 10-132-190-105 sssd[pam]: Starting up
```

Example nscd exception information

```
Feb 11 11:44:42 10-120-205-33 nscd: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780:
Can't contact LDAP server
Feb 11 11:44:43 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780:
Can't contact LDAP server
```

```
Feb 11 11:44:44 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.92:21780:  
Can't contact LDAP server
```

- If yes, go to [Step 11](#).
- If no, go to [Step 12](#).

Step 11 Check whether the LdapServer node is faulty, for example, the service IP address is unreachable or the network latency is too high. If the fault occurs periodically, locate and eliminate it and run the **top** command to check whether abnormal software exists.

Check whether the memory of the NodeAgent process is insufficient.

Step 12 Log in to the faulty node as user **root** and run the following command to view the NodeAgent process logs:

```
vi /var/log/Bigdata/nodeagent/scriptlog/agent_gc.log.*.current
```

Step 13 Check whether the log file contains an error indicating that the metaspace size or heap memory size is insufficient.

- If yes, go to [Step 14](#).
- If no, go to [Step 17](#).

Step 14 Run the **su - omm** command to switch to user **omm**, edit the corresponding file based on the cluster version, increase the values of **nodeagent.Xms** (initial heap memory) and **nodeagent.Xmx** (maximum heap memory), and save the modification.

The path of the file containing the parameters is as follows:

- Versions earlier than MRS 3.2.1: **/opt/Bigdata/om-agent/nodeagent/bin/nodeagent_ctl.sh**
- MRS 3.2.1 or later: **\$NODE_AGENT_HOME/etc/agent/nodeagent.properties**

Step 15 Run the following commands to restart the NodeAgent service:

```
sh ${BIGDATA_HOME}/om-agent/nodeagent/bin/stop-agent.sh
```

```
sh ${BIGDATA_HOME}/om-agent/nodeagent/bin/start-agent.sh
```

Step 16 Wait a moment and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 17](#).

Check whether the NodeAgent process is faulty.

Step 17 Log in to the faulty node as user **omm** and run the following command:

```
ps -ef | grep "Dprocess.name=nodeagent" | grep -v grep
```

Step 18 Check whether the command output is empty.

- If yes, go to [Step 19](#).
- If no, go to [Step 21](#).

Step 19 View the NodeAgent startup and run logs to locate the fault. After the fault is rectified, go to [Step 20](#).

- NodeAgent run logs: **/var/log/Bigdata/nodeagent/agentlog/agent.log**

- NodeAgent start and stop logs: `/var/log/Bigdata/nodeagent/scriptlog/nodeagent_ctl.log`

Step 20 Run the following commands to restart the NodeAgent service:

```
sh ${BIGDATA_HOME}/om-agent/nodeagent/bin/stop-agent.sh
```

```
sh ${BIGDATA_HOME}/om-agent/nodeagent/bin/start-agent.sh
```

Collect fault information.

Step 21 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 22 Select the following nodes from **Services** and click **OK**.

- NodeAgent
- Controller
- OS

Step 23 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 24 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.5 ALM-12007 Process Fault

Description

This alarm is generated when the process health check module detects that the process connection status is **Bad** for three consecutive times. The process health check module checks the process status every 5 seconds.

This alarm is cleared when the process can be connected.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12007 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The service provided by the process is unavailable.

Possible Causes

- The instance process is abnormal.
- The disk space is insufficient.

NOTE

If a large number of process fault alarms exist in a time segment, files in the installation directory may be deleted mistakenly or permission on the directory may be modified.

Procedure

Check whether the instance process is abnormal.

Step 1 In the FusionInsight Manager portal, click **O&M > Alarm > Alarms**, click  in the row where the alarm is located, and click the host name to view the host address for which the alarm is generated

Step 2 On the **Alarms** page, check whether the **ALM-12006 Node Fault** is generated.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Handle the alarm according to **ALM-12006 Node Fault**.

Step 4 Log in to the host for which the alarm is generated as user **root**. Check whether the installation directory user, user group, and permission of the alarm role are correct. The user, user group, and the permission must be **omm:ficommon 750**.

For example, the NameNode installation directory is ``${BIGDATA_HOME}`/FusionInsight_Current/1_8_NameNode/etc`.

- If yes, go to **Step 6**.
- If no, go to **Step 5**.

Step 5 Run the following command to set the permission to **750** and **User:Group** to **omm:ficommon**:

```
chmod 750 <folder_name>
```

```
chown omm:ficommon <folder_name>
```

Step 6 Wait for 5 minutes. In the alarm list, check whether **ALM-12007 Process Fault** is cleared.

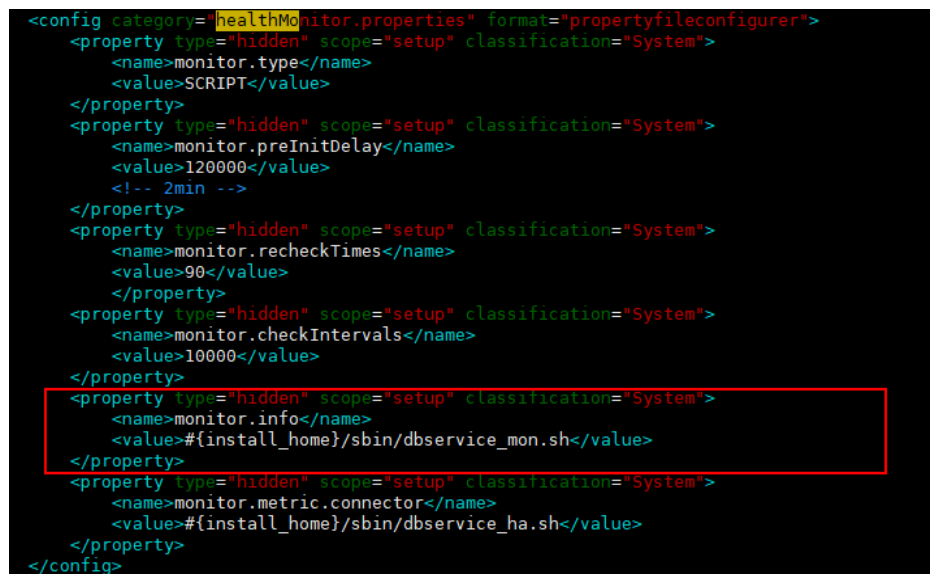

- If yes, no further action is required.
- If no, go to [Step 7](#).

Step 7 Log in to the active OMS node as user **root** and run the following command to view the **configurations.xml** file. In the preceding command, "Service name" is the service name queried in [Step 1](#).

```
vi $BIGDATA_HOME/components/current/Service name/configurations.xml
```

Search for the keyword **healthMonitor.properties**, find the health check configuration item corresponding to the alarm reporting instance, and record the interface or script path specified by **monitor.info**, as shown in the following figure.

Check the logs recorded in the interface or script and rectify the fault.

```
<config category="healthMonitor.properties" format="propertyfileconfigurer">
  <property type="hidden" scope="setup" classification="System">
    <name>monitor.type</name>
    <value>SCRIPT</value>
  </property>
  <property type="hidden" scope="setup" classification="System">
    <name>monitor.preInitDelay</name>
    <value>120000</value>
    <!-- 2min -->
  </property>
  <property type="hidden" scope="setup" classification="System">
    <name>monitor.recheckTimes</name>
    <value>90</value>
  </property>
  <property type="hidden" scope="setup" classification="System">
    <name>monitor.checkIntervals</name>
    <value>10000</value>
  </property>
  <property type="hidden" scope="setup" classification="System">
    <name>monitor.info</name>
    <value>#{install_home}/sbin/dbservice_mon.sh</value>
  </property>
  <property type="hidden" scope="setup" classification="System">
    <name>monitor.metric.connector</name>
    <value>#{install_home}/sbin/dbservice_ha.sh</value>
  </property>
</config>
```

Step 8 Wait for 5 minutes. In the alarm list, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Check whether disk space is sufficient.

Step 9 On the FusionInsight Manager, check whether the alarm list contains **ALM-12017 Insufficient Disk Capacity**.

- If yes, go to [Step 10](#).
- If no, go to [Step 13](#).

Step 10 Rectify the fault by following the steps provided in **ALM-12017 Insufficient Disk Capacity**.

- Step 11** Wait for 5 minutes. In the alarm list, check whether **ALM-12017 Insufficient Disk Capacity** is cleared.
- If yes, go to [Step 12](#).
 - If no, go to [Step 13](#).
- Step 12** Wait for 5 minutes. In the alarm list, check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 13](#).
- Collect fault information.**
- Step 13** On the FusionInsight Manager, choose **O&M > Log > Download**.
- Step 14** According to the service name obtained in [Step 1](#), select the component and **NodeAgent** from the **Service** and click **OK**.
- Step 15** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 16** Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.6 ALM-12010 Manager Heartbeat Interruption Between the Active and Standby Nodes

Description

This alarm is generated when the active Manager does not receive the heartbeat signal from the standby Manager within 7 seconds.

This alarm is cleared when the active Manager receives heartbeat signals from the standby Manager.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12010	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

When the active Manager process is abnormal, an active/standby failover cannot be performed, and services are affected.

Possible Causes

- The link between the active and standby Manager is abnormal.
- The node name configuration is incorrect.
- The port is disabled by the firewall.

Procedure

Check whether the network between the active and standby Manager server is normal.

- Step 1** In the FusionInsight Manager portal, click **O&M > Alarm > Alarms**, click  in the row containing the alarm and view the IP address of the standby Manager (Peer Manager) server in the alarm details.
- Step 2** Log in to the active OMS node as user **root**.
- Step 3** Run the **ping standby Manager heartbeat IP address** command to check whether the standby Manager server is reachable.
- If yes, go to [Step 6](#).
 - If no, go to [Step 4](#).
- Step 4** Contact the network administrator to check whether the network is faulty.
- If yes, go to [Step 5](#).
 - If no, go to [Step 6](#).
- Step 5** Rectify the network fault and check whether the alarm is cleared from the alarm list.
- If yes, no further action is required.

- If no, go to [Step 6](#).

Check whether the node name is correctly configured.

Step 6 Run the following command to go to the software installation directory of the active OMS node:

```
cd /opt
```

Step 7 Run the following command to find the configuration file directory of the active and standby nodes.

```
find -name hacom_local.xml
```

Step 8 Run the following command to go to the **workspace** directory:

```
cd${BIGDATA_HOME}/om-server/OMS/workspace0/ha/local/hacom/conf/
```

Step 9 Run the **vim** command to open the **hacom_local.xml** file. Check whether the local and peer nodes are correctly configured. The local node is configured as the active node, and the peer node is configured as the standby node.

- If yes, go to [Step 12](#).
- If no, go to [Step 10](#).

Step 10 Modify the configuration of the active and standby nodes in the **hacom_local.xml** file and press **Esc** to return to the command mode. Run the **:wq** command to save the modification and exit.

Step 11 Check whether the alarm is cleared automatically.

- If yes, no further action is required.
- If no, go to [Step 12](#).

Check whether the port is disabled by the firewall.

Step 12 Run the **lsof -i :20012** command to check whether the heartbeat ports of the active and standby nodes are enabled. If the command output is displayed, the ports are enabled. Otherwise, the ports are disabled by the firewall.

- If yes, go to [Step 13](#).
- If no, go to [Step 16](#).

Step 13 Run the **iptables -P INPUT ACCEPT** command to avoid the server disconnection.

Step 14 Run the following command to clear the firewall:

```
iptables -F
```

Step 15 Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to [Step 16](#).

Collect fault information.

Step 16 On the FusionInsight Manager, choose **O&M > Log > Download**.

Step 17 Select the following nodes from the **Service** and click **OK**:

- OmmServer

- Controller
- NodeAgent

Step 18 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.7 ALM-12011 Manager Data Synchronization Exception Between the Active and Standby Nodes

Description

The system checks data synchronization between the active and standby Manager nodes every 60 seconds. This alarm is generated when the standby Manager fails to synchronize files with the active Manager.

This alarm is cleared when the standby Manager synchronizes files with the active Manager.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12011	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Some configurations will be lost after an active/standby switchover because the configuration files on the standby Manager are not updated. Maybe Manager and some components cannot run properly.

Possible Causes

- The link between the active and standby Managers is interrupted or The storage space of the **/srv/BigData/LocalBackup** directory is full.
- The synchronization file does not exist or the file permission is incorrect.

Procedure

Check whether the network between the active Manager server and the standby Manager server is normal.

Step 1 In the FusionInsight Manager portal, click **O&M > Alarm > Alarms**, click  in the row where the alarm is located and obtain the standby Manager server IP address (Peer Manager IP address) in the alarm details.

Step 2 Log in to the active Manager server as user **root**.

Step 3 Run the **ping standby Manager IP address** command to check whether the standby Manager server is reachable.

- If yes, go to [Step 6](#).
- If no, go to [Step 4](#).

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Check whether the storage space of the /srv/BigData/LocalBackup directory is full.

Step 6 Run the following command to check whether the storage space of the **/srv/BigData/LocalBackup** directory is full:

df -hl /srv/BigData/LocalBackup

- If yes, go to [Step 7](#).

- If no, go to [Step 10](#).

Step 7 Run the following command to clear unnecessary backup files:

```
rm -rf Directory to be cleared
```

Example:

```
rm -rf /srv/BigData/LocalBackup/0/default-oms_20191211143443
```

Step 8 On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

In the **Operation** column of the backup task to be performed, click **Configure** and change the value of **Maximum Number of Backup Copies** to reduce the number of backup file sets.

Step 9 Wait about 1 minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

Check whether the synchronization file exists and whether the file permission is normal.

Step 10 Run the following command to check whether the synchronization file exists.

```
find /srv/BigData/ -name "sed*"
```

```
find /opt -name "sed*"
```

- If yes, go to [Step 11](#).
- If no, go to [Step 12](#).

Step 11 Run the following command to view the synchronization file information and permission obtained in [Step 10](#).

```
ll path of the file to be found
```

- If the size of the file is 0 and the permission column is -, the file is a junk file. Run the following command to delete it.

```
rm -rf files to be deleted
```

Wait for several minutes and check whether the alarm is cleared. If the alarm persists, go to [Step 12](#).

- If the file size is not 0, go to [Step 12](#).

Step 12 View the log files generated when the alarm is generated.

1. Run the following command to switch to the HA run log file path.

```
cd /var/log/Bigdata/omm/oms/ha/runlog/
```

2. Decompress and view the log files generated when the alarm is generated.

For example, if the name of the file to be viewed is

ha.log.2021-03-22_12-00-07.gz, run the following command:

```
gunzip ha.log.2021-03-22_12-00-07.gz
```

```
vi ha.log.2021-03-22_12-00-07
```

Check whether error information is reported before and after the alarm generation time.

- If yes, rectify the fault based on the error information. Then go to [Step 13](#).

For example, if the following error information is displayed, the directory permission is insufficient. In this case, change the directory permission to be the same as that on the normal node.

```

[2021-03-22 14:08:35.344][10195489353][0][NOTICE][hasondAlarm info: id=1,category=0,cause=0,locatino=1,addinfo={},lochostr(node-master1mfc),locha=(192.168.
```

- If no, go to [Step 14](#).

Step 13 Wait about 10 minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 14](#).

Collect fault information.

Step 14 On the FusionInsight Manager, choose **O&M > Log > Download**.

Step 15 Select the following nodes from the **Service** and click **OK**:

- OmmServer
- Controller
- NodeAgent

Step 16 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 17 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.8 ALM-12012 NTP Service Is Abnormal

Alarm Description

The system checks whether the NTP service on a node synchronizes time with the NTP service on the active OMS node every 60 seconds. This alarm is generated when the NTP service fails to synchronize time for two consecutive times.

This alarm is generated when the time difference between the NTP service on a node and the NTP service on the active OMS node is greater than or equal to 20s for two consecutive times. This alarm is cleared when the time difference is less than 20s.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12012	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The time on the node is inconsistent with that on other nodes in the cluster. Therefore, some FusionInsight applications on the node may not run properly.

Possible Causes

- The NTP service on the current node cannot start properly.
- The current node fails to synchronize time with the NTP service on the active OMS node.
- The key authenticated by the NTP service on the current node is inconsistent with that on the active OMS node.
- The time offset between the node and the NTP service on the active OMS node is large.

Handling Procedure

Check the NTP service mode of the node.

Step 1 Log in to the active management node as user **root**, run the **su - omm** command to switch to user **omm**, and run the following command to check the resource status on the active and standby nodes:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh
```

- If "chrony" is displayed in the **ResName** column of the command output, go to [Step 2](#).
- If "ntp" is displayed in the **ResName** column, go to [Step 20](#).

 **NOTE**

If both "chrony" and "ntp" are displayed in the **ResName** column of the command output, the NTP service mode is being switched. Wait for 10 minutes and go to [Step 1](#) again. If both "chrony" and "ntp" persist, contact O&M personnel.

Check whether the chrony service on the node is started properly.

Step 2 On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the page that is displayed, click  in the row containing the alarm, and view the name of the host for which the alarm is generated in **Location**.

Step 3 Check whether the chronyd process is running on the node where the alarm is generated. Log in to the node for which the alarm is generated as user **root** and run the **ps -ef | grep chronyd | grep -v grep** command to check whether the command output contains the chronyd process.

- If yes, go to [Step 6](#).
- If no, go to [Step 4](#).

Step 4 Start the NTP service.

Step 5 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Check whether the current node can synchronize time properly with the chrony service on the active OMS node.

Step 6 Check whether the node can synchronize time with the NTP service on the active OMS node based on additional information of the alarm.

- If yes, go to [Step 7](#).
- If no, go to [Step 17](#).

Step 7 Check whether the synchronization with the chrony service on the active OMS node is faulty.

Log in to the node for which the alarm is generated as user **root** and run the **chronyc sources** command.

In the command output, if there is an asterisk (*) before the IP address of the chrony service on the active OMS node, the synchronization is normal. The command output is as follows:

```
MS Name/IP address      Stratum Poll Reach LastRx Last sample
=====
^* 10.10.10.162         10 10 377 626 +16us[ +15us] +/- 308us
```

In the command output, if there is no asterisk (*) before the IP address of the NTP service on the active OMS node, and the value of **Reach** is **0**, the synchronization is abnormal.

```
MS Name/IP address      Stratum Poll Reach LastRx Last sample
=====
^? 10.1.1.1            0 10 0 - +0ns[ +0ns] +/- 0ns
```

- If yes, go to [Step 8](#).
- If no, go to [Step 38](#).

Step 8 The chrony synchronization failure is typically caused by the system firewall. If the firewall can be disabled, disable it. If the firewall cannot be disabled, check the firewall configuration policy and ensure that UDP ports 123 and 323 are not disabled. (For details, see the firewall configuration policy of each system.)

Step 9 Check whether the alarm is cleared 10 minutes later.

- If yes, no further action is required.
- If no, go to [Step 10](#).

Step 10 Log in to the active OMS node as user **root** and run the following command to view the authentication code whose key index is **1M**:

In Red Hat Enterprise Linux, run the **cat \${BIGDATA_HOME}/om-server/OMS/workspace/conf/chrony.keys** command.

Step 11 Run the following command to check whether the key is the same as that queried in [Step 10](#):

In Red Hat Enterprise Linux, run the **diff \${BIGDATA_HOME}/om-server/OMS/workspace/conf/chrony.keys /etc/chrony.keys** command.

NOTE

If the keys are the same, no result is returned after the command is executed. For example:

```
host01:~ # cat ${BIGDATA_HOME}/om-server/OMS/workspace/conf/chrony.keys
1 M sdYbq;o^CzEAWo<U=Tw5
host01:~ # diff ${BIGDATA_HOME}/om-server/OMS/workspace/conf/chrony.keys /etc/chrony.keys
host01:~ #
```

- If yes, go to [Step 12](#).
- If no, go to [Step 38](#).

Step 12 Run the **cat \${BIGDATA_HOME}/om-server/om/packaged-distributables/ntpKeyFile** command to check whether the key is the same as that queried in [Step 10](#). (Compare the key with that of the authentication key index **1M** queried in [Step 10](#).)

- If yes, go to [Step 13](#).
- If no, go to [Step 15](#).

Step 13 Log in to the faulty node as user **root** and run the **cat /etc/chrony.keys** command in Red Hat Enterprise Linux to check whether the key is the same as that queried in [Step 12](#) (compare it with that of the authentication key index **1M** for comparison).

- If yes, go to [Step 38](#).
- If no, go to [Step 14](#).

Step 14 Run the **su - omm** command to switch to user **omm**, change the key of the authentication key index **1M** in **\${NODE_AGENT_HOME}/chrony.keys** to the key of **ntpKeyFile** in [Step 12](#), and go to [Step 16](#).

Step 15 Run the following commands as user **root** or **omm** to change the NTP key of the active OMS node (change **ntp.keys** to **ntpkeys** in Red Hat Enterprise Linux):

```
cd ${BIGDATA_HOME}/om-server/OMS/workspace/conf
```

```
sed -i "`cat chrony.keys | grep -n '1 M'|awk -F ':' '{print $1}'`d" chrony.keys
```

```
echo "1 M `cat ${BIGDATA_HOME}/om-server/om/packaged-distributables/  
ntpKeyFile`" >> chrony.keys
```

Check whether the key of the authentication key index **1M** in **chrony.keys** is the same as that of **ntpKeyFile**.

- If yes, go to [Step 16](#).
- If no, change the key of the authentication key index **1M** in **chrony.keys** to the key of **ntpKeyFile** and go to [Step 16](#).

Step 16 After 5 minutes, run the **systemctl restart chronyd** command to restart the chrony service on the active OMS node. After 15 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 38](#).

Check whether the time deviation between the node and the chrony service on the active OMS node is large.

Step 17 Check whether the time deviation is large in additional information of the alarm.

- If yes, go to [Step 18](#).
- If no, go to [Step 38](#).

Step 18 On the **Hosts** tab page, select the host for which the alarm is generated, and choose **More > Stop All Instances** to stop all the services on the node.

If the time on the alarm node is later than that on the chrony service of the active OMS node, adjust the time of the alarm node. After adjusting the time, choose **More > Start All Instances** to start the services on the node.

If the time on the alarm node is earlier than that on the chrony service of the active OMS node, wait until the time deviation is due and adjust the time of the alarm node. After adjusting the time, choose **More > Start All Instances** to start the services on the node.

NOTE

If you do not wait, data loss may occur.

Step 19 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 38](#).

Check whether the NTP service on the node is started properly.

Step 20 On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the page that is displayed, click  in the row containing the alarm, and view the name of the host for which the alarm is generated in **Location**.

Step 21 Check whether the ntpd process is running on the node using the following method. Log in to the alarm node as user **root** and run the **ps -ef | grep ntpd | grep -v grep** command to check whether the command output contains the ntpd process.

- If yes, go to [Step 24](#).

- If no, go to [Step 22](#).

Step 22 Run the **service ntp start** command (or the **service ntpd start** command in Red Hat Enterprise Linux) to start the NTP service.

Step 23 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 24](#).

Check whether the node can synchronize time properly with the NTP service on the active OMS node.

Step 24 Check whether the node can synchronize time with the NTP service on the active OMS node based on additional information of the alarm.

- If yes, go to [Step 25](#).
- If no, go to [Step 35](#).

Step 25 Check whether the synchronization with the NTP service on the active OMS node is faulty.

Log in to the alarm node as user **root** and run the **ntpq -np** command.

If an asterisk (*) exists before the IP address of the NTP service on the active OMS node in the command output, the synchronization is in normal state. The command output is as follows:

```
remote refid st t when poll reach delay offset jitter
=====
*10.10.10.162 .LOCL. 1 u 1 16 377 0.270 -1.562 0.014
```

If there is no asterisk (*) before the IP address of the NTP service on the active OMS node, as shown in the following command output, and the value of **refid** is **.INIT.**, the synchronization is abnormal.

```
remote refid st t when poll reach delay offset jitter
=====
10.10.10.162 .INIT. 1 u 1 16 377 0.270 -1.562 0.014
```

- If yes, go to [Step 26](#).
- If no, go to [Step 38](#).

Step 26 The NTP synchronization failure is typically caused by the system firewall. If the firewall can be disabled, run the **iptables -F** command to disable it. If the firewall cannot be disabled, run the **iptables -L** command to check the firewall configuration policy and ensure that the UDP port 123 is not disabled. (For details, see the firewall configuration policy of each system.)

Step 27 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 28](#).

Step 28 Log in to the active OMS node as user **root** and run the following command to view the authentication key index **1M**:

In SUSE Linux, run the **cat \${BIGDATA_HOME}/om-server/OMS/workspace/conf/ntp.keys** command.

In Red Hat Enterprise Linux or EulerOS, run the **cat \${BIGDATA_HOME}/om-server/OMS/workspace/conf/ntpkeys** command.

Step 29 Run the following command to check whether the key is the same as that queried in [Step 28](#):

In SUSE Linux, run the **diff `${BIGDATA_HOME}/om-server/OMS/workspace/conf/ntp.keys /etc/ntp.keys`** command.

In Red Hat Enterprise Linux or EulerOS, run the **diff `${BIGDATA_HOME}/om-server/OMS/workspace/conf/ntpkeys /etc/ntp/ntpkeys`** command.

 **NOTE**

If the keys are the same, no result is returned after the command is executed. For example:

```
host01:~ # cat ${BIGDATA_HOME}/om-server/OMS/workspace/conf/ntp.keys
1 M sdYbq;o^CzEAWo<U=Tw5
host01:~ # diff ${BIGDATA_HOME}/om-server/OMS/workspace/conf/ntp.keys /etc/ntp.keys
host01:~ #
```

- If yes, go to [Step 30](#).
- If no, go to [Step 38](#).

Step 30 Run the **cat `${BIGDATA_HOME}/om-server/om/packaged-distributables/ntpKeyFile`** command to check whether the key is the same as that queried in [Step 28](#). (Compare the key with that of the authentication key index **1M** queried in [Step 28](#).)

- If yes, go to [Step 31](#).
- If no, go to [Step 33](#).

Step 31 Log in to the faulty node as user **root** and run the **cat `/etc/ntp.keys`** command in SUSE Linux (or the **cat `/etc/ntp/ntpkeys`** command in Red Hat Enterprise Linux) to check whether the key is the same as the value queried in [Step 30](#) (use the key of the authentication key index **1M** for comparison).

- If yes, go to [Step 38](#).
- If no, go to [Step 32](#).

Step 32 Run the **su - omm** command to switch to user **omm**, change the key of the authentication key index **1M** in **`${NODE_AGENT_HOME}/ntp.keys`** (**`${NODE_AGENT_HOME}/ntpkeys`** in Red Hat Enterprise Linux) to the key of **ntpKeyFile** in [Step 30](#), and go to [Step 34](#).

Step 33 Run the following commands as user **root** or **omm** to change the NTP key of the active OMS node (change **ntp.keys** to **ntpkeys** in Red Hat Enterprise Linux):

```
cd ${BIGDATA_HOME}/om-server/OMS/workspace/conf
sed -i "cat ntp.keys | grep -n '1 M'|awk -F ':' '{print $1}'`d" ntp.keys
echo "1 M `cat ${BIGDATA_HOME}/om-server/om/packaged-distributables/ntpKeyFile`" >>ntp.keys
```

Check whether the key of the authentication key index **1M** in **ntp.keys** is the same as that of **ntpKeyFile**.

- If yes, go to [Step 34](#).
- If no, change the key of the authentication key index **1M** in **ntp.keys** to the key of **ntpKeyFile** and go to [Step 34](#).

Step 34 After 5 minutes, run the **service ntp restart** command to restart the NTP service on the active OMS node. After 15 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 38](#).

Check whether the time deviation between the node and the NTP service on the active OMS node is large.

Step 35 Check whether the time deviation is large in additional information of the alarm.

- If yes, go to [Step 36](#).
- If no, go to [Step 38](#).

Step 36 On the **Hosts** tab page, select the host for which the alarm is generated, and choose **More > Stop All Instances** to stop all the services on the node.

If the time on the alarm node is later than that on the NTP service of the active OMS node, adjust the time of the alarm node. After adjusting the time, choose **More > Start All Instances** to start the services on the node.

If the time on the alarm node is earlier than that on the NTP service of the active OMS node, wait until the time deviation is due and adjust the time of the alarm node. After adjusting the time, choose **More > Start All Instances** to start the services on the node.

 **NOTE**

If you do not wait, data loss may occur.

Step 37 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 38](#).

Collect fault information.

Step 38 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 39 Expand the **Service** drop-down list, select **NodeAgent** and **OmmServer** for the target cluster, and click **OK**. Expand the **Hosts** dialog box and select the alarm node and the active OMS node.

Step 40 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 41 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

10.9 ALM-12014 Partition Lost

Description

The system checks the partition status every 60 seconds. This alarm is generated when the system detects that a partition to which service directories are mounted is lost (because the device is removed or goes offline, or the partition is deleted). The system checks the partition status periodically.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12014	Major	<ul style="list-style-type: none">• Yes: MRS 3.3.0 and later, MRS 3.1.0.0.10/3.1.5.0.3 and later patch versions• No: Versions earlier than MRS 3.3.0

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DirName	Specifies the directory for which the alarm is generated.
PartitionName	Specifies the device partition for which the alarm is generated.

Impact on the System

Service data fails to be written into the partition, and the service system runs abnormally.

Possible Causes

- The hard disk is removed.
- The hard disk is offline, or a bad sector exists on the hard disk.

Procedure

- Step 1** On FusionInsight Manager, click **O&M > Alarm > Alarms**, and click  in the row where the alarm is located.
- Step 2** Obtain **HostName**, **PartitionName** and **DirName** from **Location**.
- Step 3** Check whether the disk of **PartitionName** on **HostName** is inserted to the correct server slot.
- If yes, go to [Step 4](#).
 - If no, go to [Step 5](#).
- Step 4** Contact hardware engineers to remove the faulty disk.
- Step 5** Log in to the **HostName** node where an alarm is reported and check whether there is a line containing **DirName** in the **/etc/fstab** file as user **root**.
- If yes, go to [Step 6](#).
 - If no, go to [Step 7](#).
- Step 6** Run the **vi /etc/fstab** command to edit the file and delete the line containing **DirName**.
- Step 7** Contact hardware engineers to insert a new disk. For details, see the hardware product document of the relevant model. If the faulty disk is in a RAID group, configure the RAID group. For details, see the configuration methods of the relevant RAID controller card.
- Step 8** Wait 20 to 30 minutes (The disk size determines the waiting time), and run the **mount** command to check whether the disk has been mounted to the **DirName** directory.
- If yes, go to [Step 9](#) for MRS 3.3.0 and later, MRS 3.1.0.0.10/3.1.5.0.3 and later patch versions. For clusters earlier than MRS 3.3.0, manually clear the alarm. No further action is required.
 - If no, go to [Step 10](#).
- Step 9** Wait about 2 minute and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 10](#).
- Collect fault information.**
- Step 10** On the FusionInsight Manager, choose **O&M > Log > Download**.
- Step 11** Select the **OmmServer** from the Services drop-down list and click **OK**.
- Step 12** Set Start Date for log collection to 10 minutes ahead of the alarm generation time and End Date to 10 minutes behind the alarm generation time and click **Download**.

Step 13 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

MRS 3.3.0 and later, MRS 3.1.0.0.10/3.1.5.0.3 and later patch versions: After the fault is rectified, the system automatically clears this alarm.

Versions earlier than MRS 3.3.0: After the fault is rectified, the system does not automatically clear this alarm, and you need to manually clear the alarm.

10.10 ALM-12015 Partition Filesystem Readonly

Description

The system checks the partition status every 60 seconds. This alarm is generated when the system detects that a partition to which service directories are mounted enters the read-only mode (due to a bad sector or a faulty file system). The system checks the partition status periodically.

This alarm is cleared when the system detects that the partition to which service directories are mounted exits from the read-only mode (because the file system is restored to read/write mode, the device is removed, or the device is formatted).

Attribute

Alarm ID	Alarm Severity	Auto Clear
12015	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
DirName	Specifies the directory for which the alarm is generated.
PartitionName	Specifies the device partition for which the alarm is generated.

Impact on the System

Service data fails to be written into the partition, and the service system runs abnormally.

Possible Causes

The hard disk is faulty, for example, a bad sector exists.

Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**, click  in the row where the alarm is located.
- Step 2** Obtain **HostName** and **PartitionName** from **Location**. **HostName** is the node where the alarm is reported, and **PartitionName** is the partition of the faulty disk.
- Step 3** Contact hardware engineers to check whether the disk is faulty. If the disk is faulty, remove it from the server.
- Step 4** After the disk is removed, alarm **ALM-12014 Partition Lost** is reported. Handle the alarm. For details, see [ALM-12014 Partition Lost](#). After the alarm **ALM-12014 Partition Lost** is cleared, alarm **ALM-12015 Partition Filesystem Readonly** is automatically cleared.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

None

10.11 ALM-12016 CPU Usage Exceeds the Threshold

Description

The system checks the CPU usage every 30 seconds and compares the actual CPU usage with the threshold. The CPU usage has a default threshold. This alarm is generated when the CPU usage exceeds the threshold for several times (configurable, 10 times by default) consecutively.

The alarm is cleared in the following two scenarios: The value of **Trigger Count** is 1 and the CPU usage is smaller than or equal to the threshold; the value of **Trigger Count** is greater than 1 and the CPU usage is smaller than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12016	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Service processes respond slowly or become unavailable.

Possible Causes

- The alarm threshold or alarm smoothing times are incorrect.
- CPU configuration cannot meet service requirements. The CPU usage reaches the upper limit. Or the service is in peak hours. As a result, the CPU usage reaches the upper limit in a short period of time.

Procedure

Check whether the alarm threshold or alarm Trigger Count are correct.

Step 1 Change the alarm threshold and alarm **Trigger Count** based on CPU usage.

On FusionInsight Manager, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > CPU > Host CPU Usage** and change the alarm smoothing times based on CPU usage, as shown in [Figure 10-1](#).

NOTE

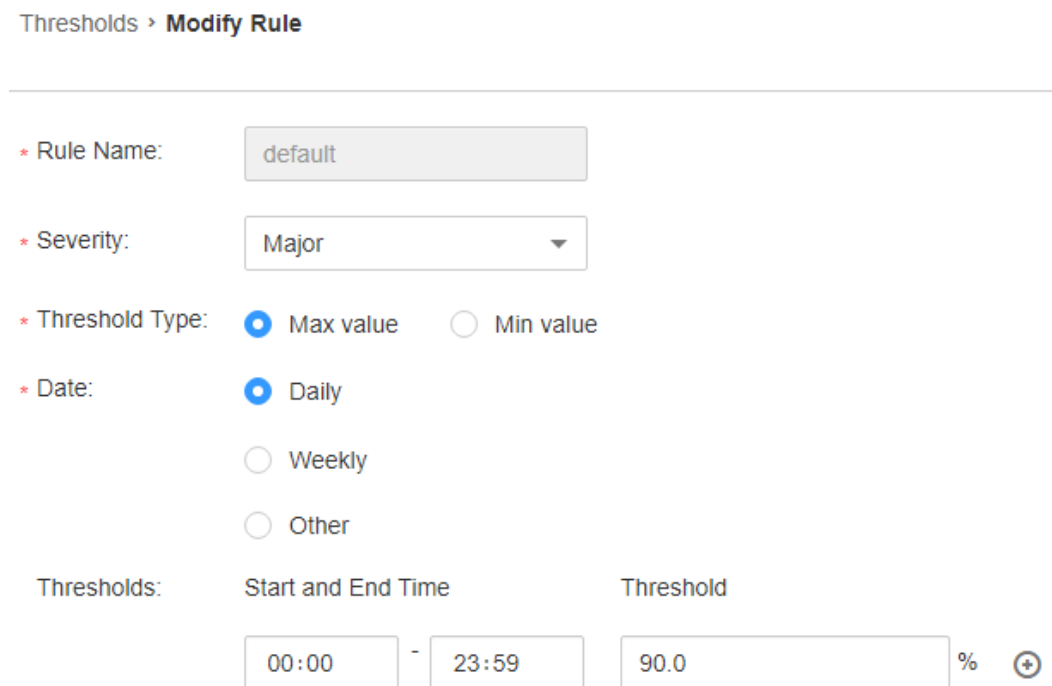

This option defines the alarm check phase. **Trigger Count** indicates the alarm check threshold. An alarm is generated when the number of check times exceeds the threshold.

Figure 10-1 Setting alarm smoothing times

On **Host CPU Usage** page and click **Modify** in the **Operation** column to change the alarm threshold, as shown in [Figure 10-2](#).

Figure 10-2 Setting an alarm threshold

Step 2 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 3](#).

Check whether the CPU usage reaches the upper limit.

Step 3 In the alarm list on FusionInsight Manager, click in the row where the alarm is located to view the alarm host address in the alarm details.

Step 4 On the **Hosts** page, click the node on which the alarm is reported.

Step 5 View the CPU usage for 5 minutes. If the CPU usage exceeds the threshold for multiple times, contact the system administrator to add more CPUs.

Step 6 Check whether the current traffic is in peak hours. If the alarm is generated during peak hours, you are advised to expand the capacity of the node or contact the system administrator to add more CPUs.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

Collect fault information.

Step 8 On the FusionInsight Manager in the active cluster, choose **O&M > Log > Download**.

Step 9 Select **OmmServer** from the **Service** and click **OK**.

Step 10 Set **Start Date** for log collection to 10 minutes ahead of the alarm generation time and **End Date** to 10 minutes behind the alarm generation time in **Time Range** and click **Download**.

Step 11 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.12 ALM-12017 Insufficient Disk Capacity

Description

The system checks the host disk usage of the system every 30 seconds and compares the actual disk usage with the threshold. The disk usage has a default threshold, this alarm is generated when the host disk usage exceeds the specified threshold.

When the **Trigger Count** is 1, this alarm is cleared when the usage of a host disk partition is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the usage of a host disk partition is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12017	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PartitionName	Specifies the device partition for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Service processes become unavailable.

Possible Causes

- The alarm threshold is incorrect.
- Disk configuration of the server cannot meet service requirements.

Procedure

Check whether the alarm threshold is appropriate.

- Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Disk > Disk Usage** and check whether the threshold (configurable, 90% by default) is appropriate.
- If yes, go to [Step 2](#).
 - If no, go to [Step 4](#).
- Step 2** Choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Disk > Disk Usage** and click **Modify** in the **Operation** column to change the alarm threshold based on site requirements. As shown in [Figure 10-3](#):

Figure 10-3 Setting an alarm threshold

Thresholds > **Modify Rule**

* Rule Name:

* Severity:

* Threshold Type: Max value Min value

* Date: Daily
 Weekly
 Other

Thresholds: Start and End Time Threshold

- %

Step 3 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

Check whether the disk usage reaches the upper limit.

Step 4 In the alarm list on FusionInsight Manager, click  in the row where the alarm is located to view the alarm host name and disk partition information in the alarm details.

Step 5 Log in to the node where the alarm is generated as user **root**.

Step 6 Run the `df -lmPT | awk '$2 != "iso9660"' | grep '^/dev/' | awk '{"readlink -m "$1 | getline real }{$1=real; print $0}' | sort -u -k 1,1` command to check the system disk partition usage. Check whether the disk is mounted to the following directories based on the disk partition name obtained in [Step 4](#): `/`, `/opt`, `/tmp`, `/var`, `/var/log`, and `/srv/BigData` (can be customized).

- If yes, the disk is a system disk. Then go to [Step 10](#).
- If no, the disk is not a system disk. Then go to [Step 7](#).

Step 7 Run the `df -lmPT | awk '$2 != "iso9660"' | grep '^/dev/' | awk '{"readlink -m "$1 | getline real }{$1=real; print $0}' | sort -u -k 1,1` command to check the system disk partition usage. Determine the role of the disk based on the disk partition name obtained in [Step 4](#).

Step 8 Check the disk service.

In MRS, check whether the disk service is HDFS, Yarn, Kafka, Supervisor.

- If yes, adjust the capacity. Then go to [Step 9](#).
- If no, go to [Step 12](#).

- Step 9** After 2 minutes, check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 12](#).
- Step 10** Run the `find / -xdev -size +500M -exec ls -l {} \;` command to check whether a file larger than 500 MB exists on the node and disk.
- If yes, go to [Step 11](#).
 - If no, go to [Step 12](#).
- Step 11** Handle the large file and check whether the alarm is cleared 2 minutes later.
- If yes, no further action is required.
 - If no, go to [Step 12](#).
- Step 12** Contact the system administrator to expand the disk capacity.
- Step 13** After 2 minutes, check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 14](#).
- Collect fault information.**
- Step 14** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 15** Select **OMS** from the **Service** and click **OK**.
- Step 16** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 17** Contact the O&M personnel and send the collected log information.
- End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13 ALM-12018 Memory Usage Exceeds the Threshold

Description

The system checks the memory usage of the system every 30 seconds and compares the actual memory usage with the threshold. The memory usage has a default threshold, this alarm is generated when the value of the memory usage exceeds the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the host memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1,

this alarm is cleared when the host memory usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12018	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Service processes respond slowly or become unavailable.

Possible Causes

Memory configuration cannot meet service requirements. The memory usage reaches the upper limit.

Procedure

Expand the system.

- Step 1** In the alarm list on FusionInsight Manager, click  in the row where the alarm is located to view the alarm host address in the alarm details.
- Step 2** Log in to the host where the alarm is generated as user **root**.
- Step 3** If the memory usage exceeds the threshold, perform memory capacity expansion.
- Step 4** Run the command **free -m | grep Mem\| | awk '{printf("%s,", \$3 * 100 / \$2)}'** to check the system memory usage.

Step 5 Wait for 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect fault information.

Step 6 On the FusionInsight Manager in the active cluster, choose **O&M > Log > Download**.

Step 7 Select **OmmServer** from the **Service** and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.14 ALM-12027 Host PID Usage Exceeds the Threshold

Description

The system checks the PID usage every 30 seconds and compares the actual PID usage with the default PID usage threshold. This alarm is generated when the system detects that the PID usage exceeds the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the PID usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the PID usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12027	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

No PID is available for new processes and service processes are unavailable.

Possible Causes

Too many processes are running on the node. You need to increase the value of **pid_max**.

Procedure

Increase the value of pid_max.

- Step 1** In the alarm list on FusionInsight Manager, click  in the row where the alarm is located to view the alarm host address in the alarm details.
- Step 2** Log in to the host where the alarm is generated as user **root**.
- Step 3** Run the **cat /proc/sys/kernel/pid_max** command to check the value of **pid_max**.
- Step 4** If the PID usage exceeds the threshold, edit the **/etc/sysctl.conf** file and increase the value of **kernel.pid_max** to twice of the value of **pid_max** queried in **Step 3**. If this parameter does not exist, add it to the end of the file.

For example, change the parameter to **kernel.pid_max=65536** and run the following command to make the parameter take effect immediately:

```
sysctl -p
```

 **NOTE**

The maximum value of **kernel.pid_max** is as follows:

- On 32-bit systems: 32768
- On 64-bit systems: 4194304 (2²²)

Step 5 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect fault information.

Step 6 On the FusionInsight Manager home page of the active cluster, choose **O&M > Log > Download**.

Step 7 Select all services from the **Service** and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.15 ALM-12028 Number of Processes in the D State and Z State on a Host Exceeds the Threshold

Alarm Description

The system checks the number of processes in the D state and Z state of user **omm** on the host every 30 seconds and compares the actual number with the threshold. The number of processes in the D state and Z state on the host has a default threshold range. This alarm is generated when the number of processes exceeds the threshold.

This alarm is cleared when **Trigger Count** is **1** and the total number of processes in the D state and Z state of user **omm** on the host does not exceed the threshold. This alarm is cleared when **Trigger Count** is greater than **1** and the total number of processes in the D state and Z state of user **omm** on the host is less than or equal to 90% of the threshold.

 **NOTE**

The function of checking the number of processes in the Z state on the host applies to MRS 3.2.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12028	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Excessive system resources are used and service processes respond slowly.

Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state.

Handling Procedure

Check the processes in the D state and Z state.

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click  to view the IP address of the host for which the alarm is generated.
- Step 2** Log in to the host for which the alarm is generated as user **root**. () Then run the **su - omm** command to switch to user **omm**.
- Step 3** Run the following command as user **omm** to view the PID of the process that is in the D state and Z state:

```
ps -elf | grep -v "[thread_checkio]" | awk 'NR!=1 {print $2, $3, $4}' | grep omm | awk -F' ' '{print $1, $3}' | grep -E "Z|D" | awk '{print $2}'
```
- Step 4** Check whether the command output is empty.
 - If yes, the service process is running properly. Then go to [Step 6](#).

- If no, go to [Step 5](#).

Step 5 Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)

Step 6 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to [Step 7](#).

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 8 Select **OMS** for **Service** and click **OK**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.16 ALM-12033 Slow Disk Fault

Alarm Description

For MRS 3.3.0 and its later versions as well as MRS 3.1.0.0.10/3.1.5.0.3 and later patch versions:

- For HDDs, the alarm is triggered when any of the following conditions is met:
 - By default, the system collects data every 3 seconds. The svctm latency reaches 1000 ms within 30 seconds in at least seven collection periods.
 - By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 150 ms within 300 seconds.
- For SSDs, the alarm is triggered when any of the following conditions is met:
 - By default, the system collects data every 3 seconds. The svctm latency reaches 1000 ms within 30 seconds in at least seven collection periods.
 - By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 20 ms within 300 seconds.

The collection period is 3 seconds, and the detection period is 30 or 300 seconds. This alarm is automatically cleared when neither of the preceding conditions is met for three consecutive detection periods (30 or 300 seconds).

For versions earlier than MRS 3.3.0:

- For HDDs, the alarm is triggered when any of the following conditions is met:
 - The system runs the **iotstat** command every 3 seconds by default, and detects that the **svctm** value exceeds 1000 ms in at least seven consecutive periods within 30 seconds.
 - The system runs the **iotstat** command every 3 seconds, and detects that more than 50% of I/Os take more than 150 ms within 300s.
- For SSDs, the alarm is triggered when any of the following conditions is met:
 - The system runs the **iotstat** command every 3 seconds by default, and detects that the **svctm** value exceeds 1000 ms for at least 10 periods within 30 seconds.
 - The system runs the **iotstat** command every 3 seconds by default, and detects that more than 60% of I/Os take more than 20 ms within 300s.

This alarm is automatically cleared when the preceding conditions have not been met for 15 minutes.

 **NOTE**

For details about how to obtain the **svctm** value, see [Related Information](#).

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12033	<ul style="list-style-type: none">• Minor: MRS 3.3.0 and its later versions as well as MRS 3.1.0.0.10/3.1.5.0.3 and later patch versions• Major: versions earlier than MRS 3.3.0	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.

Parameter	Description
HostName	Specifies the host for which the alarm was generated.
DiskName	Specifies the disk for which the alarm was generated.

Impact on the System

Service performance deteriorates, service processing capabilities become poor, and services may be unavailable.

Possible Causes

The disk is aged or has bad sectors.

Handling Procedure

Check the disk status.

- Step 1** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**.
- Step 2** View the detailed information about the alarm. Check the values of **HostName** and **DiskName** in the location information to obtain the information about the faulty disk for which the alarm is generated.
- Step 3** Check whether the node for which the alarm is generated is in a virtualization environment.
 - If yes, go to [Step 4](#).
 - If no, go to [Step 7](#).
- Step 4** Check whether the storage performance provided by the virtualization environment meets the hardware requirements. Then, go to [Step 5](#).
- Step 5** Log in to the alarm node as user **root**, run the **df -h** command, and check whether the command output contains the value of the **DiskName** field.
 - If yes, go to [Step 7](#).
 - If no, go to [Step 6](#).
- Step 6** Run the **lsblk** command to check whether the mapping between the value of **DiskName** and the disk has been created.

```

sda                8:0        0 27810G 0
├─sda1             8:1         0   509M 0 /boot
└─sda2             8:2         0 278.4G 0
   ├─system-opt (dm-0) 253:0        0   50G 0 /opt
   ├─system-root (dm-1) 253:1        0   50G 0 /
   ├─system-swap (dm-2) 253:2        0   50G 0
   └─system-var (dm-3) 253:3        0   50G 0 /var
    
```

- If yes, go to [Step 7](#).
- If no, go to [Step 22](#).

Step 7 Log in to the alarm node as user **root**, run the **lsscsi | grep "/dev/sd[x]"** command to view the disk information, and check whether RAID has been set up.

 **NOTE**

In the command, **/dev/sd[x]** indicates the disk name obtained in [Step 2](#).

Example:

lsscsi | grep "/dev/sda"

In the command output, if **ATA**, **SATA**, or **SAS** is displayed in the third line, the disk has not been organized into a RAID group. If other information is displayed, RAID has been set up.

- If yes, go to [Step 12](#).
- If no, go to [Step 8](#).

Step 8 Run the **smartctl -i /dev/sd[x]** command to check whether the hardware supports the SMART tool.

Example:

smartctl -i /dev/sda

In the command output, if "SMART support is: Enabled" is displayed, the hardware supports SMART. If "Device does not support SMART" or other information is displayed, the hardware does not support SMART.

- If yes, go to [Step 9](#).
- If no, go to [Step 16](#).

Step 9 Run the **smartctl -H --all /dev/sd[x]** command to check basic SMART information and determine whether the disk is working properly.

Example:

smartctl -H --all /dev/sda

Check the value of **SMART overall-health self-assessment test result** in the command output. If the value is **FAILED**, the disk is faulty and needs to be replaced. If the value is **PASSED**, check the value of **Reallocated_Sector_Ct** or **Elements in grown defect list**. If the value is greater than 100, the disk is faulty and needs to be replaced.

- If yes, go to [Step 10](#).
- If no, go to [Step 18](#).

Step 10 Run the **smartctl -l error -H /dev/sd[x]** command to check the Glist of the disk and determine whether the disk is normal.

Example:

smartctl -l error -H /dev/sda

Check the **Command/Feature_name** column in the command output. If **READ SECTOR(S)** or **WRITE SECTOR(S)** is displayed, the disk has bad sectors. If other

errors occur, the disk circuit board is faulty. Both errors indicate that the disk is abnormal and needs to be replaced.

If "No Errors Logged" is displayed, no error log exists. You can trigger the disk SMART self-check.

- If yes, go to [Step 11](#).
- If no, go to [Step 18](#).

Step 11 Run the `smartctl -t long /dev/sd[x]` command to trigger the disk SMART self-check. After the command is executed, the time when the self-check is to be completed is displayed. After the self-check is completed, repeat [Step 9](#) and [Step 10](#) to check whether the disk is working properly.

Example:

```
smartctl -t long /dev/sda
```

- If yes, go to [Step 17](#).
- If no, go to [Step 18](#).

Step 12 Run the `smartctl -d [sat|scsi]+megaraid,[DID] -H --all /dev/sd[x]` command to check whether the hardware supports SMART.

 NOTE

- In the command, `[sat|scsi]` indicates the disk type. Both types need to be used.
- `[DID]` indicates the slot information. Slots 0 to 15 need to be used.

For example, run the following commands in sequence:

```
smartctl -d sat+megaraid,0 -H --all /dev/sda
```

```
smartctl -d sat+megaraid,1 -H --all /dev/sda
```

```
smartctl -d sat+megaraid,2 -H --all /dev/sda
```

...

Try the command combinations of different disk types and slot information. If "SMART support is: Enabled" is displayed in the command output, the disk supports SMART. Record the parameters of the disk type and slot information when a command is successfully executed. If "SMART support is: Enabled" is not displayed in the command output, the disk does not support SMART.

- If yes, go to [Step 13](#).
- If no, go to [Step 16](#).

Step 13 Run the `smartctl -d [sat|scsi]+megaraid,[DID] -H --all /dev/sd[x]` command recorded in [Step 12](#) to check basic SMART information and determine whether the disk is normal.

Example:

```
smartctl -d sat+megaraid,2 -H --all /dev/sda
```

Check the value of **SMART overall-health self-assessment test result** in the command output. If the value is **FAILED**, the disk is faulty and needs to be replaced. If the value is **PASSED**, check the value of **Reallocated_Sector_Ct** or

Elements in grown defect list. If the value is greater than 100, the disk is faulty and needs to be replaced.

- If yes, go to [Step 14](#).
- If no, go to [Step 18](#).

Step 14 Run the `smartctl -d [sat|scsi]+megaraid,[DID] -l error -H /dev/sd[x]` command to check the Glist of the disk and determine whether the hard disk is working properly.

Example:

```
smartctl -d sat+megaraid,2 -l error -H /dev/sda
```

Check the **Command/Feature_name** column in the command output. If **READ SECTOR(S)** or **WRITE SECTOR(S)** is displayed, the disk has bad sectors. If other errors occur, the disk circuit board is faulty. Both errors indicate that the disk is abnormal and needs to be replaced.

If "No Errors Logged" is displayed, no error log exists. You can trigger the disk SMART self-check.

- If yes, go to [Step 15](#).
- If no, go to [Step 18](#).

Step 15 Run the `smartctl -d [sat|scsi]+megaraid,[DID] -t long /dev/sd[x]` command to trigger the disk SMART self-check. After the command is executed, the time when the self-check is to be completed is displayed. After the self-check is completed, repeat [Step 13](#) and [Step 14](#) to check whether the disk is working properly.

Example:

```
smartctl -d sat+megaraid,2 -t long /dev/sda
```

- If yes, go to [Step 17](#).
- If no, go to [Step 18](#).

Step 16 If the configured RAID controller card does not support SMART, the disk does not support SMART. In this case, use the check tool provided by the corresponding RAID controller card vendor to rectify the fault. Then go to [Step 17](#).

For example, LSI is a MegaCLI tool.

Step 17 On FusionInsight Manager, choose **O&M > Alarm > Alarms**, click **Clear** in the **Operation** column of the alarm, and check whether the alarm is reported on the same disk again.

If the alarm is reported for three times, replace the disk.

- If yes, go to [Step 18](#).
- If no, no further action is required.

Replace the disk.

Step 18 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**.

Step 19 View the detailed information about the alarm. Check the values of **HostName** and **DiskName** in the location information to obtain the information about the faulty disk for which the alarm is reported.

Step 20 Replace the disk.

Step 21 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 22](#).

Collect the fault information.

Step 22 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 23 Select **OMS** for **Service** and click **OK**.

Step 24 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 25 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

The **svctm** value can be obtained as follows:

- MRS 3.1.0:

Run the **iostat -x -t** command in the OS.

```
lomm@node-master1hxyk ~]$ iostat -x -t
Linux 3.10.0-862.14.1.5.h520.eulerosv2r7.x86_64 (node-master1hxyk) 11/11/2022 _x86_64_ (4 CPU)

11/11/2022 03:35:20 PM
avg-cpu:  %user   %nice %system %iowait  %steal   %idle
           27.66    0.00   15.66    0.63    0.00   56.06

Device:            rrqm/s   wrqm/s     r/s     w/s    kB/s    kB/s  avgrq-sz  avgrq-sz   await  r_await  w_await   svctm   util

```

- Versions later than MRS 3.1.0:

$$svctm = (tot_ticks_new - tot_ticks_old) / (rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old)$$
- Versions earlier than MRS 3.3.0: If $rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0$, then **svctm** = 0.
- MRS 3.3.0 and its later versions as well as MRS 3.1.0.0.10/3.1.5.0.3 and later patch versions:

When the detection period is 30 seconds, if $rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0$, then **svctm** = 0.

When the detection period is 300 seconds and $rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0$, if $tot_ticks_new - tot_ticks_old = 0$, then **svctm** = 0; otherwise, the value of **svctm** is infinite.

The parameters can be obtained as follows:

The system runs the `cat /proc/diskstats` command every 3 seconds to collect data. For example:

```

comm@ ~$ jls cat /proc/diskstats
253 0 vda 1101553 35446 83439787 3338546 28744856 48314024 1054257652 52667332 0 19569526 40342913 0 0 0 0

253 16 vdb 275920 21939 15977738 2171665 39477604 28238831 2653881640 482234435 0 30581946 465964144 0 0 0 0
253 17 vdb1 275439 21939 15948866 2171472 31293358 28238811 2653881432 481841639 0 30038274 465857164 0 0 0 0
7 0 loop0 356 0 17442 150 0 0 0 0 149 105 0 0 0 0
    
```

In the two commands:

In the data collected for the first time, the number in the fourth column is the **rd_ios_old** value, the number in the eighth column is the **wr_ios_old** value, and the number in the thirteenth column is the **tot_ticks_old** value.

In the data collected for the second time, the number in the fourth column is the **rd_ios_new** value, the number in the eighth column is the **wr_ios_new** value, and the number in the thirteenth column is the **tot_ticks_new** value.

In this case, the value of **svctm** is as follows:

$$(19571460 - 19569526) / (1101553 + 28747977 - 1101553 - 28744856) = 0.6197$$

10.17 ALM-12034 Periodical Backup Failure

Description

The system executes the periodic backup task every 60 minutes. This alarm is generated when a periodical backup task fails to be executed. This alarm is cleared when the next backup task is executed successfully.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12034	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
TaskName	Specifies the task.

Impact on the System

There are not available backup packages for a long time, so the system cannot be restored in case of exceptions.

Possible Causes

The alarm cause depends on the task details. Handle the alarm according to the logs and alarm details.

Procedure

Check whether the disk space is sufficient.

Step 1 In the FusionInsight Manager portal, click **O&M > Alarm > Alarms**.

Step 2 In the alarm list, click  in the row where the alarm is located and obtain **TaskName** from **Location**.

Step 3 Log in to the active node of the cluster as the **root** user and check the backup and restoration logs in `/var/log/Bigdata/controller/backup/`.

```
cd /var/log/Bigdata/controller/backup/
```

```
vi Log file name
```

Check whether the log file contains information similar to the following:

```
Upload backup files to *** file failed, error info: ***
```

- If yes, go to [Step 4](#).
- If no, go to [Step 7](#).

Step 4 On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**. Locate the backup task based on **TaskName**, click **Configure** in the **Operation** column, and check whether all configuration items are correctly configured.

- If yes, go to [Step 7](#).
- If no, modify the configuration, save the modification, and go to [Step 5](#).

Step 5 Choose **More > Back Up Now** to start the backup task and check whether the backup task is successfully executed.

- If yes, go to [Step 6](#).
- If no, go to [Step 7](#).

Step 6 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

Step 7 Choose **More > View History** in the **Operation** column. In the displayed dialog box view the task details.

Figure 10-4 View History

Step 8 In the displayed dialog box and click \checkmark to check whether the following message is displayed: Failed to backup xx due to insufficient disk space, move the data in the xx directory to other directories.

- If yes, go to [Step 9](#).
- If no, go to [Step 16](#).

Step 9 Choose **Backup Path > View** and obtain the **Backup Path**.

Step 10 Log in to the node as user **root** and run the following command to check the node mounting details:

df -h

Step 11 Check whether the available space of the node to which the backup path is mounted is less than 20 GB.

- If yes, go to [9](#).
- If no, go to [Step 16](#).

Step 12 Check whether there are many backup packages in the backup directory.

- If yes, go to [Step 13](#).
- If no, go to [Step 16](#).

Step 13 Enable the available space of the node to which the backup directory is mounted to be greater than 20 GB by moving backup packages out of the backup directory or delete the backup packages.

Step 14 After the problem is resolved, perform the backup task again and check whether the backup task execution is successful.

- If yes, go to [Step 15](#).
- If no, go to [Step 16](#).

Step 15 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 16](#).

Collect fault information.

Step 16 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 17 Select **Controller** from the **Service** and click **OK**.

Step 18 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.18 ALM-12035 Unknown Data Status After Recovery Task Failure

Description

After the recovery task fails, the system automatically rolls back every 60 minutes. If the rollback fails, data may be lost. If this occurs, an alarm is reported. This alarm is cleared when the next recovery task execution is successful.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12035	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
TaskName	Specifies the task.

Impact on the System

After the recovery task fails, the system automatically rolls back. If the rollback fails, data may be lost or the data status may be unknown, which may affect services.

Possible Causes

The alarm cause depends on the task details. Handle the alarm according to the logs and alarm details.

Procedure

Collect fault information.

- Step 1** In the FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the running status of the component meets the requirements. (The OMS and DBService must be in the normal state, and other components must be stopped.)
- If yes, go to [Step 9](#).
 - If no, go to [Step 2](#).
- Step 2** Restore the component status as required and start the recovery task again.
- Step 3** Log in to the FusionInsight Manager portal and click **O&M** > **Alarm** > **Alarms**.
- Step 4** In the alarm list, click  in the row where the alarm is located to obtain **TaskName** from **Location**.
- Step 5** Choose **O&M** > **Backup and Restoration** > **Restoration Management**.
- Step 6** Find the restoration task by **Task Name** and view the task details.
- Step 7** Perform the recovery task again and check whether the recovery task execution is successful.
- If yes, go to [8](#).
 - If no, go to [9](#).
- Step 8** After 2 minutes, check whether the alarm is cleared.
- If yes, no further action is required.

- If no, go to 9.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 10 Select **Controller** from the **Service** and click **OK**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.19 ALM-12037 NTP Server Abnormal

Description

The system checks the NTP server status every 60 seconds. This alarm is generated when the system detects that the NTP server is abnormal for 10 consecutive times.

This alarm is cleared when the NTP server recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12037	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
HostName	Specifies the IP address of the NTP server for which the alarm is generated.

Impact on the System

The NTP server configured on the active OMS node is abnormal. In this case, the active OMS node cannot synchronize time with the NTP server and a time offset may be generated in the cluster.

Possible Causes

- The NTP server network is abnormal.
- The NTP server authentication fails.
- The NTP server time cannot be obtained.
- The time obtained from the NTP server is not continuously updated.

Procedure

Check the NTP server network.

- Step 1** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and click  in the row where the alarm is located.
- Step 2** View the alarm additional information to check whether the NTP server fails to be pinged.
- If yes, go to [Step 3](#).
 - If no, go to [Step 4](#).
- Step 3** Contact the network administrator to check the network configuration and ensure that the network between the NTP server and the active OMS node is normal. Then, check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 4](#).

Check whether the NTP server authentication fails.

- Step 4** Log in to the active OMS node as user **root**.
- Step 5** Run the following command to check the status of the resources on the active and standby nodes:
- ```
su - omm
sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh
```
- If "chrony" is displayed in the **ResName** column of the command output, go to [Step 6](#).
  - If "ntp" is displayed in the **ResName** column, go to [Step 7](#).

 NOTE

If both "chrony" and "ntp" are displayed in the **ResName** column of the command output, the NTP service mode is being switched. Wait for 10 minutes and perform [Step 5](#) again. If both "chrony" and "ntp" still exist in the **ResName** column, contact O&M personnel.

**Step 6** Run the command **chronyc sources** to check whether the NTP server authentication fails.

If the value of **Reach** for chrony is **0**, the connection or authentication fails.

- If yes, go to [Step 12](#).
- If no, go to [Step 8](#).

**Step 7** Run the command **ntpq -np** to check whether the NTP server authentication fails.

If **refid** of the NTP server is **.AUTH.**, the authentication fails.

- If yes, go to [Step 12](#).
- If no, go to [Step 8](#).

**Check whether the time can be obtained from the NTP server.**

**Step 8** View the alarm additional information to check whether the time can be obtained from the NTP server.

- If yes, go to [Step 9](#).
- If no, go to [Step 10](#).

**Step 9** Contact the provider of the NTP server to rectify the NTP server fault. After the NTP server is normal, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

**Check whether the time obtained from the NTP server is not continuously updated.**

**Step 10** View the alarm additional information to check whether the time obtained from the NTP server is not continuously updated.

- If yes, go to [Step 11](#).
- If no, go to [Step 12](#).

**Step 11** Contact the provider of the NTP server to rectify the NTP server fault. After the NTP server is normal, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

**Collect fault information.**

**Step 12** On the FusionInsight Manager, choose **O&M > Log > Download**.

**Step 13** Select **NodeAgent** and **OmmServer** from the **Service** and click **OK**.

**Step 14** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 15** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.20 ALM-12038 Monitoring Indicator Dumping Failure

## Description

After monitoring indicator dumping is configured on FusionInsight Manager, the system checks the monitoring indicator dumping result at the dumping interval (60 seconds by default). This alarm is generated when the dumping fails.

This alarm is cleared when dumping is successful.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12038    | Major          | Yes        |

## Parameters

| Name        | Meaning                                                           |
|-------------|-------------------------------------------------------------------|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

## Impact on the System

The upper-layer management system cannot obtain monitoring indicators from the FusionInsight Manager system.

## Possible Causes

- The server cannot be connected.
- The save path on the server cannot be accessed.
- The monitoring indicator file fails to be uploaded.

## Procedure

### Check whether the server connection is normal.

- Step 1** Check whether the network between the FusionInsight Manager system and the server is normal.
- If yes, go to [Step 3](#).
  - If no, go to [Step 2](#).
- Step 2** Contact the network administrator to recover the network and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 3](#).
- Step 3** Choose **System > Interconnection > Upload Performance Data** and check whether the FTP username, password, port, dump mode, and public key configured on the upload performance data page are consistent with the configuration on the server.
- If yes, go to [Step 5](#).
  - If no, go to [Step 4](#).
- Step 4** Enter the correct configuration information, click **OK**, and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 5](#).

### Check the permission of the save path on the server is correct.

- Step 5** Choose **System > Interconnection > Upload Performance Data** and check the configuration items **FTP Username**, **Save Path**, and **Dump Mode**.
- If the dump mode is FTP, go to [Step 6](#).
  - If the dump mode is SFTP, go to [Step 7](#).
- Step 6** Log in to the server in FTP mode. In the default path, check whether **FTP Username** has the read and write permission of the relative path **Save Path**.
- If yes, go to [Step 9](#).
  - If no, go to [Step 8](#).
- Step 7** Log in to the server in SFTP mode and check whether **FTP Username** has the read and write permission of the absolute path **Save Path**.
- If yes, go to [Step 9](#).
  - If no, go to [Step 8](#).
- Step 8** Add the read and write permission and check whether the alarm is cleared.
- If yes, no further action is required.

- If no, go to [Step 9](#).

**Check whether the save path on the server has sufficient disk space.**

**Step 9** Log in to the server and check whether the save path has sufficient disk space.

- If yes, go to [Step 11](#).
- If no, go to [Step 10](#).

**Step 10** Delete unnecessary files or go to the monitoring indicator dumping configuration page to change the save path. Then, check whether the save path has sufficient disk space.

- If yes, no further action is required.
- If no, go to [Step 11](#).

**Collect fault information.**

**Step 11** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 12** Select **OMS** from the **Service** and click **OK**.

**Step 13** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 14** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.21 ALM-12039 Active/Standby OMS Databases Not Synchronized

## Description

The system checks the data synchronization status between the active and standby OMS Databases every 10 seconds. This alarm is generated when the synchronization status cannot be queried for 30 consecutive times or when the synchronization status is abnormal.

This alarm is cleared when the data synchronization status becomes normal.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12039    | Critical       | Yes        |

## Parameters

| Name                | Meaning                                                           |
|---------------------|-------------------------------------------------------------------|
| Source              | Specifies the cluster or system for which the alarm is generated. |
| ServiceName         | Specifies the service for which the alarm is generated.           |
| RoleName            | Specifies the role for which the alarm is generated.              |
| HostName            | Specifies the host for which the alarm is generated.              |
| Local GaussDB HA IP | Specifies the HA IP address of the local GaussDB.                 |
| Peer GaussDB HA IP  | Specifies the HA IP address of the peer GaussDB.                  |
| SYNC_PERCENT        | Specifies the synchronization percentage.                         |

## Impact on the System

When data is not synchronized between the active and standby OMS Databases, data may be lost or abnormal if the active instance becomes abnormal.

## Possible Causes

- The network between the active and standby nodes is unstable.
- The standby OMS Database is abnormal.
- The standby node disk space is full.

## Procedure

**Check whether the network between the active and standby nodes is normal.**

- Step 1** Log in to FusionInsight Manager, click **O&M > Alarm > Alarms**, click  in the row where the alarm is located, and query the standby OMS Database IP address.
- Step 2** Log in to the active OMS Database node as user **root**.
- Step 3** Run the **ping Standby OMS Database heartbeat IP address** command to check whether the standby OMS Database node is reachable.

- If yes, go to [Step 6](#).
- If no, go to [Step 4](#).

**Step 4** Contact the network administrator to check whether the network is faulty.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

**Step 5** Rectify the network fault and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Check whether the standby OMS Database is normal.** (Skip this check for versions later than MRS 3.1.2.)

**Step 6** Log in to the standby OMS Database node as user **root**.

**Step 7** Run the **su - omm** command to switch to user **omm**.

**Step 8** Go to the `/${BIGDATA_HOME}/om-server/om/sbin/` directory and run the `./status-oms.sh` command to check whether the OMS Database resource status of the standby DBService is normal. In the command output, check whether the following information is displayed in the row where **ResName** is **gaussDB**:

For example:

```
10_10_10_231 gaussDB Standby_normal Normal Active_standby
```

- If yes, go to [Step 9](#).
- If no, go to [Step 16](#).

**Check whether the standby node disk space is full.**

**Step 9** Log in to the standby OMS Database node as user **root**.

**Step 10** Run the **su - omm** command to switch to user **omm**.

**Step 11** Run the **echo \${BIGDATA\_DATA\_HOME}/dbdata\_om** command to obtain the OMS Database data directory.

**Step 12** Run the **df -h** command to view the system disk partition usage information.

**Step 13** Check whether the disk where the OMS Database data directory is mounted is full.

- If yes, go to [Step 14](#).
- If no, go to [Step 16](#).

**Step 14** Expand the disk capacity.

**Step 15** After the disk capacity is expanded, wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 16](#).

**Collect fault information.**

**Step 16** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 17** Select **OMMServer** from the **Service** and click **OK**.

**Step 18** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 19** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.22 ALM-12040 Insufficient System Entropy

## Alarm Description

MRS 3.2.0 or later:

The system checks whether the rng-tools or haveged tool has been enabled and correctly configured every 5 minutes. If neither tool is configured, this alarm is generated. If either is configured, the system continues to check the entropy. If the entropy is less than 100 for five consecutive times, this alarm is generated.

This alarm is cleared when rng-tools or haveged has been installed and enabled on the target node and the entropy of the OS is greater than or equal to 100 in at least one of five entropy checks.

MRS 3.1.2 or earlier:

The system checks the entropy for five consecutive times at 00:00 every day. Specifically, the system checks whether rng-tools or haveged has been enabled and correctly configured. If neither is configured, the system continues to check the entropy. If the entropy is less than 100 for five consecutive times, this alarm is reported.

This alarm is cleared when the system detects that the true random number mode has been configured, the random number parameters have been configured in the pseudo-random number mode, or neither mode is configured but the entropy of the OS is greater than or equal to 100 in at least one of five entropy checks.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12040    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description                                                        |
|-------------|--------------------------------------------------------------------|
| Source      | Specifies the cluster or system for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated.           |
| RoleName    | Specifies the role for which the alarm was generated.              |
| HostName    | Specifies the host for which the alarm was generated.              |

## Impact on the System

The system is not running properly.

## Possible Causes

- rng-tools or haveged has not been installed or started.
- The entropy of the OS is smaller than 100 for multiple consecutive times.

## Handling Procedure

**Check whether haveged or rng-tools has been installed or started.**

**Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**.

**Step 2** Check the value of **HostName** in the **Location** area to obtain the name of the host for which the alarm is generated.

**Step 3** Log in to the node for which the alarm is generated as user **root**.

**Step 4** Run the **/bin/rpm -qa | grep -w "haveged"** command to check the haveged installation status and check whether the command output is empty.

- If yes, go to [Step 6](#).
- If no, go to [Step 5](#).

**Step 5** Run the **/sbin/service haveged status |grep "running"** command and check the command output.

- If the command is executed successfully, haveged has been installed and configured correctly and is running properly. Go to [Step 8](#).
- If the command fails to execute, haveged is not running properly. Run the following command to manually restart haveged and go to [Step 9](#):

**systemctl restart haveged.service**

**Step 6** Run the **/bin/rpm -qa | grep -w "rng-tools"** command to check the rng-tools installation and check whether the command output is empty.

- If yes, contact the OS vendor to install and start haveged or rng-tools. Then go to [Step 9](#).

- If no, go to [Step 7](#).

**Step 7** Run the `ps -ef | grep -v "grep" | grep rngd | tr -d " " | grep "\-r/dev/urandom"` command and check the command output.

- If the command is executed successfully, rngd has been installed and configured correctly and is running properly. Go to [Step 8](#).
- If the command fails to execute, rngd is not running properly. Run the following command to manually restart rngd and go to [Step 9](#):

```
systemctl restart rngd.service
```

#### Check the entropy of the OS.

**Step 8** Manually check the entropy of the OS.

Log in to the target node as user **root** and run the `cat /proc/sys/kernel/random/entropy_avail` command to check whether the entropy of the OS meets cluster installation requirements (no less than 100).

- If yes, the entropy of the OS is not less than 100. Go to [Step 9](#).
- If no, the entropy of the OS is less than 100. Use either of the following methods and go to [Step 9](#).
  - Method 1: Use haveged (true random number mode). Contact the OS vendor to install and start haveged.
  - Method 2: Use rng-tools (pseudo-random number mode). Contact the OS vendor to install and start rng-tools and configure it based on the OS type.

**Step 9** Wait until the system to check the entropy at 00:00 on the following day and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

#### Collect fault information.

**Step 10** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 11** Select **NodeAgent** for **Service** and click **OK**.

**Step 12** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 13** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## 10.23 ALM-12041 Incorrect Permission on Key Files

### Description

The system checks whether the permission, user, and user group information about critical directories or files is normal every 5 minutes. This alarm is generated when the information is abnormal.

This alarm is cleared when the information becomes normal.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12041    | Major          | Yes        |

### Parameters

| Name        | Meaning                                                           |
|-------------|-------------------------------------------------------------------|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service name for which the alarm is generated.      |
| RoleName    | Specifies the role name for which the alarm is generated.         |
| HostName    | Specifies the object (host ID) for which the alarm is generated.  |
| PathName    | Specifies the path or name of the abnormal file.                  |

### Impact on the System

System functions are unavailable.

### Possible Causes

The file permission is abnormal or the file is lost due to a user manually modified information such as the file permission, user, and user group, or the system is powered off unexpectedly.

### Procedure

**Check whether the abnormal file exists and whether the permission on the abnormal file is correct.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**.
- Step 2** Check the value of **HostName** to obtain the host name involved in this alarm. Check the value of **PathName** to obtain the path or name of the abnormal file.
- Step 3** Log in to the node for which the alarm is generated as user **root**.
- Step 4** Run the `ll pathName` command, where *pathName* indicates the name of the abnormal file to obtain the user, permission, and user group information about the file or directory.
- Step 5** Go to `/${BIGDATA_HOME}/om-agent/nodeagent/etc/agent/autocheck` directory. Then run the `vi keyfile` command and search for the name of the abnormal file and check the due permission of the file.

 **NOTE**

To ensure proper configuration synchronization between the active and standby OMS servers, files, directories, and files and sub-directories in the directories configured in `/${SOMS_RUN_PATH}/workspace/ha/module/hasync/plugin/conf/filesync.xml` will also be monitored except files and directories in **keyfile**. User **omm** must have read and write permissions of files and read and execute permissions of directories.

- Step 6** Compare the real-world permission of the file with the due permission obtained in [Step 5](#) and correct the permission, user, and user group information for the file.
- Step 7** Wait a hour and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 8](#).

 **NOTE**

If the disk partition where the cluster installation directory resides is used up, some temporary files will be generated in the program installation directory when running the `sed` command fails. Users do not have the read, write, and execute permissions of these temporary files. The system reports an alarm indicating that permissions of temporary files are abnormal if these files are within the monitoring range of the alarm. Perform the preceding alarm handling processes to clear the alarm. Alternatively, you can directly delete the temporary files after confirming that files with abnormal permissions are temporary. The temporary file generated after a `sed` command execution failure is similar to the following.

```
-rwx-----. 1 omm wheel 347 Jan 26 13:11 REALM_RESET_CONFIG
-rwx-----. 1 omm wheel 351 Jan 22 09:07 REALM_RESET_CONFIG_KRB
----- 1 omm wheel 0 Jan 26 13:15 sedbT8Cs4
-rwx-----. 1 omm wheel 7457 Jan 22 03:20 unlockuser.sh
```

**Collect fault information.**

- Step 8** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 9** Select **NodeAgent** from the **Service** and click **OK**.
- Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 11** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.24 ALM-12042 Incorrect Configuration of Key Files

## Description

The system checks whether critical configurations are correct every 5 minutes. This alarm is generated when the configurations are abnormal.

This alarm is cleared when the configurations become normal.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12042    | Major          | Yes        |

## Parameters

| Name        | Meaning                                                           |
|-------------|-------------------------------------------------------------------|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service name for which the alarm is generated.      |
| RoleName    | Specifies the role name for which the alarm is generated.         |
| HostName    | Specifies the object (host ID) for which the alarm is generated.  |
| PathName    | Specifies the path or name of the abnormal file.                  |

## Impact on the System

Functions related to the file are abnormal.

## Possible Causes

The file configuration is modified manually or the system is powered off unexpectedly.

## Procedure

### Check abnormal file configuration.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**.
- Step 2** Check the value of **HostName** to obtain the host name involved in this alarm. Check the value of **PathName** to obtain the path or name of the abnormal file.
- Step 3** Log in to the node for which the alarm is generated as user **root**.
- Step 4** View the `$BIGDATA_LOG_HOME/nodeagent/scriptlog/checkfileconfig.log` file and analyze the cause based on the error log. Locate the check standards of the file in the [Related Information](#) and manually check and modify the file based on the standards.

Run the `vi file name` command to enter the editing mode, and then press **Insert** to start editing.

After the modification is complete, press **Esc** to exit the editing mode and enter `:wq` to save the settings and exit.

For example:

```
vi /etc/ssh/sshd_config
```

- Step 5** Wait a hour and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 6](#).

### Collect fault information.

- Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 7** Select **NodeAgent** from the **Service** and click **OK**.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

- **Check standards of `/etc/fstab`**

Check whether the partitions configured in the `/etc/fstab` file can be found in `/proc/mounts`.

Check whether the swap partitions configured in `fstab` correspond to those in `/proc/swaps`.
- **Check the `/etc/hosts` configuration file.**

Run **cat /etc/hosts**. If any of the following situations occurs, the **/etc/hosts** configuration file is abnormal:

- a. The **/etc/hosts** file does not exist.
  - b. The host name is not configured in the file.
  - c. The host name maps to multiple IP addresses in the file.
  - d. The IP address corresponding to the host name does not exist in the command output of the **ifconfig** command.
  - e. One IP address maps to multiple host names in the file.
- **Check standards of /etc/ssh/sshd\_config**  
Run the **vi /etc/ssh/sshd\_config** command to check whether configuration items are configured as follows:
    - a. The value of **UseDNS** must be set to **no**.
    - b. The value of **MaxStartups** must be greater than or equal to 1000.
    - c. At least one of the **PasswordAuthentication** and **ChallengeResponseAuthentication** parameters must be left blank or at least one of the parameters be set to **yes**.

## 10.25 ALM-12045 Read Packet Dropped Rate Exceeds the Threshold

### Alarm Description

The system checks the read packet dropped rate every 30 seconds. This alarm is generated when the read packet dropped rate exceeds the threshold (the default threshold is 0.5%) for multiple times (the default value is 5).

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Reading > Read Packet Dropped Rate**.

This alarm is cleared when **Trigger Count** is 1 and the read packet dropped rate is less than or equal to the threshold. This alarm is cleared when **Trigger Count** is greater than 1 and the read packet dropped rate is less than or equal to 90% of the threshold.

The alarm detection is disabled by default. If you want to enable this function, check whether this function can be enabled based on Checking System Environments.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12045    | Major          | Yes          |

## Alarm Parameters

| Parameter         | Description                                                        |
|-------------------|--------------------------------------------------------------------|
| Source            | Specifies the cluster or system for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated.           |
| RoleName          | Specifies the role for which the alarm was generated.              |
| HostName          | Specifies the host for which the alarm was generated.              |
| PortName          | Specifies the network port for which the alarm was generated.      |
| Trigger Condition | Specifies the threshold for triggering the alarm.                  |

## Impact on the System

The service performance deteriorates or some services time out.

Risk warning: In SUSE kernel 3.0 or later or Red Hat 7.2, the system kernel modifies the mechanism for counting the number of dropped read packets. In this case, this alarm may be generated even if the network is running properly, but services are not affected. You are advised to check the system environment first.

## Possible Causes

- The NICs are bonded in active/standby mode.
- The alarm threshold is improperly configured.
- The network quality is poor.

## Handling Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the page that is displayed, click  in the row containing the alarm, and view the name of the host for which the alarm is generated and the NIC name.

**Check whether the NICs are bonded in active/standby mode.**

**Step 2** Log in to the alarm node as user **omm** and run the **ls -l /proc/net/bonding** command to check whether the **/proc/net/bonding** directory exists on the node.

- If yes, the bond mode is configured for the node. Go to [Step 3](#).

```
ls -l /proc/net/bonding/
total 0
-r--r--r-- 1 root root 0 Oct 11 17:35 bond0
```

- If no, the bond mode is not configured for the node. Go to [Step 5](#).

```
ls -l /proc/net/bonding/
ls: cannot access /proc/net/bonding/: No such file or directory
```

**Step 3** Run the `cat /proc/net/bonding/bond0` command to check whether the value of **Bonding Mode** in the configuration file is **fault-tolerance**.

 **NOTE**

In the command, **bond0** indicates the name of the bond configuration file. Use the file name obtained in [Step 2](#).

```
cat /proc/net/bonding/bond0
Ethernet Channel Bonding Driver: v3.7.1 (April 27, 2011)

Bonding Mode: fault-tolerance (active-backup)
Primary Slave: eth1 (primary_reselect always)
Currently Active Slave: eth1
MII Status: up
MII Polling Interval (ms): 100
Up Delay (ms): 0
Down Delay (ms): 0

Slave Interface: eth0
MII Status: up
Speed: 1000 Mbps
Duplex: full
Link Failure Count: 1
Slave queue ID: 0

Slave Interface: eth1
MII Status: up
Speed: 1000 Mbps
Duplex: full
Link Failure Count: 1
Slave queue ID: 0
```

- If yes, the NICs are bonded in active/standby mode. Go to [Step 4](#).
- If no, go to [Step 5](#).

**Step 4** Check whether the NIC specified by **NetworkCardName** in the alarm is the standby NIC.

- If yes, the alarm of the standby NIC cannot be automatically cleared. Manually clear the alarm on the alarm management page. No further action is required.
- If no, go to [Step 5](#).

 **NOTE**

To determine the standby NIC, check the `/proc/net/bonding/bond0` configuration file. If the NIC name corresponding to **NetworkCardName** is **Slave Interface** but not **Currently Active Slave** (the current active NIC), the NIC is the standby one.

**Check whether the threshold is set properly.**

**Step 5** Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Reading > Read Packet Dropped Rate**, and check whether the alarm threshold is configured properly. The default value is **0.5%**. You can adjust the threshold as needed.

- If yes, go to [Step 8](#).
- If no, go to [Step 6](#).

**Step 6** Choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Reading > Read Packet Dropped Rate**. Click **Modify** in the **Operation** column to change the threshold. See [Figure 10-5](#).

**Figure 10-5** Configuring the alarm threshold

**Step 7** After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Check whether the network connection is normal.**

**Step 8** Contact the network administrator to check whether the network is normal.

- If yes, rectify the fault and go to [Step 9](#).
- If no, go to [Step 10](#).

**Step 9** After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

**Collect the fault information.**

**Step 10** On FusionInsight Manager of the active cluster, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 11** Select **OMS** for **Service** and click **OK**.

**Step 12** Expand the **Hosts** dialog box and select the alarm node and the active OMS node.

**Step 13** Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

**Step 14** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 10.26 ALM-12046 Write Packet Dropped Rate Exceeds the Threshold

## Alarm Description

The system checks the write packet dropped rate every 30 seconds. This alarm is generated when the write packet dropped rate exceeds the threshold (the default threshold is 0.5%) for multiple times (the default value is 5).

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Writing > Write Packet Dropped Rate**.

If **Trigger Count** is **1**, this alarm is cleared when the network write packet dropped rate is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the network write packet dropped rate is less than or equal to 90% of the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12046    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description                                                        |
|-------------|--------------------------------------------------------------------|
| Source      | Specifies the cluster or system for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated.           |
| RoleName    | Specifies the role for which the alarm was generated.              |
| HostName    | Specifies the host for which the alarm was generated.              |
| Port Name   | Specifies the network port for which the alarm was generated.      |

| Parameter         | Description                                       |
|-------------------|---------------------------------------------------|
| Trigger Condition | Specifies the threshold for triggering the alarm. |

## Impact on the System

The service performance deteriorates or some services time out.

## Possible Causes

- The alarm threshold is improperly configured.
- The network quality is poor.

## Handling Procedure

**Check whether the threshold is set properly.**

**Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Writing > Write Packet Dropped Rate**, and check whether the alarm threshold is configured properly. The default value is **0.5%**. You can adjust the threshold as needed.

- If yes, go to [Step 4](#).
- If no, go to [Step 2](#).

**Step 2** Choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Writing > Write Packet Dropped Rate**. Click **Modify** in the **Operation** column to change the threshold.

See [Figure 10-6](#).

**Figure 10-6** Configuring the alarm threshold

**Step 3** After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Check whether the network connection is normal.**

**Step 4** Contact the network administrator to check whether the network is normal.

- If yes, rectify the fault and go to [Step 5](#).
- If no, go to [Step 6](#).

**Step 5** After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Collect the fault information.**

**Step 6** On FusionInsight Manager of the active cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

**Step 7** Select **OMS** for **Service** and click **OK**.

**Step 8** Expand the **Hosts** dialog box and select the alarm node and the active OMS node.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

**Step 10** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 10.27 ALM-12047 Read Packet Error Rate Exceeds the Threshold

## Alarm Description

The system checks the read packet error rate every 30 seconds. This alarm is generated when the read packet error rate exceeds the threshold (the default threshold is **0.5%**) for multiple times (the default value is **5**).

To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Packet Error Rate**.

If **Trigger Count** is **1**, this alarm is cleared when the read packet error rate is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is

cleared when the read packet error rate is less than or equal to 90% of the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12047    | Major          | Yes          |

## Alarm Parameters

| Parameter         | Description                                                        |
|-------------------|--------------------------------------------------------------------|
| Source            | Specifies the cluster or system for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated.           |
| RoleName          | Specifies the role for which the alarm was generated.              |
| HostName          | Specifies the host for which the alarm was generated.              |
| Port Name         | Specifies the network port for which the alarm was generated.      |
| Trigger Condition | Specifies the threshold for triggering the alarm.                  |

## Impact on the System

The communication is intermittently interrupted, and services time out.

## Possible Causes

- The alarm threshold is improperly configured.
- The network quality is poor.

## Handling Procedure

**Check whether the threshold is set properly.**

**Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Reading > Read Packet Error Rate**, and check whether the alarm threshold is configured properly. The default value is **0.5%**. You can adjust the threshold as needed.

- If yes, go to [Step 4](#).
- If no, go to [Step 2](#).

**Step 2** Choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Reading > Read Packet Error Rate**. Click **Modify** in the **Operation** column to change the threshold.

See [Figure 10-7](#).

# 10.29 ALM-12049 Network Read Throughput Rate Exceeds the Threshold

## Description

The system checks the network read throughput rate every 30 seconds and compares the actual throughput rate with the threshold (the default threshold is 80%). This alarm is generated when the system detects that the network read throughput rate exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Reading > Read Throughput Rate**.

When the **Trigger Count** is 1, this alarm is cleared when the network read throughput rate is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the network read throughput rate is less than or equal to 90% of the threshold.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12049    | Major          | Yes        |

## Parameters

| Name            | Meaning                                                           |
|-----------------|-------------------------------------------------------------------|
| Source          | Specifies the cluster or system for which the alarm is generated. |
| ServiceName     | Specifies the service for which the alarm is generated.           |
| RoleName        | Specifies the role for which the alarm is generated.              |
| HostName        | Specifies the host for which the alarm is generated.              |
| NetworkCardName | Specifies the network port for which the alarm is generated.      |

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

The service system runs improperly or is unavailable.

## Possible Causes

- The alarm threshold is set improperly.
- The network port rate cannot meet the current service requirements.

## Procedure

**Check whether the threshold is set properly.**

**Step 1** On the FusionInsight Manager, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Reading > Read Throughput Rate** and check whether the alarm threshold is set properly. (By default, 80% is a proper value. However, users can configure the value as required.)

- If yes, go to [Step 2](#).
- If no, go to [Step 4](#).

**Step 2** Based on actual usage condition, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Reading > Read Throughput Rate** and click **Modify** in the **Operation** column to modify the alarm threshold.

For details, see [Figure 10-9](#).

**Figure 10-9** Setting alarm thresholds

**Step 3** Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Check whether the network port rate can meet the service requirements.**

**Step 4** On FusionInsight Manager, click  in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host and the network port name for which the alarm is generated.

**Step 5** Log in to the host for which the alarm is generated as user **root**.

**Step 6** Run the **ethtool network port name** command to check the maximum speed of the current network port.

 **NOTE**

In the VM environment, you cannot run a command to query the network port rate. It is recommended that you contact the system administrator to confirm whether the network port rate meets the requirements.

**Step 7** If the network read throughput rate exceeds the threshold, contact the system administrator to increase the network port rate.

**Step 8** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Collect fault information.**

**Step 9** On the FusionInsight Manager home page of the active cluster, choose **O&M > Log > Download**.

- Step 10** Select **OMS** from the **Service** and click **OK**.
- Step 11** Set **Host** to the node for which the alarm is generated and the active OMS node.
- Step 12** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 13** Contact the O&M personnel and send the collected log information.
- End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

# 10.31 ALM-12051 Disk Inode Usage Exceeds the Threshold

## Description

The system checks the disk Inode usage every 30 seconds and compares the actual Inode usage with the threshold (the default threshold is 80%). This alarm is generated when the Inode usage exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Disk > Disk Inode Usage**.

When the **Trigger Count** is 1, this alarm is cleared when the disk Inode usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the disk Inode usage is less than or equal to 90% of the threshold.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12051    | Major          | Yes        |

## Parameters

| Name   | Meaning                                                           |
|--------|-------------------------------------------------------------------|
| Source | Specifies the cluster or system for which the alarm is generated. |

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| ServiceName       | Specifies the service for which the alarm is generated.                                                                      |
| RoleName          | Specifies the role for which the alarm is generated.                                                                         |
| HostName          | Specifies the host for which the alarm is generated.                                                                         |
| PartitionName     | Specifies the disk partition for which the alarm is generated.                                                               |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

Data cannot be properly written to the file system.

## Possible Causes

Massive small files are stored in the disk.

## Procedure

### Massive small files are stored in the disk.

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms** and click  in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host and the disk partition for which the alarm is generated.

**Step 2** Log in to the host for which the alarm is generated as user **root**.

**Step 3** Run the **df -i | grep -iE "partition name/FileSystem"** command to check the current disk Inode usage.

```
df -i | grep -iE "xvda2/FileSystem"
Filesystem Inodes IUsed IFree IUse% Mounted on
/dev/xvda2 2359296 207420 2151876 9% /
```

**Step 4** If the Inode usage exceeds the threshold, manually check small files stored in the disk partition and confirm whether these small files can be deleted.

### NOTE

Run the **for i in /\*; do echo \$i; find \$i|wc -l; done** command to query the number of files in a partition. Replace **/\*** with the specified partition.

```
for i in /srv/*; do echo $i; find $i|wc -l; done
/srv/BigData
4284
/srv/ftp
1
/srv/www
13
```

- If yes, run the **rm -rf *Path of the file or folder*** to be deleted command to delete the file or folder and go to [Step 5](#).

 **NOTE**

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

- If no, expand the capacity. Then, perform [Step 5](#).

**Step 5** Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Collect fault information.**

**Step 6** On the FusionInsight Manager home page of the active cluster, choose **O&M > Log > Download**.

**Step 7** Select **OMS** from the **Service** and click **OK**.

**Step 8** Set **Host** to the node for which the alarm is generated and the active OMS node.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.32 ALM-12052 TCP Temporary Port Usage Exceeds the Threshold

## Description

The system checks the TCP temporary port usage every 30 seconds and compares the actual usage with the threshold (the default threshold is 80%). This alarm is generated when the TCP temporary port usage exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm > Thresholds > *Name of the desired cluster* > Host > Network Status > TCP Ephemeral Port Usage**.

When the **Trigger Count** is 1, this alarm is cleared when the TCP temporary port usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the TCP temporary port usage is less than or equal to 90% of the threshold.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12052    | Major          | Yes        |

## Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster or system for which the alarm is generated.                                                            |
| ServiceName       | Specifies the service for which the alarm is generated.                                                                      |
| RoleName          | Specifies the role for which the alarm is generated.                                                                         |
| HostName          | Specifies the host for which the alarm is generated.                                                                         |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

Services on the host cannot establish external connections, and therefore they are interrupted.

## Possible Causes

- The temporary port cannot meet the current service requirements.
- The system is abnormal.

## Procedure

### Expand the temporary port number range.

- Step 1** On FusionInsight Manager, click  in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host for which the alarm is generated.
- Step 2** Log in to the host for which the alarm is generated as user **omm**.
- Step 3** Run the `cat /proc/sys/net/ipv4/ip_local_port_range |cut -f 1` command to obtain the value of the start port and run the `cat /proc/sys/net/ipv4/ip_local_port_range |cut -f 2` command to obtain the value of the end port. The total number of temporary ports is the value of the end port minus the value of the start port. If the total number of temporary ports is smaller than 28,232, the

random port range of the OS is narrow. Contact the system administrator to increase the port range.

**Step 4** Run the `ss -ant 2>/dev/null | grep -v LISTEN | awk 'NR > 2 {print $4}' | awk -F'|' '{print $NF}' | awk '$1 >' "Value of the start port" {print $1}' | sort -u | wc -l` command to calculate the number of used temporary ports.

**Step 5** The formula for calculating the usage of the temporary ports is: Usage of the temporary ports = (Number of used temporary ports/Total number of temporary ports) x 100%. Check whether the temporary port usage exceeds the threshold.

- If yes, go to [Step 7](#).
- If no, go to [Step 6](#).

**Step 6** Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Check whether the system environment is abnormal.**

**Step 7** Run the following command to import the temporary file and view the frequently used ports in the `port_result.txt` file:

```
netstat -tnp|sort > $BIGDATA_HOME/tmp/port_result.txt
```

```
netstat -tnp|sort
Active Internet connections (w/o servers)

Proto Recv Send LocalAddress ForeignAddress State PID/ProgramName tcp 0 0 10-120-85-154:45433
10-120-85-154:9866 CLOSE_WAIT 94237/java
tcp 0 0 10-120-85-154:45434 10-120-85-154:9866 CLOSE_WAIT 94237/java
tcp 0 0 10-120-85-154:45435 10-120-85-154:9866 CLOSE_WAIT 94237/java
...
```

**Step 8** Run the following command to view the processes that occupy a large number of ports:

```
ps -ef |grep PID
```

#### NOTE

- PID is the processes ID queried in [Step 7](#).
- Run the following command to collect information about all processes and check the processes that occupy a large number of ports:

```
ps -ef > $BIGDATA_HOME/tmp/ps_result.txt
```

**Step 9** After obtaining the administrator's approval, clear the processes that occupy a large number of ports. Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

**Collect fault information.**

**Step 10** On the FusionInsight Manager home page of the active cluster, choose **O&M > Log > Download**.

**Step 11** Select **OMS** from the **Service** and click **OK**.

- Step 12** Set **Host** to the node for which the alarm is generated and the active OMS node.
- Step 13** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 14** Contact the O&M personnel and send the collected log information and files **port\_result.txt** and **ps\_result.txt**. Then, delete the two residual temporary files from the environment.
- End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.33 ALM-12053 Host File Handle Usage Exceeds the Threshold

## Description

The system checks the file handle usage every 30 seconds and compares the actual usage with the threshold (the default threshold is 80%). This alarm is generated when the host file handle usage exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Host Status > Host File Handle Usage**.

When the **Trigger Count** is 1, this alarm is cleared when the host file handle usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the host file handle usage is less than or equal to 90% of the threshold.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12053    | Major          | Yes        |

## Parameters

| Name   | Meaning                                                           |
|--------|-------------------------------------------------------------------|
| Source | Specifies the cluster or system for which the alarm is generated. |

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| ServiceName       | Specifies the service for which the alarm is generated.                                                                      |
| RoleName          | Specifies the role for which the alarm is generated.                                                                         |
| HostName          | Specifies the host for which the alarm is generated.                                                                         |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

The I/O operations, such as opening a file or connecting to network, cannot be performed and programs are abnormal.

## Possible Causes

- The application process is abnormal. For example, the opened file or socket is not closed.
- The number of file handles cannot meet the current service requirements.
- The system is abnormal.

## Procedure

### Check information about files opened in processes.

- Step 1** On FusionInsight Manager, click  in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host for which the alarm is generated.
- Step 2** Log in to the host for which the alarm is generated as user **root**.
- Step 3** Run the `lsof -n|awk '{print $2}'|sort|uniq -c|sort -nr|more` command to check the process that occupies excessive file handles.
- Step 4** Check whether the processes in which a large number of files are opened are normal. For example, check whether there are files or sockets not closed.
- If yes, go to [Step 5](#).
  - If no, go to [Step 7](#).
- Step 5** Release the abnormal processes that occupy too many file handles.
- Step 6** Five minutes later, check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 7](#).

### Increase the number of file handles.

- Step 7** On FusionInsight Manager, click  in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host for which the alarm is generated.
- Step 8** Log in to the host for which the alarm is generated as user **root**.
- Step 9** Contact the system administrator to increase the number of system file handles.
- Step 10** Run the **cat /proc/sys/fs/file-nr** command to view the used handles and the maximum number of file handles. The first value is the number of used handles, the third value is the maximum number. Please check whether the usage exceeds the threshold.
- If yes, go to **Step 9**.
  - If no, go to **Step 11**.
- ```
# cat /proc/sys/fs/file-nr
12704 0 640000
```
- Step 11** Wait for 5 minutes, and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to **Step 12**.
- Check whether the system environment is abnormal.**
- Step 12** Contact the system administrator to check whether the operating system is abnormal.
- If yes, go to **Step 13** to rectify the fault.
 - If no, go to **Step 14**.
- Step 13** Wait for 5 minutes, and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to **Step 14**.
- Collect fault information.**
- Step 14** On the FusionInsight Manager home page of the active cluster, choose **O&M > Log > Download**.
- Step 15** Select **OMS** from the **Service** and click **OK**.
- Step 16** Set **Host** to the node for which the alarm is generated and the active OMS node.
- Step 17** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 18** Contact the O&M personnel and send the collected log information.
- End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.34 ALM-12054 Invalid Certificate File

Alarm Description

The system checks whether the certificate file is invalid (has expired or is not valid yet) on 23:00 every day. This alarm is generated when the certificate file is invalid.

This alarm is cleared when a valid certificate is imported and the alarm detection mechanism is triggered on the next hour.

NOTE

For MRS 3.2.0 or later, the certificate file is checked at the beginning of each hour.
For versions earlier than MRS 3.2.0, the certificate file is checked on 23:00 every day.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12054	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Some functions are unavailable.

Possible Causes

No certificate (CA certificate, HA root certificate, HA user certificate, Gaussdb root certificate, or Gaussdb user certificate) is imported to the system, the certificate fails to be imported, or the certificate file is invalid.

Handling Procedure

Check the alarm cause.

Step 1 On FusionInsight Manager, locate the target alarm in the real-time alarm list and click .

View **Additional Information** to obtain the additional information about the alarm.

- If **CA Certificate** is displayed in the additional alarm information, log in to the active OMS management node as user **omm** and go to [Step 2](#).
- If **HA root Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to [Step 3](#).
- If **HA server Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to [Step 4](#).
- If **Certificate has expired** is displayed in the additional information, view **Location** to obtain the name of the host for which the alarm is generated. Then, log in to the host as user **omm** and perform [Step 2](#) to [Step 4](#) in sequence to check whether the certificates have expired. If these certificates have not expired, check whether other certificates have been imported. If yes, import the certificate files again.

Check the validity period of the certificate files in the system.

Step 2 Check whether the current system time is in the validity period of the CA certificate.

Run the **bash \${CONTROLLER_HOME}/security/cert/conf/querycertvalidity.sh** command to check the effective time and due time of the CA root certificate.

- If yes, go to [Step 7](#).
- If no, go to [Step 5](#).

Step 3 Check whether the current system time is in the validity period of the HA root certificate.

Run the **openssl x509 -noout -text -in \${CONTROLLER_HOME}/security/certHA/root-ca.crt** command to check the effective time and due time of the HA root certificate.

- If yes, go to [Step 7](#).
- If no, go to [Step 6](#).

Step 4 Check whether the current system time is in the validity period of the HA user certificate.

Run the **openssl x509 -noout -text -in \${CONTROLLER_HOME}/security/certHA/server.crt** command to check the effective time and due time of the HA user certificate.

- If yes, go to [Step 7](#).
- If no, go to [Step 6](#).

The following is an example of the effective time and due time of a CA or HA certificate:

Certificate:

```
Data:
  Version: 3 (0x2)
  Serial Number:
    97:d5:0e:84:af:ec:34:d8
  Signature Algorithm: sha256WithRSAEncryption
  Issuer: C=CN, ST=xxx, L=yyy, O=zzz, OU=IT, CN=HADOOP.COM
  Validity
    Not Before: Dec 13 06:38:26 2016 GMT      // Effective time
    Not After : Dec 11 06:38:26 2026 GMT      // Due time
```

Import certificate files.

Step 5 Import a new CA certificate file.

Apply for or generate a new CA certificate file and import it to the system. For details, see [Replacing the CA Certificate](#). The alarm is automatically cleared after the CA certificate is imported. Check whether this alarm is reported again during periodic check.

- If yes, go to [Step 7](#).
- If no, no further action is required.

Step 6 Import a new HA certificate file.

Apply for or generate a new HA certificate file and import it to the system. For details, see [Replacing HA Certificates](#). The alarm is automatically cleared after the CA certificate is imported. Check whether this alarm is reported again during periodic check.

- If yes, go to [Step 7](#).
- If no, no further action is required.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 8 In the **Services** area, select **Controller**, **OmmServer**, **OmmCore**, and **Tomcat**, and click **OK**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

For details about how to handle an expired OBS certificate, see [OBS Certificate in a Cluster Expired](#).

10.35 ALM-12055 Certificate File Is About to Expire

Alarm Description

The system checks the certificate file on 23:00 every day. This alarm is generated if the certificate file is about to expire within 30 days.

This alarm is cleared when a certificate that is not about to expire is imported and the alarm detection mechanism is triggered on the next hour.

NOTE

For MRS 3.2.0 or later, the certificate file is checked at the beginning of each hour.
For versions earlier than MRS 3.2.0, the certificate file is checked on 23:00 every day.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12055	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Some functions are unavailable.

Possible Causes

The remaining validity period of a system certificate (CA certificate, HA root certificate, HA user certificate, Gaussdb root certificate, or Gaussdb user certificate) is less than 30 days.

Handling Procedure

Check the alarm cause.

Step 1 On FusionInsight Manager, locate the target alarm in the real-time alarm list and click .

View **Additional Information** to obtain the additional information about the alarm.

- If **CA Certificate** is displayed in the additional alarm information, log in to the active OMS management node as user **omm** and go to [Step 2](#).
- If **HA root Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to [Step 3](#).
- If **HA server Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to [Step 4](#).

Check the validity period of the certificate files in the system.

Step 2 Check whether the remaining validity period of the CA certificate is smaller than the alarm threshold.

Run the **bash \${CONTROLLER_HOME}/security/cert/conf/querycertvalidity.sh** command to check the effective time and due time of the CA root certificate.

- If yes, go to [Step 5](#).
- If no, go to [Step 7](#).

Step 3 Check whether the remaining validity period of the HA root certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in \${CONTROLLER_HOME}/security/certHA/root-ca.crt** command to check the effective time and due time of the HA root certificate.

- If yes, go to [Step 6](#).
- If no, go to [Step 7](#).

Step 4 Check whether the remaining validity period of the HA user certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in \${CONTROLLER_HOME}/security/certHA/server.crt** command to check the effective time and due time of the HA user certificate.

- If yes, go to [Step 6](#).
- If no, go to [Step 7](#).

The following is an example of the effective time and due time of a CA or HA certificate:

```
Certificate:
Data:
  Version: 3 (0x2)
  Serial Number:
    97:d5:0e:84:af:ec:34:d8
  Signature Algorithm: sha256WithRSAEncryption
```

```
Issuer: C=CN, ST=xxx, L=yyy, O=zzz, OU=IT, CN=HADOOP.COM
Validity
  Not Before: Dec 13 06:38:26 2016 GMT // Effective time
  Not After : Dec 11 06:38:26 2026 GMT // Due time
```

Import certificate files.

Step 5 Import a new CA certificate file.

Apply for or generate a new CA certificate file and import it to the system. For details, see [Replacing the CA Certificate](#). Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to [Step 7](#).
- If no, no further action is required.

Step 6 Import a new HA certificate file.

Apply for or generate a new HA certificate file and import it to the system. For details, see [Replacing HA Certificates](#). Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to [Step 7](#).
- If no, no further action is required.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 8 In the **Services** area, select **Controller**, **OmmServer**, **OmmCore**, and **Tomcat**, and click **OK**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.36 ALM-12057 Metadata Not Configured with the Task to Periodically Back Up Data to a Third-Party Server

Description

After the system is installed, it checks whether the task for periodically backing up metadata to the third-party server, and then performs the check hourly. If the task for periodically backing up metadata to a third-party server is not configured, a critical alarm is generated.

This alarm is cleared when a user creates such a backup task.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12057	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If metadata is not backed up to a third-party server, metadata cannot be restored if both the active and standby management nodes of the cluster are faulty and local backup data is lost.

Possible Causes

Metadata is not configured with the task to periodically back up data to a third-party server.

Procedure

Step 1 On the FusionInsight Manager portal choose **O&M > Alarm > Alarms**.

Step 2 In the alarm list, click  in the row where the alarm is located and identify the data module from which the alarm is generated based on **Additional Information**.

Step 3 Choose **O&M > Backup and Restoration > Backup Management > Create**.

Step 4 Configure a backup task. The backup data to be configured is consistent with the data in Additional Information of the alarm.

Back up data to a third-party server, for example, remote HDFS (RemoteHDFS), NAS (NFS/CIFS), Object Storage Service (OBS), and SFTP server (SFTP). For details, see [Backing Up Data](#).

Step 5 After the backup task is created successfully, wait for two minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect fault information

Step 6 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 7 In the **Service** area, select **Controller** and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.37 ALM-12061 Process Usage Exceeds the Threshold

Description

The system checks the usage of the omm process every 30 seconds. Users can run the `ps -o nlwp, pid, args, -u omm | awk '{sum+=$1} END {print "", sum}'` command to obtain the number of concurrent processes of user **omm**. Run the `ulimit -u` command to obtain the maximum number of processes that can be simultaneously opened by user **omm**. Divide the number of concurrent processes by the maximum number to obtain the process usage of user **omm**. The process

usage has a default threshold. This alarm is generated when the process usage exceeds the threshold.

If **Trigger Count** is **3** and the process usage is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1** and the process usage is less than or equal to 90% of the threshold, this alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12061	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

- Switch to user **omm** fails.
- New omm process cannot be created.

Possible Causes

- The alarm threshold is improperly configured.
- The maximum number of processes (including threads) that can be concurrently opened by user **omm** is inappropriate.
- An excessive number of threads are opened at the same time.

Procedure

Check whether the alarm threshold or alarm hit number is properly configured.

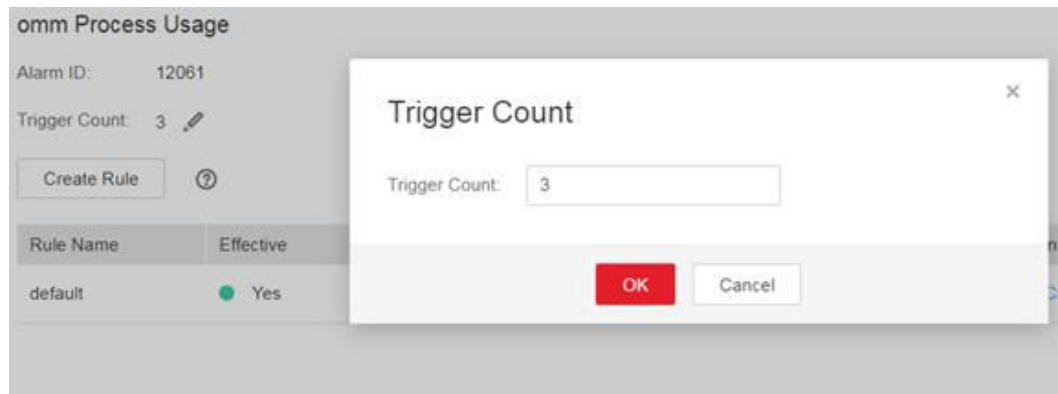

- Step 1** On the FusionInsight Manager, change the alarm threshold and **Trigger Count** based on the actual CPU usage.

Specifically, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Process > omm Process Usage** to change Trigger Count, as shown in [Figure 10-11](#).

 **NOTE**

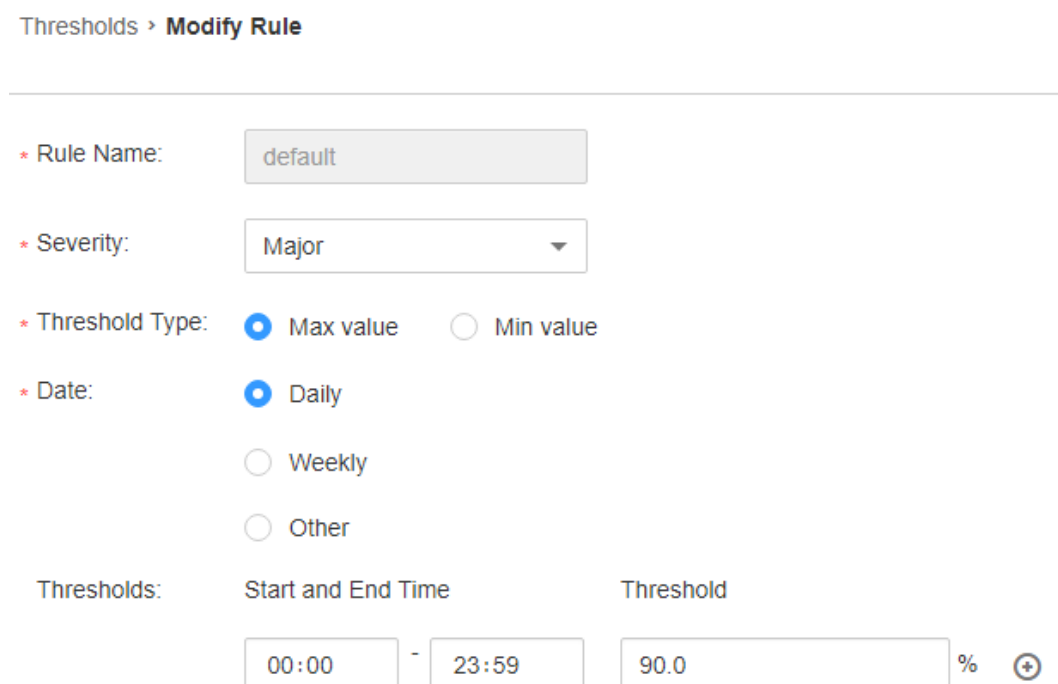

The alarm is generated when the process usage exceeds the threshold for the times specified by **Trigger Count**.

Figure 10-11 Setting Trigger Count

Set the alarm threshold based on the actual process usage. To check the process usage, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Process > omm Process Usage**, as shown in [Figure 10-12](#).

Figure 10-12 Setting an alarm threshold

Step 2 2 minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 3](#).

Check whether the maximum number of processes (including threads) opened by user omm is appropriate.

Step 3 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host for which the alarm is generated.

Step 4 Log in to the host where the alarm is generated as user **root**.

Step 5 Run the **su - omm** command to switch to user **omm**.

Step 6 Run the **ulimit -u** command to obtain the maximum number of threads that can be concurrently opened by user **omm** and check whether the number is greater than or equal to 60000.

- If it is, go to [Step 8](#).
- If it is not, go to [Step 7](#).

Step 7 Run the **ulimit -u 60000** command to change the maximum number to 60000. Two minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 12](#).

Check whether an excessive number of processes are opened at the same time.

Step 8 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host for which the alarm is generated.

Step 9 Log in to the host where the alarm is generated as user **root**.

Step 10 Run the **ps -o nlwp, pid, lwp, args, -u omm|sort -n** command to check the numbers of threads used by the system.

The result is sorted based on the thread number. Analyze the top 5 thread numbers and check whether the threads are incorrectly used.

- If it is, perform the following operations to stop the parent processes of the top 5 abnormally used processes without affecting services, go to [Step 11](#).
 - a. Run the following command to query the parent process of the corresponding process:
ps -ef | grep "Process ID"
The third column in the command output is the parent process ID.
 - b. Run the following command to stop the parent process:
kill -9 parent process ID
- If it is not, run the **ulimit -u** command to change the maximum number to be greater than 60000.

Step 11 Five minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 12](#).

Collect fault information.

- Step 12** On the FusionInsight Manager home page of the active clusters, choose **O&M > Log > Download**.
- Step 13** Select **OmmServer** and **NodeAgent** from the **Service** and click **OK**.
- Step 14** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.
- Step 15** Contact the O&M personnel and send the collected log information.
- End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

Related Information

None

10.38 ALM-12062 OMS Parameter Configurations Mismatch with the Cluster Scale

Description

The system checks whether the OMS parameter configurations match with the cluster scale at each top hour. If the OMS parameter configurations do not meet the cluster scale requirements, the system generates this alarm. This alarm is automatically cleared when the OMS parameter configurations are modified.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12062	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the name of the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Parameter	Description
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The OMS configuration is not modified when the cluster is installed or the system capacity is expanded.

Possible Causes

The OMS parameter configurations mismatch with the cluster scale.

Procedure

Check whether the OMS parameter configurations match with the cluster scale.

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host for which the alarm is generated.
- Step 2** Log in to the host where the alarm is generated as user **root**.
- Step 3** Run the **su - omm** command to switch to user **omm**.
- Step 4** Run the **vi \$BIGDATA_LOG_HOME/controller/scriptlog/modify_manager_param.log** command to open the log file and search for the log file containing the following information: Current oms configurations cannot support *xx* nodes. In the information, *xx* indicates the number of nodes in the cluster.
- Step 5** Optimize the current cluster configuration by following the instructions in [Optimizing Manager Configurations Based on the Number of Cluster Nodes](#).
- Step 6** One hour later, check whether the alarm is cleared.
 - If it is, no further action is required.
 - If it is not, go to [Step 7](#).

Collect fault information.

- Step 7** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 8** Select **Controller** from the **Service** and click **OK**.
- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

Optimizing Manager Configurations Based on the Number of Cluster Nodes

Step 1 Log in to the active Manager node as user **omm**.

Step 2 Run the following command to switch the directory:

```
cd ${BIGDATA_HOME}/om-server/om/sbin
```

Step 3 Run the following command to view the current Manager configurations.

```
sh oms_config_info.sh -q
```

Step 4 Run the following command to specify the number of nodes in the current cluster.

Command format: **sh oms_config_info.sh -s *number of nodes***

Example:

```
sh oms_config_info.sh -s 1000
```

Enter **y** as prompted.

The following configurations will be modified:

Module	Parameter	Current	Target
Controller	controller.Xmx	4096m	=> 16384m
Controller	controller.Xms	1024m	=> 8192m
Controller	controller.node.heartbeat.error.threshold	30000	=> 60000
Pms	pms.mem	8192m	=> 10240m

Do you really want to do this operation? (y/n):

The configurations are updated successfully if the following information is displayed:

```
...  
Operation has been completed. Now restarting OMS server. [done]  
Restarted oms server successfully.
```

NOTE

- OMS is automatically restarted during the configuration update process.
- Clusters with similar quantities of nodes have same Manager configurations. For example, when the number of nodes is changed from 100 to 101, no configuration item needs to be updated.

----End

10.39 ALM-12063 Unavailable Disk

Description

The system checks whether the data disk of the current host is available at the top of each hour. The system creates files, writes files, and deletes files in the mount directory of the disk. If the operations fail, the alarm is generated. If the operations succeed, the disk is available, and the alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12063	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the name of the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DiskName	Specifies the disk for which the alarm is generated.

Impact on the System

Data read or write on the data disk fails, and services are abnormal.

Possible Causes

- The permission of the disk mount directory is abnormal.
- There are disk bad sectors.

Procedure

Check whether the permission of the disk mount directory is normal.

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host and **DiskName** for the disk for which the alarm is generated.
- Step 2** Log in to the host where the alarm is generated as user **root**.
- Step 3** Run the **df -h |grep DiskName** command to obtain the mount point and check whether the permission of the mount directory is unwritable or unreadable.
 - If it is, go to [Step 4](#).
 - If it is not, go to [Step 8](#).

NOTE

If the permission of the mount directory is 000 or the owner is **root**, the mount directory is unreadable and unwritable.

- Step 4** Modify the directory permission.
- Step 5** One hour later, check whether this alarm is cleared.
- If it is, no further action is required.
 - If it is not, go to **Step 6**.
- Step 6** Contact hardware engineers to rectify the disk.
- Step 7** One hour later, check whether this alarm is cleared.
- If it is, no further action is required.
 - If it is not, go to **Step 8**.
- Collect fault information.**
- Step 8** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 9** Select **NodeAgent** from the **Service** and click **OK**.
- Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 11** Contact the O&M personnel and send the collected log information.
- End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.40 ALM-12064 Host Random Port Range Conflicts with Cluster Used Port

Alarm Description

The system checks whether the random port range of the host conflicts with the range of ports used by the Cluster system every hour. The alarm is generated if they conflict. The alarm is automatically cleared when the random port range of the host is changed to the normal range.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12064	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the name of the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The default port of the Cluster system is occupied. As a result, some processes fail to be started.

Possible Causes

The random port range configuration is modified.

Procedure

Check the random port range of the system.

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host for which the alarm is generated.
- Step 2** Log in to the host where the alarm is generated as user **root**.
- Step 3** Run the `cat /proc/sys/net/ipv4/ip_local_port_range` command to obtain the random port range of the host and check whether the minimum value is smaller than 32768.
 - If it is, go to [Step 4](#).
 - If it is not, go to [Step 7](#).
- Step 4** Run the `vim /etc/sysctl.conf` command to change the value of `net.ipv4.ip_local_port_range` to **32768 61000**. If this parameter does not exist, add the following configuration: `net.ipv4.ip_local_port_range = 32768 61000`.
- Step 5** Run the `sysctl -p /etc/sysctl.conf` command for the modification to take effect.
- Step 6** One hour later, check whether the alarm is cleared.
 - If it is, no further action is required.
 - If it is not, go to [Step 7](#).

Collect fault information.

- Step 7** On FusionInsight Manager, choose **O&M > Log > Download**.

Step 8 Select **NodeAgent** for **Service** and click **OK**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.41 ALM-12066 Trust Relationships Between Nodes Become Invalid

Alarm Description

The system checks whether the trust relationship between the active OMS node and other Agent nodes is normal every hour. The alarm is generated if the mutual trust fails. This alarm is automatically cleared after the fault is rectified.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12066	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

Some operations on the management plane may be abnormal.

Possible Causes

- The `/etc/ssh/sshd_config` configuration file is damaged.
- The password of user `omm` has expired.

Handling Procedure

Check the status of the `/etc/ssh/sshd_config` configuration file.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm and click  to view the host list in the alarm details.

Step 2 Log in to the active OMS node as user `omm`.

Step 3 Run the `ssh` command, for example, `ssh host2`, on each node in the alarm details to check whether the connection fails. (`host2` is a node other than the OMS node in the alarm details.)

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

Step 4 Open the `/etc/ssh/sshd_config` configuration file on `host2` and check whether `AllowUsers` or `DenyUsers` is configured for other nodes.

- If yes, go to [Step 5](#).
- If no, contact OS experts.

Step 5 Modify the whitelist or blacklist to ensure that user `omm` is in the whitelist or not in the blacklist. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Check the status of the password of user `omm`.

Step 6 Check the interaction information of the `ssh` command.

- If the password of user `omm` is required, go to [Step 7](#).
- If message "Enter passphrase for key '/home/omm/.ssh/id_rsa':" is displayed, go to [Step 9](#).
- If the connection is set up successfully, run the following command to restart `ssh-agent` and then go to [Step 3](#):

```
ps -ef|grep ssh-agent |grep -v grep |awk '{print $2}' | xargs kill -9
```

Step 7 Check the trust list (`/home/omm/.ssh/authorized_keys`) of user `omm` on the OMS node and `host2` node. Check whether the trust list contains the public key file (`/home/omm/.ssh/id_rsa.pub`) of user `omm` on the peer host.

- If yes, contact OS experts.
- If no, add the public key of user `omm` of the peer host to the trust list of the local host.

Step 8 Add the public key of user `omm` of the peer host to the trust list of the local host. Run the `ssh` command, for example, `ssh host2`, on each node in the alarm details

to check whether the connection fails. (*host2* is a node other than the OMS node in the alarm details.)

- If yes, go to [Step 9](#).
- If no, check whether the alarm is cleared. If the alarm is cleared, no further action is required; otherwise, go to [Step 9](#).

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Select **Controller** for **Service** and click **OK**.

Step 11 Click  in the upper right corner to set the log collection time range. Generally, the time range is 10 minutes before and after the alarm generation time. Click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

Perform the following steps to handle abnormal trust relationships between nodes:

NOTICE

- Perform this operation as user **omm**.
- If the network between nodes is disconnected, rectify the network fault first. Check whether the two nodes are connected to the same security group and whether **hosts.deny** and **hosts.allow** are set.

1. Run the **ssh-add -l** command on both nodes to check whether any identities exist.

```
[omm@node-group-2eU40 ~]$  
[omm@node-group-2eU40 ~]$  
[omm@node-group-2eU40 ~]$  
[omm@node-group-2eU40 ~]$ ll .ssh/  
total 32  
-rw----- 1 omm wheel    0 Dec 29 14:17 agent.pid  
-rw----- 1 omm wheel 12901 Mar  9 14:48 authorized_keys  
-rw----- 1 omm wheel   54 Sep 24 11:42 config  
-rw----- 1 omm wheel 1766 Sep 24 11:43 id_rsa  
-rw----- 1 omm wheel  402 Sep 24 11:42 id_rsa.pub  
-rw----- 1 omm wheel   88 Jun  8 2020 id_rsa.sha256  
[omm@node-group-2eU40 ~]$  
[omm@node-group-2eU40 ~]$ ssh-add -l  
The agent has no identities.  
[omm@node-group-2eU40 ~]$  
[omm@node-group-2eU40 ~]$  
[omm@node-group-2eU40 ~]$  
[omm@node-group-2eU40 ~]$ vim /var/log/Bigdata/nodeagent/  
agentlog/  alarmlog/  monitorlog/ scriptlog/  
[omm@node-group-2eU40 ~]$ vim /var/log/Bigdata/nodeagent/scriptlog/  
agent_alarm_py.log          install.log  
agent_alarm_py.log.1       installntp.log
```

- If yes, go to 4.
 - If no, go to 2.
2. If no identities are displayed, run the `ps -ef|grep ssh-agent` command to find the `ssh-agent` process, stop the process, and wait for the process to automatically restart.

```
omm@node-group-2eU40 ~]$  
omm@node-group-2eU40 ~]$  
omm@node-group-2eU40 ~]$ ssh-add -l  
The agent has no identities.  
omm@node-group-2eU40 ~]$  
omm@node-group-2eU40 ~]$  
omm@node-group-2eU40 ~]$ ps -ef|grep ssh-agent  
omm 18729 1 0 14:53 ? 00:00:00 ssh-agent -a /home/omm/.ssh/agent.pid  
omm 25098 1 0 14:54 ? 00:00:00 bash /opt/Bigdata/om-agent/nodeagent/bin/ssh-agent-monitor-startup.sh  
omm 25286 25098 0 14:54 ? 00:00:00 bash /opt/Bigdata/om-agent/nodeagent/bin/ssh-agent-monitor.sh  
omm 27201 4913 0 14:54 pts/0 00:00:00 grep --color=auto ssh-agent  
omm@node-group-2eU40 ~]$  
omm@node-group-2eU40 ~]$  
omm@node-group-2eU40 ~]$ ssh-add -l
```

3. Run the `ssh-add -l` command to check whether the identities have been added. If yes, manually run the `ssh` command to check whether the trust relationship is normal.

```
omm 22276 4913 0 14:53 pts/0 00:00:00 grep --color=auto ssh-agent  
omm@node-group-2eU40 ~]$  
omm@node-group-2eU40 ~]$  
omm@node-group-2eU40 ~]$  
omm@node-group-2eU40 ~]$ ssh-add -l  
The agent has no identities.  
omm@node-group-2eU40 ~]$  
omm@node-group-2eU40 ~]$  
omm@node-group-2eU40 ~]$ ps -ef|grep ssh-agent  
omm 18729 1 0 14:53 ? 00:00:00 ssh-agent -a /home/omm/.ssh/agent.pid  
omm 25098 1 0 14:54 ? 00:00:00 bash /opt/Bigdata/om-agent/nodeagent/bin/ssh-agent-monitor-startup.sh  
omm 25286 25098 0 14:54 ? 00:00:00 bash /opt/Bigdata/om-agent/nodeagent/bin/ssh-agent-monitor.sh  
omm 27201 4913 0 14:54 pts/0 00:00:00 grep --color=auto ssh-agent  
omm@node-group-2eU40 ~]$  
omm@node-group-2eU40 ~]$  
omm@node-group-2eU40 ~]$ ssh-add -l  
2049 SHA256:cnRbubhh1HxpT0z1B50zym1KXN1afyvn0IHp1Zjg /home/omm/.ssh/id_rsa (RSA)  
omm@node-group-2eU40 ~]$  
omm@node-group-2eU40 ~]$  
omm@node-group-2eU40 ~]$ ssh 10.33.109.226  
Warning: Permanently added '10.33.109.226' (ECDSA) to the list of known hosts.  
ast login: Tue Mar 9 14:53:49 2021
```

4. If identities exist, check whether the `/home/omm/.ssh/authorized_keys` file contains the information in the `/home/omm/.ssh/id_rsa.pub` file of the peer node. If it does not, manually add the information.
5. Check whether the permissions on the files in the `/home/omm/.ssh` directory are modified.
6. Check the `/var/log/Bigdata/nodeagent/scriptlog/ssh-agent-monitor.log` file.
7. If the `/home` directory of user `omm` is deleted, contact MRS support personnel for assistance.

10.42 ALM-12067 Tomcat Resource Is Abnormal

Alarm Description

HA checks the Tomcat resources of Manager every 85 seconds. This alarm is generated when HA detects that the Tomcat resources are abnormal for two consecutive times.

This alarm is cleared when HA detects that the Tomcat resources become normal.

Resource Type of Tomcat is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new Tomcat resources have been enabled on the new active Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12067	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

- The active/standby Manager switchover occurs.
- The Tomcat process repeatedly restarts.

Possible Causes

- The Tomcat directory permission is abnormal, and the Tomcat process is abnormal.

Handling Procedure

Check whether the permission on the Tomcat directory is normal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click  to view the IP address of the host for which the alarm is generated.

Step 2 Log in to the alarm host as user **root**.

Step 3 Run the **su - omm** command to switch to user **omm**.

Step 4 Run the **vi \$BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/tomcat.log** command to check whether the Tomcat resource log contains keyword **Cannot find XXX** and rectify the file permission based on the keyword.

Step 5 After 5 minutes, check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect the fault information.

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** In the **Services** area, select **OmmServer** and **Tomcat**, and click **OK**.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.43 ALM-12068 ACS Resource Exception

Alarm Description

HA checks the ACS resources of Manager every 80 seconds. This alarm is generated when HA detects that the ACS resources are abnormal for two consecutive times.

This alarm is cleared when HA detects that the ACS resources are normal.

Resource Type of ACS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new ACS resources have been enabled on the new active Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12068	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.

Parameter	Description
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

- The active/standby Manager switchover occurs.
- The ACS process repeatedly restarts, which may cause the FusionInsight Manager login failure.

Possible Causes

The ACS process is abnormal.

Handling Procedure

Check whether the ACS process is normal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click  to view the name of the host for which the alarm is generated.

Step 2 Log in to the alarm host as user **root**.

Step 3 Run the **su - omm** command and then **sh \${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** to check whether the status of the ACS resources managed by the HA is normal. In the single-node system, the ACS resource is in the normal state. In the dual-node system, the ACS resource is in the normal state on the active node and in the stopped state on the standby node.

- If yes, go to [Step 6](#).
- If no, go to [Step 4](#).

Step 4 Run the **vi \$BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/acs.log** command to check whether the ACS resource log of HA contains the keyword **ERROR**. If yes, analyze the logs to locate the resource exception cause and fix the exception.

Step 5 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 In the **Services** area, select **Controller** and **OmmServer**, and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.44 ALM-12069 AOS Resource Exception

Alarm Description

HA checks the AOS resources of Manager every 81 seconds. This alarm is generated when HA detects that the AOS resources are abnormal for two consecutive times.

This alarm is cleared when HA detects that the AOS resources become normal.

Resource Type of AOS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new AOS resources have been enabled on the new active Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12069	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.

Parameter	Description
HostName	Specifies the host for which the alarm was generated.

Impact on the System

- The active/standby Manager switchover occurs.
- The AOS process repeatedly restarts, which may cause the FusionInsight Manager login failure.

Possible Causes

The AOS process is abnormal.

Handling Procedure

Check whether the AOS process is normal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click  to view the name of the host for which the alarm is generated.

Step 2 Log in to the alarm host as user **root**.

Step 3 Run the **su - omm** command and then **sh \${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** to check whether the status of the AOS resources managed by the HA is normal. In the single-node system, the AOS resource is in the normal state. In the dual-node system, the AOS resource is in the normal state on the active node and in the stopped state on the standby node.

- If yes, go to [Step 6](#).
- If no, go to [Step 4](#).

Step 4 Run the **vi \$BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/aos.log** command to check whether the AOS resource log of HA contains the keyword **ERROR**. If yes, analyze the logs to locate the resource exception cause and fix the exception.

Step 5 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 7 In the **Services** area, select **Controller** and **OmmServer**, and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

10.45 ALM-12070 Controller Resource Is Abnormal

Alarm Description

HA checks the controller resources of Manager every 80 seconds. This alarm is generated when HA detects that the controller resources are abnormal for 2 consecutive times.

This alarm is cleared when the Controller resource is normal.

Resource Type of Controller is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new Controller resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12070	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the name of the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby FusionInsight Manager switchover occurs.
- The Controller process repeatedly restarts, which may cause the FusionInsight Manager login failure.

Possible Causes

The Controller process is abnormal.

Procedure

Check whether the controller process is normal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su - omm** command to switch to user **omm**. Run the **sh \$ {BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the Controller resources managed by the HA is normal. In the single-node system, the Controller resource is in the normal state. In the dual-node system, the Controller resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to [Step 6](#).
- If it is not, go to [Step 4](#).

Step 4 Run the **vi \$BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/controller.log** command to view the Controller resource logs, and run the **vi \$BIGDATA_LOG_HOME/controller/controller.log** command to view the Controller running logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

Step 5 Five minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 6](#).

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 7 Select **Controller** and **OmmServe** for **Service** and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour before and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.46 ALM-12071 Httpd Resource Is Abnormal

Description

HA checks the httpd resources of Manager every 120 seconds. This alarm is generated when HA detects that the httpd resources are abnormal for 10 consecutive times.

This alarm is cleared when the httpd resource is normal.

Resource Type of httpd is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new httpd resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12071	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby FusionInsight Manager switchover occurs.
- The httpd process is repeatedly restarts, which may lead to the failure to visit the native service UI.

Possible Causes

The httpd process is abnormal.

Procedure

Check whether the httpd process is abnormal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su - omm** command to switch to user **omm**.

Step 4 Run the **sh \${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the httpd resources managed by the HA is normal. In the single-node system, the httpd resource is in the normal state. In the dual-node system, the httpd resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to [Step 7](#).
- If it is not, go to [Step 5](#).

Step 5 Run the **vi \$BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/httpd.log** command to view the httpd resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

Step 6 Five minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 7](#).

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 8 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 9 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

10.47 ALM-12072 FloatIP Resource Is Abnormal

Description

HA checks the floatip resources of Manager every 9 seconds. This alarm is generated when HA detects that the floatip resources are abnormal for 3 consecutive times.

This alarm is cleared when the FloatIP resource is normal.

Resource Type of FloatIP is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new FloatIP resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12072	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby FusionInsight Manager switchover occurs.
- The FloatIP process is repeatedly restarts, which may lead to the failure to visit the native service UI.

Possible Causes

- The floating IP address is abnormal.

Procedure

Check the floating IP address status of the active management node.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the address of the host for which the alarm is generated and the resource name.

