Notice

The purchased products, services and features are stipulated by the contract made between Huawei Cloud and the customer. All or part of the products, services and features described in this document may not be within the purchase scope or the usage scope. Unless otherwise specified in the contract, all statements, information, and recommendations in this document are provided "AS IS" without warranties, guarantees or representations of any kind, either express or implied.

The information in this document is subject to change without notice. Every effort has been made in the preparation of this document to ensure accuracy of the contents, but all statements, information, and recommendations in this document do not constitute a warranty of any kind, express or implied.

Contents

1 Preparing a User.....	1
1.1 Configuring Cloud Service Permissions.....	1
1.2 Creating an MRS User.....	2
1.3 Creating a Custom Policy.....	7
1.4 Synchronizing IAM Users to MRS.....	12
2 Configuring a Cluster.....	18
2.1 How to Buy an MRS Cluster.....	18
2.2 Quick Configuration.....	19
2.2.1 Quickly Buying a Hadoop Analysis Cluster.....	19
2.2.2 Quickly Buying an HBase Query Cluster.....	21
2.2.3 Quickly Buying a Kafka Streaming Cluster.....	24
2.2.4 Quickly Buying a ClickHouse Cluster.....	26
2.2.5 Quickly Buying a Real-time Analysis Cluster.....	28
2.3 Buying a Custom Cluster.....	31
2.4 Configuring Custom Topology.....	50
2.5 Adding a Tag to a Cluster/Node.....	64
2.6 Communication Security Authorization.....	68
2.7 Configuring Auto Scaling Rules.....	72
2.7.1 Overview.....	72
2.7.2 Configuring Auto Scaling During Cluster Creation.....	74
2.7.3 Creating an Auto Scaling Policy for an Existing Cluster.....	75
2.7.4 Scenario 1: Using Auto Scaling Rules Alone.....	76
2.7.5 Scenario 2: Using Resource Plans Alone.....	78
2.7.6 Scenario 3: Using Both Auto Scaling Rules and Resource Plans.....	78
2.7.7 Modifying an Auto Scaling Policy.....	80
2.7.8 Deleting an Auto Scaling Policy.....	81
2.7.9 Enabling or Disabling an Auto Scaling Policy.....	81
2.7.10 Viewing an Auto Scaling Policy.....	81
2.7.11 Configuring Automation Scripts.....	82
2.7.12 Configuring Auto Scaling Metrics.....	83
2.8 Managing Data Connections.....	89
2.8.1 Configuring Data Connections.....	89
2.8.2 Configuring an RDS Data Connection.....	91

2.8.2.1 Configuring an RDS Data Connection.....	91
2.8.2.2 Configuring a Ranger Data Connection.....	96
2.8.2.3 Configuring a Hive Data Connection.....	102
2.8.3 Configuring a LakeFormation Data Connection.....	104
2.8.3.1 Scenario.....	104
2.8.3.2 Preparations.....	105
2.8.3.3 Configuring a LakeFormation Data Connection During Cluster Creation.....	114
2.9 Installing Third-Party Software Using Bootstrap Actions.....	120
2.10 Viewing Failed MRS Tasks.....	122
2.11 Viewing Information of a Historical Cluster.....	122
3 Managing Clusters.....	125
3.1 Logging In to a Cluster.....	125
3.1.1 MRS Cluster Node Overview	125
3.1.2 Logging In to an ECS.....	127
3.1.3 Determining Active and Standby Management Nodes.....	131
3.2 Cluster Overview.....	133
3.2.1 Cluster List.....	133
3.2.2 Checking the Cluster Status.....	135
3.2.3 Viewing Basic Cluster Information.....	138
3.2.4 Viewing Cluster Patch Information.....	143
3.2.5 Managing Components and Monitoring Hosts.....	143
3.3 Viewing and Customizing Cluster Monitoring Metrics.....	148
3.4 Cluster O&M.....	150
3.4.1 Importing and Exporting Data.....	150
3.4.2 Changing the Subnet of a Cluster.....	155
3.4.3 Changing the Security Group of a Cluster.....	159
3.4.4 Configuring Message Notification.....	160
3.4.5 Checking Health Status.....	163
3.4.5.1 Before You Start.....	163
3.4.5.2 Performing a Health Check.....	164
3.4.5.3 Viewing and Exporting a Health Check Report.....	165
3.4.6 Remote O&M.....	165
3.4.6.1 Authorizing O&M.....	165
3.4.6.2 Sharing Logs.....	166
3.4.7 Viewing MRS Operation Logs.....	167
3.4.8 Changing Billing Mode to Yearly/Monthly.....	168
3.4.9 Unsubscribing from a Cluster.....	169
3.4.10 Unsubscribing from a Specified Node in a Yearly/Monthly Cluster.....	169
3.4.11 Deleting a Cluster.....	172
3.5 Managing Nodes.....	172
3.5.1 Scaling Out a Cluster.....	173
3.5.2 Scaling In a Cluster.....	178

3.5.3 Removing ClickHouseServer Instance Nodes.....	183
3.5.3.1 Constraints on ClickHouseServer Scale-in.....	183
3.5.3.2 Scaling In ClickHouseServer Nodes.....	187
3.5.4 Managing a Host (Node).....	189
3.5.5 Isolating a Host.....	190
3.5.6 Canceling Host Isolation.....	192
3.5.7 Scaling Up Master Node Specifications.....	193
3.5.8 Expanding a Data Disk.....	199
3.5.9 Synchronizing Disk Information.....	202
3.6 Job Management.....	203
3.6.1 Introduction to MRS Jobs.....	203
3.6.2 Running a MapReduce Job.....	208
3.6.3 Running a SparkSubmit or Spark Job.....	212
3.6.4 Running a HiveSQL Job.....	218
3.6.5 Running a SparkSql Job.....	222
3.6.6 Running a Flink Job.....	226
3.6.7 Running a HadoopStreaming Job.....	233
3.6.8 Viewing Job Configuration and Logs.....	235
3.6.9 Stopping a Job.....	236
3.6.10 Deleting a Job.....	236
3.6.11 Using Encrypted OBS Data for Job Running.....	237
3.6.12 Configuring Job Notification Rules.....	244
3.7 Component Management.....	245
3.7.1 Object Management.....	245
3.7.2 Viewing Configuration.....	246
3.7.3 Managing Services.....	248
3.7.4 Configuring Service Parameters.....	250
3.7.5 Configuring Customized Service Parameters.....	253
3.7.6 Synchronizing Service Configuration.....	256
3.7.7 Managing Role Instances.....	258
3.7.8 Configuring Role Instance Parameters.....	259
3.7.9 Synchronizing Role Instance Configuration.....	261
3.7.10 Decommissioning and Recommissioning a Role Instance.....	262
3.7.11 Starting and Stopping a Cluster.....	264
3.7.12 Synchronizing Cluster Configuration.....	265
3.7.13 Exporting Cluster Configuration.....	266
3.7.14 Performing Rolling Restart.....	267
3.8 Alarm Management.....	276
3.8.1 Viewing the Alarm List.....	276
3.8.2 Viewing the Event List.....	279
3.8.3 Viewing and Manually Clearing an Alarm.....	282
3.9 Patch Management.....	283

3.9.1 Installing an Online Patch.....	283
3.9.2 Installing a Rolling Patch.....	285
3.9.3 Restoring Patches for the Isolated Hosts.....	289
3.9.4 MRS Patch Description.....	290
3.9.4.1 Fixed the Privilege Escalation Vulnerability of User omm.....	290
3.9.4.2 MRS 3.0.5.1 Patch Description.....	292
3.9.4.3 MRS 2.1.0.11 Patch Description.....	294
3.9.4.4 MRS 2.1.0.10 Patch Description.....	300
3.9.4.5 MRS 2.1.0.9 Patch Description.....	305
3.9.4.6 MRS 2.1.0.8 Patch Description.....	309
3.9.4.7 MRS 2.1.0.7 Patch Description.....	313
3.9.4.8 MRS 2.1.0.6 Patch Description.....	316
3.9.4.9 MRS 2.1.0.3 Patch Description.....	319
3.9.4.10 MRS 2.1.0.2 Patch Description.....	321
3.9.4.11 MRS 2.1.0.1 Patch Description.....	322
3.9.4.12 MRS 2.0.6.1 Patch Description.....	324
3.9.4.13 MRS 2.0.1.3 Patch Description.....	324
3.9.4.14 MRS 2.0.1.2 Patch Description.....	325
3.9.4.15 MRS 2.0.1.1 Patch Description.....	326
3.9.4.16 MRS 1.9.3.3 Patch Description.....	327
3.9.4.17 MRS 1.9.3.1 Patch Description.....	329
3.9.4.18 MRS 1.9.2.2 Patch Description.....	330
3.9.4.19 MRS 1.9.0.8, 1.9.0.9, and 1.9.0.10 Patch Description.....	332
3.9.4.20 MRS 1.9.0.7 Patch Description.....	336
3.9.4.21 MRS 1.9.0.6 Patch Description.....	340
3.9.4.22 MRS 1.9.0.5 Patch Description.....	343
3.9.4.23 MRS 1.8.10.1 Patch Description.....	346
3.10 Tenant Management.....	346
3.10.1 Before You Start.....	346
3.10.2 Overview.....	347
3.10.3 Creating a Tenant.....	348
3.10.4 Creating a Sub-tenant.....	351
3.10.5 Deleting a Tenant.....	355
3.10.6 Managing a Tenant Directory.....	356
3.10.7 Restoring Tenant Data.....	359
3.10.8 Creating a Resource Pool.....	360
3.10.9 Modifying a Resource Pool.....	362
3.10.10 Deleting a Resource Pool.....	363
3.10.11 Configuring a Queue.....	364
3.10.12 Configuring the Queue Capacity Policy of a Resource Pool.....	367
3.10.13 Clearing Configuration of a Queue.....	368
3.11 Bootstrap Actions.....	369

3.11.1 Introduction to Bootstrap Actions.....	370
3.11.2 Preparing the Bootstrap Action Script.....	370
3.11.3 View Execution Records.....	371
3.11.4 Adding a Bootstrap Action.....	372
3.11.5 Modifying a Bootstrap Action.....	374
3.11.6 Deleting a Bootstrap Action.....	375
4 Using an MRS Client.....	376
4.1 Installing a Client.....	376
4.1.1 Installing a Client (MRS 3.x or Later).....	376
4.1.2 Installing a Client (Versions Earlier Than 3.x).....	385
4.2 Updating a Client.....	390
4.2.1 Updating a Client (Version 3.x or Later).....	390
4.2.2 Updating a Client (Versions Earlier Than 3.x).....	392
4.3 Using the Client of Each Component.....	397
4.3.1 Using a ClickHouse Client.....	397
4.3.2 Using a Flink Client.....	400
4.3.3 Using a Flume Client.....	411
4.3.4 Using an HBase Client.....	417
4.3.5 Using an HDFS Client.....	419
4.3.6 Using a Hive Client.....	421
4.3.7 Using an Impala Client.....	425
4.3.8 Using a Kafka Client.....	428
4.3.9 Using a Kudu Client.....	429
4.3.10 Using the Oozie Client.....	430
4.3.11 Using a Storm Client.....	432
4.3.12 Using a Yarn Client.....	433
5 Configuring a Cluster with Decoupled Storage and Compute.....	435
5.1 MRS Storage-Compute Decoupling.....	435
5.2 Interconnecting with OBS Using the Cluster Agency Mechanism.....	436
5.2.1 Configuring a Storage-Compute Decoupled Cluster (Agency).....	436
5.2.2 Configuring a Storage-Compute Decoupled Cluster (AK/SK).....	445
5.2.3 Configuring the Policy for Clearing Component Data in the Recycle Bin.....	449
5.2.4 Interconnecting MRS with OBS Using an Agency.....	452
5.2.4.1 Interconnecting Flink with OBS.....	452
5.2.4.2 Interconnecting Flume with OBS.....	453
5.2.4.3 Interconnecting HDFS with OBS.....	455
5.2.4.4 Interconnecting Hive with OBS.....	456
5.2.4.5 Interconnecting MapReduce with OBS.....	460
5.2.4.6 Interconnecting Spark2x with OBS.....	461
5.2.4.7 Interconnecting Sqoop with External Storage Systems.....	464
5.2.4.8 Interconnecting Hudi with OBS.....	470
5.2.5 Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS.....	471

5.2.6 Accessing OBS from a Client on a Node Outside the Cluster.....	477
5.3 FAQ.....	479
5.3.1 Example Interconnecting HDFS with OBS.....	479
6 Accessing Web Pages of Open Source Components Managed in MRS Clusters..	482
6.1 Web UIs of Open Source Components.....	482
6.2 Common Ports of Components.....	485
6.3 Access Through Direct Connect.....	504
6.4 EIP-based Access.....	506
6.5 Access Using a Windows ECS.....	509
6.6 Creating an SSH Channel for Connecting to an MRS Cluster and Configuring the Browser.....	511
7 Accessing Manager.....	514
7.1 Accessing FusionInsight Manager (MRS 3.x or Later).....	514
7.2 Accessing MRS Manager (MRS 2.x or Earlier).....	518
8 FusionInsight Manager Operation Guide (Available for 3.x).....	526
8.1 Homepage.....	526
8.1.1 Overview.....	526
8.1.2 Managing Monitoring Metric Reports.....	528
8.1.3 Querying the FusionInsight Manager Version.....	530
8.2 Cluster.....	531
8.2.1 Cluster Management.....	531
8.2.1.1 Overview.....	531
8.2.1.2 Performing a Rolling Restart of a Cluster.....	533
8.2.1.3 Managing Expired Configurations.....	536
8.2.1.4 Downloading the Client.....	537
8.2.1.5 Modifying Cluster Attributes.....	538
8.2.1.6 Managing Cluster Configurations.....	539
8.2.1.7 Managing Static Service Pools.....	540
8.2.1.7.1 Static Service Resources.....	540
8.2.1.7.2 Configuring Cluster Static Resources.....	541
8.2.1.7.3 Viewing Cluster Static Resources.....	544
8.2.1.8 Managing Clients.....	545
8.2.1.8.1 Managing a Client.....	545
8.2.1.8.2 Batch Upgrading Clients.....	547
8.2.1.8.3 Updating the hosts File in Batches.....	548
8.2.2 Managing a Service.....	549
8.2.2.1 Overview.....	549
8.2.2.2 Service Management Operations.....	553
8.2.2.2.1 Service Details Page.....	554
8.2.2.2.2 Performing Active/Standby Switchover of a Role Instance.....	556
8.2.2.2.3 Resource Monitoring.....	556
8.2.2.2.4 Collecting Stack Information.....	560

8.2.2.2.5 Switching Ranger Authentication.....	564
8.2.2.3 Service Configuration.....	565
8.2.2.3.1 Modifying Service Configuration Parameters.....	565
8.2.2.3.2 Modifying Custom Configuration Parameters of a Service.....	566
8.2.3 Instance Management.....	568
8.2.3.1 Overview.....	568
8.2.3.2 Decommissioning and Recommissioning an Instance.....	570
8.2.3.3 Managing Instance Configurations.....	572
8.2.3.4 Viewing the Instance Configuration File.....	574
8.2.3.5 Instance Group.....	575
8.2.3.5.1 Managing Instance Groups.....	575
8.2.3.5.2 Viewing Information About an Instance Group.....	577
8.2.3.5.3 Configuring Instantiation Group Parameters.....	577
8.3 Hosts.....	578
8.3.1 Host Management Page.....	578
8.3.1.1 Viewing the Host List.....	578
8.3.1.2 Viewing the Host Dashboard.....	579
8.3.1.3 Checking Host Processes and Resources.....	580
8.3.2 Host Maintenance Operations.....	580
8.3.2.1 Starting and Stopping All Instances on a Host.....	580
8.3.2.2 Performing a Host Health Check.....	581
8.3.2.3 Configuring Racks for Hosts.....	581
8.3.2.4 Isolating a Host.....	583
8.3.2.5 Exporting Host Information.....	584
8.3.3 Resource Overview.....	585
8.3.3.1 Distribution.....	585
8.3.3.2 Trend.....	587
8.3.3.3 Cluster.....	588
8.3.3.4 Host.....	588
8.4 O&M.....	589
8.4.1 Alarms.....	589
8.4.1.1 Overview of Alarms and Events.....	589
8.4.1.2 Alarm Threshold.....	592
8.4.1.3 Configuring the Alarm Masking Status.....	610
8.4.2 Log.....	611
8.4.2.1 Log Online Search.....	611
8.4.2.2 Log Download.....	614
8.4.3 Perform a Health Check.....	614
8.4.3.1 Viewing a Health Check Task.....	614
8.4.3.2 Managing Health Check Reports.....	615
8.4.3.3 Modifying Health Check Configuration.....	616
8.4.4 Configuring Backup and Backup Restoration.....	616

8.4.4.1 Creating a Backup Task.....	616
8.4.4.2 Creating a Backup Restoration Task.....	618
8.4.4.3 Managing Backup and Backup Restoration Tasks.....	618
8.5 Audit.....	619
8.5.1 Overview.....	619
8.5.2 Configuring Audit Log Dumping.....	620
8.6 Tenant Resources.....	623
8.6.1 Multi-Tenancy.....	623
8.6.1.1 Overview.....	623
8.6.1.2 Technical Principles.....	624
8.6.1.2.1 Multi-Tenant Management.....	624
8.6.1.2.2 Multi-Tenant Model.....	627
8.6.1.2.3 Resource Overview.....	631
8.6.1.2.4 Dynamic Resources.....	631
8.6.1.2.5 Storage Resources.....	634
8.6.1.3 Multi-Tenancy Usage.....	635
8.6.1.3.1 Overview.....	635
8.6.1.3.2 Process Overview.....	636
8.6.2 Using the Superior Scheduler.....	638
8.6.2.1 Creating Tenants.....	638
8.6.2.1.1 Adding a Tenant.....	638
8.6.2.1.2 Adding a Sub-Tenant.....	642
8.6.2.1.3 Adding a User and Binding the User to a Tenant Role.....	646
8.6.2.2 Managing Tenants.....	649
8.6.2.2.1 Managing Tenant Directories.....	649
8.6.2.2.2 Restoring Tenant Data.....	651
8.6.2.2.3 Deleting a Tenant.....	652
8.6.2.3 Managing Resources.....	652
8.6.2.3.1 Adding a Resource Pool.....	652
8.6.2.3.2 Modifying a Resource Pool.....	654
8.6.2.3.3 Deleting a Resource Pool.....	654
8.6.2.3.4 Modifying Queue Resources.....	655
8.6.2.3.5 Configuring the Queue Capacity Policy of a Resource Pool.....	657
8.6.2.3.6 Clearing Queue Configurations.....	659
8.6.2.4 Managing Global User Policies.....	660
8.6.3 Using the Capacity Scheduler.....	661
8.6.3.1 Creating Tenants.....	662
8.6.3.1.1 Adding a Tenant.....	662
8.6.3.1.2 Adding a Sub-Tenant.....	666
8.6.3.1.3 Adding a User and Binding the User to a Tenant Role.....	669
8.6.3.2 Managing Tenants.....	671
8.6.3.2.1 Managing Tenant Directories.....	671

8.6.3.2.2 Restoring Tenant Data.....	673
8.6.3.2.3 Deleting a Tenant.....	674
8.6.3.2.4 Clearing Non-associated Queues of a Tenant.....	675
8.6.3.3 Managing Resources.....	676
8.6.3.3.1 Adding a Resource Pool.....	676
8.6.3.3.2 Modifying a Resource Pool.....	677
8.6.3.3.3 Deleting a Resource Pool.....	677
8.6.3.3.4 Modifying Queue Resources.....	678
8.6.3.3.5 Configuring the Queue Capacity Policy of a Resource Pool.....	679
8.6.3.3.6 Clearing Queue Configurations.....	680
8.6.4 Switching the Scheduler.....	681
8.7 System.....	684
8.7.1 Configuring Permissions.....	685
8.7.1.1 Managing Users.....	685
8.7.1.1.1 Creating a User.....	685
8.7.1.1.2 Modifying User Information.....	686
8.7.1.1.3 Exporting User Information.....	687
8.7.1.1.4 Locking a User.....	687
8.7.1.1.5 Unlocking a User.....	688
8.7.1.1.6 Deleting a User.....	688
8.7.1.1.7 Changing a User Password.....	689
8.7.1.1.8 Initializing a Password.....	690
8.7.1.1.9 Exporting an Authentication Credential File.....	691
8.7.1.2 Managing User Groups.....	692
8.7.1.3 Managing Roles.....	694
8.7.1.4 Security Policies.....	696
8.7.1.4.1 Configuring Password Policies.....	697
8.7.1.4.2 Configuring the Independent Attribute.....	702
8.7.2 Configuring Interconnections.....	703
8.7.2.1 Configuring SNMP Northbound Parameters.....	703
8.7.2.2 Configuring Syslog Northbound Parameters.....	705
8.7.2.3 Configuring Monitoring Metric Dumping.....	710
8.7.3 Importing a Certificate.....	712
8.7.4 OMS Management.....	714
8.7.4.1 Overview of the OMS Page.....	714
8.7.4.2 Modifying OMS Service Configuration Parameters.....	715
8.7.5 Viewing Component Packages.....	717
8.8 Cluster Management.....	718
8.8.1 Cluster Mutual Trust Management.....	718
8.8.1.1 Overview of Mutual Trust Between Clusters.....	718
8.8.1.2 Changing Manager's Domain Name.....	719
8.8.1.3 Configuring Cross-Manager Mutual Trust Between Clusters.....	723

8.8.1.4 Assigning User Permissions After Cross-Cluster Mutual Trust Is Configured.....	725
8.8.2 Configuring Scheduled Backup of Alarm and Audit Information.....	726
8.8.3 Modifying the FusionInsight Manager Routing Table.....	727
8.8.4 Replacing the NTP Server for the Cluster.....	730
8.8.5 Switching to the Maintenance Mode.....	732
8.8.6 Routine Maintenance of Manager.....	734
8.9 Log Management.....	737
8.9.1 About Logs.....	737
8.9.2 Manager Log List.....	754
8.9.3 Configuring the Log Level and Log File Size.....	765
8.9.4 Configuring the Number of Local Audit Log Backups.....	767
8.9.5 Viewing Role Instance Logs.....	767
8.10 Backup and Recovery Management.....	768
8.10.1 Introduction.....	769
8.10.2 Backing Up Data.....	775
8.10.2.1 Backing Up Manager Data.....	775
8.10.2.2 Backing Up CDL Data.....	780
8.10.2.3 Backing Up ClickHouse Metadata.....	781
8.10.2.4 Backing Up ClickHouse Service Data.....	784
8.10.2.5 Backing Up DBService Data.....	787
8.10.2.6 Backing Up Flink Metadata.....	791
8.10.2.7 Backing Up HBase Metadata.....	794
8.10.2.8 Backing Up HBase Service Data.....	797
8.10.2.9 Backing Up NameNode Data.....	803
8.10.2.10 Backing Up HDFS Service Data.....	806
8.10.2.11 Backing Up Hive Service Data.....	811
8.10.2.12 Backing Up IoTDB Metadata.....	817
8.10.2.13 Backing Up IoTDB Service Data.....	820
8.10.2.14 Backing Up Kafka Metadata.....	823
8.10.3 Recovering Data.....	826
8.10.3.1 Restoring Manager Data.....	826
8.10.3.2 Restoring CDL Data.....	831
8.10.3.3 Restoring ClickHouse Metadata.....	833
8.10.3.4 Restoring ClickHouse Service Data.....	835
8.10.3.5 Restoring DBService data.....	838
8.10.3.6 Restoring Flink Metadata.....	841
8.10.3.7 Restoring HBase Metadata.....	844
8.10.3.8 Restoring HBase Service Data.....	847
8.10.3.9 Restoring NameNode Data.....	852
8.10.3.10 Restoring HDFS Service Data.....	856
8.10.3.11 Restoring Hive Service Data.....	860
8.10.3.12 Restoring IoTDB Metadata.....	864

8.10.3.13 Restoring IoTDB Service Data.....	867
8.10.3.14 Restoring Kafka Metadata.....	870
8.10.4 Enabling Cross-Cluster Replication.....	873
8.10.5 Managing Local Quick Restoration Tasks.....	874
8.10.6 Modifying a Backup Task.....	875
8.10.7 Viewing Backup and Restoration Tasks.....	876
8.10.8 How Do I Configure the Environment When I Create a ClickHouse Backup Task on FusionInsight Manager and Set the Path Type to RemoteHDFS?.....	877
8.11 Security Management.....	878
8.11.1 Security Overview.....	878
8.11.1.1 Right Model.....	879
8.11.1.2 Right Mechanism.....	880
8.11.1.3 Authentication Policies.....	881
8.11.1.4 Permission Verification Policies.....	883
8.11.1.5 User Account List.....	885
8.11.1.6 Default Permission Information.....	925
8.11.1.7 FusionInsight Manager Security Functions.....	928
8.11.2 Account Management.....	929
8.11.2.1 Account Security Settings.....	929
8.11.2.1.1 Unlocking LDAP Users and Management Accounts.....	929
8.11.2.1.2 Internal an Internal System User.....	930
8.11.2.1.3 Enabling and Disabling Permission Verification on Cluster Components.....	931
8.11.2.1.4 Logging In to a Non-Cluster Node Using a Cluster User in Normal Mode.....	934
8.11.2.2 Changing the Password for a System User.....	935
8.11.2.2.1 Changing the Password for User admin.....	935
8.11.2.2.2 Changing the Password for an OS User.....	936
8.11.2.3 Changing the Password for a System Internal User.....	937
8.11.2.3.1 Changing the Password for the Kerberos Administrator.....	937
8.11.2.3.2 Changing the Password for the OMS Kerberos Administrator.....	938
8.11.2.3.3 Changing the Passwords of the LDAP Administrator and the LDAP User (Including OMS LDAP).....	938
8.11.2.3.4 Changing the Password for the LDAP Administrator.....	940
8.11.2.3.5 Changing the Password for a Component Running User.....	941
8.11.2.4 Changing the Password for a Database User.....	943
8.11.2.4.1 Changing the Password of the OMS Database Administrator.....	943
8.11.2.4.2 Changing the Password for the Data Access User of the OMS Database.....	944
8.11.2.4.3 Changing the Password for a Component Database User.....	945
8.11.2.4.4 Resetting the Component Database User Password.....	946
8.11.2.4.5 Changing the Password for User omm in DBService.....	947
8.11.2.4.6 Changing the Password for User compdbuser of the DBService Database.....	947
8.11.2.5 Changing or Resetting the Password for User admin of Manager.....	948
8.11.3 Certificate Management.....	949
8.11.3.1 Replacing the CA Certificate.....	949

8.11.3.2 Replacing HA Certificates.....	952
8.11.4 Security Hardening.....	955
8.11.4.1 Hardening Policies.....	955
8.11.4.2 Configuring a Trusted IP Address to Access LDAP.....	956
8.11.4.3 HFile and WAL Encryption.....	959
8.11.4.4 Configuring Hadoop Security Parameters.....	965
8.11.4.5 Configuring an IP Address Whitelist for Modification Allowed by HBase.....	968
8.11.4.6 Updating a Key for a Cluster.....	969
8.11.4.7 Hardening the LDAP.....	970
8.11.4.8 Configuring Kafka Data Encryption During Transmission.....	971
8.11.4.9 Configuring HDFS Data Encryption During Transmission.....	972
8.11.4.10 Configuring Spark2x Data Encryption During Transmission.....	975
8.11.4.11 Configuring ZooKeeper SSL.....	976
8.11.4.12 Encrypting the Communication Between the Controller and the Agent.....	978
8.11.4.13 Updating SSH Keys for User omm.....	979
8.11.5 Security Maintenance.....	980
8.11.5.1 Account Maintenance Suggestions.....	980
8.11.5.2 Password Maintenance Suggestions.....	980
8.11.5.3 Log Maintenance Suggestions.....	981
8.11.6 Security Statement.....	981
9 MRS Manager Operation Guide (Available for 2.x and Earlier Versions).....	983
9.1 Introduction to MRS Manager.....	983
9.2 Checking Running Tasks.....	986
9.3 Monitoring Management.....	986
9.3.1 Dashboard.....	986
9.3.2 Managing Services and Monitoring Hosts.....	988

9.3.4 Configuring Monitoring Metric Dumping.....	994
9.4 Alarm Management.....	995
9.4.1 Viewing and Manually Clearing an Alarm.....	995
9.4.2 Configuring an Alarm Threshold.....	997
9.4.3 Configuring Syslog Northbound Interface Parameters.....	998
9.4.4 Configuring SNMP Northbound Interface Parameters.....	1001
9.5 Alarm Reference (Applicable to MRS 2.x and Earlier Versions).....	1003
9.5.1 ALM-12001 Audit Log Dump Failure (For MRS 2.x or Earlier).....	1003
9.5.2 ALM-12002 HA Resource Abnormal (For MRS 2.x or Earlier).....	1005
9.5.3 ALM-12004 OLdap Resource Abnormal (For MRS 2.x or Earlier).....	1007
9.5.4 ALM-12005 OKerberos Resource Abnormal (For MRS 2.x or Earlier).....	1009
9.5.5 ALM-12006 Node Fault (For MRS 2.x or Earlier).....	1010
9.5.6 ALM-12007 Process Fault (For MRS 2.x or Earlier).....	1012
9.5.7 ALM-12010 Manager Heartbeat Interruption Between the Active and Standby Nodes (For MRS 2.x or Earlier).....	1014

9.5.8 ALM-12011 Data Synchronization Exception Between the Active and Standby Manager Nodes (For MRS 2.x or Earlier).....	1015
9.5.9 ALM-12012 NTP Service Abnormal (For MRS 2.x or Earlier).....	1017
9.5.10 ALM-12014 Device Partition Lost (For MRS 2.x or Earlier).....	1020
9.5.11 ALM-12015 Device Partition File System Read-Only (For MRS 2.x or Earlier).....	1022
9.5.12 ALM-12016 CPU Usage Exceeds the Threshold (For MRS 2.x or Earlier).....	1023
9.5.13 ALM-12017 Insufficient Disk Capacity (For MRS 2.x or Earlier).....	1025
9.5.14 ALM-12018 Memory Usage Exceeds the Threshold (For MRS 2.x or Earlier).....	1027
9.5.15 ALM-12027 Host PID Usage Exceeds the Threshold (For MRS 2.x or Earlier).....	1029
9.5.16 ALM-12028 Number of Processes in the D State on the Host Exceeds the Threshold (For MRS 2.x or Earlier).....	1030
9.5.17 ALM-12031 User omm or Password Is About to Expire (For MRS 2.x or Earlier).....	1032
9.5.18 ALM-12032 User ommdba or Password Is About to Expire (For MRS 2.x or Earlier).....	1034
9.5.19 ALM-12033 Slow Disk Fault (For MRS 2.x or Earlier).....	1035
9.5.20 ALM-12034 Periodic Backup Failure (For MRS 2.x or Earlier).....	1042
9.5.21 ALM-12035 Unknown Data Status After Recovery Task Failure (For MRS 2.x or Earlier).....	1044
9.5.22 ALM-12037 NTP Server Abnormal (For MRS 2.x or Earlier).....	1046
9.5.23 ALM-12038 Monitoring Indicator Dump Failure (For MRS 2.x or Earlier).....	1048
9.5.24 ALM-12039 GaussDB Data Is Not Synchronized (For MRS 2.x or Earlier).....	1050
9.5.25 ALM-12040 Insufficient System Entropy (For MRS 2.x or Earlier).....	1052
9.5.26 ALM-12041 Permission of Key Files Is Abnormal (For MRS 2.x or Earlier).....	1054
9.5.27 ALM-12042 Key File Configurations Are Abnormal (For MRS 2.x or Earlier).....	1055
9.5.28 ALM-12043 DNS Parsing Duration Exceeds the Threshold (For MRS 2.x or Earlier).....	1057
9.5.29 ALM-12045 Read Packet Dropped Rate Exceeds the Threshold (For MRS 2.x or Earlier).....	1059
9.5.30 ALM-12046 Write Packet Dropped Rate Exceeds the Threshold (For MRS 2.x or Earlier).....	1064
9.5.31 ALM-12047 Read Packet Error Rate Exceeds the Threshold (For MRS 2.x or Earlier).....	1066
9.5.32 ALM-12048 Write Packet Error Rate Exceeds the Threshold (For MRS 2.x or Earlier).....	1067
9.5.33 ALM-12049 Read Throughput Rate Exceeds the Threshold (For MRS 2.x or Earlier).....	1069
9.5.34 ALM-12050 Write Throughput Rate Exceeds the Threshold (For MRS 2.x or Earlier).....	1071
9.5.35 ALM-12051 Disk Inode Usage Exceeds the Threshold (For MRS 2.x or Earlier).....	1073
9.5.36 ALM-12052 Usage of Temporary TCP Ports Exceeds the Threshold (For MRS 2.x or Earlier).....	1075
9.5.37 ALM-12053 File Handle Usage Exceeds the Threshold (For MRS 2.x or Earlier).....	1077
9.5.38 ALM-12054 Invalid Certificate File (For MRS 2.x or Earlier).....	1079
9.5.39 ALM-12055 Certificate File Is About to Expire (For MRS 2.x or Earlier).....	1082
9.5.40 ALM-12180 Disk Card I/O (For MRS 2.x or Earlier).....	1084
9.5.41 ALM-12357 Failed to Export Audit Logs to OBS (For MRS 2.x or Earlier).....	1087
9.5.42 ALM-13000 ZooKeeper Service Unavailable (For MRS 2.x or Earlier).....	1089
9.5.43 ALM-13001 Available ZooKeeper Connections Are Insufficient (For MRS 2.x or Earlier).....	1092
9.5.44 ALM-13002 ZooKeeper Memory Usage Exceeds the Threshold (For MRS 2.x or Earlier).....	1094
9.5.45 ALM-14000 HDFS Service Unavailable (For MRS 2.x or Earlier).....	1096
9.5.46 ALM-14001 HDFS Disk Usage Exceeds the Threshold (For MRS 2.x or Earlier).....	1097
9.5.47 ALM-14002 DataNode Disk Usage Exceeds the Threshold (For MRS 2.x or Earlier).....	1099
9.5.48 ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold (For MRS 2.x or Earlier).....	1101

9.5.49 ALM-14004 Number of Damaged HDFS Blocks Exceeds the Threshold (For MRS 2.x or Earlier)	1102
9.5.50 ALM-14006 Number of HDFS Files Exceeds the Threshold (For MRS 2.x or Earlier)	1104
9.5.51 ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold (For MRS 2.x or Earlier)	1105
9.5.52 ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold (For MRS 2.x or Earlier)	1107
9.5.53 ALM-14009 Number of Faulty DataNodes Exceeds the Threshold (For MRS 2.x or Earlier)	1108
9.5.54 ALM-14010 NameService Is Abnormal (For MRS 2.x or Earlier)	1110
9.5.55 ALM-14011 HDFS DataNode Data Directory Is Not Configured Properly (For MRS 2.x or Earlier)	1113
9.5.56 ALM-14012 HDFS Journalnode Data Is Not Synchronized (For MRS 2.x or Earlier)	1116
9.5.57 ALM-16000 Percentage of Sessions Connected to the HiveServer to the Maximum Number Allowed Exceeds the Threshold (For MRS 2.x or Earlier)	1118
9.5.58 ALM-16001 Hive Warehouse Space Usage Exceeds the Threshold (For MRS 2.x or Earlier)	1120
9.5.59 ALM-16002 Hive SQL Execution Success Rate Is Lower Than the Threshold (For MRS 2.x or Earlier)	1122
9.5.60 ALM-16004 Hive Service Unavailable (For MRS 2.x or Earlier)	1124
9.5.61 ALM-16005 Number of Failed Hive SQL Executions in the Last Period Exceeds the Threshold (For MRS 2.x or Earlier)	1128
9.5.62 ALM-18000 Yarn Service Unavailable (For MRS 2.x or Earlier)	1129
9.5.63 ALM-18002 NodeManager Heartbeat Lost (For MRS 2.x or Earlier)	1131
9.5.64 ALM-18003 NodeManager Unhealthy (For MRS 2.x or Earlier)	1132
9.5.65 ALM-18004 NodeManager Disk Usability Ratio Is Lower Than the Threshold (For MRS 2.x or Earlier)	1133
9.5.66 ALM-18006 MapReduce Job Execution Timeout (For MRS 2.x or Earlier)	1134
9.5.67 ALM-18008 Heap Memory Usage of Yarn ResourceManager Exceeds the Threshold (For MRS 2.x or Earlier)	1136
9.5.68 ALM-18009 Heap Memory Usage of MapReduce JobHistoryServer Exceeds the Threshold (For MRS 2.x or Earlier)	1138
9.5.69 ALM-18010 Number of Pending Yarn Tasks Exceeds the Threshold (For MRS 2.x or Earlier)	1140
9.5.70 ALM-18011 Memory of Pending Yarn Tasks Exceeds the Threshold (For MRS 2.x or Earlier)	1141
9.5.71 ALM-18012 Number of Terminated Yarn Tasks in the Last Period Exceeds the Threshold (For MRS 2.x or Earlier)	1143
9.5.72 ALM-18013 Number of Failed Yarn Tasks in the Last Period Exceeds the Threshold (For MRS 2.x or Earlier)	1144
9.5.73 ALM-19000 HBase Service Unavailable (For MRS 2.x or Earlier)	1145
9.5.74 ALM-19006 HBase Replication Sync Failed (For MRS 2.x or Earlier)	1146
9.5.75 ALM-19007 HBase Merge Queue Exceeds the Threshold (for 2.x and Earlier Versions)	1149
9.5.76 ALM-20002 Hue Service Unavailable (For MRS 2.x or Earlier)	1151
9.5.77 ALM-23001 Loader Service Unavailable (For MRS 2.x or Earlier)	1153
9.5.78 ALM-24000 Flume Service Unavailable (For MRS 2.x or Earlier)	1157
9.5.79 ALM-24001 Flume Agent Is Abnormal (For MRS 2.x or Earlier)	1158
9.5.80 ALM-24003 Flume Client Connection Interrupted (For MRS 2.x or Earlier)	1160
9.5.81 ALM-24004 Flume Fails to Read Data (For MRS 2.x or Earlier)	1162
9.5.82 ALM-24005 Data Transmission by Flume Is Abnormal (For MRS 2.x or Earlier)	1164
9.5.83 ALM-25000 LdapServer Service Unavailable (For MRS 2.x or Earlier)	1166
9.5.84 ALM-25004 Abnormal LdapServer Data Synchronization (For MRS 2.x or Earlier)	1168

9.5.85 ALM-25500 KrbServer Service Unavailable (For MRS 2.x or Earlier).....	1171
9.5.86 ALM-26051 Storm Service Unavailable (For MRS 2.x or Earlier).....	1173
9.5.87 ALM-26052 Number of Available Supervisors in Storm Is Lower Than the Threshold (For MRS 2.x or Earlier).....	1175
9.5.88 ALM-26053 Slot Usage of Storm Exceeds the Threshold (For MRS 2.x or Earlier).....	1176
9.5.89 ALM-26054 Heap Memory Usage of Storm Nimbus Exceeds the Threshold (For MRS 2.x or Earlier).....	1178
9.5.90 ALM-27001 DBService Unavailable (For MRS 2.x or Earlier).....	1180
9.5.91 ALM-27003 DBService Heartbeat Interruption Between the Active and Standby Nodes (For MRS 2.x or Earlier).....	1182
9.5.92 ALM-27004 Data Inconsistency Between Active and Standby DBServices (For MRS 2.x or Earlier).....	1184
9.5.93 ALM-28001 Spark Service Unavailable (For MRS 2.x or Earlier).....	1186
9.5.94 ALM-38000 Kafka Service Unavailable (For MRS 2.x or Earlier).....	1188
9.5.95 ALM-38001 Insufficient Kafka Disk Capacity (For MRS 2.x or Earlier).....	1190
9.5.96 ALM-38002 Heap Memory Usage of Kafka Exceeds the Threshold (For MRS 2.x or Earlier).....	1193
9.5.97 ALM-43001 Spark Service Unavailable (For MRS 2.x or Earlier).....	1194
9.5.98 ALM-43006 Heap Memory Usage of the JobHistory Process Exceeds the Threshold (For MRS 2.x or Earlier).....	1196
9.5.99 ALM-43007 Non-Heap Memory Usage of the JobHistory Process Exceeds the Threshold (For MRS 2.x or Earlier).....	1197
9.5.100 ALM-43008 Direct Memory Usage of the JobHistory Process Exceeds the Threshold (For MRS 2.x or Earlier).....	1199
9.5.101 ALM-43009 JobHistory GC Time Exceeds the Threshold (For MRS 2.x or Earlier).....	1200
9.5.102 ALM-43010 Heap Memory Usage of the JDBCServer Process Exceeds the Threshold (For MRS 2.x or Earlier).....	1202
9.5.103 ALM-43011 Non-Heap Memory Usage of the JDBCServer Process Exceeds the Threshold (For MRS 2.x or Earlier).....	1203
9.5.104 ALM-43012 Direct Memory Usage of the JDBCServer Process Exceeds the Threshold (For MRS 2.x or Earlier).....	1205
9.5.105 ALM-43013 JDBCServer GC Time Exceeds the Threshold (For MRS 2.x or Earlier).....	1206
9.5.106 ALM-44004 Presto Coordinator Resource Group Queuing Tasks Exceed the Threshold (For MRS 2.x or Earlier).....	1208
9.5.107 ALM-44005 Presto Coordinator Process GC Time Exceeds the Threshold (For MRS 2.x or Earlier).....	1209
9.5.108 ALM-44006 Presto Worker Process GC Time Exceeds the Threshold (For MRS 2.x or Earlier)....	1210
9.5.109 ALM-45325 Presto Service Unavailable (For MRS 2.x or Earlier).....	1212

1 Preparing a User

1.1 Configuring Cloud Service Permissions

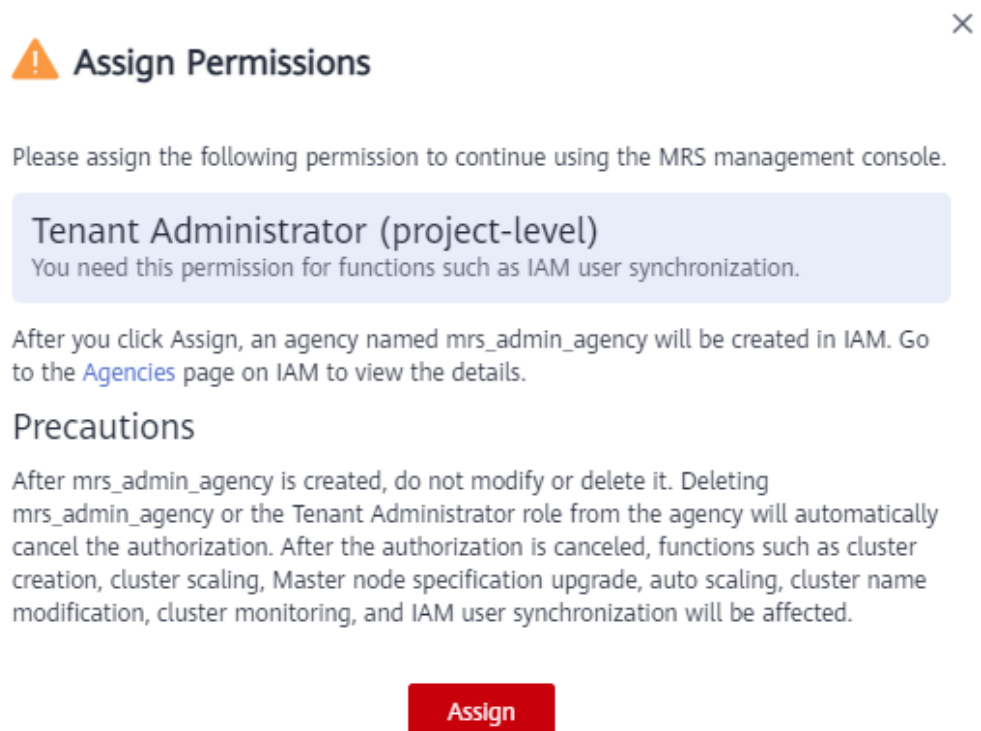

The MapReduce Service (MRS) console can interact with MRS clusters to provide related functions and monitor cluster status. Permission assignment is required when you use MRS for the first time.

After permission assignment, MRS creates an agency named **mrs_admin_agency** in Identity and Access Management (IAM). After the agency is created, do not modify or delete it. Deleting the agency or the Tenant Administrator role in the agency will automatically cancel the permission assignment. If permission assignment is canceled, functions such as cluster creation, cluster scale-in/out, Master node specification upgrade, auto scaling, cluster name modification, and IAM user synchronization will be affected, and the cluster running status cannot be monitored.

Procedure

- Step 1** Log in to the management console.
- Step 2** Choose **Analytics > MapReduce Service** in the service list. The **Assign Permissions** page is displayed.

Figure 1-1 Assigning permissions

Step 3 Click **Assign**.

After assignment is agreed, an agency named **mrs_admin_agency** will be created in IAM. Do not modify or delete the agency after it is created. After the agency is created, you can use MRS.

NOTE

After assignment, if the agency fails to be created, it is probably because the number of agencies already reaches the upper limit. In this case, log in to the IAM console and delete unnecessary agencies, or contact the administrator to increase the agency quota.

----End

1.2 Creating an MRS User

Use **IAM** to implement fine-grained permission control over your MRS. With IAM, you can:

- Create IAM users under your Huawei Cloud account for employees based on your enterprise's organizational structure so that each employee is allowed to access MRS resources using their unique security credential (IAM user).
- Grant only the permissions required for users to perform a specific task.
- Entrust a Huawei Cloud account or cloud service to perform efficient O&M on your MRS resources.

If your Huawei Cloud account does not require IAM users, skip this section.

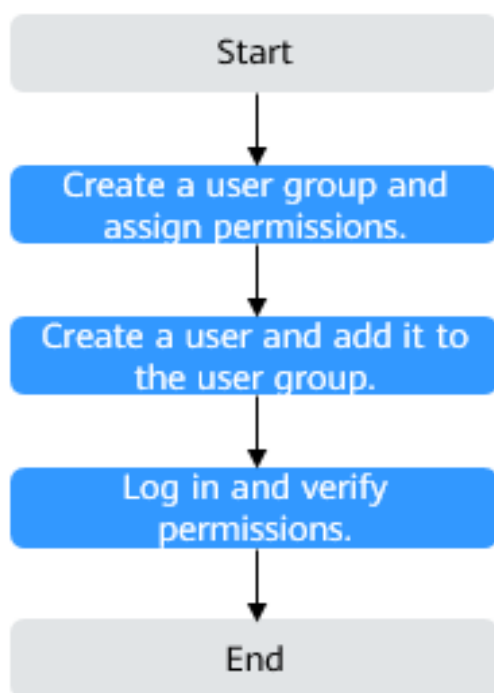

This section describes the procedure for granting permissions (see [Figure 1-2](#)).

Prerequisites

Learn about the permissions supported by MRS by referring to [Permission Management](#). For the permissions of other services, see [Permission Description](#).

Process Flow

Figure 1-2 Process for granting MRS permissions

1. **Creating a User Group and Assigning Permissions**
Create a user group on the IAM console, and assign MRS permissions to the group.
2. **Create a user and add it to a user group.**
Create a user on the IAM console and add the user to the group created in [1. Create a user group and assign permissions to it.](#)
3. **Log in** and verify permissions.
Log in to the console by using the user created, and verify that the user has the granted permissions.
 - Choose **Service List > Analytics > MapReduce Service**. Click **Buy Cluster** on the MRS console. If you fail to buy an MRS cluster (assume that you only have the **MRS ReadOnlyAccess** permission), the **MRS ReadOnlyAccess** policy has taken effect.
 - Choose any other service in **Service List**. If a message appears indicating that you have insufficient permissions to access the service, the **MRS ReadOnlyAccess** policy has already taken effect.

MRS Permission Description

By default, new IAM users do not have any permissions. To assign permissions to a user, add the user to one or more groups and assign permissions policies or roles to these groups. The user then inherits permissions from the groups it is a member of and can perform specified operations on cloud services based on the permissions.

MRS is a project-level service deployed and accessed in specific physical regions. To assign permissions to a user group, specify **Scope** as **Region-specific projects** and select projects in the corresponding region for the permissions to take effect. If **All projects** is selected, the permissions will take effect for the user group in all region-specific projects. When accessing MRS, the users need to switch to a region where they have been authorized to use the MRS service.

You can grant permissions by using roles and policies.

- **Roles:** A type of coarse-grained authorization mechanism that defines permissions related to user responsibilities. This mechanism provides only a limited number of service-level roles for authorization. When using roles to grant permissions, you need to also assign other roles on which the permissions depend to take effect. However, roles are not an ideal choice for fine-grained authorization and secure access control.
- **Policies:** A type of fine-grained authorization mechanism that defines permissions required to perform operations on specific cloud resources under certain conditions. This mechanism allows for more flexible policy-based authorization, meeting requirements for secure access control. For example, you can grant MRS users only the permissions for performing specified operations on MRS clusters, such as creating a cluster and querying a cluster list rather than deleting a cluster. Most policies define permissions based on APIs. For the API actions supported by MRS, see [Permissions Policies and Supported Actions](#).

[Table 1-1](#) lists all the default system policies supported by MRS.

Table 1-1 MRS system policies

Policy	Description	Type
MRS FullAccess	Administrator permissions for MRS. Users granted these permissions can operate and use all MRS resources.	Fine-grained policy
MRS CommonOperations	Common user permissions for MRS. Users granted these permissions can use MRS but cannot add or delete resources.	Fine-grained policy
MRS ReadOnlyAccess	Read-only permission for MRS. Users granted these permissions can only view MRS resources.	Fine-grained policy

Policy	Description	Type
MRS Administrator	Permissions: <ul style="list-style-type: none"> All operations on MRS Users with permissions of this policy must also be granted permissions of the Tenant Guest and Server Administrator policies. 	RBAC policy

Table 1-2 lists the common operations supported by each system-defined policy or role of MRS. Select the policies or roles as required.

Table 1-2 Common operations supported by each system-defined policy

Operation	MRS FullAccess	MRS CommonOperations	MRS ReadOnlyAccess	MRS Administrator
Creating a cluster	√	x	x	√
Resizing a cluster	√	x	x	√
Upgrading node specifications	√	x	x	√
Deleting a cluster	√	x	x	√
Querying cluster details	√	√	√	√
Querying a cluster list	√	√	√	√
Configuring an auto scaling rule	√	x	x	√
Querying a host list	√	√	√	√
Querying operation logs	√	√	√	√

Operation	MRS FullAccess	MRS CommonOperations	MRS ReadOnlyAccess	MRS Administrator
Creating and executing a job	√	√	x	√
Stopping a job	√	√	x	√
Deleting a single job	√	√	x	√
Deleting jobs in batches	√	√	x	√
Querying job details	√	√	√	√
Querying a job list	√	√	√	√
Creating a folder	√	√	x	√
Deleting a file	√	√	x	√
Querying a file list	√	√	√	√
Operating cluster tags in batches	√	√	x	√
Creating a single cluster tag	√	√	x	√
Deleting a single cluster tag	√	√	x	√
Querying a resource list by tag	√	√	√	√
Querying cluster tags	√	√	√	√
Accessing Manager	√	√	x	√

Operation	MRS FullAccess	MRS CommonOperations	MRS ReadOnlyAccess	MRS Administrator
Querying a patch list	√	√	√	√
Installing a patch	√	√	x	√
Uninstalling a patch	√	√	x	√
Authorizing O&M channels	√	√	x	√
Sharing O&M channel logs	√	√	x	√
Querying an alarm list	√	√	√	√
Subscribing to alarm notification	√	√	x	√
Submitting an SQL statement	√	√	x	√
Querying SQL results	√	√	x	√
Canceling an SQL execution task	√	√	x	√

1.3 Creating a Custom Policy

Custom policies can be created to supplement the system-defined policies of MRS. For the actions that can be added to custom policies, see [Permissions Policies and Supported Actions](#).

You can create custom policies in either of the following ways:

- Visual editor: Select cloud services, actions, resources, and request conditions. This does not require knowledge of policy syntax.

- JSON: Edit JSON policies from scratch or based on an existing policy.

For details, see [Creating a Custom Policy](#).

 **NOTE**

Custom policy modifications do not take effect immediately. You need to wait about 15 minutes.

The following section contains examples of common MRS custom policies.

Example Custom Policies

- Example 1: Allowing users to create MRS clusters only

```
{
  "Version": "1.1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "mrs:cluster:create",
        "ecs:*:*",
        "bms:*:*",
        "evs:*:*",
        "vpc:*:*",
        "smn:*:*"
      ]
    }
  ]
}
```

- Example 2: Allowing users to resize an MRS cluster

```
{
  "Version": "1.1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "mrs:cluster:resize"
      ]
    }
  ]
}
```

- Example 3: Allowing users to create a cluster, create and execute a job, and delete a single job, but denying cluster deletion

```
{
  "Version": "1.1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "mrs:cluster:create",
        "mrs:job:submit",
        "mrs:job:delete"
      ]
    },
    {
      "Effect": "Deny",
      "Action": [
        "mrs:cluster:delete"
      ]
    }
  ]
}
```

- Example 4: Allowing users to create an ECS cluster with the minimum permission

 NOTE

- If you need a key pair when creating a cluster, add the following permissions: **ecs:serverKeypairs:get** and **ecs:serverKeypairs:list**.
- Add the **kms:cmk:list** permission when encrypting data disks during cluster creation.
- Add the **mrs:alarm:subscribe** permission to enable the alarm function during cluster creation.
- Add the **rds:instance:list** permission to use external data sources during cluster creation.

```
{
  "Version": "1.1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "mrs:cluster:create"
      ]
    },
    {
      "Effect": "Allow",
      "Action": [
        "ecs:cloudServers:updateMetadata",
        "ecs:cloudServerFlavors:get",
        "ecs:cloudServerQuotas:get",
        "ecs:servers:list",
        "ecs:servers:get",
        "ecs:cloudServers:delete",
        "ecs:cloudServers:list",
        "ecs:serverInterfaces:get",
        "ecs:serverGroups:manage",
        "ecs:servers:setMetadata",
        "ecs:cloudServers:get",
        "ecs:cloudServers:create"
      ]
    },
    {
      "Effect": "Allow",
      "Action": [
        "vpc:securityGroups:create",
        "vpc:securityGroupRules:delete",
        "vpc:vpcs:create",
        "vpc:ports:create",
        "vpc:securityGroups:get",
        "vpc:subnets:create",
        "vpc:privateIps:delete",
        "vpc:quotas:list",
        "vpc:networks:get",
        "vpc:publicIps:list",
        "vpc:securityGroups:delete",
        "vpc:securityGroupRules:create",
        "vpc:privateIps:create",
        "vpc:ports:get",
        "vpc:ports:delete",
        "vpc:publicIps:update",
        "vpc:subnets:get",
        "vpc:publicIps:get",
        "vpc:ports:update",
        "vpc:vpcs:list"
      ]
    },
    {
      "Effect": "Allow",
      "Action": [

        "bms:serverFlavors:get"  
      ]  
    }  
  ]  
}
```

- Example 5: Allowing users to create a BMS cluster with the minimum permission

 NOTE

- If you need a key pair when creating a cluster, add the following permissions: **ecs:serverKeypairs:get** and **ecs:serverKeypairs:list**.
- Add the **kms:cmk:list** permission when encrypting data disks during cluster creation.
- Add the **mrs:alarm:subscribe** permission to enable the alarm function during cluster creation.
- Add the **rds:instance:list** permission to use external data sources during cluster creation.

```
{  
  "Version": "1.1",  
  "Statement": [  
    {  
      "Effect": "Allow",  
      "Action": [  
        "mrs:cluster:create"  
      ]  
    },  
    {  
      "Effect": "Allow",  
      "Action": [  
        "ecs:servers:list",  
        "ecs:servers:get",  
        "ecs:cloudServers:delete",  
        "ecs:serverInterfaces:get",  
        "ecs:serverGroups:manage",  
        "ecs:servers:setMetadata",  
        "ecs:cloudServers:create",  
        "ecs:cloudServerFlavors:get",  
        "ecs:cloudServerQuotas:get"  
      ]  
    },  
    {  
      "Effect": "Allow",  
      "Action": [  
        "vpc:securityGroups:create",  
        "vpc:securityGroupRules:delete",  
        "vpc:vpcs:create",  
        "vpc:ports:create",  
        "vpc:securityGroups:get",  
        "vpc:subnets:create",  
        "vpc:privateIps:delete",  
        "vpc:quotas:list",  
        "vpc:networks:get",  
        "vpc:publicIps:list",  
        "vpc:securityGroups:delete",  
        "vpc:securityGroupRules:create",  
        "vpc:privateIps:create",  
        "vpc:ports:get",  
        "vpc:ports:delete",  
        "vpc:publicIps:update",  
        "vpc:subnets:get",  
        "vpc:publicIps:get",  
      ]  
    }  
  ]  
}
```

```
        "vpc:ports:update",
        "vpc:vpcs:list"
    ]
  },
  {
    "Effect": "Allow",
    "Action": [
      "evs:quotas:get",
      "evs:types:get"
    ]
  },
  {
    "Effect": "Allow",
    "Action": [
      "bms:servers:get",
      "bms:servers:list",
      "bms:serverQuotas:get",
      "bms:servers:updateMetadata",
      "bms:serverFlavors:get"
    ]
  }
]
}
```

- Example 6: Allowing users to create a hybrid ECS and BMS cluster with the minimum permission

 NOTE

- If you need a key pair when creating a cluster, add the following permissions: **ecs:serverKeyPairs:get** and **ecs:serverKeyPairs:list**.
- Add the **kms:cmk:list** permission when encrypting data disks during cluster creation.
- Add the **mrs:alarm:subscribe** permission to enable the alarm function during cluster creation.
- Add the **rds:instance:list** permission to use external data sources during cluster creation.

```
{
  "Version": "1.1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "mrs:cluster:create"
      ]
    },
    {
      "Effect": "Allow",
      "Action": [
        "ecs:cloudServers:updateMetadata",
        "ecs:cloudServerFlavors:get",

        "bms:serverFlavors:get"
    ]
}
]
```

1.4 Synchronizing IAM Users to MRS

IAM user synchronization is to synchronize IAM users bound with MRS policies to the MRS system and create accounts with the same usernames but different passwords as the IAM users. Then, you can use an IAM username (the password needs to be reset by user **admin** of Manager) to log in to Manager for cluster management, and submit jobs on the GUI in a cluster with Kerberos authentication enabled.

Table 1-3 compares IAM users' permission policies and the synchronized users' permissions on MRS. For details about the default permissions on Manager, see [Default Permission Information](#).

Table 1-3 Policy and permission mapping after synchronization

Policy Type	IAM Policy	User's Default Permissions on MRS After Synchronization	Have Permission to Perform the Synchronization	Have Permission to Submit Jobs
Fine-grained	MRS ReadOnlyAccess	Manager_viewer	No	No
	MRS CommonOperations	<ul style="list-style-type: none"> • Manager_viewer • default • launcher-job 	No	Yes
	MRS FullAccess	<ul style="list-style-type: none"> • Manager_administrator • Manager_auditor • Manager_operator • Manager_tenant • Manager_viewer • System_administrator • default • launcher-job 	Yes	Yes

Policy Type	IAM Policy	User's Default Permissions on MRS After Synchronization	Have Permission to Perform the Synchronization	Have Permission to Submit Jobs
RBAC	MRS Administrator	<ul style="list-style-type: none"> • Manager_administrator • Manager_auditor • Manager_operator • Manager_tenant • Manager_viewer • System_administrator • default • launcher-job 	No	Yes
	Server Administrator, Tenant Guest, and MRS Administrator	<ul style="list-style-type: none"> • Manager_administrator • Manager_auditor • Manager_operator • Manager_tenant • Manager_viewer • System_administrator • default • launcher-job 	Yes	Yes

Policy Type	IAM Policy	User's Default Permissions on MRS After Synchronization	Have Permission to Perform the Synchronization	Have Permission to Submit Jobs
	Tenant Administrator	<ul style="list-style-type: none"> • Manager_administrator • Manager_auditor • Manager_operator • Manager_tenant • Manager_viewer • System_administrator • default • launcher-job 	Yes	Yes
Custom	Custom policy	<ul style="list-style-type: none"> • Manager_viewer • default • launcher-job 	<ul style="list-style-type: none"> • If custom policies use RBAC policies as a template, refer to the RBAC policies. • If custom policies use fine-grained policies as a template, refer to the fine-grained policies. The fine-grained policies are recommended. 	Yes

 NOTE

To facilitate user permission management, use fine-grained policies rather than RBAC policies. In fine-grained policies, the Deny action takes precedence over other actions.

- A user has permission to synchronize IAM users only when the user has the Tenant Administrator role or has the Server Administrator, Tenant Guest, and MRS Administrator roles at the same time.
- A user with the **action:mrs:cluster:syncUser** policy has permission to synchronize IAM users.

Procedure

- Step 1** Create a user and authorize the user to use MRS. For details, see [Creating an MRS User](#).
- Step 2** Log in to the MRS management console and create a cluster. For details, see [Buying a Custom Cluster](#).
- Step 3** In the navigation pane on the left, choose **Active Clusters**. Click a cluster name to go to the cluster details page.
- Step 4** On the **Dashboard** tab page, click **Synchronize** next to **IAM User Sync** to synchronize IAM users.
- Step 5** In the **IAM User Sync** dialog box, search for the user group to which the IAM user to be synchronized belongs and click the user group name. In the **User** column, select the desired IAM user and click **Synchronize**.

 NOTE

- You can select all users to synchronize them at a time.
 - If you select user groups only, users will not be synchronized. You must select specific user names in the user group.
 - All user groups are displayed. Those cannot be selected cannot be synchronized.
- Step 6** After a synchronization request is sent, choose **Operation Logs** in the navigation tree on the left of the MRS console to check whether the synchronization is successful. For details about the logs, see [Viewing MRS Operation Logs](#).
 - Step 7** After the synchronization is successful, use the user synchronized with IAM to perform subsequent operations.

 NOTE

- When the policy of the user group to which the IAM user belongs changes from **MRS ReadOnlyAccess** to **MRS CommonOperations**, **MRS FullAccess**, or **MRS Administrator**, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from **MRS CommonOperations**, **MRS FullAccess**, or **MRS Administrator** to **MRS ReadOnlyAccess**, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.
- After you click **Synchronize** on the right side of **IAM User Sync**, the cluster details page is blank for a short time, because user data is being synchronized. The page will be properly displayed after the data synchronization is complete.

- Submitting jobs in a security cluster: Users can submit jobs using the job management function on the GUI in the security cluster. For details, see [Running a MapReduce Job](#).
- All tabs are displayed on the cluster details page, including **Components**, **Tenants**, and **Backups & Restorations**.
- Logging in to Manager
 - a. Log in to Manager as user **admin**. For details, see [Accessing Manager](#).
 - b. Initialize the password of the user synchronized with IAM. For details, see [Initializing the Password of a System User](#).
 - c. Modify the role bound to the user group to which the user belongs to control user permissions on Manager. For details, see [Related Tasks](#). For details about how to create and modify a role, see [Creating a Role](#). After the component role bound to the user group to which the user belongs is modified, it takes some time for the role permissions to take effect.
 - d. Log in to Manager using the user synchronized with IAM and the password after the initialization in [Step 7.b](#).

 **NOTE**

If the IAM user's permission changes, go to [Step 4](#) to perform second synchronization. After the second synchronization, a system user's permissions are the union of the permissions defined in the IAM system policy and the permissions of roles added by the system user on Manager. After the second synchronization, a custom user's permissions are subject to the permissions configured on Manager.

- System user: If all user groups to which an IAM user belongs are bound to system policies (RABC policies and fine-grained policies belong to system policies), the IAM user is a system user.
- Custom user: If the user group to which an IAM user belongs is bound to any custom policy, the IAM user is a custom user.

Step 8 Undo IAM user synchronization.

To undo the synchronization of an IAM user, select the user in the **User** column in the **Synchronized** tab and click **Undo Sync**.

To undo the synchronization of all users in an IAM user group, select the user group in the **User Group** column in the **Synchronized** tab and click **Undo Sync**.

----End

2 Configuring a Cluster

2.1 How to Buy an MRS Cluster

This section describes how to buy an MRS cluster.

- **Quickly Buying a Hadoop Analysis Cluster:** In the **Quick Config** tab, you can quickly configure parameters to buy a Hadoop analysis cluster within a few minutes, facilitating analysis and queries of vast amounts of data.
- **Quickly Buying an HBase Query Cluster:** In the **Quick Config** tab, you can quickly configure parameters to buy an HBase query cluster within a few minutes, facilitating storage and distributed computing of vast amounts of data.
- **Quickly Buying a Kafka Streaming Cluster:** In the **Quick Config** tab, you can quickly configure parameters to buy a Kafka streaming cluster within a few minutes, facilitating streaming data ingestion as well as real-time data processing and storage.
- **Quickly Buying a ClickHouse Cluster:** You can quickly buy a ClickHouse cluster. ClickHouse is a columnar database management system used for online analysis. It features optimal compression rate and fast query performance.
- **Quickly Buying a Real-time Analysis Cluster:** You can buy a real-time analysis cluster within a few minutes to quickly collect, analyze, and query a large amount of data.
- **Buying a Custom Cluster:** On the **Custom Config** tab page, you can flexibly configure parameters to buy clusters based on application scenarios, such as the billing mode and ECS specifications to better suit your service requirements.

If you have registered with Huawei Cloud, log in to the management console and access your MRS. If you do not have an account, register one with Huawei Cloud. After the registration, your account can be used to access all public cloud services, including your MRS.

Registering with Huawei Cloud

If you already have a Huawei Cloud account, skip this part. If you do not have a Huawei Cloud account, perform the following operations to create an account:

Step 1 Visit [Huawei Cloud](#).

Step 2 Click **Register** and complete the registration as instructed.

After you have successfully registered, the system automatically redirects you to your personal information page.

----End

2.2 Quick Configuration

2.2.1 Quickly Buying a Hadoop Analysis Cluster

This section describes how to quickly buy a Hadoop analysis cluster for analysis and query of vast amounts of data. In the open source Hadoop ecosystem, Hadoop uses YARN to manage cluster resources, Hive and Spark to provide offline storage and computing of large-scale distributed data, Spark Streaming and Flink to offer streaming data computing, and Presto to enable interactive queries, Tez to provide a distributed computing framework of directed acyclic graphs (DAGs).

The Hadoop analysis cluster consists of the following components:

- MRS 1.9.2: Hadoop 2.8.3, Spark 2.2.2, Hive 2.3.3, Presto 0.216, Tez 0.9.1, Ranger 1.0.1, and Flink 1.7.0.
- MRS 3.1.0: Hadoop 3.1.1, Hive 3.1.0, Spark2x 2.4.5, Flink 1.12.0, ZooKeeper 3.5.6, Ranger 2.0.0, Tez 0.9.2, and Presto 333.
- MRS 3.1.2-LTS.3: Hadoop 3.1.1, Hive 3.1.0, Spark2x 3.1.1, Flink 1.12.2, ZooKeeper 3.6.3, Ranger 2.0.0, and Tez 0.9.2.
- MRS 3.1.5: Hadoop 3.1.1, Hive 3.1.0, Spark2x 3.1.1, Tez 0.9.2, Flink 1.12.2, ZooKeeper 3.6.3, Ranger 2.0.0, and Presto 333.

Quickly Buying a Hadoop Analysis Cluster

Step 1 Go to the [Buy Cluster](#) page.

Step 2 On the displayed page, click the **Quick Config** tab.

Step 3 Configure basic cluster information. For details about the parameters, see [Buying a Custom Cluster](#).

- **Region:** Use the default value.
- **Billing Mode: Pay-per-use.** If you select this mode, a prepaid balance will be frozen. For details, see [Billing Description](#).
- **Cluster Name:** You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, for example, **mrs_20180321**.
- **Cluster Type:** Use the default value.

- **Version Type: Normal** is selected by default. (Components vary depending on the version type. Select a version type as needed.)
- **Cluster Version:** Select the latest version, which is the default value. (The components provided by a cluster vary according to the cluster version. Select a cluster version based on site requirements.)
- **Component:** Select **Hadoop analysis cluster**.
- **AZ:** Use the default value.
- **Enterprise Project:** Retain the default value.
- **VPC:** Use the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
- **Subnet:** Use the default value.
- **CPU Architecture:** Use the default value.
- **Cluster Node:** Select the number of cluster nodes and node specifications based on site requirements. For MRS 3.x or later, the memory of the master node must be greater than 64 GB.
- **Kerberos Authentication:** Whether to enable Kerberos authentication. This option cannot be changed after you buy a cluster.
- **Username:** The default value is **root/admin**. User **root** is used to remotely log in to ECSs, and user **admin** is used to access the cluster management page.
- **Password:** Set a password for user **root/admin**.
- **Confirm Password:** Enter the password of user **root/admin** again.

Figure 2-1 Hadoop Analysis Cluster

The screenshot displays the configuration page for a Hadoop Analysis Cluster. Key elements include:

- Region:** A dropdown menu with a globe icon.
- Billing Mode:** Two buttons: 'Yearly/Monthly' and 'Pay-per-use' (selected).
- Cluster Name:** A text input field.
- Cluster Type:** A dropdown menu with 'Custom' selected.
- Custom Cluster:** A light blue box containing three bullet points:
 - A wide range of components in this type are provided.
 - You can deploy management roles and control roles separately, on the same nodes, or together with data roles.
 - You are advised not to deploy multiple data storage services in the same node group to avoid resource contention.
- Version Type:** Two buttons: 'LTS' (selected) and 'Normal'.
- Cluster Version:** A dropdown menu.
- Component:** A grid of four cluster options:
 - Real-time Analysis Cluster:** Hadoop 3.3.1, Flink 1.15.0, Kafka 2.11-2.4.0, ZooKeeper 3.6.3, Ranger 2.0.0 and ClickHouse 22.3.2.2. Description: Massive data collection, real-time data analysis and query.
 - ClickHouse Cluster:** ZooKeeper 3.6.3 and ClickHouse 22.3.2.2. Description: A Column Database Management System (DBMS...).
 - Hadoop Analysis Cluster:** Hadoop 3.3.1, Hive 3.1.0, Spark2x 3.1.1, Flink 1.15.0, ZooKeeper 3.6.3, Ranger 2.0.0 and Tez 0.9.2. Description: Analysis and query of vast amounts of data.
 - HBase Query Cluster:** Hadoop 3.3.1, HBase 2.2.3, ZooKeeper 3.6.3 and Ranger 2.0.0. Description: Massive data storage and millisecond-level data queries.

Figure 2-2 Cluster node configurations

Cluster Node

Node Group: master_node_default_group

Node Type: Master

Billing Mode: Pay-per-use

Node Count: 3

Instance Specifications: General computing-plus 16 vCPUs | 64 GB | ac7.4xlarge.4

System Disk: Ultra-high I/O | 100 GB x 1

Data Disk: Ultra-high I/O | 200 GB x 1

Node Group: node_group_1

Node Type: Core

Billing Mode: Pay-per-use

Node Count: 3

Instance Specifications: General computing-plus 16 vCPUs | 64 GB | ac7.4xlarge.4

System Disk: Ultra-high I/O | 100 GB x 1

Data Disk: Ultra-high I/O | 200 GB x 1

Kerberos Authentication: The Presto component does not support Kerberos authentication.

Username: adminroot
The admin user is for logging in to the cluster management page, and the root user is for remotely logging in to an ECS or RDS.