Step 2 Log in to the active management node as user **root**.

Step 3 Run the following command, go to the `/${BIGDATA_HOME}/om-server/om/sbin/` directory.

```
su - omm
```

```
cd ${BIGDATA_HOME}/om-server/om/sbin/
```

Step 4 Run the `sh status-oms.sh` command, and execute the `status-oms.sh` script to check whether the floating IP address of the active FusionInsight Manager is normal. View the command output, locate the row where **ResName** is **floatip**, and check whether the following information is displayed.

For example:

```
10-10-10-160 floatip Normal Normal Single_active
```

- If it is, go to [Step 8](#).
- If it is not, go to [Step 5](#).

Step 5 Run the `ifconfig` command to check whether the NIC with the floating IP address exists.

- If it does, go to [Step 8](#).
- If it does not, go to [Step 6](#).

Step 6 Run the `ifconfig NIC name Floating IPaddress netmask Subnet mask` command to reconfigure the NIC with the floating IP address. (For example, `ifconfig eth0 10.10.10.102 netmask 255.255.255.0`).

Step 7 Five minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 8](#).

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 9 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 10 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

10.48 ALM-12073 CEP Resource Is Abnormal

Description

HA checks the cep resources of Manager every 60 seconds. This alarm is generated when HA detects that the cep resources are abnormal for 2 consecutive times.

This alarm is cleared when the CEP resource is normal.

Resource Type of CEP is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new CEP resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12073	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby FusionInsight Manager switchover occurs.
- The CEP process repeatedly restarts, causing monitoring data to be abnormal.

Possible Causes

The CEP process is abnormal.

Procedure

Check whether the CEP process is abnormal.

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.
- Step 2** Log in to the host for which the alarm is generated as user **root**.
- Step 3** Run the **su -omm** command and then the **sh \${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the CEP resources managed by the HA is normal. In the single-node system, the CEP resource is in the normal state. In the dual-node system, the CEP resource is in the normal state on the active node and in the stopped state on the standby node.
- If it is, go to [Step 6](#).
 - If it is not, go to [Step 4](#).
- Step 4** Run the **vi \$BIGDATA_LOG_HOME/omm/oms/cep/cep.log** and **vi \$BIGDATA_LOG_HOME/omm/oms/cep/scriptlog/cep_ha.log** commands to view the CEP resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.
- Step 5** Five minutes later, check whether this alarm is cleared.
- If it is, no further action is required.
 - If it is not, go to [Step 6](#).

Collect fault information.

- Step 6** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 7** Select **Controller** and **OmmServer** for **Service** and click **OK**.
- Step 8** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

10.49 ALM-12074 FMS Resource Is Abnormal

Description

HA checks the fms resources of Manager every 60 seconds. This alarm is generated when HA detects that the fms resources are abnormal for 2 consecutive times.

This alarm is cleared when the FMS resource is normal.

Resource Type of FMS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new FMS resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12074	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby FusionInsight Manager switchover occurs.
- The FMS process repeatedly restarts. As a result, alarm information may fail to be reported.

Possible Causes

The FMS process is abnormal.

Procedure

Check whether the FMS process is abnormal.

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.
- Step 2** Log in to the host for which the alarm is generated as user **root**.
- Step 3** Run the **su -omm** command and then the **sh \${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the FMS resources managed by the HA is normal. In the single-node system, the FMS resource is in the normal state. In the dual-node system, the FMS resource is in the normal state on the active node and in the stopped state on the standby node.
- If it is, go to [Step 6](#).
 - If it is not, go to [Step 4](#).
- Step 4** Run the **vi \$BIGDATA_LOG_HOME/omm/oms/fms/fms.log** and **vi \$BIGDATA_LOG_HOME/omm/oms/fms/scriptlog/fms_ha.log** commands to view the FMS resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.
- Step 5** 5 minutes later, check whether this alarm is cleared.
- If it is, no further action is required.
 - If it is not, go to [Step 6](#).

Collect fault information.

- Step 6** On FusionInsight Manager, choose **O&M> Log > Download**.
- Step 7** Select **Controller** and **OmmServer** for **Service** and click **OK**.
- Step 8** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

10.50 ALM-12075 PMS Resource Is Abnormal

Description

HA checks the pms resources of Manager every 55 seconds. This alarm is generated when HA detects that the pms resources are abnormal for three consecutive times.

This alarm is cleared when the PMS resource is normal.

Resource Type of PMS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new PMS resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12075	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby FusionInsight Manager switchover occurs.
- The PMS process repeatedly restarts, causing monitoring information to be abnormal.

Possible Causes

The PMS process is abnormal.

Procedure

Check whether the PMS process is abnormal.

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.
- Step 2** Log in to the host for which the alarm is generated as user **root**.
- Step 3** Run the **su -omm** command and then the **sh \${BIGDATA_HOME}/omm-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the PMS resources managed by the HA is normal. In the single-node system, the PMS resource is in the normal state. In the dual-node system, the PMS resource is in the normal state on the active node and in the stopped state on the standby node.
- If it is, go to [Step 6](#).
 - If it is not, go to [Step 4](#).
- Step 4** Run the **vi \$BIGDATA_LOG_HOME/omm/oms/pms/pms.log** and **vi \$BIGDATA_LOG_HOME/omm/oms/pms/scriptlog/pms_ha.log** commands to view the PMS resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.
- Step 5** Five minutes later, check whether this alarm is cleared.
- If it is, no further action is required.
 - If it is not, go to [Step 6](#).

Collect fault information.

- Step 6** On FusionInsight Manager, choose **O&M> Log > Download**.
- Step 7** Select **Controller** and **OmmServer** for **Service** and click **OK**.
- Step 8** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected log information.

10.51 ALM-12076 GaussDB Resource Is Abnormal

Description

HA checks the Manager database every 10 seconds. This alarm is generated when HA detects that the database is abnormal for 3 consecutive times.

This alarm is cleared when the database is normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12076	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If databases are abnormal, all core services and related service processes, such as alarms and monitoring functions, are affected.

Possible Causes

An exception occurs in the database.

Procedure

Check the database status of the active and standby management nodes.

- Step 1** Log in to the active and standby management nodes respectively as user **root**. Run the **su - ommdba** command to switch to user **ommdba**, and then run the **gs_ctl query** command to check whether the following information is displayed in the command output.

Command output of the active management node:

```
Ha state:
  LOCAL_ROLE: Primary
  STATIC_CONNECTIONS      : 1
  DB_STATE                 : Normal
  DETAIL_INFORMATION      : user/password invalid
Senders info:
  No information
Receiver info:
  No information
```

Command output of the standby management node:

```
Ha state:
  LOCAL_ROLE: Standby
  STATIC_CONNECTIONS      : 1
  DB_STATE                : Normal
  DETAIL_INFORMATION     : user/password invalid
Senders info:
  No information
Receiver info:
  No information
```

- If it is, go to [Step 3](#).
- If it is not, go to [Step 2](#).

Step 2 Contact the network administrator to check whether the network is faulty.

- If it is, go to [Step 3](#).
- If it is not, go to [Step 5](#).

Step 3 Five minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 4](#).

Step 4 Log in to the active and standby management nodes, run the `su -omm` command to switch to user `omm`, go to the `/${BIGDATA_HOME}/om-server/om/sbin/` directory, and run the `status-oms.sh` script to check whether the floating IP addresses and GaussDB resources of the active and standby FusionInsight Managers are in the status shown in the following figure.

acs	Normal	Normal	Single_active
aos	Normal	Normal	Single_active
cep	Normal	Normal	Single_active
controller	Normal	Normal	Single_active
feed_watchdog	Normal	Normal	Double_active
floatip	Normal	Normal	Single_active
fms	Normal	Normal	Single_active
gaussDB	Active_normal	Normal	Active_standby
heartBeatCheck	Normal	Normal	Single_active
httpd	Normal	Normal	Single_active
iam	Normal	Normal	Single_active
ntp	Active_normal	Normal	Active_standby
okerberos	Normal	Normal	Double_active
oldap	Active_normal	Normal	Active_standby
pms	Normal	Normal	Single_active
tomcat	Normal	Normal	Single_active
acs	Stopped	Normal	Single_active
aos	Stopped	Normal	Single_active
cep	Stopped	Normal	Single_active
controller	Stopped	Normal	Single_active
feed_watchdog	Normal	Normal	Double_active
floatip	Stopped	Normal	Single_active
fms	Stopped	Normal	Single_active
gaussDB	Standby_normal	Normal	Active_standby
heartBeatCheck	Stopped	Normal	Single_active
httpd	Stopped	Normal	Single_active

- If they are, find the alarm in the alarm list and manually clear the alarm.
- If they are not, go to [Step 5](#).

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 6 Select **OmmServer** for **Service** and click **OK**.

Step 7 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 8 Contact the O&M personnel and send the collected log information.

10.52 ALM-12077 User omm Expired

Description

The system starts at 00:00 every day to check whether user **omm** has expired every eight hours. This alarm is generated if the user account has expired.

This alarm is cleared when the expiration time of user **omm** is changed and the user account status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12077	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

User **omm** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services.

Possible Causes

User **omm** has expired.

Procedure

Check whether user omm in the system has expired.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l omm** command to view the information about the password of user **omm**.

Step 2 View the value of **Account expires** to check whether the user configurations have expired.

NOTE

If the parameter value is **never**, the user configurations never expire.

- If they do, go to [Step 3](#).
- If they do not, go to [Step 4](#).

Step 3 Run the **chage -E 'yyyy-MM-dd' omm** command to set the expiration time of user **omm**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to [Step 4](#).

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

10.53 ALM-12078 Password of User omm Expired

Description

The system starts at 00:00 every day to check whether the password of user **omm** has expired every 8 hours. This alarm is generated if the password has expired.

This alarm is cleared when the expiration time of user **omm** password is changed and the user password status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12078	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The password of user **omm** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services.

Possible Causes

The password of user **omm** has expired.

Procedure

Check whether the password of user omm in the system has expired.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l omm** command to view the information about the password of user **omm**.

Step 2 View the value of **Password expires** to check whether the user configurations have expired.

 **NOTE**

If the parameter value is **never**, the user configurations never expire.

- If they do, go to [Step 3](#).
- If they do not, go to [Step 4](#).

Step 3 Run the **chage -M 'days' omm** command to set the validity period of the password for user **omm**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to [Step 4](#).

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M> Log > Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

10.54 ALM-12079 User omm Is About to Expire

Description

The system starts at 00:00 every day to check whether user **omm** is about to expire every 8 hours. This alarm is generated if the user account will expire no less than 15 days later.

This alarm is cleared when the expiration time of user **omm** is changed and the user account status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12079	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

User **omm** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services.

Possible Causes

The account of user **omm** is about to expire.

Procedure

Check whether user omm is about to expire.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l omm** command to view the information about the password of user **omm**.

Step 2 View the value of **Account expires** to check whether the user configurations are about to expire.

 **NOTE**

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password are about to expire within 15 days.

- If they are, go to [Step 3](#).
- If they are not, go to [Step 4](#).

Step 3 Run the **chage -E 'yyyy-MM-dd' omm** command to set the validity period of user **omm**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to [Step 4](#).

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

HostName	Specifies the host for which the alarm is generated.

Impact on the System

The OMS database cannot be managed and data cannot be accessed.

Possible Causes

The account of user **ommdba** for the host has expired.

Procedure

Check whether user `ommdba` has expired.

Step 1 Log in to the faulty node as user `root`.

Run the `chage -l ommdba` command to view the information about the password of user `ommdba`.

Step 2 View the value of **Account expires** to check whether the user configurations have expired.

NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password have expired.

- If they do, go to [Step 3](#).
- If they do not, go to [Step 4](#).

Step 3 Run the `chage -E 'yyyy-MM-dd' omm` command to set the validity period of user `ommdba`. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to [Step 4](#).

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

Related Information

None

10.57 ALM-12082 User `ommdba` Is About to Expire

Description

The system starts at 00:00 every day to check whether user `ommdba` is about to expire every 8 hours. This alarm is generated if the user account will expire no less than 15 days later.

This alarm is cleared when the expiration time of user **ommdba** is reset and the user account status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12082	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The OMS database cannot be managed and data cannot be accessed.

Possible Causes

The account of user **ommdba** for the host is about to expire.

Procedure

Check whether user ommdba is about to expire.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l ommdba** command to view the information about user **ommdba**.

Step 2 View the value of **Account expires** to check whether the user configurations are about to expire.

NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password are about to expire within 15 days.

- If they are, go to [Step 3](#).
- If they are not, go to [Step 4](#).

Step 3 Run the **chage -E 'yyyy-MM-dd' ommdba** command to set the validity period of user **ommdba**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to [Step 4](#).

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

10.58 ALM-12083 Password of User ommdba Is About to Expire

Description

The system starts at 00:00 every day to check whether the password of user **ommdba** is about to expire every 8 hours. This alarm is generated if the password is about to expire no less than 15 days later.

This alarm is cleared when the expiration time of user **ommdba** password is reset and the user password status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12083	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The OMS database cannot be managed and data cannot be accessed.

Possible Causes

The password of user **ommdba** is about to expire.

Procedure

Check whether the password of user ommdba in the system is about to expire.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l ommdba** command to view the information about the password of user **ommdba**.

Step 2 View the value of **Password expires** to check whether the user configurations are about to expire.

 **NOTE**

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password are about to expire within 15 days.

- If they are, go to [Step 3](#).
- If they are not, go to [Step 4](#).

Step 3 Run the **chage -M 'days' ommdba** command to set the validity period of the password for user **ommdba**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to [Step 4](#).

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

10.59 ALM-12084 Password of User ommdba Expired

Description

The system starts at 00:00 every day to check whether the password of user **ommdba** has expired every 8 hours. This alarm is generated if the password has expired.

This alarm is cleared when the expiration time of user **ommdba** password is reset and the user password status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12084	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The password of user **ommdba** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services.

Possible Causes

The password of user **ommdba** for the host has expired.

Procedure

Check whether the password of user ommdba in the system has expired.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l ommdba** command to view the information about the password of user **ommdba**.

Step 2 View the value of **Password expires** to check whether the user configurations have expired.

NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password have expired.

- If they do, go to [Step 3](#).
- If they do not, go to [Step 4](#).

Step 3 Run the **chage -M 'days' ommdba** command to set the validity period of the password for user **ommdba**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to [Step 4](#).

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

10.60 ALM-12085 Service Audit Log Dump Failure

Description

The system dumps service audit logs at 03:00 every day and stores them on the OMS node. This alarm is generated when the dump fails. This alarm is cleared when the next dump succeeds.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12085	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The service audit logs may be lost.

Possible Causes

- The service audit logs are oversized.
- The OMS backup storage space is insufficient.
- The storage space of a host where the service is located is insufficient.

Procedure

Check whether the service audit logs are oversized.

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host and additional information for which the alarm is generated.

- Step 2** Log in to the host where the alarm is generated as user **root**.
- Step 3** Run the **vi \${BIGDATA_LOG_HOME}/controller/scriptlog/getLogs.log** command to check whether the keyword "LOG SIZE is more than 5000MB" can be searched.
- If it can, go to **Step 4**.
 - If it cannot, go to **Step 5**.
- Step 4** Check whether the oversized service audit logs are caused by exceptions.
- The OMS backup storage space is insufficient.**
- Step 5** Run the **vi \${BIGDATA_LOG_HOME}/controller/scriptlog/getLogs.log** command to check whether the keyword "Collect log failed, too many logs on" can be searched.
- If it can, obtain the host IP address following the keyword "Collect log failed, too many logs on", and go to **Step 6**.
 - If it cannot, go to **Step 11**.
- Step 6** Log in to the host with the IP address obtained in **Step 5** as user **root**.
- Step 7** Run the **vi \${BIGDATA_LOG_HOME}/nodeagent/scriptlog/collectLog.log** command to check whether the keyword "log size exceeds" can be searched.
- If it can, go to **Step 9**.
 - If it cannot, go to **Step 8**.
- Step 8** Check whether the alarm additional information contains the keyword "no enough space".
- If yes, go to **Step 9**.
 - If no, go to **Step 11**.
- Step 9** Perform the following operations to expand the disk capacity (only for MRS 3.1.2 and earlier versions) or reduce the maximum number of audit log backups:
- Expand the capacity of the OMS node.
 - Run the following command to edit the file and decrease the value of **MAX_NUM_BK_AUDITLOG**.
- ```
vi ${CONTROLLER_HOME}/etc/om/componentsauditlog.properties
```
- Step 10** In the next execution period, 03:00, check whether the alarm is cleared.
- If it is, no further action is required.
  - If it is not, go to **Step 11**.
- Check whether the space of the host where the service is located is insufficient.**
- Step 11** Run the **vi \${BIGDATA\_LOG\_HOME}/controller/scriptlog/getLogs.log** command to check whether the keyword "Collect log failed, no enough space on *hostIp*" can be searched.
- If it can, obtain the IP address of the abnormal host and go to **Step 12**.
  - If it cannot, go to **Step 15**.
- Step 12** Log in to the host with the IP address obtained as user **root**, and run the **df "\${BIGDATA\_HOME}/tmp" -IP | tail -1 | awk '{print (\$4/1024)}'** command to

obtain the remaining space of the host log directory. Check whether the value is less than 1000 MB.

- If it is, go to [Step 13](#).
- If it is not, go to [Step 15](#).

**Step 13** Expand the capacity of the node

**Step 14** In the next execution period, 03:00, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 15](#).

**Collect fault information.**

**Step 15** On FusionInsight Manager, choose **O&M> Log > Download**.

**Step 16** Select **Controller** for **Service** and click **OK**.

**Step 17** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

**Step 18** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

## Related Information

None

# 10.61 ALM-12087 System Is in the Upgrade Observation Period

## Description

The system checks whether it is in the upgrade observation period at 00:00 every day and checks whether the duration that it has been in the upgrade observation state exceeds the preset upgrade observation period, 10 days by default. This alarm is generated when the system is in the upgrade observation period and the duration that the system has been in the upgrade observation state exceeds the preset period (10 days by default). This alarm is automatically cleared if the system exits the upgrade observation period after the user performs a rollback or submission.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12087    | Major          | Yes        |

## Parameters

| Name                              | Meaning                                                                  |
|-----------------------------------|--------------------------------------------------------------------------|
| Source                            | Specifies the cluster or system for which the alarm is generated.        |
| ServiceName                       | Specifies the service for which the alarm is generated.                  |
| RoleName                          | Specifies the role for which the alarm is generated.                     |
| HostName                          | Specifies the host for which the alarm is generated.                     |
| Upgrade Observation Period (Days) | Specifies the days that the system is in the upgrade observation period. |

## Impact on the System

The next upgrade or patch installation will fail.

## Possible Causes

The upgrade task is not submitted a specified period of time (10 days by default) after the system upgrade.

## Procedure

**Check whether the system is in the upgrade observation period.**

**Step 1** Log in to the active management node as user **root**.

**Step 2** Run the following commands to switch to user **omm** and log in to the **omm** database:

```
su - omm
```

```
gsql -U omm -W omm database password -p 20015
```

**Step 3** Run the **select \* from OM\_CLUSTERS** command to view cluster information.

**Step 4** Check whether the value of **upgradObservationPeriod isON** is **true**, as shown in [Figure 10-13](#).

- If it is, the system is in the upgrade observation period. Use the UpdateTool to submit the upgrade task. For details, see the upgrade guide of the corresponding version.
- If it is not, go to [Step 6](#).

**Figure 10-13** Cluster information

```

CLUSTER_ID | CLUSTER_NAME | CLUSTER_DESCRIPTION | STACK_NAME | STACK_TIME | PRESTACK_NAME | PRESTACK_TIME | STACK_MODEL | CURRENT_PATCH_VERSION | IS_DETACHED | UPDATE_MODE |
OBSERVATION_PERIOD | EXTERNAL_LINK
-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
<cluster_id> | <test_1> | | DEFAULT_STACK | 1552290738886 | | | | | | | | |
{"type":"UPGRADE","updateEndTime":"1552291484883","startObservationPeriod":{"isOn":false,"updateEndTime":"03"} | 0

```

**Step 5** In the early morning of the next day, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

**Collect fault information.**

**Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 7** Select **Controller** from the **Service** and click **OK**.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

## Related Information

None

# 10.62 ALM-12089 Inter-Node Network Is Abnormal

## Description

The alarm module checks the network health status of nodes in the cluster every 10 seconds. This alarm is generated when the network between two nodes is unreachable or the network status is unstable.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12089    | Major          | Yes        |

## Parameters

| Name        | Meaning                                                           |
|-------------|-------------------------------------------------------------------|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

## Impact on the System

Functions of some components, such as HDFS and ZooKeeper, are affected.

## Possible Causes

- The node breaks down.
- The network is faulty.

## Procedure

### Check the network health status.

**Step 1** In the alarm list on FusionInsight Manager, click the drop-down button of the alarm and view **Additional Information**. Record the source IP address and destination IP address of the node for which the alarm is reported.

**Step 2** Log in to the node for which the alarm is reported. On the node, ping the target node to check whether the network between the two nodes is normal.

- If yes, go to [6](#).
- If no, go to [3](#).

### Check the node status.

**Step 3** On FusionInsight Manager, click **Host** and check whether the host list contains the faulty node to determine whether the faulty node has been removed from the cluster.

- If yes, go to [5](#).
- If no, go to [4](#).

**Step 4** Check whether the faulty node is powered off.

- If yes, start the faulty node and go to [Step 2](#).
- If no, contact related personnel to find root cause, if need to remove the faulty nodes from the cluster and go to [5](#), otherwise go to [6](#).

**Step 5** Remove the file `$NODE_AGENT_HOME/etc/agent/hosts.ini` of all nodes in the cluster, and clean up the file `/var/log/Bigdata/unreachable/unreachable_ip_info.log`, and then manually clear the alarm.

**Step 6** Wait for 30 seconds and checking if the alarm was been cleared.

- If yes, no further action is required.
- If no, go to 7.

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **OmmAgent** from the **Service** and click **OK**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.63 ALM-12091 Abnormal disaster Resources

## Alarm Description

HA checks the disaster resources of Manager every 86 seconds. This alarm is generated when HA detects that the disaster resources have been abnormal for 10 consecutive times.

This alarm is cleared when HA detects that the disaster resources become normal.

**Resource Type** of disaster is **Single-active**. Active/Standby switchover will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new disaster resources have been enabled on the new active Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12091    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description                                                       |
|-------------|-------------------------------------------------------------------|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

## Impact on the System

- The active/standby Manager switchover occurs.
- The disaster process restarts repeatedly, which may cause active/standby DR to be unavailable.

## Possible Causes

The disaster process is abnormal.

## Handling Procedure

**Check whether the disaster process is normal.**

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click  to view the name of the host for which the alarm is generated.
- Step 2** Log in to the host for which the alarm is generated as user **root**.
- Step 3** Run the **su - omm** command to switch to user **omm**.
- Step 4** Run the **sh \${BIGDATA\_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status\_ha.sh** command to check whether the status of the disaster resources managed by the HA is normal. In the single-node system, the disaster resource is in the normal state. In the dual-node system, the disaster resource is in the normal state on the active node and in the stopped state on the standby node.
- If yes, go to [Step 7](#).
  - If no, go to [Step 5](#).
- Step 5** Run the **vi \${BIGDATA\_LOG\_HOME}/disaster/disaster.log** command to check whether the disaster resource log of HA contains the keyword **ERROR**. If yes, analyze the logs to locate the resource exception cause and fix the exception.
- Step 6** Wait 5 minutes and check whether the alarm is automatically cleared.
- If yes, no further action is required.
  - If no, go to [Step 7](#).

**Collect fault information.**

- Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 8** Expand the **Service** drop-down list, select **Disaster** for the target cluster, and click **OK**.
- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

# 10.64 ALM-12099 core dump Occurred

## Description

GaussDB A manages the core file. It manages the lifecycle of core files generated when applications crash and manages alarm notification. This alarm is generated when a new core file is detected.

### NOTE

This section applies to MRS 3.1.5 and later versions.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12099    | Minor          | No         |

## Parameters

| Name        | Meaning                                                           |
|-------------|-------------------------------------------------------------------|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |

| Name     | Meaning                                              |
|----------|------------------------------------------------------|
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

## Impact on the System

This alarm indicates that some processes crashed. If a key process crashes, the cluster may be temporarily unavailable.

## Possible Causes

Related processes crash.

## Procedure

---

**CAUTION**

- Users' sensitive data may be involved in the following operations on parsing the core file stack information. Therefore, development or O&M personnel can perform these operations only after being authorized.
- The core file generated for the alarm is retained for 72 hours by default. If the period for storing the file exceeds 72 hours or the file size exceeds the preset value, the system automatically clears the file. Therefore, once this alarm is generated, contact O&M personnel in a timely manner.

---

**Step 1** In the alarm list on the FusionInsight Manager page, click the row containing the alarm, and view the host IP address for which the alarm is generated in the alarm details. Then, view the path for storing the core file according to the **DumpedFilePath** attribute in the additional information.

**Step 2** Log in to the host for which the alarm is generated as user **omm** and run the **gdb --version** command to check whether the gdb tool is installed on the host.

- If no, install the gdb tool and then go to **Step 3**.
- If yes, go to the **Step 3**.

**Step 3** Use the gdb tool to view the stack details of the core file.

1. Go to the **DumpedFilePath** directory and find the core file.
2. Run the following commands to obtain the symbol table of the core file:  

```
source $BIGDATA_HOME/mppdb/.mppdbgs_profile
cd ${BIGDATA_HOME}/FusionInsight_MPPDB_XXX/install/FusionInsight-MPPDB-XXX/package/MPPDB_ALL_PACKAGE
tar -xzf GaussDB-Kernel-V300R002C00-Operating system-64bit-symbol.tar.gz
```

**cd symbols/bin/**

Find the symbol table file whose name is the same as the process name in the alarm. For example, the symbol table file for the `cm_agent` process is **cm\_agent.symbol**.

Copy the obtained symbol table to the `#{GAUSSHOME}/bin` directory.

3. Run the **gdb --batch -n -ex thread -ex bt core file name** command to view the stack details of the core file.

**Step 4** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system does not automatically clear this alarm, and you need to manually clear the alarm.

## Related Information

None

# 10.65 ALM-12100 AD Service Connection Failed

## Alarm Description

After a third-party active directory (AD) is interconnected, the third-party AD domain user can be synchronized using the synchronization period (60 minutes by default) or manually. During data synchronization, the AD service status will be checked. This alarm is generated when AD service unavailability is detected for three consecutive times. This alarm is cleared when AD service recovers.

 **NOTE**

This section applies to MRS 3.1.5 and later versions.

## Alarm Attributes

| Alarm ID | Severity | Auto Clear |
|----------|----------|------------|
| 12100    | Major    | Yes        |

## Alarm Parameters

| Alarm Parameters | Description                                                         |
|------------------|---------------------------------------------------------------------|
| Source           | Specifies the cluster or system for which the alarm is generated.   |
| ServiceName      | Specifies the name of the service for which the alarm is generated. |

| Alarm Parameters | Description                                                      |
|------------------|------------------------------------------------------------------|
| RoleName         | Specifies the name of the role for which the alarm is generated. |
| HostName         | Specifies the name of the host for which the alarm is generated. |

## Impact on the System

When the alarm is generated, the AD service is unavailable, and AD domain user synchronization fails. An AD domain user cannot log in to FusionInsight Manager and execute services.

## Possible Causes

- The configuration item for interconnecting with the third-party AD is incorrect.
- The network connection between FusionInsight and the third-party AD service is faulty.
- AD server fault
- AD service fault

## Handling Procedure

### Check the third-party AD configuration.

**Step 1** On the **FusionInsight Manager** page, choose **System > Permission > Third-Party AD**. The third-party AD configuration page is displayed.

**Step 2** Check whether the **AD IP Address, LDAP Port, Bind DN, and Bind DN Password** parameters are correctly set.

- If yes, go to [Step 5](#).
- If no, go to [Step 3](#).

**Step 3** Modify the incorrect parameters, and then click **OK**.

**Step 4** Choose **System > Permission > User > AD Domain User**, click **Manual Synchronization**, and check whether the message "Manual synchronization successfully." is displayed in the upper right corner of the page.

- If yes, no further action is required.
- If no, go to [Step 5](#).

### Check the third-party AD server and the network.

**Step 5** Log in to the active management node as user **root**.

**Step 6** On the host you have logged in to, ping the IP address of the third-party AD server to check whether the third-party AD server can be pinged.

- If yes, go to [Step 7](#).
- If no, go to [Step 8](#).

**Step 7** Run the following command to check whether the third-party AD service can be connected:

**telnet** *IP port*

*IP* indicates the IP address of the third-party AD server, and *port* indicates the port used by the third-party AD server.

- If yes, go to [Step 8](#).
- If no, contact O&M personnel to check the network.

**Step 8** Contact the third-party AD service administrator to check whether the AD service is normal.

- If yes, go to [Step 9](#).
- If no, contact the third-party AD service administrator to rectify the AD server fault.

**Collect the fault information.**

**Step 9** On the **FusionInsight Manager** page, choose **O&M > Log > Download**.

**Step 10** In the **Service** area, select **Controller** under **OMS** and click **OK**.

**Step 11** Click  in the upper right corner to set **Start Date** and **End Date** to 10 minutes before and after the time when the alarm is generated, and click **Download**.

**Step 12** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm. You do not need to manually clear it.

## Reference

None

# 10.66 ALM-12101 AZ Unhealthy

## Description

After the AZ DR function is enabled, the system checks the AZ health status every 5 minutes. This alarm is generated when the system detects that the AZ is subhealthy or unhealthy. This alarm is cleared when the AZ becomes healthy.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12101    | Critical       | Yes        |

## Parameters

| Parameter   | Meaning                                                 |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| AZName      | Specifies the AZ for which the alarm is generated.      |
| HostName    | Specifies the host for which the alarm is generated.    |

## Impact on the System

The health status of an AZ is determined by whether the health status of storage resources (HDFS), computing resources (Yarn), and key roles in the AZ exceeds the configured threshold.

An AZ is subhealthy when:

- The computing resources (Yarn) are unhealthy, but the storage resources (HDFS) are healthy. Tasks cannot be submitted to the local AZ, but data can still be read and written in the local AZ.
- The computing resources (Yarn) are healthy, but some storage resources (HDFS) are unhealthy. Tasks can be submitted to the local AZ, and some data can be read and written in the local AZ. This depends on the locality of data detected by Spark/Hive scheduling.

An AZ is unhealthy when:

- The computing resources (Yarn) are healthy, but the storage resources (HDFS) are unhealthy. Although tasks can be submitted to the local AZ, data cannot be read or written in the local AZ. As a result, the tasks submitted to the local AZ are invalid.
- The computing resources (Yarn) and storage resources (HDFS) are unhealthy. Tasks cannot be submitted to the local AZ, and data cannot be read or written in the local AZ.
- The health status of key roles except Yarn and HDFS is lower than the configured threshold.

## Possible Causes

- The computing resources (Yarn) are unhealthy.
- The storage resources (HDFS) are unhealthy.
- Some storage resources (HDFS) are unhealthy.
- Key roles except Yarn and HDFS are unhealthy.

## Procedure

### Disable the DR drill.

- Step 1** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Cross-AZ HA**. The Cross-AZ HA page is displayed.
- Step 2** In the AZ DR list, check whether **Perform DR Drill** in the **Operation** column of the AZ whose health status is **Unhealthy** is gray.
- If yes, go to **Step 4**.
  - If no, go to **Step 3**.
- Step 3** Click **Restore** in the **Operation** column of the target AZ. Wait 2 minutes and refresh the page to view the health status of the AZ. Check whether the health status is normal.
- If yes, no further action is required.
  - If no, go to **Step 4**.

### Collect the fault information.

- Step 4** Log in to the active management node as user **root**.
- Step 5** View logs of unhealthy services.
- HDFS log files are stored in **/var/log/Bigdata/hdfs/nn/hdfs-az-state.log**.
  - Yarn log files are stored in **/var/log/Bigdata/yarn/rm/yarn-az-state.log**.
  - For other services, view the service health check logs in the corresponding service log directory.
- Step 6** Contact O&M personnel and provide detailed log file information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.67 ALM-12102 AZ HA Component Is Not Deployed Based on DR Requirements

## Alarm Description

The alarm module checks the deployment status of AZ HA components every 5 minutes. This alarm is generated when the components that support DR are not deployed based on DR requirements after AZ is enabled. This alarm is cleared when the components are deployed based on DR requirements.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12102    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description                                              |
|-------------|----------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |

## Impact on the System

The cross-AZ HA capability of a single cluster is affected.

## Possible Causes

The roles of the components that support DR are not deployed based on DR requirements.

## Handling Procedure

### Obtain alarm information.

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**.

**Step 2** In the alarm list, click  in the row that contains the alarm and view the roles that are not deployed based on DR requirements in **Additional Information**.

### Redeploy the role instance.

**Step 3** Choose **Cluster > Services > Name of the desired service > Instance**. On the instance page, redeploy or adjust the role instance.

**Step 4** Check whether the alarm is cleared 10 minutes later.

- If yes, no further action is required.
- If no, contact O&M personnel.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

## 10.68 ALM-12103 Executor Resource Exception

### Alarm Description

HA checks the Executor resources of Manager every 30 seconds. This alarm is generated when HA detects that the Executor resources are abnormal for two consecutive times.

This alarm is cleared when the Executor resources are normal.

**Resource Type** of Executor is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new Executor resources have been enabled on the new active Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12103    | Major          | Yes          |

### Alarm Parameters

| Parameter   | Description                                                        |
|-------------|--------------------------------------------------------------------|
| Source      | Specifies the cluster or system for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated.           |
| RoleName    | Specifies the role for which the alarm was generated.              |
| HostName    | Specifies the host for which the alarm was generated.              |

### Impact on the System

- The active/standby Manager switchover occurs.
- The Executor process keeps restarting. As a result, the cluster page may fail to be accessed.

### Possible Causes

The Executor process is abnormal.

## Handling Procedure

**Check whether the Executor process is abnormal.**

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click  to view the name of the host for which the alarm is generated.
- Step 2** Log in to the host for which the alarm is generated as user **root**.
- Step 3** Run the **su - omm** command to switch to user **omm**.
- Step 4** Run the **sh \${BIGDATA\_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status\_ha.sh** command to check whether the status of the Executor resources managed by the HA is normal. In the single-node system, the Executor resource is in the normal state. In the dual-node system, the Executor resource is in the normal state on the active node and in the stopped state on the standby node.
- If yes, go to [Step 7](#).
  - If no, go to [Step 5](#).
- Step 5** Run the **vi \$BIGDATA\_LOG\_HOME/omm/oms/ha/scriptlog/executor.log** command to check whether the Executor resource log of HA contains the keyword **ERROR**. If yes, analyze the log to locate the resource exception cause and fix the exception.
- Step 6** After 5 minutes, check whether this alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 7](#).

**Collect the fault information.**

- Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 8** In the **Services** area, select **Controller** and **OmmServer**, and click **OK**.
- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact O&M personnel and provide the collected logs.

----End

## 10.69 ALM-12104 Abnormal Knox Resources

### Alarm Description

HA checks the Knox resources of Manager every 70 seconds. This alarm is generated when HA detects that the Knox resources are abnormal for three consecutive times.

This alarm is cleared when HA detects that the Knox resources are normal.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12104    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description                                                        |
|-------------|--------------------------------------------------------------------|
| Source      | Specifies the cluster or system for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated.           |
| RoleName    | Specifies the role for which the alarm was generated.              |
| HostName    | Specifies the host for which the alarm was generated.              |

## Impact on the System

Requests sent by upper-layer services by using Knox cannot be properly processed.

## Possible Causes

The Knox process is abnormal.

## Handling Procedure

Check whether the Knox process is normal.

- Step 1** Log in to FusionInsight Manager. In the alarm list, locate the row that contains the alarm and view the name of the host for which the alarm is generated.
- Step 2** Use PuTTY to log in to the host for which the alarm is generated as user **root**.
- Step 3** Run the **su - omm** command to switch to user **omm**.
- Step 4** Run the **sh \${BIGDATA\_HOME}/om-server/om/sbin/status-oms.sh** command to check whether the status of the Knox resources managed by HA is normal. If the status is normal, the Knox resources are normal. Otherwise, the Knox resources are abnormal.
  - If yes, go to [Step 7](#).
  - If no, go to [Step 5](#).
- Step 5** Run the **vi \$BIGDATA\_LOG\_HOME/omm/oms/ha/scriptlog/knox.log** command to check whether the Knox resource log of HA contains the keyword **ERROR**. If yes, analyze the log to locate the resource exception cause and fix the exception.

**Step 6** After 5 minutes, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

Collect the fault information.

**Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 8** In the **Services** area, select **Controller** and **OmmServer**, and click **OK**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact O&M personnel and provide the collected logs.

----End

## 10.70 ALM-12110 Failed to get ECS temporary AK/SK

### Alarm Description

Meta calls the ECS API to obtain the AK/SK information every 5 minutes and caches the information. Before the AK/SK expires, Meta calls the API again to update it. This alarm is generated when Meta fails to call the API for three consecutive times.

This alarm is cleared when Meta successfully calls the ECS API.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12110    | Major          | Yes          |

### Alarm Parameters

| Parameter   | Description                                              |
|-------------|----------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName    | Specifies the role for which the alarm was generated.    |
| HostName    | Specifies the host for which the alarm was generated.    |

## Impact on the System

In storage-compute decoupling scenarios, the cluster cannot obtain the latest temporary AK/SK, which may lead to failure access to OBS.

## Possible Causes

- The meta role of the MRS cluster is abnormal.
- The cluster has been bound to an agency and accessed OBS but has been unbound from the agency. As a result, the cluster has not been bound to any agency.

## Handling Procedure

**Check the status of the meta role.**

**Step 1** On FusionInsight Manager of the cluster, choose **O&M > Alarm > Alarms**. On the page that is displayed, click  in the row containing the alarm, and determine the IP address of the host for which the alarm is generated.

**Step 2** On FusionInsight Manager of the cluster, choose **Cluster > Services > meta**. On the page that is displayed, click the **Instances** tab, and check whether the meta role corresponding to the host for which the alarm is generated is normal.

- If yes, go to [Step 5](#).
- If no, go to [Step 3](#).

**Step 3** Select the abnormal role, click **More**, and select **Restart Instance** to restart the abnormal meta role.

**Step 4** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Step 5** Log in to the host obtained in [Step 1](#) and check whether the `/var/log/Bigdata/meta/mrs-meta.log` file contains error information. If yes, rectify the fault based on the log information.

**Step 6** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Rebind the cluster to an agency.**

**Step 7** Log in to the MRS management console.

**Step 8** In the navigation pane on the left, choose **Active Clusters**. On the page that is displayed, click the cluster name to go to its overview page. Then, check whether the cluster is bound to an agency in the O&M management area.

- If yes, go to [Step 10](#).
- If no, go to [Step 9](#).

**Step 9** Click **Manage Agency**. On the page that is displayed, rebind the cluster to an agency. Then check whether the alarm is cleared a few minutes later.

- If yes, no further action is required.
- If no, go to [Step 10](#).

**Collect fault information.**

**Step 10** On FusionInsight Manager of the active cluster, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 11** Expand the **Service** drop-down list, select **meta** for the target cluster, and click **OK**.

**Step 12** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 13** Contact O&M personnel and provide the collected logs.

----End

## 10.71 ALM-12172 Failed to Report Metrics to Cloud Eye

### Alarm Description

After metric sharing is enabled for a cluster, the Controller periodically collects cluster metrics and reports them to Cloud Eye.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12172    | Major          | Yes          |

### Alarm Parameters

| Parameter   | Description                                                        |
|-------------|--------------------------------------------------------------------|
| Source      | Specifies the cluster or system for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated.           |
| RoleName    | Specifies the role for which the alarm was generated.              |
| HostName    | Specifies the host for which the alarm was generated.              |

### Impact on the System

MRS monitoring metrics are unavailable on Cloud Eye.

## Possible Causes

- Failed to call Cloud Eye APIs due to insufficient permissions.
- Failed to report data to Cloud Eye due to network problems.
- Failed to report data to Cloud Eye due to internal errors.

## Handling Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the page that is displayed, click  in the row containing the alarm and view the additional information of the alarm.

**Step 2** Rectify the fault based on the following scenarios:

- If "Call CES to send metrics fail. Permission exception" is displayed in the additional information, the token of the resource tenant is invalid. Restart the Controller and obtain the token again.
- If "Call CES to send metrics fail. Request CES error code xxx" is displayed in the additional information, an error occurs in the request to Cloud Eye. Check the network connectivity and authentication information.
- If "Call CES to send metrics fail. CES internal error code xxx" is displayed in the additional information, the Cloud Eye service encounters an internal error and is unavailable. Contact O&M personnel and send collected fault logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 10.72 ALM-12180 Suspended Disk I/O

## Alarm Description

**For MRS 3.3.0 and its later versions as well as MRS 3.1.0.0.10/3.1.5.0.3 and later patch versions:**

- For HDDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency reaches 6 seconds within 30 seconds in at least seven collection periods.
  - By default, the system collects data every 3 seconds. The disk queue depth (**avgqu-sz**) is greater than 0, the IOPS or bandwidth is 0, and **ioutil** is greater than 99% in at least 10 collection periods within 30 seconds.
  - By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 1000 ms within 300 seconds.
- For SSDs, the alarm is triggered when any of the following conditions is met:

- By default, the system collects data every 3 seconds. The svctm latency reaches 3 seconds within 30 seconds in at least seven collection periods.
- By default, the system collects data every 3 seconds. The disk queue depth (**avgqu-sz**) is greater than 0, the IOPS or bandwidth is 0, and **ioutil** is greater than 99% in at least 10 collection periods within 30 seconds.
- By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 500 ms within 300 seconds.

The collection period is 3 seconds, and the detection period is 30 or 300 seconds. This alarm is automatically cleared when neither of the preceding conditions is met for three consecutive detection periods (30 or 300 seconds).

#### For versions earlier than MRS 3.3.0:

- For HDDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency exceeds 6 seconds within 30 seconds in at least 10 collection periods.
  - By default, the system collects data every 3 seconds. The disk queue depth (**avgqu-sz**) is greater than 0, the IOPS or bandwidth is 0, and **ioutil** is greater than 99% in at least 10 collection periods within 30 seconds.
- For SSDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency exceeds 2 seconds within 30 seconds in at least 10 collection periods.
  - By default, the system collects data every 3 seconds. The disk queue depth (**avgqu-sz**) is greater than 0, the IOPS or bandwidth is 0, and **ioutil** is greater than 99% in at least 10 collection periods within 30 seconds.

This alarm is automatically cleared when the preceding conditions have not been met for 90s.

#### NOTE

For details about how to obtain and calculate related parameters, see [Related Information](#).

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12180    | Major          | Yes          |

## Alarm Parameters

| Parameter | Description                                                        |
|-----------|--------------------------------------------------------------------|
| Source    | Specifies the cluster or system for which the alarm was generated. |

| Parameter   | Description                                              |
|-------------|----------------------------------------------------------|
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName    | Specifies the role for which the alarm was generated.    |
| HostName    | Specifies the host for which the alarm was generated.    |
| DiskName    | Specifies the disk for which the alarm was generated.    |

## Impact on the System

A continuously high I/O usage may adversely affect service operations and result in service loss.

## Possible Causes

The disk is aged.

## Handling Procedure

### Replace the disk.

**Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**.

**Step 2** View the detailed information about the alarm. Check the values of **HostName** and **DiskName** in the location information to obtain the information about the faulty disk for which the alarm is reported.

**Step 3** Replace the hard disk.

**Step 4** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

### Collect fault information.

**Step 5** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 6** Select **OMS** for **Service** and click **OK**.

**Step 7** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 8** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

Obtain and calculate related parameters as follows:

- Run the following command in the OS to collect data:

**iostat -x -t 1 1**

```
[root@node-master1cnv ~]# iostat -x -t 1 1

```

- Calculate **svctm** as follows in versions later than MRS 3.1.0:

$$svctm = (tot\_ticks\_new - tot\_ticks\_old) / (rd\_ios\_new + wr\_ios\_new - rd\_ios\_old - wr\_ios\_old)$$

- Versions earlier than MRS 3.3.0: If **rd\_ios\_new + wr\_ios\_new - rd\_ios\_old - wr\_ios\_old = 0**, then **svctm = 0**.
- MRS 3.3.0 and its later versions as well as MRS 3.1.0.0.10/3.1.5.0.3 and later patch versions:

When the detection period is 30 seconds, if **rd\_ios\_new + wr\_ios\_new - rd\_ios\_old - wr\_ios\_old = 0**, then **svctm = 0**.

When the detection period is 300 seconds and **rd\_ios\_new + wr\_ios\_new - rd\_ios\_old - wr\_ios\_old = 0**, if **tot\_ticks\_new - tot\_ticks\_old = 0**, then **svctm = 0**; otherwise, the value of **svctm** is infinite.

The parameters can be obtained as follows:

The system runs the **cat /proc/diskstats** command every 3 seconds to collect data. For example:

```

omm@ jls cat /proc/diskstats
253 0 vda 1101553 35446 83439787 3338546 28744856 48314024 1054257652 52667332 0 19569526 40342913 0 0 0

253 7 vda7 157987 105 3477434 149542 6507759 1029060 140677872 14351373 0 1670157 11117724 0 0 0
253 8 vda8 312935 8169 22369722 458354 12181277 34364199 531855680 17727525 0 9061647 11387424 0 0 0
253 16 vdb 275920 21939 15977738 2171665 39477604 28238831 2653881640 482234435 0 30581946 465964144 0 0 0
253 17 vdb1 275439 21939 15948866 2171472 31293358 28238811 2653881432 481841639 0 30038274 465857164 0 0 0
7 0 loop0 356 0 17442 150 0 0 0 0 149 105 0 0 0

```

In the two commands:

In the data collected for the first time, the number in the fourth column is the **rd\_ios\_old** value, the number in the eighth column is the **wr\_ios\_old** value, and the number in the thirteenth column is the **tot\_ticks\_old** value.

In the data collected for the second time, the number in the fourth column is the **rd\_ios\_new** value, the number in the eighth column is the **wr\_ios\_new** value, and the number in the thirteenth column is the **tot\_ticks\_new** value.

In this case, the value of **svctm** is as follows:

$$(19571460 - 19569526) / (1101553 + 28747977 - 1101553 - 28744856) = 0.6197$$

## 10.73 ALM-12186 CGroup Task Usage Exceeds the Threshold

### Alarm Description

The system checks the CGroup task usage of user **omm** every 5 minutes. This alarm is generated when the CGroup task usage exceeds 90%. This alarm is cleared when the CGroup task usage is less than or equal to 90%.

CGroup task usage = Number of used CGroup tasks/Maximum number of CGroup tasks

You can run the **systemctl status user-\$(id -u).slice | grep limit | awk -F ' '{print \$2}'** command as user **omm** to obtain the number of used CGroup tasks of this user and run the **echo \$(systemctl status user-\$(id -u).slice | grep limit | awk -F ' '{print \$4}') | sed -e 's/)//g'** command to obtain the maximum number of CGroup tasks allowed for this user.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12186    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description                                                       |
|-------------|-------------------------------------------------------------------|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

## Impact on the System

- Failed to switch to user **omm**.
- Failed to create new **omm** processes.
- A faulty service or process cannot be restarted.

## Possible Causes

The CGroup task usage exceeds 90%.

## Handling Procedure

**Check the maximum number of threads that can be concurrently opened by user omm is properly set.**

**Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. On the page that is displayed, click  in the row containing the alarm, and view the name of the host for which the alarm is generated in **Location**. Click the host name to view its IP address.

**Step 2** Log in to the host for which the alarm is generated as user **omm**.

**Step 3** Run the following command to obtain the maximum number of threads that can be concurrently opened by user **omm** and check whether this number is greater than or equal to **60000**:

```
systemctl status user-$(id -u).slice | grep limit
```

- If yes, go to [Step 6](#).
- If no, go to [Step 4](#).

**Step 4** Switch to user **root** and run the following command to change the value for user **omm** to **60000**:

```
systemctl set-property user-2000.slice TasksMax=60000
```

**Step 5** Change the value of **UserTasksMax** in the **/etc/systemd/logind.conf** file to **60000**. (If the parameter is commented out, uncomment it.) Save the file, wait 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Collect fault information.**

**Step 6** On FusionInsight Manager of the cluster, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 7** Expand the **Service** drop-down list, select **OmmServer** and **NodeAgent** for the target cluster, and click **OK**.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

# 10.74 ALM-12187 Failed to Expand Disk Partition Capacity

## Alarm Description

The system checks the disk space every 60 seconds. When detecting that the disk space is expanded, the system expands disk partition. This alarm is generated when the disk partition fails to be expanded.

This alarm is cleared when the system detects that the disk partition is successfully expanded.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12187    | Minor          | Yes          |

## Alarm Parameters

| Parameter          | Description                                                       |
|--------------------|-------------------------------------------------------------------|
| Source             | Specifies the cluster or system for which the alarm is generated. |
| ServiceName        | Specifies the service for which the alarm is generated.           |
| RoleName           | Specifies the role for which the alarm is generated.              |
| HostName           | Specifies the host for which the alarm is generated.              |
| MountDirectoryName | Specifies the directory for which the alarm is generated.         |

## Impact on the System

The expanded data disk space cannot be used to store data.

## Possible Causes

- The growpart scale-out tool is not installed.
- The system fails to execute the command for expanding disk partition.

## Handling Procedure

### Check whether growpart is installed.

**Step 1** Log in to FusionInsight Manager, click **O&M**, and choose **Alarm > Alarms** to view the alarm details. In the **Location** column, check the name of the host and mount directory for which the alarm is generated. Click the host name to view its IP address.

**Step 2** Log in to the node for which the alarm is generated as user **root**.

**Step 3** Run the following command to check whether growpart is installed:

### which growpart

If information similar to the following is displayed, the growpart tool is installed. Otherwise, contact O&M personnel to install the growpart tool.

```
[root@xxx ~]#which growpart
/usr/bin/growpart
```

**Step 4** Wait for 5 minutes, then choose **O&M**, and choose **Alarm > Alarms** on FusionInsight Manager. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

### Run the disk partition expansion command.

**Step 5** Run the following command to view the disk and partition information:

### lsblk

Search for the partition and the disk based on the mount directory name in the alarm location information, and check the disk and partition sizes.

In the following example, the mount directory is `/srv/BigData/data1`, the used disk is `/dev/vdb`, and the disk partition is `/dev/vdb1`.

```
[root@ ~]# lsblk
NAME MAJ:MIN RM SIZE RO TYPE MOUNTPOINT
loop0 7:0 0 1.5G 0 loop /media
vda 253:0 0 500G 0 disk
├─vda1 253:1 0 220G 0 part /
├─vda2 253:2 0 1K 0 part
├─vda5 253:5 0 10G 0 part /tmp
├─vda6 253:6 0 10G 0 part /var
├─vda7 253:7 0 60G 0 part /srv/BigData
├─vda8 253:8 0 180G 0 part /var/log
└─vdb 253:16 0 650G 0 disk
 └─vdb1 253:17 0 600G 0 part /srv/BigData/data1
```

**Step 6** Run the following command to expand the partition using growpart:

**growpart** *Data disk Partition number*

Run the following command:

**growpart /dev/vdb 1**

If information similar to the following is displayed, the execution is successful. If the execution fails, contact O&M personnel.

```
[root@host- ~]# growpart /dev/vdb 1
CHANGED: partition=1 start=2048 old: size=1258287104 end=1258289152 new: size=1363146719 end=1363148767
```

**Step 7** Run the following command to expand the file system size of the disk partition:

**resize2fs** *Disk partition*

Run the following command:

**resize2fs /dev/vdb1**

If information similar to the following is displayed, the execution is successful:

```
[root@host- ~]# resize2fs /dev/vdb1
resize2fs 1.46.4 (18-Aug-2021)
Filesystem at /dev/vdb1 is mounted on /srv/BigData/data1; on-line resizing required
old_desc_blocks = 75, new_desc_blocks = 82
The filesystem on /dev/vdb1 is now 170393339 (4k) blocks long.
```

**Step 8** Wait for 5 minutes, click **O&M**, and choose **Alarm > Alarms** on FusionInsight Manager. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, contact O&M personnel.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

# 10.75 ALM-12188 diskmgmt Disk Monitoring Unavailable

## Alarm Description

NodeAgent checks the status of the diskmgmt disk monitoring service every 5 minutes. This alarm is generated when diskmgmt disk monitoring is unavailable.

This alarm is cleared when the diskmgmt disk monitoring service recovers.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12188    | Minor          | Yes          |

## Alarm Parameters

| Parameter   | Description                                                       |
|-------------|-------------------------------------------------------------------|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

## Impact on the System

When diskmgmt disk monitoring is unavailable, the read-only detection of the device partition file system, device partition loss detection, and disk partition scale-out detection cannot be performed.

## Possible Causes

- The diskmgmt disk monitoring service does not exist.
- The diskmgmt disk monitoring service is not started.

## Handling Procedure

**Check whether the diskmgmt disk monitoring service exists.**

**Step 1** Log in to FusionInsight Manager, click **O&M**, and choose **Alarm > Alarms** to view the alarm details. In the **Location** column, check the name of the host for which the alarm is generated. Click the host name to view its IP address.

**Step 2** Log in to the node for which the alarm is generated as user **root**.

**Step 3** Run the following command to check whether the core service file exists:

```
stat /usr/local/diskmgmt/inner/diskmgtd
```

If the file does not exist, contact O&M personnel.

**Start the diskmgmt disk monitoring service.**

**Step 4** Run the following command to start the diskmgmt disk monitoring service:

```
systemctl restart diskmgmt
```

**Step 5** Run the following command to check whether the diskmgmt disk monitoring service is started:

```
systemctl status diskmgmt
```

- If information similar to the following is displayed, the service is started successfully. Go to [Step 6](#).

```
[root@host: ~]# systemctl status diskmgmt
● diskmgmt.service - Disk monitor service
 Loaded: loaded (/usr/lib/systemd/system/diskmgmt.service; enabled; vendor preset: disabled)
 Active: active (running) since Thu 2023-08-10 09:29:18 CST; 5 days ago
 Main PID: 33996 (diskmgtd)
 Tasks: 2 (limit: 407663)
 Memory: 5.6M
 CGroup: /system.slice/diskmgmt.service
 └─ 33996 /bin/bash /usr/local/diskmgmt/inner/diskmgtd
 └─ 1974506 sleep 8

Notice: journal has been rotated since unit was started, output may be incomplete.
```

- If no, contact O&M personnel.

**Step 6** Wait for 5 minutes, click **O&M**, and choose **Alarm > Alarms** on FusionInsight Manager. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, contact O&M personnel.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

## 10.76 ALM-12190 Number of Knox Connections Exceeds the Threshold

### Alarm Description

The system periodically checks the number of connections to all Knox topologies. This alarm is generated when the number of connections to a topology exceeds the threshold (90% by default). This alarm is automatically cleared when the number of connections to a topology falls below the threshold.

#### NOTE

This alarm applies to clusters of MRS 3.1.0 or later.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12190    | Major          | Yes          |

### Alarm Parameters

| Parameter   | Description                                                        |
|-------------|--------------------------------------------------------------------|
| Source      | Specifies the cluster or system for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated.           |
| RoleName    | Specifies the role for which the alarm was generated.              |
| HostName    | Specifies the host for which the alarm was generated.              |
| Topology    | Specifies the Knox topology for which the alarm was generated.     |

### Impact on the System

The topology may reach the upper limit of connections and fail to forward requests, adversely affecting the MRS functions.

### Possible Causes

Hue or Manager is too frequently used, but the default maximum number of Knox connections is small.

## Handling Procedure

**Step 1** Log in to active and standby OMS nodes as user **root**, respectively.

**Step 2** Add the following configuration to the **gateway-site.xml** file on the active and standby OMS nodes to increase the number of thread pools:

**vi /opt/knox/conf/gateway-site.xml**

```
<property>
<name>gateway.httpClient.maxConnections</name>
<value>64</value>
</property>
```

**Step 3** Log in to the active OMS node as user **omm** and run the following command to restart the Knox process:

**sh /opt/knox/bin/restart-knox.sh**

**Step 4** After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Step 5** Contact O&M personnel to rectify the fault.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 10.77 ALM-13000 ZooKeeper Service Unavailable

## Description

The system checks the ZooKeeper service status every 60 seconds. This alarm is generated when the ZooKeeper service is unavailable.

This alarm is cleared when the ZooKeeper service recovers.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
13000	Critical	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

ZooKeeper cannot provide coordination services for upper layer components and the components that depend on ZooKeeper may not run properly.

## Possible Causes

- The DNS is installed on the ZooKeeper node.
- The network is faulty.
- The KrbServer service is abnormal.
- The ZooKeeper instance is abnormal.
- The disk capacity is insufficient.

## Procedure

### Check the DNS.

- Step 1** Check whether the DNS is installed on the node where the ZooKeeper instance is located. On the Linux node where the ZooKeeper instance is located, run the `cat /etc/resolv.conf` command to check whether the file is empty.
- If yes, go to [Step 2](#).
  - If no, go to [Step 3](#).
- Step 2** Run the `service named status` command to check whether the DNS is started.
- If yes, go to [Step 3](#).
  - If no, go to [Step 5](#).
- Step 3** Run the `service named stop` command to stop the DNS service. If "Shutting down name server BIND waiting for named to shut down (28s)" is displayed, the DNS service is stopped successfully. Comment out the content (if any) in `/etc/resolv.conf`.
- Step 4** On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.
- If yes, no further action is required.

- If no, go to [Step 5](#).

**Check the network status.**

**Step 5** On the Linux node where the ZooKeeper instance is located, run the **ping** command to check whether the host names of other nodes where the ZooKeeper instance is located can be pinged successfully.

- If yes, go to [Step 9](#).
- If no, go to [Step 6](#).

**Step 6** Modify the IP addresses in **/etc/hosts** and add the host name and IP address mapping.

**Step 7** Run the **ping** command again to check whether the host names of other nodes where the ZooKeeper instance is located can be pinged successfully.

- If yes, go to [Step 8](#).
- If no, go to [Step 23](#).

**Step 8** On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Check the KrbServer service status (Skip this step if the normal mode is used).**

**Step 9** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services**.

**Step 10** Check whether the KrbServer service is normal.

- If yes, go to [Step 13](#).
- If no, go to [Step 11](#).

**Step 11** Perform operations based on "ALM-25500 KrbServer Service Unavailable" and check whether the KrbServer service is recovered.

- If yes, go to [Step 12](#).
- If no, go to [Step 23](#).

**Step 12** On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 13](#).

**Check the ZooKeeper service instance status.**

**Step 13** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > ZooKeeper > quorumpeer**.

**Step 14** Check whether the ZooKeeper instances are normal.

- If yes, go to [Step 18](#).
- If no, go to [Step 15](#).

**Step 15** Select instances whose status is not good, and choose **More > Restart Instance**.

**Step 16** Check whether the instance status is good after restart.

- If yes, go to [Step 17](#).
- If no, go to [Step 18](#).

**Step 17** On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 18](#).

**Check disk status.**

**Step 18** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Service > ZooKeeper > quorumpeer**, and check the node host information of the ZooKeeper instance.

**Step 19** On FusionInsight Manager, click **Host**.

**Step 20** In the **Disk** column, check whether the disk space of each node where ZooKeeper instances are located is insufficient (disk usage exceeds 80%).

- If yes, go to [Step 21](#).
- If no, go to [Step 23](#).

**Step 21** Expand disk capacity. For details, see "ALM-12017 Insufficient Disk Capacity".

**Step 22** On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 23](#).

**Collect fault information.**

**Step 23** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 24** Select the following nodes in the required cluster from the **Service**: (KrbServer logs do not need to be downloaded in normal mode.)

- ZooKeeper
- KrbServer

**Step 25** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 26** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 10.78 ALM-13001 Available ZooKeeper Connections Are Insufficient

### Description

The system checks ZooKeeper connections every 60 seconds. This alarm is generated when the system detects that the number of used ZooKeeper instance connections exceeds the threshold (80% of the maximum connections).

When the **Trigger Count** is 1, this alarm is cleared when the number of used ZooKeeper instance connections is smaller than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the number of used ZooKeeper instance connections is smaller than or equal to 90% of the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
13001	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host name for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

### Impact on the System

Available ZooKeeper connections are insufficient. When the connection usage reaches 100%, external connections cannot be handled.

## Possible Causes

The number of connections to the ZooKeeper node exceeds the threshold. Connection leakage occurs on some connection processes, or the maximum number of connections does not comply with the actual scenario.

## Procedure

### Check connection status.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the displayed interface, click the drop-down button of **Available ZooKeeper Connections Are Insufficient** and confirm the node IP address of the host for which the alarm is generated in the Location Information.
- Step 2** Obtain the PID of the ZooKeeper process. Log in to the node involved in this alarm as user **root** and run the **pgrep -f proc\_zookeeper** command.
- Step 3** Check whether the PID can be correctly obtained.
  - If yes, go to **Step 4**.
  - If no, go to **Step 15**.
- Step 4** Obtain all the IP addresses connected to the ZooKeeper instance and the number of connections and check 10 IP addresses with top connections. Run the following command based on the obtained PID: **lsof -i|grep \$pid | awk '{print \$9}' | cut -d : -f 2 | cut -d \> -f 2 | awk '{a[\$1]++} END {for(i in a){print i,a[i] | "sort -r -g -k 2"}}' | head -10**. (The PID obtained in the preceding step is used.)
- Step 5** Check whether node IP addresses and number of connections are successfully obtained.
  - If yes, go to **Step 6**.
  - If no, go to **Step 15**.
- Step 6** Obtain the ID of the port connected to the process. Run the following command based on the obtained PID and IP address: **lsof -i|grep \$pid | awk '{print \$9}'|cut -d \> -f 2 |grep \$IP| cut -d : -f 2**. (The PID and IP address obtained in the preceding step are used.)
- Step 7** Check whether the port ID is successfully obtained.
  - If yes, go to **Step 8**.
  - If no, go to **Step 15**.
- Step 8** Obtain the ID of the connected process. Log in to each IP address and run the following command based on the obtained port ID: **lsof -i|grep \$port**. (The port ID obtained in the preceding step is used.)
- Step 9** Check whether the process ID is successfully obtained.
  - If yes, go to **Step 10**.
  - If no, go to **Step 15**.
- Step 10** Check whether connection leakage occurs on the process based on the obtained process ID.
  - If yes, go to **Step 11**.

- If no, go to [Step 12](#).

**Step 11** Close the process where connection leakage occurs and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

**Step 12** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer** > **Performance** and increase the value of **maxCnxns** as required.

**Figure 10-14** maxCnxns

Parameter	Value
* maxClientCnxns	2000
* maxCnxns	20000

**Step 13** Save the configuration and restart the ZooKeeper service.

**Step 14** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 15](#).

#### Collect fault information.

**Step 15** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

**Step 16** Select **ZooKeeper** in the required cluster from the **Service**:

**Step 17** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 18** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 10.79 ALM-13002 ZooKeeper Direct Memory Usage Exceeds the Threshold

### Description

The system checks the direct memory usage of the ZooKeeper service every 30 seconds. The alarm is generated when the direct memory usage of a ZooKeeper instance exceeds the threshold (80% of the maximum memory).

When the **Trigger Count** is 1, this alarm is cleared when the ZooKeeper Direct memory usage is less than the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the ZooKeeper Direct memory usage is less than 80% of the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
13002	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

### Impact on the System

If the available direct memory of the ZooKeeper service is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The direct memory of the ZooKeeper instance is overused or the direct memory is inappropriately allocated.

## Procedure

### Check the direct memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the displayed interface, click the drop-down button of **ZooKeeper Direct Memory Usage Exceeds the Threshold**. Check the IP address of the instance that reports the alarm.
  - Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > ZooKeeper > Instance > quorumpeer(the IP address checked)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > CPU and Memory**, and select **ZooKeeper Heap And Direct Buffer Resource Percentage**, click **OK**.
  - Step 3** Check whether the used direct buffer memory of ZooKeeper reaches 80% of the maximum direct buffer memory specified for ZooKeeper.
    - If yes, go to [Step 4](#).
    - If no, go to [Step 8](#).
  - Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > ZooKeeper > Configurations > All Configurations > quorumpeer > System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC\_OPTS** parameter.
    - If yes, in the **GC\_OPTS** parameter, delete "-XX:MaxDirectMemorySize" and go to [Step 5](#).
    - If no, go to [Step 6](#).
  - Step 5** Save the configuration and restart the ZooKeeper service.
  - Step 6** Check whether the **ALM-13004 ZooKeeper Heap Memory Usage Exceeds the Threshold** exists.
    - If yes, handle the alarm by referring to **ALM-13004 ZooKeeper Heap Memory Usage Exceeds the Threshold**.
    - If no, go to [Step 7](#).
  - Step 7** Check whether the alarm is cleared.
    - If yes, no further action is required.
    - If no, go to [Step 8](#).
- Collect fault information.**
- Step 8** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
  - Step 9** Select **ZooKeeper** in the required cluster from the **Service**.
  - Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 11** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.80 ALM-13003 GC Duration of the ZooKeeper Process Exceeds the Threshold

## Alarm Description

The system checks the garbage collection (GC) duration of the ZooKeeper process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
13003	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

A long GC duration of the ZooKeeper process may interrupt the services.

## Possible Causes

The heap memory of the ZooKeeper process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

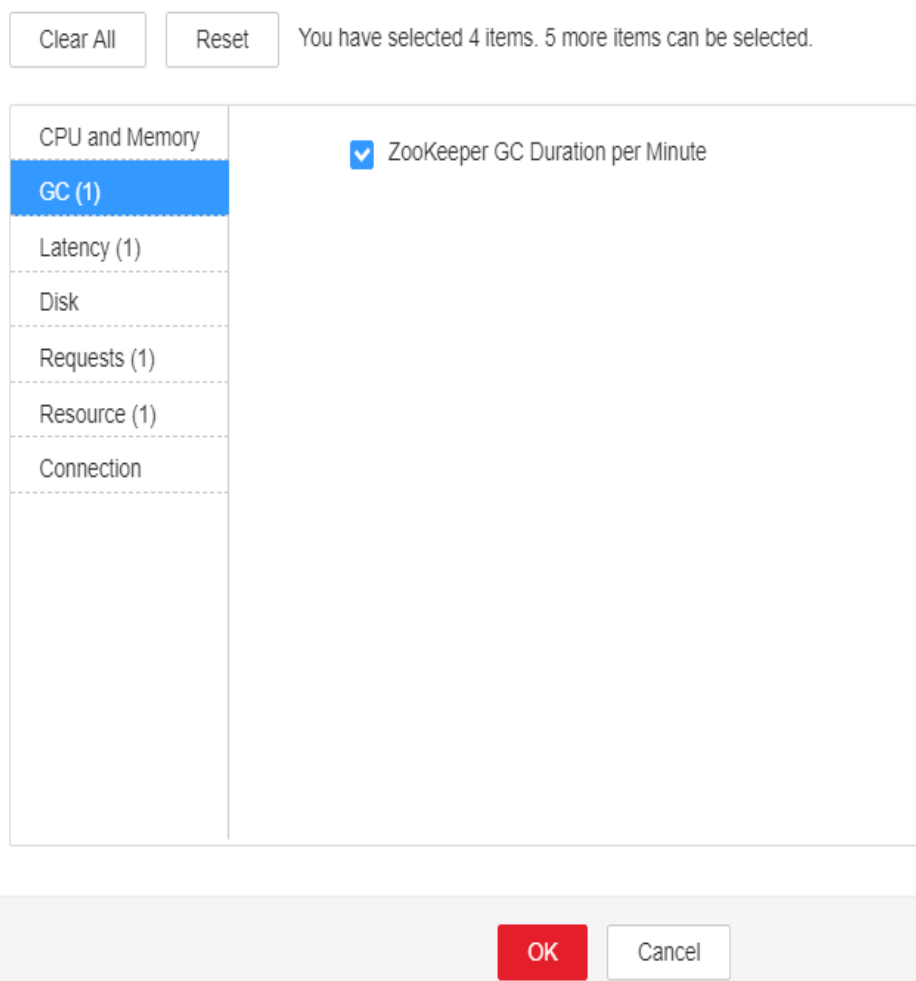

## Handling Procedure

**Check the GC duration.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the displayed page, click the drop-down list of **GC Duration of the ZooKeeper Process Exceeds the Threshold**. View the IP address of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > *Name of the desired cluster* > Services > ZooKeeper > Instance > quorumpeer**. Click the drop-down list in the upper right corner of **Chart**, choose **Customize > GC**, select **ZooKeeper GC Duration per Minute**, and click **OK** to check the GC duration statistics of the ZooKeeper process collected every minute.

**Figure 10-15** ZooKeeper GC duration

### Customize Statistics

**Step 3** Check whether the GC duration of the ZooKeeper process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to [Step 4](#).
- If no, go to [Step 8](#).

**Step 4** Check whether memory leakage occurs in the application.

**Step 5** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > ZooKeeper > Configurations > All Configurations > quorumpeer > System**. Increase the value of the **GC\_OPTS** parameter as required.

**NOTE**

Generally, **-Xmx** is twice of ZooKeeper data capacity. If the capacity of ZooKeeper reaches 2 GB, set **GC\_OPTS** as follows:

```
-Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=512M -XX:MetaspaceSize=64M -XX:MaxMetaspaceSize=64M -XX:CMSFullGCsBeforeCompaction=1
```

**Step 6** Save the configuration and restart the ZooKeeper service.

**Step 7** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Collect the fault information.**

**Step 8** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 9** Expand the **Service** drop-down list, and select **ZooKeeper** for the target cluster.

**Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 11** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 10.81 ALM-13004 ZooKeeper Heap Memory Usage Exceeds the Threshold

## Description

The system checks the heap memory usage of the ZooKeeper service every 60 seconds. The alarm is generated when the heap memory usage of a ZooKeeper instance exceeds the threshold (95% of the maximum memory).

The alarm is cleared when the memory usage is less than the threshold.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
13004	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

If the available ZooKeeper heap memory is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The heap memory of the ZooKeeper instance is overused or the heap memory is inappropriately allocated.

## Procedure

### Check heap memory usage.

- Step 1** On the FusionInsight Manager portal, On the displayed interface, click the drop-down button of **ZooKeeper Heap Memory Usage Exceeds the Threshold** and confirm the node IP address of the host for which the alarm is generated in the Location Information.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > ZooKeeper > Instance**, click **quorumpeer** in the **Role** column of the corresponding IP address. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > CPU and Memory**, and select **ZooKeeper Heap And Direct Buffer Resource Percentage**, click **OK**. Check the heap memory usage.
- Step 3** Check whether the used heap memory of ZooKeeper reaches 95% of the maximum heap memory specified for ZooKeeper.
  - If yes, go to **Step 4**.
  - If no, go to **Step 7**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > ZooKeeper > Configurations > All Configurations > quorumpeer > System**. Increase the value of **-Xmx** in **GC\_OPTS** as required. The details are as follows:
  1. On the **Instance** tab, click **quorumpeer** in the **Role** column of the corresponding IP address. Choose **Customize > CPU and Memory** in the

upper right corner, and select **ZooKeeper Heap And Direct Buffer Resource**, click **OK** to check the heap memory used by ZooKeeper.

2. Change the value of **-Xmx** in the **GC\_OPTS** parameter based on the actual heap memory usage. Generally, the value is twice the size of the ZooKeeper data volume. For example, if 2 GB ZooKeeper heap memory is used, the following configurations are recommended: **-Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=512M -XX:MetaspaceSize=64M -XX:MaxMetaspaceSize=64M -XX:CMSFullGCsBeforeCompaction=1**

**Step 5** Save the configuration and restart the ZooKeeper service.

**Step 6** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **ZooKeeper** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.82 ALM-13005 Failed to Set the Quota of Top Directories of ZooKeeper Components

## Description

The system sets quotas for each ZooKeeper top-level directory in the **customized.quota** configuration item and components every 5 hours. This alarm is generated when the system fails to set the quota for a directory.

This alarm is cleared when the setting succeeds after a failure.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13005	Minor	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
ServiceDirectory	Specifies the directory for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

## Impact on the System

Components can write a large amount of data to the top-level directory of ZooKeeper. As a result, the ZooKeeper service is unavailable.

## Possible Causes

The quota for the alarm directory is inappropriate.

## Procedure

**Check whether the quota for the alarm directory is appropriate.**

**Step 1** Log in to FusionInsight Manager, and choose **Cluster > Name of the desired cluster > Services > ZooKeeper**. On the displayed page, choose **Configurations > All Configurations > Quota**. Check whether the directory for which the alarm is reported and its quota exist in the **customized.quota** configuration item.

- If yes, go to [Step 5](#).
- If no, go to [Step 2](#).

**Step 2** Check whether the alarm directory for which the alarm is reported is in the following alarm list.

**Table 10-1** Component alarm directory

Component	Alarm Directory
Hbase	/hbase

Component	Alarm Directory
Hive	/beelinesql
Yarn	/rmstore
Storm	/stormroot
Streaming	/storm
Kafka	/kafka

- If yes, go to [Step 3](#).
- If no, go to [Step 7](#).

**Step 3** View the component of the alarm directory in the table, open the corresponding service page, and choose **Configurations > All Configurations**. On the displayed page, search for **zk.quota** in the upper right corner. The search result is the quota of the alarm directory.

**Step 4** Check whether the quota of the alarm directory for which the alarm is reported is appropriate. The quota must be greater than or equal to the actual value, which can be obtained in **Trigger Condition**.

**Step 5** Modify the **services.quota** value as prompted and save the configuration.

**Step 6** After the time specified by **service.quotas.auto.check.cron.expression**, check whether the alarm is cleared.

The **service.quotas.auto.check.cron.expression** parameter indicates the scheduled expression used by ZooKeeper to set the directory quota. You can choose **Cluster > Services > ZooKeeper > Configurations > All Configurations** on FusionInsight Manager and set this parameter. The default value is `*/5 * * * *`, indicating 5 minutes.

- If it is, no further action is required.
- If no, go to [Step 7](#).

#### Collect fault information.

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **ZooKeeper** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.83 ALM-13006 Znode Number or Capacity Exceeds the Threshold

## Description

The system periodically detects the status of secondary Znode in the ZooKeeper service data directory every four hours. This alarm is generated when the number or capacity of secondary Znodes exceeds the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13006	Minor	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
ServiceDirectory	Specifies the directory for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

## Impact on the System

A large amount of data is written to the ZooKeeper data directory. As a result, ZooKeeper cannot provide normal services.

## Possible Causes

A large amount of data is written to the ZooKeeper data directory. The threshold is not appropriate.

## Procedure

**Check whether a large amount of data is written to the directory for which the alarm is generated.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the displayed interface, click the drop-down button of **Znode Number or Capacity Exceeds the Threshold**. Confirm the Znode for which the alarm is generated in Location Information.
- Step 2** Log in to FusionInsight Manager, open the ZooKeeper service interface, and select **Resource**. In the table **Used Resources (By Second-Level Znode)**, check whether a large amount of data is written to the top-level Znode for which the alarm is reported.
- If it is, go to **Step 3**.
  - If it is not, go to **Step 4**.

**Figure 10-16** Used Resources (By Second-Level Znode)

- Step 3** Log in to the ZooKeeper client and delete the data in the top-level Znode.
- Step 4** Log in to FusionInsight Manager and open the ZooKeeper service interface. On the **Resource** page, choose **By Znode quantity** in **Used Resources (By Second-Level Znode)**. **Threshold Configuration of By Znode quantity** is displayed. Click **Modify** under **Operation**. Increase the threshold by referring to the value of **max.Znode.count** by choosing **Cluster > Name of the desired cluster > Services > ZooKeeper > Configurations > All Configurations > Quota**.

**Figure 10-17** Modify Rule

### Modify Rule

\* Rule Name:

\* Alarm Severity:

\* Threshold Type:  Max value  Min value

\* Date:  Daily  
 Weekly  
 Others

Thresholds:

Start and End Time	Threshold
00:00 - 23:59	200000

**Step 5** In the **Used Resources (By Second-Level Znode)**, choose  > **By capacity**. The **Threshold Settings** page of **By Capacity** is displayed. Click **Modify** under **Operation**. Increase the threshold by referring to the value of **max.data.size** by choosing **Cluster > Name of the desired cluster > Services > ZooKeeper > Configurations > All Configurations > Quota**.

**Step 6** Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **ZooKeeper** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 10.84 ALM-13007 Available ZooKeeper Client Connections Are Insufficient

### Description

The system periodically detects the number of active processes between the ZooKeeper client and the ZooKeeper server every 60 seconds. This alarm is generated when the number of connections exceeds the threshold.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13007	Minor	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the host name for which the alarm is generated.
ClientIP	Specifies the client IP address.
ServerIP	Specifies the server IP address.
Trigger Condition	Specifies the cause of the alarm.

### Impact on the System

A large number of connections to ZooKeeper caused the ZooKeeper to be fully connected and unable to provide normal services.

### Possible Causes

A large number of client processes are connected to ZooKeeper. The thresholds are not appropriate.

## Procedure

**Check whether there are a large number of client processes connected to ZooKeeper.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the displayed interface, click the drop-down button of **Available ZooKeeper Client Connections Are Insufficient**. Confirm the node IP address of the host for which the alarm is generated in the Location Information.
- Step 2** Open the ZooKeeper service interface, click **Resource** to enter the **Resource** page, and check whether the number of connections of the client with the IP address specified by **Number of Connections (By Client IP Address)** is large.
- If it is, go to **Step 3**.
  - If it is not, go to **Step 4**.
- Step 3** Check whether connection leakage occurs on the client process.
- Step 4** Click  in the **Number of Connections (by Client IP Address)** to enter the **Thresholds** page, and click **Modify** under **Operation**. Increase the threshold by referring to the value of **maxClientCnxns** by choosing **Cluster > Name of the desired cluster > Services > ZooKeeper > Configurations > All Configurations > quorumpeer**.
- Step 5** Check whether the alarm is cleared.
- If it is, no further action is required.
  - If it is not, go to **Step 6**.
- Collect fault information.**
- Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 7** Select **ZooKeeper** in the required cluster from the **Service**.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected logs.
- End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 10.85 ALM-13008 ZooKeeper Znode Usage Exceeds the Threshold

### Description

The system checks the level-2 Znode status in the ZooKeeper data directory every hour. This alarm is generated when the system detects that the level-2 Znode usage exceeds the threshold.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13008	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
ServiceDirectory	Specifies the directory for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

### Impact on the System

A large amount of data is written to the ZooKeeper data directory. As a result, ZooKeeper cannot provide services properly.

### Possible Causes

- A large amount of data is written to the ZooKeeper data directory.
- The user-defined threshold is inappropriate.

### Procedure

**Check whether a large amount of data is written into the directory for which the alarm is generated.**

- Step 1** Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper**, and click **Resource**. Click **By Znode quantity in Used Resources (By Second-Level Znode)**, and check whether a large amount of data is written to the top Znode.
- If yes, go to **Step 2**.
  - If no, go to **Step 4**.
- Step 2** Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, select **Location** from the drop-down list box next to **ALM-13008 ZooKeeper Znode Quantity Usage Exceeds Threshold**, and obtain the Znode path in **ServiceDirectory**.
- Step 3** Log in to the ZooKeeper client as a cluster user and delete unnecessary data from the Znode corresponding to the alarm.
- Step 4** Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** > **Configurations** > **All Configurations**, and search for **max.znode.count**, which is the maximum number of ZooKeeper directories. The alarm threshold is 80% of this parameter. Increase the value of this parameter, click **Save**, and restart the service for the configuration to take effect.
- Step 5** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 6**.
- Collect fault information.**
- Step 6** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.
- Step 7** Select **ZooKeeper** in the required cluster from the **Service**.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected logs.
- End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 10.86 ALM-13009 ZooKeeper Znode Capacity Usage Exceeds the Threshold

### Alarm Description

The system checks the level-2 ZNode status in the ZooKeeper data directory every hour. This alarm is generated when the system detects that the capacity usage exceeds the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
13009	Major	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
ServiceDirectory	Specifies the directory for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

A large amount of data is written to the ZooKeeper data directory. As a result, ZooKeeper cannot provide services properly.

### Possible Causes

- A large volume of data has been written to the ZooKeeper data directory.
- The threshold is improperly defined.

### Handling Procedure

**Check whether a large volume of data is written to the alarm directory.**

- Step 1** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. Click the drop-down list in the row containing **ALM-13009 ZooKeeper ZNode Capacity Usage Exceeds the Threshold**, and find the ZNode for which the alarm is generated in the **Location** area.
- Step 2** Choose **Cluster > Services > ZooKeeper**. On the page that is displayed, click the **Resource** tab. In the **Used Resources (By Second-Level ZNode)** area, click **By capacity** and check whether a large amount of data is written to the top-level ZNode directory.
- If yes, record the directory to which a large amount of data is written and go to **Step 3**.
  - If no, go to **Step 5**.
- Step 3** Check whether data in the directory can be deleted.

---

**NOTICE**

Deleting data from ZooKeeper is a high-risk operation. Exercise caution when performing this operation.

---

- If yes, go to **Step 4**.
  - If no, go to **Step 5**.
- Step 4** Log in to the ZooKeeper client and delete unnecessary data from the directory to which a large amount of data is written.
1. Log in to the ZooKeeper client installation directory, for example, **/opt/client**, and configure environment variables.  
**cd /opt/client**  
**source bigdata\_env**
  2. Run the following command to authenticate the user (skip this step for a cluster in normal mode):  
**kinit Component service user**
  3. Run the following command to log in to the client tool:  
**zkCli.sh -server <Service IP address of the node where any ZooKeeper instance resides>:<Client port>**
  4. Run the following command to delete unnecessary data:  
**delete Path of the file to be deleted**
- Step 5** Log in to FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > ZooKeeper > Configurations > All Configurations**, and search for **max.data.size**. The value of **max.data.size** is the maximum capacity quota of the ZooKeeper directory. The unit is byte. Search for the **GC\_OPTS** configuration item and check the value of **Xmx**.
- Step 6** Compare the values of **max.data.size** and **Xmx\*0.65**. The threshold is the smaller value multiplied by 80%. You can change the values of **max.data.size** and **Xmx\*0.65** to increase the threshold.
- Step 7** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Collect the fault information.**

**Step 8** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

**Step 9** Expand the **Service** drop-down list, and select **ZooKeeper** for the target cluster.

**Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 11** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 10.87 ALM-13010 Znode Usage of a Directory with Quota Configured Exceeds the Threshold

## Description

The system checks the Znode usage of all service directories with quota configured every hour. This alarm is generated when the system detects that the level-2 Znode usage exceeds the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13010	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.

Name	Meaning
ServiceDirectory	Specifies the directory for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

## Impact on the System

A large amount of data is written to the ZooKeeper data directory. As a result, ZooKeeper cannot provide services properly.

## Possible Causes

- A large amount of data is written to the ZooKeeper data directory.
- The user-defined threshold is inappropriate.

## Procedure

**Check whether a large amount of data is written into the directory for which the alarm is generated.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. Confirm the Znode for which the alarm is generated in **Location** of this alarm.
- Step 2** Choose **Cluster > Name of the desired cluster > Services > ZooKeeper** and click **Resource**. In **Used Resources (By Second-Level Znode)**, check whether a large amount of data is written into the top Znode.
  - If yes, go to **Step 3**.
  - If no, go to **Step 5**.
- Step 3** Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, select Location from the drop-down list box next to **ALM-13010 Znode Usage of a Directory with Quota Configured Exceeds the Threshold**, and obtain the Znode path in ServiceDirectory.
- Step 4** Log in to the ZooKeeper client as a cluster user and delete unwanted data in the Znode for which the alarm is generated.
- Step 5** Log in to FusionInsight Manager, and choose **Cluster > Name of the desired cluster > Services > Component of the top Znode for which the alarm is generated**. Choose **Configurations > All Configurations**, search for **zk.quota.number**, increase its value, click **Save**.

---

### NOTICE

If the Component of the top Znode for which the alarm is generated is ClickHouse, change the value of **clickhouse.zookeeper.quota.node.count**.

---

**Step 6** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **ZooKeeper** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.88 ALM-14000 HDFS Service Unavailable

## Description

The system checks the NameService service status every 60 seconds. This alarm is generated when all the NameService services are abnormal and the system considers that the HDFS service is unavailable.

This alarm is cleared when at least one NameService service is normal and the system considers that the HDFS service recovers.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14000	Critical	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

HDFS fails to provide services for HDFS service-based upper-layer components, such as HBase and MapReduce. As a result, users cannot read or write files.

## Possible Causes

- The ZooKeeper service is abnormal.
- All NameService services are abnormal.
- The number of service requests is too large, and the HDFS health check fails to read and write files.
- The health check fails due to HDFS FullGC.

## Procedure

### Check the ZooKeeper service status.

**Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the Alarm page, check whether **ALM-13000 ZooKeeper Service Unavailable** is reported.

- If yes, go to [Step 2](#).
- If no, go to [Step 4](#).

**Step 2** See **ALM-13000 ZooKeeper Service Unavailable** to rectify the health status of ZooKeeper fault and check whether the **Running Status** of the ZooKeeper service restores to **Normal**.

- If yes, go to [Step 3](#).
- If no, go to [Step 13](#).

**Step 3** On the **O&M > Alarm > Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

### Handle the NameService service exception alarm.

**Step 4** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the Alarms page, check whether **ALM-14010 NameService Service Unavailable** is reported.

- If yes, go to [Step 5](#).

- If no, go to [Step 7](#).

**Step 5** See **ALM-14010 NameService Service Unavailable** to handle the abnormal NameService services and check whether each NameService service exception alarm is cleared.

- If yes, go to [Step 6](#).
- If no, go to [Step 13](#).

**Step 6** On the **O&M > Alarm > Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Check whether the HDFS health check fails to read or write files due to a large number of service requests.**

**Step 7** On FusionInsight Manager, choose **O&M > Alarm > Alarms**, and check whether **ALM-14021 NameNode Average RPC Processing Time Exceeds the Threshold** or **ALM-14022 NameNode Average RPC Queuing Time Exceeds the Threshold** is generated.

- If yes, go to [Step 8](#).
- If no, go to [Step 10](#).

**Step 8** Rectify the abnormal NameServices by following the handling methods of **ALM-14021 NameNode Average RPC Processing Time Exceeds the Threshold** and **ALM-14022 NameNode Average RPC Queuing Time Exceeds the Threshold**. Then, check whether the alarms are cleared.

- If yes, go to [Step 9](#).
- If no, go to [Step 13](#).

**Step 9** On the **O&M > Alarm > Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

**Check whether the health check fails due to HDFS FullGC.**

**Step 10** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the Alarms page, check whether **ALM-14014 NameNode GC Time Exceeds the Threshold** is reported.

- If yes, go to [Step 11](#).
- If no, go to [Step 13](#).

**Step 11** See **ALM-14014 NameNode GC Time Exceeds the Threshold** to handle the abnormal NameService services and check whether each NameService service exception alarm is cleared.

- If yes, go to [Step 12](#).
- If no, go to [Step 13](#).

**Step 12** On the **O&M > Alarm > Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 13](#).

**Collect fault information.**

**Step 13** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 14** Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS

**Step 15** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 16** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.89 ALM-14001 HDFS Disk Usage Exceeds the Threshold

## Description

The system checks the HDFS disk usage every 30 seconds and compares the actual HDFS disk usage with the threshold. The HDFS disk usage indicator has a default threshold, this alarm is generated when the value of the disk usage of a Hadoop distributed file system (HDFS) indicator exceeds the threshold.

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the value of the disk usage of HDFS cluster indicator is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the value of the disk usage of HDFS cluster indicator is less than or equal to 90% of the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14001	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

Writing Hadoop distributed file system (HDFS) data is affected.

## Possible Causes

The disk space configured for the HDFS cluster is insufficient.

## Procedure

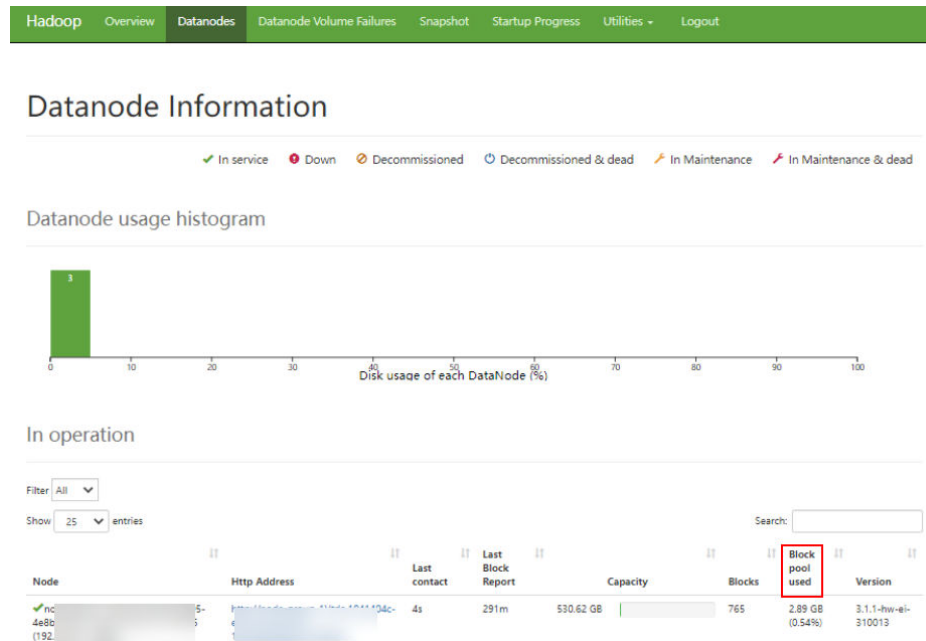

**Check the disk capacity and delete unnecessary files.**

- Step 1** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**.
- Step 2** Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Disk**, and select **Percentage of HDFS Capacity** to check whether the HDFS disk usage exceeds the threshold (80% by default).
  - If yes, go to **Step 3**.
  - If no, go to **Step 11**.
- Step 3** In the **Basic Information** area, click the **NameNode(Active)** of the failure NameService and the HDFS WebUI page is displayed.

### NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

- Step 4** On the HDFS web user interface (WebUI), click **Datanodes** tab. In the **Block pool used** column, view the disk usage of all DataNodes to check whether the disk usage of any DataNode exceeds the threshold.
- If yes, go to [Step 6](#).
  - If no, go to [Step 11](#).

**Figure 10-18** Datanode Information

- Step 5** Log in to the MRS client node as user **root**.
- Step 6** Run **cd /opt/client** to switch to the client installation directory, and run **source bigdata\_env**. If the cluster uses the security mode, perform security authentication. Run **kinit hdfs** and enter the password as prompted. Please obtain the password from the administrator.
- Step 7** Run the **hdfs dfs -rm -r file or directory** command to delete unnecessary files.
- Step 8** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 9](#).
- Expand the system.**
- Step 9** Expand the disk capacity.
- Step 10** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 11](#).
- Collect fault information.**
- Step 11** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 12** Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS

**Step 13** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 14** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.90 ALM-14002 DataNode Disk Usage Exceeds the Threshold

## Alarm Description

The system checks the DataNode disk usage every 30 seconds and compares the actual disk usage with the threshold. A default threshold range is provided for the DataNode disk usage. This alarm is generated when the DataNode disk usage exceeds the threshold.

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS**.

If **Trigger Count** is **1**, this alarm is cleared when the DataNode disk usage is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the DataNode disk usage is less than or equal to 80% of the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14002	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.

Parameter	Description
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

Insufficient disk space will impact data write to HDFS.

## Possible Causes

- The disk space configured for the HDFS cluster is insufficient.
- Data skew occurs among DataNodes.

## Handling Procedure

**Check whether the cluster disk capacity is insufficient.**

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**, and check whether the **ALM-14001 HDFS Disk Usage Exceeds the Threshold** alarm exists.

- If yes, go to [Step 2](#).
- If no, go to [Step 4](#).

**Step 2** Handle the alarm by following the instructions in **ALM-14001 HDFS Disk Usage Exceeds the Threshold** and check whether the alarm is cleared.

- If yes, go to [Step 3](#).
- If no, go to [Step 11](#).

**Step 3** Choose **O&M > Alarm > Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Check the balance status of DataNodes.**

**Step 4** On FusionInsight Manager, choose **Hosts**. Check whether the number of DataNodes on each rack is almost the same. If the difference is large, adjust the racks to which DataNodes belong to ensure that the number of DataNodes on each rack is almost the same. Restart the HDFS service for the settings to take effect.

**Step 5** Choose **Cluster > Name of the desired cluster > Services > HDFS**.

**Step 6** In the **Basic Information** area, click **NameNode(Active)**. The HDFS web UI is displayed.

 NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

- Step 7** In the **Summary** area of the HDFS web UI, check whether the value of **Max** is 10% greater than that of **Median** in **DataNodes usages**.
- If yes, go to **Step 8**.
  - If no, go to **Step 11**.
- Step 8** Balance skewed data in the cluster. Log in to the MRS client as user **root**. If the cluster is in normal mode, run the **su - omm** command to switch to user **omm**. Run the **cd** command to go to the client installation directory and run the **source bigdata\_env** command. If the cluster uses the security mode, perform security authentication. Run **kinit hdfs** and enter the password as prompted. Obtain the password from the MRS cluster administrator.
- Step 9** Run the following command to balance data distribution:
- ```
hdfs balancer -threshold 10
```
- Step 10** Wait several minutes and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to **Step 11**.
- Collect the fault information.**
- Step 11** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 12** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.
- Step 13** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 14** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.91 ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold

Alarm Description

The system checks the lost blocks every 30 seconds and compares the actual lost blocks with the threshold. The lost blocks indicator has a default threshold. This alarm is generated when the number of lost HDFS blocks exceeds the threshold.

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS**.

If **Trigger Count** is **1**, this alarm is cleared when the value of lost HDFS blocks is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the value of lost HDFS blocks is less than or equal to 90% of the threshold.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|--|--------------|
| 14003 | Major
NOTE
The alarm severity in MRS 3.1.5 is Critical . | Yes |

Alarm Parameters

| Parameter | Description |
|-------------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |
| NameServiceName | Specifies the NameService for which the alarm was generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

Data stored in HDFS is lost. HDFS may enter the security mode and cannot provide write services. Lost block data cannot be restored.

Possible Causes

- The DataNode instance is abnormal.
- Data is deleted.

Handling Procedure

Check the DataNode instance.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance**.

Step 2 Check whether the **Running Status** of all DataNode instance is **Normal**.

- If yes, go to [Step 11](#).
- If no, go to [Step 3](#).

Step 3 Restart the DataNode instance and check whether the DataNode instance restarts successfully.

- If yes, go to [Step 4](#).
- If no, go to [Step 5](#).

Step 4 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Delete the damaged file.

Step 5 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **NameNode(Active)**. On the WebUI page of the HDFS, view the information about lost blocks.

NOTE

- If a block is lost, a line in red is displayed on the WebUI.
- By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 The user checks whether the file containing the lost data block is useful.

NOTE

Files generated in directories **/mr-history**, **/tmp/hadoop-yarn**, and **/tmp/logs** during MapReduce task execution are unnecessary.

- If yes, go to [Step 7](#).
- If no, go to [Step 8](#).

Step 7 The user checks whether the file containing the lost data block is backed up.

- If yes, go to [Step 8](#).

- If no, go to [Step 11](#).

Step 8 Log in to the HDFS client as user **root**. The user password is defined by the user before the installation. Contact the MRS cluster administrator to obtain the password. Run the following commands:

- Security mode:
`cd Client installation directory`
`source bigdata_env`
`kinit hdfs`
- Normal mode:
`su - omm`
`cd Client installation directory`
`source bigdata_env`

Step 9 On the node client, run `hdfs fsck / -delete` to delete the lost file. If the file where the lost block is located is a useful file, you need to write the file again to restore the data.

 **NOTE**

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

Step 10 Choose **O&M > Alarm > Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

Collect the fault information.

Step 11 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 12 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 13 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.92 ALM-14006 Number of HDFS Files Exceeds the Threshold

Alarm Description

The system periodically checks the number of HDFS files every 30 seconds and compares the number of HDFS files with the threshold. This alarm is generated when the system detects that the number of HDFS files exceeds the threshold.

If **Trigger Count** is **1**, this alarm is cleared when the number of HDFS files is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the number of HDFS files is less than or equal to 90% of the threshold.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 14006 | Minor | Yes |

Alarm Parameters

| Parameter | Description |
|-------------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |
| NameServiceName | Specifies the NameService for which the alarm was generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

Disk storage space is insufficient, which may result in data import failure. The performance of the HDFS system is affected.

Possible Causes

The number of HDFS files exceeds the threshold.

Handling Procedure

Check the number of files in the system.

- Step 1** On FusionInsight Manager, check the number of HDFS files. Specifically, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **File and Block**, and select **HDFS File** and **Total Blocks**.
- Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**, and search for the **GC_OPTS** parameter under **NameNode**.
- Step 3** Configure the threshold of the number of configuration file objects. Specifically, change the value of **Xmx** (GB) in the **GC_OPTS** parameter. The threshold (specified by *y*) is calculated as follows: $y = 0.2007 \times Xmx - 0.6312$, where *x* indicates the memory capacity *Xmx* (GB) and *y* indicates the number of files (unit: kW). Adjust the memory size as required.
- Step 4** Confirm that the value of **GC_PROFILE** is **custom** so that the **GC_OPTS** configuration takes effect. Click **Save** and choose **More** > **Restart Instance** to restart the service.
- Step 5** Check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 6](#).

Check whether needless files exist in the system.

- Step 6** Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata_env** to configure the environment variables.
- If the cluster uses the security mode, perform security authentication.
- Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the MRS cluster administrator.
- Step 7** Run **hdfs dfs -ls file or directory** to check whether the files in the directory can be deleted.
- If yes, go to [Step 8](#).
 - If no, go to [Step 9](#).
- Step 8** Run the **hdfs dfs -rm -r file or directory path** command. After deleting unnecessary files, wait until the files are retained in the recycle bin for a period longer than the value of **fs.trash.interval** on the NameNode. Then check whether the alarm is cleared.

NOTE

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

- If yes, no further action is required.

- If no, go to [Step 9](#).

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 10 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

{Bigdata_tmp_dir}
```

The number of NameNode files is proportional to the used memory size of the NameNode. When file objects change, you need to change **-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M** in the default value. The following table lists the reference values.

Table 10-2 NameNode JVM configuration

| Number of File Objects | Reference Value |
|------------------------|--|
| 10,000,000 | -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M |
| 20,000,000 | -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G |

| Number of File Objects | Reference Value |
|------------------------|--|
| 50,000,000 | -Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G |
| 100,000,000 | -Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G |
| 200,000,000 | -Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G |
| 300,000,000 | -Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G |

10.93 ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold

Description

The system checks the HDFS NameNode Heap Memory usage every 30 seconds and compares the actual Heap memory usage with the threshold. The HDFS NameNode Heap Memory usage has a default threshold. This alarm is generated when the HDFS NameNode Heap Memory usage exceeds the threshold.

You can change the threshold in **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the HDFS NameNode Heap memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the HDFS NameNode Heap memory usage is less than or equal to 90% of the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 14007 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |

| Name | Meaning |
|-------------------|--|
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

The HDFS NameNode Heap Memory usage is too high, which affects the data read/write performance of the HDFS.

Possible Causes

The HDFS NameNode Heap Memory is insufficient.

Procedure

Delete unnecessary files.

Step 1 Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata_env**.

If the cluster uses the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the **hdfs dfs -rm -r file or directory** command to delete unnecessary files.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

Check the NameNode JVM memory usage and configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS**.

Step 5 In the **Basic Information** area, click **NameNode(Active)** to go to the HDFS WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 On the HDFS WebUI, click the **Overview** tab. In **Summary**, check the numbers of files, directories, and blocks in the HDFS.

Step 7 On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Configurations > All Configurations**. In **Search**, enter **GC_OPTS** to check the **GC_OPTS** memory parameter of **HDFS->NameNode**.

Adjust the configuration in the system.

Step 8 Check whether the memory is configured properly based on the number of files in [Step 6](#) and the NameNode Heap Memory parameters in [Step 7](#).

- If yes, go to [Step 9](#).
- If no, go to [Step 11](#).

NOTE

The recommended mapping between the number of HDFS file objects (filesystem objects = files + blocks) and the JVM parameters configured for NameNode is as follows:

- If the number of file objects reaches 10,000,000, you are advised to set the JVM parameters as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the number of file objects reaches 20,000,000, you are advised to set the JVM parameters as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
- If the number of file objects reaches 50,000,000, you are advised to set the JVM parameters as follows: -Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
- If the number of file objects reaches 100,000,000, you are advised to set the JVM parameters as follows: -Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
- If the number of file objects reaches 200,000,000, you are advised to set the JVM parameters as follows: -Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
- If the number of file objects reaches 300,000,000, you are advised to set the JVM parameters as follows: -Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

Step 9 Modify the heap memory parameters of the NameNode based on the mapping between the number of file objects and the memory. Click **Save** and choose **Dashboard > More > Restart Service**.

Step 10 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

Collect fault information.

Step 11 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 12 Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS

Step 13 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.94 ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold

Description

The system checks the HDFS DataNode Heap Memory usage every 30 seconds and compares the actual Heap Memory usage with the threshold. The HDFS DataNode Heap Memory usage has a default threshold. This alarm is generated when the HDFS DataNode Heap Memory usage exceeds the threshold.

You can change the threshold in **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the HDFS DataNode Heap Memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the HDFS DataNode Heap Memory usage is less than or equal to 90% of the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 14008 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

| Name | Meaning |
|-------------------|--|
| Trigger condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

The HDFS DataNode Heap Memory usage is too high, which affects the data read/write performance of the HDFS.

Possible Causes

The HDFS DataNode Heap Memory is insufficient.

Procedure

Delete unnecessary files.

Step 1 Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata_env**.

If the cluster uses the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the **hdfs dfs -rm -r file or directory** command to delete unnecessary files.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

Check the DataNode JVM memory usage and configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS**.

Step 5 In the **Basic Information** area, click **NameNode(Active)** to go to the HDFS WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 On the HDFS WebUI, click the **DataNodes** tab, and check the number of blocks of all DataNodes related to the alarm.

Step 7 On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Configurations > All Configurations**. In **Search**, enter **GC_OPTS** to check the GC_OPTS memory parameter of **HDFS->DataNode**.

Adjust the configuration in the system.

Step 8 Check whether the memory is configured properly based on the number of block in [Step 6](#) and the DataNode Heap Memory parameters in [Step 7](#).

- If yes, go to [Step 9](#).
- If no, go to [Step 11](#).

 **NOTE**

The mapping between the average number of blocks of a DataNode instance and the DataNode memory is as follows:

- If the average number of blocks of a DataNode instance reaches 2,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the average number of blocks of a DataNode instance reaches 5,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

Step 9 Modify the heap memory parameters of the DataNode based on the mapping between the number of blocks and the memory. Click **Save** and choose **Dashboard > More > Restart Service**.

Step 10 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

Collect fault information.

Step 11 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 12 Select **HDFS** in the required cluster from the **Service**.

Step 13 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.95 ALM-14009 Number of Dead DataNodes Exceeds the Threshold

Description

The system periodically detects the number of dead DataNodes in the HDFS cluster every 30 seconds, and compares the number with the threshold. The

number of DataNodes in the Dead state has a default threshold. This alarm is generated when the number exceeds the threshold.

You can change the threshold in **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the number of Dead DataNodes is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the number of Dead DataNodes is less than or equal to 90% of the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 14009 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| NameServiceName | Specifies the NameService for which the alarm is generated. |
| Trigger condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

DataNodes that are in the Dead state cannot provide HDFS services.

Possible Causes

- DataNodes are faulty or overloaded.
- The network between the NameNode and the DataNode is disconnected or busy.
- NameNodes are overloaded.

- The NameNodes are not restarted after the DataNode is deleted.

Procedure

Check whether DataNodes are faulty.

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**. The **HDFS Status** page is displayed.

Step 2 In the **Basic Information** area, click **NameNode(Active)** to go to the HDFS WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 3 On the HDFS WebUI, click the **Datanodes** tab. In the **In operation** area, click **Filter** to check whether **down** is in the drop-down list.

- If yes, select **down**, record the information about the filtered DataNodes, and go to [Step 4](#).
- If no, go to [Step 8](#).

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance** to check whether recorded DataNodes exist in the instance list.

- If all recorded DataNodes exist, go to [Step 5](#).
- If none of the recorded DataNodes exists, go to [Step 6](#).
- If some of the recorded DataNodes exist, go to [Step 7](#).

Step 5 Locate the DataNode instance, click **More** > **Restart Instance** to restart it and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

Step 6 Select all NameNode instances, choose **More** > **Instance Rolling Restart** to restart them and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 16](#).

Step 7 Select all NameNode instances, choose **More** > **Instance Rolling Restart** to restart them. Locate the DataNode instance, click **More** > **Restart Instance** to restart it and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

Check the status of the network between the NameNode and the DataNode.

Step 8 Log in to the faulty DataNode on the management page as user **root**, and run the **ping IP address of the NameNode** command to check whether the network between the DataNode and the NameNode is abnormal.

On the FusionInsight Manager page, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance**. In the instance list, view the service plane IP address of the faulty DataNode.

- If yes, go to [Step 9](#).
- If no, go to [Step 10](#).

Step 9 Rectify the network fault, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

Check whether the DataNode is overloaded.

Step 10 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** and check whether the alarm **ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold** exists.

- If yes, go to [Step 11](#).
- If no, go to [Step 13](#).

Step 11 See **ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold** to handle the alarm and check whether the alarm is cleared.

- If yes, go to [Step 12](#).
- If no, go to [Step 13](#).

Step 12 Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to [Step 13](#).

Check whether the NameNode is overloaded.

Step 13 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** and check whether the alarm **ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold** exists.

- If yes, go to [Step 14](#).
- If no, go to [Step 16](#).

Step 14 See **ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold** to handle the alarm and check whether the alarm is cleared.

- If yes, go to [Step 15](#).
- If no, go to [Step 16](#).

Step 15 Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to [Step 16](#).

Collect fault information.

Step 16 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 17 Select **HDFS** in the required cluster from the **Service**.

Step 18 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.96 ALM-14010 NameService Service Is Abnormal

Alarm Description

The system checks the NameService service status every 180 seconds. This alarm is generated when the NameService service is unavailable.

This alarm is cleared when the NameService service recovers.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 14010 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-----------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |
| NameServiceName | Specifies the NameService for which the alarm was generated. |

Impact on the System

HDFS fails to provide services for upper-layer components based on the NameService service, such as HBase and MapReduce. As a result, users cannot read or write files.

Possible Causes

- The KrbServer service is abnormal.
- The JournalNode is faulty.
- The DataNode is faulty.
- The disk capacity is insufficient.
- The NameNode enters safe mode.

Handling Procedure

Check the KrbServer service status.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 2 Check whether the KrbServer service exists.

- If yes, go to [Step 3](#).
- If no, go to [Step 6](#).

Step 3 Click **KrbServer**.

Step 4 Click **Instances**. On the KrbServer management page, select the faulty instance, and choose **More** > **Restart Instance**. Check whether the instance successfully restarts.

- If yes, go to [Step 5](#).
- If no, go to [Step 24](#).

Step 5 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Check the JournalNode instance status.

Step 6 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 7 Choose **HDFS** > **Instances**.

Step 8 Check whether the **Running Status** of the JournalNode is **Normal**.

- If yes, go to [Step 11](#).
- If no, go to [Step 9](#).

Step 9 Select the faulty JournalNode, and choose **More** > **Restart Instance**. Check whether the JournalNode successfully restarts.

- If yes, go to [Step 10](#).
- If no, go to [Step 24](#).

Step 10 Choose **O&M > Alarm > Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

Check the DataNode instance status.

Step 11 On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > HDFS**.

Step 12 Click **Instances** and check whether **Running Status** of all DataNodes is **Normal**.

- If yes, go to [Step 15](#).
- If no, go to [Step 13](#).

Step 13 Click **Instances**. On the DataNode management page, select the faulty instance, and choose **More > Restart Instance**. Check whether the DataNode successfully restarts.

- If yes, go to [Step 14](#).
- If no, go to [Step 15](#).

Step 14 Choose **O&M > Alarm > Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 15](#).

Check disk status.

Step 15 On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Host**.

Step 16 In the **Disk** column, check whether the disk space is insufficient.

- If yes, go to [Step 17](#).
- If no, go to [Step 19](#).

Step 17 Expand the disk capacity.

Step 18 Choose **O&M > Alarm > Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 19](#).

Check whether NameNode is in the safe mode.

Step 19 On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > HDFS**. Click **NameNode(Active)** of the abnormal NameService. The NameNode web UI is displayed.

 **NOTE**

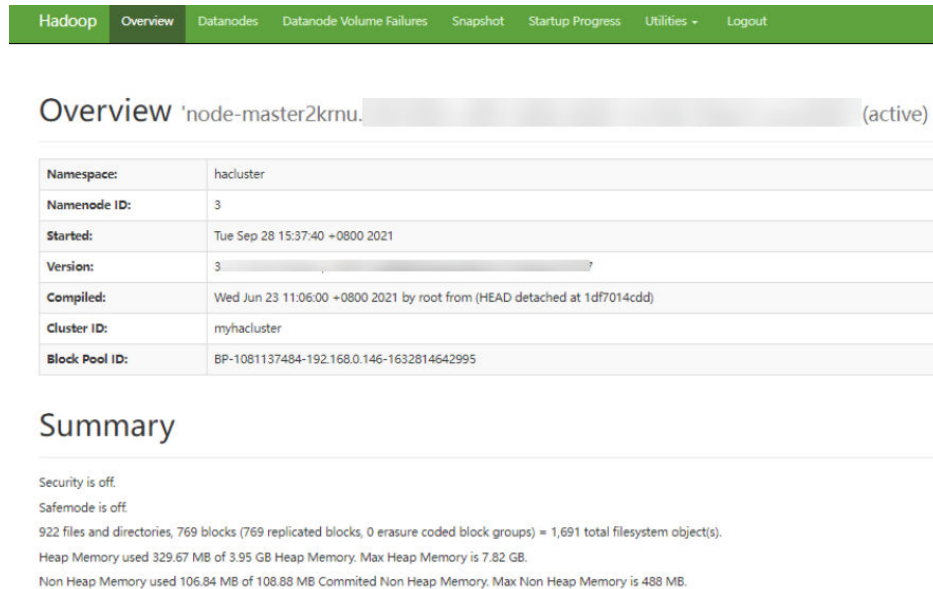

By default, the admin user does not have the management rights of other components. If the page cannot be opened or the content is not completely displayed due to insufficient permission when you access the native page of a component, you can manually create a user with the management rights of the corresponding component to log in to the component.

Step 20 On the NameNode web UI, check whether "Safe mode is ON." is displayed.

Information behind **Safe mode is ON** is alarm information and is displayed based actual conditions.

- If yes, go to [Step 21](#).
- If no, go to [Step 24](#).

Figure 10-19 Overview

Step 21 Log in to the client as user **root**. Run the **cd** command to go to the client installation directory and run the **source bigdata_env** command. If the cluster uses the security mode, perform security authentication. Run the **kinit hdfs** command and enter the password as prompted. The password can be obtained from the MRS cluster administrator. If the cluster uses the non-security mode, log in as user **omm** and run the command. Ensure that user **omm** has the client execution permission.

Step 22 Run **hdfs dfsadmin -safemode leave**.

Step 23 Choose **O&M > Alarm > Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 24](#).

Collect the fault information.

Step 24 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 25 In the **Service** area, select the following nodes of the desired cluster.

- ZooKeeper
- HDFS

Step 26 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 27 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.97 ALM-14011 DataNode Data Directory Is Not Configured Properly

Description

The DataNode parameter **dfs.datanode.data.dir** specifies DataNode data directories. This alarm is generated when a configured data directory cannot be created, a data directory uses the same disk as other critical directories in the system, or multiple directories use the same disk immediately.

This alarm is cleared when the DataNode data directory is configured properly and this DataNode for which the alarm is generated is restarted.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 14011 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

If the DataNode data directory is mounted to the root directory or a critical directory, the disk space of the root directory or critical directory will be used up after long time running and the system will be faulty.

If the DataNode data directory is not configured properly, HDFS performance will deteriorate.

Possible Causes

- The DataNode data directory fails to be created.
- The DataNode data directory uses the same disk with critical directories, such as / or /**boot**.
- Multiple directories in the DataNode data directory use the same disk.

Procedure

Check the alarm cause and information about the DataNode for which the alarm is generated.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

Step 2 In **HostName** of **Location**, obtain the host name of the DataNode for which the alarm is generated.

Delete directories that do not comply with the disk plan from the DataNode data directory.

Step 3 Choose **Cluster > Name of the desired cluster > Services > HDFS > Instance**. In the instance list, click the DataNode instance on the node for which the alarm is generated.

Step 4 Click **Instance Configurations** and view the value of the DataNode parameter **dfs.datanode.data.dir**.

Step 5 Check whether all DataNode data directories are consistent with the disk plan.

- If yes, go to [Step 6](#).
- If no, go to [Step 9](#).

Step 6 Modify the DataNode parameter **dfs.datanode.data.dir** and delete the incorrect directories.

Step 7 Choose **Cluster > Name of the desired cluster > Services > HDFS > Instance** and restart the DataNode instance.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Step 9 Log in to the DataNode for which the alarm is generated as user **root**.

- If the alarm cause is "The DataNode data directory fails to be created", go to [Step 10](#).
- If the alarm cause is "The DataNode data directory uses the same disk with critical directories, such as / or /**boot**", go to [Step 17](#).
- If the alarm cause is "Multiple directories in the DataNode data directory uses the same disk", go to [Step 21](#).

Check whether the DataNode data directory fails to be created.

- Step 10** Run the `su - omm` command to switch to user `omm`.
- Step 11** Run the `ls` command to check whether the directories exist in the DataNode data directory.
- If yes, go to [Step 26](#).
 - If no, go to [Step 12](#).
- Step 12** Run the `mkdir data directory` command to create the directory and check whether the directory can be successfully created.
- If yes, go to [Step 24](#).
 - If no, go to [Step 13](#).
- Step 13** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** to check whether alarm **ALM-12017 Insufficient Disk Capacity** exists.
- If yes, go to [Step 14](#).
 - If no, go to [Step 15](#).
- Step 14** Adjust the disk capacity and check whether alarm **ALM-12017 Insufficient Disk Capacity** is cleared. For details, see **ALM-12017 Insufficient Disk Capacity**.
- If yes, go to [Step 12](#).
 - If no, go to [Step 15](#).
- Step 15** Check whether user `omm` has the `rwX` or `X` permission of all the upper-layer directories of the directory. (For example, for `/tmp/abc/`, user `omm` has the `X` permission for directory `tmp` and the `rwX` permission for directory `abc`.)
- If yes, go to [Step 24](#).
 - If no, go to [Step 16](#).
- Step 16** Run the `chmod u+rwX path` or `chmod u+X path` command as user `root` to assign the `rwX` or `X` permission of these directories to user `omm`. Then go to [Step 12](#).
- Check whether the DataNode data directory use the same disk as other critical directories in the system.**
- Step 17** Run the `df` command to obtain the disk mounting information of each directory in the DataNode data directory.
- Step 18** Check whether the directories mounted to the disk are critical directories, such as `/` or `/boot`.
- If yes, go to [Step 19](#).
 - If no, go to [Step 24](#).
- Step 19** Change the value of the DataNode parameter `dfs.datanode.data.dir` and delete the directories that use the same disk as critical directories.
- Step 20** Go to [Step 24](#).
- Check whether multiple directories in the DataNode data directory use the same disk.**
- Step 21** Run the `df` command to obtain the disk mounting information of each directory in the DataNode data directory. Record the mounted directory in the command output.

- Step 22** Modify the DataNode node parameters **dfs.datanode.data.dir** to reserve only one directory among the directories that mounted to the same disk directory.
- Step 23** Go to [Step 24](#).
- Restart the DataNode and check whether the alarm is cleared.**
- Step 24** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Instance** and restart the DataNode instance
- Step 25** Check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 26](#).
- Collect fault information.**
- Step 26** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 27** Select **HDFS** in the required cluster from the **Service**.
- Step 28** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 29** Contact the O&M personnel and send the collected logs.
- End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.98 ALM-14012 JournalNode Is Out of Synchronization

Description

On the active NameNode, the system checks the data consistency of all JournalNodes in the cluster every 5 minutes. This alarm is generated when the data on a JournalNode is inconsistent with the data on the other JournalNodes.

This alarm is cleared in 5 minutes after the data on JournalNodes is consistent.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 14012 | Major | Yes |

Parameters

| Name | Meaning |
|-----------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| NameServiceName | Specifies the NameService for which the alarm is generated. |

Impact on the System

When a JournalNode is working incorrectly, the data on the node becomes inconsistent with that on the other JournalNodes. If data on more than half of JournalNodes is inconsistent, the NameNode cannot work correctly, making the HDFS service unavailable.

Possible Causes

- The JournalNode instance does not exist (deleted or migrated).
- The JournalNode instance has not been started or has been stopped.
- The JournalNode instance is working incorrectly.
- The network of the JournalNode is unreachable.

Procedure

Check whether the JournalNode instance has been started up.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.
- Step 2** Check **Location** and obtain the IP address of the JournalNode for which the alarm is generated.
- Step 3** Choose **Cluster > Name of the desired cluster > Services > HDFS > Instance**. In the instance list, check whether the JournalNode instance exists on the node for which the alarm is generated.
 - If yes, go to **Step 5**.
 - If no, go to **Step 4**.
- Step 4** Choose **O&M > Alarm > Alarms**. In the alarm list, click **Clear** in the **Operation** column of the alarm. In the dialog box that is displayed, click **OK**. No further action is needed.

Step 5 Click the JournalNode instance and check whether its **Configuration Status** is **Synchronized**.

- If yes, go to [Step 8](#).
- If no, go to [Step 6](#).

Step 6 Select the JournalNode instance and choose **Start Instance** to start the instance.

Step 7 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 15](#).

Check whether the JournalNode instance is working correctly.

Step 8 Check whether **Running Status** of the JournalNode instance is **Normal**.

- If yes, go to [Step 11](#).
- If no, go to [Step 9](#).

Step 9 Select the JournalNode instance and choose **More > Restart Instance** to start the instance.

Step 10 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 15](#).

Check whether the network of the JournalNode is reachable.

Step 11 On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Instance** to check the service IP address of the active NameNode.

Step 12 Log in to the active NameNode as user **root**.

Step 13 Run the **ping** command to check whether a timeout occurs or the network is unreachable between the active NameNode and the JournalNode.

ping *service IP address of the JournalNode*

- If yes, go to [Step 14](#).
- If no, go to [Step 15](#).

Step 14 Contact the network administrator to rectify the network fault and check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to [Step 15](#).

Collect fault information.

Step 15 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 16 Select **HDFS** in the required cluster from the **Service**.

Step 17 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.99 ALM-14013 Failed to Update the NameNode Fslmage File

Description

HDFS metadata is stored in the Fslmage file of the NameNode data directory, which is specified by the **dfs.namenode.name.dir** configuration item. The standby NameNode periodically combines existing Fslmage files and Editlog files stored in the JournalNode to generate a new Fslmage file, and then pushes the new Fslmage file to the data directory of the active NameNode. This period is specified by the **dfs.namenode.checkpoint.period** configuration item of HDFS. The default value is 3600s, namely, one hour. If the Fslmage file in the data directory of the active NameNode is not updated, the HDFS metadata combination function is abnormal and requires rectification.

On the active NameNode, the system checks the Fslmage file information every five minutes. This alarm is generated when no Fslmage file is generated within three combination periods.

This alarm is cleared when a new Fslmage file is generated and pushed to the active NameNode, which indicates that the HDFS metadata combination function can be properly used.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 14013 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |

| Name | Meaning |
|-----------------|---|
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| NameServiceName | Specifies the NameService for which the alarm is generated. |

Impact on the System

If the FsImage file in the data directory of the active NameNode is not updated, the HDFS metadata combination function is abnormal and requires rectification. If it is not rectified, the Editlog files increase continuously after HDFS runs for a period. In this case, HDFS restart is time-consuming because a large number of Editlog files need to be loaded. In addition, this alarm also indicates that the standby NameNode is abnormal and the NameNode high availability (HA) mechanism becomes invalid. When the active NameNode is faulty, the HDFS service becomes unavailable.

Possible Causes

- The standby NameNode is stopped.
- The standby NameNode instance is working incorrectly.
- The standby NameNode fails to generate a new FsImage file.
- Space of the data directory on the standby NameNode is insufficient.
- The standby NameNode fails to push the FsImage file to the active NameNode.
- Space of the data directory on the active NameNode is insufficient.

Procedure

Check whether the standby NameNode is stopped.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.
- Step 2** View **Location** and obtain the host name of the active NameNode for which the alarm is generated and name of the NameService where the active NameNode resides.
- Step 3** Choose **Cluster > Name of the desired cluster > Services > HDFS > Instance**, find the standby NameNode instance of the NameService in the instance list, and check whether its **Configuration Status** is **Synchronized**.
 - If yes, go to **Step 6**.
 - If no, go to **Step 4**.
- Step 4** Select the standby NameNode instance, choose **Start Instance**, and wait until the startup is complete.

Step 5 Wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Check whether the NameNode instance is working correctly.

Step 6 Check whether **Running Status** of the standby NameNode instance is **Normal**.

- If yes, go to [Step 9](#).
- If no, go to [Step 7](#).

Step 7 Select the standby NameNode instance, choose **More > Restart Instance**, and wait until the startup is complete.

Step 8 Wait for a NameNode metadata combination period and check whether the alarm is cleared.

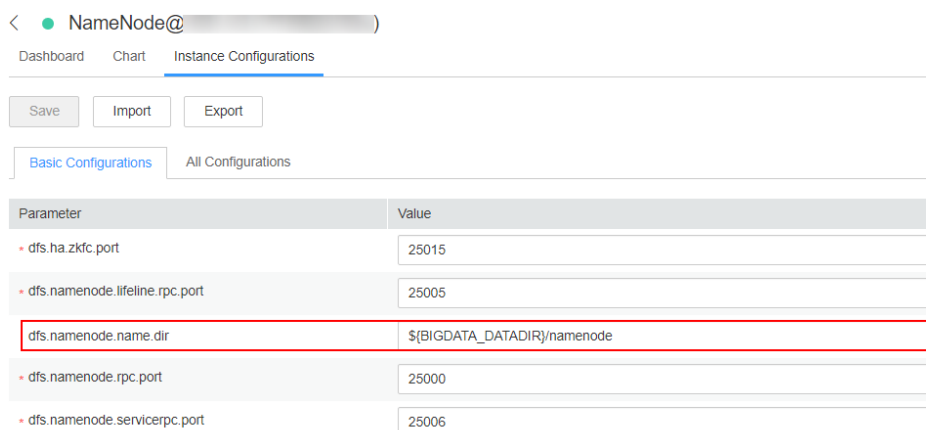

- If yes, no further action is required.
- If no, go to [Step 30](#).

Check whether the standby NameNode fails to generate a new FsImage file.

Step 9 On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Configurations > All Configurations**, and search and obtain the value of **dfs.namenode.checkpoint.period**. This value is the period of NameNode metadata combination.

Step 10 Choose **Cluster > Name of the desired cluster > Services > HDFS > Instance** and obtain the service IP addresses of the active and standby NameNodes of the NameService for which the alarm is generated.

Step 11 Click the **NameNode(XX,Standby)** and **Instance Configurations** to obtain the value of **dfs.namenode.name.dir**. This value is the FsImage storage directory of the standby NameNode.

< ● NameNode@

Dashboard Chart Instance Configurations

Save Import Export

Basic Configurations All Configurations

| Parameter | Value |
|--------------------------------|------------------------------|
| dfs.ha.zkfc.port | 25015 |
| dfs.namenode.lifeline.rpc.port | 25005 |
| dfs.namenode.name.dir | \$(BIGDATA_DATADIR)/namenode |
| dfs.namenode.rpc.port | 25000 |
| dfs.namenode.servicerpc.port | 25006 |

Step 12 Log in to the standby NameNode as user **root** or **omm**.

Step 13 Go to the FsImage storage directory and check the generation time of the newest FsImage file.

cd *Storage directory of the standby NameNode/current*

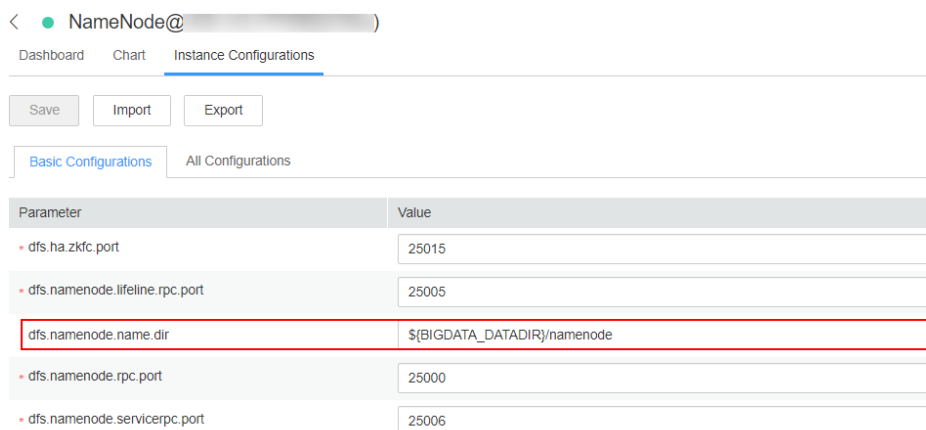

stat -c %y \$(ls -t | grep "fsimage_[0-9]*\$" | head -1)

- Step 14** Run the **date** command to obtain the current system time.
- Step 15** Calculate the time difference between the generation time of the newest FsImage file and the current system time and check whether the time difference is greater than three times of the metadata combination period.
- If yes, go to [Step 16](#).
 - If no, go to [Step 20](#).
- Step 16** The metadata combination function of the standby NameNode is faulty. Run the following command to check whether the fault is caused by insufficient storage space.
- Go to the FsImage storage directory and check the size of the newest FsImage file (in MB).
- ```
cd Storage directory of the standby NameNode/current
du -m $(ls -t | grep "fsimage_[0-9]*$" | head -1) | awk '{print $1}'
```
- Step 17** Run the following command to check the available disk space of the standby NameNode (in MB).
- ```
df -m ./ | awk 'END{print $4}'
```
- Step 18** Compare the FsImage file size and the available disk space and determine whether another FsImage file can be stored on the disk.
- If yes, go to [Step 7](#).
 - If no, go to [Step 19](#).
- Step 19** Clear the redundant files on the disk where the directory resides to reserve sufficient space for metadata. After the clearance, wait for a NameNode metadata combination period and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 20](#).
- Check whether the standby NameNode fails to push the FsImage file to the active NameNode.**
- Step 20** Log in to the standby NameNode as user **root**.
- Step 21** Run the **su - omm** command to switch to user **omm**.
- Step 22** Run the following command to check whether the standby NameNode can push the file to the active NameNode.
- ```
tmpFile=/tmp/tmp_test_$(date +%s)
echo "test" > $tmpFile
scp $tmpFile Service IP address of the active NameNode:/tmp
```
- If yes, go to [Step 24](#).
  - If no, go to [Step 23](#).
- Step 23** When the standby NameNode fails to push data to the active NameNode as user **omm**, contact the system administrator to handle the fault. Wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 24](#).

**Check whether space on the data directory of the active NameNode is insufficient.**

**Step 24** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Instance**, click the active NameNode of the NameService for which the alarm is generated, and then click **Instance Configurations** to obtain the value of **dfs.namenode.name.dir**. This value is the Fslmage storage directory of the active NameNode.

**Step 25** Log in to the active NameNode as user **root** or **omm**.

**Step 26** Go to the Fslmage storage directory and check the size of the newest Fslmage file (in MB).

**cd** *Storage directory of the active NameNode/current*

**du -m \$(ls -t | grep "fsimage\_[0-9]\*\$" | head -1) | awk '{print \$1}'**

**Step 27** Run the following command to check the available disk space of the active NameNode (in MB).

**df -m ./ | awk 'END{print \$4}'**

**Step 28** Compare the Fslmage file size and the available disk space and determine whether another Fslmage file can be stored on the disk.

- If yes, go to [Step 30](#).
- If no, go to [Step 29](#).

**Step 29** Clear the redundant files on the disk where the directory resides to reserve sufficient space for metadata. After the clearance, wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 30](#).

**Collect fault information.**

**Step 30** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 31** Select **NameNode** in the required cluster from the **Service**.

**Step 32** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 33** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.100 ALM-14014 NameNode GC Time Exceeds the Threshold

## Description

The system checks the garbage collection (GC) duration of the NameNode process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14014	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

A long GC duration of the NameNode process may interrupt the services.

## Possible Causes

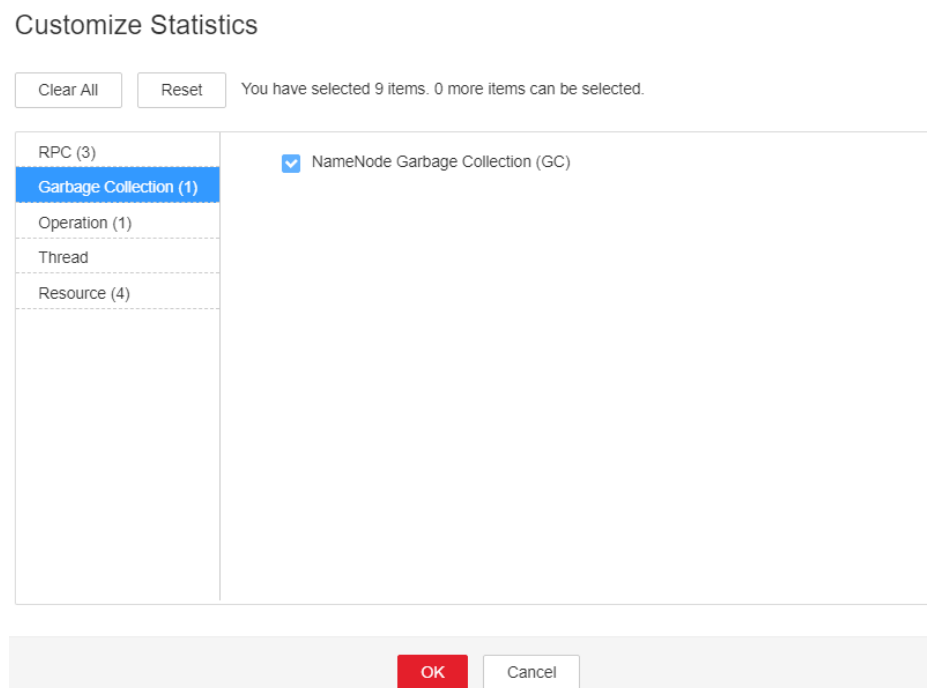

The heap memory of the NameNode instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

## Procedure

### Check the GC duration.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the displayed interface, click the drop-down button of **ALM-14014 NameNode GC Time Exceeds the Threshold**. Then check the role name in **Location** and confirm the IP address of the instance.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Instance > NameNode (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > Garbage Collection**, and select **NameNode Garbage Collection (GC)** to check the GC duration statistics of the NameNode process collected every minute.

**Figure 10-20** NameNode Garbage Collection (GC)

- Step 3** Check whether the GC duration of the NameNode process collected every minute exceeds the threshold (12 seconds by default).
- If yes, go to [Step 4](#).
  - If no, go to [Step 7](#).

- Step 4** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations** > **NameNode** > **System** to increase the value of **GC\_OPTS** parameter as required.

 **NOTE**

The recommended mapping between the number of HDFS file objects (filesystem objects = files + blocks) and the JVM parameters configured for NameNode is as follows:

- If the number of file objects reaches 10,000,000, you are advised to set the JVM parameters as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the number of file objects reaches 20,000,000, you are advised to set the JVM parameters as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
- If the number of file objects reaches 50,000,000, you are advised to set the JVM parameters as follows: -Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
- If the number of file objects reaches 100,000,000, you are advised to set the JVM parameters as follows: -Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
- If the number of file objects reaches 200,000,000, you are advised to set the JVM parameters as follows: -Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
- If the number of file objects reaches 300,000,000, you are advised to set the JVM parameters as follows: -Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

- Step 5** Save the configuration and restart the NameNode instance.

- Step 6** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 7](#).

**Collect fault information.**

- Step 7** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

- Step 8** Select **NameNode** in the required cluster from the **Service**.

- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

- Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 10.101 ALM-14015 DataNode GC Time Exceeds the Threshold

### Description

The system checks the garbage collection (GC) duration of the DataNode process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14015	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

### Impact on the System

A long GC duration of the DataNode process may interrupt the services.

### Possible Causes

The heap memory of the DataNode instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

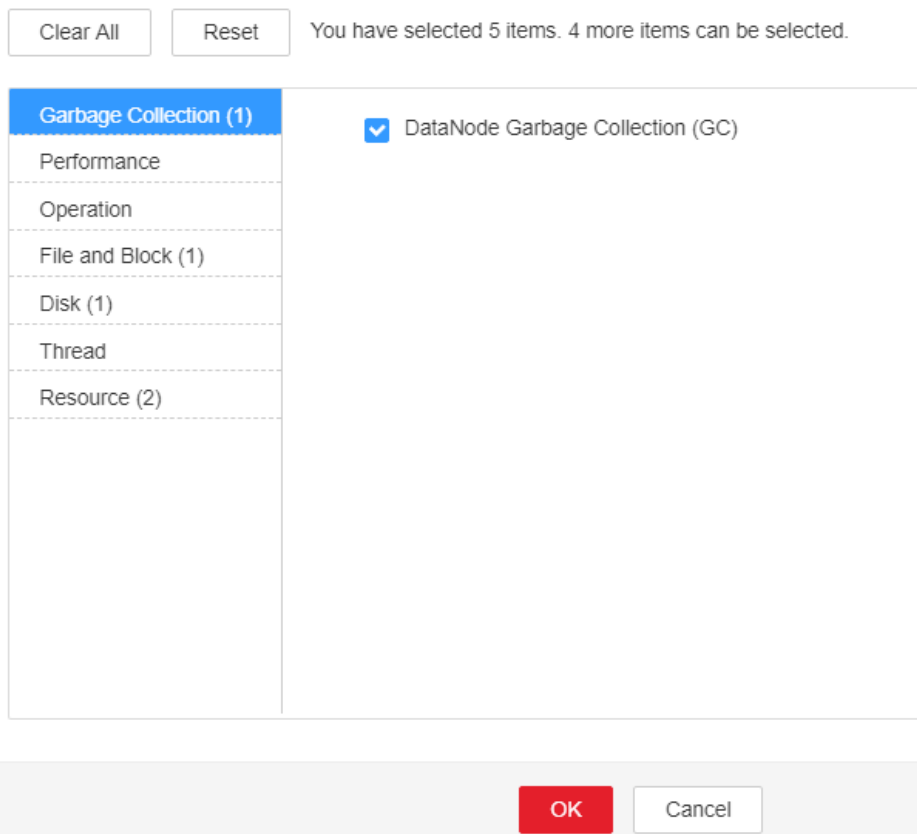

## Procedure

### Check the GC duration.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the displayed interface, click the drop-down button of **ALM-14015 DataNode GC Time Exceeds the Threshold**. Then check the role name in **Location** and confirm the IP address of the instance.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Instance > DataNode (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > Garbage Collection**, and select **DataNode Garbage Collection (GC)** to check the GC duration statistics of the DataNode process collected every minute.

**Figure 10-21** DataNode Garbage Collection (GC)

### Customize Statistics

- Step 3** Check whether the GC duration of the DataNode process collected every minute exceeds the threshold (12 seconds by default).
- If yes, go to **Step 4**.
  - If no, go to **Step 7**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Configurations > All Configurations > DataNode > System** to increase the value of **GC\_OPTS** parameter as required.

 NOTE

The mapping between the average number of blocks of a DataNode instance and the DataNode memory is as follows:

- If the average number of blocks of a DataNode instance reaches 2,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the average number of blocks of a DataNode instance reaches 5,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

**Step 5** Save the configuration and restart the DataNode instance.

**Step 6** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **DataNode** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.102 ALM-14016 DataNode Direct Memory Usage Exceeds the Threshold

## Alarm Description

The system checks the direct memory usage of HDFS every 30 seconds. This alarm is generated when the direct memory usage of DataNode instances exceeds the threshold (90% of the maximum memory).

This alarm is automatically cleared when the direct memory usage is less than the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14016	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

If the available direct memory of DataNode instances is insufficient, a memory overflow may occur and the service breaks down.

## Possible Causes

The direct memory of DataNode instances is overused or the direct memory is inappropriately allocated.

## Handling Procedure

**Check the direct memory usage.**

- Step 1** On the **Home** page of FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the page that is displayed, click the drop-down list in the row containing **ALM-14016 DataNode Direct Memory Usage Exceeds the Threshold**, and view the role name and IP address of the instance for which the alarm is generated in the **Location** area.
- Step 2** On the **Home** page of FusionInsight Manager, choose **Cluster > Services > HDFS**. On the page that is displayed, click the **Instance** tab. In the instance list, select **DataNode** (IP address of the instance for which this alarm is generated). Click the drop-down list in the upper right corner of the chart, choose **Customize > Resource**, and select **DataNode Memory** to check the direct memory usage.

- Step 3** Check whether the used direct memory of a DataNode instance reaches 90% (default threshold) of the maximum direct memory allocated to it.
- If yes, go to [Step 4](#).
  - If no, go to [Step 8](#).
- Step 4** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > HDFS > Configurations > All Configurations > DataNode > System**. Check whether **-XX:MaxDirectMemorySize** exists in the **GC\_OPTS** parameter.
- If yes, go to [Step 5](#).
  - If no, go to [Step 6](#).

**Step 5** Adjust the value of **-XX:MaxDirectMemorySize**.

1. In **GC\_OPTS**, check the value of **-Xmx** and check whether the node memory is sufficient.

 **NOTE**

You can determine whether the node memory is sufficient based on the actual environment. For example, you can use the following method:

Use the IP address to log in to the instance for which the alarm is generated as user **root** and run the **free -g** command to check the value of **Mem** in the **free** column. The value indicates the available memory of the node. In the following example, the available memory of the node is 4 GB.