Password:

Confirm Password:

Step 4 Select the checkbox to enable secure communications. For details, see [Communication Security Authorization](#).

Step 5 Click **Buy Now**.

If Kerberos authentication is enabled, check whether this function is required. If it is, click **Continue**. If not, click **Back** to disable it and then proceed with the subsequent step. This option cannot be changed after you buy a cluster.

NOTE

For any doubt about the pricing, click **Pricing details** in the lower left corner.

Step 6 Click **Back to Cluster List** to view the cluster status. Click **Access Cluster** to view cluster details.

For details about cluster status during creation, see the description of the status parameters in [Table 3-4](#).

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

On the MRS management console, a maximum of 10 clusters can be concurrently created, and a maximum of 100 clusters can be managed.

----End

2.2.2 Quickly Buying an HBase Query Cluster

This section describes how to quickly buy an HBase query cluster. The HBase cluster uses Hadoop and HBase components to provide a column-oriented distributed cloud storage system featuring enhanced reliability, excellent performance, and elastic scalability. It applies to the storage and distributed computing of massive amounts of data. You can use HBase to build a storage system capable of storing TB- or even PB-level data. With HBase, you can filter and analyze data with ease and get responses in milliseconds, rapidly mining data value.

The HBase analysis cluster consists of the following components:

- MRS 1.9.2: Hadoop 2.8.3, HBase 1.3.1, and Ranger 1.0.1.

- MRS 3.1.0: Hadoop 3.1.1, HBase 2.2.3, ZooKeeper 3.5.6, and Ranger 2.0.0.
- MRS 3.1.2-LTS.3: Hadoop 3.1.1, HBase 2.2.3, ZooKeeper 3.6.3, and Ranger 2.0.0.
- MRS 3.1.5: Hadoop 3.1.1, HBase 2.2.3, ZooKeeper 3.6.3, and Ranger 2.0.0.
- MRS 3.2.0-LTS.1: Hadoop 3.1.1, HBase 2.2.3, ZooKeeper 3.6.3, and Ranger 2.0.0.

Quickly Buying an HBase Query Cluster

Step 1 Go to the [Buy Cluster](#) page.

Step 2 On the displayed page, click the **Quick Config** tab.

Step 3 Configure basic cluster information. For details about the parameters, see [Buying a Custom Cluster](#).

- **Region:** Use the default value.
- **Billing Mode: Pay-per-use.** If you select this mode, a prepaid balance will be frozen. For details, see [Billing Description](#).
- **Cluster Name:** You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, for example, **mrs_20180321**.
- **Cluster Type:** Use the default value.
- **Version Type: Normal** is selected by default. (Components vary depending on the version type. Select a version type as needed.)
- **Cluster Version:** Select the latest version, which is the default value. (The components provided by a cluster vary according to the cluster version. Select a cluster version based on site requirements.)
- **Component:** Select **HBase Query Cluster**.
- **AZ:** Use the default value.
- **Enterprise Project:** Retain the default value.
- **VPC:** Use the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
- **Subnet:** Use the default value.
- **Enterprise Project:** Select the default project.
- **Cluster Node:** Select the number of cluster nodes and node specifications based on site requirements. For MRS 3.x or later, the memory of the master node must be greater than 64 GB.
- **Kerberos Authentication:** Whether to enable Kerberos authentication. This option cannot be changed after you buy a cluster.
- **Username:** The default value is **root/admin**. User **root** is used to remotely log in to ECSs and user **admin** is used to access FusionInsight Manager.
- **Password:** Set a password for user **root/admin**.
- **Confirm Password:** Enter the password of user **root/admin** again.

Kerberos Authentication

Username: admin/root
The admin user is for logging in to the cluster management page, and the root user is for remotely logging in to an ECS or BMS.

Password:

Confirm Password:

Step 4 Select the checkbox to enable secure communications. For details, see [Communication Security Authorization](#).

Step 5 Click **Buy Now**.

If Kerberos authentication is enabled, check whether this function is required. If it is, click **Continue**. If not, click **Back** to disable it and then proceed with the subsequent step. This option cannot be changed after you buy a cluster.

NOTE

For any doubt about the pricing, click **Pricing details** in the lower left corner.

Step 6 Click **Back to Cluster List** to view the cluster status. Click **Access Cluster** to view cluster details.

For details about cluster status during creation, see the description of the status parameters in [Table 3-4](#).

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

On the MRS management console, a maximum of 10 clusters can be concurrently created, and a maximum of 100 clusters can be managed.

----End

2.2.3 Quickly Buying a Kafka Streaming Cluster

This section describes how to quickly buy a Kafka streaming cluster. The Kafka cluster uses the Kafka and Storm components to provide an open source messaging system with high throughput and scalability. It is widely used in scenarios such as log collection and monitoring data aggregation to implement efficient streaming data collection and real-time data processing and storage.

The Kafka streaming cluster consists of the following components:

- MRS 1.9.2: Kafka 1.1.0 and Storm 1.2.1

Quickly Buying a Kafka Streaming Cluster

Step 1 Go to the [Buy Cluster](#) page.

Step 2 On the displayed page, click the **Quick Config** tab.

Step 3 Configure basic cluster information. For details about the parameters, see [Buying a Custom Cluster](#).

- **Region:** Use the default value.
- **Billing Mode: Pay-per-use.** If you select this mode, a prepaid balance will be frozen. For details, see [Billing Description](#).
- **Cluster Name:** You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, for example, **mrs_20200321**.
- **Cluster Type:** Select **Streaming cluster**.
- **Version Type:** Select **Normal**.
- **Cluster Version:** Select a cluster version as you need.
- **Component:** Select **Kafka streaming cluster**.
- **AZ:** Use the default value.
- **Enterprise Project:** Retain the default value.
- **VPC:** Use the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
- **Subnet:** Use the default value.
- **CPU Architecture:** Use the default value. This parameter is unavailable in MRS 3.x.
- **Cluster Node:** Select the number of cluster nodes and node specifications based on site requirements. For MRS 3.x or later, the memory of the master node must be greater than 64 GB.
- **LVM:** Use the default value. This parameter is not available in MRS 3.x.

- **Kerberos Authentication:** Whether to enable Kerberos authentication. This option cannot be changed after you buy a cluster.
- **Username:** The default value is **root/admin**. User **root** is used to remotely log in to ECSs, and user **admin** is used to access the cluster management page.
- **Password:** Set a password for user **root/admin**.
- **Confirm Password:** Enter the password of user **root/admin** again.

2.2.4 Quickly Buying a ClickHouse Cluster

This section describes how to quickly buy a ClickHouse cluster. ClickHouse is a columnar database management system used for online analysis. It features optimal compression rate and fast query performance. It is widely used in Internet advertisement, app and web traffic analysis, telecom, finance, and IoT fields.

The ClickHouse cluster consists of the following components:

- MRS 3.1.0: ClickHouse 21.3.4.25 and ZooKeeper 3.5.6.
- MRS 3.1.2-LTS.3: .
- MRS 3.1.5: ClickHouse 21.3.4.25 and ZooKeeper 3.6.3.
- MRS 3.2.0-LTS.1: ClickHouse 22.3.2.2 and ZooKeeper 3.6.3.

The ClickHouse cluster table engine that uses Kunpeng as the CPU architecture does not support HDFS and Kafka.

Quickly Buying a ClickHouse Cluster

Step 1 Go to the [Buy Cluster](#) page.

Step 2 On the displayed page, click the **Quick Config** tab.

Step 3 Configure basic cluster information. For details about the parameters, see [Buying a Custom Cluster](#).

- **Region:** Use the default value.
- **Billing Mode: Pay-per-use.** If you select this mode, a prepaid balance will be frozen. For details, see [Billing Description](#).
- **Cluster Name:** You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, Example: **mrs_20201121**.

- **Cluster Type:** Use the default value.
- **Version Type:** **Normal** is selected by default. (Components vary depending on the version type. Select a version type as needed.)
- **Cluster Version:** Select the latest version, which is the default value. (The components provided by a cluster vary according to the cluster version. Select a cluster version based on site requirements.)
- **Component:** Select **ClickHouse cluster**.
- **AZ:** Use the default value.
- **Enterprise Project:** Retain the default value.
- **VPC:** Use the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
- **Subnet:** Use the default value.
- **CPU Architecture:** Retain the default value.
- **Cluster Node:** Select the number of cluster nodes and node specifications based on site requirements. For MRS 3.x or later, the memory of the master node must be greater than 64 GB.
- **Kerberos Authentication:** Whether to enable Kerberos authentication. This option cannot be changed after you buy a cluster.
- **Username:** The default value is **root/admin**. User **root** is used to remotely log in to ECSs and user **admin** is used to access FusionInsight Manager.
- **Password:** Set a password for user **root/admin**.
- **Confirm Password:** Enter the password of user **root/admin** again.

2.2.5 Quickly Buying a Real-time Analysis Cluster

This section describes how to quickly buy a real-time analysis cluster. The real-time analysis cluster uses Hadoop, Kafka, Flink, and ClickHouse to collect, analyze, and query a large amount of data in real time.

The real-time analysis cluster consists of the following components:

- MRS 3.1.0: Hadoop 3.1.1, Kafka 2.11-2.4.0, Flink 1.12.0, ClickHouse 21.3.4.25, ZooKeeper 3.5.6, and Ranger 2.0.0.
- MRS 3.1.2-LTS.3: Hadoop 3.1.1, Kafka 2.11-2.4.0, Flink 1.12.2, ClickHouse 21.3.4.25, ZooKeeper 3.6.3, and Ranger 2.0.0.
- MRS 3.1.5: Hadoop 3.1.1, Kafka 2.11-2.4.0, Flink 1.12.2, ClickHouse 21.3.4.25, ZooKeeper 3.6.3, and Ranger 2.0.0.

- MRS 3.2.0-LTS.1: Hadoop 3.1.1, Kafka 2.11-2.4.0, Flink 1.15.0, ClickHouse 22.3.2.2, ZooKeeper 3.6.3, and Ranger 2.0.0.

Quickly Buying a Real-time Analysis Cluster

Step 1 Go to the [Buy Cluster](#) page.

Step 2 On the displayed page, click the **Quick Config** tab.

Step 3 Configure basic cluster information. For details about the parameters, see [Buying a Custom Cluster](#).

- **Region:** Use the default value.
- **Billing Mode: Pay-per-use.** If you select this mode, a prepaid balance will be frozen. For details, see [Billing Description](#).
- **Cluster Name:** You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, Example: **mrs_20201130**.
- **Cluster Type:** Use the default value.
- **Version Type: Normal** is selected by default. (Components vary depending on the version type. Select a version type as needed.)
- **Cluster Version:** Select the latest version, which is the default value. (The components provided by a cluster vary according to the cluster version. Select a cluster version based on site requirements.)
- **Component:** Select **Real-time Analysis Cluster**.
- **AZ:** Use the default value.
- **VPC:** Use the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
- **Subnet:** Use the default value.
- **Enterprise Project:** Use the default value.
- **CPU Architecture:** Retain the default value.
- **Cluster Node:** Select the number of cluster nodes and node specifications based on site requirements. For MRS 3.x or later, the memory of the master node must be greater than 64 GB.
- **Kerberos Authentication:** Whether to enable Kerberos authentication. This option cannot be changed after you buy a cluster.
- **Username:** The default value is **root/admin**. User **root** is used to remotely log in to ECSs and user **admin** is used to access FusionInsight Manager.
- **Password:** Set a password for user **root/admin**.
- **Confirm Password:** Enter the password of user **root/admin** again.

Figure 2-9 Real-time analysis cluster

Figure 2-10 Cluster node configurations

Step 4 Select the checkbox to enable secure communications. For details, see [Communication Security Authorization](#).

Step 5 Click **Buy Now**.

If Kerberos authentication is enabled, check whether this function is required. If it is, click **Continue**. If not, click **Back** to disable it and then proceed with the subsequent step. This option cannot be changed after you buy a cluster.

NOTE

For any doubt about the pricing, click **Pricing details** in the lower left corner.

Step 6 Click **Back to Cluster List** to view the cluster status. Click **Access Cluster** to view cluster details.

For details about cluster status during creation, see the description of the status parameters in [Table 3-4](#).

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

On the MRS management console, a maximum of 10 clusters can be concurrently created, and a maximum of 100 clusters can be managed.

----End

2.3 Buying a Custom Cluster

To use MRS, buy a cluster on the MRS management console.

You can create an IAM user or user group on the IAM management console and grant it specific operation permissions, to perform refined resource management after registering an account. For details, see [Creating an MRS User](#).

Video Tutorial

This tutorial demonstrates how to create an MRS 3.1.0 cluster on the management console and configure software, hardware, and advanced settings.

NOTE

The UI may vary depending on the version. This tutorial is for reference only.

Procedure

Step 1 Go to the [Buy Cluster](#) page.

Step 2 Click the **Custom Config** tab.

NOTE

When creating a cluster, pay attention to quota notification. If a resource quota is insufficient, increase the resource quota as prompted and create a cluster.

Step 3 Configure cluster information by referring to [Software Configurations](#) and click **Next**.

--	--

To add a task node group in the current MRS cluster for auto scaling, perform the following operations:

Add an analysis task node group.

- For a cluster whose **Cluster Type** is **Analysis cluster** or **Hybrid cluster**:
The system automatically adds the analysis task node group **task_node_analysis_group**. Set the number of nodes, instance specifications, and node disk configurations as needed.
If the analysis task node group is not required, you can manually delete it.
- For a cluster whose **Cluster Type** is **Custom**:
 - a. In the cluster node configuration area, click **Add Node Group** to manually add a node group.
 - b. Set **Topology Adjustment** to **Enable**.
 - c. Manually select the role topology so that the node group contains only the NodeManager (NM) role.

You can also manually add a task node group after the cluster is created. For details, see [Adding a Task Node](#).

Add a streaming task node group (supported only by MRS 1.9.2):

For a cluster whose **Cluster Type** is **Streaming cluster** or **Hybrid cluster**:

The system automatically adds the streaming task node group **task_node_streaming_group**. Set the number of nodes, instance specifications, and node disk configurations as needed.

If the streaming task node group is not required, you can manually delete it.

Step 5 Set advanced options by referring to [Advanced Options](#) Then, click **Next**.

Step 6 On the **Confirm Configuration** page, check the cluster configuration information. If you need to adjust the configuration, click  to go to the corresponding tab page and configure parameters again.

Step 7 Select the checkbox to enable secure communications. For details, see [Communication Security Authorization](#).

Step 8 Click **Buy Now**.

If Kerberos authentication is enabled, check whether this function is required. If it is, click **Continue**. If not, click **Back** to disable it and then proceed with the subsequent step. This option cannot be changed after you buy a cluster.

 **NOTE**

For any doubt about the pricing, click **Pricing details** in the lower left corner.

If you select the pay-per-use billing mode, the order may fail to be placed because the account may be in risk. In this case, contact technical support.

Step 9 Click **Back to Cluster List** to view the cluster status.

For details about cluster status during creation, see the description of the status parameters in [Table 3-4](#).

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

On the MRS management console, a maximum of 10 clusters can be concurrently created, and a maximum of 100 clusters can be managed.

----End

Software Configurations

Table 2-1 MRS cluster software configuration

Parameter	Description
Region	Select a region . Cloud service products in different regions cannot communicate with each other over an intranet. For low network latency and quick access, select the nearest region.
Billing Mode	MRS provides two billing modes. <ul style="list-style-type: none">• Yearly/Monthly• Pay-per-use A prepaid balance will be frozen. For details, see Billing .
Required Duration	This parameter is valid in Yearly/Monthly billing mode and indicates a cluster subscription duration. The minimum cluster duration is 1 month and the maximum available cluster duration is 1 year. If Auto-renew is selected, monthly subscriptions are automatically renewed every month and yearly subscriptions are automatically renewed every year.
Cluster Name	The cluster name must be unique. A cluster name can contain 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. The default name is mrs_XXXX . XXXX is a random collection of letters and digits.

Parameter	Description
Cluster Type	<p>The cluster types are as follows:</p> <ul style="list-style-type: none"> • Analysis cluster: is used for offline data analysis and provides Hadoop components. • Streaming cluster: is used for streaming tasks and provides stream processing components. • Hybrid cluster: is used for both offline data analysis and streaming processing and provides Hadoop components and streaming processing components. You are advised to use a hybrid cluster to perform offline data analysis and streaming processing tasks at the same time. • Custom: You can adjust the cluster service deployment mode based on service requirements. For details, see Configuring Custom Topology. (This type is currently available only in MRS 3.x.) <p>NOTE</p> <ul style="list-style-type: none"> • MRS streaming clusters do not support job and file management functions. • To install all components in a cluster, select Custom.
Version Type	<p>The following version types are available:</p> <ul style="list-style-type: none"> • Normal: <ul style="list-style-type: none"> - Supports basic cluster operations, such as configuration, management, and O&M. - Supports components such as Presto, Impala, Kudu, and Sqoop. • LTS: <ul style="list-style-type: none"> - In addition to basic cluster operations, the LTS version supports version upgrade. - Supports multi-AZ deployment. - Supports HetuEngine, IoTDB, and CDL. <p>The default version type is Normal.</p>
Cluster Version	<p>Currently, MRS 1.9.2, 3.1.0, 3.1.5, 3.2.0-LTS.1, and 3.1.2-LTS.3, and are supported. The latest version of MRS is used by default.</p>
Component	<p>MRS cluster components. For details about component versions supported by different versions of MRS clusters, see List of MRS Component Versions.</p>

Parameter	Description
Metadata	<p>Whether to use external data sources to store metadata.</p> <ul style="list-style-type: none">• Local: Metadata is stored in the local cluster.• External data connection: Metadata of external data sources is used. If the cluster is abnormal or deleted, metadata is not affected. This mode applies to scenarios where storage and compute are decoupled. <p>Clusters that support the Hive or Ranger component support this function.</p>
Component	<p>This parameter is available only when Metadata is set to External data connection. It indicates the type of an external data source.</p> <ul style="list-style-type: none">• Hive• Ranger
Data Connection Type	<p>This parameter is available only when Metadata is set to External data connection. It indicates the type of an external data source. When you create a cluster, Data Connection Type can only be set to Local database.</p>
Component port (supported only for the LTS version)	<p>Policy of the default communication port of each component in the MRS cluster.</p> <ul style="list-style-type: none">• Open source: Use the port provided by the open source component.• Custom: Customize a port for the component. <p>For details about the differences between default open source port and default custom port, see Web UIs of Open Source Components.</p>

Hardware Configurations

Table 2-2 MRS cluster hardware configuration

Parameter	Description
AZ	<p>Select the AZ associated with the region of the cluster.</p> <p>An AZ is a physical area that uses independent power and network resources. AZs are physically isolated but interconnected through the internal network. This improves the availability of applications. You are advised to create clusters in different AZs.</p>

Parameter	Description
Enterprise Project	<p>Select the enterprise project to which the cluster belongs. To use an enterprise project, create one on the Enterprise > Project Management page.</p> <p>The Enterprise Management console of the enterprise project is designed for resource management. It helps enterprises manage cloud-based personnel, resources, permissions, and finance in a hierarchical manner, such as management of companies, departments, and projects.</p>
VPC	<p>A VPC is a secure, isolated, and logical network environment.</p> <p>Select the VPC for which you want to create a cluster and click View VPC to view the name and ID of the VPC. If no VPC is available, create one.</p>
Subnet	<p>A subnet provides dedicated network resources that are isolated from other networks, improving network security.</p> <p>Select the subnet for which you want to create a cluster. Click View Subnet to view details about the selected subnet. If no subnet is created in the VPC, go to the VPC console and choose Subnets > Create Subnet to create one. For details about how to configure network ACL outbound rules, see How Do I Configure a Network ACL Outbound Rule?</p> <p>NOTE</p> <p>The number of IP addresses required by creating an MRS cluster depends on the number of cluster nodes and selected components, but not the cluster type.</p> <p>In MRS, IP addresses are automatically assigned to clusters during cluster creation basically based on the following formula: Quantity of IP addresses = Number of cluster nodes + 2 (one for Manager; one for the DB). In addition, if the Hadoop, Hue, Sqoop, and Presto or Loader and Presto components are selected during cluster deployment, one IP address is added for each component. To buy a ClickHouse cluster independently, the number of IP addresses required is calculated as follows: Number of IP addresses = Number of cluster nodes + 1 (for Manager).</p>

Parameter	Description
Security Group	<p>A security group is a set of ECS access rules. It provides access policies for ECSs that have the same security protection requirements and are mutually trusted in a VPC.</p> <p>When you create a cluster, you can select Auto create from the drop-down list of Security Group to create a security group or select an existing security group.</p> <p>NOTE When you select a security group created by yourself, ensure that the inbound rule contains a rule in which Protocol is set to All, Port is set to All, and Source is set to a trusted accessible IP address range. Do not use 0.0.0.0/0 as a source address. Otherwise, security risks may occur. If you do not know the trusted accessible IP address range, select Auto create.</p>
EIP	<p>After binding an EIP to an MRS cluster, you can use the EIP to access the Manager web UI of the cluster.</p> <p>When creating a cluster, you can select an available EIP from the drop-down list and bind it. If no EIP is available in the drop-down list, click Manage EIP to access the EIPs service page to buy one.</p> <p>NOTE The EIP must be in the same region as the cluster.</p>

Table 2-3 Cluster node information

Parameter	Description
CPU Architecture	<p>CPU architecture supported by MRS. This parameter is not available for MRS 3.1.0 and 3.1.5.</p> <ul style="list-style-type: none"> • x86: The x86-based CPU architecture uses Complex Instruction Set Computing (CISC). Each instruction can be used to execute low-level hardware operations. The number of instructions is large, and the length of each instruction is different. Therefore, executing such an instruction is complex and time-consuming. • Kunpeng: The Kunpeng-based CPU architecture uses Reduced Instruction Set Computing (RISC). RISC is a microprocessor that executes fewer types of computer instructions but at a higher speed than CISC. RISC simplifies the computer architecture and improves the running speed. Compared with the x86-based CPU architecture, the Kunpeng-based CPU architecture has a more balanced performance and power consumption ratio. Kunpeng features high density, low power consumption, high cost-effectiveness.

Parameter	Description
Common Node Configurations	This parameter is available only when Cluster Type is set to Custom . Value options include Compact , Full-size , and OMS-separate . For details, see Custom Cluster Template Description .
Node Group	<p>Name of a node group</p> <p>An MRS cluster consists of multiple ECS nodes. The system manages the nodes based on node groups.</p> <p>Nodes in a cluster are classified into the following types based on the roles of components deployed on the nodes:</p> <ul style="list-style-type: none">• Master: manages the cluster and allocates cluster executable files to core nodes. traces the execution status of each job, and monitors the DataNode running status.• Core: cluster worker node, which processes and analyzes data and stores process data. The system automatically creates a core node group based on the components contained in the cluster. For example, if you select the ClickHouse component, the system adds the ClickHouse node group and deploys the ClickHouseServer role in the node group by default.• Task: provides compute resources, on which Yarn and Storm (supported only by MRS 1.9.2) are installed. Task nodes do not store persistent data. When compute resources in a cluster are insufficient, you can configure auto scaling policies to automatically increase task nodes. When the data volume change is small in a cluster but the cluster's service processing capabilities need to be remarkably and temporarily improved, add Task nodes to address the following situations: For clusters whose Cluster Type is Analysis cluster, Streaming cluster (supported only by MRS 1.9.2), and Hybrid cluster, the system automatically adds the corresponding task node groups. You can delete the task node groups if they are not required.
Node Type	<p>Type of the nodes in the group. Options include Core and Task.</p> <p>NOTE</p> <p>If the node group type is set to Task, only the NodeManager role (except mandatory roles) can be deployed in the node group.</p>

Parameter	Description
Payment Type	<p>Billing mode of nodes in a cluster.</p> <ul style="list-style-type: none"> • The billing mode of Master and Core nodes is the same as that of the cluster. • The billing mode of Task nodes is fixed to Pay-per-use, that is, Task nodes in a yearly/monthly subscribed cluster are still billed in a pay-per-use basis.
Node Count	<p>Configure node quantity in each node group.</p> <ul style="list-style-type: none"> • Master Node Groups: The number of Master instances ranges from 3 to 9. • At least one Core node must exist and the total number of Core and Task nodes cannot exceed 10,000. <p>Click  to add a node group, click  to modify the node instance specifications, and click  to delete the added node group.</p> <p>NOTE A small number of nodes may cause clusters to run slowly while a large number of nodes may be unnecessarily costly. Set an appropriate value based on data to be processed.</p>

Parameter	Description
Instance Specifications	<p>Instance specifications of Master or Core nodes. MRS supports host specifications determined by CPU, memory, and disk space. See ECS Specifications Used by MRS and to obtain the allowed instance specifications. Click  to configure the instance specifications, system disk, and data disk parameters of the cluster node.</p> <p>MRS supports BMS specifications only when the billing mode of a cluster is Yearly/Monthly.</p> <p>MRS supports the following hybrid deployment of ECSs and BMSs:</p> <ul style="list-style-type: none">• Master, Core, and Task nodes are deployed on ECSs.• Master and Core nodes are deployed on BMSs, and Task nodes are deployed on ECSs.• Master nodes are deployed on either ECSs or BMSs, Core nodes are deployed on either ECSs or BMSs, and Task nodes are deployed on ECSs. <p>Tenants share physical resources of ECSs, but can exclusively use resources of BMSs. BMSs can better meet your requirements for deploying key applications and services that require high performance (such as big data clusters and enterprise middleware systems) and a secure and reliable running environment.</p> <p>If BMS specifications are used, Master node specifications cannot be scaled up.</p> <p>NOTE</p> <ul style="list-style-type: none">• More advanced instance specifications provide better data processing. However, they require higher cluster cost.• Instance specifications may vary in different AZs. If no instance specifications in the current AZ can meet your requirements, switch to another AZ.• If you select HDDs for Core nodes, there is no billing information for data disks. The fees are charged with ECSs.• If you select non-HDD disks for Core nodes, the disk types of Master and Core nodes are determined by Data Disk.• If Sold out appears next to an instance specification of a node, the node of this specification cannot be bought. You can only buy nodes of other specifications.• The Master node specification (4 vCPUs 8 GB) is not within the SLA after-sales scope. It is applicable only to the test environment and is not recommended for the production environment.• For MRS 3.x or later, the memory of the master node must be greater than 64 GB.

Parameter	Description
System Disk	<p>Storage type and storage space of the system disk on a node.</p> <p>Storage type can be any of the following:</p> <ul style="list-style-type: none">● SAS: high I/O● SSD: ultra-high I/O● GPSSD: general-purpose SSD
Data Disk	<p>Data disk storage space of a node. For more data storage, you can add disks when creating a cluster. A maximum of 10 disks can be added to each Core or Task node.</p> <ul style="list-style-type: none">● Data storage and computing are separated. Data is stored in OBS, which features low cost and unlimited storage capacity. The clusters can be deleted at any time in OBS. The computing performance is determined by OBS access performance and is lower than that of HDFS. This configuration is recommended if data computing is infrequent.● Data storage and computing are not separated. Data is stored in HDFS, which features high cost, high computing performance, and limited storage capacity. Before deleting clusters, you must export and store the data. This configuration is recommended if data computing is frequent. <p>The storage type can be any of the following:</p> <ul style="list-style-type: none">● SAS: high I/O● SSD: ultra-high I/O● GPSSD: general-purpose SSD <p>NOTE</p> <p>More nodes in a cluster require higher disk capacity of Master nodes. To ensure stable cluster running, set the disk capacity of the Master node to over 600 GB if the number of nodes is 300 and increase it to over 1 TB if the number of nodes reaches 500.</p>
LVM	<p>This parameter is valid when a streaming Core node is created only. Click this parameter to enable or disable the disk LVM management function. This parameter is not available in MRS 3.x and later versions.</p> <p>If LVM is enabled, all disks on a node are mounted as logical volumes. This delivers more proper disk planning to avoid data skew, thereby improving system stability.</p>

Parameter	Description
Topology Adjustment	If the deployment mode in the Common Node does not meet the requirements, set Topology Adjustment to Enable and adjust the instance deployment mode based on service requirements. For details, see Topology Adjustment for a Custom Cluster . This parameter is valid only when Cluster Type is set to Custom .

Advanced Options

Table 2-4 MRS cluster advanced configuration topology

Parameter	Description
Kerberos Authentication	<p>Whether to enable Kerberos authentication when logging in to Manager. This option cannot be changed after you buy a cluster.</p> <ul style="list-style-type: none">  : If Kerberos Authentication is disabled, common users can use all functions of an MRS cluster. You are advised to disable Kerberos authentication in single-user scenarios. If Kerberos authentication is disabled, you can follow instructions in Security Configuration Suggestions for Clusters with Kerberos Authentication Disabled to perform security configuration.  : If Kerberos Authentication is enabled, common users cannot use the file and job management functions of an MRS cluster and cannot view cluster resource usage or the job records for Hadoop and Spark. To use more cluster functions, the users must contact the Manager administrator to assign more permissions. You are advised to enable Kerberos authentication in multi-user scenarios. Currently, Presto does not support Kerberos authentication.
Username	Name of the administrator of Manager. admin is used by default.

Parameter	Description
Password	<p>Password of the Manager administrator</p> <p>The following requirements must be met:</p> <ul style="list-style-type: none"> ● Must contain 8 to 26 characters. ● Must contain at least four of the following: <ul style="list-style-type: none"> - Lowercase letters - Uppercase letters - Digits - At least one of the following special characters: `~!@#\$\$%^&*()-_+= {[];:','<.>/? ● Cannot be the same as the username or the username spelled backwards. <p>Password Strength: The colorbar in red, orange, and green indicates weak, medium, and strong password, respectively.</p>
Confirm Password	Enter the password of the Manager administrator again.

Parameter	Description
Login Mode	<ul style="list-style-type: none">• Password Log in to the ECS or BMS as user root. Enter the password of user root and confirm the password. A password must meet the following requirements:<ol style="list-style-type: none">1. Must be a string and 8 to 26 characters long.2. Must contain at least four of the following: uppercase letters, lowercase letters, digits, and special characters (<code>~!@#%&^&*()- _ = + [{ } ; : ' , < . > / ?</code>).3. The password cannot be the username or the reverse username.• Key Pair Key pairs are used to log in to ECS nodes of the cluster. Select a key pair from the drop-down list. Select "I acknowledge that I have obtained private key file <i>SSHkey-xxx</i> and that without this file I will not be able to log in to my ECS." If you have never created a key pair, click View Key Pair to create or import a key pair. And then, obtain a private key file. A key pair, also called an SSH key, consists of a public key and a private key. You can create an SSH key and download the private key for authenticating remote login. For security, a private key can only be downloaded once. Keep it secure. Use an SSH key in either of the following two methods:<ol style="list-style-type: none">1. Creating an SSH key: After you create an SSH key, a public key and a private key are generated. The public key is stored in the system, and the private key is stored in the local ECS. When you log in to an ECS, the public and private keys are used for authentication.2. Importing an SSH key: If you have obtained the public and private keys, import the public key into the system. When you log in to an ECS, the public and private keys are used for authentication.
Hostname Prefix	Enter the prefix for the computer hostname of an ECS or BMS in the cluster.
Setting Advanced Options	Advanced function parameters of an MRS cluster. Select Configure . For details, see Table 2-5 .

Table 2-5 (Optional) Advanced configuration information of the MRS cluster

Parameter	Description
Tag	For details, see Adding a Tag to a Cluster/Node .
Auto Scaling	Auto scaling can be configured only after you specify task node specifications in the Configure Hardware step by referring to Configuring Auto Scaling Rules .
Bootstrap Action	For details, see Adding a Bootstrap Action .
Agency	<p>By binding an agency, ECSs or BMSs can manage some of your resources. Determine whether to configure an agency based on the actual service scenario.</p> <p>For example, you can configure an agency of the ECS type to automatically obtain the AK/SK to access OBS. For details, see Configuring a Storage-Compute Decoupled Cluster (Agency).</p> <p>The MRS_ECS_DEFAULT_AGENCY agency has the OBSOperateAccess permission of OBS and the CESFullAccess (for users who have enabled fine-grained policies), CES Administrator, and KMS Administrator permissions in the region where the cluster is located.</p>
Data Disk Encryption	<p>Whether to encrypt data in the data disk mounted to the cluster. This function is disabled by default. To use this function, you must have the Security Administrator and KMS Administrator permissions. This parameter is not available for MRS 3.1.0 and MRS 3.1.2-LTS.3.</p> <p>Keys used by encrypted data disks are provided by the Key Management Service (KMS) of the Data Encryption Workshop (DEW), secure and convenient. Therefore, you do not need to establish and maintain the key management infrastructure.</p> <p>Click Data Disk Encryption to enable or disable the data disk encryption function. For details, see EVS Disk Encryption.</p>
Data Disk Key ID	This parameter is displayed only when the Data Disk Encryption function is enabled. This parameter indicates the key ID corresponding to the selected key name. This parameter is not available for MRS 3.1.0 and MRS 3.1.2-LTS.3.

Parameter	Description
Data Disk Key Name	<p>This parameter is mandatory when the Data Disk Encryption function is enabled. Select the name of the key used to encrypt the data disk. By default, the default master key named evs/default is selected. You can select another master key from the drop-down list. This parameter is not available for MRS 3.1.0 and MRS 3.1.2-LTS.3.</p> <p>If disks are encrypted using a CMK, which is then disabled or scheduled for deletion, the disks can no longer be read from or written to, and data on these disks may never be restored. Exercise caution when performing this operation.</p> <p>Click View Key List to enter a page where you can create and manage keys.</p>
Alarm	If the alarm function is enabled, the cluster maintenance personnel can be notified in a timely manner to locate faults when the cluster runs abnormally or the system is faulty.
Rule Name	Name of the rule for sending alarm messages. The value can contain only digits, letters, hyphens (-), and underscores (_).
Topic Name	<p>Select an existing topic or click Create Topic to create a topic. To deliver messages published to a topic, you need to add a subscriber to the topic. For details, see Adding Subscriptions to a Topic.</p> <p>A topic serves as a message sending channel, where publishers and subscribers can interact with each other.</p>
Logging	<p>Whether to collect logs when cluster creation fails.</p> <p>After the logging function is enabled, system logs and component run logs are automatically collected and saved to the OBS file system in scenarios such as cluster creation failures and scale-out or scale-in failures for O&M personnel to quickly locate faults. The log information is retained for a maximum of seven days.</p>

Failed to Create a Cluster

If a cluster fails to be created, the failed task will be managed on the **Manage Failed Tasks** page. Choose **Active Clusters**. Click  in [Figure 2-14](#) to go to the **Manage Failed Tasks** page. In the **Task Status** column, hover your cursor over  to view the failure cause. See [Figure 2-15](#). You can delete failed tasks by referring to [Viewing Failed MRS Tasks](#).

Figure 2-14 Failed task management

Figure 2-15 Failure cause

Manage Failed Tasks

Failed cluster tasks, including cluster creation, termination, scale-out, scale-in, stopping, patch installation, and patch uninstallation tasks are displayed here.

Delete All All types

Cluster Name	Cluster ID	Task Status	Task Type	Failed	Operati...
mrs		Failed	Create cl...		Delete
mrs		Failed	Create cl...		Delete
mrs		Failed	Create cl...		Delete
mrs		Failed	Create cl...		Delete
mrs		Failed	Create cl...		Delete

Table 2-6 lists the error codes of MRS cluster creation failures.

Table 2-6 Error codes

Error Code	Description
MRS.101	Insufficient quota to meet your request. Contact customer service to increase the quota.
MRS.102	The token cannot be null or invalid. Try again later or contact customer service.
MRS.103	Invalid request. Try again later or contact customer service.
MRS.104	Insufficient resources. Try again later or contact customer service.
MRS.105	Insufficient IP addresses in the existing subnet. Try again later or contact customer service.
MRS.201	Failed due to an ECS error. Try again later or contact customer service.
MRS.202	Failed due to an IAM error. Try again later or contact customer service.
MRS.203	Failed due to a VPC error. Try again later or contact customer service.
MRS.400	MRS system error. Try again later or contact customer service.

2.4 Configuring Custom Topology

The analysis cluster, streaming cluster, and hybrid cluster provided by MRS use fixed templates to deploy cluster processes. Therefore, you cannot customize service processes on management nodes and control nodes. If you want to customize the cluster deployment, set **Cluster Type** to **Custom** when creating a cluster. In this way, you can customize the deployment mode of process instances on the management nodes and control nodes in the cluster. Only MRS 3.x and later versions support the creation of clusters in a custom topology.

A custom cluster provides the following functions:

- Separated deployment of the management and control roles: The management role and control role are deployed on different Master nodes.
- Co-deployment of the management and control roles: The management and control roles are co-deployed on the Master node.
- ZooKeeper is deployed on an independent node to improve reliability.
- Components are deployed separately to avoid resource contention.

Roles in an MRS cluster:

- **Management Node (MN)**: is the node to install Manager (the management system of the MRS cluster). It provides a unified access entry. Manager centrally manages nodes and services deployed in the cluster.
- **Control Node (CN)**: controls and monitors how data nodes store and receive data, and send process status, and provides other public functions. Control nodes of MRS include HMaster, HiveServer, ResourceManager, NameNode, JournalNode, and SlapdServer.
- **Data Node (DN)**: A data node executes the instructions sent by the management node, reports task status, stores data, and provides other public functions. Data nodes of MRS include DataNode, RegionServer, and NodeManager.

Customizing a Cluster

Step 1 Go to the [Buy Cluster](#) page.

Step 2 Click the **Custom Config** tab.

Step 3 Configure basic cluster information. For details about the parameters, see [Software Configurations](#).

- **Region**: Retain the default value.
- **Billing Mode**: Select **Yearly/Monthly** or **Pay-per-use**.
- **Cluster Name**: You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, for example, **mrs_20180321**.
- **Cluster Version**: Currently, only MRS 3.x is available.
- **Cluster Type**: Select **Custom** and select components as required.

Step 4 Click **Next**. Configure hardware information.

- **AZ:** Retain the default value.
- **Enterprise Project:** Retain the default value.
- **VPC:** Retain the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
- **Subnet:** Retain the default value.
- **Security Group:** Select **Auto create**.
- **EIP:** Select **Bind later**.
- **Common Node:** For details, see [Custom Cluster Template Description](#).
- **Node Count:** Adjust the number of cluster instances based on the service volume. For details, see [Table 2-8](#).
- **Instance Specifications:** Click  to configure the instance specifications, system disk and data disk storage types, and storage space.
- **Topology Adjustment:** If the deployment mode in the **Common Node** does not meet the requirements, you need to manually install some instances that are not deployed by default, or you need to manually install some instances, set **Topology Adjustment** to **Enable** and adjust the instance deployment mode based on service requirements. For details, see [Topology Adjustment for a Custom Cluster](#).

Step 5 Click **Next** and set advanced options.

For details about the parameters, see [Advanced Options](#).

Step 6 Click **Next**.

On the **Confirm Configuration** page, check the cluster configuration information. If you need to adjust the configuration, click  to go to the corresponding tab page and configure parameters again.

Step 7 Select the checkbox to enable secure communications. For details, see [Communication Security Authorization](#).

Step 8 Click **Buy Now**.

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

Step 9 Click **Back to Cluster List** to view the cluster status.

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

----End

Custom Cluster Template Description

Table 2-7 Common templates for custom clusters

Common Node	Description	Node Range
Compact	The management role and control role are deployed on the Master node, and data instances are deployed in the same node group. This deployment mode applies to scenarios where the number of control nodes is less than 100, reducing costs.	<ul style="list-style-type: none">• The number of Master nodes is greater than or equal to 3 and less than or equal to 11.• The total number of node groups is less than or equal to 10, and the total number of nodes in non-Master node groups is less than or equal to 10,000.
OMS-separate	The management role and control role are deployed on different Master nodes, and data instances are deployed in the same node group. This deployment mode is applicable to a cluster with 100 to 500 nodes and delivers better performance in high-concurrency load scenarios.	<ul style="list-style-type: none">• The number of Master nodes is greater than or equal to 5 and less than or equal to 11.• The total number of node groups is less than or equal to 10, and the total number of nodes in non-Master node groups is less than or equal to 10,000.
Full-size	The management role and control role are deployed on different Master nodes, and data instances are deployed in different node groups. This deployment mode is applicable to a cluster with more than 500 nodes. Components can be deployed separately, which can be used for a larger cluster scale.	<ul style="list-style-type: none">• The number of Master nodes is greater than or equal to 9 and less than or equal to 11.• The total number of node groups is less than or equal to 10, and the total number of nodes in non-Master node groups is less than or equal to 10,000.

Table 2-8 Node deployment scheme of a customized MRS cluster

Node Deployment Principle		Applicable Scenario	Networking Rule
Management nodes, control nodes, and data nodes are deployed separately. (This scheme requires at least eight nodes.)	$MN \times 2 + CN \times 9 + DN \times n$	(Recommended) This scheme is used when the number of data nodes is 500–2000.	<ul style="list-style-type: none"> If the number of nodes in a cluster exceeds 200, the nodes are distributed to different subnets and the subnets are interconnected with each other in Layer 3 using core switches. Each subnet can contain a maximum of 200 nodes and the allocation of nodes to different subnets must be balanced. If the number of nodes is less than 200, the nodes in the cluster are deployed in the same subnet and the nodes are interconnected with each other in Layer 2 using aggregation switches.
	$MN \times 2 + CN \times 5 + DN \times n$	(Recommended) This scheme is used when the number of data nodes is 100–500.	
	$MN \times 2 + CN \times 3 + DN \times n$	(Recommended) This scheme is used when the number of data nodes is 30–100.	
The management nodes and control nodes are deployed together, and the data nodes are deployed separately.	$(MN+CN) \times 3 + DN \times n$	(Recommended) This scheme is used when the number of data nodes is 3–30.	Nodes in the cluster are deployed in the same subnet and are interconnected with each other at Layer 2 through aggregation switches.

Node Deployment Principle	Applicable Scenario	Networking Rule
<p>The management nodes, control nodes, and data nodes are deployed together.</p>	<ul style="list-style-type: none"> This scheme is applicable to a cluster having fewer than 6 nodes. This scheme requires at least three nodes. <p>NOTE This template is not recommended in the production environment or commercial environment.</p> <ul style="list-style-type: none"> If management, control, and data nodes are co-deployed, cluster performance and reliability are greatly affected. If the number of nodes meet the requirements, deploy data nodes separately. If the number of nodes is insufficient to support separately deployed data nodes, use the dual-plane networking mode for this scenario. The traffic of the management network is isolated from that of the service network to prevent excessive data volumes on the service plane, ensuring correct delivery of management operations. 	<p>Nodes in the cluster are deployed in the same subnet and are interconnected with each other at Layer 2 through aggregation switches.</p>

Topology Adjustment for a Custom Cluster

Table 2-9 Topology adjustment

Service	Dependency	Role	Role Deployment Suggestions	Description
OMSServer	-	OMSServer	This role can be deployed it on the Master node and cannot be modified.	-

Service	Dependency	Role	Role Deployment Suggestions	Description
ClickHouse	Depends on ZooKeeper.	CHS (ClickHouseServer)	This role can be deployed on all nodes. Number of role instances to be deployed: an even number ranging from 2 to 256	A non-Master node group with this role assigned is considered as a Core node.
		CLB (ClickHouseBalancer)	This role can be deployed on all nodes. Number of role instances to be deployed: 2 to 256	-
ZooKeeper	-	QP(quorumpeer)	This role can be deployed on the Master node only. Number of role instances to be deployed: 3 to 9, with the step size of 2	-
Hadoop	Depends on ZooKeeper.	NN(NameNode)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2	-
		HFS (HttpFS)	This role can be deployed on the Master node only. Number of role instances to be deployed: 0 to 10	-
		JN(JournalNode)	This role can be deployed on the Master node only. Number of role instances to be deployed: 3 to 60, with the step size of 2	-

Service	Depende ncy	Role	Role Deployment Suggestions	Description
		DN(Data Node)	This role can be deployed on all nodes. Number of role instances to be deployed: 3 to 10,000	A non-Master node group with this role assigned is considered as a Core node.
		RM(Reso urceMana ger)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2	-
		NM(Node Manager)	This role can be deployed on all nodes. Number of role instances to be deployed: 3 to 10,000	-
		JHS(JobHi storyServ er)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2	-
		TLS(Timel ineServer)	This role can be deployed on the Master node only. Number of role instances to be deployed: 0 to 1	-
Presto	Depends on Hive.	PCD(Coor dinator)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2	-

Service	Dependency	Role	Role Deployment Suggestions	Description
		PWK(Worker)	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to 10,000	-
Spark2x	<ul style="list-style-type: none"> • Depends on Hadoop. • Depends on Hive. • Depends on ZooKeeper. 	JS2X(JDBCServer2x)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2 to 10	-
		JH2X(JobHistory2x)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2	-
		SR2X(SparkResource2x)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2 to 50	-
		IS2X(IndexServer2x)	(Optional) This role can be deployed on the Master node only. Number of role instances to be deployed: 0 to 2, with the step size of 2	-
HBase	Depends on Hadoop.	HM(HMaster)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2	-

Service	Depende ncy	Role	Role Deployment Suggestions	Description
		TS(ThriftS erver)	This role can be deployed on all nodes. Number of role instances to be deployed: 0 to 10,000	-
		RT(RESTS erver)	This role can be deployed on all nodes. Number of role instances to be deployed: 0 to 10,000	-
		RS(Regio nServer)	This role can be deployed on all nodes. Number of role instances to be deployed: 3 to 10,000	-
		TS1(Thrift 1Server)	This role can be deployed on all nodes. Number of role instances to be deployed: 0 to 10,000	If the Hue service is installed in a cluster and HBase needs to be used on the Hue web UI, install this instance for the HBase service.
Hive	<ul style="list-style-type: none"> • Depen ds on Hadoo p. • Depen ds on DBServ ice. 	MS(Meta Store)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2 to 10	-
		WH (WebHCa t)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 10	-

Service	Depende ncy	Role	Role Deployment Suggestions	Description
		HS(HiveS erver)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2 to 80	-
Hue	Depends on DBService .	H(Hue)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2	-
Sqoop	Depends on Hadoop.	SC(Sqoop Client)	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to 10,000	-
Kafka	Depends on ZooKeepe r.	B(Broker)	This role can be deployed on all nodes. Number of role instances to be deployed: 3 to 10,000	-
Flume	-	MS(Monit orServer)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2	-
		F(Flume)	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to 10,000	A non-Master node group with this role assigned is considered as a Core node.

Service	Dependency	Role	Role Deployment Suggestions	Description
Tez	<ul style="list-style-type: none"> • Depends on Hadoop. • Depends on DBService. • Depends on ZooKeeper. 	TUI(TezUI)	<p>This role can be deployed on the Master node only.</p> <p>Number of role instances to be deployed: 1 to 2</p>	-

2.5 Adding a Tag to a Cluster/Node

Tags are used to identify clusters/nodes. Adding tags to clusters/nodes can help you identify and manage your resources.

- **Cluster tags:** You can add up to 10 tags to a cluster during cluster creation or add them on the details page of a created cluster. Updating a cluster tag will synchronize the tag to all nodes in the cluster.
- **Node tags:** You can use the default tag or add tags to nodes in an MRS cluster when you configure an auto scaling policy. Node tags take the tag quotas. You can view the tags of a node in the **Nodes** tab on MRS console.
- **Default tags:** An MRS cluster contains multiple nodes, and each node is an ECS and contains EVS disks. After the default tag is enabled, the system automatically creates a cluster tag and a tag for each node. The default tag is automatically synchronized to the corresponding ECS or EVS instances.

To view node tags, go to the **Nodes** tab on the MRS console, and move the cursor to the tag icon of a node in the node list.

NOTE

- MRS tag updates are synchronized to the ECSs or EVS disks in the cluster. However, if you modify MRS cluster tags on the ECS or EVS console, the modification will not be synchronized to MRS. To ensure tag consistency, do not modify MRS cluster tags on the ECS or EVS console.
- You can add a maximum of 10 tags to a cluster. If the number of tags of a node in the cluster reaches the upper limit, no more tags can be added to the cluster.
- If default tags are enabled, a default tag is added to the cluster and each node, which takes two quotas. That is, a maximum of 10 tags can be added by default. In this case, a maximum of eight more tags can still be added.

If your organization has configured tag strategies for MRS, add tags to clusters/nodes based on the strategies. If a tag does not comply with the tag strategies, the cluster/node may be failed to be created. Contact the organization administrator to learn more about the tag strategies.

A tag consists of a tag key and a tag value. [Table 2-10](#) provides tag key and value requirements.

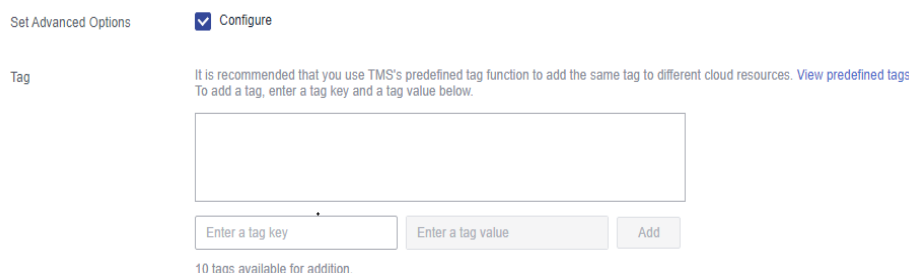

Table 2-10 Tag key and value requirements

Parameter	Requirement	Example
Key	<p>A tag key cannot be left blank.</p> <p>A tag key must be unique in a cluster.</p> <p>A tag key contains a maximum of 36 characters.</p> <p>A tag value cannot contain special characters (=*<>\\, /) or start or end with spaces.</p>	Organization
Value	<p>A tag value contains a maximum of 43 characters.</p> <p>A tag value cannot contain special characters (=*<>\\, /) or start or end with spaces.</p> <p>This parameter can be left blank.</p>	Apache

Adding Tags to a Cluster

- Adding cluster tags during cluster creation
 - a. Log in to the MRS console.
 - b. Click **Buy Cluster**. The page for buying a cluster is displayed.
 - c. Click the **Custom Config** tab.
 - d. Configure the cluster software and hardware by referring to [Buying a Custom Cluster](#).
 - e. Select **Configure** on the right of **Set Advanced Options** and enter the key and value of a new tag.

Figure 2-16 Adding a tag to a cluster

- Adding tags to an existing cluster

- a. Log in to the MRS management console.
- b. In the navigation pane on the left, choose **Active Clusters**. Click the name of a running cluster. The basic information page of the cluster is displayed.
- c. Click the **Tags** tab.
- d. Click **Add/Edit Tag**. If this is your first time adding a tag, click **Add Tag**. In the displayed dialog box, enter the key and value of a tag, and click **Add**.

×

Add/Edit Tag

It is recommended that you use TMS's predefined tag function to add the same tag to different cloud resources. [View predefined tags](#) 

To add a tag, enter a tag key and a tag value below.

10 tags available for addition.

NOTE

You can also add cluster tags by enabling default tags. All nodes will be tagged with the cluster ID and node IDs, which takes two quotas.

- e. Click **OK**.

Adding Tags to a Node

- Node tags are automatically added when a default tag is added to a cluster. For details, see [Adding tags to an existing cluster](#).
- Adding node tags for auto scaling

If you add a tag when configuring an auto scaling policy, MRS automatically adds the tag to the new nodes and synchronizes the tag to the ECSs and EVS disks.

 - a. Log in to the MRS management console.
 - b. In the navigation pane on the left, choose **Active Clusters**. Click the name of a running cluster. The basic information page of the cluster is displayed.
 - c. On the page that is displayed, click the **Auto Scaling** tab.
 - d. Click **Edit** on the right of an existing auto scaling policy. In the displayed dialog box, enter the key and value of the tag you want to add, and click **Add**.

Edit Auto Scaling Policy

Rule Name: default-expand-1 | Add 1 Task node(s) if YARNAppRunning is greater than 75 for 1 five-minute period(s). | Edit | Delete

Cooldown Period: 20 minutes

Scale-in | Add Rule

Rule Name: default-shrink-1 | Terminate 1 Task node(s) if YARNAppRunning is less than 25 for 1 five-minute period(s). | Edit | Delete

Cooldown Period: 20 minutes

Add Tag ⓘ

To add a tag, enter a tag key and a tag value below.

Enter a tag key | Enter a tag value | Add

9 tags available for addition.

I agree to authorize MRS to scale out or in nodes based on the above rule.

OK | Cancel

NOTE

- You need to enable the auto scaling policy and configure scale-out rules. Otherwise, the node tags will not take effect.
 - If tag quotas are insufficient, delete the cluster tag or modify existing a tag of the auto scaling policy, and then enable the policy.
 - Tags cannot be added to auto scaling policies of resource pools.
- e. Click **OK**.

Searching for Target Clusters by Tags

On the **Active Clusters** page, search for the target cluster by tag key or tag value.

1. Log in to the MRS console.
2. In the upper right corner of the **Active Clusters** page, click **Search by Tag** to access the search page.
3. Enter the tag of the cluster to be searched.
You can select a tag key or tag value from their drop-down lists. When the tag key or tag value is exactly matched, the system can automatically locate the target cluster. If you enter multiple tags, their intersections are used to search for the cluster.
4. Click **Search**.
The system searches for the target cluster by tag key or value.

Managing Tags

You can view, add, and delete tags on the **Tags** tab page of the cluster.

1. Log in to the MRS console.
2. On the **Active Clusters** page, click the name of a cluster for which you want to manage tags.
The cluster details page is displayed.
3. Click the **Tags** tab and view, add, and delete tags on the tab page.
 - View
On the **Tags** tab page, you can view details about tags of the cluster, including the number of tags and the key and value of each tag.

- Add
Click **Add/Edit Tag** in the upper left corner. In the displayed **Add/Edit Tag** dialog box, enter the key and value of the tag to be added, and click **OK**.
- Delete
Locate the row that contains the tag you want to delete and click **Delete** in the **Operation** column. In the displayed **Delete Tag** dialog box, enter **DELETE**, and click **Yes**.

2.6 Communication Security Authorization

MRS clusters provision, manage, and use big data components through the management console. Big data components are deployed in a user's VPC. If the MRS management console needs to directly access big data components deployed in the user's VPC, you need to enable the corresponding security group rules after you have obtained user authorization. This authorization process is called secure communications.

If the secure communications function is not enabled, MRS clusters cannot be created. If you disable the communication after a cluster is created, the cluster status will be **Network channel is not authorized** and the following functions will be affected:

- Functions, such as big data component installation, cluster scale-out/scale-in, and Master node specification upgrade, are unavailable.
- The cluster running status, alarms, and events cannot be monitored.
- The node management, component management, alarm management, file management, job management, patch management, and tenant management functions on the cluster details page are unavailable.
- The Manager page and the website of each component cannot be accessed.

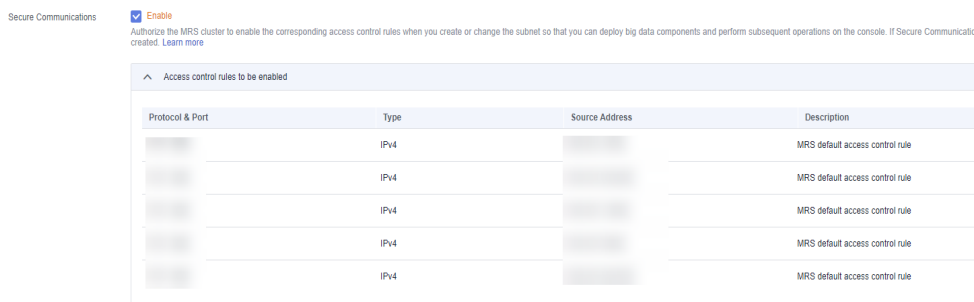

After the secure communications function is enabled again, the cluster status is restored to **Running**, and the preceding functions become available. For details, see [Enabling Secure Communications for Clusters with This Function Disabled](#).

If the security group rules authorized in the cluster are insufficient for you to provision, manage, and use big data components,  is displayed on the right of **Secure Communications**. In this case, click **Update** to update the security group rules. For details, see [Update](#).

Enabling Secure Communications During Cluster Creation

- Step 1** Log in to the MRS console.
- Step 2** Click **Buy Cluster**. The page for buying a cluster is displayed.
- Step 3** On the displayed page, select **Quick Config**.
- Step 4** Configure cluster information by referring to [Quick Configuration](#) or [Buying a Custom Cluster](#).
- Step 5** Select the check box for **Secure Communications**.

Figure 2-17 Secure communications

Step 6 Click **Buy Now**.

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

----End

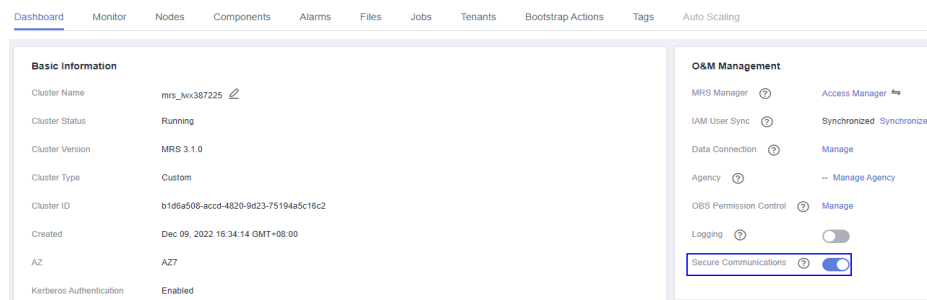

Disabling Secure Communications After a Cluster Is Created

Step 1 Log in to the MRS console.

Step 2 In the active cluster list, click the name of the cluster for which you want to disable secure communications.

The cluster details page is displayed.

Figure 2-18 Secure Communications

Step 3 Click the switch on the right of **Secure Communications** to disable authorization. In the dialog box that is displayed, click **OK**.

After the authorization is disabled, the cluster status changes to **Network channel unauthorized**, and some functions of the cluster are unavailable. Exercise caution when performing this operation.

Figure 2-19 Disabling secure communications

Disable Secure Communications

If Secure Communications is disabled, the security group rules of the cluster will be deleted. As a result, operations such as this required for O&M cannot be performed on the cluster and some functions of the cluster will be unavailable. Disabling Secure Communications is a high-risk operation. Exercise caution when performing this operation. The following security group rules will be deleted. [Learn more](#)

2.7 Configuring Auto Scaling Rules

2.7.1 Overview

In big data application scenarios, especially real-time data analysis and processing, the number of cluster nodes needs to be dynamically adjusted according to data volume changes to provide the required number of resources. The auto scaling function of MRS enables the task nodes of a cluster to be automatically scaled to match cluster loads. If the data volume changes periodically, you can configure an auto scaling rule so that the number of task nodes can be automatically adjusted in a fixed period of time before the data volume changes.

- Auto scaling rules: You can increase or decrease task nodes based on real-time cluster loads. Auto scaling will be triggered with a certain delay when the data volume changes.
- Resource plans: Set the task node quantity based on the time range. If the data volume changes periodically, you can create resource plans to resize the cluster before the data volume changes, thereby avoiding delays in increasing or decreasing resources.

You can configure either auto scaling rules or resource plans or both to trigger auto scaling. Configuring both resource plans and auto scaling rules improves the cluster node scalability to cope with occasionally unexpected data volume peaks.

In some service scenarios, resources need to be reallocated or service logic needs to be modified after cluster scale-out or scale-in. If you manually scale out or scale in a cluster, you can log in to cluster nodes to reallocate resources or modify service logic. If you use auto scaling, MRS enables you to customize automation scripts for resource reallocation and service logic modification. Automation scripts can be executed before and after auto scaling and automatically adapt to service load changes, all of which eliminates manual operations. In addition, automation scripts can be fully customized and executed at various moments, meeting your personalized requirements and improving auto scaling flexibility.

- Auto scaling rules:
 - You can set a maximum of five rules for scaling out or in a cluster, respectively.
 - The system determines the scale-out and then scale-in based on your configuration sequence. Important policies take precedence over other

- policies to prevent repeated triggering when the expected effect cannot be achieved after a scale-out or scale-in.
- Comparison factors include greater than, greater than or equal to, less than, and less than or equal to.
 - Cluster scale-out or scale-in can be triggered only after the configured metric threshold is reached for consecutive $5n$ (the default value of n is 1) minutes.
 - After each scale-out or scale-in, there is a cooling duration that is greater than 0 and lasts 20 minutes by defaults.
 - In each cluster scale-out or scale-in, at least one node and at most 100 nodes can be added or reduced.
 - The number of task nodes in a cluster is limited to the default number of nodes configured by users or the node quantity range in the resource plan that takes effect in the current time period. The node quantity range in the resource plan that takes effect in the current time period has a higher priority.
- Resource plans (setting the number of Task nodes by time range):
 - You can specify a Task node range (minimum number to maximum number) in a time range. If the number of Task nodes is beyond the Task node range in a resource plan, the system triggers cluster scale-out or scale-in.
 - You can set a maximum of five resource plans for a cluster.
 - A resource plan cycle is by day. The start time and end time can be set to any time point between 00:00 and 23:59. The start time must be at least 30 minutes earlier than the end time. Time ranges configured for different resource plans cannot overlap.
 - After a resource plan triggers cluster scale-out or scale-in, there is 10-minute cooling duration. Auto scaling will not be triggered again within the cooling time.
 - When a resource plan is enabled, the number of Task nodes in the cluster is limited to the default node range configured by you in other time periods except the time period configured in the resource plan.
 - Automation scripts:
 - You can set an automation script so that it can automatically run on cluster nodes when auto scaling is triggered.
 - You can set a maximum number of 10 automation scripts for a cluster.
 - You can specify an automation script to be executed on one or more types of nodes.
 - Automation scripts can be executed before or after scale-out or scale-in.
 - Before using automation scripts, upload them to a cluster VM or OBS file system in the same region as the cluster. The automation scripts uploaded to the cluster VM can be executed only on the existing nodes. If you want to make the automation scripts run on the new nodes, upload them to the OBS file system.

2.7.2 Configuring Auto Scaling During Cluster Creation

When you create a cluster, you can configure the auto scaling function in advanced configuration parameters.

 **NOTE**

Auto scaling policies can be configured during cluster creation only for analysis, streaming, and hybrid clusters.

Video Tutorial

This tutorial demonstrates how to configure AS when purchasing a cluster and how to add an AS policy to an existing cluster.

 **NOTE**

The UI may vary depending on the version. This tutorial is for reference only.

Procedure

- Step 1** Log in to the MRS management console.
- Step 2** When you buy a cluster containing task nodes, configure the cluster software and hardware information by referring to [Buying a Custom Cluster](#). Then, on the **Set Advanced Options** page, enable **Analysis Task** and configure or modify auto scaling rules and resource plans.

Figure 2-23 Configuring auto scaling rules when creating a cluster

 NOTE

You can configure the auto scaling rules by referring to the following scenarios:

- [Scenario 1: Using Auto Scaling Rules Alone](#)
- [Scenario 2: Using Resource Plans Alone](#)
- [Scenario 3: Using Both Auto Scaling Rules and Resource Plans](#)

----End

2.7.3 Creating an Auto Scaling Policy for an Existing Cluster

After a cluster is created, you can configure rules for the task node group in a cluster by node group or resource pool.

The node group policy and resource pool policy are mutually exclusive. You can configure either of them as needed.

MRS 3.1.5 or later supports the specified resource pool policy.

Item	By Node Group	By Resource Pool
Auto scaling object	All nodes in the task node group	Task nodes in the resource pool specified by an auto scaling policy
Resource pool ownership of added nodes	Default resource pool	Resource pool specified by the auto scaling policy
Scale-in object	Random scale-in of nodes in the task node group	Random scale-in of nodes in a resource pool specified by an auto scaling policy

Prerequisites

- A task node group has been configured by referring to [Adding a Task Node](#).
- A resource pool has been added by referring to [Creating a Resource Pool](#) if you plan to configure auto scaling policies by resource pool.

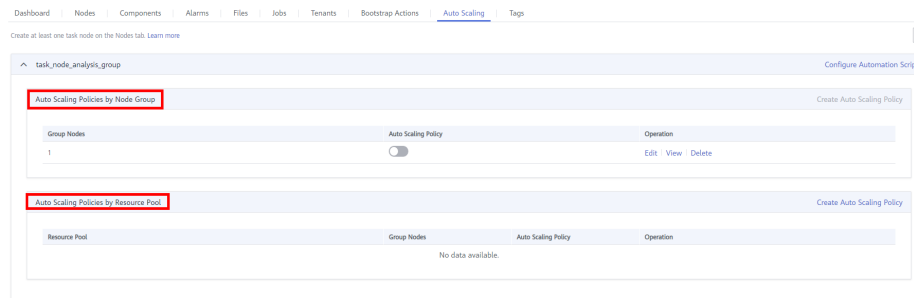

Procedure

Step 1 Log in to the MRS management console.

Step 2 Choose **Active Clusters**, select a running cluster, and click its name. to access its details page.

Step 3 On the page that is displayed, click the **Auto Scaling** tab.

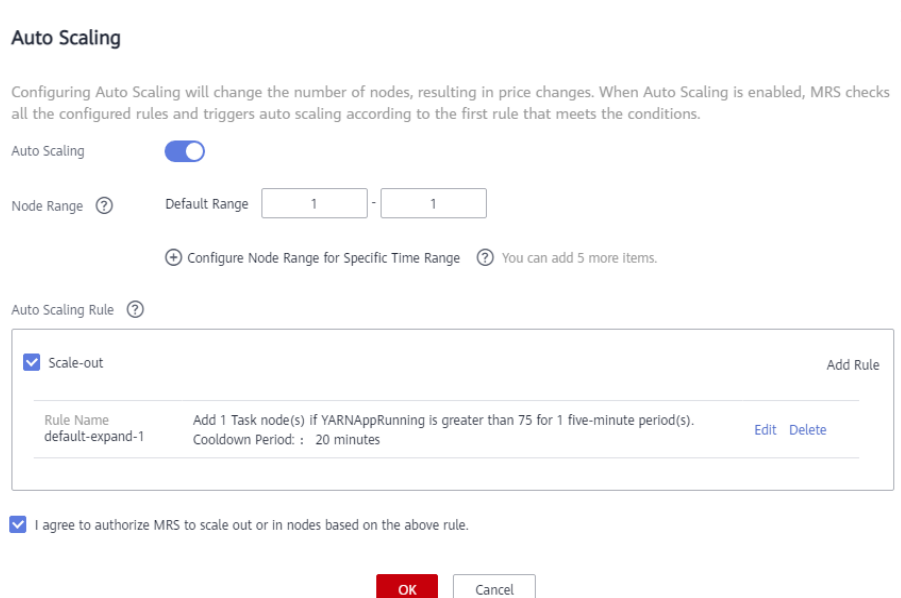

You can configure policies by resource pool or node group as needed.

NOTE

- Auto scaling policies of different node groups are mutually exclusive. That is, you can enable auto scaling policies only for one node group.
- An auto scaling rule adjusts the number of nodes, but also affects the actual price. Exercise caution when adding an auto scaling rule.

Step 4 Click **Create Auto Scaling Policy** to create an auto scaling policy.

NOTE

You can configure the auto scaling rules by referring to the following scenarios:

- [Scenario 1: Using Auto Scaling Rules Alone](#)
- [Scenario 2: Using Resource Plans Alone](#)
- [Scenario 3: Using Both Auto Scaling Rules and Resource Plans](#)

----End

2.7.4 Scenario 1: Using Auto Scaling Rules Alone

Scenario where only auto scaling rules are configured: The number of nodes needs to be dynamically adjusted based on the YARN resource usage. When the available YARN memory is less than 20%, five nodes need to be added. When the available YARN memory is greater than 70%, five nodes need to be reduced. The number of nodes in a task node group ranges from 1 to 10.

Procedure

Step 1 Go to the **Auto Scaling** page to configure auto scaling rules.

- Configure the **Default Range** parameter.

Enter a task node range, in which auto scaling is performed. This constraint applies to all scale-in and scale-out rules. The maximum value range allowed is 0 to 500.

The value range in this example is 1 to 10.

- Configure an auto scaling rule.

To enable **Auto Scaling**, you must configure a scale-out or scale-in rule.

- a. Select **Scale-Out** or **Scale-In**.
- b. Click **Add Rule**.

Figure 2-24 Add Rule dialog box

Add Rule

Rule Name

If ? ?

Last For five-minute periods ?

Add nodes ?

Cooldown Period minutes ?

- c. Configure **Rule Name**, **If**, **Last For**, **Add**, and **Cooldown Period**. For details about auto scaling metrics, see [Configuring Auto Scaling Metrics](#).
- d. Click **OK**.

You can view, edit, or delete the rules you configured in the **Scale-out** or **Scale-in** area on the **Auto Scaling** page. You can click **Add Rule** to configure multiple rules.

Step 2 Click **OK**.

NOTE

If you want to configure an auto scaling rule for an existing cluster, select **I agree to authorize MRS to scale out or in nodes based on the above rule**.

----End

2.7.5 Scenario 2: Using Resource Plans Alone

If the data volume changes regularly every day and you want to scale out or scale in a cluster before the data volume changes, you can create resource plans to adjust the number of Task nodes as planned in the specified time range.

Background

A real-time processing service sees a sharp increase in data volume from 7:00 to 13:00 on Monday, Tuesday, and Saturday. Assume that an MRS streaming cluster is used to process the service data. Five task nodes are required from 7:00 to 13:00 on Monday, Tuesday, and Saturday, while only two are required at other time.

Procedure

Step 1 Go to the **Auto Scaling** page to configure a resource plan.

 **NOTE**

A resource plan can be configured to adjust the number of nodes, which affects the actual price. Exercise caution when performing this operation.

Step 2 For example, the **Default Range** of node quantity is set to **2-2**, indicating that the number of task nodes is fixed to 2 except the time range specified in the resource plan.

Step 3 Click **Configure Node Range for Specific Time Range** under **Default Range** or **Add Resource Plan**.

Step 4 Configure **Effective On**, **Time Range**, and **Node Range**.

For example, set **Effective On** to **Monday, Tuesday, and Saturday**, **Time Range** to **07:00-13:00**, and **Node Range** to **5-5**. This indicates that the number of task nodes is fixed at 5 from 07:00 to 13:00.

You can click **Configure Node Range for Specific Time Range** to configure multiple resource plans.

 **NOTE**

- **Effective On** is set to **Daily** by default. You can also select one or multiple days from Monday to Sunday.
- If you do not set **Node Range**, its default value will be used.
- If you set both **Node Range** and **Time Range**, the node range you set will be used during the time range you set, and the default node range will be used beyond the time range you set. If the time is not within the configured time range, the default range is used.

----End

2.7.6 Scenario 3: Using Both Auto Scaling Rules and Resource Plans

If the data volume is not stable and the expected fluctuation may occur, the fixed Task node range cannot guarantee that the requirements in some service

scenarios are met. In this case, it is necessary to adjust the number of Task nodes based on the real-time loads and resource plans.

Background

A real-time processing service sees an unstable increase in data volume from 7:00 to 13:00 on Monday, Tuesday, and Saturday. For example, 5 to 8 task nodes are required from 7:00 to 13:00 on Monday, Tuesday, and Saturday, and 2 to 4 are required beyond this period. Therefore, you can set an auto scaling rule based on a resource plan. When the data volume exceeds the expected value, the number of Task nodes can be adjusted if resource loads change, without exceeding the node range specified in the resource plan. When a resource plan is triggered, the number of nodes is adjusted within the specified node range with minimum affect. That is, increase nodes to the upper limit and decrease nodes to the lower limit.