```
Mem: total used free shared buff/cache available
..... 112 48 4 10 58 46
```

If the value of **Mem** is at least that of **-Xmx**, the node memory is sufficient. If the value of **Mem** is less than that of **-Xmx**, the node memory is insufficient.

- If yes, change the value of **-XX:MaxDirectMemorySize** to that of **-Xmx**.
  - If no, increase **-XX:MaxDirectMemorySize** to a value no larger than that of **Mem**.
2. Save the configuration and restart the DataNode instances.

- Step 6** Check whether **ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold** exists.
- If yes, rectify the fault by referring to **ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold**.
  - If no, go to [Step 7](#).

- Step 7** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 8](#).

**Collect the fault information.**

- Step 8** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 9** Expand the **Service** drop-down list, and select **DataNode** for the target cluster.
- Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 11** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 10.103 ALM-14017 NameNode Direct Memory Usage Exceeds the Threshold

## Description

The system checks the direct memory usage of the HDFS service every 30 seconds. This alarm is generated when the direct memory usage of a NameNode instance exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14017	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

If the available direct memory of the HDFS service is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The direct memory of the NameNode instance is overused or the direct memory is inappropriately allocated.

## Procedure

### Check the direct memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the displayed interface, click the drop-down button of **ALM-14017 NameNode Direct Memory Usage Exceeds the Threshold**. Then check the role name in **Location** and confirm the IP address of the instance.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Instance > NameNode (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > Resource**, and select **NameNode Memory** to check the direct memory usage.
- Step 3** Check whether the used direct memory of NameNode reaches 90% of the maximum direct memory specified for NameNode by default.
- If yes, go to **Step 4**.
  - If no, go to **Step 8**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Configurations > All Configurations > NameNode > System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC\_OPTS** parameter.
- If yes, go to **Step 5**.
  - If no, go to **Step 6**.
- Step 5** In the **GC\_OPTS** parameter, delete "-XX:MaxDirectMemorySize". Save the configuration and restart the NameNode instance.
- Step 6** Check whether the **ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold** exists.
- If yes, handle the alarm by referring to **ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold**.
  - If no, go to **Step 7**.
- Step 7** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 8**.

### Collect fault information.

- Step 8** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 9** Select **NameNode** in the required cluster from the **Service**.

**Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 11** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

# 10.104 ALM-14018 NameNode Non-heap Memory Usage Exceeds the Threshold

## Description

The system checks the non-heap memory usage of the HDFS NameNode every 30 seconds and compares the actual usage with the threshold. The non-heap memory usage of the HDFS NameNode has a default threshold. This alarm is generated when the non-heap memory usage of the HDFS NameNode exceeds the threshold.

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS** to change the threshold.

This alarm is cleared when the no-heap memory usage of the HDFS NameNode is less than or equal to the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14018	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

If the memory usage of the HDFS NameNode is too high, data read/write performance of HDFS will be affected.

## Possible Causes

Non-heap memory of the HDFS NameNode is insufficient.

## Procedure

### Delete unnecessary files.

**Step 1** Log in to the HDFS client as user **root**. Run the **cd** command to go to the client installation directory, and run the **source bigdata\_env** command.

If the cluster adopts the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

**Step 2** Run the **hdfs dfs -rm -r file or directory path** command to delete unnecessary files.

**Step 3** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

### Check the NameNode JVM non-heap memory usage and configuration.

**Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS**. The HDFS status page is displayed.

**Step 5** In the **Basic Information** area, click **NameNode(Active)**. The HDFS WebUI is displayed.

### NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

**Step 6** On the HDFS WebUI, click the **Overview** tab. In **Summary**, check the numbers of files, directories, and blocks in HDFS.

**Step 7** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Configurations > All Configurations**. In **Search**, enter **GC\_OPTS** to check the **GC\_OPTS** non-heap memory parameter of **HDFS->NameNode**.

#### Adjust system configurations.

**Step 8** Check whether the non-heap memory is properly configured based on the number of file objects in **Step 6** and the non-heap parameters configured for NameNode in **Step 7**.

- If yes, go to **Step 9**.
- If no, go to **Step 12**.

#### NOTE

The recommended mapping between the number of HDFS file objects (filesystem objects = files + blocks) and the JVM parameters configured for NameNode is as follows:

- If the number of file objects reaches 10,000,000, you are advised to set the JVM parameters as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the number of file objects reaches 20,000,000, you are advised to set the JVM parameters as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
- If the number of file objects reaches 50,000,000, you are advised to set the JVM parameters as follows: -Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
- If the number of file objects reaches 100,000,000, you are advised to set the JVM parameters as follows: -Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
- If the number of file objects reaches 200,000,000, you are advised to set the JVM parameters as follows: -Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
- If the number of file objects reaches 300,000,000, you are advised to set the JVM parameters as follows: -Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

**Step 9** Modify the **GC\_OPTS** parameter of the NameNode based on the mapping between the number of file objects and non-heap memory.

**Step 10** Save the configuration and click **Dashboard > More > Restart Service**.

**Step 11** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

#### Collect fault information.

**Step 12** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 13** Select the following services in the required cluster from the **Service**.

- ZooKeeper
- HDFS

**Step 14** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 15** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.105 ALM-14019 DataNode Non-heap Memory Usage Exceeds the Threshold

## Description

The system checks the non-heap memory usage of the HDFS DataNode every 30 seconds and compares the actual usage with the threshold. The non-heap memory usage of the HDFS DataNode has a default threshold. This alarm is generated when the non-heap memory usage of the HDFS DataNode exceeds the threshold.

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS** to change the threshold.

This alarm is cleared when the no-heap memory usage of the HDFS DataNode is less than or equal to the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14019	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

If the memory usage of the HDFS DataNode is too high, data read/write performance of HDFS will be affected.

## Possible Causes

Non-heap memory of the HDFS DataNode is insufficient.

## Procedure

### Delete unnecessary files.

**Step 1** Log in to the HDFS client as user **root**. Run the **cd** command to go to the client installation directory, and run the **source bigdata\_env** command.

If the cluster adopts the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

**Step 2** Run the **hdfs dfs -rm -r file or directory path** command to delete unnecessary files.

**Step 3** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

### Check the DataNode JVM non-heap memory usage and configuration.

**Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS**.

**Step 5** In the **Basic Information** area, click **NameNode(Active)**. The HDFS WebUI is displayed.

#### NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

**Step 6** On the HDFS WebUI, click the **Datanodes** tab to view the number of blocks of all DataNodes that report alarms.

**Step 7** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Configurations > All Configurations**. In **Search**,

enter **GC\_OPTS** to check the **GC\_OPTS** non-heap memory parameter of **HDFS->DataNode**.

#### Adjust system configurations.

**Step 8** Check whether the memory is properly configured based on the number of blocks in [Step 6](#) and the memory parameters configured for DataNode in [Step 7](#).

- If yes, go to [Step 9](#).
- If no, go to [Step 12](#).

#### NOTE

The mapping between the average number of blocks of a DataNode instance and the DataNode memory is as follows:

- If the average number of blocks of a DataNode instance reaches 2,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the average number of blocks of a DataNode instance reaches 5,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

**Step 9** Modify the **GC\_OPTS** parameter of the DataNode based on the mapping between the number of blocks and memory.

**Step 10** Save the configuration and click **Dashboard > More > Restart Service**.

**Step 11** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

#### Collect fault information.

**Step 12** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 13** Select the following services in the required cluster from the **Service**.

- ZooKeeper
- HDFS

**Step 14** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 15** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 10.106 ALM-14020 Number of Entries in the HDFS Directory Exceeds the Threshold

### Description

The system obtains the number of subfiles and subdirectories in a specified directory every hour and checks whether it reaches the percentage of the threshold (the maximum number of subfiles and subdirectories in an HDFS directory, the threshold for triggering an alarm is **90%** by default). If it exceeds the percentage of the threshold, an alarm is triggered.

When the number of subfiles and subdirectories in the directory the alarm is lower than the percentage of the threshold, the alarm is automatically cleared. When the monitoring switch is disabled, alarms corresponding to all directories are cleared. If a directory is removed from the monitoring list, alarms corresponding to the directory are cleared.

#### NOTE

- The **dfs.namenode.fs-limits.max-directory-items** parameter specifies the maximum number of subfiles and subdirectories in the HDFS directory. Its default value is **1048576**. If the number of subfiles and subdirectories in a directory exceeds the parameter value, subfiles and subdirectories cannot be created in the directory.
- The **dfs.namenode.directory-items.monitor** parameter specifies the list of directories to be monitored. Its default value is **/tmp,/SparkJobHistory,/mr-history**.
- The **dfs.namenode.directory-items.monitor.enabled** parameter is used to enable or disable the monitoring switch. Its default value is **true**, which means the monitoring switch is enabled by default.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14020	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.

Name	Meaning
Directory	Specifies the directory for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

If the number of entries in the monitored directory exceeds 90% of the threshold, an alarm is triggered, but entries can be added to the directory. Once the maximum threshold is exceeded, entries will fail to be added to the directory.

## Possible Causes

The number of entries in the monitored directory exceeds 90% of the threshold.

## Procedure

### Check whether unnecessary files exist in the system.

**Step 1** Log in to the HDFS client as user **root**. Run the **cd** command to go to the client installation directory, and run the **source bigdata\_env** command to set the environment variables.

If the cluster is in security mode, security authentication is required.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

**Step 2** Run the following command to check whether files and directories in the directory with the alarm can be deleted:

```
hdfs dfs -ls Directory with the alarm
```

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

**Step 3** Run the following command to delete unnecessary files.

```
hdfs dfs -rm -r -f File or directory path
```

### NOTE

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

**Step 4** Wait 1 hour and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

### Check whether the threshold is correctly configured.

**Step 5** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**. Search for the **dfs.namenode.fs-limits.max-directory-items** parameter and check whether the parameter value is appropriate.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

**Step 6** Increase the parameter value.

**Step 7** Save the configuration and click **Dashboard** > **More** > **Restart Service**.

**Step 8** Wait 1 hour and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

**Collect fault information.**

**Step 9** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

**Step 10** Select **HDFS** in the required cluster from the **Service**.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.107 ALM-14021 NameNode Average RPC Processing Time Exceeds the Threshold

## Description

The system checks the average RPC processing time of NameNode every 30 seconds, and compares the actual average RPC processing time with the threshold (default value: 100 ms). This alarm is generated when the system detects that the average RPC processing time exceeds the threshold for several consecutive times (10 times by default).

You can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **HDFS** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the average RPC processing time of NameNode is less than or equal to the threshold. When the

**Trigger Count** is greater than 1, this alarm is cleared when the average RPC processing time of NameNode is less than or equal to 90% of the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14021	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

NameNode cannot process the RPC requests from HDFS clients, upper-layer services that depend on HDFS, and DataNode in a timely manner. Specifically, the services that access HDFS run slowly or the HDFS service is unavailable.

## Possible Causes

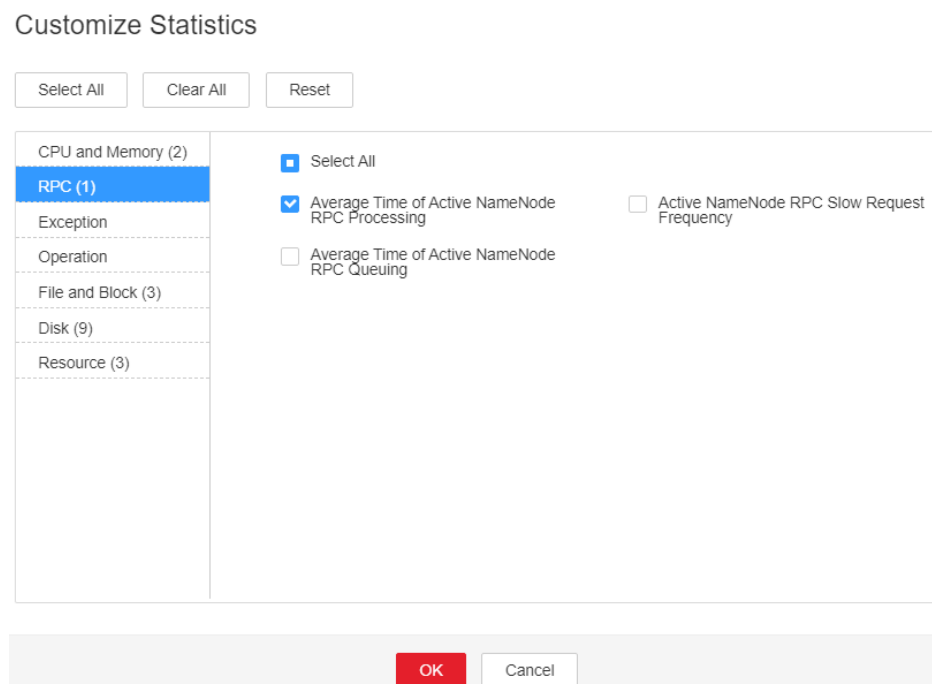

- The CPU performance of NameNode nodes is insufficient and therefore NameNode nodes cannot process messages in a timely manner.
- The configured NameNode memory is too small and frame freezing occurs on the JVM due to frequent full garbage collection.
- NameNode parameters are not configured properly, so NameNode cannot make full use of system performance.

## Procedure

**Obtain alarm information.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.
- Step 2** Check the alarm. Obtain the host name of the NameNode node involved in this alarm from the **HostName** information of **Location**. Then obtain the name of the NameService node involved in this alarm from the **NameServiceName** information of **Location**.
- Check whether the threshold is too small.**
- Step 3** Check the status of the services that depend on HDFS. Check whether the services run slowly or task execution times out.
- If yes, go to **Step 8**.
  - If no, go to **Step 4**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > RPC**, and select **Average Time of Active NameNode RPC Processing** and click **OK**.

**Figure 10-22** Average Time of Active NameNode RPC Processing

- Step 5** On the **Average Time of Active NameNode RPC Processing** monitoring page, obtain the value of the NameService node involved in this alarm.
- Step 6** On the FusionInsight Manager portal, choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS**. Locate **Average Time of Active NameNode RPC Processing** and click the **Modify** in the **Operation** column of the default rule. The **Modify Rule** page is displayed. Change **Threshold** to 150% of the peak value within one day before and after the alarm is generated. Click **OK** to save the new threshold.

**Figure 10-23** Modify Rule

Thresholds: Start and End Time Threshold

-   ms

**Step 7** Wait for 5 minutes and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Check whether the CPU performance of the NameNode node is sufficient.**

**Step 8** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and check whether **ALM-12016 CPU Usage Exceeds the Threshold** is generated for the NameNode node.

- If yes, go to [Step 9](#).
- If no, go to [Step 11](#).

**Step 9** Handle **ALM-12016 CPU Usage Exceeds the Threshold** by taking recommended actions.

**Step 10** Wait for 10 minutes and check whether alarm 14021 is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

**Check whether the memory of the NameNode node is too small.**

**Step 11** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and check whether **ALM-14007 HDFS NameNode Heap Memory Usage Exceeds the Threshold** is generated for the NameNode node.

- If yes, go to [Step 12](#).
- If no, go to [Step 14](#).

**Step 12** Handle **ALM-14007 HDFS NameNode Heap Memory Usage Exceeds the Threshold** by taking recommended actions.

- Step 13** Wait for 10 minutes and check whether alarm 14021 is automatically cleared.
- If yes, no further action is required.
  - If no, go to [Step 14](#).

**Check whether NameNode parameters are configured properly.**

- Step 14** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Configurations > All Configurations**. Search for parameter **dfs.namenode.handler.count** and view its value. If the value is less than or equal to 128, change it to **128**. If the value is greater than 128 but less than 192, change it to **192**.
- Step 15** Search for parameter **ipc.server.read.threadpool.size** and view its value. If the value is less than 5, change it to **5**.
- Step 16** Click **Save** and click **OK**.
- Step 17** On the **Instance** page of HDFS, select the standby NameNode of NameService involved in this alarm and choose **More > Restart Instance**. Enter the password and click **OK**. Wait until the standby NameNode is started up.
- Step 18** On the **Instance** page of HDFS, select the active NameNode of NameService involved in this alarm and choose **More > Restart Instance**. Enter the password and click **OK**. Wait until the active NameNode is started up.
- Step 19** Wait for 1 hour and then check whether the alarm is automatically cleared.
- If yes, no further action is required.
  - If no, go to [Step 20](#).
- Collect fault information.**

## 10.108 ALM-14022 NameNode Average RPC Queuing Time Exceeds the Threshold

### Description

The system checks the average RPC queuing time of NameNode every 30 seconds, and compares the actual average RPC queuing time with the threshold (default value: 200 ms). This alarm is generated when the system detects that the average RPC queuing time exceeds the threshold for several consecutive times (10 times by default).

You can choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the average RPC queuing time of NameNode is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the average RPC queuing time of NameNode is less than or equal to 90% of the threshold.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14022	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

NameNode cannot process the RPC requests from HDFS clients, upper-layer services that depend on HDFS, and DataNode in a timely manner. Specifically, the services that access HDFS run slowly or the HDFS service is unavailable.

## Possible Causes

- The CPU performance of NameNode nodes is insufficient and therefore NameNode nodes cannot process messages in a timely manner.
- The configured NameNode memory is too small and frame freezing occurs on the JVM due to frequent full garbage collection.
- NameNode parameters are not configured properly, so NameNode cannot make full use of system performance.
- The volume of services that access HDFS is too large and therefore NameNode is overloaded.

## Procedure

### Obtain alarm information.

**Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

**Step 2** Check the alarm. Obtain the alarm generation time from **Generated**. Obtain the host name of the NameNode node involved in this alarm from the **HostName** information of **Location**. Then obtain the name of the NameService node involved in this alarm from the **NameServiceName** information of **Location**.

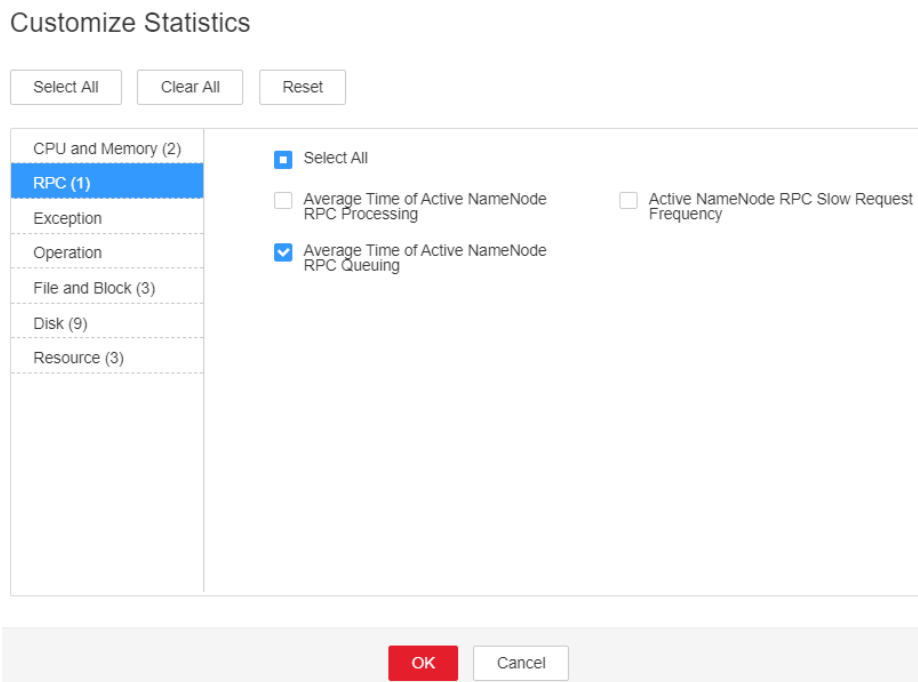

### Check whether the threshold is too small.

**Step 3** Check the status of the services that depend on HDFS. Check whether the services run slowly or task execution times out.

- If yes, go to [Step 8](#).
- If no, go to [Step 4](#).

**Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > RPC**, and select **Average Time of Active NameNode RPC Queuing** and click **OK**.

**Figure 10-24** Average Time of Active NameNode RPC Queuing

**Step 5** On the **Average Time of Active NameNode RPC Queuing** monitoring page, obtain the value of the NameService node involved in this alarm.

**Step 6** On the FusionInsight Manager portal, choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS**. Locate **Average Time of Active NameNode RPC Queuing** and click the **Modify** in the **Operation** column of the default rule. The **Modify Rule** page is displayed. Change **Threshold** to 150% of the monitored value. Click **OK** to save the new threshold.

**Step 7** Wait for 1 minute and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Check whether the CPU performance of the NameNode node is sufficient.**

**Step 8** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and check whether **ALM-12016 HDFS NameNode Memory Usage Exceeds the Threshold** is generated.

- If yes, go to [Step 9](#).
- If no, go to [Step 11](#).

**Step 9** Handle **ALM-12016 CPU Usage Exceeds the Threshold** by taking recommended actions.

**Step 10** Wait for 10 minutes and check whether alarm 14022 is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

**Check whether the memory of the NameNode node is too small.**

**Step 11** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and check whether **ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold** is generated.

- If yes, go to [Step 12](#).
- If no, go to [Step 14](#).

**Step 12** Handle **ALM-14007 CPU Usage Exceeds the Threshold** by taking recommended actions.

**Step 13** Wait for 10 minutes and check whether alarm 14022 is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 14](#).

**Check whether NameNode parameters are configured properly.**

**Step 14** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Configurations > All Configurations**. Search for parameter **dfs.namenode.handler.count** and view its value. If the value is less than or equal to 128, change it to **128**. If the value is greater than 128 but less than 192, change it to **192**.

**Step 15** Search for parameter **ipc.server.read.threadpool.size** and view its value. If the value is less than 5, change it to **5**.

**Step 16** Click **Save**, and click **OK**.

**Step 17** On the **Instance** page of HDFS, select the standby NameNode of NameService involved in this alarm and choose **More > Restart Instance**. Enter the password and click **OK**. Wait until the standby NameNode is started up.

**Step 18** On the **Instance** page of HDFS, select the active NameNode of NameService involved in this alarm and choose **More > Restart Instance**. Enter the password and click **OK**. Wait until the active NameNode is started up.

**Step 19** Wait for 1 hour and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 20](#).

**Check whether the HDFS workload changes and reduce the workload properly.**

**Step 20** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS**. Click the drop-down menu in the upper right corner of **Chart**, click **Customize**, select **Average Time of Active NameNode RPC Queuing** and click **OK**.

**Figure 10-25** Average Time of Active NameNode RPC Queuing

**Step 21** Click . The **Details** page is displayed.

**Step 22** Set the monitoring data display period, from 5 days before the alarm generation time to the alarm generation time. Click **OK**.

**Step 23** On the **Average RPC Queuing Time** monitoring page, check whether the point in time when the queuing time increases abruptly exists.

- If yes, go to **Step 24**.
- If no, go to **Step 27**.

**Step 24** Confirm and check the point in time. Check whether a new task frequently accesses HDFS and whether the access frequency can be reduced.

**Step 25** If a Balancer task starts at the point in time, stop the task or specify a node for the task to reduce the HDFS workload.

**Step 26** Wait for 1 hour and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 27**.

#### Collect fault information.

**Step 27** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 28** Select **HDFS** in the required cluster from the **Service**.

**Step 29** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 30** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

# 10.109 ALM-14023 Percentage of Total Reserved Disk Space for Replicas Exceeds the Threshold

## Description

The system checks the percentage of total reserved disk space for replicas (Total reserved disk space for replicas/(Total reserved disk space for replicas + Total remaining disk space)) every 30 seconds and compares the actual percentage with the threshold (**90%** by default). This alarm is generated when the percentage of total reserved disk space for replicas exceeds the threshold for multiple consecutive times (**Trigger Count**).

The alarm is cleared in the following two scenarios: The value of **Trigger Count** is **1** and the percentage of total reserved disk space for replicas is less than or equal to the threshold; the value of **Trigger Count** is greater than **1** and the percentage of total reserved disk space for replicas is less than or equal to 90% of the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14023	Minor	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.

Name	Meaning
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

The performance of writing data to HDFS is affected. If all remaining DataNode space is reserved for replicas, writing HDFS data fails.

## Possible Causes

- The alarm threshold is improperly configured.
- The disk space configured for the HDFS cluster is insufficient.
- The volume of services that access HDFS is too large and therefore DataNode is overloaded.

## Procedure

Check whether the alarm threshold is appropriate.

**Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS > Disk > Percentage of Reserved Space for Replicas of Unused Space** to check whether the alarm threshold is appropriate. (The default threshold is **90%**. Users can change it as required.)

- If yes, go to [Step 4](#).
- If no, go to [Step 2](#).

**Step 2** Choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS > Disk > Percentage of Reserved Space for Replicas of Unused Space** and Click **Modify**, change the threshold based on the actual usage.

**Figure 10-26** Modify Thresholds

**Step 3** Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

Check whether an alarm indicating insufficient disk space is generated.

**Step 4** On the FusionInsight Manager portal, check whether **ALM-14001 HDFS Disk Usage Exceeds the Threshold** or **ALM-14002 DataNode Disk Usage Exceeds the Threshold** exists on the **O&M > Alarm > Alarms** page.

- If yes, go to [Step 5](#).
- If no, go to [Step 7](#).

**Step 5** Handle the alarm by referring to instructions in **ALM-14001 HDFS Disk Usage Exceeds the Threshold** or **ALM-14002 DataNode Disk Usage Exceeds the Threshold** and check whether the alarm is cleared.

- If yes, go to [Step 6](#).
- If no, go to [Step 7](#).

**Step 6** Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Expand the DataNode capacity.**

**Step 7** Expand the DataNode capacity.

**Step 8** Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Collect fault information.**

**Step 9** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 10** Select **HDFS** in the required cluster from the **Service**.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.110 ALM-14024 Tenant Space Usage Exceeds the Threshold

## Description

The system checks the space usage (used space of each directory/space allocated to each directory) of each directory associated with a tenant every hour and compares the space usage of each directory with the threshold set for the directory. This alarm is generated when the space usage exceeds the threshold.

This alarm is cleared when the space usage is less than or equal to the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14024	Minor	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
TenantName	Specifies the tenant for which the alarm is generated.
DirectoryName	Specifies the directory for which the alarm is generated.
Trigger condition	Specifies the threshold for triggering the alarm.

## Impact on the System

This alarm is generated if the space usage of the tenant directory exceeds the custom threshold. File writing to the directory is not affected. If the used space exceeds the maximum storage space allocated to the directory, the HDFS fails to write data to the directory.

## Possible Causes

- The alarm threshold is improperly configured.
- The space allocated to the tenant is improper.

## Procedure

**Check whether the alarm threshold is appropriate.**

- Step 1** View the alarm location information to obtain the tenant name and tenant directory for which the alarm is generated.

**Step 2** On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the storage space threshold configured for the tenant directory for which the alarm is generated is proper. (The default value 90% is a proper value. You can set it based on the site requirements.)

- If yes, go to [Step 5](#).
- If no, go to [Step 3](#).

**Step 3** On the **Resources** page, click **Modify** to modify or delete the storage space threshold.

**Step 4** About one minute later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Check whether the space allocated to the tenant is appropriate.**

**Step 5** On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the storage space quota of the tenant directory for which the alarm is generated is proper based on the actual service status of the tenant directory.

- If yes, go to [Step 8](#).
- If no, go to [Step 6](#).

**Step 6** On the **Resources** page, click **Modify** to modify the storage space quota.

**Step 7** About one minute later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Collect fault information.**

**Step 8** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 9** Select **HDFS** in the required cluster and **NodeAgent** under **Manager** from the **Service**.

**Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 11** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## 10.111 ALM-14025 Tenant File Object Usage Exceeds the Threshold

### Description

The system checks the file object usage (used file objects of each directory/ number of file objects allocated to each directory) of each directory associated with a tenant every hour and compares the file object usage of each directory with the threshold set for the directory. This alarm is generated when the file object usage exceeds the threshold.

This alarm is cleared when the file object usage is less than or equal to the threshold.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14025	Minor	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
TenantName	Specifies the tenant for which the alarm is generated.
DirectoryName	Specifies the directory for which the alarm is generated.
Trigger condition	Specifies the threshold for triggering the alarm.

### Impact on the System

This alarm is generated if the usage of file objects in a tenant directory exceeds the custom threshold. File writing to the directory is not affected. If the number of

used file objects exceeds the maximum number of file objects allocated to the directory, the HDFS fails to write data to the directory.

## Possible Causes

- The alarm threshold is improperly configured.
- The maximum number of file objects allocated to the tenant directory is inappropriate.

## Procedure

### Check whether the alarm threshold is appropriate.

- Step 1** View the alarm location information to obtain the tenant name and tenant directory for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the file object threshold configured for the tenant directory for which the alarm is generated is proper. (The default value 90% is a proper value. You can set it based on the site requirements.)
- If yes, go to [Step 5](#).
  - If no, go to [Step 3](#).
- Step 3** On the **Resources** page, click **Modify** to modify or delete the file object threshold of the tenant directory for which the alarm is generated.
- Step 4** About one minute later, check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 5](#).

### Check whether the maximum number of file objects allocated to the tenant is appropriate.

- Step 5** On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the maximum number of file objects configured for the tenant directory for which the alarm is generated is proper based on the actual service status of the tenant directory.
- If yes, go to [Step 8](#).
  - If no, go to [Step 6](#).
- Step 6** On the **Resources** page, click **Modify** to modify or delete the maximum number of file objects configured for the tenant directory.
- Step 7** About one minute later, check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 8](#).

### Collect fault information.

- Step 8** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 9** Select **HDFS** in the required cluster and **NodeAgent** under **Manager** from the **Service**.

**Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 11** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.112 ALM-14026 Blocks on DataNode Exceed the Threshold

## Alarm Description

The system checks the number of blocks on each DataNode every 30 seconds. This alarm is generated when the number of blocks on the DataNode exceeds the threshold.

If **Trigger Count** is **1** and the number of blocks on the DataNode is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1** and the number of blocks on the DataNode is less than or equal to 90% of the threshold, this alarm is cleared.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14026	Minor	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.

Parameter	Description
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

If this alarm is reported, there are too many blocks on the DataNode. In this case, data writing into the HDFS may fail due to insufficient disk space.

## Possible Causes

- The alarm threshold is improperly configured.
- Data skew occurs among DataNodes.
- The disk space configured for the HDFS cluster is insufficient.

## Handling Procedure

### Change the threshold.

- Step 1** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **HDFS**. Then choose **Configurations > All Configurations**. On the displayed page, find the **GC\_OPTS** parameter under **HDFS->DataNode**.
- Step 2** Set the threshold of the DataNode blocks. Specifically, change the value of **Xmx** of the **GC\_OPTS** parameter. **Xmx** specifies the memory, and each GB memory supports a maximum of 500,000 DataNode blocks. Set the memory as required. Confirm that **GC\_PROFILE** is set to **custom** and save the configuration.
- Step 3** Choose **Cluster**, click the name of the desired cluster, and choose **HDFS > Instance**. Select the DataNode instance whose status is **Expired**, click **More**, and select **Restart Instance** to make the **GC\_OPTS** configuration take effect.
- Step 4** Check whether the alarm is cleared 5 minutes later.
  - If yes, no further action is required.
  - If no, go to [Step 5](#).

### Check whether associated alarms are reported.

- Step 5** On FusionInsight Manager, choose **O&M > Alarm > Alarms**, and check whether the **ALM-14002 DataNode Disk Usage Exceeds the Threshold** alarm exists.
  - If yes, go to [Step 6](#).
  - If no, go to [Step 8](#).
- Step 6** Handle the alarm by following the instructions in **ALM-14002 DataNode Disk Usage Exceeds the Threshold** and check whether the alarm is cleared.
  - If yes, go to [Step 7](#).
  - If no, go to [Step 8](#).

**Step 7** Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Expand the DataNode capacity.**

**Step 8** Expand the DataNode capacity.

**Step 9** On FusionInsight Manager, wait for 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

**Collect fault information.**

**Step 10** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 11** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

**Step 12** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 13** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

**Configuration rules of the DataNode JVM parameter.**

Default value of the DataNode JVM parameter **GC\_OPTS**:

```
-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M -
XX:MetaspaceSize=128M -XX:MaxMetaspaceSize=128M -
XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -
XX:CMSInitiatingOccupancyFraction=65 -XX:+PrintGCDetails -
Dsun.rmi.dgc.client.gcInterval=0x7FFFFFFFFFFFFFFE -
Dsun.rmi.dgc.server.gcInterval=0x7FFFFFFFFFFFFFFE -XX:-
OmitStackTraceInFastThrow -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation
-XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M -
Djdk.tls.ephemeralDHKeySize=2048
```

Average number of saved blocks = Number of HDFS blocks x 3/Number of DataNodes

 NOTE

To obtain the number of HDFS blocks, log in to FusionInsight Manager, choose **Cluster > Services > HDFS**, click **NameNode(xxx,Active)** to the right of **NameNode Web UI** to go to the native HDFS web UI, and then view the information in the **Summary** area.

## Summary

Security is on.  
Safemode is off.  
1,580 files and directories, 1,183 blocks (1,183 replicated blocks, 0 erasure coded block groups) = 2,763 total filesystem object(s).  
Heap Memory used 179.06 MB of 1.99 GB Heap Memory. Max Heap Memory is 3.98 GB.  
Non Heap Memory used 134 MB of 137.06 MB Committed Non Heap Memory. Max Non Heap Memory is 488 MB.

If the average number of blocks on a single DataNode has changed, modify **-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M** in the default value. The following table lists the reference values.

**Table 10-3** DataNode JVM configuration

Average Number of Blocks in a DataNode Instance	Reference Value
2,000,000	-Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
5,000,000	-Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

**Xmx** specifies memory which corresponds to the threshold of the number of DataNode blocks, and each GB memory supports a maximum of 500,000 DataNode blocks. Set the memory as required.

## 10.113 ALM-14027 DataNode Disk Fault

### Alarm Description

The system checks the disk status on DataNodes every 60 seconds. This alarm is generated when a disk is faulty.

After all faulty disks on the DataNode are recovered, you need to manually clear the alarm and restart the DataNode.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14027	Major	No

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Failed Volumes	Specifies the list of faulty disks.

## Impact on the System

If this alarm is reported, there are abnormal disk partitions on the DataNode. This may cause the loss of written files.

## Possible Causes

- The hard disk is faulty.
- The disk permissions are configured improperly.

## Handling Procedure

**Check whether a disk alarm is generated.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms** and check whether **ALM-12014 Partition Lost** or **ALM-12033 Slow Disk Fault** exists.
- If yes, go to **Step 2**.
  - If no, go to **Step 4**.
- Step 2** Rectify the fault by referring to the handling procedure of **ALM-12014 Partition Lost** or **ALM-12033 Slow Disk Fault**. Then, check whether the alarm is cleared.
- If yes, go to **Step 3**.
  - If no, go to **Step 4**.
- Step 3** Wait 5 minutes and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 4**.

**Modify disk permissions.**

- Step 4** Choose **O&M > Alarm > Alarms** and view **Location** and **Additional Information** of the alarm to obtain the location of the faulty disk.

- Step 5** Log in to the node for which the alarm is generated as user **root**. Go to the directory where the faulty disk is located, and run the **ll** command to check whether the permission of the faulty disk is **711** and whether the user is **omm**.
- If yes, go to [Step 8](#).
  - If no, go to [Step 6](#).
- Step 6** Modify the permission of the faulty disk. For example, if the faulty disk is **data1**, run the following commands:
- ```
chown omm:wheel data1  
chmod 711 data1
```
- Step 7** In the alarm list on Manager, click **Clear** in the **Operation** column of the alarm to manually clear the alarm. Choose **Cluster > Services > HDFS > Instance**, select the DataNode, choose **More > Restart Instance**, wait for 5 minutes, and check whether a new alarm is reported.
- If no, no further action is required.
 - If yes, go to [Step 8](#).
- Collect the fault information.**
- Step 8** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 9** Expand the **Service** drop-down list, and select **HDFS** and **OMS** for the target cluster.
- Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 11** Contact O&M personnel and provide the collected logs.
- End

Alarm Clearance

After the fault is rectified, the system does not automatically clear this alarm and you need to manually clear the alarm.

Related Information

None

10.114 ALM-14028 Number of Blocks to Be Supplemented Exceeds the Threshold

Alarm Description

The system checks the number of blocks to be supplemented every 30 seconds and compares the number with the threshold. The number of blocks to be

supplemented has a default threshold. This alarm is generated when the number of blocks to be supplemented exceeds the threshold.

You can change the threshold specified by **Blocks Under Replicated (NameNode)** by choosing **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS > File and Block**.

If **Trigger Count** is set to **1** and the number of blocks to be supplemented is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1** and the number of blocks to be supplemented is less than or equal to 90% of the threshold, this alarm is cleared.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 14028 | Minor | Yes |

Alarm Parameters

| Parameter | Description |
|-------------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |
| NameServiceName | Specifies the NameService for which the alarm was generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

Data stored in HDFS is lost. HDFS may enter the security mode and cannot provide write services. Lost block data cannot be restored.

Possible Causes

- The DataNode instance is abnormal.
- Data is deleted.
- The number of replicas written into the file is greater than the number of DataNodes.

Handling Procedure

- Step 1** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, check whether alarm **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold** is generated.
- If yes, go to **Step 2**.
 - If no, go to **Step 3**.
- Step 2** Rectify the fault according to the handling procedure of **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold**. Five minutes later, check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to **Step 3**.
- Step 3** Log in to the HDFS client as user **root**. The user password is defined by the user before the installation. Contact the MRS cluster administrator to obtain the password. Run the following commands:
- Security mode:

```
cd Client installation directory  
source bigdata_env  
kinit hdfs
```
 - Normal mode:

```
su - omm  
cd Client installation directory  
source bigdata_env
```
- Step 4** Run the **hdfs fsck / >> fsck.log** command to obtain the status of the current cluster.
- Step 5** Run the following command to count the number (M) of blocks to be replicated:
- ```
cat fsck.log | grep "Under-replicated"
```
- Step 6** Run the following command to count the number ( $N$ ) of blocks to be replicated in the **/tmp/hadoop-yarn/staging/** directory:
- ```
cat fsck.log | grep "Under replicated" | grep "/tmp/hadoop-yarn/staging/" | wc -l
```
-  **NOTE**
- /tmp/hadoop-yarn/staging/** is the default directory. If the directory is modified, obtain it from the configuration item **yarn.app.mapreduce.am.staging-dir** in the **mapred-site.xml** file.
- Step 7** Check whether the percentage of N is greater than 50% ($N/M > 50\%$).
- If yes, go to **Step 8**.
 - If no, go to **Step 9**.
- Step 8** Run the following command to reconfigure the number of file replicas in the directory (set the number of file replicas to the number of DataNodes or the default number of file replicas):
- ```
hdfs dfs -setrep -w Number of file replicas/tmp/hadoop-yarn/staging/
```

 **NOTE**

To obtain the default number of file replicas:

Log in to FusionInsight Manager, choose **Cluster > Services > HDFS > Configurations > All Configurations**, and search for the **dfs.replication** parameter. The value of this parameter is the default number of file replicas.

Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Collect the fault information.**

**Step 9** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 10** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 10.115 ALM-14029 Number of Blocks in a Replica Exceeds the Threshold

## Alarm Description

The system checks the number of blocks in a single replica every four hours and compares the number with the threshold. There is a threshold for the number of blocks in a single replica. This alarm is generated when the actual number of blocks in a single replica exceeds the threshold.

This alarm is cleared when the number of blocks to be supplemented is less than the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14029	Minor	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
NameServiceName	Specifies the NameService for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

Replica data is prone to be lost when a node is faulty. Too many files of a single replica affect the security of the HDFS file system.

## Possible Causes

- The DataNode is faulty.
- The disk is faulty.
- Files are written to a single replica.

## Handling Procedure

**Step 1** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, check whether alarm **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold** is generated.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

**Step 2** Rectify the fault according to the handling procedure of **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold**. In the next detection period, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

- Step 3** Check whether files of a single replica have been written into the service.
- If yes, go to [Step 4](#).
  - If no, go to [Step 7](#).
- Step 4** Log in to the HDFS client as user **root**. The user password is defined by the user before the installation. Contact the MRS cluster administrator to obtain the password. Run the following commands:
- Security mode:  
`cd Client installation directory`  
`source bigdata_env`  
`kinit hdfs`
  - Normal mode:  
`su - omm`  
`cd Client installation directory`  
`source bigdata_env`
- Step 5** Run the following command on the client node to increase the number of replicas for a single replica file:
- ```
hdfs dfs -setrep -w file replica number file name or file path
```
- Step 6** In the next detection period, check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 7](#).
- Collect the fault information.**
- Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 8** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.
- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.116 ALM-14030 HDFS Allows Write of Single-Replica Data

Alarm Description

This alarm is generated when **dfs.single.replication.enable** is set to **true**, indicating that HDFS is configured to allow write of single-replica data.

This alarm is cleared when this function is disabled on HDFS.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 14030 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |

Impact on the System

If this configuration is enabled on the server and the number of HDFS replicas configured on the client is 1, single-replica data can be written to HDFS. Data of a single replica may be lost. Therefore, the system does not allow write of single-replica data by default. If a service requires single-replica data write to a directory, modify the HDFS configuration item **dfs.single.replication.exclude.pattern**.

Possible Causes

The HDFS configuration item **dfs.single.replication.enable** is set to **true**.

Handling Procedure

- Step 1** Log in to FusionInsight Manager and choose **Cluster > Services > HDFS**. On the page that is displayed, click the **Configurations** tab then the **All Configurations** sub-tab.

Step 2 Search for **dfs.single.replication.enable** in the search box, change the value of the configuration item to **false**, and click **Save**.

Step 3 Wait for about 10 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 5 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.117 ALM-14031 DataNode Process Is Abnormal

Alarm Description

The DataNode process checks the process status every 20 seconds. This alarm is generated when the process status is abnormal and does not recover for a long time.

This alarm is cleared when the process status recovers.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 14031 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

If the process status is abnormal, the process cannot provide services properly. As a result, the entire service may become abnormal.

Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state. The process may also be suspended and enter the T state.

Handling Procedure

Check whether the process is in the D, Z, or T state.

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. Wait for about 10 minutes and check whether the alarm is automatically cleared.
- If the alarm is not in the list, no further action is required.
 - If the alarm is in the list, view the alarm details and record the IP address of the host where the alarm is generated. Run the command in [Step 2](#).
- Step 2** Log in to the host where the alarm is generated as the **root** user and run the **su - omm** command to switch to the **omm** user.
- Step 3** Run the following command to check the process state:
- ```
ps ww -eo stat,cmd| grep -w org.apache.hadoop.hdfs.server.datanode.DataNode | grep -v grep | awk '{print $1}'
```
- Step 4** Check whether the command output contains any abnormal state (D, Z, or T).
- If the output contains any abnormal state, go to [Step 5](#).
  - If the output does not contain abnormal states, go to [Step 7](#).
- Step 5** Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)

**Step 6** Wait 5 minutes and check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm fails to be cleared, go to [Step 7](#).

**Collect fault information.**

**Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 8** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

**Step 9** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact O&M personnel and provide the collected logs.

----End

# 10.120 ALM-14034 Router Process Is Abnormal

## Alarm Description

The Router process checks the process status every 20 seconds. This alarm is generated when the process status is abnormal and does not recover for a long time.

This alarm is cleared when the process status recovers.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14034	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Parameter	Description
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

If the process status is abnormal, the process cannot provide services properly. As a result, the entire service may become abnormal.

## Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state. The process may also be suspended and enter the T state.

## Handling Procedure

**Check whether the process is in the D, Z, or T state.**

**Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. Wait for about 10 minutes and check whether the alarm is automatically cleared.

- If the alarm is not in the list, no further action is required.
- If the alarm is in the list, view the alarm details and record the IP address of the host where the alarm is generated. Run the command in [Step 2](#).

**Step 2** Log in to the host where the alarm is generated as the **root** user and run the **su - omm** command to switch to the **omm** user.

**Step 3** Run the following command to check whether the process state is abnormal:

```
ps ww -eo stat,cmd| grep -w
org.apache.hadoop.hdfs.server.federation.router.DFSRouter | grep -v grep |
awk '{print$1}'
```

**Step 4** Check whether the command output contains any abnormal state (D, Z, or T).

- If the output contains any abnormal state, go to [Step 5](#).
- If the output does not contain abnormal states, go to [Step 7](#).

**Step 5** Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)

**Step 6** Wait 5 minutes and check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm fails to be cleared, go to [Step 7](#).

**Collect fault information.**

**Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

- Step 8** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.
- Step 9** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

# 10.121 ALM-14035 HttpFS Process Is Abnormal

## Alarm Description

The HttpFS process checks the process status every 20 seconds. This alarm is generated when the process status is abnormal and does not recover for a long time.

This alarm is cleared when the process status recovers.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14035	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

If the process status is abnormal, the process cannot provide services properly. As a result, the entire service may become abnormal.

## Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state. The process may also be suspended and enter the T state.

## Handling Procedure

**Check whether the process is in the D, Z, or T state.**

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. Wait for about 10 minutes and check whether the alarm is automatically cleared.
- If the alarm is not in the list, no further action is required.
  - If the alarm is in the list, view the alarm details and record the IP address of the host where the alarm is generated. Run the command in [Step 2](#).
- Step 2** Log in to the host where the alarm is generated as the **root** user and run the **su - omm** command to switch to the **omm** user.
- Step 3** Run the following command to check whether the process state is abnormal:
- ```
ps ww -eo stat,cmd| grep -w  
org.apache.hadoop.fs.http.server.HttpFSServerWebServer | grep -v grep | awk  
'{print$1}'
```
- Step 4** Check whether the command output contains any abnormal state (D, Z, or T).
- If the output contains any abnormal state, go to [Step 5](#).
 - If the output does not contain abnormal states, go to [Step 7](#).
- Step 5** Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)
- Step 6** Wait 5 minutes and check whether the alarm is cleared.
- If the alarm is cleared, no further action is required.
 - If the alarm fails to be cleared, go to [Step 7](#).
- Collect fault information.**
- Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 8** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.
- Step 9** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.122 ALM-16000 Percentage of Sessions Connected to the HiveServer to Maximum Number Allowed Exceeds the Threshold

Description

The system detects the percentage of sessions connected to the HiveServer to the maximum number of allowed sessions every 30 seconds. This indicator can be viewed on the **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** > *HiveServer instance*. This alarm is generated when the percentage exceeds the default value **90%**.

To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Hive** > **Percentage of Sessions Connected to the HiveServer to Maximum Number of Sessions Allowed by the HiveServer**.

When the **Trigger Count** is 1, this alarm is cleared when the percentage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the percentage is less than or equal to 90% of the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 16000 | Minor | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |

| Name | Meaning |
|-------------------|--|
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

If a connection alarm is generated, too many sessions are connected to Hive and new connections are unavailable.

Possible Causes

Too many clients are connected to HiveServer.

Procedure

Increase the maximum number of connections to Hive.

- Step 1** On the FusionInsight Manager portal, Choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configurations** > **All Configurations**.
- Step 2** Search for **hive.server.session.control.maxconnections** and increase the value of this parameter. If the value of this parameter is **A**, the threshold is **B**, and the number of sessions connected to the HiveServer is **C**, adjust the value of this parameter according to **A x B > C**. To view the number of sessions connected to the HiveServer, check the value of **Statistics for Sessions of the HiveServer** on the Hive monitoring page.
- Step 3** Check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 4](#).

Collect fault information.

- Step 4** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.
- Step 5** Select **Hive** in the required cluster from the **Service**.
- Step 6** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 7** Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.123 ALM-16001 Hive Warehouse Space Usage Exceeds the Threshold

Description

This alarm is generated when the Hive warehouse space usage exceeds the specified threshold (85% by default). The system checks the Hive data warehouse space usage every 30s. The indicator **Percentage of HDFS Space Used by Hive to the Available Space** can be viewed on the Hive service monitoring page.

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Hive > Percentage of HDFS Space Used by Hive to the Available Space**.

When the **Trigger Count** is 1, this alarm is cleared when the Hive warehouse space usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the Hive warehouse space usage is less than or equal to 90% of the threshold.

NOTE

The administrator can reduce the warehouse space usage by expanding the warehouse capacity or releasing the used space.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 16001 | Minor | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |

| Name | Meaning |
|-------------------|--|
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

The system fails to write data, which causes data loss.

Possible Causes

- The upper limit of the HDFS capacity available for Hive is too small.
- The HDFS space is insufficient.
- Some data nodes break down.

Procedure

Expand the system configuration.

- Step 1** Analyze the cluster HDFS capacity usage and increase the upper limit of the HDFS capacity available for Hive.

Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configurations** > **All Configurations**, find **hive.metastore.warehouse.size.percent**, and increase its value so that larger HDFS capacity will be available for Hive. Assume that the value of the configuration item is A, the total HDFS storage space is B, the threshold is C, and the HDFS space used by Hive is D. The adjustment policy is $A \times B \times C > D$. The total HDFS storage space can be viewed on the HDFS NameNode page. The HDFS space used by Hive can be viewed on the Hive monitoring page.

- Step 2** Check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 3](#).

Expand the system.

- Step 3** Expand the system.

- Step 4** Check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 5](#).

Check whether the data node is normal.

- Step 5** On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms**.

- Step 6** Check whether "ALM-12006 Node Fault", "ALM-12007 Process Fault", or "ALM-14002 DataNode Disk Usage Exceeds the Threshold" exist.
- If yes, go to [Step 7](#).
 - If no, go to [Step 9](#).
- Step 7** Clear the alarm by following the steps provided in "ALM-12006 Node Fault", "ALM-12007 Process Fault", and "ALM-14002 DataNode Disk Usage Exceeds the Threshold".
- Step 8** Check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 9](#).
- Collect fault information.**
- Step 9** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 10** Select **Hive** in the required cluster from the **Service**.
- Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 12** Contact the O&M personnel and send the collected logs.
- End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.124 ALM-16002 Hive SQL Execution Success Rate Is Lower Than the Threshold

Description

The system checks the percentage of the HQL statements that are executed successfully in every 30 seconds. The formula is: Percentage of HQL statements that are executed successfully = Number of HQL statements that are executed successfully by Hive in a specified period/Total number of HQL statements that are executed by Hive. This indicator can be viewed on the **Cluster > Name of the desired cluster > Services > Hive > Instance > HiveServer instance**. The default threshold of the percentage of HQL statements that are executed successfully is **90%**. An alarm is reported when the percentage is lower than the **90%**. Users can view the name of the host where an alarm is generated in the location information about the alarm. The IP address of the host is the IP address of the HiveServer node.

Users can modify the threshold by choosing **O&M > Alarm > Thresholds > Name of the desired cluster > Hive > Percentage of HQL Statements That Are Executed Successfully by Hive**.

This alarm is cleared when the execution success rate is higher than 110% of the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 16002 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

The system configuration and performance cannot meet service processing requirements.

Possible Causes

- A syntax error occurs in HQL statements.
- The HBase service is abnormal when a Hive on HBase task is performed.
- The Spark service is abnormal when a Hive on Spark task is performed.
- The dependent basic services, such as HDFS, Yarn, and ZooKeeper, are abnormal.

Procedure

Check whether the HQL statements comply with syntax.

- Step 1** On the FusionInsight Manager page, choose **O&M > Alarm** to view the alarm details and obtain the node where the alarm is generated.
- Step 2** Use the Hive client to log in to the HiveServer node where an alarm is reported. Query the HQL syntax provided by Apache, and check whether the HQL commands are correct. For details, see <https://cwiki.apache.org/confluence/display/hive/languagemanual>.
- If yes, go to **Step 4**.
 - If no, go to **Step 3**.

 **NOTE**

To view the user who runs an incorrect statement, you can download the hiveserver audit log file of the HiveServer node where this alarm is generated. **Start Data** and **End Data** are 10 minutes before and after the alarm generation time respectively. Open the log file and search for the **Result=FAIL** keyword to filter the log information about the incorrect statement, and then view the user who runs the incorrect statement according to **UserName** in the log information.

- Step 3** Enter the correct HQL statements, and check whether the command can be properly executed.
- If yes, go to **Step 12**.
 - If no, go to **Step 4**.

Check whether the HBase service is abnormal.

- Step 4** Check whether an Hive on HBase task is performed with the user who runs the HQL command.
- If yes, go to **Step 5**.
 - If no, go to **Step 8**.
- Step 5** On the FusionInsight Manager page, click **Cluster > Name of the desired cluster > Services**, check whether the HBase service is normal in the service list.
- If yes, go to **Step 8**.
 - If no, go to **Step 6**.

- Step 6** Choose **O&M > Alarm**, check the related alarms displayed on the alarm page and clear them according to related alarm help.

- Step 7** Enter the correct HQL statements, and check whether the command can be properly executed.
- If yes, go to **Step 12**.
 - If no, go to **Step 8**.

Check whether the HDFS, Yarn, and ZooKeeper are normal.

- Step 8** On the FusionInsight Manager portal, click **Cluster > Name of the desired cluster > Services**.
- Step 9** In the service list, check whether the services, such as HDFS, Yarn, and ZooKeeper are normal.
- If yes, go to **Step 12**.
 - If no, go to **Step 10**.

- Step 10** Check the related alarms displayed on the alarm page and clear them according to related alarm help.
- Step 11** Enter the correct HQL statements, and check whether the command can be properly executed.
- If yes, go to **Step 12**.
 - If no, go to **Step 13**.
- Step 12** After 1 minute, check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to **Step 13**.
- Collect fault information.**
- Step 13** On the FusionInsight Manager home page, choose **O&M > Log > Download**.
- Step 14** Select the following nodes in the required cluster from the **Service**:
- MapReduce
 - Hive
- Step 15** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 16** Contact the O&M personnel and send the collected logs.
- End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.125 ALM-16003 Background Thread Usage Exceeds the Threshold

Description

The system checks the background thread usage in every 30 seconds. This alarm is generated when the usage of the background thread pool of Hive exceeds the threshold, 90% by default.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 16003 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

There are too many background threads, so the newly submitted task cannot run in time.

Possible Causes

The usage of the background thread pool of Hive is excessively high when:

- There are many tasks executed in the background thread pool of HiveServer.
- The capacity of the background thread pool of HiveServer is too small.

Procedure

Check the number of tasks executed in the background thread pool of HiveServer.

- Step 1** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive**. On the displayed page, click **HiveServer Instance** and check values of **Background Thread Count** and **Background Thread Usage**.

Figure 10-27 Background

Chart

Step 2 Check whether the number of background threads in the latest half an hour is excessively high. (By default, the queue number is 100, and the thread number is considered as high if it is 90 or larger.)

- If it is, go to **Step 3**.
- If it is not, go to **Step 5**.

Step 3 Adjust the number of tasks submitted to the background thread pool. (For example, cancel some time-consuming tasks with low performance.)

Step 4 Check whether the values of Background Thread Count and Background Thread Usage decrease.

- If it is, go to **Step 7**.
- If it is not, go to **Step 5**.

Check the capacity of the HiveServer background thread pool.

Step 5 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive**. On the displayed page, click **HiveServer Instance** and check values of Background Thread Count and Background Thread Usage.

Figure 10-28 Background

Chart

Step 6 Increase the value of `hive.server2.async.exec.threads` in the `${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/1_23_HiveServer/etc/hive-site.xml` file. For example, increase the value by 20%.

Step 7 Save the modification.

Step 8 Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 10 Select **Hive** in the required cluster from the **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.126 ALM-16004 Hive Service Unavailable

Description

This alarm is generated when the HiveServer service is unavailable. The system checks the HiveServer service status every 60 seconds.

This alarm is cleared when the HiveServer service is normal.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 16004 | Critical | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The system cannot provide data loading, query, and extraction services.

Possible Causes

- Hive service unavailability may be related to the faults of the Hive process as well as basic services, such as ZooKeeper, Hadoop distributed file system (HDFS), Yarn, and DBService.
 - The ZooKeeper service is abnormal.
 - The HDFS service is abnormal.
 - The Yarn service is abnormal.
 - The DBService service is abnormal.
 - The Hive service process is abnormal. If the alarm is caused by Hive process fault, the alarm report has a delay of about 5 minutes.
- The network communication between the Hive and basic services is interrupted.
- The permission on the HDFS temporary directory of Hive is abnormal.
- The local disk space of the Hive node is insufficient.

Procedure

Check the HiveServer/MetaStore process status.

- Step 1** On the FusionInsight Manager portal, click **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance**. In the Hive instance list, check whether the HiveServer or MetaStore instances are in the Unknown state.
- If yes, go to [Step 2](#).
 - If no, go to [Step 4](#).
- Step 2** In the Hive instance list, choose **More** > **Restart Instance** to restart the HiveServer/MetaStore process.

NOTICE

During HiveServer or MetaStore instance restart, the instance cannot provide services for external systems. SQL tasks that are being executed on the instance may fail.

- Step 3** In the alarm list, check whether **Hive Service Unavailable** is cleared.
- If yes, no further action is required.
 - If no, go to [Step 4](#).

Check the ZooKeeper service status.

- Step 4** On the FusionInsight Manager, check whether the alarm list contains **Process Fault**.
- If yes, go to [Step 5](#).
 - If no, go to [Step 8](#).
- Step 5** In the **Process Fault**, check whether **ServiceName** is **ZooKeeper**.
- If yes, go to [Step 6](#).

- If no, go to [Step 8](#).

Step 6 Rectify the fault by following the steps provided in "ALM-12007 Process Fault".

Step 7 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

Check the HDFS service status.

Step 8 On the FusionInsight Manager, check whether the alarm list contains **HDFS Service Unavailable**.

- If yes, go to [Step 9](#).
- If no, go to [Step 11](#).

Step 9 Rectify the fault by following the steps provided in "ALM-14000 HDFS Service Unavailable".

Step 10 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

Check the Yarn service status.

Step 11 In FusionInsight Manager alarm list, check whether **Yarn Service Unavailable** is generated.

- If yes, go to [Step 12](#).
- If no, go to [Step 14](#).

Step 12 Rectify the fault. For details, see "ALM-18000 Yarn Service Unavailable".

Step 13 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 14](#).

Check the DBService service status.

Step 14 In FusionInsight Manager alarm list, check whether **DBService Service Unavailable** is generated.

- If yes, go to [Step 15](#).
- If no, go to [Step 17](#).

Step 15 Rectify the fault. For details, see "ALM-27001 DBService Service Unavailable".

Step 16 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 17](#).

Check the network connection between the Hive and ZooKeeper, HDFS, Yarn, and DBService.

Step 17 On the FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > Hive**.

Step 18 Click **Instance**.

The HiveServer instance list is displayed.

Step 19 Click **Host Name** in the row of **HiveServer**.

The active HiveServer host status page is displayed.

Step 20 Record the IP address under **Basic Information**.

Step 21 Use the IP address obtained in **Step 20** to log in to the host where the active HiveServer runs as user **omm**.

Step 22 Run the **ping** command to check whether communication between the host that runs the active HiveServer and the hosts that run the ZooKeeper, HDFS, Yarn, and DBService services is normal. (Obtain the IP addresses of the hosts that run the ZooKeeper, HDFS, Yarn, and DBService services in the same way as that for obtaining the IP address of the active HiveServer.)

- If yes, go to **Step 31**.
- If no, go to **Step 23**.

Step 23 Contact the administrator to restore the network.

Step 24 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 31**.

Check the permission on the HDFS temporary directory.

Step 25 Log in to the node where the HDFS client is located and run the following command to go to the HDFS client installation directory:

```
cd Client installation directory
```

```
source bigdata_env
```

```
kinit user with the supergroup permission (Skip this step for common clusters.)
```

Step 26 Run the following command to check whether the permission on the data warehouse directory is 770:

```
hdfs dfs -ls /tmp | grep hive-scratch
```

- If yes, go to **Step 29**.
- If no, go to **Step 27**.

Step 27 Run the following command to restore the default data warehouse permission:

```
hdfs dfs -chmod 770 /tmp/hive-scratch
```

Step 28 Wait for several minutes and check whether the Hive Service Unavailable alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 29**.

Check whether the local disk space is normal.

Step 29 Run the **df -h** command to check the root directory and check whether the disk usage of the **/srv**, **/var**, and **/opt** directories exceeds 95%.

- If yes, go to [Step 30](#).
- If no, go to [Step 31](#).

Step 30 Clear unnecessary information in the corresponding directory to ensure that the available disk space is greater than 80%. Wait for several minutes and check whether the Hive Service Unavailable alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 31](#).

Collect fault information.

Step 31 On the FusionInsight Manager, choose **O&M > Log > Download**.

Step 32 Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS
- Yarn
- DBService
- Hive

Step 33 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 34 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.127 ALM-16005 The Heap Memory Usage of the Hive Process Exceeds the Threshold

Description

The system checks the Hive service status every 30 seconds. The alarm is generated when the heap memory usage of an Hive service exceeds the threshold (95% of the maximum memory).

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > Hive** to change the threshold.

The alarm is cleared when the heap memory usage is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 16005 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service name for which the alarm is generated. |
| RoleName | Specifies the role name for which the alarm is generated. |
| HostName | Specifies the object (host ID) for which the alarm is generated. |

Impact on the System

When the heap memory usage of Hive is overhigh, the performance of Hive task operation is affected. In addition, a memory overflow may occur so that the Hive service is unavailable.

Possible Causes

The heap memory of the Hive instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

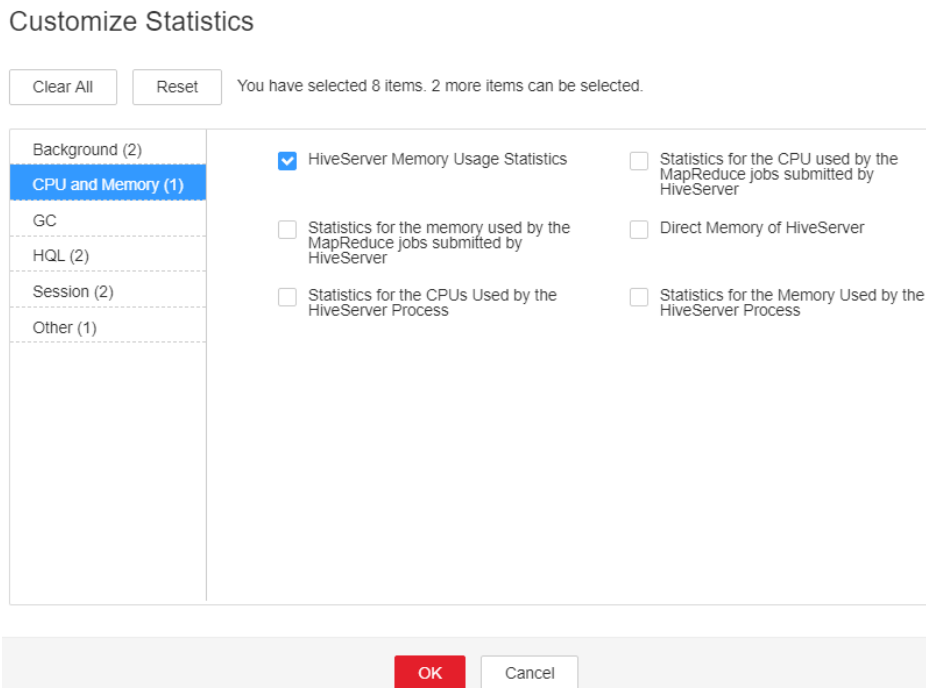

Procedure

Check heap memory usage.

- Step 1** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16005**. Then check the role name in **Location** and confirm the IP address of the instance.
 - If the role for which the alarm is generated is HiveServer, go to [Step 2](#).
 - If the role for which the alarm is generated is MetaStore, go to [Step 3](#).
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Hive > Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize > CPU and Memory**, and select **HiveServer Memory Usage Statistics** and click **OK**, check whether the used heap memory of the HiveServer service reaches the threshold(default value: 95%) of the maximum heap memory specified for HiveServer.

- If yes, go to [Step 4](#).
- If no, go to [Step 7](#).

Figure 10-29 HiveServer Memory Usage Statistics

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **MetaStore Memory Usage Statistics** and click **OK**, check whether the used heap memory of the MetaStore service reaches the threshold(default value: 95%) of the maximum heap memory specified for MetaStore.

- If yes, go to [Step 4](#).
- If no, go to [Step 7](#).

Figure 10-30 MetaStore Memory Usage Statistics

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configurations** > **All Configurations**. Choose **HiveServer/MetaStore** > **JVM**. Adjust the value of **-Xmx** in **HIVE_GC_OPTS/METASTORE_GC_OPTS** as the following rules. Click **Save**.

NOTE

Suggestions for GC parameter settings for the HiveServer:

- When the heap memory used by the HiveServer process reaches the threshold (default value: 95%) of the maximum heap memory set by the HiveServer process, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2GB by default, change the value of **-Xmx** to 4GB. You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically. On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Hive** > **CPU and Memory** > **HiveServer Heap Memory Usage Statistics (HiveServer)** to view **Threshold**.

Suggestions for GC parameter settings for the MetaServer:

- When the heap memory used by the MetaStore process reaches the threshold (default value: 95%) of the maximum heap memory set by the MetaStore process, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2GB by default, change the value of **-Xmx** to 4GB. On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Hive** > **CPU and Memory** > **MetaStore Heap Memory Usage Statistics (MetaStore)** to view **Threshold**.
- You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically.

Step 5 Click **More** > **Restart Service** to restart the service.

NOTICE

During Hive service restart, instances cannot provide services for external systems, and the SQL tasks that are being executed on the instances may fail.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 8 Select **Hive** in the required cluster from the **Service**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.128 ALM-16006 The Direct Memory Usage of the Hive Process Exceeds the Threshold

Description

The system checks the Hive service status every 30 seconds. The alarm is generated when the direct memory usage of an Hive service exceeds the threshold (95% of the maximum memory).

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > Hive** to change the threshold.

The alarm is cleared when the direct memory usage is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 16006 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service name for which the alarm is generated. |
| RoleName | Specifies the role name for which the alarm is generated. |
| HostName | Specifies the object (host ID) for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

When the direct memory usage of Hive is overhigh, the performance of Hive task operation is affected. In addition, a memory overflow may occur so that the Hive service is unavailable.

Possible Causes

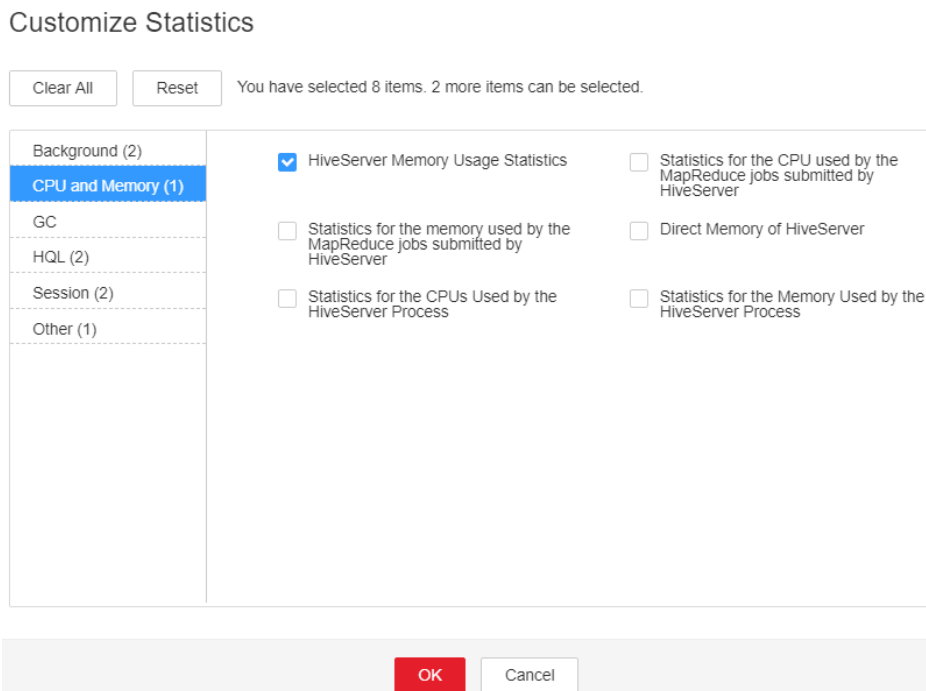

The direct memory of the Hive instance on the node is overused or the direct memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check direct memory usage.

- Step 1** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16006**. Then check the role name in **Location** and confirm the IP address of the instance.
- If the role for which the alarm is generated is HiveServer, go to [Step 2](#).
 - If the role for which the alarm is generated is MetaStore, go to [Step 3](#).
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Hive > Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize > CPU and Memory**, and select **HiveServer Memory Usage Statistics** and click **OK**, check whether the used direct memory of the HiveServer service reaches the threshold (default value: 95%) of the maximum direct memory specified for HiveServer.
- If yes, go to [Step 4](#).
 - If no, go to [Step 7](#).

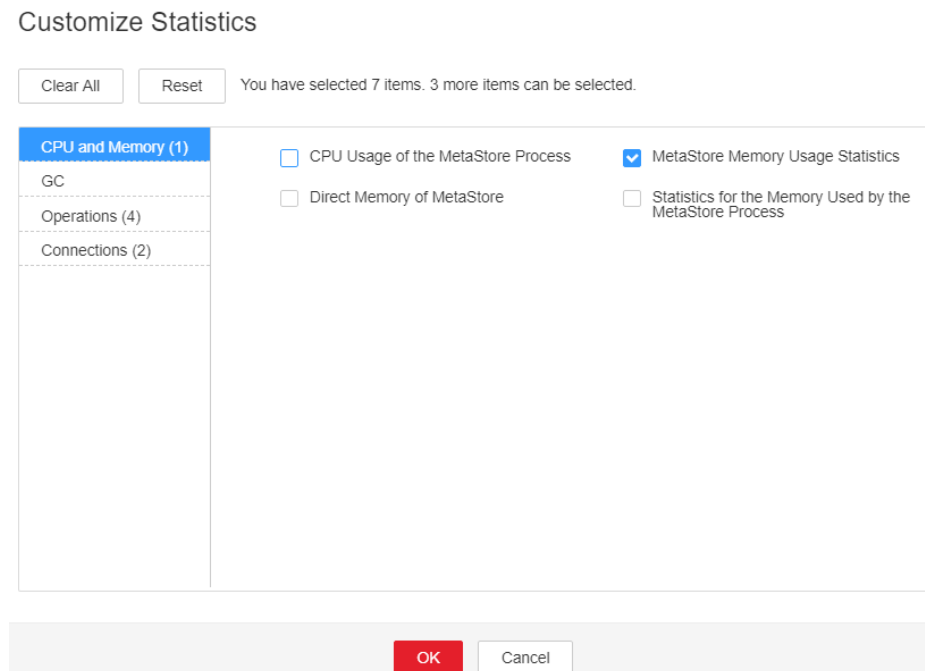

Figure 10-31 HiveServer Memory Usage Statistics

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **MetaStore Memory Usage Statistics** and click **OK**, check whether the used direct memory of the MetaStore service reaches the threshold(default value: 95%) of the maximum direct memory specified for MetaStore.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Figure 10-32 MetaStore Memory Usage Statistics

Step 4 On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Hive > Configurations > All Configurations**. Choose **HiveServer/MetaStore > JVM**. Adjust the value of **-XX:MaxDirectMemorySize** in **HIVE_GC_OPTS/METASTORE_GC_OPTS** as the following rules. Click **Save**.

NOTE

Suggestions for GC parameter settings for the HiveServer:

- It is recommended that you set the value of **-XX:MaxDirectMemorySize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 8 GB, **-XX:MaxDirectMemorySize** is set to 1024 MB. If **-Xmx** is set to 4 GB, **-XX:MaxDirectMemorySize** is set to 512 MB. It is recommended that the value of **-XX:MaxDirectMemorySize** be greater than or equal to 512 MB.

Suggestions for GC parameter settings for the MetaServer:

- It is recommended that you set the value of **-XX:MaxDirectMemorySize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 8 GB, **-XX:MaxDirectMemorySize** is set to 1024 MB. If **-Xmx** is set to 4 GB, **-XX:MaxDirectMemorySize** is set to 512 MB. It is recommended that the value of **-XX:MaxDirectMemorySize** be greater than or equal to 512 MB.

Step 5 Click **More > Restart Service** to restart the service.

NOTICE

During Hive service restart, instances cannot provide services for external systems, and the SQL tasks that are being executed on the instances may fail.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 8 Select **Hive** in the required cluster from the **Service**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.129 ALM-16007 Hive GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) time of the Hive service every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (exceeds 12 seconds for three consecutive checks.) To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Hive**. This alarm is cleared when the Hive GC time is shorter than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 16007 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service name for which the alarm is generated. |
| RoleName | Specifies the role name for which the alarm is generated. |

| Name | Meaning |
|-------------------|--|
| HostName | Specifies the object (host ID) for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

If the GC time exceeds the threshold, Hive data read and write are affected.

Possible Causes

The memory of Hive instances is overused, the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC time.

- Step 1** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16007**. Then check the role name in **Location** and confirm the IP address of the instance.
- If the role for which the alarm is generated is HiveServer, go to [Step 2](#).
 - If the role for which the alarm is generated is MetaStore, go to [Step 3](#).
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Hive > Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize > GC**, and select **Garbage Collection (GC) Time of HiveServer** and click **OK** to check whether the GC time is longer than 12 seconds.
- If yes, go to [Step 4](#).
 - If no, go to [Step 7](#).

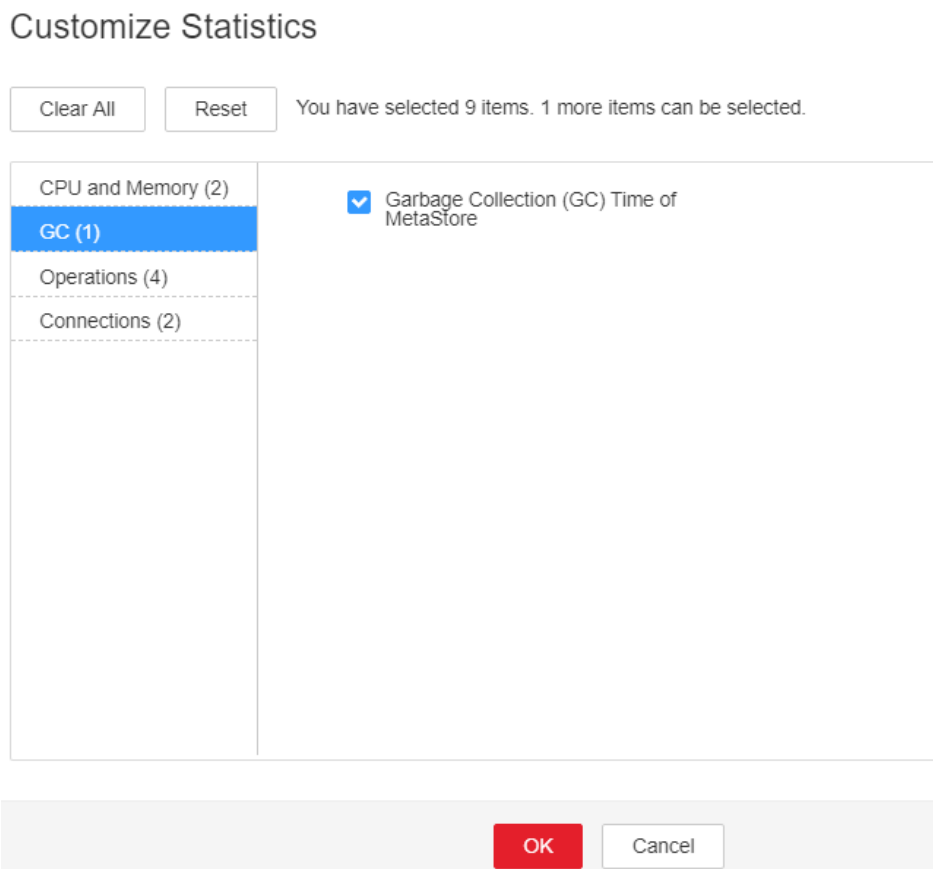

Figure 10-33 Garbage Collection (GC) Time of HiveServer
Customize Statistics

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **GC**, and select **Garbage Collection (GC) Time of MetaStore** and click **OK** to check whether the GC time is longer than 12 seconds.

- If yes, go to [Step 4](#).
- If no, go to [Step 7](#).

Figure 10-34 Garbage Collection (GC) Time of MetaStore

Check the current JVM configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configurations** > **All Configurations**. Choose **HiveServer/MetaStore** > **JVM**. Adjust the value of **-Xmx** in **HIVE_GC_OPTS/METASTORE_GC_OPTS** as the following rules. Click **Save**.

NOTE

Suggestions for GC parameter settings for the HiveServer:

- When the Hive GC time exceeds the threshold, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2 GB by default, change the value of **-Xmx** to 4 GB.
- You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically.

Suggestions for GC parameter settings for the MetaServer:

- When the Meta GC time exceeds the threshold, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2 GB by default, change the value of **-Xmx** to 4 GB.
- You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically.

Step 5 Click **More** > **Restart Service** to restart the service.

NOTICE

During Hive service restart, instances cannot provide services for external systems, and the SQL tasks that are being executed on the instances may fail.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

Collect fault information.

Step 7 On the FusionInsight Manager portal of active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 8 In the **Service**, select **Hive** in the required cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.130 ALM-16008 Non-Heap Memory Usage of the Hive Process Exceeds the Threshold

Description

The system checks the Hive service status every 30 seconds. The alarm is generated when the non-heap memory usage of an Hive service exceeds the threshold (95% of the maximum memory).

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Hive** to change the threshold.

The alarm is cleared when the non-heap memory usage is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 16008 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service name for which the alarm is generated. |
| RoleName | Specifies the role name for which the alarm is generated. |
| HostName | Specifies the object (host ID) for which the alarm is generated. |

Impact on the System

When the non-heap memory usage of Hive is overhigh, the performance of Hive task operation is affected. In addition, a memory overflow may occur so that the Hive service is unavailable.

Possible Causes

The non-heap memory of the Hive instance on the node is overused or the non-heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

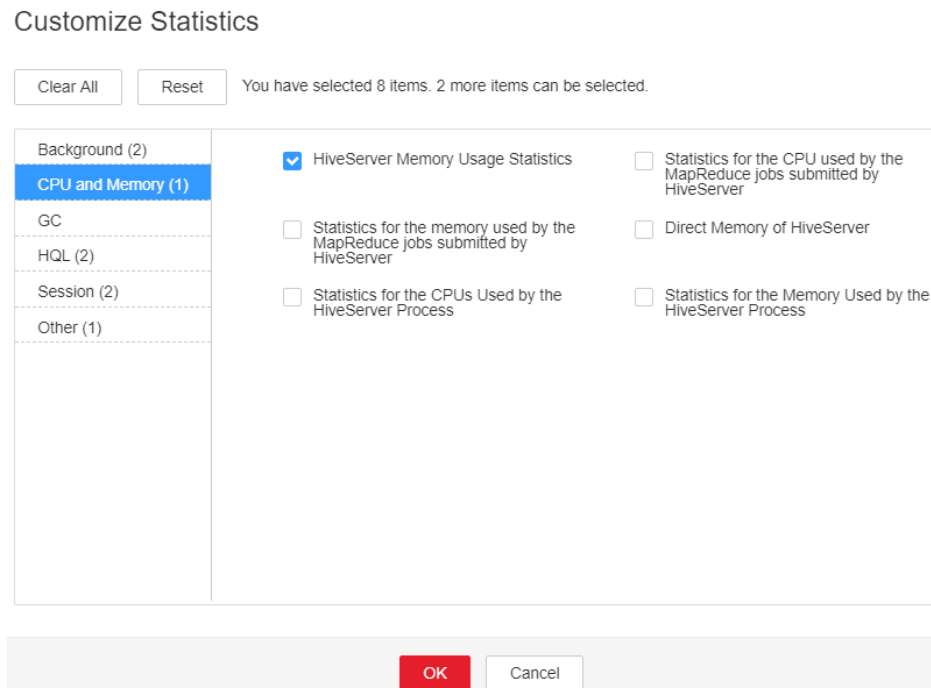

Procedure

Check non-heap memory usage.

- Step 1** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16008**. Then check the role name in **Location** and confirm the IP address of the instance.
 - If the role for which the alarm is generated is HiveServer, go to [Step 2](#).
 - If the role for which the alarm is generated is MetaStore, go to [Step 3](#).
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Hive > Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize > CPU and Memory**, and select **HiveServer Memory Usage Statistics** and click **OK**, check whether the used non-heap memory of the HiveServer service reaches the threshold(default value: 95%) of the maximum non-heap memory specified for HiveServer.

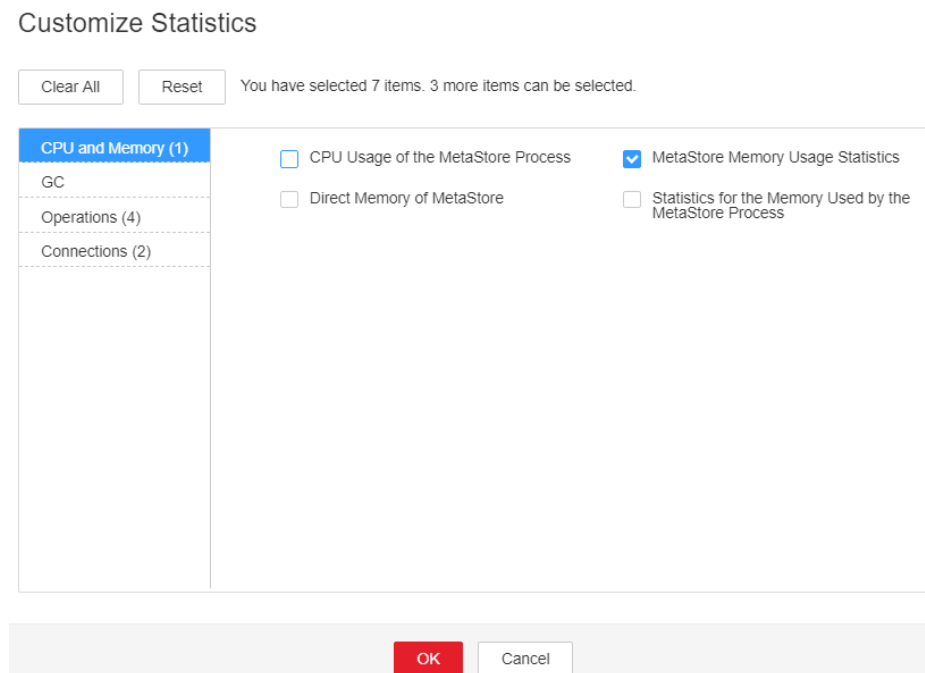

- If yes, go to [Step 4](#).
- If no, go to [Step 7](#).

Figure 10-35 HiveServer Memory Usage Statistics

- Step 3** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **MetaStore Memory Usage Statistics** and click **OK**, check whether the used non-heap memory of the MetaStore service reaches the threshold (default value: 95%) of the maximum non-heap memory specified for MetaStore.
- If yes, go to [Step 4](#).
 - If no, go to [Step 7](#).

Figure 10-36 MetaStore Memory Usage Statistics

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configurations** > **All Configurations**. Choose **HiveServer/MetaStore** > **JVM**. Adjust the value of **-XX:MaxMetaspaceSize** in **HIVE_GC_OPTS/METASTORE_GC_OPTS** as the following rules. Click **Save**.

NOTE

Suggestions for GC parameter settings for the HiveServer:

- It is recommended that you set the value of **-XX:MaxMetaspaceSize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 2 GB, **-XX:MaxMetaspaceSize** is set to 256 MB. If **-Xmx** is set to 4 GB, **-XX:MaxMetaspaceSize** is set to 512 MB.

Suggestions for GC parameter settings for the MetaServer:

- It is recommended that you set the value of **-XX:MaxMetaspaceSize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 2 GB, **-XX:MaxMetaspaceSize** is set to 256 MB. If **-Xmx** is set to 4 GB, **-XX:MaxMetaspaceSize** is set to 512 MB.

Step 5 Click **More** > **Restart Service** to restart the service.

NOTICE

During Hive service restart, instances cannot provide services for external systems, and the SQL tasks that are being executed on the instances may fail.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 8 Select **Hive** in the required cluster from the **Service**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.131 ALM-16009 Map Number Exceeds the Threshold

Description

The system checks the number of HQL maps in every 30 seconds. This alarm is generated if the number exceeds the threshold. By default, **Trigger Count** is set to 3, and the threshold is 5000.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 16009 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

| Name | Meaning |
|-------------------|--|
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

If the number of HQL maps executed on Hive is excessively large, the HQL execution speed is slow, and a large number of resources are occupied.

Possible Causes

The HQL statements are not the optimal.

Procedure

Check the number of HQL maps.

Step 1 On FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Resource**. Check the HQL statements with the excessively large number (5000 or more) of maps in **HQL Map Count**.

Step 2 Locate the corresponding HQL statements, optimize them and execute them again.

Step 3 Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Select **Hive** in the required cluster from the **Service**.

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.132 ALM-16045 Hive Data Warehouse Is Deleted

Description

The system checks the Hive data warehouse in every 60 seconds. This alarm is generated when the Hive data warehouse is deleted.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 16045 | Critical | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The default Hive data warehouse is deleted. As a result, creating databases or tables in the default data warehouse fails, and services are affected.

Possible Causes

Hive periodically checks the status of the default data warehouse and finds that the default data warehouse is deleted.

Procedure

Check the default Hive data warehouse.

Step 1 Log in to the node where the client is located as user **root**.

Step 2 Run the following command to check whether the **warehouse** directory exists in **hdfs://hacluster/user/<username>/Trash/Current/**.

```
hdfs dfs -ls hdfs://hacluster/user/<username>/Trash/Current/
```

For example, if **user/hive/warehouse** exists:

```
host01:/opt/client # hdfs dfs -ls hdfs://hacluster/user/test/.Trash/Current/  
Found 1 items  
drwx----- - test hadoop      0 2019-06-17 19:53 hdfs://hacluster/user/test/.Trash/Current/user
```

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

Step 3 By default, there is an automatic recovery mechanism for the data warehouse. You can wait for 5 ~10s to check whether the default data warehouse is restored. If the data warehouse is not recovered, manually run the following command to restore the data warehouse.

```
hdfs dfs -mv hdfs://hacluster/user/<username>/.Trash/Current/user/hive/  
warehouse /user/hive/warehouse
```

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Collect fault information.

Step 5 Collect related information in the **.Trash/Current/** directory on the client background.

Step 6 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.133 ALM-16046 Hive Data Warehouse Permission Is Modified

Description

The system checks the Hive data warehouse permission in every 60 seconds. This alarm is generated if the permission is modified.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 16046 | Critical | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

If the permission on the Hive default data warehouse is modified, the permission for users or user groups to create databases or tables in the default data warehouse is changed.

Possible Causes

Hive periodically checks the status of the default data warehouse and finds that default data warehouse permission is changed.

Procedure

Check the Hive default data warehouse permission.

Step 1 Log in to the node where the client is located as user **root**.

Step 2 Run the following command to go to the HDFS client installation directory:

```
cd Client installation directory
```

```
source bigdata_env
```

kinit *User who has the supergroup permission* (Skip this step for a common cluster.)

Step 3 Run the following command to restore the default data warehouse permission:

- Security mode: **hdfs dfs -chmod 770 hdfs://hacluster/user/hive/warehouse**
- Non-security mode: **hdfs dfs -chmod 777 hdfs://hacluster/user/hive/warehouse**

Step 4 Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 5](#).

Collect fault information.

Step 5 Collect related information in the **hdfs://hacluster/user/hive/warehouse** directory on the client background.

Step 6 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.134 ALM-16047 HiveServer Has Been Deregistered from ZooKeeper

Alarm Description

The system checks the Hive service every 60 seconds. This alarm is generated when Hive registration information on ZooKeeper is lost or Hive cannot connect to ZooKeeper.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 16047 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |

Impact on the System

When a Hive client sets up a new connection, it cannot select the HiveServer node that has been deregistered from ZooKeeper. If all HiveServer nodes have been deregistered from ZooKeeper, the HiveServer service will be unavailable.

Possible Causes

- The ZooKeeper instance is abnormal.
- Some Hive configurations are incorrect.

Handling Procedure

Check the ZooKeeper service status.

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Alarms** and check whether **ALM-12007 Process Fault** exists in the alarm list.

- If yes, go to [Step 2](#).
- If no, go to [Step 5](#).

Step 2 In **Location** of **ALM-12007 Process Fault**, check whether the service name is **ZooKeeper**.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

Step 3 Rectify the fault by following steps provided in **ALM-12007 Process Fault**.

Step 4 In the alarm list, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check whether the Hive configurations are correctly modified.

Step 5 On FusionInsight Manager, choose **Audit**. On the **Audit** page, click **Advanced Search**, click  on the right of **Operation Type**, select **Save configuration**, click **OK**, and click **Search**.

Step 6 In the search result, check the historical configurations of Hive- and ZooKeeper-related services in the **Service** column. [Table 10-4](#) lists some configurations that may affect the connection between Hive and ZooKeeper.

Table 10-4 Configurations related to connection between Hive and ZooKeeper

| Service | Parameter | Description |
|---------|----------------------------|--|
| Hive | HIVE_GC_OPTS | HiveServer memory configuration. If the configuration is abnormal, HiveServer may restart repeatedly. In this case, you need to check the health status of the instance processes. |
| | hive.zookeeper.quorum | IP address of the node accommodating ZooKeeper that is connected to Hive. |
| | hive.zookeeper.client.port | Port of the ZooKeeper client connected to Hive. |

| Service | Parameter | Description |
|-----------|---------------------------------------|--|
| | hive.zookeeper.session.timeout | Timeout interval of the session set up between Hive and ZooKeeper. |
| | hive.zookeeper.connection.timeout | Timeout interval for Hive to connect to ZooKeeper. |
| | hive.zookeeper.connection.max.retries | Maximum number of retries for Hive to connect to ZooKeeper. |
| ZooKeeper | clientPort | Port number of the ZooKeeper client. |
| | ssl.enabled | Whether to enable SSL connections of ZooKeeper. |

Restart related instances.

- Step 7** Log in to FusionInsight Manager. Choose **O&M > Alarm > Alarms**, click the drop-down list in the row that contains the alarm, and view the role and the IP address of the node for which the alarm is generated in **Location**.
- Step 8** Choose **Cluster**, click the name of the desired cluster, and choose **Services > Hive > Instance**. On the page that is displayed, select the instance at the IP address for which the alarm is generated, click **More**, and select **Restart Instance**.

NOTICE

During Hive instance restart, the instance cannot provide services for external systems. SQL tasks that are being executed on the instance may fail.

- Step 9** Wait 5 minutes and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to **Step 10**.

Collect fault information.

- Step 10** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 11** Expand the **Service** drop-down list, and select **Hive** for the target cluster.
- Step 12** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 13** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

10.135 ALM-16048 Tez or Spark Library Path Does Not Exist

Description

The system checks the Tez and Spark library paths every 180 seconds. This alarm is generated when the Tez or Spark library path does not exist.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 16048 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The Hive on Tez and Hive on Spark functions are affected.

Possible Causes

The Tez or Spark library path is deleted from the HDFS.

Procedure

Check the default Hive data warehouse.

Step 1 Log in to the node where the client is located as user **root**.

Step 2 Run the following command to check whether the **tezlib** or **sparklib** directory exists in the **hdfs://hacluster/user/{User name}/.Trash/Current/** director:

hdfs dfs -ls hdfs://hacluster/user/<username>/.Trash/Current/

For example, the following information shows that **/user/hive/tezlib/8.1.0.1/** and **/user/hive/sparklib/8.1.0.1/** exist.

```
host01:/opt/client # hdfs dfs -ls hdfs://hacluster/user/test/.Trash/Current/
Found 1 items
drwx----- - test hadoop      0 2019-06-17 19:53 hdfs://hacluster/user/test/.Trash/Current/user
```

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

Step 3 Run the following command to restore **tezlib** and **sparklib**.

hdfs dfs -mv hdfs://hacluster/user/<username>/.Trash/Current/user/hive/tezlib/8.1.0.1/tez.tar.gz /user/hive/tezlib/8.1.0.1/tez.tar.gz

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Collect fault information.

Step 5 Collect related information in the **.Trash/Current/** directory on the client background.

Step 6 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.136 ALM-17003 Oozie Service Unavailable

Description

The system checks the Oozie service status in every 5 seconds. This alarm is generated when Oozie or a component on which Oozie depends cannot provide services properly.

This alarm is automatically cleared when the Oozie service recovers.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 17003 | Critical | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

Oozie cannot be used to submit jobs.

Possible Causes

- The DBService service is abnormal or the data of Oozie stored in DBService is damaged.
- The HDFS service is abnormal or the data of Oozie stored in HDFS is damaged.
- The Yarn service is abnormal.
- The Nodeagent process is abnormal.

Procedure

Query the Oozie service health status code.

- Step 1** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Oozie**. Click **oozie** (any one is OK) on the **oozie WebUI**. to go to the Oozie WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

- Step 2** Add **/servicehealth** to the URL in the address box of the browser and access again. The value of **statusCode** is the current Oozie service health status code.

For example, visit **https://10.10.0.117:20026/Oozie/oozie/130/oozie/servicehealth**. The result is as follows:

```
{"beans":[{"name":"serviceStatus","statusCode":0}]}
```

If the health status code cannot be displayed or the browser does not respond, the service may be unavailable due to Oozie process fault. See **Step 13** to rectify the fault.

Step 3 Perform the operations based on the error code. For details, see [Table 10-5](#).

Table 10-5 Oozie service health status code

| Status Code | Description | Error Cause | Solution |
|-------------|------------------------------------|---|-------------------------------|
| 0 | The service is running properly. | None | None |
| 18002 | The DBService service is abnormal. | Oozie fails to connect to DBService or the data stored in DBService is damaged. | See Step 4 . |
| 18003 | The HDFS service is abnormal. | Oozie fails to connect to HDFS or the data stored in HDFS is damaged. | See Step 7 . |
| 18005 | The MapReduce service is abnormal. | The Yarn service is abnormal. | See Step 11 . |

Check the DBService service.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the DBService service is running properly.

- If yes, go to [Step 6](#).
- If no, go to [Step 5](#).

Step 5 Resolve the problem of DBService based on the alarm help and check whether the Oozie alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 18](#).

Step 6 Log in to the Oozie database to check whether the data is complete.

1. Log in to the active DBService node as user **root**.

On the FusionInsight Manager page, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService** > **Instance** to view the IP address of the active DBService node.

2. Run the following command to log in to the Oozie database:

```
su - omm
```

```
source ${BIGDATA_HOME}/FusionInsight_BASE_8.1.0.1/install/  
FusionInsight-dbservice-2.7.0/dbservice_profile
```

```
gsql -U Username -W Oozie database password -p 20051 -d Database name
```

3. After the login is successful, enter **\d** to check whether there are 15 data tables.

The Oozie service has 15 data tables by default. If these data tables are deleted or the table structure is modified, the Oozie service may be unavailable. Contact the O&M personnel to back up the data and perform restoration.

Check the HDFS service.

Step 7 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the HDFS service is running properly.

- If yes, go to [Step 9](#).
- If no, go to [Step 8](#).

Step 8 Resolve the problem of HDFS based on the alarm help and check whether the Oozie alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 18](#).

Step 9 Log in to HDFS to check whether the Oozie file directory structure is complete.

1. Download and install an HDFS client..
2. Log in to the client node as user **root** and run the following commands to check whether **/user/oozie/share** exists.

If the cluster uses the security mode, perform security authentication.

```
kinit admin
```

```
hdfs dfs -ls /user/oozie/share
```

- If yes, go to [Step 18](#).
- If no, go to [Step 10](#).

Step 10 In the Oozie client installation directory, manually upload the share directory to **/user/oozie** in HDFS, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 18](#).

Check the Yarn and MapReduce service.

Step 11 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the Yarn and MapReduce services are running properly.

- If yes, go to [Step 18](#).
- If no, go to [Step 12](#).

Step 12 Resolve the problem of Yarn and MapReduce based on the alarm help and check whether the Oozie alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 18](#).

Check the Oozie process.

Step 13 Log in to each node of Oozie as user **root**.

Step 14 Run the **ps -ef | grep oozie** command to check whether the Oozie process exists.

- If yes, go to [Step 15](#).
- If no, go to [Step 18](#).

Step 15 Collect fault information in **prestartDetail.log**, **oozie.log**, and **catalina.out** in the Oozie log directory **/var/log/Bigdata/oozie**. If the alarm is not caused by manual misoperation, go to [Step 16](#).

Check the Nodeagent process.

Step 16 Log in to each node of Oozie as user **root**. Run the **ps -ef | grep nodeagent** command to check whether the Nodeagent process exists.

- If yes, go to [Step 17](#).
- If no, go to [Step 18](#).

Step 17 Run the **kill -9 *The process ID of nodeagent*** command, wait 10 minutes, and check whether alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 18](#).

Step 18 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.137 ALM-17004 Oozie Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of the Oozie service every 60 seconds. The alarm is generated when the heap memory usage of a Metadata instance exceeds the threshold (95% of the maximum memory). The alarm is cleared when the heap memory usage is less than the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 17004 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

The heap memory overflow may cause a service breakdown.

Possible Causes

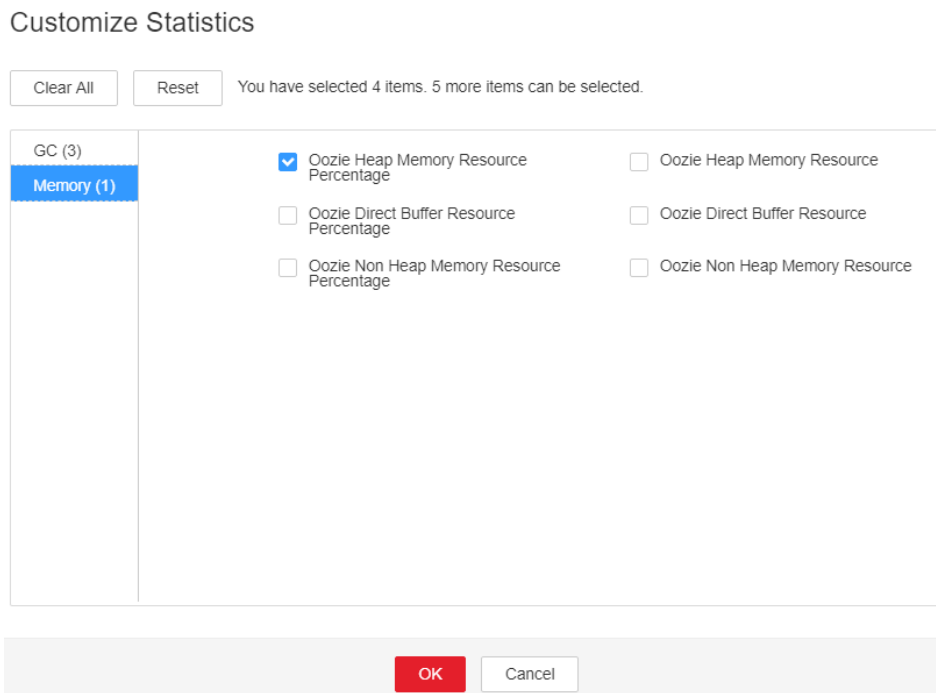

The heap memory of the Oozie instance is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Oozie Heap Memory Usage Exceeds the Threshold > Location**. Check the IP address of the instance involved in this alarm.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Oozie > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize > Memory > Oozie Heap Memory Resource Percentage**. Click **OK**.

Figure 10-37 Oozie Heap Memory Resource Percentage

Step 3 Check whether the used heap memory of Oozie reaches the threshold (the default value is 95% of the maximum heap memory) specified for Oozie.

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Oozie** > **Configurations** > **All Configurations**. Set Search **GC_OPTS** in the search box. Increase the value of **-Xmx** as required, and click **Save** > **OK**.

NOTE

Suggestions on GC parameter settings for Oozie:

You are advised to set **-Xms** and **-Xmx** to the same value to prevent adverse impact on performance when JVM dynamically adjusts the heap memory size.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

NOTICE

During the service or instance restart, services are interrupted, but submitted jobs are not affected.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Oozie** in the required cluster from the **Service**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.138 ALM-17005 Oozie Non Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the non heap memory usage of Oozie every 30 seconds. This alarm is reported if the non heap memory usage of Oozie exceeds the threshold (80%). This alarm is cleared if the non heap memory usage is lower than the threshold.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 17005 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |

| Parameter | Description |
|-------------------|---|
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

Non-heap memory overflow may cause service breakdown.

Possible Causes

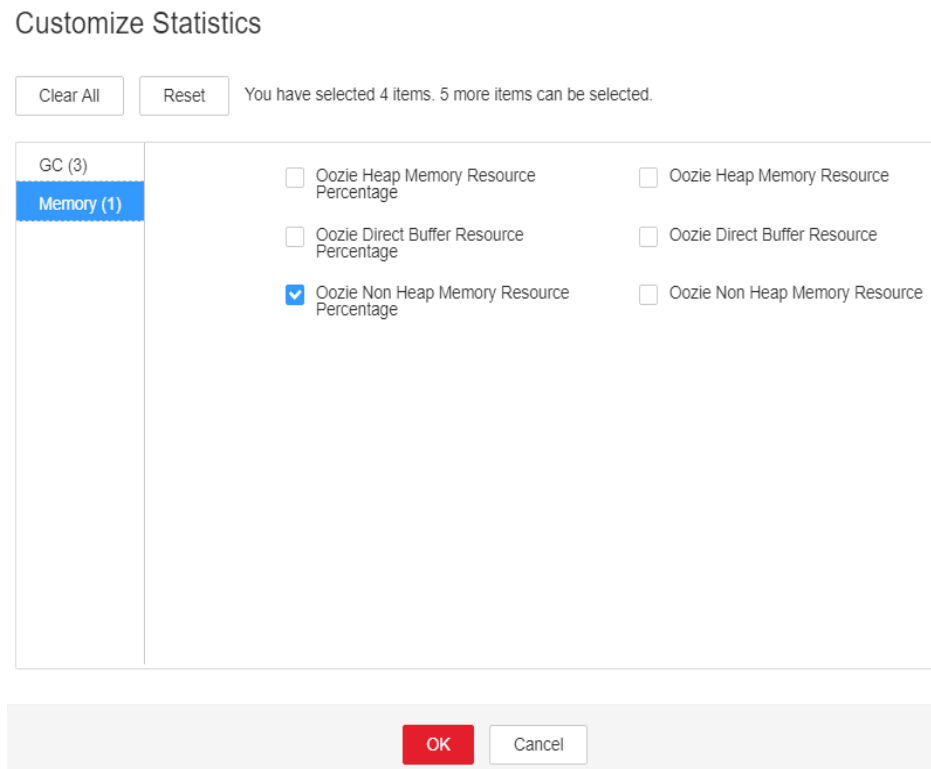

The non-heap memory of the Oozie instance is overused or the non-heap memory is inappropriately allocated.

Handling Procedure

Check non-heap memory usage.

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > Oozie Non Heap Memory Usage Exceeds the Threshold**. On the displayed page, check the location information of the alarm. Check the name of the instance host for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Name of the target cluster > Services > Oozie** and click the **Instance** tab. On the displayed page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Memory** and select **Oozie Non Heap Memory Resource Percentage**. Click **OK**.

Figure 10-38 Oozie non-heap memory usage

- Step 3** Check whether the non-heap memory used by Oozie reaches the threshold (80% of the maximum non-heap memory by default).
- If yes, go to [Step 4](#).
 - If no, go to [Step 6](#).

- Step 4** On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Oozie** and click the **Configurations** and then **All Configurations**. On the displayed page, search for the **GC_OPTS** parameter in the search box and check whether it contains **-XX: MaxMetaspaceSize**. If yes, increase the value of **-XX: MaxMetaspaceSize** based on the site requirements. If no, manually add **-XX: MaxMetaspaceSize** and set its value to 1/8 of the value of **-Xmx**. Click **Save**, and then click **OK**

 **NOTE**

JDK1.8 does not support the **MaxPermSize** parameter.

Suggestions on GC parameter settings for Oozie:

Set the value of **-XX:MaxMetaspaceSize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 2 GB, **-XX:MaxMetaspaceSize** is set to 256 MB. If **-Xmx** is set to 4 GB, **-XX:MaxMetaspaceSize** is set to 512 MB.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 6](#).

NOTICE

During the service or instance restart, services are interrupted, but submitted jobs are not affected.

Collect fault information.

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.
- Step 7** Expand the **Service** drop-down list, and select **Oozie** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.139 ALM-17006 Oozie Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the Oozie service every 30 seconds. The alarm is generated when the direct memory usage of an Oozie instance exceeds the threshold (80% of the maximum memory). The alarm is cleared when the direct memory usage of Oozie is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 17006 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

The direct memory overflow may cause a service breakdown.

Possible Causes

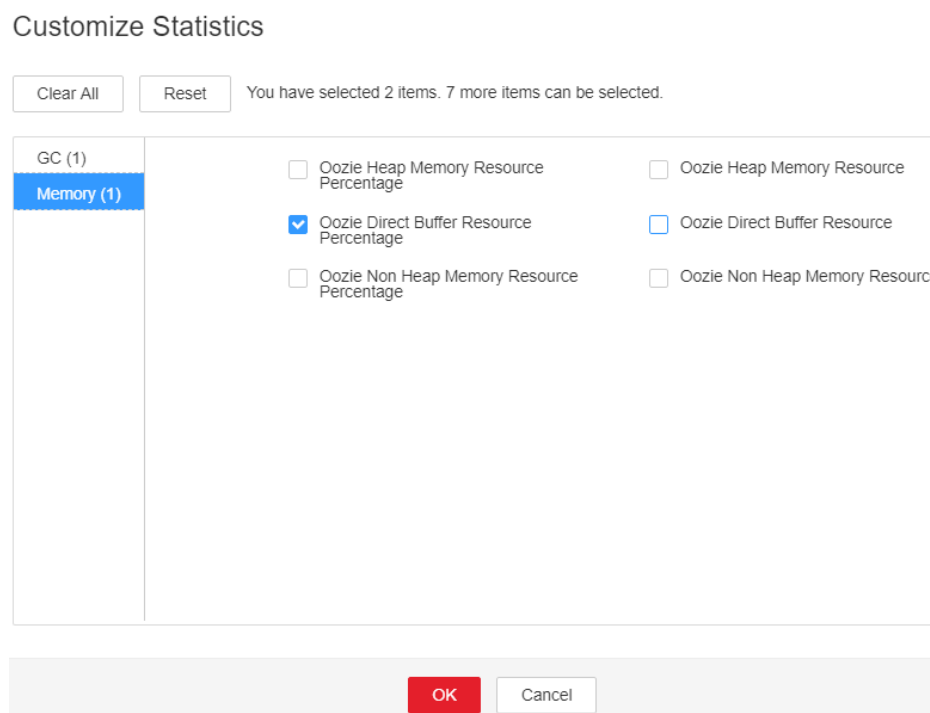

The direct memory of the Oozie instance is overused or the direct memory is inappropriately allocated.

Procedure

Check direct memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Oozie Direct Memory Usage Exceeds the Threshold > Location**. Check the IP address of the instance involved in this alarm.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Oozie > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize > Memory > Oozie Direct Buffer Resource Percentage**. Click **OK**.

Figure 10-39 Oozie Direct Buffer Resource Percentage

- Step 3** Check whether the used direct memory of Oozie reaches the threshold (the default value is 80% of the maximum direct memory) specified for Oozie.
- If yes, go to **Step 4**.
 - If no, go to **Step 6**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Oozie > Configurations**. Click **All Configurations**. Search **GC_OPTS** in the search box. Increase the value of **-XX:MaxDirectMemorySize** as required, and click **Save**. Click **OK**.

NOTE

Suggestions on GC parameter settings for Oozie:

You are advised to set the value of **-XX:MaxDirectMemorySize** to 1/4 of the value of **-Xmx**. For example, if **-Xmx** is set to 4 GB, **-XX:MaxDirectMemorySize** is set to 1024 MB. If **-Xmx** is set to 2 GB, **-XX:MaxDirectMemorySize** is set to 512 MB. It is recommended that the value of **-XX:MaxDirectMemorySize** be greater than or equal to 512 MB.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 6](#).

NOTICE

During the service or instance restart, services are interrupted, but submitted jobs are not affected.

Collect fault information.

- Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 7** Select **Oozie** in the required cluster from the **Service** drop-down list.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.140 ALM-17007 Garbage Collection (GC) Time of the Oozie Process Exceeds the Threshold

Description

The system checks GC time of the Oozie process every 60 seconds. The alarm is generated when GC time of the Oozie process exceeds the threshold (default value: **12 seconds**). The alarm is cleared when GC time is less than the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 17007 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

Oozie responds slowly when it is used to submit tasks.

Possible Causes

The heap memory of the Oozie instance is overused or the heap memory is inappropriately allocated.

Procedure

Check GC time.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Garbage Collection (GC) Time of the Oozie Process Exceeds the Threshold > Location**. Check the IP address of the instance involved in this alarm.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Oozie > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize > GC > Garbage Collection (GC) Time of Oozie**. Click **OK**.

Figure 10-40 Garbage Collection (GC) Time of Oozie

- Step 3** Check whether GC time of the Oozie process every second exceeds the threshold (default value: **12 seconds**).
- If yes, go to **Step 4**.
 - If no, go to **Step 6**.

- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Oozie > Configurations**. Click **All Configurations**. Search **GC_OPTS** in the search box. Increase the value of **-Xmx** as required, and click **Save**. Click **OK**.

NOTE

Suggestions on GC parameter settings for Oozie:

You are advised to set **-Xms** and **-Xmx** to the same value to prevent adverse impact on performance when JVM dynamically adjusts the heap memory size.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to **Step 6**.

NOTICE

During the service or instance restart, services are interrupted, but submitted jobs are not affected.

Collect fault information.

- Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

- Step 7** Select **Oozie** in the required cluster from the **Service** drop-down list.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected logs.
- End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.141 ALM-17008 Abnormal Connection Between Oozie and ZooKeeper

Alarm Description

In HA mode, Oozie depends on ZooKeeper. This alarm is generated when the connection between Oozie and ZooKeeper is abnormal for three consecutive times.

This alarm is cleared when the connection between Oozie and ZooKeeper becomes normal.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 17008 | Minor | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

| Parameter | Description |
|-------------------|---|
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

In HA mode, the Oozie service will restart if this alarm is reported.

Possible Causes

- The ZooKeeper service is abnormal.
- Oozie fails to connect to ZooKeeper.

Handling Procedure

Check the ZooKeeper service status.

- Step 1** In the service list on FusionInsight Manager, check whether **Running Status** of ZooKeeper is **Normal**.
- If yes, go to [Step 5](#).
 - If no, go to [Step 2](#).
- Step 2** In the alarm list, check whether **ALM-13000 ZooKeeper Service Unavailable** is reported.
- If yes, go to [Step 3](#).
 - If no, go to [Step 5](#).
- Step 3** Rectify the fault by performing the operations provided for **ALM-13000 ZooKeeper Service Unavailable**.
- Step 4** Wait for several minutes and check whether the alarm **Abnormal Connection Between Oozie and ZooKeeper** is cleared.
- If yes, no further action is required.
 - If no, go to [Step 5](#).

Check the connectivity between Oozie and ZooKeeper.

- Step 5** Log in to FusionInsight Manager, choose **O&M > Log > Online Search**, select the Oozie service, and search for the keyword **[Oozie Alarm Enhancement] [ZooKeeper]** in the log. View the cause in the log, and rectify the fault. In the alarm list, check whether the alarm **Abnormal Connection Between Oozie and ZooKeeper** is cleared.
- If yes, no further action is required.
 - If no, go to [Step 6](#).

Collect fault information.

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 7 Select **Oozie** for **Service** and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.142 ALM-17009 Abnormal Connection Between Oozie and DBService

Alarm Description

Oozie depends on DBService. After a task is submitted, the system checks DBService connectivity. This alarm is generated when the service fails the check for 10 consecutive times.

This alarm is cleared when the connection between Oozie and DBService becomes normal.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 17009 | Minor | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

| Parameter | Description |
|-------------------|---|
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

The Oozie service cannot be used to submit jobs.

Possible Causes

- The DBService service is abnormal.
- Oozie fails to connect to DBService.

Handling Procedure

Check the DBService status.

- Step 1** In the service list on FusionInsight Manager, check whether **Running Status** of DBService is **Normal**.
- If yes, go to [Step 5](#).
 - If no, go to [Step 2](#).
- Step 2** In the alarm list, check whether **ALM-27001 DBService Service Unavailable** is reported.
- If yes, go to [Step 3](#).
 - If no, go to [Step 5](#).
- Step 3** Rectify the fault by performing the operations provided for **ALM-27001 DBService Service Unavailable**.
- Step 4** Wait for several minutes and check whether the alarm **Abnormal Connection Between Oozie and DBService** is cleared.
- If yes, no further action is required.
 - If no, go to [Step 5](#).

Check the connectivity between Oozie and DBService.

- Step 5** Log in to FusionInsight Manager, choose **O&M > Log > Online Search**, select the Oozie service, and search for the keyword **[Oozie Alarm Enhancement][DB Service]** in the log. View the cause in the log, and rectify the fault. In the alarm list, check whether the alarm **Abnormal Connection Between Oozie and DBService** is cleared.
- If yes, no further action is required.
 - If no, go to [Step 6](#).

Collect fault information.

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

- Step 7** Select **Oozie** for **Service** and click **OK**.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.
- End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.143 ALM-17010 Abnormal Connection Between Oozie and HDFS

Alarm Description

Oozie depends on HDFS. After a task is submitted, the system checks HDFS connectivity. This alarm is generated when the service fails the check for 3 consecutive times.

This alarm is cleared when the connection between Oozie and HDFS becomes normal.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 17010 | Minor | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

| Parameter | Description |
|-------------------|---|
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

The Oozie service is abnormal and Oozie-related jobs cannot be submitted.

Possible Causes

The HDFS service restarts, there is a fault, or the network connectivity is abnormal.

Handling Procedure

Check the HDFS service status.

- Step 1** In the service list on FusionInsight Manager, check whether **Running Status** of HDFS is **Normal**.
- If yes, go to [Step 5](#).
 - If no, go to [Step 2](#).
- Step 2** In the alarm list, check whether the "ALM-14000 HDFS Service Unavailable" alarm is generated.
- If yes, go to [Step 3](#).
 - If no, go to [Step 5](#).
- Step 3** Rectify the fault by performing the operations provided for **ALM-14000 HDFS Service Unavailable**.
- Step 4** Wait for several minutes and check whether the alarm **Abnormal Connection Between Oozie and HDFS** is cleared.
- If yes, no further action is required.
 - If no, go to [Step 5](#).

Check the connectivity between Oozie and HDFS.

- Step 5** Log in to FusionInsight Manager, choose **O&M > Log > Online Search**, select the Oozie service, and search for the keyword **[Oozie Alarm Enhancement][HDFS]** in the log. View the cause in the log, and rectify the fault. In the alarm list, check whether the alarm **Abnormal Connection Between Oozie and HDFS** is cleared.
- If yes, no further action is required.
 - If no, go to [Step 6](#).

Collect fault information.

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Select **Oozie** for **Service** and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

10.144 ALM-17011 Abnormal Connection Between Oozie and Yarn

Alarm Description

Oozie depends on Yarn. After a task is submitted, the system checks Yarn connectivity. This alarm is generated when the service fails the check for 5 consecutive times.

This alarm is cleared when the connection between Oozie and Yarn becomes normal.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 17011 | Minor | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

| Parameter | Description |
|-------------------|---|
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

The Oozie service is abnormal and tasks cannot be submitted to Yarn.

Possible Causes

- The Yarn service is abnormal.
- The connection between Oozie and Yarn is abnormal.

Handling Procedure

Check the YARN service status.

Step 1 In the service list on FusionInsight Manager, check whether **Running Status** of Yarn is **Normal**.

- If yes, go to [Step 5](#).
- If no, go to [Step 2](#).

Step 2 In the alarm list, check whether **ALM-18000 YARN Service Unavailable** is generated.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

Step 3 Rectify the fault by performing the operations provided for **ALM-18000 Yarn Service Unavailable**.

Step 4 Wait for several minutes and check whether the alarm **Abnormal Connection Between Oozie and Yarn** is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check the connectivity between Oozie and Yarn.

Step 5 Log in to FusionInsight Manager, choose **O&M > Log > Online Search**, select the Oozie service, and search for the keyword **[Oozie Alarm Enhancement][Yarn]** in the log. View the cause in the log, and rectify the fault. In the alarm list, check whether the alarm **Abnormal Connection Between Oozie and Yarn** is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 7 Select **Oozie** for **Service** and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.145 ALM-18000 Yarn Service Unavailable

Description

This alarm is generated when the Yarn service is unavailable. The alarm module checks the Yarn service status every 60 seconds.

The alarm is cleared when the Yarn service recovers.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18000 | Critical | Yes |

Parameters

| Name | Meaning |
|------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceNam | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The cluster cannot provide Yarn services. Users cannot run new applications. Submitted applications cannot be run.

Possible Causes

- The ZooKeeper service is abnormal.
- The HDFS service is abnormal.
- There is no active ResourceManager instance in the Yarn cluster.
- All the NodeManagers in the Yarn cluster are abnormal.

Procedure

Check ZooKeeper service status.

Step 1 On the FusionInsight Manager, check whether the alarm list contains **ALM-13000 ZooKeeper Service Unavailable**.

- If yes, go to [Step 2](#).
- If no, go to [Step 3](#).

Step 2 Rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 3](#).

Check the HDFS service status.

Step 3 On the FusionInsight Manager, check whether the alarm list contains the HDFS alarms.

- If yes, go to [Step 4](#).
- If no, go to [Step 5](#).

Step 4 Choose **O&M > Alarm > Alarms**, handle HDFS alarms based on the alarm help, and check whether the Yarn alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check the ResourceManager status in the Yarn cluster.

Step 5 On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn**.

Step 6 In **Dashboard**, check whether there is an active ResourceManager instance in the Yarn cluster.

- If yes, go to [Step 7](#).
- If no, go to [Step 10](#).

Check the NodeManager node status in the Yarn cluster.

Step 7 On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Instance**.

Step 8 Query NodeManager **Running Status**, and check whether there are unhealthy nodes.

- If yes, go to [Step 9](#).
- If no, go to [Step 10](#).

Step 9 Rectify the fault by following the steps provided in **ALM-18002 NodeManager Heartbeat Lost** or **ALM-18003 NodeManager Unhealthy**. After the fault is rectified, check whether the Yarn alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

Collect fault information.

Step 10 On the FusionInsight Manager portal of the active cluster, choose **O&M > Log > Download**.

Step 11 Select **Yarn** in the required cluster from the **Service**.

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.146 ALM-18002 NodeManager Heartbeat Lost

Description

The system checks the number of lost NodeManager nodes every 30 seconds, and compares the number with the threshold. The Number of Lost Nodes indicator has a default threshold. The alarm is generated when the value of Number of Lost Nodes exceeds the threshold.

To change the threshold, on FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > Yarn**. On the displayed page, choose **Configurations > All Configurations**, and change the value of **yarn.nodemanager.lost.alarm.threshold**. You do not need to restart Yarn to make the change take effect.

The default threshold is 0. The alarm is generated when the number of lost nodes exceeds the threshold, and is cleared when the number of lost nodes is less than the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18002 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Lost Host | Specifies the list of hosts with lost nodes. |

Impact on the System

- The lost NodeManager node cannot provide the Yarn service.
- The number of containers decreases, so the cluster performance deteriorates.

Possible Causes

- NodeManager is forcibly deleted without decommission.
- All the NodeManager instances are stopped or the NodeManager process is faulty.
- The host where the NodeManager node resides is faulty.
- The network between the NodeManager and ResourceManager is disconnected or busy.

Procedure

Check the NodeManager status.

Step 1 On the FusionInsight Manager, and choose **O&M > Alarm > Alarms**. Click  before the alarm and obtain lost nodes in **Additional Information**.

Step 2 Check whether the lost nodes are hosts that have been manually deleted without decommission.

- If yes, go to **Step 3**.

- If no, go to [Step 5](#).

Step 3 After the setting, Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn**. On the displayed page, choose **Configurations** > **All Configurations**. Search for **yarn.nodemanager.lost.alarm.threshold** and change its value to the number of hosts that are not out of service and proactively deleted. After the setting, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

Step 4 Manually clear the alarm. Note that decommission must be performed before deleting hosts.

Step 5 On the FusionInsight Manager portal, choose **Cluster** > **Hosts**, and check whether the nodes obtained in [Step 1](#) are healthy.

- If yes, go to [Step 7](#).
- If no, go to [Step 6](#).

Step 6 Rectify the node fault based on **ALM-12006 Node Fault** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

Check the process status.

Step 7 On the FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Instance**, and check whether there are NodeManager instances whose status is not **Good**.

- If yes, go to [Step 10](#).
- If no, go to [Step 8](#).

Step 8 Check whether the NodeManager instance is deleted.

- If yes, go to [Step 9](#).
- If no, go to [Step 11](#).

Step 9 Restart the active and standby ResourceManager instances, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 13](#).

Check the instance status.

Step 10 Select NodeManager instances which running state is not **Normal** and restart them. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

Check the network status.

Step 11 Log in to the management node, **ping** the IP address of the lost NodeManager node to check whether the network is disconnected or busy.

- If yes, go to [Step 12](#).

- If no, go to [Step 13](#).

Step 12 Rectify the network, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 13](#).

Collect fault information.

Step 13 On the FusionInsight Manager in the active cluster, choose **O&M > Log > Download**.

Step 14 Select **Yarn** in the required cluster from the **Service**.

Step 15 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.147 ALM-18003 NodeManager Unhealthy

Description

The system checks the number of unhealthy NodeManager nodes every 30 seconds, and compares the number with the threshold. The Unhealthy Nodes indicator has a default threshold. This alarm is generated when the value of the Unhealthy Nodes indicator exceeds the threshold.

To change the threshold, on FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > Yarn**. On the displayed page, choose **Configurations > All Configurations**, and change the value of **yarn.nodemanager.unhealthy.alarm.threshold**. You do not need to restart Yarn to make the change take effect.

The default threshold is 0. The alarm is generated when the number of unhealthy nodes exceeds the threshold, and is cleared when the number of unhealthy nodes is less than the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18003 | Major | Yes |

Parameters

| Name | Meaning |
|----------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Unhealthy Host | Specifies the list of hosts with unhealthy nodes. |

Impact on the System

- The faulty NodeManager node cannot provide the Yarn service.
- The number of containers decreases, so the cluster performance deteriorates.

Possible Causes

- The hard disk space of the host where the NodeManager node resides is insufficient.
- User **omm** does not have the permission to access a local directory on the NodeManager node.

Procedure

Check the hard disk space of the host.

- Step 1** On the FusionInsight Manager, and choose **O&M > Alarm > Alarms**. Click  before the alarm and obtain unhealthy nodes in **Additional Information**.
- Step 2** Choose **Cluster > Name of the desired cluster > Services > Yarn > Instance**, select the NodeManager instance corresponding to the host, choose **Instance Configurations > All Configurations** and view disks corresponding to **yarn.nodemanager.local-dirs** and **yarn.nodemanager.log-dirs**.
- Step 3** Choose **O&M > Alarm > Alarms**. In the alarm list, check whether the related disk has the alarm **ALM-12017 Insufficient Disk Capacity**.
- If yes, go to **Step 4**.
 - If no, go to **Step 5**.
- Step 4** Rectify the disk fault based on **ALM-12017 Insufficient Disk Capacity** and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to **Step 7**.

Step 5 Choose **Hosts** > *Name of the desired host* . On the **Dashboard** page, check the disk usage of the corresponding partition. Check whether the percentage of the used space of the mounted disk exceeds the value of **yarn.nodemanager.disk-health-checker.max-disk-utilization-per-disk-percentage**

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Reduce the disk usage to less than the value of **yarn.nodemanager.disk-health-checker.max-disk-utilization-per-disk-percentage**, wait for 10 to 20 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check the access permission of the local directory on each NodeManager node.

Step 7 Obtain the NodeManager directory viewed in **Step 2**, log in to each NodeManager node as user **root**, and go to the obtained directory.

Step 8 Run the **ll** command to check whether the permission of the **localdir** and **containerlogs** folders is **755** and whether **User:Group** is **omm:ficommon**.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Run the following command to set the permission to **755** and **User:Group** to **omm:ficommon**:

```
chmod 755 <folder_name>
```

```
chown omm:ficommon <folder_name>
```

Step 10 Wait for 10 to 20 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager in the active cluster, choose **O&M** > **Log** > **Download**.

Step 12 Select **Yarn** in the required cluster from the **Service**.

Step 13 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.148 ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold

Description

The system checks the heap memory usage of Yarn ResourceManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Yarn ResourceManager exceeds the threshold (95% of the maximum memory by default).

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > Yarn** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the heap memory usage of Yarn ResourceManager is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the heap memory usage of Yarn ResourceManager is less than or equal to 95% of the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18008 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service name for which the alarm is generated. |
| RoleName | Specifies the role name for which the alarm is generated. |
| HostName | Specifies the object (host ID) for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

When the heap memory usage of Yarn ResourceManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

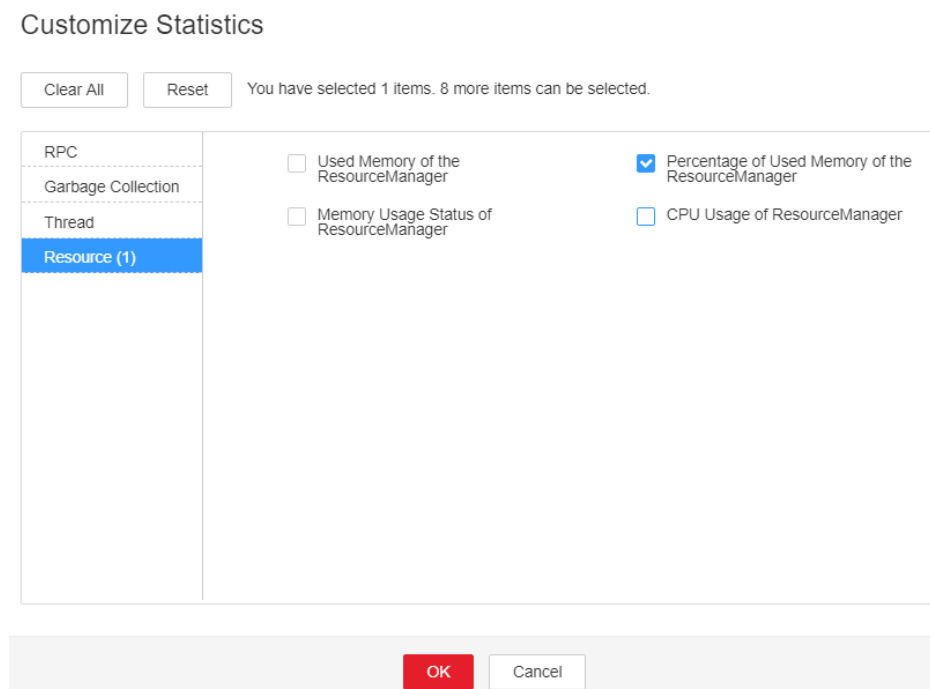

The heap memory of the Yarn ResourceManager instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the heap memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Heap Memory Usage of Yarn ResourceManager Exceeds the Threshold > Location**. Check the HostName of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Instance > ResourceManager** (Indicates the host name of the instance for which the alarm is generated). Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > ResourceManager > Percentage of Used Memory of the ResourceManager**. Check the heap memory usage.

Figure 10-41 Percentage of Used Memory of the ResourceManager

- Step 3** Check whether the used heap memory of ResourceManager reaches 95% of the maximum heap memory specified for ResourceManager.
- If yes, go to **Step 4**.

- If no, go to [Step 6](#).

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Configurations** > **All Configurations** > **ResourceManager** > **System**. Increase the value of **GC_OPTS** parameter as required, click **Save**. Restart the role instance.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of ResourceManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms10G -Xmx10G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 1000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms20G -Xmx20G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 2000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms40G -Xmx40G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 3000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms60G -Xmx60G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 4000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms80G -Xmx80G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 5000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms100G -Xmx100G -XX:NewSize=3G -XX:MaxNewSize=6G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.149 ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold

Description

The system checks the heap memory usage of Mapreduce JobHistoryServer every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Mapreduce JobHistoryServer exceeds the threshold (95% of the maximum memory by default).

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > Mapreduce** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the heap memory usage of MapReduce JobHistoryServer is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the heap memory usage of MapReduce JobHistoryServer is less than or equal to 95% of the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18009 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service name for which the alarm is generated. |
| RoleName | Specifies the role name for which the alarm is generated. |
| HostName | Specifies the object (host ID) for which the alarm is generated. |

| Name | Meaning |
|-------------------|--|
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

When the heap memory usage of Mapreduce JobHistoryServer is overhigh, the performance of Mapreduce log archiving is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The heap memory of the Mapreduce JobHistoryServer instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > ALM-18009 Heap Memory Usage of MapReduce JobHistoryServer Exceeds the Threshold > Location**. Check the HostName of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Mapreduce > Instance > JobHistoryServer**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > JobHistoryServer heap memory usage statistics**. JobHistoryServer indicates the corresponding HostName of the instance for which the alarm is generated. Check the heap memory usage.
- Step 3** Check whether the used heap memory of JobHistoryServer reaches 95% of the maximum heap memory specified for JobHistoryServer.
- If yes, go to **Step 4**.
 - If no, go to **Step 6**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Mapreduce > Configurations > All Configurations > JobHistoryServer > System**. Increase the value of **GC_OPTS** parameter as required, click **Save**. Click **OK** and restart the role instance.

NOTE

The mapping between the number of historical tasks (10000) and the memory of JobHistoryServer is as follows:

```
-Xms30G -Xmx30G -XX:NewSize=1G -XX:MaxNewSize=2G
```

- Step 5** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Mapreduce

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.150 ALM-18010 ResourceManager GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the ResourceManager process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18010 | Major | Yes |

Parameters

| Name | Meaning |
|--------|---|
| Source | Specifies the cluster for which the alarm is generated. |

| Name | Meaning |
|-------------------|--|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

A long GC duration of the ResourceManager process may interrupt the services.

Possible Causes

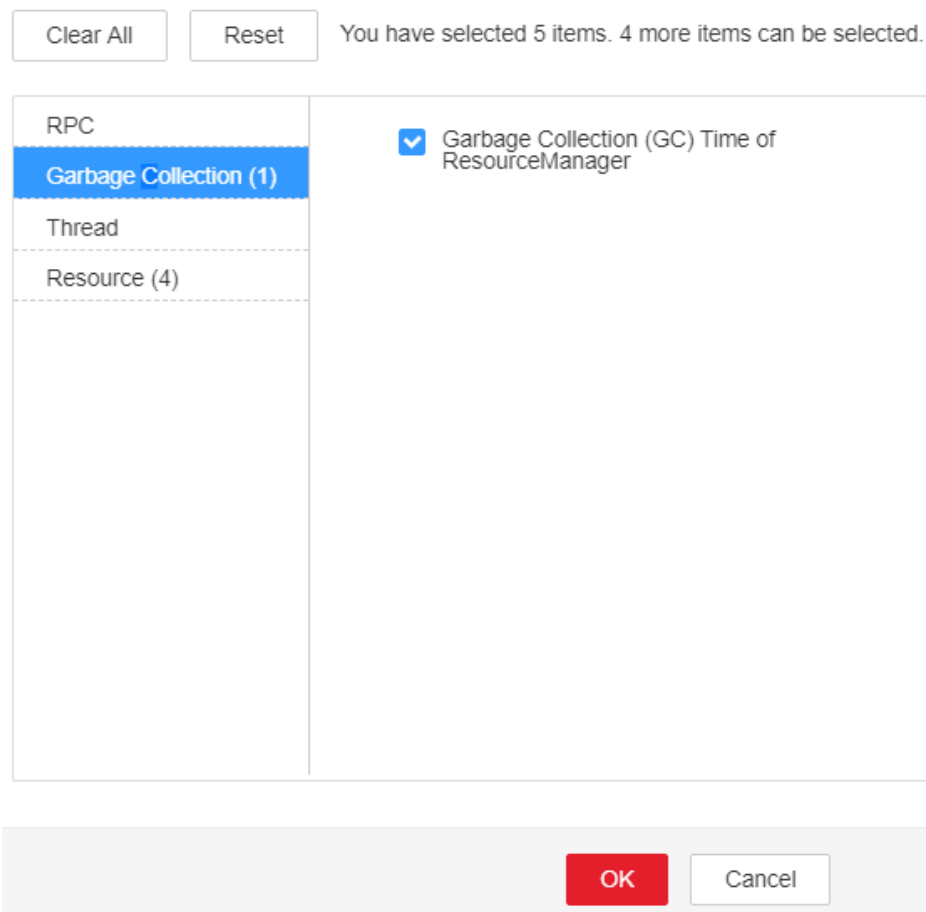

The heap memory of the ResourceManager instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > ALM-18010 ResourceManager GC Time Exceeds the Threshold > Location** to check the IP address of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Instance > ResourceManager (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > Garbage Collection (GC) Time of ResourceManager** to check the GC duration statistics of the Broker process collected every minute.

Figure 10-42 Garbage Collection (GC) Time of ResourceManager
Customize Statistics

Step 3 Check whether the GC duration of the ResourceManager process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Configurations** > **All Configurations** > **ResourceManager** > **System** to increase the value of **GC_OPTS** parameter as required.

 **NOTE**

The mapping between the number of NodeManager instances in a cluster and the memory size of ResourceManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms10G -Xmx10G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 1000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms20G -Xmx20G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 2000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms40G -Xmx40G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 3000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms60G -Xmx60G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 4000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms80G -Xmx80G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 5000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms100G -Xmx100G -XX:NewSize=3G -XX:MaxNewSize=6G

Step 5 Save the configuration and restart the ResourceManager instance.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 8 Select **ResourceManager** in the required cluster from the **Service**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.151 ALM-18011 NodeManager GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the NodeManager process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18011 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

A long GC duration of the NodeManager process may interrupt the services.

Possible Causes

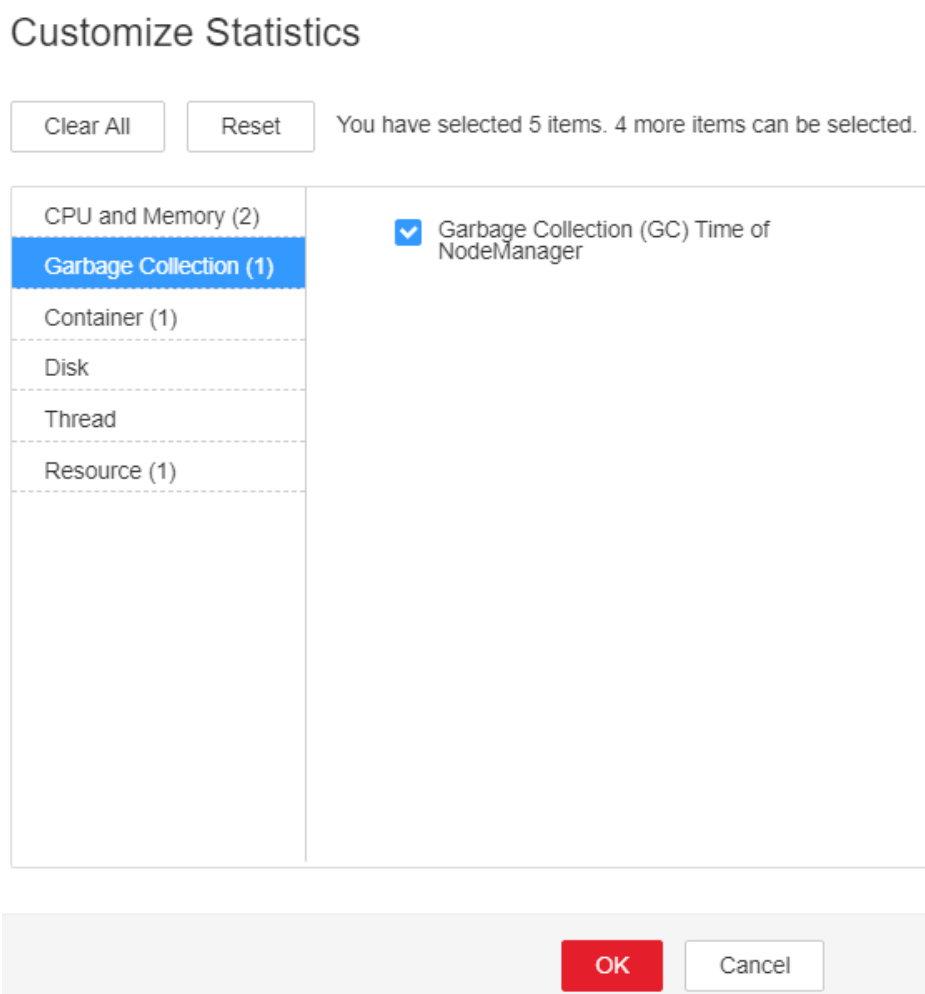

The heap memory of the NodeManager instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > ALM-18011 NodeManager GC Time Exceeds the Threshold > Location** to check the IP address of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Instance > NodeManager (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > Garbage Collection (GC) Time of NodeManager** to check the GC duration statistics of the Broker process collected every minute.

Figure 10-43 Garbage Collection (GC) Time of NodeManager

- Step 3** Check whether the GC duration of the NodeManager process collected every minute exceeds the threshold (12 seconds by default).
- If yes, go to **Step 4**.
 - If no, go to **Step 7**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Configurations > All Configurations > NodeManager > System** to increase the value of **GC_OPTS** parameter as required.

 **NOTE**

The mapping between the number of NodeManager instances in a cluster and the memory size of NodeManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters for NodeManager instances are as follows: -Xms2G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters for NodeManager instances are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters for NodeManager instances are as follows: -Xms8G -Xmx8G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Save the configuration and restart the NodeManager instance.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 8 Select **NodeManager** in the required cluster from the **Service**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

10.152 ALM-18012 JobHistoryServer GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the JobHistoryServer process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18012 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

A long GC duration of the JobHistoryServer process may interrupt the services.

Possible Causes

The heap memory of the JobHistoryServer instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > ALM-18012 JobHistoryServer GC Time Exceeds the Threshold > Location** to check the IP address of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > MapReduce > Instance > JobHistoryServer (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > Garbage Collection (GC) Time of the JobHistoryServer** to check the GC duration statistics of the Broker process collected every minute.

Step 3 Check whether the GC duration of the JobHistoryServer process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to [Step 4](#).
- If no, go to [Step 7](#).

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **MapReduce** > **Configurations** > **All Configurations** > **JobHistoryServer** > **System** to increase the value of **GC_OPTS** parameter as required.

 **NOTE**

The mapping between the number of historical tasks (10000) and the memory of the JobHistoryServer is as follows:

```
-Xms30G -Xmx30G -XX:NewSize=1G -XX:MaxNewSize=2G
```

Step 5 Save the configuration and restart the JobHistoryServer instance.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **JobHistoryServer** in the required cluster from the **Service**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

10.153 ALM-18013 ResourceManager Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of ResourceManager every 30 seconds. This alarm is generated when the direct memory usage of ResourceManager instances exceeds the threshold (90% of the maximum memory).

This alarm is automatically cleared when the direct memory usage is less than the threshold.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 18013 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

If the available direct memory of ResourceManager is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

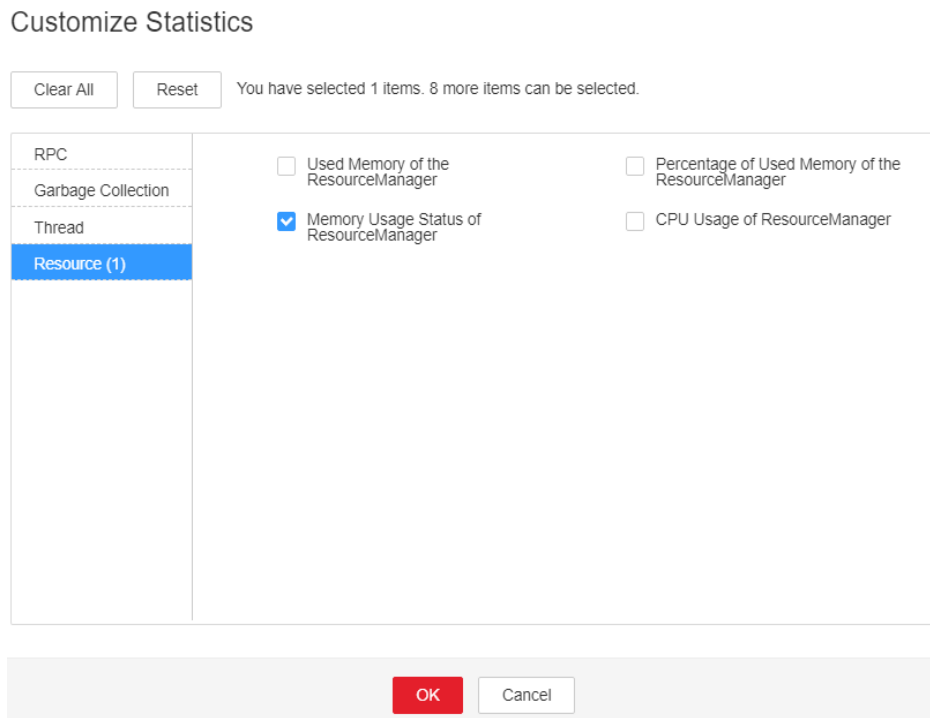

The direct memory of ResourceManager instances is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-18013 ResourceManager Direct Memory Usage Exceeds the Threshold > Location**. View the IP address of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > Yarn**. On the page that is displayed, click the **Instances** tab and click the ResourceManager instance for which this alarm is generated. Click the drop-down list in the upper right corner of the chart area, choose **Customize > Resource**, and select **Memory Usage Status of ResourceManager** to check the direct memory usage.

Figure 10-44 Customizing ResourceManager memory usage details

- Step 3** Check whether the used direct memory of a ResourceManager instance reaches 90% (default threshold) of the maximum direct memory allocated to it.
- If yes, go to [Step 4](#).
 - If no, go to [Step 9](#).
- Step 4** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > Yarn > Configurations > All Configurations > ResourceManager > System**. Check whether **-XX:MaxDirectMemorySize** exists in the **GC_OPTS** parameter.
- If yes, go to [Step 5](#).
 - If no, go to [Step 7](#).
- Step 5** Delete the **-XX:MaxDirectMemorySize** parameter from **GC_OPTS** and save the configuration.

NOTE

MaxDirectMemorySize indicates the maximum off-heap memory size. If the **MaxDirectMemorySize** parameter of ResourceManager is not specified, the memory of ResourceManager is not limited. By default, **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter is not set.

- Step 6** Perform the following steps to restart the ResourceManager instance:

NOTICE

- Restarting the standby ResourceManager instance does not affect services.
- During the ResourceManager switchover, new jobs cannot be submitted to Yarn, but submitted jobs are not affected.

1. On the Yarn service page, click the **Instances** tab, select the **ResourceManager (Standby)** instance, choose **More**, select **Restart Instance**, and verify the password to restart the instance.
2. After the standby instance is restarted, click the **Dashboard** tab of Yarn, choose **More**, select **Perform ResourceManager Switchover**, and verify the password to perform an active/standby switchover.
3. After the active/standby switchover is complete, click the **Instances** tab on the Yarn service page, select the **ResourceManager (Standby)** instance, choose **More**, select **Restart Instance**, and verify the password to restart the instance. Wait until the instance is restarted.

Step 7 Check whether **ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold** exists.

- If yes, rectify the fault by referring to **ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold**.
- If no, go to [Step 8](#).

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 10 Expand the **Service** drop-down list, and select **ResourceManager** for the target cluster.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.154 ALM-18014 NodeManager Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the Yarn service every 30 seconds. This alarm is generated when the direct memory usage of a NodeManager instance exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18014 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

If the available direct memory of the Yarn service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

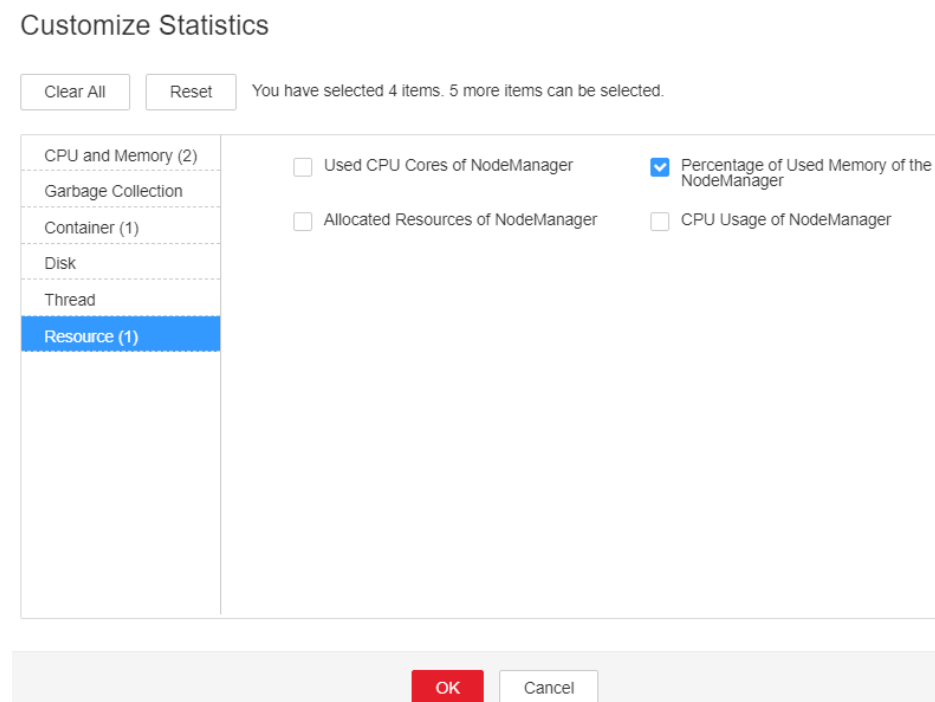

The direct memory of the NodeManager instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > ALM-18014 NodeManager Direct Memory Usage Exceeds the Threshold > Location** to check the IP address of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Instance > NodeManager (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > Resource > Percentage of Used Memory of the NodeManager** to check the direct memory usage.

Figure 10-45 Percentage of Used Memory of the NodeManager

- Step 3** Check whether the used direct memory of NodeManager reaches 90% of the maximum direct memory specified for NodeManager by default.
- If yes, go to [Step 4](#).
 - If no, go to [Step 9](#).
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Configurations > All Configurations > NodeManager > System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC_OPTS** parameter.
- If yes, go to [Step 5](#).
 - If no, go to [Step 7](#).
- Step 5** In the **GC_OPTS** parameter, delete "-XX:MaxDirectMemorySize".
- Step 6** Save the configuration and restart the NodeManager instance.

Step 7 Check whether the **ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold**.
- If no, go to [Step 8](#).

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 10 Select **NodeManager** in the required cluster from the **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.155 ALM-18015 JobHistoryServer Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the MapReduce service every 30 seconds. This alarm is generated when the direct memory usage of a JobHistoryServer instance exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18015 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

If the available direct memory of the MapReduce service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the JobHistoryServer instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > ALM-18015 JobHistoryServer Direct Memory Usage Exceeds the Threshold > Location** to check the IP address of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > MapReduce > Instance > JobHistoryServer (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > Memory Usage Status of JobHistoryServer** to check the direct memory usage.
- Step 3** Check whether the used direct memory of JobHistoryServer reaches 90% of the maximum direct memory specified for JobHistoryServer by default.
 - If yes, go to **Step 4**.
 - If no, go to **Step 9**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > MapReduce > Configurations > All Configurations > JobHistoryServer > System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC_OPTS** parameter.

- If yes, go to [Step 5](#).
- If no, go to [Step 7](#).

Step 5 In the `GC_OPTS` parameter, delete "-XX:MaxDirectMemorySize".

Step 6 Save the configuration and restart the JobHistoryServer instance.

Step 7 Check whether the **ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold**.
- If no, go to [Step 8](#).

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 10 Select **JobHistoryServer** in the required cluster from the **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.156 ALM-18016 Non Heap Memory Usage of ResourceManager Exceeds the Threshold

Description

The system checks the Non Heap memory usage of Yarn ResourceManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the Non Heap memory usage of Yarn ResourceManager exceeds the threshold (90% of the maximum memory by default).

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > Yarn** to change the threshold.

The alarm is cleared when the Non Heap memory usage is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18016 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service name for which the alarm is generated. |
| RoleName | Specifies the role name for which the alarm is generated. |
| HostName | Specifies the object (host ID) for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

When the Non Heap memory usage of Yarn ResourceManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The Non Heap memory of the Yarn ResourceManager instance on the node is overused or the Non Heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

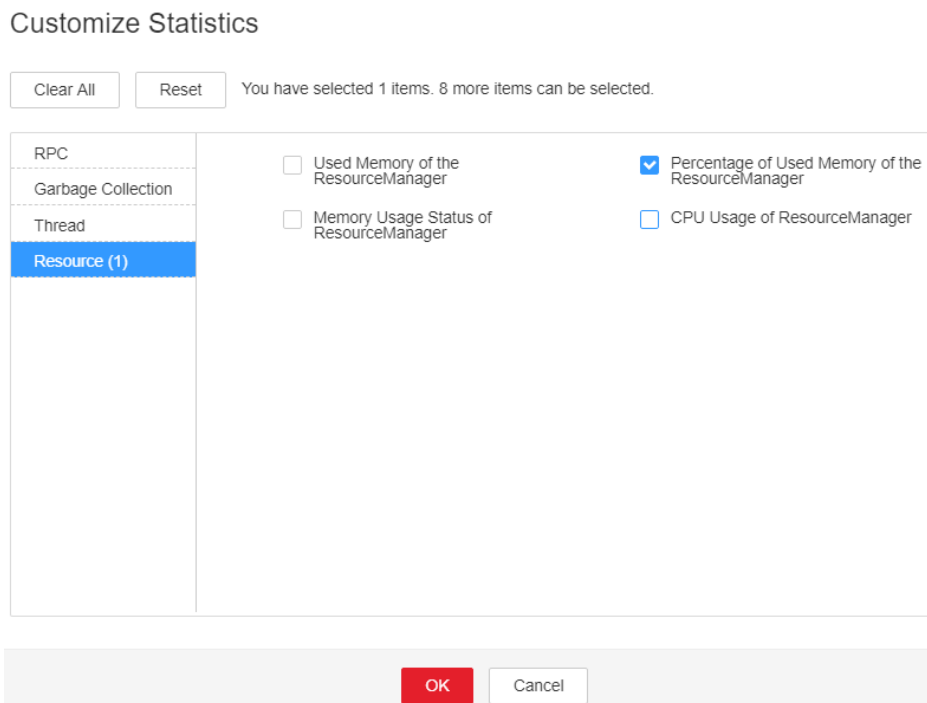

Procedure

Check the Non Heap memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > ALM-18016 Non Heap Memory Usage of Yarn ResourceManager Exceeds the Threshold > Location**. Check the HostName of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Instance > ResourceManager**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > Percentage of Used Memory of the ResourceManager**. ResourceManager indicates the

corresponding HostName of the instance for which the alarm is generated. Check the Non Heap memory usage.

Figure 10-46 Percentage of Used Memory of the ResourceManage

Step 3 Check whether the used Non Heap memory of ResourceManager reaches 90% of the maximum Non Heap memory specified for ResourceManager by default.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Configurations > All Configurations > ResourceManager > System**. Adjust the **GC_OPTS** memory parameter of ResourceManager. Save the configuration and restart the ResourceManager instance.

 **NOTE**

The mapping between the number of NodeManager instances in a cluster and the memory size of ResourceManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms10G -Xmx10G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 1000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms20G -Xmx20G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 2000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms40G -Xmx40G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 3000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms60G -Xmx60G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 4000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms80G -Xmx80G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 5000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms100G -Xmx100G -XX:NewSize=3G -XX:MaxNewSize=6G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.157 ALM-18017 Non Heap Memory Usage of NodeManager Exceeds the Threshold

Description

The system checks the Non Heap memory usage of Yarn NodeManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the Non Heap memory usage of Yarn NodeManager exceeds the threshold (90% of the maximum memory by default).

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > Yarn** to change the threshold.

The alarm is cleared when the Non Heap memory usage is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18017 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service name for which the alarm is generated. |
| RoleName | Specifies the role name for which the alarm is generated. |
| HostName | Specifies the object (host ID) for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

When the Non Heap memory usage of Yarn NodeManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

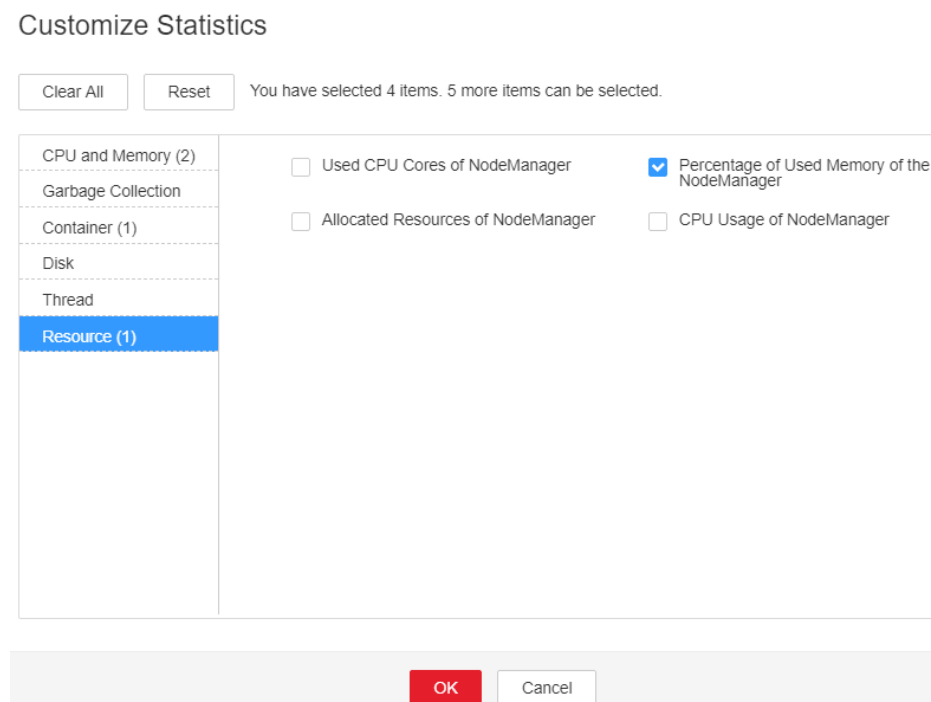

The Non Heap memory of the Yarn NodeManager instance on the node is overused or the Non Heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the Non Heap memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > ALM-18017 Non Heap Memory Usage of Yarn NodeManager Exceeds the Threshold > Location**. Check the HostName of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Instance > NodeManager**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > Resource > Percentage of Used Memory of the NodeManager**. NodeManager indicates the corresponding HostName of the instance for which the alarm is generated. Check the Non Heap memory usage.

Figure 10-47 Percentage of Used Memory of the NodeManager

- Step 3** Check whether the used Non Heap memory of NodeManager reaches 90% of the maximum Non Heap memory specified for NodeManager by default.
- If yes, go to **Step 4**.
 - If no, go to **Step 6**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Configurations > All Configurations > NodeManager > System**. Adjust the **GC_OPTS** memory parameter of NodeManager, click **Save**, and click **OK**, and restart the role instance.

 **NOTE**

The mapping between the number of NodeManager instances in a cluster and the memory size of NodeManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters for NodeManager instances are as follows: -Xms2G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters for NodeManager instances are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters for NodeManager instances are as follows: -Xms8G -Xmx8G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.158 ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of Yarn NodeManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Yarn NodeManager exceeds the threshold (95% of the maximum memory by default).

The alarm is cleared when the heap memory usage is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18018 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service name for which the alarm is generated. |
| RoleName | Specifies the role name for which the alarm is generated. |
| HostName | Specifies the object (host ID) for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

When the heap memory usage of Yarn NodeManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The heap memory of the Yarn NodeManager instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

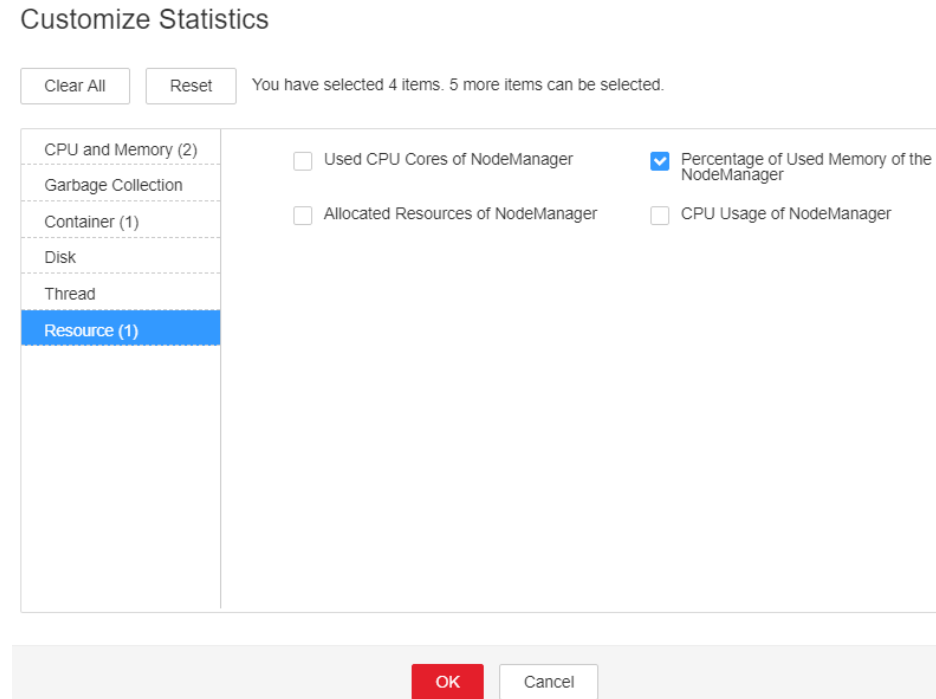

Procedure

Check the heap memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold > Location**. Check the HostName of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Instance > NodeManager**. Click the drop-down menu

in the upper right corner of **Chart**, choose **Customize > Resource > Percentage of Used Memory of the NodeManager** to check the heap memory usage.

Figure 10-48 Percentage of Used Memory of the NodeManager

Step 3 Check whether the used heap memory of NodeManager reaches 95% of the maximum heap memory specified for NodeManager.

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

Step 4 On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Configurations > All Configurations > NodeManager > System**. Increase the value of **GC_OPTS** parameter as required, click **Save**, and click **OK**, and restart the role instance.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of NodeManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters for NodeManager instances are as follows: `-Xms2G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G`
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters for NodeManager instances are as follows: `-Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G`
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters for NodeManager instances are as follows: `-Xms8G -Xmx8G -XX:NewSize=1G -XX:MaxNewSize=2G`

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.159 ALM-18019 Non Heap Memory Usage of JobHistoryServer Exceeds the Threshold

Description

The system checks the Non Heap memory usage of MapReduce JobHistoryServer every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the Non Heap memory usage of MapReduce JobHistoryServer exceeds the threshold (90% of the maximum memory by default).

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > MapReduce** to change the threshold.

The alarm is cleared when the Non Heap memory usage is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18019 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service name for which the alarm is generated. |
| RoleName | Specifies the role name for which the alarm is generated. |
| HostName | Specifies the object (host ID) for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

When the Non Heap memory usage of MapReduce JobHistoryServer is overhigh, the performance of MapReduce task submission and operation is affected. In addition, a memory overflow may occur so that the MapReduce service is unavailable.

Possible Causes

The Non Heap memory of the MapReduce JobHistoryServer instance on the node is overused or the Non Heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the Non Heap memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > ALM-18019 Non Heap Memory Usage of MapReduce JobHistoryServer Exceeds the Threshold > Location**. Check the HostName of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > MapReduce > Instance > JobHistoryServer**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > JobHistoryServer Non Heap memory usage statistics**. JobHistoryServer indicates the corresponding HostName of the instance for which the alarm is generated. Check the Non Heap memory usage.
- Step 3** Check whether the used Non Heap memory of JobHistoryServer reaches 90% of the maximum Non Heap memory specified for JobHistoryServer.
 - If yes, go to **Step 4**.

- If no, go to [Step 6](#).

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **MapReduce** > **Configurations** > **All Configurations** > **JobHistoryServer** > **System**. Adjust the **GC_OPTS** memory parameter of the NodeManager, click **Save**, and click **OK**, and restart the role instance.

 **NOTE**

The mapping between the number of historical tasks (10000) and the memory of the JobHistoryServer is as follows:

```
-Xms30G -Xmx30G -XX:NewSize=1G -XX:MaxNewSize=2G
```

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- MapReduce

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.160 ALM-18020 Yarn Task Execution Timeout

Alarm Description

The system checks MapReduce and Spark tasks (except for permanent JDBC tasks) submitted to Yarn every 15 minutes. This alarm is generated when the task execution time exceeds the timeout duration specified by the user. However, the task can be properly executed. The client timeout parameter of MapReduce is `mapreduce.application.timeout.alarm` and that of Spark is `spark.application.timeout.alarm`. The unit is ms.

This alarm is cleared when the task is finished or terminated.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 18020 | Minor | Yes |

Alarm Parameters

| Parameter | Description |
|-------------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| ApplicationName | Specifies the object (application ID) for which the alarm was generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

The alarm persists after task execution times out. However, the task can still be properly executed, so this alarm does not exert any impact on the system.

Possible Causes

- The specified timeout duration is shorter than the required execution time.
- The queue resources for task running are insufficient.
- Task data skew occurs. As a result, some tasks process a large amount of data and take a long time to execute.

Handling Procedure

Check whether the timeout interval is correctly set.

- Step 1** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. The **Alarms** page is displayed.
- Step 2** Select the alarm whose ID is **18020**. In the alarm details, view **Location** to obtain the timeout task name and timeout duration.
- Step 3** Based on the task name and timeout interval, choose **Cluster > Name of the desired cluster > Services > Yarn > ResourceManager (Active)** to log in to the native Yarn page. Then find the task on the native page, check its **StartTime** and calculate the task execution time based on the current system time. Check whether the task execution time exceeds the timeout duration.

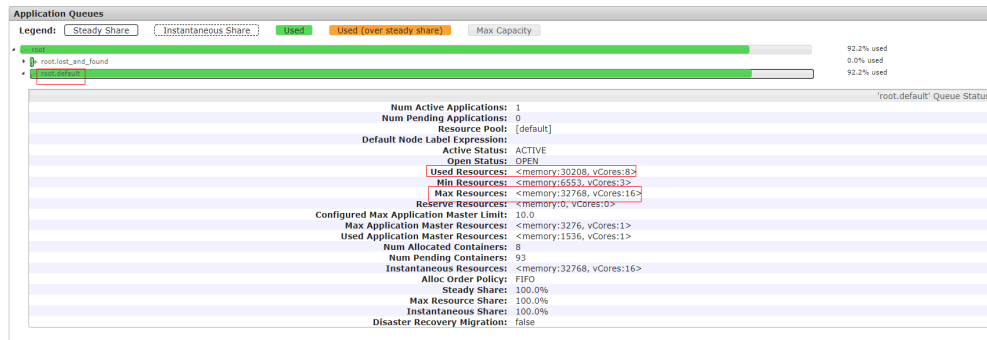

- If yes, go to [Step 4](#).
- If no, go to [Step 10](#).

Step 4 Evaluate the expected task execution time based on the service and compare it with the task timeout interval. If the timeout interval is too short, set the timeout interval (**mapreduce.application.timeout.alarm** or **spark.application.timeout.alarm**) of the client to the task expected execution time. Run the task again and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check whether the queue resources are sufficient.

Step 5 Find the task on the native page and view the queue name of the task. Click **Scheduler** on the left of the native page. On the **Applications Queues** page, find the corresponding queue name and expand the queue details, as shown in the following figure.

Step 6 Check whether the value of **Used Resources** in the queue details is approximately equal to the value of **Max Resources**, which indicates that the resources in the queue submitted by the task have been used up. If the queue resources are insufficient, choose **Tenant Resources > Dynamic Resource Plan > Resource Distribution Policy** on FusionInsight Manager and increase the value of **Max Resources** for the queue. Run the task again and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

Check whether data skew occurs.

Step 7 On the native Yarn page, click *task ID* (for example, **application_1565337919723_0002**) > **Tracking URL:ApplicationMaster** > **job_1565337919723_0002**. The following page is displayed.

Step 8 Choose **Job > Map tasks** or **Job > Reduce tasks** on the left and check whether the execution time of each Map or Reduce task differs greatly. If yes, task data skew occurs. In this case, you need to balance the task data.

Step 9 Rectify the fault based on the preceding causes and perform the tasks again. Then, check whether the alarm persists.

- If yes, go to **Step 10**.
- If no, no further action is required.

Collect the fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 11 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.161 ALM-18021 Mapreduce Service Unavailable

Description

The alarm module checks the MapReduce service status every 60 seconds. This alarm is generated when the system detects that the MapReduce service is unavailable.

The alarm is cleared when the MapReduce service recovers.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18021 | Critical | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The cluster cannot provide the MapReduce service. For example, MapReduce cannot be used to view task logs or the log archive function is unavailable.

Possible Causes

- The JobHistoryServer instance is abnormal.
- The KrbServer service is abnormal.
- The ZooKeeper service abnormal.
- The HDFS service abnormal.
- The Yarn service is abnormal.

Procedure

Check MapReduce service JobHistoryServer instance status.

Step 1 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **MapReduce** > **Instance**.

Step 2 Check whether the running status of JobHistoryServer is **Normal**.

- If yes, go to [Step 11](#).
- If no, go to [Step 3](#).

Check the KrbServer service status.

Step 3 In the alarm list on FusionInsight Manager, check whether **ALM-25500 KrbServer Service Unavailable** exists.

- If yes, go to [Step 4](#).
- If no, go to [Step 5](#).

Step 4 Rectify the fault by following the steps provided in **ALM-25500 KrbServer Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check the ZooKeeper service.

Step 5 In the alarm list on FusionInsight Manager, check whether **ALM-13000 ZooKeeper Service Unavailable** exists.

- If yes, go to [Step 6](#).
- If no, go to [Step 7](#).

Step 6 Rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

Check the HDFS service status.

Step 7 In the alarm list on FusionInsight Manager, check whether **ALM-14000 HDFS Service Unavailable** exists.

- If yes, go to [Step 8](#).
- If no, go to [Step 9](#).

Step 8 Rectify the fault by following the steps provided in **ALM-14000 HDFS Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Check the Yarn service status.

Step 9 In the alarm list on FusionInsight Manager, check whether **ALM-18000 Yarn Service Unavailable** exists.

- If yes, go to [Step 10](#)
- If no, go to [Step 11](#).

Step 10 Rectify the fault by following the steps provided in **ALM-18000 Yarn Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

Collect fault information.

Step 11 On the FusionInsight Manager home page of the active cluster, choose **O&M > Log > Download**.

Step 12 Select **MapReduce** in the required cluster from the **Service**.

Step 13 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.162 ALM-18022 Insufficient Yarn Queue Resources

Description

The alarm module checks Yarn queue resources every 60 seconds. This alarm is generated when available resources or ApplicationMaster (AM) resources of a queue are insufficient.

This alarm is cleared when available resources are sufficient.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 18022 | Minor | Yes |

Parameters

| Parameter Name | Description |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| QueueName | Specifies the queue for which the alarm is generated. |
| QueueMetric | Specifies the metric of the queue for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

- An application being executed takes longer time.
- An application fails to be executed for a long time after being submitted.

Possible Causes

- NodeManager node resources are insufficient.
- The configured maximum resource capacity of the queue is excessively small.
- The configured maximum AM resource percentage is excessively small.

Procedure

View alarm details.

- Step 1** On the FusionInsight Manager, choose **O&M > Alarm > Alarms**.
- Step 2** View location information of this alarm and check whether **QueueName** is **root** and **QueueMetric** is **Memory** or **QueueName** is **root** and **QueueMetric** is **vCores**.
- If yes, go to [Step 3](#).
 - If no, go to [Step 4](#).
- Step 3** The memory or CPU of the Yarn cluster is insufficient. In this case, log in to the node where NodeManager resides and run the **free -g** and **cat /proc/cpuinfo** commands to query the available memory and available CPU of the node, respectively. On FusionInsight Manager, increase the values of **yarn.nodemanager.resource.memory-mb** and **yarn.nodemanager.resource.cpu-vcores** for the Yarn NodeManager based on the query results. Then, restart the NodeManager instance. Check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 4](#).
- Step 4** View location information of this alarm and check whether **QueueName** is **<Tenant Queue>** and **QueueMetric** is **Memory**, or **QueueName** is **<Tenant Queue>** and **QueueMetric** is **vCores** in **Location**, check whether **available Memory =** or **available vCores =** are included in **Additional Information**.
- If yes, go to [Step 5](#).
 - If no, go to [Step 7](#).
- Step 5** The memory or CPU of the tenant queue is insufficient. In this case, choose **Tenant Resources > Dynamic Resource Plan > Resource Distribution Policy** and increase the value of **Maximum Capacity**. Then, check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 6](#).
- Step 6** Choose **Cluster > Name of the desired cluster > Services > Yarn > Configurations > All Configurations**. Enter the keyword "threshold" and click **ResourceManager**. Adjust the threshold values of the following parameters:
- If **Additional Information** contains **available Memory =**, change the value of **yarn.queue.memory.alarm.threshold** to a value smaller than that of **available Memory =** in **Additional Information**.
- If **Additional Information** contains **available vCores =**, change the value of **yarn.queue.vcore.alarm.threshold** to a value smaller than that of **available vCores =** in **Additional Information**.
- Wait for five minutes and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 9](#).
- Step 7** If **available AmMemory =** or **available AmvCores =** is included in **Additional Information**, ApplicationMaster memory or CPU of the tenant queue is

insufficient. In this case, choose **Tenant Resources > Dynamic Resource Plan > Queue Configuration** and increase the value of **Maximum Am Resource Percent**. Then, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

Step 8 Choose **Cluster > Name of the desired cluster > Services > Yarn > Configurations > All Configurations**. Enter the keyword "threshold" and click **ResourceManager**. Adjust the threshold values of the following parameters:

If **Additional Information** contains **available AmMemory =**, change the value of **yarn.queue.memory.alarm.threshold** to a value smaller than that of **available AmMemory =** in **Additional Information**.

If **Additional Information** contains **available AmvCores =**, change the value of **yarn.queue.vcore.alarm.threshold** to a value smaller than that of **available AmvCores =** in **Additional Information**.

Wait for five minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Collect fault information.

Step 9 Log in to FusionInsight Manager of the active cluster, and choose **O&M > Log > Download**.

Step 10 Select **Yarn** in the required cluster from the **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Reference

None

10.163 ALM-18023 Number of Pending Yarn Tasks Exceeds the Threshold

Alarm Description

The alarm module checks the number of pending applications in the Yarn root queue every 60 seconds. The alarm is generated when the number exceeds 60.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 18023 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|---|
| Source | Specifies the cluster for which the alarm was generated. |
| QueueName | Specifies the queue for which the alarm was generated. |
| QueueMetric | Specifies the queue metric for which the alarm was generated. |

Impact on the System

- It takes long time to end an application.
- A new application cannot run after submission.

Possible Causes

- NodeManager node resources are insufficient.
- The maximum resource capacity of the queue and the maximum AM resource percentage are too small.
- The monitoring threshold is too small.

Handling Procedure

Check NodeManager resources.

- Step 1** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager (Active)** to access the ResourceManager web UI.
- Step 2** Click **Scheduler** and check whether the root queue resources are used up in **Application Queues**.
- If yes, go to [Step 3](#).
 - If no, go to [Step 4](#).
- Step 3** Expand the capacity of the NodeManager instance of the Yarn service. After the capacity expansion, check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 6](#).

Check the maximum queue resource capacity and the maximum AM resource percentage.

Step 4 Check whether the resources of the queue corresponding to the pending task are used up.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

Step 5 On FusionInsight Manager, choose **Tenant Resources > Dynamic Resource Plan** and add resources as required. Check whether the alarms are cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Adjust the monitoring thresholds.

Step 6 On FusionInsight Manager, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Yarn > Applications > Pending Applications**, and increase the thresholds as required.

Step 7 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to [Step 8](#).

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 9 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.164 ALM-18024 Pending Yarn Memory Usage Exceeds the Threshold

Alarm Description

The alarm module checks the pending memory of Yarn every 60 seconds. The alarm is generated when the pending memory exceeds the threshold. Pending

memory indicates the total memory that is not allocated to submitted Yarn applications.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 18024 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|---|
| Source | Specifies the cluster for which the alarm was generated. |
| QueueName | Specifies the queue for which the alarm was generated. |
| QueueMetric | Specifies the queue metric for which the alarm was generated. |

Impact on the System

- It takes long time to end an application.
- A new application cannot run after submission.

Possible Causes

- NodeManager node resources are insufficient.
- The maximum resource capacity of the queue and the maximum AM resource percentage are too small.
- The monitoring threshold is too small.

Handling Procedure

Check NodeManager resources.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager (Active)** to access the ResourceManager web UI.

Step 2 Click **Scheduler** and check whether the root queue resources are used up in **Application Queues**.

- If yes, go to [Step 3](#).
- If no, go to [Step 4](#).

Step 3 Expand the capacity of the NodeManager instance of the Yarn service. After the capacity expansion, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Check the maximum queue resource capacity and the maximum AM resource percentage.

Step 4 Check whether the resources of the queue corresponding to the pending task are used up.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

Step 5 On FusionInsight Manager, choose **Tenant Resources > Dynamic Resource Plan** and add resources as required. Check whether the alarms are cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Adjust the monitoring thresholds.

Step 6 On FusionInsight Manager, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Yarn > CPU and Memory > Pending Memory**, and increase the threshold as required.

Step 7 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to [Step 8](#).

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 9 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.165 ALM-18025 Number of Terminated Yarn Tasks Exceeds the Threshold

Description

The alarm module checks the number of terminated applications in the Yarn root queue every 60 seconds. The alarm is generated when the number exceeds 50 for three consecutive times.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 18025 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Cluster Name | Specifies the cluster for which the alarm is generated. |
| Service Name | Specifies the service for which the alarm is generated. |
| Role Name | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

A large number of application tasks are forcibly terminated.

Possible Causes

- The user forcibly terminates a large number of tasks.
- The system terminates tasks due to some error.

Procedure

Check the alarm details.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** to go to the alarm page.
- Step 2** View **Additional Information** in the alarm details to check whether the alarm threshold is too small.
- If yes, go to **Step 3**.
 - If no, go to **Step 4**.
- Step 3** Choose **O&M > Alarm > Thresholds > Name of the desired cluster > Yarn > Other > Terminated Applications of root queue** to modify the threshold. Go to **Step 6**.
- Step 4** Choose **Cluster > Name of the desired cluster > Services > Yarn > ResourceManager(Active)** to access the ResourceManager web UI.
- Step 5** Click **KILLED** in **Applications** and click the task on the top. View the description of **Diagnostics** and rectify the fault based on the task termination details (for example, the task is terminated by a user).

Figure 10-49 Click **KILLED**

- Step 6** Wait for 3 minutes and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to **Step 7**.

Collect the fault information.

- Step 7** On the FusionInsight Manager, choose **O&M > Log > Download**.
- Step 8** Expand the **Service** drop-down list, and select **Yarn** for the target cluster.
- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.166 ALM-18026 Number of Failed Yarn Tasks Exceeds the Threshold

Description

The alarm module checks the number of failed applications in the Yarn root queue every 60 seconds. The alarm is generated when the number exceeds 50 for three consecutive times.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 18026 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Cluster Name | Specifies the cluster for which the alarm is generated. |
| Service Name | Specifies the service for which the alarm is generated. |
| Role Name | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

- A large number of application tasks fail to be executed.
- Failed tasks need to be submitted again.

Possible Causes

The task fails to be executed due to some error.

Procedure

Check the alarm details.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** to go to the alarm page.
- Step 2** View **Additional Information** in the alarm details to check whether the alarm threshold is too small.
- If yes, go to **Step 3**.
 - If no, go to **Step 4**.
- Step 3** Choose **O&M > Alarm > Thresholds > Name of the desired cluster > Yarn > Other > Failed Applications of root queue** to modify the threshold. Go to **Step 6**.
- Step 4** Choose **Cluster > Name of the desired cluster > Services > Yarn > ResourceManager(Active)** to access the ResourceManager web UI.
- Step 5** Click **FAILED** in **Applications** and click the task on the top. View the description of **Diagnostics** and rectify the fault based on the task failure causes.

Figure 10-50 Click **FAILED**

- Step 6** Wait for 3 minutes and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to **Step 7**.

Collect the fault information.

- Step 7** On the FusionInsight Manager, choose **O&M > Log > Download**.
- Step 8** Expand the **Service** drop-down list, and select **Yarn** for the target cluster.
- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.167 ALM-19000 HBase Service Unavailable

Alarm Description

The alarm module checks the HBase service status every 120 seconds. This alarm is generated when the HBase service is unavailable.

This alarm is cleared when the HBase service recovers.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19000 | Critical | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |

Impact on the System

Operations such as data read/write and table creation cannot be performed.

Possible Causes

- ZooKeeper is abnormal.
- HDFS is abnormal.
- HBase is abnormal.
- The network connection is abnormal.
- The service configuration value is incorrect.

Handling Procedure

Check the ZooKeeper service status.

Step 1 In the service list on FusionInsight Manager, check whether **Running Status** of ZooKeeper is **Normal**.

- If yes, go to [Step 5](#).
- If no, go to [Step 2](#).

Step 2 In the alarm list, check whether **ALM-13000 ZooKeeper Service Unavailable** exists.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

Step 3 Rectify the fault by performing the operations provided for **ALM-13000 ZooKeeper Service Unavailable**.

Step 4 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check the HDFS service status.

Step 5 In the alarm list, check whether **ALM-14000 HDFS Service Unavailable** exists.

- If yes, go to [Step 6](#).
- If no, go to [Step 8](#).

Step 6 Rectify the fault by performing the operations provided for **ALM-14000 HDFS Service Unavailable**.

Step 7 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

Step 8 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, choose **Services > HDFS**, and check whether **Safe Mode** of HDFS is **ON**.

- If yes, go to [Step 9](#).
- If no, go to [Step 12](#).

Step 9 Log in to the HDFS client as user **root**. Run the **cd** command to go to the client installation directory and run the **source bigdata_env** command.

If the cluster uses the security mode, perform security authentication. Obtain the password of user **hdfs** from the MRS cluster administrator, run the **kinit hdfs** command, and enter the password as prompted.

Step 10 Run the following command to manually exit the safe mode:

```
hdfs dfsadmin -safemode leave
```

Step 11 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

Check the HBase service status.

- Step 12** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > HBase**.
- Step 13** Check whether there is one active HMaster and one standby HMaster.
- If yes, go to [Step 15](#).
 - If no, go to [Step 14](#).
- Step 14** Click **Instances** and select the HMaster instance whose status is not **Active**. Click **More** and select **Restart Instance** to restart HMaster. Then check whether there is one active HMaster and one standby HMaster.
- If yes, go to [Step 15](#).
 - If no, go to [Step 21](#).

NOTICE

During the HMaster restart, table operations cannot be performed, and the HBase web UI is inaccessible. Data read and write operations are not affected.

- Step 15** Choose **Cluster**, click the name of the desired cluster, choose **Services > HBase**, and click **HMaster(Active)** to access the HMaster web UI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

- Step 16** Check whether at least one RegionServer exists under **Region Servers**.
- If yes, go to [Step 17](#).
 - If no, go to [Step 21](#).
- Step 17** Choose **Tables > System Tables** and check whether **hbase:meta**, **hbase:namespace**, and **hbase:acl** exist in the **Table Name** column, as shown in [Figure 10-51](#).
- If yes, go to [Step 18](#).
 - If no, go to [Step 19](#).

Figure 10-51 HBase system tables

| Table Name | Description |
|------------------------|--|
| hbase:acl | The hbase:acl table holds information about acl. |
| hbase:index | The hbase:index table holds information about table indices. |
| hbase:meta | The hbase:meta table holds references to all User Table regions. |
| hbase:namespace | The hbase:namespace table holds information about namespaces. |

- Step 18** Click **hbase:meta**, **hbase:namespace**, and **hbase:acl** to check whether all pages can be opened. If all of them can be opened, the tables are normal.

- If yes, go to [Step 19](#).
- If no, go to [Step 25](#).

 **NOTE**

In a normal cluster, ACL permission control is disabled for HBase by default. The `hbase:acl` table is generated only after ACL permission control is manually enabled. In this case, you need to check this table.

Step 19 View the HMaster startup status.

On the **Tasks** page shown in [Figure 10-52](#), the **RUNNING** value in the **State** column indicates that HMaster is being started and provides how much time HMaster keeps in that state. As shown in [Figure 10-53](#), if the state is **COMPLETE**, HMaster has been started.

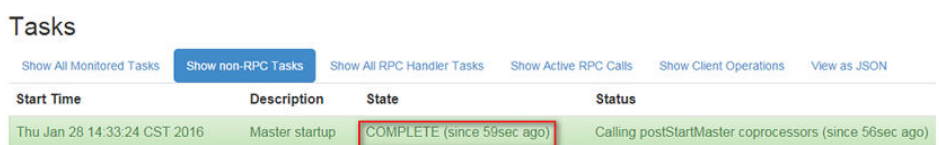

Check whether HMaster has been in the **RUNNING** state for a long time.

Figure 10-52 HMaster being started

| Start Time | Description | State | Status |
|------------------------------|----------------|--------------------------|-------------------------------------|
| Thu Jan 28 14:43:12 CST 2016 | Master startup | RUNNING (since 1sec ago) | Initializing master service threads |

Figure 10-53 HMaster startup completed

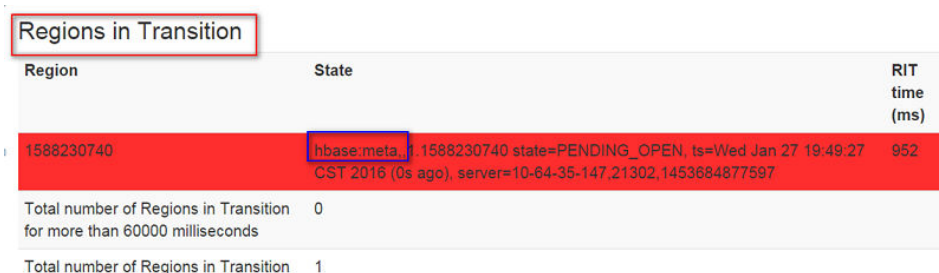

| Start Time | Description | State | Status |
|------------------------------|----------------|----------------------------|--|
| Thu Jan 28 14:33:24 CST 2016 | Master startup | COMPLETE (since 59sec ago) | Calling postStartMaster coprocessors (since 56sec ago) |

- If yes, go to [Step 20](#).
- If no, go to [Step 21](#).

Step 20 On the HMaster web UI, check whether any `hbase:meta` is in the **Regions in Transition** state for a long time.

Figure 10-54 Regions in Transition

| Region | State | RIT time (ms) |
|------------|--|---------------|
| 1588230740 | hbase:meta, 1588230740 state=PENDING_OPEN, ts=Wed Jan 27 19:49:27 CST 2016 (0s ago), server=10-64-35-147.21302,1453684877597 | 952 |

Total number of Regions in Transition for more than 60000 milliseconds: 0

Total number of Regions in Transition: 1

- If yes, go to [Step 21](#).
- If no, go to [Step 22](#).

Step 21 After ensuring that services are not affected, log in to FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, choose **Services** > **HBase**,

click **More**, and select **Restart Service**. In the dialog box that is displayed, enter the password, and click **OK**.

- If yes, go to [Step 22](#).
- If no, go to [Step 25](#).

NOTICE

During HBase service restart, the service is unavailable. For example, data cannot be read or written, table operations cannot be performed, and the HBase web UI is inaccessible.

Step 22 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 25](#).

Check whether the HBase configurations are correctly modified.

Step 23 On FusionInsight Manager, choose **Audit**. On the **Audit** page, click **Advanced Search**, click  on the right of **Operation Type**, select **Save configuration**, click **OK**, and click **Search**.

Step 24 In the search result, check whether the historical configurations of HBase-related services in the **Service** column, such as ZooKeeper, HDFS, and HBase, may affect the HBase service status. [Table 10-6](#) lists some configurations that may affect the HBase service status.

Table 10-6 Configurations affecting the HBase service status

| Parameter | Possible Impact |
|--|---|
| GC_OPTS | The memory configuration may be improper. You need to check the health status of instance processes. |
| hbase.rpc.protection | If the HBase service is not restarted offline after the value of this parameter is changed, the connection authentication fails and the HBase service becomes abnormal. |
| hbase.regionserver.metahandler.count | If there are too many regions in the cluster but this parameter is set to a small value, RIT may occur and regions cannot be brought online for a long time. |
| hbase.regionserver.thread.compaction.large | If this parameter is set to a large value, the node CPU usage may be too high. |
| hbase.regionserver.thread.compaction.small | If this parameter is set to a large value, the node CPU usage may be too high. |
| hbase.coprocessor.master.classes | If a custom coprocessor is used in the configuration, a logic error may cause the service to be unavailable. |

| Parameter | Possible Impact |
|--|---|
| hbase.coprocessor.region.classes | If a custom coprocessor is used in the configuration, a logic error may cause the service to be unavailable. |
| hbase.coprocessor.regionserver.classes | If a custom coprocessor is used in the configuration, a logic error may cause the service to be unavailable. |
| zookeeper.session.timeout | If this parameter is set to a small value, the connection between HBase and ZooKeeper times out too quickly. As a result, the HMaster instance and RegionServer may restart repeatedly. |

Check the network connection between HMaster and dependent components.

- Step 25** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > HBase**.
- Step 26** Click **Instances**. In the HMaster instance list, record the management IP address of the active HMaster instance.
- Step 27** Log in to the active HMaster node as user **omm** through the IP address obtained in [Step 26](#).
- Step 28** Run the **ping** command to check whether the network connection between the active HMaster node and the host where the dependent components reside is normal. (The dependent components include ZooKeeper, HDFS, and Yarn. The method of obtaining the IP address of the host where the dependent components reside is the same as that of obtaining the IP address of the active HMaster node.)
- If yes, go to [Step 31](#).
 - If no, go to [Step 29](#).
- Step 29** Contact the network administrator to restore the network.
- Step 30** In the alarm list, check whether this alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 31](#).

Collect fault information.

- Step 31** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 32** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select the following services for the target cluster:
- ZooKeeper
 - HDFS
 - HBase

Step 33 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 34 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.168 ALM-19006 HBase Replication Sync Failed

Description

The alarm module checks the HBase DR data synchronization status every 30 seconds. When disaster recovery (DR) data fails to be synchronized to a standby cluster, the alarm is triggered.

When DR data synchronization succeeds, the alarm is cleared.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 19006 | Critical | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

| Name | Meaning |
|-------------------|--|
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

HBase data in a cluster fails to be synchronized to the standby cluster, causing data inconsistency between active and standby clusters.

Possible Causes

- The HBase service on the standby cluster is abnormal.
- A network exception occurs.

Procedure

Observe whether the system automatically clears the alarm.

Step 1 On the FusionInsight Manager portal of the active cluster, click **O&M > Alarm > Alarms**.

Step 2 In the alarm list, click the alarm to obtain alarm generation time from **Generated** of the alarm. Check whether the alarm has existed for five minutes.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Wait five minutes and check whether the system automatically clears the alarm.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the HBase service status of the standby cluster.

Step 4 Log in to the FusionInsight Manager portal of the active cluster, and click **O&M > Alarm > Alarms**.

Step 5 In the alarm list, click the alarm to obtain **HostName** from **Location**.

Step 6 Access the node where the HBase client of the active cluster resides as user **omm**.

If the cluster uses a security mode, perform security authentication first and then access the **hbase shell** interface as user **hbase**.

```
cd /opt/client
```

```
source ./bigdata_env
```

```
kinit hbaseuser
```

Step 7 Run the **status 'replication', 'source'** command to check the DR synchronization status of the faulty node.

The DR synchronization status of a node is as follows.

10-10-10-153:

SOURCE: PeerID=abc, SizeOfLogQueue=0, ShippedBatches=2, ShippedOps=2, ShippedBytes=320, LogReadInBytes=1636, LogEditsRead=5, LogEditsFiltered=3, SizeOfLogToReplicate=0, TimeForLogToReplicate=0, ShippedHFiles=0, SizeOfHFileRefsQueue=0, AgeOfLastShippedOp=0, TimeStampsOfLastShippedOp=Mon Jul 18 09:53:28 CST 2016, Replication Lag=0, FailedReplicationAttempts=0
SOURCE: PeerID=abc1, SizeOfLogQueue=0, ShippedBatches=1, ShippedOps=1, ShippedBytes=160, LogReadInBytes=1636, LogEditsRead=5, LogEditsFiltered=3, SizeOfLogToReplicate=0, TimeForLogToReplicate=0, ShippedHFiles=0, SizeOfHFileRefsQueue=0, AgeOfLastShippedOp=16788, TimeStampsOfLastShippedOp=Sat Jul 16 13:19:00 CST 2016, Replication Lag=16788, FailedReplicationAttempts=5

Step 8 Obtain **PeerID** corresponding to a record whose **FailedReplicationAttempts** value is greater than 0.

In the preceding step, data on the faulty node 10-10-10-153 fails to be synchronized to a standby cluster whose **PeerID** is **abc1**.

Step 9 Run the **list_peers** command to find the cluster and the HBase instance corresponding to the **PeerID** value.

```
PEER_ID CLUSTER_KEY STATE TABLE_CFS
abc1 10.10.10.110,10.10.10.119,10.10.10.133:2181:/hbase2 ENABLED
abc 10.10.10.110,10.10.10.119,10.10.10.133:2181:/hbase ENABLED
```

In the preceding information, **/hbase2** indicates that data is synchronized to the HBase2 instance of the standby cluster.

Step 10 In the service list of FusionInsight Manager of the standby cluster, check whether the running status of the HBase instance obtained by using **Step 9** is **Normal**.

- If yes, go to **Step 14**.
- If no, go to **Step 11**.

Step 11 In the alarm list, check whether the **ALM-19000 HBase Service Unavailable** alarm is generated.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Follow troubleshooting procedures in **ALM-19000 HBase Service Unavailable** to rectify the fault.

Step 13 Wait for a few minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check network connections between RegionServers on active and standby clusters.

Step 14 Log in to the FusionInsight Manager portal of the active cluster, and click **O&M > Alarm > Alarms**.

Step 15 In the alarm list, click the alarm to obtain **HostName** from **Location**.

Step 16 Use the IP address obtained in **Step 15** to log in to a faulty RegionServer node as user **omm**.

Step 17 Run the **ping** command to check whether network connections between the faulty RegionServer node and the host where RegionServer of the standby cluster resides are in the normal state.

- If yes, go to [Step 20](#).
- If no, go to [Step 18](#).

Step 18 Contact the network administrator to restore the network.

Step 19 After the network is running properly, check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to [Step 20](#).

Collect fault information.

Step 20 On the FusionInsight Manager interface of active and standby clusters, choose **O&M > Log > Download**.

Step 21 In the **Service** drop-down list box, select **HBase** in the required cluster.

Step 22 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 23 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.169 ALM-19007 HBase GC Time Exceeds the Threshold

Description

The system checks the old generation garbage collection (GC) time of the HBase service every 60 seconds. This alarm is generated when the detected old generation GC time exceeds the threshold (exceeds 5 seconds for three consecutive checks by default). To change the threshold, on the FusionInsight Manager portal, choose **O&M > Alarm > Thresholds > Name of the desired cluster > HBase > GC > GC time for old generation**. This alarm is cleared when the old generation GC time of the HBase service is shorter than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 19007 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service name for which the alarm is generated. |
| RoleName | Specifies the role name for which the alarm is generated. |
| HostName | Specifies the object (host ID) for which the alarm is generated. |

Impact on the System

If the old generation GC time exceeds the threshold, HBase data read and write are affected.

Possible Causes

The memory of HBase instances is overused, the heap memory is inappropriately allocated, or a large number of I/O operations exist in HBase. As a result, GCs occur frequently.

Procedure

Check the GC time.

- Step 1** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **ID** is **19007**. Then check the role name in **Location** and confirm the IP address of the instance.
- If the role for which the alarm is generated is HMaster, go to [Step 2](#).
 - If the role for which the alarm is generated is RegionServer, go to [Step 3](#).
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HBase > Instance** and click the HMaster for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize > GC > Garbage Collection (GC) Time of HMaster** and click **OK** to check whether the value of **GC time for old generation** is greater than the threshold (exceeds 5 seconds for three consecutive checks periods by default).
- If yes, go to [Step 4](#).
 - If no, go to [Step 6](#).

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the RegionServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **GC** > **Garbage Collection (GC) Time of RegionServer** and click **OK** to check whether the value of **GC time for old generation** is greater than the threshold (exceeds 5 seconds for three consecutive checks periods by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Figure 10-56 Garbage Collection (GC) Time of RegionServer
Customize Statistics

Check the current JVM configuration.

- Step 4** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations**, and click **All Configurations**. In Search, enter **GC_OPTS** to check the **GC_OPTS** memory parameter of role HMaster(HBase->HMaster), RegionServer(HBase->RegionServer). Adjust the values of **-Xmx** and **-XX:CMSInitiatingOccupancyFraction** of the GC_OPTS parameter by referring to the Note.

 NOTE

1. Suggestions on GC parameter configurations for HMaster
 - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
 - Set **-XX:NewSize** to the value of **-XX:MaxNewSize**, which is one eighth of **-Xmx**.
 - For large-scale HBase clusters with a large number of regions, increase values of **GC_OPTS** parameters for HMaster. Specifically, set **-Xmx** to 4 GB if the number of regions is less than 100,000. If the number of regions is more than 100,000, set **-Xmx** to be greater than or equal to 6 GB. For each increased 35,000 regions, increase the value of **-Xmx** by 2 GB. The maximum value of **-Xmx** is 32 GB.
2. Suggestions on GC parameter configurations for RegionServer
 - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
 - Set **-XX:NewSize** to one eighth of **-Xmx**.
 - Set the memory for RegionServer to be greater than that for HMaster. If sufficient memory is available, increase the heap memory.
 - Set **-Xmx** based on the machine memory size. Specifically, set **-Xmx** to 32 GB if the machine memory is greater than 200 GB, to 16 GB if the machine memory is greater than 128 GB and less than 200 GB, and to 8 GB if the machine memory is less than 128 GB. When **-Xmx** is set to 32 GB, a RegionServer node supports 2000 regions and 200 hotspot regions.
 - **XX:CMSInitiatingOccupancyFraction** to be less than and equal to **85**, and it is calculated as follows: $100 \times (\text{hfile.block.cache.size} + \text{hbase.regionserver.global.memstore.size})$

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect fault information.

Step 6 On the FusionInsight Manager interface of active and standby clusters, choose **O&M > Log > Download**.

Step 7 In the **Service** drop-down list box, select **HBase** in the required cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.170 ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold

Description

The system checks the HBase service status every 30 seconds. The alarm is generated when the heap memory usage of an HBase service exceeds the threshold (90% of the maximum memory).

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 19008 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service name for which the alarm is generated. |
| RoleName | Specifies the role name for which the alarm is generated. |
| HostName | Specifies the object (host ID) for which the alarm is generated. |

Impact on the System

If the available HBase heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The heap memory of the HBase service is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

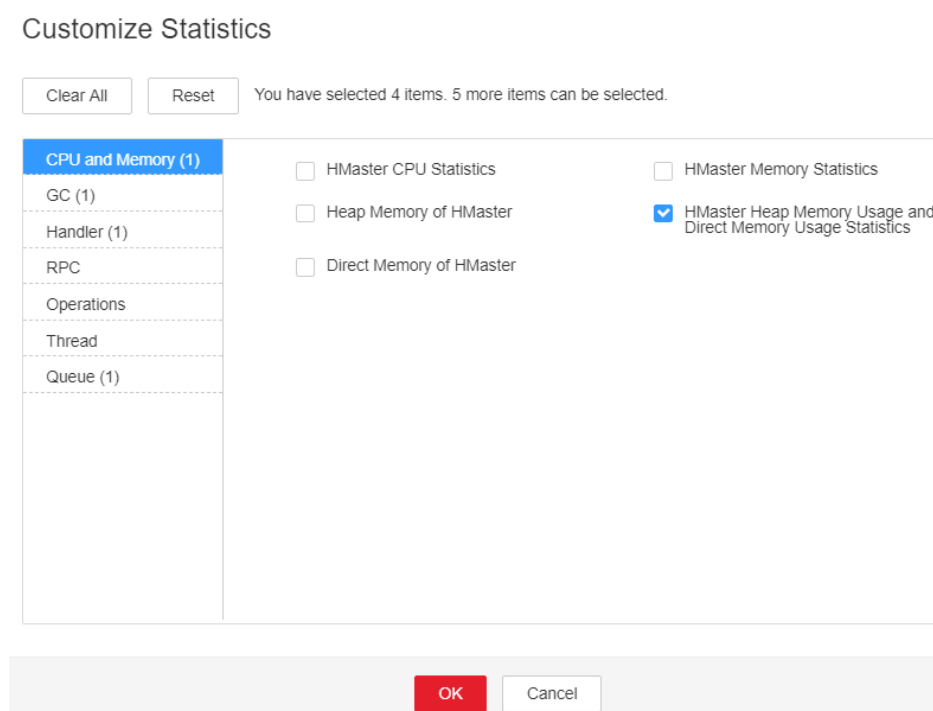

- Step 1** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **ID** is **19008**. Then check the role name in **Location** and confirm the IP address of the instance.

- If the role for which the alarm is generated is HMaster, go to [Step 2](#).
- If the role for which the alarm is generated is RegionServer, go to [Step 3](#).

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the HMaster for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory** > **HMaster Heap Memory Usage and Direct Memory Usage Statistics** and click **OK**, check whether the used heap memory of the HBase service reaches 90% of the maximum heap memory specified for HBase.

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

Figure 10-57 HMaster Heap Memory Usage and Direct Memory Usage Statistics

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the RegionServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory** > **RegionServer Heap Memory Usage and Direct Memory Usage Statistics** and click **OK**, check whether the used heap memory of the HBase service reaches 90% of the maximum heap memory specified for HBase.

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

Figure 10-58 RegionServer Heap Memory Usage and Direct Memory Usage Statistics

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations**, and click **All Configurations**. Choose **HMaster/RegionServer** > **System**. Increase the value of **-Xmx** in **GC_OPTS** by referring to the Note.

NOTE

1. Suggestions on GC parameter configurations for HMaster
 - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
 - Set **-XX:NewSize** to the value of **-XX:MaxNewSize**, which is one eighth of **-Xmx**.
 - For large-scale HBase clusters with a large number of regions, increase values of **GC_OPTS** parameters for HMaster. Specifically, set **-Xmx** to 4 GB if the number of regions is less than 100,000. If the number of regions is more than 100,000, set **-Xmx** to be greater than or equal to 6 GB. For each increased 35,000 regions, increase the value of **-Xmx** by 2 GB. The maximum value of **-Xmx** is 32 GB.
2. Suggestions on GC parameter configurations for RegionServer
 - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
 - Set **-XX:NewSize** to one eighth of **-Xmx**.
 - Set the memory for RegionServer to be greater than that for HMaster. If sufficient memory is available, increase the heap memory.
 - Set **-Xmx** based on the machine memory size. Specifically, set **-Xmx** to 32 GB if the machine memory is greater than 200 GB, to 16 GB if the machine memory is greater than 128 GB and less than 200 GB, and to 8 GB if the machine memory is less than 128 GB. When **-Xmx** is set to 32 GB, a RegionServer node supports 2000 regions and 200 hotspot regions.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 7 Select **HBase** in the required cluster from the **Service** drop-down list.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.171 ALM-19009 Direct Memory Usage of the HBase Process Exceeds the Threshold

Description

The system checks the HBase service status every 30 seconds. The alarm is generated when the direct memory usage of an HBase service exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 19009 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service name for which the alarm is generated. |

| Name | Meaning |
|----------|--|
| RoleName | Specifies the role name for which the alarm is generated. |
| HostName | Specifies the object (host ID) for which the alarm is generated. |

Impact on the System

If the available HBase direct memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

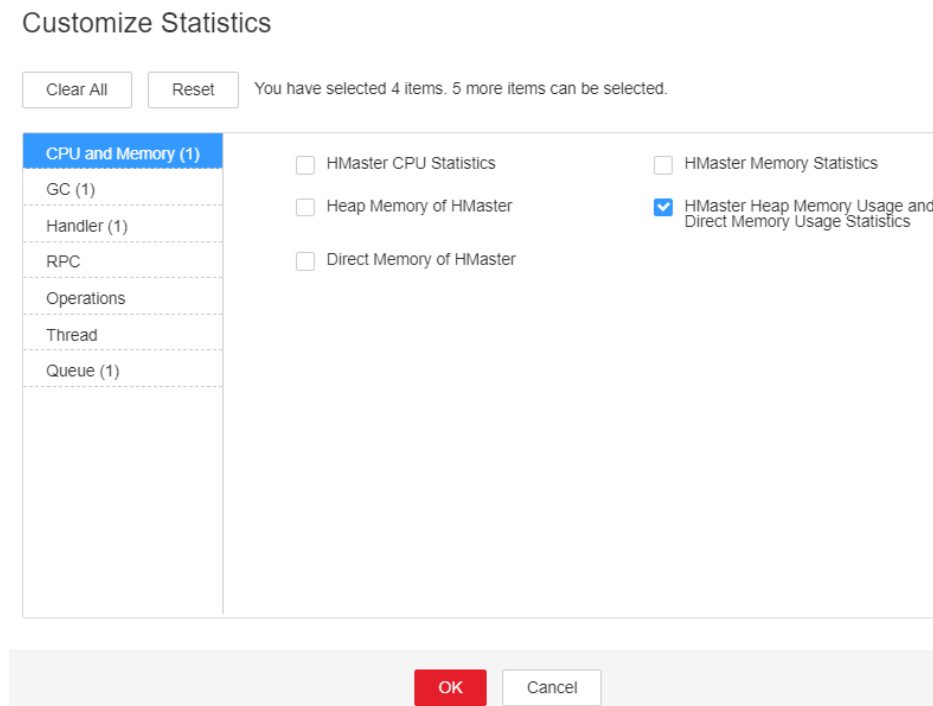

The direct memory of the HBase service is overused or the direct memory is inappropriately allocated.

Procedure

Check direct memory usage.

- Step 1** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **ID** is **19009**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- If the role for which the alarm is generated is HMaster, go to [Step 2](#).
 - If the role for which the alarm is generated is RegionServer, go to [Step 3](#).
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HBase > Instance** and click the HMaster for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize > CPU and Memory > HMaster Heap Memory Usage and Direct Memory Usage Statistics** and click **OK** to check whether the used direct memory of the HBase service reaches 90% of the maximum direct memory specified for HBase.
- If yes, go to [Step 4](#).
 - If no, go to [Step 8](#).

Figure 10-59 HMaster Heap Memory Usage and Direct Memory Usage Statistics

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the RegionServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory** > **RegionServer Heap Memory Usage and Direct Memory Usage Statistics** and click **OK** to check whether the used direct memory of the HBase service reaches 90% of the maximum direct memory specified for HBase.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Figure 10-60 RegionServer Heap Memory Usage and Direct Memory Usage Statistics

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations**, and click **All Configurations**. Choose **HMaster/RegionServer** > **System** and check whether **XX:MaxDirectMemorySize** exists in **GC_OPTS**.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations**, and click **All Configurations**. Choose **HMaster/RegionServer** > **System** and delete **XX:MaxDirectMemorySize** from **GC_OPTS**.

Step 6 Check whether the **ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold** alarm is generated.

If yes, handle the alarm by referring to **ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold**.

If no, go to **Step 8**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 9 In the **Service** in the required cluster drop-down list box, select **HBase**.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.172 ALM-19011 RegionServer Region Number Exceeds the Threshold

Description

The system checks the number of regions on each RegionServer in each HBase service instance every 30 seconds. The region number is displayed on the HBase service monitoring page and RegionServer role monitoring page. This alarm is generated when the number of regions on a RegionServer exceeds the threshold (default value: 2000) for 20 consecutive times. The threshold can be changed by choosing **O&M > Alarm > Thresholds > Name of the desired cluster > HBase**. This alarm is cleared when the number of regions is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 19011 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |

| Name | Meaning |
|----------|--|
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The data read/write performance of HBase is affected when the number of regions on a RegionServer exceeds the threshold.

Possible Causes

- The RegionServer region distribution is unbalanced.
- The HBase cluster scale is too small.

Procedure

View alarm location information.

Step 1 On the FusionInsight Manager home page, choose **O&M > Alarm > Alarms**, select this alarm, and view the service instance and host name in **Location**.

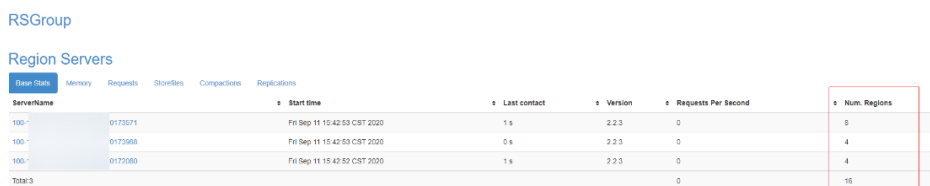

Step 2 On the FusionInsight Manager home page, choose **Cluster > Name of the desired cluster > Services**, click the HBase service instance for which the alarm is generated, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, check whether the region distribution on the RegionServer is balanced.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

- If yes, go to [Step 9](#).
- If no, go to [Step 3](#).

Figure 10-61 WebUI of HBase instance

RSGroup

Region Servers

| HostName | Start time | Last contact | Version | Requests Per Second | Num. Regions | |
|----------|------------|------------------------------|---------|---------------------|--------------|----|
| 100- | 0172071 | Fri Sep 11 15:42:53 CST 2020 | 1 s | 2.2.3 | 0 | 8 |
| 100- | 0172088 | Fri Sep 11 15:42:53 CST 2020 | 0 s | 2.2.3 | 0 | 4 |
| 100- | 0172080 | Fri Sep 11 15:42:52 CST 2020 | 1 s | 2.2.3 | 0 | 4 |
| Total: | | | | 0 | | 16 |

Enable load balancing.

Step 3 Log in to the node where the HBase client is located as user **root**. Go to the client installation directory, and set environment variables.

```
cd client installation directory
```

```
source bigdata_env
```

If the cluster adopts the security mode, perform security authentication. Specifically, run the **kinit hbase** command and enter the password as prompted (obtain the password from the administrator).

- Step 4** Run the following commands to go to the HBase shell command window and check whether the load balancing function is enabled.

hbase shell

balancer_enabled

- If yes, go to [Step 6](#).
- If no, go to [Step 5](#).

- Step 5** On the HBase shell command window, run the following commands to enable the load balancing function and check whether the function is enabled.

balance_switch true

balancer_enabled

- Step 6** On the HBase shell command window, run the **balancer** command to manually trigger the load balancing function.

 **NOTE**

You are advised to enable and manually trigger the load balancing function during off-peak hours.

- Step 7** On the FusionInsight Manager home page, choose **Cluster > Name of the desired cluster > Services > HBase**, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, refresh the page and check whether the region distribution is balanced.

- If yes, go to [Step 8](#).
- If no, go to [Step 21](#).

- Step 8** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Delete unwanted HBase tables.

 **NOTE**

Exercise caution when deleting data to ensure data is deleted correctly.

- Step 9** On the FusionInsight Manager home page, choose **Cluster > Name of the desired cluster > Services > HBase**, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, view tables stored in the HBase service instance and record unwanted tables that can be deleted.

- Step 10** On the HBase shell command window, run the **disable** command and **drop** command to delete the table to decrease the number of regions.

disable 'name of the table to be deleted'

drop 'name of the table to be deleted'

Step 11 On the HBase shell command window, run the following command to check whether the load balancing function is enabled.

balancer_enabled

- If yes, go to [Step 13](#).
- If no, go to [Step 12](#).

Step 12 On the HBase shell command window, run the following commands to enable the load balancing function and confirm that the function is enabled.

balance_switch true

balancer_enabled

Step 13 On the HBase shell command window, run the **balancer** command to manually trigger the load balancing function.

Step 14 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, refresh the page and check whether the region distribution is balanced.

- If yes, go to [Step 15](#).
- If no, go to [Step 21](#).

Step 15 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 16](#).

Adjust the threshold.

Step 16 On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **HBase** > **Regions(RegionServer)**, select the applied rule, and click **Modify** to check whether the threshold is proper.

- If it is excessively small, increase the threshold as required and go to [Step 17](#).
- If it is proper, go to [Step 18](#).

Figure 10-62 Regions(RegionServer_1)

Step 17 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 18](#).

Perform system capacity expansion.

Step 18 Add nodes to the HBase cluster and add RegionServer instances to the nodes. Then enable and manually trigger the load balancing function.

- Step 19** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services**, click the HBase service instance for which the alarm is generated, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, refresh the page and check whether the region distribution is balanced.
- If yes, go to **Step 20**.
 - If no, go to **Step 21**.
- Step 20** Check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to **Step 21**.
- Collect fault information.**
- Step 21** On the FusionInsight Manager home page of the active and standby clusters, choose **O&M** > **Log** > **Download**.
- Step 22** Select **HBase** in the required cluster from the **Service**.
- Step 23** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 24** Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.173 ALM-19012 HBase System Table Directory or File Lost

Description

The system checks whether HBase directories and files exist on the HDFS every 120 seconds. This alarm is generated when the system detects that the files or directories do not exist. This alarm is cleared when the files or directories are restored.

The HBase directories and files are as follows:

- Directory of the namespace **hbase** on the HDFS
- **hbase.version** file
- Directory of the table **hbase:meta** on the HDFS, .tableinfo file, and .regioninfo file
- Directory of the table **hbase:namespace** on the HDFS, .tableinfo file, and .regioninfo file

- Directory of the table **hbase:hindex** on the HDFS, .tableinfo file, and .regioninfo file
- Directory of the **hbase:acl** table on the HDFS, .tableinfo, and .regioninfo file (This table does not exist in the common mode cluster by default.)

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 19012 | Critical | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The HBase service fails to restart or start.

Possible Causes

Files or directories on the HDFS are missing.

Procedure

Locate the alarm cause.

- Step 1** On the FusionInsight Manager, choose **O&M > Alarm > Alarms**. Click this alarm and check whether **Alarm Cause** indicates unknown errors.
- If yes, go to [Step 4](#).
 - If no, go to [Step 2](#)
- Step 2** On the FusionInsight Manager home page, choose **O&M > Backup and Restoration > Backup Management**. Check whether there are success records of the backup task named **default** or other HBase metadata backup tasks that have been successfully executed.
- If yes, go to [Step 3](#).

- If no, go to [Step 4](#).

Step 3 Use the latest backup metadata to restore the metadata of the HBase service.

Collect fault information.

Step 4 On the FusionInsight Manager page of the active and standby clusters, choose **O&M > Log > Download**.

Step 5 In the **Service** area, select faulty HBase services in the required cluster.

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.174 ALM-19013 Duration of Regions in transaction State Exceeds the Threshold

Description

The system checks the number of regions in transaction state on HBase every 300 seconds. This alarm is generated when the system detects that the duration of regions in transaction state exceeds the threshold for two consecutive times. This alarm is cleared when all timeout regions are restored.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 19013 | Major | Yes |

Parameters

| Name | Meaning |
|--------|---|
| Source | Specifies the cluster for which the alarm is generated. |

| Name | Meaning |
|-------------|---|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

Some data in the table gets lost or becomes unavailable.

Possible Causes

- Compaction is permanently blocked.
- The HDFS files are abnormal.

Procedure

Locate the alarm cause.

Step 1 On the FusionInsight Manager, choose **O&M > Alarm > Alarms**, select this alarm, and view the **HostName** and **RoleName** in **Location**.

Step 2 Choose **Cluster > Name of the desired cluster > Services > HBase**, Click the drop-down menu in the chartarea and choose **Customize > Service >**

Region in transaction count to view **Region in transaction count over threshold**. Check whether the monitoring item detects a value in three consecutive detection periods. (The default threshold is 60 seconds.)

- If yes, go to [Step 3](#).
- If no, go to [Step 7](#).

Figure 10-63 Region in transaction count

Step 3 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **HMaster (Active)** > **Tables** to check whether the regions of only one table transaction status time out.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Figure 10-64 Tables

Step 4 Run the **hbase hbck** command on the client and check whether the error message "No table descriptor file under hdfs://hacluster/hbase/data/default/table" is displayed.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Log in to the client as user **root**. Run the following command:

```
cd client installation directory
source bigdata_env
```

If the cluster is in security mode, run the **kinit hbase** command

Log in to the HMaster WebUI, choose **Procedure & Locks** in the navigation tree, and check whether any process ID is in the **Waiting** state in **Procedures**. If yes, run the following command to release the procedure lock:

```
hbase hbck -j client installation directory/HBase/hbase/tools/hbase-hbck2-*.jar  
bypass -o pid
```

Check whether the state is in the **Bypass** state. If the procedure on the UI is always in **RUNNABLE(Bypass)** state, perform an active/standby switchover. Run the **assigns** command to bring the region online again.

```
hbase hbck -j client installation directory/HBase/hbase/tools/hbase-hbck2-*.jar  
assigns -o regionName
```

Step 6 Repeat **Step 4**. Run the **hbase hbck** command on the client and check whether the error message "No table descriptor file under hdfs://hacluster/hbase/data/default/table" is displayed.

- If yes, go to **Step 7**.
- If no, no further action is required.

Collect fault information.

Step 7 On the FusionInsight Manager page of the active and standby clusters, choose **O&M > Log > Download**.

Step 8 In the **Service** area, select faulty HBase services in the required cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.175 ALM-19014 Capacity Quota Usage on ZooKeeper Exceeds the Threshold Severely

Alarm Description

The system checks the ZNode usage of the HBase service every 120 seconds. This alarm is generated when the ZNode capacity usage of the HBase service exceeds the critical alarm threshold (90% by default).

This alarm is cleared when the ZNode capacity usage is less than the critical alarm threshold.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19014 | Critical | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |
| Threshold | Specifies the threshold for generating the alarm. |

Impact on the System

This alarm indicates that the capacity usage of the ZNode of HBase has exceeded the threshold severely. As a result, the write request of the HBase service fails.

Possible Causes

- DR is configured for HBase, and data synchronization fails or is slow in DR.
- A large number of WAL files are being split in the HBase cluster.

Handling Procedure

Check the capacity configuration and usage of ZNodes.

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Alarms**, select the alarm whose ID is **19014**, and view the threshold in **Additional Information**.

Step 2 Log in to the HBase client as user **root**. Run the following command to go to the client installation directory:

```
cd Client installation directory
```

Run the following command to set environment variables:

```
source bigdata_env
```

If the cluster uses the security mode, run the following command to perform security authentication:

kinit hbase

Enter the password as prompted (obtain the password from the MRS cluster administrator).

- Step 3** Run the **hbase zkcli** command to log in to the ZooKeeper client and run the **listquota /hbase** command to check the ZNode capacity quota of the HBase service. The ZNode root directory in the command is specified by the **zookeeper.znode.parent** parameter of the HBase service. The marked area in the following figure shows the capacity configuration of the root ZNode of the HBase service.

```
[zk: :24002, :24002, :24002(CONNECTED) 145] listquota /hbase
absolute path is /zookeeper/quota/hbase
Output quota for /hbase count=1500000,bytes=10240
Output stat for /hbase count=42,bytes=1601
```

- Step 4** Run the **getusage /hbase/splitWAL** command to check the capacity usage of the ZNode. Check whether the ratio of **Data size** to the ZNode capacity quota is close to the alarm threshold.
- If yes, go to [Step 5](#).
 - If no, go to [Step 6](#).
- Step 5** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. Check whether the alarm whose ID is **12007**, **19000**, or **19013** and the **ServiceName** in **Location** is the current HBase service exists.
- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to [Step 8](#).
 - If no, go to [Step 9](#).
- Step 6** Run the **getusage /hbase/replication** command to check the capacity usage of the ZNode. Check whether the ratio of **Data size** to the ZNode capacity quota is close to the alarm threshold.
- If yes, go to [Step 7](#).
 - If no, go to [Step 9](#).
- Step 7** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. Check whether the alarm whose ID is **19006** and **ServiceName** in **Location** is the current HBase service exists.
- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to [Step 8](#).
 - If no, go to [Step 9](#).
- Step 8** Check whether the alarm is cleared five minutes later.
- If yes, no further action is required.
 - If no, go to [Step 9](#).
- Collect the fault information.**
- Step 9** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

- Step 10** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HBase** for the target cluster.
- Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 12** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

10.176 ALM-19015 Quantity Quota Usage on ZooKeeper Exceeds the Threshold

Alarm Description

The system checks the ZNode usage of the HBase service every 120 seconds. This alarm is generated when the system detects that the ZNode quantity usage of the HBase service exceeds the alarm threshold (75% by default).

This alarm is cleared when the ZNode quantity usage is less than the alarm threshold.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19015 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |

| Parameter | Description |
|-----------|---|
| HostName | Specifies the host for which the alarm was generated. |
| Threshold | Specifies the threshold for generating the alarm. |

Impact on the System

This alarm indicates that the ZNode quantity usage in the HBase service has exceeded the threshold. If this alarm is not handled in a timely manner, the problem severity may be escalated to **Critical**, affecting data writing.

Possible Causes

- DR is configured for HBase, and data synchronization fails or is slow in DR.
- A large number of WAL files are being split in the HBase cluster.

Handling Procedure

Check the quantity quota and usage of ZNodes.

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Alarms**, select the alarm whose ID is **19015**, and view the threshold in **Additional Information**.

Step 2 Log in to the HBase client as user **root**. Run the following command to go to the client installation directory:

```
cd Client installation directory
```

Run the following command to set environment variables:

```
source bigdata_env
```

If the cluster uses the security mode, run the following command to perform security authentication:

```
kinit hbase
```

Enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 3 Run the **hbase zkcli** command to log in to the ZooKeeper client and run the **listquota /hbase** command to check the ZNode quantity quota of the HBase service. The ZNode root directory in the command is specified by the **zookeeper.znode.parent** parameter of the HBase service. The marked area in the following figure shows the quantity quota configuration of the root ZNode of the HBase service.

```
[zk: :24002, :24002, :24002(CONNECTED) 7] listquota /hbase
absolute path is /zookeeper/quota/hbase
Output quota for /hbase count=1500000,bytes=10240
Output stat for /hbase count=59,bytes=1902
```

Step 4 Run the **getusage /hbase/splitWAL** command to check the ZNode quantity usage and check whether the ratio of **Node count** in the command output to the ZNode quantity quota is close to the alarm threshold.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On FusionInsight Manager, choose **O&M > Alarm > Alarms**. Check whether the alarm whose ID is **12007**, **19000**, or **19013** and the **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 6 Run the **getusage /hbase/replication** command to check the ZNode quantity usage and check whether the ratio of **Node count** in the command output to the ZNode quantity quota is close to the alarm threshold.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 On FusionInsight Manager, choose **O&M > Alarm > Alarms**. Check whether the alarm whose ID is **19006** and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 10 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.177 ALM-19016 Quantity Quota Usage on ZooKeeper Exceeds the Threshold Severely

Alarm Description

The system checks the ZNode usage of the HBase service every 120 seconds. This alarm is generated when the znode usage of the HBase service exceeds the critical alarm threshold (90% by default).

This alarm is cleared when the quantity usage of the ZNode is less than the critical alarm threshold.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19016 | Critical | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |
| Threshold | Specifies the threshold for generating the alarm. |

Impact on the System

This alarm indicates that the quantity usage of the ZNode of HBase has exceeded the threshold severely. As a result, the write request of the HBase service fails.

Possible Causes

- DR is configured for HBase, and data synchronization fails or is slow in DR.
- A large number of WAL files are being split in the HBase cluster.

Handling Procedure

Check the quantity quota and usage of ZNodes.

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**, select the alarm whose ID is **19016**, and view the threshold in **Additional Information**.
- Step 2** Log in to the HBase client as user **root**. Run the following command to go to the client installation directory:

```
cd Client installation directory
```

Run the following command to set environment variables:

```
source bigdata_env
```

If the cluster uses the security mode, run the following command to perform security authentication:

```
kinit hbase
```

Enter the password as prompted (obtain the password from the MRS cluster administrator).

- Step 3** Run the **hbase zkcli** command to log in to the ZooKeeper client and run the **listquota /hbase** command to check the ZNode quantity quota of the HBase service. The ZNode root directory in the command is specified by the **zookeeper.znode.parent** parameter of the HBase service. The marked area in the following figure shows the quantity configuration of the root ZNode of the HBase service.

```
[zk: :24002, :24002, :24002(CONNECTED) 7] listquota /hbase
absolute path is /zookeeper/quota/hbase
Output quota for /hbase count=1500000,bytes=10240
Output stat for /hbase count=59,bytes=1902
```

- Step 4** Run the **getusage /hbase/splitWAL** command to check the ZNode usage and check whether the ratio of **Node count** in the command output to the znode quantity quota is close to the alarm threshold.
- If yes, go to **Step 5**.
 - If no, go to **Step 6**.
- Step 5** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. Check whether the alarm whose ID is **12007**, **19000**, or **19013** and the **ServiceName** in **Location** is the current HBase service exists.
- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
 - If no, go to **Step 9**.
- Step 6** Run the **getusage /hbase/replication** command to check the ZNode usage and check whether the ratio of **Node count** in the command output to the ZNode quantity quota is close to the alarm threshold.
- If yes, go to **Step 7**.
 - If no, go to **Step 9**.
- Step 7** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. Check whether the alarm whose ID is **19006** and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 10 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

10.178 ALM-19017 Capacity Quota Usage on ZooKeeper Exceeds the Threshold

Alarm Description

The system checks the ZNode usage of the HBase service every 120 seconds. This alarm is generated when the system detects that the ZNodes capacity usage of the HBase service exceeds the alarm threshold (75% by default).

This alarm is cleared when the capacity usage of the ZNode capacity is less than the threshold.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19017 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |
| Threshold | Specifies the threshold for generating the alarm. |

Impact on the System

This alarm indicates that the ZNodes capacity usage in the HBase service has exceeded the threshold. If this alarm is not handled in a timely manner, the problem severity may be escalated to **Critical**, affecting data writing.

Possible Causes

- DR is configured for HBase, and data synchronization fails or is slow in DR.
- A large number of WAL files are being split in the HBase cluster.

Handling Procedure

Check the capacity configuration and usage of ZNodes.

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Alarms**, select the alarm whose ID is **19017**, and view the threshold in **Additional Information**.

Step 2 Log in to the HBase client as user **root**. Run the following command to go to the client installation directory:

```
cd Client installation directory
```

Run the following command to set environment variables:

```
source bigdata_env
```

If the cluster uses the security mode, run the following command to perform security authentication:

```
kinit hbase
```

Enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 3 Run the **hbase zkcli** command to log in to the ZooKeeper client and run the **listquota /hbase** command to check the ZNode quantity quota of the HBase

service. The ZNode root directory in the command is specified by the **zookeeper.znode.parent** parameter of the HBase service. The marked area in the following figure shows the quantity configuration of the root ZNode of the HBase service.

10.179 ALM-19018 HBase Compaction Queue Size Exceeds the Threshold

Alarm Description

The system checks the HBase compaction queue size every 30 seconds. This alarm is generated when the compaction queue size exceeds the alarm threshold (**100** by default) for three consecutive times. This alarm is cleared when the compaction queue size is less than the threshold.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19018 | Minor | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |

Impact on the System

The cluster performance may deteriorate, affecting data read and write.

Possible Causes

- The number of HBase RegionServers is too small.
- There are excessive regions on a single RegionServer of HBase.

- The HBase RegionServer heap size is small.
- Resources are insufficient.
- Related parameters are not configured properly.

Handling Procedure

Check whether related parameters are properly configured.

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. On the page that is displayed, check whether the alarm whose **Alarm ID** is **19008** or **19011** exists.
- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 3**.
 - If no, go to **Step 2**.
- Step 2** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > HBase**. On the page that is displayed, click the **Configurations** tab then the **All Configurations** sub-tab, search for **hbase.hstore.compaction.min**, **hbase.hstore.compaction.max**, **hbase.regionserver.thread.compaction.small**, and **hbase.regionserver.thread.compaction.throttle**, and set them to larger values.
- Step 3** Check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to **Step 4**.

Collect the fault information.

- Step 4** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 5** Expand the **Service** drop-down list, and select **HBase** for the target cluster.
- Step 6** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 7** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.180 ALM-19019 Number of HBase HFiles to Be Synchronized Exceeds the Threshold

Alarm Description

The system checks the number of HFiles to be synchronized by the RegionServer of each HBase service instance every 30 seconds. This indicator can be viewed on the RegionServer role monitoring page. This alarm is generated when the number of HFiles to be synchronized on a RegionServer exceeds the threshold (exceeding 128 for 20 consecutive times by default). To change the threshold, choose **O&M > Alarm > Threshold Configuration > Name of the desired cluster > HBase**. This alarm is cleared when the number of HFiles to be synchronized is less than or equal to the threshold.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19019 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

If the number of HFiles to be synchronized by a RegionServer exceeds the threshold, the number of ZNodes used by HBase exceeds the threshold, affecting the HBase service status.

Possible Causes

- The network is abnormal.
- The RegionServer region distribution is unbalanced.
- The HBase service scale of the standby cluster is too small.

Handling Procedure

View alarm location information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19019**, and view the service instance and host name in **Location**.

Check the network connection between RegionServers on active and standby clusters.

Step 2 Run the **ping** command to check whether the network connection between the faulty RegionServer node and the host where RegionServer of the standby cluster resides is normal.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

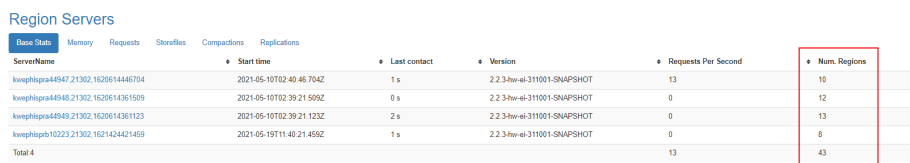

Step 3 Contact the network administrator to restore the network.

Step 4 After the network recovers, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the RegionServer region distribution in the active cluster.

Step 5 On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance and check whether regions are evenly distributed on the Region Server.

| ServerName | Start time | Last contact | Version | Requests Per Second | Num. Regions |
|----------------------------------|--------------------------|--------------|------------------------------|---------------------|--------------|
| kwep1pr44947.21302.1620614446704 | 2021-05-10T02:40:46.704Z | 1 s | 2.2.3.hive-el311001-SNAPSHOT | 13 | 10 |
| kwep1pr44948.21302.1620614361509 | 2021-05-10T02:39:21.509Z | 0 s | 2.2.3.hive-el311001-SNAPSHOT | 0 | 12 |
| kwep1pr44949.21302.1620614361123 | 2021-05-10T02:39:21.123Z | 2 s | 2.2.3.hive-el311001-SNAPSHOT | 0 | 13 |
| kwep1pr10223.21302.1621424421459 | 2021-05-19T11:49:21.459Z | 1 s | 2.2.3.hive-el311001-SNAPSHOT | 0 | 8 |
| Total 4 | | | | 13 | 43 |

Step 6 Log in to the faulty RegionServer node as user **omm**.

Step 7 Run the following commands to go to the client installation directory and set the environment variable:

```
cd Client installation directory
```

```
source bigdata_env
```

If the cluster uses the security mode, perform security authentication. Run the **kinit hbase** command and enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 8 Run the following commands to check whether the load balancing function is enabled.

hbase shell**balancer_enabled**

- If yes, go to [Step 10](#).
- If no, go to [Step 9](#).

Step 9 Run the following commands in HBase Shell to enable the load balancing function and check whether the function is enabled.

```
balance_switch true
```

```
balancer_enabled
```

Step 10 Run the **balancer** command to manually trigger the load balancing function.

 **NOTE**

You are advised to enable and manually trigger the load balancing function during off-peak hours.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

Check the HBase service scale of the standby cluster.

Step 12 Expand the HBase cluster, add a node, and add a RegionServer instance on the node. Then, perform [Step 6](#) to [Step 10](#) to enable the load balancing function and manually trigger it.

Step 13 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance, refresh the page, and check whether regions are evenly distributed.

- If yes, go to [Step 14](#).
- If no, go to [Step 15](#).

Step 14 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 15](#).

Collect the fault information.

Step 15 On FusionInsight Manager of the standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 16 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 17 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.181 ALM-19020 Number of HBase WAL Files to Be Synchronized Exceeds the Threshold

Alarm Description

The system checks the number of WAL files to be synchronized by the RegionServer of each HBase service instance every 30 seconds. This indicator can be viewed on the RegionServer role monitoring page. This alarm is generated when the number of WAL files to be synchronized on a RegionServer exceeds the threshold (exceeding 128 for 20 consecutive times by default). To change the threshold, choose **O&M > Alarm > Threshold Configuration > Name of the desired cluster > HBase**. This alarm is cleared when the number of WAL files to be synchronized is less than or equal to the threshold.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19020 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

If the number of WAL files to be synchronized by a RegionServer exceeds the threshold, the number of ZNodes used by HBase exceeds the threshold, affecting the HBase service status.

Possible Causes

- The network is abnormal.
- The RegionServer region distribution is unbalanced.
- The HBase service scale of the standby cluster is too small.

Handling Procedure

View alarm location information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19020**, and view the service instance and host name in **Location**.

Check the network connection between RegionServers on active and standby clusters.

Step 2 Run the **ping** command to check whether the network connection between the faulty RegionServer node and the host where RegionServer of the standby cluster resides is normal.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Contact the network administrator to restore the network.

Step 4 After the network recovers, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the RegionServer region distribution in the active cluster.

Step 5 On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance and check whether regions are evenly distributed on the Region Server.

| ServerName | Start time | Last contact | Version | Requests Per Second | Num. Regions |
|-----------------------------------|--------------------------|--------------|-----------------------------|---------------------|--------------|
| kwehpsra44947.21302.1620614446704 | 2021-05-10T02:40:46.704Z | 1 s | 2.2.3-hw-el-311001-SNAPSHOT | 13 | 10 |
| kwehpsra44948.21302.1620614361509 | 2021-05-10T02:39:21.509Z | 0 s | 2.2.3-hw-el-311001-SNAPSHOT | 0 | 12 |
| kwehpsra44949.21302.1620614361123 | 2021-05-10T02:39:21.123Z | 2 s | 2.2.3-hw-el-311001-SNAPSHOT | 0 | 13 |
| kwehpspb10223.21302.1621424421459 | 2021-05-19T11:49:21.459Z | 1 s | 2.2.3-hw-el-311001-SNAPSHOT | 0 | 8 |
| Total 4 | | | | 13 | 43 |

Step 6 Log in to the faulty RegionServer node as user **omm**.

Step 7 Run the following commands to go to the client installation directory and set the environment variable:

```
cd Client installation directory  
source bigdata_env
```

If the cluster uses the security mode, perform security authentication. Run the **kinit hbase** command and enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 8 Run the following commands to check whether the load balancing function is enabled.

hbase shell

balancer_enabled

- If yes, go to [Step 10](#).
- If no, go to [Step 9](#).

Step 9 Run the following commands in HBase Shell to enable the load balancing function and check whether the function is enabled.

balance_switch true

balancer_enabled

Step 10 Run the **balancer** command to manually trigger the load balancing function.

 **NOTE**

You are advised to enable and manually trigger the load balancing function during off-peak hours.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

Check the HBase service scale of the standby cluster.

Step 12 Expand the HBase cluster, add a node, and add a RegionServer instance on the node. Then, perform [Step 6](#) to [Step 10](#) to enable the load balancing function and manually trigger it.

Step 13 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance, refresh the page, and check whether regions are evenly distributed.

- If yes, go to [Step 14](#).
- If no, go to [Step 15](#).

Step 14 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 15](#).

Collect the fault information.

Step 15 On FusionInsight Manager of the standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 16 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 17 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

10.182 ALM-19021 Handler Usage of RegionServer Exceeds the Threshold

Alarm Description

The system checks the RegionServer handler usage of each HBase service instance every 30 seconds. This alarm is generated when the handler usage of a RegionServer exceeds the threshold (90% for five consecutive times by default). This alarm is cleared if the handler usage is lower than or equal to the threshold.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19021 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

RegionServers or HBase cannot provide services properly.

Possible Causes

- The value of a handler is too small.
- Hotspotting occurs.

Handling Procedure

View alarm location information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**, locate the row that contains the alarm whose **Alarm ID** is **19021**, and view the service instance and host name in **Location**.

Check the handler configuration.

Step 2 Choose **Cluster > Services > HBase** and click the **Configurations** tab. In the upper right corner of the page, search for **hbase.regionserver.handler.count** and check whether its value is too small. The default value is **200**.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Change the value of this parameter to a larger value and save the configuration. Choose **Cluster > Services > HBase**, click the **Instance** tab, select the affected RegionServer instances, and choose **More > Instance Rolling Restart**. In the displayed dialog box, enter the username and password. In the **Instance Rolling Restart** dialog box, click **OK** and wait until the rolling restart is complete.

Step 4 After the configuration takes effect, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether cluster hotspotting occurs.

Step 5 On FusionInsight Manager, choose **Cluster > Services > HBase** and click **HMaster(Active)** following **HMaster WebUI** to go to the web UI of the HBase instance. In the **Region Servers** area of the **Home** page, click **Requests** and check whether the requests in the **Filtered Read Request Count** and **Write Request Count** columns are evenly distributed.

| ServerName | Request Per Second | Read Request Count | Filtered Read Request Count | Write Request Count |
|------------|--------------------|--------------------|-----------------------------|---------------------|
| | 0 | 4591 | 0 | 1460 |
| | 0 | 708601 | 1957 | 1375 |
| | 0 | 3472032 | 685564 | 1183 |

- If yes, go to **Step 13**.
- If no, go to **Step 6**.

Step 6 Check whether regions are evenly distributed.

On FusionInsight Manager, choose **Cluster > Services > HBase** and click **HMaster(Active)** following **HMaster WebUI** to go to the web UI of the HBase

instance. In the **Region Servers** area of the **Home** page, click **Base Stats** and check whether the regions in the **Num.Regions** column are evenly distributed.

| ServerName | Start time | Last contact | Version | Requests Per Second | Num. Regions |
|------------|--------------------------|--------------|---------|---------------------|--------------|
| | 2021-05-10T02:40:46.704Z | 1 s | | 13 | 10 |
| | 2021-05-10T02:39:21.509Z | 0 s | | 0 | 12 |
| | 2021-05-10T02:39:21.123Z | 2 s | | 0 | 13 |
| | 2021-05-19T11:40:21.459Z | 1 s | | 0 | 8 |
| Total:4 | | | | 13 | 43 |

- If yes, go to **Step 13**.
- If no, go to **Step 7**.

Step 7 Log in to the faulty RegionServer node as user **omm**.

Step 8 Run the following commands to go to the client installation directory and set the environment variable:

```
cd Client installation directory
```

```
source bigdata_env
```

If the cluster uses the security mode, run the following command to perform security authentication:

```
kinit hbase
```

Enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 9 Run the following commands to check whether the load balancing function is enabled. If the command output is **true**, the load balancing function is enabled.

```
hbase shell
```

```
balancer_enabled
```

```
hbase:004:0> balancer_enabled
true
Took 0.0165 seconds
=> true
```

- If yes, go to **Step 13**.
- If no, go to **Step 10**.

Step 10 Run the following commands in HBase Shell to enable the load balancing function and check whether the function is enabled.

```
balance_switch true
```

```
balancer_enabled
```

NOTE

You are advised to enable and manually trigger the load balancing function during off-peak hours.

Step 11 Run the following command to manually trigger the load balancing function:

```
balancer
```

Step 12 After the load balancing is complete, log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 13](#).

Collect the fault information.

Step 13 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 14 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 15 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 16 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

10.183 ALM-19022 HBase Hotspot Detection Is Unavailable

Alarm Description

When the MetricController instance is installed for HBase, the alarm module checks the health status of the active HBase MetricController instance every 120 seconds. This alarm is generated when the active HBase MetricController instance does not exist or is unavailable and the hotspot detection function is unavailable.

This alarm is cleared when the active HBase MetricController instance recovers.

NOTE

This alarm applies only to MRS 3.3.0 or later.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19022 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The HBase hotspot detection function is unavailable.

Possible Causes

- The ZooKeeper service is abnormal.
- The HBase service is abnormal.
- In the current HBase service, the MetricController instance on the same node as the active HMaster instance is not started.
- The network is abnormal.

Handling Procedure

Check the ZooKeeper service status.

Step 1 In the service list on FusionInsight Manager, check whether **Running Status** of ZooKeeper is **Normal**.

- If yes, go to [Step 5](#).
- If no, go to [Step 2](#).

Step 2 In the alarm list, check whether **ALM-13000 ZooKeeper Service Unavailable** exists.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

Step 3 Rectify the fault by performing the operations provided for **ALM-13000 ZooKeeper Service Unavailable**.

Step 4 Wait for several minutes and check whether the alarm **HBase Hotspot Detection Is Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check the HBase service status.

- Step 5** In the service list on FusionInsight Manager, check whether **Running Status** of HBase is **Normal**.
- If yes, go to [Step 9](#).
 - If no, go to [Step 6](#).
- Step 6** In the alarm list, check whether the alarm ALM-19000 HBase Service Unavailable exists.
- If yes, go to [Step 7](#).
 - If no, go to [Step 9](#).
- Step 7** Rectify the fault by following the steps provided for **ALM-19000 HBase Service Unavailable**.
- Step 8** Wait for several minutes and check whether the alarm **HBase Hotspot Detection Is Unavailable** is cleared.
- If yes, no further action is required.
 - If no, go to [Step 9](#).
- Check whether the MetricController instance deployed on the same node as the active HMaster instance is started.**
- Step 9** On FusionInsight Manager, choose **Cluster > Service > HBase**, and click **Instances** to check whether the **MetricController(Active)** instance exists.
- If yes, go to [Step 12](#).
 - If no, go to [Step 10](#).
- Step 10** Select the MetricController instance whose management IP address is the same as that of the active HMaster instance, and click **Start Instance**.
- Step 11** After the MetricController instance is restarted, check whether the alarm **HBase Hotspot Detection Is Unavailable** is cleared.
- If yes, no further action is required.
 - If no, go to [Step 12](#).
- Check the network connectivity between the started MetricController instances and the active HMaster node.**
- Step 12** Log in to the node where the active HMaster instance is deployed and run **ping IP address of the node where the standby MetricController instance is deployed** to check whether the network connection between the started MetricController instances and the host where the active HMaster instance is deployed is normal.
- If yes, go to [Step 15](#).
 - If no, go to [Step 13](#).
- Step 13** Contact the network administrator to restore the network.
- Step 14** After the network recovers, check whether the alarm **HBase Hotspot Detection Is Unavailable** is cleared.
- If yes, no further action is required.
 - If no, go to [Step 15](#).
- Collect fault information.**

- Step 15** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.
- Step 16** Expand the **Service** drop-down list, and select **HBase** for the target cluster.
- Step 17** In the **Host** area, select the host where the HMaster instance is deployed.
- Step 18** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 19** Contact O&M personnel and provide the collected logs.
- End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.184 ALM-19023 Region Traffic Restriction for HBase

Alarm Description

When the MetricController instance is installed for the HBase service, self-healing from hotspotting is automatically enabled. The alarm module checks whether there are regions whose request traffic is restricted due to hotspot issues in HBase every 120 seconds. This alarm is generated when the region where hotspot traffic is restricted is detected in HBase.

This alarm is cleared when the region is no longer a hotspot.

This alarm applies only to MRS 3.3.0 or later.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19023 | Critical | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |

| Parameter | Description |
|-----------|--|
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

If the traffic of a hotspot region is restricted, the number of handlers for processing the requests in the region is limited. As a result, services requesting the region may slow down or retry upon failure.

Possible Causes

Too many requests are directed to a single region when the HBase service is accessed.

Handling Procedure

Check whether there are too many requests in a single region of HBase.

- Step 1** Log in to FusionInsight Manager, and Choose **O&M > Alarm > Alarms**.
- Step 2** In **Additional Information** of **Region Traffic Restriction for HBase**, view the reported table name and region information.
- Step 3** On FusionInsight Manager, choose **Cluster > Service > HBase** and click the hyperlink on the right of HMaster web UI.
- Step 4** Click **Table Details** and adjust service configurations in the region where the table in **Step 2** is deployed.
- Step 5** Wait a moment and then check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to **Step 6**.

Collect fault information.

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **HBase** for the target cluster.
- Step 8** In the **Host** area, select the host where the HMaster instance is deployed.
- Step 9** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm will be automatically cleared.

Related Information

None.

10.185 ALM-19024 RPC Requests P99 Latency on RegionServer Exceeds the Threshold

Alarm Description

The system checks P99 latency for RPC requests on each RegionServer instance of the HBase service every 30 seconds. This alarm is generated when P99 latency for RPC requests on a RegionServer exceeds the threshold for 10 consecutive times.

This alarm is cleared when P99 latency for RPC requests on a RegionServer instance is less than or equal to the threshold.

This alarm applies only to MRS 3.3.0 or later.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|---|--------------|
| 19024 | <ul style="list-style-type: none">• Critical: The default threshold is 10 seconds.• Major: The default threshold is 5 seconds. | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

| Parameter | Description |
|-------------------|---|
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

If RPC requests P99 latency exceeds the threshold, the RegionServer cannot deliver normal service performance externally. If RPC requests P99 latency on most RegionServers in the cluster exceeds the threshold, HBase may fail to provide services for external systems.

Possible Causes

- RegionServer GC duration is too long.
- The HDFS RPC response is too slow.
- RegionServer request concurrency is too high.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19024**, and view the service instance and host name in **Location**.

Check the GC duration of RegionServer.

Step 2 In the alarm list on FusionInsight Manager, check whether the "HBase GC Duration Exceeds the Threshold" alarm is generated for the service instance in [Step 1](#).

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

Step 3 Rectify the fault by following the handling procedure of "ALM-19007 HBase GC Duration Exceeds the Threshold".

Step 4 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check HDFS RPC response time.

Step 5 In the alarm list on FusionInsight Manager, check whether alarm "Average NameNode RPC Processing Time Exceeds the Threshold" is generated for the HDFS service on which the HBase service depends.

- If yes, go to [Step 6](#).
- If no, go to [Step 8](#).

Step 6 Rectify the fault by following the handling procedure of "ALM-14021 Average NameNode RPC Processing Time Exceeds the Threshold".

Step 7 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

Check the number of concurrent processes on a RegionServer.

Step 8 In the alarm list on FusionInsight Manager, check whether the "Handler Usage of RegionServer Exceeds the Threshold" alarm is generated for the service instance in [Step 1](#).

- If yes, go to [Step 9](#).
- If no, go to [Step 11](#).

Step 9 Rectify the fault by following the handling procedure of "ALM-19021 Handler Usage of RegionServer Exceeds the Threshold".

Step 10 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

Collect fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 12 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.186 ALM-19025 Damaged StoreFile in HBase

Alarm Description

The system checks the **hdfs://hacluster/hbase/autocorrupt** and **hdfs://hacluster/hbase/MasterData/autocorrupt** directories on HDFS of each HBase service every 120 seconds. This alarm is generated when there are files in the directories.

This alarm is cleared when the **hdfs://hacluster/hbase/autocorrupt** and **hdfs://hacluster/hbase/MasterData/autocorrupt** directories do not exist or are empty.

This alarm applies only to MRS 3.3.0 or later.

 **NOTE**

hdfs://hacluster indicates the name of the file system used by HBase, and **/hbase** indicates the root directory of HBase in the file system. You can log in to FusionInsight Manager, choose **Cluster > Services > HBase** and click **Configuration**. Search for **fs.defaultFS** and **hbase.data.rootdir**.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19025 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

There are damaged StoreFile files in HBase, which may cause data loss.

Possible Causes

The StoreFile files are damaged.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19025**, and view the service in **Location**.

Step 2 Log in to the node where the HDFS and HBase clients are installed as the client installation user and run the following commands:

```
cd Client installation directory  
source bigdata_env
```

kinit *Component service user* (If Kerberos authentication is disabled for the cluster (the cluster is in normal mode), skip this step.)

Step 3 Check the damaged StoreFile file.

- Run the following command to check whether the **/hbase/autocorrupt** directory of HDFS is empty. If it is not, go to **Step 4**.

```
hdfs dfs -ls -R hdfs://hacluster/hbase/autocorrupt
```

- Run the following command to check whether the **/hbase/MasterData/autocorrupt** directory of HDFS is empty. If it is not, go to **Step 9**.

```
hdfs dfs -ls -R hdfs://hacluster/hbase/MasterData/autocorrupt
```

Step 4 Run the following command to restore the StoreFile files in the **hdfs://hacluster/hbase/autocorrupt** directory:

```
hdfs debug recoverLease -path hdfs://hacluster/hbase/autocorrupt/Name space/Table/Region/Column family/StoreFile files
```

Step 5 Check whether the damaged StoreFile files are restored. If the following information is displayed, the restoration is successful:

```
recoverLease SUCCEEDED on hdfs://hacluster/hbase/autocorrupt/default/h1/865665fe32db62dadada68b644359809/cf1/95f210f931ad44c99e4028470be7d292
```

If yes, go to **Step 6**.

If no, go to **Step 9**.

Step 6 Run the following command to move the files back to the **hdfs://hacluster/hbase/data** directory:

```
hdfs dfs -mv hdfs://hacluster/hbase/autocorrupt/Name space/Table/Region/Column family/StoreFile files hdfs://hacluster/hbase/data/Name space/Table/Region/Column family/StoreFile files
```

Step 7 Run the following command on HBase Shell to bring the region online again:

```
hbase shell
```

```
unassign'Region'
```

```
assign'Region'
```

Step 8 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 10 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.187 ALM-19026 Damaged WAL Files in HBase

Alarm Description

The system checks the **hdfs://hacluster/hbase/corrupt** directory on the HDFS of each HBase service every 120 seconds. This alarm is generated when there are WAL files in the **/hbase/corrupt** directory.

This alarm is cleared when the **/hbase/corrupt** directory does not exist or does not contain WAL files.

This alarm applies only to MRS 3.3.0 or later.

NOTE

hdfs://hacluster indicates the name of the file system used by HBase, and **/hbase** indicates the root directory of HBase in the file system. You can log in to FusionInsight Manager, choose **Cluster > Services > HBase** and click **Configuration**. Search for **fs.defaultFS** and **hbase.data.rootdir**.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19026 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

There are damaged WAL files in HBase, which may cause data loss.

Possible Causes

The WAL files are damaged.

Handling Procedure

- Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19026**, and view the service in **Location**.
- Step 2** Log in to the node where the HDFS clients are installed as the client installation user and run the following commands:
- ```
cd Client installation directory

source bigdata_env

kinit Component service user (If Kerberos authentication is disabled for the cluster (the cluster is in normal mode), skip this step.)
```
- Step 3** Run the following command to check the damaged WAL files and go to **Step 4**:
- ```
hdfs dfs -ls hdfs://hacluster/hbase/corrupt/*%2C*
```
- Collect fault information.**
- Step 4** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 5** Expand the **Service** drop-down list, and select **HBase** for the target cluster.
- Step 6** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 7** Contact O&M personnel and provide the collected logs.
- End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.188 ALM-20002 Hue Service Unavailable

Description

This alarm is generated when the Hue service is unavailable. The system checks the Hue service status every 60 seconds.

This alarm is cleared when the Hue service is normal.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 20002 | Critical | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The system cannot provide data loading, query, and extraction services.

Possible Causes

- The internal KrbServer service on which the Hue service depends is abnormal.
- The internal DBService service on which the Hue service depends is abnormal.
- The network connection to the DBService is abnormal.

Procedure

Check whether the KrbServer is abnormal.

- Step 1** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services**. In the service list, check whether the **KrbServer** running status is **Normal**.

- If yes, go to [Step 4](#).
- If no, go to [Step 2](#).

Step 2 Restart the KrbServer service.

Step 3 Wait several minutes, and check whether **Hue Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

Check whether the DBService is abnormal.

Step 4 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 5 In the service list, check whether the **DBService** running status is **Normal**.

- If yes, go to [Step 8](#).
- If no, go to [Step 6](#).

Step 6 Restart the DBService.

NOTICE

When the service is rebooted, it becomes unavailable and can disrupt business operations.

Step 7 Wait several minutes, and check whether **Hue Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

Check whether the network connection to the DBService is normal.

Step 8 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Hue** > **Instance**, record the IP address of the active Hue.

Step 9 Log in to the active Hue.

Step 10 Run the **ping** command to check whether communication between the host that runs the active Hue and the hosts that run the DBService is normal. (Obtain the IP addresses of the hosts that run the DBService in the same way as that for obtaining the IP address of the active Hue.)

- If yes, go to [Step 13](#).
- If no, go to [Step 11](#).

Step 11 Contact the administrator to restore the network.

Step 12 Wait several minutes, and check whether **Hue Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 13](#).

Collect fault information.

Step 13 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 14 Select the following nodes in the required cluster from the **Service** drop-down list:

- Hue
- Controller

Step 15 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.189 ALM-23001 Loader Service Unavailable

Description

The system checks the Loader service availability every 60 seconds. This alarm is generated when the system detects that the Loader service is unavailable. This alarm is cleared when the Loader service is available.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 23001 | Critical | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

When the Loader service is unavailable, the data loading, import, and conversion functions are unavailable.

Possible Causes

- The internal service on which the Loader service depends is abnormal.
 - The ZooKeeper service is abnormal.
 - The HDFS service is abnormal.
 - The DBService service is abnormal.
 - The Yarn service is abnormal.
 - The Mapreduce service is abnormal.
- Environment fault: The network is abnormal, which the Loader service cannot communicate with the depended internal services and cannot provide services.
- Software fault: The Loader service cannot run properly.

Procedure

Check the ZooKeeper service status.

- Step 1** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** to check whether the ZooKeeper running status is **Normal**.
- If yes, go to [Step 3](#).
 - If no, go to [Step 2](#).
- Step 2** Choose **More** > **Restart Service** to restart the ZooKeeper service. In the alarm list, check whether **LoaderService Unavailable** is cleared.
- If yes, no further action is required.
 - If no, go to [Step 3](#).
- Step 3** On the FusionInsight Manager, check whether the alarm list contains **Process Fault**.
- If yes, go to [Step 4](#).
 - If no, go to [Step 7](#).
- Step 4** In the **Location** area of **Process Fault**, check whether **ServiceName** is **ZooKeeper**.
- If yes, go to [Step 5](#).
 - If no, go to [Step 7](#).
- Step 5** Rectify the fault by following the steps provided in **ALM-12007 Process Fault**.
- Step 6** In the alarm list, check whether **Loader Service Unavailable** is cleared.
- If yes, no further action is required.
 - If no, go to [Step 7](#).

Check the HDFS service status.

Step 7 On the FusionInsight Manager, check whether the alarm list contains **HDFS Service Unavailable**.

- If yes, go to [Step 8](#).
- If no, go to [Step 10](#).

Step 8 Rectify the fault by following the steps provided in **ALM-14000 HDFS Service Unavailable**.

Step 9 In the alarm list, check whether **Loader Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

Check the DBService status.

Step 10 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService** to check whether the DBService running status is **Normal**.

- If yes, go to [Step 12](#).
- If no, go to [Step 11](#).

Step 11 Choose **More** > **Restart Service** to restart the DBService service. In the alarm list, check whether **LoaderService Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

Check the Mapreduce status.

Step 12 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Mapreduce** to check whether the Mapreduce running status is **Normal**.

- If yes, go to [Step 16](#).
- If no, go to [Step 13](#).

Step 13 Choose **More** > **Restart Service** to restart the Mapreduce service. In the alarm list, check whether **LoaderService Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 16](#).

Check the Yarn status.

Step 14 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** to check whether the Yarn running status is **Normal**.

- If yes, go to [Step 16](#).
- If no, go to [Step 15](#).

Step 15 Choose **More** > **Restart Service** to restart the Yarn service. In the alarm list, check whether **LoaderService Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 16](#).

Step 16 On the FusionInsight Manager, check whether the alarm list contains **Yarn Service Unavailable**.

- If yes, go to [Step 17](#).
- If no, go to [Step 19](#).

Step 17 Rectify the fault by following the steps provided in **ALM-18000 Yarn Service Unavailable**.

Step 18 In the alarm list, check whether **Loader Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 19](#).

Check the network connection between Loader and dependent components.

Step 19 On the FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > Loader**.

Step 20 Click **Instance** and the LoaderServer instance list is displayed.

Step 21 Record the **Management IP Address** in the row of **LoaderServer(Active)**.

Step 22 Log in to the host where the active LoaderServer runs as **omm** user using the IP address obtained in [Step 21](#).

Step 23 Run the **ping** command to check whether communication between the host that runs the active LoaderServer and the hosts that run the dependent components. (The dependent components include ZooKeeper, DBService, HDFS, Mapreduce and Yarn. Obtain the IP addresses of the hosts that run these services in the same way as that for obtaining the IP address of the active LoaderServer.)

- If yes, go to [Step 26](#).
- If no, go to [Step 24](#).

Step 24 Contact the administrator to restore the network.

Step 25 In the alarm list, check whether **Loader Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 26](#).

Collect fault information.

Step 26 On the FusionInsight Manager, choose **O&M > Log > Download**.

Step 27 Select the following nodes in the required cluster from the **Service** drop-down list:

- ZooKeeper
- HDFS
- DBService
- Yarn
- Mapreduce
- Loader

Step 28 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 29 On the FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > Loader**.

Step 30 Choose **More > Restart Service**, and click **OK**.

Step 31 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 32](#).

Step 32 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.190 ALM-23003 Loader Task Execution Failure

Description

This alarm is generated immediately when the system detects that the Loader job fails. This alarm is cleared when the failed job is manually handled by a user. This alarm must be manually cleared.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 23003 | Minor | No |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| JobID | Specifies the ID of failed Loader job. |
| JobName | Specifies the failed Loader job. |

| Name | Meaning |
|----------|---|
| UserName | Specifies the name of the user who submits the Loader job. |
| Details | Supplementary information for which the alarm is generated. |

Impact on the System

An exception occurs during the execution of the submitted Loader job, and the execution fails. No execution result can be obtained. Execute the job again after rectifying the fault.

Possible Causes

- Task parameters are incorrectly configured.
- Exceptions occur when Yarn is executing a job.

Procedure

Check whether task parameters are incorrectly configured.

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms** and click the alarm drop-down list from the alarm list, obtain the **Alarm Cause**.
- Step 2** If the alarm cause is "Failure to submit job", view error details in **Additional Information**, and go to the Loader WebUI to view the execution history of the job.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

- Step 3** Submit the task again.
- Step 4** Check whether the task executed successfully.
- If yes, go to [Step 9](#).
 - If no, go to [Step 5](#).

Check whether exceptions occur when Yarn is executing a job.

- Step 5** On FusionInsight Manager, click the alarm drop-down list from the alarm list, obtain the **Alarm Cause**.
- Step 6** Check whether the Yarn activity is executed properly in the **Alarm Cause**. If the alarm cause is "Yarn execution failed", the Yarn activity is abnormal.
- If yes, go to [Step 7](#).
 - If no, go to [Step 10](#).
- Step 7** Submit the task again.

Step 8 Please check whether the task executed successfully.

- If yes, go to [Step 9](#).
- If no, go to [Step 10](#).

Step 9 In the alarm list, click **Clear** from **Operation** to manually clear the alarm. No further action is required.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 11 Select the following nodes in the required cluster from the **Service** drop-down list:

- DBService
- HDFS
- Loader
- Mapreduce
- Yarn
- ZooKeeper

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system does not automatically clear this alarm, and you need to manually clear the alarm.

Related Information

None

10.191 ALM-23004 Loader Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of the Loader service every 60 seconds. The alarm is generated when the heap memory usage of a Loader instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. The alarm is cleared when the heap memory usage is less than the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 23004 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

The heap memory overflow may cause a service breakdown.

Possible Causes

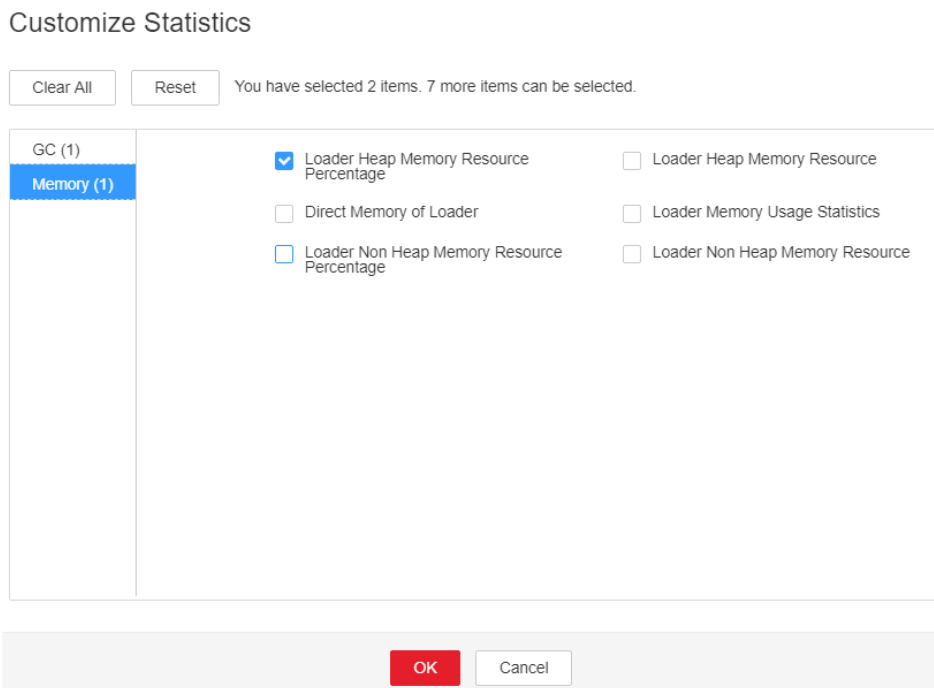

The heap memory of the Loader instance is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Loader Heap Memory Usage Exceeds the Threshold > Location**. Check the host name of the instance involved in this alarm.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Loader > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize > Memory > Loader Heap Memory Resource Percentage**. Click **OK**.

Figure 10-65 Loader Heap Memory Resource Percentage

Step 3 Check whether the used heap memory of Loader reaches the threshold (the default value is 95% of the maximum heap memory) specified for Loader.

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Loader** > **Configurations**. Click **All Configurations**. Increase the value of **-Xmx** in **GC_OPTS** as required, and click **Save**. Click **OK**.

NOTE

- If this alarm is generated, the heap memory configured for the current Loader instance is insufficient for data transmission. You are advised to open the instance monitoring page, display the Loader heap memory resource status monitoring chart, and observe the change trend of the heap memory used by Loader in the monitoring chart. Then change the value of **-Xmx** to twice the current heap memory usage or to another value to meet site requirements.
- When setting the heap memory, you can set **-Xms** and **-Xmx** to similar values to avoid performance deterioration caused by heap size adjustment after each GC.
- Ensure that the sum of **-Xmx** and **XX:MaxPermSize** is not greater than the physical memory of the node server.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

NOTE

During service or instance restart, Loader cannot provide services to external systems. New jobs cannot be submitted, but jobs being executed are not affected.

Collect fault information.

- Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 7** Select **Loader** in the required cluster from the **Service** drop-down list.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected fault logs.
- End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.192 ALM-23005 Loader Non-Heap Memory Usage Exceeds the Threshold

Description

The system checks the non-heap memory usage of the Loader service every 30 seconds. The alarm is generated when the non-heap memory usage of a Loader instance exceeds the threshold (80% of the maximum memory) for 5 consecutive times. The alarm is cleared when the non-heap memory usage is less than the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 23005 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |

| Name | Meaning |
|-------------------|--|
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

The non-heap memory overflow may cause a service breakdown.

Possible Causes

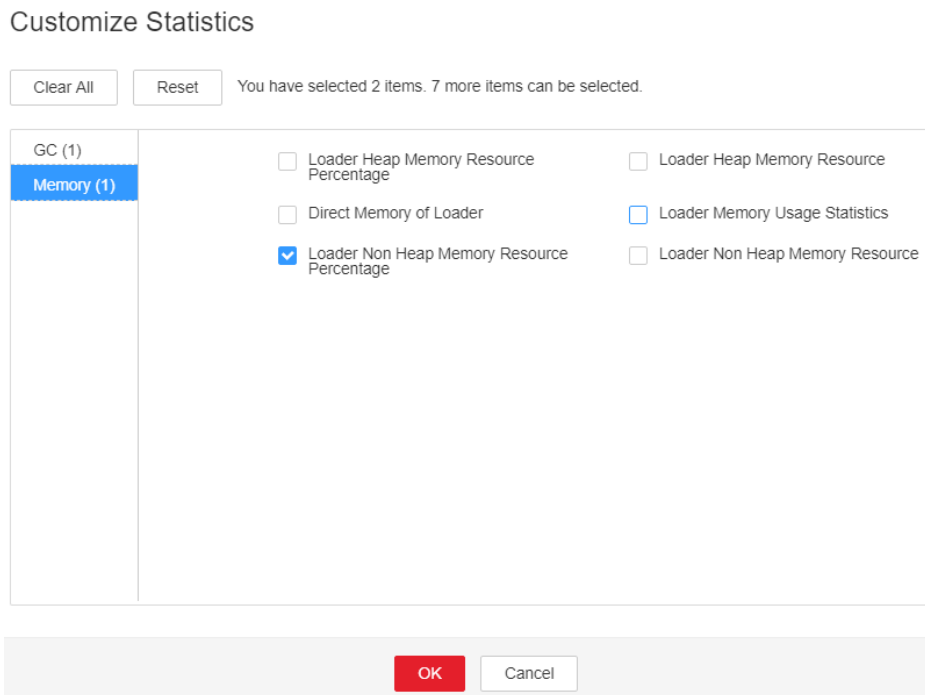

The non-heap memory of the Loader instance is overused or the non-heap memory is inappropriately allocated.

Procedure

Check non-heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Loader Non-Heap Memory Usage Exceeds the Threshold > Location**. Check the host name of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster > *Name of the desired cluster* > Services > Loader > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize > Memory > Loader Non Heap Memory Resource Percentage**. Click **OK**.

Figure 10-66 Loader Non Heap Memory Resource Percentage

Step 3 Check whether the used non-heap memory of Loader reaches the threshold (the default value is 80% of the maximum non-heap memory) specified for Loader.

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Loader** > **Configurations**. Click **All Configurations** Search **LOADER_GC_OPTS** in the search box. If the **-XX:MaxPermSize** parameter is not configured, set the initial value to **-XX:MaxPermSize=256M** for the first time. (If the alarm persists after the first adjustment, perform the second adjustment by referring to the following note.) And click **Save**. Click **OK**.

NOTE

If this alarm is generated, the non-heap memory configured for the current Loader instance is insufficient for the service scenario. You are advised to open the instance monitoring page, open the Loader non-heap memory resource status monitoring chart, and observe the change trend of the non-heap memory used by Loader in the monitoring chart. Then change the value of **-XX:MaxPermSize** to twice the current non-heap memory usage or to another value to meet site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

NOTE

During service or instance restart, Loader cannot provide services to external systems. New jobs cannot be submitted, but jobs being executed are not affected.

Collect fault information.

- Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 7** Select **Loader** in the required cluster from the **Service** drop-down list.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected fault logs.
- End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.193 ALM-23006 Loader Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the Loader service every 30 seconds. The alarm is generated when the direct memory usage of a Loader instance exceeds the threshold (80% of the maximum memory) for 5 consecutive times. The alarm is cleared when the direct memory usage of Loader is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 23006 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |

| Name | Meaning |
|-------------------|--|
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

The direct memory overflow may cause a service breakdown.

Possible Causes

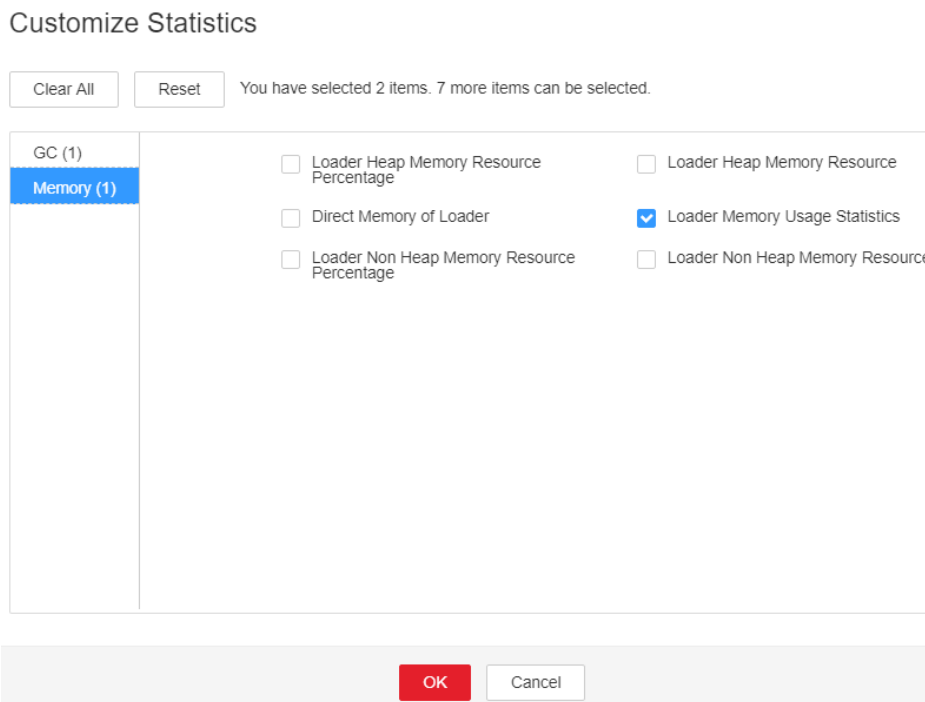

The direct memory of the Loader instance is overused or the direct memory is inappropriately allocated.

Procedure

Check direct memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Loader Direct Memory Usage Exceeds the Threshold > Location**. Check the host name of the instance involved in this alarm.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > *Name of the desired cluster* > Services > Loader > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize > Memory > Loader Memory Usage Statistics**. Click **OK**.

Figure 10-67 Loader Memory Usage Statistics

Step 3 Check whether the used direct memory of Loader reaches the threshold (the default value is 80% of the maximum direct memory) specified for Loader.

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Loader** > **Configurations**. Click **All Configurations**. Search **LOADER_GC_OPTS** in the search box. Increase the value of **-XX:MaxDirectMemorySize** as required, and click **Save**. Click **OK**.

NOTE

If this alarm is generated, the direct memory configured for the current Loader instance is insufficient for the service scenario. You are advised to open the instance monitoring page, display the Loader direct memory resource status monitoring chart, and observe the change trend of the direct memory used by Loader in the monitoring chart. Then change the value of **-XX:MaxDirectMemorySize** to twice the current direct memory usage or to another value to meet site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

NOTE

During service or instance restart, Loader cannot provide services to external systems. New jobs cannot be submitted, but jobs being executed are not affected.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

- Step 7** Select **Loader** in the required cluster from the **Service** drop-down list.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected fault logs.
- End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.194 ALM-23007 Garbage Collection (GC) Time of the Loader Process Exceeds the Threshold

Description

The system checks GC time of the Loader process every 60 seconds. The alarm is generated when GC time of the Loader process exceeds the threshold (default value: **12 seconds**) for 5 consecutive times. The alarm is cleared when GC time is less than the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 23007 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

| Name | Meaning |
|-------------------|--|
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

Loader service response is slow.

Possible Causes

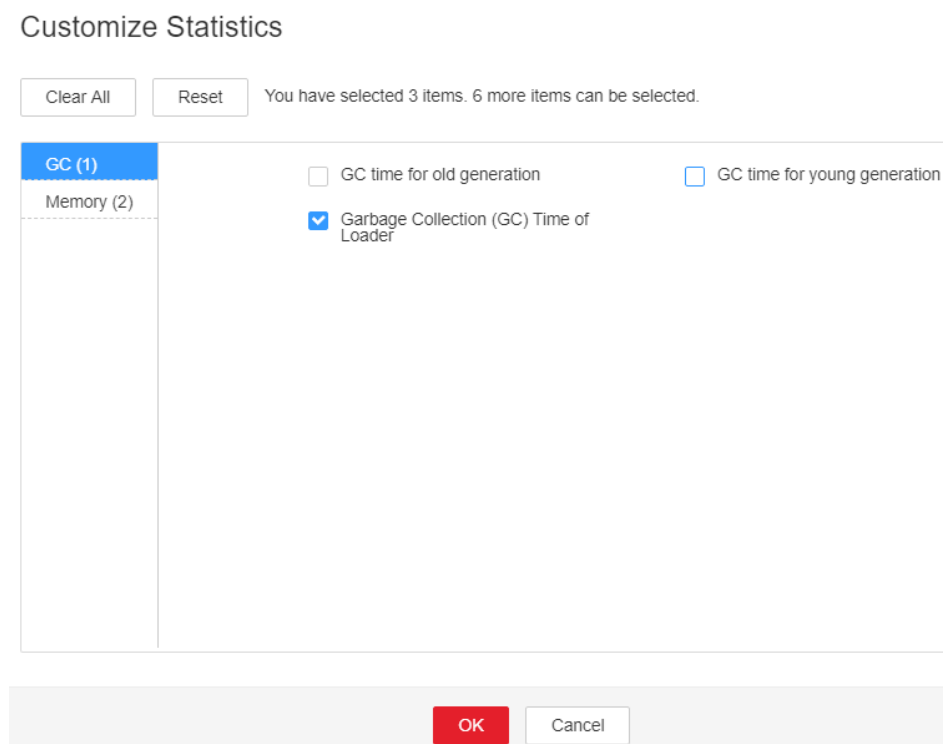

The heap memory of the Loader instance is overused or the heap memory is inappropriately allocated.

Procedure

Check GC time.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Garbage Collection (GC) Time of the Loader Process Exceeds the Threshold > Location**. Check the host name of the instance involved in this alarm.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Loader > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize > GC > Garbage Collection (GC) Time of Loader**. Click **OK**.

Figure 10-68 Garbage Collection (GC) Time of Loader

Step 3 Check whether GC time of the Loader process every second exceeds the threshold (default value: **12 seconds**).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Loader** > **Configurations**. Click **All Configurations**. Search **LOADER_GC_OPTS** in the search box. Increase the value of **-Xmx** as required, and click **Save**. Click **OK**.

 **NOTE**

If this alarm is generated, the heap memory configured for the current Loader instance cannot meet the heap memory required for data transmission. You are advised to handle the problem by referring to **Step 4** in section **ALM-23004 Loader Heap Memory Usage Exceeds the Threshold**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

 **NOTE**

During service or instance restart, Loader cannot provide services to external systems. New jobs cannot be submitted, but jobs being executed are not affected.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Loader** in the required cluster from the **Service** drop-down list.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.195 ALM-24000 Flume Service Unavailable

Alarm Description

The alarm module checks the Flume service status every 180 seconds. This alarm is generated if the Flume service is abnormal.

This alarm is automatically cleared after the Flume service recovers.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 24000 | Critical | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |

Impact on the System

Flume cannot work and data transmission is interrupted.

Possible Causes

All Flume instances are faulty.

Handling Procedure

Step 1 Log in to a Flume node as user **omm** and run the **ps -ef|grep "flume.role=server"** command to check whether the Flume process exists on the node.

- If yes, go to [Step 3](#).
- If no, restart the faulty Flume node or Flume service and go to [Step 2](#).

Step 2 In the alarm list, check whether alarm "Flume Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to [Step 3](#).

Collect the fault information.

Step 3 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 4 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 5 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 6 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.196 ALM-24001 Flume Agent Exception

Alarm Description

The Flume agent monitoring module monitors the Flume agent status. This alarm is generated when the Flume agent process is faulty (checked every 5 seconds) or the Flume agent fails to start (an alarm is reported immediately).

This alarm is cleared when the Flume agent process recovers, Flume agent starts successfully, and the alarm handling is completed.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 24001 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| AgentId | Specifies the ID of the agent for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |

Impact on the System

The Flume agent instance for which the alarm is generated cannot provide services properly, and the data transmission tasks of the instance are temporarily interrupted. Real-time data is lost during real-time data transmission.

Possible Causes

- The **JAVA_HOME** directory does not exist, or the Java permission is incorrect.
- The Flume agent directory permission is incorrect.
- The Flume agent fails to start.

Handling Procedure

Check whether the JAVA_HOME directory exists or whether the JAVA permission is correct.

Step 1 Log in to the host for which the alarm is generated as user **root**.

Step 2 Obtain the installation directory of the Flume client for which the alarm is generated. (The value of **AgentId** can be obtained from **Location** of the alarm.)