Procedure

Step 1 Go to the **Auto Scaling** page to configure auto scaling rules.

An auto scaling rule adjusts the number of nodes, but also affects the actual price. Exercise caution when adding an auto scaling rule.

- **Default Range**
Enter a task node range, in which auto scaling is performed. This constraint applies to all scale-in and scale-out rules.
For example, this parameter is set to **2-4** in this scenario.
- **Auto Scaling**
To enable **Auto Scaling**, you must configure a scale-out or scale-in rule.
 - a. Select **Scale-Out** or **Scale-In**.
 - b. Click **Add Rule**. The **Add Rule** page is displayed.

Figure 2-25 Adding a rule

The screenshot shows the 'Add Rule' configuration page. The form contains the following fields and options:

- Rule Name:** default-expand-2
- If:** YARNAppRunning (dropdown), Greater than (dropdown), 75 (input field)
- Last For:** 1 (input field), five-minute periods (dropdown)
- Add:** 1 (input field), nodes (dropdown)
- Cooldown Period:** 20 (input field), minutes (dropdown)

At the bottom of the form are two buttons: **OK** (red) and **Cancel** (grey).

- c. Configure the **Rule Name**, **If**, **Last for**, **Add**, and **Cooldown Period** parameters.
- d. Click **OK**.

You can view, edit, or delete the rules you configured in the **Scale-out** or **Scale-in** area on the **Auto Scaling** page.

Step 2 Configure a resource plan.

1. Click **Configure Node Range for Specific Time Range** under **Default Range** or **Add Resource Plan**.
2. Configure **Effective On**, **Time Range**, and **Node Range**.

For example, set **Effective On** to **Monday, Tuesday, and Saturday**, **Time Range** to **07:00-13:00**, and **Node Range** to **5-8**.

You can click **Configure Node Range for Specific Time Range** or **Add Resource Plan** to configure multiple resource plans.

 **NOTE**

- **Effective On** is set to **Daily** by default. You can also select one or multiple days from Monday to Sunday.
- If you do not set **Node Range**, its default value will be used.
- If you set both **Node Range** and **Time Range**, the node range you set will be used during the time range you set, and the default node range will be used beyond the time range you set. If the time is not within the configured time range, the default range is used.

----End

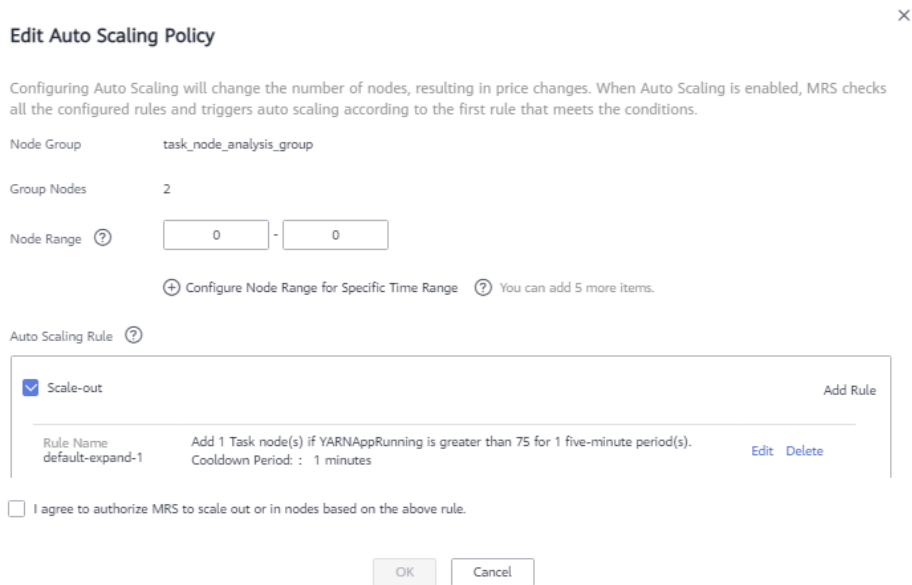

2.7.7 Modifying an Auto Scaling Policy

Step 1 Log in to the MRS management console.

Step 2 Choose **Active Clusters**, select a running cluster, and click its name. to access its details page.

Step 3 Click the **Auto Scaling** tab.

Step 4 Click **Edit** on the right of the target auto scaling policy.

----End

2.7.8 Deleting an Auto Scaling Policy

- Step 1** Log in to the MRS management console.
- Step 2** Choose **Active Clusters**, select a running cluster, and click its name. to access its details page.
- Step 3** Click the **Auto Scaling** tab.
- Step 4** Click **Delete** on the right of an existing AS policy. In the displayed dialog box, click **OK**.

----End

2.7.9 Enabling or Disabling an Auto Scaling Policy

- Step 1** Log in to the MRS management console.
- Step 2** Choose **Active Clusters**, select a running cluster, and click its name. to access its details page.
- Step 3** Click the **Auto Scaling** tab.
- Step 4** Toggle **Auto Scaling Policy** on or off to enable or disable an auto scaling policy.

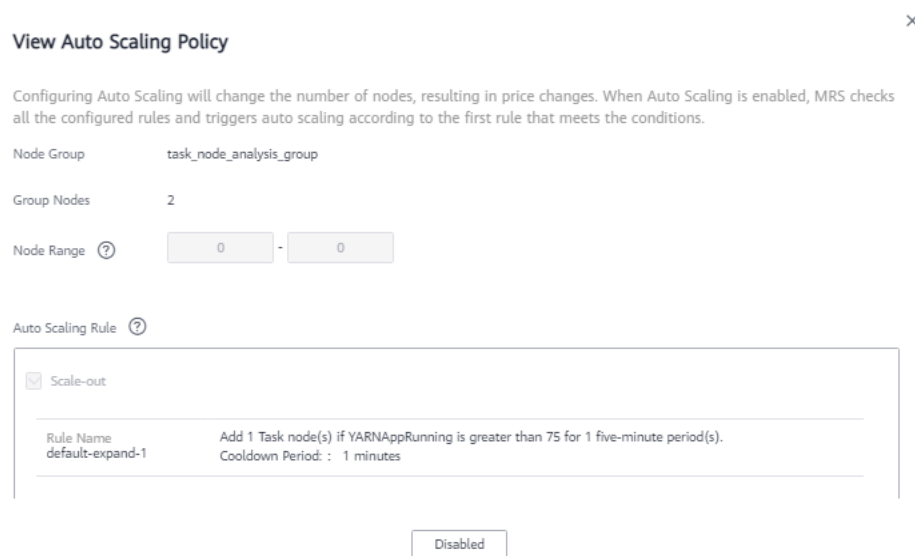

----End

2.7.10 Viewing an Auto Scaling Policy

- Step 1** Log in to the MRS management console.
- Step 2** Choose **Active Clusters**, select a running cluster, and click its name. to access its details page.

Step 3 Click the **Auto Scaling** tab.

Step 4 Click **View** on the right of the target auto scaling policy to view it.

----End

2.7.11 Configuring Automation Scripts

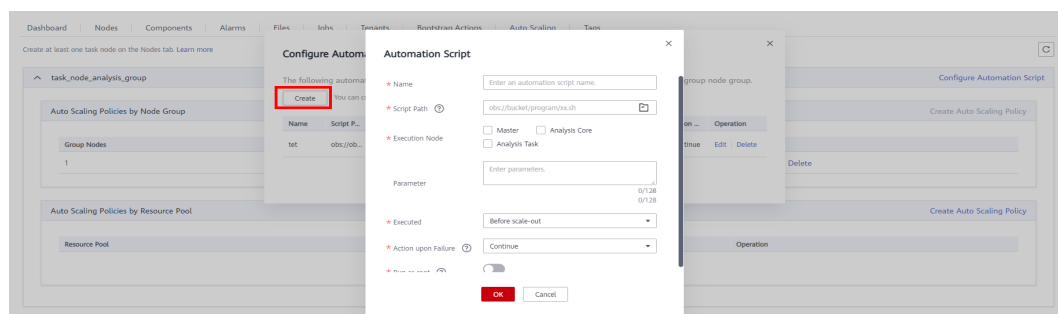

Step 1 Log in to the MRS management console.

Step 2 Choose **Active Clusters**, select a running cluster, and click its name. to access its details page.

Step 3 Click the **Auto Scaling** tab.

Step 4 Click **Configure Automation Script**.

Step 5 Click **Add**.

Step 6 Configure **Name**, **Script Path**, **Execution Node**, **Parameter**, **Executed**, and **Action upon Failure**. For details about the parameters, see [Table 2-14](#).

Step 7 Click **OK** to save the automation script configurations.

----End

2.7.12 Configuring Auto Scaling Metrics

Auto Scaling Policies by Node Group

When you add a rule, you can refer to [Table 2-11](#) to configure the corresponding metrics.

Table 2-11 Auto scaling metrics

Cluster Type	Metric	Value Type	Description
Streaming cluster	StormSlotAvailable	Integer	Number of available Storm slots Value range: 0 to 2147483646
	StormSlotAvailablePercentage	Percentage	Percentage of available Storm slots, that is, the proportion of the available slots to total slots Value range: 0 to 100
	StormSlotUsed	Integer	Number of used Storm slots Value range: 0 to 2147483646
	StormSlotUsedPercentage	Percentage	Percentage of the used Storm slots, that is, the proportion of the used slots to total slots Value range: 0 to 100
	StormSupervisorMemAverageUsage	Integer	Average memory usage of the Supervisor process of Storm Value range: 0 to 2147483646
	StormSupervisorMemAverageUsagePercentage	Percentage	Average percentage of the used memory of the Supervisor process of Storm to the total memory of the system Value range: 0 to 100
	StormSupervisorCPUAverageUsagePercentage	Percentage	Average percentage of the used CPUs of the Supervisor process of Storm to the total CPUs Value range: 0 to 6000
Analysis cluster	YARNAppPending	Integer	Number of pending tasks on YARN Value range: 0 to 2147483646

Cluster Type	Metric	Value Type	Description
	YARNAppPending Ratio	Ratio	Ratio of pending tasks on YARN, that is, the ratio of pending tasks to running tasks on YARN Value range: 0 to 2147483646
	YARNAppRunning	Integer	Number of running tasks on YARN Value range: 0 to 2147483646
	YARNContainerAllocated	Integer	Number of containers allocated to YARN Value range: 0 to 2147483646
	YARNContainerPending	Integer	Number of pending containers on YARN Value range: 0 to 2147483646
	YARNContainerPendingRatio	Ratio	Ratio of pending containers on Yarn, that is, the ratio of pending containers to running containers on YARN Value range: 0 to 2147483646
	YARNCPUAllocated	Integer	Number of virtual CPUs (vCPUs) allocated to YARN Value range: 0 to 2147483646
	YARNCPUAvailable	Integer	Number of available vCPUs on YARN Value range: 0 to 2147483646
	YARNCPUAvailablePercentage	Percentage	Percentage of available vCPUs on YARN that is, the proportion of available vCPUs to total vCPUs Value range: 0 to 100
	YARNCPUPending	Integer	Number of pending vCPUs on YARN Value range: 0 to 2147483646
	YARNMemoryAllocated	Integer	Memory allocated to YARN, in MB Value range: 0 to 2147483646
	YARNMemoryAvailable	Integer	Available memory on YARN in MB Value range: 0 to 2147483646

Cluster Type	Metric	Value Type	Description
	YARNMemoryAvailablePercentage	Percentage	Percentage of available memory on YARN that is, the proportion of available memory to total memory on YARN Value range: 0 to 100
	YARNMemoryPending	Integer	Pending memory on YARN Value range: 0 to 2147483646

 **NOTE**

- When the value type is percentage or ratio in [Table 2-11](#), the valid value can be accurate to percentile. The percentage metric value is a decimal value with a percent sign (%) removed. For example, 16.80 represents 16.80%.
- Hybrid clusters support all metrics of analysis and streaming clusters.

Auto Scaling Policies by Resource Pool

When adding a rule, you can refer to [Table 2-12](#) to configure the corresponding metrics.

 **NOTE**

Auto scaling policies can be configured for a cluster by resource pool in MRS 3.1.5 or later.

Table 2-12 Rule configuration description

Cluster Type	Metric	Value Type	Description
Analysis/Custom cluster	ResourcePoolMemoryAvailable	Integer	Available memory on YARN in the resource pool, in MB Value range: 0 to 2147483646
	ResourcePoolMemoryAvailablePercentage	Percentage	Percentage of available memory on YARN in the resource pool, that is, the proportion of available memory to total memory on YARN Value range: 0 to 100

Cluster Type	Metric	Value Type	Description
	ResourcePoolCPU Available	Integer	Number of available vCPUs on YARN in the resource pool Value range: 0 to 2147483646
	ResourcePoolCPU AvailablePercentage	Percentage	Percentage of available vCPUs on YARN in the resource pool. that is, the proportion of available vCPUs to total vCPUs Value range: 0 to 100

When you add a resource plan, you can configure parameters by referring to [Table 2-13](#).

Table 2-13 Resource plan configuration items

Parameter	Description
Effective On	The effective date of a resource plan. Daily is selected by default. You can also select one or multiple days from Monday to Sunday.
Time Range	Start time and end time of a resource plan are accurate to minutes, with the value ranging from 00:00 to 23:59 . For example, if a resource plan starts at 8:00 and ends at 10:00, set this parameter to 8:00-10:00 . The end time must be at least 30 minutes later than the start time.
Node Range	The number of nodes in a resource plan ranges from 0 to 500 . In the time range specified in the resource plan, if the number of task nodes is less than the specified minimum number of nodes, it will be increased to the specified minimum value of the node range at a time. If the number of task nodes is greater than the maximum number of nodes specified in the resource plan, the auto scaling function reduces the number of task nodes to the maximum value of the node range at a time. The minimum number of nodes must be less than or equal to the maximum number of nodes.

 NOTE

- When a resource plan is enabled, the **Default Range** value on the auto scaling page forcibly takes effect beyond the time range specified in the resource plan. For example, if **Default Range** is set to **1-2**, **Time Range** is between **08:00-10:00**, and **Node Range** is **4-5** in a resource plan, the number of Task nodes in other periods (0:00-8:00 and 10:00-23:59) of a day is forcibly limited to the default node range (1 to 2). If the number of nodes is greater than 2, auto scale-in is triggered; if the number of nodes is less than 1, auto scale-out is triggered.
- When a resource plan is not enabled, the **Default Range** takes effect in all time ranges. If the number of nodes is not within the default node range, the number of Task nodes is automatically increased or decreased to the default node range.
- Time ranges of resource plans cannot be overlapped. The overlapped time range indicates that two effective resource plans exist at a time point. For example, if resource plan 1 takes effect from **08:00** to **10:00** and resource plan 2 takes effect from **09:00** to **11:00**, the time range between **09:00** to **10:00** is overlapped.
- The time range of a resource plan must be on the same day. For example, if you want to configure a resource plan from **23:00** to **01:00** in the next day, configure two resource plans whose time ranges are **23:00-00:00** and **00:00-01:00**, respectively.

Automation Script

When you add an automation script, you can configure related parameters by referring to [Table 2-14](#).

Table 2-14 Automation script configuration description

Parameter	Description
Name	<p>Name of an automation script</p> <p>The value can contain only numbers, letters, spaces, hyphens (-), and underscores (_) and must not start with a space.</p> <p>The value can contain 1 to 64 characters.</p> <p>NOTE</p> <p>A name must be unique in the same cluster. You can configure the same name for different clusters.</p>
Script Path	<p>Script path. The value can be an OBS file system path or a local VM path.</p> <ul style="list-style-type: none">• An OBS file system path must start with obs:// and end with .sh, for example, obs://mrs-samples/xxx.sh.• A local VM path must start with a slash (/) and end with .sh. For example, the path of the example script for installing the Zepelin is /opt/bootstrap/zepelin/zepelin_install.sh.

Parameter	Description
Execution Node	<p>Select a type of the node where an automation script is executed.</p> <p>NOTE</p> <ul style="list-style-type: none"> • If you select Master nodes, you can choose whether to run the script only on the active Master nodes by enabling or disabling the Active Master switch. • If you enable it, the script runs only on the active Master nodes. If you disable it, the script runs on all master nodes. This function is disabled by default.
Parameter	<p>Automation script parameter. The following predefined variables can be imported to obtain auto scaling information:</p> <ul style="list-style-type: none"> • `\${mrs_scale_node_num}`: Number of auto scaling nodes. The value is always positive. • `\${mrs_scale_type}`: Scale-out/in type. The value can be scale_out or scale_in. • `\${mrs_scale_node_hostnames}`: Host names of the auto scaling nodes. Use commas (,) to separate multiple host names. • `\${mrs_scale_node_ips}`: IP address of the auto scaling nodes. Use commas (,) to separate multiple IP addresses. • `\${mrs_scale_rule_name}`: Name of the triggered auto scaling rule. For a resource plan, this parameter is set to resource_plan.
Executed	<p>Time for executing an automation script. The following four options are supported: Before scale-out, After scale-out, Before scale-in, and After scale-in.</p> <p>NOTE</p> <p>Assume that the execution nodes include Task nodes.</p> <ul style="list-style-type: none"> • The automation script executed before scale-out cannot run on the Task nodes to be added. • The automation script executed after scale-out can run on the added Task nodes. • The automation script executed before scale-in can run on Task nodes to be deleted. • The automation script executed after scale-in cannot run on the deleted Task nodes.
Action upon Failure	<p>Whether to continue to execute subsequent scripts and scale-out/in after the script fails to be executed.</p> <p>NOTE</p> <ul style="list-style-type: none"> • You are advised to set this parameter to Continue in the commissioning phase so that the cluster can continue the scale-out/in operation no matter whether the script is executed. • If the script fails to be executed, view the log in /var/log/Bootstrap on the cluster VM. • The scale-in operation cannot be rolled back. Therefore, the Action upon Failure can only be set to Continue after scale-in.

 NOTE

The automation script is triggered only during auto scaling. It is not triggered when the cluster node is manually scaled out or in.

2.8 Managing Data Connections

2.8.1 Configuring Data Connections

MRS data connections are used to manage external source connections used by components in a cluster. For example, if Hive metadata uses an external relational database, a data connection can be used to associate the external relational database with the Hive component.

- **Local:** Metadata is stored in the local GaussDB of a cluster. When the cluster is deleted, the metadata is also deleted. To retain the metadata, manually back up the metadata in the database in advance.
- **External data connection:** After the cluster is created, you can select **RDS PostgreSQL database** or **RDS MySQL database** that is associated with the same VPC and subnet as the current cluster. Metadata is stored in the associated database and is not deleted when the current cluster is deleted. Multiple MRS clusters can share the same metadata.

 NOTE

When Hive metadata is switched between different clusters, MRS synchronizes only the permissions in the metadata database of the Hive component. The permission model on MRS is maintained on MRS Manager. Therefore, when Hive metadata is switched between clusters, the permissions of users or user groups cannot be automatically synchronized to MRS Manager of another cluster.

Creating a Data Connection

Step 1 Log in to the MRS management console, and choose **Data Connections** in the left navigation pane.

Step 2 Click **Create Data Connection**.

For details about how to configure an RDS data connection, see [Creating an RDS Data Connection](#).

NOTE

- **RDS PostgreSQL database.** Clusters that support Hive can connect to this type of database.
- **RDS MySQL database.** Clusters that support Hive or Ranger can connect to this type of database.
- **GaussDB(for MySQL) database.** Only clusters of MRS 3.1.2-LTS.3, MRS 3.1.5, and MRS 3.3.0 can connect to this type of database.
- Currently, MRS supports **PostgreSQL 14** on RDS.
- Currently, MRS supports only **MySQL 5.7.x/MySQL 8.0x** on RDS.

For details about how to configure a LakeFormation data connection, see [Creating a LakeFormation Connection](#).

Step 3 Click **OK**.

----End

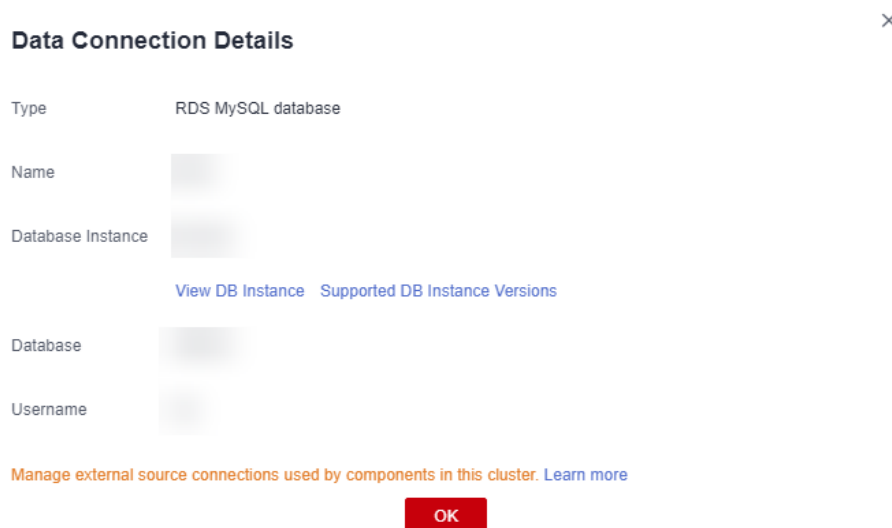

Viewing Data Connection Details

Step 1 Log in to the MRS management console, and choose **Data Connections** in the left navigation pane.

Step 2 In the data connection list, click the desired data connection. On the page that is displayed, view its details.

For example, the data connection information of the RDS MySQL database is as follows:

Figure 2-26 Viewing the data connection information of the RDS MySQL database

----End

Deleting a Data Connection

Step 1 Log in to the MRS management console, and choose **Data Connections** in the left navigation pane.

Step 2 In the **Operation** column of the data connection list, click **Delete** in the row where the data connection to be deleted is located. Enter **DELETE** in the **Delete Data Connection** dialog box and click **OK**.

If the selected data connection has been associated with a cluster, the deletion does not affect the cluster.

----End

Configuring a Data Connection During Cluster Creation

Step 1 Go to the [Buy Cluster](#) page.

Step 2 Click the **Custom Config** tab.

Step 3 When you create a cluster, **Data Connection Type** can only be set to **Local database**. For details about how to configure other parameters, see [Buying a Custom Cluster](#).

----End

2.8.2 Configuring an RDS Data Connection

2.8.2.1 Configuring an RDS Data Connection

Preparations

Step 1 Log in to the RDS management console.

Step 2 Buy an RDS DB instance. For details, see [Buying a DB Instance](#).

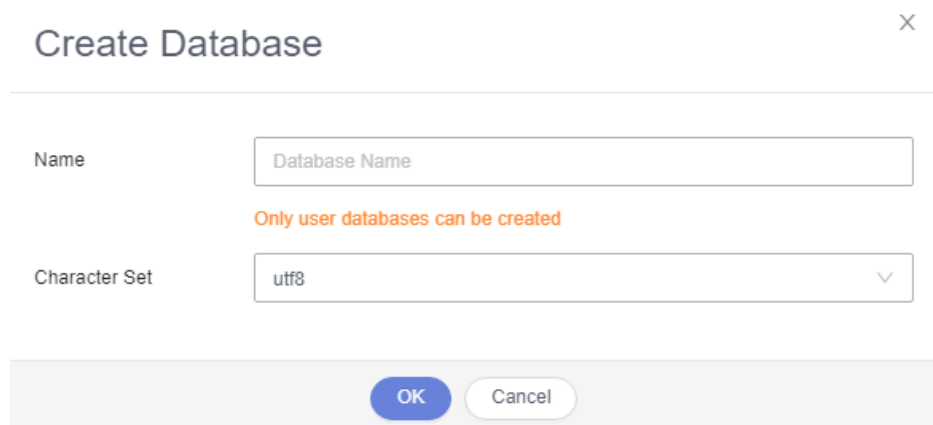

Step 3 In the left navigation pane of the RDS management console, choose **Instances**. Locate the row containing the RDS DB instance used by MRS data connections, click **More** in the **Operation** column, and select **Log In** to log in to the DB instance as user **root**.

Step 4 On the home page of the instance, click **Create Database** to create a database.

NOTE

If no new database is created, the MRS data connections will fail to configure.

Create Database

Name

Character Set

Only user databases can be created

OK Cancel

Step 5 On the top of the page, choose **Account Management > User Management**.

NOTE

If the selected data connection is **RDS MySQL database**, ensure that the database user is user **root**. If the user is not **root**, perform **Step 5** to **Step 7**.

Step 6 Click **Create User** to create a non-root user and select all permissions listed in **Global Permissions**.

The screenshot shows the 'Create User' form in the User Management interface. The form is organized into several sections:

- Basic Information:** Contains fields for Username (mrs_test01), Host (%), Password, and Confirm Password. There is an 'Add DAS IP Address' button next to the Host field.
- Advanced Settings:** A section that is currently collapsed.
- Global Permissions:** A section with a list of permissions:
 - Permission (checked)
 - SELECT (checked)
 - INSERT (checked)
 - UPDATE (checked)
 - DELETE (checked)
 - CREATE (checked)
- Object Permissions:** A section that is currently collapsed.
- Role:** A section that is currently collapsed.

Step 7 On the top of the page, choose **SQL Operations > SQL Query**, switch to the target database by database name, and run the following SQL statements to grant permissions to the database user. In the following statements, *db_name* and *db_user* indicate the name of the database to be connected to MRS and the name of the new user, respectively.

```
grant all privileges on db_name.* to db_user'@%' with grant option;
grant reload on *.* to db_user'@%' with grant option;
flush privileges;
```

Step 8 Create a data connection by referring to [Creating an RDS Data Connection](#).

----End

Creating an RDS Data Connection

Create an RDS data connection for an existing MRS cluster.

Step 1 Log in to the MRS management console, and choose **Data Connections** in the left navigation pane.

Step 2 Click **Create Data Connection**.

Step 3 Configure parameters according to [Table 2-15](#).

Table 2-15 Parameters for creating a data connection

Parameter	Description
Type	<p>The type of an external source connection. Value options are as follows:</p> <ul style="list-style-type: none"> • RDS PostgreSQL database. Clusters that support Hive can connect to this type of database. • RDS MySQL database. Clusters that support Hive or Ranger can connect to this type of database. • GaussDB(for MySQL) database. Only clusters of MRS 3.1.2-LTS.3, MRS 3.1.5, and MRS 3.3.0 can connect to this type of database.
Name	The name of a data connection.

Parameter	Description
Database Instance	<p>The RDS database instance. This instance must be created in RDS before being referenced here, and the database must have been created. For details, see Preparations. Click View DB Instance to view the created DB instances.</p> <p>NOTE</p> <ul style="list-style-type: none"> • To ensure network communications between the cluster and the PostgreSQL database, create the instance in the same VPC and subnet as the cluster. • The inbound rule of the security group of the RDS DB instance must allow access of the instance to port 3306. To configure that, click the instance name on the RDS console to go to the instance management page. In the Connection Information area, click the name next to Security Group. On the page that is displayed, click the Inbound Rules tab, and click Add Rule. In the displayed Add Inbound Rule dialog box, in the Protocol & Port area, select TCP and enter port number 3306. In the Source area, select IP address and enter the IP addresses of all nodes where the MetaStore instances of Hive are located. • Currently, MRS supports PostgreSQL 14 on RDS. • Currently, MRS supports only MySQL 5.7.x/MySQL 8.0.x on RDS.
Database	The name of the database to be connected to.
Username	The username for logging in to the database to be connected.
Password	The password for logging in to the database to be connected.

NOTE

When **Type** is set to **RDS MySQL database** or **GaussDB(for MySQL)**, **Username** must be **root**. If the user is not **root**, perform operations by referring to [Preparations](#).

Step 4 Click **OK**.

----End

2.8.2.2 Configuring a Ranger Data Connection

Switch the Ranger metadata of the existing cluster to the metadata stored in the RDS database. This operation enables multiple MRS clusters to share the same metadata, and the metadata will not be deleted when the clusters are deleted. In this way, Ranger metadata migration is not required during cluster migration.

Prerequisites

You have created an RDS MySQL database instance by referring to [Creating an RDS Data Connection](#).

NOTE

- For versions earlier than MRS 3.x, if **Type** is set to **RDS MySQL database**, **Username** must be **root**. If the user is not **root**, create a user and grant permissions to the user by referring to [Preparations](#).
- For MRS 3.x or later clusters, when **Type** is set to **RDS MySQL database**, **Username** must not be **root**. In this case, create a user and grant permissions to the user by referring to [Preparations](#).

Preparing for MySQL Database Ranger Metadata Configuration

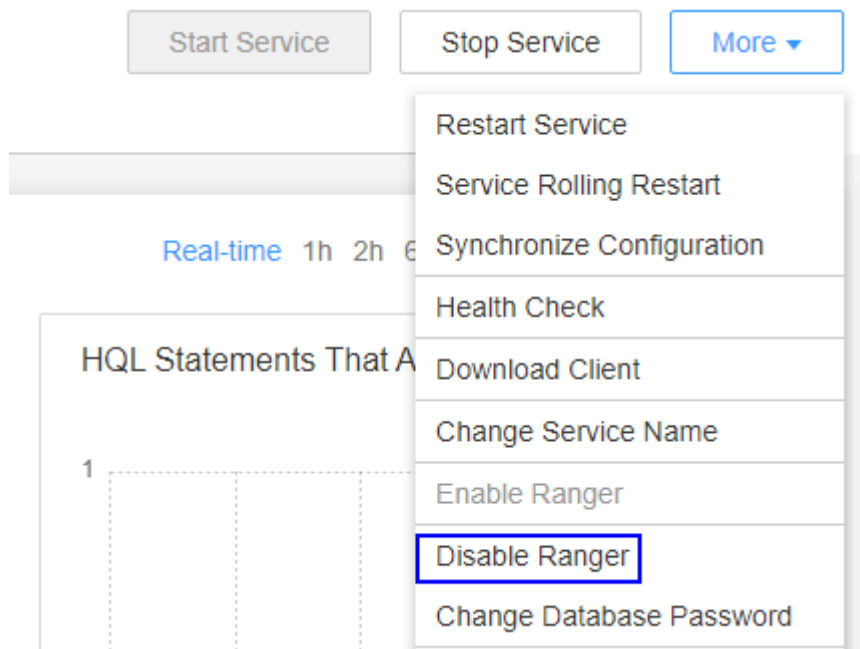

This operation is required only for **MRS 3.1.0 or later**.

Step 1 Log in to FusionInsight Manager. For details, see [Accessing FusionInsight Manager \(MRS 3.x or Later\)](#). Choose **Clusters** > **Services** > *Service name*.

Currently, the following components in an MRS 3.1.x cluster support Ranger authentication: HDFS, HBase, Hive, Spark, Impala, Storm, and Kafka.

Step 2 In the upper right corner of the **Dashboard** page, click **More** and select **Disable Ranger**. If **Disable Ranger** is dimmed, Ranger authentication is disabled, as shown in [Figure 2-28](#).

Figure 2-28 Disabling Ranger authentication

Step 3 (Optional) To use an existing authentication policy, perform this step to export the authentication policy on the Ranger web page. After the Ranger metadata is switched, you can import the existing authentication policy again. The following uses Hive as an example. After the export, a policy file in JSON format is generated in a local directory.

1. Log in to FusionInsight Manager.
2. Choose **Cluster** > **Services** > **Ranger** to go to the Ranger service overview page.

3. Click **RangerAdmin** in the **Basic Information** area to go to the Ranger web UI.
The **admin** user in Ranger belongs to the **User** type. To view all management pages, click the username in the upper right corner and select **Log Out** to log out of the system.
4. Log in to the system as user **rangeradmin** (default password: **Rangeradmin@123**) or another user who has the Ranger administrator permissions. For details about the users and their default passwords, see User Account List.
5. Click the export button  in the row where the Hive component is located to export the authentication policy.

Figure 2-29 Exporting authentication policies

6. Click **Export**. After the export is complete, a policy file in JSON format is generated in a local directory.

Figure 2-30 Exporting Hive authentication policies

----End

Configuring a Data Connection for an MRS Cluster

- Step 1** Log in to the MRS console.
- Step 2** Click the name of the cluster to view its details.
- Step 3** Click **Manage** on the right of **Data Connection** to go to the data connection configuration page.
- Step 4** Click **Configure Data Connection** and set related parameters.
 - **Component Name:** Ranger
 - **Module Type:** Ranger metadata
 - **Connection Type:** RDS MySQL database
 - **Connection Instance:** Select a created RDS MySQL DB instance. For details about how to create a data connection, see [Creating an RDS Data Connection](#).
- Step 5** Select **I understand the consequences of performing the scale-in operation** and click **Test**.

Step 6 After the test is successful, click **OK** to complete the data connection configuration.

Step 7 Log in to FusionInsight Manager.

Step 8 Choose **Cluster > Services > Ranger** to go to the Ranger service overview page.

Step 9 Choose **More > Restart Service** or **More > Service Rolling Restart**.

If you choose **Restart Service**, services will be interrupted during the restart. If you select **Service Rolling Restart**, rolling restart can minimize the impact or do not affect service running.

Restarting Ranger will affect the permissions of all components controlled by Ranger and may affect service running. Restart Ranger when the cluster is idle or during off-peak hours. Before the Ranger component is restarted, the policies in the Ranger component still take effect.

Figure 2-31 Restarting a service

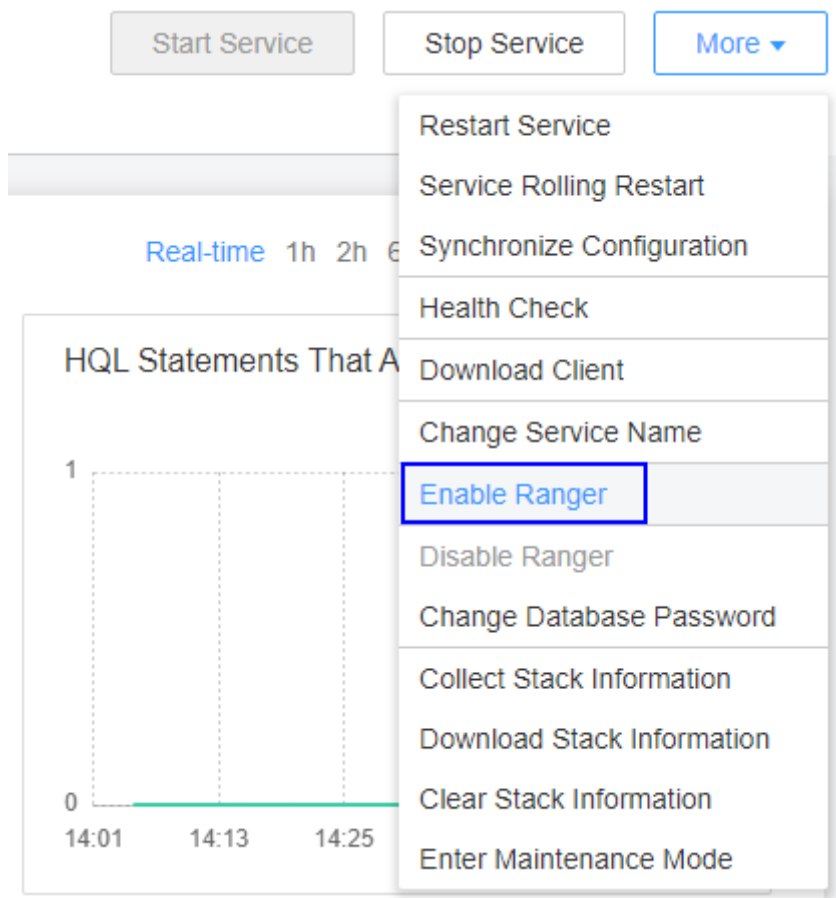

Step 10 Enable Ranger authentication for the component to be authenticated. The Hive component is used as an example.

Currently, the following components in an MRS 3.1.x cluster support Ranger authentication: HDFS, HBase, Hive, Spark, Impala, Storm, and Kafka.

1. Log in to FusionInsight Manager and choose **Cluster > Services > Service Name**.
2. In the upper right corner of the **Dashboard** page, click **More** and select **Enable Ranger**.

Figure 2-32 Enabling Ranger authentication

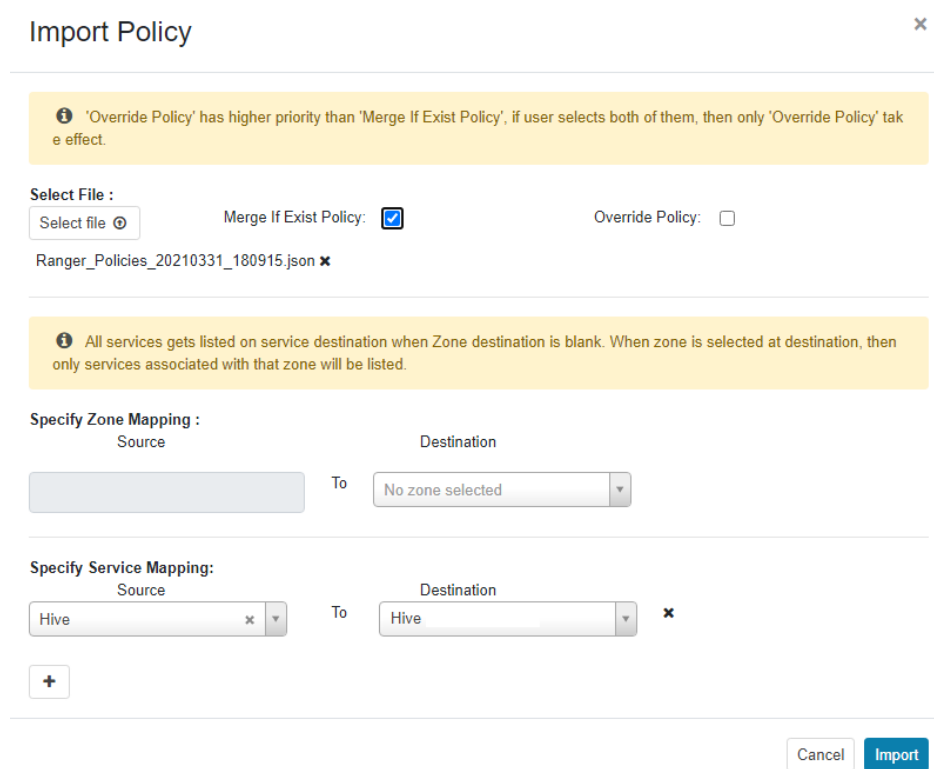

Step 11 Log in to the Ranger web UI and click the import button  in the row of the Hive component.

Step 12 Import parameters.

- Click **Select file** and select the authentication policy file downloaded in [Step 3.6](#).
- Select **Merge If Exist Policy**.

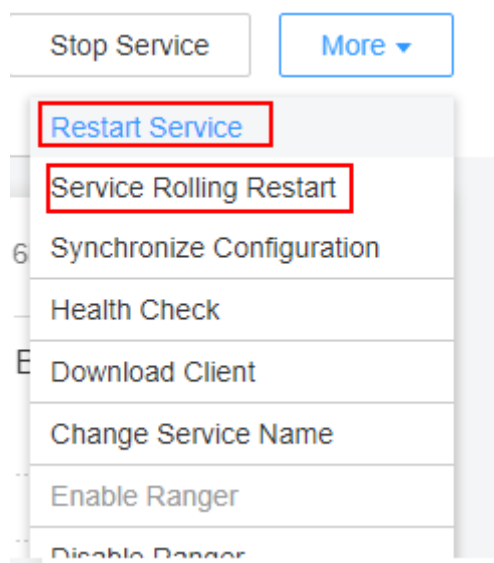

Figure 2-33 Importing authentication policies

Step 13 Restart the component for which Ranger authentication is enabled.

1. Log in to FusionInsight Manager.
2. Choose **Cluster > Services > Hive** to go to the Hive service overview page.
3. Choose **More > Restart Service** or **More > Service Rolling Restart**.

Figure 2-34 Restarting a service

If you choose **Restart Service**, services will be interrupted during the restart. If you select **Service Rolling Restart**, rolling restart can minimize the impact or do not affect service running.

----End

2.8.2.3 Configuring a Hive Data Connection

This section describes how to switch the Hive metadata of an active cluster to the metadata stored in a local database or RDS database after you buy a cluster. This operation enables multiple MRS clusters to share the same metadata, and the metadata will not be deleted when the clusters are deleted. In this way, Hive metadata migration is not required during cluster migration.

NOTE

- When Hive metadata is switched between different clusters, MRS synchronizes only the permissions in the metadata database of the Hive component. The permission model on MRS is maintained on MRS Manager. Therefore, when Hive metadata is switched between clusters, the permissions of users or user groups cannot be automatically synchronized to MRS Manager of another cluster.
- For clusters whose version is earlier than MRS 3.x, if the selected data connection is **RDS MySQL database**, ensure that the database user is **root**. If the user is not **root**, create a user and grant permissions to the user by referring to [Preparations](#).
- For MRS 3.x or later clusters, when **Type** is set to **RDS MySQL database**, **Username** must not be **root**. In this case, create a user and grant permissions to the user by referring to [Preparations](#).

Configuring a Hive Data Connection

This function is not supported in MRS 3.0.5.

- Step 1** Log in to the MRS console. In the navigation pane on the left, choose **Active Clusters**.
- Step 2** Click the name of a cluster to go to the cluster details page.
- Step 3** On the **Dashboard** tab page, click **Manage** next to **Data Connection**.
- Step 4** On the **Data Connection** dialog box, the data connections associated with the cluster are displayed. You can click **Edit** or **Delete** to edit or delete the data connections.
- Step 5** If there is no associated data connection on the **Data Connection** dialog box, click **Configure Data Connection** to add a connection.

NOTE

Only one data connection can be configured for a module type. For example, after a data connection is configured for Hive metadata, no other data connection can be configured for it. If no module type is available, the **Configure Data Connection** button is unavailable.

Table 2-16 Configuring a Hive data connection

Parameter	Description
Component	Hive

Parameter	Description
Module Type	Hive metadata
Data Connection Type	<ul style="list-style-type: none"> • RDS PostgreSQL database (supported for clusters of MRS 1.9.x) • RDS MySQL database • Local database
Instance	<p>This parameter is valid only when Data Connection Type is set to RDS PostgreSQL database or RDS MySQL database. Select the name of the connection between the MRS cluster and the RDS database. This instance must be created before being referenced here. You can click Create Data Connection to create a data connection. For details, see Creating an RDS Data Connection.</p>

Figure 2-35 Configuring a data connection

Configure Data Connection

Component Name

Module Type

Data Connection Type

Instance [Create Data Connection](#)

Step 6 Click **Test** to test connectivity of the data connection.

Step 7 After the data connection is successful, click **OK**.

 NOTE

- After Hive metadata is configured, restart Hive. Hive will create necessary database tables in the specified database. (If tables already exist, they will not be created.)
- Before restarting the Hive service, ensure that the driver package has been installed on all nodes where Metastore instances are located.
 - Postgres: Use the open source Postgres driver package to replace the existing one of the cluster. Upload the PostgreSQL driver package **postgresql-42.2.5.jar** to the `$(BIGDATA_HOME)/third_lib/Hive` directory on all MetaStore nodes. To download the open source driver package, visit <https://repo1.maven.org/maven2/org/postgresql/postgresql/42.2.5/>.
 - MySQL: Go to the MySQL official website (<https://www.mysql.com/>). Choose **DOWNLOADS** and click **MySQL Community (GPL) Downloads**. On the displayed page, click **Connector/J** to download the driver package of the corresponding version and upload the driver package to the `/opt/Bigdata/FusionInsight_HD_*/install/FusionInsight-Hive-*/hive-*/lib/` directory on all RDSMetastore nodes.

----End

2.8.3 Configuring a LakeFormation Data Connection

2.8.3.1 Scenario

LakeFormation is a one-stop enterprise-class data lake and warehouse construction service. It provides APIs and a GUI for unified management of data lake metadata, and is compatible with Hive metadata and Ranger permission models. LakeFormation can connect to multiple compute engines and big data cloud services seamlessly to ensure quick building and easy operation of data lakes and unleash rich value of service data.

You can create a LakeFormation instance and connect it to an MRS cluster for centrally manage data lake metadata and permission.

Restrictions and Constraints

The restrictions and constraints of interconnecting LakeFormation with MRS clusters are as follows.

- **Before interconnecting LakeFormation with MRS clusters, pay attention to the following restrictions:**
 - MRS clusters and LakeFormation instances must belong to the same cloud account and region.
 - The VPC where the access client created by LakeFormation resides must be in the same VPC as MRS clusters.
 - MRS clusters can only interconnect with Hive Catalog of LakeFormation instances.
 - For existing MRS clusters, you need to migrate the metadata database and permission policies to the LakeFormation instance, and then configure the interconnection.
- **After MRS is interconnected with LakeFormation, MRS components are subject to the following constraints:**

- Hive does not support temporary tables.
- Hive does not support cross-cluster column encryption.
- Hive WebHCat cannot interconnect with LakeFormation.
- If the table directory is not empty when Hive creates an internal table, the table cannot be created.
- Before creating a Hudi table, you need to add the path authorization of the Hudi table directory on LakeFormation to grant OBS read and write permissions.
- Fields in a Hudi table cannot be edited on the LakeFormation console. You can only add, delete, or modify table fields on the Hudi client.
- When Flink reads and writes Hive tables, only **hive_sync.mode=jdbc** can be used to synchronize Hive tables. HMS is not supported.
- When Spark tries to access the **default** library on the client, it needs permission for the OBS path. If Spark uses a user account that lacks this permission, the client shows a message saying so. However, this does not affect the database creation, which still succeeds.
- **After MRS is interconnected with LakeFormation, the permission policy restrictions are as follows:**
 - In LakeFormation authorization, only LakeFormation roles can be used as authorization entities. Users or user groups cannot be used as authorization entities.
 - The PolicySync process does not modify the default policy of the RangerAdmin Hive module in the cluster. The default policy still takes effect.
 - After the PolicySync process is started, it compares the permissions with those of LakeFormation instances and deletes the non-default policies that do not exist in LakeFormation. You are advised to migrate the permission policies to LakeFormation instances first.
 - For the Hive module on the RangerAdmin web UI, do not add or delete non-default policies. Grant permissions on the data permission page of LakeFormation instances.
 - After the interconnection between the MRS cluster and LakeFormation is canceled, the non-default policies of RangerAdmin will not be cleared. You need to manually clear them.
 - Hive does not support SQL statements for granting permissions. You need to grant permissions on the **Data Permissions** page.

2.8.3.2 Preparations

Creating a LakeFormation Instance

Step 1 Log in to the Huawei Cloud management console, click  in the upper left corner, and choose **Analytics > DataArts LakeFormation**. The LakeFormation console is displayed.

Step 2 Click **Buy Instance** in the upper right corner of the page and create a LakeFormation instance by referring to [Creating a LakeFormation Instance](#).

Step 3 Create the **hive** catalog and the **default** database. If the catalog and database already exist in the instance, skip this step. For details, see [Managing Metadata](#).

MRS can interconnect with LakeFormation only when the catalog name of the LakeFormation instance is **hive**.

1. Ensure that the instance name displayed in the upper left corner is the name of the newly created instance. Then, choose **Metadata** > **Catalog** page. You only need one **hive** catalog per instance. If you already have one in the current instance, you can skip creating another one.
2. Click **Create** in the upper right corner. On the displayed page, set the following parameters, and click **Submit**.
 - **Catalog Name:** Enter **hive**. Do not use custom names.
 - **Select Location:** Click **+** to select the OBS storage path corresponding to the catalog, for example, **obs://lakeformation-test/hive** (which must be an existing path), and click **OK**.
 - Set other parameters based on the site requirements.

< Create Catalog

Basic Information

* Catalog Name Select +
Location

Catalog Type Description

Database Storage Locations

Add

No.	Location
-----	----------

Submit Cancel

3. In the navigation pane on the left, choose **Metadata** > **Database**, click **Create Database**, configure the following parameters, and click **Submit**. You only need one **default** database per instance. If you already have one in the current instance, you can skip creating another one.
 - **Database Name:** Enter **default**. Do not use custom names.
 - **Catalog:** **hive**
 - **Select Location:** Click **+** to select a location in the Hive Catalog storage path, for example, **obs://lakeformation-test/hive/default** (which must be an existing path), and click **OK**.
 - Set other parameters based on the site requirements.

Step 4 Choose **Data Permissions > Data Authorization** in the navigation pane on the left. On the displayed page, you can grant permissions to access Hive Catalog to users and user groups based on service requirements. For details, see [Granting Permissions](#).

Step 5 Choose **Clients** in the navigation pane on the left. Click **Create** to create a client for access management. The VPC and Subnet must be the same as those of the MRS cluster you want to interconnect. For details, see [Managing Access Clients](#).

You can obtain the VPC and subnet of the MRS cluster on the **Dashboard** page of the cluster on the MRS management console.

Go to the client details page, record the access IP address of the client.

----End

Creating an Agency for Interconnecting with LakeFormation

Step 1 Log in to Huawei Cloud management console and go to the **Identity and Access Management** console page.

Step 2 In the navigation pane on the left, choose **Agencies**. Click **Create Agency** in the upper right corner, set related parameters, and click **Next**.

Refer to the following descriptions to configure the parameters:

- **Agency Name:** For example, enter **visit_lakeformation_agency**.
- **Agency Type:** Select **Account**.
- **Delegated Account:** Enter the name of the delegated Huawei Cloud account.
- **Validity Period:** Set this parameter as you need.

Figure 2-36 Creating an agency

The screenshot shows the 'Create Agency' form in the Huawei Cloud management console. The form is titled 'Agencies / Create Agency'. It contains the following fields and options:

- Agency Name:** A text input field.
- Agency Type:** Two radio button options: **Account** (selected) and **Cloud service**. Below the **Account** option is the text: 'Delegate another Huawei Cloud account to perform operations on your resources.' Below the **Cloud service** option is the text: 'Delegate a cloud service to access your resources in other cloud services.'
- Delegated Account:** A text input field.
- Validity Period:** A dropdown menu with 'Unlimited' selected.
- Description:** A text area with a character count of '0/255' at the bottom right.

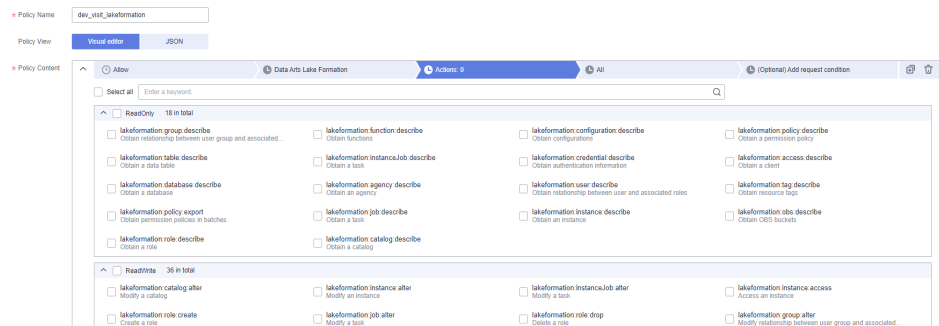

At the bottom of the form, there are two buttons: a red **Next** button and a white **Cancel** button.

Step 3 In the upper right corner of the **Select Policy/Role** page, click **Create Policy**, configure the following information, and click **Next**.

- **Policy Name:** For example, enter **dev_visit_lakeformation**.
- **Policy View:** Select **Visual editor** or **JSON**.
- **Policy Content:**

The policy must contain **lakeformation:policy:export** and **lakeformation:role:describe**. Set other parameters as you need.

- If you are using the visual editor, set the **Policy Content** as follows: Select **Data Arts LakeFormation** for **Cloud Service** and select the required permissions in **Actions**. Set other parameters as you need.

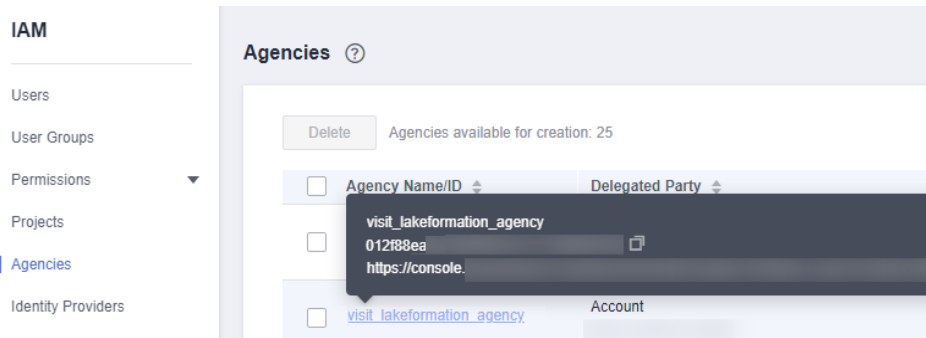

- If you are using the JSON view, configure the policy content by referring to the following content:

```
{
  "Version": "1.1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "lakeformation:table:create",
        "lakeformation:database:alter",
        "lakeformation:table:alter",
        "lakeformation:database:drop",
        "lakeformation:database:create",
        "lakeformation:role:describe",
        "lakeformation:policy:create",
        "lakeformation:policy:export",
        "lakeformation:function:alter",
        "lakeformation:function:describe",
        "lakeformation:table:drop",
        "lakeformation:catalog:describe",
        "lakeformation:table:describe",
        "lakeformation:function:drop",
        "lakeformation:database:describe",
        "lakeformation:function:create",
        "lakeformation:transaction:operate"
      ]
    }
  ]
}
```

Step 4 Select the new policy name, for example, **dev_visit_lakeformation**, and click **Next**.

Step 5 Select the desired scope requiring minimum authorization and click **OK** to create an agency.

Step 6 On the **Agencies** page, move the cursor to the name of the newly created agency to obtain the ID of the agency that has the permission to access LakeFormation.

----End

Creating an Agency for Interconnecting with OBS

Step 1 Log in to Huawei Cloud management console and go to the **Identity and Access Management** console page.

Step 2 In the navigation pane on the left, choose **Agencies**. Click **Create Agency** in the upper right corner, set related parameters, and click **Next**.

Refer to the following descriptions to set the parameters:

- **Agency Name:** For example, enter **visit_obs_agency**.
- **Agency Type:** Select **Account**.
- **Delegated Account:** Enter the name of the delegated Huawei Cloud account.
- **Validity Period:** Set this parameter as you need.

Step 3 In the upper right corner of the **Select Policy/Role** page, click **Create Policy**, configure the following information, and click **Next**.

- **Policy Name:** For example, enter **dev_visit_obs**.
- **Policy View:** Select **JSON**.
- **Policy Content:** Enter the following information.

```
{
  "Version": "1.1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "obs:bucket:GetBucketLocation",
        "obs:bucket:ListBucketMultipartUploads",
        "obs:object:GetObject",
        "obs:object:ModifyObjectMetaData",
        "obs:object:DeleteObject",
        "obs:object:ListMultipartUploadParts",
        "obs:bucket:HeadBucket",
        "obs:object:AbortMultipartUpload",
        "obs:bucket:ListBucket",
        "obs:object:PutObject"
      ],
      "Resource": [
        "OBS:*:*:bucket:*",
        "OBS:*:*:object:*"
      ]
    }
  ]
}
```

NOTE

In the **Resource** parameter, **bucket** indicates the OBS bucket name, and **object** indicates the OBS object name. Specify the names as needed. If this parameter is set to *, the policy applies to all OBS buckets or objects.

- Set other parameters as you need.

Step 4 Select the new policy name, for example, **dev_visit_obs**, and click **Next**.

Step 5 Select the desired scope requiring minimum authorization and click **OK** to create an agency.

Step 6 On the **Agencies** page, move the cursor to the name of the newly created agency to obtain the ID of the agency that has the permission to access OBS.

----End

Creating an ECS/BMS Agency

Step 1 Log in to Huawei Cloud management console and go to the **Identity and Access Management** console page.

Step 2 In the navigation pane on the left, choose **Agencies**. Click **Create Agency** in the upper right corner, set related parameters, and click **Next**.

Refer to the following descriptions to set the parameters:

- **Agency Name:** For example, enter **lakeformation_test**.
- **Agency Type:** Select **Cloud service**.
- **Cloud Service:** Select **ECS BMS**.
- **Validity Period:** Set this parameter as you need.

Step 3 In the upper right corner of the **Select Policy/Role** page, click **Create Policy**, configure the following information, and click **Next**.

- **Policy Name:** Enter a policy name.
- **Policy View:** Select **JSON**.
- **Policy Content:** Configure the parameter as follows.

```
{
  "Version": "1.1",
  "Statement": [
    {
      "Action": [
        "iam:agencies:assume"
      ],
      "Resource": {
        "uri": [
          "/iam/agencies/ID of the agency that grants LakeFormation access permission to your account",
          "/iam/agencies/ID of the agency that grants the OBS access permission to your account"
        ]
      },
      "Effect": "Allow"
    }
  ]
}
```

NOTE

- To obtain the ID of the agency that has the permission to access LakeFormation, refer to [Step 6](#).
- To obtain the ID of the agency that has the permission to access OBS, refer to [Step 6](#).

Step 4 Select the name of the newly created custom agency and click **Next**.

Step 5 Select the desired scope requiring minimum authorization and click **OK** to create an agency.

----End

Creating a LakeFormation Connection

NOTE

You need to contact technical support to be added in the whitelist before you create a LakeFormation data connection.

- Step 1** Log in to the MRS management console, and choose **Data Connections** in the left navigation pane.
- Step 2** Click **Create Data Connection**.
- Step 3** Set parameters by referring to [Table 2-17](#) and click **OK**.

Table 2-17 LakeFormation data connection

Parameter	Description
Type	Select LakeFormation . Only MRS 3.3.0-LTS supports this connection type.
Name	The name of a data connection.
LakeFormation Instance	Select an instance name. This instance is created in the LakeFormation console before being referenced here. For details about how to create the instance, see Creating a LakeFormation Instance . Click View instances to view created instances.
VPC	It must be in the same VPC as the MRS cluster you want to interconnect.
Subnet	Subnet name
VPC Endpoint	Select a VPC endpoint or click Create VPC endpoints for LakeFormation Instance. After you select a VPC endpoint, you will be charged by the VPCEP service.
LakeFormation Agency	Select Available agencies and select the agency created in Creating an Agency for Interconnecting with LakeFormation , for example, <code>visit_lakeformation_agency</code> .

LakeFormation Agency: MRS_LAKEFORMA... Available agencies ?

↻

[Manage external source connections used by components in this cluster. Learn more](#)

OK Cancel

Step 4 Record the ID of the created data connection on the **Data Connections** page.

----End

Obtaining the Account ID

Step 1 Log in to the management console as the user for interconnecting MRS with LakeFormation.

Step 2 Hover over the username and choose **My Credentials** from the drop-down list.

Step 3 On the **API Credentials** page, obtain the **Account ID** and view the **Project ID** in the project list.

IAM User Name: Account Name:

IAM User ID: Account ID: 20490i

Projects

Project ID	Project Name	Region
1c0fbdb		

Step 4 Grant the user the permission to use LakeFormation.

1. Click in the upper left corner and choose **Analytics > LakeFormation**.
2. Check whether the authorization page is displayed, or go to the **Service Authorization** page to check whether the service has been authorized.

- If yes, select the checkbox next to **I have read and agree with the LakeFormation Service Statement.** and click **Authorize.**
- If no, the user already has the permission to perform operations on LakeFormation.

----End

2.8.3.3 Configuring a LakeFormation Data Connection During Cluster Creation

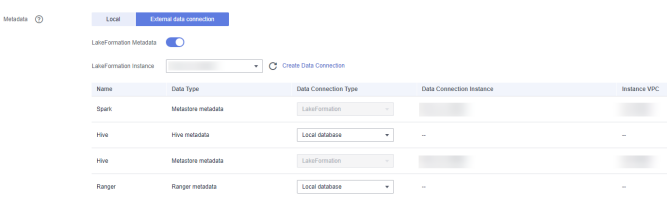

You can configure a LakeFormation data connection when you create an MRS 3.3.0-LTS cluster. You need to configure MRS cluster parameters to interconnect with LakeFormation after the cluster is created.

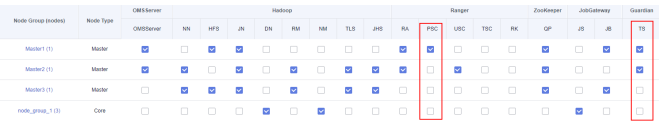

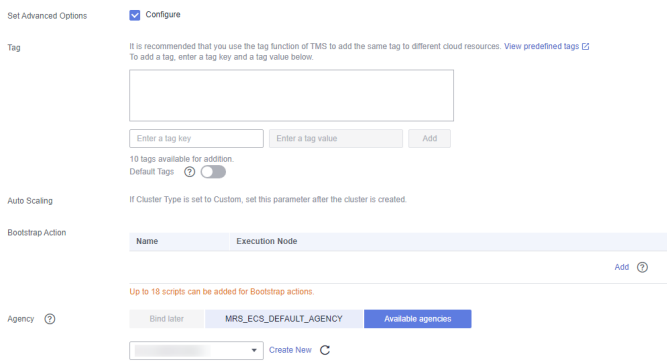

Configuring a LakeFormation Data Connection During Cluster Creation

- Step 1** Go to the [Buy Cluster](#) page.
- Step 2** Click **Buy Cluster.** The page for buying a cluster is displayed.
- Step 3** On the page for buying a cluster, click the **Custom Config** tab.
- Step 4** Create a cluster by referring to [Configuring Custom Topology.](#) The cluster must meet the requirements described in [Table 2-18.](#)

Table 2-18 Data connection parameters

Parameter	Description
Version Type	LTS
Cluster Version	Version of the MRS cluster to be interconnected Currently, LakeFormation data connections can be configured during creation of MRS 3.3.0-LTS clusters and later versions only.

Parameter	Description																									
Component	<p>Components such as Hadoop, Ranger, Hive, Guardian, Spark (optional), and Flink (optional) must be included. For example, the following figure shows an example configuration. The configuration may vary depending on the cluster version.</p>  <p>The screenshot shows a table of components with columns for Name, Version, and Description. The components listed are: Hadoop (3.3.1), Spark (3.3.1), HBase (2.4.14), Hive (3.1.0), Loader (1.99.3), Kafka (2.152.8.1), Flume (1.11.0), Flink (1.15.0), Oozie (5.1.0), ZooKeeper (3.8.1), HdfsEngine (2.0.0), Ranger (2.3.0), Tez (0.10.2), ClickHouse (23.2.17), HlTD (1.1.0), JobGateway (1.0.0), and Guardian (0.1.0). Checkmarks are present next to Hadoop, Spark, Flink, Ranger, JobGateway, and Guardian.</p>																									
Metadata	<p>Select External data connection and set the following parameters:</p> <ol style="list-style-type: none"> LakeFormation Metadata: Enable this function. LakeFormation Instance: Select the LakeFormation data connection created in Creating a LakeFormation Connection. Data Connection Type: Retain the default value. <p>For example, the following figure shows an example configuration. The configuration may vary depending on the cluster version.</p>  <p>The screenshot shows the Metadata configuration page. The 'External data connection' tab is selected. The 'LakeFormation Metadata' toggle is turned on. Below it, there is a dropdown for 'LakeFormation instance' and a 'Create Data Connection' button. A table lists data connections for Spark, Hive, and Ranger. The table has columns: Name, Data Type, Data Connection Type, Data Connection Instance, and Instance VPC.</p> <table border="1" data-bbox="742 1422 1332 1556"> <thead> <tr> <th>Name</th> <th>Data Type</th> <th>Data Connection Type</th> <th>Data Connection Instance</th> <th>Instance VPC</th> </tr> </thead> <tbody> <tr> <td>Spark</td> <td>Metastore metadata</td> <td>LakeFormation</td> <td>[Instance]</td> <td>[VPC]</td> </tr> <tr> <td>Hive</td> <td>Hive metadata</td> <td>Local database</td> <td>--</td> <td>--</td> </tr> <tr> <td>Hive</td> <td>Metastore metadata</td> <td>LakeFormation</td> <td>[Instance]</td> <td>[VPC]</td> </tr> <tr> <td>Ranger</td> <td>Ranger metadata</td> <td>Local database</td> <td>--</td> <td>--</td> </tr> </tbody> </table>	Name	Data Type	Data Connection Type	Data Connection Instance	Instance VPC	Spark	Metastore metadata	LakeFormation	[Instance]	[VPC]	Hive	Hive metadata	Local database	--	--	Hive	Metastore metadata	LakeFormation	[Instance]	[VPC]	Ranger	Ranger metadata	Local database	--	--
Name	Data Type	Data Connection Type	Data Connection Instance	Instance VPC																						
Spark	Metastore metadata	LakeFormation	[Instance]	[VPC]																						
Hive	Hive metadata	Local database	--	--																						
Hive	Metastore metadata	LakeFormation	[Instance]	[VPC]																						
Ranger	Ranger metadata	Local database	--	--																						
VPC	VPC where the LakeFormation data connection belongs.																									
Subnet	Subnet name																									

Parameter	Description
Topology Adjustment	<p>Cluster node topology. Select Enable and ensure that at least one PolicySync (PSC) instance is on a Ranger node which also has the RangerAdmin (RA) instance and at least two TokenSever (TS) instances are added to the Guardian component.</p> <p>For example, the following figure shows an example configuration. The configuration may vary depending on the cluster version.</p> 
Kerberos Authentication	Enable this function.
Agency	<p>Select Configure next to Set Advanced Options, select Available agencies for Agency, and select the agency created in Creating an ECS/BMS Agency.</p> <p>For example, the following figure shows an example configuration. The configuration may vary depending on the cluster version.</p> 

Step 5 Click the name of the created MRS cluster on the **Active Clusters** page. In the displayed tab, click **Synchronize** next to **IAM User Sync** to synchronize IAM users.

O&M Management

MRS Manager 

Access Manager 

IAM User Sync 

Synchronized **Synchronize**

Step 6 Refer to [Configuring the MRS 3.3.0-LTS Cluster](#) to configure decoupled storage and compute and download the client.

----End

Configuring the MRS 3.3.0-LTS Cluster

Step 1 Log in to FusionInsight Manager of the MRS cluster. For details, see [Accessing FusionInsight Manager \(MRS 3.x or Later\)](#).

Step 2 Configure the Guardian component.

1. On FusionInsight Manager, click **Cluster**, choose **Services > Guardian**, click **Configurations**, and then **All Configurations**. Search for and modify the following parameters, and click **Save**.

Table 2-19 Guardian parameters

Parameter	Description	Value
token.server.access.iam.domain.id	Account ID of the user who accesses IAM Obtain the account ID by referring to Obtaining the Account ID .	xxx
token.server.access.iam.project.id	Project ID of the user who accesses IAM Obtain the project ID by referring to Obtaining the Account ID .	xxx
token.server.access.label.agency.name	Name of an IAM agency. The agency must have the permission to access OBS. Set the value to the name of the agency created in Creating an Agency for Interconnecting with OBS .	visit_obs_agency
fs.obs.delegation.token.providers	Name of the class that generates delegation.token . The default value is empty. Select both the following parameters: <ul style="list-style-type: none">- com.huawei.mrs.dt.MRSDelegationTokenProvider- com.huawei.mrs.dt.GuardianDTPProvider	com.huawei.mrs.dt.MRSDelegationTokenProvider,com.huawei.mrs.dt.GuardianDTPProvider
fs.obs.guardian.accesslabel.enabled	Whether to enable access label for using Guardian to connect to OBS.	true

Parameter	Description	Value
fs.obs.guardian.enabled	Whether to enable Guardian.	true

- In the **Dashboard** tab of the Guardian service, choose **More > Restart Service**.

Step 3 Interconnecting Hive with OBS

- Log in to FusionInsight Manager, click **Cluster**, choose **Services > Hive**, click **Configurations**, and then **All Configurations**.
- In the navigation pane on the left, choose **HiveServer > Customization**. Configure the following parameters.

Table 2-20 Custom HiveServer parameters

Parameter	Description	Example Value
hive.server.customized.configs	<ul style="list-style-type: none"> Add the hive.metastore.warehouse.dir parameter. Set this parameter to the OBS storage path of the hive Catalog, which is obtained in Creating a LakeFormation Instance. 	<ul style="list-style-type: none"> Name: hive.metastore.warehouse.dir Value: obs://lakeformation-test/hive

Figure 2-38 Configuring **hive.metastore.warehouse.dir**

- Click **Save**.

Step 4 Interconnecting Spark with OBS If your cluster does not have the Spark component, skip this step.

- Log in to FusionInsight Manager and choose **Cluster > Services > Spark**. Click **Configurations** then **All Configurations**.
- In the navigation pane on the left, choose **JDBCServer > Customization**. Add custom parameters and set them by referring to the following table.

Table 2-21 Spark parameters

Custom Item	Value
custom	<ul style="list-style-type: none">- Parameter: spark.sql.warehouse.location.first- Value: true
spark.hive-site.customized.configs	<ul style="list-style-type: none">- Parameter: hive.metastore.warehouse.dir- Value: Set this parameter to the OBS storage path of the hive Catalog, which is obtained in Creating a LakeFormation Instance. For example, obs://lakeformation-test/hive.

3. In the navigation pane on the left, choose **SparkResource > Customization**. Set parameters by referring to [Table 2-21](#).
4. Click **Save**.

Step 5 In the **Components** tab of the MRS cluster, check whether there are expired components. If there are, click **Restart** in the **Operation** column to restart these components.

Step 6 Download and reinstall the complete MRS cluster client. For details, see [Installing a Client \(MRS 3.x or Later\)](#).

Step 7 Update the built-in client configuration file of the cluster to submit jobs on the management console.

On the dashboard page of the MRS cluster, obtain the EIP, use this IP address to log in to a Master node, and run the following commands to refresh the built-in client of the cluster:

```
su - omm
```

```
sh /opt/executor/bin/refresh-client-config.sh
```

Step 8 Log in to the node where the client is installed and check the database on the Hive client to verify that the interconnection is successful.

```
source Client installation path//bigdata_env
```

```
kinit Component service user
```

```
beeline
```

```
show databases;desc database default;
```

```
!q
```

Step 9 On the Spark client, check the database to ensure that the interconnection is successful. If your cluster does not have the Spark component, skip this step.

```
source Client installation path//Spark/component_env
```

```
spark-sql
```

```
show databases;desc database default;  
----End
```

2.9 Installing Third-Party Software Using Bootstrap Actions

Prerequisites

The bootstrap action script has been prepared by referring to [Preparing the Bootstrap Action Script](#).

Adding a Bootstrap Action When Creating a Cluster

- Step 1** Go to the [Buy Cluster](#) page.
- Step 2** Click the **Custom Config** tab.
- Step 3** Configure the cluster software and hardware by referring to [Buying a Custom Cluster](#).
- Step 4** In the **Set Advanced Options** area, select **Configure** and click **Add** in the **Bootstrap Action** area.

Table 2-22 Parameters

Parameter	Description
Name	Name of a bootstrap action script The value can contain only digits, letters, spaces, hyphens (-), and underscores (_) and must not start with a space. The value can contain 1 to 64 characters. NOTE A name must be unique in the same cluster. You can set the same name for different clusters.
Script Path	Script path. The value can be an OBS file system path or a local VM path. <ul style="list-style-type: none">• An OBS file system path must start with obs:// and end with .sh, for example, obs://mrs-samples/xxx.sh.• A local VM path must start with a slash (/) and end with .sh. NOTE A path must be unique in the same cluster, but can be the same for different clusters.
Parameter	Bootstrap action script parameters
Execution Node	Select a type of the node where the bootstrap action script is executed.