```
ps -ef|grep AgentId | grep -v grep | awk -F 'conf-file ' '{print $2}' | awk -F 'fusioninsight' '{print $1}'
```

Step 3 Run the **su - Flume installation user** command to switch to the Flume installation user and run the **cd Flume client installation directory/fusioninsight-flume-1.9.0/conf/** command to go to the Flume configuration directory.

Step 4 Run the **cat ENV_VARS | grep JAVA_HOME** command.

Step 5 Check whether the **JAVA_HOME** directory exists. If both the command output in [Step 4](#) and **ll \$JAVA_HOME/** are not empty, the **JAVA_HOME** directory exists.

- If yes, go to [Step 7](#).
- If no, go to [Step 6](#).

Step 6 Specify a correct **JAVA_HOME** directory, for example, **export JAVA_HOME=\${BIGDATA_HOME}/common/runtime0/jdkVersion number**.

Step 7 Run the **\$JAVA_HOME/bin/java -version** command to check whether the Flume agent running user has the Java execution permission. If the Java version is displayed in the command output, the Java permission meets the requirement. Otherwise, the Java permission does not meet the requirement.

- If yes, go to [Step 9](#).
- If no, go to [Step 8](#).

NOTE

JAVA_HOME is the environment variable exported during Flume client installation. You can also go to **Flume client installation directory/fusioninsight-flume-1.9.0/conf** and run the **cat ENV_VARS | grep JAVA_HOME** command to view the variable value.

Step 8 Run the **chmod 750 \$JAVA_HOME/bin/java** command to grant the Java execution permission to the Flume agent running user.

Check the directory permission of the Flume agent.

Step 9 Log in to the host for which the alarm is generated as user **root**.

Step 10 Run the following command to switch to the Flume agent installation directory:

```
cd Flume client installation directory/fusioninsight-flume-1.9.0/conf/
```

Step 11 Run the **ls -al * -R** command to check whether any file owner is the user running the Flume agent.

- If yes, go to **Step 12**.
- If no, run the **chown** command to change the file owner to the user who runs the Flume agent.

Check the Flume agent configuration.

Step 12 Run the **cat properties.properties | grep spoolDir** and **cat properties.properties | grep TAILDIR** commands to check whether the Flume source type is spoolDir or tailDir. If any command output is displayed, the Flume source type is spoolDir or tailDir.

- If yes, go to **Step 13**.
- If no, go to **Step 17**.

Step 13 Check whether the data monitoring directory exists.

- If yes, go to **Step 15**.
- If no, go to **Step 14**.

 **NOTE**

Run the **cat properties.properties | grep spoolDir** command to view the spoolDir monitoring directory.

```
[root@fusioninsight-flume-1.9.0/conf]# cat properties.properties | grep spoolDir
client.sources.aal.spoolDir = /opt/liuxingcheng/flumeclient/sourcedata/flumesourcedata1
[root@fusioninsight-flume-1.9.0/conf]#
```

Run the **cat properties.properties | grep parentDir** command to view the tailDir monitoring directory.

```
[root@fusioninsight-flume-1.9.0/conf]# cat properties.properties | grep parentDir
server.sources.AAAA.filegroups.F1.parentDir = /tmp/flumetest/taildir_data
[root@fusioninsight-flume-1.9.0/conf]#
```

Step 14 Specify a correct data monitoring directory.

Step 15 Check whether the Flume agent user has the read, write, and execute permissions on the monitoring directory specified in **Step 13**.

- If yes, go to **Step 17**.
- If no, go to **Step 16**.

 **NOTE**

Go to the monitoring directory as the Flume running user. If files can be created, the Flume running user has the read, write, and execute permissions on the monitoring directory.

Step 16 Run the **chmod 777 *Flume monitoring directory*** command to grant the Flume agent running user the read, write, and execute permissions on the monitoring directory specified in **Step 13**.

Step 17 Check whether the components connected to the Flume sink are in safe mode.

- If yes, go to **Step 18**.

- If no, go to [Step 23](#).

 **NOTE**

If the sinks in the **properties.properties** configuration file are the HDFS sink and HBase sink, and the configuration file contains a keytab file, the components connected to the Flume sink are in safe mode.

If the sink in the **properties.properties** configuration file is the Kafka sink and ***.security.protocol** is set to **SASL_PLAINTEXT** or **SASL_SSL**, Kafka connected to the Flume sink is in safe mode.

Step 18 Run the **ll *keytab path*** command to check whether the keytab authentication path specified by the ***.kerberosKeytab** parameter in the configuration file exists.

- If yes, go to [Step 20](#).
- If no, go to [Step 19](#).

 **NOTE**

To view the keytab path, run the **cat properties.properties | grep keytab** command.

Step 19 Change the value of **kerberosKeytab** in [Step 18](#) to the custom keytab path and go to [Step 21](#).

Step 20 Go to [Step 18](#) and check whether the Flume agent running user has the permission to access the keytab authentication file. If the keytab path is returned, the user has the permission. Otherwise, the user does not have the permission.

- If yes, go to [Step 22](#).
- If no, go to [Step 21](#).

Step 21 Run the **chmod 755 *keytab file*** command to grant the read permission on the keytab file specified in [Step 19](#), and restart the Flume process.

Step 22 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 23](#).

Collect fault information.

Step 23 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 24 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 25 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 26 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.197 ALM-24003 Flume Client Connection Interrupted

Alarm Description

The alarm module monitors the port connection status on the Flume server. This alarm is generated if the Flume server fails to receive a connection message from the Flume client in three consecutive minutes.

This alarm is cleared after the Flume server receives a connection message from the Flume client.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 24003 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| Client IP Address | Specifies the IP address of the Flume client. |
| Client Name | Specifies the agent name of the Flume client. |
| Sink Name | Specifies the sink name of Flume Agent. |

Impact on the System

The communication between the Flume client and the server fails. The Flume client cannot send data to the Flume server.

Possible Causes

- The network connection between the Flume client and the server is faulty.
- The Flume client's process is abnormal.
- The Flume client is incorrectly configured.

Handling Procedure

Check the network connection between the Flume client and the server.

Step 1 Log in to the host whose IP address is specified by **Flume ClientIP** in the alarm information as user **root**.

Step 2 Run the **ping *Flume server IP address*** command to check whether the network connection between the Flume client and the server is normal.

- If yes, go to **Step 3**.
- If no, go to **Step 11**.

Check whether the Flume client's process is normal.

Step 3 Log in to the host whose IP address is specified by **Flume ClientIP** in the alarm information as user **root**.

Step 4 Run the **ps -ef|grep flume |grep client** command to check whether the Flume client process exists.

- If yes, go to **Step 5**.
- If no, go to **Step 11**.

Check the Flume client configuration.

Step 5 Log in to the host whose IP address is specified by **Flume ClientIP** in the alarm information as user **root**.

Step 6 Run the **cd *Flume client installation directory*/fusioninsight-flume-1.9.0/conf/** command to go to Flume's configuration directory.

Step 7 Run the **cat *properties.properties*** command to query the current configuration file of the Flume client.

Step 8 Check whether the ***properties.properties*** file is correctly configured according to the configuration description of the Flume agent.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Modify the ***properties.properties*** configuration file.

Check whether the alarm is cleared.

Step 10 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect the fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 12 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Collect logs in the **/var/log/Bigdata/flume-client** directory on the Flume client using a transmission tool.

Step 15 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.198 ALM-24004 Exception Occurs When Flume Reads Data

Alarm Description

The alarm module monitors the Flume source status. This alarm is generated when the duration in which the source cannot read data exceeds the threshold.

The default threshold is **0**, indicating that this function is disabled. You can change the threshold by modifying the **properties.properties** file in the **conf** directory. Specifically, modify the **NoDatatime** parameter of required the source.

The alarm is cleared when the source reads the data and the alarm handling is complete.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 24004 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|---------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |
| AgentId | Specifies the ID of the agent for which the alarm was generated. |
| ComponentType | Specifies the type of the component for which the alarm was generated. |

| Parameter | Description |
|---------------|--|
| ComponentName | Specifies the name of the component for which the alarm was generated. |

Impact on the System

If data is found in the data source but the Flume source continuously fails to read data, the collection is stopped.

Possible Causes

- The Flume source is faulty, so data cannot be sent.
- The network is faulty, so the data cannot be sent.

Handling Procedure

Check whether the Flume source is faulty.

Step 1 Open the **properties.properties** configuration file on the local PC, search for keyword **type = spoolDir** in the file, and check whether the Flume source type is **spoolDir**.

- If yes, go to [Step 2](#).
- If no, go to [Step 3](#).

Step 2 View the **spoolDir** monitoring directory to check whether all files are already transferred.

- If yes, no further action is required.
- If no, go to [Step 5](#).

NOTE

The monitoring directory of **spoolDir** is specified by the **.spoolDir** parameter in the **properties.properties** configuration file. If all files in the monitoring directory have been transferred, the file name extension of all files in the monitoring directory is **.COMPLETED**.

Step 3 Open the **properties.properties** configuration file on the local PC, search for **org.apache.flume.source.kafka.KafkaSource** in the file, and check whether the Flume source type is **Kafka**.

- If yes, go to [Step 4](#).
- If no, go to [Step 7](#).

Step 4 Check whether the topic data configured by the **Kafka** source has been used up.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Step 5 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > Flume > Instances**.

Step 6 Go to the Flume instance page of the faulty node to check whether the **Source Speed Metrics** in the alarm is **0**.

- If yes, go to [Step 11](#).
- If no, go to [Step 7](#).

Check the network connectivity between the node with the IP address configured for the Flume source and the faulty node.

Step 7 Open the **properties.properties** configuration file on the local PC, search for **type = avro** in the file, and check whether the Flume source type is Avro.

- If yes, go to [Step 8](#).
- If no, go to [Step 11](#).

Step 8 Log in to the faulty node as user **root**, and run the **ping IP address of the Flume source** command to check whether the peer host can be pinged successfully.

- If yes, go to [Step 11](#).
- If no, go to [Step 9](#).

Step 9 Contact the network administrator to restore the network.

Step 10 Wait for a while and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to [Step 11](#).

Collect fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 12 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

None

10.199 ALM-24005 Exception Occurs When Flume Transmits Data

Alarm Description

The alarm module monitors the capacity status of Flume Channel. The alarm is generated immediately when the duration that Channel is fully occupied exceeds

the threshold or the number of times that Source fails to send data to Channel exceeds the threshold.

The default threshold is **10**. You can change the threshold by modifying the **channelfullcount** parameter of the related channel in the **properties.properties** configuration file in the **conf** directory.

The alarm is cleared when the space of Flume Channel is released and the alarm handling is complete.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 24005 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|---------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |
| AgentId | Specifies the ID of the agent for which the alarm was generated. |
| ComponentType | Specifies the type of the component for which the alarm was generated. |
| ComponentName | Specifies the name of the component for which the alarm was generated. |

Impact on the System

If the disk usage of Flume Channel increases continuously, the time required for importing data to a specified destination prolongs. When the disk usage of Flume Channel reaches 100%, the Flume agent process pauses.

Possible Causes

- Flume Sink is faulty, so the data cannot be sent.
- The network is faulty, so the data cannot be sent.

Handling Procedure

Check whether Flume Sink is faulty.

- Step 1** Open the **properties.properties** configuration file on the local PC, search for **type = hdfs** in the file, and check whether the Flume sink type is HDFS.
- If yes, go to [Step 2](#).
 - If no, go to [Step 3](#).
- Step 2** On FusionInsight Manager, check whether **HDFS Service Unavailable** alarm is generated in the alarm list and whether the HDFS service is stopped in the service list.
- If the alarm is reported, clear it according to the handling suggestions of ALM-14000 HDFS Service Unavailable; if the HDFS service is stopped, start it. Then, go to [Step 7](#).
 - If no, go to [Step 7](#).
- Step 3** Open the **properties.properties** configuration file on the local PC, search for **type = hbase** in the file, and check whether the Flume sink type is HBase.
- If yes, go to [Step 4](#).
 - If no, go to [Step 5](#).
- Step 4** On FusionInsight Manager, check whether **HBase Service Unavailable** alarm is generated in the alarm list and whether the HBase service is stopped in the service list.
- If the alarm is reported, clear it according to the handling suggestions of ALM-19000 HBase Service Unavailable; if the HBase service is stopped, start it. Then, go to [Step 7](#).
 - If no, go to [Step 7](#).
- Step 5** Open the **properties.properties** configuration file on the local PC, search for **org.apache.flume.sink.kafka.KafkaSink** in the file, and check whether the Flume sink type is Kafka.
- If yes, go to [Step 6](#).
 - If no, go to [Step 9](#).
- Step 6** On FusionInsight Manager, check whether **Kafka Service Unavailable** alarm is generated in the alarm list and whether the Kafka service is stopped in the service list.
- If the alarm is reported, clear it according to the handling suggestions of ALM-38000 Kafka Service Unavailable; if the Kafka service is stopped, start it. Then, go to [Step 7](#).
 - If no, go to [Step 7](#).
- Step 7** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > Flume > Instance**.
- Step 8** Go to the Flume instance page of the faulty node to check whether the indicator **Sink Speed Metrics** is 0.
- If yes, go to [Step 13](#).
 - If no, go to [Step 9](#).
- Check the network connection between the faulty node and the node that corresponds to the Flume Sink IP address.**
- Step 9** Open the **properties.properties** configuration file on the local PC, search for **type = avro** in the file, and check whether the Flume sink type is Avro.

- If yes, go to [Step 10](#).
- If no, go to [Step 13](#).

Step 10 Log in to the faulty node as user **root**, and run the **ping** *IP address of the Flume sink* command to check whether the peer host can be pinged successfully.

- If yes, go to [Step 13](#).
- If no, go to [Step 11](#).

Step 11 Contact the network administrator to restore the network.

Step 12 In the alarm list, check whether the alarm is cleared after a period.

- If yes, no further action is required.
- If no, go to [Step 13](#).

Collect the fault information.

Step 13 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 14 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 15 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

10.200 ALM-24006 Heap Memory Usage of Flume Server Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the Flume service every 60 seconds. This alarm is generated when the heap memory usage of the Flume instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 24006 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

Heap memory overflow may cause service breakdown.

Possible Causes

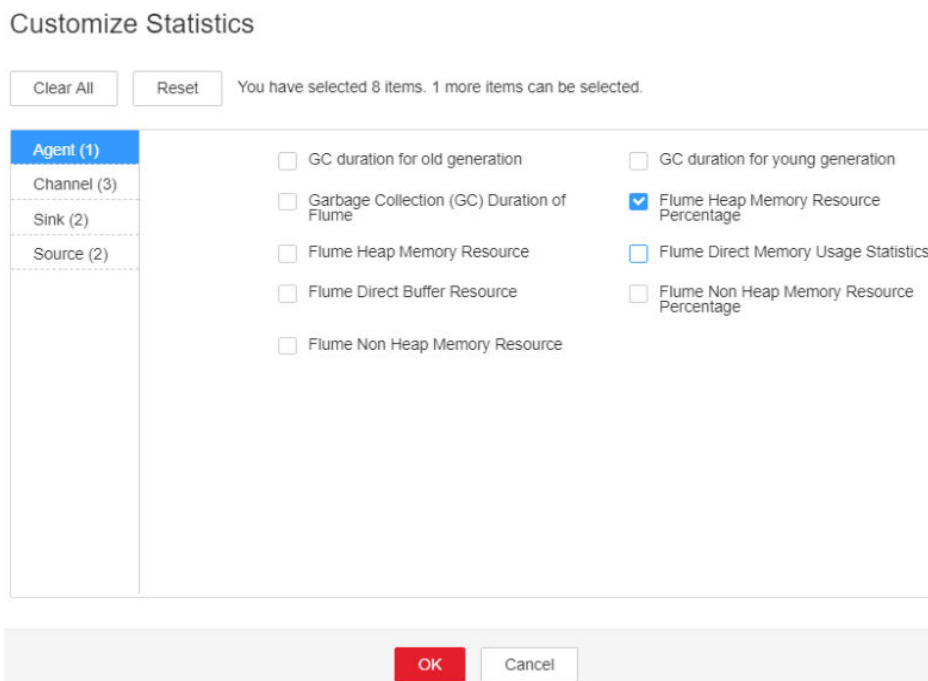

The heap memory of the Flume instance is overused or the heap memory is inappropriately allocated.

Handling Procedure

Check the heap memory usage.

- Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing **Flume Heap Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Name of the target cluster > Services > Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Flume Heap Memory Resource Percentage**. Then, click **OK**.

Figure 10-69 Flume Heap Memory Resource Percentage

- Step 3** Check whether the heap memory used by Flume reaches the threshold (95% of the maximum heap memory by default).
- If yes, go to **Step 4**.
 - If no, go to **Step 6**.

- Step 4** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-Xmx** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for the Flume server is insufficient for data transmission. You are advised to change the heap memory to: Channel capacity x Maximum size of a single data record x Number of channels. Note that the value of **xmx** cannot exceed the remaining memory of the node.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to **Step 6**.

NOTICE

- During the restart, the Flume service is interrupted.
- During the instance restart, if the failover mode of SinkGroup is configured and at least one instance is running properly, the Flume service is not interrupted. Otherwise, the Flume service is interrupted.

Collect the fault information.

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Flume** for the target cluster.
- Step 8** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.
- End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.201 ALM-24007 Flume Server Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the Flume service every 60 seconds. This alarm is generated when the direct memory usage of the Flume instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the Flume direct memory usage is less than or equal to the threshold.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 24007 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |

| Parameter | Description |
|-------------------|---|
| HostName | Specifies the host for which the alarm was generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

Direct memory overflow may cause service breakdown.

Possible Causes

The direct memory of the Flume process is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

- Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing **Flume Direct Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Name of the target cluster > Services > Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Flume Direct Memory Resource Percentage**. Then, click **OK**.

Figure 10-70 Flume Direct Memory Usage Statistics

Step 3 Check whether the direct memory used by Flume reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory size configured for the Flume server instance cannot meet service requirements. You are advised to change the value of **-XX:MaxDirectMemorySize** to twice the current direct memory size or change the value based on site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

NOTICE

- During the restart, the Flume service is interrupted.
- During the instance restart, if the failover mode of SinkGroup is configured and at least one instance is running properly, the Flume service is not interrupted. Otherwise, the Flume service is interrupted.

Collect the fault information.

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Flume** for the target cluster.
- Step 8** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.
- End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.202 ALM-24008 Flume Server Non Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the non-heap memory usage of the Flume service every 60 seconds. This alarm is generated when the non-heap memory usage of the Flume instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 24008 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |

| Parameter | Description |
|-------------------|---|
| HostName | Specifies the host for which the alarm was generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

Non-heap memory overflow may cause service breakdown.

Possible Causes

The non-heap memory of the Flume instance is overused or the non-heap memory is inappropriately allocated.

Handling Procedure

Check non-heap memory usage.

- Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing **Flume Non Heap Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Name of the target cluster > Services > Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Flume Non Heap Memory Resource Percentage**. Then, click **OK**.

Figure 10-71 Flume Non-Heap Memory Resource Percentage

- Step 3** Check whether the non-heap memory used by Flume reaches the threshold (80% of the maximum non-heap memory by default).
- If yes, go to [Step 4](#).
 - If no, go to [Step 6](#).

- Step 4** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the Flume server instance cannot meet service requirements. You are advised to change the value of **-XX:MaxPermSize** to twice the current non-heap memory size or change the value based on site requirements.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 6](#).

NOTICE

- During the restart, the Flume service is interrupted.
- During the instance restart, if the failover mode of SinkGroup is configured and at least one instance is running properly, the Flume service is not interrupted. Otherwise, the Flume service is interrupted.

Collect the fault information.

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Flume** for the target cluster.
- Step 8** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.
- End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

10.203 ALM-24009 Flume Server Garbage Collection (GC) Time Exceeds the Threshold

Alarm Description

The system checks the GC duration of the Flume process every 60 seconds. This alarm is generated when the GC duration of the Flume process exceeds the threshold (12 seconds by default) for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 24009 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |

| Parameter | Description |
|-------------------|---|
| HostName | Specifies the host for which the alarm was generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

Flume data transmission efficiency decreases.

Possible Causes

The heap memory of the Flume process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC duration.

- Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing **GC Duration Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Name of the target cluster > Services > Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Garbage Collection (GC) Duration of Flume**. Then, click **OK**.

Figure 10-72 Garbage Collection (GC) Duration of Flume

Step 3 Check whether the GC duration of the Flume process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-Xmx** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

 **NOTE**

If this alarm is generated, the heap memory configured for the Flume server is insufficient for data transmission. You are advised to change the heap memory to: Channel capacity x Maximum size of a single data record x Number of channels. Note that the value of **xmx** cannot exceed the remaining memory of the node.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

NOTICE

- During the restart, the Flume service is interrupted.
 - During the instance restart, if the failover mode of SinkGroup is configured and at least one instance is running properly, the Flume service is not interrupted. Otherwise, the Flume service is interrupted.
-

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

10.204 ALM-24010 Flume Certificate File Is Invalid or Damaged

This section applies to MRS 3.2.0 or later.

Alarm Description

Flume checks whether the Flume certificate file is valid (whether the certificate exists and whether the certificate format is correct) every hour. This alarm is generated when the certificate file is invalid or damaged. This alarm is automatically cleared when the certificate file becomes valid again.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 24010 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |

Impact on the System

The Flume client cannot access the Flume server.

Possible Causes

The Flume certificate file is invalid or damaged.

Handling Procedure

View alarm information.

- Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row

containing **ALM-24010 Flume Certificate File Is Invalid or Damaged**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to go to the Flume service certificate directory:

```
cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf
```

Step 4 Run the **ls -l** command to check whether the **flume_sChat.crt** file exists.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

Step 5 Run the **openssl x509 -in flume_sChat.crt -text -noout** command to check whether certificate details are displayed properly.

- If yes, go to [Step 9](#).
- If no, go to [Step 6](#).

Step 6 Run the following command to go to the Flume script directory:

```
cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin
```

Step 7 Run the following command to generate a new certificate file. Then check whether the alarm is automatically cleared one hour later.

```
sh geneJKS.sh -f Custom certificate password of the Flume role on the server -g Custom certificate password of the Flume role on the client
```

- If yes, go to [Step 8](#).
- If no, go to [Step 9](#).

NOTE

The custom certificate passwords must meet the following complexity requirements:

- Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
- Contain 8 to 64 characters.
- Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

Step 8 Check whether this alarm is generated again during periodic system check.

- If yes, go to [Step 9](#).
- If no, no further action is required.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

10.205 ALM-24011 Flume Certificate File Is About to Expire

This section applies to MRS 3.2.0 or later.

Alarm Description

Flume checks whether the Flume certificate file is about to expire every hour. This alarm is generated when the remaining validity period is at most 30 days. This alarm is automatically cleared when the remaining validity period is greater than 30 days.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 24011 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |

Impact on the System

Currently, there is no impact on the system.

Possible Causes

The Flume certificate file is about to expire.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing **ALM-24011 Flume Certificate Is About to Expire**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to go to the Flume service certificate directory:

```
cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf
```

Step 4 Run the following command to check the effective time and expiration time of the Flume user certificate:

```
openssl x509 -noout -text -in flume_sChat.crt
```

Step 5 Perform [Step 6](#) to [Step 7](#) during off-peak hours to update the certificate file as needed.

Step 6 Run the following command to go to the Flume script directory:

```
cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin
```

Step 7 Run the following command to generate a new certificate file. Then, check whether the alarm is automatically cleared one hour later.

```
sh geneJKS.sh -f Custom certificate password of the Flume role on the server -g Custom certificate password of the Flume role on the client
```

- If yes, go to [Step 9](#).
- If no, go to [Step 8](#).

NOTE

The custom certificate passwords must meet the following complexity requirements:

- Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
- Contain 8 to 64 characters.
- Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

Step 8 Log in to the Flume node for which the alarm is generated as user **omm** and repeat **Step 6** to **Step 7**. Then, check whether the alarm is automatically cleared one hour later.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 10**.
- If no, no further action is required.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 11 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 12 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M personnel and provide the collected logs.

10.206 ALM-24012 Flume Certificate File Has Expired

This section applies to MRS 3.2.0 or later.

Alarm Description

Flume checks whether its certificate file in the system has expired every hour. This alarm is generated when the server certificate has expired. This alarm is automatically cleared when the certificate file becomes valid again.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 24012 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |

Impact on the System

The Flume client cannot access the Flume server.

Possible Causes

The Flume certificate file has expired.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing **ALM-24012 Flume Certificate Has Expired**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to go to the Flume service certificate directory:

```
cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf
```

Step 4 Run the following command to check the effective time and expiration time of the HA user certificate to determine whether the certificate file is still in the validity period:

```
openssl x509 -noout -text -in flume_sChat.crt
```

- If yes, go to [Step 9](#).
- If no, go to [Step 5](#).

Step 5 Run the following command to go to the Flume script directory:

```
cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/  
flume/bin
```

Step 6 Run the following command to generate a new certificate file. Then, check whether the alarm is automatically cleared one hour later.

```
sh geneJKS.sh -f Custom certificate password of the Flume role on the server -g  
Custom certificate password of the Flume role on the client
```

- If yes, go to [Step 8](#).
- If no, go to [Step 7](#).

10.207 ALM-24013 Flume MonitorServer Certificate File Is Invalid or Damaged

This section applies to MRS 3.2.0 or later.

Alarm Description

MonitorServer checks whether its certificate file is valid (whether the certificate exists and whether the certificate format is correct) every hour. This alarm is generated when the certificate file is invalid or damaged. This alarm is automatically cleared when the certificate file becomes valid again.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 24013 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |

Impact on the System

The Flume client cannot access the Flume server.

Possible Causes

The MonitorServer certificate file is invalid or damaged.

Handling Procedure

View alarm information.

- Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row

containing **ALM-24013 MonitorServer Certificate File Is Invalid or Damaged**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to go to the MonitorServer certificate file directory:

```
cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf
```

Step 4 Run the **ls -l** command to check whether the **ms_sChat.crt** file exists:

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

Step 5 Run the **openssl x509 -in ms_sChat.crt -text -noout** command to check whether certificate details are displayed.

- If yes, go to [Step 9](#).
- If no, go to [Step 6](#).

Step 6 Run the following command to go to the Flume script directory:

```
cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin
```

Step 7 Run the following command to generate a new certificate file. Then check whether the alarm is automatically cleared one hour later.

```

10.209 ALM-24015 Flume MonitorServer Certificate File Has Expired

This section applies to MRS 3.2.0 or later.

Alarm Description

MonitorServer checks whether its certificate file in the system has expired every hour. This alarm is generated when the server certificate has expired. This alarm is automatically cleared when the MonitorServer certificate file becomes valid again.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 24015 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |

Impact on the System

The Flume client cannot access the Flume server.

Possible Causes

The MonitorServer certificate file has expired.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing **ALM-24015 MonitorServer Certificate Has Expired**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to go to the MonitorServer certificate file directory:

```
cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf
```

Step 4 Run the following command to check the effective time and expiration time of the user certificate to determine whether the certificate file is still in the validity period:

```
openssl x509 -noout -text -in ms_sChat.crt
```

- If yes, go to [Step 9](#).
- If no, go to [Step 5](#).

Step 5 Run the following command to go to the Flume script directory:

```
cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/  
flume/bin
```

Step 6 Run the following command to generate a new certificate file. Then, check whether the alarm is automatically cleared one hour later.

```
sh geneJKS.sh -m Custom password of the MonitorServer certificate on the server  
-n Custom password of the MonitorServer certificate on the client
```

- If yes, go to [Step 8](#).

 **NOTE**

The custom certificate passwords must meet the following complexity requirements:

- Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
- Contain 8 to 64 characters.
- Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

Step 7 Log in to the Flume node for which the alarm is generated as user **omm** and repeat [Step 5](#) to [Step 6](#). Then, check whether the alarm is automatically cleared one hour later.

- If yes, go to [Step 8](#).
- If no, go to [Step 9](#).

Step 8 Check whether this alarm is generated again during periodic system check.

- If yes, go to [Step 9](#).
- If no, no further action is required.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 10 Select **MonitorServer** in the required cluster for **Service**.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.210 ALM-25000 LdapServer Service Unavailable

Description

The system checks the LdapServer service status every 30 seconds. This alarm is generated when the system detects that both the active and standby LdapServer services are abnormal.

This alarm is cleared when the system detects that one or two LdapServer services are normal.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 25000 | Critical | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

When this alarm is generated, no operation can be performed for the KrbServer users and LdapServer users in the cluster. For example, users, user groups, or roles cannot be added, deleted, or modified, and user passwords cannot be changed on the FusionInsight Manager portal. The authentication for existing users in the cluster is not affected.

Possible Causes

- The node where the LdapServer service locates is faulty.
- The LdapServer process is abnormal.

Procedure

Check whether the nodes where the two SlapdServer instances of the LdapServer service are located are faulty.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **LdapServer** > **Instance** to go to the LdapServer instance page to obtain the host name of the node where the two SlapdServer instances locates.

Step 2 Choose **O&M** > **Alarm** > **Alarms**. On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **Node Fault** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Check whether the host name in the alarm is consistent with the **Step 1** host name.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Handle the alarm according to "ALM-12006 Node Fault".

Step 5 Check whether **LdapServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the LdapServer process is normal.

Step 6 Choose **O&M** > **Alarm** > **Alarms**. On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **Process Fault** exists.

- If yes, go to **Step 7**.
- If no, go to **Step 10**.

Step 7 Check whether the service and host name in the alarm are consistent with the LdapServer service and host name.

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

Step 8 Handle the alarm according to "ALM-12007 Process Fault".

Step 9 Check whether **LdapServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 11 Select **LdapServer** in the required cluster from the **Service**.

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.211 ALM-25004 Abnormal LdapServer Data Synchronization

Description

The system checks the LdapServer data every 30 seconds. This alarm is generated when the data on the active and standby LdapServers of Manager is inconsistent for 12 consecutive times. This alarm is cleared when the data on the active and standby LdapServers is consistent.

The system checks the LdapServer data every 30 seconds. This alarm is generated when the LdapServer data in the cluster is inconsistent with that on Manager for 12 consecutive times. This alarm is cleared when the data is consistent.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 25004 | Critical | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

LdapServer data inconsistency occurs because the LdapServer data in Manager is damaged or the LdapServer data in the cluster is damaged. The LdapServer process with damaged data cannot provide services externally, and the authentication functions of Manager and the cluster are affected.

Possible Causes

- The network of the node where the LdapServer process locates is faulty.
- The LdapServer process is abnormal.
- The OS restart damages data on LdapServer.
- The amount of Oldap data exceeds the threshold (10 MB by default).

Procedure

Check whether the network where the LdapServer nodes reside is faulty.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. Record the IP address of HostName in the alarm locating information as IP1 (if multiple alarms exist, record the IP addresses as IP1, IP2, and IP3 respectively).

Step 2 Contact O&M personnel and log in to the nodes corresponding to IP 1. Run the ping command to check whether the IP address of the management plane of the active OMS node can be pinged.

- If yes, go to [Step 4](#).
- If no, go to [Step 3](#).

Step 3 Contact the network administrator to recover the network and check whether **Abnormal LdapServer Data Synchronization** is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

Check whether the LdapServer processes are normal.

Step 4 On the **Alarm** page of FusionInsight Manager, check whether the **OLdap Resource Abnormal** exists.

- If yes, go to [Step 5](#).
- If no, go to [Step 7](#).

Step 5 Clear the alarm by following the steps provided in "ALM-12004 OLdap Resource Abnormal".

Step 6 Check whether **Abnormal LdapServer Data Synchronization** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to [Step 7](#).

Step 7 On the **Alarm** page of FusionInsight Manager, check whether **Process Fault** is generated for the LdapServer service.

- If yes, go to [Step 8](#).
- If no, go to [Step 10](#).

Step 8 Handle the alarm according to "ALM-12007 Process Fault".

Step 9 Check whether **Abnormal LdapServer Data Synchronization** is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

Check whether the LdapServer processes are normal.

Step 10 On FusionInsight Manager, choose **O&M > Alarm > Alarms**. Record the IP address of HostName in the alarm locating information as "IP1" (if multiple alarms exist, record the IP addresses as "IP1", "IP2", and "IP3" respectively). Choose **Cluster > Name of the desired cluster > Services > LdapServer > Configurations**. Record the port number of LdapServer as "PORT". (If the IP address in the alarm locating information is the IP address of the standby management node, choose **System > OMS > oldap > Modify Configuration** and record the listening port number of LdapServer.)

Step 11 Log in to the nodes corresponding to IP1 as user **omm**.

Step 12 Run the following command to check whether errors are displayed in the queried information.

```
ldapsearch -H ldaps://IP1:PORT -LLL -x -D cn=root,dc=hadoop,dc=com -W -b ou=Peoples,dc=hadoop,dc=com
```

After running the command, enter the **LDAP** administrator password. Contact the system administrator to obtain the password.

- If yes, go to [Step 13](#).
- If no, go to [Step 15](#).

Step 13 Recover the LdapServer and OMS nodes using data backed up before the alarm is generated.

 **NOTE**

Use the OMS data and LdapServer data backed up at the same point in time to recover the data. Otherwise, the service and operation may fail. To recover data when services run properly, you are advised to manually back up the latest management data and then recover the data. Otherwise, Manager data produced between the backup point in time and the recovery point in time will be lost.

Step 14 Check whether alarm **Abnormal LdapServer Data Synchronization** is cleared.

- If yes, no further action is required.
- If no, go to [Step 15](#).

Check whether the data volume of the Oldap exceeds the threshold (10 MB by default). (This step applies only to versions earlier than MRS 3.3.0. For MRS 3.3.0 and later versions, go to [Step 18](#).)

Step 15 Log in to the active OMS node as user **omm**.

Step 16 Run the following command to check whether the directory contains **.mdb** files.

```
ll /srv/BigData/ldapData/oldap/data/
```

- If yes, check and record the size of the **.mdb** file and go to [Step 17](#).

- If no, go to [Step 18](#).

Step 17 Run the following command to view the Oldap configuration and record the value of **Map size** (the default value is **10485760** bytes, that is, 10 MB)

```
mdb_stat -e /srv/BigData/ldapData/oldap/data/
```

Check whether the size of the **.mdb** file with [Step 16](#) records reaches the value of **Map size**.

- If yes, contact the O&M personnel.
- If no, go to [Step 18](#).

Collect fault information.

Step 18 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 19 Select **LdapServer** in the required cluster and **OmsLdapServer** from the **Service**.

Step 20 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 21 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.212 ALM-25005 nscd Service Exception

Alarm Description

The system checks the status of the nscd service every 60 seconds. This alarm is generated when the nscd process fails to be queried for four consecutive times (three minutes) or users in LdapServer cannot be obtained.

This alarm is cleared when the process is restored and users in LdapServer can be obtained.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 25005 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |

Impact on the System

The alarmed node may not be able to synchronize data from LdapServer. The `id` command may fail to obtain the LDAP data, affecting upper-layer services.

Possible Causes

- The `nscd` service is not started.
- The network is faulty, and cannot access the LDAP server.
- NameService is abnormal.
- Users cannot be queried because the OS executes commands too slowly.

Handling Procedure

Check whether the `nscd` service is started.

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. Record the IP address of **HostName** in **Location** of the alarm as **IP1** (if multiple alarms exist, record the IP addresses as **IP1**, **IP2**, and **IP3** respectively).
- Step 2** Contact the O&M personnel to access the node using IP1 as user **root**. Run the `ps -ef | grep nscd` command on the node and check whether the `/usr/sbin/nscd` process is started.
- If yes, go to [Step 5](#).
 - If no, go to [Step 3](#).
- Step 3** Run the `service nscd restart` command as user **root** to restart the `nscd` service. Then run the `ps -ef | grep nscd` command to check whether the `nscd` service is started.
- If yes, go to [Step 4](#).
 - If no, go to [Step 15](#).
- Step 4** Wait for 5 minutes and run the `ps -ef | grep nscd` command again as user **root**. Check whether the service exists.
- If yes, go to [Step 11](#).
 - If no, go to [Step 15](#).

Check whether the network is faulty, and whether the LDAP server can be accessed.

Step 5 Log in to the alarmed node as user **root** and run the **ping** command to check whether the network connectivity between this node and the LdapServer node is normal.

- If yes, go to [Step 6](#).
- If no, contact network administrators to troubleshoot the fault.

Check whether the NameService is normal.

Step 6 Log in to the alarmed node as user **root**. Run the **cat /etc/nsswitch.conf** command to check whether the **passwd**, **group**, **services**, **netgroup**, and **aliases** of NameService are correctly configured.

The correct parameter configurations are as follows:

passwd: compat ldap; group: compat ldap; services: files ldap; netgroup: files ldap; aliases: files ldap

- If yes, go to [Step 7](#).
- If no, go to [Step 9](#).

Step 7 Log in to the alarmed node as user **root**. Run the **cat /etc/nscd.conf** command to check whether the **enable-cache passwd**, **positive-time-to-live passwd**, **enable-cache group**, and **positive-time-to-live group** in the configuration file are correctly configured.

The correct parameter configurations are as follows:

enable-cache passwd: yes; positive-time-to-live passwd: 600; enable-cache group: yes; positive-time-to-live group: 3600

- If yes, go to [Step 8](#).
- If no, go to [Step 10](#).

Step 8 Run the **/usr/sbin/nscd -i group** and **/usr/sbin/nscd -i passwd** commands as user **root**. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If yes, go to [Step 11](#).
- If no, go to [Step 15](#).

Step 9 Run the **vi /etc/nsswitch.conf** command as user **root**. Correct the configurations in [Step 6](#) and save the file. Run the **service nscd restart** command to restart the nscd service. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If yes, go to [Step 11](#).
- If no, go to [Step 15](#).

Step 10 Run the **vi /etc/nscd.conf** command as user **root**. Correct the configurations in [Step 7](#) and save the file. Run the **service nscd restart** command to restart the nscd service. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If yes, go to [Step 11](#).
- If no, go to [Step 15](#).

Step 11 Log in to the FusionInsight Manager portal. Wait for 5 minutes and check whether the **nscd Service Exception** alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

Check whether frame freezing occurs when running a command in the operating system.

Step 12 Log in to the faulty node as user **root**, run the **id admin** command, and check whether the command execution takes a long time. If the command execution takes more than 3 seconds, the command execution is deemed to be slow.

- If yes, go to [Step 13](#).
- If no, go to [Step 15](#).

Step 13 Run the **cat /var/log/messages** command to check whether the nscd frequently restarts or the error information "Can't contact LDAP server" exists.

nscd exception example:

```
Feb 11 11:44:42 10-120-205-33 nscd: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780:
Can't contact LDAP server
Feb 11 11:44:43 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780:
Can't contact LDAP server
Feb 11 11:44:44 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.92:21780:
Can't contact LDAP server
```

- If yes, go to [Step 14](#).
- If no, go to [Step 15](#).

Step 14 Run the **vi\$BIGDATA_HOME/tmp/random_ldap_ip_order** command to modify the number at the end. If the original number is an odd number, change it to an even number. If the number is an even number, change it to an odd number.

Run the **vi /etc/ldap.conf** command to enter the editing mode, press **Insert** to start editing, and then change the first two IP addresses of the URI configuration item.

After the modification is complete, press **Esc** to exit the editing mode and enter **:wq!** to save the settings and exit.

Run the **service nscd restart** command to restart the nscd service. Wait 5 minutes and run the **id admin** command again. Check whether the command execution is slow.

- If yes, go to [Step 15](#).
- If no, log in to other faulty nodes and repeat [Step 12](#) to [Step 14](#) to check whether the first LdapServer node in the URI before modifying **/etc/ldap.conf** is faulty. For example, check whether the service IP address is unreachable, the network delay is too long, or other abnormal software is deployed.

Collect the fault information.

Step 15 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 16 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **LdapClient** for the target cluster.

Step 17 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.213 ALM-25006 Sssd Service Exception

Description

The system checks the status of the sssd service every 60 seconds. This alarm is generated when the sssd process fails to be queried for four consecutive times (three minutes) or users in LdapServer cannot be obtained.

This alarm is cleared when the process is restored and users in LdapServer can be obtained.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 25006 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service name for which the alarm is generated. |
| HostName | Specifies the object (host ID) for which the alarm is generated. |

Impact on the System

The alarmed node may not be able to synchronize data from LdapServer. The id command may fail to obtain the LDAP data, affecting upper-layer services.

Possible Causes

- The sssd service is not started or is incorrectly started.
- The network is faulty and cannot access the LDAP server.
- NameService is abnormal.
- Users cannot be queried because the OS executes commands too slowly.

Procedure

Check whether the sssd service is correctly started.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. Find the IP address of **HostName** in **Location** of the alarm and record it as IP1 (if multiple alarms exist, record the IP addresses as IP1, IP2, and IP3 respectively).

Step 2 Contact the O&M personnel to access the node using IP1 as user **root**. Run the **ps -ef | grep sssd** command and check whether the **/usr/sbin/sss**d process is started.

- If the process is started, go to [Step 3](#).
- If the process is not started, go to [Step 4](#).

Step 3 Check whether the sssd process queried in [Step 2](#) has three subprocesses.

- If yes, go to [Step 5](#).
- If no, go to [Step 4](#).

Step 4 Run the **service sssd restart** command as user **root** to restart the sssd service. Then run the **ps -ef | grep sssd** command to check whether the sssd process is normal.

In the normal state, the **/usr/sbin/sss**d process has three subprocesses: **/usr/libexec/sss**d/sss_d_be, **/usr/libexec/sss**d/sss_d_nss, and **/usr/libexec/sss**d/sss_d_pam.

- If it exists, go to [Step 9](#).
- If it does not exist, go to [Step 13](#).

Check whether the LDAP server can be accessed.

Step 5 Log in to the alarmed node as user **root**. Run the **ping** command to check the network connectivity between this node and the LdapServer node.

- If the network is normal, go to [Step 6](#).
- If the network is faulty, contact network administrators to troubleshoot the fault.

Check whether NameService is normal.

Step 6 Log in to the alarmed node as user **root**. Run the **cat /etc/nsswitch.conf** command and check the **passwd** and **group** configurations of NameService.

The correct parameter configurations are as follows: **passwd: compat ldap** and **group: compat ldap**.

- If the configurations are correct, go to [Step 7](#).
- If the configurations are incorrect, go to [Step 8](#).

- Step 7** Run the `/usr/sbin/sss_cache -G` and `/usr/sbin/sss_cache -U` commands as user **root**. Wait for 2 minutes and run the `id admin` and `id backup/manager` commands to check whether results can be queried.
- If results are queried, go to [Step 9](#).
 - If no result is queried, go to [Step 13](#).
- Step 8** Run the `vi /etc/nsswitch.conf` command as user **root**. Correct the configurations in [Step 6](#) and save the file. Run the `service sssd restart` command to restart the sssd service. Wait for 2 minutes and run the `id admin` and `id backup/manager` commands to check whether results can be queried.
- If results are queried, go to [Step 9](#).
 - If no result is queried, go to [Step 13](#).
- Step 9** Log in to the FusionInsight Manager portal. Wait for 5 minutes and check whether the **sssd Service Exception** alarm is cleared.
- If the alarm is cleared, no further action is required.
 - If the alarm persists, go to [Step 10](#).

Check whether frame freezing occurs when running a command in the operating system.

- Step 10** Log in to the faulty node as user **root**, run the `id admin` command, and check whether the command execution takes a long time. If the command execution takes more than 3 seconds, the command execution is deemed to be slow.
- If yes, go to [Step 11](#).
 - If no, go to [Step 13](#).
- Step 11** Run the `cat /var/log/messages` command to check whether the sssd frequently restarts or the error information **Can't contact LDAP server** exists.

sssd restart example:

```
Feb 7 11:38:16 10-132-190-105 sssd[pam]: Shutting down
Feb 7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
Feb 7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
Feb 7 11:38:16 10-132-190-105 sssd[be[default]]: Shutting down
Feb 7 11:38:16 10-132-190-105 sssd: Starting up
Feb 7 11:38:16 10-132-190-105 sssd[be[default]]: Starting up
Feb 7 11:38:16 10-132-190-105 sssd[nss]: Starting up
Feb 7 11:38:16 10-132-190-105 sssd[pam]: Starting up
```

- If yes, go to [Step 12](#).
 - If no, go to [Step 13](#).
- Step 12** Run the `vi $BIGDATA_HOME/tmp/random_ldap_ip_order` command to modify the number at the end. If the original number is an odd number, change it to an even number. If the number is an even number, change it to an odd number.

Run the `vi /etc/sss/sss.conf` command to reverse the first two IP addresses of the `ldap_uri` configuration item, save the settings, and exit.

Run the `ps -ef | grep sssd` command to query the ID of the sssd process, kill it, and run the `/usr/sbin/sss -D -f` command to restart the sssd service. Wait 5 minutes and run the `id admin` command again.

Check whether the command execution is slow.

- If yes, go to **Step 13**.
- If no, log in to other faulty nodes and run **Step 10** to **Step 12**. Collect logs and check whether the first ldapserver node in the ldap_uri before modifying `/etc/sss/sss.conf` is faulty. For example, check whether the service IP address is unreachable, the network latency is too long, or other abnormal software is deployed.

Collect fault information.

Step 13 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 14 Select **LdapClient** in the required cluster from the **Service**.

Step 15 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.214 ALM-25007 Number of SlapdServer Connections Exceeds the Threshold

Alarm Description

The system checks the number of process connections on the SlapdServer node every 30 seconds and compares the actual number with the threshold. This alarm is generated when the number of process connections exceeds the threshold (**1000** by default) for multiple times (**5** by default).

Its **Trigger Count** is configurable. If **Trigger Count** is set to **1**, this alarm is cleared when the number of process connections is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the number of process connections is less than or equal to 90% of the threshold.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 25007 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

Processes respond slowly or do not work.

Possible Causes

- There are too many SlapdServer connections.
- The alarm threshold or alarm trigger count is improperly configured.

Handling Procedure

Check whether there are too many SlapdServer process connections.

Step 1 Log in to FusionInsight Manager and choose **Cluster > Services > LdapServer**.

Step 2 On the LdapServer dashboard page, observe the SlapdServer process connections and decrease the connections based on service requirements.

Figure 10-73 SlapdServer process connections

Step 3 Wait about 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 4 On FusionInsight Manager, choose **O&M > Alarm > Thresholds**, click the name of the desired cluster, choose **LdapServer > Other > SlapdServer Service Connections**, and check whether the alarm trigger count and alarm threshold are set properly.

- If yes, go to [Step 7](#).
- If no, go to [Step 5](#).

Step 5 Change the trigger count and alarm threshold based on the actual number of process connections, and apply the changes.

Step 6 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 8 Expand the **Service** drop-down list, and select **LdapServer** for the target cluster.

Step 9 Specify **Hosts** for collecting logs, which is optional. By default, all hosts are selected.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.215 ALM-25008 SlapdServer CPU Usage Exceeds the Threshold

Alarm Description

The system checks the CPU usage of the SlapdServer node every 30 seconds and compares the actual usage with the threshold. This alarm is generated when the SlapdServer CPU usage exceeds the threshold for multiple times (5 by default).

Its **Trigger Count** is configurable. If **Trigger Count** is set to **1**, this alarm is cleared when the SlapdServer CPU usage is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the SlapdServer CPU usage is less than or equal to 90% of the threshold.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|---|--------------|
| 25008 | Critical (default threshold: 85%)
Major (default threshold: 75%) | Yes |

Alarm Parameters

| Parameter | Description |
|-------------------|---|
| Source | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm. |

Impact on the System

Processes respond slowly or do not work.

Possible Causes

- The alarm threshold or alarm trigger count is improperly configured.
- The CPU configuration cannot meet service requirements, and the CPU usage reaches the upper limit.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds**, click the name of the desired cluster, choose **LdapServer > Other > SlapdServer Service Total CPU Percentage**, and check whether the alarm trigger count and alarm threshold are set properly.

- If yes, go to [Step 4](#).
- If no, go to [Step 2](#).

Step 2 Change the trigger count and alarm threshold based on the actual CPU usage, and apply the changes.

Step 3 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

Check whether the CPU usage reaches the upper limit.

Step 4 On FusionInsight Manager, choose **O&M > Alarm > Alarms**. In the right pane, click this alarm and obtain the host name in **Location**.

Step 5 Choose **Cluster > Services > LdapServer**, click the **Instance** tab, and click the SlapdServer instance corresponding to the host name in [Step 4](#).

Step 6 On the dashboard of the instance, observe the real-time data of the **CPU Usage of a Single SlapdServer Instance** chart for about 5 minutes and check whether the CPU usage exceeds the threshold (75% by default) for multiple times.

- If yes, go to [Step 7](#).
- If no, go to [Step 9](#).

Step 7 Check whether the status of other SlapdServer instances is normal. For details, see [Step 5](#) to [Step 6](#).

- If yes, contact the MRS cluster administrator to evaluate whether to expand the capacity of SlapdServer instances. Then, go to [Step 8](#).
- If no, repair the faulty SlapdServer instance and go to [Step 8](#).

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 10 Expand the **Service** drop-down list, and select **LdapServer** for the target cluster.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.216 ALM-25500 KrbServer Service Unavailable

Description

The system checks the KrbServer service status every 30 seconds. This alarm is generated when the system detects that the KrbServer service is abnormal.

This alarm is cleared when the system detects that the KrbServer service is normal.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 25500 | Critical | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

When this alarm is generated, no operation can be performed for the KrbServer component in the cluster. The authentication of KrbServer in other components will be affected. The running status of components that depend on KrbServer in the cluster is Bad.

Possible Causes

- The node where the KrbServer service locates is faulty.
- The OLdap service is abnormal.

Procedure

Check whether the node where the KrbServer service locates is faulty.

Step 1 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **KrbServer** > **Instance** to go to the KrbServer instance page to obtain the host name of the node where the KrbServer service locates.

Step 2 On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **Node Fault** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Check whether the host name in the alarm is consistent with the **Step 1** host name.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Handle the alarm according to "ALM-12006 Node Fault".

Step 5 Check whether **KrbServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the OLdap service is normal.

Step 6 On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **OLdap Resource Abnormal** exists.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Handle the alarm according to "ALM-12004 OLdap Resource Abnormal".

Step 8 Check whether **KrbServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 Select **KrbServer** in the required cluster from the **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.217 ALM-26051 Storm Service Unavailable

Description

The system checks the Storm service status every 30 seconds. This alarm is generated when all Nimbus nodes in the cluster are abnormal and the Storm service is unavailable.

This alarm is cleared when the Storm service recovers.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 26051 | Critical | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The cluster cannot provide the Storm service, and users cannot perform new Storm tasks.

Possible Causes

- The Kerberos cluster is faulty.
- The ZooKeeper cluster is faulty or suspended.
- The active and standby Nimbus nodes in the Storm cluster are abnormal

Procedure

Check the status of the Kerberos cluster. (Skip this step if the normal mode is used.)

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 2 Check whether the running status of the Kerberos service is **Normal**.

- If yes, go to [Step 5](#).
- If no, go to [Step 3](#).

Step 3 See the related maintenance information of **ALM-25500 KrbServer Service Unavailable**.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check the status of the ZooKeeper cluster.

Step 5 Check whether the running status of the ZooKeeper service is **Normal**.

- If yes, go to [Step 8](#).
- If no, go to [Step 6](#).

Step 6 If ZooKeeper service is stopped, start it, else see the related maintenance information of **ALM-13000 ZooKeeper Service Unavailable**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

Check the status of the active and standby Nimbus nodes.

Step 8 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Nimbus** to go to the Nimbus Instances page.

Step 9 Check whether only one Nimbus node that is in the **Active** state in **Roles**.

- If yes, go to [Step 13](#).
- If no, go to [Step 10](#).

Step 10 Select two Nimbus role instances, choose **More** > **Restart Instance**, and check whether the instances restart successfully.

- If yes, go to [Step 11](#).
- If no, go to [Step 13](#).

Step 11 Log in to the FusionInsight Manager portal again, choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Nimbus** to check whether the running status is **Normal**.

- If yes, go to [Step 12](#).
- If no, go to [Step 13](#).

Step 12 Wait for 30 seconds and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 13](#).

Collecting Fault Information

Step 13 On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 14 Select the following nodes in the required cluster from the **Service** drop-down list:

- KrbServer

NOTE

KrbServer logs do not need to be downloaded in normal mode.

- ZooKeeper
- Storm

Step 15 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.218 ALM-26052 Number of Available Supervisors of the Storm Service Is Less Than the Threshold

Description

The system periodically checks the number of available Supervisors every 60 seconds and compares the number of available Supervisors with the threshold. This alarm is generated when the number of available Supervisors is less than the threshold.

You can change the threshold in **O&M > Alarm > Thresholds > Name of the desired cluster**.

This alarm is cleared when the number of available Supervisors is greater than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 26052 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

Existing tasks in the cluster cannot be performed. The cluster can receive new Storm tasks, but cannot perform these tasks.

Possible Causes

The status of some Supervisors in the cluster is abnormal.

Procedure

Check the Supervisor status.

Step 1 Choose **Cluster > Name of the desired cluster > Services > Storm > Supervisor** to go to the Storm service management page.

Step 2 In **Roles**, check whether any instance whose status is **Faulty** or **Restoring** exists.

- If yes, go to **Step 3**.

- If no, go to [Step 5](#).

Step 3 Select Supervisor role instances whose status is **Faulty** or **Restoring**, choose **More > Restart Instance**, and check whether the instances restart successfully.

- If yes, go to [Step 4](#).
- If no, go to [Step 5](#).

Step 4 Wait for 30 seconds, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

 **NOTE**

Services are interrupted when the Supervisor is being restarted. Then, services are restored after the restarting.

Collect fault information.

Step 5 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 6 Select **Storm** and **ZooKeeper** in the required cluster from the **Service** drop-down list box.

Step 7 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.219 ALM-26053 Storm Slot Usage Exceeds the Threshold

Description

The system checks the slot usage every 60 seconds and compares the actual slot usage with the threshold. This alarm is generated when the slot usage is greater than the threshold.

You can change the threshold in **O&M > Alarm > Thresholds**.

This alarm is cleared when the slot usage is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 26053 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

New Storm tasks cannot be performed.

Possible Causes

- The status of some Supervisors in the cluster is abnormal.
- The status of all Supervisors is normal, but the processing capability is insufficient.

Procedure

Check the Supervisor status.

Step 1 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Instance** to go to the Storm instance management page.

Step 2 Check whether any instance whose status is **Faulty** or **Restoring** exists.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

Step 3 Select Supervisor role instances whose status is **Faulty** or **Restoring**, choose **More** > **Restart Instance**, and check whether the instances restart successfully.

- If yes, go to [Step 4](#).
- If no, go to [Step 10](#).

Step 4 Wait several minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Increase the number of slots in each Supervisor.

Step 5 Log in to the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Configurations** > **All Configurations**.

Step 6 Increase the number of ports in the **supervisor.slots.ports** parameter of each Supervisor role and restart the instance.

Step 7 Wait several minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

Step 8 Perform capacity expansion for Supervisor.

Step 9 Wait several minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

 **NOTE**

Services are interrupted when the Supervisor is being restarted. Then, services are restored after the restarting.

Collect fault information.

Step 10 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 11 Select **Storm** and **ZooKeeper** in the required cluster from the **Service** drop-down list box.

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.220 ALM-26054 Nimbus Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of Storm Nimbus every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Storm Nimbus exceeds the threshold (80% of the maximum memory by default) for 5 consecutive times.

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > Storm > Nimbus** to change the threshold.

The alarm is cleared when the heap memory usage is less than or equal to the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 26054 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service name for which the alarm is generated. |
| RoleName | Specifies the role name for which the alarm is generated. |
| HostName | Specifies the object (host ID) for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

When the heap memory usage of Storm Nimbus is overhigh, frequent GCs occur. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The heap memory of the Storm Nimbus instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the heap memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Heap Memory Usage of Storm Nimbus Exceeds the Threshold > Location**. Check the host name of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Storm > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize > Nimbus > Heap Memory Usage of Nimbus**. Click **OK**.
- Step 3** Check whether the used heap memory of Nimbus reaches the threshold (The default value is 80% of the maximum heap memory) specified for Nimbus.
- If yes, go to **Step 4**.
 - If no, go to **Step 6**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Storm > Configurations > All Configurations > Nimbus > System**. Change the value of **-Xmx** in **NIMBUS_GC_OPTS** based on site requirements, and click **Save**. Click **OK**.

NOTE

- You are advised to set **-Xms** and **-Xmx** to the same value to prevent adverse impact on performance when JVM dynamically adjusts the heap memory size.
- The number of Workers grows as the Storm cluster scale increases. You can increase the value of **GC_OPTS** for Nimbus. The recommended value is as follows: If the number of Workers is 20, set **-Xmx** to a value greater than or equal to 1 GB. If the number of Workers exceeds 100, set **-Xmx** to a value greater than or equal to 5 GB.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to **Step 6**.

NOTE

During the restart of the service or instance, services are interrupted. After the service or instance is restarted, services are restored.

Collect fault information.

- Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 7** Select the following node in the required cluster from the **Service** drop-down list.
- NodeAgent
 - Storm

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.221 ALM-27001 DBService Service Unavailable

Description

The alarm module checks the DBService service status every 30 seconds. This alarm is generated when the system detects that DBService service is unavailable.

This alarm is cleared when DBService service recovers.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 27001 | Critical | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

Impact on the System

The database service is unavailable and cannot provide data import and query functions for upper-layer services, which results in some services exceptions.

Possible Causes

- The floating IP address does not exist.
- There is no active DBServer instance.
- The active and standby DBServer processes are abnormal.

Procedure

Check whether the floating IP address exists in the cluster environment.

Step 1 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService** > **Instance**.

Step 2 Check whether the active instance exists.

- If yes, go to [Step 3](#).
- If no, go to [Step 9](#).

Step 3 Select the active DBServer instance and record the IP address.

Step 4 Log in to the host that corresponds to the preceding IP address as user **root**, and run the **ifconfig** command to check whether the DBService floating IP address exists on the node.

- If yes, go to [Step 5](#).
- If no, go to [Step 9](#).

Step 5 Run the **ping floatip** command to check whether the DBService floating IP address can be pinged successfully.

- If yes, go to [Step 6](#).
- If no, go to [Step 9](#).

Step 6 Log in to the host that corresponds to the DBService floating IP address as user **root**, and run the command to delete the floating IP address.

ifconfig interface down

Step 7 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService** > **More** > **Restart Service** to restart DBService, and check whether DBService is restarted successfully.

- If yes, go to [Step 8](#).
- If no, go to [Step 9](#).

Step 8 Wait for about 2 minutes and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to [Step 14](#).

Check the status of the active DBServer instance.

Step 9 Select the DBServer instance whose role status is abnormal and record the IP address.

- Step 10** On the **Alarm** page, check whether **Process Fault** occurs in the DBServer instance on the host that corresponds to the IP address.
- If yes, go to [Step 11](#).
 - If no, go to [Step 14](#).

Step 11 Handle the alarm according to "ALM-12007 Process Fault".

- Step 12** Wait for about 5 minutes and check whether the alarm is cleared in the alarm list.
- If yes, no further action is required.
 - If no, go to [Step 19](#).

Check the status of the active and standby DBServers.

Step 13 Log in to the host that corresponds to the preceding IP address as user **root**, and run the **su - omm** command to switch to user **omm**.

Step 14 Run the **cd \${DBSERVER_HOME}** command to go to the installation directory of the DBService.

Step 15 Run the **sh sbin/status-dbserver.sh** command to view the status of the active and standby HA processes of DBService. Determine whether the status can be viewed successfully.

| HAMode | | | | |
|------------|-------------|----------------|---------------------|----------------|
| double | | | | |
| NodeName | HostName | HAVersion | StartTime | HAActive |
| HAAllResOK | HARunPhase | | | |
| 10_5_89_12 | host01 | V100R001C01 | 2019-06-13 21:33:09 | active |
| normal | Activated | | | |
| 10_5_89_66 | host03 | V100R001C01 | 2019-06-13 21:33:09 | standby |

| 10_5_89_66 | floatip | Stopped | Normal | Single_active |
| 10_5_89_66 | gaussDB | Standby_normal | Normal | Active_standby |

- If yes, go to [Step 16](#).
 - If no, go to [Step 19](#).
- Step 16** Check whether the active and standby HA processes are in the abnormal state.
- If yes, go to [Step 17](#).
 - If no, go to [Step 19](#).
- Step 17** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > DBService > More > Restart Service** to restart DBService, and check whether the system displays a message indicating that the restart is successful.
- If yes, go to [Step 18](#).
 - If no, go to [Step 19](#).
- Step 18** Wait for about 2 minutes and check whether the alarm is cleared in the alarm list.
- If yes, no further action is required.
 - If no, go to [Step 19](#).

Collect fault information.

- Step 19** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 20** Select **DBService** in the required cluster and **NodeAgent** from the **Service**.
- Step 21** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 22** Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

None

10.222 ALM-27003 DBService Heartbeat Interruption Between the Active and Standby Nodes

Description

This alarm is generated when the active or standby DBService node does not receive heartbeat messages from the peer node for 7 seconds.

This alarm is cleared when the heartbeat recovers.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 27003 | Major | Yes |

Parameters

| Name | Meaning |
|-------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

| Name | Meaning |
|-------------------------|---------------------------------|
| Local DBService HA Name | Specifies a local DBService HA. |
| Peer DBService HA Name | Specifies a peer DBService HA. |

Impact on the System

During the DBService heartbeat interruption, only one node can provide the service. If this node is faulty, no standby node is available for failover and the service is unavailable.

Possible Causes

The link between the active and standby DBService nodes is abnormal.

Procedure

Check whether the network between the active DBService server and the standby DBService server is normal.

Step 1 In the alarm list on FusionInsight Manager, click  in the row where the alarm is located in the real-time alarm list and view the standby DBService server address.

Step 2 Log in to the active DBService server as user **root**.

Step 3 Run the **ping *standby DBService heartbeat IP address*** command to check whether the standby DBService server is reachable.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 7 Select the following nodes in the required cluster from the **Service**:

- DBService
- Controller
- NodeAgent

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.223 ALM-27004 Data Inconsistency Between Active and Standby DBServices

Description

The system checks the data synchronization status between the active and standby DBService every 10 seconds. This alarm is generated when the synchronization status cannot be queried for six consecutive times or when the synchronization status is abnormal.

This alarm is cleared when the synchronization status becomes normal.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 27004 | Critical | Yes |

Parameters

| Name | Meaning |
|-------------------------|---|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Local DBService HA Name | Specifies the HA name of the local DBService. |
| Peer DBService HA Name | Specifies the HA name of the peer DBService. |

| Name | Meaning |
|--------------|---|
| SYNC_PERCENT | Specifies the synchronization percentage. |

Impact on the System

When data is not synchronized between the active and standby DBServices, data may be lost or abnormal if the active instance becomes abnormal.

Possible Causes

- The network between the active and standby nodes is unstable.
- The standby DBService is abnormal.
- The standby node disk space is full.
- The CPU usage of the GaussDB process on the active DBService node is high. You need to locate the failure cause based on logs.

Procedure

Check whether the network between the active and standby nodes is normal.

- Step 1** On FusionInsight Manager, choose **Cluster > Services > DBService > Instance**, check the service IP address of the standby DBServer instance.
- Step 2** Log in to the active DBService node as user **root**.
- Step 3** Run the **ping Standby DBService heartbeat IP address** command to check whether the standby DBService node is reachable.
- If yes, go to **Step 6**.
 - If no, go to **Step 4**.
- Step 4** Contact the network administrator to check whether the network is faulty.
- If yes, go to **Step 5**.
 - If no, go to **Step 6**.
- Step 5** Rectify the network fault and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to **Step 6**.

Check whether the standby DBService is normal.

- Step 6** Log in to the standby DBService node as user **root**.
- Step 7** Run the **su - omm** command to switch to user **omm**.
- Step 8** Go to the **`\${DBSERVER_HOME}/sbin** directory and run the **./status-dbserver.sh** command to check whether the GaussDB resource status of the standby DBService is normal. In the command output, check whether the following information is displayed in the row where **ResName** is **gaussDB**:

For example:

10_10_10_231 gaussDB Standby_normal Normal Active_standby

- If yes, go to [Step 9](#).
- If no, go to [Step 16](#).

Check whether the standby node disk space is full. (Skip this check for versions later than MRS 3.1.2.)

Step 9 Log in to the standby DBService node as user **root**.

Step 10 Run the **su - omm** command to switch to user **omm**.

Step 11 Go to the **\${DBSERVER_HOME}** directory, and run the following commands to obtain the DBService data directory:

```
cd ${DBSERVER_HOME}
source .dbservice_profile
echo ${DBSERVICE_DATA_DIR}
```

Step 12 Run the **df -h** command to view the system disk partition usage information.

Step 13 Check whether the DBService data directory space is full.

- If yes, go to [Step 14](#).
- If no, go to [Step 16](#).

Step 14 Expand the disk capacity.

Step 15 After the disk capacity is expanded, wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 16](#).

Collect fault information.

Step 16 On the FusionInsight Manager portal, choose **O&M > Log > Download**.

Step 17 In the **Service** area, select **DBService** of the target cluster and **OS, OS Statistics, and OS Performance** under **OMS**, and click **OK**.

Step 18 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.224 ALM-27005 Database Connections Usage Exceeds the Threshold

Description

The system checks the usage of the number of database connections of the nodes where DBServer instances are located every 30 seconds and compares the usage with the threshold. If the usage exceeds the threshold for five consecutive times (this number is configurable, and 5 is the default value), the system generates this alarm. The default usage threshold is 90%, and you can configure it based on site requirements.

The trigger count is configurable. This alarm is cleared in the following scenarios:

- The trigger count is 1, and the usage of the number of database connections is less than or equal to the threshold.
- The trigger count is greater than 1, and the usage of the number of database connections is less than or equal to 90% of the threshold.

Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 27005 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|--|
| Source | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

Upper-layer services may fail to connect to the DBService database, affecting services.

Possible Causes

- Too many database connections are used.
- The maximum number of database connections is improperly configured.
- The alarm threshold or alarm trigger count is improperly configured.

Procedure

Checking whether too many data connections are used

- Step 1** On FusionInsight Manager, click DBService in the service list on the left navigation pane. The DBService monitoring page is displayed.
- Step 2** Observe the number of connections used by the database user, as shown in [Figure 10-74](#). Based on the service scenario, reduce the number of database user connections.

Figure 10-74 Number of connections used by database users

- Step 3** Wait for 2 minutes and check whether the alarm is automatically cleared.
- If it is, no further action is required.
 - If it is not, go to [Step 4](#).

Checking whether the maximum number of database connections is properly configured

- Step 4** Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService** > **Configurations**. On the displayed page, select the **All Configurations** tab, and increase the maximum number of database connections based on service requirements, as shown in [Figure 10-75](#). Click **Save**. In the displayed **Save configuration** dialog box, click **OK**.

Figure 10-75 Setting the maximum number of database connections

Step 5 After the maximum number of database connections is changed, restart DBService (do not restart the upper-layer services).

Procedure: Log in to FusionInsight Manager and choose **Cluster > Name of the desired cluster > Services > DBService**. On the displayed page, choose **More > Restart Service**. Enter the password of the current login user and click **OK**. Do not select **Restart upper-layer services**, click **OK**.

Step 6 After the service is restarted, wait for 2 minutes and check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 7**.

Checking whether the alarm threshold or trigger count is properly configured

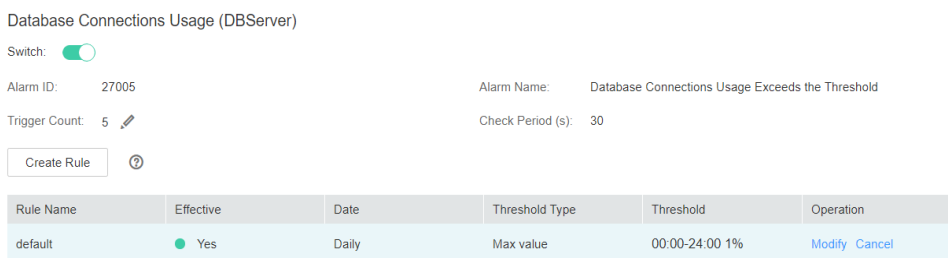

Step 7 Log in to FusionInsight Manager and change the alarm threshold and alarm trigger count based on the actual database connection usage.

Choose **O&M > Alarm > Thresholds > Name of the desired cluster > DBService > Database > Database Connections Usage (DBServer)**. In the **Database Connections Usage (DBServer)** area, click the pencil icon next to **Trigger Count**. In the displayed dialog box, change the trigger count, as shown in **Figure 10-76**.

NOTE

Trigger Count: If the usage of the number of database connections exceeds the threshold consecutively for more than the value of this parameter, an alarm is generated.

Figure 10-76 Setting alarm trigger count

Based on the actual database connection usage, choose **O&M > Alarm > Thresholds > Name of the desired cluster > DBService > Database > Database Connections Usage (DBServer)**. In the **Database Connections Usage (DBServer)** area, click **Modify** in the **Operation** column. In the **Modify Rule** dialog box, modify the required parameters and click **OK** as shown in **Figure 10-77**.

Figure 10-77 Set alarm threshold

Thresholds > **Modify Rule**

* Rule Name:

* Severity:

* Threshold Type: Max value Min value

* Date: Daily
 Weekly
 Other

| Thresholds: | Start and End Time | Threshold |
|-------------|---|---------------------------------|
| | <input type="text" value="00:00"/> - <input type="text" value="23:59"/> | <input type="text" value="90"/> |

Step 8 Wait for 2 minutes and check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 9**.

Collect fault information

Step 9 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 10 Select **DBService** in the required cluster from the **Service**.

Step 11 Specify the host for collecting logs by setting the **Host** parameter that is optional. By default, all hosts are selected.

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.225 ALM-27006 Disk Space Usage of the Data Directory Exceeds the Threshold

Description

The system checks the disk space usage of the data directory on the active DBServer node every 30 seconds and compares the disk usage with the threshold. The alarm is generated when the disk space usage exceeds the threshold for five consecutive times (the default value). The number of consecutive times is configurable. The disk space usage threshold of the data directory is set to 80% by default, which is configurable as well.

The value of **hit number** is configurable. When the value is set to **1** and the disk space usage is lower than or equal to the threshold, the alarm is cleared. When the value is greater than 1 and the disk space usage is lower than 90% of the threshold, the alarm is cleared.

Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 27006 | Major | Yes |

Parameters

| Name | Meaning |
|-------------------|---|
| ClusterName | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |
| PartitionName | Specifies the disk partition where the alarm is generated. |
| Trigger Condition | Specifies the threshold triggering the alarm. If the actual indicator value exceeds this threshold, the alarm is generated. |

Impact on the System

- Service processes become unavailable.
- When the disk space usage of the data directory exceeds 90%, the database reports the "Database Enters the Read-Only Mode" alarm and enters the read-only mode, which may cause service data loss.

Possible Causes

- The alarm threshold is improperly configured.
- The data volume of the database is too large or the disk configuration cannot meet service requirements, causing excessive disk usage.

Procedure

Check whether the threshold is set properly.

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Thresholds > Name of the desired cluster > DBService > Database > Disk Space Usage of the Data Directory** to check whether the alarm threshold is proper (the default value 80% is a proper value).

- If yes, go to [Step 3](#).
- If no, go to [Step 2](#).

Step 2 Change the alarm threshold based on the actual service situation.

Step 3 Choose **Cluster > Name of the desired cluster > Services > DBService**. On the **Dashboard** page, view the **Disk Space Usage of the Data Directory** chart and check whether the disk space usage of the data directory is lower than the threshold.

- If yes, go to [Step 4](#).
- If no, go to [Step 5](#).

Figure 10-78 Disk Space Usage of the Data Directory

Step 4 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check whether large files are incorrectly written into the disk.

- Step 5** Log in to the active DBService node as user **omm**.
- Step 6** Run the following commands to view the files whose size exceeds 500 MB in the data directory and check whether there are large files incorrectly written into the directory:
- ```
source $DBSERVER_HOME/.dbservice_profile
find "$DBSERVICE_DATA_DIR"/../ -type f -size +500M
```
- If yes, go to [Step 7](#).
  - If no, go to [Step 8](#).
- Step 7** Handle the large files based on the actual scenario and check whether the alarm is cleared 2 minutes later.
- If yes, no further action is required.
  - If no, go to [Step 8](#).
- Collect fault information.**
- Step 8** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 9** Expand the **Service** drop-down list, and select **DBService** for the target cluster.
- Step 10** Specify the host for collecting logs by setting the **Host** parameter which is optional. By default, all hosts are selected.
- Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 12** Contact the O&M personnel and send the collected logs.
- End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.226 ALM-27007 Database Enters the Read-Only Mode

## Description

The system checks the disk space usage of the data directory on the active DBServer node every 30 seconds. The alarm is generated when the disk space usage exceeds 90%.

The alarm is cleared when the disk space usage is lower than 80%.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
27007	Critical	Yes

## Parameters

Name	Meaning
ClusterName	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the actual indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

The database enters the read-only mode, causing service data loss.

## Possible Causes

The disk configuration cannot meet service requirements. The disk usage reaches the upper limit.

## Procedure

**Check whether the disk space usage reaches the upper limit.**

- Step 1** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService**.
- Step 2** On the **Dashboard** page, view the **Disk Space Usage of the Data Directory** chart and check whether the disk space usage of the data directory exceeds 90%.
  - If yes, go to **Step 3**.
  - If no, go to **Step 13**.
- Step 3** Log in to the active management node of the DBServer as user **omm** and run the following commands to check whether the database enters the read-only mode:

```
source $DBSERVER_HOME/.dbservice_profile
gsql -U omm -W password -d postgres -p 20051
show default_transaction_read_only;
```

 NOTE

In the preceding commands, *password* indicates the password of user **omm** of the DBService database (You can view the initial password of user omm in User [User Account List](#)). You can run the `\q` command to exit the database.

Check whether the value of **default\_transaction\_read\_only** is **on**.

```
POSTGRES=# show default_transaction_read_only;
default_transaction_read_only

on
(1 row)
```

- If yes, go to [Step 4](#).
- If no, go to [Step 13](#).

**Step 4** Run the following commands to open the **dbservice.properties** file:

```
source $DBSERVER_HOME/.dbservice_profile
```

```
vi ${DBSERVICE_SOFTWARE_DIR}/tools/dbservice.properties
```

**Step 5** Change the value of **gaussdb\_readonly\_auto** to **OFF**.

**Step 6** Run the following command to open the **postgresql.conf** file:

```
vi ${DBSERVICE_DATA_DIR}/postgresql.conf
```

**Step 7** Delete **default\_transaction\_read\_only = on**.

**Step 8** Run the following command for the configuration to take effect:

```
gs_ctl reload -D ${DBSERVICE_DATA_DIR}
```

**Step 9** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. On the right of the alarm "Database Enters the Read-Only Mode", click **Clear** in the **Operation** column. In the dialog box that is displayed, click **OK** to manually clear the alarm.

**Step 10** Log in to the active management node of the DBServer as user **omm** and run the following commands to view the files whose size exceeds 500 MB in the data directory and check whether there are large files incorrectly written into the directory:

```
source $DBSERVER_HOME/.dbservice_profile
```

```
find "$DBSERVICE_DATA_DIR"/../ -type f -size +500M
```

- If yes, go to [Step 11](#).
- If no, go to [Step 13](#).

**Step 11** Handle the files that are incorrectly written into the directory based on the actual scenario.

**Step 12** Log in to FusionInsight Manager and choose **Cluster > Name of the desired cluster > Services > DBService**. On the **Dashboard** page, view the **Disk Space Usage of the Data Directory** chart and check whether the disk space usage is lower than 80%.

- If yes, no further action is required.

- If no, go to [Step 13](#).

**Figure 10-79** Disk Space Usage of the Data Directory

**Collect fault information.**

- Step 13** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 14** Expand the **Service** drop-down list, and select **DBService** for the target cluster.
- Step 15** Specify the host for collecting logs by setting the **Host** parameter which is optional. By default, all hosts are selected.
- Step 16** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 17** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.227 ALM-29000 Impala Service Unavailable

## Alarm Description

The alarm module checks the Impala service status every 30 seconds. This alarm is generated if the Impala service is abnormal.

This alarm is cleared after the Impala service recovers.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29000	Critical	Yes

## Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

## Impact on the System

When the Impala service is abnormal, you cannot perform cluster operations on Impala through FusionInsight Manager. The Impala service functions are unavailable.

## Possible Causes

- The Hive service is abnormal.
- The KrbServer service is abnormal.
- The Impala process is abnormal.

## Handling Procedure

**Check whether the services on which Impala depends are normal.**

**Step 1** On FusionInsight Manager, choose **Cluster > Services** to check whether Hive and KrbServer are stopped.

- If yes, start the stopped services and go to [Step 2](#).
- If no, go to [Step 3](#).

**Step 2** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. In the alarm list, check whether the **Impala Service Unavailable** alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 3](#).

- Step 3** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. In the alarm list, check whether ALM-16004 Hive Service Unavailable and ALM-25500 KrbServer Service Unavailable exist.
- If yes, go to **Step 4**.
  - If no, go to **Step 5**.
- Step 4** Rectify the fault by following the handling procedure of **ALM-16004 Hive Service Unavailable** or **ALM-25500 KrbServer Service Unavailable**. Then, check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 5**.
- Check whether the Impala process is normal.**
- Step 5** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. Check whether ALM-12007 Process Fault exists in the alarm list.
- If yes, go to **Step 6**.
  - If no, go to **Step 7**.
- Step 6** Rectify the fault by referring to the handling method of **ALM-12007 Process Fault**, and then check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 7**.
- Collect the fault information.**
- Step 7** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 8** Expand the **Service** drop-down list, and select **Impala** for the target cluster.
- Step 9** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact O&M personnel and provide the collected logs.
- End

## Alarm Clearance

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

## Related Information

None

## 10.228 ALM-29004 Impalad Process Memory Usage Exceeds the Threshold

### Alarm Description

The system checks the memory usage of the Impalad process every 30 seconds. This alarm is generated when the system detects that the memory usage exceeds the default threshold (80%).

This alarm is automatically cleared when the system detects that the memory usage of the process falls below the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29004	Minor	Yes

### Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

The memory usage is too high. Some query tasks may fail due to insufficient memory.

### Possible Causes

The Impalad process is executing a large number of query tasks.

## Handling Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Thresholds > Impala > CPU and Memory > Impalad Process Memory Usage (Impalad)** and check the threshold.

**Step 2** If the alarm threshold is smaller than 80%, increase the alarm threshold as required and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 3](#).

**Step 3** If the threshold is greater than 80%, check whether a large number of concurrent query tasks exist when the alarm is generated. A large number of concurrent query tasks will cause the memory usage to increase sharply. After the tasks are complete, check whether the alarm is automatically cleared. During this period, some tasks may fail to be executed or may be canceled due to insufficient memory. In this case, try again.

### NOTE

If the memory usage always exceeds the threshold, the cluster capacity needs to be expanded.

- If yes, no further action is required.
- If no, go to [Step 4](#).

### Collect fault information.

**Step 4** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 5** Expand the **Service** drop-down list, and select **Impala** for the target cluster.

**Step 6** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 7** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

The alarm is automatically cleared after the burst concurrent tasks are complete.

## Related Information

None

## 10.229 ALM-29005 Number of JDBC Connections to Impalad Exceeds the Threshold

### Alarm Description

The system checks the number of client connections to the Impalad node every 30 seconds. This alarm is generated when the number of client connections exceeds the customized threshold (60 by default).

This alarm is automatically cleared when the number of client connections is less than the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29005	Major	Yes

### Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

New client connections may be blocked or even fail.

### Possible Causes

The number of client connections maintained by the Impalad service is too large or the threshold is too small.

## Handling Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Thresholds > Impala > Connections > Number of JDBC Connections to Impalad Process** to check the configured threshold.

Number of JDBC Connections to Impalad Process (Impalad)

Switch:

Alarm ID: 29005      Alarm Name: Number of JDBC Connections to Impalad Exceeds the Threshold

Trigger Count: 1      Check Period (s): 30

Create Rule

Rule Name	Effective	Date	Threshold Type	Threshold	Operation
default	<span style="color: green;">●</span> Yes	Daily	Max value	00:00-24:00 <b>60</b>	<a href="#">Modify</a> <a href="#">Cancel</a>

**Step 2** Check the number of JDBC applications connected to Impalad and stop idle applications. Check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 3** to change the number of concurrent client connections.

**Step 3** On FusionInsight Manager, choose **Cluster > Impala > Configurations > All Configurations > Impalad > Customization**. Add the customized parameter -- **fe\_service\_threads**. The default value of this parameter is **64**. Change the value as required and click **Save**.

Save Import Export

Basic Configurations All Configurations

- Impala
  - Customization
  - HDFSClient
  - OBS
  - Ranger
- StateStore
- Catalog
- Impalad
  - Customization**

**Step 5** After the restart is complete, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Collect fault information.**

**Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 7** Expand the **Service** drop-down list, and select **Impala** for the target cluster.

**Step 8** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

## Related Information

None

# 10.230 ALM-29006 Number of ODBC Connections to Impalad Exceeds the Threshold

## Alarm Description

The system checks the number of client connections to the Impalad node every 30 seconds. This alarm is generated when the number of client connections exceeds the customized threshold (60 by default).

This alarm is automatically cleared when the number of client connections is less than the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29006	Major	Yes

## Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

New client connections may be blocked or even fail.

## Possible Causes

The number of client connections maintained by the Impalad service is too large or the threshold is too small.

## Handling Procedure

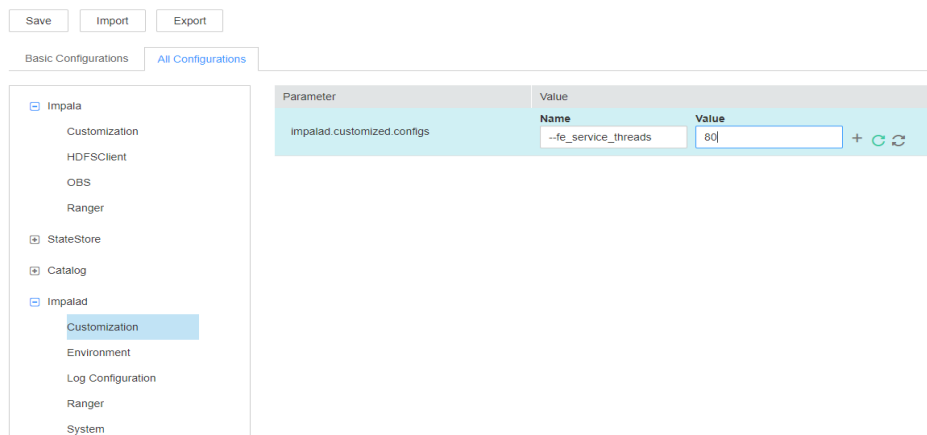

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Thresholds > Impala > Connections > Number of ODBC Connections to Impalad Process (Impalad)** to check the threshold.

- Step 2** Check the number of ODBC applications connected to Impalad and stop idle applications. Check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 3** to change the number of concurrent connections supported by Impalad.

- Step 3** On FusionInsight Manager, choose **Cluster > Impala > Configurations > All Configurations > Impalad > Customization**. Add the customized parameter -- **fe\_service\_threads**. The default value of this parameter is **64**. Change the value as required and click **Save**.

**Step 4** After the query tasks on all clients are complete, click the **Instance** tab. Select all Impalad instances, and restart them.

**NOTE**

The service will become unavailable when all instances are restarted. If a single instance is restarted, the tasks that are being executed on that instance will fail and the service will become available.

**Step 5** After the restart is complete, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

**Collect fault information.**

**Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

**Step 7** Expand the **Service** drop-down list, and select **Impala** for the target cluster.

**Step 8** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

**Alarm Clearance**

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

## Related Information

# 10.231 ALM-29007 Impalad Process Memory Usage Exceeds the Threshold

## Alarm Description

The system checks the memory usage of the Impalad process every 30 seconds. This alarm is generated when the system detects that the memory usage exceeds the default threshold (80%).

This alarm is automatically cleared when the system detects that the memory usage of the process falls below the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29007	Minor	Yes

## Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

The memory usage is too high. Some query tasks may fail due to insufficient memory.

## Possible Causes

The Impalad process is executing a large number of query tasks.

## Handling Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Thresholds > Impala > CPU and Memory > Impalad Process Memory Usage (Impalad)** and check the threshold.
- Step 2** If the alarm threshold is smaller than 80%, increase the alarm threshold as required and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 3](#).
- Step 3** If the threshold is greater than 80%, check whether a large number of concurrent query tasks exist when the alarm is generated. A large number of concurrent query tasks will cause the memory usage to increase sharply. After the tasks are complete, check whether the alarm is automatically cleared. During this period, some tasks may fail to be executed or may be canceled due to insufficient memory. In this case, try again.

### NOTE

If the memory usage always exceeds the threshold, the cluster capacity needs to be expanded.

- If yes, no further action is required.
- If no, go to [Step 4](#).

### Collect fault information.

- Step 4** On FusionInsight Manager of the active or standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 5** Expand the **Service** drop-down list, and select **Impala** for the target cluster.
- Step 6** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 7** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

The alarm is automatically cleared after the burst concurrent tasks are complete.

## Related Information

None

## 10.232 ALM-29008 Number of ODBC Connections to Impalad Exceeds the Threshold

### Alarm Description

The system checks the number of client connections to the Impalad node every 30 seconds. This alarm is generated when the number of client connections exceeds the customized threshold (60 by default).

This alarm is automatically cleared when the number of client connections is less than the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29008	Major	Yes

### Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

New client connections may be blocked or even fail.

### Possible Causes

The number of client connections maintained by the Impalad service is too large or the threshold is too small.

## Handling Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Thresholds > Impala > Connections > Number of ODBC Connections to Impalad Process (Impalad)** to check the threshold.
- Step 2** Check the number of ODBC applications connected to Impalad and stop idle applications. Check whether the alarm is automatically cleared.
- If yes, no further action is required.
  - If no, go to **Step 3** to change the number of concurrent connections supported by Impalad.
- Step 3** On FusionInsight Manager, choose **Cluster > Impala > Configurations > All Configurations > Impalad > Customization**. Add the custom parameter **--fe\_service\_threads**. The default value of this parameter is **64**. Change the value as required and click **Save**.
- Step 4** After the query tasks on all clients are complete, click the **Instances** tab. Select all Impalad instances, and restart them.

### NOTE

The service will become unavailable when all instances are restarted. If a single instance is restarted, the tasks that are being executed on that instance will fail and the service will become available.

- Step 5** After the restart is complete, check whether the alarm is cleared.
- If yes, no further action is required.
  - If yes, go to **Step 6**.

### Collect fault information.

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Impala** for the target cluster.
- Step 8** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

## 10.233 ALM-29010 Number of Queries Being Submitted by Impalad Exceeds the Threshold

### Alarm Description

The system checks the total number of queries being submitted by the Impalad node every 60 seconds. This alarm is generated when the number of queries exceeds the customized threshold (150 by default).

This alarm is automatically cleared when the number of queries is less than the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29010	Major	Yes

### Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

The queries may be blocked or even fail.

### Possible Causes

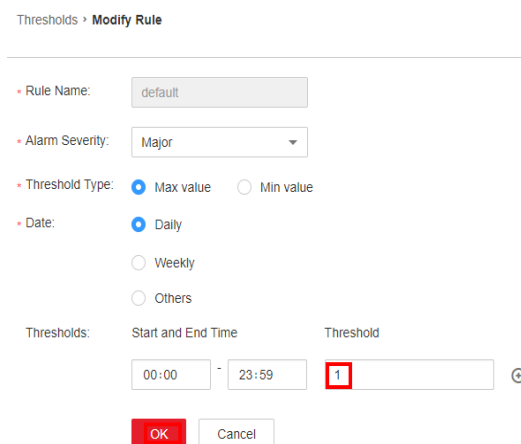

The Impalad service has maintained a large number of queries, or the threshold is too small.

## Handling Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Thresholds > Impala > Query Task Sum Statistics > Total number of Queries Being Submitted (Impalad)** and check the threshold.

**Step 2** Change the threshold.

**Step 3** Click the **Instances** tab, select all Impalad instances, and restart them.

### NOTE

The service will become unavailable when all instances are restarted. If a single instance is restarted, the tasks that are being executed on that instance will fail and the service will become available.

**Step 4** After the restart is complete, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

### Collect fault information.

**Step 5** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 6** Expand the **Service** drop-down list, and select **Impala** for the target cluster.

**Step 7** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 8** Contact O&M personnel and provide the collected logs.

**Alarm Clearance**

This alarm is automatically cleared after the fault is rectified.

**Related Information**

None

**10.236 ALM-29013 Impalad FGC Time Exceeds the Threshold**

**Alarm Description**

The system checks the FGC time of the Impalad service every 60 seconds. This alarm is generated when the FGC time exceeds the threshold (12 seconds) for five consecutive times. This alarm is cleared when the FGC time is less than or equal to the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29013	Major	Yes

## Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

Data read and write are affected.

## Possible Causes

The memory of the node instance is overused or the heap memory is inappropriately allocated, causing frequent occurrence of the GC process.

## Handling Procedure

Check the GC time.

**Step 1** Choose **O&M > Alarm > Thresholds > Impala > Process FGCT > Process FGCT of Impalad (Impalad)**, and check the threshold (12s by default).

**Step 2** Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, and check whether the alarm whose **Alarm ID** is **29013** exists in the alarm list.

- If yes, go to [3](#).
- If no, no further action is required.

- Step 3** On FusionInsight Manager, choose **Cluster > Impala**, click the **Instances** tab, select the Impalad instance for which the alarm is generated, then click the **Chart** tab, locate the **Process FGCT** chart, and check whether the FGC time is greater than the threshold in **1**.
- If yes, go to **4**.
  - If no, go to **Step 5**.
- Step 4** Choose **O&M > Alarm > Thresholds > Impala > Process FGCT > Process FGCT of Impalad (Impalad)**, and change the threshold to a value less than the time obtained in **3**. Then, check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 5**.
- Collect fault information.**
- Step 5** On FusionInsight Manager of the active or standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 6** Expand the **Service** drop-down list, and select **Impala** for the target cluster.
- Step 7** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 8** Contact O&M personnel and provide the collected logs.

# 10.237 ALM-29014 Catalog FGC Time Exceeds the Threshold

## Alarm Description

The system checks the FGC time of the Catalog service every 60 seconds. This alarm is generated when the FGC time exceeds the threshold (12 seconds) for five consecutive times. This alarm is cleared when the FGC time is less than or equal to the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29014	Major	Yes

## Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

Data read and write are affected.

## Possible Causes

The memory of the node instance is overused or the heap memory is inappropriately allocated, causing frequent occurrence of the GC process.

## Handling Procedure

Check the GC time.

- Step 1** Choose **O&M > Alarm > Thresholds**, click the name of the desired cluster, choose **Impala > Process FGCT > Process FGCT of Catalog (Catalog)**, and check the threshold (12s by default).

- Step 2** Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, and check whether the alarm whose **Alarm ID** is **29014** exists in the alarm list.

- If yes, go to **3**.
- If no, no further action is required.

- Step 3** On FusionInsight Manager, choose **Cluster > Impala**, click the **Instance** tab, select the Catalog instance for which the alarm is generated, then click the **Chart** tab, locate the **Process FGCT** chart, and check whether the FGC time is greater than the threshold in **1**.

- If yes, go to **4**.

- If no, go to [5](#).

**Step 4** Choose **O&M > Alarm > Thresholds**, click the name of the desired cluster, choose **Impala > Process FGCT > Process FGCT of Catalog (Catalog)**, and change the threshold to a value less than the time obtained in [3](#). Then, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [5](#).

**Collect fault information.**

**Step 5** On FusionInsight Manager of the active or standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 6** Expand the **Service** drop-down list, and select **Impala** for the target cluster.

**Step 7** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 8** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 10.238 ALM-29015 Catalog Process Memory Usage Exceeds the Threshold

## Alarm Description

The system checks the memory usage of the Catalog process every 30 seconds. This alarm is generated when the system detects that the memory usage exceeds the default threshold (80%).

This alarm is automatically cleared when the system detects that the memory usage of the process falls below the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29015	Major	Yes

## Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

The memory usage is too high. Some query tasks may fail due to insufficient memory.

## Possible Causes

The memory of the node instance is overused or the memory is inappropriately configured.

## Handling Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Thresholds > Impala > CPU and Memory > Catalog Process Memory Usage (Impalad)** and check the threshold.
- Step 2** If the alarm threshold is smaller than 80%, increase the alarm threshold as required and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 3](#).
- Step 3** If the threshold is greater than 80%, check whether a large number of concurrent query tasks exist when the alarm is generated. A large number of concurrent query tasks will cause the memory usage to increase sharply. After the tasks are complete, check whether the alarm is automatically cleared. During this period, some tasks may fail to be executed or may be canceled due to insufficient memory. In this case, try again.

### NOTE

If the memory usage always exceeds the threshold, the cluster capacity needs to be expanded.

- If yes, no further action is required.

- If no, go to [Step 4](#).

**Collect fault information.**

- Step 4** On FusionInsight Manager of the active or standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 5** Expand the **Service** drop-down list, and select **Impala** for the target cluster.
- Step 6** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 7** Contact O&M personnel and provide the collected logs.

# 10.239 ALM-29016 Impalad Instance in the Sub-healthy State

## Alarm Description

In MRS 3.1.5, the system checks every 60 seconds whether the Hive Server2 HTTP port (28000) of Impalad responds to cURL requests. This alarm is generated when the returned result has been incorrect for 20 seconds in two consecutive times. This alarm is cleared when the system correctly responds within 20 seconds.

In other MRS versions, the system checks every 60 seconds whether Impalad can execute **select 1**. This alarm is generated when the returned result has been incorrect for 20 seconds in two consecutive times. This alarm is cleared when the SQL statement is correctly executed within 20 seconds.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29016	Minor	Yes

## Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

## Impact on the System

Impalad cannot execute SQL statements or SQL statement execution times out, which affects data read and write.

## Possible Causes

The Impalad service maintains too many queries.

## Handling Procedure

- Step 1** Log in to FusionInsight Manager and choose **Cluster > Services > Impala > Impalad Web UI**. On the displayed page, click any node to go to the web UI.
- Step 2** On the web UI, click **/backends** to view the Impala instance list. Locate the instance for which the alarm is generated and click **Web UI**. After the web UI of the subhealthy node is displayed, click **/queries** to check the task execution status and check whether any task is executed slowly.
  - If yes, go to **Step 3**.
  - If no, go to **Step 4**.
- Step 3** After the task is complete, check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 4**.
- Step 4** On FusionInsight Manager, choose **Cluster > Services > Impala > Instances**, select the Impala instance for which the alarm is generated, click **More**, and select **Restart Instance**. Then, check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 5**.

### NOTE

The service will become unavailable when all instances are restarted. If a single instance is restarted, the tasks that are being executed on that instance will fail and the service will become available.

**Collect fault information.**

- Step 5** On FusionInsight Manager of the active or standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 6** Expand the **Service** drop-down list, and select **Impala** for the target cluster.
- Step 7** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 8** Contact O&M personnel and provide the collected logs.

----End

**Alarm Clearance**

This alarm is automatically cleared after the fault is rectified.

**10.240 ALM-29100 Kudu Service Unavailable**

**Alarm Description**

The system checks the Kudu service status every 60 seconds. This alarm is generated when the system detects that all Kudu instances are abnormal and considers that the Kudu service is unavailable.

This alarm is cleared when at least one Kudu instance becomes normal and the system considers that the Kudu instance service is restored.

**Alarm Attributes**

Alarm ID	Alarm Severity	Auto Cleared
29100	Critical	Yes

**Alarm Parameters**

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.

Type	Parameter	Description
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

## Impact on the System

Users cannot use the Kudu service.

## Possible Causes

Some Kudu instances are abnormal.

## Handling Procedure

**Handle the Kudu instance exceptions.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the displayed page, locate the alarm ALM-29100 Kudu Service Unavailable.
- Step 2** In the **Location Information** column, record the host name and role name.
- Step 3** Choose **Cluster > Services > Kudu > Instances**. Click the role name for the host name obtained in [Step 2](#), view the instance logs, and restore the instance. Then, check whether the alarm is cleared.
- If yes, go to [Step 4](#).
  - If no, go to [Step 5](#).
- Step 4** Choose **O&M > Alarm > Alarms** and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 5](#).

**Collect the fault information.**

- Step 5** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 6** Expand the **Service** drop-down list, and select **Kudu** for the target cluster.
- Step 7** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 8** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

## Related Information

# 10.241 ALM-29104 Tserver Process Memory Usage Exceeds the Threshold

## Alarm Description

The system checks the memory usage of the Kudu Tserver process every 60 seconds. This alarm is generated when the system detects that the memory usage of the Kudu Tserver process exceeds the threshold.

This alarm is cleared when the memory usage of the Tserver process becomes normal and the system considers that the Kudu instance service recovers.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29104	Critical	Yes

## Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

Users cannot use the Kudu service.

## Possible Causes

The memory usage of a KuduTserver instance is too high.

## Handling Procedure

### Handle the Kudu instance exceptions.

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the displayed page, locate alarm **ALM-29104 Tserver Process Memory Usage Exceeds the Threshold** and view the alarm source.
- Step 2** Choose **O&M > Alarm > Thresholds > Kudu**. Locate the threshold of this alarm and check whether the Kudu instance memory usage exceeds the threshold. If yes, rectify the fault or change the threshold.
- Step 3** Choose **O&M > Alarm** and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [4](#).

### Collect fault information.

- Step 4** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 5** Expand the **Service** drop-down list, and select **Kudu** for the target cluster.
- Step 6** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 7** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

None

# 10.242 ALM-29106 Tserver Process CPU Usage Exceeds the Threshold

## Alarm Description

The system checks the Kudu service status every 60 seconds. This alarm is generated when the system detects that the CPU usage of the Kudu Tserver process is too high.

This alarm is cleared when the CPU usage of the Tserver process becomes normal and the system considers that the Kudu instance service recovers.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29106	Critical	Yes

## Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

Users cannot use the Kudu service.

## Possible Causes

The CPU usage of a KuduTserver instance is too high.

## Handling Procedure

**Handle the Kudu instance exceptions.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the displayed page, locate alarm **ALM-29106 Tserver Process CPU Usage Exceeds the Threshold** and view the alarm source.
- Step 2** Choose **O&M > Alarm > Thresholds > Kudu**. Locate the alarm threshold and check whether the CPU usage of the cluster Kudu instance exceeds the threshold. If yes, rectify the fault or change the threshold.
- Step 3** Choose **O&M > Alarm** and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [4](#).

**Collect fault information.**

- Step 4** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 5** Expand the **Service** drop-down list, and select **Kudu** for the target cluster.
- Step 6** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 7** Contact O&M personnel and provide the collected logs.
- End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 10.243 ALM-29107 Tserver Process Memory Usage Exceeds the Threshold

## Alarm Description

The system checks the Kudu service status every 60 seconds. This alarm is generated when the memory usage of the Kudu Tserver process exceeds the threshold.

This alarm is cleared when the memory usage of the Tserver process becomes normal and the system considers that the Kudu instance service recovers.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29107	Critical	Yes

## Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.

Type	Parameter	Description
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

Users cannot use the Kudu service.

## Possible Causes

The memory usage of the KuduTserver instance is too high.

## Handling Procedure

**Handle the Kudu instance exceptions.**

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the displayed page, locate alarm **ALM-29107 Tserver Process Memory Usage Exceeds the Threshold** and view the alarm source.

**Step 2** Choose **O&M > Alarm > Thresholds > Kudu**. Locate the alarm threshold, compare the memory usage of the KuduTserver instance in the cluster with the threshold, and find the node whose memory usage exceeds the threshold.

Add nodes or reschedule jobs to reduce the memory usage of the Tserver node or change the threshold.

**Step 3** Choose **O&M > Alarm** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [4](#).

**Collect fault information.**

**Step 4** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 5** Expand the **Service** drop-down list, and select **Kudu** for the target cluster.

**Step 6** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 7** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 10.244 ALM-38000 Kafka Service Unavailable

## Description

The system checks the Kafka service status every 30 seconds. This alarm is generated when the Kafka service is unavailable.

This alarm is cleared when the Kafka service recovers.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38000	Critical	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

The cluster cannot provide the Kafka service, and users cannot perform new Kafka tasks.

## Possible Causes

- The KrbServer service is abnormal.(Skip this step if the normal mode is used.)
- The ZooKeeper service is abnormal or does not respond.
- The Broker instance in the Kafka cluster are abnormal.

## Procedure

**Check the status of the KrbServer service. (Skip this step if the normal mode is used.)**

- Step 1** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **KrbServer**.
- Step 2** Check whether the running status of the KrbServer service is **Normal**.
- If yes, go to **Step 5**.
  - If no, go to **Step 3**.
- Step 3** Rectify the fault by following the steps provided in **ALM-25500 KrbServer Service Unavailable**.
- Step 4** Perform **Step 2** again.
- Check the status of the ZooKeeper cluster.**
- Step 5** Check whether the running status of the ZooKeeper service is **Normal**.
- If yes, go to **Step 8**.
  - If no, go to **Step 6**.
- Step 6** If ZooKeeper service is stopped, start it, else rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**.
- Step 7** Perform **Step 5** again.
- Check the Broker status.**
- Step 8** Choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance** to go to the Kafka instances page.
- Step 9** Check whether all instances in **Roles** are running properly.
- If yes, go to **Step 11**.
  - If no, go to **Step 10**.
- Step 10** Select all Broker instances, choose **More** > **Restart Instance**, and check whether the instances restart successfully.
- If yes, go to **Step 11**.
  - If no, go to **Step 13**.
- Step 11** Choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** to check whether the running status is **Normal**.
- If yes, go to **Step 12**.
  - If no, go to **Step 13**.
- Step 12** Wait for 30 seconds and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 13**.
- Collecting Fault Information**
- Step 13** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.
- Step 14** Select **Kafka** in the required cluster from the **Service** drop-down list.
- Step 15** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 16** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.245 ALM-38001 Insufficient Kafka Disk Capacity

## Description

The system checks the Kafka disk usage every 60 seconds and compares the actual disk usage with the threshold. The disk usage has a default threshold. This alarm is generated when the disk usage is greater than the threshold.

You can change the threshold in **O&M > Alarm > Thresholds**. Under the service list, choose **Kafka > Disk > Broker Disk Usage (Broker)** and change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the Kafka disk usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the Kafka disk usage is less than or equal to 90% of the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38001	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
PartitionName	Specifies the disk partition where the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

Kafka data write operations are affected.

## Possible Causes

- The configuration (such as number and size) of the disks for storing Kafka data cannot meet the requirement of the current service traffic, due to which the disk usage reaches the upper limit.
- Data retention time is too long, due to which the data disk usage reaches the upper limit.
- The service plan does not distribute data evenly, due to which the usage of some disks reaches the upper limit.

## Procedure

### Check the disk configuration of Kafka data.

**Step 1** On the FusionInsight Manager portal and click **O&M > Alarm > Alarms**.

**Step 2** In the alarm list, locate the alarm and obtain **HostName** from **Location**.

**Step 3** Click **Cluster > Name of the desired cluster > Hosts**.

**Step 4** In the host list, click the host name obtained in [Step 2](#).

**Step 5** Check whether the **Disk** area contains the partition name in the alarm.

- If yes, go to [Step 6](#).
- If no, manually clear the alarm and no further operation is required.

**Step 6** Check whether the disk partition usage contained in the alarm reaches 100% in the **Disk** area.

- If yes, handle the alarm by following the instructions in [Related Information](#).
- If no, go to [Step 7](#).

### Check the Kafka data storage duration.

**Step 7** Choose **Cluster > Name of the desired cluster > Services > Kafka > Configurations**.

**Step 8** Check whether the value of parameter **disk.adapter.enable** is set to **true**.

- If yes, go to [Step 10](#).

- If no, go to [Step 9](#).

**Step 9** Set the value of `disk.adapter.enable` to `true`. Check whether the value of `adapter.topic.min.retention.hours` is properly set.

- If yes, go to [Step 10](#).
- If no, adjust the data retention period based on service requirements.

#### NOTICE

If the disk auto-adaptation function is enabled, some historical data of specified topics is deleted. If the retention period of some topics cannot be adjusted, click **All Configurations** and add the topics to the value of the `disk.adapter.topic.blacklist` parameter.

**Step 10** Wait 10 minutes and check whether the usage of faulty disks reduces.

- If yes, wait until the alarm is cleared.
- If no, go to [Step 11](#).

**Check the Kafka data plan.**

**Step 11** In the **Instance** area, click **Broker**. In the **Real Time** area of Broker, Click the drop-down menu in the Chart area and choose **Customize** to customize monitoring items.

**Step 12** In the dialog box, select **Disk > Broker Disk Usage** and click **OK**.

The Kafka disk usage information is displayed.

**Figure 10-80** Broker Disk Usage

#### Customize Statistics

Traffic		
Disk (1)		
Request		
Process (1)		

OK
Cancel

- Step 13** View the information in [Step 12](#) to check whether there is only the disk parathion for which the alarm is generated in [Step 2](#).
- If yes, go to [Step 14](#).
  - If no, go to [Step 15](#).
- Step 14** Perform disk planning and mount a new disk again. Go to the **Instance Configurations** page of the node for which the alarm is generated, modify **log.dirs**, add other disk directories, and restart the Kafka instance.
- Step 15** Determine whether to shorten the data retention time configured on Kafka based on service requirements and service traffic.
- If yes, go to [Step 16](#).
  - If no, go to [Step 17](#).
- Step 16** Log in to FusionInsight Manager, select **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations**, and click **All Configurations**. In the search box on the right, enter **log.retention.hours**. The value of the parameter indicates the default data retention time of the topic. You can change the value to a smaller one.

 **NOTE**

- For a topic whose data retention time is configured alone, the modification of the data retention time on the Kafka Service Configuration page does not take effect.
- To modify the data retention time for a topic, use the Kafka client command-line interface (CLI) to configure the topic.

Example: `kafka-topics.sh --zookeeper "ZooKeeper IP address:2181/kafka" --alter --topic "Topic name" --config retention.ms= "retention time"`

- Step 17** Check whether the usage of some disks reaches the upper limit due to unreasonable configuration of the partitions of some topics. For example, the number of partitions configured for a topic with large data volume is smaller than the number of disks. In this case, the data is not evenly allocated to disks.

 **NOTE**

If you do not know which topics have a large amount of service data, perform the following steps:

1. Log in to an instance node based on the host node information obtained in [Step 2](#).
2. Go to the data directory (directory specified by **log.dirs** before the modification in [Step 14](#)).
3. Run the following command to check whether there is topic with partition that use large disk space.

```
du -h --max-depth=1 ./
```

- If yes, go to [Step 18](#).
- If no, go to [Step 19](#).

- Step 18** In the Kafka client CLI, run the following command to perform partition capacity expansion for the topic:

```
kafka-topics.sh --zookeeper "ZooKeeper IP address:2181/kafka" --alter --topic "Topic name" --partitions="New number of partitions"
```

 NOTE

- You are advised to set the new number of partitions to a multiple of the number of Kafka data disks.
- The step may not quickly clear the alarm, and you need to modify the data retention time in [Step 11](#) to gradually balance data allocation.

**Step 19** Determine whether to perform capacity expansion.

 NOTE

You are advised to perform capacity expansion for Kafka when the current disk usage exceeds 80%.

- If yes, go to [Step 20](#).
- If no, go to [Step 21](#).

**Step 20** Expand the disk capacity and check whether the alarm is cleared after capacity expansion.

- If yes, no further action is required.
- If no, go to [Step 22](#).

**Step 21** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 22](#).

**Collect fault information.**

**Step 22** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 23** Select **Kafka** in the required cluster from the **Service** drop-down list.

**Step 24** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 25** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

**Step 1** Log in to FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > Kafka > Instance**, stop the Broker instance whose status is **Restoring**, record the management IP address of the node where the Broker instance is located, and record **broker.id**. The value can be obtained by using the following method: Click the role name. On the **Configurations** page, select **All Configurations**, and search for the **broker.id** parameter.

**Step 2** Log in to the recorded management IP address as user **root**, and run the **df -lh** command to view the mounted directory whose disk usage is 100%, for example, **/\${BIGDATA\_DATA\_HOME}/kafka/data1**.

- Step 3** Go to the directory, run the **du -sh \*** command to view the size of each file in the directory, check whether files other than **kafka-logs** exist, and determine whether these files can be deleted or migrated.
- If yes, go to **Step 8**.
  - If no, go to **Step 4**.
- Step 4** Go to the **kafka-logs** directory, run the **du -sh \*** command, select a partition folder to be moved. The naming rule is **Topic name-Partition ID**. Record the topic and partition.
- Step 5** Modify the **recovery-point-offset-checkpoint** and **replication-offset-checkpoint** files in the **kafka-logs** directory in the same way.
1. Decrease the number in the second line in the file. (To remove multiple directories, the number deducted is equal to the number of files to be removed.)
  2. Delete the line of the to-be-removed partition. (The line structure is "Topic name Partition ID Offset". Save the data before deletion. Subsequently, the content must be added to the file of the same name in the destination directory.)
- Step 6** Modify the **recovery-point-offset-checkpoint** and **replication-offset-checkpoint** files in the destination data directory. For example, **`\${BIGDATA\_DATA\_HOME}/kafka/data2/kafka-logs** in the same way.
- Increase the number in the second line in the file. (To move multiple directories, the number added is equal to the number of files to be moved.)
  - Add the to-be moved partition to the end of the file. (The line structure is "Topic name Partition ID Offset". You can copy the line data saved in **Step 5**.)
- Step 7** Move the partition to the destination directory. After the partition is moved, run the **chown omm:wheel -R Partition directory** command to modify the directory owner group for the partition.
- Step 8** Log in to FusionInsight Manager and choose **Cluster > Name of the desired cluster > Services > Kafka > Instance** to start the Broker instance.
- Step 9** Wait for 5 to 10 minutes and check whether the health status of the Broker instance is **Normal**.
- If yes, resolve the disk capacity insufficiency problem according to the handling method of "ALM-38001 Insufficient Kafka Disk Space" after the alarm is cleared.
  - If no, contact the O&M personnel.
- End

## 10.246 ALM-38002 Kafka Heap Memory Usage Exceeds the Threshold

### Description

The system checks the Kafka service status every 30 seconds. The alarm is generated when the heap memory usage of a Kafka instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the heap memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the heap memory usage is less than or equal to 90% of the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38002	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

If the available Kafka heap memory is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The heap memory of the Kafka instance is overused or the heap memory is inappropriately allocated.

## Procedure

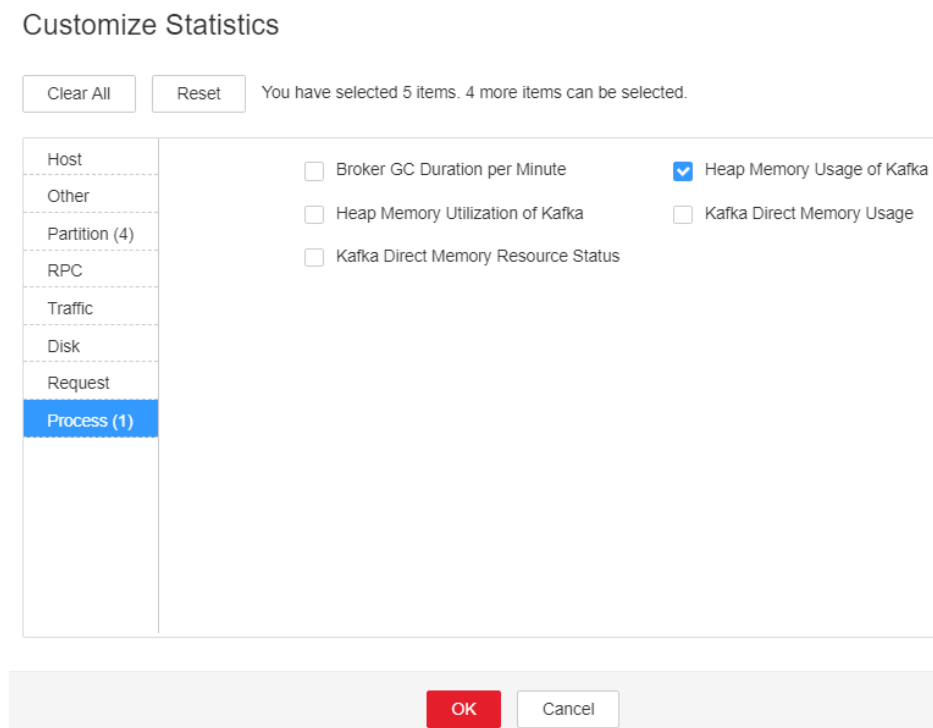

**Check heap memory usage.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Kafka Heap Memory Usage Exceeds the Threshold > Location**. Check the host name of the instance involved in this alarm.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Kafka > Instance**. Click the instance for which the alarm is

generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area, choose **Customize > Process > Heap Memory Usage of Kafka**, and click **OK**.

**Figure 10-81** Heap Memory Usage of Kafka

**Step 3** Check whether the used heap memory of Kafka reaches 95% of the maximum heap memory specified for Kafka.

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

**Check the heap memory size configured for Kafka.**

**Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Kafka > Configurations > All Configurations > Broker(Role) > Environment**. Increase the value of **KAFKA\_HEAP\_OPTS** by referring to the Note.

**Figure 10-82** KAFKA\_HEAP\_OPTS

Parameter	Value
KAFKA_HEAP_OPTS	-Xmx6G -Xms6G

**NOTE**

- It is recommended that **-Xmx** and **-Xms** be set to the same value.
- You are advised to view **Heap Memory Usage of Kafka** by referring to [Step 2](#), and set the value of **KAFKA\_HEAP\_OPTS** to twice the value of **Heap Memory Used by Kafka**.

**Step 5** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Collect fault information.**

**Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 7** Select **Kafka** in the required cluster from the **Service** drop-down list.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.247 ALM-38004 Kafka Direct Memory Usage Exceeds the Threshold

## Description

The system checks the direct memory usage of the Kafka service every 30 seconds. This alarm is generated when the direct memory usage of a Kafka instance exceeds the threshold (80% of the maximum memory) for 10 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the direct memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the direct memory usage is less than or equal to 90% of the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38004	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

If the available direct memory of the Kafka service is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The direct memory of the Kafka instance is overused or the direct memory is inappropriately allocated.

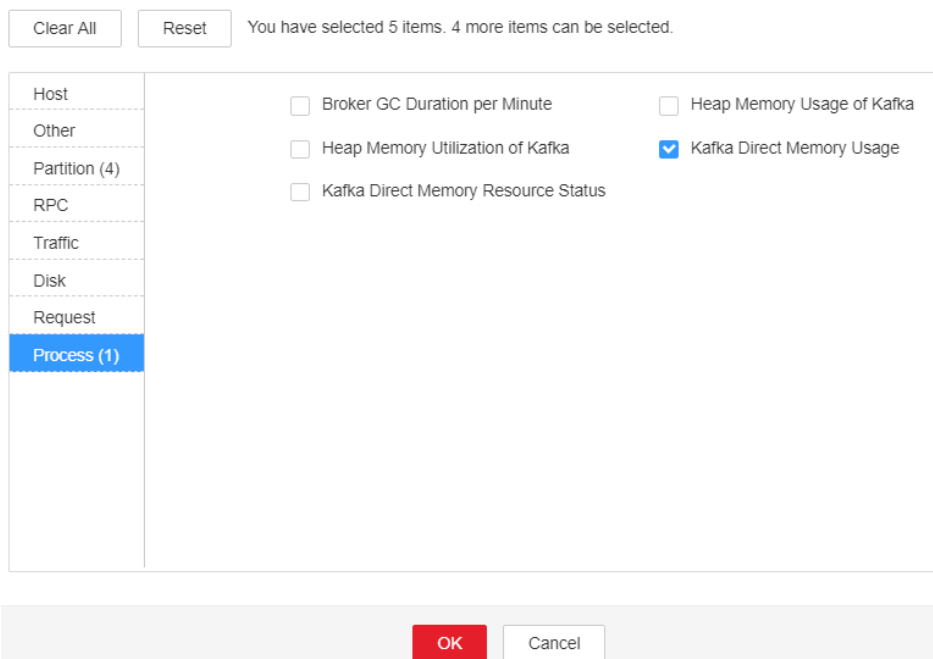

## Procedure

**Check the direct memory usage.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Kafka Direct Memory Usage Exceeds the Threshold > Location** to check the host name of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Kafka > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the Chart area and choose **Customize > Process > Kafka Direct Memory Usage**, and click **OK**.

**Figure 10-83** Kafka Direct Memory Usage

Customize Statistics

**Step 3** Check whether the used direct memory of Kafka reaches 80% of the maximum direct memory specified for Kafka.

- If yes, go to [Step 4](#).
- If no, go to [Step 7](#).

**Check the direct memory size configured for the Kafka.**

**Step 4** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations** > **Broker(Role)** > **Environment** to increase the value of **-Xmx** configured in the **KAFKA\_HEAP\_OPTS** parameter by referring to the Note.

**NOTE**

- It is recommended that **-Xmx** and **-Xms** be set to the same value.
- You are advised to view **Kafka Direct Memory Usage** by referring to [Step 2](#), and set the value of **KAFKA\_HEAP\_OPTS** to twice the value of **Direct Memory Used by Kafka**.

**Step 5** Save the configuration and restart the Kafka service.

**Step 6** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

**Step 8** Select **Kafka** in the required cluster from the **Service** drop-down list.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.248 ALM-38005 GC Duration of the Broker Process Exceeds the Threshold

## Description

The system checks the garbage collection (GC) duration of the Broker process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default) for 3 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the GC duration is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the GC duration is less than or equal to 90% of the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38005	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

A long GC duration of the Broker process may interrupt the services.

## Possible Causes

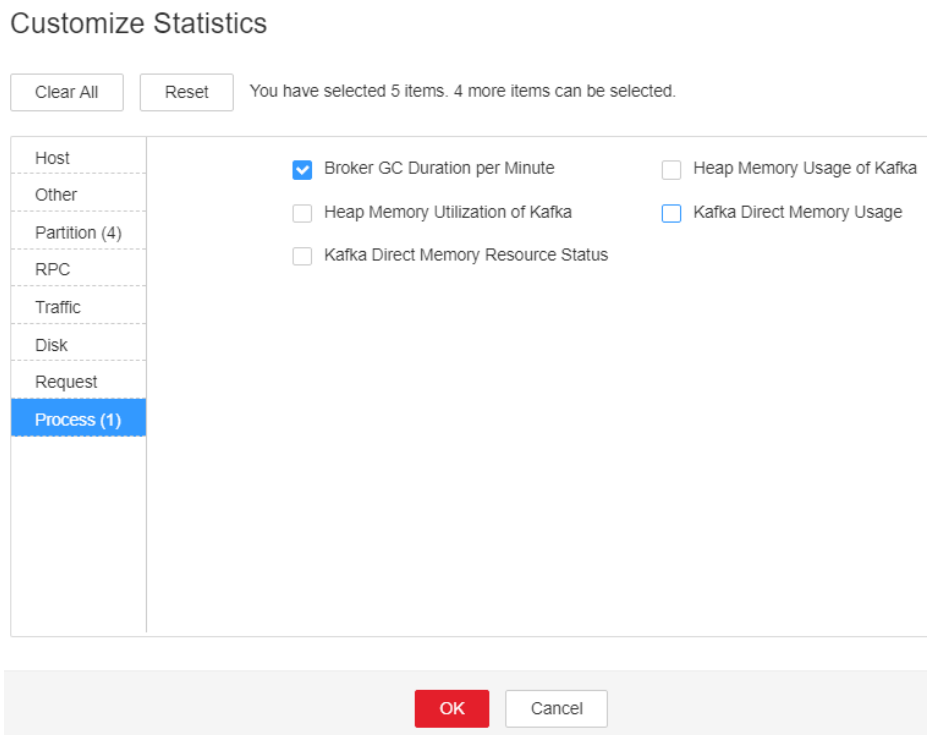

The Kafka GC duration of the node is too long or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

## Procedure

### Check the GC duration.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > GC Duration of the Broker Process Exceeds the Threshold > Location**. Check the host name of the instance involved in this alarm.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > *Name of the desired cluster* > Services > Kafka > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area, choose **Customize > Process > Broker GC Duration per Minute**, and click **OK**.

**Figure 10-84** Broker GC Duration per Minute

**Step 3** Check whether the GC duration of the Broker process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to [Step 4](#).
- If no, go to [Step 7](#).

**Check the direct memory size configured for the Kafka.**

**Step 4** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations** > **Broker(Role)** > **Environment** to increase the value of **-Xmx** configured in the **KAFKA\_HEAP\_OPTS** parameter by referring to the Note.

**NOTE**

- It is recommended that **-Xmx** and **-Xms** be set to the same value.
- You are advised to set the value of **KAFKA\_HEAP\_OPTS** to twice the value of **Direct Memory Used by Kafka**.

On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **Process** > **Kafka Direct Memory Resource Status** to check the value of **Direct Memory Used by Kafka**.

**Step 5** Save the configuration and restart the Kafka service.

**Step 6** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

- Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 8** Select **Kafka** in the required cluster from the **Service** drop-down list.
- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact the O&M personnel and send the collected logs.
- End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.249 ALM-38006 Percentage of Kafka Partitions That Are Not Completely Synchronized Exceeds the Threshold

## Description

The system checks the percentage of Kafka partitions that are not completely synchronized to the total number of partitions every 60 seconds. This alarm is generated when the percentage exceeds the threshold (50% by default) for 3 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the percentage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the percentage is less than or equal to 90% of the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38006	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

Too many Kafka partitions that are not completely synchronized affect service reliability. In addition, data may be lost when leaders are switched.

## Possible Causes

Some nodes where the Broker instance resides are abnormal or stop running. As a result, replicas of some partitions in Kafka are out of the in-sync replicas (ISR) set.

## Procedure

### Check Broker instances.

- Step 1** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. The Kafka instances page is displayed.
- Step 2** Check whether faulty nodes exist among all Broker nodes.
- If yes, record the host name of the node and go to [Step 3](#).
  - If no, go to [Step 5](#).
- Step 3** On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms** to check whether the fault described in [Step 2](#) exists in the alarm information and handle the alarm based on corresponding methods.
- Step 4** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. The Kafka instances page is displayed.
- Step 5** Check whether stopped nodes exist among all Broker instance.
- If yes, go to [Step 6](#).
  - If no, go to [Step 7](#).
- Step 6** Select all stopped Broker instances and click **Start Instance**.
- Step 7** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 8](#).

### Collect fault information.

- Step 8** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 9** Select **Kafka** in the required cluster from the **Service** drop-down list.
- Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 11** Contact the O&M personnel and send the collected logs.
- End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.250 ALM-38007 Status of Kafka Default User Is Abnormal

## Description

The system checks the default user of Kafka every 60 seconds. This alarm is generated when the system detects that the user status is abnormal.

**Trigger Count** is set to **1**. This alarm is cleared when the user status becomes normal.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38007	Critical	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
HostName	Specifies the host name for which the alarm is generated.
Trigger Condition	Specifies the condition that the Kafka default user status is abnormal.

## Impact on the System

If the Kafka default user status is abnormal, metadata synchronization between Brokers and interaction between Kafka and ZooKeeper will be affected, affecting service production, consumption, and topic creation and deletion.

## Possible Causes

- The Sssd service is abnormal.
- Some Broker instances stop running.

## Procedure

### Check whether the Sssd service is abnormal.

**Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Status of Kafka Default User Is Abnormal > Location** to check the host name of the instance for which the alarm is generated.

**Step 2** Find the host information in the alarm information and log in to the host.

**Step 3** Run the `id -Gn kafka` command and check whether "No such user" is displayed in the command output.

- If yes, record the host name of the node and go to [Step 4](#).
- If no, go to [Step 6](#).

**Step 4** On the FusionInsight Manager home page, choose **O&M > Alarm > Alarms**. Check whether there is **Sssd Service Exception** in the alarm information. If there is, handle the alarm based on alarm information.

### Check the running status of the Broker instance.

**Step 5** On the FusionInsight Manager home page, choose **Cluster > Name of the desired cluster > Services > Kafka > Instance**. The Kafka instance page is displayed.

**Step 6** Check whether there are stopped nodes on all Broker instances.

- If yes, go to [Step 7](#).
- If no, go to [Step 8](#).

**Step 7** Select all stopped Broker instances and click **Start Instance**.

**Step 8** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Collect fault information.**

- Step 9** On FusionInsight Manager, choose **O&M > Log > Download**.
  - Step 10** In the **Service** area, select **Kafka** in the required cluster.
  - Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
  - Step 12** Contact the O&M personnel and send the collected logs.
- End

**Alarm Clearing**

After the fault is rectified, the system automatically clears this alarm.

**Related Information**

None

## 10.251 ALM-38008 Abnormal Kafka Data Directory Status

**Description**

The system checks the Kafka data directory status every 60 seconds. This alarm is generated when the system detects that the status of a data directory is abnormal.

**Trigger Count** is set to **1**. This alarm is cleared when the data directory status becomes normal.

**Attribute**

Alarm ID	Alarm Severity	Automatically Cleared
38008	Major	Yes

**Parameters**

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host name for which the alarm is generated.
DirName	Specifies the directory name for which the alarm is generated.
Trigger Condition	Specifies the condition that the Kafka data directory status is abnormal.

## Impact on the System

If the Kafka data directory status is abnormal, the current replicas of all partitions in the data directory are brought offline, and the data directory status of multiple nodes is abnormal at the same time. As a result, some partitions may become unavailable.

## Possible Causes

- The data directory permission is tampered with.
- The disk where the data directory is located is faulty.

## Procedure

### Check the permission on the faulty data directory.

**Step 1** Find the host information in the alarm information and log in to the host.

**Step 2** In the alarm information, check whether the data directory and its subdirectories belong to the omm:wheel group.

- If yes, record the host name of the node and go to [Step 4](#).
- If no, go to [Step 3](#).

**Step 3** Restore the owner group of the data directory and its subdirectories to omm:wheel.

- If yes, go to [Step 6](#).
- If no, go to [Step 5](#).

### Check whether the disk where the data directory is located is faulty.

**Step 4** In the upper-level directory of the data directory, create and delete files as user **omm**. Check whether data read/write on the disk is normal.

**Step 5** Replace or repair the disk where the data directory is located to ensure that data read/write on the disk is normal.

**Step 6** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. On the Kafka instance page that is displayed, restart the Broker instance on the host recorded in [Step 2](#).

**Step 7** After Broker is started, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Collect fault information.**

**Step 8** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 9** In the **Service** area, select **Kafka** in the required cluster.

**Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 11** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

# 10.252 ALM-38009 Busy Broker Disk I/Os (Applicable to Versions Later Than MRS 3.1.0)

### NOTE

- This section applies to versions later than MRS 3.1.0.
- If the alarm name is **ALM-38009 Kafka Topic Overload**, handle the alarm by following the instructions provided in [ALM-38009 Kafka Topic Overload \(Applicable to MRS 3.1.0 and Earlier Versions\)](#).

## Alarm Description

The system checks the I/O status of each Kafka disk every 60 seconds. This alarm is generated when the disk I/O of a Kafka data directory on a broker exceeds the threshold (80% by default).

Its **Trigger Count** is **3**. This alarm is cleared when the disk I/O is lower than the threshold (80% by default).

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
38009	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
DataDirectoryName	Specifies the name of the Kafka data directory with frequent disk I/Os.

## Impact on the System

The disk partition has frequent I/Os. Data may fail to be written to the Kafka topic for which the alarm is generated.

## Possible Causes

- There are many replicas configured for the topic.
- The parameter for batch writing producer's messages is inappropriately configured. The service traffic of this topic is too heavy, and the current partition configuration is inappropriate.

## Handling Procedure

**Check the number of topic replicas.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. Locate the row that contains this alarm, click , and view the host name in **Location**.
- Step 2** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, choose **Services > Kafka > KafkaTopic Monitor**, search for the topic for which the alarm is generated, and check the number of replicas.
- Step 3** Reduce the replication factors of the topic (for example, reduce to **3**) if the number of replicas is greater than 3.

Run the following command on the FusionInsight client to replan the replicas of Kafka topics:

```
kafka-reassign-partitions.sh --zookeeper {zk_host}:{port}/kafka --reassignment-json-file {manual assignment json file path} --execute
```

For example:

```
/opt/client/Kafka/kafka/bin/kafka-reassign-partitions.sh --zookeeper 10.149.0.90:2181,10.149.0.91:2181,10.149.0.92:2181/kafka --reassignment-json-file expand-cluster-reassignment.json --execute
```

 NOTE

In the `expand-cluster-reassignment.json` file, describe the brokers to which the partitions of the topic are migrated in the following format: `{"partitions":[{"topic": "topicName", "partition": 1, "replicas": [1,2,3] }], "version":1}`

**Step 4** Observe for a period of time and check whether the alarm is cleared. If the alarm persists, go to [Step 5](#).

**Check the partition planning of the topic.**

**Step 5** On the **KafkaTopic Monitor** page, view **Topic Input Traffic** in the **Topic Traffic** area of each topic, obtain the topic with the largest value, and check the partitions of this topic as well as information about the host of these partitions.

**Step 6** Log in to the host queried in [Step 5](#) and run the `iostat -d -x` command to check the `%util` value of each disk.

```
:/opt/R3/FusionInsight_Manager/software/packs # iostat -d -x
Linux 3.0.76-0.11-default (189-39-172-162) 06/26/19 _x86_64_
Device: rrmq/s wrqm/s r/s w/s rsec/s wsec/s avgrq-sz avgqu-sz await svctm %util
xvda 0.04 44.44 1.26 21.94 43.62 531.02 24.78 0.03 1.44 0.56 1.30
xvde 0.16 431.84 13.78 82.51 284.32 4115.90 45.70 0.06 1.41 0.64 6.21
```

- If the `%util` value of each disk exceeds the threshold (**80%** by default), expand the Kafka disk capacity. After the capacity expansion, replan the topic partitions by referring to [Step 3](#).
- If the `%util` values of the disks vary greatly, check the disk partition configuration of Kafka. For example, check the value of `log.dirs` in the `{BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/1_14_Broker/etc/server.properties` file.

Run the following command to view the **Filesystem** information:

```
df -h log.dirs value
```

The command output is as follows.

```
:/opt/R3/FusionInsight_Manager/software/packs # df -h /srv/BigData/kafka/data1/kafka-logs/
filesystem Size Used Avail Use% Mounted on
/dev/xvda2 38G 21G 14G 62% /
```

- If the partition where Filesystem is located matches the partition with a high `%util` value, plan Kafka partitions on idle disks, configure `log.dirs` as an idle disk directory, and replan topic partitions by referring to [Step 3](#). Ensure that the partitions of the topic are evenly distributed to each disk.

**Step 7** Observe for a period of time and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, repeat [Step 5](#) to [Step 6](#) three times. Then, go to [Step 8](#).

**Step 8** Observe for a period of time and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Collect fault information.**

**Step 9** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

**Step 10** Expand the **Service** drop-down list, and select **Kafka** for the target cluster.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

# 10.253 ALM-38009 Kafka Topic Overload (Applicable to MRS 3.1.0 and Earlier Versions)

### NOTE

- This section applies to MRS 3.1.0 or earlier.
- If the alarm name is **ALM-38009 Busy Broker Disk I/Os**, handle the alarm by following the instructions provided in [ALM-38009 Busy Broker Disk I/Os \(Applicable to Versions Later Than MRS 3.1.0\)](#).

## Alarm Description

The system checks the overload status of each Kafka topic every 60 seconds. This alarm is generated when the percentage of partitions of a topic on the overloaded disk exceeds the threshold (40% by default).

Its **Trigger Count** is 1. This alarm is cleared when the percentage of partitions of a topic on the overloaded disk is lower than the threshold (40% by default).

An overloaded disk refers to the disk whose I/O usage of a disk partition is greater than 80%.

For example:

The partitions of Topic A are distributed on three brokers. The I/O usages of the disk partitions on two brokers are greater than 80%.

The percentage of partitions on the overloaded disk is 2/3, greater than 40%, this alarm is generated.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
38009	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
TopicName	Specifies the Kafka topic for which the alarm was generated.

## Impact on the System

The disk partition has frequent I/Os. Data may fail to be written to the Kafka topic for which the alarm is generated.

## Possible Causes

- There are many replicas configured for the topic.
- The parameter for batch writing producer's messages is inappropriately configured. The service traffic of this topic is too heavy, and the current partition configuration is inappropriate.

## Handling Procedure

**Check the number of topic replicas.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. Locate the row that contains this alarm, click , and view the host name in **Location**.
- Step 2** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, choose **Services > Kafka > KafkaTopic Monitor**, search for the topic for which the alarm is generated, and check the number of replicas.
- Step 3** Reduce the replication factors of the topic (for example, reduce to **3**) if the number of replicas is greater than 3.

Run the following command on the FusionInsight client to replan the replicas of Kafka topics:

```
kafka-reassign-partitions.sh --zookeeper {zk_host}:{port}/kafka --reassignment-json-file {manual assignment json file path} --execute
```

For example:

```
/opt/client/Kafka/kafka/bin/kafka-reassign-partitions.sh --zookeeper 10.149.0.90:2181,10.149.0.91:2181,10.149.0.92:2181/kafka --reassignment-json-file expand-cluster-reassignment.json --execute
```

 NOTE

In the `expand-cluster-reassignment.json` file, describe the brokers to which the partitions of the topic are migrated in the following format: `{"partitions":[{"topic": "topicName", "partition": 1, "replicas": [1,2,3] }], "version":1}`

**Step 4** Observe for a period of time and check whether the alarm is cleared. If the alarm persists, go to [Step 5](#).

**Check the partition planning of the topic.**

**Step 5** On the **KafkaTopic Monitor** page, view **Topic Input Traffic** in the **Topic Traffic** area of each topic, obtain the topic with the largest value, and check the partitions of this topic as well as information about the host of these partitions.

**Step 6** Log in to the host queried in [Step 5](#) and run the `iostat -d -x` command to check the `%util` value of each disk.

```
:/opt/R3/FusionInsight_Manager/software/packs # iostat -d -x
Linux 3.0.76-0.11-default (189-39-172-162) 06/26/19 _x86_64_
Device: rrqm/s wrqm/s r/s w/s rsec/s wsec/s avgrq-sz avgqu-sz await svctm %util
xvda 0.04 44.44 1.26 21.94 43.62 531.02 24.78 0.03 1.44 0.56 1.30
xvde 0.16 431.84 13.78 82.51 284.32 4115.90 45.70 0.06 1.41 0.64 6.21
```

- If the `%util` value of each disk exceeds the threshold (**80%** by default), expand the Kafka disk capacity. After the capacity expansion, replan the topic partitions by referring to [Step 3](#).
- If the `%util` values of the disks vary greatly, check the disk partition configuration of Kafka. For example, check the value of `log.dirs` in the `{BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/1_14_Broker/etc/server.properties` file.

Run the following command to view the **Filesystem** information:

```
df -h log.dirs value
```

The command output is as follows.

```
:/opt/R3/FusionInsight_Manager/software/packs # df -h /srv/BigData/kafka/data1/kafka-logs/
filesystem Size Used Avail Use% Mounted on
/dev/xvda2 38G 21G 14G 62% /
```

- If the partition where Filesystem is located matches the partition with a high `%util` value, plan Kafka partitions on idle disks, configure `log.dirs` as an idle disk directory, and replan topic partitions by referring to [Step 3](#). Ensure that the partitions of the topic are evenly distributed to each disk.

**Step 7** Observe for a period of time and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, repeat [Step 5](#) to [Step 6](#) three times. Then, go to [Step 8](#).

**Step 8** Observe for a period of time and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Collect fault information.**

**Step 9** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

**Step 10** Expand the **Service** drop-down list, and select **Kafka** for the target cluster.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 10.254 ALM-38010 Topics with Single Replica

## Description

The system checks the number of replicas of each topic every 60 seconds on the node where the Kafka Controller resides. This alarm is generated when there is one replica for a topic.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38010	Major	No

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
TopicName	Specifies the list of topics for which the alarm is generated.

## Impact on the System

There is the single point of failure (SPOF) risk for topics with only one replica. When the node where the replica resides becomes abnormal, the partition does not have a leader, and services on the topic are affected.

## Possible Causes

- The number of replicas for the topic is incorrectly configured.

## Procedure

### Check the number of replicas for the topic.

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**, click  of this alarm, and view the **TopicName** list in **Location**.

**Step 2** Check whether replicas need to be added for the topic for which the alarm is generated.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

**Step 3** On the FusionInsight client, re-plan topic replicas and describe the partition distribution of the topic in the **add-replicas-reassignment.json** file in the following format: {"partitions":[{"topic": "*topic name*","partition": 1,"replicas": [1,2] }],"version":1}. Then, run the following command to add replicas:

```
kafka-reassign-partitions.sh --zookeeper {zk_host}:{port}/kafka --reassignment-json-file {manual assignment json file path} --execute
```

For example:

```
/opt/client/Kafka/kafka/bin/kafka-reassign-partitions.sh --zookeeper 192.168.0.90:2181,192.168.0.91:2181,192.168.0.92:2181/kafka --reassignment-json-file add-replicas-reassignment.json --execute
```

**Step 4** Run the following command to check the task execution progress:

```
kafka-reassign-partitions.sh --zookeeper {zk_host}:{port}/kafka --reassignment-json-file {manual assignment json file path} --verify
```

For example:

```
/opt/client/Kafka/kafka/bin/kafka-reassign-partitions.sh --zookeeper 192.168.0.90:2181,192.168.0.91:2181,192.168.0.92:2181/kafka --reassignment-json-file add-replicas-reassignment.json --verify
```

**Step 5** After completing the handling operations or confirming that the alarm has no impact, manually clear the alarm on FusionInsight Manager.

**Step 6** After a period of time, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 7](#).

### Collect fault information.

**Step 7** On FusionInsight Manager, choose **O&M > Log > Download**.

- Step 8** In the **Service** area, select **Kafka** in the required cluster.
- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact the O&M personnel and send the collected logs.
- End

## Alarm Clearing

If the alarm has no impact, manually clear the alarm.

## Related Information

None

# 10.255 ALM-38011 User Connection Usage on Broker Exceeds the Threshold

## Description

The system checks the number of connections of each user on Broker every 30 seconds. This alarm is generated when the connection usage of a user on the Broker exceeds the threshold (80% by default) for 5 consecutive times.

The number of times that smoothing is performed is 5. This alarm is cleared when the connection usage of a user on the Broker is less than the threshold.

The alarm can be automatically cleared. However, if the number of connections of a user suddenly becomes 0 and no connection is created, the alarm cannot be automatically cleared. You need to manually clear it.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38011	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
UserName	Specifies the username for which the alarm is generated.

## Impact on the System

If the number of connections of a user is excessive, the user cannot create new connections to the Broker.

## Possible Causes

- The number of connections (created by a user) used by the client exceeds the preset threshold.
- The threshold for the connection usage does not meet service requirements.

## Procedure

**Check the number of connections established by the same user on the client.**

- Step 1** On the FusionInsight Manager home page, choose **O&M > Alarm > Alarms > User Connection Usage on Broker Exceeds the Threshold**. Check the host name and username of the Broker instance for which the alarm is generated in **Location**.
- Step 2** On FusionInsight Manager home page, choose **Cluster > Name of the desired cluster > Services > Kafka > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area, choose **Customize > Other**, and select **User Connection Usage on Broker, Maximum Number of User Connections on Broker**, and **Number of User Connections on Broker** to view the number of the current user connections on the Broker.
- Step 3** Observe the number of real-time connections of the current alarm user and check whether the real-time monitoring data of the current user exists.
  - If yes, go to **Step 4**.
  - If no, the current user has disconnected all connections. You need to clear the alarm manually, and no further action is required.

### NOTE

After the alarm user disconnects all connections, the monitoring data of the user disappears. In this case, the alarm will not be automatically cleared. You need to manually clear it.

- Step 4** Check whether the user is authorized by the service side.

If yes, go to **Step 7**.

If no, go to [Step 5](#).

**Step 5** Run the following command on the client to limit the number of connections of the user. There are two configuration rules based on the following commands:

1. For the specific Broker and user, run the following command:

```
kafka-configs.sh --bootstrap-server <broker ip:port> --alter --add-config 'max.connections.per.user.overrides=[<username>:<connection.number>]' --entity-type brokers --entity-name <broker.id> --command-config Kafka/kafka/config/producer.properties
```

 NOTE

For unauthorized users, confirm with the service side to reduce the maximum number of connections of an unauthorized user or set the maximum number of connections to 0.

In the command, you need to specify the IP address and port number of Broker, set values of configuration items, and specify the **brokerId** and **username**. Here, the user refers to the authorized Kerberos user.

The configuration updated using the command line tool can take effect dynamically. The configuration becomes invalid after the service is restarted. To make the configuration take effect after the restart, choose **Cluster > Name of the desired cluster > Services > Kafka > Configurations > All Configurations > Broker > Server** on the FusionInsight Manager home page and update the configuration to **max.connections.per.user.overrides**.

2. For the specific use and default Broker (that is, all Broker instances in the cluster), run the following command:

```
kafka-configs.sh --bootstrap-server <broker ip:port> --alter --add-config 'max.connections.per.user.overrides=[<username>:<connection.number>]' --entity-type brokers ---entity-default --command-config Kafka/kafka/config/client.properties
```

Example:

```
kafka-configs.sh --bootstrap-server 10.153.3.26:21007 --alter --add-config 'max.connections.per.user.overrides=[showcase:4]' --entity-type brokers --entity-name 1 --command-config Kafka/kafka/config/client.properties
```

**Step 6** Check whether the maximum number of connections is 0 and whether the number of connections of the current user decreases or remains unchanged according to [Step 2](#).

- If yes, manually clear the alarm and no further action is required.
- If no, go to [Step 7](#).

**Step 7** Check whether the number of real-time connections and connection usage of the current user are sharply increased when they are compared with historical data, and whether have exceeded the specified maximum number of connections.

- If yes, go to [Step 8](#).
- If no, go to [Step 9](#).

 NOTE

If there is an obvious increase after the comparison and the maximum number of connections has reached the preset value, the connections of the user may be abnormal. You need to confirm with the service party.

**Check whether the number of user connections meets service requirements.**

- Step 8** Check whether the number of connections of the user meets service requirements.
- If yes, go to [Step 9](#).
  - If no, contact the service party to rectify the fault.

 **NOTE**

If the number of user connections is abnormal, contact the service party to rectify the fault from the following aspects:

- Check whether new services are added so that the number of user connections increases sharply.
- Check whether handle leakage occurs on the code at the service side.

- Step 9** Consider whether to increase the maximum number of connections of the user.
- If yes, go to [Step 10](#).
  - If no, go to [Step 12](#).

- Step 10** Increase the maximum number of connections based on the service requirements. Set the number of connections of the user on the Kafka client. For details, see [Step 5](#).

- Step 11** Wait for several minutes and then check whether the alarm is automatically cleared.
- If yes, go to [Step 12](#).
  - If no, go to [Step 2](#).

- Step 12** Determine whether to add the user to the whitelist based on service requirements on the service side.
- If yes, go to [Step 13](#).
  - If no, go to [Step 15](#).

 **NOTE**

To add a user to the whitelist, you need to restart the Kafka service. However, this operation will cause service interruption and affect service running. Therefore, you must confirm with the service side before performing this operation.

- Step 13** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations** > **Broker(Role)** > **Server** to add the user to the **max.connections.per.user.whitelist** configuration item.

- Step 14** Restart the service for the modification to take effect. In addition, you need to manually clear the alarm, and no further action is required.

**Collect the fault information.**

- Step 15** On the FusionInsight Manager homepage, choose **O&M** > **Log** > **Download**.

- Step 16** Expand the **Service** drop-down list, and select **Kafka** for the target cluster.

- Step 17** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

- Step 18** Contact the O&M personnel and send the collected fault logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.256 ALM-43001 Spark2x Service Unavailable

## Alarm Description

The system checks the Spark2x service status every 300 seconds. This alarm is generated when the Spark2x service is unavailable.

This alarm is cleared when the Spark2x service recovers.

### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JobHistory2x is changed to JobHistory. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
43001	Critical	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

The Spark tasks submitted by users fail to be executed.

## Possible Causes

- The KrbServer service is abnormal.
- The LdapServer service is abnormal.
- ZooKeeper is abnormal.
- HDFS is abnormal.
- Yarn is abnormal.
- The corresponding Hive service is abnormal.
- The Spark2x assembly package is abnormal.
- The NameNode memory is insufficient.
- The memory of the Spark process is insufficient.

## Handling Procedure

If the alarm is abnormal Spark2x assembly packet, the Spark packet is abnormal. Wait for about 10 minutes. The alarm is automatically cleared.

**Check whether service unavailability alarms exist in services that Spark2x depends on.**

**Step 1** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**.

**Step 2** Check whether the following alarms exist in the alarm list:

- ALM-25500 KrbServer Service Unavailable
- ALM-25000 LdapServer Service Unavailable
- ALM-13000 ZooKeeper Service Unavailable
- ALM-14000 HDFS Service Unavailable
- ALM-18000 Yarn Service Unavailable
- ALM-16004 Hive Service Unavailable
- If yes, go to [Step 3](#).
- If no, go to [Step 4](#).

**Step 3** Handle the alarms based on the troubleshooting methods provided in the alarm help.

After the alarm is cleared, wait a few minutes and check whether the alarm GuardianService Unavailable is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Check whether the NameNode memory is insufficient.**

**Step 4** Check whether the NameNode memory is insufficient.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

**Step 5** Restart the NameNode to release the memory. Then, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Check whether the memory of the Spark process is insufficient.**

**Step 6** Check whether the memory of the Spark process is insufficient due to memory-related modifications.

- If yes, go to [Step 7](#).
- If no, go to [Step 8](#).

**Step 7** Ensure that the memory of the Spark process is sufficient or expand the cluster capacity. Then, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Collect fault information.**

**Step 8** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 9** In the **Service** area, select the following nodes of the desired cluster. (Hive is the specific Hive service determined based on **ServiceName** in the alarm location information).

- KrbServer
- LdapServer
- ZooKeeper
- HDFS
- Yarn
- Hive

**Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 11** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

## 10.257 ALM-43006 Heap Memory Usage of the JobHistory2x Process Exceeds the Threshold

### Description

The system checks the JobHistory2x Process status every 30 seconds. The alarm is generated when the heap memory usage of a JobHistory2x Process exceeds the threshold (95% of the maximum memory).

#### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JobHistory2x is changed to JobHistory. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
43006	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

### Impact on the System

If the available JobHistory2x Process heap memory is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

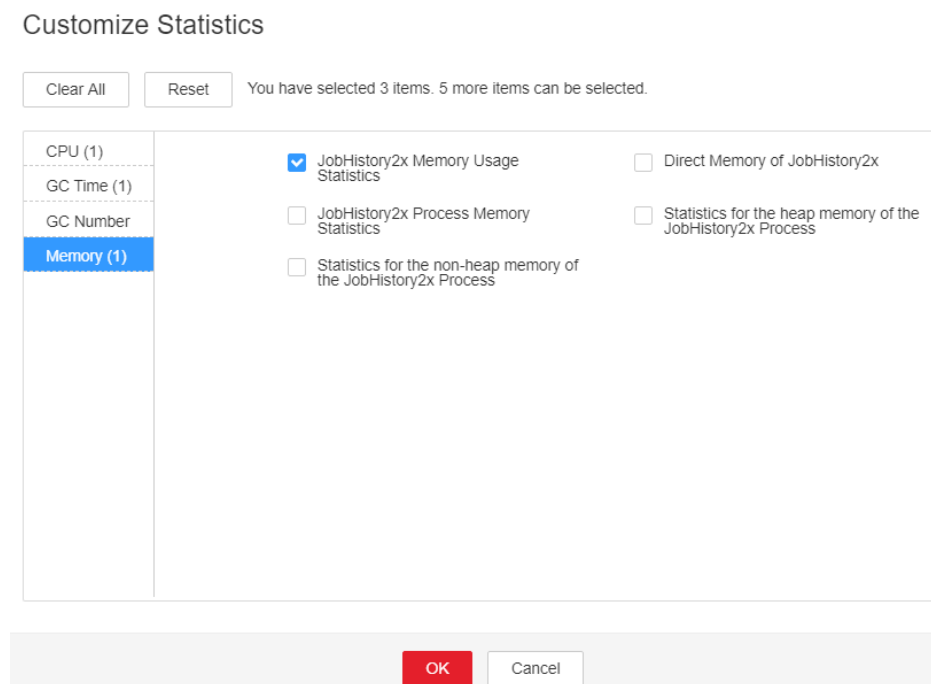

The heap memory of the JobHistory2x Process is overused or the heap memory is inappropriately allocated.

## Procedure

### Check heap memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43006**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Spark2x > Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize > Memory > JobHistory2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used heap memory of the JobHistory2x Process reaches the threshold (default value is 95%) of the maximum heap memory specified for JobHistory2x.
- If yes, go to [Step 3](#).
  - If no, go to [Step 7](#).

**Figure 10-85** JobHistory2x Memory Usage Statistics

- Step 3** On the FusionInsight Manager home page, choose **Cluster > Name of the desired cluster > Services > Spark2x > Instance**. Click **JobHistory2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize > Memory > Statistics for the heap memory of the JobHistory2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used heap memory of the JobHistory2x process in the corresponding period and obtain the maximum value.

**Figure 10-86** Statistics for the heap memory of the JobHistory2x Process

Customize Statistics

You have selected 3 items. 5 more items can be selected.

CPU (1)	<input type="checkbox"/> JobHistory2x Memory Usage Statistics	<input type="checkbox"/> Direct Memory of JobHistory2x
GC Time (1)	<input type="checkbox"/> JobHistory2x Process Memory Statistics	<input checked="" type="checkbox"/> Statistics for the heap memory of the JobHistory2x Process
GC Number	<input type="checkbox"/> Statistics for the non-heap memory of the JobHistory2x Process	
Memory (1)		

**Step 4** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JobHistory2x** > **Default**. The default value of **SPARK\_DAEMON\_MEMORY** is 4GB. You can change the value according to the following rules: Ratio of the maximum heap memory usage of the JobHistory2x to the **Threshold** of the **JobHistory2x Heap Memory Usage Statistics (JobHistory2x)** in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after the parameter value is adjusted, increase the value by 1 time.

 **NOTE**

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **Memory** > **JobHistory2x Heap Memory Usage Statistics (JobHistory2x)** to view **Threshold**.

**Step 5** Restart all JobHistory2x instances.

---

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

**Step 6** After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

**Step 8** Select **Spark2x** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.258 ALM-43007 Non-Heap Memory Usage of the JobHistory2x Process Exceeds the Threshold

## Description

The system checks the JobHistory2x Process status every 30 seconds. The alarm is generated when the non-heap memory usage of a JobHistory2x Process exceeds the threshold (95% of the maximum memory).

### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JobHistory2x is changed to JobHistory. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
43007	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

If the available JobHistory2x Process non-heap memory is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The non-heap memory of the JobHistory2x Process is overused or the non-heap memory is inappropriately allocated.

## Procedure

### Check non-heap memory usage.

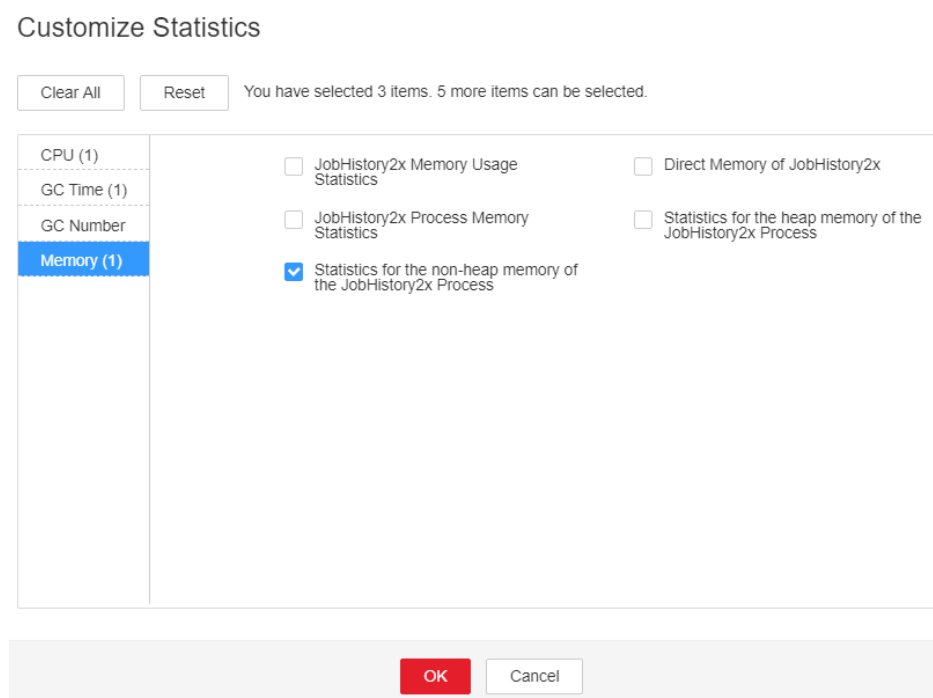

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43007**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Spark2x > Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize > Memory > JobHistory2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used non-heap memory of the JobHistory2x Process reaches the threshold (default value is 95%) of the maximum non-heap memory specified for JobHistory2x.
  - If yes, go to [Step 3](#).
  - If no, go to [Step 7](#).

**Figure 10-87** JobHistory2x Memory Usage Statistics

**Step 3** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click **JobHistory2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Memory** > **Statistics for the non-heap memory of the JobHistory2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used non-heap memory of the JobHistory2x process in the corresponding period and obtain the maximum value.

**Figure 10-88** Statistics for the non-heap memory of the JobHistory2x Process

- Step 4** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JobHistory2x** > **Default**. You can change the value of - **XX:MaxMetaspaceSize** in **SPARK\_DAEMON\_JAVA\_OPTS** according to the following rules: Ratio of the JobHistory2x non-heap memory usage to the **Threshold of JobHistory2x Non-Heap Memory Usage Statistics (JobHistory2x)** in the alarm period.

 **NOTE**

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **Memory** > **JobHistory2x Non-Heap Memory Usage Statistics (JobHistory2x)** to view **Threshold**.

- Step 5** Restart all JobHistory2x instances.

---

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

- Step 6** After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

- Step 7** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

- Step 8** Select **Spark2x** in the required cluster from the **Service**.

- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

- Step 10** Contact the O&M personnel and send the collected logs.

## 10.259 ALM-43008 The Direct Memory Usage of the JobHistory2x Process Exceeds the Threshold

### Description

The system checks the JobHistory2x Process status every 30 seconds. The alarm is generated when the direct memory usage of a JobHistory2x Process exceeds the threshold (95% of the maximum memory).

#### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JobHistory2x is changed to JobHistory. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
43008	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

### Impact on the System

If the available JobHistory2x Process direct memory is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

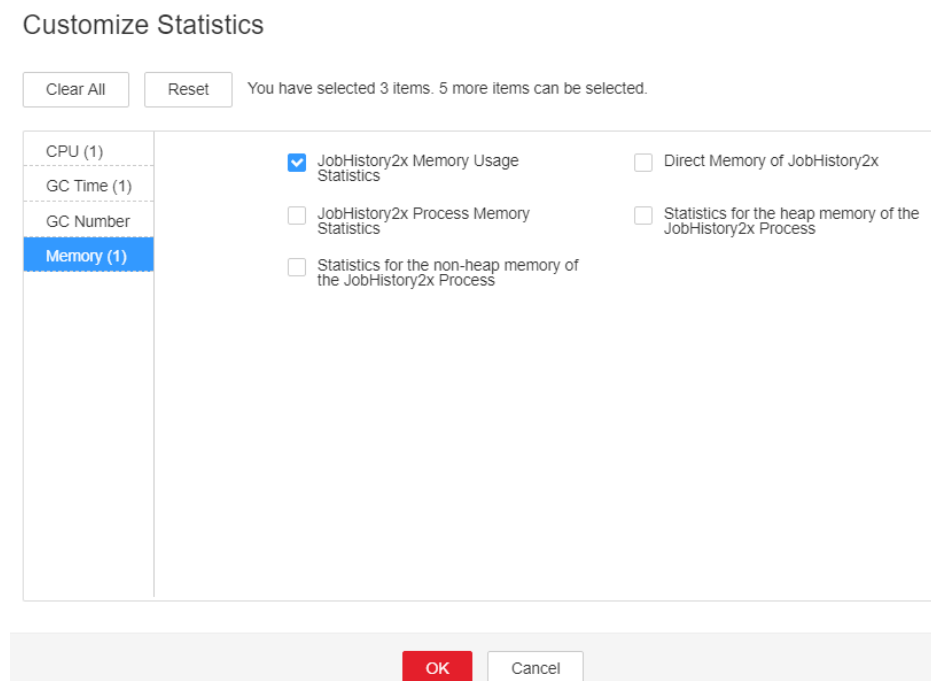

The direct memory of the JobHistory2x Process is overused or the direct memory is inappropriately allocated.

## Procedure

### Check direct memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43008**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Spark2x > Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize > Memory > JobHistory2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used direct memory of the JobHistory2x Process reaches the threshold (default value is 95%) of the maximum direct memory specified for JobHistory2x.
- If yes, go to [Step 3](#).
  - If no, go to [Step 7](#).

**Figure 10-89** JobHistory2x Memory Usage Statistics

- Step 3** On the FusionInsight Manager home page, choose **Cluster > Name of the desired cluster > Services > Spark2x > Instance**. Click **JobHistory2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize > Memory > Direct Memory of JobHistory2x**, and click **OK**. Based on the alarm generation time, check the values of the used direct memory of the JobHistory2x process in the corresponding period and obtain the maximum value.

**Figure 10-90** Direct Memory of JobHistory2x

Customize Statistics

You have selected 3 items. 5 more items can be selected.

CPU (1)	<input type="checkbox"/> JobHistory2x Memory Usage Statistics	<input checked="" type="checkbox"/> Direct Memory of JobHistory2x
GC Time (1)	<input type="checkbox"/> JobHistory2x Process Memory Statistics	<input type="checkbox"/> Statistics for the heap memory of the JobHistory2x Process
GC Number	<input type="checkbox"/> Statistics for the non-heap memory of the JobHistory2x Process	
Memory (1)		

- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Spark2x > Configurations**, and click **All Configurations**. Choose **JobHistory2x > Default**. The default value of `-XX:MaxDirectMemorySize` in `SPARK_DAEMON_JAVA_OPTS` is 512 MB. You can change the value according to the following rules: Ratio of the maximum direct memory usage of the JobHistory2x to the **Threshold** of the **JobHistory2x Direct Memory Usage Statistics (JobHistory2x)** in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after the parameter value is adjusted, increase the value by 1 time. It is recommended that the value be less than or equal to the value of `SPARK_DAEMON_MEMORY`.

 **NOTE**

On the FusionInsight Manager home page, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Spark2x > Memory > JobHistory2x Direct Memory Usage Statistics (JobHistory2x)** to view **Threshold**.

- Step 5** Restart all JobHistory2x instances.

---

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

- Step 6** After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

- Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 8** Select **Spark2x** in the required cluster from the **Service**.
- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact the O&M personnel and send the collected logs.

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.260 ALM-43009 JobHistory2x Process GC Time Exceeds the Threshold

## Description

The system checks the garbage collection (GC) time of the JobHistory2x Process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (exceeds 5 seconds for three consecutive checks.) To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Spark2x > GC Time > Total GC time in milliseconds (JobHistory2x)**. This alarm is cleared when the JobHistory2x GC time is shorter than or equal to the threshold.

### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JobHistory2x is changed to JobHistory. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
43009	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

If the GC time exceeds the threshold, JobHistory2x maybe run in low performance.

## Possible Causes

The memory of JobHistory2x is overused, the heap memory is inappropriately allocated. As a result, GCs occur frequently.

## Procedure

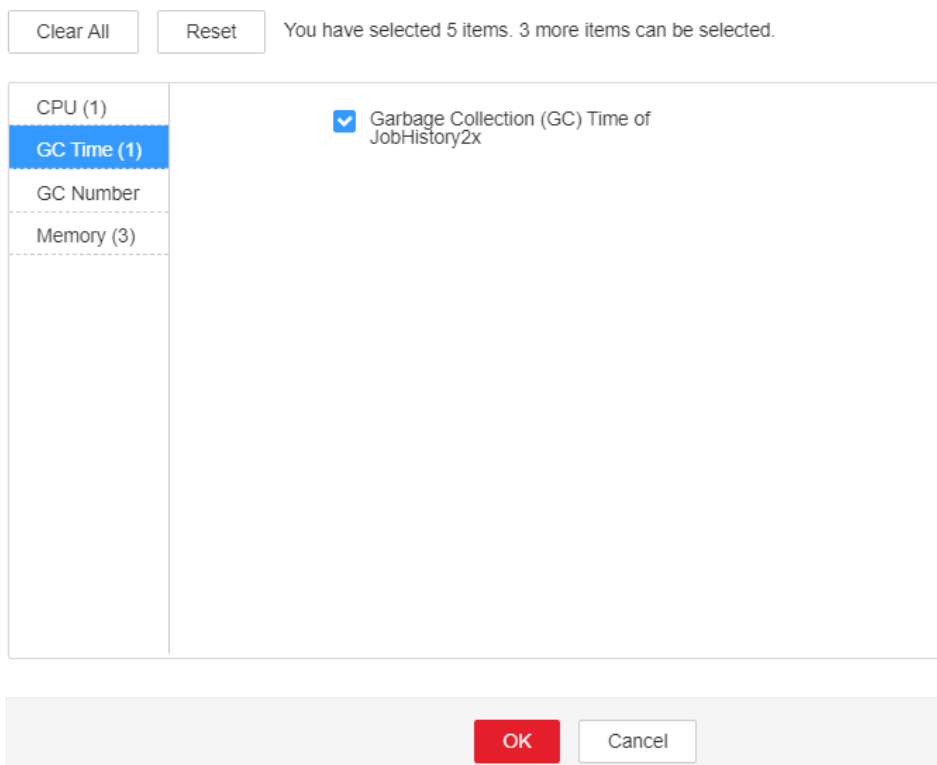

### Check the GC time.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43009**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Spark2x > Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize > GC Time > Garbage Collection (GC) Time of JobHistory2x** from the drop-down list box in the upper right corner and click **OK** to check whether the GC time is longer than the threshold(default value: 12 seconds).
  - If yes, go to [Step 3](#).
  - If no, go to [Step 6](#).

**Figure 10-91** Garbage Collection (GC) Time of JobHistory2x

### Customize Statistics

**Step 3** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JobHistory2x** > **Default**. The default value of **SPARK\_DAEMON\_MEMORY** is 4GB. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. If the alarm is frequently reported, increase the value by 1 time.

**Step 4** Restart all JobHistory2x instances.

#### NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

**Step 5** After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

#### Collect fault information.

**Step 6** On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log** > **Download**.

**Step 7** Select **Spark2x** in the required cluster from the **Service**.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

# 10.261 ALM-43010 Heap Memory Usage of the JDBCServer2x Process Exceeds the Threshold

## Description

The system checks the JDBCServer2x Process status every 30 seconds. The alarm is generated when the heap memory usage of a JDBCServer2x Process exceeds the threshold (95% of the maximum memory).

### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JDBCServer2x is changed to JDBCServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
43010	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.

Name	Meaning
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

If the available JDBCServer2x Process heap memory is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

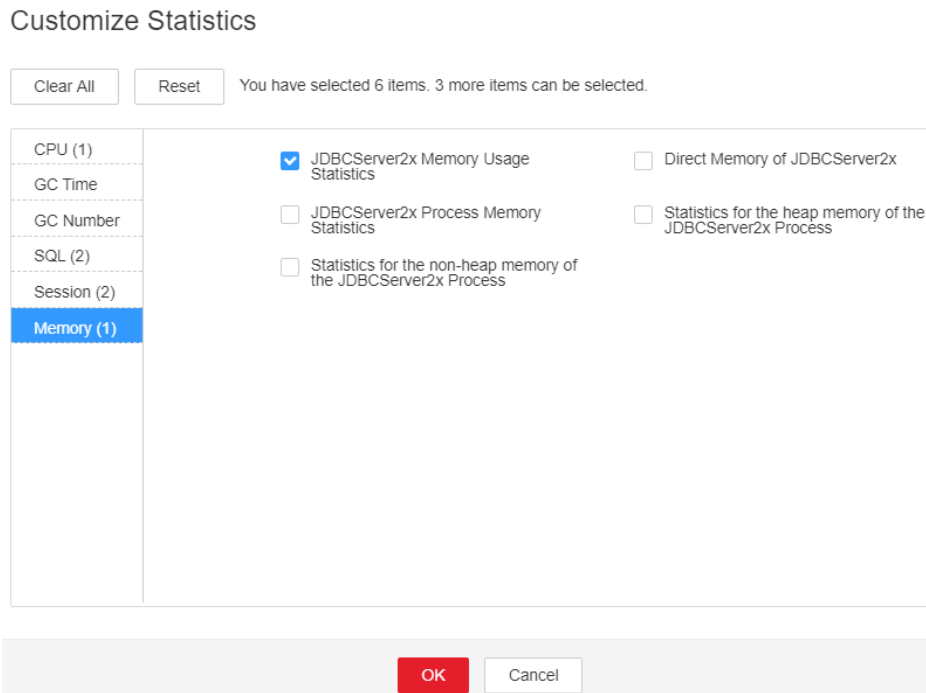

The heap memory of the JDBCServer2x Process is overused or the heap memory is inappropriately allocated.

## Procedure

**Check heap memory usage.**

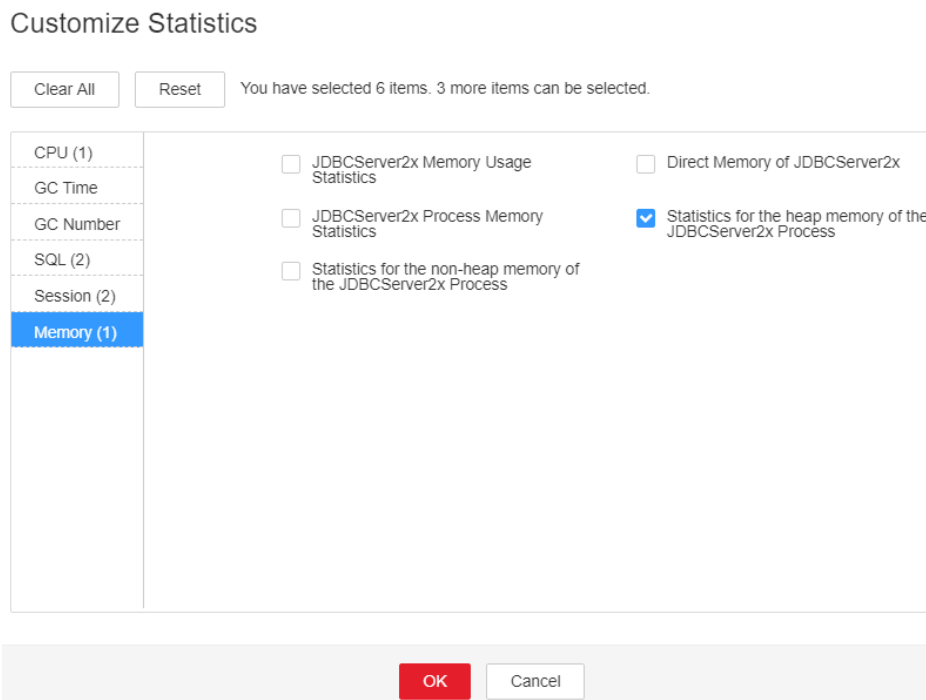

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43010**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Spark2x > Instance** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize > Memory > JDBCServer2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used heap memory of the JDBCServer2x Process reaches the threshold (default value is 95%) of the maximum heap memory specified for JDBCServer2x.
  - If yes, go to [Step 3](#).
  - If no, go to [Step 7](#).

**Figure 10-92** JDBCServer2x Memory Usage Statistics

**Step 3** On the FusionInsight Manager home page, choose **Cluster > Name of the desired cluster > Services > Spark2x > Instance**. Click **JDBCServer2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize > Memory > Statistics for the heap memory of the JDBCServer2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used heap memory of the JDBCServer2x process in the corresponding period and obtain the maximum value.

**Figure 10-93** Statistics for the heap memory of the JDBCServer2x Process

**Step 4** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JDBCServer2x** > **Tuning**. The default value of **SPARK\_DRIVER\_MEMORY** is 4 GB. You can change the value according to the following rules: Ratio of the maximum heap memory usage of the JobHistory2x to the **Threshold** of the **JDBCServer2x Heap Memory Usage Statistics (JDBCServer2x)** in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after the parameter value is adjusted, increase the value by 1 time. In the case of large service volume and high concurrency, add instances.

 **NOTE**

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **Memory** > **JDBCServer2x Heap Memory Usage Statistics (JDBCServer2x)** to view **Threshold**.

**Step 5** Restart all JDBCServer2x instances.

---

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

**Step 6** After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

**Step 8** Select **Spark2x** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## 10.262 ALM-43011 Non-Heap Memory Usage of the JDBCServer2x Process Exceeds the Threshold

### Description

The system checks the JDBCServer2x Process status every 30 seconds. The alarm is generated when the non-heap memory usage of an JDBCServer2x Process exceeds the threshold (95% of the maximum memory).

#### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JDBCServer2x is changed to JDBCServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
43011	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

### Impact on the System

If the available JDBCServer2x Process non-heap memory is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

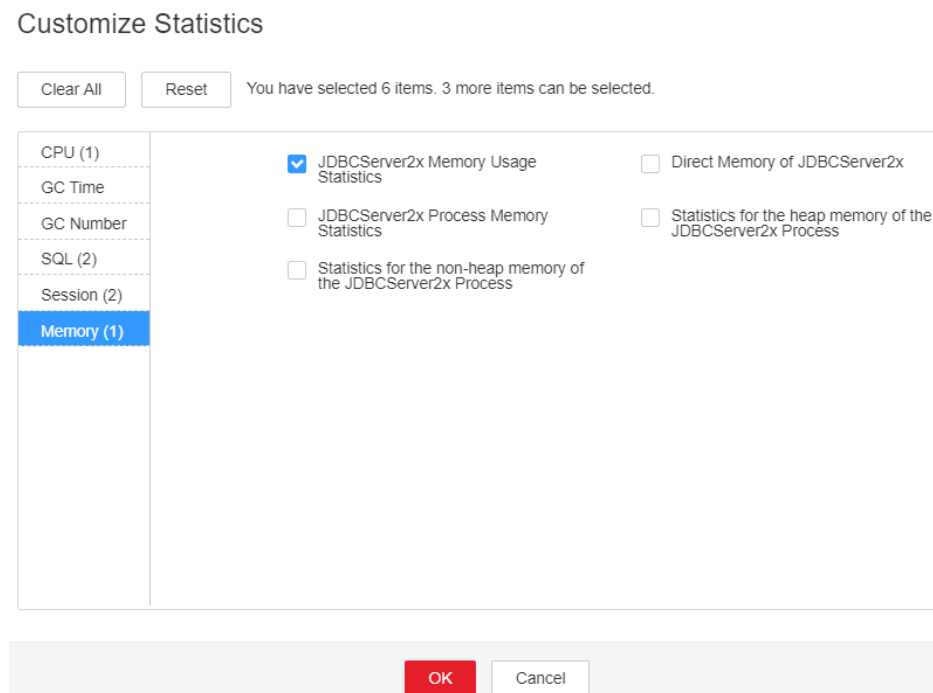

The non-heap memory of the JDBCServer2x Process is overused or the non-heap memory is inappropriately allocated.

## Procedure

### Check non-heap memory usage.

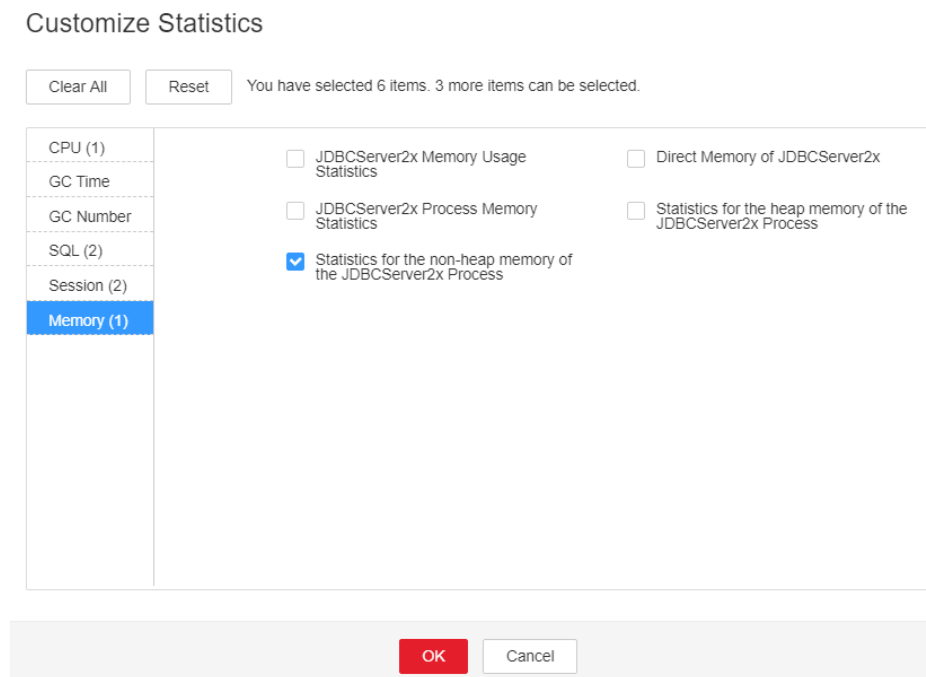

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43011**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Spark2x > Instance** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize > Memory > JDBCServer2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used non-heap memory of the JDBCServer2x Process reaches the threshold (default value is 95%) of the maximum non-heap memory specified for JDBCServer2x.
- If yes, go to **Step 3**.
  - If no, go to **Step 7**.

**Figure 10-94** JDBCServer2x Memory Usage Statistics

- Step 3** On the FusionInsight Manager home page, choose **Cluster > Name of the desired cluster > Services > Spark2x > Instance**. Click **JDBCServer2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize > Memory > Statistics for the non-heap memory of the JDBCServer2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used non-heap memory of the JDBCServer2x process in the corresponding period and obtain the maximum value.

**Figure 10-95** Statistics for the non-heap memory of the JDBCServer2x Process

**Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Spark2x > Configurations**, and click **All Configurations**. Choose **JDBCServer2x > Tuning**. You can change the value of **-XX:MaxMetaspaceSize** in **spark.driver.extraJavaOptions** according to the following rules: Ratio of the JDBCServer2x non-heap memory usage to the **Threshold of JDBCServer2x Non-Heap Memory Usage Statistics (JDBCServer2x)** in the alarm period.

**NOTE**

On the FusionInsight Manager home page, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Spark2x > Memory > JDBCServer2x Non-Heap Memory Usage Statistics (JDBCServer2x)** to view **Threshold**.

**Step 5** Restart all JDBCServer2x instances.

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

**Step 6** After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **Spark2x** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 10.263 ALM-43012 Direct Heap Memory Usage of the JDBCServer2x Process Exceeds the Threshold

## Description

The system checks the JDBCServer2x Process status every 30 seconds. The alarm is generated when the direct heap memory usage of a JDBCServer2x Process exceeds the threshold (95% of the maximum memory).

### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JDBCServer2x is changed to JDBCServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
43012	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.

Name	Meaning
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

If the available JDBCServer2x Process direct heap memory is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The direct heap memory of the JDBCServer2x Process is overused or the direct heap memory is inappropriately allocated.

## Procedure

**Check direct heap memory usage.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43012**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Spark2x > Instance** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize > Memory > JDBCServer2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used direct heap memory of the JDBCServer2x Process reaches the threshold (default value is 95%) of the maximum direct heap memory specified for JDBCServer2x.
  - If yes, go to **Step 3**.
  - If no, go to **Step 7**.

**Step 4** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JDBCServer2x** > **Tuning**. The default value of **-XX:MaxDirectMemorySize** in **spark.driver.extraJavaOptions** is 512 MB. You can change the value according to the following rules: Ratio of the maximum direct memory usage of the JDBCServer2x to the **Threshold** of the **JDBCServer2x Direct Memory Usage Statistics (JDBCServer2x)** in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after the parameter value is adjusted, increase the value by 1 time. In the case of large service volume and high service concurrency, you are advised to add instances.

 **NOTE**

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **Memory** > **JDBCServer2x Direct Memory Usage Statistics (JDBCServer2x)** to view **Threshold**.

**Step 5** Restart all JDBCServer2x instances.

---

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

**Step 6** After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

**Step 8** Select **Spark2x** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## 10.264 ALM-43013 JDBCServer2x Process GC Time Exceeds the Threshold

### Description

The system checks the garbage collection (GC) time of the JDBCServer2x Process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (exceeds 5 seconds for three consecutive checks.) To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Spark2x > GC Time > Total GC time in milliseconds (JDBCServer2x)**. This alarm is cleared when the JDBCServer2x GC time is shorter than or equal to the threshold.

#### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JDBCServer2x is changed to JDBCServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
43013	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

## Impact on the System

If the GC time exceeds the threshold, JDBCServer2x maybe run in low performance.

## Possible Causes

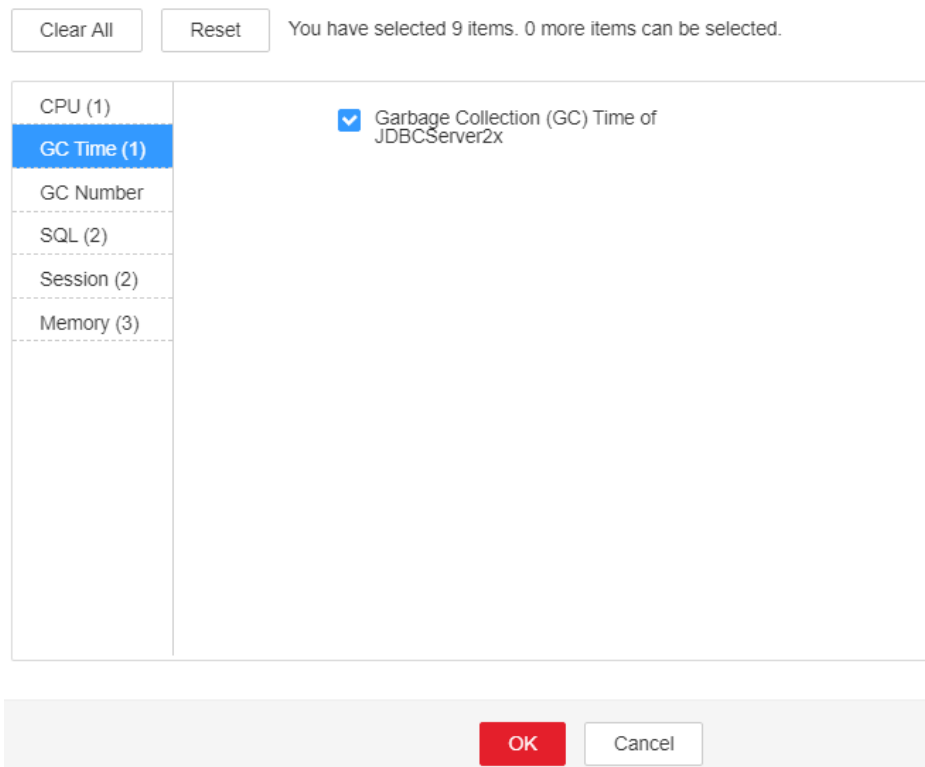

The memory of JDBCServer2x is overused, the heap memory is inappropriately allocated. As a result, GCs occur frequently.

## Procedure

### Check the GC time.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43013**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Spark2x > Instance** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize > GC Time > Garbage Collection (GC) Time of JDBCServer2x** from the drop-down list box in the upper right corner and click **OK** to check whether the GC time is longer than the threshold(default value: 12 seconds).
- If yes, go to [Step 3](#).
  - If no, go to [Step 6](#).

**Figure 10-98** Garbage Collection (GC) Time of JDBCServer2x  
Customize Statistics

- Step 3** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JDBCServer2x** > **Default**. The default value of **SPARK\_DRIVER\_MEMORY** is 4 GB. If this alarm is generated occasionally, increase the value by 0.5 times. If the alarm is frequently reported, increase the value by 1 time. In the case of large service volume and high service concurrency, you are advised to add instances.
- Step 4** Restart all JDBCServer2x instances.

---

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

- Step 5** After 10 minutes, check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 6](#).
- Collect fault information.**
- Step 6** On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log** > **Download**.
- Step 7** Select **Spark2x** in the required cluster from the **Service**.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

# 10.265 ALM-43017 JDBCServer2x Process Full GC Number Exceeds the Threshold

## Description

The system checks the number of Full garbage collection (GC) times of the JDBCServer2x process every 60 seconds. This alarm is generated when the detected Full GC number exceeds the threshold (exceeds 12 for three consecutive checks.) You can change the threshold by choosing **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **GC number** > **Full GC Number of**

**JDBCServer2x.** This alarm is cleared when the Full GC number of the JDBCServer2x process is less than or equal to the threshold.

 **NOTE**

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JDBCServer2x is changed to JDBCServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
43017	Major	Yes

## Parameters

Name	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

The performance of the JDBCServer2x process is affected, or even the JDBCServer2x process is unavailable.

## Possible Causes

The heap memory usage of the JDBCServer2x process is excessively large, or the heap memory is inappropriately allocated. As a result, Full GC occurs frequently.

## Procedure

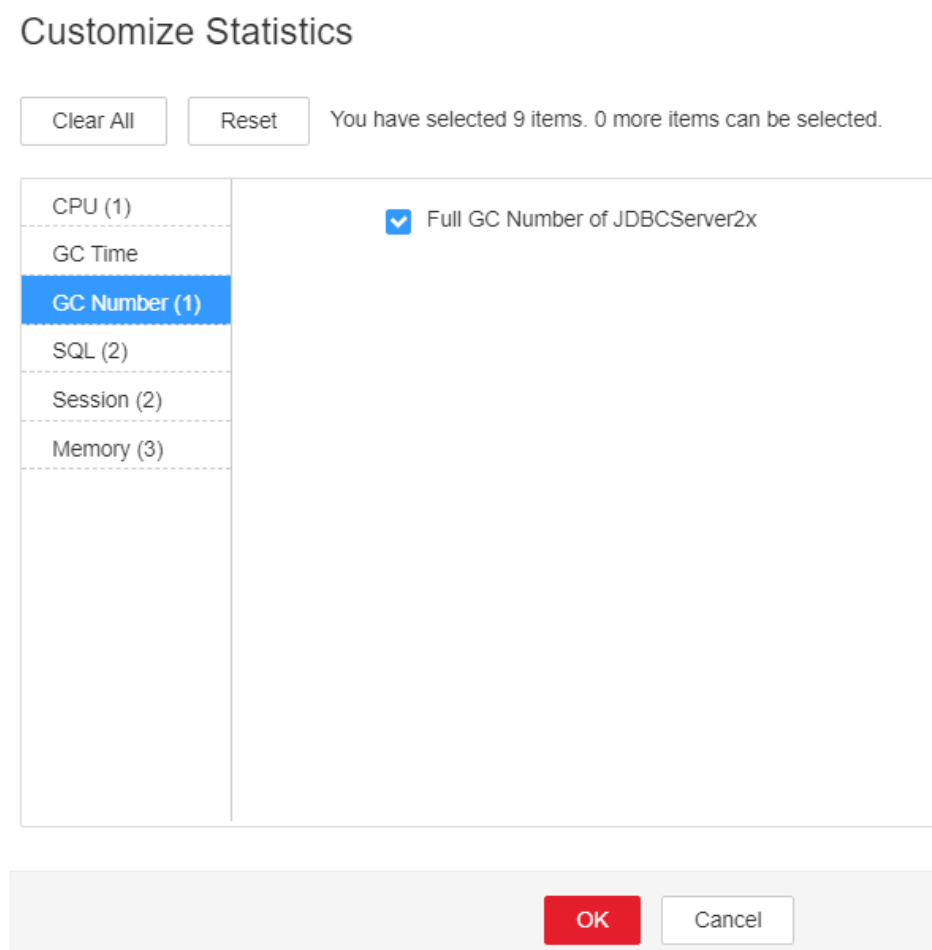

### Check the number of Full GCs.

- Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, select this alarm, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.

- Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. On the displayed page, click the JDBCServer2x for which the alarm is reported. On the **Dashboard** page that is displayed, click the drop-down menu in the Chart area and choose **Customize** > **GC Number** > **Full GC Number of JDBCServer2x** in the upper right corner and click **OK**. Check whether the number of Full GCs of the JDBCServer2x process is greater than the threshold (default value: 12).
- If it is, go to **Step 3**.
  - If it is not, go to **Step 6**.

**Figure 10-99** Full GC Number of JDBCServer2x

- Step 3** Choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations**. On the displayed page, choose **JDBCServer2x** > **Tuning**. The default value of **SPARK\_DRIVER\_MEMORY** is 4GB. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. If the alarm is frequently reported, increase the value by 1 time. In the case of large service volume and high concurrency, add instances.

- Step 4** Restart all JDBCServer2x instances.

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

**Step 5** After 10 minutes, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 6](#).

**Collect fault information.**

**Step 6** Log in to FusionInsight Manager, and choose **O&M > Log > Download**.

**Step 7** Select **Spark2x** in the required cluster from the **Service** drop-down list.

**Step 8** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

# 10.266 ALM-43018 JobHistory2x Process Full GC Number Exceeds the Threshold

## Description

The system checks the number of Full garbage collection (GC) times of the JobHistory2x process every 60 seconds. This alarm is generated when the detected Full GC number exceeds the threshold (exceeds 12 for three consecutive checks.) You can change the threshold by choosing **O&M > Alarm > Thresholds > Name of the desired cluster > Spark2x > GC number > Full GC Number of JobHistory2x**. This alarm is cleared when the Full GC number of the JobHistory2x process is less than or equal to the threshold.

### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JobHistory2x is changed to JobHistory. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
43018	Major	Yes

## Parameters

Name	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

The performance of the JobHistory2x process is affected, or even the JobHistory2x process is unavailable.

## Possible Causes

The heap memory usage of the JobHistory2x process is excessively large, or the heap memory is inappropriately allocated. As a result, Full GC occurs frequently.

## Procedure

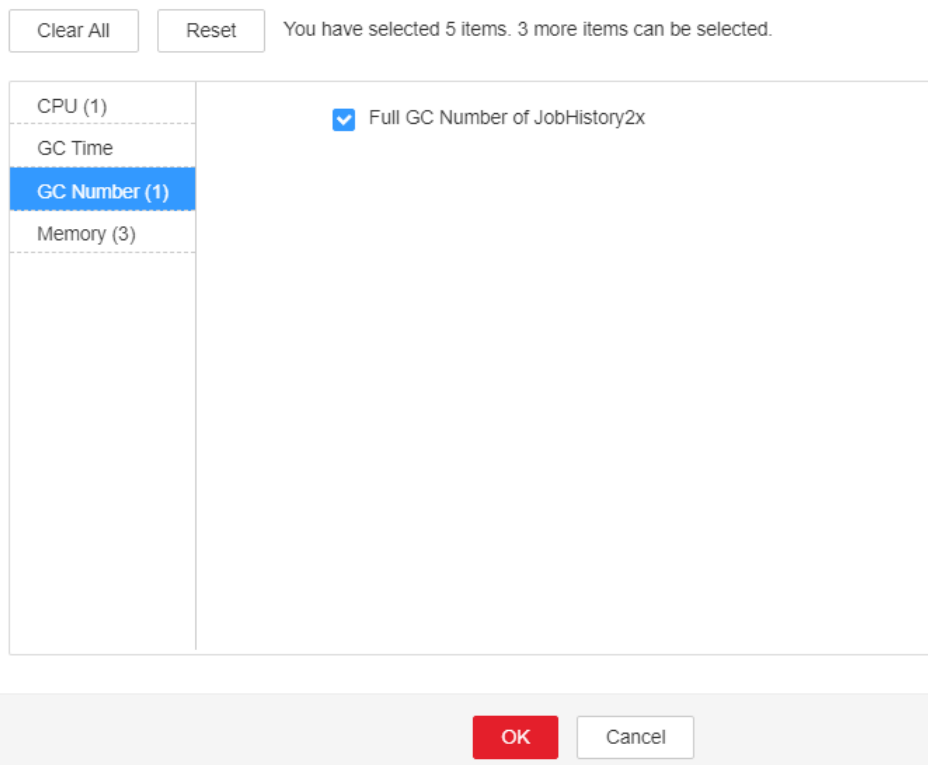

### Check the number of Full GCs.

- Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, select this alarm, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** Choose **Cluster > Name of the desired cluster > Services > Spark2x > Instance**. On the displayed page, click the JobHistory2x for which the alarm is reported. On the **Dashboard** page that is displayed, click the drop-down menu in the Chart area and choose **Customize > GC Number > Full GC Number of JobHistory2x** in the upper right corner and click **OK**. Check whether the number of Full GCs of the JobHistory2x process is greater than the threshold(default value: 12).
  - If it is, go to **Step 3**.

- If it is not, go to [Step 6](#).

**Figure 10-100** Full GC Number of JobHistory2x

### Customize Statistics

**Step 3** Choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations**. On the displayed page, choose **JobHistory2x** > **Default**. The default value of **SPARK\_DAEMON\_MEMORY** is 4GB. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. If the alarm is frequently reported, increase the value by 1 time.

**Step 4** Restart all JobHistory2x instances.

#### NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

**Step 5** After 10 minutes, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 6](#).

#### Collect fault information.

**Step 6** Log in to FusionInsight Manager, and choose **O&M** > **Log** > **Download**.

**Step 7** Select **Spark2x** in the required cluster from the **Service**.

**Step 8** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

# 10.267 ALM-43019 Heap Memory Usage of the IndexServer2x Process Exceeds the Threshold

## Description

The system checks the IndexServer2x process status every 30 seconds. The alarm is generated when the heap memory usage of a IndexServer2x process exceeds the threshold (95% of the maximum memory).

### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, IndexServer2x is changed to IndexServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

Alarm ID	Severity	Auto Clear
43019	Major	Yes

## Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Parameter	Description
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

If the available IndexServer2x process heap memory is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The heap memory of the IndexServer2x process is overused or the heap memory is inappropriately allocated.

## Procedure

**Check the heap memory usage.**

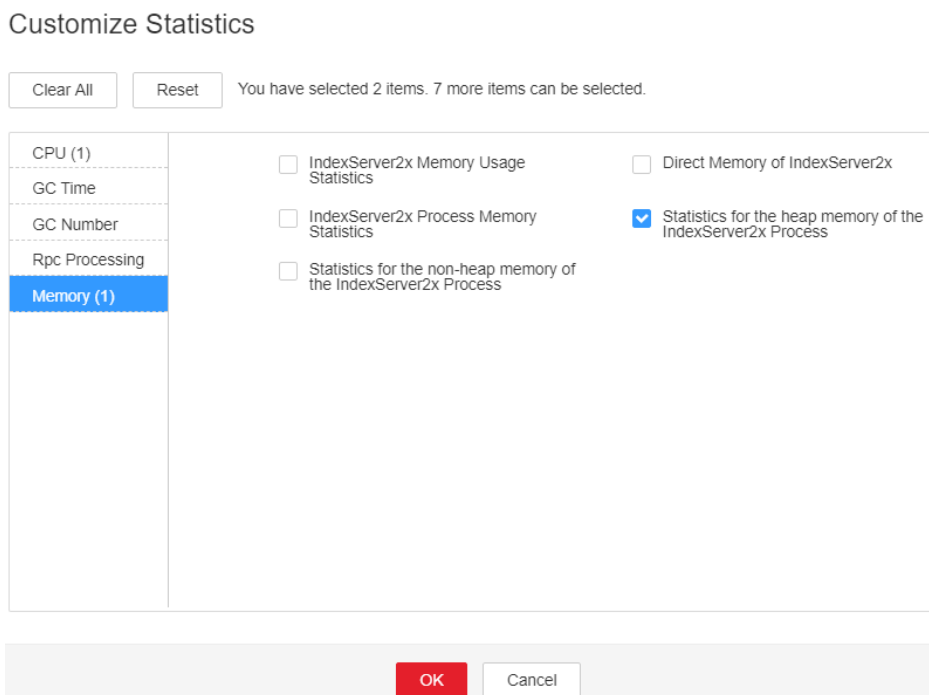

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. In the displayed alarm list, choose the alarm for which the ID is **43019**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > Spark2x > Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize > Memory > IndexServer2x Memory Usage Statistics > OK**. Check whether the heap memory used by the IndexServer2x process reaches the maximum heap memory threshold (95% by default).
- If the threshold is reached, go to **Step 3**.
  - If the threshold is not reached, go to **Step 7**.

**Figure 10-101** IndexServer2x Memory Usage Statistics

**Step 3** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **Statistics for the heap memory of the IndexServer2x Process** > **OK**. Based on the alarm generation time, check the values of the used heap memory of the IndexServer2x process in the corresponding period and obtain the maximum value.

**Figure 10-102** Statistics for the heap memory of the IndexServer2x Process

**Step 4** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > Spark2x > Configurations > All Configuration > IndexServer2x > Tuning**. The default value of the **SPARK\_DRIVER\_MEMORY** parameter is 4 GB. You can change the value based on the ratio of the maximum heap memory used by the IndexServer2x process to the threshold specified by **IndexServer2x Heap Memory Usage Statistics (IndexServer2x)** in the alarm period. If the alarm persists after the parameter value is changed, increase the value by 0.5 times. If the alarm is generated frequently, double the rate.

**NOTE**

On FusionInsight Manager, you can choose **O&M > Alarm > Thresholds > Name of the desired cluster > Spark2x > Memory > IndexServer2x Heap Memory Usage Statistics (IndexServer2x)** to view the threshold.

**Step 5** Restart all IndexServer2x instances.

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

**Step 6** After 10 minutes, check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to [Step 7](#).

**Collect fault information.**

**Step 7** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 8** Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and provide the collected logs.

# 10.268 ALM-43020 Non-Heap Memory Usage of the IndexServer2x Process Exceeds the Threshold

## Description

The system checks the IndexServer2x process status every 30 seconds. The alarm is generated when the non-heap memory usage of the IndexServer2x process exceeds the threshold (95% of the maximum memory).

### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, IndexServer2x is changed to IndexServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

Alarm ID	Severity	Auto Clear
43020	Major	Yes

## Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

If the available IndexServer2x process non-heap memory is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

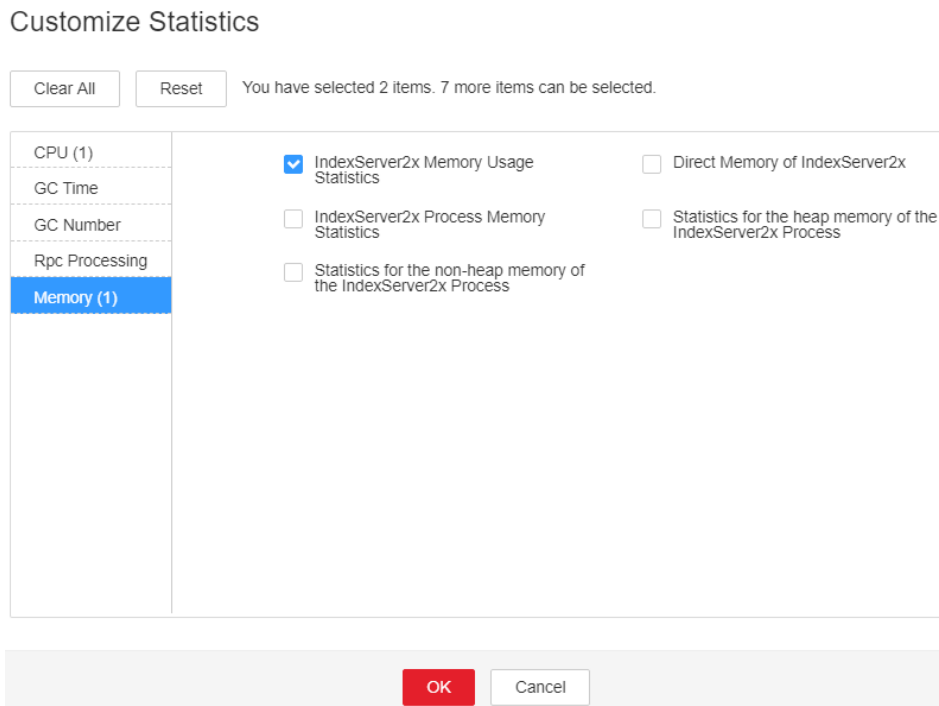

The non-heap memory of the IndexServer2x process is overused or the non-heap memory is inappropriately allocated.

## Procedure

**Check non-heap memory usage.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. In the displayed alarm list, choose the alarm for which the ID is **43020**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > Spark2x > Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize > Memory > IndexServer2x Memory Usage Statistics > OK**. Check whether the non-heap memory used by the IndexServer2x process reaches the maximum non-heap memory threshold (95% by default).
  - If the threshold is reached, go to **Step 3**.
  - If the threshold is not reached, go to **Step 7**.

**Figure 10-103** IndexServer2x Memory Usage Statistics

**Step 3** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **Statistics for the non-heap memory of the IndexServer2x Process** > **OK**. Based on the alarm generation time, check the values of the used non-heap memory of the IndexServer2x process in the corresponding period and obtain the maximum value.

**Step 4** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > Spark2x > Configurations > All Configurations > IndexServer2x > Tuning**. You can change the value of **XX:MaxMetaspaceSize** in the **spark.driver.extraJavaOptions** parameter based on the ratio of the maximum non-heap memory used by the IndexServer2x process to the threshold specified by **IndexServer2x Non-Heap Memory Usage Statistics (IndexServer2x)** in the alarm period.

**NOTE**

On FusionInsight Manager, you can choose **O&M > Alarm > Thresholds > Name of the desired cluster > Spark2x > Memory > IndexServer2x Non-Heap Memory Usage Statistics (IndexServer2x)** to view the threshold.

**Step 5** Restart all IndexServer2x instances.

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

**Step 6** After 10 minutes, check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to [Step 7](#).

**Collect fault information.**

**Step 7** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 8** Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and provide the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Reference

None

# 10.269 ALM-43021 Direct Memory Usage of the IndexServer2x Process Exceeds the Threshold

## Description

The system checks the IndexServer2x process status every 30 seconds. The alarm is generated when the direct heap memory usage of a IndexServer2x process exceeds the threshold (95% of the maximum memory).

### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, IndexServer2x is changed to IndexServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

Alarm ID	Severity	Auto Clear
43021	Major	Yes

## Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Parameter	Description
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

If the available IndexServer2x process direct memory is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The direct heap memory of the IndexServer2x process is overused or the direct heap memory is inappropriately allocated.

## Procedure

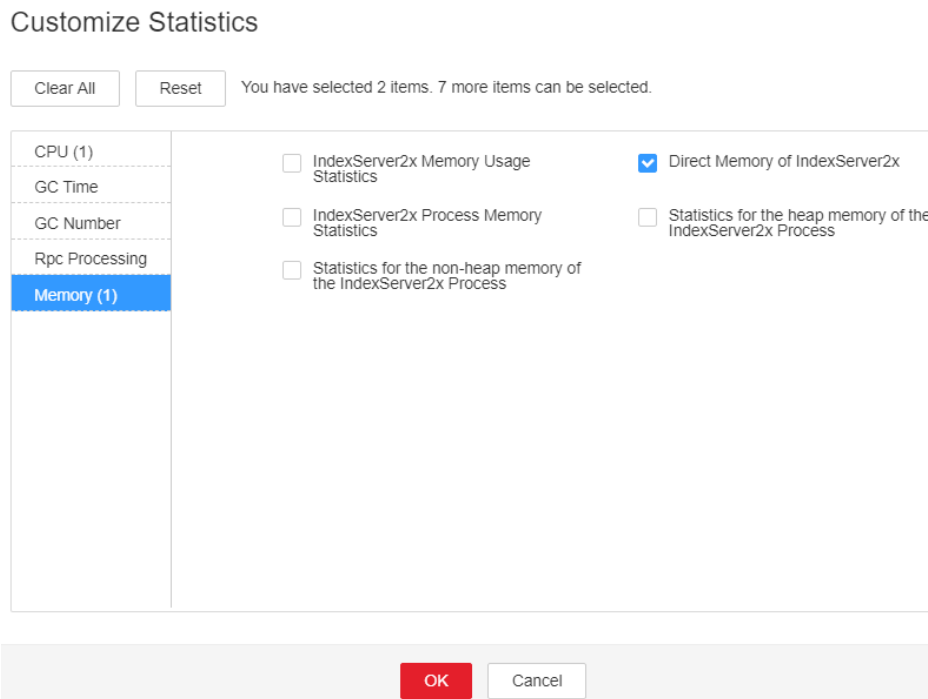

**Check direct heap memory usage.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. In the displayed alarm list, choose the alarm for which the ID is **43021**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > Spark2x > Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize > Memory > IndexServer2x Memory Usage Statistics > OK**. Check whether the direct memory used by the IndexServer2x process reaches the maximum direct memory threshold.
- If the threshold is reached, go to **Step 3**.
  - If the threshold is not reached, go to **Step 7**.

**Figure 10-105** IndexServer2x Memory Usage Statistics

**Step 3** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **Direct Memory of IndexServer2x** > **OK**. Based on the alarm generation time, check the values of the used direct memory of the IndexServer2x process in the corresponding period and obtain the maximum value.

**Figure 10-106** Direct Memory of IndexServer2x

**Step 4** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations** > **IndexServer2x> Tuning**. You can change the value of **XX:MaxDirectMemorySize** (the default value is 512 MB) in the **spark.driver.extraJavaOptions** parameter based on the ratio of the maximum direct memory used by the IndexServer2x process to the threshold specified by **IndexServer2x Direct Memory Usage Statistics (IndexServer2x)** in the alarm period. If the alarm persists after the parameter value is changed, increase the value by 0.5 times. If the alarm is generated frequently, double the rate.

**NOTE**

On FusionInsight Manager, you can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **Memory** > **IndexServer2x Direct Memory Usage Statistics (IndexServer2x)** to view the threshold.

**Step 5** Restart all IndexServer2x instances.

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

**Step 6** After 10 minutes, check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to [Step 7](#).

**Collect fault information.**

**Step 7** On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

**Step 8** Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and provide the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Reference

None

# 10.270 ALM-43022 IndexServer2x Process GC Time Exceeds the Threshold

## Description

The system checks the GC time of the IndexServer2x process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (12 seconds) for three consecutive times. To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Spark2x > GC Time > Total GC time in milliseconds (IndexServer2x)**. This alarm is cleared when the IndexServer2x GC time is shorter than or equal to the threshold.

### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, IndexServer2x is changed to IndexServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

Alarm ID	Severity	Auto Clear
43022	Major	Yes

## Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

If the GC time exceeds the threshold, IndexServer2x may run in low performance or even unavailable.

## Possible Causes

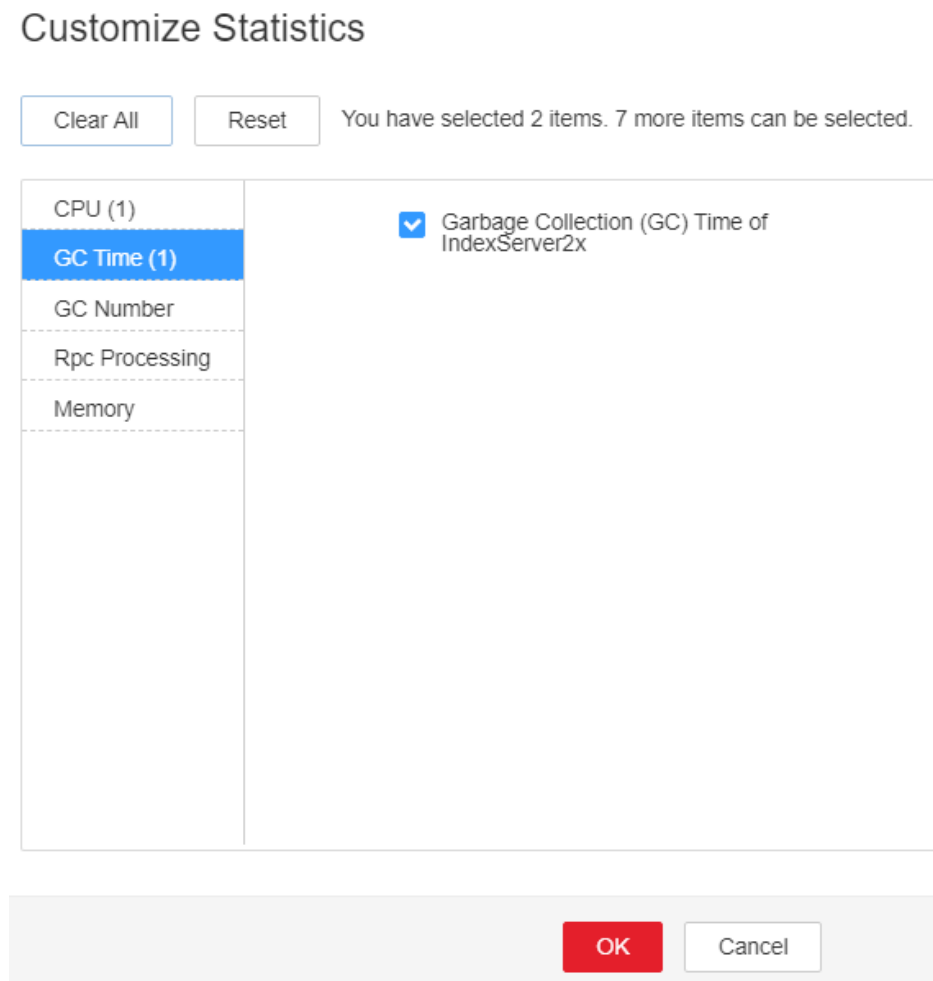

The heap memory of the IndexServer2x process is overused or the heap memory is inappropriately allocated. As a result, GC occurs frequently.

## Procedure

### Check the GC time.

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. In the displayed alarm list, choose the alarm with ID **43022**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > Spark2x > Instance** and click the IndexServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize > GC Time > Garbage Collection (GC) Time of IndexServer2x** from the drop-down list box in the upper right corner and click **OK** to check whether the GC time is longer than the threshold (default value: 12 seconds).
  - If the threshold is reached, go to **Step 3**.
  - If the threshold is not reached, go to **Step 6**.

**Figure 10-107** Garbage Collection (GC) Time of IndexServer2x

**Step 3** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations** > **IndexServer2x** > **Default**. The default value of the **SPARK\_DRIVER\_MEMORY** is 4 GB. You can change the value according to the following rules: Increase the value of the **SPARK\_DRIVER\_MEMORY** parameter 1.5 times to its default value. If this alarm is still generated occasionally after the adjustment, increase the value by 0.5 times. Double the value if the alarm is reported frequently.

**Step 4** Restart all IndexServer2x instances.

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

**Step 5** After 10 minutes, check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to [Step 6](#).

**Collect fault information.**

- Step 6** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and provide the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Reference

None

# 10.271 ALM-43023 IndexServer2x Process Full GC Number Exceeds the Threshold

## Description

The system checks the Full GC number of the IndexServer2x process every 60 seconds. This alarm is generated when the detected Full GC number exceeds the threshold (12) for three consecutive times. You can change the threshold by choosing **O&M > Alarm > Thresholds > Name of the desired cluster > Spark2x > GC Number > Full GC Number of IndexServer2x**. This alarm is cleared when the Full GC number of the IndexServer2x process is less than or equal to the threshold. This alarm is cleared when the Full GC number of the IndexServer2x process is less than or equal to the threshold.

### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, IndexServer2x is changed to IndexServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

Alarm ID	Severity	Auto Clear
43023	Major	Yes

## Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

If the GC number exceeds the threshold, IndexServer2x maybe run in low performance or even unavailable.

## Possible Causes

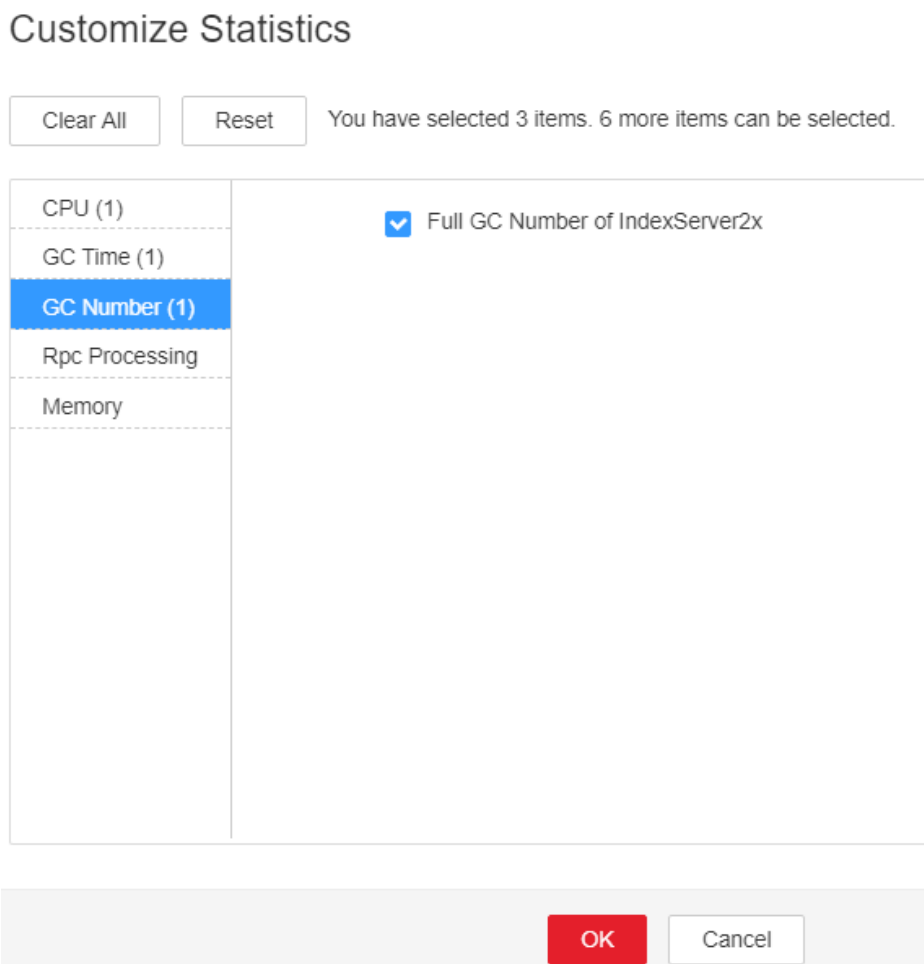

The heap memory of the IndexServer2x process is overused or the heap memory is inappropriately allocated. As a result, Full GC occurs frequently.

## Procedure

### Check the number of Full GCs.

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. In the displayed alarm list, choose the alarm with the ID **43023**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > Spark2x > Instance** and click the IndexServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the chart area and choose **Customize > GC Number > Full GC Number of IndexServer2x** from the drop-down list box in the upper right corner and click **OK** to check whether the GC number is larger than the threshold (default value: 12).
  - If the threshold is reached, go to [Step 3](#).
  - If the threshold is not reached, go to [Step 6](#).

**Figure 10-108** Full GC Number of IndexServer2x

**Step 3** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations** > **IndexServer2x** > **Tuning**. The default value of the **SPARK\_DRIVER\_MEMORY** is 4 GB. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. Double the value if the alarm is reported frequently. In the case of large service volume and high service concurrency, you are advised to add instances.

**Step 4** Restart all IndexServer2x instances.

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

**Step 5** After 10 minutes, check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to [Step 6](#).

**Collect fault information.**

- Step 6** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected fault logs.
- End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Reference

None

# 10.272 ALM-44000 Presto Service Unavailable

## Alarm Description

The system checks the Presto service status every 60 seconds. This alarm is generated when the system detects that Presto is unavailable.

This alarm is cleared when the Presto service recovers.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
44000	Critical	Yes

## Alarm Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

Presto cannot run SQL queries.

## Possible Causes

- The Presto coordinator or worker process is faulty.
- The network communication between Presto coordinator and worker instances is interrupted.

## Handling Procedure

**Step 1** Check the status of the coordinator and worker processes.

1. Log in to FusionInsight Manager and choose **Cluster > Services > Presto**. On the page that is displayed, click the **Instance** tab. In the Presto instance list, check whether the status of all coordinator or worker instances is **Unknown**.
  - If yes, go to **2**.
  - If no, go to **1**.
2. In the upper part of the Presto instance list, choose **More > Restart Service** to restart the coordinator and worker processes.
3. In the alarm list, check whether ALM-44000 Presto Service Unavailable is cleared.
  - If yes, no further action is required.
  - If no, go to **1** in **Step 2**.

**Step 2** Collect fault information.

1. On FusionInsight Manager, choose **System > Export Log**.
2. Select **Presto** for **Service**.
3. Click  in the upper right corner.  
Set **Start Time** and **End Time** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **OK**.
4. Contact the O&M engineers and send the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

# 10.273 ALM-44004 Presto Coordinator Resource Group Queuing Tasks Exceed the Threshold

## Alarm Description

This alarm is generated when the system detects that the number of queuing tasks in a resource group exceeds the threshold. The system queries the number of queuing tasks in a resource group through the JMX interface. You can choose **Components > Presto > Service Configuration** (switch **Basic** to **All**) > **Presto > resource-groups** to configure a resource group. You can choose **Components > Presto > Service Configuration** (switch **Basic** to **All**) > **Coordinator > Customize > resourceGroupAlarm** to configure the threshold of each resource group.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
44004	Major	Yes

## Alarm Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

If the number of queuing tasks in a resource group exceeds the threshold, a large number of tasks may be in the queuing state. The Presto task time exceeds the expected value. When the number of queuing tasks in a resource group exceeds the maximum number (**maxQueued**) of queuing tasks in the resource group, new tasks cannot be executed.

## Possible Causes

The resource group configuration is improper or too many tasks in the resource group are submitted.

## Handling Procedure

- Step 1** Choose **Components > Presto > Service Configuration** (switch **Basic** to **All**) > **Presto > resource-groups** to adjust the resource group configuration.
- Step 2** You can choose **Components > Presto > Service Configuration** (switch **Basic** to **All**) > **Coordinator > Customize > resourceGroupAlarm** to modify the threshold of each resource group.
- Step 3** Collect the fault information.
  - Log in to the cluster node based on the host name in the fault information and query the number of queuing tasks based on **Resource Group** in the additional information on the Presto client.
  - Log in to the cluster node based on the host name in the fault information, view the **/var/log/Bigdata/nodeagent/monitorlog/monitor.log** file, and search for resource group information to view the monitoring collection information of the resource group.

3. Contact O&M personnel and send the collected logs.

----End

# 10.274 ALM-44005 Presto Coordinator Process GC Time Exceeds the Threshold

## Description

The system collects GC time of the Presto Coordinator process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). You can change the threshold by choosing **System > Configure Alarm Threshold > Service > Presto > Coordinator > Presto Process Garbage Collection Time > Garbage Collection Time of the Coordinator Process** on MRS Manager. This alarm is cleared when the Coordinator process GC time is less than or equal to the threshold.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
44005	Major	Yes

## Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

## Impact on the System

If the GC time of the Coordinator process is too long, the Coordinator process running performance will be affected and the Coordinator process will even be unavailable.

## Possible Causes

The heap memory of the Coordinator process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

## Procedure

### Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.

#### NOTE

For MRS 1.8.10 or earlier, log in to MRS Manager and choose **Alarms**.

2. Select the alarm whose **Alarm ID** is **44005** and then check the role name in **Location** and confirm the IP address of the instance.
3. Choose **Components > Presto > Instances > Coordinator** (business IP address of the instance for which the alarm is generated) > **Customize > Presto Garbage Collection Time**. Click **OK** to view the GC time.
4. Check whether the GC time of the Coordinator process is longer than 5 seconds.
  - If yes, go to [Step 1.5](#).
  - If no, go to [Step 2](#).
5. Choose **Components > Presto > Service Configuration**, and switch **Basic** to **All**. Choose **Presto > Coordinator**. Increase the value of **-Xmx** (maximum heap memory) in the **JAVA\_OPTS** parameter based on the site requirements.
6. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

### Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

# 10.275 ALM-44006 Presto Worker Process GC Time Exceeds the Threshold

## Description

The system collects GC time of the Presto Worker process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). You can change the threshold by choosing **System > Configure Alarm Threshold > Service > Presto > Worker > Presto Garbage Collection Time > Garbage Collection Time of the Worker Process** on MRS Manager. This alarm is cleared when the Worker process GC time is shorter than or equal to the threshold.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
44006	Major	Yes

## Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

## Impact on the System

If the GC time of the Worker process is too long, the Worker process running performance will be affected and the Worker process will even be unavailable.

## Possible Causes

The heap memory of the Worker process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

## Procedure

### Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.

#### NOTE

For MRS 1.8.10 or earlier, log in to MRS Manager and choose **Alarms**.

2. Select the alarm whose **Alarm ID** is **44006**. Then check the role name in **Location** and confirm the IP address of the instance.
3. Choose **Components > Presto > Instances > Worker** (business IP address of the instance for which the alarm is generated) **> Customize > Presto Garbage Collection Time**. Click **OK** to view the GC time.
4. Check whether the GC time of the Worker process is longer than 5 seconds.
  - If yes, go to [Step 1.5](#).
  - If no, go to [Step 2](#).
5. Choose **Components > Presto > Service Configuration**, and switch **Basic** to **All**, and choose **Presto > Worker** Increase the value of **-Xmx** (maximum heap memory) in the **JAVA\_OPTS** parameter based on the site requirements.
6. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

# 10.276 ALM-45000 HetuEngine Service Unavailable

## Alarm Description

The system checks the HetuEngine service status every 300 seconds. This alarm is generated when the HetuEngine service is unavailable.

This alarm is cleared when the HetuEngine service recovers.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45000	Critical	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

HetuEngine tasks fail to execute.

## Possible Causes

- The KrbServer service is abnormal.
- The ZooKeeper service is abnormal.
- The HDFS service is abnormal.
- The Yarn service is abnormal.
- The DBService service is abnormal.
- The Hive service is abnormal.
- There are no HSBroker instances in HetuEngine.

## Handling Procedure

### Check the KrbServer service status.

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarm**.

**Step 2** In the alarm list, check whether the "ALM-25500 KrbServer Service Unavailable" alarm is generated.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

**Step 3** Clear "ALM-25500 KrbServer Service Unavailable" according to the alarm help.

**Step 4** In the alarm list, check whether the alarm "ALM-45000 HetuEngine Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

### Check the ZooKeeper service status.

**Step 5** In the alarm list, check whether the alarm "ALM-12007 Process Fault" is generated.

- If yes, go to [Step 6](#).
- If no, go to [Step 9](#).

**Step 6** In the alarm list, click  in the row that contains the "Process Fault" alarm. Check whether the name of the service for which the alarm is generated is ZooKeeper in **Location Information**.

- If yes, go to [Step 7](#).
- If no, go to [Step 9](#).

**Step 7** Clear "ALM-12007 Process Fault" according to the alarm help.

**Step 8** In the alarm list, check whether the alarm "ALM-45000 HetuEngine Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

### Check the HDFS service status.

**Step 9** In the alarm list, check whether the "ALM-14000 HDFS Service Unavailable" alarm is generated.

- If yes, go to [Step 10](#).
- If no, go to [Step 12](#).

**Step 10** Clear "ALM-14000 HDFS Service Unavailable" according to the alarm help.

**Step 11** In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

**Check the YARN service status.**

**Step 12** In the alarm list, check whether the "ALM-18000 YARN Service Unavailable" alarm is generated.

- If yes, go to [Step 13](#).
- If no, go to [Step 15](#).

**Step 13** Clear "ALM-18000 YARN Service Unavailable" according to the alarm help.

**Step 14** In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 15](#).

**Check the DBService service status.**

**Step 15** In the alarm list, check whether the "ALM-27001 DBService Service Unavailable" alarm is generated.

- If yes, go to [Step 16](#).
- If no, go to [20](#).

**Step 16** Clear "ALM-27001 DBService Service Unavailable" according to the alarm help.

**Step 17** In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to [20](#).

**Check the Hive service status.**

**Step 18** In the alarm list, check whether the "ALM-16004 Hive Service Unavailable" alarm is generated.

- If yes, go to [Step 19](#).
- If no, go to [20](#).

**Step 19** Clear "ALM-16004 Hive Service Unavailable" according to the alarm help.

**Step 20** In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to [20](#).

**Check whether there are no HSBroker instances in HetuEngine.**

- Step 21** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HetuEngine**. On the page that is displayed, click the **Instance** tab.
- Step 22** Check whether there are no HSBroker instances.
- If yes, click **Add Instance** to add one.
  - If no, go to [23](#).
- Step 23** In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.
- If yes, no further action is required.
  - If no, go to [23](#).
- Check the network connection between HetuEngine and ZooKeeper, HDFS, YARN, DBService, and Hive.**
- Step 24** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HetuEngine**. On the page that is displayed, click the **Instance** tab.
- Step 25** Click the host name in the **HSBroker** row and record the management IP address in the **Basic Information** area.
- Step 26** Log in to the host where HSBroker resides as user **omm** using the IP address obtained in [Step 25](#).
- Step 27** Run the **ping** command to check whether the network connection between the host where HSBroker resides and the hosts where ZooKeeper, HDFS, Yarn, DBService, and Hive reside is in the normal state.
- If yes, go to [Step 30](#).
  - If no, go to [Step 28](#).
- Step 28** Contact the network administrator to restore the network.
- Step 29** In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 30](#).
- Collect fault information.**
- Step 30** On FusionInsight Manager, choose **O&M** > **Log** > **Download**.
- Step 31** Expand the **Service** drop-down list. In the **Services** dialog box that is displayed, select **HetuEngine** under the target cluster name, and click **OK**.
- Step 32** Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.
- Step 33** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.
- Step 34** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

## Reference

None

# 10.277 ALM-45001 Faulty HetuEngine Compute Instances

This alarm applies only to MRS 3.2.0 or later.

## Alarm Description

The system checks the HetuEngine compute instance status every 60 seconds. This alarm is generated when a HetuEngine compute instance is faulty.

This alarm is cleared when all faulty HetuEngine compute instances are restored.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45001	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

HetuEngine tasks fail to execute.

## Possible Causes

- The HDFS service is abnormal.

- The Yarn service is abnormal.
- Yarn queue resources are insufficient.
- The process of compute instances is faulty.

## Handling Procedure

### Check the HDFS service status.

**Step 1** In the alarm list, check whether the "ALM-14000 HDFS Service Unavailable" alarm is generated.

- If yes, go to [Step 2](#).
- If no, go to [Step 4](#).

**Step 2** Clear "ALM-14000 HDFS Service Unavailable" according to the alarm help.

**Step 3** In the alarm list, check whether the "ALM-45001 Faulty HetuEngine Compute Instances" alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

### Check the YARN service status.

**Step 4** In the alarm list, check whether the "ALM-18000 YARN Service Unavailable" alarm is generated.

- If yes, go to [Step 5](#).
- If no, go to [Step 7](#).

**Step 5** Clear "ALM-18000 YARN Service Unavailable" according to the alarm help.

**Step 6** In the alarm list, check whether the "ALM-45001 Faulty HetuEngine Compute Instances" alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

### Check the YARN queue resource status.

**Step 7** In the alarm list, check whether the "ALM-18022 Insufficient YARN Queue Resources" alarm is generated.

- If yes, go to [8](#).
- If no, go to [Step 10](#).

**Step 8** Clear "ALM-18022 Insufficient YARN Queue Resources" according to the alarm help.

**Step 9** In the alarm list, check whether the "ALM-45001 Faulty HetuEngine Compute Instances" alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

### Check the HetuEngine compute instance status.

**Step 10** Log in to FusionInsight Manager as an administrator who can access the HetuEngine web UI and choose **Cluster > Services > HetuEngine**.

- Step 11** In the **Basic Information** area on the **Dashboard** tab page, click the link next to **HSConsole WebUI** to access the HSConsole page.
- Step 12** On the compute instance page, check whether any compute instances are in the **FAULT** state.
- If yes, go to **Step 13**.
  - If no, go to **Step 14**.
- Step 13** In the **Operation** column of the target compute instance, click **Start** and wait until the instance is started.
- Step 14** In the alarm list, check whether the "ALM-45001 Faulty HetuEngine Compute Instances" alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 15**.
- Collect fault information.**
- Step 15** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 16** Expand the **Service** drop-down list. In the **Services** dialog box that is displayed, select **HetuEngine** under the target cluster name, and click **OK**.
- Step 17** Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.
- Step 18** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.
- Step 19** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 10.278 ALM-45003 HetuEngine QAS Disk Capacity Is Insufficient

This section applies to MRS 3.3.0 or later.

## Alarm Description

The system checks the HetuEngine QAS disk usage every 60 seconds and compares the actual disk usage with the threshold. The disk usage has a default threshold. This alarm is generated if the disk usage exceeds the threshold.

To change the threshold, choose **O&M > Alarm > Thresholds**. In the service list, choose **HetuEngine > Disk > QAS Disk Usage (QAS)**.

If the **Trigger Count** is **1**, this alarm is cleared when the usage of the HetuEngine QAS disk is less than or equal to the threshold. If the **Trigger Count** is greater than **1**, this alarm is cleared when the disk usage is less than or equal to 80% of the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45003	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PartitionName	Specifies the disk partition for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

If the disk capacity is insufficient, QAS fails to write data, affecting SQL diagnosis and automatic recommendation of materialized views.

## Possible Causes

- The alarm threshold is improperly configured.
- The configuration of the HetuEngine QAS disk cannot meet service requirements. The disk usage reaches the upper limit.

## Handling Procedure

**Check whether the threshold is set properly.**

**Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Thresholds**. In the service list, choose **HetuEngine > Disk > QAS Disk Usage (QAS)**. Check whether the alarm threshold is set properly. The default threshold is 80% of the disk capacity. You can change the threshold as required.

- If the threshold is set properly, go to [Step 4](#).
- If the threshold is not set properly, go to [Step 2](#).

**Step 2** Click **Modify** in the **Operation** column to modify and save the alarm threshold as required.

**Step 3** Wait 2 minutes and check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to [Step 4](#).

**Check whether the disk usage reaches the upper limit.**

**Step 4** Expand the alarm information, view the information in the **Location** area, and check the role name and host name of the QAS disk where the alarm is generated.

**Step 5** Choose **Cluster > Services > HetuEngine** and click **Instance**. On the displayed page, click the QAS role name in the alarm information. On the instance page that is displayed, click **Chart** and check whether the QAS disk usage in the **QAS Disk Usage** chart exceeds the threshold (80% of the disk capacity by default).

- If the disk usage reaches the upper limit, go to [Step 6](#).
- If the disk usage does not reach the upper limit, go to [Step 9](#).

**Step 6** Log in to the host of the node where the QAS instance reporting the alarm is located as the **root** user.

**Step 7** Run the following command to go to the QAS data directory and delete temporary files as required:

```
cd ${BIGDATA_DATA_HOME}/hetuengine/qas
```

---

**NOTICE**

Deleting temporary files affects the latest QAS execution result but does not affect subsequent results.

---

**Step 8** Wait 2 minutes and check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm fails to be cleared, go to [Step 9](#).

**Collect fault information.**

**Step 9** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 10** Expand the **Service** drop-down list, select **HetuEngine** for the target cluster, and click **OK**.

**Step 11** Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

**Step 12** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 13** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

# 10.279 ALM-45175 Average Time for Calling OBS Metadata APIs Is Greater than the Threshold

## Alarm Description

The system checks whether the average duration for calling OBS metadata APIs is greater than the threshold every 30 seconds. This alarm is generated when the number of consecutive times that the average time exceeds the specified threshold is greater than the number of smoothing times.

This alarm is automatically cleared when the average duration for calling the OBS metadata APIs is lower than the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45175	Minor	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Parameter	Description
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

If the average time for calling the OBS metadata APIs exceeds the threshold, the upper-layer big data computing services may be affected. To be more specific, the execution time of some computing tasks will exceed the threshold.

## Possible Causes

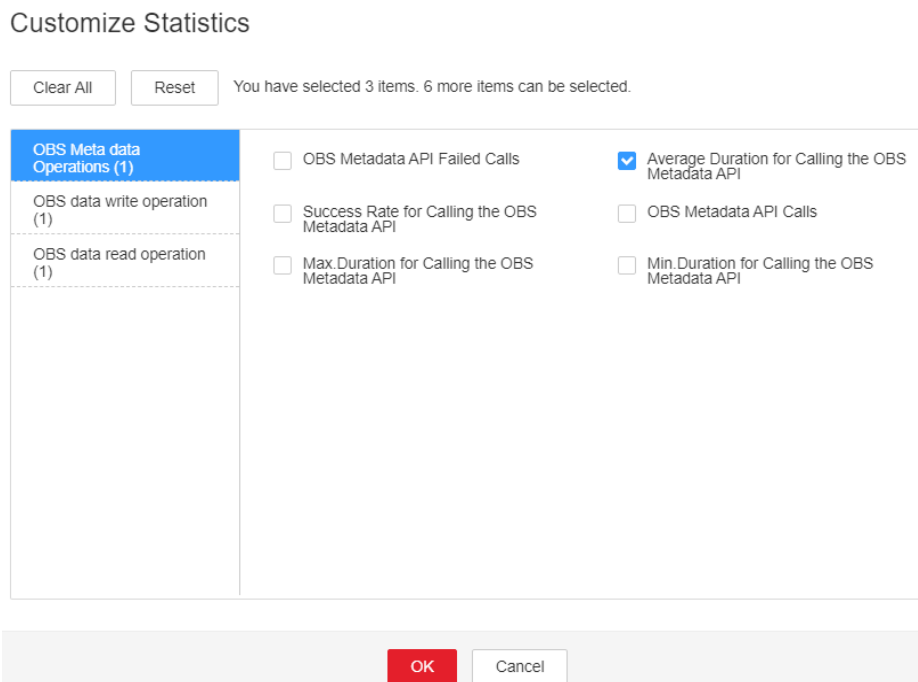

Frame freezing occurs on the OBS server, or the network between the OBS client and the OBS server is unstable.

## Handling Procedure

**Check the heap memory usage.**

- Step 1** On the **FusionInsight Manager** homepage, choose **O&M > Alarm > Alarms > Average Time for Calling the OBS Metadata API Exceeds the Threshold**, view the role name in **Location**, and check the instance IP address.
- Step 2** Choose **Cluster > Name of the desired cluster > Services > meta > Instance > meta** (IP address of the instance for which the alarm is generated). Click the drop-down list in the upper right corner of the chart area and choose **Customize**. In the dialog box that is displayed, select **Average time of OBS interface calls** from **OBS Meta data Operations**, and click **OK**. Check whether the average time of OBS metadata API calls exceeds the threshold.
  - If yes, go to [Step 3](#).
  - If no, go to [Step 5](#).

**Figure 10-109** Average duration for calling the OBS metaData API

**Step 3** Choose **Cluster** > *Name of the desired cluster* > **O&M** > **Alarm** > **Thresholds** > **meta** > **Average Time for Calling the OBS Metadata API**. Increase the threshold or smoothing times as required.

**Step 4** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

#### Collect the fault information.

**Step 5** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

**Step 6** In the **Services** area, select **NodeAgent**, **NodeMetricAgent**, **OmmServer**, and **OmmAgent** under OMS.

**Step 7** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

**Step 8** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

## 10.280 ALM-45176 Success Rate of Calling OBS Metadata APIs Is Lower than the Threshold

### Alarm Description

The system checks whether the success rate of calling OBS metadata APIs is lower than the threshold every 30 seconds. This alarm is generated when the success rate is lower than the threshold.

This alarm is automatically cleared when the success rate of calling APIs for writing OBS data is greater than the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45176	Minor	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

If the success rate of calling the OBS metadata APIs is less than the threshold, the upper-layer big data computing services may be affected. To be more specific, some computing tasks may fail to be executed.

### Possible Causes

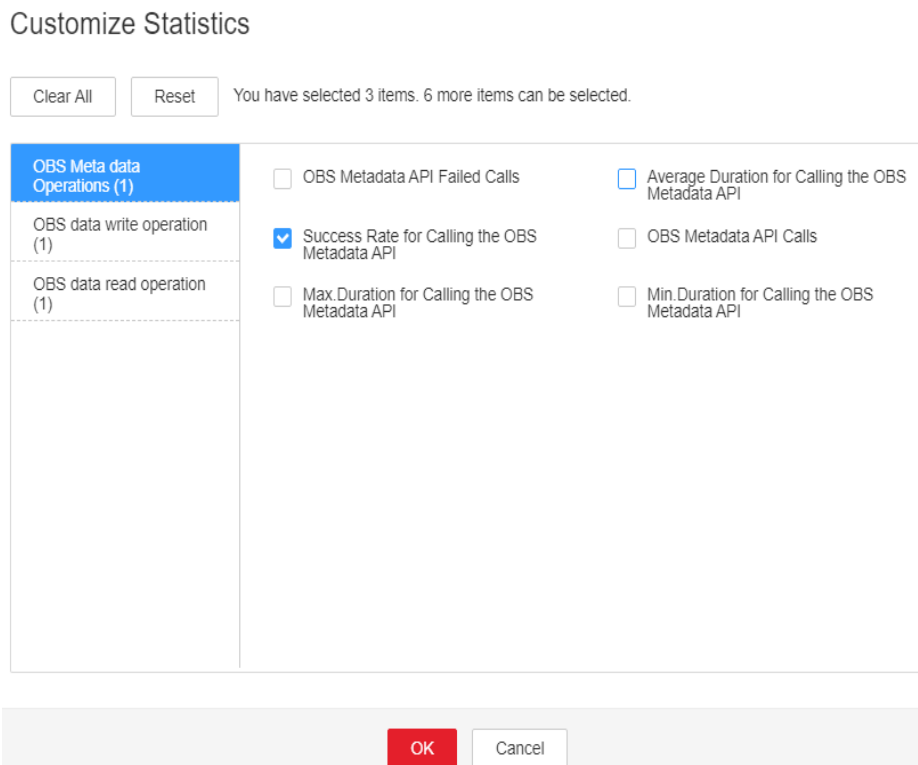

An execution exception or severe timeout occurs on the OBS server.

## Handling Procedure

### Check the heap memory usage.

- Step 1** On the **FusionInsight Manager** homepage, choose **O&M > Alarm > Alarms > Success Rate for Calling the OBS Metadata API Is Lower Than the Threshold**, view the role name in **Location**, and check the instance IP address.
- Step 2** Choose **Cluster > Name of the desired cluster > Services > meta > Instance > meta** (IP address of the instance for which the alarm is generated). Click the drop-down list in the upper right corner of the chart area and choose **Customize**. In the dialog box that is displayed, select **Success percent of OBS interface calls** from **OBS Meta data Operations**, and click **OK**. Check whether the average time of OBS metadata API calls exceeds the threshold.
- If yes, go to **Step 3**.
  - If no, go to **Step 5**.

**Figure 10-110** Successful rate for calling the OBS API

- Step 3** Choose **Cluster > Name of the desired cluster > O&M > Alarm > Thresholds > meta > Success Rate for Calling the OBS Metadata API**. Increase the threshold or smoothing times as required.
- Step 4** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 5**.

### Collect the fault information.

- Step 5** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 6** In the **Services** area, select **NodeAgent**, **NodeMetricAgent**, **OmmServer**, and **OmmAgent** under OMS.

**Step 7** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

**Step 8** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

# 10.281 ALM-45177 Success Rate of Calling OBS Data Read APIs Is Lower than the Threshold

## Alarm Description

The system checks whether the success rate of calling APIs for reading OBS data is lower than the threshold every 30 seconds. This alarm is generated when the success rate is lower than the threshold.

This alarm is automatically cleared when the success rate of calling APIs for reading OBS data is greater than the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45177	Minor	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.

Parameter	Description
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

If the success rate of calling the OBS APIs for reading data is less than the threshold, the upper-layer big data computing services may be affected. To be more specific, some computing tasks may fail to be executed.

## Possible Causes

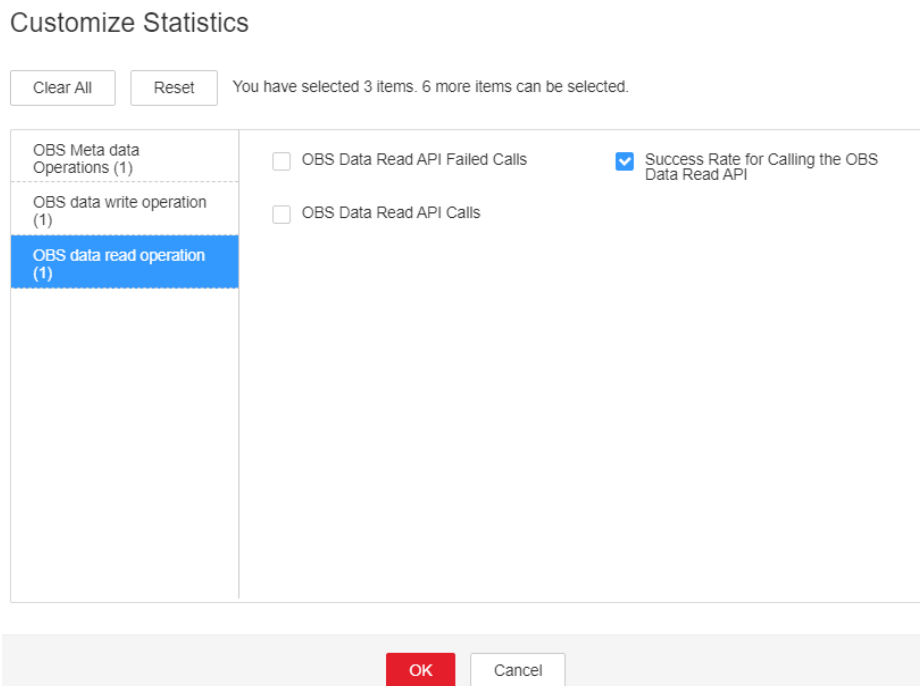

An execution exception or severe timeout occurs on the OBS server.

## Handling Procedure

**Check the heap memory usage.**

- Step 1** On the **FusionInsight Manager** homepage, choose **O&M > Alarm > Alarms > Success Rate for Calling the OBS Data Read API Is Lower Than the Threshold**, view the role name in **Location**, and check the instance IP address.
- Step 2** Choose **Cluster > Name of the desired cluster > Services > meta > Instance > meta** (IP address of the instance for which the alarm is generated). Click the drop-down list in the upper right corner of the chart area and choose **Customize**. In the dialog box that is displayed, select **Success percent of OBS data read operation interface calls** from **OBS data read operation**, and click **OK**. Check whether the average time of OBS metadata API calls exceeds the threshold.
- If yes, go to [Step 3](#).
  - If no, go to [Step 5](#).

**Figure 10-111** Success rate for calling the OBS data read API

**Step 3** Choose **Cluster > Name of the desired cluster > O&M > Alarm > Thresholds > meta > Success Rate for Calling the OBS Data Read API**. Increase the threshold or smoothing times as required.

**Step 4** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

**Collect the fault information.**

**Step 5** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 6** In the **Services** area, select **NodeAgent**, **NodeMetricAgent**, **OmmServer**, and **OmmAgent** under OMS.

**Step 7** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

**Step 8** Contact O&M personnel and provide the collected logs.

## 10.286 ALM-45182 Number of Throttled OBS Operations Exceeds the Threshold

### Alarm Description

The system checks whether the number of throttled OBS operations exceeds the threshold every 30 seconds. This alarm is generated when the number of throttled OBS operations exceeds the threshold.

This alarm is automatically cleared when the number of throttled OBS operations is less than the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45182	Minor	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

Certain upper-layer big data computing tasks will fail to execute.

### Possible Causes

The frequency of requesting OBS APIs is too high.

## Handling Procedure

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Thresholds**. On the **Thresholds** page, choose **meta > Number of Throttled OBS Operations**. In the right pane, set **Threshold** or **Trigger Count** to a larger value as required.
- Step 2** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 3**.
- Step 3** Contact OBS O&M personnel to check whether the OBS service is normal.
- If yes, go to **Step 4**.
  - If no, contact OBS O&M personnel to restore the OBS service.

### Collect fault information.

- Step 4** On FusionInsight Manager, choose **Cluster > Services > meta**. On the page that is displayed, click the **Chart** tab. On this tab page, select **OBS Throttled** in the **Chart Category** area. In the **Number of Throttled OBS Operations-All Instances** chart, view the host name of the instance that has the maximum number of throttled OBS API calls. For example, the host name is **node-ana-coreUQqJ0002**.

- Step 5** Choose **O&M > Log > Download** and select **meta** and **meta** under it for **Service**.
- Step 6** Select the host obtained in **Step 4** for **Hosts**.
- Step 7** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

# 10.287 ALM-45275 Ranger Service Unavailable

## Alarm Description

The alarm module checks the Ranger service status every 180 seconds. This alarm is generated if the Ranger service is abnormal.

This alarm is cleared after the Ranger service recovers.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45275	Critical	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

When the Ranger service is unavailable, Ranger cannot work properly and the native Ranger UI cannot be accessed.

## Possible Causes

- The DBService service on which Ranger depends is abnormal.
- The RangerAdmin role instance is abnormal.

## Handling Procedure

**Check the DBService process status.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the displayed page, check whether the ALM-27001 DBService Service Unavailable alarm is reported.
- If yes, go to [Step 2](#).
  - If no, go to [Step 3](#).
- Step 2** Rectify the DBService service fault by following the handling procedure of ALM-27001 DBService Service Unavailable. After the DBService alarm is cleared, check whether Ranger Service Unavailable alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 3](#).
- Check all RangerAdmin instances.**
- Step 3** Log in to the node where the RangerAdmin instance is located as user **omm** and run the **ps -ef|grep "proc\_rangeradmin"** command to check whether the RangerAdmin process exists on the current node.
- If yes, go to [Step 5](#).
  - If no, restart the faulty RangerAdmin instance or Ranger service and go to [Step 4](#).

---

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

---

- Step 4** In the alarm list, check whether the alarm "Ranger Service Unavailable" is cleared.
- If yes, no further action is required.
  - If no, go to [Step 5](#).

**Collect the fault information.**

- Step 5** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 6** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 7** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 8** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

## Related Information

None

# 10.288 ALM-45276 Abnormal RangerAdmin Status

## Alarm Description

The alarm module checks the RangerAdmin service status every 60 seconds. This alarm is generated if RangerAdmin is unavailable.

This alarm is automatically cleared after the RangerAdmin service recovers.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45276	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Role for which the alarm is generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

If the status of a RangerAdmin is abnormal, access to the Ranger native UI is not affected. If there are two abnormal RangerAdmin instances, the Ranger native UI cannot be accessed and operations such as creating, modifying, and deleting policies are unavailable.

## Possible Causes

The RangerAdmin port is not started.

## Handling Procedure

**Check the port process.**

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click  to view the name of the host for which the alarm is generated.
- Step 2** Log in to the node where the RangerAdmin instance is located as user **omm**. Run the **ps -ef|grep "proc\_rangeradmin" | grep -v grep | awk -F ' ' '{print \$2}'** command to obtain *pid* of the RangerAdmin process, and run the **netstat -anp| grep *pid* | grep LISTEN** command to check whether the RangerAdmin process monitors port 21401 in a security cluster or port 21400 in a normal cluster.
- If yes, go to [Step 4](#).
  - If no, restart the faulty RangerAdmin instance or Ranger service and go to [Step 3](#).

---

#### NOTICE

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

---

- Step 3** In the alarm list, check whether the "Abnormal RangerAdmin Status" alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 4](#).

#### Collect the fault information.

- Step 4** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 5** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 6** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 7** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

## Related Information

None

## 10.289 ALM-45277 RangerAdmin Heap Memory Usage Exceeds the Threshold

### Alarm Description

The system checks the heap memory usage of the RangerAdmin service every 60 seconds. This alarm is generated when the system detects that the heap memory usage of the RangerAdmin instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45277	Major	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

Heap memory overflow may cause service breakdown.

### Possible Causes

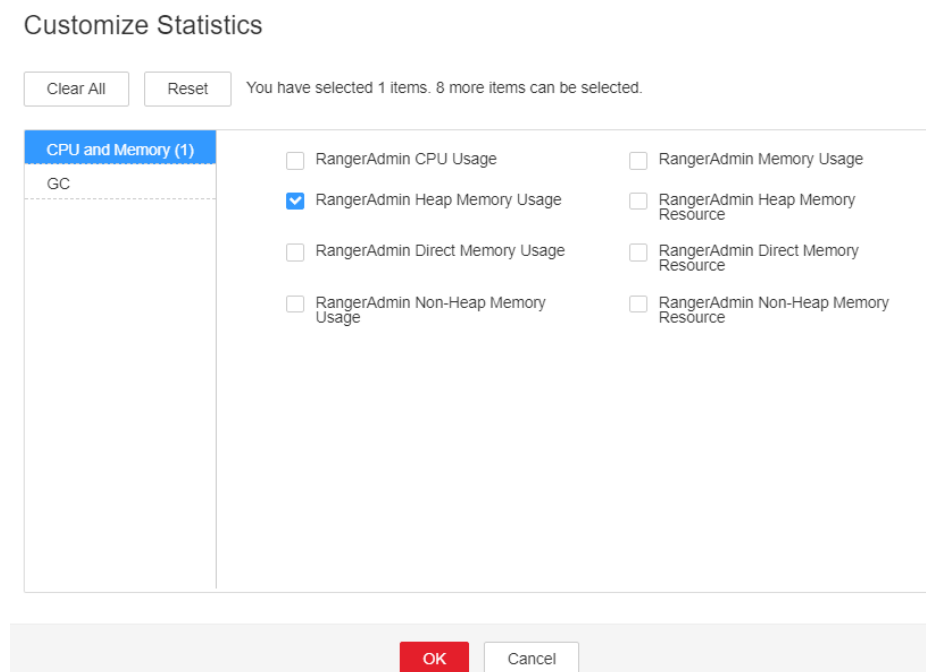

The heap memory usage of the RangerAdmin instance is high or the heap memory is improperly allocated.

### Handling Procedure

**Check the heap memory usage.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45277 RangerAdmin Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > RangerAdmin Heap Memory Usage**. Click **OK**.

**Figure 10-113** RangerAdmin heap memory usage

- Step 3** Check whether the heap memory used by RangerAdmin reaches the threshold (95% of the maximum heap memory by default).
- If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > RangerAdmin > Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin > System**. Increase the value of **-Xmx** in the **GC\_OPTS** parameter based on the site requirements and save the configuration.

**NOTE**

If this alarm is generated, the heap memory configured for RangerAdmin cannot meet the heap memory required by the RangerAdmin process. You are advised to check the heap memory usage of RangerAdmin and change the value of **-Xmx** in **GC\_OPTS** to the twice of the heap memory used by RangerAdmin. The value can be changed based on the actual service scenario. For details, see **Step 2**.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.

- If no, go to [Step 6](#).

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

**Collect the fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

# 10.290 ALM-45278 RangerAdmin Direct Memory Usage Exceeds the Threshold

## Alarm Description

The system checks the direct memory usage of the RangerAdmin service every 60 seconds. This alarm is generated when the direct memory usage of the RangerAdmin instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the direct memory usage of RangerAdmin is less than or equal to the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45278	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

Direct memory overflow may cause service breakdown.

## Possible Causes

The direct memory of the RangerAdmin instance is overused or the direct memory is inappropriately allocated. As a result, the memory usage exceeds the threshold.

## Handling Procedure

**Check the direct memory usage.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45278 RangerAdmin Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > RangerAdmin Direct Memory Usage**. Click **OK**.

**Figure 10-114** RangerAdmin direct memory usage

**Step 3** Check whether the direct memory used by RangerAdmin reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

**Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > RangerAdmin > Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin > System**. Increase the value of **-XX:MaxDirectMemorySize** in the **GC\_OPTS** parameter based on the site requirements and save the configuration.

**NOTE**

If this alarm is generated, the direct memory configured for RangerAdmin cannot meet the direct memory required by the RangerAdmin process. You are advised to check the direct memory usage of RangerAdmin and change the value of **-XX:MaxDirectMemorySize** in **GC\_OPTS** to the twice of the direct memory used by RangerAdmin. You can change the value based on the actual service scenario. For details, see [Step 2](#).

**Step 5** Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

**Collect the fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.
- End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

# 10.291 ALM-45279 RangerAdmin Non Heap Memory Usage Exceeds the Threshold

## Alarm Description

The system checks the non-heap memory usage of the RangerAdmin service every 60 seconds. This alarm is generated when the non-heap memory usage of the RangerAdmin instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45279	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.

Parameter	Description
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

Non-heap memory overflow may cause service breakdown.

## Possible Causes

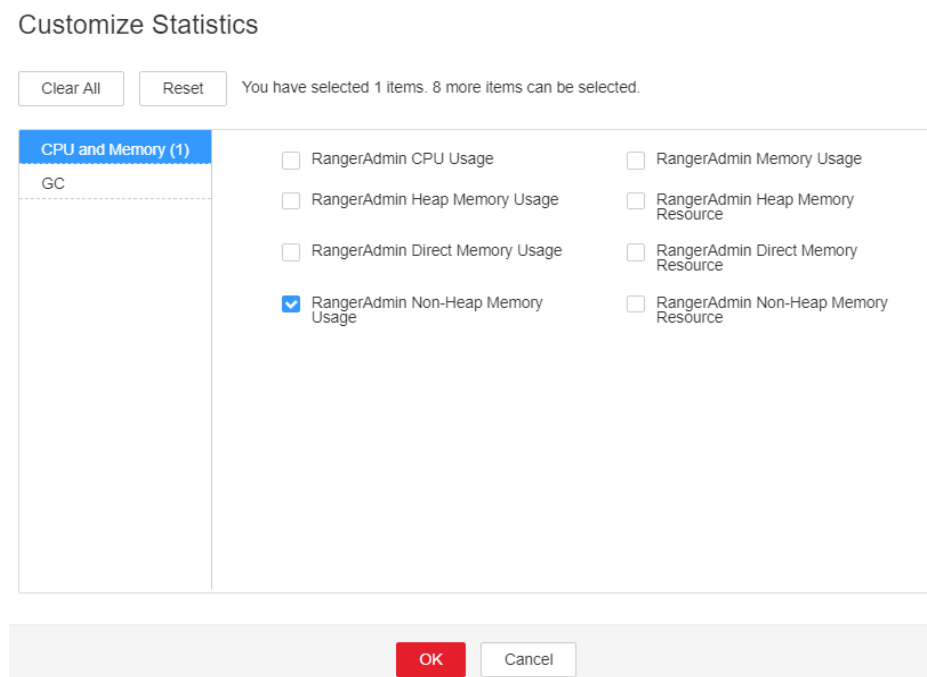

The non-heap memory usage of the RangerAdmin instance is high or the non-heap memory is improperly allocated.

## Handling Procedure

**Check non-heap memory usage.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45279 RangerAdmin Non Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > RangerAdmin Non Heap Memory Usage**. Click **OK**.

**Figure 10-115** RangerAdmin non-heap memory usage

- Step 3** Check whether the non-heap memory used by RangerAdmin reaches the threshold (80% of the maximum non-heap memory by default).
- If yes, go to [Step 4](#).
  - If no, go to [Step 6](#).

- Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > RangerAdmin > Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin > System**. Set **-XX:MaxPermSize** in the **GC\_OPTS** parameter to a larger value based on site requirements and save the configuration.

 **NOTE**

If this alarm is generated, the non-heap memory size configured for the RangerAdmin instance cannot meet the non-heap memory required by the RangerAdmin process. You are advised to change the value of **-XX:MaxPermSize** in **GC\_OPTS** to the twice of the current non-heap memory usage or change the value based on the site requirements.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 6](#).

---

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

---

**Collect the fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## 10.292 ALM-45280 RangerAdmin GC Duration Exceeds the Threshold

### Alarm Description

The system checks the GC duration of the RangerAdmin process every 60 seconds. This alarm is generated when the GC duration of the RangerAdmin process exceeds the threshold (12 seconds by default) for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45280	Major	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

The RangerAdmin responds slowly.