Parameter	Description
Executed	<p>Select the time when the bootstrap action script is executed.</p> <ul style="list-style-type: none"> • Before initial component start • After initial component start <p>NOTE You can only manually run the third-party component installation script on the node to install a running cluster component.</p>
Action upon Failure	<p>Whether to continue to execute subsequent scripts and create a cluster after the script fails to be executed.</p> <p>NOTE You are advised to set this parameter to Continue in the debugging phase so that the cluster can continue to be installed and started no matter whether the bootstrap action is successful.</p>
Run as root	<p>Whether to escalate the permission to user root</p> <p>If the bootstrap action requires root user operations, enable this function, or the bootstrap action may fail to execute.</p> <p>NOTE This parameter is available for MRS 3.1.5 clusters.</p>

Step 5 Click **OK**.

After the bootstrap action is added, you can edit, clone, or delete it in the **Operation** column.

----End

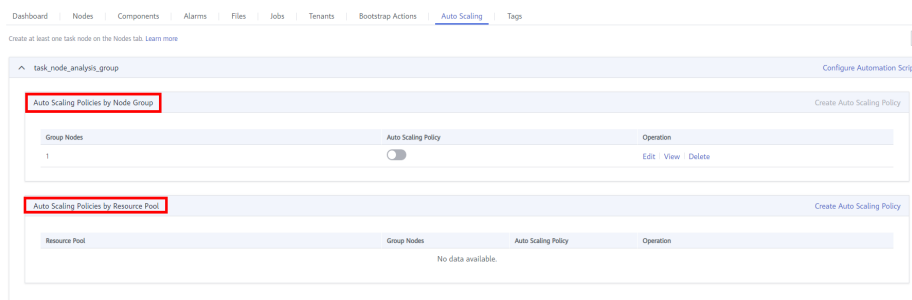

Adding an Automation Script on the Auto Scaling Page

Step 1 Log in to the MRS management console.

Step 2 Choose **Active Clusters**, select a running cluster, and click its name. to access its details page.

Step 3 On the page that is displayed, click the **Auto Scaling** tab.

You can configure policies by resource pool or node group as needed. For details, see [Creating an Auto Scaling Policy for an Existing Cluster](#)

 **NOTE**

- Auto scaling policies of different node groups are mutually exclusive. That is, you can enable auto scaling policies only for one node group.
- An auto scaling rule adjusts the number of nodes, but also affects the actual price. Exercise caution when adding an auto scaling rule.

Step 4 (Optional) Configure automation scripts.

1. Click **Configure Automation Script**.
2. Click **Add**.
3. Configure **Name**, **Script Path**, **Execution Node**, **Parameter**, **Executed**, and **Action upon Failure**. For details about the parameters, see [Table 2-14](#).
4. Click **OK** to save the automation script configurations.

----End

2.10 Viewing Failed MRS Tasks

This section describes how to view and delete a failed MRS task.

Background

If a cluster fails to be created, deleted, scaled out, or scaled in, the **Manage Failed Tasks** page is displayed. Only the tasks that fail to be deleted are displayed on the **Cluster History** page. You can delete a failed task that is not required.

Procedure

Step 1 Log in to the MRS console.

Step 2 In the navigation pane on the left, choose **Active Clusters**.

Step 3 Click  or the number on the right of **Failed Tasks**. The **Manage Failed Tasks** page is displayed.

Step 4 In the **Operation** column of the cluster that you want to start, click **Delete**.

In this step, only one job can be deleted.

Step 5 You can click **Delete All** in the upper left corner of the task list to delete all failed tasks.

----End

2.11 Viewing Information of a Historical Cluster

Choose **Cluster History** and click the name of a target cluster. You can view the cluster configuration information, nodes, auto scaling information, component information, job information, bootstrap action, and tags.

The following table describes the parameters for the historical cluster information.

Table 2-23 Basic cluster information

Parameter	Description
Cluster Name	Name of a cluster. The cluster name is set when the cluster is created.
Cluster Status	Status of a cluster.
Billing Mode	Billing mode of a cluster. Currently, Pay-per-use and Yearly/Monthly are supported.
Cluster Version	Cluster version
Cluster Type	Type of the cluster to be created.
Obtaining a cluster ID	Unique identifier of a cluster, which is automatically assigned when a cluster is created
Created	Time when a cluster is created.
Order ID	Order ID for creating the cluster. This parameter is available only when Billing Mode is set to Yearly/Monthly .
AZ	Availability zone (AZ) in the region of a cluster, which is set when a cluster is created.
Default Subnet	Subnet selected during cluster creation. A subnet provides dedicated network resources that are isolated from other networks, improving network security.
VPC	VPC selected during cluster creation. A VPC is a secure, isolated, and logical network environment.
OBS Permission Control	Click Manage and modify the mapping between MRS users and OBS permissions. For details, see Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS .
Creating a data connection	Click Manage to view the data connection type associated with the cluster. For details, see Configuring Data Connections .
Agency	Click Manage Agency to bind or modify an agency for the cluster. An agency allows ECS or BMS to manage MRS resources. You can configure an agency of the ECS type to automatically obtain the AK/SK to access OBS. For details, see Configuring a Storage-Compute Decoupled Cluster (Agency) . The MRS_ECS_DEFAULT_AGENCY agency has the OBSOperateAccess permission of OBS and the CESFullAccess (for users who have enabled fine-grained policies), CES Administrator, and KMS Administrator permissions in the region where the cluster is located.

Parameter	Description
Key Pair	Name of a key pair. Set this parameter when creating a cluster. If the login mode is set to password during cluster creation, this parameter is not displayed.
Kerberos Authentication	Whether to enable Kerberos authentication when logging in to Manager. NOTE Kerberos authentication cannot be manually enabled or disabled after the cluster is created. Set this parameter with caution when creating a cluster. If you need to change the authentication status, you are advised to create a new cluster.
Enterprise Project	Enterprise project to which a cluster belongs. Only on the Active Clusters page, you can click the name of an enterprise project to go to its Enterprise Project Management page.
Security Group	Security group name of the cluster.
Streaming Core Node LVM	Indicates whether to enable the Logical Volume Manager (LVM) function of streaming Core nodes.
Data Disk Key Name	Name of the key used to encrypt data disks. To manage the used keys, log in to the key management console.
Data Disk Key ID	ID of the key used to encrypt data disks.
Component Version	Version of each component installed in the cluster.
Agency	Delegates ECSs or BMSs to manage some of your resources.

Go back to the historical clusters page. You can use the following buttons to perform operations. For details about the buttons, see the following table.

Table 2-24 Icon description

Icon	Description
	Click  to manually refresh the node information.
	Enter a cluster name in the search bar and click  to search for a cluster.

3 Managing Clusters

3.1 Logging In to a Cluster

3.1.1 MRS Cluster Node Overview

An MRS cluster consists of multiple ECSs. The system manages nodes in node groups based on specifications. Nodes in the same node group use same ECS specifications. Nodes in a cluster can be classified into Master nodes, Core nodes, and Task nodes based on the roles of components deployed on the nodes. For details about the node types, see [Table 3-1](#).

Table 3-1 Cluster node types

Node Type	Functions
Master node	<p>Management node of an MRS cluster. It manages and monitors the cluster. In the navigation pane of the MRS management console, choose Active Clusters, select a running cluster, and click its name to switch to the cluster details page. On the Nodes tab page, view the Name. The node that contains master1 in its name is the Master1 node. The node that contains master2 in its name is the Master2 node.</p> <p>You can log in to a Master node either using VNC on the ECS management console or using SSH. After logging in to the Master node, you can access Core nodes without entering passwords.</p> <p>The system automatically deploys the Master nodes in active/standby mode and supports the high availability (HA) feature for MRS cluster management. If the active management node fails, the standby management node switches to the active state and takes over services.</p> <p>To determine whether the Master1 node is the active management node, see Determining Active and Standby Management Nodes.</p>
Core node	<p>Work node of an MRS cluster. It processes and analyzes data and stores process data.</p> <p>In the Nodes tab of the cluster details page, the nodes in the node group whose Node Type includes Core are core nodes.</p>
Task node	<p>Compute node. When the compute resources of a cluster are insufficient, you can configure elastic scaling policies to increase nodes automatically.</p> <p>In the Nodes tab of the cluster details page, the nodes in the node group whose Node Type is Task are task nodes.</p> <p>If only the NodeManager (Yarn) or Supervisor (Storm) role is deployed in a node group in addition to basic mandatory roles, this node group is a Task node group.</p>

MRS cluster nodes support remote login. The following remote login methods are available:

- GUI login: Use the remote login function provided by the ECS management console to log in to the Linux interface of the Master node in the cluster.
- SSH login: Applies to Linux ECSs only. You can use a remote login tool (such as PuTTY) to log in to an ECS. The ECS must have a bound EIP.

For details about how to apply for and bind EIP for the Master node, see [Assigning an EIP and Binding It to an ECS](#).

You can log in to a Linux ECS using either a key pair or password.

NOTICE

If you need to use a key pair to access a cluster node, you need to log in to the node as user **root**. For details, see [Logging In to an ECS Using a Key Pair \(SSH\)](#).

For details about how to access a cluster node using a password, see [Logging In to an ECS Using a Password \(SSH\)](#).

3.1.2 Logging In to an ECS

This section describes how to remotely log in to an ECS in an MRS cluster using the remote login (VNC mode) function provided on the ECS management console or a key or password (SSH mode). Remote login (VNC mode) is mainly used for emergency O&M. In other scenarios, it is recommended that you log in to the ECS using SSH.

 NOTE

To log in to a cluster node using SSH, you need to add an inbound rule to the security group of the cluster. Set **Source** to *IPv4 address of the client/32* or *IPv6 address of the client/128* and set the port number to **22**. For details, see [Adding a Security Group Rule](#).

Logging In to an ECS Using VNC

- Step 1** Log in to the MRS management console.
- Step 2** Choose **Active Clusters** in the navigation pane, select a running cluster, and click its name to switch to the cluster details page.
- Step 3** On the **Nodes** tab page, click the name of a Master node in the Master node group to log in to the ECS management console.
- Step 4** In the upper right corner, click **Remote Login**.
- Step 5** Enter the username and password for logging in to the Master node as prompted.
 1. If you select **Password** for **Login Mode**, you need to enter **root** in **Username** and the password you set during cluster creation in **Password**.

Figure 3-1 Selecting password as the login mode

* Login Mode Password Key Pair

Username root

Keep your password secure. The system cannot retrieve your password.

* Password

* Confirm Password

2. If you select **Key Pair** for **Login Mode** when creating a cluster, perform the following operations to log in to the cluster:
 - a. After the cluster is created, assign an EIP and bind it to the Master node of the cluster. For details, see [Assigning an EIP and Binding It to an ECS](#).
 - b. Remotely log in to the Master node in SSH mode as user **root** using the key file.
 - c. Run the **passwd root** command to set a password for user **root**.
 - d. Go back to the login interface, and enter **root** and the password set in [Step 5.2.c](#) to log in to the node.

----End

Logging In to an ECS Using a Key Pair (SSH)

Logging In to the ECS from Local Windows

To log in to the Linux ECS from local Windows, perform the operations described in this section. The following procedure uses PuTTY as an example to log in to the ECS.

1. Log in to the MRS management console.
2. Choose **Active Clusters** in the navigation pane, select a running cluster, and click its name to switch to the cluster details page.
3. On the **Nodes** tab page, click the name of a Master node in the Master node group to log in to the ECS management console.
4. Click the **EIPs** tab, click **Bind EIP** to bind an EIP to the ECS, and record the EIP. If an EIP has been bound to the ECS, skip this step.
5. Check whether the private key file has been converted to **.ppk** format.
 - If yes, go to [10](#).
 - If no, go to [6](#).
6. Run PuTTY.
7. In the **Actions** area, click **Load** and import the private key file you used during ECS creation.

Ensure that the private key file is in the format of **All files (*.*)**.
8. Click **Save private key**.

9. Save the converted private key, for example, **kp-123.ppk**, to a local directory.
10. Run PuTTY.
11. Choose **Connection > Data**. Enter the image username in **Auto-login username**.

 **NOTE**

The image username for cluster nodes is **root**.

12. Choose **Connection > SSH > Auth**. In the last configuration item **Private key file for authentication**, click **Browse** and select the private key converted in [9](#).
13. Click **Session**.
 - a. **Host Name (or IP address)**: Enter the EIP bound to the ECS.
 - b. **Port**: Enter **22**.
 - c. **Connection Type**: Select **SSH**.
 - d. **Saved Sessions**: Task name, which can be clicked for remote connection when you use PuTTY next time

Figure 3-2 Clicking Session

14. Click **Open** to log in to the ECS.
If you log in to the ECS for the first time, PuTTY displays a security warning dialog box, asking you whether to accept the ECS security certificate. Click **Yes** to save the certificate to your local registry.

Logging In to the ECS from Local Linux

To log in to the Linux ECS from local Linux, perform the operations described in this section. The following procedure uses private key file **kp-123.pem** as an example to log in to the ECS. The name of your private key file may differ.

1. On the Linux CLI, run the following command to change operation permissions:

```
chmod 400 /path/kp-123.pem
```

 NOTE

In the preceding command, *path* refers to the path where the key file is saved.

2. Run the following command to log in to the ECS:

```
ssh -i /path/kp-123.pem Default username@EIP
```

For example, if the default username is **root** and the EIP is **123.123.123.123**, run the following command:

```
ssh -i /path/kp-123.pem root@123.123.123.123
```

 NOTE

- *path* indicates the path where the key file is saved.
- *EIP* indicates the EIP bound to the ECS.
- The image username is **root** for cluster nodes.

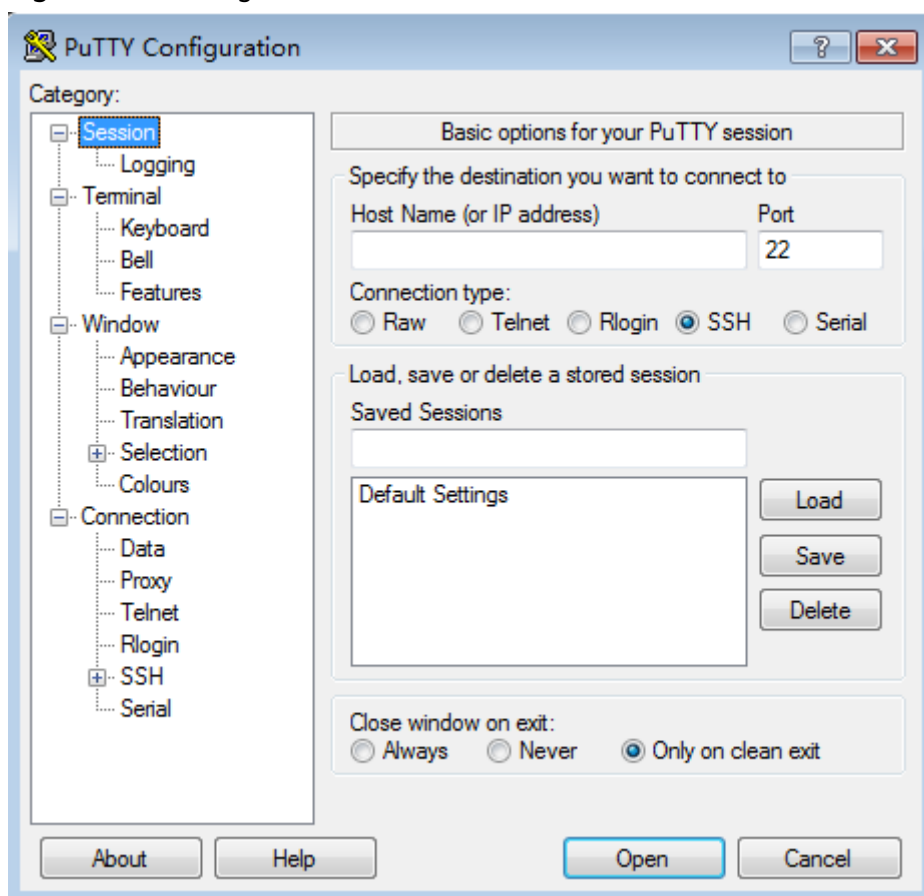

Logging In to an ECS Using a Password (SSH)

Logging In to the ECS from Local Windows

To log in to the Linux ECS from local Windows, perform the operations described in this section. The following procedure uses PuTTY as an example to log in to the ECS.

- Step 1** Log in to the MRS management console.
- Step 2** Choose **Active Clusters** in the navigation pane, select a running cluster, and click its name to switch to the cluster details page.
- Step 3** On the **Nodes** tab page, click the name of a Master node in the Master node group to log in to the ECS management console.
- Step 4** Click the **EIPs** tab, click **Bind EIP** to bind an EIP to the ECS, and record the EIP. If an EIP has been bound to the ECS, skip this step.
- Step 5** Run PuTTY.
- Step 6** Click **Session**.
 1. **Host Name (or IP address)**: Enter the EIP bound to the ECS.
 2. **Port**: Enter **22**.
 3. **Connection Type**: Select **SSH**.
 4. **Saved Sessions**: Task name, which can be clicked for remote connection when you use PuTTY next time

Figure 3-3 Clicking **Session**

Step 7 Click **Window** and select **UTF-8** for **Remote character set:** in **Translation**.

Step 8 Click **Open** to log in to the ECS.

If you log in to the ECS for the first time, PuTTY displays a security warning dialog box, asking you whether to accept the ECS security certificate. Click **Yes** to save the certificate to your local registry.

Step 9 After the SSH connection to the ECS is set up, enter the username and password as prompted to log in to the ECS.

NOTE

The username is **root** and the password is the one you set during cluster creation.

----End

Logging In to the ECS from Local Linux

If the local host runs Linux, perform steps **Step 1** to **Step 4** to bind an EIP to the ECS, and run the following command on the CLI to log in to the ECS: **ssh EIP bound by the ECS**

3.1.3 Determining Active and Standby Management Nodes

Scenario

Some O&M operation scripts and commands need to be run or can be run only on the active management node. You can log in to a Master node or the Manager

(MRS 3.x or later) to determine the active and standby management nodes (active and standby OMS nodes).

In active/standby mode, a switchover can be implemented between Master1 and Master2. For this reason, Master1 may not be the active management node for Manager.

Running the Script to Determine Active and Standby Nodes

Step 1 Find the Master nodes of an MRS cluster.

1. Log in to the MRS console, choose **Active Clusters** and click the name of the target cluster to access its details page.
2. On the **Nodes** tab page, view Master node names. The node that contains **master1** in its name is the Master1 node. The node that contains **master2** in its name is the Master2 node.

Step 2 Determine the active and standby management nodes of the Manager.

1. Remotely log in to the Master1 node. For details, see [Logging In to an ECS](#). Master nodes support Cloud-Init. The preset username for Cloud-Init is **root** and the password is the one you set during cluster creation.
2. Run the following commands to switch the user:

```
sudo su - root
```

```
su - omm
```

3. Run the following command to identify the active and standby management nodes:

For versions earlier than MRS 3.x, run the **sh \${BIGDATA_HOME}/om-0.0.1/sbin/status-oms.sh** command.

For MRS 3.x or later: Run the **sh \${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh** command.

In the command output, the node whose **HAActive** is **active** is the active management node (mgtomsdat-sh-3-01-1 in the following example), and the node whose **HAActive** is **standby** is the standby management node (mgtomsdat-sh-3-01-2 in the following example).

```
Ha mode
double
NodeName      HostName      HAVersion      StartTime      HAActive
HAAllResOK    HARunPhase
192-168-0-30  mgtomsdat-sh-3-01-1    V100R001C01    20xx-11-18 23:43:02
active        normal        Activated
192-168-0-24  mgtomsdat-sh-3-01-2    V100R001C01    20xx-11-21 07:14:02
standby      normal        Deactivated
```

NOTE

If the Master1 node to which you have logged in is the standby management node and you need to log in to the active management node, run the following command:

```
ssh IP address of Master2 node
```

----End

Logging in to Manager to Determine Active and Standby Nodes

This section applies only to MRS 3.x or later.

Step 1 Log in to Manager. For details, see [Accessing Manager](#).

Step 2 Click **Hosts**. The **Hosts** page is displayed.

Step 3 View and record the IP addresses of the active and standby management nodes.

Hosts

<input type="checkbox"/>	Host Name	Management IP Addr...	Service IP Address	Running Status
<input type="checkbox"/>	1			● Normal
<input type="checkbox"/>	2			● Normal
<input type="checkbox"/>	3			● Normal
<input type="checkbox"/>	★ 7			● Normal
<input type="checkbox"/>	★ 8			● Normal
<input type="checkbox"/>	9			● Normal

- If a host name starts with ★, it is the active management node (active OMS node). View and record the value of **Management IP Address** in the row containing the active node.
- If a host name starts with ☆, the host is a standby management node (standby OMS node). View and record the value of **Management IP Address** in the row containing the standby node.

----End

3.2 Cluster Overview

3.2.1 Cluster List

You can quickly view the status of all clusters and jobs by viewing the dashboard information, and obtain relevant MRS documents from **Help** in the left navigation pane on the MRS console.

MRS is used to manage and analyze massive data. It is easy to use. You can create a cluster and add MapReduce, Spark, and Hive jobs to the cluster to analyze and process user data. After being processed, you can transmit the data in SSL encryption mode to OBS to ensure data integrity and confidentiality.

Cluster Status

Log in to the MRS management console. You can view the status of existing clusters in the active cluster list. You search for status clusters in a specified status from the **Status** drop-down list. [Table 3-2](#) lists all the cluster statuses.

Table 3-2 Cluster status

Status	Description
Starting	If a cluster is being created, the cluster is in the Starting state.
Running	If a cluster is successfully created and is running properly, its status is Running .
Scaling out	If the Master, Core, or Task node in a cluster is being added, the cluster is in the Scaling out state. NOTE If the cluster scale-out fails, you can add node to the cluster again.
Scaling in	If a cluster node is being deleted, the cluster node is in the Scaling in state. This state shows when you scale in or elastically scale in a cluster node, decommission a node in a yearly/monthly cluster, change the OS, or reinstall the OS.
Abnormal	If some components in a cluster are abnormal, the cluster is Abnormal .
Deleting	If a pay-per-use cluster node is being deleted, the cluster status changes to Deleting . This state is displayed after you click Delete and confirm the deletion. NOTE A yearly/monthly cluster cannot be deleted.
Frozen	If the grace period of a yearly/monthly resource expires but the resource is not renewed, or if the fee of a pay-per-use resource fails to be deducted and you have not topped up your account before the grace period expires, the system freezes the resource in the Frozen state. NOTE A frozen cluster is unavailable and its all ECSs are shut down. After being unfrozen, the cluster returns to the Running state. If no renewal fee is paid, the cluster will be deleted after a specified period (called freeze period) and the cluster status will be changed to Deleted .
Restoring node...	If a faulty node in the cluster is being recovered, its status is Restoring node...

Job Status

Table 3-3 describes the status of jobs that you execute after logging in to the MRS management console.

Table 3-3 Job status

Status	Description
Accepted	Initial status of a job after it is successfully submitted.

Status	Description
Running	A job is being executed.
Completed	A job has been executed and completed successfully.
Terminated	A job is stopped during execution.
Abnormal	An error occurs during job execution or job execution fails.

3.2.2 Checking the Cluster Status

The cluster list contains all clusters in MRS. You can view clusters in various states. If a large number of clusters are involved, navigate through multiple pages to view all of the clusters.

MRS, as a platform managing and analyzing massive data, provides a PB-level data processing capability. MRS allows you to buy multiple clusters. The cluster quantity is subject to that of ECSs.

Clusters are listed in chronological order by default in the cluster list, with the most recent cluster displayed at the top. [Table 3-4](#) describes the cluster list parameters.

- **Active Clusters:** contain all clusters except the clusters in the **Failed** and **Deleted** states.
- **Cluster History:** contains the clusters in the **Deleted** states. Only clusters deleted within the last six months are displayed. If you want to view clusters deleted six months ago, contact Huawei Cloud technical support.
- **Failed Tasks:** only contain the tasks in the **Failed** state. You can click  on the **Active Cluster** page to view failed tasks.

Table 3-4 Parameters in the active cluster list

Parameter	Description
Name/ID	Cluster name, which is set when a cluster is created. Unique identifier of a cluster, which is automatically assigned when a cluster is created. <ul style="list-style-type: none">•  : Change the cluster name.•  : Copy the cluster ID.
Cluster Version	Cluster version.
Cluster Type	The type of a cluster you want to create.
Nodes	Number of nodes that can be deployed in a cluster. This parameter is set when a cluster is created.

Parameter	Description
Status	<p>Status and operation progress description of a cluster.</p> <p>The cluster creation progress includes:</p> <ul style="list-style-type: none"> • Verifying cluster parameters • Applying for cluster resources • Creating VMs • Initializing VMs • Installing MRS Manager • Deploying the cluster • Cluster installation failed <p>The cluster scale-out progress includes:</p> <ul style="list-style-type: none"> • Preparing for scale-out • Creating VMs • Initializing VMs • Adding nodes to the cluster • Scale-out failed <p>The cluster scale-in progress includes:</p> <ul style="list-style-type: none"> • Preparing for scale-in • Decommissioning instance • Deleting VMs • Deleting nodes from the cluster • Scale-in failed <p>The system will display causes of cluster installation, scale-out, and scale-in failures. For details, see Table 2-6.</p>
Billing Mode	<p>Currently, the commercial version of MRS is charged based on ECSs in a cluster.</p> <ul style="list-style-type: none"> • Yearly/Monthly: The duration ranges from one month to one year. The minimum cluster duration is 1 month and the maximum available cluster duration is 1 year. • Pay-per-use: Nodes are charged by actual duration of use, with a billing cycle of one hour. <p>The billing start time, that is, the time when the cluster node is successfully created is displayed under Billing Mode.</p>
Created	<p>The time when a cluster node is successfully created. This parameter is displayed only on the Cluster History page.</p>
Deleted	<p>Time when a cluster node billing stops and the cluster node begins to be deleted. This parameter is valid only for historical clusters displayed on the Cluster History page.</p>
AZ	<p>Availability zone (AZ) in the region of a cluster, which is set when a cluster is created.</p>

Parameter	Description
Enterprise Project	Enterprise project to which a cluster belongs.
Operation	<ul style="list-style-type: none"> Delete: If the cluster is no longer needed after the job execution is complete, you can click Delete. To confirm deletion, enter DELETE in the displayed dialog box and click OK. The cluster status changes from Running to Deleting. After the cluster is deleted, the cluster status changes to Deleted and is displayed in the historical cluster list. A cluster failed to be deployed will be automatically deleted. This parameter is displayed in Active Clusters only. <p>NOTE Typically after data is analyzed and stored, or when the cluster encounters an exception and cannot work, you can delete a cluster. If a cluster is deleted before data processing and analysis are completed, data loss may occur. Therefore, exercise caution when deleting a cluster.</p> Change to Yearly/Monthly: If you want to change the billing mode of a cluster from Pay-per-use to the more economical Yearly/Monthly mode, click Change to Yearly/Monthly. This parameter is displayed in Active Clusters only. Clone: To clone a historical cluster, locate the row of the cluster and click Clone in the Operation column. Alternatively, click the name of the cluster you want to clone. On the basic information page, click Clone in the upper right corner. Renew: If you want to renew a yearly/monthly cluster, click Renew in the row of the cluster. This parameter is displayed only for active yearly/monthly clusters. Unsubscribe: If a yearly/monthly cluster is no longer needed after job execution, choose More > Unsubscribe. For details, see Unsubscribing from a Cluster. This parameter is displayed only for active yearly/monthly clusters. Modify Auto-Renewal: To enable auto-renewal for a cluster, choose More > Modify Auto-renewal in the row of the cluster. Then modify auto-renewal settings as you need. This parameter is displayed only for active yearly/monthly clusters.

Table 3-5 Button description

Button	Description
	Select an enterprise project from the drop-down list to filter the corresponding cluster.

Button	Description
	Select a status to filter clusters from the drop-down list: <ul style="list-style-type: none"> • All statuses • Starting • Running • Scaling out • Scaling in • Abnormal • Deleting • Restoring node... • Frozen
	Choose Active Clusters and click  to go to the page for managing failed tasks.  <i>Num.</i> displays the failed tasks in the failed state.
	Enter a cluster name in the search bar and click  to search for a cluster.
Search by Tag	Click Search by Tag , enter the tag of the cluster to be queried, and click Search to search for the clusters. You can select a tag key or tag value from their drop-down lists. When the tag key or tag value is exactly matched, the system can automatically locate the target cluster. If you enter multiple tags, their intersections are used to search for the cluster.
	Click  to manually refresh the cluster list.

3.2.3 Viewing Basic Cluster Information

You can monitor and manage the clusters you have created. On the **Active Clusters** page. Click the name of a cluster to go to the cluster details page. On the displayed page, view the basic configuration and node information of the cluster.

 **NOTE**

On the MRS console, operations performed on an ECS cluster are basically the same as those performed on a BMS cluster. This document describes operations on an ECS cluster. If operations on the two clusters differ, the operations will be described separately.

On the cluster details page, click **Dashboard**. [Table 3-6](#), [Table 3-7](#), [Table 3-8](#), and [Table 3-9](#) describe the parameters on the **Dashboard** tab page.

Table 3-6 Basic information

Parameter	Description
Cluster Name	The name of a cluster. Configure this parameter when creating a cluster. Click  to change the cluster name. For versions earlier than MRS 3.x, only the cluster name displayed on the MRS management console is changed, while the cluster name on MRS Manager is not changed synchronously.
Cluster Status	The cluster status. For details, see Table 3-2 .
Cluster Version	MRS version information.
Cluster Type	There are three types of clusters: <ul style="list-style-type: none">• Analysis Cluster: is used for offline data analysis and provides Hadoop components.• Streaming Cluster: is used for streaming tasks and provides stream processing components.• Hybrid Cluster: is used for both offline data analysis and streaming processing and provides Hadoop components and streaming processing components.• Custom: An MRS cluster with all custom components. MRS 3.x or later supports this type.
Cluster ID	Unique identifier of a cluster, which is automatically assigned when a cluster is created.
Created	Time when a cluster is created.
AZ	Availability zone (AZ) in the region of a cluster, which is set when a cluster is created.
Kerberos Authentication	Whether to enable Kerberos authentication when logging in to Manager.
Enterprise Project	The enterprise project to which a cluster belongs. Only on the Active Clusters page, you can click the name of an enterprise project to go to its Enterprise Project Management page.

Table 3-7 Network information

Parameter	Description
Default Subnet	<p>The subnet selected during cluster creation.</p> <p>If the subnet IP addresses are insufficient, click Change Subnet to switch to another subnet in the same VPC of the current cluster to obtain more available subnet IP addresses. Changing a subnet does not affect the IP addresses and subnets of existing nodes.</p> <p>A subnet provides dedicated network resources that are isolated from other networks, improving network security.</p>
VPC	<p>VPC selected during cluster creation.</p> <p>A VPC is a secure, isolated, and logical network environment.</p>
EIP	<p>After binding an EIP to an MRS cluster, you can use the EIP to access the Manager web UI of the cluster. If you do not need the EIP, click Unbind to unbind the EIP from the cluster. The Manager will not be accessible through the unbound EIP.</p> <p>NOTE If you unbind the EIP from a cluster, other users may fail to access the Manager of that cluster.</p>
Security Group	The security group name of the cluster.

Table 3-8 O&M management

Parameter	Description
MRS Manager	<p>Portal for the Manager page.</p> <ul style="list-style-type: none">For MRS 3.x or later, see Accessing FusionInsight Manager (MRS 3.x or Later).For versions earlier than MRS 3.x, you need to bind an EIP and add a security group rule as prompted before accessing the MRS Manager page. For details, see Accessing MRS Manager (MRS 2.x or Earlier).
IAM User Sync	<p>IAM user information (including federated users) can be synchronized to an MRS cluster for cluster management. For details, see Synchronizing IAM Users to MRS.</p> <p>NOTE The Components, Tenants, and Backups & Restorations tab pages on the cluster details page can be used only after users are synchronized. After an MRS 3.x cluster is synchronized, you can use the Components function.</p> <p>For a federated user, only information about the user that logged in the system can be synchronized.</p>

Parameter	Description
Data Connection	Click Manage to view the data connection type associated with the cluster. For details, see Configuring Data Connections .
Agency	Click Manage Agency to bind or modify an agency for the cluster. An agency allows ECS or BMS to manage MRS resources. You can configure an agency of the ECS type to automatically obtain the AK/SK to access OBS. For details, see Configuring a Storage-Compute Decoupled Cluster (Agency) . The MRS_ECS_DEFAULT_AGENCY agency has the OBS OperateAccess permission of OBS and the CES FullAccess (for users who have enabled fine-grained policies), CES Administrator, and KMS Administrator permissions in the region where the cluster is located.
OBS Permission Control	Click Manage and modify the mapping between MRS users and OBS permissions. For details, see Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS .
Logging	Used to collect logs about cluster creation and scaling failures.
Secure Communications	Used to display the security authorization status. You can click  to enable or disable security authorization. Disabling security authorization brings high risks. Exercise caution when performing this operation. For details, see Communication Security Authorization .

Table 3-9 Billing information

Parameter	Description
Billing Mode	Billing mode of a cluster. Currently, Pay-per-use and Yearly/Monthly are supported.
Last Transaction Order	Order number for purchasing a cluster. This parameter is available only when Billing Mode is set to Yearly/Monthly .
Created	Time when the cluster is created. This parameter is available only when Billing Mode is set to Yearly/Monthly .
Expired	Cluster expiration time. This parameter is available only when Billing Mode is set to Yearly/Monthly .
Upon Expiration	The cluster will enter the grace period upon expiration. This parameter is available only when Billing Mode is set to Yearly/Monthly .

On the cluster details page, click **Nodes**. For details about the node parameters, see [Table 3-10](#).

Table 3-10 Node information

Parameter	Description
Configure Task Node	Used to add a Task node. For details, see Adding a Task Node . For 3.x and later versions, this operation applies only to the analysis cluster, streaming cluster, and hybrid cluster.
Add Node Group	Used to add node groups. This method applies only to customized clusters of 3.x or later. For details, see Adding a Node Group .
Node Group	Node group name.
Node Type	<p>Node type:</p> <ul style="list-style-type: none">● Master: A Master node in an MRS cluster manages the cluster, assigns MapReduce executable files to Core nodes, traces the execution status of each job, and monitors the DataNode running status.● A task node group is a group of nodes where only data roles that do not store data are deployed. The roles include NodeManager, ThriftServer, Thrift1Server, RESTServer, Supervisor, LogViewer, HBaseIndexer, and TagSync.● If other roles are deployed in the node group in addition to the preceding roles, the node group is the Core node group. <p>On the Nodes tab page, click  next to a node group name to unfold the nodes contained in the node group. Click a node name to remotely log in to the ECS using the password or key pair configured during cluster creation. For details about the parameters, see Managing Components and Monitoring Hosts.</p>
Node Count	Number of nodes in a node group.
Billing Mode	Billing mode of the cluster you purchased, including Pay-Per-Use and Yearly/Monthly .

Parameter	Description
Operation	<ul style="list-style-type: none">• Scale Up Specifications: For details, see Scaling Up Master Node Specifications.• Scale Out: For details, see Scaling Out a Cluster.• Scale In: For details, see Scaling In a Cluster.• Delete: To delete a node group, ensure that there is no node in the node group.• Decommission Node: To decommission a node group, decommission all its nodes. This parameter is available for yearly/monthly clusters only.• Recommission Node: Recommission a node that has been decommissioned. This parameter is available for yearly/monthly clusters only.• View Roles: You can view information about roles deployed on the node group. This function applies only to custom clusters of 3.x and later.

3.2.4 Viewing Cluster Patch Information

To view patch information about cluster components, you can download the required patch if the cluster component, such as Hadoop or Spark, is faulty. On the MRS console, choose **Active Clusters**, select a cluster, and click the cluster name. On the cluster details page that is displayed, upgrade the component and rectify the fault.

NOTE

MRS 3.x does not have patch version information. Therefore, this section is not involved.

- Patch Name: name of the patch package
- Published: time when the patch package is released
- Status: patch status
- Patch Description: patch version description
- Operation: patch installation or uninstallation

3.2.5 Managing Components and Monitoring Hosts

You can manage the following status and metrics of all components (including role instances) and hosts on the MRS console:

- Status information: includes operation, health, configuration, and role instance status.
- Indicator information: includes key monitoring indicators for each component.
- Export monitoring metrics. (This function is not supported in MRS 3.x or later.)

 NOTE

- For versions earlier than MRS 3.x, see [Managing Services and Monitoring Hosts](#).
- For MRS 3.x or later, see [Procedure](#).
- You can set the interval for automatically refreshing the page or click  to refresh the page immediately.
- Component management supports the following parameter values:
 - Refresh every 30 seconds
 - Refresh every 60 seconds
 - Stop refreshing

Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Procedure

Manage components.

 NOTE

For details about how to perform operations on MRS Manager, see [Managing Service Monitoring](#).

Step 1 On the MRS cluster details page, click **Components**.

- [Table 3-11](#) describes the service operating status.

Table 3-11 Service operating status

Status	Description
Started	The service is started.
Stopped	The service is stopped.
Failed to start	Failed to start the role instance.
Failed to stop	Failed to stop the service.
Unknown	Indicates initial service status after the background system restarts.

- [Table 3-12](#) describes the service health status.

Table 3-12 Service health status

Status	Description
Good	Indicates that all role instances in the service are running properly.

Status	Description
Faulty	Indicates that the running status of at least one role instance is Faulty or the status of the service on which the current service depends is abnormal.
Unknown	Indicates that all role instances in the service are in the Unknown state.
Restoring	Indicates that the background system is restarting the service.
Partially Healthy	Indicates that the status of the service on which the service depends is abnormal, and APIs related to the abnormal service cannot be invoked by external systems.

- [Table 3-13](#) describes the service health status.

Table 3-13 Service configuration status

Status	Description
Synchronized	The latest configuration takes effect.
Configuration expired	The latest configuration does not take effect after the parameter modification. Related services need to be restarted.
Configuration failed	The communication is incorrect or data cannot be read or written during the parameter configuration. Use Synchronize Configuration to rectify the fault.
Configuring	Parameters are being configured.
Unknown	Indicates that configuration status cannot be obtained.

Step 2 Click a specified service in the list to view its status and metric information.

Step 3 Customize and view monitoring graphs.

1. In the **Charts** area, click **Customize** to customize service monitoring metrics.
2. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.

----End

Manage role instances.

 **NOTE**

For versions earlier than MRS 3.x, see [Managing Role Instances](#).

Step 1 On the MRS cluster details page, click **Components**. In the component list, click the specified service name.

Figure 3-4 Components tab page

Name	Version	Operating Status	Health Status	Configuration Status
▼ Hadoop	3.1.1			
Spark2x	2.4.5	✔ Started	✔ Good	✔ Synchronized
HBase	2.2.3	✔ Started	✔ Good	✔ Synchronized
Hive	3.1.0	✔ Started	✔ Good	✔ Synchronized
Hue	4.7.0	✔ Started	✔ Good	✔ Synchronized
Kafka	2.11-2.4.0	✔ Started	✔ Good	✔ Synchronized
Flume	1.9.0	✔ Started	✔ Good	✔ Synchronized
Flink	1.12.0	✔ Started	✔ Good	✔ Synchronized
Oozie	5.1.0	✔ Started	✔ Good	✔ Synchronized
ZooKeeper	3.5.6	✔ Started	✔ Good	✔ Synchronized

Step 2 Click **Instances** to view the role status.

Figure 3-5 Instances tab page

Role	Host Name	OMP IP Address	Business IP Address	Rack	Running Status	Configuration Status
<input type="checkbox"/> DataNode	node-group-1auID.mrs-fmq.com			default-rack00	✔ Good	✔ Synchronized
<input type="checkbox"/> DataNode	node-group-1e8vg.mrs-fmq.com			default-rack00	✔ Good	✔ Synchronized
<input type="checkbox"/> DataNode	node-group-1u0tB.mrs-fmq.com			default-rack00	✔ Good	✔ Synchronized
<input type="checkbox"/> HDFS	node-master3Dv8E.mrs-fmq.com			default-rack80	✔ Good	✔ Synchronized
<input type="checkbox"/> HDFS	node-master1CYXU.mrs-fmq.com			default-rack80	✔ Good	✔ Synchronized
<input type="checkbox"/> JournalNode	node-master3Dv8E.mrs-fmq.com			default-rack80	✔ Good	✔ Synchronized
<input type="checkbox"/> JournalNode	node-master2LDLY.mrs-fmq.com			default-rack80	✔ Good	✔ Synchronized
<input type="checkbox"/> JournalNode	node-master1CYXU.mrs-fmq.com			default-rack80	✔ Good	✔ Synchronized
<input type="checkbox"/> NameNode(Active)	node-master3Dv8E.mrs-fmq.com			default-rack80	✔ Good	✔ Synchronized
<input type="checkbox"/> NameNode(Standby)	node-master2LDLY.mrs-fmq.com			default-rack80	✔ Good	✔ Synchronized

The role instance list contains the Role, Host Name, Management IP Address, Service IP Address, Rack, Running Status, and Configuration Status of each instance.

- **Table 3-14** shows the running status of a role instance.

Table 3-14 Role instance running status

Status	Description
Good	Indicates that the instance is running properly.
Bad	Indicates that the instance cannot run properly.
Decommissioned	Indicates that the instance is out of service.
Not started	Indicates that the instance is stopped.

Status	Description
Unknown	Indicates that the initial status of the instance cannot be detected.
Starting	Indicates that the instance is being started.
Stopping	Indicates that the instance is being stopped.
Restoring	Indicates that an exception may occur in the instance and the instance is being automatically rectified.
Decommissioning	Indicates that the instance is being decommissioned.
Recommissioning	Indicates that the instance is being recommissioned.
Failed to start	Indicates that the service fails to be started.
Failed to stop	Indicates that the service fails to be stopped.

- [Table 3-15](#) shows the configuration status of a role instance.

Table 3-15 Role instance configuration status

Status	Description
Synchronized	The latest configuration takes effect.
Configuration expired	The latest configuration does not take effect after the parameter modification. Related services need to be restarted.
Configuration failed	The communication is incorrect or data cannot be read or written during the parameter configuration. Use Synchronize Configuration to rectify the fault.
Configuring	Parameters are being configured.
Unknown	Current configuration status cannot be obtained.

By default, the **Role** column is sorted in ascending order. You can click the sorting icon next to **Role**, **Host Name**, **OM IP Address**, **Business IP Address**, **Rack**, **Running Status**, or **Configuration Status** to change the sorting mode.

You can filter out all instances of the same role in the **Role** column.

You can set search criteria in the role search area by clicking **Advanced Search**, and click **Search** to view specified role information. You can click **Reset** to reset the search criteria. Fuzzy search is supported.

Step 3 Click the target role instance to view its status and metric information.

Step 4 Customize and view monitoring graphs.

1. In the **Charts** area, click **Customize** to customize service monitoring metrics.

2. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.

----End

Manage hosts.

NOTE

For versions earlier than MRS 3.x, see [Managing Hosts](#).

- Step 1** On the MRS cluster details page, click the **Nodes** tab and expand a node group to view the host status.

The host list of a group contains the **Node Name/Resource ID**, **IP**, **Status**, **Specifications**, **Disks**, and **AZ**.

- [Table 3-16](#) shows the host operating status.

Table 3-16 Host operating status

Status	Description
Normal	The host and service roles on the host are running properly.
Isolated	The host is isolated, and the service roles on the host stop running.

- [Table 3-17](#) describes the host health status.

Table 3-17 Host health status

Status	Description
Good	The host can properly send heartbeats.
Bad	The host fails to send heartbeats due to timeout.
Unknown	The host initial status is unknown during the operation of adding or deleting a host.

By default, data is sorted in ascending order by node name. You can click  to change the order.

- Step 2** Click the target node in the list to view its status and metric information.

----End

3.3 Viewing and Customizing Cluster Monitoring Metrics

MRS cluster nodes are classified into management nodes, control nodes, and data nodes. The change trends of key host monitoring metrics on each type of node

can be calculated and displayed as curve charts in reports based on the customized periods. If a host belongs to multiple node types, the metric statistics will be repeatedly collected.

This section provides overview of MRS clusters and describes how to view, customize, and export node monitoring metrics on MRS Manager.

 **NOTE**

Cluster metrics are monitored periodically. The average historical monitoring interval is about 5 minutes.

- Scenario 1: **applicable to clusters earlier than MRS 3.x**
 - Method 1:
 - i. Choose **Active Clusters** and click a cluster name to go to the cluster details page.
 - ii. Click the **Dashboard** tab, you can view the cluster host health status statistics on the lower part of the displayed tab page.
 - iii. To view or export a report of other metrics, log in to Manager by referring to [Accessing Manager](#).
 - iv. On the Manager page, view, customize, and export the node monitoring metric report by referring to [Dashboard](#).
 - Method 2:
 - i. Log in to the MRS console.
 - ii. Choose **Active Clusters** and click a cluster name to go to the cluster details page.
 - iii. On the **Dashboard** tab page, click **Click to synchronize** next to **IAM User Sync** to synchronize IAM users.
 - iv. After the synchronization is complete, click the **Monitor** tab to view the monitoring metric report of the cluster.
 - v. In time range area, specify a period to view monitoring data. The options are as follows:
 - Last 1 hour
 - Last 3 hours
 - Last 12 hours
 - Last 24 hours
 - Recent 7 days
 - Recent 30 days
 - Customize: You can customize the period for viewing monitoring data.
 - vi. Customize a monitoring metric report.
 - 1) Click **Customize** and select monitoring metrics to display.
 - 2) Click **OK** to save the selected monitoring metrics for display.

 **NOTE**

Click **Clear** to cancel all the selected monitoring metrics in a batch.

- vii. Export a monitoring report.
 - 1) Select a period.

The options are as follows:
Last 1 hour, Last 3 hours, Last 12 hours, Last 24 hours, Recent 7 days, Recent 30 days, or Customize (selection of a time range)
 - 2) Click **Export**. MRS will generate a report about the selected monitoring metrics in a specified time range. Save the report.
- **Scenario 2 (applicable to MRS 3.x or later clusters)**
 - a. Log in to the MRS console.
 - b. Choose **Active Clusters** and click a cluster name to go to the cluster details page.
 - c. On the **Dashboard** tab page, click **Click to synchronize** next to **IAM User Sync** to synchronize IAM users.
 - d. After the synchronization is complete, click the **Monitor** tab to view the monitoring metric report of the cluster.
 - e. In time range area, specify a period to view monitoring data. The options are as follows:
 - Last 1 hour
 - Last 3 hours
 - Last 12 hours
 - Last 24 hours
 - Recent 7 days
 - Recent 30 days
 - Customize: You can customize the period for viewing monitoring data.
 - f. Customize a monitoring metric report.
 - i. Click **Customize** and select monitoring metrics to be displayed.
 - ii. Click **OK** to save the selected monitoring metrics for display.

 **NOTE**

Click **Clear** to cancel all the selected monitoring metrics in a batch.

3.4 Cluster O&M

3.4.1 Importing and Exporting Data

Through the **Files** tab page, you can create, delete, import, export, delete files in the analysis cluster. Currently, file creation is not supported. Streaming clusters do not support the file management function on the MRS GUI. In a cluster with Kerberos authentication enabled, to read or write the folders in the root directory,

add a role that has the required permissions on the folders by referring to [Creating a Role](#). Then, add the new role to the user group to which the user who submits the job belongs by referring to [Related Tasks](#).

Background

Data sources processed by MRS are from OBS or HDFS. OBS is an object-based storage service that provides you with massive, secure, reliable, and cost-effective data storage capabilities. MRS can process data in OBS directly. You can view, manage, and use data by using the web page of the management control platform or OBS client. In addition, you can use REST APIs independently or integrate APIs to service applications to manage and access data.

Before creating jobs, upload the local data to OBS for MRS to compute and analyze. MRS allows exporting data from OBS to HDFS for computing and analyzing. After the data analysis and computing are completed, you can store the data in HDFS or export them to OBS. HDFS and OBS can also store the compressed data in the format of **bz2** or **gz**.

Importing Data

Currently, MRS can only import data from OBS to HDFS. The file upload rate decreases with the increase of the file size. This mode applies to scenarios where the data volume is small.

You can perform the following steps to import files and directories:

1. Log in to the MRS console.
2. On the **Active Clusters** page displayed by default, click the name of the target cluster to enter the cluster details page.
3. Click the **Files** tab, and go to the file management page.
4. Select **HDFS File List**.
5. Go to the data storage directory, for example, **bd_app1**.

The **bd_app1** directory is only an example. You can use any directory on the page or create a new one.

The requirements for creating a folder are as follows:

- The folder name contains a maximum of 255 characters
 - The folder name cannot be empty.
 - The folder name cannot contain the following special characters: `/*?"<>| \;&,'![]$%+`
 - The value cannot start or end with a period (.).
 - The spaces at the beginning and end are ignored.
6. Click **Import Data** and configure the HDFS and OBS paths correctly. When configuring the OBS or HDFS path, click **Browse**, select a file directory, and click **Yes**.

Figure 3-6 Importing data

Import Data from OBS to HDFS

The screenshot shows a dialog box titled "Import Data from OBS to HDFS". It contains two rows of input fields. The first row is labeled "OBS Path" and has a question mark icon to its left. The input field is empty, and there is a "Browse" button to its right. The second row is labeled "HDFS Path" and has the text "/user/" in the input field, with a "Browse" button to its right. Below these fields are two buttons: a red "OK" button and a white "Cancel" button.

- OBS path
 - The path must start with **obs://**.
 - Files or programs encrypted by KMS cannot be imported.
 - An empty folder cannot be imported.
 - The directory and file name can contain letters, digits, hyphens (-), and underscores (_), but cannot contain the following special characters ;|&><'\$*?\
 - The directory and file name cannot start or end with a space, but can contain spaces between them.
 - The OBS full path contains a maximum of 255 characters.
- HDFS path
 - The path starts with **/user** by default.
 - The directory and file name can contain letters, digits, hyphens (-), and underscores (_), but cannot contain the following special characters: ;|&><'\$*?\:
 - The directory and file name cannot start or end with a space, but can contain spaces between them.
 - The HDFS full path contains a maximum of 255 characters.

7. Click **OK**.

You can view the file upload progress on the **File Operation Records** tab page. MRS processes the data import operation as a DistCp job. You can also check whether the DistCp job is successfully executed on the **Jobs** tab page.

Exporting Data

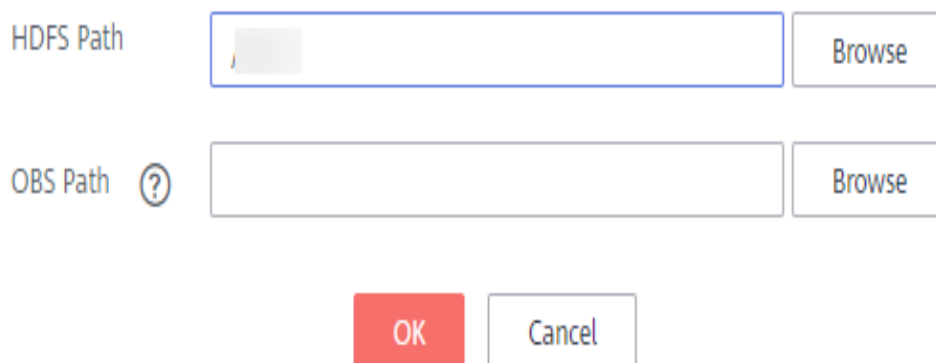

After the data analysis and computing are completed, you can store the data in HDFS or export them to OBS.

You can perform the following steps to export files and directories:

1. Log in to the MRS console.
2. On the **Active Clusters** page displayed by default, click the name of the target cluster to enter the cluster details page.
3. Click the **Files** tab, and the file management page is displayed.
4. Select **HDFS File List**.
5. Go to the data storage directory, for example, **bd_app1**.
6. Click **Export Data** and configure the OBS and HDFS paths. When configuring the OBS or HDFS path, click **Browse**, select a file directory, and click **Yes**.

Figure 3-7 Exporting data

Export Data from HDFS to OBS

The screenshot shows a dialog box titled "Export Data from HDFS to OBS". It contains two input fields. The first is labeled "HDFS Path" and has a "Browse" button to its right. The second is labeled "OBS Path" with a question mark icon to its left and a "Browse" button to its right. At the bottom of the dialog are two buttons: "OK" (red) and "Cancel" (white with grey border).

- OBS path
 - The path must start with **obs://**.
 - The directory and file name can contain letters, digits, hyphens (-), and underscores (_), but cannot contain the following special characters: ;|&>,<'\$*?\
 - The directory and file name cannot start or end with a space, but can contain spaces between them.
 - The OBS full path contains a maximum of 255 characters.
- HDFS path
 - The path starts with **/user** by default.

- The directory and file name can contain letters, digits, hyphens (-), and underscores (_), but cannot contain the following special characters: ;|&>,<'\$*?\\:
- The directory and file name cannot start or end with a space, but can contain spaces between them.
- The HDFS full path contains a maximum of 255 characters.

NOTE

When a folder is exported to OBS, a label file named **folder name_ \$folder\$** is added to the OBS path. Ensure that the exported folder is not empty. If the exported folder is empty, OBS cannot display the folder and only generates a file named **folder name_ \$folder\$**.

7. Click **OK**.

You can view the file upload progress on the **File Operation Records** tab page. MRS processes the data export operation as a DistCp job. You can also check whether the DistCp job is successfully executed on the **Jobs** tab page.

Viewing Operation Logs

When importing and exporting data on the MRS management console, you can choose **Files > File Operation Records** to view the data import and export progress.

Table 3-18 describes the parameters of the file operation record.

Table 3-18 File operation record parameters

Parameter	Description
Created	Time when the data import or export task is created.
Source Path	Source path of data. <ul style="list-style-type: none">• OBS path during data import.• HDFS path during data export.
Target Path	Target path of data. <ul style="list-style-type: none">• HDFS path during data import.• OBS path during data import.
Status	Status during data import or export. <ul style="list-style-type: none">• Submitted• Accepted• Running• Completed• Terminated• Abnormal

Parameter	Description
Duration (min)	Time of data import or export. The unit is minute.
Result	Result of data import or export. <ul style="list-style-type: none"> • Successful • Failed • Killed • Undefined
Operation	View Log: allows you to view file operation logs.

3.4.2 Changing the Subnet of a Cluster

If the current subnet does not have sufficient IP addresses, you can change to another subnet in the same VPC of the current cluster to obtain more available subnet IP addresses. Changing a subnet does not affect the IP addresses or subnets of existing nodes.

For details about how to configure network ACL outbound rules, see [How Do I Configure a Network ACL Outbound Rule?](#)

Changing a Subnet When No Network ACL Is Associated

- Step 1** Log in to the MRS console.
- Step 2** Click the target cluster name to go to its details page.
- Step 3** Click **Change Subnet** on the right of **Default Subnet**.

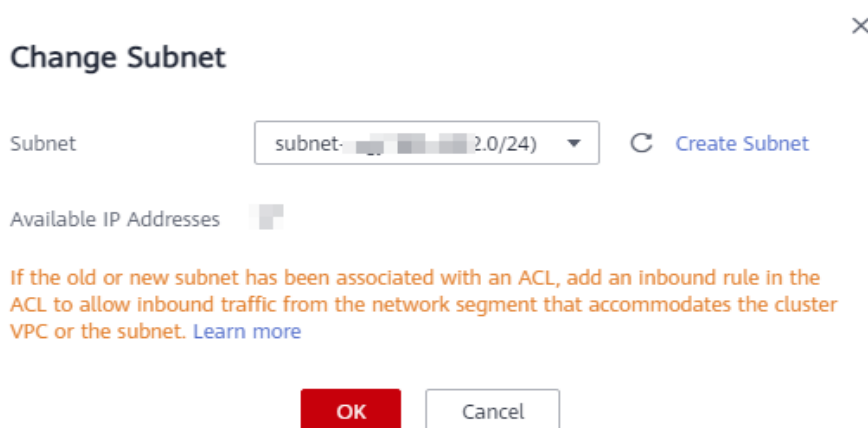

Figure 3-8 Changing a subnet

- Step 4** Select the target subnet and click **OK**.

If no subnet is available, click **Create Subnet** to create a subnet first.

Figure 3-9 Selecting the target subnet

----End

Changing a Subnet When a Network ACL Is Associated

- Step 1** Log in to the MRS console and click the target cluster to go to its details page.
- Step 2** In the **Basic Information** area, view **VPC**.
- Step 3** Log in to the VPC console. In the navigation pane on the left, choose **Virtual Private Cloud** and obtain the IPv4 CIDR block corresponding to the VPC obtained in [Step 2](#).

Figure 3-10 Obtaining the IPv4 CIDR block

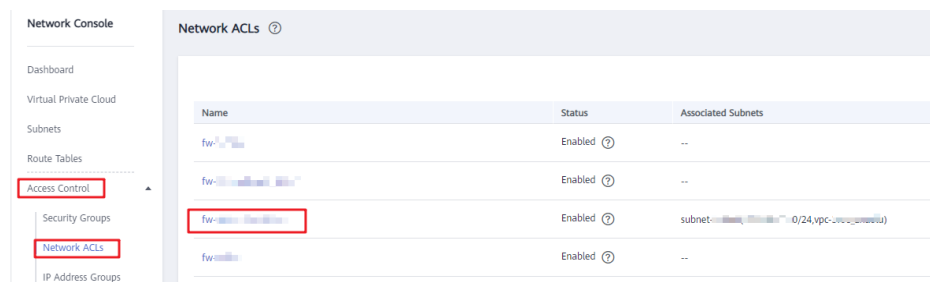

- Step 4** Choose **Access Control > Network ACLs** and click the name of the network ACL that is associated with the default and new subnets.

NOTE

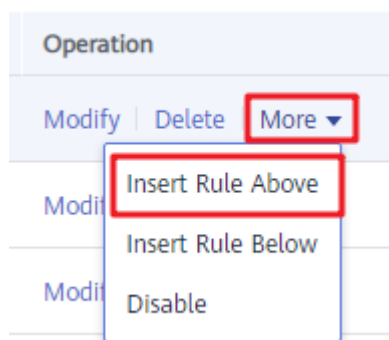

If both the default and new subnets are associated with a network ACL, add inbound rules to the network ACL by referring to [Step 5](#) to [Step 7](#).

Figure 3-11 Network ACLs

Step 5 On the **Inbound Rules** page, choose **More > Insert Rule Above** in the **Operation** column.

Figure 3-12 Inserting Rule Above

Step 6 Add a network ACL rule. Set **Action** to **Allow**, **Source** to the VPC IPv4 CIDR block obtained in **Step 3**, and retain the default values for other parameters.

Figure 3-13 Adding a network ACL rule

Step 7 Click **OK**.

NOTE

If you do not want to allow access from all IPv4 CIDR blocks of the VPC, add the IPv4 CIDR blocks of the default and new subnets by performing **Step 8** to **Step 12**. If the rules for VPC IPv4 CIDR blocks have been added, skip **Step 8** to **Step 12**.

Step 8 Log in to the MRS console.

Step 9 Click the target cluster to go to its details page.

Step 10 Click **Change Subnet** on the right of **Default Subnet**.

Figure 3-14 Changing a subnet

Step 11 Obtain the IPv4 CIDR blocks of the default and new subnets.

NOTICE

In this case, you do not need to click **OK** displayed in the **Change Subnet** dialog box. Otherwise, the default subnet will be updated to the new subnet, thereby making it difficult to query the IPv4 CIDR block of the default subnet. Exercise caution when performing this operation.

Figure 3-15 Obtaining the subnet IP address

Step 12 Add the IPv4 CIDR blocks of the default and target subnets to the inbound rules of the network ACL bound to the two subnets by referring to [Step 4](#) to [Step 7](#).

Step 13 Log in to the MRS console.

Step 14 Click the target cluster to go to its details page.

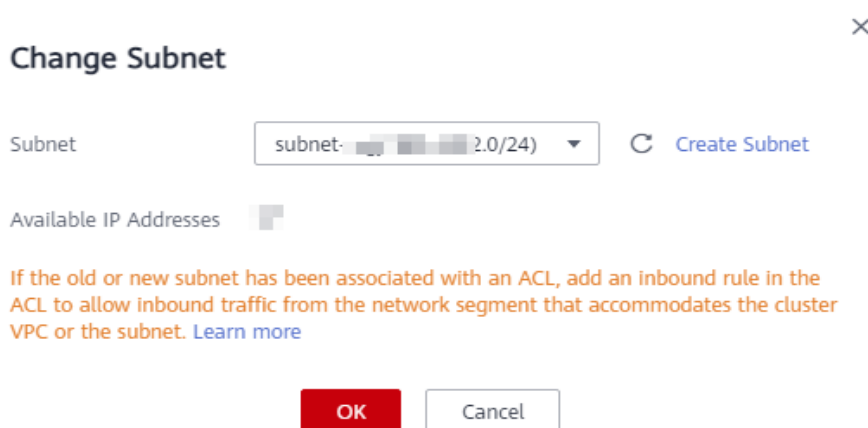

Step 15 Click **Change Subnet** on the right of **Default Subnet**.

Figure 3-16 Changing a subnet

Step 16 Select the target subnet and click **OK**.

Figure 3-17 Selecting the target subnet

----End

How Do I Configure a Network ACL Outbound Rule?

- **Method 1**
Allow all outbound traffic. This method ensures that clusters can be created and used properly.

Figure 3-18 Allowing all outbound traffic

Status	Type	Action	Protocol	Source [?]	Source Port Range [?]	Destination [?]	Destination Port Range [?]
Enabled	IPv4	Allow	All	0.0.0.0/0	All	0.0.0.0/0	All

- **Method 2**
Allow the mandatory outbound rules that can ensure the successful creation of clusters. You are not advised to use this method because created clusters may not run properly due to absent outbound rules. If the preceding problem occurs, contact O&M personnel.
Similar to the example provided in method 1, set **Action** to **Allow** and add the outbound rules whose destinations are the address with **Secure Communications** enabled, NTP server address, OBS server address, OpenStack address, and DNS server address, respectively.

3.4.3 Changing the Security Group of a Cluster

This topic describes how to change the security group after a cluster is created. Changing the security group may cause network communication risks. You need to ensure that security group rules have been configured in a new security group.

For details about security groups and security group rules, see [Security Groups and Security Group Rules](#).

Changing the Security Group

- Step 1** Log in to the MRS console.
- Step 2** Click the name of a cluster to enter its details page.

Step 3 Click **Change Security Group** on the right of the security group.

Figure 3-19 Changing the security group

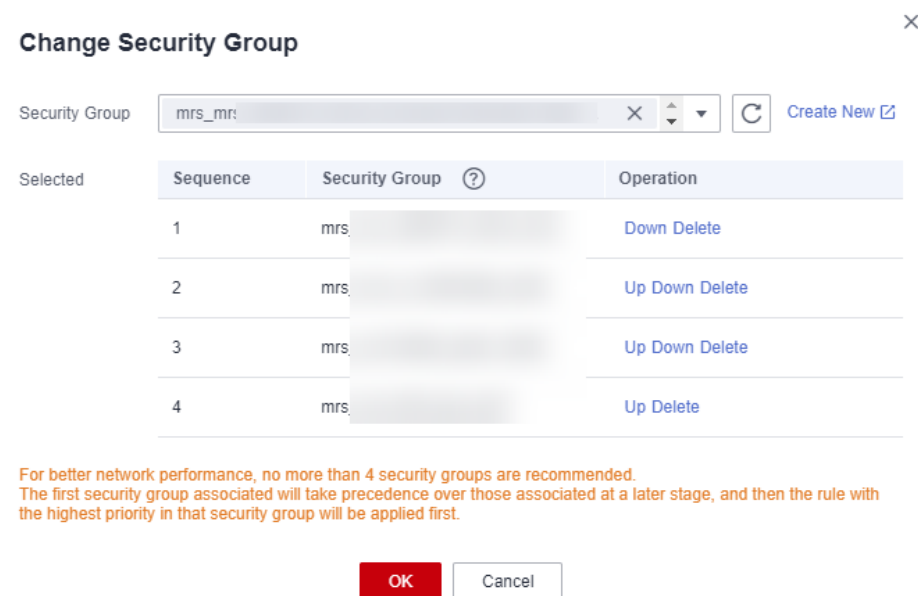

Step 4 Select the target security group and click **OK**.

If no security group is available, click **Create New** to access the security group console, create one, and select the new security group.

You can select a maximum of four security groups at a time. The security group rules that are bound first are used first, and rules with higher priorities in the group are used first.

Figure 3-20 Selecting the security group

----End

3.4.4 Configuring Message Notification

MRS uses SMN to offer a publish/subscribe model to achieve one-to-multiple message subscriptions and notifications in a variety of message types (SMSs and emails).

Scenario

On the MRS management console, you can enable or disable the notification service on the **Alarms** page. The functions in the following scenarios can be implemented only after the required cluster function is enabled:

- After a user subscribes to the notification service, the MRS management plane notifies the user of success or failure of manual cluster scale-out and scale-in, cluster deletion, and auto scaling by emails or SMS messages.

- The management plane checks the alarms about the MRS cluster and sends a notification to the tenant if the alarms are critical.
- If either of the operations such as deletion, shutdown, specifications modification, restart, and OS update is performed on an ECS in a cluster, the MRS cluster works abnormally. The management plane notifies a user when detecting that the VM of the user is in either of the preceding operations.

Creating a Topic

A topic is a specified event for message publication and notification subscription. It serves as a message sending channel, where publishers and subscribers can interact with each other.

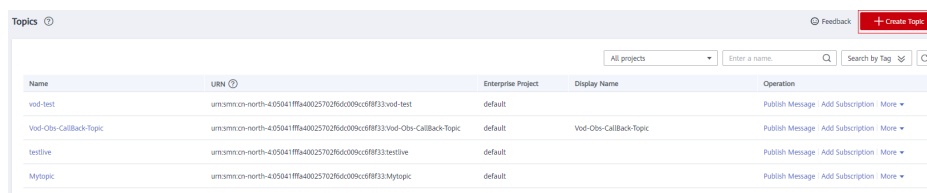

1. Log in to the management console.
2. Click **Service List**. Under **Management & Governance**, click **Simple Message Notification**.

The **SMN** page is displayed.

3. In the navigation pane, choose **Topic Management > Topics**.

The **Topics** page is displayed.

4. Click **Create Topic**.

Name	URN	Enterprise Project	Display Name	Operation
vod-test	urn:smn-cn-north-4:050411ff44025702f6c009cc0f8f33:vod-test	default		Publish Message Add Subscription More
Vod-Obs-Callback-Topic	urn:smn-cn-north-4:050411ff44025702f6c009cc0f8f33:vod-Obs-Callback-Topic	default	Vod-Obs-Callback-Topic	Publish Message Add Subscription More
testlive	urn:smn-cn-north-4:050411ff44025702f6c009cc0f8f33:testlive	default		Publish Message Add Subscription More
Mytopic	urn:smn-cn-north-4:050411ff44025702f6c009cc0f8f33:Mytopic	default		Publish Message Add Subscription More

The **Create Topic** dialog box is displayed.

5. In **Topic Name**, enter a topic name. In **Display Name**, enter a display name.
6. Select an existing project from the **Enterprise Project** drop-down list, or click **Create Enterprise Project** to create an enterprise project on the **Enterprise Project Management** page and then select it.
7. Set tag keys and tag values. Tags consist of keys and values. They identify cloud resources so that you can easily categorize and search for your resources.

Adding Subscriptions to a Topic

To deliver messages published to a topic to subscribers, you must add subscription endpoints to the topic. SMN automatically sends a confirmation message to the subscription endpoint. The confirmation message is valid only within 48 hours. The subscribers must confirm the subscription within 48 hours so that they can receive notification messages. Otherwise, the confirmation message becomes invalid, and you need to send it again.

1. Log in to the management console.
2. Under **Management & Governance**, click **Simple Message Notification**.

The **SMN** page is displayed.

3. In the navigation pane, choose **Topic Management > Topics**.

The **Topics** page is displayed.

4. Locate the topic to which you want to add a subscription, click **More** in the **Operation** column, and select **Add Subscription**.

The **Add Subscription** box is displayed.

Protocol can be set to **SMS**, FunctionGraph (function), **HTTP**, **HTTPS**, and **Email**.

Endpoint indicates the address of the subscription endpoint. SMS and email, endpoints can be entered in batches. When adding endpoints in batches, each endpoint address occupies a line. You can enter a maximum of 10 endpoints.

5. Click **OK**.

The subscription you added is displayed in the subscription list.

Sending Notifications to Subscribers

1. Log in to the MRS console.
2. Choose **Active Clusters**, select a running cluster, and click its name to go to its details page.
3. Click **Alarms**.
4. Choose **Notification Rules** > **Add Notification Rule**. The **Add Notification Rule** page is displayed.

Add Notification Rule

Rule Name

Message Notification

Notification Type

Subscription Items

- Critical
- Major
- Minor
- Suggestion

5. Set the notification rule parameters.

Table 3-19 Parameters of a notification rule

Parameter	Description
Rule Name	User-defined notification rule name. Only digits, letters, hyphens (-), and underscores (_) are allowed.
Message Notification	<ul style="list-style-type: none">• If you enable this function, the system sends notifications to subscribers based on the notification rule.• If you disable this function, the rule does not take effect, that is, notifications are not sent to subscribers.
Topic Name	Select an existing topic or click Create Topic to create a topic.
Notification Type	Select the type of the notification to be subscribed to. <ul style="list-style-type: none">• Alarm• Event
Subscription Items	Select the items to be subscribed to. You can select all or some items as required. 6. Click **OK**.

 **NOTE**

After a message subscription rule is applied, you may receive some historical alarms.

3.4.5 Checking Health Status

3.4.5.1 Before You Start

This section describes how to manage health checks on the MRS console.

Health check management operations on the MRS console apply only to clusters of **MRS 1.9.2**.

Health check management on Manager applies to all versions. For MRS 3.x and later versions, see [Viewing a Health Check Task](#). For versions earlier than MRS 3.x, see [Performing a Health Check](#).

3.4.5.2 Performing a Health Check

Scenario

To ensure that cluster parameters, configurations, and monitoring are correct and that the cluster can run stably for a long time, you can perform a health check during routine maintenance.

NOTE

A system health check includes MRS Manager, service-level, and host-level health checks:

- MRS Manager health checks focus on whether the unified management platform can provide management functions.
- Service-level health checks focus on whether components can provide services properly.
- Host-level health checks focus on whether host indicators are normal.

The system health check includes three types of check items: health status, related alarms, and customized monitoring indicators for each check object. The health check results are not always the same as the **Health Status** on the portal.

Procedure

- Manually perform the health check for all services.
On the MRS details page, choose **Management Operations > Start Cluster Health Check**.

NOTE

For the operations on MRS Manager, see [Performing a Health Check](#); for the operations on FusionInsight Manager of MRS 3.x or later, see [Overview](#).

- The cluster health check includes Manager, service, and host status checks.
- To perform cluster health checks, you can also choose **System > Check Health Status > Start Cluster Health Check** on MRS Manager.
- To export the health check result, click **Export Report** in the upper left corner.
- Manually perform the health check for a service.
 - a. On the MRS cluster details page, click **Components**.
 - b. Select the target service from the service list.
 - c. Choose **More > Start Service Health Check** to start the health check for the service.
- Manually perform the health check for a host.
 - a. On the MRS details page, click **Nodes**.
 - b. Expand the node group information and select the check box of the host to be checked.
 - c. Choose **Node > Start Host Health Check** to start the health check for the host.

3.4.5.3 Viewing and Exporting a Health Check Report

Scenario

You can view the health check result on MRS and export it for further analysis.

NOTE

A system health check includes MRS Manager, service-level, and host-level health checks:

- MRS Manager health checks focus on whether the unified management platform can provide management functions.
- Service-level health checks focus on whether components can provide services properly.
- Host-level health checks focus on whether host indicators are normal.

The system health check includes three types of check items: health status, related alarms, and customized monitoring indicators for each check object. The health check results are not always the same as the **Health Status** on the portal.

Prerequisites

You have performed a health check.

Procedure

- Step 1** On the cluster details page, choose **Management Operations > View Cluster Health Check Report**.

- Step 2** Click **Export Report** on the health check report pane to export the report and view detailed information about check items.

----End

3.4.6 Remote O&M

3.4.6.1 Authorizing O&M

If you need HUAWEI CLOUD technical support for troubleshooting, you can use the O&M authorization function to authorize HUAWEI CLOUD technical support engineers to access your local host for fault location.

Authorizing for Cluster Nodes

- Step 1** Log in to the MRS management console.
- Step 2** In the navigation pane of the MRS management console, choose **Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

- Step 3** In the upper right corner of the page, click **O&M**, choose **Authorize for Cluster Nodes**, and select the deadline for the HUAWEI CLOUD support engineers to access the local host. Before the deadline, the support personnel have the temporary permission to access the local host.
- Step 4** Select the check box to confirm authorization and click **OK**.
- Step 5** After the fault is rectified, click **O&M** in the upper right corner of the page and choose **Deauthorize for Cluster Nodes** to retrieve the access permission granted to the HUAWEI CLOUD support engineers.

----End

3.4.6.2 Sharing Logs

If you need HUAWEI CLOUD technical support personnel to help you with troubleshooting, you can use the log sharing function to provide logs in a specific time to HUAWEI CLOUD technical support personnel for fault location.

Procedure

- Step 1** Log in to the MRS management console.
- Step 2** In the navigation pane of the MRS management console, choose **Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.
- Step 3** In the upper right corner of the displayed page, choose **O&M > Share Log** to open the **Share Log** dialog box.
- Step 4** Select the start time and end time in **Time Range**.

Figure 3-21 Sharing logs

Share Log

This log will be shared with O&M personnel for fault location.

Time Range

OK

Cancel

NOTE

- Select **Time Range** based on the suggestions of HUAWEI CLOUD support personnel.
- **End Date** must be later than **Start Date**. Otherwise, logs cannot be filtered by time.

----End

3.4.7 Viewing MRS Operation Logs

You can view operation logs of clusters and jobs on the **Operation Logs** page. Log information is typically used for quickly locating faults in case of cluster exceptions, helping users resolve problems.

Operation Type

Currently, the following operation logs are provided by MRS. You can filter the logs in the search box.

- Cluster operations
 - Creating, deleting, scaling out, and scaling in a cluster
 - Creating and deleting a directory, deleting a file
- Job operations: Creating, stopping, and deleting a job
- Data operations: IAM user tasks, adding user, and adding user group

Log Fields

Logs are listed in chronological order by default in the log list, with the most recent logs displayed at the top.

[Table 3-20](#) describes various fields in a log.

Table 3-20 Log description

Parameter	Description
Operation Type	Various types of operations, including: <ul style="list-style-type: none">• Cluster operations• Job operations• Data operations
Operation IP	IP address where an operation is performed. NOTE If an MRS cluster fails to be deployed, the cluster is automatically deleted, and the operation logs of the automatically deleted cluster do not contain the Operation IP of the user.
Users	The user who performs the operation
Operation	Operation details. The value can contain a maximum of 2048 characters.
Time	Operation time. For a deleted cluster, only logs generated within the last six months are displayed. To view logs generated six months ago, contact Huawei Cloud technical support.
Enterprise Project	Enterprise project to which the cluster belongs

Table 3-21 Icon description

Icon	Description
	Select an enterprise project from the drop-down list box to filter logs.
	Select an operation type from the drop-down list box to filter logs. <ul style="list-style-type: none"> • All Operation Types: Filter all logs. • Cluster: Filter logs for Cluster. • Job: Filter logs for Job. • Data: Filter logs for Data.
	Filter logs by time. <ol style="list-style-type: none"> 1. Click the input box. 2. Specify the date and time. 3. Click OK. <p>The left-side input box indicates the start time and the right-side one indicates the end time. The start time must be earlier than or equal to the end time. Otherwise, logs cannot be filtered.</p>
	Enter a keyword of the Operation Details in the search box and click  to search for logs.
	Click  to manually refresh the log list.

3.4.8 Changing Billing Mode to Yearly/Monthly

This section describes how to change the billing mode of a cluster from **Pay-per-use** to **Yearly/Monthly**.

This operation can be performed only when the cluster status is **Running** or **Stopping**.

- Step 1** Log in to the MRS console.
- Step 2** In the navigation pane on the left, choose **Active Clusters**.
- Step 3** In the **Operation** column corresponding to the cluster for which you want to change the billing mode, click **Change to Yearly/Monthly**.
- Step 4** If you are sure you want to change the billing mode, click **Yes**.
- Step 5** On the **Change Subscription** page that is displayed, choose how often you would like to renew and click **Pay**.

After the order is submitted, the cluster status changes from **Running** to **Changing to Yearly/Monthly**.

After the order is paid successfully, the cluster billing mode starts changing to **Yearly/Monthly**. After the billing mode is successfully changed, the cluster status is **Running**.

 **NOTE**

After the billing mode is changed to yearly/monthly, task nodes in a cluster are still billed in pay-per-use mode. During the change, the configured AS rules do not trigger scaling actions. Change the billing mode at an appropriate time to avoid any adverse impact on your services.

----End

3.4.9 Unsubscribing from a Cluster

If a cluster charged in **Yearly/Monthly** mode is not required after the job execution, you can unsubscribe from it. After the cluster is unsubscribed, resources and data will be deleted and cannot be restored. Ensure that the data is backed up before you unsubscribed from the cluster.

For details about the unsubscription rules, see [Conditional Unsubscription](#).

Background

Typically after data is analyzed and stored, or when the cluster encounters an exception and cannot work, you can unsubscribe a cluster. When the MRS cluster fails to be deployed, the cluster is automatically unsubscribed.

Procedure

- Step 1** Log in to the MRS management console.
- Step 2** In the navigation pane on the left, choose **Active Clusters**.
- Step 3** In the **Operation** column of the cluster from which you want to unsubscribe, click **Unsubscribe**.
- Step 4** On the **Unsubscribe** page, confirm the cluster information, select reasons for unsubscription, and confirm the unsubscription amount and related fees.
- Step 5** Click **Confirm**.
- Step 6** Confirm the unsubscription information and click **Yes** to submit the unsubscription application.

After the unsubscription application is submitted, the cluster status changes from **Running** to **Deleting**. After the cluster is deleted, the cluster status changes to **Deleted** and is displayed in **Cluster History**.

----End

3.4.10 Unsubscribing from a Specified Node in a Yearly/Monthly Cluster

You can reduce the number of specific nodes to scale in a cluster so that MRS delivers better storage and computing capabilities at lower O&M costs based on service requirements.

Currently, you can unsubscribe from a maximum of 20 Core nodes at a time, but there must be at least 2 Core nodes available after unsubscription.

NOTE

You can unsubscribe from a node only after the node is successfully isolated or decommissioned. Otherwise, data loss may occur.

Usage Restrictions

- If the number of Core nodes in the cluster is less than or equal to the number of HDFS copies, MRS does not support node unsubscription to ensure data reliability. The number of HDFS copies can be queried using the **dfs.replication** parameter in the HDFS parameter configuration.
- MRS does not support unsubscription from nodes where ZooKeeper, Kudu, Kafka, or ClickHouse is deployed.

How to Unsubscribe from a Specified Node in a Yearly/Monthly Cluster

- Step 1** Disable the auto-renewal function of the cluster where the node to be unsubscribed from is located. For details, see [Disabling Auto-Renewal](#).
- Step 2** Log in to the MRS console.
- Step 3** On the **Active Clusters** page, and click the name of the target cluster to be operated. The cluster details page is displayed.
- Step 4** On the **Dashboard** page of the cluster, click **Synchronize** on the right of **IAM User Sync**.
- Step 5** Unsubscribe from or isolate a node.

NOTE

Currently, only clusters of the following versions support unsubscription from specified nodes in yearly/monthly clusters. For clusters of other versions, contact technical support.

- MRS 2.1.0 (patch 2.1.0.5 or later)
- MRS 3.1.0 (patch 3.1.0.0.2 or later)
- MRS 3.1.5
- MRS 3.2.0-LTS.1 (patch 3.2.0-LTS.1.3 or later)
- If the cluster is earlier than MRS 2.x:
 - a. Click **Isolate Node** in the **Operation** column of the node group to be unsubscribed from.
 - b. Select the node to be unsubscribed from and click **OK**.

The time required for isolating a node depends on the data volume on the node. A larger data volume indicates a longer time.

After the node is isolated, the node status changes to **Isolated**. The **Unsubscribe from Node** button is displayed on the **Nodes** tab page.
- If the cluster is MRS 3.1.0, 3.1.5, or 3.2.0-LTS.1:
 - a. Click **Decommission Node** in the **Operation** column of the node group to be unsubscribed from.
 - b. Select the node to be decommissioned and click **OK**.

The time required for decommissioning a node depends on the data volume on the node. A larger data volume indicates a longer time.

After the node is decommissioned, the node status changes to **Decommissioned**.

 **NOTE**

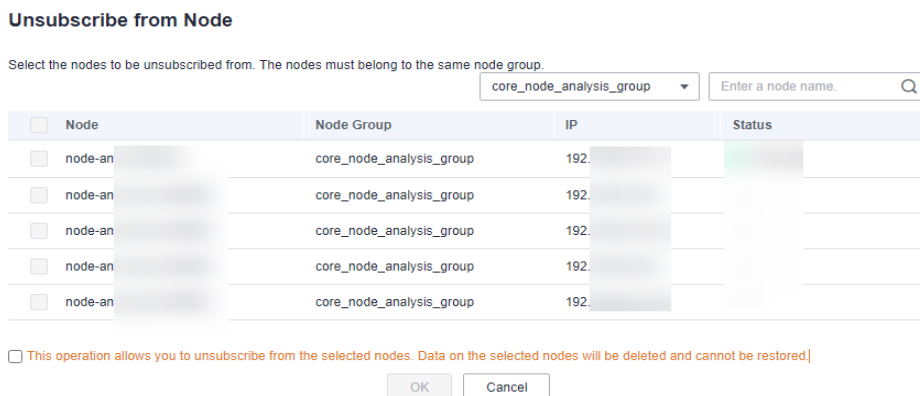

- For clusters of MRS 3.x (except MRS 3.1.0, 3.1.5, and 3.2.0-LTS.1), perform the following operations:
 1. If the DataNode of HDFS, NodeManager of Yarn, or RegionServer of HBase is deployed on the node to be unsubscribed from, log in to FusionInsight Manager and decommission the related instances. For details, see [Decommissioning and Recommissioning an Instance](#).
 2. Log in to the MRS management console, on the **Nodes** tab, select the nodes to be unsubscribed from, and choose **Node Operation** > **Isolate Host**. After the host is isolated, contact the technical engineer to unsubscribe from the node.
- Only one node can be isolated or decommissioned at a time. You can unsubscribe from a node only after the node is successfully isolated or decommissioned.
- If the node fails to isolate or decommission, log in to Manager. Click , search for the name of the task that fails to isolate or decommission the host in the task list, click the name, and rectify the fault as prompted.

Step 6 On the cluster details page, choose **Nodes** > **Unsubscribe from Node**.

Step 7 Select the node to be unsubscribed from and click **OK**.

Currently, you can unsubscribe from a maximum of 20 Core nodes at a time, but there must be at least 2 Core nodes available after unsubscription.

Figure 3-22 Selecting a node to be unsubscribed from

Step 8 On the **Refund Details** page, select "I understand a handling fee will be charged for this unsubscription" as prompted if needed, and click **Confirm**. If this check box does not appear, skip this step.

The cluster status changes to **Scaling in**. After the scale-in is complete, the cluster status changes to **Running**, and the specified node is deleted.

Figure 3-23 Refund details

Refund Details

Please explain your specific reason for canceling your subscription. Enter a maximum of 100 characters.

0/100

I understand a handling fee will be charged for this unsubscription.

Confirm

Step 9 (Optional) To enable auto-renewal for a cluster, see [Enabling Auto-Renewal](#).

----End

3.4.11 Deleting a Cluster

You can delete an MRS cluster after job execution is complete. The deleted or unsubscribed cluster is no longer billed.

Background

You can manually delete a cluster after data analysis is complete or when the cluster encounters an exception. A cluster failed to be deployed will be automatically deleted.

A yearly/monthly billed cluster cannot not be deleted but can be unsubscribed from. For details about how to unsubscribe from a cluster, see [Unsubscribing from a Cluster](#).

Procedure

- Step 1** Log in to the MRS management console.
- Step 2** In the navigation pane on the left, choose **Active Clusters**.
- Step 3** In the cluster list, locate the row containing the cluster to be deleted, and click **Delete** in the **Operation** column. In the **Delete Cluster** dialog box, enter **DELETE** in the confirmation text box and click **OK**.

The cluster status changes from **Running** to **Deleting**, and finally to **Deleted**. You can view the deleted cluster in **Cluster History**. The deleted cluster is no longer billed.

----End

3.5 Managing Nodes

3.5.1 Scaling Out a Cluster

The storage and computing capabilities of MRS can be improved by simply adding Core nodes or Task nodes instead of modifying system architecture, reducing O&M costs. Core nodes can process and store data. You can add Core nodes to expand the node quantities and handle peak loads. Task nodes are used to process data instead of storing persistent data.

Background

Only Master, Core, and Task nodes can be added.

When you log in to a node added for scale-out as user **root**, the password set during cluster creation is required.

Constraints

- When you expand a node group where HBase is installed:
If automatic DNS registration is not enabled for a node in the cluster, do not start HBase when you expand the node group. Then, update the HBase client configuration by referring to [Updating a Client](#) and start the HBase instances on the node to be expanded.
Automatic DNS registration is enabled by default in the following versions:
MRS 1.9.3, MRS 3.1.0, MRS 3.1.2-LTS, MRS 3.1.5, and MRS 3.2.0-LTS
You can check whether this DNS function is supported by checking whether the **features** field in the response body contains **register_dns_server**. For details, see [Querying the Metadata of a Cluster Version](#).
- After a scale-out, the clients installed on nodes in the cluster do not need to be updated. For details about how to update the client installed on nodes outside the cluster, see [Updating a Client](#).
- If you need to balance HDFS data after scale-out, see [Balancing DataNode Capacity](#). For details about how to balance Kafka data, see [Kafka Balancing Tool Instructions](#).

Scaling Out a Cluster Billed in Pay-per-Use Mode

Step 1 Log in to the MRS console.

Step 2 Choose **Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 Click the **Nodes** tab. In the **Operation** column of the node group, click **Scale Out**. The **Scale Out** page is displayed.

The scale-out operation can only be performed on the running clusters.

Step 4 Set the type of **System Disk** and **Data Disk**, **Scale-Out Nodes**, **Enable Components** and **Run Bootstrap Action**, and click **OK**. The **Enable Components** and **Run Bootstrap Action** parameters may not be supported by clusters of some versions. The operations are subject to the UI.

✕

Scale Out

Node Type Analysis Core ▾

Current Nodes 3

Scale-Out Nodes - 0 +

Insufficient node quota. [Increase quota](#)

OK
Cancel

NOTE

- If the Task node group does not exist in the cluster, configure the Task node by referring to [Related Tasks](#).
- If a bootstrap action is added during cluster creation, the **Run Bootstrap Action** parameter is valid. If this function is enabled, the bootstrap actions added during cluster creation will be run on all the scaled out nodes.
- If the **New Specifications** parameter is available, the specifications that are the same as those of the original nodes have been sold out or discontinued. Nodes with new specifications will be added.
- Before scaling out the cluster, check whether its security group configuration is correct. Ensure that an inbound security group rule contains a rule in which **Protocol & Port** is set to **All**, and **Source** is set to a trusted accessible IP address range.

Step 5 In the **Add Node** dialog box, click **OK**.

Step 6 A dialog box is displayed in the upper right corner of the page, indicating that the scale-out task is submitted successfully.

The following parameters explain the cluster scale-out process:

- During scale-out: If a cluster is being scaled out, its status is **Scaling out**. The submitted jobs will be executed and you can submit new jobs. You are not allowed to continue to scale out or delete the cluster. You are advised not to restart the cluster or modify the cluster configuration.

- Successful scale-out: The cluster status is **Running**. The resources used in the old nodes and expanded nodes are charged.
- Failed scale-out: The cluster status is **Running**. You can execute jobs and scale out the cluster again.

After the cluster is scaled out, you can view the node information of the cluster on the **Nodes** page.

----End

Scaling Out a Cluster Billed in Yearly/Monthly Mode

Step 1 Log in to the MRS console.

Step 2 Choose **Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 Click the **Nodes** tab. In the **Operation** column of the node group, click **Scale Out**. The **Scale Out** page is displayed.

The scale-out operation can only be performed on the running clusters.

Step 4 Set the type of the **System Disk** and **Data Disk**, **Scale-Out Nodes**, **Enable Components** and **Run Bootstrap Action**. The system displays the expiration time of the cluster and the fee required for adding nodes. **Enable Components** and **Run Bootstrap Action** may not be supported by clusters of some versions. The operations are subject to the UI.

NOTE

- If a bootstrap action is added during cluster creation, the **Run Bootstrap Action** parameter is valid. If this function is enabled, the bootstrap actions added during cluster creation will be run on all the scaled out nodes.
- If the **New Specifications** parameter is available, the specifications that are the same as those of the original nodes have been sold out or discontinued. Nodes with new specifications will be added.
- Before scaling out the cluster, check whether its security group configuration is correct. Ensure that an inbound security group rule contains a rule in which **Protocol & Port** is set to **All**, and **Source** is set to a trusted accessible IP address range.
- Click **Submit Order**.

On the **Purchase MapReduce Service** page, click **Pay**.

- Click **Confirm order, not pay**.

On the cluster information page, choose **Fee > My Order** and click **Pay**.

Step 5 After the payment is successful, return to the MRS management console to view the cluster status.

The following parameters explain the cluster scale-out process:

- During scale-out: If a cluster is being scaled out, its status is **Scaling out**. The submitted jobs will be executed and you can submit new jobs. You are not allowed to continue to scale out or delete the cluster. You are advised not to restart the cluster or modify the cluster configuration.
- Successful scale-out: The cluster status is **Running**. The resources used in the old nodes and expanded nodes are charged.

- Failed scale-out: The cluster status is **Running**. You can execute jobs and scale out the cluster again.

After the cluster is scaled out, you can view the node information of the cluster on the **Nodes** page.

----End

Adding a Task Node

You can scale out an MRS cluster by manually adding task nodes.

To add a task node to a custom cluster, perform the following steps:

- On the cluster details page, click the **Nodes** tab and click **Add Node Group**. The **Add Node Group** page is displayed.
- Select **Task** for **Node Type**. Retain the default value **NM** for **Deploy Roles**. To deploy the NodeManager role, the node type must be **Task**. Set other parameters as required.

Figure 3-24 Adding a task node group

Disks

Role	Deploy In	Number of ...	Role Type	Deployed ...	Max. Multi-i...	Restricted ...
ClickHous...	All node groups	You can depl...	Data storage	--	--	Scale-in

To add a task node to a non-custom cluster, perform the following steps:

- On the cluster details page, click the **Nodes** tab and click **Configure Task Node**. The **Configure Task Node** page is displayed.
- On the **Configure Task Node** page, set **Node Type**, **Instance Specifications**, **Nodes**, **System Disk**. In addition, if **Add Data Disk** is enabled, configure the storage type, size, and number of data disks.

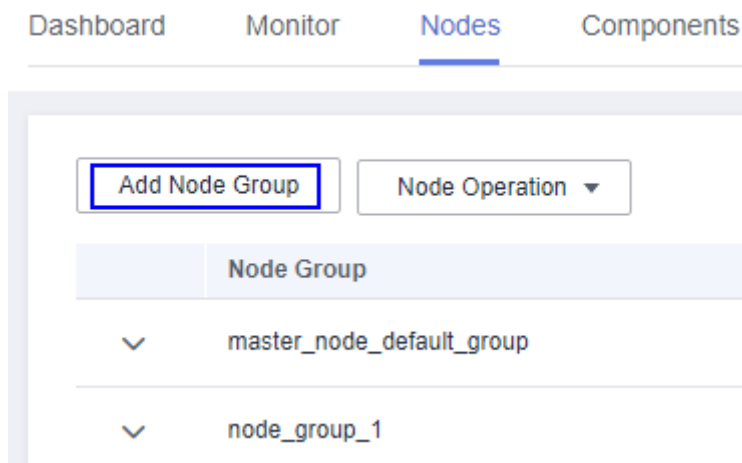

3. Click **OK**.

Adding a Node Group

NOTE

Used to add node groups and applies to customized clusters of MRS 3.x.

1. On the cluster details page, click the **Nodes** tab and click **Add Node Group**. The **Add Node Group** page is displayed.

Figure 3-25 Clicking Add Node Group

2. Set the parameters as needed.
3. Click **OK**.

3.5.2 Scaling In a Cluster

You can reduce the number of core or task nodes to scale in a cluster based on service requirements so that MRS delivers better storage and computing capabilities at lower O&M costs.

The scale-in operation is not allowed for a cluster that is performing active/standby synchronization.

NOTE

Only pay-per-use clusters can be scaled in. For details about how to scale in a yearly/monthly node, see [Unsubscribing from a Specified Node in a Yearly/Monthly Cluster](#).

Background

A cluster can have three types of nodes, master, core, and task nodes. Currently, only core and task nodes can be removed. To scale in a cluster, you only need to adjust the number of nodes on the MRS console. MRS then automatically selects the nodes to be removed.

The policies for MRS to automatically select nodes are as follows:

- MRS does not select the nodes with basic components installed, such as ZooKeeper, DBService, KrbServer, and LdapServer, because these basic components are the basis for the cluster to run.
- Core nodes store cluster service data. When scaling in a cluster, ensure that all data on the core nodes to be removed has been migrated to other nodes. You can perform follow-up scale-in operations only after all component services are decommissioned, for example, removing nodes from Manager and deleting ECSs. When selecting core nodes, MRS preferentially selects the nodes with a small amount of data and healthy instances to be decommissioned to prevent decommissioning failures. For example, if DataNodes are installed on core nodes in an analysis cluster, MRS preferentially selects the nodes with small data volume and good health status during scale-in.

When core nodes are removed, their data is migrated to other nodes. If the user business has cached the data storage path, the client will automatically update the path, which may increase the service processing latency temporarily. Cluster scale-in may slow the response of the first access to some HBase on HDFS data. You can restart HBase or disable or enable related tables to resolve this issue.

- Task nodes are computing nodes and do not store cluster data. Data migration is not involved in removing task nodes. Therefore, when selecting task nodes, MRS preferentially selects nodes whose health status is faulty, unknown, or subhealthy. On the **Components** tab of the MRS console, click a service and then the **Instances** tab to view the health status of the node instances.

Scale-In Verification Policy

To prevent component decommissioning failures, components provide different decommissioning constraints. Scale-in is allowed only when the constraints of all installed components are met. [Table 3-22](#) describes the scale-in verification policies.

Table 3-22 Decommissioning constraints

Component	Constraint
HDFS/DataNode	<p>The number of available nodes after the scale-in is greater than or equal to the number of HDFS copies and the total HDFS data volume does not exceed 80% of the total HDFS cluster capacity.</p> <p>This ensures that the remaining space is sufficient for storing existing data after the scale-in and reserves some space for future use.</p> <p>NOTE To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total.</p>
HBase/RegionServer	<p>The total available memory of RegionServers on all nodes except the nodes to be removed is greater than 1.2 times of the memory which is currently used by RegionServers on these nodes.</p> <p>This ensures that the node to which the region on a decommissioned node is migrated has sufficient memory to bear the region of the decommissioned node.</p>
Storm/Supervisor	<p>After the scale-in, ensure that the number of slots in the cluster is sufficient for running the submitted tasks.</p> <p>This prevents no sufficient resources being available for running the stream processing tasks after the scale-in.</p>
Flume/FlumeServer	<p>If FlumeServer is installed on a node and Flume tasks have been configured for the node, the node cannot be deleted.</p> <p>This prevents the deployed service program from being deleted by mistake.</p>

Component	Constraint
ClickHouse/ ClickHouseServer	For details, see Constraints on ClickHouseServer Scale-in . This ensures that data on the decommissioned nodes is migrated to in-use nodes.

Scaling In a Cluster by Specifying the Node Quantity

Step 1 Log in to the MRS console.

Step 2 On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

Step 3 Click the **Nodes** tab. In the **Operation** column of the node group, click **Scale In** to go to the **Scale In** page.

This operation can be performed only when the cluster and all nodes in it are running.

Step 4 Set **Scale-In Type** to **Node quantity**.

Step 5 Set **Scale-In Nodes** and click **OK**.

Scale In

To improve scale-in reliability, MRS features standard scale-in rules for big data service components. If you perform the scale-in, the server and data disks will be deleted and cannot be recovered. [Learn more](#)

Scale-In Type Node quantity Specific node

Node Type Analysis Core

Current Nodes 4

* Scale-In Nodes - +

I understand the consequences of performing the scale-in operation.

OK Cancel

 NOTE

- Before scaling in the cluster, check whether its security group configuration is correct. Ensure that an inbound security group rule contains a rule in which **Protocol & Port** is set to **All**, and **Source** is set to a trusted accessible IP address range.
- If damaged data blocks exist in HDFS, the cluster may fail to be scaled in. Contact Huawei Cloud technical support.

Step 6 A dialog box displayed in the upper right corner of the page indicates that the task of removing the node is submitted successfully.

The cluster scale-in process is explained as follows:

- During scale-in: The cluster status is **Scaling In**. The submitted jobs will be executed, and you can submit new jobs. You are not allowed to continue to scale in or delete the cluster. You are advised not to restart the cluster or modify the cluster configuration.
- Successful scale-in: The cluster status is **Running**. The resources used after the cluster scale-in are billed.
- Failed scale-in: The cluster status is **Running**. You can execute jobs or scale-in the cluster again.

After the cluster is scaled in, you can view the node information of the cluster on the **Nodes** page.

----End

Scaling In a Cluster by Removing Nodes that Are No Longer Needed

If a faulty node is no longer needed, you can use this function to remove it. When the node is removed, the instance of the component role will not be decommissioned. Before deleting the node, ensure that the data on the node has been backed up. For details about how to remove ClickHouseServer nodes, see [Removing ClickHouseServer Instance Nodes](#). Only pay-per-use nodes can be scaled in.

Step 1 Log in to MRS Manager and choose **Hosts**.

Step 2 Select the host to be removed, choose **More**, and select **Isolate** to isolate the host.

For versions earlier than MRS 3.x, isolate the node to be removed by referring to [Isolating a Host](#).

The time required for isolating a host depends on the data volume on the host. A larger data volume requires a longer time.

After the node is isolated, the node status changes to **Isolated**.

 NOTE

- If the host isolation fails, log in to MRS Manager, click  to search for the task that fails to isolate the host in the task list, and rectify the fault as prompted.
- Isolating a host helps you decommission a node. If data on the node has been backed up, you can skip the operation of isolating a host, directly stop the host on the ECS console, and scale in the host.
- If a host is faulty, forcibly remove the node.

- Step 3** Log in to the MRS console.
- Step 4** Click the name of the cluster to go to its details page.
- Step 5** Click the **Nodes** tab.
- Step 6** Locate the row that contains the target node group and click **Scale In** in the **Operation** column to go to the **Scale In** page.
- Step 7** Set **Scale-In Type** to **Specific node** and select the node to be removed.

Nodes in the **Stopped**, **Lost**, **Unknown**, **Isolated**, or **Faulty** status can be specified for scale-in. If the node cannot be selected, click **Stop ECS** to go to the ECS console to stop the node. On the cluster details page of the MRS console, click the **Alarms** tab and check whether any service fault alarms are generated after the node is stopped. If no such an alarm is generated, go back to the **Scale In** page and select the corresponding node for scale-in. If such an alarm is generated, clear the alarm before the scale-in.

Figure 3-26 Removing a specific node

- Step 8** Select **I understand the consequences of performing the scale-in operation**, and click **OK**.
- Step 9** Click the **Components** tab and check whether each component is normal. If any component is abnormal, wait for 5 to 10 minutes and check the component status again. If the fault persists, contact Huawei Cloud technical support.

- Step 10** Click the **Alarms** tab and check whether there are exception alarms. If there are exception alarms, clear them before performing other operations.

----End

3.5.3 Removing ClickHouseServer Instance Nodes

3.5.3.1 Constraints on ClickHouseServer Scale-in

Cluster Scale

- If a cluster has only one shard, the instance nodes cannot be removed from the cluster.
- Multiple instance nodes in the same shard **must be decommissioned or recommissioned at the same time.**

To query cluster shard information, perform the following steps:

- a. Log in to the node where the client is installed as the client installation user.

```
cd Client installation directory
```

```
source bigdata_env
```

In security mode, run the following commands:

```
kinit ClickHouse service user
```

```
clickhouse client --host IP address of the ClickHouse instance --port 9440 --secure
```

In normal mode, run the following command:

```
clickhouse client --host IP address of the ClickHouse instance --user Username --password --port 9000
```

Enter the password.

- b. Run the following command to query the cluster shard information:

```
select cluster,shard_num,replica_num,host_name from system.clusters;
```

Cluster Storage

Ensure that the disk space of nodes that will not be decommissioned is sufficient for storing data of all decommissioned nodes. There must be approximately 10% redundant storage space after decommissioning to ensure that the remaining instances can run properly. The procedure is as follows:

1. Run the following command to check the disk usage on each node:

```
select * from system.disks;
```

free_space indicates the free disk space, and **total_space** indicates the total disk space. The used space is calculated by subtracting the value of **free_space** from that of **total_space**, and its unit is byte.
2. Run the preceding command on a node you want to decommission and calculate the data volume on the node using the preceding formula.
3. Run the preceding command on a node that will not be decommissioned, and then use the following formula: (Value of **free_space** – Data volume of the

node to be decommissioned)/Value of **total_space**. If the result is greater than 10%, the node can be decommissioned.

Cluster Status

If there is any faulty ClickHouseServer instance node in the cluster, all instance nodes in the cluster cannot be decommissioned. Log in to Manager, choose **Cluster > Services > ClickHouse**, click **Instance**, and view the running status of each node in the cluster.

Database

If a database is deployed only on an instance node you want to decommission, the instance node cannot be decommissioned. To remove the instance node, you need to create the database on all ClickHouseServer instance nodes in the cluster. The procedure is as follows:

1. Run the **select * from system.databases;** command to collect the database list of each node.
name indicates the database name. **engine** indicates the database engine, and the default value is **Atomic**. If the default engine is used, you do not need to specify the engine when creating a table.
2. For the database deployed only on the instance node to be decommissioned, run the following command to create the database:
create database xxx engine=xxx on cluster xxx;

Local Non-replicated Table

If a local non-replicated table is deployed only on an instance node you want to decommission, the instance node cannot be decommissioned. To decommission the node, create a local non-replicated table with the same name on any node that will not be decommissioned.

For example, the current cluster has two shards, shard 1 has two nodes A and B, and shard 2 has two nodes C and D. The non-replicated table **test** was created without the **ON CLUSTER** keyword, so the table is created only on node A.

In this case, to decommission nodes A and B in shard 1, you need to create the table **test** on node C or D in shard 2.

Run the following command to list the data tables of each node:

```
select database,name,engine,create_table_query from system.tables where database != 'system';
```

Perform the following operations according to the result:

- Check the **engine** column. The table that does not contain the **Replicated** field is a local non-replicated table.
- If there are no replicated tables on any nodes that will not be decommissioned, create one based the table created by **create_table_query**. The following creation statement is an example:

```
CREATE TABLE {database}.{table} ('column name' type...) ENGINE = MergeTree;
```

Replicated Table

If a replicated table exists only on some nodes in the cluster, the nodes where the replicated table is deployed cannot be decommissioned. You need to manually create the replicated table on all instance nodes where no replicated table is deployed in the cluster before decommissioning.

For example, the current cluster has two shards, shard 1 has two nodes A and B, and shard 2 has two nodes C and D. The replicated table **test** was created without the **ON CLUSTER** keyword, so the table is created only on nodes A and B.

To decommission nodes A and B in shard 1, you need to create the table **test** on nodes C and D in shard 2.

Run the following command to list the data tables of each node:

```
select database,name,engine,create_table_query from system.tables where database != 'system';
```

Perform the following operations according to the result:

- Check the **engine** column. The table that contains the **Replicated** field is a replicated table.
- If there are no replicated tables on any nodes that will not be decommissioned, create one based the table created by **create_table_query**.

Distributed Table

Distributed tables will not be migrated automatically for decommissioning. Create distributed tables on the nodes that will not be decommissioned.

Run the following command to list data tables of each node and check the **engine** column. These tables are distributed tables if this column contains field **Distributed**.

```
select database,name,engine from system.tables where database != 'system';
```

NOTE

Creating distributed tables on these nodes will not affect the decommissioning, but may affect subsequent service operations.

View

Views will not be automatically migrated for decommissioning, and views do not store data. Run the following command to list data tables of each node and check the **engine** column. These tables are views if this column contains field **View**.

```
select database,name,engine from system.tables where database != 'system';
```

Run the following command to delete the views one by one:

```
drop view {database_name}.{table_name};
```

Materialized Views

Materialized views will not be automatically migrated for Decommissioning. Create materialized views on the nodes that will not be decommissioned. If the

materialized view of a node to be decommissioned does not display the specified aggregation table but uses an embedded table, the node cannot be decommissioned.

Run the following command to list data tables of each node and check the **engine** column. These tables are materialized views if this column contains field **MaterializedView**.

```
select database,name,engine, create_table_query from system.tables where database != 'system';
```

The table whose **create_table_query** column contains the **POPULATE** field is an embedded table. Views are initialized when they are created, and newly inserted data is ignored during the initialization. A table that does not contain the **POPULATE** field is an aggregation table. Newly inserted data is directly inserted into the view charts and support tables, and the original data is manually loaded into the views and support tables. The table creation operations of the aggregation table and embedded table are different.

Perform the following operations to process the materialized views of the node to be decommissioned:

1. Record the materialized views and delete them.
drop view {database_name}.{table_name};
2. After the node decommissioning is complete, delete and recreate the corresponding materialized views on in-use nodes to update the materialized views.
3. To create an aggregation table, specify **WHERE** to search for historical data and manually import the historical data to the materialized views. Otherwise, historical data cannot be imported to the materialized views based on unified conditions. As a result, data is imported repeatedly. For example, an update point can be specified to ensure that data before the update point is manually loaded in **INSERT** mode.
 - Add **WHERE {Time field (for example, date)}>= toDate ({Current time (for example, '2022-12-01 00:00:00')})** to the table creation statement.
 - **insert into {table} select {Table field} from {Source table} where {Time field}< toDate ({Current time})** is used to load original data.
4. Embedded tables will lose data generated during table creation. You can specify **WHERE** to filter out all historical data. In this case, an empty table is created, and you only need to manually insert all data in the historical data source table.

Tables of Third-Party Engines

Currently, tables of third-party engines cannot be automatically migrated for decommissioning.

Run the following command to list data tables of each node and check the **engine** column. These tables are tables of third-party engines if this column does not contain any of the following fields: **MergeTree**, **View**, **MaterializedView**, **Distributed**, and **Log**. (The **engine** column of a third-party engine table may contain field **Memory**, **HDFS**, or **MySQL**.)

```
select database,name,engine from system.tables where database != 'system';
```

Create third-party engine tables on the nodes that will not be decommissioned and delete those from the nodes that will be decommissioned.

Detached Data

If the table on a node to be decommissioned has been detached and data still exists in the **detached** directory, the node cannot be decommissioned. You need to attach the data in the **detached** directory to other directories before decommissioning.

1. Run the following command to view the **system.detached_parts** system catalog of the node to be decommissioned:
select * from system.detached_parts;
2. If **detached part** data exists and these partitions are no longer used, run the following command to delete the **detached part** data:
**ALTER TABLE {table_name} DROP DETACHED PARTITION {partition_expr}
SETTINGS allow_drop_detached = 1;**
3. Run the following command to check whether there is any **detached part** data in the **system.detached_parts** system catalog:
select * from system.detached_parts;
If the command output is empty, there is no **detached part** data in this system catalog.

3.5.3.2 Scaling In ClickHouseServer Nodes

Before removing ClickHouseServer instance nodes, you need to decommission them. Multiple node replicas of the same shard **must be decommissioned at the same time**. If there is a faulty ClickHouseServer instance node in the cluster, all instance nodes of the cluster cannot be decommissioned. For more constraints, see [Constraints on ClickHouseServer Scale-in](#).

NOTE

- Perform the decommissioning in idle hours because the operation will occupy certain bandwidth resources.
- The decommissioning operation can be performed only to ClickHouseServer. ClickHouseBalancer cannot be decommissioned.
- **This operation is only supported for MRS 3.1.2 and later.**

Step 1 Use PuTTY to log in to the node where ClickHouseServer is installed as user **root** and run the following command:

```
echo 'select * from system.clusters' | curl -k 'https://IP address of the node  
where the ClickHouseServer instance is located:Port number/' -u ck_user:Password  
--data-binary @-
```

Record the nodes of the same shard. In the following command output, the nodes with the same number in bold belong to the same shard.

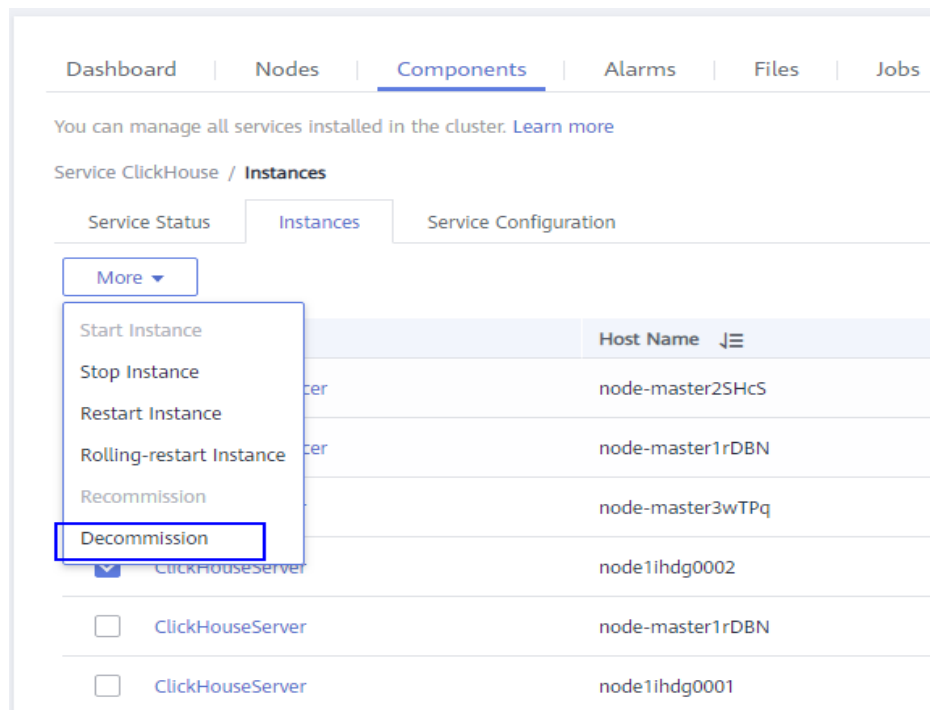

```
[root@kwephispra44948 ~]# echo 'select * from system.clusters' | curl -k 'https://10.112.17.189:21422/' -u  
ck_user:Bigdata_2013 --data-binary @-  
default_cluster 1 1 1 kwephispra44947 10.112.17.150 21427 0 0 0  
default_cluster 1 1 2 kwephispra44948 10.112.17.189 21427 0 0 0
```

 NOTE

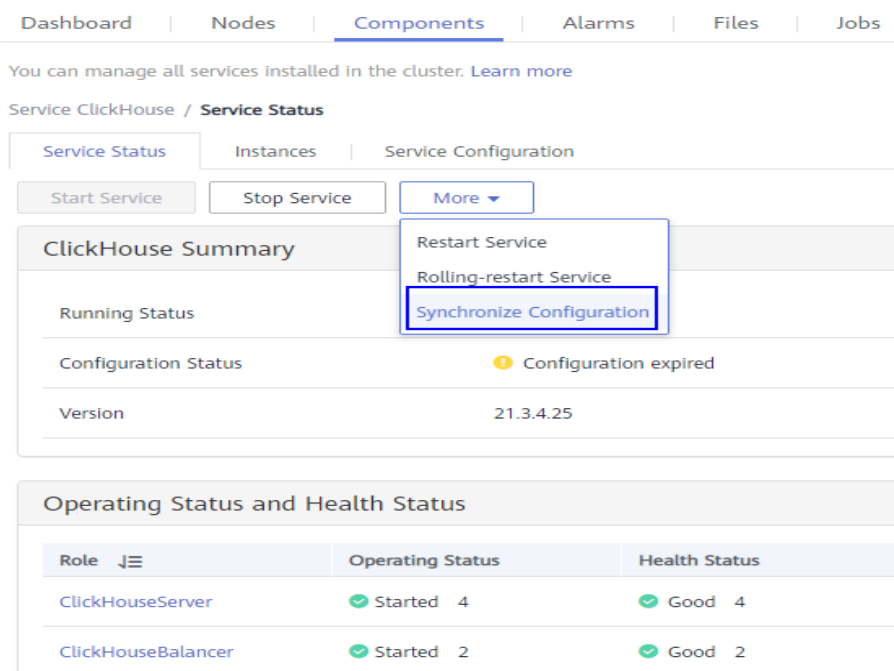

- To view the port number of ClickHouseServer instance nodes, log in to FusionInsight Manager, choose **Cluster > Services > ClickHouse**, click **Configuration > All Configurations**, and choose **ClickHouseServer (Role)** on the left.
In security mode (Kerberos authentication enabled), check the value of **https_port**, which is the port of a ClickHouseServer instance node.
In common mode (Kerberos authentication disabled), check the value of **http_port**, which is the port of a ClickHouseServer instance node.
- **ck_user** indicates the created ClickHouse user, which must be bound to a role with the ClickHouse administrator permission. For details about how to create a user and a role, see [Creating a User](#) and [Managing Roles](#), respectively.

Step 2 Log in to the MRS console and click the cluster name to go to the cluster details page.

Step 3 Click the **Components** tab and click **ClickHouse**. Then switch to **Instances**, select the **ClickHouseServer** instances to be removed, click **More**, and select **Decommission**.

Step 4 Click the **Components** tab and click **ClickHouse**. Then click **More**, and select **Synchronize Configuration**.

- Step 5** Click the **Nodes** tab and click the ClickHouseServer instance node that has been decommissioned.
- Step 6** On the ECS page, click **Stop**. In the displayed dialog box, select **Forcibly stop the preceding ECSs** and click **Yes**.
- Step 7** Go back to the MRS console, click the **Nodes** tab, locate the row that contains the target node group, and click **Scale In** in the **Operation** column to go to the **Scale In** page.
- Step 8** Set **Scale-In Type** to **Specific node** and select the node to be removed.
- Step 9** Select **I understand the consequences of performing the scale-in operation**. Click **OK**.
- Step 10** Click the **Components** tab and check whether each component is normal. If any component is abnormal, wait for 5 to 10 minutes and check the component status again. If the fault persists, contact Huawei Cloud technical support.
- Step 11** Click the **Alarms** tab and check whether there are exception alarms. If there are exception alarms, clear them before performing other operations.

----End

3.5.4 Managing a Host (Node)

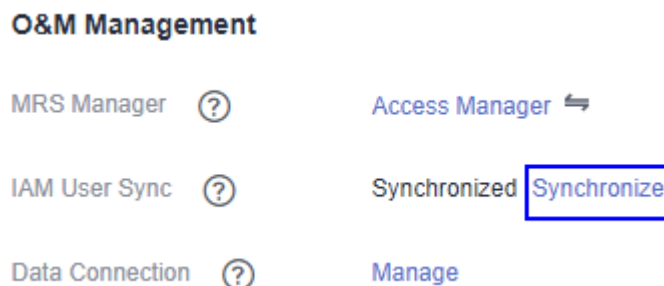

Scenario

To check an abnormal or faulty host (node), you need to stop all host roles on MRS. To recover host services after the host fault is rectified, restart all roles.

Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Figure 3-27 Synchronizing IAM users

Procedure

- Step 1** On the MRS details page, click **Nodes**.
- Step 2** Unfold the node group information and select the check box of the target node.
- Step 3** Choose **Node Operation** > **Start All Roles** or **Stop All Roles** to perform the required operation.

----End

3.5.5 Isolating a Host

Scenario

If a host is found to be abnormal or faulty, affecting cluster performance or preventing services from being provided, you can temporarily exclude that host from the available nodes in the cluster. In this way, the client can access other available nodes. In scenarios where patches are to be installed in a cluster, you can also exclude a specified node from patch installation.

You can isolate a host manually on MRS based on the actual service requirements or O&M plan. Only non-management nodes can be isolated.

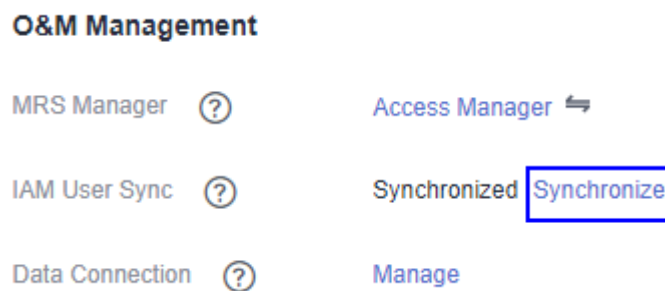

Impact on the System

- After a host is isolated, all role instances on the host will be stopped. You cannot start, stop, or configure the host and any instances on the host.
- After a host is isolated, statistics of the monitoring status and indicator data of the host hardware and instances cannot be collected or displayed.

Prerequisites

You have synchronized IAM users. (To synchronize IAM users, on the **Dashboard** tab page, click **Synchronize** next to **IAM User Sync**.)

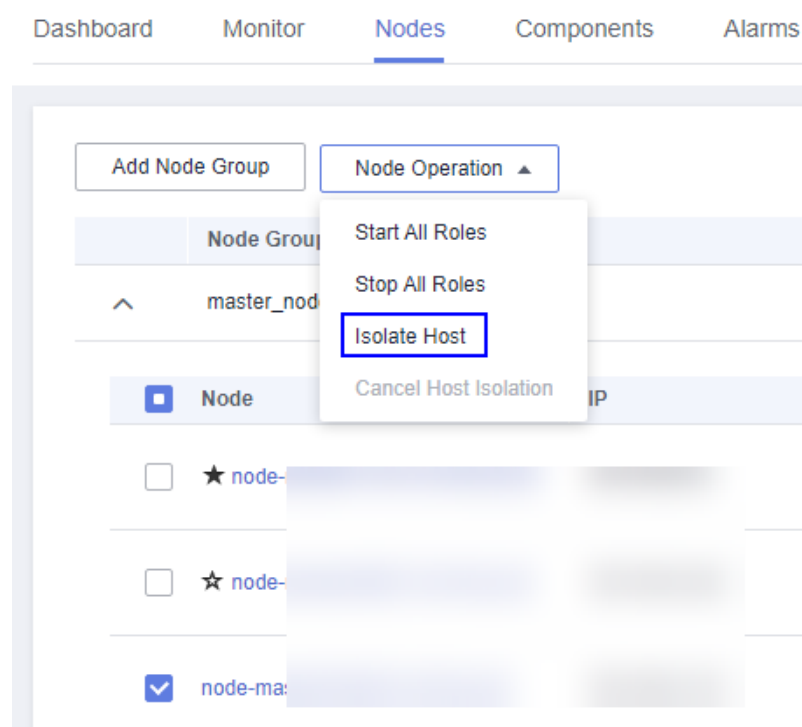

Figure 3-28 Synchronizing IAM users

Procedure

- Step 1** On the MRS details page, click **Nodes**.
- Step 2** Unfold the node group information and select the check box of the target host.
- Step 3** Choose **Node Operation** > **Isolate Host**.

Figure 3-29 Isolating a host

- Step 4** Confirm the information about the host to be isolated and click **OK**.
When **Operation successful** is displayed, click **Finish**. The host is isolated successfully, and the value of **Operating Status** becomes **Isolated**.

NOTE

For isolated hosts, you can cancel the isolation and add them to the cluster again. For details, see [Canceling Host Isolation](#).

----End

3.5.6 Canceling Host Isolation

Scenario

After the exception or fault of a host is handled, you must cancel the isolation of the host for proper usage.

You can cancel the isolation of a host on MRS.

Prerequisites

- The host is in the **Isolated** state.
- The exception or fault of the host has been rectified.
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Figure 3-30 Synchronizing IAM users

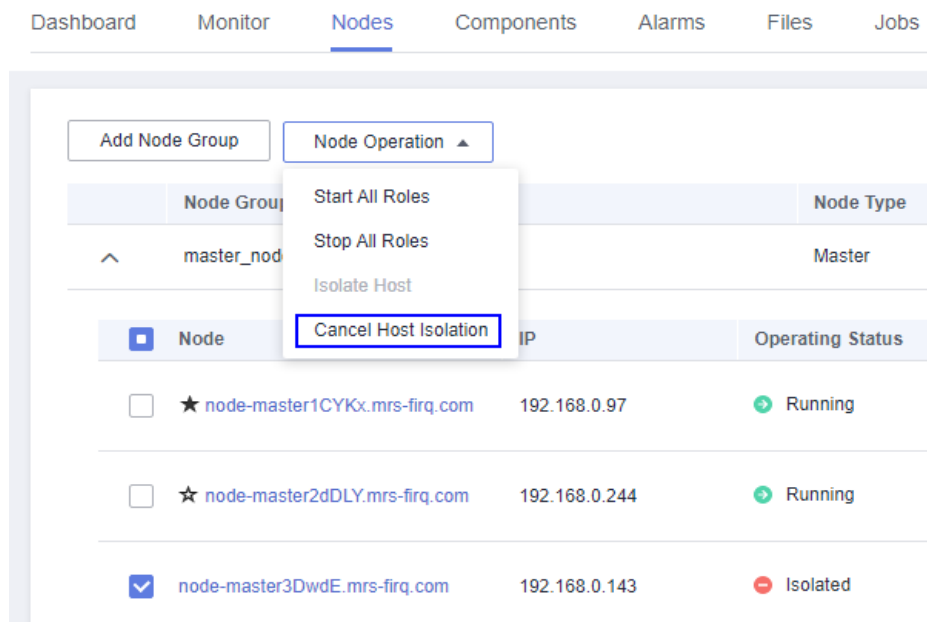

O&M Management

Procedure

- Step 1** On the MRS details page, click **Nodes**.
- Step 2** Unfold the node group information and select the check box of the target host that you want to cancel its isolation.
- Step 3** Choose **Node Operation** > **Cancel Host Isolation**.

Figure 3-31 Canceling host isolation

Step 4 Confirm the information about the host for which the isolation is to be cancelled and click **OK**.

When **Operation successful** is displayed, click **Finish**. The host is de-isolated successfully, and the value of **Operating Status** becomes **Normal**.

----End

3.5.7 Scaling Up Master Node Specifications

As users' increasing services lead to Core node scale-out and high CPU usage, Master node specifications cannot meet user requirements and need to be scaled up. This section describes how to scale up Master node specifications.

Prerequisites

- You have checked whether the Host Security Service (HSS) is enabled. If HSS is enabled, disable the HSS monitoring on the MRS cluster before you scale up master node specifications.
- Ensure that sufficient specification resources are available throughout the steps in [Scaling Up Master Node Specifications \(Step-by-Step Upgrade\)](#).

Use Restrictions

- Master nodes can be scaled up for clusters with two or more master nodes.
- The specifications of the Master node in a BMS cluster cannot be upgraded.
- For MRS 1.8.2 or later to a version earlier than MRS 3.x or MRS 3.1.0 or later, see [Scaling Up Master Node Specifications \(One-Click Upgrade\)](#).
- For MRS 3.0.5 and a version earlier than MRS 1.8.2, see [Scaling Up Master Node Specifications \(Step-by-Step Upgrade\)](#).
- Do not perform other operations on the cluster during the scale-up.

Scaling Up Master Node Specifications (One-Click Upgrade)

Step 1 Log in to the MRS console.

Step 2 In the navigation pane on the left, choose **Active Clusters**, select the cluster for which you want to scale up Master node specifications, and click its name to switch to the cluster details page.

Step 3 On the **Nodes** tab page, select **Scale Up Specifications** in the **Operation** column of the Master node group. The **Scale Up Master Node Specifications** page is displayed.

Step 4 Select the target specifications and click **Submit Order**. The order has been submitted successfully.

The node specification scale-up takes some time. After the scale-up is successful, the cluster status changes to **Running**.

NOTE

- The VM to be scaled up is automatically stopped during the scale-up and started after the scale-up is complete.
- The scale-up does not automatically upgrade the memory of components due to different component usage requirements. You can adjust the memory of components as needed.

----End

Scaling Up Master Node Specifications (Step-by-Step Upgrade)

Preparing for Scaling Up Master Node Specifications

Step 1 Log in to the MRS console.

Step 2 In the navigation pane on the left, choose **Active Clusters**, select the cluster for which you want to scale up Master node specifications, and click its name to switch to the cluster details page.

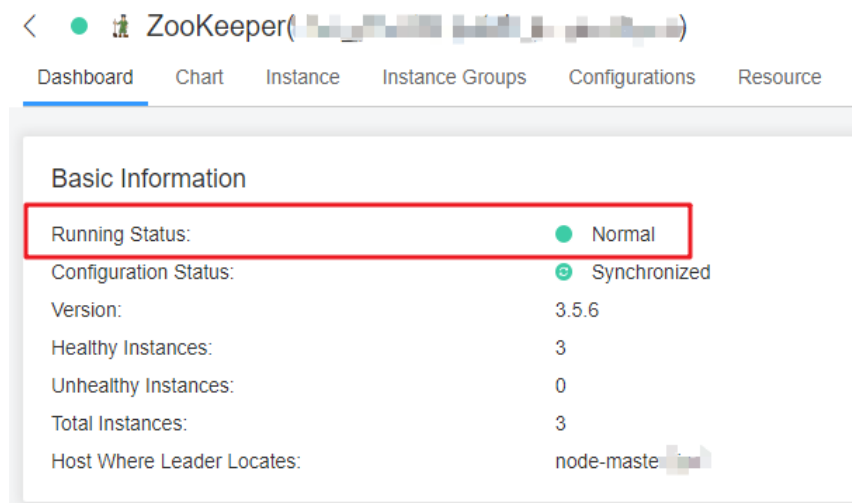

Step 3 Ensure that the cluster status is **Running**.

Step 4 On the **Nodes** tab page, ensure that all nodes in the cluster are in the **Running** state.

Step 5 Log in to Manager and go to the cluster management page. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).

Step 6 Choose **Cluster > Services > ZooKeeper > Dashboard** and ensure that **Running Status** of the ZooKeeper service is **Normal**.

Figure 3-32 ZooKeeper service status

Step 7 Update service parameter settings as required. For details, see [Configuring Service Parameters](#).

NOTE

You need to perform this step only once before scaling up the standby Master node.

Step 8 Choose **Cluster > Services > HDFS > Instance**.

Step 9 Record the business IP address of **NameNode (Standby)**. When upgrading the specifications of the active Master node, record the business IP address of **NameNode (Active)**. [Figure 3-33](#) shows the location of the business IP address.

Figure 3-33 Business IP address of the NameNode

Role	Running Status	Configuration Status	Host Name	Management IP Address	Service IP Address	Rack	Instance Group
ZkC	Normal	Synchronized	node-masterChief	192.168.1.100	192.168.1.100	/default/rao5501	ZkC-DEFAULT
ZkC	Normal	Synchronized	node-masterStby	192.168.1.100	192.168.1.100	/default/rao5501	ZkC-DEFAULT
NameNode (hacuster Standby)	Normal	Synchronized	node-masterChief	192.168.1.100	192.168.1.100	/default/rao5501	NameNode-DEFAULT
NameNode (hacuster Active)	Normal	Synchronized	node-masterStby	192.168.1.100	192.168.1.100	/default/rao5501	NameNode-DEFAULT

NOTE

Only when the cluster is an analysis cluster, you can perform [Step 8](#) to [Step 9](#) to record the IP addresses of the active and standby nodes.

Step 10 On the upper right of the Manager page, check the number next to the  icon. If the number is 0, there is no running tasks in the cluster.

Step 11 Click **Hosts**. If the cluster is an analysis cluster, select the checkbox of the host corresponding to the business IP address of the **NameNode** recorded in [Step 9](#). If the cluster is a streaming cluster, you do not need to distinguish the active and standby nodes. You only need to choose hosts for the scale-up.

Step 12 Choose **More > Stop All Instances** and wait until all instances are stopped.

 NOTE

- When the node where Manager resides is scaled up, Manager may not be accessed due to an active/standby switchover. It is a normal phenomenon. Try to log in to Manager later. If the login fails for a long time, contact O&M personnel.
- After all roles are stopped, the following alarms may be generated. After the scale-up of Master node specifications is complete and all roles are started, the alarms are automatically cleared.
 - [ALM-12006 Node Fault](#)
 - [ALM-12010 Manager Heartbeat Interruption Between the Active and Standby Nodes](#)
 - [ALM-12039 Active/Standby OMS Databases Not Synchronized](#)
 - [ALM-14000 HDFS Service Unavailable](#)
 - [ALM-14010 NameService Service Is Abnormal](#)
 - [ALM-14012 JournalNode Is Out of Synchronization](#)
 - [ALM-16004 Hive Service Unavailable](#)
 - [ALM-18000 Yarn Service Unavailable](#)
 - [ALM-19000 HBase Service Unavailable](#)
 - [ALM-20002 Hue Service Unavailable](#)
 - [ALM-27001 DBService Service Unavailable](#)
 - [ALM-27003 DBService Heartbeat Interruption Between the Active and Standby Nodes](#)
 - [ALM-27004 Data Inconsistency Between Active and Standby DBServices](#)
 - [ALM-43001 Spark2x Service Unavailable](#)

----End

Scaling Up Master Node Specifications

Step 1 Log in to the MRS console.

Step 2 In the navigation pane on the left, choose **Active Clusters**, select the cluster for which you want to scale up Master node specifications, and click its name to switch to the cluster details page.

Step 3 On the **Nodes** tab page, select **Scale Up Specifications** in the **Operation** column of the Master node group.

Step 4 Select the target specifications and click **Next**.

 NOTE

Ensure that target specification resources are sufficient. Otherwise, the active node cannot be scaled up.

Step 5 On the **Confirm** page that is displayed, confirm the target node specifications and fees and click **OK**.

Step 6 Ensure that all services on the standby Master node have been stopped. For operation details, refer to [Step 1](#) to [Step 12](#) in the **Preparing for Scaling Up Master Node Specifications** part. On the **Scale Up Master Node Specifications** page, select **Are you sure you have stopped all services on the standby Master node?** and **If not all services are stopped before the scale-up, data saving failure or data damage may occur.** and click **Submit Order**.

Step 7 On the **Warning** page that is displayed, confirm again that all services on the standby Master node are stopped and click **OK** to start scaling up the specifications of the standby Master node.

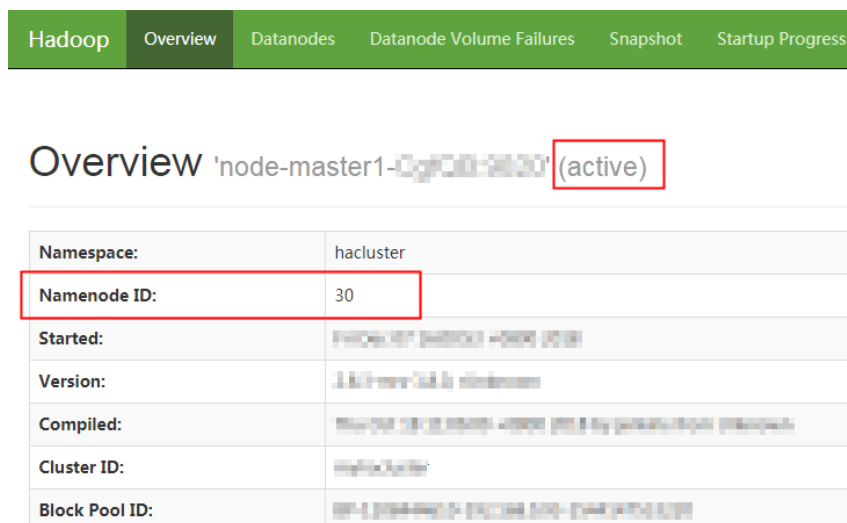

The node specification scale-up takes some time. Please wait. After the scale-up is successful, the cluster status changes to **Scaled-up-first**. Otherwise, contact O&M personnel.

Step 8 After the standby Master node has been scaled up successfully, start all services and set parameters on the standby Master node by referring to **Step 1** to **Step 11** in the **Operations After the Master Node Specifications Scale-up** part.

Step 9 After the services on the standby Master node are started, perform an active/standby NameNode switchover. Perform this step only for an analysis cluster and skip this step for a streaming cluster.

1. Access the NameNode web UI of the active and standby nodes separately. For details about how to access the NameNode web UI, see **Step 11**.
2. In the navigation bar on the NameNode web UI, choose **Overview** and record the NameNode IDs of the active and standby nodes. Do not close the page after recording.

Figure 3-34 NameNode ID of the active node

3. Log in to the ECS of any Master node and run the following command to configure environment variables:

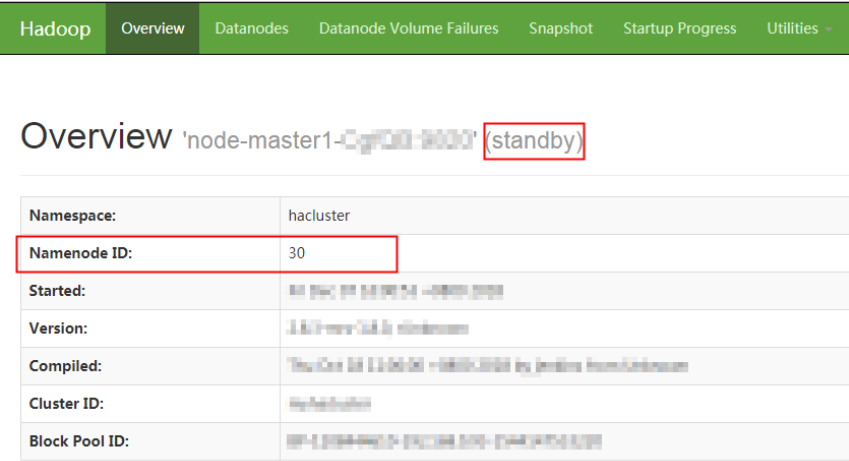

```
source /opt/Bigdata/client/bigdata_env
```
4. If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If the Kerberos authentication is disabled for the current cluster, skip this step.

```
kinit MRS cluster user
```

For example, **kinit admin**.
5. Run the following command to perform an active/standby NameNode switchover:

```
hdfs haadmin -failover <NameNode ID of the active node> <NameNode ID of the standby node>
```
6. Go to the NameNode web UI page that is not closed in **Step 9.2** and refresh the page. You can view that the active/standby NameNode switchover is complete.

Figure 3-35 NameNode

The screenshot shows the Hadoop Manager interface with the 'Overview' tab selected. The page title is 'Overview 'node-master1-CyF00-9000' (standby)'. Below the title is a table with the following information:

Namespace:	hacluster
Namenode ID:	30
Started:	Mon Dec 01 04:00:00 +0800 2020
Version:	3.6.2-rcv-2.6.0-rcv-2.6.0
Compiled:	Thu Oct 26 11:00:00 +0800 2018 by jenkins from/unknown
Cluster ID:	hacluster
Block Pool ID:	BP-12345678-12345678-12345678

- Step 10** Stop all services on the active Master node by referring to [Step 1](#) to [Step 12](#) in the **Preparing for Scaling Up Master Node Specifications** part.
- Step 11** On the **Scale Up Master Node Specifications** page, select **I confirm that all services on the standby Master node have been started.** and **I confirm that all services on the active Master node have been stopped,** and click **Submit**.
- Step 12** On the **Confirm** page that is displayed, confirm again that all services on the active Master node are stopped and click **OK** to start scaling up the specifications of the active Master node.
- The node specification scale-up takes some time. Please wait. After the scale-up is successful, the cluster status changes to **Scaled-up-success**. Otherwise, contact O&M personnel.
- Step 13** Start all services and set parameters on the active Master node by referring to [Step 1](#) to [Step 11](#) in the **Operations After the Master Node Specifications Scale-up** part.
- Step 14** On the **Scale Up Master Node Specifications** page, select **Are you sure you have started all services on the active Master node?** and click **OK** to complete the scale-up.

----End

Operations After the Master Node Specifications Scale-up

- Step 1** Log in to Manager and go to the cluster management page. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).
- Step 2** Click **Hosts**. Check basic information about the host corresponding to the business IP address of the NameNode recorded in [Step 9](#) in the **Preparing for Scaling Up Master Node Specifications** part. If the **Running Status** is **Good** and **Disk**, **Memory**, and **CPU** have values, perform [Step 9](#). If any of the preceding conditions is not met, go to the next step.
- Step 3** Log in to the standby Master node remotely. For details, see [Logging In to an ECS](#).
- Step 4** Run the following command to switch to user **omm**:

```
su - omm
```

Step 5 Run the following command to start the Agent:

```
sh /opt/Bigdata/nodeagent/bin/start-agent.sh
```

Step 6 Run the following command to check whether the Agent is started successfully:

```
jps | grep NodeAgent
```

Step 7 Log in to Manager and go to the cluster management page. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).

Step 8 Click **Hosts**. Check basic information about the host corresponding to the business IP address of the NameNode recorded in [Step 9](#) in the **Preparing for Scaling Up Master Node Specifications** part to ensure that **Running Status** is **Good** and **Disk, Memory, and CPU** have values.

 **NOTE**

It may take 3 minutes until the host status is normal after the Agent is started successfully. Please wait. If the host status is abnormal for a long time, contact O&M personnel.

Step 9 On the Manager page, click **Hosts** and select the checkbox of the host corresponding to the business IP address of the NameNode recorded in [Step 9](#) in the **Preparing for Scaling Up Master Node Specifications** part.

Step 10 Choose **More > Start All Instances** and wait until all instances are started.

Step 11 Access the NameNode web UI and check the NameNode startup status.

1. On FusionInsight Manager, choose **Cluster > Services > HDFS > Dashboard**.
2. In the **HDFS Summary** column, click **NameNode** of the active or standby node that has been scaled up on the right of **NameNode Web UI**.
3. Go to the **NameNode Web UI** page, choose **Startup Progress** in the navigation bar. After ensuring that **Percent Complete** is displayed as 100%, go to the next step, as shown in [Figure 3-36](#).

Figure 3-36 NameNode startup status

 **NOTE**

Perform [Step 11](#) for an analysis cluster and skip this step for a streaming cluster.

----End

3.5.8 Expanding a Data Disk

As your business grows, more data disk capacity is needed.

This section describes how to expand a data disk on the MRS console.

If the cluster version is MRS 3.1.0 (patch 3.1.0.0.11 or a later patch must be installed), MRS 3.1.5 (patch 3.1.5.0.3 or a later patch must be installed), or MRS

3.3.0-LTS, expand the data disk capacity by referring to [One-Click Data Disk Expansion](#).

If the cluster version is MRS 3.1.2-LTS.3 or MRS 3.2.0-LTS.1, you can expand the data disk capacity by referring to [Manual Data Disk Expansion](#).

 **NOTE**

All data disks of selected nodes will be expanded.

Constraints

- A data disk capacity can only be expanded, and cannot be reduced.
- A data disk can be expanded to a maximum of 32 TB.
- Local disks cannot be expanded.
- System disks cannot be expanded.
- Only the EVS disks, disk partitions, and file systems mounted to the cluster nodes by default during creation can be expanded.
- The cloud server to which an EVS disk is mounted must be in the running state. The EVS disk must be in in-use or available state.

One-Click Data Disk Expansion

If the cluster version is MRS 3.1.0 (patch 3.1.0.0.11 or a later patch must be installed), MRS 3.1.5 (patch 3.1.5.0.3 or a later patch must be installed), or MRS 3.3.0-LTS, perform the following steps to expand the data disk capacity:

- Step 1** Log in to the MRS console. On the **Active Clusters** page that is displayed, click the name of the desired cluster in the cluster list.
- Step 2** On the MRS details page, click **Nodes**.
- Step 3** Locate the node group where the target disk belongs, click **Expand Data Disk Capacity** in the **Operation** column.
- Step 4** Select the nodes to be expanded, set the target capacity, and click **OK**.

If there are a large number of nodes, you can fuzzy search for nodes by name or IP address, or filter nodes by data disk capacity.

 NOTE

- The estimated price is based on the disk capacity displayed and may be inaccurate. You will be billed based on the actual disk capacity of the node. Synchronize the disk information before expanding for more accurate estimated price.
- If the data disk of a node group has been expanded, same expansion will be performed for subsequent scale-out of the node group or cluster cloning.
- When multiple nodes are selected for scale-out, some disks mounted to the nodes may have higher capacity than the target volume. In this case, the disks will not be expanded or billed.
- Only the data disks mounted to a node by default during cluster creation can be expanded. For data disks mounted by yourself, only the EVS disks can be expanded. For details, see [Extending Partitions and File Systems for Data Disks \(Linux\)](#) or contact Huawei Cloud technical support.
- When a disk partition or file system is being expanded, the additional capacity can be expanded only to the tail partition of the disk. A system disk has multiple partitions and cannot be expanded.

Step 5 Check whether the data disk is expanded.

1. In the disk column, check whether the data disk is expanded to the target volume.
2. Log in to FusionInsight Manager, view the disk information of the expanded node, and check whether the corresponding disk partition is expanded.

----End

Manual Data Disk Expansion

For clusters of MRS 3.1.2-LTS.3, and MRS 3.2.0-LTS.1 versions, perform the following steps to expand data disks:

1. Contact Huawei Cloud technical support to enable the data disk expansion function.
2. Expand an EVS disk by referring to [One-Click Data Disk Expansion](#).
Only EVS disks can be expanded to the target volume. Disk partitions and file systems cannot be expanded automatically.
3. Expand a disk partition and file system.
Download the data disk expansion patches by referring to [Patch Download Addresses](#). Expand a disk partition and file system by referring to the [README.md](#) file in the patch description.
4. If there is a data disk mounted by a user and the disk partition and file system cannot be expanded, handle the problem by referring to [Extending Partitions and File Systems for Data Disks \(Linux\)](#) or contact Huawei Cloud technical support.

3.5.9 Synchronizing Disk Information

To obtain the latest EVS disk status, you need to synchronize disk information on the MRS console. This function updates the disk information in the cluster.

Background

If the information displayed on the console is not the actual disk information or "Data disk: -- (Synchronize disk information)" is displayed in the node list, you can use this function to update disk information.