### Possible Causes

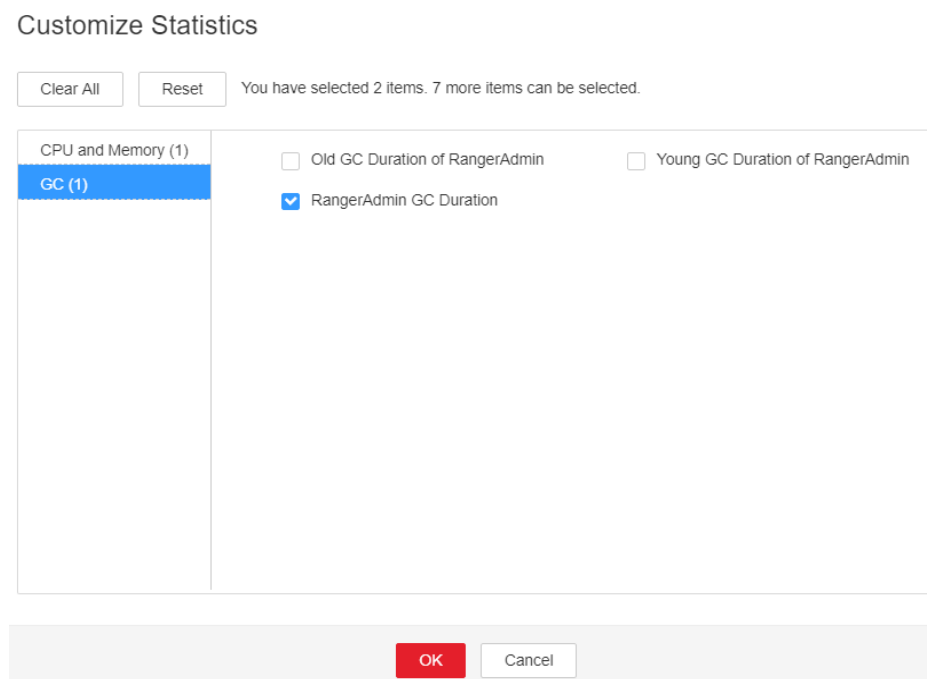

The heap memory of the RangerAdmin instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

### Handling Procedure

**Check the GC duration.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45280 RangerAdmin GC Duration Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize > GC > RangerAdmin GC Duration**. Click **OK**.

**Figure 10-116** RangerAdmin garbage collection (GC) duration

- Step 3** Check whether the GC duration of the RangerAdmin process collected every minute exceeds the threshold (12 seconds by default).
- If yes, go to [Step 4](#).
  - If no, go to [Step 6](#).
- Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > RangerAdmin > Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin > System**. Increase the value of **-Xmx** in the **GC\_OPTS** parameter based on the site requirements and save the configuration.

**NOTE**

If this alarm is generated, the heap memory configured for RangerAdmin cannot meet the heap memory required by the RangerAdmin process. You are advised to check the heap memory usage of RangerAdmin and change the value of **-Xmx** in **GC\_OPTS** to the twice of the heap memory used by RangerAdmin. The value can be changed based on the actual service scenario. For details, see [Step 2](#).

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 6](#).

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

**Collect the fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

----End

**Alarm Clearance**

This alarm is automatically cleared after the fault is rectified.

## 10.293 ALM-45281 UserSync Heap Memory Usage Exceeds the Threshold

**Alarm Description**

The system checks the heap memory usage of the UserSync service every 60 seconds. This alarm is generated when the system detects that the heap memory usage of the UserSync instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

**Alarm Attributes**

Alarm ID	Alarm Severity	Auto Cleared
45281	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

Heap memory overflow may cause service breakdown.

## Possible Causes

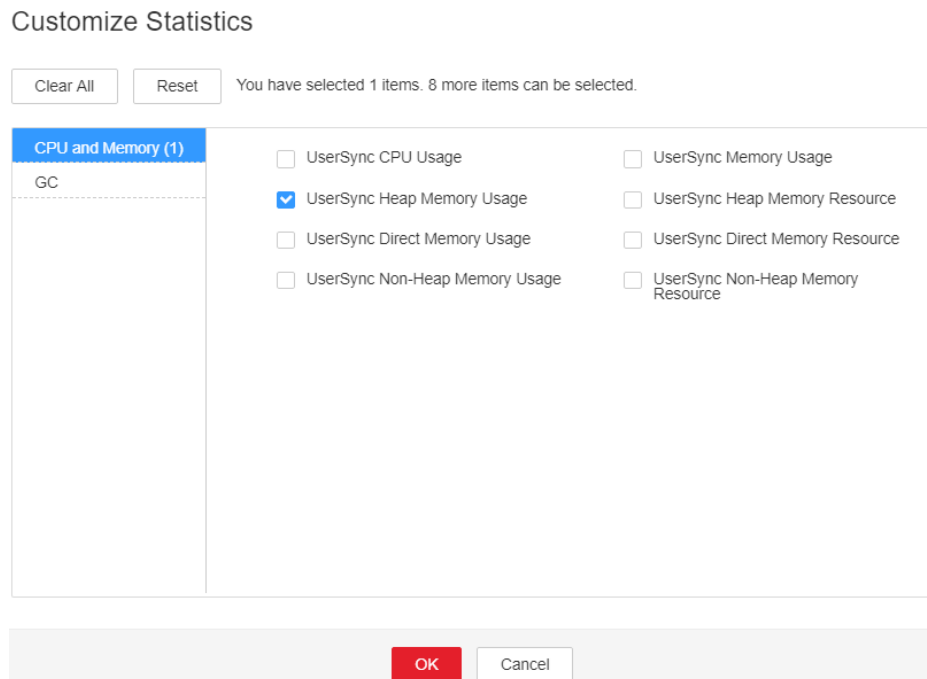

The heap memory usage of the UserSync instance is high or the heap memory is improperly allocated.

## Handling Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45281 UserSync Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > UserSync Heap Memory Usage**. Click **OK**.

**Figure 10-117** UserSync heap memory usage

**Step 3** Check whether the heap memory used by UserSync reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

**Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > UserSync > Instance Configuration**. Click **All Configurations**, and choose **UserSync > System**. Increase the value of **-Xmx** in the **GC\_OPTS** parameter based on the site requirements and save the configuration.

**NOTE**

If this alarm is generated, the heap memory configured for UserSync cannot meet the heap memory required by the UserSync process. You are advised to change the **-Xmx** value of **GC\_OPTS** to twice that of the heap memory used by UserSync. You can change the value based on the actual service scenario. For details about how to check the UserSync heap memory usage, see [Step 2](#).

**Step 5** Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

**Collect the fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

## 10.295 ALM-45283 UserSync Non Heap Memory Usage Exceeds the Threshold

### Alarm Description

The system checks the non-heap memory usage of the UserSync service every 60 seconds. This alarm is generated when the non-heap memory usage of the UserSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45283	Major	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

Non-heap memory overflow may cause service breakdown.

### Possible Causes

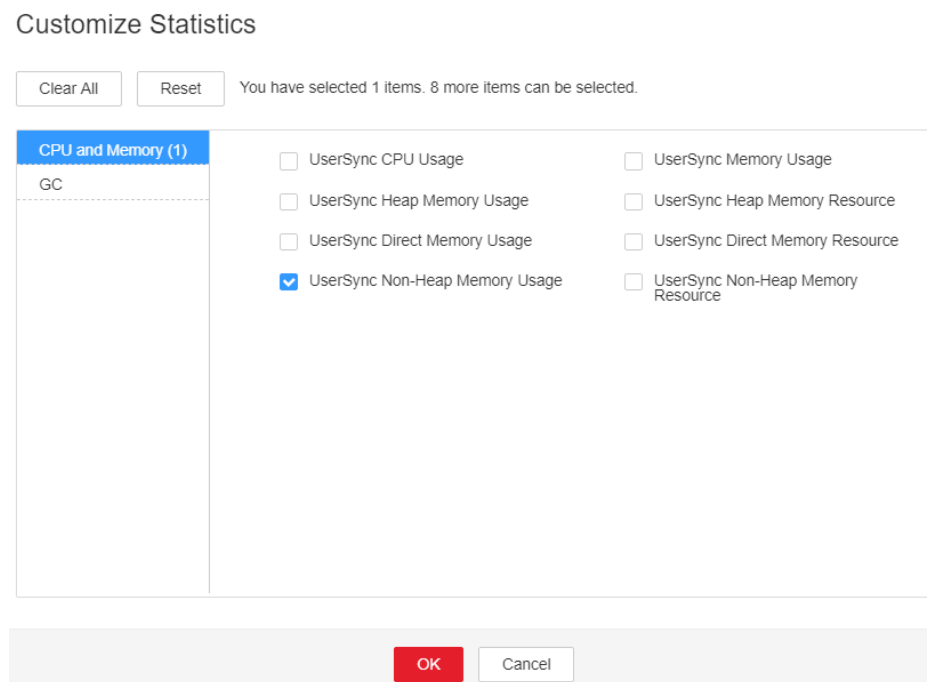

The non-heap memory of the UserSync process is overused or the non-heap memory is inappropriately allocated.

### Handling Procedure

**Check non-heap memory usage.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45283 UserSync Non Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > UserSync Non Heap Memory Usage**. Click **OK**.

**Figure 10-119** UserSync non-heap memory usage

- Step 3** Check whether the non-heap memory used by UserSync reaches the threshold (80% of the maximum non-heap memory by default).
- If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > UserSync > Instance Configuration**. Click **All Configurations**, and choose **UserSync > System**. Set **-XX:MaxPermSize** in the **GC\_OPTS** parameter to a larger value based on site requirements and click **Save** to save the configuration.

**NOTE**

If this alarm is generated, the non-heap memory size configured for the UserSync instance cannot meet the non-heap memory required by the UserSync process. You are advised to change the **-XX:MaxPermSize** value of **GC\_OPTS** to twice that of the current non-heap memory size or change the value based on the site requirements.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 6**.

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

**Collect the fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.
- Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

----End

**Alarm Clearance**

This alarm is automatically cleared after the fault is rectified.

**Related Information**

None

## 10.296 ALM-45284 UserSync Garbage Collection (GC) Time Exceeds the Threshold

**Alarm Description**

The system checks the GC duration of the UserSync process every 60 seconds. This alarm is generated when the GC duration of the UserSync process exceeds the threshold (12 seconds by default) for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

**Alarm Attributes**

Alarm ID	Alarm Severity	Auto Cleared
45284	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Threshold for triggering the alarm.

## Impact on the System

UserSync responds slowly.

## Possible Causes

The heap memory of the UserSync instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

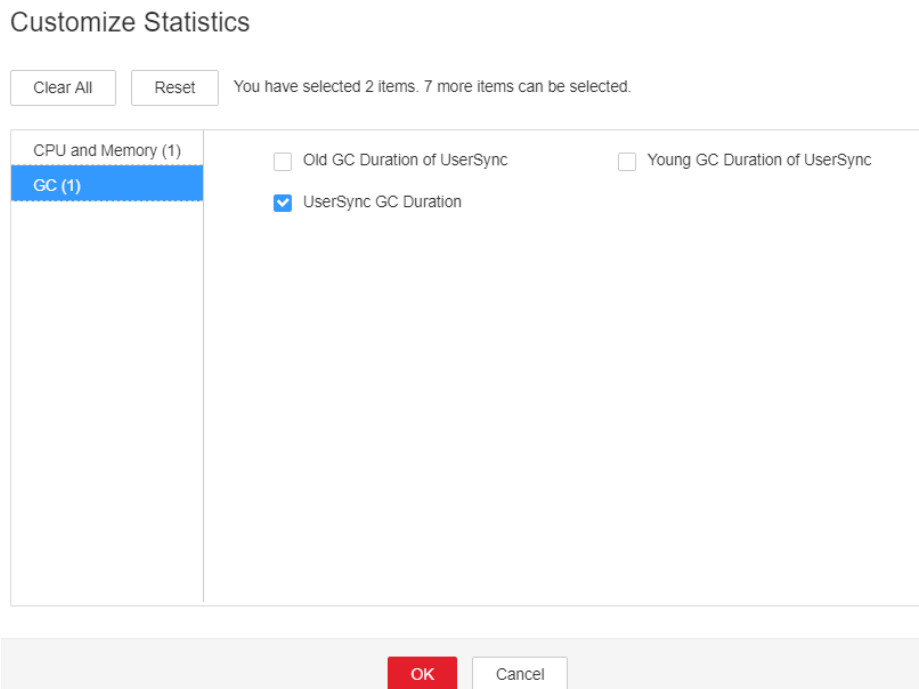

## Handling Procedure

**Check the GC time.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45284 UserSync Garbage Collection (GC) Time Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize > GC > UserSync GC Duration**. Click **OK**.

**Figure 10-120** UserSync GC Duration

**Step 3** Check whether the GC duration of the UserSync process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

**Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > UserSync > Instance Configuration**. Click **All Configurations**, and choose **UserSync > System**. Increase the value of **-Xmx** in the **GC\_OPTS** parameter based on the site requirements and save the configuration.

**NOTE**

If this alarm is generated, the heap memory configured for UserSync cannot meet the heap memory required by the UserSync process. You are advised to change the value of **GC\_OPTS** to the twice that of the heap memory used by UserSync. You can change the value based on the actual service scenario. For details about how to check the UserSync heap memory usage, see [Step 2](#).

**Step 5** Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

**Collect the fault information.**

- Step 6** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.
- End

## Alarm Clearance

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

## Related Information

# 10.297 ALM-45285 TagSync Heap Memory Usage Exceeds the Threshold

## Alarm Description

The system checks the heap memory usage of the TagSync service every 60 seconds. This alarm is generated when the heap memory usage of the TagSync instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45285	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.

Parameter	Description
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

Heap memory overflow may cause service breakdown.

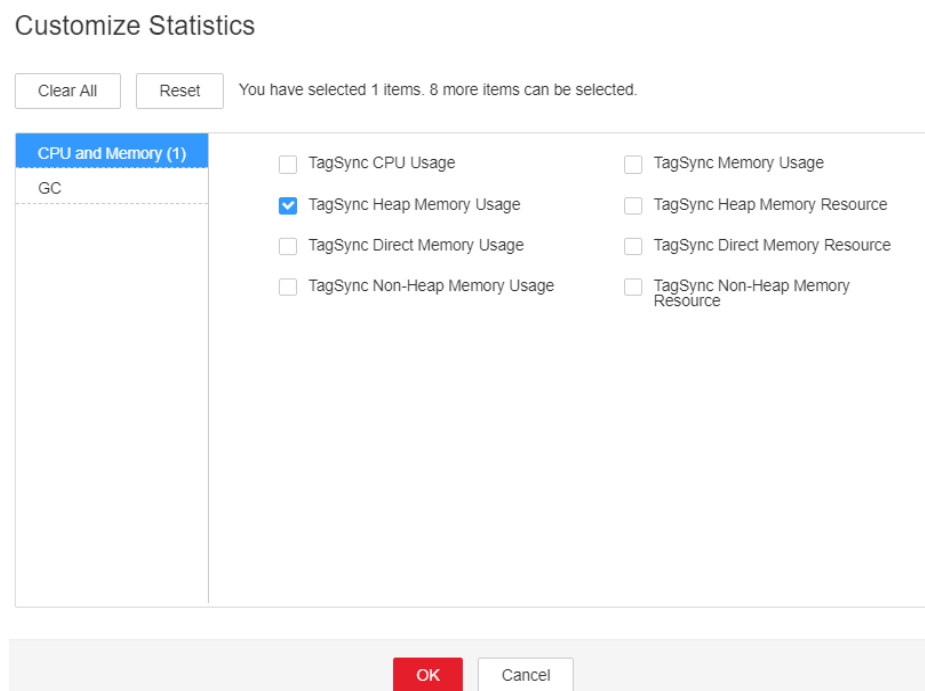

## Possible Causes

The heap memory usage of the TagSync instance is high or the heap memory is improperly allocated.

## Handling Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45285 TagSync Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > TagSync Heap Memory Usage**. Click **OK**.

**Figure 10-121** TagSync heap memory usage

- Step 3** Check whether the heap memory used by TagSync reaches the threshold (95% of the maximum heap memory by default).
- If yes, go to [Step 4](#).
  - If no, go to [Step 6](#).

- Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > TagSync > Instance Configuration**. Click **All Configurations** and choose **TagSync > System**. Increase the value of **-Xmx** in the **GC\_OPTS** parameter based on the site requirements and save the configuration.

 **NOTE**

If this alarm is generated, the heap memory configured for TagSync cannot meet the heap memory required by the TagSync process. You are advised to change the **-Xmx** value of **GC\_OPTS** to twice that of the heap memory used by TagSync. You can change the value based on the actual service scenario. For details about how to check the TagSync heap memory usage, see [Step 2](#).

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 6](#).

---

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

---

**Collect the fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

## 10.298 ALM-45286 TagSync Direct Memory Usage Exceeds the Threshold

### Alarm Description

The system checks the direct memory usage of the TagSync service every 60 seconds. This alarm is generated when the direct memory usage of the TagSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the TagSync direct memory usage is less than or equal to the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45286	Major	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

Direct memory overflow may cause service breakdown.

### Possible Causes

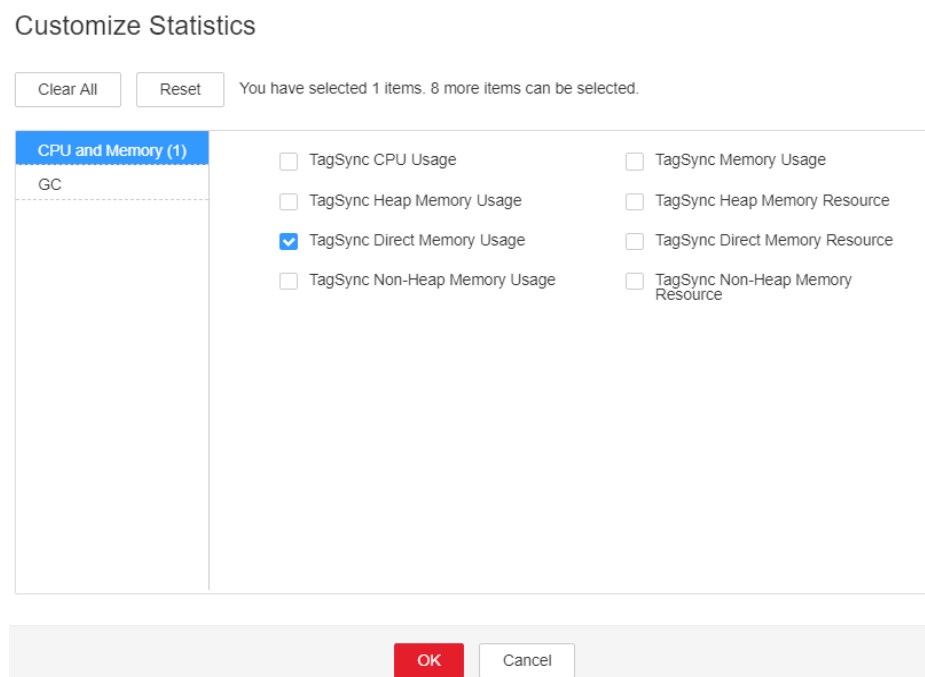

The direct memory of the TagSync instance is overused or the direct memory is inappropriately allocated. As a result, the memory usage exceeds the threshold.

### Handling Procedure

**Check the direct memory usage.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45286 TagSync Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > TagSync Direct Memory Usage**. Click **OK**.

**Figure 10-122** TagSync direct memory usage

- Step 3** Check whether the direct memory used by the TagSync reaches the threshold (80% of the maximum direct memory by default).
- If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > TagSync > Instance Configuration**. Click **All Configurations** and choose **TagSync > System**. Increase the value of **-XX:MaxDirectMemorySize** in the **GC\_OPTS** parameter based on the site requirements and save the configuration.

**NOTE**

If this alarm is generated, the direct memory configured for TagSync cannot meet the direct memory required by the TagSync process. You are advised to check the direct memory usage of TagSync and change the value of **-XX:MaxDirectMemorySize** in **GC\_OPTS** to the twice of the direct memory used by TagSync. You can change the value based on the actual service scenario. For details, see **Step 2**.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.

- If no, go to [Step 6](#).

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

**Collect the fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 10.299 ALM-45287 TagSync Non Heap Memory Usage Exceeds the Threshold

## Alarm Description

The system checks the non-heap memory usage of the TagSync service every 60 seconds. This alarm is generated when the non-heap memory usage of the TagSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45287	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

Non-heap memory overflow may cause service breakdown.

## Possible Causes

The non-heap memory of the TagSync process is overused or the non-heap memory is inappropriately allocated.

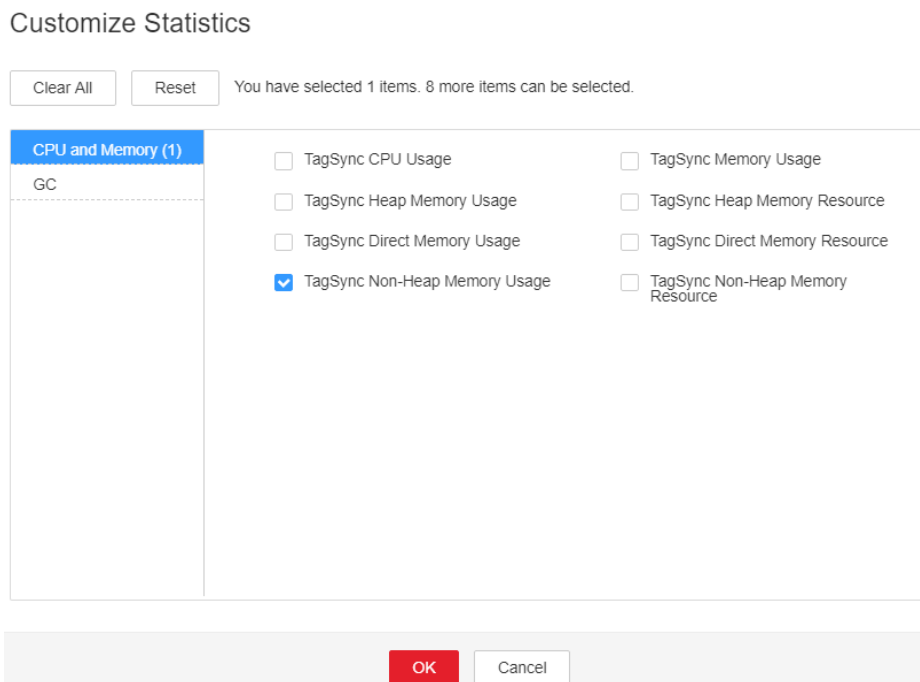

## Handling Procedure

**Check non-heap memory usage.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45287 TagSync Non Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > TagSync Non Heap Memory Usage**. Click **OK**.

**Figure 10-123** TagSync non-heap memory usage

**Step 3** Check whether the non-heap memory used by TagSync reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

**Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > TagSync > Instance Configuration**. Click **All Configurations** and choose **TagSync > System**. Set **-XX:MaxPermSize** in the **GC\_OPTS** parameter to a larger value based on site requirements and save the configuration.

**NOTE**

If this alarm is generated, the non-heap memory size configured for the TagSync instance cannot meet the non-heap memory required by the TagSync process. You are advised to change the **-XX:MaxPermSize** value of **GC\_OPTS** to twice that of the current non-heap memory size or change the value based on the site requirements.

**Step 5** Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

**Collect the fault information.**

**Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

# 10.300 ALM-45288 TagSync Garbage Collection (GC) Time Exceeds the Threshold

## Alarm Description

The system checks the GC duration of the TagSync process every 60 seconds. This alarm is generated when the GC duration of the TagSync process exceeds the threshold (12 seconds by default) for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45288	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Parameter	Description
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

TagSync responds slowly.

## Possible Causes

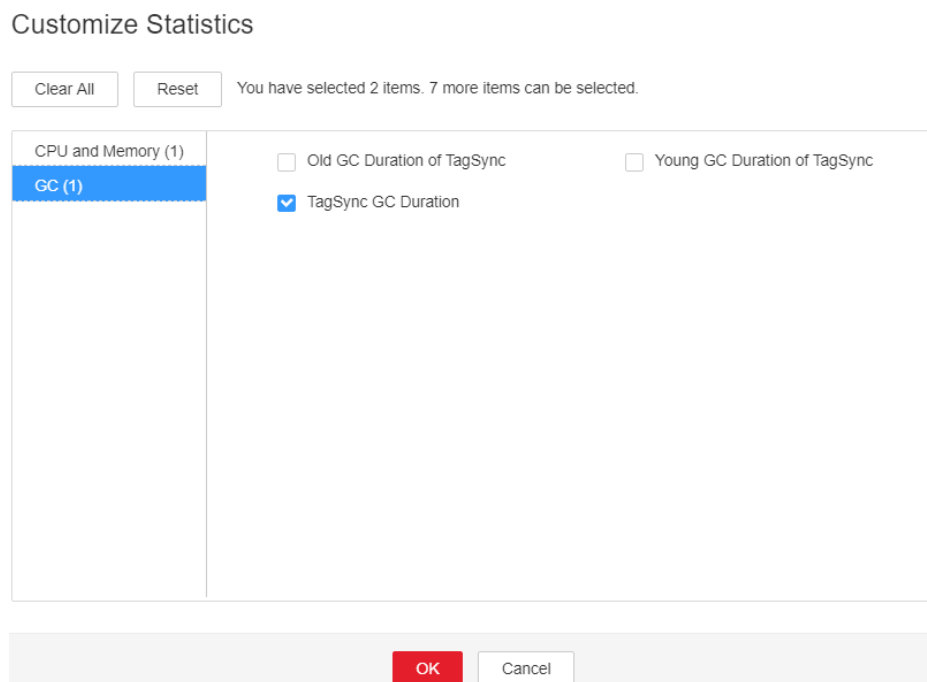

The heap memory of the TagSync instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

## Handling Procedure

**Check the GC duration.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45288 TagSync Garbage Collection (GC) Time Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize > GC > TagSync GC Duration**. Click **OK**.

**Figure 10-124** TagSync GC duration

- Step 3** Check whether the GC duration of the TagSync process collected every minute exceeds the threshold (12 seconds by default).
- If yes, go to [Step 4](#).
  - If no, go to [Step 6](#).
- Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > TagSync > Instance Configuration**. Click **All Configurations** and choose **TagSync > System**. Increase the value of **-Xmx** in the **GC\_OPTS** parameter based on the site requirements and save the configuration.

 **NOTE**

If this alarm is generated, the heap memory configured for TagSync cannot meet the heap memory required by the TagSync process. You are advised to change the **-Xmx** value of **GC\_OPTS** to twice that of the heap memory used by TagSync. You can change the value based on the actual service scenario. For details about how to check the TagSync heap memory usage, see [Step 2](#).

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 6](#).

---

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

---

**Collect the fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

## 10.301 ALM-45289 PolicySync Heap Memory Usage Exceeds the Threshold

### Alarm Description

The system checks the heap memory usage of the PolicySync service every 60 seconds. This alarm is generated when the heap memory usage of the PolicySync instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45289	Major	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

Heap memory overflow may cause service breakdown.

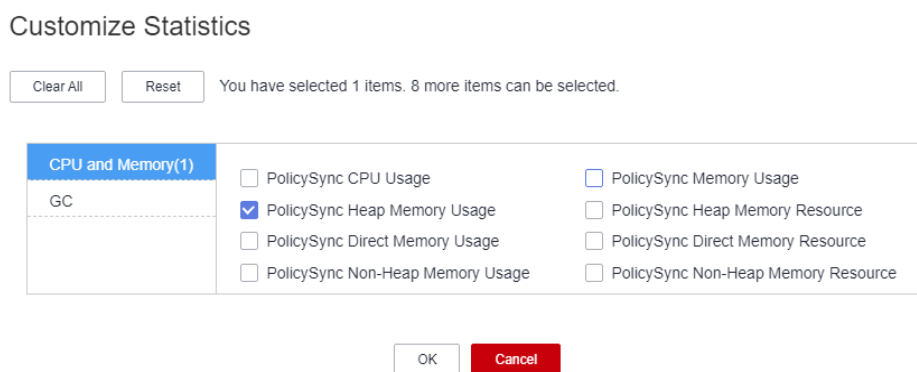

### Possible Causes

The heap memory of the PolicySync instance is overused or the heap memory is inappropriately allocated.

## Handling Procedure

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms > ALM-45289 PolicySync Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > PolicySync Heap Memory Usage**. Click **OK**.

**Figure 10-125** PolicySync Heap Memory Usage

- Step 3** Check whether the heap memory used by PolicySync reaches the threshold (95% of the maximum heap memory by default).
- If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > PolicySync**. Click **Instance Configuration** and then **All Configurations**, and choose **PolicySync > System**. Set **-Xmx** in the **GC\_OPTS** parameter to a larger value based on site requirements and save the configuration.

### NOTE

If this alarm is generated, the heap memory configured for PolicySync cannot meet the heap memory required by the PolicySync process. You are advised to change the value of **-Xmx** in **GC\_OPTS** to twice that of the heap memory used by PolicySync. You can change the value based on the actual service scenario. Refer to **Step 2** to view the PolicySync heap memory usage.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 6**.

### NOTICE

When the service is rebooted, it becomes unavailable and can disrupt business operations. When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

**Collect fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 8** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

----End

**Alarm Clearance**

This alarm is automatically cleared after the fault is rectified.

**Related Information**

None.

## 10.302 ALM-45290 PolicySync Direct Memory Usage Exceeds the Threshold

**Alarm Description**

The system checks the direct memory usage of the PolicySync service every 60 seconds. This alarm is generated when the direct memory usage of the PolicySync instance exceeds the threshold (90% of the maximum memory) for five consecutive times. This alarm is cleared when the PolicySync direct memory usage is less than or equal to the threshold.

**Alarm Attributes**

Alarm ID	Alarm Severity	Auto Cleared
45290	Major	Yes

**Alarm Parameters**

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

Direct memory overflow may cause service breakdown.

## Possible Causes

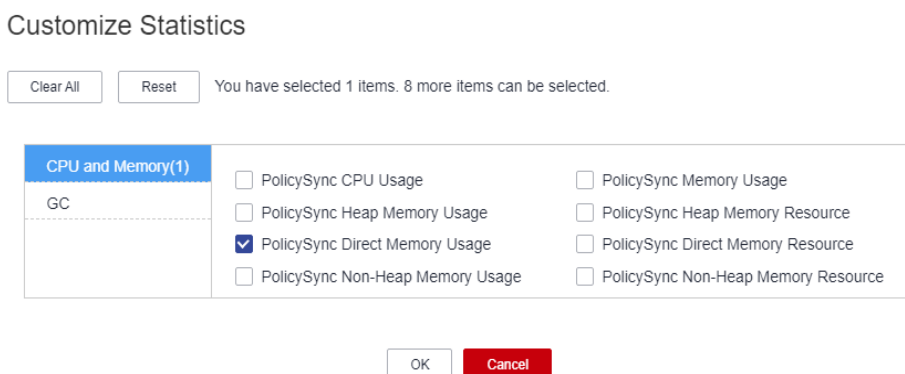

The direct memory of the PolicySync process is overused or the direct memory is inappropriately allocated.

## Handling Procedure

**Check the direct memory usage.**

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms > ALM-45290 PolicySync Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > PolicySync Direct Memory Usage**. Click **OK**.

**Figure 10-126** PolicySync Direct Memory Usage

- Step 3** Check whether the direct memory used by the PolicySync reaches the threshold (90% of the maximum direct memory by default).
- If yes, go to **Step 4**.

- If no, go to [Step 6](#).

**Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > PolicySync**. Click **Instance Configuration** and then **All Configurations**, and choose **PolicySync > System**. Set **-XX:MaxDirectMemorySize** in the **GC\_OPTS** parameter to a larger value based on site requirements and save the configuration.

 **NOTE**

If this alarm is generated, the direct memory configured for PolicySync cannot meet the direct memory required by the PolicySync process. You are advised to check the direct memory usage of PolicySync and change the value of **-XX:MaxDirectMemorySize** in **GC\_OPTS** to the twice of the direct memory used by PolicySync. You can change the value based on the actual service scenario. Refer to [Step 2](#) to view the TokenServer direct memory usage.

**Step 5** Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

---

**NOTICE**

When the service is rebooted, it becomes unavailable and can disrupt business operations. When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

**Collect fault information.**

**Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

**Step 8** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

## 10.303 ALM-45291 PolicySync Non-Heap Memory Usage Exceeds the Threshold

### Alarm Description

The system checks the non-heap memory usage of the PolicySync service every 60 seconds. This alarm is generated when the non-heap memory usage of the PolicySync instance exceeds the threshold (90% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45291	Major	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

Non-heap memory overflow may cause service breakdown.

### Possible Causes

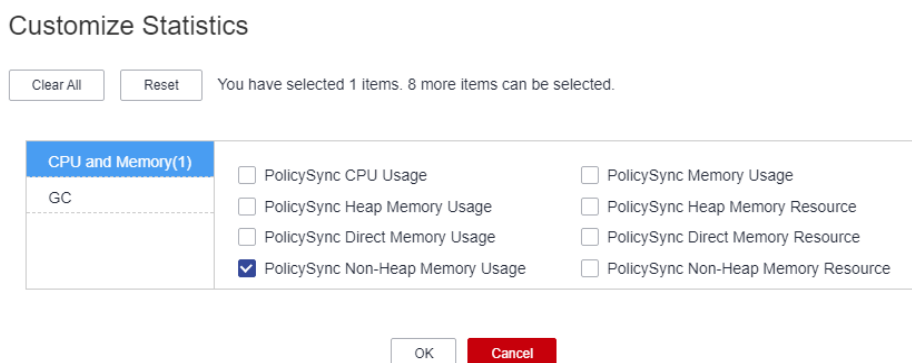

The non-heap memory of the PolicySync instance is overused or the non-heap memory is inappropriately allocated.

### Handling Procedure

**Check non-heap memory usage.**

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms > ALM-45291 PolicySync Non-Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > PolicySync Non-Heap Memory Usage**. Click **OK**.

**Figure 10-127** PolicySync Non-Heap Memory Usage

- Step 3** Check whether the non-heap memory used by PolicySync reaches the threshold (90% of the maximum heap memory by default).
- If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > PolicySync**. Click **Instance Configuration** and then **All Configurations**, and choose **PolicySync > System**. Set **-XX:MaxPermSize** in the **GC\_OPTS** parameter to a larger value based on site requirements and save the configuration.

**NOTE**

If this alarm is generated, the non-heap memory size configured for the PolicySync instance cannot meet the non-heap memory required by the PolicySync process. You are advised to change the value of **-XX:MaxPermSize** in **GC\_OPTS** to twice that of the current non-heap memory size or change the value based on site requirements.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 6**.

**NOTICE**

When the service is rebooted, it becomes unavailable and can disrupt business operations. When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

**Collect fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 8** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.
- End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

# 10.304 ALM-45292 PolicySync GC Duration Exceeds the Threshold

## Alarm Description

The system checks the GC duration of the PolicySync process every 60 seconds. This alarm is generated when the GC duration of the PolicySync process exceeds the threshold for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45292	Critical (default threshold: 20000ms) Major (default threshold: 12000ms)	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

PolicySync responds slowly.

## Possible Causes

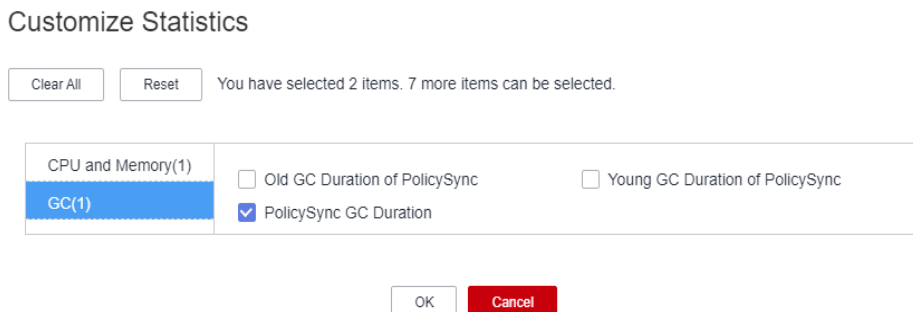

The heap memory of the PolicySync process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

## Handling Procedure

**Check the GC duration.**

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms > ALM-45292 PolicySync GC Duration Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize > GC > PolicySync GC Duration**. Click **OK**.

**Figure 10-128** PolicySync GC Duration

- Step 3** Check whether the GC duration of the PolicySync process collected every minute exceeds the threshold (12 seconds by default).
- If yes, go to **Step 4**.
  - If no, go to **Step 6**.

**Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > PolicySync**. Click **Instance Configuration** and then **All Configurations**, and choose **PolicySync > System**. Set **-Xmx** in the **GC\_OPTS** parameter to a larger value based on site requirements and save the configuration.

 **NOTE**

If this alarm is generated, the heap memory configured for PolicySync cannot meet the heap memory required by the PolicySync process. You are advised to change the value of **-Xmx** in **GC\_OPTS** to twice that of the heap memory used by PolicySync. You can change the value based on the actual service scenario. Refer to [Step 2](#) to view the PolicySync heap memory usage.

**Step 5** Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

---

**NOTICE**

When the service is rebooted, it becomes unavailable and can disrupt business operations. When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

**Collect fault information.**

**Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

**Step 8** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

None.

# 10.305 ALM-45325 Presto Service Unavailable

 **NOTE**

This section applies only to MRS 3.1.5 or later.

## Alarm Description

The system checks the Presto service status every 60 seconds. This alarm is generated when the Presto service is unavailable. This alarm is cleared when the Presto service recovers.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45325	Critical	Yes

## Alarm Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

Presto cannot execute SQL statements.

## Possible Causes

- The Presto coordinator or worker process is faulty.
- The network communication between Presto coordinator and worker instances is interrupted.

## Handling Procedure

**Check the status of the coordinator and worker processes.**

**Step 1** Log in to FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > Presto**. On the page that is displayed, click the **Instance** tab. In the Presto instance list, check whether the running status of all coordinator or worker instances is **Unknown**.

- If yes, go to [2](#).
- If no, go to [4](#).

**Step 2** Above the Presto instance list, click **More** and select **Restart Service** to restart the coordinator and worker processes.

**Step 3** In the alarm list, check whether **ALM-45325 Presto Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to 4.

**Collect fault information.**

**Step 4** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

**Step 5** Expand the **Service** drop-down list, and select **Presto** for the target cluster.

**Step 6** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 7** Contact the O&M engineers and send the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

# 10.306 ALM-45326 Number of Presto Coordinator Threads Exceeds the Threshold

## Alarm Description

The system checks the number of threads used by Presto coordinator and worker instances. The default threshold is 1024. This alarm is generated when the number of Presto coordinator or worker threads exceeds the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45326	Minor	Yes

## Alarm Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

None

## Possible Causes

- Too many threads are used by Presto instances.
- Too many Presto tasks are concurrently executed.

## Handling Procedure

### Check the number of concurrent tasks.

**Step 1** Check whether the CPU load of the current cluster is normal and the number of concurrent SQL statements meets the expectation.

- If yes, go to [2](#).
- If no, go to [Step 4](#).

### Adjust the alarm threshold for the number of threads.

**Step 2** Log in to FusionInsight Manager and choose **O&M > Alarm > Thresholds**. On the **Thresholds** page, choose **Presto** and click **Number of Threads (Coordinator)** or **Number of Threads (Worker)**. Then, locate the row that contains the **default** rule and click **Modify** in the **Operation** column to increase the threshold, for example, increase the threshold by 20%.

**Step 3** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [6](#).

### Upgrade coordinator specifications or add worker node groups.

**Step 4** Check the number of coordinator and worker threads. If the number of coordinator threads is too large, upgrade coordinator node specifications to increase the number of CPU cores. If the number of worker threads is too large, add worker node groups.

**Step 5** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

### Collect fault information.

**Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 7** Expand the **Service** drop-down list, and select **Presto** for the target cluster.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 10.307 ALM-45327 Presto Coordinator Process GC Time Exceeds the Threshold

## Alarm Description

The system collects the garbage collection (GC) time of the Presto coordinator process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). This alarm is cleared when the GC time of the coordinator process is less than or equal to the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45327	Minor	Yes

## Alarm Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

If the GC time of the coordinator process is too long, the coordinator process performance will be adversely affected, and the coordinator process will even become unavailable.

## Possible Causes

The heap memory of the coordinator process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

## Handling Procedure

### Check the GC duration.

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. Locate the row that contains this alarm and view the IP address and role name of the instance in **Location**.
- Step 2** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > Presto**. On the page that is displayed, click the **Instance** tab and click the **Coordinator** instance for which the alarm is generated to access its dashboard. In the upper right corner of the **Dashboard** page, click the drop-down list icon and select **Customize**. On the **Customize Statistics** page, choose **Cluster Status**, select **Presto Garbage Collection Time**, and click **OK** to check whether the GC time is greater than 5 seconds.
  - If yes, go to [3](#).
  - If no, go to [6](#).
- Step 3** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > Presto**. On the page that is displayed, click **Configurations** and **All Configurations**, choose **Coordinator > JVM**, increase the value of **Xmx** in the **JAVA\_OPTS** parameter, and click **Save**.
- Step 4** Return to the **Dashboard** page, click **More**, and select **Restart Service** to restart the service.
- Step 5** Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [6](#).

### Collect fault information.

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, select **Presto** for the target cluster, and click **OK**.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact the O&M engineers and send the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

## 10.309 ALM-45329 Presto Coordinator Resource Group Queuing Tasks Exceed the Threshold

### Alarm Description

The system queries the number of queuing tasks in a resource group through the JMX interface. This alarm is generated when the system detects that the number of queuing tasks in a resource group exceeds the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45329	Minor	Yes

### Alarm Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

A large number of tasks may be in the queuing state and cannot be processed as expected. When the number of queuing tasks in a resource group exceeds the threshold (**maxQueued**), new tasks cannot be executed.

### Possible Causes

The resource group configuration is improper or too many tasks in the resource group are submitted.

### Handling Procedure

- Step 1** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > Presto**. On the page that is displayed, click **Configurations** and **All Configurations**, choose **Coordinator > Customization**, and change the

value of **resourceGroupAlarm** in the **resource-groups** parameter to change the threshold for each resource group.

**Step 2** Collect fault information.

1. Log in to the cluster node based on the host name in the fault information and query the number of queuing tasks on the Presto client based on **Resource Group** in the additional information.
2. Log in to the cluster node based on the host name in the fault information, view the **/var/log/Bigdata/nodeagent/monitorlog/monitor.log** file, and search for resource group information to view the monitoring collection information of the resource group.
3. Contact O&M personnel and provide the collected logs.

----End

### Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## 10.310 ALM-45330 Number of Presto Worker Threads Exceeds the Threshold

 NOTE

This section applies only to MRS 3.1.5 or later.

### Alarm Description

The system checks the number of threads used by Presto coordinator and worker instances. The default threshold is 1024. This alarm is generated when the number of Presto coordinator or worker threads exceeds the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45330	Minor	Yes

### Alarm Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm was generated.

Parameter	Description
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

None

## Possible Causes

- Too many threads are used by Presto instances.
- Too many Presto tasks are concurrently executed.

## Handling Procedure

### Check the number of concurrent tasks.

**Step 1** Check whether the CPU load of the current cluster is normal and the number of concurrent SQL statements meets the expectation.

- If yes, go to [2](#).
- If no, go to [4](#).

### Adjust the alarm threshold for the number of threads.

**Step 2** Log in to FusionInsight Manager and choose **O&M > Alarm > Thresholds**. On the **Thresholds** page, choose **Presto** and click **Number of Threads (Coordinator)** or **Number of Threads (Worker)**. Then, locate the row that contains the **default** rule and click **Modify** in the **Operation** column to increase the threshold, for example, increase the threshold by 20%.

**Step 3** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [6](#).

### Upgrade coordinator specifications or add worker node groups.

**Step 4** Check the number of coordinator and worker threads. If the number of coordinator threads is too large, upgrade coordinator node specifications to increase the number of CPU cores. If the number of worker threads is too large, add worker node groups.

**Step 5** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [6](#).

# 10.316 ALM-45336 Presto Worker2 Process GC Time Exceeds the Threshold

## Alarm Description

The system collects the garbage collection (GC) time of the Presto worker2 process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). This alarm is cleared when the GC time of the worker2 process is less than or equal to the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45336	Minor	Yes

## Alarm Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm was generated.

Parameter	Description
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

If the GC time of the worker2 process is too long, the worker2 process performance will be adversely affected, and the worker2 process will even become unavailable.

## Possible Causes

The heap memory of the worker2 process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

## Handling Procedure

### Check the GC duration.

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. Locate the row that contains this alarm and view the IP address and role name of the instance in **Location**.
- Step 2** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > Presto**. On the page that is displayed, click the **Instance** tab and click the **Worker2** instance for which the alarm is generated to access its dashboard. In the upper right corner of the **Dashboard** page, click the drop-down list icon and select **Customize**. On the **Customize Statistics** page, choose **Cluster Status**, select **Presto Garbage Collection Time**, and click **OK** to check whether the GC time is greater than 5 seconds.
  - If yes, go to [3](#).
  - If no, go to [6](#).
- Step 3** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > Presto**. On the page that is displayed, click **Configurations** and **All Configurations**, choose **Worker2 > JVM**, increase the value of **Xmx** in the **JAVA\_OPTS** parameter, and click **Save**.
- Step 4** Return to the **Dashboard** page, click **More**, and select **Restart Service** to restart the service.
- Step 5** Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [6](#).

### Collect fault information.

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.
- Step 7** Expand the **Service** drop-down list, and select **Presto** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

# 10.317 ALM-45337 Presto Worker3 Process GC Time Exceeds the Threshold

## Alarm Description

The system collects the garbage collection (GC) time of the Presto worker3 process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). This alarm is cleared when the GC time of the worker3 process is less than or equal to the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45337	Minor	Yes

## Alarm Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Parameter	Description
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

If the GC time of the worker3 process is too long, the worker3 process performance will be adversely affected, and the worker3 process will even become unavailable.

## Possible Causes

The heap memory of the worker3 process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

## Handling Procedure

### Check the GC duration.

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. Locate the row that contains this alarm and view the IP address and role name of the instance in **Location**.
- Step 2** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > Presto**. On the page that is displayed, click the **Instance** tab and click the **Worker3** instance for which the alarm is generated to access its dashboard. In the upper right corner of the **Dashboard** page, click the drop-down list icon and select **Customize**. On the **Customize Statistics** page, choose **Cluster Status**, select **Presto Garbage Collection Time**, and click **OK** to check whether the GC time is greater than 5 seconds.
  - If yes, go to [3](#).
  - If no, go to [6](#).
- Step 3** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > Presto**. On the page that is displayed, click **Configurations** and **All Configurations**, choose **Worker3 > JVM**, increase the value of **Xmx** in the **JAVA\_OPTS** parameter, and click **Save**.
- Step 4** Return to the **Dashboard** page, click **More**, and select **Restart Service** to restart the service.
- Step 5** Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [6](#).

### Collect fault information.

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Presto** for the target cluster.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

# 10.318 ALM-45338 Presto Worker4 Process GC Time Exceeds the Threshold

## Alarm Description

The system collects the garbage collection (GC) time of the Presto worker4 process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). This alarm is cleared when the GC time of the worker4 process is less than or equal to the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45338	Minor	Yes

## Alarm Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

If the GC time of the worker4 process is too long, the worker4 process performance will be adversely affected, and the worker4 process will even become unavailable.

## Possible Causes

The heap memory of the worker4 process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

## Handling Procedure

### Check the GC duration.

**Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. Locate the row that contains this alarm and view the IP address and role name of the instance in **Location**.

**Step 2** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > Presto**. On the page that is displayed, click the **Instance** tab and click the **Worker4** instance for which the alarm is generated to access its dashboard. In the upper right corner of the **Dashboard** page, click the drop-down list icon and select **Customize**. On the **Customize Statistics** page, choose **Cluster Status**, select **Presto Garbage Collection Time**, and click **OK** to check whether the GC time is greater than 5 seconds.

- If yes, go to **3**.
- If no, go to **6**.

**Step 3** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > Presto**. On the page that is displayed, click **Configurations** and **All Configurations**, choose **Worker4 > JVM**, increase the value of **Xmx** in the **JAVA\_OPTS** parameter, and click **Save**.

**Step 4** Return to the **Dashboard** page, click **More**, and select **Restart Service** to restart the service.

**Step 5** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **6**.

### Collect fault information.

**Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 7** Expand the **Service** drop-down list, and select **Presto** for the target cluster.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

# 10.319 ALM-45425 ClickHouse Service Unavailable

## Alarm Description

The alarm module checks the ClickHouse instance status every 60 seconds. This alarm is generated when the alarm module detects that all ClickHouse instances are abnormal.

This alarm is cleared when the system detects that any ClickHouse instance is restored and the alarm is cleared.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45425	Critical	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

The ClickHouse service is abnormal. You cannot use FusionInsight Manager to perform cluster operations on the ClickHouse service. The ClickHouse service function is unavailable.

## Possible Causes

The configuration information in the **metrika.xml** file in the component configuration directory of the faulty ClickHouse instance node is inconsistent with that of the corresponding ClickHouse instance in the ZooKeeper.

## Handling Procedure

**Check whether the configuration in metrika.xml of the ClickHouse instance is correct.**

**Step 1** Log in to FusionInsight Manager, choose **Cluster > Services > ClickHouse > Instance**, and locate the abnormal ClickHouse instance based on the alarm information.

- If yes, go to [Step 2](#).
- If no, go to [Step 9](#).

**Step 2** Log in to the host where the ClickHouse service is abnormal and ping the IP address of another normal ClickHouse instance node to check whether the network connection is normal.

- If yes, go to [Step 3](#).
- If no, contact the network administrator to repair the network.

**Step 3** Log in to the node where the client is installed as the client installation user and run the following commands:

```
cd {Client installation path}
```

```
source bigdata_env
```

- For a cluster with Kerberos authentication enabled (security mode):  

```
kinit Component service user
```

```
clickhouse client --host IP address of the ClickHouseServer instance that reports the alarm --port 9440 --secure
```
- For a cluster with Kerberos authentication disabled (normal mode):  

```
clickhouse client --host IP address of the ClickHouseServer instance that reports the alarm --user Username --password --port 9000
```

Run the following command to query the value of **macros.id**:

```
select substitution from system.macros where macro='id';
```

**Step 4** Log in to the host where the ZooKeeper client is located and log in to the ZooKeeper client.

Switch to the client installation directory.

Example: 

```
cd /opt/client
```

Run the following command to configure environment variables:

```
source bigdata_env
```

Run the following command to authenticate the user (skip this step in common mode):

**kinit** *Component service user*

Run the following command to log in to the client tool:

**zkCli.sh -server** *service IP address of the node where the ZooKeeper role instance locates:client port*

**Step 5** Run the following command to check whether the ClickHouse cluster topology information can be obtained.

**get /clickhouse/config/value of macros.id in Step 3/metrika.xml**

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

**Step 6** Log in to the host where the ClickHouse instance is abnormal and go to the configuration directory of the ClickHouse instance.

```
cd ${BIGDATA_HOME}/FusionInsight_ClickHouse_Version/
x_x_ClickHouseServer/etc
```

**cat metrika.xml**

**Step 7** Check whether the cluster topology information on ZooKeeper obtained in **Step 5** is the same as that in the **metrika.xml** file in the component configuration directory in **Step 6**.

- If yes, check whether the alarm is cleared. If the alarm persists, go to **Step 9**.
- If no, go to **Step 8**.

**Step 8** On FusionInsight Manager, choose **Cluster > Services > ClickHouse**, click **More**, and select **Synchronize Configuration**. Then, check whether the service status is normal and whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 9**.

**Collect the fault information.**

**Step 9** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 10** Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

**Step 11** Choose the corresponding host from the host list.

**Step 12** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 13** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 10.320 ALM-45426 ClickHouse Service Quantity Quota Usage in ZooKeeper Exceeds the Threshold

## Alarm Description

The alarm module checks the quota usage of the ClickHouse service in the ZooKeeper every 60 seconds. This alarm is generated when the alarm module detects that the usage exceeds the threshold (90%).

This alarm is cleared when the system detects that the usage is lower than the threshold and the alarm is cleared.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45426	Major (default)	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

After the ZooKeeper quantity quota of the ClickHouse service exceeds the threshold, you cannot perform cluster operations on the ClickHouse service on FusionInsight Manager. As a result, the ClickHouse service cannot be used.

## Possible Causes

- When table data is created, inserted, or deleted, the ClickHouse creates znodes on ZooKeeper nodes. As the service volume increases, the number of znodes may exceed the configured threshold.

- No quota limit is set for the metadata directory **/clickhouse** of ClickHouse in ZooKeeper.

## Handling Procedure

**Check the number of znodes created by ClickHouse on ZooKeeper.**

**Step 1** Log in to the host where the ZooKeeper client is located and log in to the ZooKeeper client.

Switch to the client installation directory.

Example: `cd /opt/client`

Run the following command to configure environment variables:

`source bigdata_env`

Run the following command to authenticate the user (skip this step in common mode):

`kinit Component service user`

Run the following command to log in to the client tool:

`zkCli.sh -server service IP address of the node where the ZooKeeper role instance locates:client port`

**Step 2** Run the following command to check the quota used by the ClickHouse in the ZooKeeper and check whether the quota information is correctly set:

`listquota /clickhouse`

absolute path is /zookeeper/quota/clickhouse  
Quota for path /clickhouse does not exist.

If the preceding information indicates that the quota configuration is incorrect, go to [Step 3](#).

If no, go to [Step 5](#).

**Step 3** Log in to FusionInsight Manager and choose **Cluster > Services > ZooKeeper**. On the displayed page, click **Configurations** and click **All Configurations**. On this sub-tab page, search for **quotas.auto.check.enable** to check whether its value is **true**.

If the value is not **true**, change the value to **true** and click **Save**.

**Step 4** On FusionInsight Manager, choose **Cluster > Services > ClickHouse**, click **More**, and select **Synchronize Configuration**. After the synchronization is successful, go to [Step 1](#).

**Step 5** Run the following command and check whether the ratio of the **count** value of **Output stat** to the **count** value of **Output quota** in the command output is greater than **0.9**:

`listquota /clickhouse`

absolute path is /zookeeper/quota/clickhouse  
**Output quota** for /clickhouse **count**=200000,bytes=1000000000  
**Output stat** for /clickhouse **count**=2667,bytes=60063

In the preceding information, the **count** value of **Output stat** is **2667**, and the **count** value of **Output quota** is **200000**.

- If yes, go to [Step 6](#).
- If no, check whether the alarm is cleared 5 minutes later. If the alarm persists, go to [Step 8](#).

**Step 6** On FusionInsight Manager, choose **Cluster > Services > ClickHouse**. Click **Configurations** and then **All Configurations**. Search for **clickhouse.zookeeper.quota.node.count**, set it to a value twice the **count** of **Output stat** in [Step 5](#). **Do not use a value larger than 6000000. Otherwise, there will be high risks. Exercise caution when setting this parameter.**

**Step 7** Restart the ClickHouse instance for which the alarm is generated, and check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, perform [Step 6](#) again, and check whether the alarm is cleared 5 minutes later. If the alarm persists, go to [Step 8](#).

---

#### NOTICE

During the instance restart, the instance is unavailable, and the ClickHouse service on that instance fails to be executed.

---

#### Collect the fault information.

**Step 8** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 9** Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

**Step 10** Choose the corresponding host from the host list.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

## 10.321 ALM-45427 ClickHouse Service Capacity Quota Usage in ZooKeeper Exceeds the Threshold

### Alarm Description

The alarm module checks the quota usage of the ClickHouse service in the ZooKeeper every 60 seconds. This alarm is generated when the alarm module detects that the usage exceeds the threshold (90%).

This alarm is cleared when the system detects that the usage is lower than the threshold and the alarm is cleared.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45427	Major (default)	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

### Impact on the System

After the ZooKeeper quantity quota of the ClickHouse service exceeds the threshold, you cannot perform cluster operations on the ClickHouse service on FusionInsight Manager. As a result, the ClickHouse service cannot be used.

### Possible Causes

- When table data is created, inserted, or deleted, the ClickHouse creates znodes on ZooKeeper nodes. As the service volume increases, the capacity of znodes may exceed the configured threshold.
- No quota limit is set for the metadata directory **/clickhouse** of ClickHouse in ZooKeeper.

## Handling Procedure

### Check the znode capacity of the ClickHouse in the ZooKeeper.

**Step 1** Log in to the host where the ZooKeeper client is located and log in to the ZooKeeper client.

Switch to the client installation directory.

Example: `cd /opt/client`

Run the following command to configure environment variables:

```
source bigdata_env
```

Run the following command to authenticate the user (skip this step in common mode):

```
kinit Component service user
```

Run the following command to log in to the client tool:

```
zkCli.sh -server service IP address of the node where the ZooKeeper role instance locates:client port
```

**Step 2** Run the following command to check the quota used by the ClickHouse in the ZooKeeper and check whether the quota information is correctly set:

```
listquota /clickhouse
```

```
absolute path is /zookeeper/quota/clickhouse
Quota for path /clickhouse does not exist.
```

- If the preceding information indicates that the quota configuration is incorrect, go to [Step 3](#).
- If not, go to [Step 5](#).

**Step 3** Log in to FusionInsight Manager and choose **Cluster > Services > ZooKeeper**. On the displayed page, click **Configurations** and click **All Configurations**. On this sub-tab page, search for **quotas.auto.check.enable** to check whether its value is **true**.

If the value is not **true**, change the value to **true** and click **Save**.

**Step 4** On FusionInsight Manager, choose **Cluster > Services > ClickHouse**, click **More**, and select **Synchronize Configuration**. After the synchronization is successful, go to [Step 1](#).

**Step 5** Run the following command and check whether the ratio of the **bytes** value of **Output stat** to the **bytes** value of **Output quota** in the command output is greater than **0.9**:

```
listquota /clickhouse
```

```
absolute path is /zookeeper/quota/clickhouse
Output quota for /clickhouse count=200000,bytes=1000000000
Output stat for /clickhouse count=2667,bytes=60063
```

In the preceding information, the **bytes** value of **Output stat** is **60063**, and the **bytes** value of **Output quota** is **1000000000**.

- If yes, go to [Step 6](#).
- If no, check whether the alarm is cleared 5 minutes later. If the alarm persists, go to [Step 8](#).

- Step 6** On FusionInsight Manager, choose **Cluster > Services > ClickHouse**. Click **Configurations** and then **All Configurations**. Search for **clickhouse.zookeeper.quota.size**, set it to a value twice the **bytes** of **Output stat** in **Step 5**. **Do not use a value larger than 6000000. Otherwise, there will be high risks. Exercise caution when setting this parameter.**
- Step 7** Restart the ClickHouse instance for which the alarm is generated, and check whether the alarm is cleared 5 minutes later.
- If yes, no further action is required.
  - If no, perform **Step 6** again, and check whether the alarm is cleared 5 minutes later. If the alarm persists, go to **Step 8**.

---

**NOTICE**

During the instance restart, the instance is unavailable, and the ClickHouse service on that instance fails to be executed.

---

**Collect fault information.**

- Step 8** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 9** Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.
- Step 10** Choose the corresponding host from the host list.
- Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 12** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 10.322 ALM-45428 ClickHouse Disk I/O Exception

## Alarm Description

This alarm is generated when the alarm module detects EIO or EROFS errors during ClickHouse read and write every 60 seconds.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45428	Major (default)	No

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

- ClickHouse fails to read and write data. The INSERT, SELECT, and CREATE operations on the local tables may be abnormal. Distributed tables are not affected.
- Services are affected, and I/Os fail.

## Possible Causes

The disk is aged or has bad sectors.

## Handling Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45428 ClickHouse Disk I/O Exception**. Check the role name and the IP address of the host where the alarm is generated in **Location**.
- Step 2** Use PuTTY to log in to the node for which the fault is generated as user **root**.
- Step 3** Run the **df -h** command to check the mount directory and find the disk mounted to the faulty directory.
- Step 4** Run the **smartctl -a /dev/sdFaulty disk** command to check the disk. In the command, *Faulty disk* indicates the disk obtained in [Step 3](#).
  - If **SMART Health Status: OK** is displayed, as shown in the following figure, the disk is healthy. In this case, go to [Step 6](#).

```

=== START OF READ SMART DATA SECTION ===
SMART Health Status: OK

Current Drive Temperature: 26 C
Drive Trip Temperature: 60 C

Manufactured in week 50 of year 2018
Specified cycle count over device lifetime: 10000
Accumulated start-stop cycles: 25
Specified load-unload count over device lifetime: 300000
Accumulated load-unload cycles: 356
Elements in grown defect list: 0

```

- If the number following **Elements in grown defect list** is not 0, as shown in the following figure, the disk may have bad sectors. If **SMART Health Status: FAILURE** is displayed, the disk is in the sub-health state. In this case, contact O&M personnel.

```

=== START OF READ SMART DATA SECTION ===
SMART Health Status: FAILURE PREDICTION THRESHOLD EXCEEDED: ascq=0x5 [asc=5d, ascq=5]

Current Drive Temperature: 30 C
Drive Trip Temperature: 60 C

Manufactured in week 50 of year 2018
Specified cycle count over device lifetime: 10000
Accumulated start-stop cycles: 28
Specified load-unload count over device lifetime: 300000
Accumulated load-unload cycles: 354
Elements in grown defect list: 5344

```

- Step 5** After the fault is rectified, manually clear the alarm on FusionInsight Manager and check whether the alarm is generated again during the periodic check.
- If yes, go to **Step 6**.
  - If no, no further action is required.

**Collect fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.
- Step 8** Choose the corresponding host from the host list.
- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact O&M personnel and provide the collected logs.

----End

**Alarm Clearance**

If the alarm has no impact, manually clear the alarm.

**Related Information**

None

## 10.323 ALM-45429 Table Metadata Synchronization Failed on the Added ClickHouse Node

### NOTE

This section applies only to MRS 3.1.2 or later.

### Alarm Description

This alarm is generated when the local table corresponding to the distributed table fails to be created during ClickHouse capacity expansion.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45429	Major	No

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

### Impact on the System

The distributed table fails to be queried.

### Possible Causes

A node is stopped or faulty during capacity expansion.

### Handling Procedure

**Step 1** On FusionInsight Manager, choose **Cluster > Services > ClickHouse > Instance**.

**Step 2** Check whether an instance is stopped, decommissioned, or faulty.

- If yes, go to [Step 3](#).
- If no, go to [Step 4](#).

**Step 3** Start the instance or rectify the instance fault until all instances are running properly.

**Step 4** On FusionInsight Manager, choose **O&M > Alarm > Alarms**, locate this alarm and the faulty host based on the location information.

**Step 5** Log in to the faulty host as user **omm**.

**Step 6** Run the following commands to initialize environment variables:

```
source Cluster installation directory/FusionInsight_ClickHouse_*/
*_ClickHouseServer/etc/ENV_VARS
```

```
source Cluster installation directory/FusionInsight_ClickHouse_*/
*_ClickHouseServer/etc/clickhouse-env.sh
```

```
export CLICKHOUSE_CONF_DIR=${CLICKHOUSE_CONF_DIR}
```

**Step 7** Run the following command to run the metadata synchronization tool to synchronize metadata from the existing node to the faulty node:

```
sh Cluster installation directory/FusionInsight_ClickHouse_*/install/
FusionInsight-ClickHouse-*/clickhouse/sbin/clickhouse-create-meta.sh true
```

**Step 8** Run the following command to view the log information and check whether the metadata has been synchronized:

```
vim /var/log/Bigdata/clickhouse/clickhouseServer/start.log
```

- If the synchronization is complete, go to [Step 9](#).
- If the synchronization fails, go to [Step 10](#).

**Step 9** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. In the **Alarm ID** column, locate the corresponding alarm and click **Clear** in the **Operation** column. In the displayed dialog box, click **OK** to manually clear the alarm.

**Collect fault information.**

**Step 10** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 11** Expand the **Service** drop-down list, select **ClickHouse** for the target cluster, and click **OK**.

**Step 12** Choose the corresponding host from the host list.

**Step 13** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

**Step 14** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm needs to be manually cleared after the fault is rectified.

## Related Information

None

# 10.324 ALM-45430 Permission Metadata Synchronization Failed on the Added ClickHouse Node

### NOTE

This section applies only to MRS 3.1.2 or later.

## Alarm Description

This alarm is generated when user and permission information fails to be synchronized during ClickHouse capacity expansion.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45430	Major	No

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

The created user does not have operation permissions on the node.

## Possible Causes

A node is stopped or faulty during capacity expansion.

## Handling Procedure

- Step 1** On FusionInsight Manager, choose **Cluster > Services > ClickHouse > Instance**.
- Step 2** Check whether an instance is stopped, decommissioned, or faulty.
- If yes, go to [Step 3](#).
  - If no, go to [Step 4](#).
- Step 3** Start the instance or rectify the instance fault until all instances are running properly.
- Step 4** On FusionInsight Manager, choose **O&M > Alarm > Alarms**, locate this alarm and the faulty host based on the location information.
- Step 5** Log in to the faulty host as user **omm**.
- Step 6** Run the following commands to initialize environment variables:
- ```
source ${BIGDATA_HOME}/FusionInsight_ClickHouse_*/
*_ClickHouseServer/etc/ENV_VARS

source ${BIGDATA_HOME}/FusionInsight_ClickHouse_*/
*_ClickHouseServer/etc/clickhouse-env.sh

export CLICKHOUSE_CONF_DIR=${CLICKHOUSE_CONF_DIR}
```
- Step 7** Run the following command to run the metadata synchronization tool to synchronize metadata from the existing node to the faulty node:
- ```
sh ${BIGDATA_HOME}/FusionInsight_ClickHouse_*/install/FusionInsight-
ClickHouse-*/clickhouse/sbin/clickhouse-create-meta.sh true
```
- Step 8** Run the following command to view the log information and check whether the metadata has been synchronized:
- ```
vim /var/log/Bigdata/clickhouse/clickhouseServer/start.log
```
- If the synchronization is complete, go to [Step 9](#).
- If the synchronization fails, go to [Step 10](#).
- Step 9** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. In the **Alarm ID** column, locate the corresponding alarm and click **Clear** in the **Operation** column. In the displayed dialog box, click **OK** to manually clear the alarm.
- Collect the fault information.**
- Step 10** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 11** Expand the **Service** drop-down list, select **ClickHouse** for the target cluster, and click **OK**.
- Step 12** Choose the corresponding host from the host list.
- Step 13** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm needs to be manually cleared after the fault is rectified.

10.325 ALM-45431 Improper ClickHouse Instance Distribution for Topology Allocation

Alarm Description

The ClickHouseServer instance distribution does not meet the topology allocation requirements.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45431 | Critical | No |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |

Impact on the System

Some ClickHouseServer instances are unavailable.

Possible Causes

During installation or capacity expansion, the number of instances or allocation mode does not meet the topology requirements.

Handling Procedure

- Step 1** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**, locate the row that contains the alarm, and analyze the cause based on **Location** and **Additional Information**.
- Step 2** Handle the alarm based on the additional alarm information and handling method in the following table.

| Additional Information | Remarks | Handling Method |
|--|---|---|
| <i>n</i> ClickHouseServer instances should be added to other AZ. | This alarm is generated when a single cluster is deployed in cross-AZ DR mode. The ClickHouseServer instance deployment does not meet the cross-AZ DR topology allocation requirements. As a result, some instances cannot work properly. | <ol style="list-style-type: none">1. On FusionInsight Manager, choose Cluster > Services > ClickHouse, click the Instance tab, locate the row that contains the alarm, view the host name in Location, and find the AZ for which the alarm is generated in the AZ column based on the host name.2. On the Instance page, click Add Instance to add <i>n</i> ClickHouseServer instances to other AZs except the AZ where the alarm is generated. |

| Additional Information | Remarks | Handling Method |
|--|---|--|
| <i>n</i> ClickHouseServer instances should be added. | This alarm is generated when a non-single-cluster is deployed in the default deployment mode of cross-AZ DR. The number of ClickHouseServer instances in the cluster is less than an even number. As a result, some instances cannot work properly. | <ol style="list-style-type: none"> 1. Determine the number (<i>n</i>) of ClickHouseServer instances to be added based on the alarm information. 2. On FusionInsight Manager, choose Cluster > Services > ClickHouse, click the Instance tab, and add <i>n</i> ClickHouseServer instances to the cluster. |

----End

Alarm Clearance

This alarm needs to be manually cleared after the fault is rectified.

Related Information

None

10.326 ALM-45432 ClickHouse User Synchronization Process Fails

Alarm Description

The system checks the status of the ClickHouse user role synchronization process every 5 minutes. This alarm is generated when the system detects that the ClickHouse user role synchronization process is faulty or the user role synchronization fails.

This alarm is automatically cleared when the ClickHouse user role synchronization process or function becomes normal.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45432 | Major | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName | Specifies the role for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |

Impact on the System

Some ClickHouseServer instances are unavailable.

Possible Causes

- The ClickHouse user role synchronization process is not started properly or exits abnormally.
- The ClickHouse user role synchronization process fails to synchronize user role information because the LdapServer service is faulty.

Handling Procedure

Check whether the ClickHouse user role synchronization process is normal.

Step 1 Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. On the page that is displayed, search for **ALM-45432 ClickHouse User Synchronization Process Fails**.

Step 2 Check the host name and additional information in the alarm details.

- If the additional information is "Process clickhouse-ugsync is not exit.", go to [Step 3](#).
- If the additional information is "Process clickhouse-ugsync sync user failed.", go to [Step 6](#).

Step 3 Log in to the faulty host as user **omm** and run the following command to check whether the ClickHouse user role synchronization process is normal:

```
ps -ef | grep 'clickhouse-ugsync'
```

Abnormal result of the synchronization process:

```
[omm@server-2110081635-0001 ~]$ ps -ef | grep 'clickhouse-ugsync'  
omm    20104 13146 0 15:57 pts/7    00:00:00 grep --color=auto clickhouse-ugsync
```

- If yes, the alarm is automatically cleared. If the alarm is cleared, no further action is required. If the alarm persists, go to [Step 8](#).
- If no, go to [Step 4](#).

Step 4 Log in to the faulty host as user **omm** and run the following command to check whether the crontab daemon task is correctly configured:

crontab -l

Normal setting of the crontab daemon task:

```
* /5 * * * * bash /xxxxx/clickhouse_ugsync_check.sh >/dev/null 2>&1
```

- If yes, check whether the alarm is cleared 5 minutes later. If the alarm is cleared, no further action is required. If the alarm persists, go to **Step 8**.
- If no, go to **Step 5**.

Step 5 Log in to FusionInsight Manager, choose **Cluster > Services > ClickHouse**. On the page that is displayed, click the **Instance** tab. On this tab page, find the abnormal ClickHouseServer instance based on the fault information, and restart it. Wait for 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During the instance restart, the instance is unavailable, and the ClickHouse service on that instance fails to be executed.

Check whether the LdapServer service is normal.

Step 6 Log in to FusionInsight Manager, choose **Cluster > Services**, and check whether **Running Status** of LdapServer is **Normal**.

- If yes, go to **Step 8**.
- If no, go to **Step 7**.

Step 7 Handle the LdapServer service unavailable alarm according to ALM-25000 LdapServer Service Unavailable.

After **Running Status** of LdapServer becomes **Normal**, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 9 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **ClickHouseServer** for the target cluster.

Step 10 Expand the **Hosts** list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.327 ALM-45433 ClickHouse AZ Topology Exception

Alarm Description

If the cross-AZ HA function is enabled for a cluster where ClickHouse has been deployed, the ClickHouse topology remains unchanged. This alarm is generated when the cross-AZ HA does not take effect if backup nodes of the same shard are in the same AZ.

This alarm is automatically cleared when the system detects that all shards meet the cross-AZ HA deployment requirements.

Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45433 | Critical | Yes |

Alarm Parameters

| Parameter | Description |
|-------------|--|
| Source | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| HostName | Specifies the host for which the alarm was generated. |

Impact on the System

The current deployment of the ClickHouse service does not support cross-AZ HA.

Possible Causes

After cross-AZ HA is enabled, all backup nodes of a shard are in the same AZ.

Handling Procedure

Modify the AZ of backup nodes.

Step 1 Log in to the node where the client is installed as the client installation user. Run the following command to switch to the client installation directory:

```
cd {Client installation path}
```

Step 2 Run the following command to configure environment variables:

```
source bigdata_env
```

Step 3 Run the following command to authenticate the user (skip this step in normal mode):

```
kinit Component service user
```

Step 4 Run the following command to log in to the client tool:

```
zkCli.sh -server Service IP address of the node where the ZooKeeper instance resides:Client port
```

Step 5 Run the following command to view the current topology:

```
get /clickhouse/topo
```

NOTE

If the ClickHouse is installed with multiple services, run the `get /clickhouse{-n}/topo` command. For example, if the ClickHouse-1 is installed, run the `get /clickhouse-1/topo` command.

```
[zk: 192.168.20.36:24002(CONNECTED) 0] get /clickhouse/topo
```

```
<topo>
<mcluster>
  <shard id="14" index="1">
    <server id="15">
      <replica>1</replica>
      <az>AZ1</az>
      <host>192-168-20-205</host>
      <port>21427</port>
    </server>
    <server id="16">
      <replica>2</replica>
      <az>AZ1</az>
      <host>192-168-20-2205</host>
      <port>21427</port>
    </server>
  </shard>
</mcluster>
</topo>
```

Step 6 Select a host from the desired shard and deploy the host in another AZ.

Step 7 Log in to FusionInsight Manager, click **Host**, select the host you have deployed in [Step 6](#) and choose **More** > **Reinstall** to reinstall the host.

- Step 8** Choose **Cluster** > **Cross-AZ HA**, click **Configure AZ and Policy** and change the AZ information of the reinstalled host to the AZ planned in the **Step 6**.
- Step 9** Wait for five minutes and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to **Step 10**.
- Collect fault information.**
- Step 10** On FusionInsight Manager, choose **O&M** > **Log** > **Download**.
- Step 11** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **ClickHouseServer** for the target cluster.
- Step 12** Expand the **Hosts** list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.
- Step 13** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 14** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

10.328 ALM-45434 A Single Replica Exists in the ClickHouse Data Table

Description

This alarm is generated when a single replica is detected in a custom logical cluster after the custom logical cluster is enabled for ClickHouse.

This alarm is automatically cleared when the system detects that the custom logical cluster uses multiple replicas.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45434	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If a hardware fault occurs, data cannot be restored.

Possible Causes

The **metrika.xml** file in the ClickHouse configuration directory contains single-replica configuration.

Procedure

Check whether the configuration in metrika.xml of the ClickHouse instance is correct.

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click  to view the name of the host for which the alarm is generated. On the **Hosts** page, view the host IP address based on the host name.
- Step 2** Log in to the host where the ClickHouse instance is abnormal, go to the configuration directory of the ClickHouse instance, and run the following commands:

```
cd ${BIGDATA_HOME}/FusionInsight_ClickHouse_Version/  
x_x_ClickHouseServer/etc  
  
cat metrika.xml
```
- Step 3** View the number of shards in each custom logical cluster and check that a single replica exists. Then, go to [Step 4](#).

 **NOTE**

If a shard contains only one node, a single replica exists in a logical cluster, as shown in the following:

```
<shard>
  <internal_replication>true</internal_replication>
  <replica>
    <host>host-name 1</host>
    <port>port</port>
    <user>clickhouse</user>
    <password/>
  </replica>
</shard>
```

Collect fault information.

- Step 4** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.
- Step 5** Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.
- Step 6** Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.
- Step 7** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 8** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.329 ALM-45435 Inconsistent Metadata of ClickHouse Tables

Alarm Description

This alarm is generated when the metadata in a distributed table or in the local table of the distributed table has been inconsistent for 180 min.

This alarm is automatically cleared when the metadata in the distributed table or in the local table of the distributed table becomes consistent.

Metadata consistency includes:

- Consistent quantity, name, sequence, and type of each column in the table
- Consistent partition keys

- Consistent sorting keys
- Consistent primary keys
- Consistent sampling keys

NOTE

If this alarm exists, table metadata is inconsistent in the ClickHouse cluster to which the current node belongs. The inconsistency may be caused by multiple reasons, not limited to those mentioned in additional information.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45435	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Table	Specifies the database name and table name for which the alarm is generated.

Impact on the System

Subsequent operations such as INSERT and ALTER on the table may fail.

Possible Causes

Table metadata modification fails or is not executed on one or more ClickHouseServer nodes.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Log in to the node where the client is installed as the client installation user and run the following commands:

```
cd {Client installation path}
```

source bigdata_env

- For a cluster with Kerberos authentication enabled (security mode):
`kinit Component service user`
`clickhouse client --host IP address of the ClickHouseServer instance that reports the alarm --port 9440 --secure`
- For a cluster with Kerberos authentication disabled (normal mode):
`clickhouse client --host IP address of the ClickHouseServer instance that reports the alarm --user Username --password --port 9000`

Step 3 Check whether any task is being executed for the table to which the alarm is generated.

Run the following command to check whether any SQL task is being executed:

```
select * from system.processes where current_database='Database name' and query like '%Table name%'
```

Run the following command to check whether a mutation task is being executed:

```
select * from system.mutations where database='Database name' and table='Table name';
```

- If the query result is empty, go to [Step 4](#).
- If the query result contains error information, rectify the fault accordingly. If the fault cannot be rectified based on the error information, go to [Step 6](#).
- If the query result contains information about an on-going task with no error, the SQL/mutation task is being executed.

Wait for 5 minutes. If the alarm is cleared, no further action is required. If the alarm persists, go to [Step 4](#).

Step 4 Modify the table structure, delete a table, or add a table based on service requirements until the table metadata of all nodes in the cluster is consistent. After 5 minutes, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Step 5 If the table has been deleted, manually clear the alarm and check whether the alarm is reported again.

- If yes, go to [Step 6](#).
- If no, no further action is required.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 7 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 8 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.330 ALM-45436 Skew ClickHouse Table Data

Alarm Description

This alarm is generated when data skew occurs in the local table of a distributed table between ClickHouse nodes. This alarm is automatically cleared when data becomes balanced.

Data skew check method:

- If **min_table_check_data_bytes** is set to **0**, data skew check is disabled.
- If **min_table_check_data_bytes** is greater than **0**, data skew check is enabled.

After data skew check is enabled, if the data volume in a table is less than the **min_table_check_data_bytes** value, no alarm will be reported due to data skew. When the data volume is greater than the **min_table_check_data_bytes** value and the data volume difference between the same table on different nodes is greater than the percentage specified in **min_table_data_varies_rate**, data skew occurs and this alarm is reported.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45436	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Parameter	Description
Table	Specifies the database name and table name for which the alarm is generated.

Impact on the System

SQL execution efficiency may be lowered.

Possible Causes

The data write policy is improper, causing unbalanced data among nodes.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Log in to the node where the client is installed as the client installation user and run the following commands:

```
cd {Client installation path}
```

```
source bigdata_env
```

- Security mode (with Kerberos enabled):

```
kinit Component service user
```

```
clickhouse client --host IP address of the ClickHouseServer instance that reports the alarm --port 9440 --secure
```

- Normal mode (with Kerberos disabled):

```
clickhouse client --host IP address of the ClickHouseServer instance that reports the alarm --user Username --password --port 9000
```

Step 3 View data distribution.

```
select FQDN(), database, table, sum(data_compressed_bytes) from clusterAllReplicas(Name of the logical cluster, system.parts) where database='Database name' and table='Table name' and active=1 group by (FQDN(), database, table);
```

Step 4 Balance data with a few clicks or migrate data based on service requirements.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

- Step 7** Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.
- Step 8** Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.
- Step 9** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact O&M personnel and provide the collected logs.
- End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.331 ALM-45437 Excessive Parts in the ClickHouse Table

Alarm Description

This alarm is generated when the number of parts exceeds the threshold specified by **part_num_threshold**.

This alarm is automatically cleared when the number of parts is less than the **part_num_threshold** value.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45437	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Parameter	Description
Table	Specifies the database name and table name for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Service errors may occur.

Possible Causes

The data distribution in the ClickHouse table is improper, or the background merge task is executed slowly.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Log in to the node where the client is installed as the client installation user and run the following commands:

```
cd {Client installation path}
```

```
source bigdata_env
```

- Security mode (with Kerberos enabled):

```
kinit Component service user
```

```
clickhouse client --host IP address of the ClickHouseServer instance that reports the alarm --port 9440 --secure
```

- Normal mode (with Kerberos disabled):

```
clickhouse client --host IP address of the ClickHouseServer instance that reports the alarm --user Username --password --port 9000
```

Step 3 Run the following command to manually merge parts:

```
optimize table Database name.Table name final;
```

Step 4 Check whether the number of parts has decreased.

```
select FQDN(), database, table, count(1) from clusterAllReplicas(default_cluster, system.parts) where database='Database name' and table='Table name' and active=1 group by (FQDN(), database, table);
```

1. If the number of parts is less than the threshold, wait for 5 minutes and check whether the alarm is cleared.
 - If yes, no further action is required.

- If no, go to [Step 5](#).
- 2. If the number of parts does not decrease, check whether the partition key of the table is set properly. If the number of partitions is too large, rectify the service logic.
- 3. If the command output is empty, the table does not exist. This alarm is a historical alarm and can be ignored. Manually clear it.

Collect fault information.

- Step 5** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 6** Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.
- Step 7** Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.
- Step 8** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.332 ALM-45438 ClickHouse Disk Usage Exceeds 80%

Alarm Description

The system checks the disk capacity of the ClickHouseServer node every 1 minute. This alarm is generated when the usage of the disk where the ClickHouse data directory or metadata directory resides exceeds 80%.

This alarm is automatically cleared when the usage of the disk where the ClickHouse data directory or metadata directory is located is lower than 80%.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45438	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DiskPath	Specifies the path of the disk for which the alarm is generated.

Impact on the System

The ClickHouse write operation may fail.

Possible Causes

The disk capacity of the ClickHouseServer node is too small.

Handling Procedure

- Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, and view the role name and the IP address for the hostname in **Location**.
- Step 2** Expand the disk capacity of the node for which the alarm is generated.
- Step 3** Go to **Step 4** if the expansion fails or the alarm persists after the expansion.
Collect fault information.
- Step 4** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 5** Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.
- Step 6** Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.
- Step 7** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 8** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.333 ALM-45439 ClickHouse Node Enters the Read-Only Mode

Alarm Description

The system checks the disk capacity of the ClickHouseServer node every 1 minute. This alarm is generated when the system detects that the disk capacity exceeds 90% and the ClickHouseServer node enters the read-only mode.

This alarm is automatically cleared when the system detects that the disk capacity is lower than 90% and the ClickHouseServer node exits the read-only mode.

NOTE

If the ClickHouseServer node is in read-only mode and you need to log in to the client to clear data, you can manually exit the read-only mode using the following method:

Log in to FusionInsight Manager, choose **Cluster > Services > ClickHouse > Configurations > All Configurations**, search for **profiles.default.readonly**, and change its value to **0**.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45439	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DiskPath	Specifies the path of the disk for which the alarm is generated.

Impact on the System

After the ClickHouseServer node enters the read-only mode, all write, modification, and deletion operations fail.

Possible Causes

The disk usage of the ClickHouse node exceeds 90%.

Handling Procedure

- Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, and view the role name and the IP address for the hostname in **Location**.
- Step 2** Expand the disk capacity of the node for which the alarm is generated.
- Step 3** Go to **Step 4** if the expansion fails or the alarm persists after the expansion.

NOTE

After the capacity expansion, this alarm can be automatically cleared only when **profiles.default.readonly** is **auto**. If its value has been manually changed, change it back to **auto**. If **profiles.default.readonly** needs to be set to **0** or **1** based on service requirements, manually clear this alarm.

Collect fault information.

- Step 4** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 5** Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.
- Step 6** Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.
- Step 7** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 8** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.334 ALM-45440 Inconsistency Between ClickHouse Replicas

Alarm Description

When the number of ClickHouse replicas is greater than 1, the system periodically checks the replicated table. This alarm is generated if replicated table data is not synchronized. This alarm is cleared when data in all replicated tables between replicas becomes synchronized.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45440	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Table	Specifies the table name for which the alarm is generated.

Impact on the System

The data reliability of the ClickHouse replicated table is affected, causing data differences and affecting the query result of the distributed table.

Possible Causes

- The ClickHouse service is overloaded.
- The connection between the ClickHouse and ZooKeeper is abnormal.

Handling Procedure

Check whether the ClickHouse service load is heavy.

Step 1 Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, and view the database name, table name, role name and IP address for the hostname in **Location**.

Step 2 Log in to the node where the client is installed as the client installation user and run the following commands:

```
cd {Client installation path}
```

```
source bigdata_env
```

- For a cluster with Kerberos authentication enabled (security mode):

```
kinit Component service user
```

```
clickhouse client --host IP address of the ClickHouseServer instance that reports the alarm --port 9440 --secure
```

- For a cluster with Kerberos authentication disabled (normal mode):

```
clickhouse client --host IP address of the ClickHouseServer instance that reports the alarm --user Username --password --port 9000
```

Step 3 Run the following statement to check whether data is frequently written to the system table. If yes, wait until the service execution is complete and check whether the alarm is cleared.

```
SELECT query_id, user, FQDN(), elapsed, query FROM system.processes ORDER BY query_id;
```

- If yes, no further action is required.
- If no, go to [Step 4](#).

Step 4 Check whether a large amount of data is written. If yes, wait until the task is complete and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Step 5 Run the following statement to check whether replicas are synchronized:

```
select table,absolute_delay, queue_size, inserts_in_queue, merges_in_queue from system.replicas where absolute_delay > 0 order by absolute_delay desc limit 10;
```

- If yes, go to [Step 6](#).
- If no, go to [Step 9](#).

Step 6 If `inserts_in_queue` contains a large amount of content to be inserted, run the following SQL statement to query the replica synchronization queue and locate the error cause:

```
SELECT database,table,type,any(last_exception),any(postpone_reason),min(create_time),max(last_attempt_time),max(last_postpone_time),max(num_postponed) AS max_postponed,max(num_tries) AS max_tries,min(num_tries) AS min_tries,countIf(last_exception != '') AS count_err,countIf(num_postponed > 0) AS count_postponed,countIf(is_currently_executing) AS count_executing,count() AS count_all FROM system.replication_queue GROUP BY database,table,type ORDER BY count_all DESC
```

Check whether an error message similar to the following is displayed:

```
Not executing fetch of part xxx because n fetches already executing, max n
```

- If yes, go to [Step 7](#).
- If no, go to [Step 9](#).

Step 7 On FusionInsight Manager, choose **Cluster > Services > ClickHouse > Configurations > All Configurations**, and check whether the value of **background_pool_size** is twice the number of cores on the node.

- If yes, go to [Step 9](#).
- If no, go to [Step 8](#).

Step 8 Set this parameter to twice the number of cores on the node and synchronize the configuration. Wait for a while and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Check the connectivity between ClickHouse and ZooKeeper.

Step 9 Log in to the node where the ClickHouseServer instance is located, go to `$ {BIGDATA_HOME}/FusionInsight_ClickHouse_*/*_*_ClickHouseServer/etc`, and check whether the port numbers of the ClickHouseServer and ZooKeeper in the **config.xml** file are the same, as shown in the following information in bold:

 **NOTE**

To view the ZooKeeper port number, choose **Cluster > Services > ZooKeeper > Configurations > All Configurations** on FusionInsight Manager, and check the value of **clientPort**.

```
<zookeeper>
<session_timeout_ms>10000</session_timeout_ms>
<node index="1">
  <host>server-2110082001-0019</host>
  <port>24002</port>
</node>
<node index="2">
  <host>server-2110082001-0018</host>
  <port>24002</port>
</node>
<node index="3">
  <host>server-2110082001-0017</host>
  <port>24002</port>
</node>
</zookeeper>
```

- If yes, go to [Step 11](#).
- If no, go to [Step 10](#).

Step 10 Change the port number to the ZooKeeper port number, restart the ClickHouseServer instance, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

Collect fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

- Step 12** Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.
- Step 13** Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.
- Step 14** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 15** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.335 ALM-45441 Zookeeper Disconnected

Alarm Description

The system checks the connection between ClickHouse and ZooKeeper every minute. This alarm is generated when the connection fails. The alarm is reported because the ZooKeeper connection is abnormal. If the connection fails for three consecutive times, the system generates an alarm.

This alarm is automatically cleared when the system detects that the connection is normal.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45441	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Parameter	Description
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If ClickHouse is disconnected from ZooKeeper, the ClickHouse service cannot be used.

Possible Causes

- The ZooKeeper service is abnormal.
- The ClickHouse service is overloaded.

Handling Procedure

Check whether ZooKeeper is normal.

- Step 1** On FusionInsight Manager, choose **Cluster > Services > ZooKeeper > quorumpeer**.
- Step 2** Check whether ZooKeeper instances are normal.
- If yes, go to [Step 6](#).
 - If no, go to [Step 3](#).
- Step 3** Select instances whose status is not good and choose **More > Restart Instance**.
- Step 4** Check whether the instance status is good after restart.
- If yes, go to [Step 5](#).
 - If no, go to [Step 10](#).
- Step 5** Choose **O&M > Alarm > Alarms** and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 6](#).

Check whether the ClickHouse service load is heavy.

- Step 6** Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, and view the role name and the IP address for the hostname in **Location**.
- Step 7** Log in to the node where the client is installed as the client installation user and run the following commands:

```
cd {Client installation path}
```

```
source bigdata_env
```

- For a cluster with Kerberos authentication enabled (security mode):
kinit *Component service user*
clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--port 9440 --secure**

- For a cluster with Kerberos authentication disabled (normal mode):
clickhouse client --host IP address of the ClickHouseServer instance that reports the alarm **--user** *User name* **--password** **--port** 9440

Step 8 Run the following statement to check whether data is frequently written to the system table. If yes, wait until the service execution is complete and check whether the alarm is cleared.

```
SELECT query_id, user, FQDN(), elapsed, query FROM system.processes ORDER BY query_id;
```

- If yes, no further action is required.
- If no, go to [Step 9](#).

Step 9 Check whether a large amount of data is written. If yes, wait until the task is complete and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 12 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.336 ALM-45442 Too Many Concurrent SQL Statements

Alarm Description

The alarm module checks the number of concurrent ClickHouse requests every 30 seconds. This alarm is generated when the number of concurrent ClickHouse requests exceeds the concurrency threshold configured on the UI.

This alarm is cleared when the system detects that the actual number of concurrent requests is less than concurrency threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45442	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If there are too many concurrent SQL statements, a large number of system resources are consumed. As a result, system response becomes slow.

Possible Causes

The ClickHouse service is overloaded.

Handling Procedure

- Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, and view the role name and the IP address for the hostname in **Location**.
- Step 2** Choose **Cluster > ClickHouse > Instance**, select an instance based on the alarm information. Choose **Chart > Concurrency** to check whether the actual number of concurrent SQL statements is greater than SQL concurrency threshold.
 - If yes, go to **Step 3**.
 - If no, go to **Step 5**.
- Step 3** Confirm with the user whether a large number of tasks were being executed during the alarming period.
 - If yes, go to **Step 4**.
 - If no, go to **Step 5**.

Step 4 On FusionInsight Manager, choose **O&M** and click **Alarm > Thresholds** in the navigation pane on the left. On the displayed page, click **ClickHouse > Concurrency** and adjust the threshold, or wait until the task is complete. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 6 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 7 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.337 ALM-45443 Slow SQL Queries in the Cluster

Alarm Description

The system checks slow SQL queries for ClickHouse every 1 minute. This alarm is generated when the execution time of a SQL statement is longer than or equal to the slow SQL threshold.

This alarm is automatically cleared when the system detects that the execution time of the SQL statement is shorter than the slow SQL threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45443	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The performance of the ClickHouse service deteriorates, which slows the response of other services. If there are too many slow SQL statements, the service may be unavailable.

Possible Causes

- The ClickHouse service is overloaded.
- The execution of SQL statements takes a long time.

Handling Procedure

Check whether the ClickHouse service load is heavy.

Step 1 Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Log in to the node where the client is installed as the client installation user and run the following commands:

```
cd {Client installation path}
```

```
source bigdata_env
```

- For a cluster with Kerberos authentication enabled (security mode):

```
kinit Component service user
```

```
clickhouse client --host IP address of the ClickHouseServer instance that reports the alarm --port --secure
```
- For a cluster with Kerberos authentication disabled (normal mode):

```
clickhouse client --host IP address of the ClickHouseServer instance that reports the alarm --user Username --password --port
```

Step 3 Run the following statement to check whether data is frequently written to the system table. If yes, wait until the service execution is complete and check whether the alarm is cleared.

```
SELECT query_id, user, FQDN(), elapsed, query FROM system.processes ORDER BY query_id;
```

- If yes, no further action is required.
- If no, go to [Step 4](#).

Checking whether the SQL statements take a long time.

Step 4 Check the logical cluster to which the alarm object belongs. Log in to FusionInsight Manager, click **Cluster**, choose **Services > ClickHouse**, and click **Logic Cluster**. On the displayed page, choose **Query Management > Ongoing Slow Queries**. Check which SQL statements take a long time on the displayed page, confirm with the user to adjust services, optimize slow SQL statements, and check whether the optimization is successful.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

Step 5 After the SQL statements are complete, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 7 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 8 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.338 ALM-45444 Abnormal ClickHouse Process

Alarm Description

The health check module checks ClickHouse instances every 30 seconds. If the number of consecutive failures exceeds the threshold, an alarm is reported. In this

case, the ClickHouse process may stop responding and services cannot be properly executed.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45444	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the ClickHouse process is abnormal, services cannot run properly.

Possible Causes

The ClickHouse process runs improperly.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Log in to the node where the client is installed as the client installation user and run the following commands:

```
cd {Client installation path}
```

```
source bigdata_env
```

- For a cluster with Kerberos authentication enabled (security mode):

```
kinit Component service user
```

```
clickhouse client --host IP address of the ClickHouseServer instance that reports the alarm --port 9440 --secure
```

- For a cluster with Kerberos authentication disabled (normal mode):

clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--user** *Username* **--password** **--port** 9000

Step 3 Run the following statement to check whether the result can be properly returned:

```
SELECT 1;
```

- If yes, go to [Step 4](#).
- If no, go to [Step 5](#).

Step 4 Wait for several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 7 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.339 ALM-45585 IoTDB Service Unavailable

Alarm Description

The system checks the IoTDB service status every 300 seconds. This alarm is generated when the IoTDB service is unavailable. This alarm is cleared when the IoTDB service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45585	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

Users cannot use the IoTDB service properly.

Possible Causes

- The KrbServer service is abnormal.
- More than 50% of IoTDBServer instances are faulty.

Handling Procedure

Check whether the KrbServer service on which the IoTDB depends is abnormal.

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Alarms**.

Step 2 In the alarm list, check whether ALM-25500 KrbServer Service Unavailable exists.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

Step 3 Handle the alarm by referring to "ALM-25500 KrbServer Service Unavailable."

Step 4 After ALM-25500 is cleared, wait a few minutes and check whether the alarm HetuServer Service Unavailable is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check whether IoTDBServer instances are faulty.

Step 5 On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Service > IoTDB > Instance**.

Step 6 Check whether the percentage of faulty IoTDBServer instances exceeds 50%. If yes, restart the faulty IoTDBServer instances and check whether the status is restored.

- If yes, no further action is required.

- If no, go to [Step 7](#).

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 8 Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

10.340 ALM-45586 IoTDBServer Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the IoTDBServer process status every 60 seconds. The alarm is generated when the heap memory usage of the IoTDBServer process exceeds the threshold (90% of the maximum memory).

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45586	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.

Parameter	Description
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

If the available IoTDBServer process heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The heap memory of the IoTDBServer process is overused or the heap memory is inappropriately allocated.

Handling Procedure

Check the heap memory usage.

- Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **45586**, view the role name in **Location**, and check the instance IP address.
- Step 2** Choose **Cluster > Name of the desired cluster > Service > IoTDB > Instance**. Click the IoTDBServer for which the alarm is generated to go to **Dashboard**. Click the drop-down list in the upper right corner of the chart area and choose **Customize > Memory**. In the dialog box that is displayed, select **IoTDBServer Heap Memory Resource Percentage**, and click **OK**. Check whether the used non-heap memory of the IoTDBServer process reaches 90% (by default) of the maximum non-heap memory specified for IoTDBServer.
- If yes, go to **Step 3**.
 - If no, go to **Step 5**.
- Step 3** Choose **Cluster > Name of the desired cluster > Service > IoTDB > Configuration**, click **All Configurations**, choose **IoTDBServer > System**, and increase the value of **-Xmx** in the **GC_OPTS** parameter.

NOTE

- The default value of **-Xmx** is **2G**.
 - If this alarm is occasionally generated, increase the value by 0.5 times. If this alarm is frequently generated, double the value.
 - In the case of large service volume and high service concurrency, you are advised to add instances.
- Step 4** Check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to **Step 5**.

Collect the fault information.

- Step 5** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 6** Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.
- Step 7** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.
- Step 8** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.341 ALM-45587 IoTDBServer GC Duration Exceeds the Threshold

Alarm Description

The system checks the GC duration of the IoTDBServer process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default) for three consecutive times. You can choose **O&M > Alarm > Threshold Configuration > Name of the desired cluster > IoTDB > GC > Total GC duration of IoTDBServer process (IoTDBServer)** to change the threshold. This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45587	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.

Parameter	Description
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

A long GC duration of the IoTDBServer process may interrupt the services.

Possible Causes

The heap memory of the IoTDBServer process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC duration.

- Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **45587**, view the role name in **Location**, and check the instance IP address.
- Step 2** Choose **Cluster > Name of the desired cluster > Service > IoTDB > Instance**. Click the IoTDBServer for which the alarm is generated to go to **Dashboard**. Click the drop-down list in the upper right corner of the chart area and choose **Customize > GC**. In the dialog box that is displayed, select **Garbage Collection (GC) Time of IoTDBServer**, and click **OK**. Check whether the GC time of the IoTDBServer process is greater than 12 seconds.
- If yes, go to **Step 3**.
 - If no, go to **Step 5**.
- Step 3** Choose **Cluster > Name of the desired cluster > Service > IoTDB > Configuration**, click **All Configurations**, choose **IoTDBServer > System**, and increase the value of **-Xmx** in the **GC_OPTS** parameter.

NOTE

- The default value of **-Xmx** is **2G**.
- If this alarm is occasionally generated, increase the value by 0.5 times. If this alarm is frequently generated, double the value.
- In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 6 Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.

Step 7 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.342 ALM-45588 IoTDBServer Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the IoTDBServer service every 60 seconds. This alarm is generated when the direct memory usage of the IoTDBServer instance exceeds the threshold (90% of the maximum memory) for five consecutive times. This alarm is cleared when the IoTDBServer direct memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45588	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Direct memory overflow may cause service breakdown.

Possible Causes

The direct memory of the IoTDBServer process is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

- Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **45588**, view the role name in **Location**, and check the instance IP address.
- Step 2** Choose **Cluster > Name of the desired cluster > Service > IoTDB > Instance**. Click the IoTDBServer for which the alarm is generated to go to **Dashboard**. Click the drop-down list in the upper right corner of the chart area and choose **Customize > Memory**. In the dialog box that is displayed, select **IoTDBServer Direct Buffer Resource Percentage**, and click **OK**.
- Step 3** Check whether the direct memory used by the IoTDBServer reaches the threshold (90% of the maximum direct memory by default).
 - If yes, go to **Step 4**.
 - If no, go to **Step 6**.
- Step 4** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Service > IoTDB > Configuration**, click **All Configurations**, choose **IoTDBServer > System**, increase the value of **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter as required, and save the configuration.

 NOTE

- If this alarm is generated, the direct memory configured for the IoTDBServer process cannot meet the requirements of the IoTDBServer process.
- You are advised to set **-XX:MaxDirectMemorySize** in **GC_OPTS** to twice the direct memory used by the IoTDBServer process. (You can change the value based on the actual service scenario.)
- To obtain the size of the direct memory used by the IoTDBServer process, choose **Customize > Memory > IoTDBServer Direct Memory Resource Status**. If **GC_OPTS** does not contain the **-XX:MaxDirectMemorySize** parameter, add it manually.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 7 Expand the **Service** drop-down list, and select **IoTDBServer** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.343 ALM-45589 ConfigNode Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the ConfigNode process every 60 seconds. This alarm is generated when the heap memory usage of the ConfigNode process exceeds the threshold (90% of the maximum memory). This alarm is cleared when the heap memory usage of the ConfigNode process is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45589	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

If the heap memory usage of the ConfigNode process is too high, the performance of the ConfigNode process is affected, and even the ConfigNode process becomes unavailable due to memory overflow.

Possible Causes

The heap memory configured for the node is improper. As a result, the usage exceeds the threshold.

Handling Procedure

Check the heap memory configuration.

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. In the real-time alarm list, click  in front of this alarm and view the role name and instance IP address in **Location**.
- Step 2** Choose **Cluster > Services > IoTDB**. Click **Instance**, click the ConfigNode corresponding to the IP address obtained in **Step 1**, and check whether **ConfigNode Heap Memory Usage** on the **Dashboard** tab page reaches the threshold specified for the ConfigNode process.

If the chart is not displayed, click the drop-down list in the upper right corner of the chart area and choose **Customize > Memory**. In the dialog box that is displayed, select **ConfigNode Heap Memory Usage** and click **OK**.

 NOTE

You can choose **O&M > Alarm > Threshold Configuration > Name of the desired cluster > IoTDB > Memory > ConfigNode Heap Memory Usage (ConfigNode)** to view the threshold.

- If yes, go to [Step 3](#).
- If no, go to [Step 6](#).

Step 3 Choose **Cluster > Services > IoTDB**. Click **Configurations** then **All Configurations**, click **ConfigNode**, and choose **System**. Set **-Xmx** in **GC_OPTS** to a larger value and save the configuration.

 NOTE

- The default value of **-Xmx** is **2G**.
- If this alarm is occasionally generated, increase the value of **-Xmx** by 0.5 times. If this alarm is frequently generated, double the value of **-Xmx**.
- In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Click **Dashboard**. Click **Restart Service** to restart the IoTDB service for the configuration to take effect.

NOTICE

During the restart of the IoTDB service, read and write requests are interrupted.

Step 5 Wait for about 120 seconds and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 7 Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.

Step 8 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.344 ALM-45590 ConfigNode GC Duration Exceeds the Threshold

Alarm Description

The system checks the GC duration of the ConfigNode process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default) for three consecutive times. This alarm is cleared when the GC duration is less than the threshold.

NOTE

You can choose **O&M > Alarm > Threshold Configuration > Name of the desired cluster > IoTDB > GC > Total GC duration of ConfigNode process (ConfigNode)** to increase the threshold by 20% each time.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45590	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

A long GC duration of the ConfigNode process may interrupt services.

Possible Causes

The heap memory configured on the node is improper. As a result, GC occurs frequently.

Handling Procedure

Check the heap memory configuration.

Step 1 Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. In the real-time alarm list, click  in the row containing this alarm and view the role name and instance IP address in **Location**.

Step 2 Choose **Cluster > Services > IoTDB**. Click **Instance**, click the ConfigNode corresponding to the IP address obtained by [Step 1](#). Switch to the **Dashboard** tab page, locate the **Total GC Duration of ConfigNode** chart, and check whether the GC duration of the ConfigNode process exceeds the threshold.

If the GC duration of ConfigNode is not displayed, click the drop-down list in the upper right corner of the chart area and choose **Customize > GC**. In the displayed dialog box, select **Total GC Duration of ConfigNode** and click **OK**.

NOTE

You can choose **O&M > Alarm > Threshold Configuration > Name of the desired cluster > IoTDB > GC > Total GC duration of ConfigNode process (ConfigNode)** to view the threshold.

- If yes, go to [Step 3](#).
- If no, go to [Step 6](#).

Step 3 Choose **Cluster > Services > IoTDB**. Click **Configurations** then **All Configurations**, click **ConfigNode**, and choose **System**. Set **-Xmx** in **GC_OPTS** to a larger value and save the configuration.

NOTE

- The default value of **-Xmx** is **2G**.
- If this alarm is occasionally generated, increase the value by 0.5 times. If this alarm is frequently generated, double the value.
- In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Click **Dashboard**. Click **Restart Service** to restart the IoTDB service for the configuration to take effect.

NOTICE

During the restart of the IoTDB service, read and write requests are interrupted.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect fault information.

- Step 6** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 7** Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.
- Step 8** Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.
- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.
- Step 10** Contact O&M personnel and provide the collected logs.
- End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.345 ALM-45591 ConfigNode Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the ConfigNode process every 60 seconds. This alarm is generated when the direct memory usage of the ConfigNode exceeds the threshold for five consecutive times. That is, the direct memory configured for ConfigNode cannot meet service requirements. This alarm is cleared when the direct memory usage of ConfigNode is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45591	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.

Parameter	Description
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Direct memory overflow may cause the IoTDB instance to be unavailable.

Possible Causes

The direct memory configured for the node is improper. As a result, the usage exceeds the threshold.

Handling Procedure

Check the direct memory configuration.

Step 1 Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. In the real-time alarm list, click  in front of this alarm and view the role name and instance IP address in **Location**.

Step 2 Choose **Cluster > Services > IoTDB**. Click **Instance**, click the ConfigNode corresponding to the IP address obtained in **Step 1**, and check whether **ConfigNode Direct Memory Usage** on the **Dashboard** tab page reaches the threshold specified for the ConfigNode process (90% of the maximum direct memory by default).

If the chart is not displayed, click the drop-down list in the upper right corner of the chart area and choose **Customize > Memory**. In the dialog box that is displayed, select **ConfigNode Direct Memory Usage** and click **OK**.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > IoTDB**. Click **Configurations** then **All Configurations**. Click **ConfigNode** and select **System**. Set **-XX:MaxDirectMemorySize** in **GC_OPTS** to a larger value as required and save the configuration.

 NOTE

- You are advised to set **-XX:MaxDirectMemorySize** in **GC_OPTS** to twice the direct memory used by the ConfigNode process. (You can change the value based on the actual service scenario.)
- To obtain the size of the direct memory used by the ConfigNode process, choose **Customize > Memory > ConfigNode Direct Memory Resource Status**.
- If **GC_OPTS** does not contain the **-XX:MaxDirectMemorySize** parameter, add it.

Step 4 Restart the affected IoTDB service or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

NOTICE

During the restart of the IoTDB service or instance, read and write requests are interrupted.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 6 Expand the **Service** drop-down list, and select **ConfigNode** for the destination cluster.

Step 7 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.346 ALM-45592 IoTDBServer RPC Execution Duration Exceeds the Threshold

Alarm Description

The system checks the RPC execution duration of the IoTDBServer process every 60 seconds. This alarm is generated when the execution duration exceeds the

threshold. This alarm is cleared when the RPC execution time of the IoTDBServer process is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45592	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

Running performance of the IoTDBServer process is affected.

Possible Causes

The processing duration of an IoTDBServer RPC request exceeds the threshold. Logs need to be further analyzed to locate the cause.

Handling Procedure

Collect fault information.

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. In the real-time alarm list, click  in front of this alarm and view the role name and instance IP address in **Location**.
- Step 2** Choose **O&M > Log > Download**.
- Step 3** Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.
- Step 4** Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the host queried in [Step 1](#), and click **OK**.

Step 5 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 6 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.347 ALM-45593 IoTDBServer Flush Execution Duration Exceeds the Threshold

Alarm Description

This alarm is generated when the data flush duration exceeds the threshold. This alarm is cleared when the flush duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45593	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

Data write is blocked and the write operation performance is affected.

Possible Causes

The IoTDB flushing on the node is slow. You need to further analyze logs.

Handling Procedure

Collect fault information.

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. In the real-time alarm list, click  in front of this alarm and view the role name and instance IP address in **Location**.
- Step 2** Choose **O&M > Log > Download**.
- Step 3** Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.
- Step 4** Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the host queried in [Step 1](#), and click **OK**.
- Step 5** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.
- Step 6** Contact O&M personnel and provide the collected logs.

10.348 ALM-45594 IoTDBServer Intra-Space Merge Duration Exceeds the Threshold

Alarm Description

This alarm is generated when the merge duration in the space exceeds the threshold. This alarm is cleared when the merge duration in the space is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45594	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

Data write is blocked and the write operation performance is affected.

Possible Causes

The merge task in the IoTDB space of the node is slow. You need to further analyze logs.

Handling Procedure

Collect fault information.

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. In the real-time alarm list, click  in front of this alarm and view the role name and instance IP address in **Location**.
- Step 2** Choose **O&M > Log > Download**.
- Step 3** Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.
- Step 4** Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the host queried in **Step 1**, and click **OK**.
- Step 5** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

10.350 ALM-45596 Procedure Execution Failed

Alarm Description

Procedures are the tasks managed and executed by the ConfigNode leader. This alarm is generated when a procedure fails to be executed. This alarm is cleared when the procedure is successfully executed.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45596	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
ProcedureInformation	Specifies the procedure-related information.

Impact on the System

Functions associated with the procedure are adversely affected.

Possible Causes

- The task for adding IoTDB replicas fails to be executed.
- The task for deleting the storage group fails to be executed.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Alarms**, locate this alarm, and click .

Step 2 Check the value of **ProcedureInformation** in **Location**. The value starts with the procedure type and contains main information about the procedure.

Check whether the task for adding replicas fails.

Step 3 Check whether the value of **ProcedureInformation** starts with **AddRegionProcedure** or **ReJoinDataNodeProcedure**.

- If yes, the task fails. Go to [Step 4](#).
- If no, go to [Step 5](#).

Step 4 Wait for half an hour. If the region is successfully added, the alarm is automatically cleared. Otherwise, go to [Step 5](#).

Check whether the task for deleting the storage group fails.

Step 5 Check whether the value of **ProcedureInformation** starts with **DeleteStorageGroupProcedure**.

- If yes, the storage group fails to be deleted. Go to [Step 6](#).
- If no, go to [Step 7](#).

Step 6 Delete the storage group displayed in **ProcedureInformation** again on the IoTDB client. If the deletion is successful, the alarm is automatically cleared. Otherwise, go to [Step 7](#).

Collect fault information.

Step 7 Choose **Cluster > Services > IoTDB > Instance** to view the hosts where all IoTDBServer and ConfigNode instances are located.

- Step 8** Choose **O&M > Log > Download**.
- Step 9** Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.
- Step 10** Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the host queried in [Step 7](#), and click **OK**.
- Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.
- Step 12** Contact O&M personnel and provide the collected logs.
- End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.351 ALM-45615 CDL Service Unavailable

Alarm Description

The system checks the CDL health status every 60 seconds. This alarm is generated when the CDL health status is **DOWN**. This alarm is cleared when the system detects that the CDL health status is **UP**.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45615	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.

Parameter	Description
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The CDL service is abnormal. You cannot use FusionInsight Manager to perform cluster operations on the CDL service. The CDL service function is unavailable.

Possible Causes

All CDLService or CDLConnector instances of the CDL service are abnormal, and the Kafka service is unavailable.

Handling Procedure

Check whether the Kafka service on which the CDL service depends is abnormal.

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**.
- Step 2** In the alarm list, check whether ALM-38000 Kafka Service Unavailable exists.
- If yes, go to [Step 3](#).
 - If no, go to [Step 5](#).
- Step 3** Handle the alarm by referring to "ALM-38000 Kafka Service Unavailable".
- Step 4** After the alarm is cleared, wait a few minutes and check whether the alarm HetuServer Service Unavailable is cleared.
- If yes, no further action is required.
 - If no, go to [Step 5](#).

Check whether CDL instances are faulty.

- Step 5** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Service > CDL > Instance**.
- Step 6** Check whether all CDLService and CDLConnector instances are faulty.
- If yes, restart the CDL service and choose **Cluster > Name of the desired cluster > Services > CDL > More > Restart Service**. If the fault persists after the restart, go to [Step 7](#) and contact O&M personnel to check CDL logs.
 - If no, go to [Step 7](#).

Collect the fault information.

- Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 8** Expand the **Service** drop-down list, and select **CDL** for the target cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

After the service is restored, the system automatically clears the alarm.

Related Information

None

10.352 ALM-45616 CDL Job Execution Exception

Alarm Description

The system checks whether a CDL job is normal every 60 seconds. This alarm is reported when the CDL job is abnormal. This alarm is cleared when the job is restored or stopped.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45616	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
JobName	Specifies the job for which the alarm was generated.
Username	Specifies the username of the job for which the alarm was generated.

Impact on the System

This alarm has no impact on the system.

Possible Causes

The CDL task fails to be executed due to incorrect parameter settings or other reasons. On the **Job Management** page of the CDL web UI, locate the row where the job is located and click **Failed/Abnormal running** in the **Status** column to view the failure cause, or view the failure cause in the logs.

Handling Procedure

- Step 1** Log in to FusionInsight Manager as a user who has the CDL job creation or administrator permission.
- Step 2** Choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**, click  in the row where **Alarm ID** is **45616**, and view the name of the job for which this alarm is generated in **Location**.
- Step 3** Choose **Cluster > Services > CDL** and click the link next to **CDLService UI** to go to the CDL web UI.
- Step 4** Locate the row where the failed job is located based on the job name obtained in **Step 2**, and click **Abnormal running** or **Failed** in the **Status** column.

Name	Created	Status	Type
pghudi			pgsql ----> kafka ----> hudi

- Step 5** On the page that is displayed, view the error information and rectify the fault. For example, **Figure 10-129** shows that the task running on Yarn is manually killed. For details, see trace error information, as shown in **Figure 10-130**.

Figure 10-129 CDL job exception

Sink information

sink-connector-id	
-------------------	--

Figure 10-130 Trace error information

Step 6 Rectify the fault based on the error information, execute the task again, and check whether the task can be executed successfully.

- If yes, no further action is required.
- If no, go to [Step 7](#).

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 8 Select **CDL** in the required cluster for **Service**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

After the job is successfully restored or stopped, the alarm is cleared if it has been reported.

Related Information

None

10.353 ALM-45617 Data Queued in the CDL Replication Slot Exceeds the Threshold

Alarm Description

If too many WALs are stacked in PostgreSQL or openGauss (applicable to MRS 3.3.0 or later), the PostgreSQL or openGauss disk space may be used up. The system checks whether the amount of data queued in the replication slot configured for a CDL job exceeds the threshold every 5 minutes. This alarm is generated when the amount of data queued in the replication slot exceeds the

threshold. This alarm is cleared when the number of data queued in the replication slot falls below the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45617	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
JobName	Specifies the job for which the alarm was generated.
DBName	Specifies the database for which the alarm was generated.
SlotName	Specifies the database replication slot for which the alarm was generated.
Lag	Specifies the data queued in the slot.

Impact on the System

WALs are continuously accumulated in the source PostgreSQL or openGauss database, causing the disk space of the source database to be used up.

Possible Causes

The CDL job is abnormal, and data processing stops; the source database is updated quickly, and CDL data processing is slow.

Handling Procedure

- Step 1** Log in to FusionInsight Manager as a user who has the CDL job creation or administrator permission.
- Step 2** Choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**, click  in the row where **Alarm ID** is **45617**, and view the name of the job for which this alarm is generated in **Location**.
- Step 3** Check whether **ALM-45616 CDL Job Execution Exception** is displayed in the alarm list.

- If yes, handle the alarm by performing operations provided for **ALM-45616 CDL Job Execution Exception**.
 - If no, go to [Step 4](#).
- Step 4** Choose **Cluster > Services > CDL**. Click the link next to **CDLService UI** to go to the CDL web UI and check whether the job is displayed in the job list based on its name obtained in [Step 2](#).
- If yes, check whether the job is abnormal.
 - If it is abnormal, go to [Step 5](#).
 - If it is not, data processing is slow. Contact O&M personnel.
 - If no, go to [Step 7](#).
- Step 5** Click **Abnormal** or **Failed** in the row where the job is located and rectify the fault based on the error information displayed on the page.
- Step 6** After rectifying the fault, run the job again and check whether the job can be executed successfully.
- If yes, no further action is required.
 - If no, go to [Step 7](#).
- Collect fault information.**
- Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 8** Expand the **Service** drop-down list, and select **CDL** for the target cluster.
- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.
- Step 10** Contact O&M personnel and provide the collected logs.
- End

Alarm Clearance

This alarm is cleared when the amount of data queued in the replication slot is less than the threshold. You do not need to manually clear the alarm.

Related Information

None

10.354 ALM-45635 FlinkServer Job Execution Failure

This section applies to MRS 3.1.2 or later.

Alarm Description

The system checks whether FlinkServer jobs fail to be executed every 10 seconds. This alarm is generated when a FlinkServer job fails. This alarm is cleared when the job is successfully restarted.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45635	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
JobName	Specifies the job for which the alarm was generated.

Impact on the System

This alarm has no impact on the system.

Possible Causes

You can view failure causes in specific logs.

Handling Procedure

- Step 1** Log in to Manager as a user who has the FlinkServer management permission.
- Step 2** Choose **Cluster > Services > Yarn** and click the link next to **ResourceManager WebUI** to go to the Yarn page.
- Step 3** Locate the failed job based on its name displayed in **Location**, search for and record the application ID of the failed job, and check whether the job logs are available on the Yarn page.

Figure 10-131 Application ID of a job

ID	User	Name	Application Type	Queue
application_1	I_0009	zw_..._kafka	Apache Flink	default

If yes, go to [Step 4](#).

If no, go to [Step 6](#).

Step 4 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

Figure 10-132 Clicking Logs

Container ID	Node	Container Exit Status	Logs
container_0009_01_000002	https/	0	Logs
container_0009_01_000001	https/	0	Logs

Showing 1 to 2 of 2 entries

NOTE

You can also log in to Manager as a user who has the FlinkServer management permission, choose **Cluster > Services > Flink**, click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management** and choose **More > Job Monitoring** in the **Operation** column to view the TaskManager logs.

Step 5 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 6 On Manager, choose **Cluster > Services > HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, select **Utilities > Browse the file system**, and download logs in the `/tmp/logs/User name/logs/Application ID of the failed job` directory.

Step 7 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearance

After the job is successfully restarted, the alarm is cleared if it has been reported.

Related Information

None

10.355 ALM-45636 Flink Job Checkpoints Keep Failing

This section applies to MRS 3.1.2 or a version between 3.1.2 and 3.3.0.

Description

The system checks the number of consecutive checkpoint failures based on the configured alarm checking interval. This alarm is generated when the number of consecutive checkpoint failures of a FlinkServer job reaches the configured threshold. This alarm is cleared when checkpoints are recovered or the job is successfully restarted.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45636	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.
Username	Specifies the username of the job for which the alarm is generated.

Impact on the System

The Flink job may fail. You need to check the status and logs of the Flink job to locate the fault. This is a job-level alarm and has no impact on FlinkServer.

Possible Causes

You can view failure causes in specific logs.

Procedure

- Step 1** Log in to Manager as a user who has the FlinkServer management permission.
- Step 2** Choose **Cluster > Services > Yarn** and click the link next to **ResourceManager WebUI** to go to the Yarn page.
- Step 3** Locate the failed job based on its name displayed in **Location**, search for and record the application ID of the failed job, and check whether the job logs are available on the Yarn page.

Figure 10-135 Application ID of a job

ID	User	Name	Application Type	Queue
application_1_0009	f...	zw_..._kafka	Apache Flink	default

If yes, go to **Step 4**.

If no, go to **Step 6**.

- Step 4** Click the application ID of the failed job to go to the job page.
 1. Click **Logs** in the **Logs** column to view JobManager logs.

10.360 ALM-45639 Checkpointing of a Flink Job Times Out

Description

The system checks the checkpointing timeout of Flink jobs every 30 seconds. This alarm is generated if the checkpointing timeout of a Flink job is longer than the threshold (600 seconds by default). This alarm is cleared when the checkpointing timeout of a job is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45639	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ApplicationName (available in MRS 3.2.1 or later)	Specifies the name of the application for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.
UserName	Specifies the username for which the alarm is generated.

Impact on the System

This alarm has no impact on the system.

Possible Causes

The job may be in the sub-healthy state. The possible causes are as follows:

- The memory for the TaskManager of the job is insufficient.
- The state memory is too large, making checkpointing time-consuming.

Procedure

- Step 1** Log in to Manager as a user who has the FlinkServer management permission.
- Step 2** Choose **O&M > Alarm > Alarms > ALM-45639 Checkpointing of a Flink Job Times Out**, view **Location**, and obtain the name of the task for which the alarm is generated.
- Step 3** Choose **Cluster > Services > Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.
- Step 4** Locate the failed task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

Related Information

None

10.361 ALM-45640 FlinkServer Heartbeat Interruption Between the Active and Standby Nodes

This section applies to MRS 3.2.0 or later.

Alarm Description

This alarm is generated when the FlinkServer active node or standby node does not receive heartbeat messages from the peer for 30 seconds (heartbeat interruption duration configured in keepalive).

This alarm is cleared when the heartbeat recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45640	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

During the FlinkServer heartbeat interruption, only one node can provide the service. If this node is faulty, no standby node is available for failover and the service is unavailable.

Possible Causes

- The active or standby FlinkServer instance is in the stopped state.
- The NIC of the floating IP address of the HA system used by the FlinkServer node is incorrectly configured. FlinkServer fails to be started.
- The link between the active and standby FlinkServer nodes is abnormal.

Handling Procedure

Check the status of the active and standby FlinkServer instances.

Step 1 Log in to FusionInsight Manager, choose **Cluster > Services > Flink > Instance**, and check the state of FlinkServer is normal.

- If yes, go to [Step 3](#).
- If no, go to [Step 2](#).

Step 2 Select the abnormal FlinkServer instance and start the instance. After the instance is started, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 3](#).

NOTICE

During the restart, the FlinkServer instance cannot provide services, but submitted jobs are not affected.

Check whether the link between the standby FlinkServer nodes is normal.

Step 3 Choose **Cluster > Services > Flink > Instance**, and check the two service IP addresses of FlinkServer.

Step 4 Log in to the server where the abnormal FlinkServer instance locates as the **root** user.

Step 5 Run the following command to check whether the server of the other FlinkServer instance is reachable:

ping *IP address of the other FlinkServer instance*

- If yes, go to [Step 8](#).
- If no, go to [Step 6](#).

Step 6 Ask the network administrator to handle the network exception.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

Check whether the logs of the node where the abnormal FlinkServer instance locates contains error information.

Step 8 Log in to the server where the abnormal FlinkServer instance locates as the **root** user.

- Step 9** Open the log file in the default directory `/var/log/Bigdata/flink/flinkserver/prestart.log` and check whether there is error message `Float ip x.x.x.x is invalid`.
- If yes, go to [Step 10](#).
 - If no, go to [Step 12](#).
- Step 10** On FusionInsight Manager, choose **Cluster > Services > Flink > Configurations > All Configurations** and search for `flink.ha.floatip`. Change the parameter value to the correct floating IP address, save the configuration, and restart the Flink service.

NOTICE

- Contact the network engineer to obtain the new floating IP address.
 - During the service restart, FlinkServer cannot provide services, but submitted jobs are not affected.
 - During the restart, the FlinkServer instance cannot provide services, but submitted jobs are not affected.
-

- Step 11** Check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 12](#).

Collect the fault information.

- Step 12** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 13** Select the Flink service in the required cluster for **Service**.
- Step 14** Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.
- Step 15** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 16** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.362 ALM-45641 Data Synchronization Exception Between the Active and Standby FlinkServer Nodes

This section applies to MRS 3.2.0 or later.

Alarm Description

The system checks data synchronization between the active and standby FlinkServer nodes every 60 seconds. This alarm is generated when the standby FlinkServer node fails to synchronize files with the active FlinkServer node.

This alarm is cleared when the standby FlinkServer synchronizes files with the active FlinkServer.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45641	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

Because the configuration files on the standby FlinkServer are not updated, some configurations will be lost after an active/standby switchover. FlinkServer and some components may not run properly.

Possible Causes

- The link between the active and standby FlinkServer nodes is interrupted.
- The synchronization file does not exist or the file permission is required.

Handling Procedure

Check whether the network between the active and standby FlinkServer is in normal state.

Step 1 On FusionInsight Manager, choose **Cluster > Services > ClickHouse > Instance**. View and record the IP addresses of active and standby FlinkServer.

Step 2 Log in to the active FlinkServer node as the **root** user.

Step 3 Run the following command to check whether the standby FlinkServer is reachable:

ping *IP address of the standby FlinkServer*

- If yes, go to [Step 6](#).
- If no, go to [Step 4](#).

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Check whether the storage space of the /srv/BigData/LocalBackup directory is insufficient.

Step 6 Run the following command to check whether the storage space of the */srv/BigData/LocalBackup* directory is insufficient:

df -hl /srv/BigData/LocalBackup

- If yes, go to [Step 7](#).
- If no, go to [Step 10](#).

Step 7 Run the following command to clear unnecessary backup files:

rm -rf *Directory to be cleared*

The following are two examples:

rm -rf /srv/BigData/LocalBackup/0/default-oms_20191211143443

Step 8 On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

In the **Operation** column of the backup task, click **Configure** and change the value of **Maximum Number of Backup Copies** to reduce the number of backup file sets.

Step 9 Wait for 1 minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

Check whether the synchronization file exists and whether the file permission is valid.

Step 10 Run the following command to check whether the synchronization file exists:

find /srv/BigData/ -name "sed*"

find /opt -name "sed*"

- If yes, go to [Step 11](#).

- If no, go to [Step 12](#).

Step 11 Run the following command to check the synchronization file information and permission queried in [Step 10](#):

ll *Path of the file you want to search for*

- If the file size is 0 and all values in the permission column are -, the file is a junk file. Run the following command to delete it:

```
rm -rf Files to be deleted
```

Wait for several minutes and check whether the alarm is cleared. If the alarm persists, go to [Step 12](#).

- If the file size is not 0, go to [Step 12](#).

Step 12 View the log file generated when the alarm is reported.

1. Run the following command to go to the HA run log file path of the current cluster:

```
cd /var/log/Bigdata/flink/flinkserver/ha/runlog
```

2. Decompress log file and view the logs generated when the alarm is reported.

For example, if the name of the file is **ha.log.2021-03-22_12-00-07.gz**, run the following command:

```
gunzip ha.log.2021-03-22_12-00-07.gz
```

```
vi ha.log.2021-03-22_12-00-07
```

Check whether error information is displayed before and after the alarm generation time in the logs.

- If it is displayed, rectify the fault based on the error information. Go to [Step 13](#).

For example, if the following error information is displayed, the directory permission is required. In this case, obtain the directory permission that is the same as the permission on a normal node.

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.363 ALM-45642 RocksDB Continuously Triggers Write Traffic Limiting

This section applies to MRS 3.3.0 or later.

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when RocksDB for a job continuously triggers write traffic limiting, that is, the RocksDB write rate is not 0. This alarm is cleared when the RocksDB write rate of the job becomes 0.

The **rocksdb.actual-delayed-write-rate** parameter specifies the RocksDB write rate of a job. Value **0** indicates that the rate is not limited, and other values indicate traffic limiting.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45642	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ApplicationName	Specifies the name of the application for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Parameter	Description
JobName	Specifies the job for which the alarm is generated.

Impact on the System

This alarm has no adverse impact on the system.

Possible Causes

When the rate at which Flink jobs write data to RocksDB is not 0, write traffic limiting is triggered. The possible causes are as follows:

- There are too many MemTables. As a result, write traffic is limited or write stops, and **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold** is generated.
- The size of SST files at level 0 is too large, and **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** is generated.
- The estimated compaction size exceeds the threshold, and **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** is generated.

Handling Procedure

Check whether write traffic limiting or write stop is caused due to too many MemTables.

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Alarms**.

Step 2 In the alarm list, check whether **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

Step 3 Handle the alarm by following the instructions provided in section **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold**.

Step 4 After ALM-45643 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check whether write traffic limiting or write stop is caused due to too many SST files at level 0.

Step 5 On FusionInsight Manager, choose **O&M > Alarm > Alarms**.

Step 6 In the alarm list, check whether **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to [Step 7](#).
- If no, go to [Step 9](#).

Step 7 Handle the alarm by following the instructions provided in section **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold**.

Step 8 After ALM-45644 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Check whether write traffic limiting or write stop is caused because the estimated compaction size exceeds the threshold.

Step 9 In the alarm list, check whether **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to [Step 10](#).
- If no, go to [Step 12](#).

Step 10 Handle the alarm by following the instructions provided in section **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold**.

Step 11 After ALM-45647 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

Collect fault information.

Step 12 Log in to FusionInsight Manager as a user who has the FlinkServer management permission.

Step 13 Choose **O&M > Alarm > Alarms > ALM-45642 RocksDB Continuously Triggers Write Traffic Limiting**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 14 Choose **Cluster > Services > Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 15 Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the native Yarn page.

Figure 10-159 Application ID of a job

The screenshot shows a table with the following structure:

ID	User	QueueUser	Name
application			

The 'ID' column contains the text 'application', which is highlighted with a red rectangular box.

- If yes, go to **Step 16**.
- If no, go to **Step 18**.

Step 16 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

NOTE

You can also log in to Manager as a user who has the FlinkServer management permission. Choose **Cluster > Services > Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

Step 17 View the job logs to rectify the fault, or contact the O&M personnel and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 18 On Manager, choose **Cluster > Services > HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities > Browse the file system**, and download logs in the */tmp/logs/Username/bucket-logs-tfile/Last four digits of the task application ID/Application ID of the task* directory.

Step 19 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.364 ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold

This section applies to MRS 3.3.0 or later.

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when the MemTable size of RocksDB for a job continuously exceeds the threshold (**metrics.reporter.alarm.job.alarm.rocksdb.get.micros.threshold**, 50000 microseconds by default). This alarm is cleared when the MemTable size of RocksDB for the job is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45643	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ApplicationName	Specifies the name of the application for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.

Impact on the System

This alarm has no adverse impact on the system.

Possible Causes

The write pressure of RocksDB is high.

Handling Procedure

Check TaskManager logs for the write pressure of RocksDB and collect logs.

- Step 1** Log in to FusionInsight Manager as a user who has the FlinkServer management permission.
- Step 2** Choose **O&M > Alarm > Alarms > ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold**, view **Location**, and obtain the name of the task for which the alarm is generated.
- Step 3** Choose **Cluster > Services > Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.
- Step 4** Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

Figure 10-163 Application ID of a job

ID	User	QueueUser	Name
application			

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

- Step 5** Click the application ID of the failed job to go to the job page.
 1. Click **Logs** in the **Logs** column to view JobManager logs.

Showing 1 to 1 of 1 entries

2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view and save TaskManager logs. Then go to **Step 7**.

Figure 10-165 Clicking the ID in the Attempt ID column

Figure 10-166 Clicking Logs

NOTE

You can also log in to Manager as a user who has the management permission for the current Flink job. Choose **Cluster > Services > Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 6 On Manager, choose **Cluster > Services > HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities > Browse the file system**, and download logs in the `/tmp/logs/Username/bucket-logs-tfile/Last four digits of the task application ID/Application ID of the task` directory.

Check whether the write pressure of RocksDB is high.

Step 7 Check whether the value of `rocksdb.size-all-mem-tables` (unit: byte) in the TaskManager monitoring logs (keyword `RocksDBMetricPrint`) is greater than or equal to the total write buffer size (Total write buffer = `write_buffer_size` x `max_write_buffer_number`).

- If yes, adjust the values of the following custom parameters on the job development page of the Flink web UI, save the settings, and go to **Step 8**.

Table 10-7 Custom parameters

Parameter	Default Value	Description
state.backend.rocksdb.writebuffer.count	<ul style="list-style-type: none"> 2 4: enables SPINNING_DISK_OPTIMIZED_HIGH_MEM. 	<ul style="list-style-type: none"> Number of buffers 2 to 10 are recommended. Adjust the value based on service requirements.
state.backend.rocksdb.writebuffer.size	64MB	<ul style="list-style-type: none"> Buffer size 64MB to 256MB are recommended.

Parameter	Default Value	Description
state.backend.rocksdb.thread.num	<ul style="list-style-type: none">- 2- 4: enables SPINNING_DISK_OPTIMIZED_HIGH_MEM.	<ul style="list-style-type: none">- Number of flush threads. Increase the number of threads to quickly flush memory data to disks.- When the number of threads is increased, the number of vCores also needs to be increased.- 2 to 10 are recommended.

- If no, go to [Step 9](#).

Step 8 Restart the job and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Step 9 Contact O&M personnel and send the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.365 ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold

This section applies to MRS 3.3.0 or later.

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when the number of SST files at level 0 of RocksDB for a job continuously exceeds the threshold (**state.backend.rocksdb.level0_slowdown_writes_trigger**, 20 by default). This alarm is cleared when the number of SST files at level 0 of RocksDB for the job is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45644	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ApplicationName	Specifies the name of the application for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.

Impact on the System

This alarm has no adverse impact on the system.

Possible Causes

Possible causes are as follows:

- The compaction pressure of RocksDB is too high, and **ALM-45646 Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** and **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** are generated.
- There are too many SST files at level 0.

Handling Procedure

Check whether the compaction pressure of RocksDB is too high and ALM-45646 is generated.

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Alarms**.

Step 2 In the alarm list, check whether **ALM-45646 Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

Step 3 Handle the alarm by following the instructions provided in section **ALM-45646 Pending Compaction Size of RocksDB Continuously Exceeds the Threshold**.

Step 4 After ALM-45646 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check whether the compaction pressure of RocksDB is too high and ALM-45647 is generated.

Step 5 In the alarm list, check whether **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to [Step 6](#).
- If no, go to [Step 8](#).

Step 6 Handle the alarm by following the instructions provided in section **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold**.

Step 7 After ALM-45647 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

Check TaskManager logs for the number of SST files at level 0 and collect logs.

Step 8 Log in to FusionInsight Manager as a user who has the FlinkServer management permission.

Step 9 Choose **O&M > Alarm > Alarms > ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 10 Choose **Cluster > Services > Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 11 Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

NOTE

You can also log in to Manager as a user who has the management permission for the current Flink job. Choose **Cluster > Services > Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 13 On Manager, choose **Cluster > Services > HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities > Browse the file system**, and download logs in the `/tmp/logs/Username/bucket-logs-tfile/Last four digits of the task application ID/Application ID of the task` directory.

Check whether the number of SST files at level 0 is too large.