Constraints

- Only cloud disk information can be synchronized.
- If disk information is being synchronized, the cluster cannot be scaled or upgraded.

Procedure

Step 1 On the MRS details page, click **Nodes**.

Step 2 Click **Synchronize Disk Info**.

Wait until "Disk information synchronization request issued successfully." is displayed in the upper right corner of the page.

----End

3.6 Job Management

3.6.1 Introduction to MRS Jobs

An MRS job is the program execution platform of MRS. It is used to process and analyze user data. After a job is created, all job information is displayed on the **Jobs** tab page. You can view a list of all jobs and create and manage jobs. If the **Jobs** tab is not displayed on the cluster details page, submit a job in the background.

Data sources processed by MRS are from OBS or HDFS. OBS is an object-based storage service that provides you with massive, secure, reliable, and cost-effective data storage capabilities. MRS can process data in OBS directly. You can view, manage, and use data by using the web page of the management control platform or OBS client. In addition, you can use REST APIs independently or integrate APIs to service applications to manage and access data.

Before creating jobs, upload the local data to OBS for MRS to compute and analyze. MRS allows exporting data from OBS to HDFS for computing and analyzing. After the analyzing and computing are complete, you can store the data in HDFS or export them to OBS. HDFS and OBS can also store the compressed data in the format of **bz2** or **gz**.

Category

An MRS cluster allows creating and managing the following jobs: If a cluster in the **Running** state fails to create a job, check the health status of related components on the cluster management page. For details, see [Viewing and Customizing Cluster Monitoring Metrics](#).

- MapReduce can quickly process large-scale data in parallel. It is a distributed data processing model and execution environment. MRS supports the submission of MapReduce JAR programs.
- Spark is a distributed in-memory computing framework. MRS supports SparkSubmit, Spark Script, and Spark SQL jobs.
 - SparkSubmit: You can submit the Spark JAR and Spark Python programs, execute the Spark Application, and compute and process user data.
 - SparkScript: You can submit the SparkScript scripts and batch execute Spark SQL statements.
 - Spark SQL: You can use Spark SQL statements (similar to SQL statements) to query and analyze user data in real time.

- Hive is an open-source data warehouse based on Hadoop. MRS allows you to submit HiveScript scripts and execute Hive SQL statements.
- Flink is a distributed big data processing engine that can perform stateful computations over both unbounded and bounded data streams.
- HadoopStreaming runs mapper or reducer jobs.

Job List

Tasks are listed in chronological order by default in the task list, with the most recent jobs displayed at the top. [Table 3-23](#) describes the parameters in the job list.

Table 3-23 Job list parameters

Parameter	Description
Name/ID	Job name, which is set when a job is created. ID is the unique identifier of a job. After a job is added, the system automatically assigns a value to ID.
Username	Name of the user who submits a job.
Type	The following data types are supported: <ul style="list-style-type: none">• DistCp: importing and exporting data• MapReduce• Spark• SparkSubmit• SparkScript• Spark SQL• Hive SQL• HiveScript• Flink• Flink SQL• HadoopStreaming NOTE <ul style="list-style-type: none">• After importing and exporting files on the Files tab page, you can view the DistCp job on the Jobs tab page.• Spark, Hive, and Flink jobs can be added only when the Spark, Hive, and Flink components are selected during cluster creation and the cluster is running.

Parameter	Description
Status	<p>Job status.</p> <ul style="list-style-type: none"> • Submitted • Accepted • Running • Completed • Terminated • Abnormal
Result	<p>Execution result of a job.</p> <ul style="list-style-type: none"> • Undefined: indicates that the job is being executed. • Successful: indicates that the job has been successfully executed. • Killed: indicates that the job is manually terminated during execution. • Failed: indicates that the job fails to be executed. <p>NOTE Once a job has succeeded or failed, you cannot execute it again. However, you can add a job, and set job parameters to submit a job again.</p>
Queue Name	Name of the queue bound to the user who submits the job
Submitted	Time when a job is submitted.
Ended	Time when a job is completed or manually stopped.

Parameter	Description
Operation	<p>Operations can be performed on the job. Click More for more operations in the drop-down list.</p> <ul style="list-style-type: none"> • Viewing Log: Click View Log to view the real-time logs of running jobs. For details, see Viewing Job Configuration and Logs. • View Details: Click View Details to view the detailed configuration information about jobs. For details, see Viewing Job Configuration and Logs. • Stop: You can click Stop to stop a running job. For details, see Stopping a Job. • View Result: Click View Result to view the execution results of SparkSQL and SparkScript jobs whose status is Completed and result is Successful. • Delete: Delete the job. For details, see Deleting a Job. <p>NOTE</p> <ul style="list-style-type: none"> • A deleted job cannot be restored. • If you choose to save job logs to OBS or HDFS, the system compresses and saves the logs to the corresponding path after the job execution is completed. Therefore, after a job execution of this type is completed, the job status is still Running. After the log is successfully stored, the job status changes to Completed. The log storage duration depends on the log size and takes several minutes.

Table 3-24 Icon description

Icon	Description
	Select a time range for job submission to filter jobs submitted in the time range.
	<p>Select a certain job execution result from the drop-down list to display jobs of the status.</p> <ul style="list-style-type: none"> • All statuses: Filter all jobs. • Successful: Filter jobs that are successfully executed. • Undefined: Filter jobs that are being executed. • Killed: Filter jobs that are manually stopped. • Failed: Filter jobs that fail to be executed.

Icon	Description
	<p>Select a certain job type from the drop-down list to display jobs of the type.</p> <ul style="list-style-type: none"> • All types • MapReduce • HiveScript • Distcp • SparkScript • Spark SQL • Hive SQL • SparkSubmit • Flink • Flink SQL • HadoopStreaming
	<p>In the search box, search for a job by setting the corresponding search condition and click .</p> <ul style="list-style-type: none"> • Job name. • Job ID. • Username. • Queue name.
	<p>Click  to manually refresh the job list.</p>

Job Execution Permission Description

For a security cluster with Kerberos authentication enabled, a user needs to synchronize an IAM user before submitting a job on the MRS web UI. After the synchronization is completed, the MRS system generates a user with the same IAM username. Whether a user has the permission to submit jobs depends on the IAM policy bound to the user during IAM synchronization. For details about the job submission policy, see [Table 1-3 in Synchronizing IAM Users to MRS](#).

When a user submits a job that involves the resource usage of a specific component, such as accessing HDFS directories and Hive tables, user **admin** (Manager administrator) must grant the relevant permission to the user. Detailed operations are as follows:

- Step 1** Log in to Manager as user **admin**.
- Step 2** Add the role of the component whose permission is required by the user. For details, see [Creating a Role](#).
- Step 3** Change the user group to which the user who submits the job belongs and add the new component role to the user group. For details, see [Related Tasks](#).

 NOTE

After the component role bound to the user group to which the user belongs is modified, it takes some time for the role permissions to take effect.

----End

3.6.2 Running a MapReduce Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results. This section describes how to submit a MapReduce job on the MRS management console. MapReduce jobs are used to submit JAR programs to quickly process massive amounts of data in parallel and create a distributed data processing and execution environment.

If the job and file management functions are not supported on the cluster details page, submit the jobs in the background.

Prerequisites

You have uploaded the program packages and data files required for running jobs to OBS or HDFS.

Before you upload the program packages and data files to OBS, you need to create an OBS agency and bind it to the MRS cluster. For details, see [Configuring a Storage-Compute Decoupled Cluster \(Agency\)](#).

Submitting a Job on the GUI

Step 1 Log in to the MRS console.

Step 2 On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

Step 3 If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

In the **Basic Information** area on the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users. For details, see [Synchronizing IAM Users to MRS](#).

 NOTE

- If this is your first time submitting a job, you need to synchronize the IAM user first. Wait for 5 minutes and then submit the job.
- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.

Step 4 Click the **Jobs** tab.

Step 5 Click **Create**. The **Create Job** page is displayed.

 **NOTE**

If the IAM username contains spaces (for example, **admin 01**), a job cannot be created.

Step 6 In **Type**, select **MapReduce**. Configure other job information.

Create Job

* Type

* Name

* Program Path

Parameters

Service Parameter

Command Reference

Table 3-25 Job configuration information

Parameter	Description
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. NOTE You are advised to set different names for different jobs.
Program Path	Path of the program package to be executed. The following requirements must be met: <ul style="list-style-type: none"> Contains a maximum of 1,023 characters, excluding special characters such as ; &><'\$. The parameter value cannot be empty or full of spaces. The path of the program to be executed can be stored in HDFS or OBS. The path varies depending on the file system. <ul style="list-style-type: none"> OBS: The path must start with obs://. Example: obs://wordcount/program/xxx.jar HDFS: The path must start with /user. For details about how to import data to HDFS, see Importing Data. For SparkScript and HiveScript, the path must end with .sql. For MapReduce, the path must end with .jar. For Flink and SparkSubmit, the path must end with .jar or .py. The .sql, .jar, and .py are case-insensitive.

Parameter	Description
Parameters	<p>(Optional) It is the key parameter for program execution. Multiple parameters are separated by space.</p> <p>Configuration method: <i>Program class name Data input path Data output path</i></p> <ul style="list-style-type: none"> Program class name: It is specified by a function in your program. MRS is responsible for transferring parameters only. Data input path: Click HDFS or OBS to select a path or manually enter a correct path. Data output path: Enter a directory that does not exist. The parameter contains a maximum of 150,000 characters. It cannot contain special characters ; &><'\$, but can be left blank. <p>CAUTION When entering a parameter containing sensitive information (for example, login password), you can add an at sign (@) before the parameter name to encrypt the parameter value. This prevents the sensitive information from being persisted in plaintext. When you view job information on the MRS console, the sensitive information is displayed as *.</p> <p>For example: username=<i>testuser</i> @password=<i>User password</i></p>
Service Parameter	<p>(Optional) It is used to modify service parameters for the job. The parameter modification applies only to the current job. To make the modification take effect permanently for the cluster, follow instructions in Configuring Service Parameters.</p> <p>To add multiple parameters, click  on the right. To delete a parameter, click Delete on the right.</p> <p>Table 3-26 lists the common service configuration parameters.</p>
Command Reference	Command submitted to the background for execution when a job is submitted.

Table 3-26 Service Parameter parameters

Parameter	Description	Example Value
fs.obs.access.key	Key ID for accessing OBS.	-
fs.obs.secret.key	Key corresponding to the key ID for accessing OBS.	-

Step 7 Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

Submitting a Job in the Background

The default client installation path for MRS 3.x or later is `/opt/Bigdata/client`, and for versions earlier than MRS 3.x is `/opt/client`. Configure the path based on site requirements.

Step 1 Log in to the MRS console.

Step 2 On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

Step 3 On the **Nodes** tab page, click the name of a Master node to go to the ECS management console.

Step 4 Click **Remote Login** in the upper right corner of the page.

Step 5 Enter the username and password of the Master node as prompted. The username is **root** and the password is the one set during cluster creation.

Step 6 Run the following command to initialize environment variables:

```
source /opt/Bigdata/client/bigdata_env
```

Step 7 If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If the Kerberos authentication is disabled for the current cluster, skip this step.

```
kinit MRS cluster user
```

Example: **kinit admin**

Step 8 Run the following command to copy the program in the OBS file system to the Master node in the cluster:

```
hadoop fs -Dfs.obs.access.key=AK -Dfs.obs.secret.key=SK -copyToLocal  
source_path.jar target_path.jar
```

Example: **hadoop fs -Dfs.obs.access.key=XXXX -Dfs.obs.secret.key=XXXX -
copyToLocal "obs://mrs-word/program/hadoop-mapreduce-examples-XXX.jar"
"/home/omm/hadoop-mapreduce-examples-XXX.jar"**

NOTE

- Commands carrying authentication passwords pose security risks. Disable historical command recording before running such commands to prevent information leakage.
- You can log in to the OBS Console using AK/SK. To obtain AK/SK information, click the username in the upper right corner of the management console and choose **My Credentials > Access Keys**.

Step 9 Run the following command to submit a wordcount job. If data needs to be read from OBS or outputted to OBS, the AK/SK parameters need to be added.

```
source /opt/Bigdata/client/bigdata_env;hadoop jar execute_jar wordcount  
input_path output_path
```

```
Example: source /opt/Bigdata/client/bigdata_env;hadoop jar /home/omm/hadoop-mapreduce-examples-XXX.jar wordcount -Dfs.obs.access.key=XXXX -Dfs.obs.secret.key=XXXX "obs://mrs-word/input/*" "obs://mrs-word/output/"
```

In the preceding command, **input_path** indicates a path for storing job input files on OBS. **output_path** indicates a path for storing job output files on OBS and needs to be set to a directory that does not exist

----End

3.6.3 Running a SparkSubmit or Spark Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results. This section describes how to submit a Spark job on the MRS console.

Prerequisites

You have uploaded the program packages and data files required for running jobs to OBS or HDFS.

NOTE

- The JAR sample program used in this section is *{Cluster client installation directory}/Spark2x/spark/examples/jars/spark-examples_*.jar*. (In some versions, the name of the **Spark2x** folder in the cluster is **Spark**. Replace it with the actual name.)
- You can log in to the client node and run the following command to upload the sample JAR package to be executed to the HDFS. For details, see [Using an HDFS Client](#).

For example, upload the file to the **/tmp** directory of the HDFS.

```
hdfs dfs -put {Client installation directory}/Spark2x/spark/examples/jars/spark-examples_*.jar /tmp
```

Submitting a Job on the GUI

Step 1 Log in to the MRS console.

Step 2 On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

Step 3 If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

In the **Basic Information** area on the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users. For details, see [Synchronizing IAM Users to MRS](#).

 **NOTE**

- If this is your first time submitting a job, you need to synchronize the IAM user first. Wait for 5 minutes and then submit the job.
- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.

Step 4 Click the **Jobs** tab.

Step 5 Click **Create**. The **Create Job** page is displayed.

Create Job

Step 6 Configure job information. Set to **SparkSubmit** and configure other parameters of the SparkSubmit job by referring to [Table 3-27](#)

Table 3-27 Job configuration information

Parameter	Description
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. NOTE You are advised to set different names for different jobs.

Parameter	Description
Program Path	<p>Path of the program package to be executed. The following requirements must be met:</p> <ul style="list-style-type: none"> • Contains a maximum of 1,023 characters, excluding special characters such as ; &><'\$. The parameter value cannot be empty or full of spaces. • The path of the program to be executed can be stored in HDFS or OBS. The path varies depending on the file system. <ul style="list-style-type: none"> - OBS: The path must start with obs://. Example: obs://wordcount/program/xxx.jar (supported in MRS 1.9.2 or later) - HDFS: The path must start with /user. For details about how to import data to HDFS, see Importing Data. • For SparkScript and HiveScript, the path must end with .sql. For MapReduce, the path must end with .jar. For Flink and SparkSubmit, the path must end with .jar or .py. The .sql, .jar, and .py are case-insensitive.
Program Parameter	<p>(Optional) Used to configure optimization parameters such as threads, memory, and vCPUs for the job to optimize resource usage and improve job execution performance.</p> <p>Table 3-28 describes the common parameters of a running program.</p>
Parameters	<p>(Optional) Key parameter for program execution. The parameter is specified by the function of the user's program. MRS is only responsible for loading the parameter. Multiple parameters are separated by space.</p> <p>The parameter contains a maximum of 150,000 characters. It cannot contain special characters ; &><'\$, but can be left blank.</p> <p>CAUTION</p> <p>When entering a parameter containing sensitive information (for example, login password), you can add an at sign (@) before the parameter name to encrypt the parameter value. This prevents the sensitive information from being persisted in plaintext. When you view job information on the MRS console, the sensitive information is displayed as *.</p> <p>For example:</p> <pre>username=testuser @password=User password</pre>
Service Parameter	<p>(Optional) It is used to modify service parameters for the job. The parameter modification applies only to the current job. To make the modification take effect permanently for the cluster, follow instructions in Configuring Service Parameters.</p> <p>To add multiple parameters, click  on the right. To delete a parameter, click Delete on the right.</p> <p>Table 3-29 lists the common service configuration parameters.</p>
Command Reference	<p>Command submitted to the background for execution when a job is submitted.</p>

Table 3-28 Program parameters

Parameter	Description	Example Value
--conf	Add the task configuration items.	spark.executor.memory=2G
--driver-memory	Set the running memory of driver.	2G
--num-executors	Set the number of executors to be started.	5
--executor-cores	Set the number of executor cores.	2
--class	Set the main class of a task.	org.apache.spark.examples.SparkPi
--files	Upload files to a task. The files can be custom configuration files or some data files from OBS or HDFS.	-
--jars	Upload additional dependency packages of a task to add the external dependency packages to the task.	-
--executor-memory	Set executor memory.	2G
--conf spark-yarn.maxAppAttempts	Control the number of AM retries.	If this parameter is set to 0 , retry is not allowed. If this parameter is set to 1 , one retry is allowed.

Table 3-29 Service Parameter parameters

Parameter	Description	Example Value
fs.obs.access.key	Key ID for accessing OBS.	-
fs.obs.secret.key	Key corresponding to the key ID for accessing OBS.	-

Table 3-30 Job configuration information

Parameter	Description
Name	<p>Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.</p> <p>NOTE You are advised to set different names for different jobs.</p>
Program Path	<p>Path of the program package to be executed. The following requirements must be met:</p> <ul style="list-style-type: none"> • Contains a maximum of 1,023 characters, excluding special characters such as ; &><'\$. The parameter value cannot be empty or full of spaces. • The path of the program to be executed can be stored in HDFS or OBS. The path varies depending on the file system. <ul style="list-style-type: none"> – OBS: The path must start with s3a://. Example: s3a://wordcount/program/xxx.jar – HDFS: The path must start with /user. For details about how to import data to HDFS, see Importing Data. • For SparkScript, the path must end with .sql. For MapReduce and Spark, the path must end with .jar. The .sql and .jar are case-insensitive.
Parameters	<p>Key parameter for program execution. The parameter is specified by the function of the user's program. MRS is only responsible for loading the parameter. Multiple parameters are separated by space.</p> <p>Configuration method: <i>Package name.Class name</i></p> <p>The parameter contains a maximum of 150,000 characters. It cannot contain special characters ; &><'\$, but can be left blank.</p> <p>CAUTION When entering a parameter containing sensitive information (for example, login password), you can add an at sign (@) before the parameter name to encrypt the parameter value. This prevents the sensitive information from being persisted in plaintext. When you view job information on the MRS console, the sensitive information is displayed as *.</p> <p>For example: <code>username=testuser @password=User password</code></p>
Import From	<p>Path for inputting data</p> <p>Data can be stored in HDFS or OBS. The path varies depending on the file system.</p> <ul style="list-style-type: none"> • OBS: The path must start with s3a://. • HDFS: The path must start with /user. For details about how to import data to HDFS, see Importing Data. <p>The parameter contains a maximum of 1,023 characters, excluding special characters such as ; &><'\$, and can be left blank.</p>

Parameter	Description
Export To	<p>Path for outputting data</p> <p>NOTE</p> <ul style="list-style-type: none">When setting this parameter, select OBS or HDFS. Select a file directory or manually enter a file directory, and click OK.If you add the hadoop-mapreduce-examples-x.x.x.jar sample program or a program similar to hadoop-mapreduce-examples-x.x.x.jar, enter a directory that does not exist. <p>Data can be stored in HDFS or OBS. The path varies depending on the file system.</p> <ul style="list-style-type: none">OBS: The path must start with s3a://.HDFS: The path must start with /user. <p>The parameter contains a maximum of 1,023 characters, excluding special characters such as ; &>,<'\$, and can be left blank.</p>
Log Path	<p>Path for storing job logs that record job running status.</p> <p>Data can be stored in HDFS or OBS. The path varies depending on the file system.</p> <ul style="list-style-type: none">OBS: The path must start with s3a://.HDFS: The path must start with /user. <p>The parameter contains a maximum of 1,023 characters, excluding special characters such as ; &>,<'\$, and can be left blank.</p>

Step 7 Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

Submitting a Job in the Background

The default client installation path for MRS 3.x or later is /opt/Bigdata/client, and for versions earlier than MRS 3.x is /opt/client. Configure the path based on site requirements.

Step 1 Create a user for submitting jobs. For details, see [Creating a User](#).

In this example, a machine-machine user has been created, and user groups (**hadoop** and **supergroup**), the primary group (**supergroup**), and role permissions (**System_administrator** and **default**) have been correctly assigned to the user.

Step 2 Download the authentication credential.

- For clusters of MRS 3.x or later, log in to FusionInsight Manager and choose **System > Permission > User**. In the **Operation** column of the newly created user, choose **More > Download Authentication Credential**.
- For clusters whose version is earlier than MRS 3.x, log in to MRS Manager and choose **System > Manage User**. In the **Operation** column of the newly created user, choose **More > Download Authentication Credential**.

Step 3 Upload the JAR program you want to run to the cluster. In this example, the Spark sample program is used.

Step 4 Upload the authentication credential of the user created in [Step 2](#) to the `/opt` directory of the client node in the cluster and run the following command to decompress the credential:

```
tar -xvf XXX_keytab.tar
```

You will obtain two files: `user.keytab` and `krb5.conf`.

Step 5 Run the following commands to load environment variables:

```
source /opt/Bigdata/client/bigdata_env
```

```
cd $SPARK_HOME
```

Step 6 Run the following command to submit a Spark job:

```
./bin/spark-submit --master yarn --deploy-mode client --conf  
spark.yarn.principal=MRSTest --conf spark.yarn.keytab=/opt/user.keytab --class  
org.apache.spark.examples.SparkPi examples/jars/spark-examples_*.jar 10
```

```
...  
Pi is roughly 3.1402231402231404
```

Parameter description:

- **deploy-mode**: computing capability of YARN, which specifies that the job is submitted using the client
- **spark.yarn.principal**: name of the user created in [Step 1](#)
- **spark.yarn.keytab**: keytab file used for user authentication
- **XXX.jar**: program run by the job

----End

3.6.4 Running a HiveSQL Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results. This section describes how to submit a HiveSQL job on the MRS management console. HiveSQL jobs are used to submit SQL statements and script files for data query and analysis. Both SQL statements and scripts are supported. If SQL statements contain sensitive information, use Script to submit them.

Prerequisites

You have uploaded the program packages and data files required for running jobs to OBS or HDFS.

Submitting a Job on the GUI

Step 1 Log in to the MRS console.

Step 2 On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

Step 3 If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

In the **Basic Information** area on the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users. For details, see [Synchronizing IAM Users to MRS](#).

 **NOTE**

- If this is your first time submitting a job, you need to synchronize the IAM user first. Wait for 5 minutes and then submit the job.
- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.

Step 4 Click the **Jobs** tab.

Step 5 Click **Create**. The **Create Job** page is displayed.

Step 6 Configure job information. Set **Type** to **HiveSql** and configure HiveSQL job information by referring to [Table 3-31](#).

Table 3-31 Job configuration information

Parameter	Description
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. NOTE You are advised to set different names for different jobs.
SQL Type	Submission type of the SQL statement <ul style="list-style-type: none">• SQL• Script
SQL Statement	This parameter is valid only when SQL Type is set to SQL . Enter the SQL statement to be executed, and then click Check to check whether the SQL statement is correct. If you want to submit and execute multiple statements at the same time, use semicolons (;) to separate them.

Parameter	Description
SQL File	<p>This parameter is valid only when SQL Type is set to Script. The path of the SQL file to be executed must meet the following requirements:</p> <ul style="list-style-type: none"> • Contains a maximum of 1,023 characters, excluding special characters such as ; &><'\$. The parameter value cannot be empty or full of spaces. • The path of the program to be executed can be stored in HDFS or OBS. The path varies depending on the file system. <ul style="list-style-type: none"> – OBS: The path must start with obs://. Example: obs://wordcount/program/xxx.jar – HDFS: The path must start with /user. For details about how to import data to HDFS, see Importing Data. • For SparkScript and HiveScript, the path must end with .sql. For MapReduce, the path must end with .jar. For Flink and SparkSubmit, the path must end with .jar or .py. The .sql, .jar, and .py are case-insensitive. <p>NOTE A file path on OBS can start with obs://. To submit jobs in this format, you need to configure permissions for accessing OBS.</p> <ul style="list-style-type: none"> • If the OBS permission control function is enabled during cluster creation, you can use the obs:// directory without extra configuration. • If the OBS permission control function is not enabled or is not supported when you create a cluster, configure the function by following instructions in Accessing OBS.
Program Parameter	<p>(Optional) Used to configure optimization parameters such as threads, memory, and vCPUs for the job to optimize resource usage and improve job execution performance.</p> <p>Table 3-32 describes the common parameters of a running program.</p>
Service Parameter	<p>(Optional) It is used to modify service parameters for the job. The parameter modification applies only to the current job. To make the modification take effect permanently for the cluster, follow instructions in Configuring Service Parameters.</p> <p>To add multiple parameters, click  on the right. To delete a parameter, click Delete on the right.</p> <p>Table 3-33 lists the common service configuration parameters.</p>
Command Reference	<p>Command submitted to the background for execution when a job is submitted.</p>

Table 3-32 Program parameters

Parameter	Description	Example Value
--hiveconf	Hive service configuration, for example, set the execution engine to MapReduce.	Setting the execution engine to MR: --hiveconf "hive.execution.engine=mr"
--hivevar	Custom variable, for example, variable ID.	Setting the variable ID: --hivevar id="123" select * from test where id = \${hivevar:id}

Table 3-33 Service parameters

Parameter	Description	Example Value
fs.obs.access.key	Key ID for accessing OBS.	-
fs.obs.secret.key	Key corresponding to the key ID for accessing OBS.	-
hive.execution.engine	Engine for running a job.	<ul style="list-style-type: none">• mr• tez

Step 7 Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

Submitting a Job in the Background

Step 1 Log in to the MRS console.

Step 2 On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

Step 3 On the **Nodes** tab page, click the name of a Master node to go to the ECS management console.

Step 4 Click **Remote Login** in the upper right corner of the page.

Step 5 Enter the username and password of the Master node as prompted. The username is **root** and the password is the one set during cluster creation.

Step 6 Run the following command to initialize environment variables:

```
source /opt/BigData/client/bigdata_env
```

 NOTE

- The default client installation path for MRS 3.x or later is `/opt/Bigdata/client`, and for versions earlier than MRS 3.x is `/opt/client`. Configure the path based on site requirements.

Step 7 If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If the Kerberos authentication is disabled for the current cluster, that is, the cluster is in normal mode, skip this step.

kinit *MRS cluster user* (The user must be in the **hive** user group.)

Step 8 Run the **beeline** command to connect to HiveServer and run tasks.

beeline

For clusters in normal mode, run the following commands. If no component service user is specified, the current OS user is used to log in to the HiveServer.

beeline -n *Component service user*

beeline -f *SQL files* (SQLs in the execution files)

----End

3.6.5 Running a SparkSql Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results. This section describes how to submit a SparkSQL job on the MRS console. SparkSQL jobs are used for data query and analysis. Both SQL statements and scripts are supported. If SQL statements contain sensitive information, use Spark Script to submit them.

Video Tutorial

This tutorial demonstrates how to submit and view a SparkSQL job on the cluster management page.

 NOTE

The UI may vary depending on the version. This tutorial is for reference only.

Prerequisites

You have uploaded the program packages and data files required for running jobs to OBS or HDFS.

Submitting a Job on the GUI

Step 1 Log in to the MRS console.

Step 2 On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

Step 3 If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

In the **Basic Information** area on the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users. For details, see [Synchronizing IAM Users to MRS](#).

 **NOTE**

- If this is your first time submitting a job, you need to synchronize the IAM user first. Wait for 5 minutes and then submit the job.
- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.

Step 4 Click the **Jobs** tab.

Step 5 Click **Create**. On the displayed **Create Job** page, set **Type** to **SparkSql** and configure SparkSql job information by referring to [Table 3-34](#).

Table 3-34 Job configuration information

Parameter	Description
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. NOTE You are advised to set different names for different jobs.
SQL Type	Submission type of the SQL statement <ul style="list-style-type: none">• SQL• Script
SQL Statement	This parameter is valid only when SQL Type is set to SQL . Enter the SQL statement to be executed, and then click Check to check whether the SQL statement is correct. If you want to submit and execute multiple statements at the same time, use semicolons (;) to separate them.

Parameter	Description
SQL File	<p>This parameter is valid only when SQL Type is set to Script. The path of the SQL file to be executed must meet the following requirements:</p> <ul style="list-style-type: none"> • Contains a maximum of 1,023 characters, excluding special characters such as ; &><'\$. The path varies depending on the file system. <ul style="list-style-type: none"> – OBS: The path must start with obs://. Example: obs://wordcount/program/xxx.jar – HDFS: The path must start with /user. For details about how to import data to HDFS, see Importing Data. • For SparkScript and HiveScript, the path must end with .sql. For MapReduce, the path must end with .jar. For Flink and SparkSubmit, the path must end with .jar or .py. The .sql, .jar, and .py are case-insensitive. <p>NOTE A file path on OBS can start with obs://. To submit jobs in this format, you need to configure permissions for accessing OBS.</p> <ul style="list-style-type: none"> • If the OBS permission control function is enabled during cluster creation, you can use the obs:// directory without extra configuration. • If the OBS permission control function is not enabled or is not supported when you create a cluster, configure the function by following instructions in Accessing OBS.
Program Parameter	<p>(Optional) Used to configure optimization parameters such as threads, memory, and vCPUs for the job to optimize resource usage and improve job execution performance.</p> <p>Table 3-35 describes the common parameters of a running program.</p>
Service Parameter	<p>(Optional) It is used to modify service parameters for the job. The parameter modification applies only to the current job. To make the modification take effect permanently for the cluster, follow instructions in Configuring Service Parameters.</p> <p>To add multiple parameters, click  on the right. To delete a parameter, click Delete on the right.</p> <p>Table 3-36 lists the common service configuration parameters.</p>
Command Reference	<p>Command submitted to the background for execution when a job is submitted.</p>

Table 3-35 Program parameters

Parameter	Description	Example Value
--conf	Task configuration items to be added.	spark.executor.memory=2G
--driver-memory	Running memory of a driver.	2G
--num-executors	Number of executors to be started.	5
--executor-cores	Number of executor cores.	2
--jars	Additional dependency packages of a task, which is used to add the external dependency packages to the task.	-
--executor-memory	Executor memory.	2G

Table 3-36 Service parameters

Parameter	Description	Example Value
fs.obs.access.key	Key ID for accessing OBS.	-
fs.obs.secret.key	Key corresponding to the key ID for accessing OBS.	-

Step 6 Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

Submitting a Job in the Background

The default client installation path for MRS 3.x or later is /opt/Bigdata/client, and for versions earlier than MRS 3.x is /opt/client. Configure the path based on site requirements.

Step 1 Create a user for submitting jobs. For details, see [Creating a User](#).

In this example, a machine-machine user has been created, and user groups (**hadoop** and **supergroup**), the primary group (**supergroup**), and role permissions (**System_administrator** and **default**) have been correctly assigned to the user.

Step 2 Download the authentication credential.

- For clusters of MRS 3.x or later, log in to FusionInsight Manager and choose **System > Permission > User**. In the **Operation** column of the newly created user, choose **More > Download Authentication Credential**.
- For clusters whose version is earlier than MRS 3.x, log in to MRS Manager and choose **System > Manage User**. In the **Operation** column of the newly created user, choose **More > Download Authentication Credential**.

Step 3 Log in to the node where the Spark client is located, upload the user authentication credential created in 2 to the `/opt` directory of the cluster, and run the following command to decompress the package:

```
tar -xvf MRSTest_XXXXXX_keytab.tar
```

After the decompression, you obtain the `user.keytab` and `krb5.conf` files.

Step 4 Before performing operations on the cluster, run the following commands:

```
source /opt/Bigdata/client/bigdata_env
```

```
cd $SPARK_HOME
```

Step 5 Open the `spark-sql` CLI and run the following SQL statement:

```
./bin/spark-sql --conf spark.yarn.principal=MRSTest --conf  
spark.yarn.keytab=/opt/user.keytab
```

To execute the SQL file, you need to upload the SQL file (for example, to the `/opt/` directory). After the file is uploaded, run the following command:

```
./bin/spark-sql --conf spark.yarn.principal=MRSTest --conf  
spark.yarn.keytab=/opt/user.keytab -f /opt/script.sql
```

```
----End
```

3.6.6 Running a Flink Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results. This section describes how to submit a Flink job on the MRS management console. Flink jobs are used to submit JAR programs to process streaming data.

Video Tutorial

This tutorial submits a Flink job to on an MRS 3.1.0 cluster where Kerberos authentication is disabled, to process data stored in OBS.

NOTE

The UI may vary depending on the version. This tutorial is for reference only.

Prerequisites

You have uploaded the program packages and data files required for running jobs to OBS or HDFS.

Submitting a Job on the GUI

Step 1 Log in to the MRS console.

Step 2 On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

Step 3 If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

In the **Basic Information** area on the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users. For details, see [Synchronizing IAM Users to MRS](#).

 **NOTE**

- If this is your first time submitting a job, you need to synchronize the IAM user first. Wait for 5 minutes and then submit the job.
- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.

Step 4 Click the **Jobs** tab.

Step 5 Click **Create**. The **Create Job** page is displayed.

Step 6 Set **Type** to **Flink**. Configure Flink job information by referring to [Table 3-37](#).

Table 3-37 Job configuration information

Parameter	Description
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. NOTE You are advised to set different names for different jobs.

Parameter	Description
Program Path	<p>Path of the program package to be executed. The following requirements must be met:</p> <ul style="list-style-type: none"> • Contains a maximum of 1,023 characters, excluding special characters such as ; &><'\$. The parameter value cannot be empty or full of spaces. • The path of the program to be executed can be stored in HDFS or OBS. The path varies depending on the file system. <ul style="list-style-type: none"> – OBS: The path must start with obs://. Example: obs://wordcount/program/xxx.jar (Supported in MRS 3.x or later) – HDFS: The path must start with /user. For details about how to import data to HDFS, see Importing Data. <p>NOTE If you use an OBS path starting with obs://, configure permission for accessing OBS as follows:</p> <ul style="list-style-type: none"> • If the OBS permission control function is enabled during cluster creation, you can use the obs:// directory without extra configuration. • If the OBS permission control function is not enabled or not available during cluster creation, perform the following steps: <ol style="list-style-type: none"> 1. On the MRS cluster details page, click the Nodes tab and expand a node group. 2. Click a node name to go to the cloud server console. 3. Click  on the right of Agency, select MRS_ECS_DEFAULT_AGENCY and add it. 4. Repeat the preceding steps to add agencies for all nodes in the cluster.
Program Parameter	<p>(Optional) Used to configure optimization parameters such as threads, memory, and vCPUs for the job to optimize resource usage and improve job execution performance.</p> <p>Table 3-38 describes the common parameters of a running program.</p>
Parameters	<p>(Optional) Key parameter for program execution. The parameter is specified by the function of the user's program. MRS is only responsible for loading the parameter. Multiple parameters are separated by space.</p> <p>The parameter contains a maximum of 150,000 characters. It cannot contain special characters ; &><'\$, but can be left blank.</p> <p>CAUTION When entering a parameter containing sensitive information (for example, login password), you can add an at sign (@) before the parameter name to encrypt the parameter value. This prevents the sensitive information from being persisted in plaintext. When you view job information on the MRS console, the sensitive information is displayed as *.</p> <p>For example: <code>username=testuser @password=User password</code></p>

Parameter	Description
Service Parameter	<p>(Optional) It is used to modify service parameters for the job. The parameter modification applies only to the current job. To make the modification take effect permanently for the cluster, follow instructions in Configuring Service Parameters.</p> <p>To add multiple parameters, click  on the right. To delete a parameter, click Delete on the right.</p> <p>Table 3-39 describes the common parameters of a service.</p>
Command Reference	Command submitted to the background for execution when a job is submitted.

Table 3-38 Program parameters

Parameter	Description	Example Value
-ytm	Memory size of each TaskManager container. (Optional unit. The unit is MB by default.)	1024
-yjm	Memory size of JobManager container. (Optional unit. The unit is MB by default.)	1024
-ys	Number of TaskManager cores.	2
-ynm	Custom name of an application on Yarn.	test
-c	Class of the program entry point (for example, the main or getPlan() method). This parameter is required only when the JAR file does not specify the class of its manifest.	com.bigdata.mrs.test

 **NOTE**

For MRS 3.x or later, the **-yn** parameter is not supported.

Table 3-39 Service parameters

Parameter	Description	Example Value
fs.obs.access.key	Key ID for accessing OBS.	-
fs.obs.secret.key	Key corresponding to the key ID for accessing OBS.	-

Step 7 Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

Submitting a Job in the Background

The default client installation path for MRS 3.x or later is `/opt/Bigdata/client`, and for versions earlier than MRS 3.x is `/opt/client`. Configure the path based on site requirements.

Step 1 Log in to the MRS client.

Step 2 Run the following command to initialize environment variables:

```
source /opt/Bigdata/client/bigdata_env
```

Step 3 If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

1. Prepare a user for submitting Flink jobs.
 - MRS 3.x or earlier: For details, see [Preparing a Development User](#).
 - MRS 3.x or later: For details, see [Preparing a Development User](#).
2. Log in to Manager as the newly created user.
 - For MRS 3.x earlier: Log in to Manager of the cluster. Choose **System** > **Manage User**. In the **Operation** column of the row that contains the added user, choose **More** > **Download authentication credential** to locate the row that contains the user.
 - For MRS 3.x or later: Log in to Manager of the cluster. Choose **System** > **Permission** > **Manage User**. On the displayed page, locate the row that contains the added user, click **More** in the **Operation** column, and select **Download authentication credential**.
3. Decompress the downloaded authentication credential package and copy the obtained file to a directory on the client node, for example, `/opt/Bigdata/client/Flink/flink/conf`. If the client is installed on a node outside the cluster, copy the obtained file to the `/etc/` directory on this node.
4. For MRS 3.x or later: In security mode, add the service IP address of the node where the client is installed and floating IP address of Manager to the `jobmanager.web.allow-access-address` configuration item in the `/opt/Bigdata/client/Flink/flink/conf/flink-conf.yaml` file.
5. Run the following commands to configure security authentication by adding the `keytab` path and username to the `/opt/Bigdata/client/Flink/flink/conf/flink-conf.yaml` configuration file.

```
security.kerberos.login.keytab: <user.keytab file path>
security.kerberos.login.principal: <Username>
```

Example:

```
security.kerberos.login.keytab: /opt/Bigdata/client/Flink/flink/conf/user.keytab
security.kerberos.login.principal: test
```
6. In the `bin` directory of the Flink client, run the following command to perform security hardening. Then, set a password for submitting jobs.

```
sh generate_keystore.sh
```

This script automatically replaces the SSL value in the `/opt/Bigdata/client/Flink/flink/conf/flink-conf.yaml` file. For MRS 3.x or earlier, external SSL is disabled by default in security clusters. To enable external SSL, run this script again after configuration. The configuration parameters do not exist in the default Flink configuration of MRS, if you enable SSL for external connections, you need to add the parameters listed in [Table 3-40](#).

Table 3-40 Parameter description

Parameter	Example Value	Description
<code>security.ssl.rest.enabled</code>	true	Switch to enable external SSL.
<code>security.ssl.rest.keystore</code>	<code>\${path}/flink.keystore</code>	Path for storing keystore .
<code>security.ssl.rest.keystore-password</code>	123456	Password of the keystore . 123456 indicates a user-defined password is required.
<code>security.ssl.rest.key-password</code>	123456	Password of the SSL key. 123456 indicates a user-defined password is required.
<code>security.ssl.rest.truststore</code>	<code>\${path}/flink.truststore</code>	Path for storing the truststore .
<code>security.ssl.rest.truststore-password</code>	123456	Password of the truststore . 123456 indicates a user-defined password is required.

 **NOTE**

- For MRS 3.x or earlier: The `generate_keystore.sh` script is automatically generated.
- The generated `flink.keystore`, `flink.truststore`, and `security.cookie` items are automatically filled in the corresponding configuration items in `flink-conf.yaml`.
- For MRS 3.x or later: You can obtain the values of `security.ssl.key-password`, `security.ssl.keystore-password`, and `security.ssl.truststore-password` using the Manager plaintext encryption API by running the following command:

```
curl -k -i -u <user name>:<password> -X POST -HContent-type:application/json -d '{"plainText":"<password>"}' 'https://x.x.x.x:28443/web/api/v2/tools/encrypt';
```

In the preceding command, `<password>` must be the same as the password used for issuing the certificate, and `x.x.x.x` indicates the floating IP address of Manager in the cluster.

Commands carrying authentication passwords pose security risks. Disable historical command recording before running such commands to prevent information leakage.

7. Configure paths for the client to access the `flink.keystore` and `flink.truststore` files.

- Absolute path: After the script is executed, the file path of **flink.keystore** and **flink.truststore** is automatically set to the absolute path **opt/Bigdata/client/Flink/flink/conf/** in the **flink-conf.yaml** file. In this case, you need to move the **flink.keystore** and **flink.truststore** files from the **conf** directory to this absolute path on the Flink client and Yarn nodes.
 - Relative path: Perform the following steps to set the file path of **flink.keystore** and **flink.truststore** to the relative path and ensure that the directory where the Flink client command is executed can directly access the relative paths.
 - i. In the **/opt/Bigdata/client/Flink/flink/conf/** directory, create a new directory, for example, **ssl**.
 - ii. Move the **flink.keystore** and **flink.truststore** file to the **/opt/Bigdata/client/Flink/flink/conf/ssl/** directory.
 - iii. For MRS 3.x or later: Change the values of the following parameters in the **flink-conf.yaml** file to relative paths:

```
security.ssl.keystore: ssl/flink.keystore
security.ssl.truststore: ssl/flink.truststore
```
 - iv. For MRS 3.x or earlier: Change the values of the following parameters in the **flink-conf.yaml** file to relative paths:

```
security.ssl.internal.keystore: ssl/flink.keystore
security.ssl.internal.truststore: ssl/flink.truststore
```
8. If the client is installed on a node outside the cluster, add the following configuration to the configuration file (for example, **/opt/Bigdata/client/Flink/flink/conf/flink-conf.yaml**). Replace **xx.xx.xxx.xxx** with the IP address of the node where the client resides.
- ```
web.access-control-allow-origin: xx.xx.xxx.xxx
jobmanager.web.allow-access-address: xx.xx.xxx.xxx
```

#### Step 4 Run a wordcount job.

- Normal cluster (Kerberos authentication disabled)
  - Run the following commands to start a session and submit a job in the session:

```
yarn-session.sh -nm "session-name" -d
flink run /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
```
  - Run the following command to submit a single job on Yarn:

```
flink run -m yarn-cluster /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
```
- Security cluster (Kerberos authentication enabled)
  - If the **flink.keystore** and **flink.truststore** file are stored in the absolute path:
    - Run the following commands to start a session and submit a job in the session:

```
yarn-session.sh -nm "session-name" -d
flink run /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
```
    - Run the following command to submit a single job on Yarn:

```
flink run -m yarn-cluster /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
```
  - If the **flink.keystore** and **flink.truststore** file are stored in the relative path:
    - In the same directory of SSL, run the following command to start a session and submit jobs in the session. The SSL directory is a relative

```
path. For example, if the SSL directory is opt/Bigdata/client/Flink/
flink/conf/, then run the following command in this directory:
yarn-session.sh -t ssl/ -nm "session-name" -d
flink run /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
```

- Run the following command to submit a single job on Yarn:  
flink run -m yarn-cluster -yt ssl/ /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar

----End

### 3.6.7 Running a HadoopStreaming Job

You can submit programs developed by yourself to run them on MRS, and obtain the results. This topic describes how to submit a HadoopStreaming job on the MRS management console.

#### Submitting a Job on the UI

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

In the **Basic Information** area on the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users. For details, see [Synchronizing IAM Users to MRS](#).

#### NOTE

- If this is your first time submitting a job, you need to synchronize the IAM user first. Wait for 5 minutes and then submit the job.
- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.

**Step 4** Click the **Jobs** tab.

**Step 5** Click **Create**. The **Create Job** page is displayed.

**Step 6** Set **Type** to **HadoopStreaming**. Configure job information by referring to [Table 3-41](#).

**Table 3-41** Job parameters

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name              | <p>Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.</p> <p><b>NOTE</b><br/>You are advised to set different names for different jobs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Program Parameter | <p>(Optional) Used to configure optimization parameters such as threads, memory, and vCPUs for the job to optimize resource usage and improve job execution performance.</p> <p><b>Table 3-42</b> describes the common parameters of a running program.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Parameters        | <p>(Optional) Key parameter for program execution. The parameter is specified by the function of the custom program. MRS is only responsible for loading the parameters. Use spaces to separate parameters. To prevent parameters from being saved as plaintext, add an at sign (@) before parameters.</p> <p>The value can contain a maximum of 150,000 characters. It cannot contain special characters ; &amp;&gt;&lt;'\$, but can be left blank.</p> <p><b>CAUTION</b><br/>When entering a parameter containing sensitive information (for example, login password), you can add an at sign (@) before the parameter name to encrypt the parameter value. This prevents the sensitive information from being persisted in plaintext. When you view job information on the MRS console, the sensitive information is displayed as *.</p> <p>For example:<br/><code>username=testuser @password=User password</code></p> |
| Service Parameter | <p>(Optional) Service parameters for the job. The parameters apply only to this job. To apply modifications to the cluster, follow instructions in <a href="#">Configuring Service Parameters</a>.</p> <p>To add more parameters, click  on the right. To delete a parameter, click <b>Delete</b> on the right.</p> <p><b>Table 3-43</b> describes the typical service parameters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Command Reference | <p>Commands submitted to the background when the job is submitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 3-42** Program parameters

| Parameter | Description                                                                            | Example Value |
|-----------|----------------------------------------------------------------------------------------|---------------|
| -ytm      | Memory size of each TaskManager container. (Optional unit. The unit is MB by default.) | 1024          |

| Parameter | Description                                                                                                                                                                                | Example Value        |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| -yjm      | Memory size of JobManager container. (Optional unit. The unit is MB by default.)                                                                                                           | 1024                 |
| -yn       | Number of Yarn containers allocated to applications. The value is the same as the number of TaskManagers.                                                                                  | 2                    |
| -ys       | Number of TaskManager cores                                                                                                                                                                | 2                    |
| -ynm      | Custom name of an application on Yarn                                                                                                                                                      | test                 |
| -c        | Class of the program entry method (for example, the <b>main</b> or <b>getPlan()</b> method). This parameter is required only when the JAR file does not specify the class of its manifest. | com.bigdata.mrs.test |

 **NOTE**

For MRS 3.x or later, the **-yn** parameter is not supported.

**Table 3-43** Service Parameter

| Parameter         | Description                                         | Example Value |
|-------------------|-----------------------------------------------------|---------------|
| fs.obs.access.key | Key ID for accessing OBS                            | -             |
| fs.obs.secret.key | Key (corresponding to the key ID) for accessing OBS | -             |

**Step 7** Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

## 3.6.8 Viewing Job Configuration and Logs

This section describes how to view job configuration and logs.

### Background

- You can view configuration information of all jobs.
- You can only view logs of running jobs.

Because logs of Spark SQL and DistCp jobs are not in the background, you cannot view logs of running Spark SQL and DistCp jobs.

## Procedure

- Step 1** Log in to the MRS management console.
- Step 2** Choose **Active Clusters** in the navigation pane, select a running cluster, and click its name to switch to the cluster details page.
- Step 3** Click **Jobs**.
- Step 4** In the **Operation** column of the job to be viewed, click **View Details**.  
In the **View Details** window that is displayed, configuration of the selected job is displayed.
- Step 5** Select a running job, and click **View Log** in the **Operation** column.  
In the new page that is displayed, real-time log information of the job is displayed.  
Each tenant can submit and view 10 jobs concurrently.  
----End

### 3.6.9 Stopping a Job

This section describes how to stop running MRS jobs.

## Background

You cannot stop Spark SQL jobs. After a job is stopped, its status changes to **Terminated** and the job cannot be executed again.

## Procedure

- Step 1** Log in to the MRS management console.
- Step 2** On the **Active Clusters** page, select a running cluster and click its name.  
The cluster details page is displayed.
- Step 3** Click **Jobs**.
- Step 4** Select a running job, and choose **More > Stop** in the **Operation** column.  
The job status changes from **Running** to **Terminated**.  
----End

### 3.6.10 Deleting a Job

This section describes how to delete an MRS job. After a job is executed, you can delete it if you do not need to view its information.

## Background

Jobs can be deleted one after another or in a batch. A deleted job cannot be restored. Therefore, exercise caution when deleting a job.

## Procedure

- Step 1** Log in to the MRS management console.
- Step 2** On the **Active Clusters** page, select a running cluster and click its name.  
The cluster details page is displayed.
- Step 3** Click **Jobs**.
- Step 4** Choose **More > Delete** from the **Operation** in the row of the target job to be deleted. Enter **DELETE** in the **Delete Job** dialog box and click **OK**.  
In this step, you can only delete one job only.
- Step 5** If you select multiple jobs and click **Delete** on the upper left of the job list. Enter **DELETE** in the **Delete Job** dialog box and click **OK**.  
You can delete one, multiple, or all jobs.
- End

### 3.6.11 Using Encrypted OBS Data for Job Running

In MRS 1.9.x encrypted data in OBS file systems can be used to run jobs, and the encrypted job running results can be stored in OBS file systems. Currently, data can be accessed only through an OBS protocol.

OBS supports data encryption and decryption using KMS keys. All encryption and decryption operations are performed on OBS, and keys are managed by DEW.

To use the OBS encryption function in MRS, you must have the KMS Administrator permissions and configure the following settings for the corresponding component:

#### NOTE

If the **OBS permission control** function is enabled in a cluster, the default agency **MRS\_ECS\_DEFAULT\_AGENCY** configured on the ECS or the AK/SK of the custom agency is used for accessing OBS. OBS uses the received AK/SK to access DEW to obtain the KMS key status. Therefore, you need to bind the KMS Administrator policy to the used agency. Otherwise, OBS returns the "403 Forbidden" error when processing encrypted data. Currently, the KMS Administrator policy is bound to the agency **MRS\_ECS\_DEFAULT\_AGENCY** by default. If you use a custom agency, you need to manually bind the policy to your custom agency.

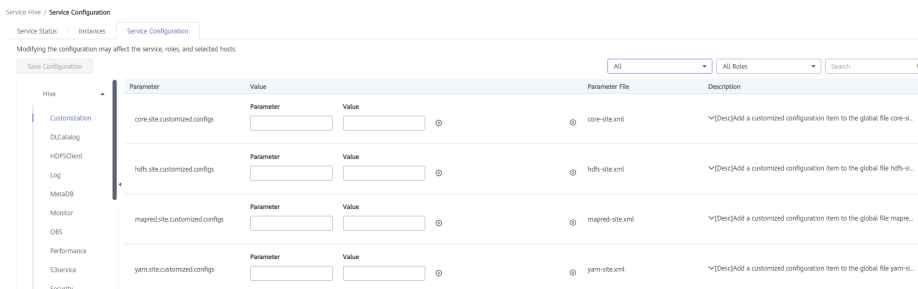

## Prerequisites

You have configured the function of accessing OBS from MRS first to use the OBS encryption function. For details, see [Configuring a Storage-Compute Decoupled Cluster \(Agency\)](#).

## Hive Configuration

- Step 1** Log in to the MRS console. On the **Active Clusters** page that is displayed, click the name of the desired cluster in the cluster list.
- Step 2** Choose **Components > Hive > Service Configuration**.

**Step 3** Switch **Basic** to **All**, and search for and set the following parameters:

**Table 3-44** Data encryption parameters

| Parameter                          | Value   | Description                                                                                                                                                                                                                                                                                    |
|------------------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fs.obs.server-side-encryption-type | SSE-KMS | <ul style="list-style-type: none"> <li><b>SSE-KMS</b>: KMS keys are used for encryption and decryption</li> <li><b>NONE</b>: The encryption function is disabled.</li> </ul>                                                                                                                   |
| fs.obs.server-side-encryption-key  | -       | (Optional) This parameter indicates an ID of the KMS key used for encryption. If <b>fs.obs.server-side-encryption-type</b> is set to <b>SSE-KMS</b> and this parameter is not set, OBS uses the default KMS key for encryption.                                                                |
| fs.obs.connection.ssl.enabled      | true    | Whether to establish a secure connection with OBS. <ul style="list-style-type: none"> <li><b>true</b>: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to <b>true</b>.</li> <li><b>false</b>: The secure connection is disabled.</li> </ul> |

**Step 4** Click **Save Configuration** and save the modified parameters as prompted.

----End

## Hadoop Configuration

### Method 1: Configuration on the GUI

**Step 1** Log in to the MRS console. On the **Active Clusters** page that is displayed, click the name of the desired cluster in the cluster list.

**Step 2** Choose **Components > HDFS > Service Configuration**.

**Step 3** Switch **Basic** to **All**, and search for and set the following parameters:

**Table 3-45** Data encryption parameters

| Parameter                          | Value   | Description                                                                                                                                                                                                                                                                                     |
|------------------------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fs.obs.server-side-encryption-type | SSE-KMS | <ul style="list-style-type: none"><li>• <b>SSE-KMS</b>: KMS keys are used for encryption and decryption</li><li>• <b>NONE</b>: The encryption function is disabled.</li></ul>                                                                                                                   |
| fs.obs.server-side-encryption-key  | -       | ID of the KMS key used for encryption. This parameter is optional.<br>If <b>fs.obs.server-side-encryption-type</b> is set to <b>SSE-KMS</b> and this parameter is not set, OBS uses the default KMS key for encryption.                                                                         |
| fs.obs.connection.ssl.enabled      | true    | Whether to establish a secure connection with OBS. <ul style="list-style-type: none"><li>• <b>true</b>: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to <b>true</b>.</li><li>• <b>false</b>: The secure connection is disabled.</li></ul> |

**Step 4** Click **Save Configuration** and operate as prompted.

**Step 5** Log in to the Master node as user **root**. The password is the password of user **root** you set when you create the cluster. If the cluster has multiple Master nodes, log in to each Master node and repeat [Step 5](#) to [Step 7](#).

**Step 6** Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

```
cd /opt/Bigdata/client
```

**Step 7** Run the following command to update client configurations, and enter the username and password. The username is **admin**, and the password is the password of user **admin** you set when you create the cluster.

```
./ autoRefreshConfig.sh
```

----End

#### Method 2: Configuration Through the Client Configuration File

Add the following parameter settings to the client configuration file, for example, **/opt/Bigdata/client/HDFS/hadoop/etc/hadoop/core-site.xml**, on the Master node. If the cluster has multiple Master nodes, log in to each Master node and perform this operation.

**Table 3-46** Data encryption parameters

| Parameter                          | Value   | Description                                                                                                                                                                                                                                                                                               |
|------------------------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fs.obs.server-side-encryption-type | SSE-KMS | <ul style="list-style-type: none"> <li>• <b>SSE-KMS</b>: KMS keys are used for encryption and decryption</li> <li>• <b>NONE</b>: The encryption function is disabled.</li> </ul>                                                                                                                          |
| fs.obs.server-side-encryption-key  | -       | <p>ID of the KMS key used for encryption. This parameter is optional.</p> <p>If <b>fs.obs.server-side-encryption-type</b> is set to <b>SSE-KMS</b> and this parameter is not set, OBS uses the default KMS key for encryption.</p>                                                                        |
| fs.obs.connection.ssl.enabled      | true    | <p>Whether to establish a secure connection with OBS.</p> <ul style="list-style-type: none"> <li>• <b>true</b>: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to <b>true</b>.</li> <li>• <b>false</b>: The secure connection is disabled.</li> </ul> |

## HBase Configuration

### Method 1: Configuration on the GUI

**Step 1** Log in to the MRS console. On the **Active Clusters** page that is displayed, click the name of the desired cluster in the cluster list.

**Step 2** Choose **Components > HBase > Service Configuration**.

**Step 3** Switch **Basic** to **All**, and search for and set the following parameters:

**Table 3-47** Data encryption parameters

| Parameter                          | Value   | Description                                                                                                                                                                                                                        |
|------------------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fs.obs.server-side-encryption-type | SSE-KMS | <ul style="list-style-type: none"> <li>• <b>SSE-KMS</b>: KMS keys are used for encryption and decryption</li> <li>• <b>NONE</b>: The encryption function is disabled.</li> </ul>                                                   |
| fs.obs.server-side-encryption-key  | -       | <p>ID of the KMS key used for encryption. This parameter is optional.</p> <p>If <b>fs.obs.server-side-encryption-type</b> is set to <b>SSE-KMS</b> and this parameter is not set, OBS uses the default KMS key for encryption.</p> |

| Parameter                     | Value | Description                                                                                                                                                                                                                                                                                    |
|-------------------------------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fs.obs.connection.ssl.enabled | true  | Whether to establish a secure connection with OBS. <ul style="list-style-type: none"> <li><b>true</b>: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to <b>true</b>.</li> <li><b>false</b>: The secure connection is disabled.</li> </ul> |

**Step 4** Click **Save Configuration** and operate as prompted.

**Step 5** Log in to the Master node as user **root**. The password is the password of user **root** you set when you create the cluster. If the cluster has multiple Master nodes, log in to each Master node and repeat **Step 5** to **Step 7**.

**Step 6** Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

```
cd /opt/Bigdata/client
```

**Step 7** Run the following command to update client configurations, and enter the username and password. The username is **admin**, and the password is the password of user **admin** you set when you create the cluster.

```
./ autoRefreshConfig.sh
```

```
----End
```

### Method 2: Configuration Through the Client Configuration File

Add the following parameter settings to the client configuration file, for example, **/opt/Bigdata/client/HBase/hbase/conf/core-site.xml**, on the Master node. If the cluster has multiple Master nodes, log in to each Master node and perform this operation.

**Table 3-48** Data encryption parameters

| Parameter                          | Value   | Description                                                                                                                                                                                                                        |
|------------------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fs.obs.server-side-encryption-type | SSE-KMS | <ul style="list-style-type: none"> <li><b>SSE-KMS</b>: KMS keys are used for encryption and decryption</li> <li><b>NONE</b>: The encryption function is disabled.</li> </ul>                                                       |
| fs.obs.server-side-encryption-key  | -       | <p>ID of the KMS key used for encryption. This parameter is optional.</p> <p>If <b>fs.obs.server-side-encryption-type</b> is set to <b>SSE-KMS</b> and this parameter is not set, OBS uses the default KMS key for encryption.</p> |

| Parameter                     | Value | Description                                                                                                                                                                                                                                                                                     |
|-------------------------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fs.obs.connection.ssl.enabled | true  | Whether to establish a secure connection with OBS. <ul style="list-style-type: none"><li>• <b>true</b>: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to <b>true</b>.</li><li>• <b>false</b>: The secure connection is disabled.</li></ul> |

## Spark Configuration

### Method 1: Configuration on the GUI

**Step 1** Log in to the MRS console. On the **Active Clusters** page that is displayed, click the name of the desired cluster in the cluster list.

**Step 2** Choose **Components > Spark > Service Configuration**.

**Step 3** Switch **Basic** to **All**, and search for and set the following parameters:

**Table 3-49** Data encryption parameters

| Parameter                          | Value   | Description                                                                                                                                                                                                                                                                                     |
|------------------------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fs.obs.server-side-encryption-type | SSE-KMS | <ul style="list-style-type: none"><li>• <b>SSE-KMS</b>: KMS keys are used for encryption and decryption</li><li>• <b>NONE</b>: The encryption function is disabled.</li></ul>                                                                                                                   |
| fs.obs.server-side-encryption-key  | -       | ID of the KMS key used for encryption. This parameter is optional.<br>If <b>fs.obs.server-side-encryption-type</b> is set to <b>SSE-KMS</b> and this parameter is not set, OBS uses the default KMS key for encryption.                                                                         |
| fs.obs.connection.ssl.enabled      | true    | Whether to establish a secure connection with OBS. <ul style="list-style-type: none"><li>• <b>true</b>: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to <b>true</b>.</li><li>• <b>false</b>: The secure connection is disabled.</li></ul> |

**Step 4** Click **Save Configuration** and operate as prompted.

**Step 5** Log in to the Master node as user **root**. The password is the password of user **root** you set when you create the cluster. If the cluster has multiple Master nodes, log in to each Master node and repeat **Step 5** to **Step 7**.

**Step 6** Run the following command to switch to the client directory, for example, `/opt/Bigdata/client`:

```
cd /opt/Bigdata/client
```

**Step 7** Run the following command to update client configurations, and enter the username and password. The username is **admin**, and the password is the password of user **admin** you set when you create the cluster.

```
./autoRefreshConfig.sh
```

----End

### Method 2: Configuration Through the Client Configuration File

Add the following parameter settings to the client configuration file, for example, `/opt/Bigdata/client/Spark/spark/conf/core-site.xml`, on the Master node. If the cluster has multiple Master nodes, log in to each Master node and perform this operation.

**Table 3-50** Data encryption parameters

| Parameter                                       | Value   | Description                                                                                                                                                                                                                                                                                        |

| <code>fs.obs.server-side-encryption-type</code> | SSE-KMS | <ul style="list-style-type: none"><li>• <b>SSE-KMS</b>: KMS keys are used for encryption and decryption</li><li>• <b>NONE</b>: The encryption function is disabled.</li></ul>                                                                                                                      |
| <code>fs.obs.server-side-encryption-key</code>  | -       | ID of the KMS key used for encryption. This parameter is optional.<br><br>If <code>fs.obs.server-side-encryption-type</code> is set to <b>SSE-KMS</b> and this parameter is not set, OBS uses the default KMS key for encryption.                                                                  |
| <code>fs.obs.connection.ssl.enabled</code>      | true    | Whether to establish a secure connection with OBS.<br><ul style="list-style-type: none"><li>• <b>true</b>: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to <b>true</b>.</li><li>• <b>false</b>: The secure connection is disabled.</li></ul> |

## Presto Configuration

**Step 1** Log in to the MRS console. On the **Active Clusters** page that is displayed, click the name of the desired cluster in the cluster list.

**Step 2** Choose **Components > Presto > Service Configuration**.

**Step 3** Switch **Basic** to **All**, and search for and set the following parameters:

**Table 3-51** Data encryption parameters

| Parameter                          | Value   | Description                                                                                                                                                                                                                                                                                     |
|------------------------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fs.obs.server-side-encryption-type | SSE-KMS | <ul style="list-style-type: none"><li>• <b>SSE-KMS</b>: KMS keys are used for encryption and decryption</li><li>• <b>NONE</b>: The encryption function is disabled.</li></ul>                                                                                                                   |
| fs.obs.server-side-encryption-key  | -       | ID of the KMS key used for encryption. This parameter is optional.<br>If <b>fs.obs.server-side-encryption-type</b> is set to <b>SSE-KMS</b> and this parameter is not set, OBS uses the default KMS key for encryption.                                                                         |
| fs.obs.connection.ssl.enabled      | true    | Whether to establish a secure connection with OBS. <ul style="list-style-type: none"><li>• <b>true</b>: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to <b>true</b>.</li><li>• <b>false</b>: The secure connection is disabled.</li></ul> |

**Step 4** Click **Save Configuration** and operate as prompted.

----End

## 3.6.12 Configuring Job Notification Rules

MRS uses SMN to offer a publish/subscribe model to achieve one-to-multiple message subscriptions and notifications in a variety of message types (SMSs and emails). You can configure job notification rules to receive notifications immediately upon a job execution success or failure.

### Procedure

**Step 1** Log in to the management console.

**Step 2** Click **Service List**. Under **Management & Governance**, click **Simple Message Notification**.

**Step 3** Create a topic and add subscriptions to the topic. For details, see [Configuring Message Notification](#).

**Step 4** Go to the MRS management console, and click the cluster name to go to the cluster details page.

**Step 5** Click the **Alarms** tab, and choose **Notification Rules > Add Notification Rule**.

**Step 6** Configure a notification rule for sending job execution results to subscribers.

**Table 3-52** Parameters of adding a notification rule

| Parameter            | Description                                                                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rule Name            | User-defined notification rule name. Only digits, letters, hyphens (-), and underscores (_) are allowed.                                                                                                |
| Message Notification | If you enable this function, subscription messages will be sent to subscribers.                                                                                                                         |
| Topic Name           | Select an existing topic or click <b>Create Topic</b> to create a topic.                                                                                                                                |
| Notification Type    | Select <b>Event</b> .                                                                                                                                                                                   |
| Subscription Items   | <ol style="list-style-type: none"> <li>Click  next to <b>Suggestion</b>.</li> <li>Click  next to <b>Manager</b>.</li> <li>Select <b>Job Running Succeeded</b> and <b>Job Running Failed</b>.</li> </ol> |

----End

## 3.7 Component Management

### 3.7.1 Object Management

MRS contains different types of basic objects. [Table 3-53](#) describes these objects.

**Table 3-53** MRS basic object overview

| Object           | Description                                             | Example                                  |
|------------------|---------------------------------------------------------|------------------------------------------|
| Service          | Function set that can complete specific business.       | KrbServer service and LdapServer service |
| Service instance | Specific instance of a service, usually called service. | KrbServer service                        |

| Object        | Description                                                                   | Example                                                                                                          |
|---------------|-------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Service role  | Function entity that forms a complete service, usually called role.           | KrbServer is composed of the KerberosAdmin role and KerberosServer role.                                         |
| Role instance | Specific instance of a service role running on a host.                        | KerberosAdmin that is running on Host2 and KerberosServer that is running on Host3                               |
| Host          | An ECS running Linux OS.                                                      | Host1 to Host5                                                                                                   |
| Rack          | Physical entity that contains multiple hosts connecting to the same switch.   | Rack1 contains Host1 to Host5.                                                                                   |
| Cluster       | Logical entity that consists of multiple hosts and provides various services. | Cluster1 cluster consists of five hosts (Host1 to Host5) and provides services such as KrbServer and LdapServer. |

### 3.7.2 Viewing Configuration

On MRS, you can view the configuration of services (including roles) and role instances.

#### Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

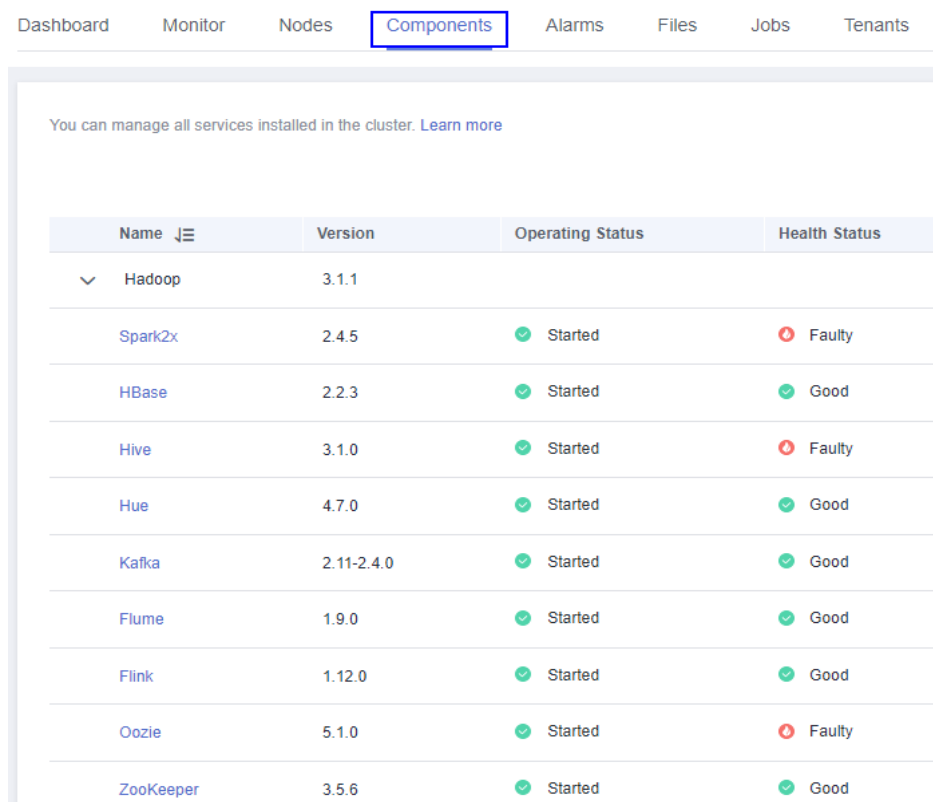

**Figure 3-37** Synchronizing IAM users

#### Procedure

- Query service configuration.
  - a. On the cluster details page, click the **Components** tab.

**Figure 3-38** Components tab page

- b. Select the target service from the service list.
- c. Click **Service Configuration**.
- d. Switch **Basic** to **All**. All configuration parameters of the service are displayed in the navigation tree. The service name and role names are displayed from upper to lower in the navigation tree.

**Figure 3-39** All configurations

- e. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.  
The parameters under the service nodes and role nodes are service configuration parameters and role configuration parameters respectively.
- f. If you select **Non-default** from the **--Select--** drop-down list, parameters whose values are not default ones are displayed on the page. (This value option is available in versions earlier than MRS 3.x.)
- Query role instance configurations.
  - a. On the MRS cluster details page, click **Components**.

**Figure 3-40** Components tab page (using MRS 1.9.2 as an example)

| Service    | Operating Status | Health Status | Configuration Status |
|------------|------------------|---------------|----------------------|
| DBService  | Started          | Good          | Synchronized         |
| KrbServer  | Started          | Good          | Synchronized         |
| LdapServer | Started          | Good          | Synchronized         |
| meta       | Started          | Good          | Synchronized         |
| Ranger     | Started          | Good          | Synchronized         |
| Flume      | Started          | Good          | Synchronized         |
| ZooKeeper  | Started          | Good          | Synchronized         |
| HDFS       | Started          | Good          | Synchronized         |
| Kafka      | Started          | Good          | Synchronized         |
| Storm      | Started          | Good          | Synchronized         |

- Select the target service from the service list.
- Click the **Instances** tab.
- Click the target role instance from the role instance list.
- Click **Instance Configuration**.
- Switch **Basic** to **All** on the right of the page. All configuration parameters of the role instance are displayed in the navigation tree.
- In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.
- If you select **Non-default** from the **--Select--** drop-down list, parameters whose values are not default ones are displayed on the page. (This value option is available in versions earlier than MRS 3.x.)

### 3.7.3 Managing Services

You can perform the following operations on MRS:

- Add or delete services. This is available only for custom clusters of MRS 3.1.2 and later versions.
- Start the service in the **Stopped**, **Stop Failed**, or **Failed to Start** state to use the service.
- Stop the services or stop abnormal services.
- Restart abnormal services or configure expired services to restore or enable the services.

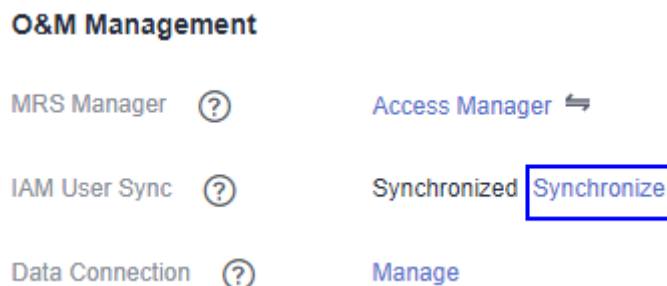

#### Prerequisites

- You have configured permissions for the user group to which the IAM users belong.**

Adding or deleting a service in a cluster is a high-risk operation. Bind the MRS FullAccess, MRS Administrator, Server Administrator, Tenant Guest, MRS Administrator, or Tenant Administrator policy to the user group before you perform this operation. For details about the permissions, see [Synchronizing IAM Users to MRS](#).