Step 14 Check whether the value of `rocksdb.num-files-at-level0` in TaskManager monitoring logs (keyword `RocksDBMetricPrint`) is greater than or equal to the value of `state.backend.rocksdb.level0_slowdown_writes_trigger` or `state.backend.rocksdb.level0_stop_writes_trigger`.

- If yes, adjust the values of the following custom parameters on the job development page of the Flink web UI, save the settings, and go to [Step 15](#).

Table 10-8 Custom parameters

Parameter	Default Value	Description
state.backend.rocksdb.level0_slowdown_writes_trigger	20	<ul style="list-style-type: none">– Number of files that trigger slowdown at level 0– 20 to 30 are recommended.
state.backend.rocksdb.level0_stop_writes_trigger	36	<ul style="list-style-type: none">– Maximum number of files that trigger stop at level 0– 36 to 46 are recommended.

- If no, go to [Step 16](#).

Step 15 Restart the job and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 16](#).

Step 16 Contact O&M personnel and send the collected logs.

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.366 ALM-45645 Pending Flush Size of RocksDB Continuously Exceeds the Threshold

This section applies to MRS 3.3.0 or later.

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when the number of pending flush requests of RocksDB for a job continuously reaches n times the number of flush/compaction threads. This alarm is cleared when the number of pending flush requests of RocksDB for the job is less than or equal to the threshold.

- The number of flush/compaction threads is the value of **state.backend.rocksdb.thread.num**. The default value is **2**. If **SPINNING_DISK_OPTIMIZED_HIGH_MEM** is enabled, the default value is **4**.
- The **metrics.reporter.alarm.job.alarm.rocksdb.background.jobs.multiplier** parameter specifies n times the number of flush/compaction threads. The default value is **2**.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45645	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ApplicationName	Specifies the name of the application for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.

Impact on the System

This alarm has no adverse impact on the system.

Possible Causes

The number of pending flush requests of RocksDB for the Flink job is too large.

Handling Procedure

Check TaskManager logs for the number of pending flush requests and collect logs.

- Step 1** Log in to FusionInsight Manager as a user who has the FlinkServer management permission.
- Step 2** Choose **O&M > Alarm > Alarms > ALM-45645 Pending Flush Size of RocksDB Continuously Exceeds the Threshold**, view **Location**, and obtain the name of the task for which the alarm is generated.
- Step 3** Choose **Cluster > Services > Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.
- Step 4** Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

Figure 10-171 Application ID of a job

ID	User	QueueUser	Name
application			

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

Showing 1 to 2 of 2 entries

NOTE

You can also log in to Manager as a user who has the management permission for the current Flink job. Choose **Cluster > Services > Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 6 On Manager, choose **Cluster > Services > HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities > Browse the file system**, and

download logs in the `/tmp/logs/Username/bucket-logs-tfile/Last four digits of the task application ID/Application ID of the task` directory.

Check whether there are too many pending flush requests.

Step 7 Check whether the sum of the values of `rocksdb.mem-table-flush-pending` and `rocksdb.compaction-pending` in TaskManager monitoring logs (keyword `RocksDBMetricPrint`) is greater than n times the number of RocksDB threads (`metrics.reporter.alarm.job.alarm.rocksdb.background.jobs.multiplier`, 2 by default). If it is, you can increase the number of RocksDB threads.

- If yes, adjust the values of the following custom parameters on the job development page of the Flink web UI, save the settings, and go to **Step 8**.

Table 10-9 Custom parameters

Parameter	Default Value	Description
state.backend.rocksdb.thread.num	<ul style="list-style-type: none"> - 2 - 4: enables <code>SPINNING_DISK_OPTIMIZE</code> and <code>D_HIGH_MEMORY</code>. 	<ul style="list-style-type: none"> - Number of flush threads. Increase the number of threads to quickly flush memory data to disks. - When the number of threads is increased, the number of vCores also needs to be increased. - 2 to 10 are recommended.

- If no, go to **Step 9**.

Step 8 Restart the job and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Contact O&M personnel and send the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.368 ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold

This section applies to MRS 3.3.0 or later.

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when the estimated pending compaction size of RocksDB for a job continuously exceeds the threshold. This alarm is cleared when the estimated pending compaction size of RocksDB for the job is less than or equal to the threshold.

The threshold of the estimated pending compaction size is the smaller value of the following two parameters:

- **state.backend.rocksdb.soft-pending-compaction-bytes-limit**. The default value is **64GB**.
- **state.backend.rocksdb.hard-pending-compaction-bytes-limit**. The default value is **256GB**.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45647	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ApplicationName	Specifies the name of the application for which the alarm is generated.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.

Impact on the System

This alarm has no adverse impact on the system.

Possible Causes

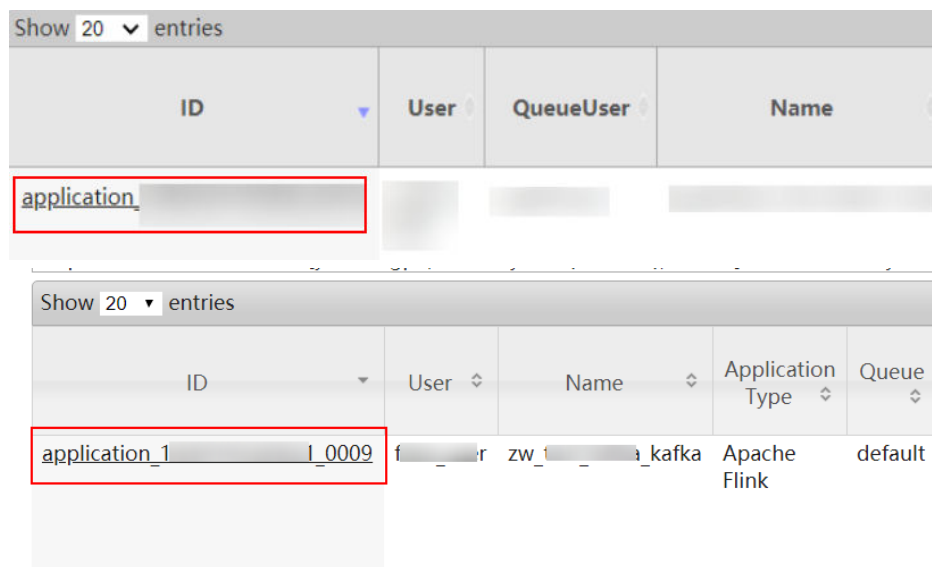

The estimated compaction data size of RocksDB is too large.

Handling Procedure

Check TaskManager logs for the estimated compaction data size and collect logs.

- Step 1** Log in to FusionInsight Manager as a user who has the FlinkServer management permission.
- Step 2** Choose **O&M > Alarm > Alarms > ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold**, view **Location**, and obtain the name of the task for which the alarm is generated.
- Step 3** Choose **Cluster > Services > Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.
- Step 4** Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

NOTE

You can also log in to Manager as a user who has the management permission for the current Flink job. Choose **Cluster > Services > Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 6 On Manager, choose **Cluster > Services > HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities > Browse the file system**, and download logs in the `/tmp/logs/Username/bucket-logs-tfile/Last four digits of the task application ID/Application ID of the task` directory.

Check whether the estimated compaction data size of RocksDB is too large.

Step 7 Check whether the value of `rocksdb.estimate-pending-compaction-bytes` (unit: byte) in TaskManager monitoring logs (keyword `RocksDBMetricPrint`) is greater than or equal to the `soft/hard-pending-compaction` size (values of `state.backend.rocksdb.soft-pending-compaction-bytes-limit` and `state.backend.rocksdb.hard-pending-compaction-bytes-limit`).

- If yes, adjust the values of the following custom parameters on the job development page of the Flink web UI, save the settings, and go to [Step 8](#).

Table 10-11 Custom parameters

Parameter	Default Value	Description
state.backend.rocksdb.soft-pending-compaction-bytes-limit	64GB	<ul style="list-style-type: none"> - When the pending compaction size exceeds the threshold, the write traffic is limited. - 64GB to 512GB are recommended.
state.backend.rocksdb.hard-pending-compaction-bytes-limit	256GB	<ul style="list-style-type: none"> - When the pending compaction size exceeds the threshold, write operations are stopped. - 64GB to 512GB are recommended.

- If no, go to [Step 9](#).

Step 8 Restart the job and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Step 9 Contact O&M personnel and send the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.369 ALM-45648 RocksDB Frequently Encounters Write-Stopped

This section applies to MRS 3.3.0 or later.

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when RocksDB for a job continuously encounters the **is-write-stopped** state. This alarm is cleared when RocksDB for the job no longer or

does not continuously encounter the **is-write-stopped** state within an alarm reporting interval.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45648	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ApplicationName	Specifies the name of the application for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.

Impact on the System

This alarm has no adverse impact on the system.

Possible Causes

The possible causes are as follows:

- There are too many MemTables and **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold** is generated.
- There are too many SST files at level 0, and **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** is generated.
- The estimated compaction size exceeds the threshold, and **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** is generated.

Handling Procedure

Check whether there are too many MemTables.

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Alarms**.

Step 2 In the alarm list, check whether **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

Step 3 Handle the alarm by following the instructions provided in section **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold**.

Step 4 After ALM-45643 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check whether the number of SST files at level 0 is too large.

Step 5 On FusionInsight Manager, choose **O&M > Alarm > Alarms**.

Step 6 In the alarm list, check whether **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to [Step 7](#).
- If no, go to [Step 9](#).

Step 7 Handle the alarm by following the instructions provided in section **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold**.

Step 8 After ALM-45644 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Check whether the estimated compaction size exceeds the threshold.

Step 9 In the alarm list, check whether **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to [Step 10](#).
- If no, go to [Step 12](#).

Step 10 Handle the alarm by following the instructions provided in section **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold**.

Step 11 After ALM-45647 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

Collect fault information.

Step 12 Log in to Manager as a user who has the management permission for the current Flink job.

Step 13 Choose **O&M > Alarm > Alarms > ALM-45648 RocksDB Frequently Encounters Write-Stopped**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 14 Choose **Cluster > Services > Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 15 Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

10.370 ALM-45649 P95 Latency of RocksDB Get Requests Continuously Exceeds the Threshold

This section applies to MRS 3.3.0 or later.

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when the P95 latency of RocksDB Get requests exceeds the threshold (**metrics.reporter.alarm.job.alarm.rocksdb.get.micros.threshold**, 50000 microseconds by default). This alarm is cleared when the P95 latency of RocksDB Get requests is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45649	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ApplicationName	Specifies the name of the application for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.

Impact on the System

This alarm has no adverse impact on the system.

Possible Causes

The possible causes are as follows:

- There are too many SST files at level 0, causing slow queries. In addition, **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** is generated.
- The cache hit ratio is lower than 60%, causing frequent swap-ins and swap-outs of the block cache.

Handling Procedure

Check whether the number of SST files at level 0 is too large.

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Alarms**.

Step 2 In the alarm list, check whether **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

Step 3 Handle the alarm by following the instructions provided in section **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold**.

Step 4 After ALM-45644 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check the cache hit ratio in TaskManager logs and collect logs.

- Step 5** Log in to FusionInsight Manager as a user who has the FlinkServer management permission.
- Step 6** Choose **O&M > Alarm > Alarms > ALM-45649 P95 Latency of RocksDB Get Requests Continuously Exceeds the Threshold**, view **Location**, and obtain the name of the task for which the alarm is generated.
- Step 7** Choose **Cluster > Services > Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.
- Step 8** Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

Figure 10-187 Application ID of a job

ID	User	QueueUser	Name
application_...			

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

- Step 9** Click the application ID of the failed job to go to the job page.
 1. Click **Logs** in the **Logs** column to view JobManager logs.

 **NOTE**

You can also log in to Manager as a user who has the management permission for the current Flink job. Choose **Cluster > Services > Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 10 On Manager, choose **Cluster > Services > HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities > Browse the file system**, and download logs in the */tmp/logs/Username/bucket-logs-tfile/Last four digits of the task application ID/Application ID of the task* directory.

Check whether the cache hit ratio is too low.

Step 11 Check the values of **rocksdb.block.cache.hit** (cache hit) and **rocksdb.block.cache.miss** (cache miss) in TaskManager monitoring logs (keyword **RocksDBMetricPrint**). Calculate the hit ratio using the following formula and check whether it is less than 60%:

rocksdb.block.cache.hit/(rocksdb.block.cache.hit+rocksdb.block.cache.miss)

- If yes, adjust the values of the following custom parameters on the job development page of the Flink web UI, save the settings, and go to [Step 12](#).

Table 10-12 Custom parameters

Parameter	Default Value	Description
state.backend.rocksdb.block.cache-size	<ul style="list-style-type: none"> - 8MB - 256MB: enables SPINNING_DISK_OPTIMIZED_HIGH_MEM. 	<ul style="list-style-type: none"> - Cache size - 8MB to 1GB are recommended.
state.backend.rocksdb.block.blocksize	<ul style="list-style-type: none"> - 4KB - 128KB: enables SPINNING_DISK_OPTIMIZED_HIGH_MEM. 	<ul style="list-style-type: none"> - Block size - 4KB to 256KB are recommended.

- If no, go to [Step 13](#).

Step 12 Restart the job and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 13](#).

Step 13 Contact O&M personnel and send the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.371 ALM-45650 P95 Latency of RocksDB Write Requests Continuously Exceeds the Threshold

This section applies to MRS 3.3.0 or later.

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when the P95 latency of RocksDB write requests exceeds the threshold (**metrics.reporter.alarm.job.alarm.rocksdb.write.micros.threshold**, 50000 microseconds by default). This alarm is cleared when the P95 latency of RocksDB write requests is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45650	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ApplicationName	Specifies the name of the application for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.

Impact on the System

This alarm has no adverse impact on the system.

Possible Causes

The possible causes are as follows:

- There are too many MemTables. As a result, write traffic is limited or write stops, and **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold** is generated.
- There are too many SST files at level 0, and **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** is generated.
- The estimated compaction size exceeds the threshold, and **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** is generated.

Handling Procedure

Check whether write traffic limiting or write stop is caused due to too many MemTables.

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Alarms**.

Step 2 In the alarm list, check whether **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

Step 3 Handle the alarm by following the instructions provided in section **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold**.

Step 4 After ALM-45643 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check whether the number of SST files at level 0 is too large.

Step 5 On FusionInsight Manager, choose **O&M > Alarm > Alarms**.

Step 6 In the alarm list, check whether **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to [Step 7](#).
- If no, go to [Step 9](#).

Step 7 Handle the alarm by following the instructions provided in section **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold**.

Step 8 After ALM-45644 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Check whether the estimated compaction size exceeds the threshold.

Step 9 In the alarm list, check whether **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to [Step 10](#).
- If no, go to [Step 12](#).

Step 10 Handle the alarm by following the instructions provided in section **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold**.

Step 11 After ALM-45647 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

Collect fault information.

Step 12 Log in to FusionInsight Manager as a user who has the FlinkServer management permission.

Step 13 Choose **O&M > Alarm > Alarms > ALM-45650 P95 Latency of RocksDB Write Requests Continuously Exceeds the Threshold**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 14 Choose **Cluster > Services > Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 15 Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

Figure 10-191 Application ID of a job

ID	User	QueueUser	Name
application			

- If yes, go to [Step 16](#).
- If no, go to [Step 18](#).

Step 16 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

container_0009_01_000002	https/	0	Logs
container_0009_01_000001	https/	0	Logs

Showing 1 to 2 of 2 entries

NOTE

You can also log in to Manager as a user who has the FlinkServer management permission. Choose **Cluster > Services > Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

- Step 17** View the job logs to rectify the fault, or contact the O&M personnel and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

- Step 18** On Manager, choose **Cluster > Services > HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities > Browse the file system**, and download logs in the `/tmp/logs/Username/bucket-logs-tfile/Last four digits of the task application ID/Application ID of the task` directory.

- Step 19** View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

10.372 ALM-45652 Flink Service Unavailable

This section applies to MRS 3.3.0 or later.

Alarm Description

The alarm module checks the Flink status every 60 seconds. This alarm is generated when the Flink service is unavailable. This alarm is cleared when the Flink service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45652	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the job for which the alarm is generated.

Impact on the System

FlinkServer and the Flink client cannot be used to submit Flink jobs.

Possible Causes

The ZooKeeper, HDFS, Yarn, KrbServer, or DBService service on which Flink depends is unavailable.

Handling Procedure

Check whether the ZooKeeper service on which Flink depends is abnormal.

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**.
- Step 2** In the alarm list, check whether "ALM-13000 ZooKeeper Service Unavailable" exists.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

Step 3 Handle the alarm by referring to "ALM-13000 ZooKeeper Service Unavailable."

Step 4 After the alarm is cleared, wait a few minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check whether the HDFS service on which Flink depends is abnormal.

Step 5 On FusionInsight Manager, choose **O&M > Alarm > Alarms**.

Step 6 In the alarm list, check whether "ALM-14000 HDFS Service Unavailable" exists.

- If yes, go to [Step 7](#).
- If no, go to [Step 9](#).

Step 7 Handle the alarm by referring to "ALM-14000 HDFS Service Unavailable."

Step 8 After the alarm is cleared, wait a few minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

Check whether the Yarn service on which Flink depends is abnormal.

Step 9 On FusionInsight Manager, choose **O&M > Alarm > Alarms**.

Step 10 In the alarm list, check whether "ALM-18000 Yarn Service Unavailable" exists.

- If yes, go to [Step 11](#).
- If no, go to [Step 13](#).

Step 11 Handle the alarm by referring to "ALM-18000 Yarn Service Unavailable."

Step 12 After the alarm is cleared, wait a few minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 13](#).

Check whether the KrbServer service on which Flink depends is abnormal.

Step 13 On FusionInsight Manager, choose **O&M > Alarm > Alarms**.

Step 14 In the alarm list, check whether "ALM-25500 KrbServer Service Unavailable" exists.

- If yes, go to [Step 15](#).
- If no, go to [Step 17](#).

Step 15 Handle the alarm by referring to "ALM-25500 KrbServer Service Unavailable."

Step 16 After the alarm is cleared, wait a few minutes and check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to [Step 17](#).

Check whether the DBService service on which Flink depends is abnormal.

Step 17 On FusionInsight Manager, choose **O&M > Alarm > Alarms**.

Step 18 In the alarm list, check whether "ALM-27001 DBService Service Unavailable" exists.

- If yes, go to [Step 19](#).
- If no, go to [Step 21](#).

Step 19 Handle the alarm by referring to "ALM-27001 DBService Service Unavailable."

Step 20 After the alarm is cleared, wait a few minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 21](#).

Collect fault information.

Step 21 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 22 Expand the **Service** drop-down list, and select **Flink** for the target cluster.

Step 23 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 24 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.373 ALM-45653 Invalid Flink HA Certificate File

This section applies to MRS 3.3.0 or later.

Alarm Description

Flink checks whether the HA certificate file is valid (whether the certificate exists and whether its format is correct) in the first health check or at 01:00:00 every day. This alarm is generated when the certificate file is invalid. This alarm is automatically cleared when the certificate file becomes valid again.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45653	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Some functions are unavailable.

Possible Causes

The HA certificate file is invalid.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45653 Invalid Flink HA Certificate File**, view **Location**, obtain the name of the host for which the alarm is generated, and click the host name to view its IP address.

Check whether the HA certificate file in the system is valid.

Step 2 Log in to the host for which the alarm is generated as user **omm**.

Step 3 Run the `cd ${BIGDATA_HOME}/FusionInsight_Flink_*/install/FusionInsight-Flink-*/ha/local/cert` command to go to the directory where the HA certificate is stored.

Step 4 Run the `ls -l` command to check whether the **server.crt** file exists.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

Step 5 Run the `openssl x509 -in server.crt -text -noout` command and check whether the command output is normal.

- If yes, go to [Step 9](#).
- If no, go to [Step 6](#).

Step 6 Run the `cd ${BIGDATA_HOME}/FusionInsight_Flink_*/install/FusionInsight-Flink-*/flink/sbin` command to go to the Flink script directory.

Step 7 Run the `sh proceed_ha_ssl_cert.sh` command to generate a new HA certificate. Then, check whether the alarm is cleared 1 minute later.

- If yes, go to [Step 8](#).
- If no, go to [Step 9](#).

Step 8 Check whether this alarm is generated again during periodic system check.

- If yes, go to [Step 9](#).
- If no, no further action is required.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **Flink** for the target cluster.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.374 ALM-45654 Flink HA Certificate Is About to Expire

This section applies to MRS 3.3.0 or later.

Alarm Description

Flink checks whether the HA certificate file is about to expire in the first health check or at 01:00:00 every day. This alarm is generated when the remaining validity period is less than or equal to 30 days. This alarm is automatically cleared when the remaining validity period is greater than 30 days.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45654	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Currently, there is no impact on the system.

Possible Causes

The HA certificate is about to expire.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45654 Flink HA Certificate Is About to Expire**, view **Location**, obtain the name of the host for which the alarm is generated, and click the host name to view its IP address.

Check whether the HA certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the host for which the alarm is generated as user **omm**.

Step 3 Run the **cd \${BIGDATA_HOME}/FusionInsight_Flink_*/install/FusionInsight-Flink-*/ha/local/cert** command to go to the directory where the HA certificate is stored.

Step 4 Run the **openssl x509 -noout -text -in server.crt** command to query the effective time and due time of the HA certificate.

Step 5 Perform **Step 6** to **Step 7** during off-peak hours to update the certificate file as needed.

- Step 6** Run the `cd ${BIGDATA_HOME}/FusionInsight_Flink_*/install/FusionInsight-Flink-*/flink/sbin` command to go to the Flink script directory.
- Step 7** Run the `sh proceed_ha_ssl_cert.sh` command to generate a new HA certificate. Then, check whether the alarm is cleared 1 minute later.
- If yes, go to [Step 9](#).
 - If no, go to [Step 8](#).
- Step 8** On the node where the standby FlinkServer instance is located, repeat [Step 6](#) to [Step 7](#). Then, check whether the alarm is cleared 1 minute later.
- If yes, go to [Step 9](#).
 - If no, go to [Step 10](#).
- Step 9** Check whether this alarm is generated again during periodic system check.
- If yes, go to [Step 10](#).
 - If no, no further action is required.

Collect fault information.

- Step 10** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 11** Expand the **Service** drop-down list, and select **Flink** for the target cluster.
- Step 12** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 13** Contact O&M personnel and provide the collected logs.

10.375 ALM-45655 Flink HA Certificate File Has Expired

This section applies to MRS 3.3.0 or later.

Alarm Description

Flink checks whether the HA certificate file has expired in the first health check or at 01:00:00 every day. This alarm is generated when the HA certificate has expired. This alarm is automatically cleared when the certificate file becomes valid again.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45655	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Some functions are unavailable.

Possible Causes

The HA certificate file has expired.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45655 Flink HA Certificate File Has Expired**, view **Location**, obtain the name of the host for which the alarm is generated, and click the host name to view its IP address.

Check whether the HA certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the host for which the alarm is generated as user **omm**.

Step 3 Run the **cd \${BIGDATA_HOME}/FusionInsight_Flink_*/install/FusionInsight-Flink-*/ha/local/cert** command to go to the directory where the HA certificate is stored.

Step 4 Run the **openssl x509 -noout -text -in server.crt** command to query the effective time and due time of the HA certificate and check whether the HA certificate file is valid.

- If yes, go to [Step 9](#).
- If no, go to [Step 5](#).

Step 5 Run the `cd ${BIGDATA_HOME}/FusionInsight_Flink_*/install/FusionInsight-Flink-*/flink/sbin` command to go to the Flink script directory.

Step 6 Run the `sh proceed_ha_ssl_cert.sh` command to generate a new HA certificate. Then, check whether the alarm is cleared 1 minute later.

- If yes, go to [Step 8](#).
- If no, go to [Step 7](#).

Step 7 On the node where the standby FlinkServer instance is located, repeat [Step 5](#) to [Step 6](#). Then, check whether the alarm is cleared 1 minute later.

- If yes, go to [Step 8](#).
- If no, go to [Step 9](#).

Step 8 Check whether this alarm is generated again during periodic system check.

- If yes, go to [Step 9](#).
- If no, no further action is required.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 10 Expand the **Service** drop-down list, and select **Flink** for the target cluster.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

10.376 ALM-45736 Guardian Service Unavailable

NOTE

This section applies only to MRS 3.1.5 or later.

Alarm Description

The alarm module checks the Guardian service status every 60 seconds. This alarm is generated if Guardian is unavailable.

This alarm is cleared after Guardian recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45736	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

Guardian cannot work properly.

Possible Causes

- The HDFS service on which the Guardian service depends is abnormal.
- The TokenServer role instance is abnormal.

Handling Procedure

Check the HDFS service status.

Step 1 Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. On the page that is displayed, check whether "ALM-14000 HDFS Service Unavailable" is reported.

- If yes, go to [Step 2](#).
- If no, go to [Step 3](#).

Step 2 Clear this alarm according to the alarm help.

After the alarm is cleared, wait a few minutes and check whether the alarm GuardianService Unavailable is cleared.

- If yes, no further action is required.
- If no, go to [Step 3](#).

Check all TokenServer instances.

Step 3 Log in to the node where the TokenServer instance resides as user **omm** and run the **ps -ef|grep "guardian.token.server.Server"** command to check whether the TokenServer process exists on the node.

- If yes, go to [Step 5](#).
- If no, restart the faulty TokenServer instance and go to [Step 4](#).

Step 4 In the alarm list, check whether the alarm "Guardian Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 6 Expand the **Service** drop-down list, and select **Guardian** for the destination cluster.

Step 7 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

10.377 ALM-45737 TokenServer Heap Memory Usage Exceeds the Threshold

NOTE

This section applies only to MRS 3.1.5 or later.

Alarm Description

The system checks the heap memory usage of the TokenServer service every 60 seconds. This alarm is generated when the heap memory usage of the TokenServer instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times.

This alarm is automatically cleared when the system detects that the heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45737	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Heap memory overflow may cause service unavailability.

Possible Causes

The heap memory of the TokenServer instance is overused or the heap memory is inappropriately allocated.

Handling Procedure

Check heap memory usage.

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms > ALM-45737 TokenServer Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > TokenServer Heap Memory Usage**. Then click **OK**.

Figure 10-195 TokenServer Heap Memory Usage

Step 3 Check whether the heap memory used by TokenServer reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster > Services > Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, choose **TokenServer > Instance Configuration**. Click **All Configurations**, and choose **TokenServer > System**. Set **-Xmx** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for TokenServer cannot meet the heap memory required by the TokenServer process. You are advised to change the value of **-Xmx** in **GC_OPTS** to twice that of the heap memory used by TokenServer. You can change the value based on the actual service scenario. Refer to **Step 2** to view the TokenServer heap memory usage.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During service or instance restart, Guardian may fail to be accessed and jobs cannot access OBS.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 7 Expand the **Service** drop-down list, and select **Guardian** for the destination cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

10.378 ALM-45738 TokenServer Direct Memory Usage Exceeds the Threshold

NOTE

This section applies only to MRS 3.1.5 or later.

Alarm Description

The system checks the direct memory usage of the TokenServer service every 60 seconds. This alarm is generated when the direct memory usage of the TokenServer instance exceeds the threshold (80% of the maximum memory) for five consecutive times.

This alarm is automatically cleared when the system detects that the TokenServer direct memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45738	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.

Parameter	Description
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Direct memory overflow may cause service unavailability.

Possible Causes

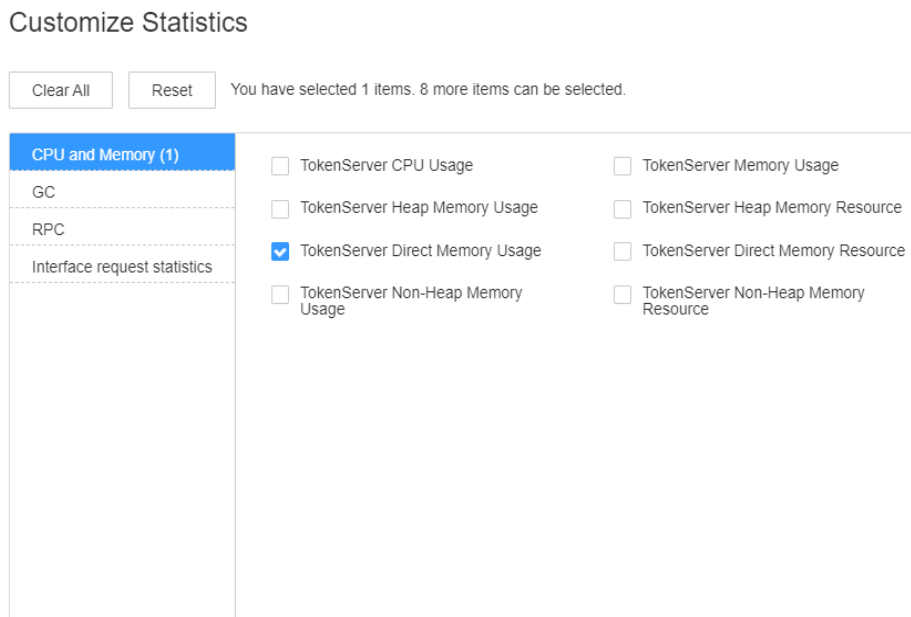

The direct memory of the TokenServer process is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms > ALM-45738 TokenServer Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > TokenServer Direct Memory Usage**. Then click **OK**.

Figure 10-196 TokenServer Direct Memory Usage

Step 3 Check whether the direct memory used by TokenServer reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

Step 4 On FusionInsight Manager, choose **Cluster > Services > Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, choose **TokenServer > Instance Configuration**. Click **All Configurations**, and choose **TokenServer > System**. Set **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory configured for TokenServer cannot meet the direct memory required by the TokenServer process. You are advised to check the direct memory usage of TokenServer and change the value of **-XX:MaxDirectMemorySize** in **GC_OPTS** to the twice of the direct memory used by TokenServer. You can change the value based on the actual service scenario. Refer to [Step 2](#) to view the TokenServer direct memory usage.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

NOTICE

During service or instance restart, Guardian may fail to be accessed and jobs cannot access OBS.

Collect fault information.

- Step 6** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Guardian** for the destination cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.
- End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.379 ALM-45739 TokenServer Non-Heap Memory Usage Exceeds the Threshold

NOTE

This section applies only to MRS 3.1.5 or later.

Alarm Description

The system checks the heap memory usage of the TokenServer service every 60 seconds. This alarm is generated when the non-heap memory usage of the TokenServer instance exceeds the threshold (80% of the maximum memory) for five consecutive times.

This alarm is automatically cleared when the system detects that the non-heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45739	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.

Parameter	Description
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Non-heap memory overflow may cause service unavailability.

Possible Causes

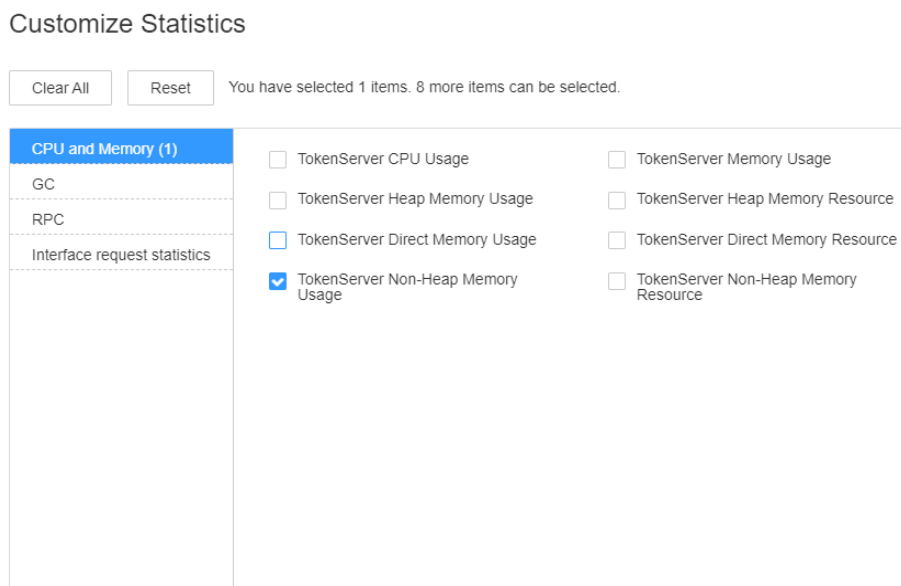

The non-heap memory of the TokenServer instance is overused or the non-heap memory is inappropriately allocated.

Handling Procedure

Check non-heap memory usage.

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms > ALM-45739 TokenServer Non-Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > TokenServer Non-Heap Memory Usage**. Then click **OK**.

Figure 10-197 TokenServer Non-Heap Memory Usage

Step 3 Check whether the non-heap memory used by TokenServer reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

Step 4 On FusionInsight Manager, choose **Cluster > Services > Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, choose **TokenServer > Instance Configuration**. Click **All Configurations**, and choose **TokenServer > System**. Set **-XX:MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the TokenServer instance cannot meet the non-heap memory required by the TokenServer process. You are advised to change the value of **-XX:MaxPermSize** in **GC_OPTS** to twice that of the current non-heap memory size or change the value based on site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

NOTICE

During service or instance restart, Guardian may fail to be accessed and jobs cannot access OBS.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M > Log > Download**.

Step 7 Expand the **Service** drop-down list, and select **Guardian** for the destination cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.380 ALM-45740 TokenServer GC Duration Exceeds the Threshold

NOTE

This section applies only to MRS 3.1.5 or later.

Alarm Description

The system checks the GC duration of the TokenServer process every 60 seconds. This alarm is generated when the GC duration of the TokenServer process exceeds the threshold (12 seconds by default) for five consecutive times.

This alarm is automatically cleared when the system detects that the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45740	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.

Parameter	Description
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

TokenServer responds slowly.

Possible Causes

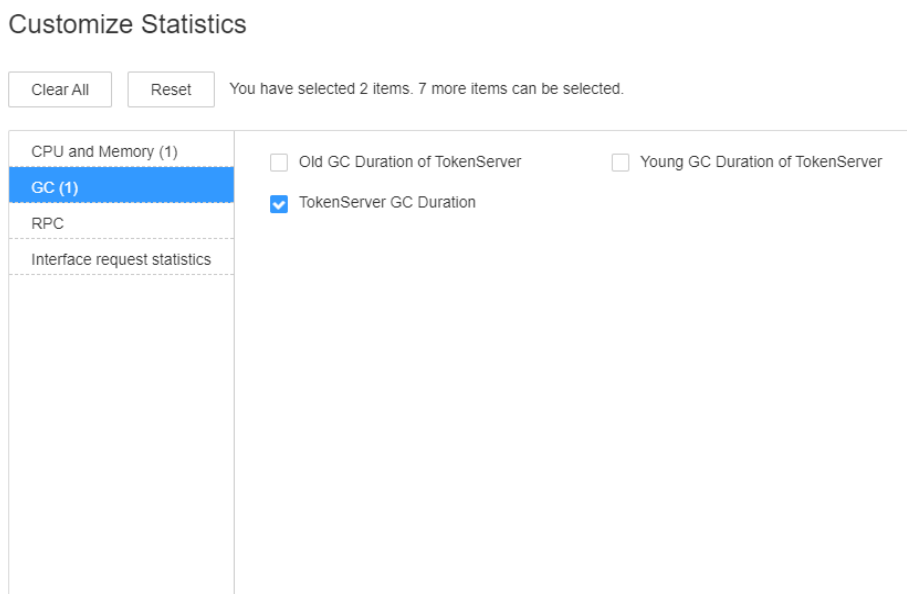

The heap memory of the TokenServer process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC duration.

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms > ALM-45740 TokenServer GC Duration Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize > GC > TokenServer GC Duration**. Then click **OK**.

Figure 10-198 TokenServer GC Duration

- Step 3** Check whether the GC duration of the TokenServer process collected every minute exceeds the threshold (12 seconds by default).
- If yes, go to [Step 4](#).
 - If no, go to [Step 6](#).

- Step 4** On FusionInsight Manager, choose **Cluster > Services > Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, choose **TokenServer > Instance Configuration**. Click **All Configurations**, and choose **TokenServer > System**. Set **-Xmx** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

 **NOTE**

If this alarm is generated, the heap memory configured for TokenServer cannot meet the heap memory required by the TokenServer process. You are advised to change the value of **-Xmx** in **GC_OPTS** to twice that of the heap memory used by TokenServer. You can change the value based on the actual service scenario. Refer to [Step 2](#) to view the TokenServer heap memory usage.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 6](#).

NOTICE

During service or instance restart, Guardian may fail to be accessed and jobs cannot access OBS.

Collect fault information.

- Step 6** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Guardian** for the destination cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

10.381 ALM-45741 Failed to Call the ECS securitykey API

NOTE

This section applies only to MRS 3.2.1 or later.

Alarm Description

Guardian caches the temporary AK/SK of the ECS agency. When the cache does not exist or is about to expire, Guardian calls the securitykey API of ECS to update the AK/SK. This alarm is generated when calling to the API fails.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45741	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The task may fail to obtain the temporary AK/SK for accessing OBS. As a result, the task cannot access OBS.

Possible Causes

- No ECS agency is bound to the cluster.
- An underlying interface of ECS is abnormal.

Handling Procedure

Check whether an agency is bound to the cluster.

- Step 1** Log in to the MRS console.
- Step 2** In the navigation pane on the left, choose **Clusters > Active Clusters**. On the page that is displayed, click the cluster name to go to its overview page. Then, check whether the cluster is bound to an agency in the O&M management area.
- If yes, go to [4](#).
 - If no, go to [3](#).
- Step 3** Click **Manage Agency**. On the page that is displayed, rebind the cluster to an agency. Then check whether the alarm is cleared a few minutes later.
- If yes, no further action is required.
 - If no, go to [4](#).
- Collect fault information.**
- Step 4** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 5** Expand the **Service** drop-down list, and select **Guardian** for the target cluster.
- Step 6** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 7** Contact O&M personnel and provide the collected logs.

10.382 ALM-45742 Failed to Call the ECS Metadata API

NOTE

This section applies only to MRS 3.1.5 or later.

Alarm Description

When Guardian calls an IAM API to obtain the temporary AK/SK, it needs to first obtain related metadata via the ECS Metadata API. This alarm is generated when Guardian fails to call the Metadata API.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45742	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The task may fail to obtain the temporary AK/SK for accessing OBS. As a result, the task cannot access OBS.

Possible Causes

An underlying interface of ECS is abnormal.

Handling Procedure

Collect fault information.

- Step 1** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 2** Expand the **Service** drop-down list, and select **Guardian** for the target cluster.
- Step 3** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

10.384 ALM-50201 Doris Service Unavailable

Alarm Description

The alarm module checks the Doris service status every 60 seconds. This alarm is generated when the alarm module detects that all FE and BE instances are abnormal.

This alarm is cleared when any FE or BE instance recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50201	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

FusionInsight Manager cannot be used to perform cluster operations on the Doris service, and Doris service functions are unavailable.

Possible Causes

The FE and BE instances are abnormal.

Handling Procedure

Restart the Doris service.

Step 1 Log in to FusionInsight Manager and choose **Cluster > Services > Doris**.

Step 2 On the page that is displayed, click **More** and select **Restart Service**. In the displayed dialog box, verify the password and click **OK** to restart the Doris service. After the service is started, go to [Step 3](#).

NOTICE

During the restart of the Doris service, the Doris service is unavailable and cannot provide services for external systems. Tasks connected to the Doris service fail.

Step 3 On FusionInsight Manager, choose **O&M > Alarm > Alarms**. In the alarm list, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 5 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.385 ALM-50202 FE CPU Usage Exceeds the Threshold

Alarm Description

The system checks the CPU usage of the FE instance every 30 seconds. The CPU usage has a default threshold. This alarm is generated when the CPU usage exceeds the threshold (**95%** by default) for multiple consecutive times (**3** by default).

This alarm is cleared when **Trigger Count** is **1** and the CPU usage is less than or equal to the threshold. This alarm is cleared when **Trigger Count** is greater than 1 and the CPU usage is less than or equal to 85% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50202	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Processes respond slowly or do not work.

Possible Causes

The alarm threshold or alarm trigger count is improperly configured.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

- Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds**, select the name of the desired cluster, and choose **Doris > CPU and Memory > CPU Usage of FE (FE)**.
- Step 2** Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

 **NOTE**

Trigger Count specifies how many times the threshold can be hit before an alarm is generated.

- Step 3** Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.
- Step 4** Wait 2 minutes and check whether the alarm is automatically cleared.
- If yes, no further action is required.
 - If no, go to [Step 5](#).

Collect fault information.

- Step 5** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 6** Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.
- Step 7** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 8** Contact O&M personnel and provide the collected logs.

10.386 ALM-50203 FE Memory Usage Exceeds the Threshold

Alarm Description

The system checks the memory usage of the FE instance every 30 seconds. This alarm is generated when the memory usage exceeds the threshold (**95%** by default) for multiple consecutive times (**3** by default).

This alarm is cleared when **Trigger Count** is **1** and the memory usage is less than or equal to the threshold. This alarm is cleared when **Trigger Count** is greater than 1 and the memory usage is less than or equal to 85% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50203	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Processes respond slowly or do not work.

Possible Causes

- The alarm threshold or alarm trigger count is improperly configured.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

- Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds**, select the name of the desired cluster, and choose **Doris > CPU and Memory > Memory Usage of FE (FE)**.
- Step 2** Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

 **NOTE**

Trigger Count specifies how many times the threshold can be hit before an alarm is generated.

- Step 3** Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.
- Step 4** Wait 2 minutes and check whether the alarm is automatically cleared.
- If yes, no further action is required.
 - If no, go to [Step 5](#).

10.389 ALM-50207 Ratio of Connections to the FE MySQL Port to the Maximum Connections Allowed Exceeds the Threshold

Alarm Description

The system checks the number of MySQL port connections every 30 seconds. This alarm is generated when the ratio of the number of current connections to the

maximum number of FE port connections exceeds the threshold (95% by default). The maximum number of FE port connections in the current cluster is specified by the **qe_max_connection** parameter. The default value is **1024**.

This alarm is cleared when the number of MySQL port connections on the FE node is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50207	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Processes respond slowly or do not work.

Possible Causes

- After the MySQL client is connected to Doris, the connection is not closed.
- A large number of services are concurrently connected to Doris.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Log in to FusionInsight Manager, choose **O&M**, and click **Alarm > Thresholds** in the navigation pane on the left. Click the name of the desired cluster > **Doris > Connection > FE MySQL Port Connections (FE)**.

Step 2 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 3 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

 **NOTE**

If there are a large number of connections, ensure there are only necessary connections. Otherwise, the service performance may be degraded or even the service may be unavailable.

Step 4 Wait for 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 6 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

10.390 ALM-50208 Failures to Clear Historical Metadata Image Files Exceed the Threshold

Alarm Description

The system checks the number of failures to clear historical metadata image files on the FE node every 30 seconds. This alarm is generated when the number of failures exceeds the threshold (**1** by default).

This alarm is cleared when the system detects that the number of failures is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50208	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Doris metadata occupies more and more disk space, which may cause service exceptions.

Possible Causes

The Doris service is abnormal.

Handling Procedure

Check whether the Doris service is normal.

Step 1 Log in to FusionInsight Manager and choose **Cluster > Services > Doris**.

Step 2 Check whether **Running Status** of the Doris service is **Normal**.

- If yes, go to [Step 4](#).
- If no, go to [Step 3](#).

Step 3 If the service process is not started, start it first and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

Step 4 Check whether other Doris-related alarms are generated in the cluster. If yes, clear them by referring to the alarm help. Then, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Collect fault information.

- Step 5** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 6** Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.
- Step 7** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 8** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

You need to manually clear the alarm after the fault is rectified.

10.391 ALM-50209 Failures to Generate Metadata Image Files Exceed the Threshold

Alarm Description

The system checks the number of failures to generate metadata image files on the FE node every 30 seconds. This alarm is generated when the number of failures exceeds the threshold (1 by default).

This alarm is cleared when the system detects that the number of failures is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50209	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The non-master FE node cannot receive the latest metadata image file. As a result, the system reliability deteriorates.

Possible Causes

The Doris service is abnormal.

Handling Procedure

Check the Doris service status.

- Step 1** Log in to FusionInsight Manager and choose **Cluster > Services > Doris**.
- Step 2** Check whether **Running Status** of the Doris service is **Normal**.
- If yes, go to [Step 4](#).
 - If no, go to [Step 3](#).
- Step 3** If the service process is not started, start it first.
- Step 4** Check whether other alarms are generated in the cluster. If yes, clear the alarms by referring to the alarm help. Then, check whether this alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 5](#).

Collect fault information.

- Step 5** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 6** Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.
- Step 7** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 8** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

You need to manually clear the alarm after the fault is rectified.

Related Information

None.

10.392 ALM-50210 Maximum Compaction Score of All BE Nodes Exceeds the Threshold

Alarm Description

The system checks the maximum compaction score of all BE nodes every 30 seconds. This alarm is generated when the maximum compaction score exceeds the threshold (10 by default).

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50210	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Query or write may be delayed.

Possible Causes

The number of concurrent service requests is large in the cluster, or the compaction queue is small.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

- Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds**, click the name of the desired cluster, and choose **Doris > Performance > Maximum compaction score of all BE nodes (BE)**.
- Step 2** Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.
- Step 3** Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.
- Step 4** Wait 2 minutes and check whether the alarm is cleared in the alarm list.
 - If yes, no further action is required.
 - If no, go to [Step 5](#).
- Step 5** Choose **Cluster > Services > Doris > Configurations > All Configurations > BE(Role) > Customization**, add the **max_base_compaction_threads** parameter to **be.conf** with a value of **10**, and add the **max_cumu_compaction_threads** parameter with a value **20**.
- Step 6** Click **Save**. Click **Instances**, select the BE instances whose configuration has expired, click **More**, and select **Restart Instance** to restart the Doris BE instances.

NOTICE

During BE instance restart, the tasks running on BE nodes will fail. The tasks on BE nodes that are not restarted are not affected.

- Step 7** Check whether the alarm is cleared.
 - If yes, no further action is required.
 - If no, go to [Step 8](#).
- Collect fault information.**
- Step 8** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
 - Step 9** Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.
 - Step 10** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.393 ALM-50211 FE Queue Length of BE Periodic Report Tasks Exceeds the Threshold

Alarm Description

The system checks the queue length of each BE periodic report task on FE every 30 seconds. This alarm is generated when the queue length exceeds the threshold (10 by default). This value indicates the number of report tasks waiting on the master FE node. A large value indicates a poor FE processing capability.

This alarm is cleared when the system detects that the queue length of BE periodic report tasks on FE is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50211	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The processing capability of FE is insufficient, affecting the service query speed.

Possible Causes

The processing capability of the master FE node is insufficient due to a large number of concurrent service requests in the Doris cluster or insufficient memory for FE processes.

Handling Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Alarms**. In the alarm list, view the role name and obtain the IP address of the instance in **Location** of the alarm whose ID is **50211**.

Step 2 Choose **Cluster > Services > Doris > Instances**, click the FE instance for which the alarm is generated, and click the **Chart** tab of the instance.

Select **JVM** from **Chart Category** on the left, and check whether **Accumulated GC duration of the old generation** of the FE process is greater than 3 seconds.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Choose **Cluster > Services > Doris > Configurations > All Configurations > FE(Role) > JVM**, and increase the value of **-Xmx** in **FE_GC_OPTS**. The default value is **8GB**.

- If this alarm is generated occasionally, increase the value by 0.5 times. If this alarm is generated frequently, double the parameter value.
- In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 5 Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds**, click the name of the desired cluster, and choose **Doris > Queue > Queue Length of BE Periodic Report Tasks on the FE (FE)**.

Step 6 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 7 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 8 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

- Step 9** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 10** Expand the **Service** drop-down list, and select **Doris** for the target cluster.
- Step 11** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 12** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.394 ALM-50212 Accumulated Old-Generation GC Duration of the FE Process Exceeds the Threshold

Alarm Description

The system checks the accumulated old-generation GC duration of the FE process every 30 seconds. This alarm is generated when the accumulated GC duration exceeds the threshold (3000 ms by default).

This alarm is cleared when the system detects that the accumulated old-generation GC duration of the FE process is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50212	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

A long GC duration of the FE process may interrupt the services.

Possible Causes

The heap memory of the FE process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Alarms**. In the alarm list, view the role name and obtain the IP address of the instance in **Location** of the alarm whose ID is **50212**.

Step 2 Choose **Cluster > Services > Doris > Instances**, click the FE instance for which the alarm is generated, and click the **Chart** tab of the instance.

Select **JVM** from **Chart Category** on the left, and check whether **Accumulated GC duration of the old generation** of the FE process is greater than 3 seconds.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

Step 3 Choose **Cluster > Services > Doris > Configurations > All Configurations > FE(Role) > JVM**, and increase the value of **-Xmx** in **FE_GC_OPTS**. The default value is **8G**.

- If this alarm is occasionally generated, increase the value by 0.5 times. If this alarm is frequently generated, double the value.
- In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

- Step 6** Expand the **Service** drop-down list, and select **Doris** for the target cluster.
- Step 7** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 8** Contact O&M personnel and provide the collected logs.
- End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.395 ALM-50213 Number of Tasks Queuing in the FE Thread Pool for Interacting with BE Exceeds the Threshold

Alarm Description

The system checks the number of queuing tasks in the FE thread pool for interacting with BE every 30 seconds. This alarm is generated when the number of queuing tasks exceeds the threshold (10 by default). This FE thread pool is the working thread pool of ThriftServer. It is specified by **rpc_port** in the **fe.conf** file and is used to interact with BE.

This alarm is cleared when the system detects that the number of tasks queuing in the FE thread pool for interacting with BE is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50213	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The read and write of the Doris service slows down.

Possible Causes

There are a large number of concurrent service requests, causing too many queuing tasks.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

- Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds**, click the name of the desired cluster, and choose **Doris > Queue > Number of tasks that are queuing in the thread pool for interaction between the FE and the BE (FE)**.
- Step 2** Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.
- Step 3** Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.
- Step 4** Wait 2 minutes and check whether the alarm is automatically cleared.
 - If yes, no further action is required.
 - If no, go to [Step 5](#).

Collect fault information.

- Step 5** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 6** Expand the **Service** drop-down list, and select **Doris** for the target cluster.
- Step 7** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 8** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.396 ALM-50214 Number of Tasks Queuing in the FE Thread Pool for Task Processing Exceeds the Threshold

Alarm Description

The system checks the number of queuing tasks in the FE thread pool for processing tasks every 30 seconds. This alarm is generated when the number of queuing tasks exceeds the threshold (10 by default). This thread pool is used by the NIO MySQL Server to process tasks.

This alarm is cleared when the system detects that the number of tasks queuing in the FE thread pool for processing tasks is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50214	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The task execution of the entire system becomes slow and blocked.

Possible Causes

Large tasks may block the task execution of the queue.

Handling Procedure

Check the execution status of FE tasks.

Step 1 On FusionInsight Manager, choose **Cluster > Services > Doris**. Click the **Chart** tab, select **Connection** from **Chart Category** in the left pane, and view the **FE MySQL Port Connections** chart. If the number of connections is large, click **Instances**, select the FE instance, and click the **Chart** tab. Select **CPU and Memory** from **Chart Category** and view the **CPU Usage of FE** chart. If the CPU usage is high, check the **Time** field in FE audit log `/var/log/Bigdata/audit/doris/fe/fe.audit.log` to collect statistics on the average task duration. If the value is also high, the alarm is caused by large concurrent tasks.

Step 2 After connecting to Doris, run the following command to check whether the default value of `queryTimeout` is too large. The default value is **300** seconds.

show variables like 'query_timeout';

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Run the following command to shorten the timeout period based on site requirements to block the tasks that take a long time:

set global query_timeout=xxx;

Step 4 Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds**, click the name of the desired cluster, and choose **Doris > Queue > Queue Length of Query Execution Thread Pool (BE)**.

Step 5 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 6 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 7 Wait 10 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 9 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.397 ALM-50215 Longest Duration of RPC Requests Received by Each FE Thrift Method Exceeds the Threshold

Alarm Description

The system checks the longest duration of RPC requests received by each FE Thrift method every 30 seconds. This alarm is generated when the longest duration exceeds the threshold (5000 ms by default).

This alarm is cleared when the longest duration of RPC requests received by each FE Thrift method is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50215	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

A longer RPC duration indicates a higher performance load and slower network request processing, which may cause service congestion.

Possible Causes

- The network has a latency.
- There are too many concurrent large SQL tasks.

Handling Procedure

- Step 1** Log in to the host where the faulty node is deployed as user **root** and run **ping /P addresses of all Doris nodes** to check whether the peer host can be pinged.
- If yes, go to **Step 3**.
 - If no, go to **Step 2**.
- Step 2** Contact the network administrator to restore the network.
- Step 3** On FusionInsight Manager, choose **Cluster > Services > Doris**. Click the **Chart** tab, select **Connection** from **Chart Category** in the left pane, and view the **FE MySQL Port Connections** chart. If the number of connections is large, click **Instances**, select the FE instance, and click the **Chart** tab. Select **CPU and Memory** from **Chart Category** and view the **CPU Usage of FE** chart. If the CPU usage is high, check the **Time** field in FE audit log **/var/log/Bigdata/audit/doris/fe/fe.audit.log** to collect statistics on the average task duration. If the value is also high, the alarm is caused by large concurrent tasks.
- Step 4** Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds**, click the name of the desired cluster, and choose **Doris > Performance > Longest duration of RPC requests received by each method of the FE thrift interface (FE)**.
- Step 5** Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.
- Step 6** Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.
- Step 7** Wait 10 minutes and check whether the alarm is automatically cleared.
- If yes, no further action is required.
 - If no, go to **Step 8**.
- Collect fault information.**
- Step 8** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 9** Expand the **Service** drop-down list, and select **Doris** for the target cluster.
- Step 10** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 11** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.398 ALM-50216 Memory Usage of the FE Node Exceeds the Threshold

Alarm Description

The system checks the memory usage of the FE node every 30 seconds. This alarm is generated when the memory usage exceeds the threshold (95% by default).

This alarm is cleared when the memory usage of the FE node falls below the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50216	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Task execution and client connection to the FE are affected.

Possible Causes

The FE heap memory is too small.

Handling Procedure

Check the FE heap memory usage.

- Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds**, select the name of the desired cluster, and choose **Doris > CPU and Memory > Memory usage of the FE node (FE)**.
1. Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.
 2. Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.
- Step 2** Log in to the FE node for which the alarm is generated as user **omm**, run the **top** command to check the memory usage of processes, locate the process with high memory usage, and check whether the process belongs to the current service and is running properly.
- If yes, go to **Step 3**.
 - If no, isolate or stop the process, or adjust the memory size, and check whether the memory is released.
- Step 3** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to **Step 4**.

NOTICE

- During the restart of the Doris service, the Doris service is unavailable and cannot provide services for external systems. Tasks connected to the Doris service fail.
 - During instance restart, the tasks running on the nodes of the instance will fail. The tasks on instance nodes that are not restarted are not affected.
-

Collect fault information.

- Step 4** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 5** Expand the **Service** drop-down list, and select **Doris** for the target cluster.
- Step 6** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 7** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.399 ALM-50217 Heap Memory Usage of the FE Node Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the FE node every 30 seconds. This alarm is generated when the heap memory usage exceeds the threshold (95% by default).

This alarm is cleared when the heap memory usage of the FE node falls below the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50217	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Task execution and client connection to the FE are affected.

Possible Causes

The FE heap memory is too small.

Handling Procedure

Check heap memory usage.

Step 1 Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds**, select the name of the desired cluster, and choose **Doris > CPU and Memory > Heap memory usage of the FE node (FE)**.

1. Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.
2. Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 2 On FusionInsight Manager, choose **Cluster > Services > Doris > FE > Configurations > All Configurations**, search for the **FE_GC_OPTS** parameter, increase the value of **-Xmx** as required, click **Save**, and click **OK**.

NOTE

- If this alarm is generated, the heap memory configured for the current Doris instance is not enough for data transmission. You are advised to open the instance monitoring page, display the Doris heap memory resource status monitoring chart, and observe the change trend of the heap memory used by Doris in the monitoring chart. Then change the value of **-Xmx** to twice the current heap memory usage or to another value to meet site requirements.
- When setting the heap memory, you can set **-Xms** and **-Xmx** to approximately the same value to prevent performance deterioration caused by heap size adjustment after each GC.
- The sum of **-Xmx** and **XX:MaxPermSize** cannot be greater than the actual physical memory of the node server.

Step 3 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

NOTICE

- During the restart of the Doris service, the Doris service is unavailable and cannot provide services for external systems. Tasks connected to the Doris service fail.
 - During instance restart, the tasks running on the nodes of the instance will fail. The tasks on instance nodes that are not restarted are not affected.
-

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 5 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.400 ALM-50219 Length of the Queue in the Thread Pool for Query Execution Exceeds the Threshold

Alarm Description

The system checks the length of the waiting queue in the query execution thread pool every 30 seconds. This alarm is generated when the length exceeds the threshold (20 by default).

This alarm is cleared when the length of the waiting queue in the current query execution thread pool is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50219	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Parameter	Description
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The task execution of the entire system becomes slow and blocked.

Possible Causes

Large tasks may block the task execution of the queue.

Handling Procedure

Check the execution status of tasks.

Step 1 On FusionInsight Manager, choose **Cluster > Services > Doris**. Click the **Chart** tab, select **Connection** from **Chart Category** in the left pane, and view the **FE MySQL Port Connections** chart. If the number of connections is large, click **Instances**, select the FE instance, and click the **Chart** tab. Select **CPU and Memory** from **Chart Category** and view the **CPU Usage of FE** chart. If the CPU usage is high, check the **Time** field in FE audit log `/var/log/Bigdata/audit/doris/fe/fe.audit.log` to collect statistics on the average task duration. If the value is also high, the alarm is caused by large concurrent tasks.

Step 2 After connecting to Doris, run the following command to check the **queryTimeout** value of the system:

```
show variables like 'query_timeout';
```

If the value is too large, run the `set global query_timeout=xxx;` command to shorten the timeout interval and block tasks that last for a long time.

Step 3 Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds**, click the name of the desired cluster, and choose **Doris > Queue > Queue Length of Query Execution Thread Pool (BE)**.

Step 4 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 5 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 6 Wait 10 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 8 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.401 ALM-50220 Error Rate of TCP Packet Receiving Exceeds the Threshold

Alarm Description

The system checks the rate of TCP packet receiving errors every 30 seconds. This alarm is generated when the error rate exceeds the threshold (5% by default).

This alarm is cleared when the error rate is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50220	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The task fails or data is lost.

Possible Causes

The network is faulty, so data cannot be sent.

Handling Procedure

Step 1 Log in to the host where the faulty node is deployed as user **root** and run **ping** *IP addresses of all Doris nodes* to check whether the peer host can be pinged.

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Contact the network administrator to restore the network.

Step 3 Wait for a while and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.402 ALM-50221 BE Data Disk Usage Exceeds the Threshold

Alarm Description

The system checks the usage of BE data disks every 30 seconds. This alarm is generated when the disk usage exceeds the threshold (95% by default).

This alarm is cleared when the system detects that the disk usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50221	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

New data fails to be written, and the task is interrupted.

Possible Causes

- The disk space of the cluster is full.
- Data skew occurs among BE nodes.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Expand the disk capacity of the node for which the alarm is generated.

Step 3 Go to [Step 4](#) if the expansion fails or the alarm persists after the expansion.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 5 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

- Step 6** Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.
- Step 7** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 8** Contact O&M personnel and provide the collected logs.
- End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.403 ALM-50222 Disk Status of a Specified Data Directory on BE Is Abnormal

Alarm Description

The system checks the disk status of a specified data directory on BE every 30 seconds. This alarm is generated when the disk status is not **1** (**1** indicates the normal state and **0** indicates the abnormal state). This alarm is cleared when the disk status of the specified data directory on BE becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50222	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Parameter	Description
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Service data may be unavailable.

Possible Causes

- The hard disk is faulty.
- The disk permissions are set incorrectly.

Handling Procedure

Check whether a disk alarm is generated.

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms** and check whether **ALM-12014 Partition Lost** or **ALM-12033 Slow Disk Fault** exists.
- If yes, go to [Step 2](#).
 - If no, go to [Step 4](#).
- Step 2** Rectify the fault by referring to the handling procedure of **ALM-12014 Partition Lost** or **ALM-12033 Slow Disk Fault**. Then, check whether the alarm is cleared.
- If yes, go to [Step 3](#).
 - If no, go to [Step 4](#).
- Step 3** Wait 5 minutes and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 4](#).

Modify disk permissions.

- Step 4** Choose **O&M > Alarm > Alarms** and view **Location** and **Additional Information** of the alarm to obtain the location of the faulty disk.
- Step 5** Log in to the node for which the alarm is generated as user **root**. Go to the directory where the faulty disk is located, and run the **ll** command to check whether the permission for the faulty disk is **711** and whether the user is **omm**.
- If yes, go to [Step 7](#).
 - If no, go to [Step 6](#).
- Step 6** Modify the permission of the faulty disk. For example, if the faulty disk is **data1**, run the following commands:

```
chown omm:wheel data1
chmod 711 data1
```

Step 7 Choose **Cluster > Services > Doris > Instances**, select this BE instance, click **More**, and select **Restart Instance**. Wait 5 minutes and check whether an alarm is generated.

- If no, no further action is required.
- If yes, go to [Step 8](#).

NOTICE

During BE instance restart, the tasks running on BE nodes will fail. The tasks on BE nodes that are not restarted are not affected.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 9 Expand the **Service** drop-down list, and select **Doris** and **OMS** for the target cluster.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.404 ALM-50223 Maximum Memory Required by BE Is Greater Than the Remaining Memory of the Machine

Alarm Description

The system checks whether the maximum memory required by BE is greater than the available memory every 30 seconds. This alarm is generated when the value is not **1** (**1** indicates that the maximum required memory is less than or equal to the available memory, and **0** indicates that the maximum required memory is greater than the available memory).

This alarm is cleared when the maximum required memory is less than or equal to the available memory.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50223	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

A task may fail to apply for memory when running.

Possible Causes

Too much BE node memory has been occupied by other processes, or the maximum memory set for the BE service is too large.

Handling Procedure

Check whether the maximum memory set for the BE node is proper.

- Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds**, click the name of the desired cluster, and choose **Doris > CPU and Memory > Relationship between the maximum memory size of the BE and the remaining memory size of the machine (BE)**.
- Step 2** Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.
- Step 3** Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.
- Step 4** Wait 2 minutes and check whether the alarm is automatically cleared.
 - If yes, no further action is required.

- If no, go to [Step 5](#).
- Step 5** Log in to the BE node for which the alarm is generated as user **omm**, run the **top** command to check the memory usage of processes, locate the process with high memory usage, and check whether the process belongs to the current service and is running properly.
- If yes, go to [Step 6](#).
 - If no, isolate or stop the process, or adjust the memory size, and check whether the memory is released.
- Step 6** Log in to the BE node for which the alarm is generated as user **omm** and run the **free -g** command to check the total memory and remaining memory in the system and estimate the memory usage.
- Step 7** On FusionInsight Manager, choose **Cluster > Services > Doris > Configurations > All Configurations > BE(Role) > Memory** and decrease the value of **mem_limit**. This parameter specifies the maximum memory allowed for BE. Then save the modification and restart the BE instance.

NOTICE

During BE instance restart, the tasks running on BE nodes will fail. The tasks on BE nodes that are not restarted are not affected.

- Step 8** After the BE instance is restarted, wait 5 minutes and check whether the alarm is cleared.
- If yes, no further action is required.
 - If no, go to [Step 9](#).

Collect fault information.

- Step 9** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 10** Expand the **Service** drop-down list, and select **Doris** for the target cluster.
- Step 11** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 12** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

10.405 ALM-50224 Failures a Certain Task Type on BE Are Increasing

Alarm Description

The system checks whether the number of failed tasks of a certain type on BE is increasing every 30 seconds. This alarm is generated when the system detects that the value is not **1** (**1** indicates that the number of failed tasks of a certain type does not increase, and **0** indicates that the failed tasks of a certain type are increasing).

This alarm is cleared when the system detects that the number of failed tasks of a certain type on BE does not increase.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50224	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

A task fails to be executed repeatedly in a certain scenario.

Possible Causes

A BE exception may occur. As a result, the number of failed tasks increases in a certain scenario.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

- Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds**, click the name of the desired cluster, and choose **Doris > Exception > Check whether the number of failed tasks of a certain type increases (BE)**.
- Step 2** Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.
- Step 3** Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.
- Step 4** Wait 2 minutes and check whether the alarm is automatically cleared.
 - If yes, no further action is required.
 - If no, go to [Step 5](#).

Collect fault information.

- Step 5** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 6** Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.
- Step 7** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 8** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

You need to manually clear the alarm after the fault is rectified.

Related Information

None.

10.406 ALM-50225 FE Instance Fault

Alarm Description

The system checks the FE process status every 30 seconds. This alarm is generated when the value is greater than **0** (**0** indicates that the FE process is normal and **1** indicates that the FE process is abnormal).

This alarm is cleared when the system detects that the FE process becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50225	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The current FE instance is unavailable.

Possible Causes

The FE instance is faulty or restarted.

Handling Procedure

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. In the alarm list, view the role name and obtain the IP address of the instance in **Location** of the alarm whose ID is **50225**.
- Step 2** Choose **Cluster > Services > Doris > Instances**, click the FE instance for which the alarm is generated, and check whether **Running Status** of the instance is **Restoring**.
- If yes, go to **Step 3**.
 - If no, go to **Step 4**.
- Step 3** Wait 2 minutes and check whether the alarm is automatically cleared.
- If yes, no further action is required.
 - If no, go to **Step 4**.
- Collect fault information.**

- Step 4** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 5** Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.
- Step 6** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 7** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.407 ALM-50226 BE Instance Fault

Alarm Description

The system checks the BE process status every 30 seconds. This alarm is generated when the value is greater than **0** (**0** indicates that the BE process is normal and **1** indicates that the BE process is abnormal).

This alarm is cleared when the system detects that the BE process becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50226	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Parameter	Description
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The current BE instance is unavailable.

Possible Causes

The BE instance is faulty or restarted.

Handling Procedure

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. In the alarm list, view the role name and obtain the IP address of the instance in **Location** of the alarm whose ID is **50226**.
 - Step 2** Choose **Cluster > Services > Doris > Instances**, click the BE instance for which the alarm is generated, and check whether **Running Status** of the instance is **Restoring**.
 - If yes, go to **Step 3**.
 - If no, go to **Step 4**.
 - Step 3** Wait 2 minutes and check whether the alarm is automatically cleared.
 - If yes, no further action is required.
 - If no, go to **Step 4**.
- Collect fault information.**
- Step 4** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
 - Step 5** Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.
 - Step 6** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
 - Step 7** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

10.408 ALM-50401 Number of JobServer Jobs Waiting to Be Executed Exceeds the Threshold

Alarm Description

The system checks the number of jobs submitted to JobServer every 30 seconds. This alarm is generated when the number of jobs to be executed exceeds 800.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50401	Critical (default threshold: 900) Major (default threshold: 800)	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

Too many JobServer jobs are detected in the queue. For details about the queue usage, see the **Additional Information** field of this alarm. The impacts are as follows:

1. When the number of JobServer jobs in the queue reaches the maximum (1000 by default), new jobs cannot be added.
2. Before the number of JobServer jobs in the queue reaches the maximum, new JobServer jobs cannot be submitted quickly. For example, it takes more time (even hours) to submit added jobs or add new jobs to Yarn.

Possible Causes

Too many jobs are submitted instantaneously.

Handling Procedure

- Step 1** Log in to FusionInsight Manager and choose **Cluster > Services > JobGateway**.
- Step 2** Click the **Instances** tab, click **Add Instance**, and add JobServer instances based on the number of submitted jobs.
- Step 3** After the instances are added, restart the JobGateway service.

NOTICE

The job functions of JobGateway will become unavailable during the service restart.

- Step 4** Wait 5 minutes and check whether the alarm is automatically cleared.
If yes, no further action is required.
If no, go to [Step 5](#).
- Collect fault information.**
- Step 5** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
 - Step 6** Expand the **Service** drop-down list, and select **JobGateway** for the target cluster.
 - Step 7** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
 - Step 8** Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

None.

10.409 ALM-50402 JobGateway Service Unavailable

Alarm Description

The system checks the JobGateway service status every 60 seconds. This alarm is generated when the JobGateway service is abnormal.

This alarm is cleared when the JobGateway service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50402	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

No job submission operation can be performed on JobGateway in the cluster. The components that depend on JobGateway in the cluster will become faulty.

Possible Causes

The node where the JobGateway service locates is faulty.

Handling Procedure

- Step 1** Log in to FusionInsight Manager, choose **Cluster > Services > JobGateway**, and click the **Instance** tab. Check for JobServer or JobBalancer instances that are faulty or not started and view the host names of these instances.
- Step 2** On the **Alarm** page of FusionInsight Manager, check whether the **NodeAgent Process Is Abnormal** alarm is generated.
 - If yes, go to [Step 3](#).
 - If no, go to [Step 6](#).
- Step 3** Check whether the host name in the alarm information is the same as the host name in [Step 1](#).
 - If yes, go to [Step 4](#).
 - If no, go to [Step 6](#).
- Step 4** Clear the alarm by following the instructions provided in **ALM-12006 NodeAgent Process Is Abnormal**.

Step 5 In the alarm list, check whether alarm **JobGateway Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

Step 7 Expand the **Service** drop-down list, and select **JobGateway** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

11 Security Description

11.1 Security Configuration Suggestions for Clusters with Kerberos Authentication Disabled

The Hadoop community version provides two authentication modes: Kerberos authentication (security mode) and Simple authentication (normal mode). When creating a cluster, you can choose to enable or disable Kerberos authentication.

Clusters in security mode use the Kerberos protocol for security authentication.

In normal mode, MRS cluster components use a native open source authentication mechanism, which is typically Simple authentication. If Simple authentication is used, authentication is automatically performed by a client user (for example, user **root**) by default when a client connects to a server. The authentication is imperceptible to the administrator or service user. In addition, when being executed, the client may even pretend to be any user (including **superuser**) by injecting **UserGroupInformation**. Cluster resource management and data control APIs are not authenticated on the server and are easily exploited and attacked by hackers.

Therefore, in normal mode, network access permissions must be strictly controlled to ensure cluster security. You are advised to perform the following operations to ensure cluster security.

- Deploy service applications on ECSs in the same VPC and subnet and avoid accessing MRS clusters through an external network.
- Configure security group rules to strictly control the access scope. Do not configure access rules that allow **Any** or **0.0.0.0** for the inbound direction of MRS cluster ports.
- If you want to access the native pages of the components in the cluster from the external, follow instructions in [Creating an SSH Channel for Connecting to an MRS Cluster and Configuring the Browser](#) for configuration.

11.2 Security Authentication Principles and Mechanisms

Function

For clusters in security mode with Kerberos authentication enabled, security authentication is required during application development.

Kerberos adopts a client/server structure and encryption technologies such as AES, and supports mutual authentication (both the client and server can authenticate each other). Kerberos is used to prevent interception and replay attacks and protect data integrity. It is a system that manages keys by using a symmetric key mechanism.

Architecture

Kerberos architecture is shown in [Figure 11-1](#) and module description in [Table 11-1](#).

Figure 11-1 Kerberos architecture

Table 11-1 Module description

Module	Description
Application Client	An application client, which is usually an application that submits tasks or jobs
Application Server	An application server, which is usually an application that an application client accesses
Kerberos	A service that provides security authentication
KerberosAdmin	A process that provides authentication user management

Module	Description
KerberosServer	A process that provides authentication ticket distribution

The process and principle are described as follows:

An application client can be a service in a cluster or a secondary development application of the customer. An application client can submit tasks or jobs to an application service.

1. Before submitting a task or job, the application client needs to apply for a ticket granting ticket (TGT) from the Kerberos service to establish a secure session with the Kerberos server.
2. After receiving the TGT request, the Kerberos service resolves parameters in the request to generate a TGT, and uses the key of the username specified by the client to encrypt the response.
3. After receiving the TGT response, the application client (based on the underlying RPC) resolves the response and obtains the TGT, and then applies for a server ticket (ST) of the application server from the Kerberos service.
4. After receiving the ST request, the Kerberos service verifies the TGT validity in the request and generates an ST of the application service, and then uses the application service key to encrypt the response.
5. After receiving the ST response, the application client packages the ST into a request and sends the request to the application server.
6. After receiving the request, the application server uses its local application service key to resolve the ST. After successful verification, the request becomes valid.

Basic Concepts

The following concepts can help users learn the Kerberos architecture quickly and understand the Kerberos service better. The following uses security authentication for HDFS as an example.

TGT

A TGT is generated by the Kerberos service and used to establish a secure session between an application and the Kerberos server. The validity period of a TGT is 24 hours. After 24 hours, the TGT expires automatically.

The following describes how to apply for a TGT (HDFS is used as an example):

1. Obtain a TGT through an API provided by HDFS.

```
/**
 * login Kerberos to get TGT, if the cluster is in security mode
 * @throws IOException if login is failed
 */
private void login() throws IOException {
    // not security mode, just return
    if (!"kerberos".equalsIgnoreCase(conf.get("hadoop.security.authentication"))) {
        return;
    }
}
```

```
//security mode
System.setProperty("java.security.krb5.conf", PATH_TO_KRB5_CONF);

UserGroupInformation.setConfiguration(conf);
UserGroupInformation.loginUserFromKeytab(PRINCIPAL_NAME, PATH_TO_KEYTAB);
}
```

2. Run shell commands on the client in kinit mode.

ST

An ST is generated by the Kerberos service and used to establish a secure session between an application and application service. An ST is valid only once.

In FusionInsight products, the generation of an ST is based on the Hadoop-RPC communication. The underlying RPC submits a request to the Kerberos server and the Kerberos server generates an ST.

Sample Authentication Code

```
package com.huawei.bigdata.hdfs.examples;

import java.io.IOException;

import org.apache.hadoop.conf.Configuration;
import org.apache.hadoop.fs.FileStatus;
import org.apache.hadoop.fs.FileSystem;
import org.apache.hadoop.fs.Path;
import org.apache.hadoop.security.UserGroupInformation;

public class KerberosTest {
    private static String PATH_TO_HDFS_SITE_XML = KerberosTest.class.getClassLoader().getResource("hdfs-site.xml")
        .getPath();
    private static String PATH_TO_CORE_SITE_XML = KerberosTest.class.getClassLoader().getResource("core-site.xml")
        .getPath();
    private static String PATH_TO_KEYTAB =
        KerberosTest.class.getClassLoader().getResource("user.keytab").getPath();
    private static String PATH_TO_KRB5_CONF =
        KerberosTest.class.getClassLoader().getResource("krb5.conf").getPath();
    private static String PRINCIPAL_NAME = "develop";
    private FileSystem fs;
    private Configuration conf;

    /**
     * initialize Configuration
     */
    private void initConf() {
        conf = new Configuration();

        // add configuration files
        conf.addResource(new Path(PATH_TO_HDFS_SITE_XML));
        conf.addResource(new Path(PATH_TO_CORE_SITE_XML));
    }

    /**
     * login Kerberos to get TGT, if the cluster is in security mode
     * @throws IOException if login is failed
     */
    private void login() throws IOException {
        // not security mode, just return
        if (!"kerberos".equalsIgnoreCase(conf.get("hadoop.security.authentication"))) {
            return;
        }
    }

    //security mode
    System.setProperty("java.security.krb5.conf", PATH_TO_KRB5_CONF);
}
```

```
UserGroupInformation.setConfiguration(conf);
UserGroupInformation.loginUserFromKeytab(PRINCIPAL_NAME, PATH_TO_KEYTAB);
}

/**
 * initialize FileSystem, and get ST from Kerberos
 * @throws IOException
 */
private void initFileSystem() throws IOException {
    fs = FileSystem.get(conf);
}

/**
 * An example to access the HDFS
 * @throws IOException
 */
private void doSth() throws IOException {
    Path path = new Path("/tmp");
    FileStatus fStatus = fs.getFileStatus(path);
    System.out.println("Status of " + path + " is " + fStatus);
    //other thing
}

public static void main(String[] args) throws Exception {
    KerberosTest test = new KerberosTest();
    test.initConf();
    test.login();
    test.initFileSystem();
    test.doSth();
}
}
```

NOTE

1. During Kerberos authentication, you need to configure the file parameters required for configuring the Kerberos authentication, including the keytab path, Kerberos authentication username, and the **krb5.conf** configuration file of the client for Kerberos authentication.
2. Method **login()** indicates calling the Hadoop API to perform Kerberos authentication and generating a TGT.
3. Method **doSth** indicates calling the Hadoop API to access the file system. In this situation, the underlying RPC automatically carries the TGT to Kerberos for verification and then an ST is generated.
4. The preceding code can be used to create **KerberosTest.java** in the HDFS secondary development sample project in security mode and run and view the commissioning result. For details, see [HDFS Development Guide \(Security Mode\)](#).

12 High-Risk Operations

Forbidden Operations

Table 12-1 lists forbidden operations during the routine cluster operation and maintenance process.

Table 12-1 Forbidden operations

Item	Risk
Delete ZooKeeper data directories.	ClickHouse, HDFS, Yarn, HBase, and Hive depend on ZooKeeper, which stores metadata. This operation has adverse impact on normal operating of related components.
Frequently switch over the active and standby JDBCServer nodes.	This operation may interrupt services.
Delete Phoenix system tables and data (SYSTEM.CATALOG, SYSTEM.STATS, SYSTEM.SEQUENCE, and SYSTEM.FUNCTION).	This operation will cause service operation failures.
Manually modify data in the Hive metabase (hivemeta database).	This operation may cause Hive data parse errors. As a result, Hive cannot provide services.
Manually perform INSERT or UPDATE operations on Hive metadata tables.	This operation may cause Hive data parse errors. As a result, Hive cannot provide services.
Change permission on the Hive private file directory hdfs:///tmp/hive-scratch .	This operation may cause unavailable Hive services.
Modify broker.id in the Kafka configuration file.	This operation may cause invalid node data.

Item	Risk
Modify the host names of nodes.	Instances and upper-layer components on the host cannot provide services properly. The fault cannot be rectified.
Reinstall the OS of a node.	This operation will cause MRS cluster exceptions, leaving MRS clusters in abnormal status.
Use private images.	This operation will cause MRS cluster exceptions, leaving MRS clusters in abnormal status.

The following tables list the high-risk operations during the operation and maintenance of each component.

High-Risk Operations on a Cluster

Table 12-2 High-risk operations on a cluster

Operation	Risk	Severity	Workaround	Check Item
Modify the file directory or file permissions of user omm without permission.	This operation will lead to MRS service unavailability.	▲ ▲ ▲ ▲ ▲	Do not perform this operation.	Check whether the MRS cluster service is available.
Bind an EIP.	This operation exposes the Master node hosting MRS Manager of the cluster to the public network, increasing the risk of network attacks from the Internet.	▲ ▲ ▲ ▲ ▲	Ensure that the bound EIP is a trusted public IP address.	None

Operation	Risk	Severity	Workaround	Check Item
Enable security group rules for port 22 of a cluster.	This operation increases the risk of exploiting vulnerability of port 22.	▲ ▲ ▲ ▲ ▲	Configure a security group rule for port 22 to allow only trusted IP addresses to access the port. You are not advised to configure the inbound rule to allow 0.0.0.0 to access the port.	None
Delete a cluster or cluster data.	Data will get lost.	▲ ▲ ▲ ▲ ▲	Before deleting the data, confirm the necessity of the operation and ensure that the data has been backed up.	None
Scale in a cluster.	Data will get lost.	▲ ▲ ▲ ▲ ▲	Before scaling in the cluster, confirm the necessity of the operation and ensure that the data has been backed up.	None
Detach or format a data disk.	Data will get lost.	▲ ▲ ▲ ▲ ▲	Before performing this operation, confirm the necessity of the operation and ensure that the data has been backed up.	None

Manager High-Risk Operations

Table 12-3 Manager high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Change the OMS password.	This operation will restart all processes of OMSServer, which has adverse impact on cluster maintenance and management.	▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check whether there are uncleared alarms and whether the cluster management and maintenance are normal.
Import the certificate .	This operation will restart OMS processes and the entire cluster, which has adverse impact on cluster maintenance and management and services.	▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Perform an upgrade.	This operation will restart Manager and the entire cluster, affecting management, maintenance, and services of the cluster. Strictly manage the user who is eligible to assign the cluster management permission to prevent security risks.	▲ ▲ ▲	Ensure that there is no other maintenance and management operations when the operation is performed.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.

Operation	Risk	Severity	Workaround	Check Item
Restore the OMS.	This operation will restart Manager and the entire cluster, affecting management, maintenance, and services of the cluster.	▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Change an IP address.	This operation will restart Manager and the entire cluster, affecting management, maintenance, and services of the cluster.	▲ ▲ ▲	Ensure that there is no other maintenance and management operations when the operation is performed and that the new IP address is correct.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Change log levels.	If the log level is changed to DEBUG , Manager responds slowly.	▲ ▲	Before the modification, confirm the necessity of the operation and change it back to the default log level in time.	None

Operation	Risk	Severity	Workaround	Check Item
Replace a control node.	This operation will interrupt services deployed on the node. If the node is a management node, the operation will restart all OMS processes, affecting the cluster management and maintenance.	▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Replace a management node.	This operation will interrupt services deployed on the node. As a result, OMS processes will be restarted, affecting the cluster management and maintenance.	▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Restart the upper-layer service at the same time during the restart of a lower-layer service.	This operation will interrupt the upper-layer service, affecting the management, maintenance, and services of the cluster.	▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.

Operation	Risk	Severity	Workaround	Check Item
Modify the OLDAP port.	This operation will restart the LdapServer and Kerberos services and all associated services, affecting service running.	▲ ▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	None
Delete the supergroup group.	Deleting the supergroup group decreases user rights, affecting service access.	▲ ▲ ▲ ▲ ▲	Before the change, confirm the rights to be added. Ensure that the required rights have been added before deleting the supergroup rights to which the user is bound, ensuring service continuity.	None
Restart a service.	Services will be interrupted during the restart. If you select and restart the upper-layer service, the upper-layer services that depend on the service will be interrupted.	▲ ▲ ▲	Confirm the necessity of restarting the system before the operation.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.

Operation	Risk	Severity	Workaround	Check Item
Change the default SSH port No.	After the default port (22) is changed, functions such as cluster creation, service/instance adding, host adding, and host reinstallation cannot be used, and results of cluster health check items for node mutual trust, omm/ommdba user password expiration, and others are incorrect.	▲ ▲ ▲	Before performing this operation, restore the SSH port to the default value.	None

CDL High-risk Operations

Table 12-4 CDL high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Start or stop basic components independently.	This operation has adverse impact on the basic functions of some services. As a result, service failures occur.	▲ ▲ ▲	Do not start or stop basic components such as Kafka, DBService, ZooKeeper, Kerberos, and LDAP separately. To start or stop basic components, select associated services.	Check whether the service status is normal.
Restart or stop services.	This operation may interrupt services.	▲ ▲	Restart or stop services when necessary.	Check whether the service is running properly.

ClickHouse High-Risk Operations

Table 12-5 ClickHouse high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Delete data directories.	This operation may cause service information loss.	▲ ▲ ▲	Do not delete data directories manually.	Check whether data directories are normal.
Remove ClickHouseServer instances.	The ClickHouseServer instance nodes in the same shard must be removed in at the same time. Otherwise, the topology information of the logical cluster is incorrect. Before performing this operation, check the database and data table information of each node in the logical cluster and perform scale-in pre-analysis to ensure that data is successfully migrated during the scale-in process to prevent data loss	▲ ▲ ▲ ▲	Before scale-in, collect information in advance to learn the status of the ClickHouse logical cluster and instance nodes.	Check the ClickHouse logical cluster topology information, database and data table information in each ClickHouseServer instance, and data volume.
Add ClickHouseServer instances.	When performing this operation, you must check whether a database or data table with the same name as that on the old node needs to be created on the new node. Otherwise, subsequent data migration, data balancing, scale-in, and decommissioning will fail.	▲ ▲ ▲ ▲	Before scale-out, confirm the function and purpose of new ClickHouseServer instances and determine whether to create related databases and data tables.	Check the ClickHouse logical cluster topology information, database and data table information in each ClickHouseServer instance, and data volume.

Operation	Risk	Severity	Workaround	Check Item
Decommission ClickHouseServer instances.	The ClickHouseServer instance nodes in the same shard must be decommissioned in at the same time. Otherwise, the topology information of the logical cluster is incorrect. Before performing this operation, check the database and data table information of each node in the logical cluster and perform decommissioning pre-analysis to ensure that data is successfully migrated during the decommissioning process to prevent data loss	▲ ▲ ▲ ▲ ▲	Before decommissioning, collect information in advance to learn the status of the ClickHouse logical cluster and instance nodes.	Check the ClickHouse logical cluster topology information, database and data table information in each ClickHouseServer instance, and data volume.
Recommission ClickHouseServer instances.	When performing this operation, you must select all nodes in the original shard. Otherwise, the topology information of the logical cluster is incorrect.	▲ ▲ ▲ ▲ ▲	Before recommissioning, you need to confirm the home information about the shards of the node to be recommissioned.	Check the ClickHouse logical cluster topology information.
Modify data directory content (file and folder creation).	This operation may cause the ClickHouse instance of the node faults.	▲ ▲ ▲	Do not create or modify files or folders in the data directories manually.	Check whether data directories are normal.

Operation	Risk	Severity	Workaround	Check Item
Start or stop basic components independently.	This operation has adverse impact on the basic functions of some services. As a result, service failures occur.	▲ ▲ ▲	Do not start or stop ZooKeeper, Kerberos, and LDAP basic components independently. Select related services when performing this operation.	Check whether the service status is normal.
Restart or stop services.	This operation may interrupt services.	▲ ▲	Restart or stop services when necessary.	Check whether the service is running properly.

DBService High-Risk Operations

Table 12-6 DBService high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Change the DBService password.	The services need to be restarted for the password change to take effect. The services are unavailable during the restart.	▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check whether there are uncleared alarms and whether the cluster management and maintenance are normal.

Operation	Risk	Severity	Workaround	Check Item
Restore DBService data.	<p>After the data is restored, the data generated after the data backup and before the data restoration is lost.</p> <p>After the data is restored, the configuration of the components that depend on DBService may expire and these components need to be restarted.</p>	<p>▲ ▲ ▲ ▲</p>	<p>Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.</p>	<p>Check whether there are uncleared alarms and whether the cluster management and maintenance are normal.</p>
Perform active/standby DBService switchover.	<p>During the DBServer switchover, DBService is unavailable.</p>	<p>▲ ▲</p>	<p>Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.</p>	<p>None</p>
Change the DBService floating IP address.	<p>The DBService needs to be restarted for the change to take effect. The DBService is unavailable during the restart.</p> <p>If the floating IP address has been used, the configuration will fail, and the DBService will fail to be started.</p>	<p>▲ ▲ ▲ ▲</p>	<p>Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.</p>	<p>Check whether services can be started properly.</p>

Flink High-Risk Operations

Table 12-7 Flink high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Change log levels.	If the log level is modified to DEBUG, the task running performance is affected.	▲ ▲	Before the modification, confirm the necessity of the operation and change it back to the default log level in time.	None
Modify file permissions.	Tasks may fail.	▲ ▲ ▲	Confirm the necessity of the operation before the modification.	Check whether related service operations are normal.

Flume High-Risk Operations

Table 12-8 Flume high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify the Flume instance start parameter GC_OPTS.	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.

Operation	Risk	Severity	Workaround	Check Item
<p>Change the default value of dfs.replication from 3 to 1.</p>	<p>This operation will have the following impacts:</p> <ol style="list-style-type: none"> 1. The storage reliability deteriorates. If the disk becomes faulty, data will be lost. 2. NameNode fails to be restarted, and the HDFS service is unavailable. 	<p>▲ ▲ ▲ ▲</p>	<p>When modifying related configuration items, check the parameter description carefully. Ensure that there are more than two replicas for data storage.</p>	<p>Check whether the default replica number is not 1 and whether the HDFS service is normal.</p>

HBase High-Risk Operations

Table 12-9 HBase high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify encryption configuration. <ul style="list-style-type: none"> • hbase.regionserver.wal.encryption • hbase.crypto.keyprovider.parameters.uri • hbase.crypto.keyprovider.parameters.encryptedtext 	Services cannot start properly.	▲ ▲ ▲ ▲	Strictly follow the prompt information when modifying related configuration items, which are associated. Ensure that new values are valid.	Check whether services can be started properly.

Operation	Risk	Severity	Workaround	Check Item
Change the value of hbase.regionserver.wal.encryption to false or switch encryption algorithm from AES to SMS4.	This operation may cause start failures and data loss.	▲ ▲ ▲ ▲	When HFile and WAL are encrypted using an encryption algorithm and a table is created, do not close or switch the encryption algorithm randomly. If an encryption table (ENCRYPTION =>AES/SMS4) is not created, you can only switch the encryption algorithm.	None
Modify HBase instance start parameter GC_OPTS and HBASE_HEAPSIZE .	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid. GC_OPTS does not conflict with HBASE_HEAPSIZE.	Check whether services can be started properly.
Use OfflineMetaRepair tool	Services cannot start properly.	▲ ▲ ▲ ▲	This tool can be used only when HBase is offline and cannot be used in data migration scenarios.	Check whether HBase services can be started properly.

HDFS High-Risk Operations

Table 12-10 HDFS high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Change HDFS NameNode data storage directory dfs.name.node.name.dir and data configuration directory dfs.datanode.data.dir .	Services cannot start properly.	▲ ▲ ▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Use the -delete parameter when you run the hadoop distcp command.	During DistCP copying, files that do not exist in the source cluster but exist in the destination cluster are deleted from the destination cluster.	▲ ▲	When using DistCP, determine whether to retain the redundant files in the destination cluster. Exercise caution when using the -delete parameter.	After DistCP copying is complete, check whether the data in the destination cluster is retained or deleted according to the parameter settings.

Operation	Risk	Severity	Workaround	Check Item
Modify the HDFS instance start parameter GC_OPTS , HADOOP_HEAPSIZE , and GC_PROFILE .	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid. GC_OPTS does not conflict with HADOOP_HEAPSIZE .	Check whether services can be started properly.
Change the default value of dfs.replication from 3 to 1 .	This operation will have the following impacts: 1. The storage reliability deteriorates. If the disk becomes faulty, data will be lost. 2. NameNode fails to be restarted, and the HDFS service is unavailable.	▲ ▲ ▲ ▲	When modifying related configuration items, check the parameter description carefully. Ensure that there are more than two replicas for data storage.	Check whether the default replica number is not 1 and whether the HDFS service is normal.
Change the remote procedure call (RPC) channel encryption mode (hadoop.rpc.protection) of each module in Hadoop.	This operation causes service faults and service exceptions.	▲ ▲ ▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether HDFS and other services that depend on HDFS can properly start and provide services.

Hive High-Risk Operations

Table 12-11 Hive high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify the Hive instance start parameter GC_OPTS .	This operation may cause Hive instance start failures.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Delete all MetaStore instances.	This operation may cause Hive metadata loss. As a result, Hive cannot provide services.	▲ ▲ ▲	Do not perform this operation unless ensure that Hive table information can be discarded.	Check whether services can be started properly.
Delete or modify files corresponding to Hive tables over HDFS interfaces or HBase interfaces.	This operation may cause Hive service data loss or tampering.	▲ ▲	Do not perform this operation unless ensure that the data can be discarded or that the operation meets service requirements.	Check whether Hive data is complete.

Operation	Risk	Severity	Workaround	Check Item
Delete or modify files corresponding to Hive tables or directory access permission over HDFS interfaces or HBase interfaces.	This operation may cause related service scenarios to be unavailable.	▲ ▲ ▲	Do not perform this operation.	Check whether related service operations are normal.
Delete or modify hdfs:///apps/templeton/hive-3.1.0.tar.gz over HDFS interfaces.	WebHCat fails to perform services due to this operation.	▲ ▲	Do not perform this operation.	Check whether related service operations are normal.
Export table data to overwrite the data at the local. For example, export the data of t1 to /opt/dir . insert overwrite local directory '/opt/dir' select * from t1;	This operation will delete target directories. Incorrect setting may cause software or OS startup failures.	▲ ▲ ▲ ▲ ▲	Ensure that the path where the data is written does not contain any files or do not use the key word overwrite in the command.	Check whether files in the target path are lost.

Operation	Risk	Severity	Workaround	Check Item
Direct different databases, tables, or partition files to the same path, for example, default warehouse path / user/hive/warehouse .	The creation operation may cause disordered data. After a database, table, or partition is deleted, other object data will be lost.	▲ ▲ ▲ ▲	Do not perform this operation.	Check whether files in the target path are lost.

IoTDB High-Risk Operations

Table 12-12 IoTDB high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Delete data directories.	This operation may cause service information loss.	▲ ▲ ▲	Do not delete data directories manually.	Check whether data directories are normal.
Modify data directory content (file and folder creation).	This operation may cause the IoTDB instance of the node faults.	▲ ▲ ▲	Do not create or modify files or folders in the data directories manually.	Check whether data directories are normal.

Operation	Risk	Severity	Workaround	Check Item
Start or stop basic components independently.	This operation has adverse impact on the basic functions of some services. As a result, service failures occur.	▲ ▲ ▲	Do not start or stop Kerberos, and LDAP basic components independently. Select related services when performing this operation.	Check whether the service status is normal.
Restart or stop services.	This operation may interrupt services.	▲ ▲	Restart or stop services when necessary.	Check whether the service is running properly.

Kafka High-Risk Operations

Table 12-13 Kafka high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Delete Topic	This operation may delete existing topics and data.	▲ ▲ ▲	Kerberos authentication is used to ensure that authenticated users have operation permissions. Ensure that topic names are correct.	Check whether topics are processed properly.
Delete data directories.	This operation may cause service information loss.	▲ ▲ ▲	Do not delete data directories manually.	Check whether data directories are normal.

Operation	Risk	Severity	Workaround	Check Item
Modify data directory content (file and folder creation).	This operation may cause the Broker instance of the node faults.	▲ ▲ ▲	Do not create or modify files or folders in the data directories manually.	Check whether data directories are normal.
Modify the disk auto-adaptation function using the disk.adapter.enable parameter.	This operation adjusts the topic data retention period when the disk usage reaches the threshold. Historical data that does not fall within the storage retention may be deleted.	▲ ▲ ▲	If the retention period of some topics cannot be adjusted, add this topic to the value of disk.adapter.topic.blacklist .	Observe the data storage period on the Kafka topic monitoring page.
Modify data directory log.dirs configuration.	Incorrect operation may cause process faults.	▲ ▲ ▲	Ensure that the added or modified data directories are empty and that the directory permissions are right.	Check whether data directories are normal.
Reduce the capacity of the Kafka cluster.	This operation may cause quantity reduction of backups of some data duplicates of topic. As a result, some topics cannot be accessed.	▲ ▲	Perform backup operation and then reduce the capacity of the Kafka cluster.	Check whether backup nodes where partitions are located are activated to ensure data security.

Operation	Risk	Severity	Workaround	Check Item
Start or stop basic components independently.	This operation has adverse impact on the basic functions of some services. As a result, service failures occur.	▲ ▲ ▲	Do not start or stop ZooKeeper, Kerberos, and LDAP basic components independently. Select related services when performing this operation.	Check whether the service status is normal.
Restart or stop services.	This operation may interrupt services.	▲ ▲	Restart or stop services when necessary.	Check whether the service is running properly.
Modify configuration parameters.	This operation requires service restart for configuration to take effect.	▲ ▲	Modify configuration when necessary.	Check whether the service is running properly.
Delete or modify metadata.	Modifying or deleting Kafka metadata on ZooKeeper may cause the Kafka topic or service unavailability.	▲ ▲ ▲	Do not delete or modify Kafka metadata stored on ZooKeeper.	Check whether the Kafka topics or Kafka service is available.
Delete metadata backup files.	After Kafka metadata backup files are modified and used to restore Kafka metadata, Kafka topics or the Kafka service may be unavailable.	▲ ▲ ▲	Do not delete Kafka metadata backup files.	Check whether the Kafka topics or Kafka service is available.

KrbServer High-Risk Operations

Table 12-14 KrbServer high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify the KADMIN_PORT parameter of KrbServer.	After this parameter is modified, if the KrbServer service and its associated services are not restarted in a timely manner, the configuration of KrbClient in the cluster is abnormal and the service running is affected.	▲ ▲ ▲ ▲ ▲	After this parameter is modified, restart the KrbServer service and all its associated services.	None
Modify the kdc_ports parameter of KrbServer.	After this parameter is modified, if the KrbServer service and its associated services are not restarted in a timely manner, the configuration of KrbClient in the cluster is abnormal and the service running is affected.	▲ ▲ ▲ ▲ ▲	After this parameter is modified, restart the KrbServer service and all its associated services.	None
Modify the KPASSWD_PORT parameter of KrbServer.	After this parameter is modified, if the KrbServer service and its associated services are not restarted in a timely manner, the configuration of KrbClient in the cluster is abnormal and the service running is affected.	▲ ▲ ▲ ▲ ▲	After this parameter is modified, restart the KrbServer service and all its associated services.	None

Operation	Risk	Severity	Workaround	Check Item
Modify the domain name of Manager system.	After the domain name is modified, if the KrbServer service and its associated services are not restarted in a timely manner, the configuration of KrbClient in the cluster is abnormal and the service running is affected.	▲ ▲ ▲ ▲ ▲	After this parameter is modified, restart the KrbServer service and all its associated services.	None
Configure cross-cluster mutual trust relationships.	This operation will restart the KrbServer service and all associated services, affecting the management and maintenance and services of the cluster.	▲ ▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.

LdapServer High-Risk Operations

Table 12-15 LdapServer high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify the LDAP_SERVER_PORT parameter of LdapServer.	After this parameter is modified, if the LdapServer service and its associated services are not restarted in a timely manner, the configuration of LdapClient in the cluster is abnormal and the service running is affected.	▲ ▲ ▲ ▲ ▲	After this parameter is modified, restart the LdapServer service and all its associated services.	None

Operation	Risk	Severity	Workaround	Check Item
Restore LdapServer data.	This operation will restart Manager and the entire cluster, affecting management, maintenance, and services of the cluster.	▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Replace the Node where LdapServer is located.	This operation will interrupt services deployed on the node. If the node is a management node, the operation will restart all OMS processes, affecting the cluster management and maintenance.	▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Change the password of LdapServer.	The LdapServer and Kerberos services need to be restarted during the password change, affecting the management, maintenance, and services of the cluster.	▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	None

Operation	Risk	Severity	Workaround	Check Item
Restart the node where LdapServer is located.	Restarting the node without stopping the LdapServer service may cause LdapServer data damage.	▲ ▲ ▲ ▲ ▲	Restore LdapServer using LdapServer backup data	None

Loader High-Risk Operations

Table 12-16 Loader high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Change the floating IP address of a Loader instance (loaderfloating.ip).	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether the Loader UI can be connected properly.
Modify the Loader instance start parameter LOADER_GC_OPTS .	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Clear table contents when adding data to HBase.	This operation will clear original data in the target table.	▲ ▲	Ensure that the contents in the target table can be cleared before the operation.	Check whether the contents in the target table can be cleared before the operation.

Spark2x High-risk Operations

 NOTE

Spark high-risk operations apply to MRS 3.x earlier versions.

Table 12-17 Spark2x high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify the configuration item spark.yarn.queue .	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Modify the configuration item spark.driver.extraJavaOptions .	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Modify the configuration item spark.yarn.driver.extraJavaOptions .	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.

Operation	Risk	Severity	Workaround	Check Item
Modify the configuration item spark.eventLog.dir .	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Modify the configuration item SPARK_DAEMON_JAVA_OPTS .	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Delete all JobHistory2x instances.	The event logs of historical applications are lost.	▲ ▲	Reserve at least one JobHistory2x instance.	Check whether historical application information is included in JobHistory2x.
Delete or modify the /user/spark2x/jars/8.1.0.1/spark-archive-2x.zip file in HDFS.	JDBCServer2x fails to be started and service functions are abnormal.	▲ ▲ ▲	Delete /user/spark2x/jars/8.1.0.1/spark-archive-2x.zip , and wait for 10-15 minutes until the .zip package is automatically restored.	Check whether services can be started properly.

Storm High-Risk Operations

Table 12-18 Storm high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify the following plug-in related configuration items: <ul style="list-style-type: none"> • storm.scheduler • nimbus.authorizer • storm.drift.transport • nimbus.blobstore.class • nimbus.topology.validator • storm.principal.local 	Services cannot start properly.	▲ ▲ ▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that the class names exist and are valid.	Check whether services can be started properly.

Operation	Risk	Severity	Workaround	Check Item
Modify the Storm instance GC_OPTS startup parameters, including: NIMBUS_GC_OPTS SUPERVISOR_GC_OPTS UI_GC_OPTS LOGVIEWER_GC_OPTS	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Modify the user resource pool configuration parameter resource.aware.scheduler.user.pools .	Services cannot run properly.	▲ ▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that resources allocated to each user are appropriate and valid.	Check whether services can be started and run properly
Change data directories.	If this operation is not properly performed, services may be abnormal and unavailable.	▲ ▲ ▲ ▲	Do not manually change data directories.	Check whether data directories are normal.
Restart services or instances.	The service will be interrupted for a short period of time, and ongoing operations will be interrupted.	▲ ▲ ▲	Restart services or instances when necessary.	Check whether the service is running properly and whether interrupted operations are restored.

Operation	Risk	Severity	Workaround	Check Item
Synchronize configurations (by restarting the required service).	The service will be restarted, resulting in temporary service interruption. If Supervisor is restarted, ongoing operations will be interrupted for a short period of time.	▲ ▲ ▲	Modify configuration when necessary.	Check whether the service is running properly and whether interrupted operations are restored.
Stop services or instances.	The service will be stopped, and related operations will be interrupted.	▲ ▲ ▲	Stop services when necessary.	Check whether the services are properly stopped.
Delete or modify metadata.	If Nimbus metadata is deleted, services are abnormal and ongoing operations are lost.	▲ ▲ ▲ ▲	Do not manually delete Nimbus metadata files.	Check whether Nimbus metadata files are normal.
Modify file permissions.	If permissions on the metadata and log directories are incorrectly modified, service exceptions may occur.	▲ ▲ ▲ ▲	Do not manually modify file permissions.	Check whether the permissions on the data and log directories are correct.
Delete topologies.	Topologies in use will be deleted.	▲ ▲ ▲ ▲	Delete topologies when necessary.	Check whether the topologies are successfully deleted.

Yarn High-Risk Operations

Table 12-19 Yarn high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Delete or change data directories yarn.nodemanager.local-dirs and yarn.nodemanager.log-dirs	This operation may cause service information loss.	▲ ▲ ▲	Do not delete data directories manually.	Check whether data directories are normal.

ZooKeeper High-Risk Operations

Table 12-20 ZooKeeper high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Delete or change ZooKeeper data directories.	This operation may cause service information loss.	▲ ▲ ▲	Follow the capacity expansion guide to change the ZooKeeper data directories.	Check whether services and associated components are started properly.
Modify the ZooKeeper instance start parameter GC_OPTS .	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.

Operation	Risk	Severity	Workaround	Check Item
Modify the znode ACL information in ZooKeeper.	If znode permission is modified in ZooKeeper, other users may have no permission to access the znode and some system functions are abnormal.	▲ ▲ ▲ ▲	During the modification, strictly follow the ZooKeeper Configuration Guide and ensure that other components can use ZooKeeper properly after ACL information modification.	Check that other components that depend on ZooKeeper can properly start and provide services.

13 Appendix

13.1 ECS Specifications Used by MRS

MRS uses ECSs of the following types in different application scenarios.

- General computing-plus: C3, C3ne, C6, and C6s
- Memory-optimized: M3, and M6
- Ultra-high I/O: I3 and IR3
- Kunpeng general computing-plus: KC1

ECS Flavor Naming Rules

AB.C.D

Example: m2.8xlarge.8

In the preceding flavor:

- **A** specifies the ECS type. For example, **s** indicates a general-purpose ECS, **c** a computing ECS, and **m** a memory-optimized ECS.
- **B** specifies the type ID. For example, the **1** in **s1** indicates a general-purpose first-generation ECS, and the **2** in **s2** indicates a general-purpose second-generation ECS.
- **C** specifies a flavor size and can be any of the following options: medium, large, and xlarge.
- **D** specifies the ratio of memory to vCPUs expressed in a digit. For example, value **4** indicates that the ratio of memory to vCPUs is 4.

Specifications

Table 13-1 General computing-plus (C) ECS specifications

Type	vCPU	Memory (GB)	Flavor	Virtualization Type
C3	32	64	c3.8xlarge.2	KVM
C3	16	64	c3.4xlarge.4	KVM
C3	32	128	c3.8xlarge.4	KVM
C3	60	256	c3ne.15xlarge.4	KVM
C3ne	32	64	c3ne.8xlarge.2	KVM
C3ne	16	64	c3ne.4xlarge.4	KVM
C3ne	32	128	c3ne.8xlarge.4	KVM
C3ne	60	256	c3ne.15xlarge.4	KVM
C6	32	64	c6.8xlarge.2	KVM
C6	64	128	c6.16xlarge.2	KVM
C6	16	64	c6.4xlarge.4	KVM
C6	32	128	c6.8xlarge.4	KVM
C6	64	256	c6.16xlarge.4	KVM
C6s	32	64	c6s.8xlarge.2	KVM
C6s	64	128	c6s.16xlarge.2	KVM

Table 13-2 Memory-optimized ECS specifications

Type	vCPU	Memory (GB)	Flavor	Virtualization Type
M3	8	64	m3.2xlarge.8	KVM
M3	16	128	m3.4xlarge.8	KVM
M3	32	256	m3.8xlarge.8	KVM
M3	60	512	m3.15xlarge.8	KVM
M6	8	64	m6.2xlarge.8	KVM
M6	16	128	m6.4xlarge.8	KVM
M6	32	256	m6.8xlarge.8	KVM

Type	vCPU	Memory (GB)	Flavor	Virtualization Type
M6	64	512	m6.16xlarge.8	KVM

Table 13-3 Ultra-high I/O ECS specifications

Type	vCPU	Memory (GB)	Flavor	Virtualization Type
I3	8	64	i3.2xlarge.8	KVM
I3	16	128	i3.4xlarge.8	KVM
I3	32	256	i3.8xlarge.8	KVM
I3	64	512	i3.16xlarge.8	KVM
IR3	16	64	ir3.4xlarge.4	KVM
IR3	32	128	ir3.8xlarge.4	KVM

13.2 BMS Specifications Used by MRS

MRS uses the following BMS in different application scenarios.

Kunpeng V1 BMS

Specifications

Table 13-4 Kunpeng V1 BMS specifications

Flavor/ID	vCPUs	Memory (GB)	Network
physical.ks1ne.4xlarge	128	512	Distributed
physical.ks1ne.8xlarge	128	1024	

13.3 A Defect Exists After Core Nodes in the MRS Cluster Are Added

Symptom

Core nodes are added, but some instances on the nodes may fail to be started. The symptoms are as follows:

1. A core node has been added and is displayed on the **Nodes** page.

<input type="checkbox"/>	Node Name/Resource ID	IP
<input type="checkbox"/>	2222ZSnM0001 1911b9db-94d1-4cbe-8eb1-eeb3088ac146	192.168.1.62

2. Some tasks for adding nodes fail or are partially successful.

Name	Status	Pro...
Run decommissioning/recomm...	Successful	100%
Add host	Partially Successful	100%

3. If IAM users have been synchronized, you can view unstarted roles on the **Components** page.
4. If they are not synchronized, you can view unstarted roles on the Manager page of this cluster.

Procedure

Scenario 1: The task for adding nodes fails before component installation.

Step 1 Perform the following steps if the MRS cluster is a pay-per-use cluster:

1. Log in to the MRS console.
2. Choose **Active Clusters** and click the cluster name to go to the cluster details page.

3. Click  in the upper part of the page. In the **Task List** column, click the task for adding core nodes.
4. Records all nodes in the verification request parameter.
5. Click the **Nodes** tab, select the nodes recorded in [Step 1.4](#), click **Stop** in the upper right corner, and stop the nodes as prompted.
6. Reduce nodes by referring to [Scaling In a Cluster](#).

Step 2 If the MRS cluster is billed on a yearly/monthly basis, unsubscribe from the abnormal nodes by referring to [Unsubscribing from a Specified Node in a Yearly/Monthly Cluster](#).

----End

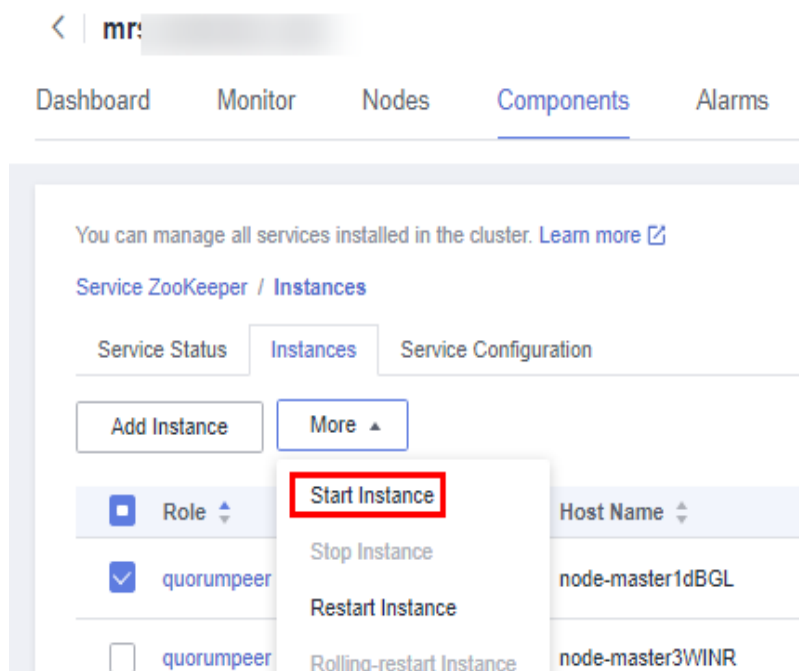

Scenario 2: The task for adding nodes fails after component installation.

Step 1 Log in to the MRS console.

Step 2 Choose **Active Clusters** and click the cluster name to go to the cluster details page.

Step 3 On the **Dashboard** tab, click **Synchronize** next to **IAM User Sync** to synchronize IAM users.

Step 4 Click **Components** and check the role status of each service. If a role is not started, select the role, click **More**, and select **Start Instance** to start the instance.

Step 5 If the startup fails, rectify the fault based on the error information in the task list and try again.

 NOTE

- If there are many abnormal roles, click **Management Operations** in the upper right corner to start all components.
- For other exceptions that cannot be resolved, contact technical support.
- You can also start the instance on the Manager page of the cluster. For details, see [Overview](#)

----End

13.4 Data Migration Solution

13.4.1 Making Preparations

This section describes how to migrate HDFS, HBase, and Hive data to an MRS cluster in different scenarios. During data migration, data may be overwritten, lost, or damaged. This document is for reference only. Please cooperate with Huawei Cloud technical personnel to formulate and implement a specific data migration solution.

Make preparations on a source cluster before data migration to prevent the source cluster from generating new data during data migration, thereby avoiding data inconsistency between the source and destination clusters after data migration. Before data migration is complete, the destination cluster must be in the initial state and cannot run any other services except data migration jobs.

Stopping Cluster Services and the Related Services

- If the Kafka service is involved in your cluster, stop all jobs that generate data in Kafka. Wait until the Kafka consumption tasks have consumed the inventory data in Kafka, and then perform the next step.
- Stop all services and jobs related to HDFS, HBase, and Hive, and stop the HBase and Hive services.

Establishing a Data Transmission Channel

- If the source cluster and destination cluster are deployed in different VPCs in the same region, create a network connection between the two VPCs to establish a data transmission channel at the network layer. For details, see [VPC Peering Connection Overview](#).
- If the source cluster and destination cluster are deployed in the same VPC but belong to different security groups, add security group rules to each security group on the VPC management console. In the security rules, **Protocol** is set to **ANY**, **Transfer Direction** is set to **Inbound**, and **Source** is set to **Security Group** (the security group of the peer cluster).
 - To add an inbound rule to the security group of the source cluster, select the security group of the destination cluster in **Source**.
 - To add an inbound rule to the security group of the destination cluster, select the security group of the source cluster in **Source**.
- If the source and destination clusters are deployed in the same security group of the same VPC and Kerberos authentication is enabled for both clusters, you

need to configure mutual trust between the two clusters. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#).

13.4.2 Exporting Metadata

To ensure that the data properties and permissions of the source cluster are consistent with those of the destination cluster, metadata of the source cluster needs to be exported to restore metadata after data migration.

The metadata to be exported includes the owner, group, and permission information of the HDFS files and Hive table description.

Exporting HDFS Metadata

The metadata information to be exported includes the permission, owner, and group information of files and folders. You can run the following HDFS client command to export:

```
$HADOOP_HOME/bin/hdfs dfs -ls -R <migrating_path> > /tmp/hdfs_meta.txt
```

- *\$HADOOP_HOME*: installation directory of the Hadoop client in the source cluster
- <migrating_path>: HDFS data directory to be migrated
- /tmp/hdfs_meta.txt: local path for storing the exported metadata

NOTE

If the source cluster can communicate with the destination cluster and you run the **hadoop distcp** command as an administrator to copy data, you can add the **-p** parameter to enable DistCp to restore the metadata of the corresponding file in the destination cluster while copying data. In this case, you can skip this step.

Exporting Hive Metadata

Hive table data is stored in HDFS. Table data and the metadata of the table data is centrally migrated in directories by HDFS in a unified manner. Metadata of Hive tables can be stored in different types of relational databases (such as MySQL, PostgreSQL, and Oracle) based on cluster configurations.

The exported metadata of the Hive tables in this document is the Hive table description stored in the relational database.

The mainstream big data release editions in the industry support Sqoop installation. For on-premises big data clusters of the community version, you can download the Sqoop of the community version for installation. Use Sqoop to decouple the metadata to be exported and the relational database, then export Hive metadata to HDFS, and migrate it together with the table data for restoration.

The following uses Account A (you) and Account B (another user) as an example:

Step 1 Download the Sqoop tool from the source cluster and install it.

For details, see <http://sqoop.apache.org/>.

Step 2 Download the JDBC driver of the relational database to the **`\${Sqoop_Home}/lib** directory.

Step 3 Run the following command to export all Hive metadata tables:

All exported data is stored in the `/user/<user_name>/<table_name>` directory on HDFS.

```
$Sqoop_Home/bin/sqoop import --connect jdbc:<driver_type>://<ip>:<port>/<database> --table  
<table_name> --username <user> -password <passwd> -m 1
```

- `$Sqoop_Home`: Sqoop installation directory
- `<driver_type>`: Database type
- `<ip>`: IP address of the database in the source cluster
- `<port>`: Port number of the database in the source cluster
- `<table_name>`: Name of the table to be exported
- `<user>`: Username
- `<passwd>`: User password

 **NOTE**

Commands carrying authentication passwords pose security risks. Disable historical command recording before running such commands to prevent information leakage.

----End

13.4.3 Copying Data

Based on the regions of and network connectivity between the source cluster and destination cluster, data copy scenarios are classified as follows:

Same Region

If the source cluster and destination cluster are in the same region, follow instructions in [Establishing a Data Transmission Channel](#) to configure the network and set up a network transmission channel. Use the DistCp tool to run the following command to copy the HDFS, HBase, Hive data files and Hive metadata backup files from the source cluster to the destination cluster.

```
$HADOOP_HOME/bin/hadoop distcp <src> <dist> -p
```

- `$HADOOP_HOME`: installation directory of the Hadoop client in the destination cluster
- `<src>`: HDFS directory of the source cluster
- `<dist>`: HDFS directory of the destination cluster

Different Regions

If the source cluster and target cluster are in different regions, use the DistCp tool to copy the source cluster data to OBS, and use the OBS cross-region replication function to copy the data to OBS in the region where the target cluster resides. For details, see [Cross-Region Replication](#). If DistCp is used, permission, owner, and group information cannot be set for files on OBS. In this case, you need to export and copy the HDFS metadata while exporting data to prevent the loss of HDFS file property information.

Migrating Data from an Offline Cluster to a Cloud

You can use the following way to migrate data from an offline cluster to the cloud.

- Direct Connect

Create a **Direct Connect** between the source cluster and target cluster, enable the network between the offline cluster egress gateway and the online VPC, and use DistCp to copy the data by referring to **Same Region**.

13.4.4 Restoring Data

HDFS File Property Restoration

Based on the exported permission information, run the HDFS commands in the background of the destination cluster to restore the file permission and owner and group information.

```
$HADOOP_HOME/bin/hdfs dfs -chmod <MODE> <path>  
$HADOOP_HOME/bin/hdfs dfs -chown <OWNER> <path>
```

Hive Metadata Restoration

Install Sqoop and run the Sqoop command in the destination cluster to import the exported Hive metadata to DBService in the MRS cluster.

```
$Sqoop_Home/bin/sqoop export --connect jdbc:postgresql://<ip>:20051/hivemeta --table <table_name> --  
username hive -password <passwd> --export-dir <export_from>
```

- `$Sqoop_Home`: Sqoop installation directory in the destination cluster
- `<ip>`: IP address of the database in the destination cluster
- `<table_name>`: Name of the table to be restored
- `<passwd>`: Password of user **hive**
- `<export_from>`: HDFS address of the metadata in the destination cluster

NOTE

Commands carrying authentication passwords pose security risks. Disable historical command recording before running such commands to prevent information leakage.

HBase Table Reconstruction

Restart the HBase service of the destination cluster to make data migration take effect. During the restart, HBase loads the data in the current HDFS and regenerates metadata. After the restart is complete, run the following command on the Master node client to load the HBase table data:

```
$HBase_Home/bin/hbase hbck -fixMeta -fixAssignments
```

After the command is executed, run the following command repeatedly to check the health status of the HBase cluster until the health status is normal:

```
hbase hbck
```

13.5 Precautions for MRS 3.x

Purpose

Clusters of versions earlier than MRS 3.x use MRS Manager to manage and monitor MRS clusters. On the Cluster Management page of the MRS management console, you can view cluster details, manage nodes, components, alarms, patches, files, jobs, tenants, and backup and restoration. In addition, you can configure Bootstrap actions and manage tags.

MRS 3.x uses FusionInsight Manager to manage and monitor clusters. On the Cluster Management page of the MRS management console, you can view cluster details, manage nodes, components, alarms, files, jobs, Bootstrap actions, and tags.

Some maintenance operations of the MRS 3.x cluster are different from those of earlier versions. For details, see [MRS Manager Operation Guide \(Available for 2.x and Earlier Versions\)](#) and [FusionInsight Manager Operation Guide \(Available for 3.x\)](#).

Accessing MRS Manager

- For details about how to access MRS Manager of versions earlier than MRS 3.x, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).
- For details about how to access FusionInsight Manager of MRS 3.x, see [Accessing FusionInsight Manager \(MRS 3.x or Later\)](#).

Modifying MRS Cluster Service Configuration Parameters

- For versions earlier than MRS 3.x, you can modify service configuration parameters on the cluster management page of the MRS management console.
 - a. Log in to the MRS console. On the displayed **Active Clusters** page, click the name of the desired cluster in the cluster list.
 - b. Choose **Components** > *Name of the desired service* > **Service Configuration**.

The **Basic Configurations** tab page is displayed by default. To modify more parameters, click the **All Configurations** tab. The navigation tree displays all configuration parameters of the service. The level-1 nodes in the navigation tree are service names or role names. The parameter category is displayed after the level-1 node is expanded.
 - c. In the navigation tree, select the specified parameter category and change the parameter values on the right.

If you are not sure about the location of a parameter, you can enter the parameter name in search box in the upper right corner. The system searches for the parameter in real time and displays the result.
 - d. Click **Save Configuration**. In the displayed dialog box, click **OK**.
 - e. Wait until the message "Operation succeeded" is displayed. Click **Finish**. The configuration is modified.

Check whether there is any service whose configuration has expired in the cluster. If yes, restart the corresponding service or role instance for the configuration to take effect. You can also select **Restart the affected services or instances** when saving the configuration.

- In MRS 3.x, you need to log in to FusionInsight Manager to modify service configuration parameters.
 - a. Log in to FusionInsight Manager.
 - b. Choose **Cluster > Services**.
 - c. Click the specified service name on the service management page.
 - d. Click **Configurations**.

The **Basic Configurations** tab page is displayed by default. To modify more parameters, click the **All Configurations** tab. The navigation tree displays all configuration parameters of the service. The level-1 nodes in the navigation tree are service names or role names. The parameter category is displayed after the level-1 node is expanded.

- e. In the navigation tree, select the specified parameter category and change the parameter values on the right.

If you are not sure about the location of a parameter, you can enter the parameter name in search box in the upper right corner. The Manager searches for the parameter in real time and displays the result.

- f. Click **Save**. In the confirmation dialog box, click **OK**.
- g. Wait until the message "Operation succeeded" is displayed. Click **Finish**. The configuration is modified.

Check whether there is any service whose configuration has expired in the cluster. If yes, restart the corresponding service or role instance for the configuration to take effect.

13.6 Installing the Flume Client

13.6.1 Installing the Flume Client on Clusters of Versions Earlier Than MRS 3.x

Scenario

To use Flume to collect logs, you must install the Flume client on a log host. You can create an ECS and install the Flume client on it.

This section applies to MRS 3.x or earlier clusters.

Prerequisites

- A streaming cluster with the Flume component has been created.
- The log host is in the same VPC and subnet with the MRS cluster.
- You have obtained the username and password for logging in to the log host.

Procedure

Step 1 Create an ECS that meets the requirements.

Step 2 Go to the cluster details page and choose **Components**.

 **NOTE**

If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Step 3 Click **Download Client**.

1. In **Client Type**, select **All client files**.
2. In **Download to**, select **Remote host**.
3. Set **Host IP Address** to the IP address of the ECS, **Host Port** to **22**, and **Save Path** to **/tmp**.
 - If the default port **22** for logging in to an ECS through SSH has been changed, set **Host Port** to a new port.
 - The value of **Save Path** contains a maximum of 256 characters.
4. Set **Login User** to **root**.

If another user is used, ensure that the user has permissions to read, write, and execute the save path.
5. Select **Password** or **SSH Private Key** for **Login Mode**.
 - **Password**: Enter the password of user **root** set during cluster creation.
 - **SSH Private Key**: Select and upload the key file used for creating the cluster.
6. Click **OK** to generate a client file.

If the following information is displayed, the client package is saved.

Client files downloaded to the remote host successfully.

If the following information is displayed, check the username, password, and security group configurations of the remote host. Ensure that the username and password are correct and an inbound rule of the SSH (22) port has been added to the security group of the remote host. And then, go to **Step 3** to download the client again.

Failed to connect to the server. Please check the network connection or parameter settings.

Figure 13-1 Downloading a client
Download Client

Warning: Generating a client will occupy a large number of disk I/Os. You are advised not to download a client when the cluster is being installed, started, and patched, or in other unstable states.

* Client Type All client files Only configuration files

* Download To Server Remote host

Files will only be saved to the following path on the server. Existing client files in the path will be overwritten.

* Host IP Address

* Host Port

* Save Path

* Login User

* Login Mode Password SSH Private Key

* Password

Step 4 Choose **Flume > Instance**. Query the **Business IP Address** of any Flume instance and any two MonitorServer instances.

Dashboard | Nodes | Components | Alarms | Patches | Files | Jobs | Tenants | Backups & Restorations

You can manage all services installed in the cluster. [Learn more](#)

Service Flume / **Instances**

Service Status | Instances | Service Configuration | Flume Management

More ▾

<input type="checkbox"/> Role ↕	Host Name ↕	OM IP Address ↕	Business IP Address ↕
<input type="checkbox"/> Flume	node-str-coreGVaQ		
<input type="checkbox"/> Flume	node-str-coreHEel		
<input type="checkbox"/> MonitorServer	node-master1LHaB		
<input type="checkbox"/> MonitorServer	node-master2mecC		

Step 5 Log in to the ECS using VNC. For details, see "User Guide" > "Login Using VNC" in *Elastic Cloud Server*. ("Instances" > "Logging In to a Linux ECS").

All images support Cloud-Init. The preset username for Cloud-Init is **root** and the password is the one you set during cluster creation. You are advised to change the password upon the first login.

Step 6 On the ECS, switch to user **root** and copy the installation package to the **/opt** directory.

```
sudo su - root
```

```
cp /tmp/MRS_Flume_Client.tar /opt
```

Step 7 Run the following command in the **/opt** directory to decompress the package and obtain the verification file and the configuration package of the client:

```
tar -xvf MRS_Flume_Client.tar
```

Step 8 Run the following command to verify the configuration package of the client:

```
sha256sum -c MRS_Flume_ClientConfig.tar.sha256
```

If the following information is displayed, the file package is successfully verified:

```
MRS_Flume_ClientConfig.tar: OK
```

Step 9 Run the following command to decompress **MRS_Flume_ClientConfig.tar**:

```
tar -xvf MRS_Flume_ClientConfig.tar
```

Step 10 Run the following command to install the client running environment to a new directory, for example, **/opt/Flumeenv**. A directory is automatically generated during the client installation.

```
sh /opt/MRS_Flume_ClientConfig/install.sh /opt/Flumeenv
```

If the following information is displayed, the client running environment is successfully installed:

```
Components client installation is complete.
```

Step 11 Run the following command to configure environment variables:

```
source /opt/Flumeenv/bigdata_env
```

Step 12 Run the following commands to decompress the Flume client package:

```
cd /opt/MRS_Flume_ClientConfig/Flume
```

```
tar -xvf FusionInsight-Flume-1.6.0.tar.gz
```

Step 13 Run the following command to check whether the password of the current user has expired:

```
chage -l root
```

If the value of **Password expires** is earlier than the current time, the password has expired. Run the **chage -M -1 root** command to validate the password.

Step 14 Run the following command to install the Flume client to a new directory, for example, **/opt/FlumeClient**. A directory is automatically generated during the client installation.

```
sh /opt/MRS_Flume_ClientConfig/Flume/install.sh -d /opt/FlumeClient -f  
service IP address of the MonitorServer instance -c path of the Flume
```

configuration file -l /var/log/ -e service IP address of Flume -n name of the Flume client

The parameters are described as follows:

- **-d**: indicates the installation path of the Flume client.
- (Optional) **-f**: indicates the service IP addresses of the two MonitorServer instances, separated by a comma (.). If the IP addresses are not configured, the Flume client will not send alarm information to MonitorServer, and the client information will not be displayed on MRS Manager.
- (Optional) **-c**: indicates the **properties.properties** configuration file that the Flume client loads after installation. If this parameter is not specified, the **fusioninsight-flume-1.6.0/conf/properties.properties** file in the client installation directory is used by default. The configuration file of the client is empty. You can modify the configuration file as required and the Flume client will load it automatically.
- (Optional) **-l**: indicates the log directory. The default value is **/var/log/Bigdata**.
- (Optional) **-e**: indicates the service IP address of the Flume instance. It is used to receive the monitoring indicators reported by the client.
- (Optional) **-n**: indicates the name of the Flume client.
- IBM JDK does not support **-Xloggc**. You must change **-Xloggc** to **-Xverbosegclog** in **flume/conf/flume-env.sh**. For 32-bit JDK, the value of **-Xmx** must not exceed 3.25 GB.
- In **flume/conf/flume-env.sh**, the default value of **-Xmx** is 4 GB. If the client memory is too small, you can change it to 512 MB or even 1 GB.

For example, run **sh install.sh -d /opt/FlumeClient**.

If the following information is displayed, the client is successfully installed:

```
install flume client successfully.
```

```
----End
```

13.6.2 Installing the Flume Client on MRS 3.x or Later Clusters

Scenario

To use Flume to collect logs, you must install the Flume client on a log host. You can create an ECS and install the Flume client on it.

This section applies to MRS 3.x or later.

Prerequisites

- A cluster with the Flume component has been created.
- The log host is in the same VPC and subnet with the MRS cluster.
- You have obtained the username and password for logging in to the log host.
- The installation directory is automatically created if it does not exist. If it exists, the directory must be left blank. The directory path cannot contain any space.

Procedure

Step 1 Obtain the software package.

Log in to the FusionInsight Manager. Choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the Flume service page that is displayed, choose **More** > **Download Client** in the upper right corner and set **Select Client Type** to **Complete Client** to download the Flume service client file.

The file name of the client is **FusionInsight_Cluster_<Cluster ID>_Flume_Client.tar**. This section takes the client file **FusionInsight_Cluster_1_Flume_Client.tar** as an example.

Step 2 Upload the software package.

Upload the software package to a directory, for example, **/opt/client**, on the node where the Flume client is to be installed as user **user**.

NOTE

user is the user who installs and runs the Flume client.

Step 3 Decompress the software package.

Log in to the node where the Flume service client is to be installed as user **user**. Go to the directory where the installation package is installed, for example, **/opt/client**, and run the following command to decompress the installation package to the current directory:

```
cd /opt/client
```

```
tar -xvf FusionInsight_Cluster_1_Flume_Client.tar
```

Step 4 Verify the software package.

Run the **sha256sum -c** command to verify the decompressed file. If **OK** is returned, the verification is successful. Example:

```
sha256sum -c FusionInsight_Cluster_1_Flume_ClientConfig.tar.sha256
```

```
FusionInsight_Cluster_1_Flume_ClientConfig.tar: OK
```

Step 5 Decompress the package.

```
tar -xvf FusionInsight_Cluster_1_Flume_ClientConfig.tar
```

Step 6 To install the Flume client on a node outside the cluster, perform the following steps to configure the installation environment. Skip this step if you install Flume client on a node in the cluster.

1. Run the following command to install the client running environment to a new directory, for example, **/opt/Flumeenv**. A directory is automatically generated during the client installation.

```
sh /opt/client/FusionInsight_Cluster_1_Flume_ClientConfig/install.sh /opt/Flumeenv
```

If the following information is displayed, the client running environment is successfully installed:

```
Components client installation is complete.
```

2. Run the following command to set environment variables:

```
source /opt/Flumeenv/bigdata_env
```

- Step 7** Run the following command in the Flume client installation directory to install the client to a specified directory (for example, **opt/FlumeClient**): After the client is installed successfully, the installation is complete.

```
cd /opt/client/FusionInsight_Cluster_1_Flume_ClientConfig/Flume/FlumeClient
```

```
./install.sh -d /opt/FlumeClient -f MonitorServerService IP address or host name of the role -c User service configuration filePath for storing properties.properties -s CPU threshold -l /var/log/Bigdata -e FlumeServer service IP address or host name -n Flume
```

 NOTE

- **-d**: Flume client installation path
- (Optional) **-f**: IP addresses or host names of two MonitorServer roles. The IP addresses or host names are separated by commas (.). If this parameter is not configured, the Flume client does not send alarm information to MonitorServer and information about the client cannot be viewed on the FusionInsight Manager GUI.
- (Optional) **-c**: Service configuration file, which needs to be generated on the configuration tool page of the Flume server based on your service requirements by referring to [Flume Service Configuration Guide](#). Upload the file to any directory on the node where the client is to be installed. If this parameter is not specified during the installation, you can upload the generated service configuration file **properties.properties** to the **/opt/FlumeClient/fusioninsight-flume-1.9.0/conf** directory after the installation.
- (Optional) **-s**: cgroup threshold. The value is an integer ranging from 1 to 100 x *N*. *N* indicates the number of CPU cores. The default threshold is **-1**, indicating that the processes added to the cgroup are not restricted by the CPU usage.
- (Optional) **-l**: Log path. The default value is **/var/log/Bigdata**. The user **user** must have the write permission on the directory. When the client is installed for the first time, a subdirectory named **flume-client** is generated. After the installation, subdirectories named **flume-client-*n*** will be generated in sequence. The letter *n* indicates a sequence number, which starts from 1 in ascending order. In the **/conf/** directory of the Flume client installation directory, modify the **ENV_VARS** file and search for the **FLUME_LOG_DIR** attribute to view the client log path.
- (Optional) **-e**: Service IP address or host name of FlumeServer, which is used to receive statistics for the monitoring indicator reported by the client.
- (Optional) **-n**: Name of the Flume client. You can choose **Cluster > Name of the desired cluster > Service > Flume > Flume Management** on FusionInsight Manager to view the client name on the corresponding node.
- If the following error message is displayed, run the **export JAVA_HOME=*JDK path*** command. You can run the **echo \$JAVA_HOME** command to query the JDK path.
JAVA_HOME is null in current user,please install the JDK and set the JAVA_HOME
- IBM JDK does not support **-Xloggc**. You must change **-Xloggc** to **-Xverbosegclog** in **flume/conf/flume-env.sh**. For 32-bit JDK, the value of **-Xmx** must not exceed 3.25 GB.
- When installing a cross-platform client in a cluster, go to the **/opt/client/FusionInsight_Cluster_1_Flume_ClientConfig/Flume/FusionInsight-Flume-1.9.0.tar.gz** directory to install the Flume client.