- **You have synchronized IAM users.** (On the **Dashboard** tab page, click **Synchronize** next to **IAM User Sync** to synchronize IAM users.)

**Figure 3-41** Synchronizing IAM users

## Adding a Service

### NOTE

Services can be added and deleted in MRS 3.1.2-LTS.3 or later.

**Step 1** On the cluster details page, Choose **Components** and click **Add Service**.

**Step 2** In the service list, select the services to be added and click **Next**.

### NOTE

- When you add a service, the underlying services on which the service depends are automatically selected. You can add multiple services at the same time.
- You can add a service only on a node in normal state.
- If you add Hadoop to a cluster with no Hadoop before, you need to refresh the cluster details page on the MRS console and synchronize IAM users so that jobs can be successfully submitted.
- A single component of the Hadoop service cannot be added to the cluster. Only the Hadoop service can be added. The Hadoop service includes MapReduce, Yarn, and HDFS.
- After the Spark2x component is added, if you need to operate SparkSQL on the Hue web UI, restart the Hue service first.

**Step 3** On the **Topology Adjustment** page, select the nodes where the service is to be deployed. For details about the deployment scheme, see [Table 2-9](#).

**Step 4** Click **OK**. After the service is added, you can view the added service on the **Components** page.

### NOTE

The services added on the console are automatically synchronized to Manager.

----End

## Deleting a Service

### NOTE

Services can be added and deleted in MRS 3.1.2-LTS.3 or later.

**Step 1** On the cluster details page, click **Components**.

**Step 2** Locate the row that contains the target service and click **Delete**.

### NOTE

- If the service to be deleted has upper-layer dependencies, the service cannot be deleted. Only one service can be deleted at a time.
- You can delete installed services except Hadoop (HDFS, Yarn, and MapReduce), Ranger, DBService, KrbServer, LdapServer, and meta services.

**Step 3** Enter **DELETE** in the displayed **Delete Service** dialog box and click **OK** to confirm the deletion.

---

### CAUTION

- The services deleted on the console are automatically synchronized to Manager.
  - Before deleting a service, back up the service data to prevent data loss.
- 

----End

## Starting, Stopping, and Restarting a Service

**Step 1** On the MRS cluster details page, click **Components**.

**Step 2** Locate the row that contains the target service, **Start**, **Stop**, and **Restart** to start, stop, or restart the service.

Services are interrelated. If a service is started, stopped, and restarted, services dependent on it will be affected.

The services will be affected in the following ways:

- If a service is to be started, the lower-layer services dependent on it must be started first.
- If a service is stopped, the upper-layer services dependent on it are unavailable.
- If a service is restarted, the running upper-layer services dependent on it must be restarted.

----End

## 3.7.4 Configuring Service Parameters

On the MRS console, you can view and modify the default service configurations based on site requirements and export or import the configurations.

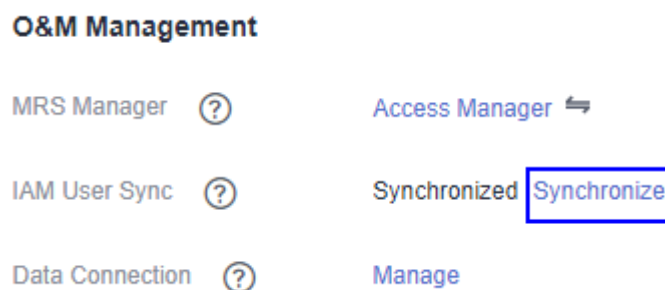

## Impact on the System

- You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.
- The parameters of DBService cannot be modified when only one DBService role instance exists in the cluster.

## Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

**Figure 3-42** Synchronizing IAM users

## Modifying Service Parameters

1. On the MRS cluster details page, click **Components**.

**Figure 3-43** Components tab page

| Name      | Version    | Operating Status | Health Status |
|-----------|------------|------------------|---------------|
| Hadoop    | 3.1.1      |                  |               |
| Spark2x   | 2.4.5      | Started          | Faulty        |
| HBase     | 2.2.3      | Started          | Good          |
| Hive      | 3.1.0      | Started          | Faulty        |
| Hue       | 4.7.0      | Started          | Good          |
| Kafka     | 2.11-2.4.0 | Started          | Good          |
| Flume     | 1.9.0      | Started          | Good          |
| Flink     | 1.12.0     | Started          | Good          |
| Oozie     | 5.1.0      | Started          | Faulty        |
| ZooKeeper | 3.5.6      | Started          | Good          |

2. Select the target service from the service list.
3. Click **Service Configuration**.
4. Switch **Basic** to **All**. All configuration parameters of the service are displayed in the navigation tree. The service name and role names are displayed from upper to lower in the navigation tree.
5. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

If you want to cancel the modification of a parameter value, click  to restore it.

6. Click **Save Configuration**, save the parameters as prompted, and restart the service.

 **NOTE**

In versions earlier than MRS 3.x, to update the queue configuration of YARN without restarting the service, choose **More > Refresh Queue** on the **Service Status** tab page.

## 3.7.5 Configuring Customized Service Parameters

Each component of MRS supports all open-source parameters. MRS supports the modification of some parameters for key application scenarios. Some component clients may not include all parameters with open-source features. To modify the component parameters that are not directly supported by MRS, you can add new parameters for components by using the configuration customization function on MRS. Newly added parameters are saved in component configuration files and take effect after restart.

### Video Tutorial

This video demonstrates how to modify service parameters on the MRS management console or FusionInsight Manager.

#### NOTE

The UI may vary depending on the version. This tutorial is for reference only.

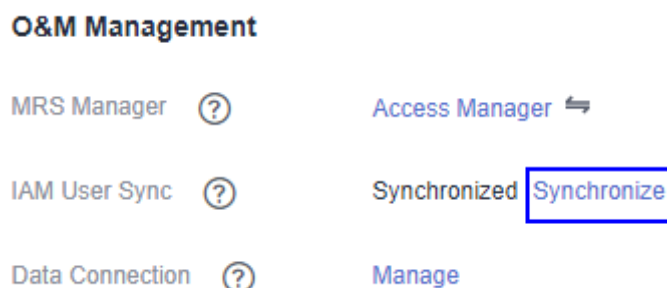

### Impact on the System

- After the service attributes are configured, the service needs to be restarted. The service cannot be accessed during restart.
- You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.

### Prerequisites

- You have understood the meanings of parameters to be added, configuration files that have taken effect, and the impact on components.
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

**Figure 3-44** Synchronizing IAM users

### Procedure

**Step 1** On the MRS cluster details page, click **Components**.

**Figure 3-45** Components tab page

| Name      | Version    | Operating Status | Health Status |
|-----------|------------|------------------|---------------|
| Hadoop    | 3.1.1      |                  |               |
| Spark2x   | 2.4.5      | Started          | Faulty        |
| HBase     | 2.2.3      | Started          | Good          |
| Hive      | 3.1.0      | Started          | Faulty        |
| Hue       | 4.7.0      | Started          | Good          |
| Kafka     | 2.11-2.4.0 | Started          | Good          |
| Flume     | 1.9.0      | Started          | Good          |
| Flink     | 1.12.0     | Started          | Good          |
| Oozie     | 5.1.0      | Started          | Faulty        |
| ZooKeeper | 3.5.6      | Started          | Good          |

**Step 2** Select the target service from the service list.

**Step 3** Click **Service Configuration**.

**Step 4** In the configuration type drop-down box on the right side, switch **Basic** to **All**.

**Figure 3-46** All configurations

| Parameter                      | Value | Parameter File | Description                                                                  |
|--------------------------------|-------|----------------|------------------------------------------------------------------------------|
| dfs.client.delete.toTrash.path |       | hdfs-site.xml  | >[Desc] A comma-delimited list of HDFS paths (i.e. ftp://user/hdfs/files/... |
| dfs.hearbeat.interval          | 10    | hdfs-site.xml  | >[Desc] Determines datanode heartbeat interval in seconds. (Default) 10...   |

**Step 5** In the navigation tree, select **Customization**. The customized parameters of the current component are displayed on MRS.

The configuration files that save the newly added customized parameters are displayed in the **Parameter File** column. Different configuration files may have same open-source parameters. After the parameters in different files are set to different values, whether the configuration takes effect depends on the loading sequence of the configuration files by components. You can customize parameters for services and roles as required. Adding customized parameters for a single role instance is not supported.

**Step 6** Based on the configuration files and parameter functions, locate the row where a specified parameter resides, enter the parameter name supported by the component in the **Parameter** column and enter the parameter value in the **Value** column.

- You can click  or  to add or delete a custom parameter. You can delete a customized parameter only after you click  for the first time.
- If you want to cancel the modification of a parameter value, click  to restore it.

**Step 7** Click **Save Configuration** and operate as prompted.

----End

## Task Example

### Configuring Customized Hive Parameters

Hive depends on HDFS. By default, Hive accesses the HDFS client. The configuration parameters to take effect are controlled by HDFS in a unified manner. For example, the HDFS parameter **ipc.client.rpc.timeout** affects the RPC timeout period for all clients to connect to the HDFS server. If you need to modify the timeout period for Hive to connect to HDFS, you can use the configuration customization function. After this parameter is added to the **core-site.xml** file of Hive, this parameter can be identified by the Hive service and its configuration overwrites the parameter configuration in HDFS.

**Step 1** On the MRS cluster details page, click **Components**.

**Step 2** Choose **Hive** > **Service Configuration**.

**Step 3** In the configuration type drop-down box on the right side, switch **Basic** to **All**.

**Step 4** In the navigation tree on the left, select **Customization** for the Hive service. The system displays the customized service parameters supported by Hive.

**Step 5** In **core-site.xml**, locate the row that contains the **core.site.customized.configs** parameter, enter **ipc.client.rpc.timeout** in the **Parameter** column, and enter a new value in the **Value** column, for example, **150000**. The unit is millisecond.

**Figure 3-47** Configuring custom parameters (using MRS 1.9.2 as an example)

**Step 6** Click **Save Configuration** and operate as prompted.

**Figure 3-48** Saving custom configurations

----End

## 3.7.6 Synchronizing Service Configuration

### Scenario

If **Configuration Status** of some services is **Configuration expired** or **Configuration failed**, synchronize configuration for the cluster or service to restore its configuration status. If all services in the cluster are in the **Configuration failed** state, synchronize the cluster configuration with the background configuration.

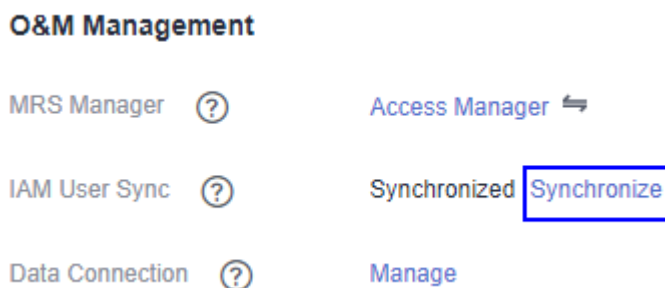

### Impact on the System

After synchronizing service configurations, you need to restart the services whose configurations have expired. These services are unavailable during restart.

### Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

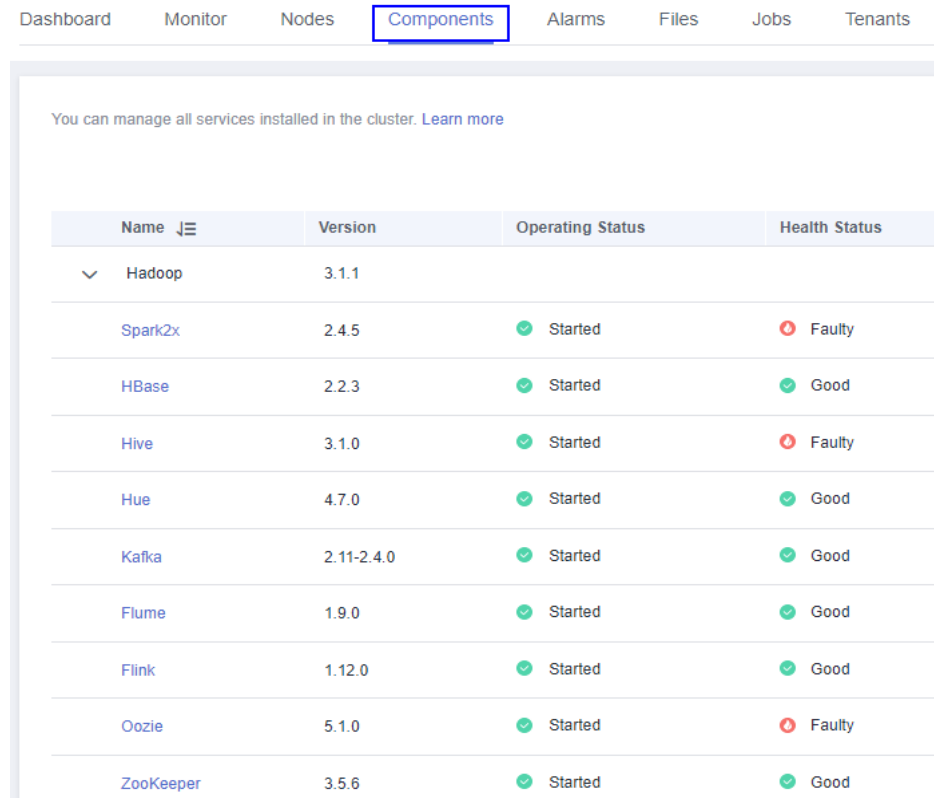

**Figure 3-49** Synchronizing IAM users

### Procedure

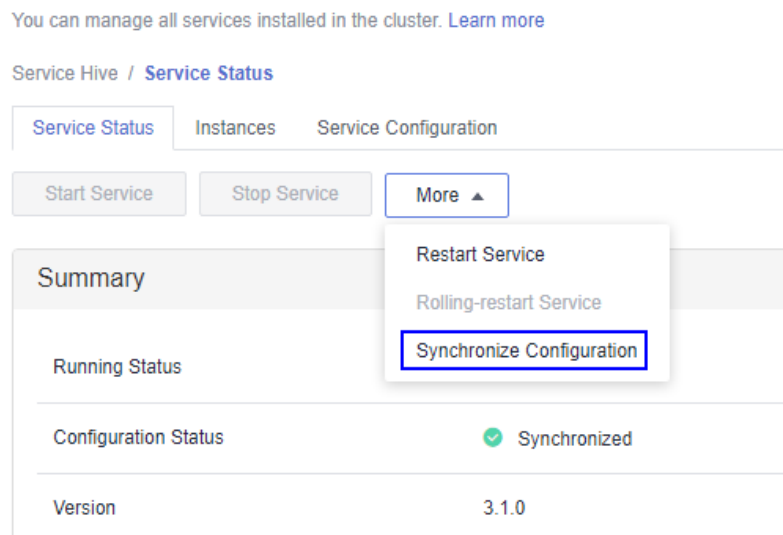

**Step 1** On the MRS cluster details page, click **Components**.

Figure 3-50 Components tab page

**Step 2** Select the target service from the service list.

**Step 3** In the **Service Status** tab, choose **More > Synchronize Configuration** and operate as prompted.

----End

## 3.7.7 Managing Role Instances

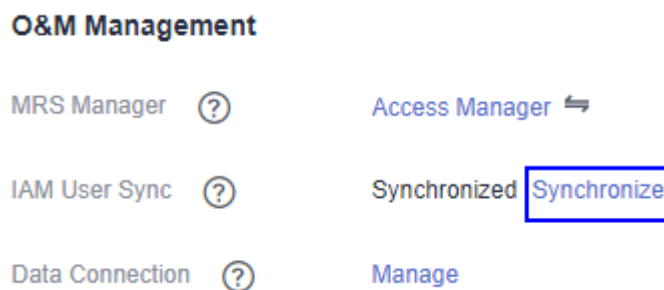

### Scenario

You can start a role instance that is in the **Stopped**, **Failed to stop** or **Failed to start** status, stop an unused or abnormal role instance or restart an abnormal role instance to recover its functions.

### Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

**Figure 3-51** Synchronizing IAM users

### Procedure

**Step 1** On the cluster details page, click the **Components** tab.

Figure 3-52 Components tab page

| Name      | Version    | Operating Status | Health Status |
|-----------|------------|------------------|---------------|
| ▼ Hadoop  | 3.1.1      |                  |               |
| Spark2x   | 2.4.5      | ✔ Started        | ✘ Faulty      |
| HBase     | 2.2.3      | ✔ Started        | ✔ Good        |
| Hive      | 3.1.0      | ✔ Started        | ✘ Faulty      |
| Hue       | 4.7.0      | ✔ Started        | ✔ Good        |
| Kafka     | 2.11-2.4.0 | ✔ Started        | ✔ Good        |
| Flume     | 1.9.0      | ✔ Started        | ✔ Good        |
| Flink     | 1.12.0     | ✔ Started        | ✔ Good        |
| Oozie     | 5.1.0      | ✔ Started        | ✘ Faulty      |
| ZooKeeper | 3.5.6      | ✔ Started        | ✔ Good        |

- Step 2** Select the target service from the service list.
- Step 3** Click the **Instances** tab.
- Step 4** Select the check box on the left of the target role instance.
- Step 5** Click **More**, select operations such as **Start Instance**, **Stop Instance**, **Restart Instance**, **Rolling-restart Instance**, or **Delete Instance** based on site requirements.

| Host Name        | OM IP Address | Business IP Address | Rack              | Operating Status | Health Status | Configuration Status |
|------------------|---------------|---------------------|-------------------|------------------|---------------|----------------------|
| node-master1mbFW | 192.168.0.187 | 192.168.0.187       | /default/rack14F5 | ✔ Started        | ✔ Good        | ✔ Synchronized       |
| node-master2bQy  | 192.168.0.82  | 192.168.0.82        | /default/rack14F5 | ✔ Started        | ✔ Good        | ✔ Synchronized       |

----End

### 3.7.8 Configuring Role Instance Parameters

#### Scenario

You can view and modify default role instance configuration on MRS based on site requirements. The configurations can be imported and exported.

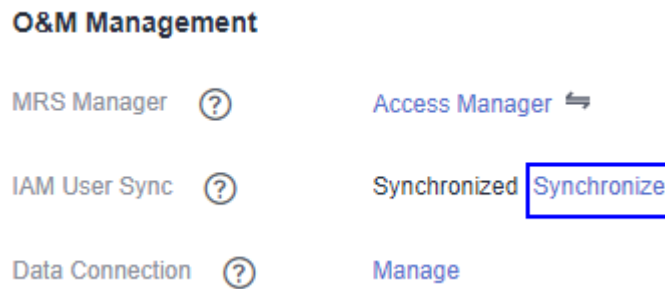

#### Impact on the System

You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.

## Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

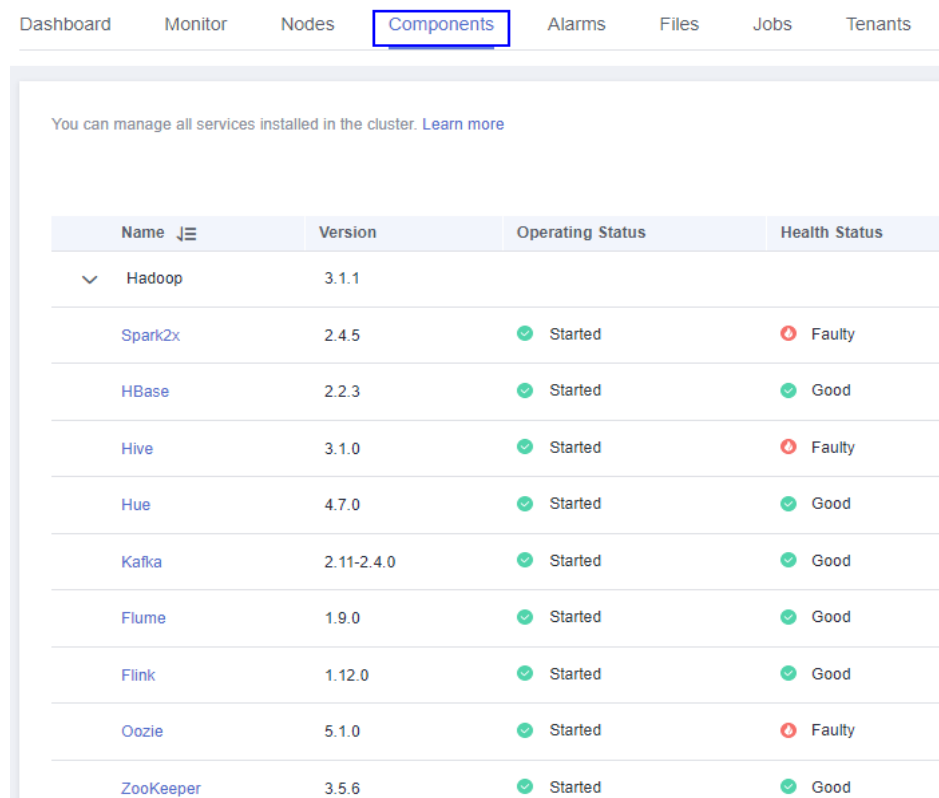

**Figure 3-53** Synchronizing IAM users

## Modifying Role Instance Parameters

1. On the cluster details page, click the **Components** tab.

**Figure 3-54** Components tab page

2. Select the target service from the service list.
3. Click the **Instances** tab.
4. Click the target role instance from the role instance list.
5. Click the **Instance Configuration** tab.

- Switch **Basic** to **All** from the drop-down list on the right of the page. All configuration parameters of the role instance are displayed in the navigation tree.
- In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

If you want to cancel the modification of a parameter value, click  to restore it.

- Click **Save Configuration** and operate as prompted.

### 3.7.9 Synchronizing Role Instance Configuration

#### Scenario

When **Configuration Status** of a role instance is **Configuration expired** or **Configuration failed**, you can synchronize the configuration data of the role instance with the background configuration.

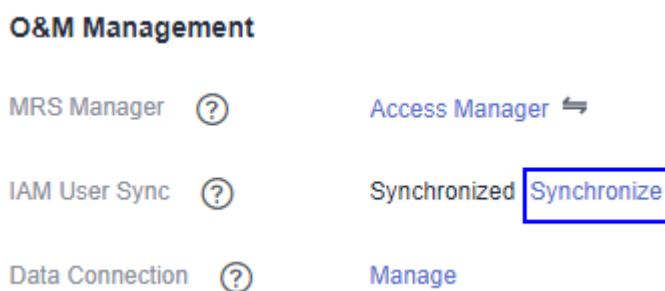

#### Impact on the System

After synchronizing a role instance configuration, you need to restart the role instance whose configuration has expired. The role instance is unavailable during restart.

#### Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

**Figure 3-55** Synchronizing IAM users

#### Procedure

- Step 1** On the cluster details page, click the **Components** tab.

Figure 3-56 Components tab page

| Name      | Version    | Operating Status | Health Status |
|-----------|------------|------------------|---------------|
| Hadoop    | 3.1.1      |                  |               |
| Spark2x   | 2.4.5      | Started          | Faulty        |
| HBase     | 2.2.3      | Started          | Good          |
| Hive      | 3.1.0      | Started          | Faulty        |
| Hue       | 4.7.0      | Started          | Good          |
| Kafka     | 2.11-2.4.0 | Started          | Good          |
| Flume     | 1.9.0      | Started          | Good          |
| Flink     | 1.12.0     | Started          | Good          |
| Oozie     | 5.1.0      | Started          | Faulty        |
| ZooKeeper | 3.5.6      | Started          | Good          |

**Step 2** Select a service name.

**Step 3** Click the **Instances** tab.

**Step 4** Click the target role instance from the role instance list.

**Step 5** Click **More** and select **Synchronize Configuration** above the role instance status and indicator information.

**Step 6** In the dialog box that is displayed, select **Restart the service or instances whose configurations have expired** and click **Yes** to restart the role instance.

----End

### 3.7.10 Decommissioning and Recommissioning a Role Instance

#### Scenario

If a Core or Task node is faulty, the cluster status may be displayed as **Abnormal**. In an MRS cluster, data can be stored on different Core nodes. You can decommission the specified role instance on MRS to stop the role instance from providing services. After fault rectification, you can recommission the role instance.

The following role instances can be decommissioned or recommissioned:

- DataNode role instance on HDFS
- NodeManager role instance on Yarn
- RegionServer role instance on HBase
- ClickHouseServer role instance on ClickHouse

 **NOTE**

ClickHouseServer role instances can be decommissioned only in MRS 3.1.2 or later.

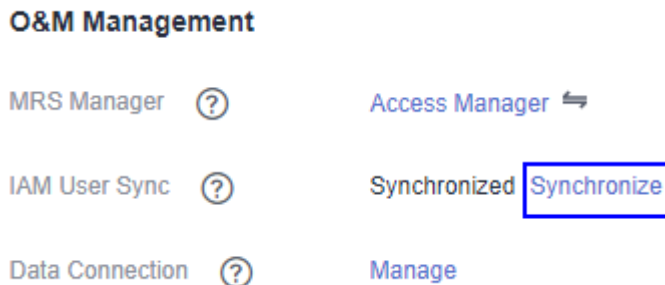

Restrictions:

- If the number of the DataNodes is less than or equal to that of HDFS copies, decommissioning cannot be performed. If the number of HDFS copies is three and the number of DataNodes is less than four in the system, decommissioning cannot be performed. In this case, an error will be reported and force MRS to exit the decommissioning 30 minutes after MRS attempts to perform the decommissioning.
- If a role instance is out of service, you must recommission the instance to start it before using it again.

## Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

**Figure 3-57** Synchronizing IAM users

## Procedure

**Step 1** On the cluster details page, click the **Components** tab.

Figure 3-58 Components tab page

| Name      | Version    | Operating Status | Health Status |
|-----------|------------|------------------|---------------|
| Hadoop    | 3.1.1      |                  |               |
| Spark2x   | 2.4.5      | Started          | Faulty        |
| HBase     | 2.2.3      | Started          | Good          |
| Hive      | 3.1.0      | Started          | Faulty        |
| Hue       | 4.7.0      | Started          | Good          |
| Kafka     | 2.11-2.4.0 | Started          | Good          |
| Flume     | 1.9.0      | Started          | Good          |
| Flink     | 1.12.0     | Started          | Good          |
| Oozie     | 5.1.0      | Started          | Faulty        |
| ZooKeeper | 3.5.6      | Started          | Good          |

**Step 2** Click a service in the service list.

**Step 3** Click the **Instances** tab.

**Step 4** Select an instance.

**Step 5** Choose **More > Decommission** or **Recommission** to perform the corresponding operation.

| Host Name        | CIM IP Address | Business IP Address | Rack            | Operating Status | Health Status | Configuration Status |
|------------------|----------------|---------------------|-----------------|------------------|---------------|----------------------|
| node-master1m0Pw | 192.168.0.187  | 192.168.0.187       | /Mfaust/rack145 | Started          | Good          | Synchronized         |
| node-master2B0Y  | 192.168.0.82   | 192.168.0.82        | /Mfaust/rack145 | Started          | Good          | Synchronized         |

**NOTE**

During the instance decommissioning, if the service corresponding to the instance is restarted in the cluster using another browser, MRS displays a message indicating that the instance decommissioning is stopped, but the **Operating Status** of the instance is displayed as **Started**. In this case, the instance has been decommissioned on the background. You need to decommission the instance again to synchronize the operating status.

----End

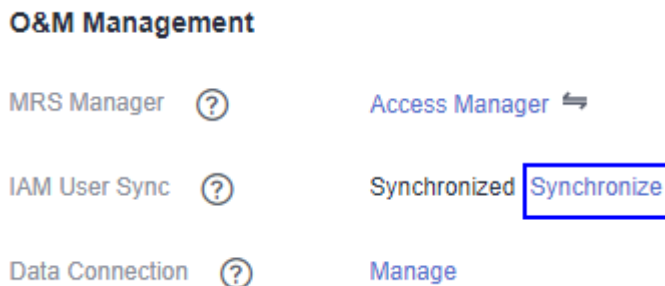

### 3.7.11 Starting and Stopping a Cluster

A cluster is a collection of service components. You can start or stop all services in a cluster.

## Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

**Figure 3-59** Synchronizing IAM users

## Procedure

On the cluster details page, choose **Management Operations** > **Start All Components** or **Stop All Components** in the upper right corner to perform the required operation.

## 3.7.12 Synchronizing Cluster Configuration

### Scenario

If **Configuration Status** of all services or some services is **Configuration expired** or **Configuration failed**, synchronize configuration for the cluster or service to restore its configuration status.

- If all services in the cluster are in the **Configuration failed** status, synchronize the cluster configuration with the background configuration.
- If all services in the cluster are in the **Configuration failed** status, synchronize the service configuration with the background configuration.

#### NOTE

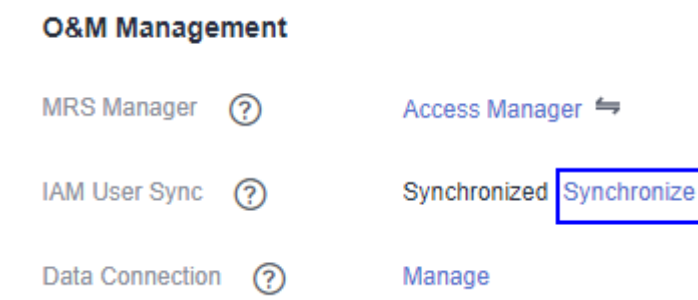

In **MRS 3.x**, you cannot perform operations in this section on the management console.

## Impact on the System

After synchronizing cluster configurations, you need to restart the services whose configurations have expired. These services are unavailable during restart.

## Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

**Figure 3-60** Synchronizing IAM users

## Procedure

- Step 1** On the cluster details page, choose **Configuration > Synchronize Configuration** in the upper right corner.

**Figure 3-61** Synchronizing configurations (using MRS 1.9.2 as an example)

- Step 2** In the displayed dialog box, select **Restart services and instances whose configuration have expired**, and click **OK** to restart the service whose configuration has expired.

When **Operation successful** is displayed, click **Finish**. The cluster is started successfully.

----End

## 3.7.13 Exporting Cluster Configuration

### Scenario

You can export all configuration data of a cluster using MRS to meet site requirements. The exported configuration data is used to rapidly update service configuration.

#### NOTE

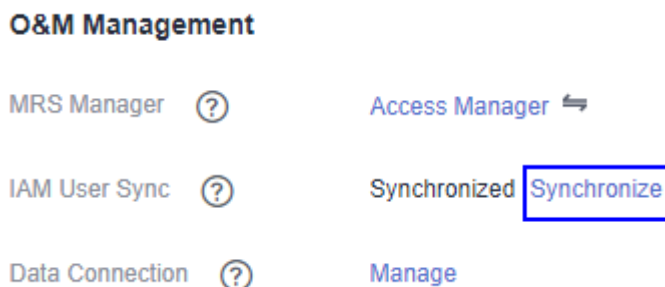

In **MRS 3.x**, you cannot perform operations in this section on the management console.

### Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

**Figure 3-62** Synchronizing IAM users

## Procedure

On the cluster details page, choose **Configuration > Export Cluster Configuration** in the upper right corner.

**Figure 3-63** Exporting cluster configurations (using MRS 1.9.2 as an example)

The exported file is used to update service configurations. For details, see **Importing Service Configuration Parameters** in [Configuring Service Parameters](#).

## 3.7.14 Performing Rolling Restart

After modifying the configuration items of a big data component, you need to restart the corresponding service to make new configurations take effect. If you use a normal restart mode, all services or instances are restarted concurrently, which may cause service interruption. To ensure that services are not affected during service restart, you can restart services or instances in batches by rolling restart. For instances in active/standby mode, a standby instance is restarted first and then an active instance is restarted. Rolling restart takes longer than normal restart.

**Table 3-54** provides services and instances that support or do not support rolling restart in the MRS cluster.

**Table 3-54** Services and instances that support or do not support rolling restart

| Service    | Instance           | Support Rolling Restart |
|------------|--------------------|-------------------------|
| Alluxio    | AlluxioJobMaster   | Yes                     |
|            | AlluxioMaster      |                         |
| ClickHouse | ClickHouseServer   | Yes                     |
|            | ClickHouseBalancer |                         |
| CDL        | CDLConnector       | Yes                     |

| Service    | Instance      | Support Rolling Restart |
|------------|---------------|-------------------------|
|            | CDLService    |                         |
| Flink      | FlinkResource | No                      |
|            | FlinkServer   |                         |
| Flume      | Flume         | Yes                     |
|            | MonitorServer |                         |
| Guardian   | TokenServer   | Yes                     |
| HBase      | HMaster       | Yes                     |
|            | RegionServer  |                         |
|            | ThriftServer  |                         |
|            | RETSerVer     |                         |
| HetuEngine | HSBroker      | Yes                     |
|            | HSConsole     |                         |
|            | HSFabric      |                         |
|            | QAS           |                         |
| HDFS       | NameNode      | Yes                     |
|            | Zkfc          |                         |
|            | JournalNode   |                         |
|            | HttpFS        |                         |
|            | DataNode      |                         |
| Hive       | MetaStore     | Yes                     |
|            | WebHCat       |                         |
|            | HiveServer    |                         |
| Hue        | Hue           | No                      |
| Impala     | Impalad       | No                      |
|            | StateStore    |                         |
|            | Catalog       |                         |
| IoTDB      | IoTDBServer   | Yes                     |
| Kafka      | Broker        | Yes                     |
|            | KafkaUI       | No                      |
| Kudu       | KuduTserver   | Yes                     |

| Service   | Instance         | Support Rolling Restart |
|-----------|------------------|-------------------------|
|           | KuduMaster       |                         |
| Loader    | Sqoop            | No                      |
| MapReduce | JobHistoryServer | Yes                     |
| Oozie     | oozie            | No                      |
| Presto    | Coordinator      | Yes                     |
|           | Worker           |                         |
| Ranger    | RangerAdmin      | Yes                     |
|           | UserSync         |                         |
|           | TagSync          |                         |
| Spark     | JobHistory       | Yes                     |
|           | JDBCServer       |                         |
|           | SparkResource    |                         |
| Storm     | Nimbus           | Yes                     |
|           | UI               |                         |
|           | Supervisor       |                         |
|           | Logviewer        |                         |
| Tez       | TezUI            | No                      |
| Yarn      | ResourceManager  | Yes                     |
|           | NodeManager      |                         |
| Zookeeper | Quorumpeer       | Yes                     |

## Restrictions

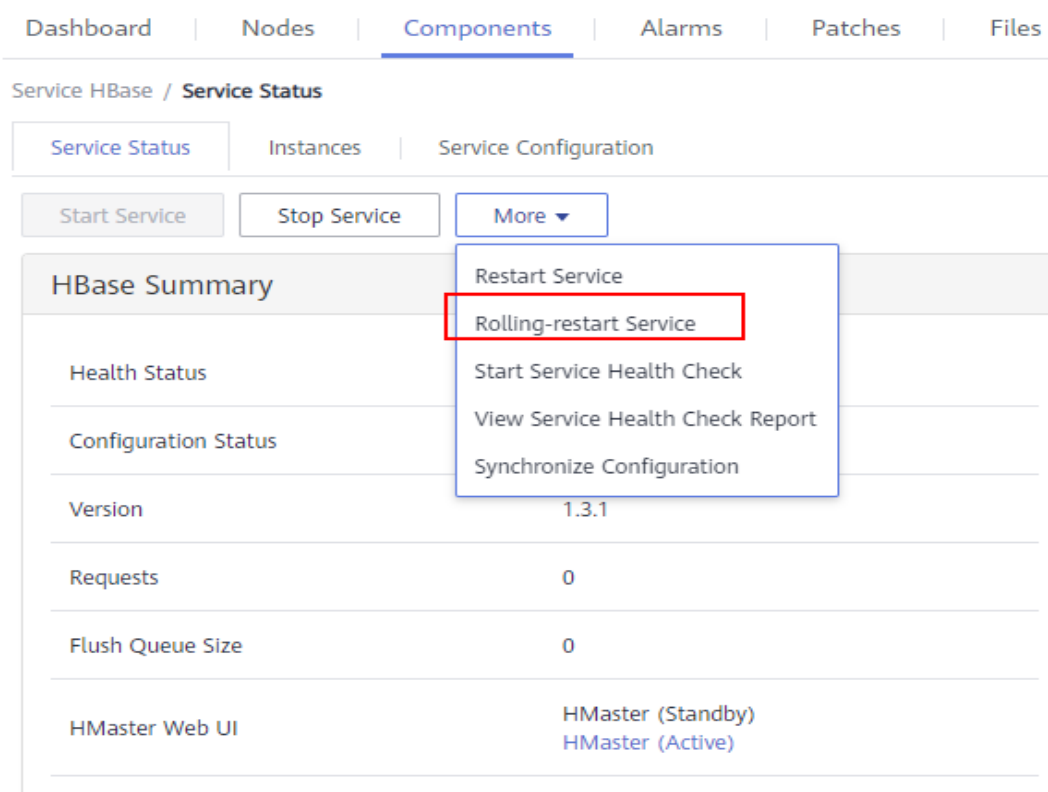

- Perform a rolling restart during off-peak hours.
  - Otherwise, a rolling restart failure may occur. For example, if the throughput of Kafka is high (over 100 MB/s) during the Kafka rolling restart, the Kafka rolling restart may fail.
  - For example, if the requests per second of each RegionServer on the native interface exceed 10,000 during the HBase rolling restart, you need to increase the number of handles to prevent a RegionServer restart failure caused by heavy loads during the restart.
- Before the restart, check the number of current requests of HBase. If the number of requests of each RegionServer on the native interface exceeds 10,000, increase the number of handles to prevent a failure.
- If the number of Core nodes in a cluster is less than six, services may be affected for a short period of time.

- Preferentially perform a rolling instance or service restart and select **Only restart instances whose configurations have expired**.

## Performing a Rolling Service Restart

- Step 1** Choose **Active Clusters** and click a cluster name to go to the cluster details page.
- Step 2** Click **Components** and select a service for which you want to perform a rolling restart.
- Step 3** On the **Service Status** tab page, click **More** and select **Rolling-restart Service**.

**Figure 3-64** Service status (MRS 1.9.2 is used as an example)

- Step 4** The **Rolling-restart Service** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the service.

**Figure 3-65** Performing a rolling service restart

## Rolling Restart Parameter Description

[Table 3-55](#) describes rolling restart parameters.

**Table 3-55** Rolling restart parameter description

| Parameter                                                | Description                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Only restart instances whose configurations have expired | Specifies whether to restart only the modified instances in a cluster.                                                                                                                                                                                                                                                                                                                            |
| Enable rack strategy                                     | Whether to enable the concurrent rack rolling restart strategy. This parameter takes effect only for roles that meet the rack rolling restart strategy. (The roles support rack awareness, and instances of the roles belong to two or more racks.)<br><b>NOTE</b><br>This parameter is configurable only when a rolling restart is performed on HDFS and YARN in MRS 3.x or later.               |
| Data Node Instances to Be Batch Restarted                | Specifies the number of instances that are restarted in each batch when the batch rolling restart strategy is used. The default value is <b>1</b> . The value ranges from 1 to 20. This parameter is valid only for data nodes.                                                                                                                                                                   |
| Batch Interval                                           | Specifies the interval between two batches of instances for rolling restart. The default value is <b>0</b> . The value ranges from 0 to 2147483647. The unit is second.<br><br>Note: Setting the batch interval parameter can increase the stability of the big data component process during the rolling restart. You are advised to set this parameter to a non-default value, for example, 10. |
| Decommissioning Timeout Interval                         | Decommissioning interval for role instances during a rolling restart.                                                                                                                                                                                                                                                                                                                             |
| Batch Fault Tolerance Threshold                          | Specifies the tolerance times when the rolling restart of instances fails to be executed in batches. The default value is <b>0</b> , which indicates that the rolling restart task ends after any batch of instances fails to be restarted. The value ranges from 0 to 2147483647.                                                                                                                |

## Procedure in a Typical Scenario

**Step 1** Choose **Active Clusters** and click a cluster name to go to the cluster details page.

**Step 2** Click **Components** and select **HBase**. The **HBase** service page is displayed.

**Step 3** Click the **Service Configuration** tab, modify an HBase parameter, and save the configuration as prompted.

 **NOTE**

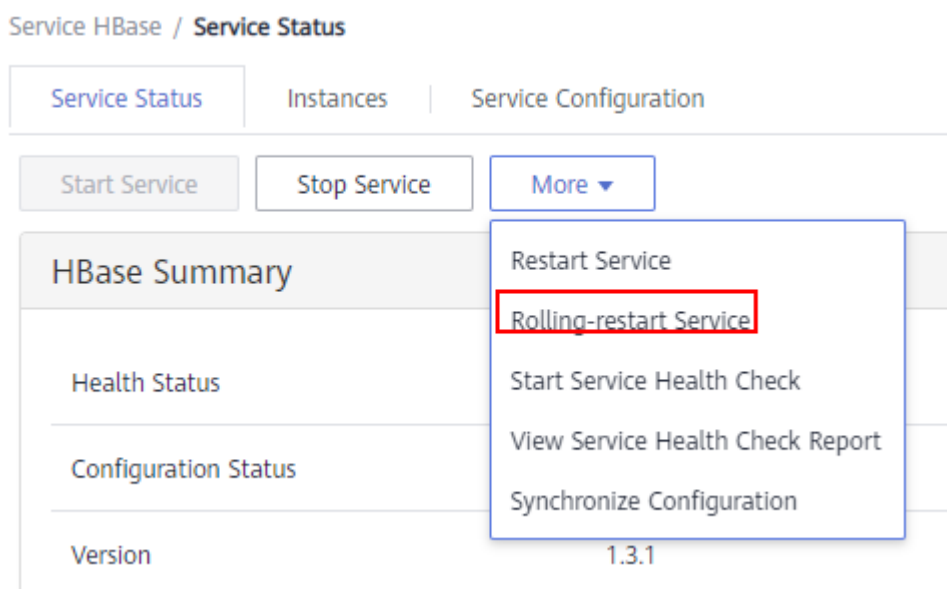

In versions earlier than MRS 3.x, do not select **Restart the affected services or instances**. This option indicates a normal restart. If you select this option, all services or instances will be restarted, which may cause service interruption.

**Step 4** After saving the configurations, click **Finish**.

**Step 5** Click the **Service Status** tab.

**Step 6** On the **Service Status** tab page, click **More** and select **Rolling-restart Service**.

**Figure 3-69** Service status - rolling restart (using MRS 1.9.2 as an example)

**Step 7** After you enter the administrator password, the **Rolling-restart Service** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart.

**Figure 3-70** Configuring the rolling service restart

### Rolling-restart Service

 The service has been stopped, perform rolling the service restart?

## 3.8 Alarm Management

### 3.8.1 Viewing the Alarm List

The alarm list displays all alarms in the MRS cluster. The MRS page displays the alarms that need to be handled in a timely manner and the events.

On the MRS management console, you can only query basic information about uncleared MRS alarms on the **Alarms** tab page. For details about how to view alarm details or manage alarms, see [Viewing and Manually Clearing an Alarm](#).

Alarms are listed in chronological order by default in the alarm list, with the most recent alarms displayed at the top.

#### Video Tutorial

This tutorial introduces how to view cluster alarms and events and configure an alarm threshold.

 **NOTE**

The UI may vary depending on the version. This tutorial is for reference only.

#### Alarm Fields

[Table 3-56](#) describes various fields in an alarm.

**Table 3-56** Alarm description

| Parameter  | Description       |
|------------|-------------------|
| Alarm ID   | ID of an alarm.   |
| Alarm Name | Name of an alarm. |

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Severity  | <p>Alarm severity.</p> <p>In versions earlier than MRS 3.x, the cluster alarm severity is as follows:</p> <ul style="list-style-type: none"> <li>• <b>Critical</b><br/>Indicates alarms reporting errors that affect cluster running, such as unavailable cluster services, node faults, data inconsistency between the active and standby GaussDB databases, and abnormal LdapServer data synchronization. You need to check the cluster status based on the alarms and rectify the faults in a timely manner.</li> <li>• <b>Major</b><br/>Indicates alarms reporting errors that affect some cluster functions, including process faults, periodic backup task failures, and abnormal key file permissions. Check the objects for which the alarms are generated based on the alarms and clear the alarms in a timely manner.</li> <li>• <b>Minor</b><br/>Indicates alarms reporting errors that do not affect major functions of the current cluster, including alarms indicating that the certificate file is about to expire, audit logs fail to be dumped, and the license file is about to expire.</li> <li>• <b>Warning</b><br/>Indicates an alarm of the lowest severity. It is used for information display or prompt and indicates that an event occurs in the scenarios when you stop a service, delete a service, stop an instance, delete an instance, delete a node, restart a service, restart an instance, perform an active/standby switchover for MRS Manager, scale in a host, or restore an instance. Additionally, this type of alarms also occurs when an instance is faulty, a job executed successfully, or a job failed to be executed.</li> </ul> <p>In MRS 3.x or later, the alarm severity of a cluster is as follows:</p> <ul style="list-style-type: none"> <li>• <b>Critical</b><br/>Indicates alarms reporting errors that affect cluster running, such as unavailable cluster services, node faults, data inconsistency between the active and standby GaussDB databases, and abnormal LdapServer data synchronization. ## 3.8.2 Viewing the Event List

The event list displays information about all events in a cluster, such as service restart and service termination.

Events are listed in the event list in chronological order by default, with the most recent events displayed at the top.

### NOTE

You can view the event list of an MRS 2.x or later cluster when IAM user synchronization is complete.

**Table 3-58** describes various fields for an event.

**Table 3-58** Event description

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Event ID       | Specifies the ID of an event.                                                                                                                                                                                                                                                                                                                                                                              |
| Event Severity | Specifies the event severity.<br>In versions earlier than MRS 3.x, the cluster event level is as follows: <ul style="list-style-type: none"><li>• Critical</li><li>• Major</li><li>• Minor</li><li>• Suggestion</li></ul> In MRS 3.x or later, the event level of a cluster is as follows: <ul style="list-style-type: none"><li>• Critical</li><li>• Major</li><li>• Minor</li><li>• Suggestion</li></ul> |
| Event Name     | Name of the generated event.                                                                                                                                                                                                                                                                                                                                                                               |
| Generated      | Time when the event is generated.                                                                                                                                                                                                                                                                                                                                                                          |
| Location       | Specifies the detailed information for locating the event,                                                                                                                                                                                                                                                                                                                                                 |

**Table 3-59** Icon description

| Icon                                                                                | Description                                                                                                                                                                                         |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Select an interval for refreshing the event list from the drop-down list. <ul style="list-style-type: none"><li>• Refresh every 30s</li><li>• Refresh every 60s</li><li>• Stop refreshing</li></ul> |

| Icon                                                                              | Description                                                                                                                                                                                                     |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Click  to manually refresh the event list.                                                                                     |
| Advanced Search                                                                   | Click <b>Advanced Search</b> . In the displayed event search area, set search criteria and click <b>Search</b> to view the information about specified events. Click <b>Reset</b> to clear the search criteria. |

## Exporting events

**Step 1** Choose **Active Clusters** and click a cluster name to go to the cluster details page.

**Step 2** Click **Alarm Management > Events**.

**Step 3** Click **Export All**.

**Step 4** In the displayed dialog box, select the type and click **OK**.

----End

## Common Events

**Table 3-60** Common events

| Event ID | Event Name                     |
|----------|--------------------------------|
| 12019    | Stop Service                   |

## 3.8.3 Viewing and Manually Clearing an Alarm

### Scenario

You can view and clear alarms on MRS.

Generally, the system automatically clears an alarm when the fault is rectified. If the fault has been rectified and the alarm cannot be automatically cleared, you can manually clear the alarm.

You can view the latest 100,000 alarms (including uncleared, manually cleared, and automatically cleared alarms) on MRS. If the number of cleared alarms exceeds 100,000 and is about to reach 110,000, the system automatically dumps the earliest 10,000 cleared alarms to the dump path.

3. In versions earlier than x, the value is the same as that of `${BIGDATA_HOME}/OMSV100R001C00x8664/workspace/data` for the active management node.

(For 3.x and later versions) The path is `${BIGDATA_HOME}/om-server/OMS/workspace/data` of the active management node.

A directory is automatically generated when alarms are dumped for the first time.

#### NOTE

Set an automatic refresh interval or click  for an immediate refresh.

The following refresh interval options are supported:

- Refresh every 30 seconds
- Refresh every 60 seconds
- Stop refreshing

### Procedure

**Step 1** Choose **Active Clusters** and click a cluster name to go to the cluster details page.

**Step 2** Click **Alarms** and view the alarm information in the alarm list.

- By default, the alarm list page displays the latest 10 alarms.
- By default, data is sorted in descending order based on the generation time. For MRS 3.x or earlier, you can click the alarm ID, severity, and generation time to modify the sorting mode. For clusters of MRS 3.x or later, you can click the severity and generation time to modify the sorting mode.
- You can filter all alarms of the same severity. The results include cleared and uncleared alarms.
- For clusters of MRS 3.x and earlier versions, you can click , , , or  in the upper right corner of the page to quickly filter **Critical**, **Major**, **Minor**, or **Suggestion** alarms that are uncleared.
- For clusters of MRS 3.x or later: You can click , , , or  in the upper right corner of the page to quickly filter uncleared **Critical**, **Major**, **Minor** or **Warning** alarms.

**Step 3** Click **Advanced Search**. In the displayed alarm search area, set search criteria and click **Search** to view the information about specified alarms. You can click **Reset** to clear the search criteria.

 **NOTE**

The start time and end time are specified in **Time Range**. You can search for alarms generated within the time range.

Handle the alarm by referring to **Alarm Reference**. If the alarms in some scenarios are generated due to other cloud services that MRS depends on, you need to contact maintenance personnel of the corresponding cloud services.

**Step 4** Click **Clear Alarm** if you need to. In the displayed dialog box, click **OK**.

 **NOTE**

If multiple alarms have been handled, you can select one or more alarms to be cleared and click **Clear Alarm** to clear the alarms in batches. A maximum of 300 alarms can be cleared in each batch.

----End

## Exporting Alarms

**Step 1** Choose **Active Clusters** and click a cluster name to go to the cluster details page.

**Step 2** Click **Alarm Management > Alarms**.

**Step 3** Click **Export All**.

**Step 4** In the displayed dialog box, select the type and click **OK**.

----End

## 3.9 Patch Management

### 3.9.1 Installing an Online Patch

Install the cluster version patch as required if you obtain patch information from:

- The message center service
- On a cluster details page of the MRS console, choose **Patches > Cluster Component Patches** to view the patches that can be installed.

## Preparing for Patch Installation

---

**⚠ CAUTION**

- For details about how to check the cluster status, see section [Performing a Health Check](#). Exceptions such as cluster node faults and hard disk faults may cause patch installation and uninstallation failures. Before you install or uninstall the patch, ensure that the cluster is healthy.
  - Click **Patches** then **Cluster Component Patches**, view the **Patch Description** column of the target patch, and read the patch description carefully to understand the patch installation procedure and impact.
  - MRS 2.x and earlier versions, MRS 3.1.5 and later versions, and MRS 3.2.0-LTS and later versions support online patch installation.
- 

## Installing a Patch

- Step 1** Log in to the MRS management console.
- Step 2** On the **Active Clusters** page displayed by default, click the name of the target cluster to enter the cluster details page.
- Step 3** In the **Patches** tab, click **Cluster Component Patches**. In the operation list, click **Install** next to the patch you want to install.
- Step 4** In the displayed dialog box, select **I have read Patch Description and understood that this operation may restart services**. Click **Yes** and wait until the patch is successfully installed.
- Step 5** Check the patch status. Restart the components and install the client patch according to the patch description.

**📖 NOTE**

If there is an isolated host in the cluster, the patch will not be installed on the isolated host. In this case, when the installation completes, the patch is partially installed. After an isolated node is restored and the isolation is canceled, you can install the patch again. In this case, the patch is installed only on the node where isolation is canceled. For versions earlier than MRS 3.x, perform operations by referring to [Restoring Patches for the Isolated Hosts](#).

----End

## Uninstalling a Patch

- Step 1** Log in to the MRS management console.
- Step 2** On the **Active Clusters** page displayed by default, click the name of the target cluster to enter the cluster details page.
- Step 3** In the **Patches** tab, click **Cluster Component Patches**. In the operation list, click **Uninstall** next to the patch you want to uninstall.
- Step 4** In the displayed dialog box, select the confirmation check box and click **Yes**. Wait until the patch is successfully uninstalled.

**Step 5** Restart the component and uninstall the client patch according to the patch description.

 **NOTE**

If there is an isolated host in the cluster, the patch will not be uninstalled on the isolated host. In this case, when the uninstallation completes, the patch is partially uninstalled. After the isolated node is restored and the isolation is canceled, you can uninstall the patch again. In this case, the patch is uninstalled only on the node whose isolation is canceled. For versions earlier than MRS 3.x, perform operations by referring to [Restoring Patches for the Isolated Hosts](#).

----End

### 3.9.2 Installing a Rolling Patch

The rolling patch function indicates that patches are installed or uninstalled for one or more services in a cluster by performing a rolling service restart (restarting services or instances in batches), without interrupting the services or within a minimized service interruption interval. Services in a cluster are divided into the following three types based on whether they support rolling patch:

- Services supporting rolling patch installation or uninstallation: All businesses or part of them (varying depending on different services) of the services are not interrupted during patch installation or uninstallation.
- Services not supporting rolling patch installation or uninstallation: Businesses of the services are interrupted during patch installation or uninstallation.
- Services with some roles supporting rolling patch installation or uninstallation: Some businesses of the services are not interrupted during patch installation or uninstallation.

 **NOTE**

In **MRS 3.x**, you cannot perform operations in this section on the management console.

**Table 3-61** provides services and instances that support or do not support rolling restart in the MRS cluster.

**Table 3-61** Services and instances that support or do not support rolling restart

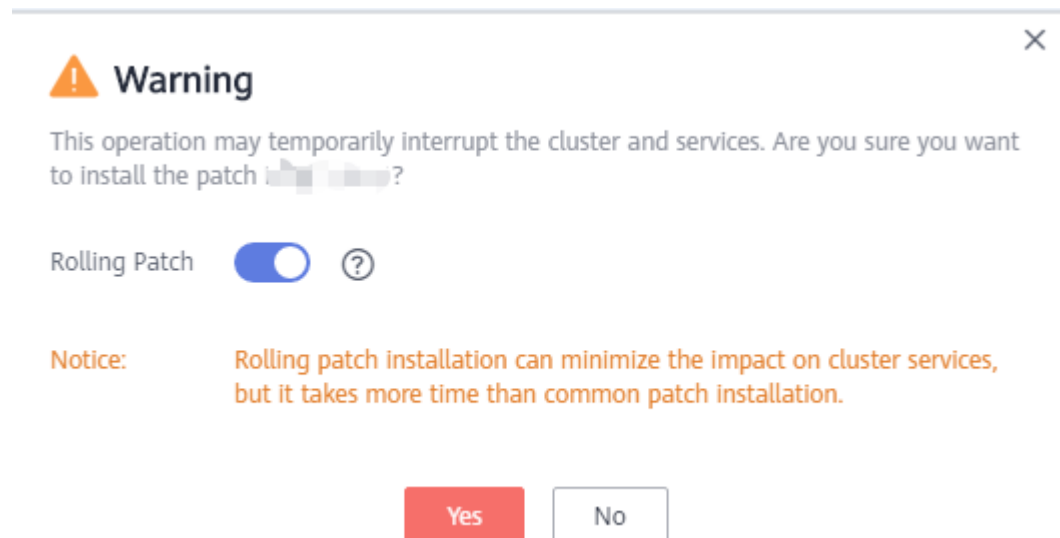

| Service    | Instance           | Support Rolling Restart |
|------------|--------------------|-------------------------|
| Alluxio    | AlluxioJobMaster   | Yes                     |
|            | AlluxioMaster      |                         |
| ClickHouse | ClickHouseServer   | Yes                     |
|            | ClickHouseBalancer |                         |
| CDL        | CDLConnector       | Yes                     |
|            | CDLService         |                         |
| Flink      | FlinkResource      | No                      |
|            | FlinkServer        |                         |

| Service    | Instance         | Support Rolling Restart |
|------------|------------------|-------------------------|
| Flume      | Flume            | Yes                     |
|            | MonitorServer    |                         |
| Guardian   | TokenServer      | Yes                     |
| HBase      | HMaster          | Yes                     |
|            | RegionServer     |                         |
|            | ThriftServer     |                         |
|            | RETSerVer        |                         |
| HetuEngine | HSBroker         | Yes                     |
|            | HSConsole        |                         |
|            | HSFabric         |                         |
|            | QAS              |                         |
| HDFS       | NameNode         | Yes                     |

| Tez       | TezUI           | No                      |
| Yarn      | ResourceManager | Yes                     |
|           | NodeManager     |                         |
| Zookeeper | Quorumpeer      | Yes                     |

## Installing a Rolling Patch

- Step 1** Log in to the MRS console.
- Step 2** On the **Active Clusters** page displayed by default, click the name of the target cluster to enter the cluster details page.
- Step 3** On the **Patches** page, click **Install** in the **Operation** column.
- Step 4** On the **Warning** page, enable or disable **Rolling Patch**.

**Figure 3-72** Rolling patch installation**NOTE**

- Enabling the rolling patch installation function: Services are not stopped before patch installation, and rolling service restart is performed after the patch installation. This minimizes the impact on cluster services but takes more time than common patch installation.
- Disabling the rolling patch uninstallation function: All services are stopped before patch uninstallation, and all services are restarted after the patch uninstallation. This temporarily interrupts the cluster and the services but takes less time than rolling patch uninstallation.
- The rolling patch installation function is not available in clusters with less than two Master nodes and three Core nodes.

**Step 5** Click **Yes** to install the target patch.

**Step 6** View the patch installation progress.

1. Access MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).
2. Choose **System > Manage Patch**. On the **Manage Patch** page, you can view the patch installation progress.

**NOTE**

For the isolated host nodes in the cluster, follow instructions in [Restoring Patches for the Isolated Hosts](#) to restore the patch.

----End

## Uninstalling a Rolling Patch

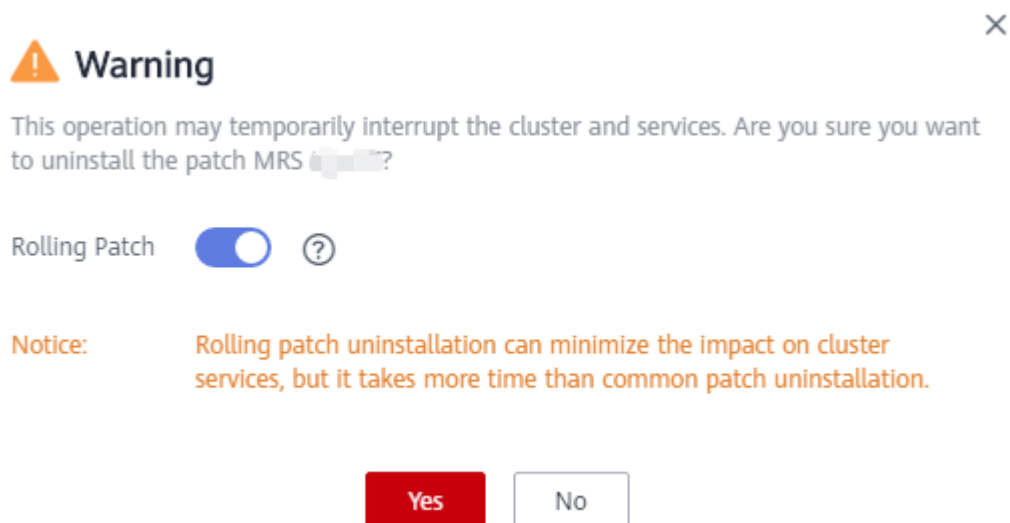

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page displayed by default, click the name of the target cluster to enter the cluster details page.

**Step 3** On the **Patches** page, click **Uninstall** in the **Operation** column.

**Step 4** On the **Warning** page, enable or disable **Rolling Patch**.

**Figure 3-73** Rolling patch uninstallation

**NOTE**

- Enabling the rolling patch uninstallation function: Services are not stopped before patch uninstallation, and rolling service restart is performed after the patch uninstallation. This minimizes the impact on cluster services but takes more time than common patch uninstallation.
- Disabling the rolling patch uninstallation function: All services are stopped before patch uninstallation, and all services are restarted after the patch uninstallation. This temporarily interrupts the cluster and the services but takes less time than rolling patch uninstallation.
- Only patches that are installed in rolling mode can be uninstalled in the same mode.

**Step 5** Click **Yes** to uninstall the target patch.

**Step 6** View the patch uninstallation progress.

1. Access MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).
2. Choose **System > Manage Patch**. On the **Manage Patch** page, you can view the patch uninstallation progress.

**NOTE**

For the isolated host nodes in the cluster, follow instructions in [Restoring Patches for the Isolated Hosts](#) to restore the patch.

----End

### 3.9.3 Restoring Patches for the Isolated Hosts

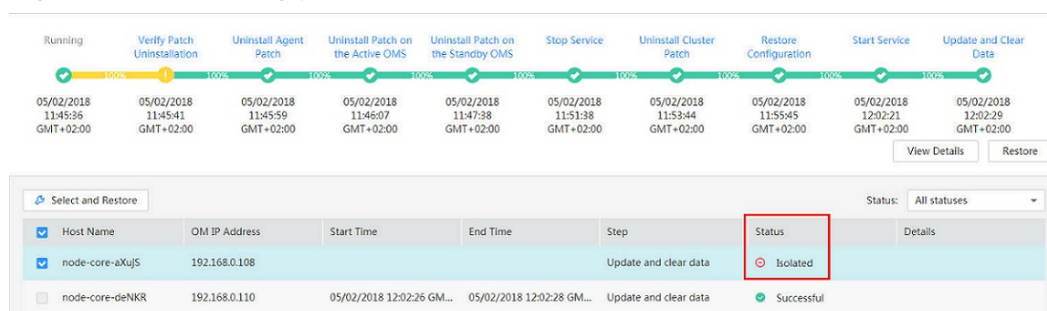

If some hosts are isolated in a cluster, perform the following operations to restore patches for these isolated hosts after patch installation on other hosts in the cluster. After patch restoration, versions of the isolated host nodes are consistent with those are not isolated.

**NOTE**

Operations in this section cannot be performed on the management console of MRS 3.x. This section applies only to versions earlier than 3.x.

- Step 1** Access MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#).
- Step 2** Choose **System > Manage Patch**. The **Manage Patch** page is displayed.
- Step 3** In the **Operation** column, click **View Details**.
- Step 4** On the patch details page, select host nodes whose **Status** is **Isolated**.
- Step 5** Click **Select and Restore** to restore the isolated host nodes.

**Figure 3-74** Restoring patches for the isolated hosts

----End

## 3.9.4 MRS Patch Description

### 3.9.4.1 Fixed the Privilege Escalation Vulnerability of User omm

#### Applicable Version

All MRS versions

#### Resolved Issue

Rectify the issue that user **omm** can use the **installSudoExecute.sh** script to obtain the permission of user **root**.

#### Structure of the Patch Package

- **install.sh**: patch installation script.
- **ips.ini**: stores the IP addresses of all nodes in the cluster. Modify this file based on the actual IP addresses of the nodes in the cluster. Each IP address occupies a line. No blank line is allowed between IP addresses. Leave a blank line at the end of the file.
- **scp-util.exp**: SCP tool script.
- **ssh-util.exp**: SSH tool script.
- **Sudo\_Vulnerability\_20210330**: directory for storing the **sudo\_repair.sh** script. You can copy the directory to the folder for running the script on each node.

- **sudo\_repair.sh**: script for fixing the vulnerability.
- **README.md**: describes how to use the patch tool.

## Installing the Patch

**Step 1** Click the address in the corresponding area of the cluster to download the patch package.

- **CN-Hong Kong**: [https://mrs-container1-patch-ap-southeast-1.obs.ap-southeast-1.myhuaweicloud.com/MRS\\_Common\\_Script/MRS\\_All\\_Sudo\\_Vulnerability\\_20210330.tar.gz](https://mrs-container1-patch-ap-southeast-1.obs.ap-southeast-1.myhuaweicloud.com/MRS_Common_Script/MRS_All_Sudo_Vulnerability_20210330.tar.gz)
- **AP-Bangkok**: [https://mrs-container1-patch-ap-southeast-2.obs.ap-southeast-2.myhuaweicloud.com/MRS\\_Common\\_Script/MRS\\_All\\_Sudo\\_Vulnerability\\_20210330.tar.gz](https://mrs-container1-patch-ap-southeast-2.obs.ap-southeast-2.myhuaweicloud.com/MRS_Common_Script/MRS_All_Sudo_Vulnerability_20210330.tar.gz)
- **AP-Singapore**: [https://mrs-container1-patch-ap-southeast-3.obs.ap-southeast-3.myhuaweicloud.com/MRS\\_Common\\_Script/MRS\\_All\\_Sudo\\_Vulnerability\\_20210330.tar.gz](https://mrs-container1-patch-ap-southeast-3.obs.ap-southeast-3.myhuaweicloud.com/MRS_Common_Script/MRS_All_Sudo_Vulnerability_20210330.tar.gz)

**Step 2** Log in to the active master node of the cluster as the **root** user.

**Step 3** Upload the patch package to **/root/**.

**Step 4** Run the following command to decompress the patch tool package **MRS\_All\_Sudo\_Vulnerability\_20210330.tar.gz** to the current directory (**/root**).

```
tar -zxvf MRS_All_Sudo_Vulnerability_20210330.tar.gz
```

**Step 5** Run the following command to go to the directory where the **ips.ini** file is located.

```
cd /root/MRS_All_Sudo_Vulnerability_20210330/
```

**Step 6** Configure the IP addresses of all nodes in the cluster in the **ips.ini** file. Each IP address occupies a line. No blank line is allowed between IP addresses. Leave a blank line at the end of the file.

**Step 7** Run the following script to install the patch.

After the script is run, you need to enter the correct password of user **root**. If the password is incorrect, the account may be locked for 5 minutes.

```
cd /root/MRS_All_Sudo_Vulnerability_20210330/
```

```
dos2unix ./*
```

```
chmod +x ./* -R
```

```
sh install.sh "install"
```

```
----End
```

## Uninstalling a Patch

Run the following script to uninstall the patch. After the script is run, you need to enter the correct password of user **root**. If the password is incorrect, the account may be locked for 5 minutes during the SSH process of the script.

```
cd /root/MRS_All_Sudo_Vulnerability_20210330/
```

```
sh install.sh "uninstall"
```

### 3.9.4.2 MRS 3.0.5.1 Patch Description

|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                                         |                                                                         |
|-----------------------------------------|-------------------------------------------------------------------------|
| <b>Compatibility with Other Patches</b> | The MRS 3.0.5.1 patch can resolve all the issues detected in MRS 3.0.5. |
|-----------------------------------------|-------------------------------------------------------------------------|

## Impact of Patch Installation

- During the installation of MRS 3.0.5.1, the executor and controller processes are automatically restarted and cluster functions on the management plane, such as job submission and cluster scaling, will be affected. Therefore, install the patch at an appropriate time.
- After you install the patch, restart the Spark2x, Hive, Yarn, Impala, Kudu, and Hue components on FusionInsight Manager for the patch to take effect. During the restart, some services may be unavailable for a short period of time. To minimize the impact on service continuity, perform the restart at a proper time.
- To install the MRS 3.0.5.1 patch, you need to manually download the patch file and install it on any master node in the cluster. For details, see the **README.md** file in the patch package.
- This patch must be also installed for any new node subsequently added to the cluster. To install the patch for this new node, install the patch on the master node and restart the corresponding service.

## Impact of Patch Installation

- During the installation of the MRS 2.1.0.11 patch, MRS Manager will be restarted, and the components such as Hive, Impala, Spark, HDFS, Yarn, MapReduce, Presto, HBase, Tez, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are

temporarily unavailable but services are not interrupted during the rolling restart.

- After the MRS 2.1.0.11 patch is installed, log in to the **standby Master node** (Log in to MRS Manager. The Master node with a hollow pentagon on the **Host Management** page is the standby Master node), switch to user **omm**, and run the **sh /opt/knox/bin/restart-knox.sh** command to restart the Knox process. This operation is not required for a cluster with only one Master node.

You can run the **ps -ef |grep knox** command to check whether the knox process is started. If the knox process ID is displayed, the knox process is started successfully.

- (Optional) After installing the MRS 2.1.0.11 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For details about how to fully update the original client of the active Master node, see [Fully Updating the Original Client of the Active Master Node](#).
  - For details about how to fully update the original client of the standby Master node, see [Fully Updating the Original Client of the Standby Master Node](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(Versions Earlier Than 3.x\)](#).

#### NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.
- (Optional) The timeout interval of the MRS Manager page and the native page of the component can be configured. You need to manually modify the following configuration:
  - a. Change the session timeout interval of the web and CAS services on all Master nodes.
    - i. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/web.xml`. The unit is minute.
    - ii. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/web/WEB-INF/web.xml`. The unit is minute.
  - b. Change the TGT validity period of the CAS on all Master nodes.

Change `1200` in `p:maxTimeToLiveInSeconds="$ {tgt.maxTimeToLiveInSeconds:1200}` and `p:timeToKillInSeconds="$ {tgt.timeToKillInSeconds:1200}"` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/spring-configuration/ticketExpirationPolicies.xml` to the corresponding timeout interval, in seconds.
  - c. Restart the Tomcat service on the active Master node.
    - i. On the active Master node, run the **netstat -anp |grep 28443 |grep LISTEN** command as user **omm** to query the Tomcat process ID.

- ii. Run the **kill -9 {pid}** command, in which *{pid}* indicates the process ID obtained in the previous step.
- iii. Wait for the process to automatically restart. You can run the **netstat -anp |grep 28443 |grep LISTEN** command to check whether the process is started. If the command output is displayed, the process is started successfully.
- d. Add or modify configuration items for each component. The values of the configuration items are the same as the timeout interval, in seconds.
  - HDFS/MapReduce/Yarn: Add the customized configuration item **http.server.session.timeout.secs**.
  - Spark: Change the value of **spark.session.maxAge**.
  - Hive: Add the customized configuration item **http.server.session.timeout.secs**.

When saving the configuration items, you can choose not to restart the affected services or instances. Restart the services or instances when the service is not busy.

### 3.9.4.4 MRS 2.1.0.10 Patch Description

#### Basic Information

## Impact of Patch Installation

- During the installation of the MRS 2.1.0.10 patch, MRS Manager will be restarted, and the components such as Hive, Impala, Spark, HDFS, Yarn, MapReduce, Presto, HBase, Tez, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are

temporarily unavailable but services are not interrupted during the rolling restart.

- After installing the MRS 2.1.0.10 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For details about how to fully update the original client of the active Master node, see [Fully Updating the Original Client of the Active Master Node](#).
  - For details about how to fully update the original client of the standby Master node, see [Fully Updating the Original Client of the Standby Master Node](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(Versions Earlier Than 3.x\)](#).

#### NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.
- (Optional) The timeout interval of the MRS Manager page and the native page of the component can be configured. You need to manually modify the following configuration:
  - a. Change the session timeout interval of the web and CAS services on all Master nodes.
    - i. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/web.xml`. The unit is minute.
    - ii. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/web/WEB-INF/web.xml`. The unit is minute.
  - b. Change the TGT validity period of the CAS on all Master nodes.  
Change `1200` in `p:maxTimeToLiveInSeconds="$ {tgt.maxTimeToLiveInSeconds:1200}` and `p:timeToKillInSeconds="$ {tgt.timeToKillInSeconds:1200}"` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/spring-configuration/ticketExpirationPolicies.xml` to the corresponding timeout interval, in seconds.
  - c. Restart the Tomcat service on the active Master node.
    - i. On the active Master node, run the `netstat -anp |grep 28443 |grep LISTEN` command as user `omm` to query the Tomcat process ID.
    - ii. Run the `kill -9 {pid}` command, in which `{pid}` indicates the process ID obtained in the previous step.
    - iii. Wait for the process to automatically restart. You can run the `netstat -anp |grep 28443 |grep LISTEN` command to check whether the process is started. If the command output is displayed, the process is started successfully.
  - d. Add or modify configuration items for each component. The values of the configuration items are the same as the timeout interval, in seconds.

- HDFS/MapReduce/Yarn: Add the customized configuration item **http.server.session.timeout.secs**.
- Spark: Change the value of **spark.session.maxAge**.
- Hive: Add the customized configuration item **http.server.session.timeout.secs**.

When saving the configuration items, you can choose not to restart the affected services or instances. Restart the services or instances when the service is not busy.

### 3.9.4.5 MRS 2.1.0.9 Patch Description

#### Basic Information

## Impact of Patch Installation

- During the installation of the MRS 2.1.0.9 patch, MRS Manager will be restarted, and the components such as Hive, Impala, Spark, HDFS, Yarn, MapReduce, Presto, HBase, Tez, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are

temporarily unavailable but services are not interrupted during the rolling restart.

- After installing the MRS 2.1.0.9 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For details about how to fully update the original client of the active Master node, see [Fully Updating the Original Client of the Active Master Node](#).
  - For details about how to fully update the original client of the standby Master node, see [Fully Updating the Original Client of the Standby Master Node](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(Versions Earlier Than 3.x\)](#).

#### NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.
- (Optional) The timeout interval of the MRS Manager page and the native page of the component can be configured. You need to manually modify the following configuration:
  - a. Change the session timeout interval of the web and CAS services on all Master nodes.
    - i. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/web.xml`. The unit is minute.
    - ii. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/web/WEB-INF/web.xml`. The unit is minute.
  - b. Change the TGT validity period of the CAS on all Master nodes.  
Change `1200` in `p:maxTimeToLiveInSeconds="$ {tgt.maxTimeToLiveInSeconds:1200}` and `p:timeToKillInSeconds="$ {tgt.timeToKillInSeconds:1200}"` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/spring-configuration/ticketExpirationPolicies.xml` to the corresponding timeout interval, in seconds.
  - c. Restart the Tomcat service on the active Master node.
    - i. On the active Master node, run the `netstat -anp |grep 28443 |grep LISTEN` command as user `omm` to query the Tomcat process ID.
    - ii. Run the `kill -9 {pid}` command, in which `{pid}` indicates the process ID obtained in the previous step.
    - iii. Wait for the process to automatically restart. You can run the `netstat -anp |grep 28443 |grep LISTEN` command to check whether the process is started. If the command output is displayed, the process is started successfully.
  - d. Add or modify configuration items for each component. The values of the configuration items are the same as the timeout interval, in seconds.

- HDFS/MapReduce/Yarn: Add the customized configuration item **http.server.session.timeout.secs**.
- Spark: Change the value of **spark.session.maxAge**.
- Hive: Add the customized configuration item **http.server.session.timeout.secs**.

When saving the configuration items, you can choose not to restart the affected services or instances. Restart the services or instances when the service is not busy.

### 3.9.4.6 MRS 2.1.0.8 Patch Description

#### Basic Information

## Impact of Patch Installation

- During the installation of the MRS 2.1.0.8 patch, MRS Manager will be restarted, and the components such as Hive, Impala, Spark, HDFS, Yarn, MapReduce, Presto, HBase, Tez, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are

temporarily unavailable but services are not interrupted during the rolling restart.

- After installing the MRS 2.1.0.8 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For details about how to fully update the original client of the active Master node, see [Fully Updating the Original Client of the Active Master Node](#).
  - For details about how to fully update the original client of the standby Master node, see [Fully Updating the Original Client of the Standby Master Node](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(Versions Earlier Than 3.x\)](#).

#### NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.
- (Optional) The timeout interval of the MRS Manager page and the native page of the component can be configured. You need to manually modify the following configuration:
  - a. Change the session timeout interval of the web and CAS services on all Master nodes.
    - i. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/web.xml`. The unit is minute.
    - ii. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/web/WEB-INF/web.xml`. The unit is minute.
  - b. Change the TGT validity period of the CAS on all Master nodes.  
Change `1200` in `p:maxTimeToLiveInSeconds="$ {tgt.maxTimeToLiveInSeconds:1200}` and `p:timeToKillInSeconds="$ {tgt.timeToKillInSeconds:1200}"` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/spring-configuration/ticketExpirationPolicies.xml` to the corresponding timeout interval, in seconds.
  - c. Restart the Tomcat service on the active Master node.
    - i. On the active Master node, run the `netstat -anp |grep 28443 |grep LISTEN` command as user `omm` to query the Tomcat process ID.
    - ii. Run the `kill -9 {pid}` command, in which `{pid}` indicates the process ID obtained in the previous step.
    - iii. Wait for the process to automatically restart. You can run the `netstat -anp |grep 28443 |grep LISTEN` command to check whether the process is started. If the command output is displayed, the process is started successfully.
  - d. Add or modify configuration items for each component. The values of the configuration items are the same as the timeout interval, in seconds.

- HDFS/MapReduce/Yarn: Add the customized configuration item **http.server.session.timeout.secs**.
- Spark: Change the value of **spark.session.maxAge**.
- Hive: Add the customized configuration item **http.server.session.timeout.secs**.

When saving the configuration items, you can choose not to restart the affected services or instances. Restart the services or instances when the service is not busy.

### 3.9.4.7 MRS 2.1.0.7 Patch Description

#### Basic Information

|-----------------------------------------|----------------------------------------------------------------------------|
| <b>Compatibility with Other Patches</b> | The MRS 2.1.0.7 patch package contains all patches released for MRS 2.1.0. |
|-----------------------------------------|----------------------------------------------------------------------------|

## Impact of Patch Installation

- During the installation of the MRS 2.1.0.7 patch, MRS Manager will be restarted, and the components such as Hive, Impala, Spark, HDFS, Yarn, MapReduce, Presto, HBase, Tez, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are temporarily unavailable but services are not interrupted during the rolling restart.
- After installing the MRS 2.1.0.7 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For details about how to fully update the original client of the active Master node, see [Fully Updating the Original Client of the Active Master Node](#).
  - For details about how to fully update the original client of the standby Master node, see [Fully Updating the Original Client of the Standby Master Node](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(Versions Earlier Than 3.x\)](#).

### NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.
- (Optional) The timeout interval of the MRS Manager page and the native page of the component can be configured. You need to manually modify the following configuration:
  - a. Change the session timeout interval of the web and CAS services on all Master nodes.
    - i. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/web.xml`. The unit is minute.
    - ii. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/web/WEB-INF/web.xml`. The unit is minute.
  - b. Change the TGT validity period of the CAS on all Master nodes.  
Change `1200` in `p:maxTimeToLiveInSeconds="$ {tgt.maxTimeToLiveInSeconds:1200}` and `p:timeToKillInSeconds="$ {tgt.timeToKillInSeconds:1200}"` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/spring-configuration/ticketExpirationPolicies.xml` to the corresponding timeout interval, in seconds.

- c. Restart the Tomcat service on the active Master node.
  - i. On the active Master node, run the **netstat -anp |grep 28443 |grep LISTEN** command as user **omm** to query the Tomcat process ID.
  - ii. Run the **kill -9 {pid}** command, in which *{pid}* indicates the process ID obtained in the previous step.
  - iii. Wait for the process to automatically restart. You can run the **netstat -anp |grep 28443 |grep LISTEN** command to check whether the process is started. If the command output is displayed, the process is started successfully.
- d. Add or modify configuration items for each component. The values of the configuration items are the same as the timeout interval, in seconds.
  - HDFS/MapReduce/Yarn: Add the customized configuration item **http.server.session.timeout.secs**.
  - Spark: Change the value of **spark.session.maxAge**.
  - Hive: Add the customized configuration item **http.server.session.timeout.secs**.

When saving the configuration items, you can choose not to restart the affected services or instances. Restart the services or instances when the service is not busy.

|-----------------------------------------|----------------------------------------------------------------------------|
| <b>Compatibility with Other Patches</b> | The MRS 2.1.0.6 patch package contains all patches released for MRS 2.1.0. |
|-----------------------------------------|----------------------------------------------------------------------------|

## Impact of Patch Installation

- During the installation of the MRS 2.1.0.6 patch, MRS Manager will be restarted, and the components such as Hive, Impala, Spark, HDFS, Yarn, MapReduce, Presto, HBase, Tez, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are temporarily unavailable but services are not interrupted during the rolling restart.
- After installing the MRS 2.1.0.6 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For details about how to fully update the original client of the active Master node, see [Fully Updating the Original Client of the Active Master Node](#).
  - For details about how to fully update the original client of the standby Master node, see [Fully Updating the Original Client of the Standby Master Node](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(Versions Earlier Than 3.x\)](#).

### NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.
- (Optional) The timeout interval of the MRS Manager page and the native page of the component can be configured. You need to manually modify the following configuration:
  - a. Change the session timeout interval of the web and CAS services on all Master nodes.
    - i. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/web.xml`. The unit is minute.
    - ii. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/web/WEB-INF/web.xml`. The unit is minute.
  - b. Change the TGT validity period of the CAS on all Master nodes.  
Change `1200` in `p:maxTimeToLiveInSeconds="$ {tgt.maxTimeToLiveInSeconds:1200}` and `p:timeToKillInSeconds="$ {tgt.timeToKillInSeconds:1200}"` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/spring-configuration/ticketExpirationPolicies.xml` to the corresponding timeout interval, in seconds.

- c. Restart the Tomcat service on the active Master node.
  - i. On the active Master node, run the **netstat -anp |grep 28443 |grep LISTEN** command as user **omm** to query the Tomcat process ID.
  - ii. Run the **kill -9 {pid}** command, in which *{pid}* indicates the process ID obtained in the previous step.
  - iii. Wait for the process to automatically restart. You can run the **netstat -anp |grep 28443 |grep LISTEN** command to check whether the process is started. If the command output is displayed, the process is started successfully.
- d. Add or modify configuration items for each component. The values of the configuration items are the same as the timeout interval, in seconds.
  - HDFS/MapReduce/Yarn: Add the customized configuration item **http.server.session.timeout.secs**.
  - Spark: Change the value of **spark.session.maxAge**.
  - Hive: Add the customized configuration item **http.server.session.timeout.secs**.

When saving the configuration items, you can choose not to restart the affected services or instances. Restart the services or instances when the service is not busy.

### 3.9.4.9 MRS 2.1.0.3 Patch Description

## Impact of Patch Installation

- During the installation of the MRS 2.1.0.3 patch, MRS Manager will be restarted, and the components such as Hive, Spark, HDFS, Yarn, MapReduce, Presto, HBase, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are temporarily unavailable but services are not interrupted during the rolling restart.
- After installing the MRS 2.1.0.3 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).

- For details about how to fully update the original client of the active Master node, see [Fully Updating the Original Client of the Active Master Node](#).
- For details about how to fully update the original client of the standby Master node, see [Fully Updating the Original Client of the Standby Master Node](#).
- For details about how to fully install the clients you set up, see [Installing a Client \(Versions Earlier Than 3.x\)](#).

 NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.

### 3.9.4.10 MRS 2.1.0.2 Patch Description

#### Basic Information

## Impact of Patch Installation

- During the installation of the MRS 2.1.0.2 patch, MRS Manager will be restarted, and the components such as Hive, Spark, HDFS, Yarn, MapReduce, Presto, HBase, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are temporarily unavailable, and services are not interrupted during the rolling restart.
- After installing the MRS 2.1.0.2 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For details about how to fully update the original client of the active Master node, see [Fully Updating the Original Client of the Active Master Node](#).
  - For details about how to fully update the original client of the standby Master node, see [Fully Updating the Original Client of the Standby Master Node](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(Versions Earlier Than 3.x\)](#).

### NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.

## Impact of Patch Installation

During the installation of MRS 2.1.0.1 patches, MRS Manager and Hive are restarted. During the restart, the services are temporarily unavailable.

After MRS 2.1.0.1 patches are installed, log in to the Master1 node of the MRS cluster and delete the job directory in HDFS.

- For a cluster with Kerberos authentication disabled, run the following command to delete the job directory in HDFS:  
**hdfs dfs -rm -r /mrs/mrsjob/hive**
- For a cluster with Kerberos authentication enabled, perform the following operations to delete the job directory in HDFS:
  - a. Run the following command and enter the password to perform authentication.  
**kinit hdfs**
  - b. Run the following command to delete the job directory in HDFS:  
**hdfs dfs -rm -r /mrs/mrsjob/hive**

### NOTE

This step is not required for a new MRS cluster because the directory does not exist in HDFS.

### 3.9.4.12 MRS 2.0.6.1 Patch Description

| <b>Compatibility with Other Patches</b> | The MRS 1.9.3.3 patch package contains all patches released for MRS 1.9.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Impact of Patch Installation

- During the installation of the MRS 1.9.3.3 patch, MRS Manager is restarted, and Hadoop, HDFS, Hive, Spark, and related dependent services are restarted in rolling mode. During the restart of MRS Manager, services are temporarily unavailable but services are not interrupted during the rolling restart.
- After installing the MRS 1.9.3.3 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For details about how to fully update the original client of the active Master node, see [Fully Updating the Original Client of the Active Master Node](#).
  - For details about how to fully update the original client of the standby Master node, see [Fully Updating the Original Client of the Standby Master Node](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(Versions Earlier Than 3.x\)](#).

### NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.

| <b>Compati<br/>bility<br/>with<br/>Other<br/>Patches</b> | None |
|----------------------------------------------------------|------|

## Impact of Patch Installation

- During the installation of the MRS 1.9.2.2 patch, MRS Manager will be restarted, and the components such as Hadoop, Hive, Spark, Kafka, Ranger, Presto, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are temporarily unavailable but services are not interrupted during the rolling restart.
- After the MRS 1.9.2.2 patch is installed, you need to restart the OMS service.

### NOTE

- Log in to the active and standby OMS nodes as user **root**, switch to user **omm**, and run the `sh ${BIGDATA_HOME}/om-0.0.1/sbin/restart-oms.sh` command to restart the OMS service.
- Both the active and standby OMS nodes need to be restarted.
- After installing the MRS 1.9.2.2 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For details about how to fully update the original client of the active Master node, see [Fully Updating the Original Client of the Active Master Node](#).
  - For details about how to fully update the original client of the standby Master node, see [Fully Updating the Original Client of the Standby Master Node](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(Versions Earlier Than 3.x\)](#).

### NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.

### 3.9.4.19 MRS 1.9.0.8, 1.9.0.9, and 1.9.0.10 Patch Description

## Impact of Patch Installation

- During the installation of the MRS 1.9.0.10 patch, MRS Manager will be restarted, and the components such as Hadoop, Hive, Spark, Presto, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are temporarily unavailable, and services are not interrupted during the rolling restart.
- After installing the MRS 1.9.0.10 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For details about how to fully update the original client of the active Master node, see [Fully Updating the Original Client of the Active Master Node](#).
  - For details about how to fully update the original client of the standby Master node, see [Fully Updating the Original Client of the Standby Master Node](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(Versions Earlier Than 3.x\)](#).

 NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.
- (Optional) In the scenario where a temporary AK/SK is obtained by using an agency to access OBS, configure the **fs.obs.auth.node-cache-short-circuit.enable** parameter to determine whether to allow access to the ECS metadata API, thereby determining whether to trigger ECS flow control.

The MRS cluster can access OBS using a temporary AK/SK obtained by an agency. The temporary AK/SK is obtained using the ECS metadata API. The ECS metadata API has a flow control threshold of 140 times within 5 minutes for a single node. After the flow control is triggered, the node is added to the blacklist and cannot call the metadata API again within 30 minutes. To prevent flow control, MRS provides the node-level cross-process cache service meta to cache temporary AK/SK.

Application scenario: Yarn jobs such as Spark and Hadoop that access OBS using a temporary AK/SK obtained by an agency. This parameter is configured in the **core-site.xml** file on the client.

The default value is **true**. The Yarn application process in the MRS cluster obtains the temporary AK/SK from the node-level cache service meta. If meta is abnormal, obtain the temporary AK/SK from the ECS metadata API.

If you do not want to directly access the ECS metadata API when the meta is abnormal, set this parameter to **false** to prevent the node from being added to the blacklist due to flow control.

### 3.9.4.20 MRS 1.9.0.7 Patch Description

#### Basic Information

Table 3-80 Basic information

|               |             |
|---------------|-------------|
| Patch Version | MRS 1.9.0.7 |
| Release Date  | 2021-01-15  |

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <p><b>Compati<br/>bility<br/>with<br/>Other<br/>Patches</b></p> | <p>The MRS 1.9.0.7 patch can resolve all problems that have been resolved by the MRS 1.9.0 patch.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Impact of Patch Installation

- During the installation of the MRS 1.9.0.7 patch, MRS Manager will be restarted, and the components such as Hadoop, Hive, Spark, Kafka, Ranger, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are temporarily unavailable but services are not interrupted during the rolling restart.
- After installing the MRS 1.9.0.7 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For details about how to fully update the original client of the active Master node, see [Fully Updating the Original Client of the Active Master Node](#).
  - For details about how to fully update the original client of the standby Master node, see [Fully Updating the Original Client of the Standby Master Node](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(Versions Earlier Than 3.x\)](#).

 NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.

### 3.9.4.21 MRS 1.9.0.6 Patch Description

#### Basic Information

**Table 3-81** Basic information

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|  | <p><b>List of resolved issues in MRS 1.9.0.5:</b></p> <p><b>MRS Manager</b></p> <p>Optimized the service restart process during configuration saving on MRS Manager.</p> <p>Rectified the periodic backup failure on MRS Manager.</p> <p><b>MRS big data components</b></p> <p>Private patch of Ranger</p> <p>Resolved the JVM Create GC thread failed issue of Yarn.</p> <p>Added the HiveServer2 task stacking alarm.</p> <p>Added the alarm indicating that the GC time of HiveServer HiveMetastore exceeds 5s.</p> <p>Added the alarm indicating that HiveServer2 uncomment ZooKeeper.</p> <p>Added the alarm indicating that Yarn tasks failed and the number of killed tasks exceeds 5 within 20 minutes.</p> <p>Corrected time zone of Spark JobHistory.</p> <p>Optimized MetaStore restart mechanism.</p> <p>Resolved the HIVE-22771 open-source issue.</p> <p>Resolved the Hive beeline log printing errors.</p> <p>Corrected the number of active nodes displayed on the Yarn page.</p> <p>Resolved the slow response of RM page display, which is caused by large number of RM threads.</p> <p>Supported OBS monitoring.</p> <p>Upgraded the OBS packages.</p> <p>Resolved the issue that some data is not inserted when 10 data records are concurrently inserted into hive-jdbc.</p> <p>Resolved the issue that Hive occasionally reports a Kryo deserialization failure.</p> <p>Resolved the issue of Spark JobHistory memory leakage.</p> <p>Resolved the issue that the application list cannot be displayed occasionally in Spark JobHistory.</p> |
|  | <p><b>List of resolved issues in MRS 1.9.0.3:</b></p> <p><b>MRS Manager</b></p> <p>Upgraded ARM JDK on MRS Manager.</p> <p>Resolved the issue that the system disk is fully occupied by logs of the Core node on MRS Manager.</p> <p><b>MRS big data components</b></p> <p>Resolved the issue that the number of Ranger logs cannot be set, which may cause full disk occupation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                 | <p><b>List of resolved issues in MRS 1.9.0.2:</b></p> <p><b>MRS Manager</b><br/>Resolved the mutual trust lost between some Core nodes in the cluster.<br/>Resolved the issue that instances fail to be added after the patch is installed.<br/>Resolved the issue that the rolling restart timeout interval of HiveServer cannot be modified on MRS Manager.</p> <p><b>MRS big data components</b><br/>Upgraded the OBS packages.</p>                                                                                                            |
|                                                                 | <p><b>List of resolved issues in MRS 1.9.0.1:</b></p> <p><b>MRS Manager</b><br/>Resolved the issue that MRS Manager does not support rolling patch installation without restarting services.</p> <p><b>MRS big data components</b><br/>Resolved the issue that the OBS entrusted access frequency is not limited to 140 times within 5 minutes.<br/>Resolved the issue that Kafka does not support open-source access.<br/>Resolved the SPARK-27637 open-source issue.<br/>Optimized the Hive rolling restart.<br/>Upgraded the OBS packages.</p> |
| <p><b>Compati<br/>bility<br/>with<br/>Other<br/>Patches</b></p> | <p>The MRS 1.9.0.6 patch can resolve all problems that have been resolved by the MRS 1.9.0 patch.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Impact of Patch Installation

- During the installation of the MRS 1.9.0.6 patch, MRS Manager will be restarted, and the components such as Hadoop, Hive, Spark, Kafka, Ranger, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are temporarily unavailable but services are not interrupted during the rolling restart.
- After installing the MRS 1.9.0.6 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For details about how to fully update the original client of the active Master node, see [Fully Updating the Original Client of the Active Master Node](#).
  - For details about how to fully update the original client of the standby Master node, see [Fully Updating the Original Client of the Standby Master Node](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(Versions Earlier Than 3.x\)](#).

 **NOTE**

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.

### 3.9.4.22 MRS 1.9.0.5 Patch Description

#### Basic Information

## Impact of Patch Installation

- During the installation of the MRS 1.9.0.5 patch, MRS Manager will be restarted, and the components such as Hadoop, Hive, Spark, Kafka, Ranger, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are temporarily unavailable but services are not interrupted during the rolling restart.
- After installing the MRS 1.9.0.5 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For details about how to fully update the original client of the active Master node, see [Fully Updating the Original Client of the Active Master Node](#).
  - For details about how to fully update the original client of the standby Master node, see [Fully Updating the Original Client of the Standby Master Node](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(Versions Earlier Than 3.x\)](#).

 NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.

### 3.9.4.23 MRS 1.8.10.1 Patch Description

#### Impact of Patch Installation

During the installation of MRS 1.8.10.1 patches, MRS Manager and Kafka are restarted. During the restart, the services are temporarily unavailable.

## 3.10 Tenant Management

### 3.10.1 Before You Start

This section describes how to manage tenants on the MRS console.

Tenant management operations on the console apply only to clusters of versions earlier than MRS 3.x.

Tenant management operations on FusionInsight Manager apply to all versions. For MRS 3.x and later versions, see [Overview](#). For versions earlier than MRS 3.x, see [Overview](#).

## 3.10.2 Overview

### Definition

An MRS cluster provides various resources and services for multiple organizations, departments, or applications to share. The cluster provides tenants as a logical entity to use these resources and services. A mode involving different tenants is called multi-tenant mode. Currently, only the analysis cluster supports tenant management.

### Principles

The MRS cluster provides the multi-tenant function. It supports a layered tenant model and allows dynamic adding or deleting of tenants to isolate resources. It dynamically manages and configures tenants' computing and storage resources.

The computing resources indicate tenants' Yarn task queue resources. The task queue quota can be modified, and the task queue usage status and statistics can be viewed.

The storage resources can be stored on HDFS. You can add and delete the HDFS storage directories of tenants, and set the quotas of file quantity and the storage space of the directories.

Tenants can create and manage tenants in a cluster based on service requirements.

- Roles, computing resources, and storage resources are automatically created when tenants are created. By default, all permissions of the new computing resources and storage resources are allocated to a tenant's roles.
- Permissions to view the current tenant's resources, add a subtenant, and manage the subtenant's resources are granted to the tenant's roles by default.
- After you have modified the tenant's computing or storage resources, permissions of the tenant's roles are automatically updated.

MRS supports a maximum of 512 tenants. The default tenants created by the system include **default**. Tenants that are in the topmost layer with the default tenant are called level-1 tenants.

### Resource Pools

Yarn task queues support only the label-based scheduling policy. This policy enables Yarn task queues to associate NodeManagers that have specific node labels. In this way, Yarn tasks run on specified nodes so that tasks are scheduled and certain hardware resources are utilized. For example, Yarn tasks requiring a large memory capacity can run on nodes with a large memory capacity by means of label association, preventing poor service performance.

In an MRS cluster, the tenant logically divides Yarn cluster nodes to combine multiple NodeManagers into a resource pool. Yarn task queues can be associated with specified resource pools by configuring queue capacity policies, ensuring efficient and independent resource utilization in the resource pools.

MRS supports a maximum of 50 resource pools. By default, the system contains a **default** resource pool.

### 3.10.3 Creating a Tenant

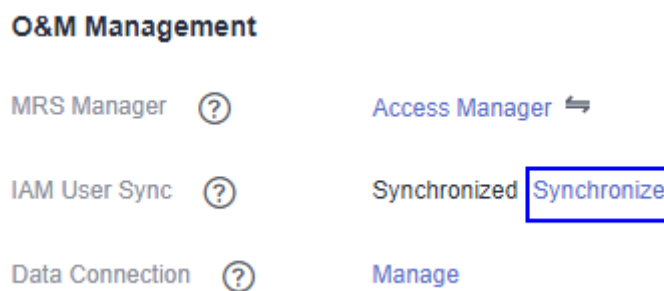

#### Scenario

You can create a tenant on MRS Manager to specify the resource usage.

#### Prerequisites

- A tenant name has been planned. The name must not be the same as that of a role or Yarn queue that exists in the current cluster.
- If a tenant requires storage resources, a storage directory has been planned based on service requirements, and the planned directory does not exist under the HDFS directory.
- The resources that can be allocated to the current tenant have been planned and the sum of the resource percentages of direct sub-tenants under the parent tenant at every level does not exceed 100%.
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Figure 3-75 Synchronizing IAM users

#### Procedure

**Step 1** On the MRS cluster details page, click **Tenants**.

Figure 3-76 Tenants tab page

#### NOTE

For MRS 3.x or later, see [Overview](#).

**Step 2** Click **Create Tenant**. On the page that is displayed, configure tenant properties. The following table takes MRS 3.x versions as an example.

**Table 3-84** Tenant parameters

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Name               | Name of the current tenant. The value consists of 3 to 50 characters, and can contain letters, digits, and underscores (_).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Tenant Type        | <b>Leaf</b> or <b>Non-leaf</b> tenant. If <b>Leaf</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added. If <b>Non-leaf</b> is selected, sub-tenants can be added to the current tenant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Compute Resource   | Compute resources can be used by the tenant. The system automatically creates a task queue named after the tenant name in Yarn. If <b>Yarn</b> is not selected, the system does not automatically create a task queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Configuration Mode | If <b>Yarn</b> is selected for <b>Compute Resource</b> , this parameter can be set to <b>Basic</b> or <b>Advanced</b> . <ul style="list-style-type: none"><li>• <b>Basic</b>: Configure the percentage of compute resources used by the tenant in the default resource pool by specifying <b>Default Resource Pool Capacity (%)</b>.</li><li>• <b>Advanced</b>: Configure the following parameters for advanced settings:<ul style="list-style-type: none"><li>– <b>Weight</b>: Tenant resource weight. The value ranges from 0 to 100. Tenant resource weight = Tenant weight/Total weight of tenants at the same level</li><li>– <b>Minimum Resources</b>: resources preempted by the tenant. The value is a percentage or absolute value of the parent tenant's resources. When a tenant's workload is light, their resources are automatically lent to other tenants. When available resources are fewer than <b>Minimum Resources</b>, the tenant can preempt the resources that were lent out.</li><li>– <b>Maximum Resources</b>: maximum resources that can be used by a tenant. The value is a percentage or absolute value of the parent tenant's resources.</li><li>– <b>Reserved Resources</b>: resources reserved for the tenant. The reserved resources cannot be used by other tenants even if no job is using resources of the tenant. The value is a percentage or absolute value of the parent tenant's resources.</li></ul></li></ul> |

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Default Resource Pool Capacity (%)  | Specifies the percentage of the computing resources used by the current tenant in the <b>default</b> resource pool. This parameter is required when <b>Configuration Mode</b> is <b>Basic</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Storage Resource                    | Specifies storage resources for the current tenant. The system automatically creates a file folder named after the tenant name in the <b>/tenant</b> directory. When a tenant is created for the first time, the system automatically creates the <b>/tenant</b> directory in the HDFS root directory. If storage resources are not <b>HDFS</b> , the system does not create a storage directory under the root directory of HDFS.                                                                                                                                                                                                                                                                                                                                                                                                  |
| Maximum Number of Files/Directories | Maximum number of files or directories that can be created in HDFS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Storage Space Quota                 | <p>Specifies the quota for HDFS storage space used by the current tenant. The value ranges from <b>1</b> to <b>8796093022208</b>. The unit is MB or GB. This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used. If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk.</p> <p><b>NOTE</b></p> <p>To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value is set to <b>500</b> MB, the actual space for storing files is about 250 MB (<math>500/2 = 250</math>).</p> |
| Storage Path                        | Specifies the tenant's HDFS storage directory. The system automatically creates a file folder named after the tenant name in the <b>/tenant</b> directory by default. For example, the default HDFS storage directory for <b>ta1</b> is <b>tenant/ta1</b> . When a tenant is created for the first time, the system automatically creates the <b>/tenant</b> directory in the HDFS root directory. The storage path is customizable.                                                                                                                                                                                                                                                                                                                                                                                                |
| Service                             | Specifies other service resources associated with the current tenant. HBase is supported. To configure this parameter, click <b>Associate Services</b> . In the dialog box that is displayed, set <b>Service</b> to <b>HBase</b> . If <b>Association Mode</b> is set to <b>Exclusive</b> , service resources are occupied exclusively. If <b>share</b> is selected, service resources are shared.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description                         | Specifies the description of the current tenant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Step 3** Click **OK** to save the settings.

It takes a few minutes to save the settings. If the **Tenant created successfully** is displayed in the upper-right corner, the tenant is added successfully. The tenant is created successfully.

 **NOTE**

- Roles, computing resources, and storage resources are automatically created when tenants are created.
- The new role has permissions on the computing and storage resources. The role and its permissions are controlled by the system automatically and cannot be controlled manually under **Manage Role**.
- If you want to use the tenant, create a system user and assign the Manager\_tenant role and the role corresponding to the tenant to the user. For details, see [Creating a User](#).

----End

## Related Tasks

**View an added tenant.**

**Step 1** On the MRS details page, click **Tenants**.

**Figure 3-77** Tenants tab page

**Step 2** In the tenant list on the left, click the name of the added tenant.

The **Summary** tab is displayed on the right by default.

**Step 3** View **Basic Information**, **Resource Quota**, and **Charts** of the tenant.

If HDFS is in the **Stopped** state, **Available** and **Used** of **Space** in **Resource Quota** are **unknown**.

----End

## 3.10.4 Creating a Sub-tenant

### Scenario

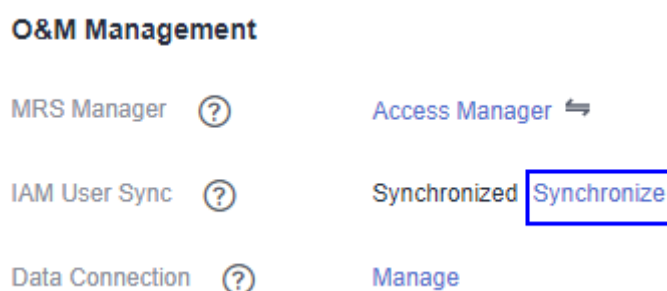

You can create a sub-tenant on MRS if the resources of the current tenant need to be further allocated.

### Prerequisites

- A parent tenant has been added.

- A tenant name has been planned. The name must not be the same as that of a role or Yarn queue that exists in the current cluster.
- If a sub-tenant requires storage resources, a storage directory has been planned based on service requirements, and the planned directory does not exist under the storage directory of the parent tenant.
- The resources that can be allocated to the current tenant have been planned and the sum of the resource percentages of direct sub-tenants under the parent tenant at every level does not exceed 100%.
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

**Figure 3-78** Synchronizing IAM users

## Procedure

**Step 1** On the MRS details page, click **Tenants**.

**Figure 3-79** Tenants tab page

### NOTE

For MRS 3.x or later, see [Overview](#).

**Step 2** In the tenant list on the left, move the cursor to the tenant node to which a sub-tenant is to be added. Click **Create sub-tenant**. On the displayed page, configure the sub-tenant attributes according to the following table which takes MRS 3.x versions as an example.

**Table 3-85** Sub-tenant parameters

| Parameter     | Description                              |
|---------------|------------------------------------------|
| Parent tenant | Specifies the name of the parent tenant. |

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                               | Specifies the name of the current tenant. The value consists of 3 to 20 characters, and can contain letters, digits, and underscores (_).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Tenant Type                        | The options include <b>Leaf</b> and <b>Non-leaf</b> . If <b>Leaf</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added. If <b>Non-leaf</b> is selected, sub-tenants can be added to the current tenant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Compute Resource                   | Specifies the dynamic computing resources for the current tenant. The system automatically creates a task queue named after the sub-tenant name in the Yarn parent queue. If <b>Yarn</b> is not selected, the system does not automatically create a task queue. If the parent tenant does not have compute resources, the sub-tenant cannot use compute resources.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Configuration Mode                 | <p>If <b>Yarn</b> is selected for <b>Compute Resource</b>, this parameter can be set to <b>Basic</b> or <b>Advanced</b>.</p> <ul style="list-style-type: none"> <li>• <b>Basic</b>: Configure the percentage of compute resources used by the tenant in the default resource pool by specifying <b>Default Resource Pool Capacity (%)</b>.</li> <li>• <b>Advanced</b>: Configure the following parameters for advanced settings: <ul style="list-style-type: none"> <li>– <b>Weight</b>: Tenant resource weight. The value ranges from 0 to 100. Tenant resource weight = Tenant weight/Total weight of tenants at the same level</li> <li>– <b>Minimum Resources</b>: resources preempted by the tenant. The value is a percentage or absolute value of the parent tenant's resources. When a tenant's workload is light, their resources are automatically lent to other tenants. When available resources are fewer than <b>Minimum Resources</b>, the tenant can preempt the resources that were lent out.</li> <li>– <b>Maximum Resources</b>: maximum resources that can be used by a tenant. The value is a percentage or absolute value of the parent tenant's resources.</li> <li>– <b>Reserved Resources</b>: resources reserved for the tenant. The value is a percentage or absolute value of the parent tenant's resources.</li> </ul> </li> </ul> |
| Default Resource Pool Capacity (%) | Specifies the percentage of the resources used by the current tenant. The base value is the total resources of the parent tenant. This parameter is required when <b>Configuration Mode</b> is <b>Basic</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Storage Resource                    | Specifies storage resources for the current tenant. The system automatically creates a file in the HDFS parent tenant directory. The file is named the same as the name of the sub-tenant. If storage resources are not <b>HDFS</b> , the system does not create a storage directory under the root directory of HDFS. If the parent tenant does not have storage resources, the sub-tenant cannot use storage resources.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Maximum Number of Files/Directories | Maximum number of files or directories that can be created in HDFS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Storage Space Quota                 | <p>Specifies the quota for HDFS storage space used by the current tenant. The minimum value is <b>1</b>, and the maximum value is the total storage quota of the parent tenant. The unit is MB or GB. This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used. If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk. If the quota is greater than the quota of the parent tenant, the actual storage capacity is subject to the quota of the parent tenant.</p> <p><b>NOTE</b></p> <p>To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value is set to <b>500</b> MB, the actual space for storing files is about 250 MB (<math>500/2 = 250</math>).</p> |
| Storage Path                        | Specifies the tenant's HDFS storage directory. The system automatically creates a file folder named after the sub-tenant name in the directory of the parent tenant by default. For example, if the sub-tenant is <b>ta1s</b> and the parent directory is <b>tenant/ta1</b> , the system sets this parameter for the sub-tenant to <b>tenant/ta1/ta1s</b> . The storage path is customizable in the parent directory. The parent directory for the storage path must be the storage directory of the parent tenant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Service                             | Specifies other service resources associated with the current tenant. HBase is supported. To configure this parameter, click <b>Associate Services</b> . In the dialog box that is displayed, set <b>Service</b> to <b>HBase</b> . If <b>Association Mode</b> is set to <b>Exclusive</b> , service resources are occupied exclusively. If <b>share</b> is selected, service resources are shared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Description                         | Specifies the description of the current tenant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Step 3** Click **OK** to save the settings.

It takes a few minutes to save the settings. If the **Tenant created successfully** is displayed in the upper-right corner, the tenant is added successfully. The tenant is created successfully.

 **NOTE**

- Roles, computing resources, and storage resources are automatically created when tenants are created.
- The new role has permissions on the computing and storage resources. The role and its permissions are controlled by the system automatically and cannot be controlled manually under **Manage Role**.
- When using this tenant, create a system user and assign the user a related tenant role. For details, see [Creating a User](#).

----End

## 3.10.5 Deleting a Tenant

### Scenario

You can delete a tenant that is not required on MRS.

### Prerequisites

- A tenant has been added.
- You have checked whether the tenant to be deleted has sub-tenants. If the tenant has sub-tenants, delete them; otherwise, you cannot delete the tenant.
- The role of the tenant to be deleted cannot be associated with any user or user group. For details about how to cancel the binding between a role and a user, see [Modifying User Information](#).
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

**Figure 3-80** Synchronizing IAM users

#### O&M Management

|                                                                                                     |                                                                                                      |
|-----------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| MRS Manager      | Access Manager  |
| IAM User Sync    | Synchronized <b>Synchronize</b>                                                                      |
| Data Connection  | Manage                                                                                               |

### Procedure

**Step 1** On the MRS details page, click **Tenants**.

**Figure 3-81** Tenants tab page

**NOTE**

For MRS 3.x or later, see [Overview](#).

**Step 2** In the tenant list on the left, move the cursor to the tenant node to be deleted and click **Delete**.

The **Delete Tenant** dialog box is displayed. If you want to save the tenant data, select **Reserve the data of this tenant**. Otherwise, the tenant's storage space will be deleted.

**Step 3** Click **OK**.

It takes a few minutes to save the configuration. After the tenant is deleted successfully, the role and storage space of the tenant are also deleted.

**NOTE**

- After the tenant is deleted, the task queue of the tenant still exists in Yarn.
- If you choose not to reserve data when deleting the parent tenant, data of sub-tenants is also deleted if the sub-tenants use storage resources.

----End

## 3.10.6 Managing a Tenant Directory

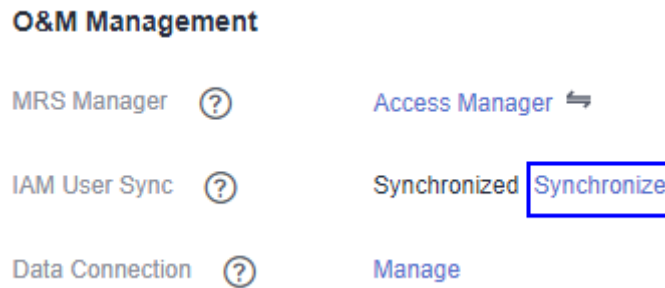

### Scenario

You can manage the HDFS storage directory used by a specific tenant on MRS. The management operations include adding a tenant directory, modifying the directory file quota, modifying the storage space, and deleting a directory.

### Prerequisites

- A tenant associated with HDFS storage resources has been added.
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

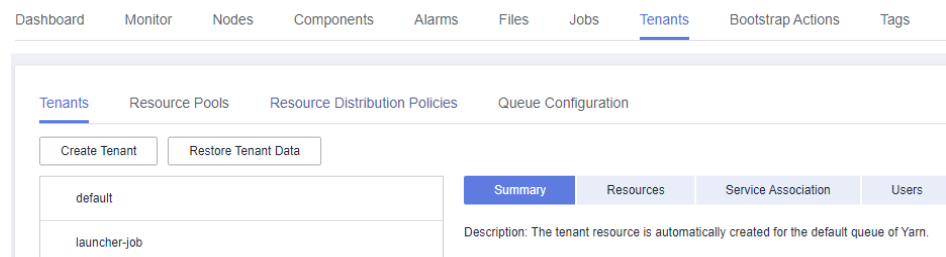

**Figure 3-82** Synchronizing IAM users

## Procedure

- View a tenant directory.
  - a. On the MRS details page, click **Tenants**.

**Figure 3-83** Tenants tab page

### NOTE

For MRS 3.x or later, see [Overview](#).

- b. In the tenant list on the left, click the target tenant.
  - c. Click the **Resources** tab.
  - d. View the **HDFS Storage** table.
    - The **Maximum Number of Files/Directories** column indicates the quotas for the file and directory quantity of the tenant directory.
    - The **Space Quota** column indicates storage space size of tenant directories.
- Add a tenant directory.

### NOTE

For MRS 3.x or later, see [Overview](#).

- b. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be added.
- c. Click the **Resources** tab.
- d. In the **HDFS Storage** table, click **Create Directory**.
  - Set **Path** to a tenant directory path.

 NOTE

- If the current tenant is not a sub-tenant, the new path is created in the HDFS root directory.
- If the current tenant is a sub-tenant, the new path is created in the specified directory.

A complete HDFS storage directory can contain a maximum of 1,023 characters. An HDFS directory name contains digits, letters, spaces, and underscores (\_). The name cannot start or end with a space.

- Set **Maximum Number of Files/Directories** to the quotas of file and directory quantity.

**Maximum Number of Files/Directories** is optional. Its value ranges from **1** to **9223372036854775806**.

- Set **Storage Space Quota** to the storage space size of the tenant directory.

The value of **Storage Space Quota** ranges from **1** to **8796093022208**.

 NOTE

To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value of **Storage Space Quota** is set to **500**, the actual space for storing files is about 250 MB ( $500/2 = 250$ ).

- e. Click **OK**. The system creates tenant directories in the HDFS root directory.
- Modify a tenant directory.
    - a. On the MRS details page, click **Tenants**.

 NOTE

For MRS 3.x or later, see [Overview](#).

- b. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be modified.
- c. Click the **Resources** tab.
- d. In the **HDFS Storage** table, click **Modify** in the **Operation** column of the specified tenant directory.
  - Set **Maximum Number of Files/Directories** to the quotas of file and directory quantity.

**Maximum Number of Files/Directories** is optional. Its value ranges from **1** to **9223372036854775806**.
  - Set **Storage Space Quota** to the storage space size of the tenant directory.

The value of **Storage Space Quota** ranges from **1** to **8796093022208**.

 NOTE

To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value of **Storage Space Quota** is set to **500**, the actual space for storing files is about 250 MB ( $500/2 = 250$ ).

- e. Click **OK**.
- Delete a tenant directory.
  - a. On the MRS details page, click **Tenants**.

 NOTE

For MRS 3.x or later, see [Overview](#).

- b. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be deleted.
- c. Click the **Resources** tab.
- d. In the **HDFS Storage** table, click **Delete** in the **Operation** column of the specified tenant directory.

The default HDFS storage directory set during tenant creation cannot be deleted. Only the newly added HDFS storage directory can be deleted.

- e. Click **OK**. The tenant directory is deleted.

## 3.10.7 Restoring Tenant Data

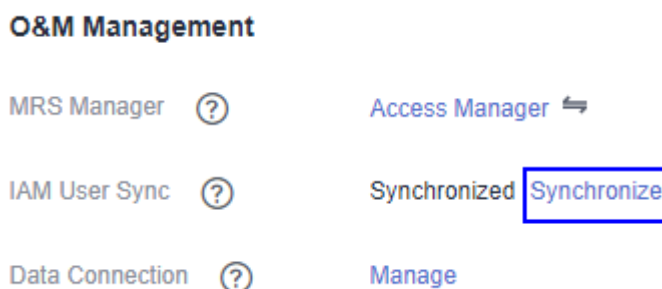

### Scenario

Tenant data is stored on Manager and in cluster components by default. When components are restored from faults or reinstalled, some tenant configuration data may be abnormal. In this case, you can manually restore the tenant data.

### Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

**Figure 3-84** Synchronizing IAM users

## Procedure

**Step 1** On the MRS details page, click **Tenants**.

**Figure 3-85** Tenants tab page

### NOTE

For MRS 3.x or later, see [Overview](#).

**Step 2** In the tenant list on the left, click a tenant node.

**Step 3** Check the status of the tenant data.

1. In **Summary**, check the color of the circle on the left of **Basic Information**. Green indicates that the tenant is available and gray indicates that the tenant is unavailable.
2. Click **Resources** and check the circle on the left of **Yarn** or **HDFS Storage**. Green indicates that the resource is available, and gray indicates that the resource is unavailable.
3. Click **Service Association** and check the **Status** column of the associated service table. **Good** indicates that the component can provide services for the associated tenant. **Bad** indicates that the component cannot provide services for the tenant.
4. If any check result is abnormal, go to **Step 4** to restore tenant data.

**Step 4** Click **Restore Tenant Data**.

**Step 5** In the **Restore Tenant Data** window, select one or more components whose data needs to be restored. Click **OK**. The system automatically restores the tenant data.

----End

## 3.10.8 Creating a Resource Pool

### Scenario

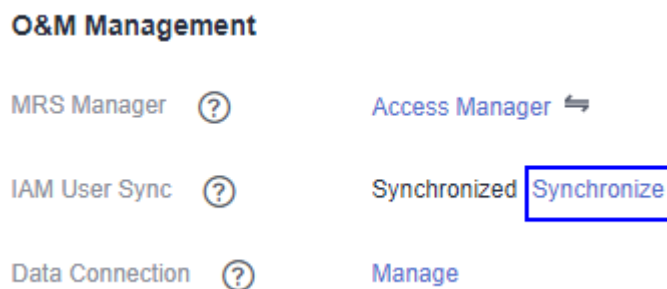

In an MRS cluster, users can logically divide Yarn cluster nodes to combine multiple NodeManagers into a Yarn resource pool. Each NodeManager belongs to one resource pool only. The system contains a **default** resource pool by default. All NodeManagers that are not added to customized resource pools belong to this resource pool.

You can create a customized resource pool on MRS and add hosts that have not been added to other customized resource pools to it.

## Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

**Figure 3-86** Synchronizing IAM users

## Procedure

**Step 1** On the MRS details page, click **Tenants**.

**Figure 3-87** Tenants tab page

### NOTE

For MRS 3.x or later, see [Overview](#).

**Step 2** Click the **Resource Pools** tab.

**Step 3** Click **Create Resource Pool**.

**Step 4** In **Create Resource Pool**, set the properties of the resource pool.

- **Name:** Enter a name for the resource pool. The name of the newly created resource pool cannot be **default**.  
The name consists of 1 to 20 characters and can contain digits, letters, and underscores (\_) but cannot start with an underscore (\_).
- **Resource Label:** Enter the resource label of the resource pool. The value can contain 1 to 50 characters, including digits, letters, underscores (\_), and hyphens (-), and must start with a digit or letter.
- **Available Hosts:** In the host list on the left, select a specified host name and add it to the resource pool. Only hosts in the cluster can be selected. The host list of a resource pool can be left blank.

**Step 5** Click **OK**.

**Step 6** After a resource pool is created, users can view the **Name, Members, Type, vCore** and **Memory** in the resource pool list. Hosts that are added to the customized resource pool are no longer members of the **default** resource pool.

----End

### 3.10.9 Modifying a Resource Pool

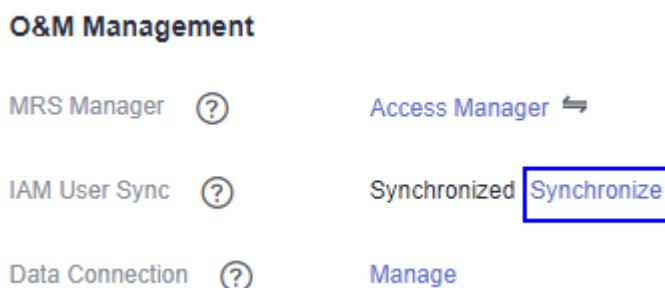

#### Scenario

You can modify members of an existing resource pool on MRS.

#### Prerequisites

You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

**Figure 3-88** Synchronizing IAM users

#### Procedure

**Step 1** On the MRS details page, click **Tenants**.

**Figure 3-89** Tenants tab page

#### NOTE

For MRS 3.x or later, see [Overview](#).

**Step 2** Click the **Resource Pools** tab.

**Step 3** Locate the row that contains the specified resource pool, and click **Modify** in the **Operation** column.

**Step 4** In **Modify Resource Pool**, modify **Added Hosts**.

- Adding a host: In the host list on the left, select the specified host name and add it to the resource pool.
- Deleting a host: In the host list on the right, click  next to a host to remove the host from the resource pool. The host list of a resource pool can be left blank.

**Step 5** Click **OK**.

----End

### 3.10.10 Deleting a Resource Pool

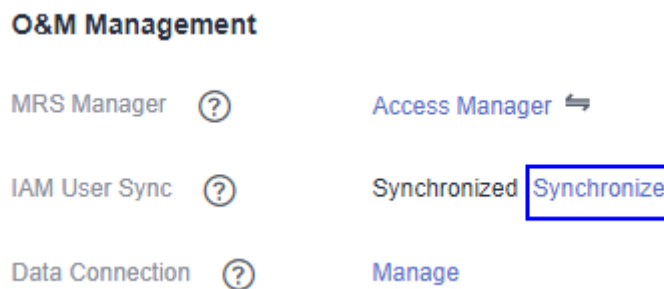

#### Scenario

You can delete an existing resource pool on MRS.

#### Prerequisites

- Any queue in a cluster cannot use the resource pool to be deleted as the default resource pool. Before deleting the resource pool, cancel the default resource pool. For details, see [Configuring a Queue](#).
- Resource distribution policies of all queues have been cleared from the resource pool being deleted. For details, see [Clearing Configuration of a Queue](#).
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

**Figure 3-90** Synchronizing IAM users

#### Procedure

**Step 1** On the MRS details page, click **Tenant**.

**Figure 3-91** Tenants tab page

 NOTE

For MRS 3.x or later, see [Overview](#).

**Step 2** Click the **Resource Pools** tab.

**Step 3** Locate the row that contains the specified resource pool, and click **Delete** in the **Operation** column.

In the displayed dialog box, click **OK**.

----End

### 3.10.11 Configuring a Queue

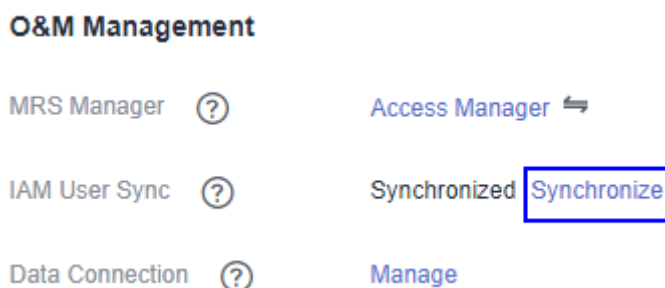

#### Scenario

You can modify the queue configuration of a specified tenant on MRS based on service requirements.

#### Prerequisites

- A tenant associated with Yarn and allocated dynamic resources has been added.
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

**Figure 3-92** Synchronizing IAM users

#### Procedure

**Step 1** On the MRS details page, click **Tenants**.

**Figure 3-93** Tenants tab page

 NOTE

For MRS 3.x or later, see [Overview](#).

**Step 2** Click the **Queue Configuration** tab.

**Step 3** In the tenant queue table, click **Modify** in the **Operation** column of the specified tenant queue.

 NOTE

- In the tenant list on the left of the **Tenant Management** tab, click the target tenant. In the window that is displayed, choose **Resource**. On the page that is displayed, click  to open the queue modification page.
- A queue can be bound to only one non-default resource pool.

Versions earlier than MRS 3.x:

**Table 3-86** Queue configuration parameters

| Parameter                                             | Description                                                                                                                                                                                                                                                 |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Applications                                  | Specifies the maximum number of applications. The value ranges from 1 to 2147483647.                                                                                                                                                                        |
| Maximum AM Resource Percent                           | Specifies the maximum percentage of resources that can be used to run the ApplicationMaster in a cluster. The value ranges from 0 to 1.                                                                                                                     |
| Minimum User Limit Percent (%)                        | Specifies the minimum percentage of resources consumed by a user. The value ranges from 0 to 100.                                                                                                                                                           |
| User Limit Factor                                     | Specifies the limit factor of the maximum user resource usage. The maximum user resource usage percentage can be obtained by multiplying the limit factor with the percentage of the tenant's actual resource usage in the cluster. The minimum value is 0. |
| Status                                                | Specifies the current status of a resource plan. The values are <b>Running</b> and <b>Stopped</b> .                                                                                                                                                         |
| Default Resource Pool (Default Node Label Expression) | Specifies the resource pool used by a queue. The default value is <b>default</b> . If you want to change the resource pool, configure the queue capacity first. For details, see <a href="#">Configuring the Queue Capacity Policy of a Resource Pool</a> . |

MRS 3.x or later:

**Table 3-87** Queue configuration parameters

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max Master Shares (%)     | Indicates the maximum percentage of resources occupied by all ApplicationMasters in the current queue.                                                                                                                                                                                                                                                       |
| Max Allocated vCores      | Indicates the maximum number of cores that can be allocated to a single YARN container in the current queue. The default value is <b>-1</b> , indicating that the number of cores is not limited within the value range.                                                                                                                                     |
| Max Allocated Memory (MB) | Indicates the maximum memory that can be allocated to a single Yarn container in the current queue. The default value is <b>-1</b> , indicating that the memory is not limited within the value range.                                                                                                                                                       |
| Max Running Apps          | Maximum number of tasks that can be executed at the same time in the current queue. The default value is <b>-1</b> , indicating that the number is not limited within the value range (the meaning is the same if the value is empty). The value <b>0</b> indicates that the task cannot be executed. The value ranges from <b>-1</b> to <b>2147483647</b> . |
| Max Running Apps per User | Maximum number of tasks that can be executed by each user in the current queue at the same time. The default value is <b>-1</b> , indicating that the number is not limited within the value range. If the value is <b>0</b> , the task cannot be executed. The value ranges from <b>-1</b> to <b>2147483647</b> .                                           |
| Max Pending Apps          | Maximum number of tasks that can be suspended at the same time in the current queue. The default value is <b>-1</b> , indicating that the number is not limited within the value range (the meaning is the same if the value is empty). The value <b>0</b> indicates that tasks cannot be suspended. The value ranges from <b>-1</b> to <b>2147483647</b> .  |
| Resource Allocation Rule  | Indicates the rule for allocating resources to different tasks of a user. The rule can be FIFO or FAIR.<br>If a user submits multiple tasks in the current queue and the rule is FIFO, the tasks are executed one by one in sequential order. If the rule is FAIR, resources are evenly allocated to all tasks.                                              |
| Default Resource Label    | Indicates that tasks are executed on a node with a specified resource label.<br><b>NOTE</b><br>If you need to use a new resource pool, change the default label to the new resource pool label.                                                                                                                                                              |

| Parameter | Description                                                                                                                                                                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Active    | <ul style="list-style-type: none"> <li>• <b>ACTIVE</b>: indicates that the current queue can receive and execute tasks.</li> <li>• <b>INACTIVE</b>: indicates that the current queue can receive but cannot execute tasks. Tasks submitted to the queue are suspended.</li> </ul> |
| Open      | <ul style="list-style-type: none"> <li>• <b>OPEN</b>: indicates that the current queue is opened.</li> <li>• <b>CLOSED</b>: indicates that the current queue is closed. Tasks submitted to the queue are rejected.</li> </ul>                                                     |

----End

### 3.10.12 Configuring the Queue Capacity Policy of a Resource Pool

#### Scenario

After a resource pool is added, the capacity policies of available resources need to be configured for Yarn task queues. This ensures that tasks in the resource pool are running properly. Each queue can be configured with the queue capacity policy of only one resource pool. Users can view the queues in any resource pool and configure queue capacity policies. After the queue policies are configured, Yarn task queues and resource pools are associated.

You can configure queue policies on MRS.

#### Prerequisites

- A resource pool has been added.
- The task queues are not associated with other resource pools. By default, all queues are associated with the **default** resource pool.
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Figure 3-94 Synchronizing IAM users

#### O&M Management

## Procedure

**Step 1** On the MRS details page, click **Tenants**.

**Figure 3-95** Tenants tab page

### NOTE

For MRS 3.x or later, see [Overview](#).

**Step 2** Click the **Resource Distribution Policies** tab.

**Step 3** In **Resource Pools**, select a specified resource pool.

**Available Resource Quota:** indicates that all resources in each resource pool are available for queues by default.

**Step 4** Locate the specified queue in the **Resource Allocation** table, and click **Modify** in the **Operation** column.

**Step 5** In **Modify Resource Allocation**, configure the resource capacity policy of the task queue in the resource pool.

- **Capacity (%)**: specifies the percentage of the current tenant's computing resource usage.
- **Maximum Capacity (%)**: specifies the percentage of the current tenant's maximum computing resource usage.

**Step 6** Click **OK** to save the settings.

----End

## 3.10.13 Clearing Configuration of a Queue

### Scenario

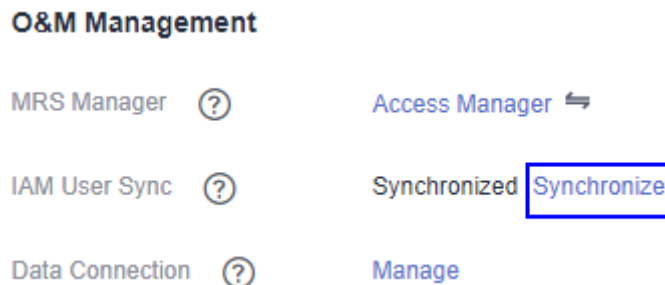

Users can clear the configuration of a queue on MRS Manager when the queue does not need resources from a resource pool or if a resource pool needs to be disassociated from the queue. Clearing queue configurations means that the resource capacity policy of the queue is canceled.

### Prerequisites

- If a queue is to be unbound from a resource pool, this resource pool cannot serve as the default resource pool of the queue. Therefore, you must first change the default resource pool of the queue to another one. For details, see [Configuring a Queue](#).

- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

**Figure 3-96** Synchronizing IAM users

## Procedure

- Step 1** On the MRS details page, click **Tenants**.

**Figure 3-97** Tenants tab page

### NOTE

For MRS 3.x or later, see [Overview](#).

- Step 2** Click the **Resource Distribution Policies** tab.
- Step 3** In **Resource Pools**, select a specified resource pool.
- Step 4** Locate the specified queue in the **Resource Allocation** table, and click **Clear** in the **Operation** column

In the **Clear Queue Configuration** dialog box, click **OK** to clear the queue configuration in the current resource pool.

### NOTE

If no resource capacity policy is configured for a queue, the clearing function is unavailable for the queue by default.

----End

## 3.11 Bootstrap Actions

### 3.11.1 Introduction to Bootstrap Actions

You can run bootstrap actions to install additional third-party software, modify the cluster running environment, and perform other customizations. Bootstrap actions can execute scripts on specified nodes before or after the first startup of cluster components. You can only manually run the third-party component installation script on the node to install a running cluster component.

If you choose to run bootstrap actions when scaling out a cluster, the bootstrap actions will be run on the newly added nodes in the same way. If auto scaling is enabled in a cluster, you can add an automation script in addition to configuring a resource plan. Then the automation script executes the corresponding script on the nodes that are scaled out or in to implement custom operations.

For versions earlier than MRS 3.x, your scripts are executed as user **root**. You can run the **su - XXX** command in a script to switch to another user.

For MRS 3.x or later, your scripts are executed as user **omm** by default. You can run the **su - XXX** command in a script to switch to another user.

#### NOTE

Versions earlier than MRS 3.x: Bootstrap action scripts must be executed as user **root**. Otherwise, your cluster may become unavailable.

MRS 3.x or later: Bootstrap action scripts must be executed as user **omm**. Otherwise, your cluster may become unavailable.

MRS determines the result based on the return code after the execution of the bootstrap action script. If the return code is **0**, the script is executed successfully. If the return code is not **0**, the execution fails. If a bootstrap action script fails to be executed on a node, the corresponding boot script will fail to be executed. In this case, you can set **Action upon Failure** to choose whether to continue to execute the subsequent scripts. Example 1: If you set **Action upon Failure** to **Continue** for all scripts during cluster creation, all the scripts will be executed regardless of whether they are successfully executed, and the startup process will be complete. Example 2: If a script fails to be executed and **Action upon Failure** is set to **Stop**, subsequent scripts will not be executed and cluster creation or scale-out will fail.

You can add a maximum of 18 bootstrap actions, which will be executed before or after the cluster component is started in the order you specified. The bootstrap actions performed before or after the component startup must be completed within 60 minutes. Otherwise, the cluster creation or scale-out will fail.

### 3.11.2 Preparing the Bootstrap Action Script

Currently, bootstrap actions support Linux shell scripts only. Script files must end with **.sh**.

### Uploading the Installation Packages and Files to an OBS File System

Before compiling a script, you need to upload all required installation packages, configuration packages, and relevant files to the OBS file system in the same region. Because networks of different regions are isolated from each other, MRS VMs cannot download OBS files from other regions.

## Compiling a Script for Downloading Files from the OBS File System

You can specify the file to be downloaded from OBS in the script. If you upload files to a private file system, you need to run the **hadoop fs** command to download the files. The following example shows that the **obs://yourbucket/myfile.tar.gz** file will be downloaded to the local host and decompressed to the **/your-dir** directory.

```
#!/bin/bash
source /opt/Bigdata/client/bigdata_env;hadoop fs -D fs.obs.endpoint=<obs-endpoint> -D fs.obs.access.key=<your-ak> -D fs.obs.secret.key=<your-sk> -copyToLocal obs://yourbucket/myfile.tar.gz ./
mkdir -p /<your-dir>
tar -zxvf myfile.tar.gz -C /<your-dir>
```

### NOTE

- The default client installation path for MRS 3.x or later is `/opt/Bigdata/client`, and for versions earlier than MRS 3.x is `/opt/client`. Configure the path based on site requirements.
- The Hadoop client has been preinstalled on the MRS node. You can run the **hadoop fs** command to download or upload data from or to OBS.
- Obtain the `obs-endpoint` of each region. For details, see [Regions and Endpoints](#).
- Commands carrying authentication passwords pose security risks. Disable historical command recording before running such commands to prevent information leakage.

## Uploading the Script to the OBS File System

After script compilation, upload the script to the OBS file system in the same region. At the time you specify, each node in the cluster downloads the script from OBS and executes the script as user **root**.

### 3.11.3 View Execution Records

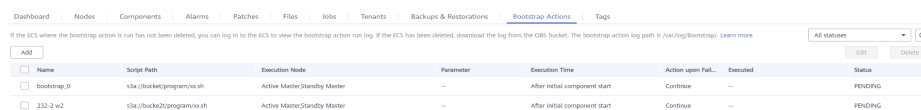

You can view the execution result of the bootstrap operation on the **Bootstrap Action** page.

#### Viewing the Execution Result

1. Log in to the MRS console.
2. In the navigation pane on the left, choose **Active Clusters**. Click a cluster you want to query.

The cluster details page is displayed.

3. On the cluster details page, click the **Bootstrap Action** tab. Information about the bootstrap actions added during cluster creation is displayed.

| Name        | Script Path                | Execution Node               | Parameter | Execution Time                | Action upon Fail | Executed | Status  |
|-------------|----------------------------|------------------------------|-----------|-------------------------------|------------------|----------|---------|
| bootstrap_0 | s3a://bucket/program/vx.sh | Active Master/Standby Master | --        | After initial component start | Continue         | --       | PENDING |
| 232-2-w2    | s3a://bucket/program/vx.sh | Active Master/Standby Master | --        | After initial component start | Continue         | --       | PENDING |

 **NOTE**

- You select **Before initial component start** or **After initial component start** in the upper right corner to query information about the related bootstrap actions.
- The last execution result is listed here. For a newly created cluster, the records of bootstrap actions executed during cluster creation are listed. If a cluster is expanded, the records of bootstrap actions executed on the newly added nodes are listed.

## Viewing Execution Logs

If you want to view the run logs of a bootstrap action, set **Action upon Failure to Continue** when adding the bootstrap action. And then, log in to each node to view the run logs in the **/var/log/Bootstrap** directory. If you add bootstrap actions before and after component start, you can distinguish bootstrap action logs of the two phases based on the timestamps.

You are advised to print logs in detail in the script so that you can view the detailed run result. MRS redirects the standard output and error output of the script to the log directory of the bootstrap action.

### 3.11.4 Adding a Bootstrap Action

Add a bootstrap action.

#### Procedure

- Step 1** Log in to the MRS management console.
- Step 2** On the **Active Clusters** page, click the name of your desired cluster.
- Step 3** On the page that is displayed, click the **Bootstrap Actions** tab.
- Step 4** Click **Add** and set parameters as prompted.

**Figure 3-98** Add Bootstrap Action

**Table 3-88** Parameters

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name           | Name of a bootstrap action script<br>The value can contain only digits, letters, spaces, hyphens (-), and underscores (_) and must not start with a space.<br>The value can contain 1 to 64 characters.<br><b>NOTE</b><br>A name must be unique in the same cluster. You can set the same name for different clusters.                                                                                                                          |
| Script Path    | Script path. The value can be an OBS file system path or a local VM path.<br><ul style="list-style-type: none"> <li>An OBS file system path must start with <b>obs://</b> and end with <b>.sh</b>, for example, <b>obs://mrs-samples/xxx.sh</b>.</li> <li>A local VM path must start with a slash (/) and end with <b>.sh</b>.</li> </ul> <b>NOTE</b><br>A path must be unique in the same cluster, but can be the same for different clusters. |
| Parameter      | Bootstrap action script parameters                                                                                                                                                                                                                                                                                                                                                                                                              |
| Execution Node | Select a type of the node where the bootstrap action script is executed.                                                                                                                                                                                                                                                                                                                                                                        |

| Parameter           | Description                                                                                                                                                                                                                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Executed            | Select the time when the bootstrap action script is executed. <ul style="list-style-type: none"><li>• Before initial component start</li><li>• After initial component start</li></ul> <b>NOTE</b><br>You can only manually run the third-party component installation script on the node to install a running cluster component.  |
| Action upon Failure | Whether to continue to execute subsequent scripts and create a cluster after the script fails to be executed.<br><b>NOTE</b><br>You are advised to set this parameter to <b>Continue</b> in the debugging phase so that the cluster can continue to be installed and started no matter whether the bootstrap action is successful. |
| Run as root         | Whether to escalate the permission to user <b>root</b><br>If the bootstrap action requires root user operations, enable this function, or the bootstrap action may fail to execute.<br><b>NOTE</b><br>This parameter is available for MRS 3.1.5 clusters.                                                                          |

**Step 5** Click **OK** to save the configuration.

**Step 6** Click **Yes**.

----End

### 3.11.5 Modifying a Bootstrap Action

#### Scenario

Modify an existing bootstrap action on an MRS cluster.

#### Procedure

**Step 1** Log in to the MRS management console.

**Step 2** On the **Active Clusters** page, click the name of your desired cluster.

**Step 3** On the page that is displayed, click the **Bootstrap Actions** tab.

**Step 4** In the list, select the item to be modified and click **Edit**.

**Step 5** Modify the parameters as needed.

**Step 6** Click **OK** to save the modification.

**Step 7** Click **Yes**.

----End

## 3.11.6 Deleting a Bootstrap Action

### Scenario

Delete a bootstrap action on an MRS cluster.

### Procedure

- Step 1** Log in to the MRS management console.
- Step 2** On the **Active Clusters** page, click the name of your desired cluster.
- Step 3** On the page that is displayed, click the **Bootstrap Actions** tab.
- Step 4** In the list, select the item to be deleted and click **Delete**.
- Step 5** Click **OK**.

----End

# 4 Using an MRS Client

---

## 4.1 Installing a Client

### 4.1.1 Installing a Client (MRS 3.x or Later)

#### Scenario

Install clients of all services (excluding Flume) in an MRS cluster. For details about how to install the Flume client, see [Installing the Flume Client](#).

You can install the clients on a node in or outside the cluster.

After modifying the server configuration of a cluster component, reinstall the component client to ensure the server and the client both run the same version to provide services properly.

#### Video Tutorial

This tutorial uses MRS 3.1.0 as an example to describe how to install and use a client.

#### NOTE

The UI may vary depending on the version. This tutorial is for reference only.

#### Prerequisites

- If the node where the client is to be installed is outside the cluster, the node must be able to communicate with the nodes in the cluster. Otherwise, client installation will fail.
- The node where the client is to be installed must have the NTP service enabled and synchronized time with the server. Otherwise, client installation will fail.
- You install the client as user **root** or any OS user. The user must have the operation permission on the client file storage directory and installation directory. The permission on the two directories is **755**.

This section uses the OS user **user\_client** as an example to describe how to install the client in the **/opt/hadoopclient** directory.

- When you install the client as a user other than **omm** or **root**, and the **/var/tmp/patch** directory already exists, you have changed the permission for the directory to **777** and changed the permission for the logs in the directory to **666**.

## Installing a Client on a Node Inside a Cluster

**Step 1** Obtain the client software package.

Log in to FusionInsight Manager by referring to [Accessing FusionInsight Manager \(MRS 3.x or Later\)](#). On the **Cluster > Dashboard** page, click the more sign (...) and select **Download Client**. In the **Download Cluster Client** dialog box displayed, configure parameters and click **OK**.

**Figure 4-1** Downloading a client

Download the **B0809** client. The cluster client provides all services.

Select Client Type: **Complete Client** Configuration Files Only

Select Platform Type:  x86\_64  aarch64

Save to Path:  ?

OK Cancel

### NOTE

- The client software package downloaded from the FusionInsight Manager homepage contains the clients of all services (excluding Flume) in the cluster. To download the client of a single service, choose **Cluster > Services > Service name**, click **More**, and select **Download Client**.
- For MRS 3.3.0 or later, click **Download Client** on the home page.

**Table 4-1** Client download parameters

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Example Value              |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| Select Client Type   | <ul style="list-style-type: none"><li>• <b>Complete Client:</b> contains the complete client software package and configuration files, which applies to non-development task scenarios.</li><li>• <b>Configuration Files Only:</b> downloads only client configuration files in the scenario where the administrator modifies the server configuration on FusionInsight Manager after the complete client is downloaded and installed in an application development task, and developers need to update client configuration files.</li></ul>                                                                                                                                                                                                 | Complete Client            |
| Select Platform Type | <p><b>The client type must match the architecture of the node where the client is to be installed. Otherwise, the installation fails. For clusters of the LTS version, only the client software package whose type is the same as that of FusionInsight Manager can be downloaded.</b></p> <ul style="list-style-type: none"><li>• <b>x86_64:</b> indicates the client software package that can be deployed on a x86 platform.</li><li>• <b>aarch64:</b> indicates the client software package that can be deployed on a TaiShan server.</li></ul>                                                                                                                                                                                           | x86_64                     |
| Save to Path         | <p>The path for storing the client software package on the active OMS node</p> <ul style="list-style-type: none"><li>• <b>Select Save to Path:</b> Customize the path for storing the client software package on the active OMS node. User <b>omm</b> must have the read, write, and execute permissions on the path.<br/>If the path is not changed, the client file generated is saved in the <b>/tmp/FusionInsight-Client</b> directory on the active OMS node in the cluster by default.</li><li>• <b>Not to select Save to Path:</b> The generated client file is automatically downloaded and saved to the local host. Before installing the client, you need to upload the file to a specified directory on the target node.</li></ul> | Select <b>Save to Path</b> |

**Step 2** Copy the client software package to a specified directory on the node where the client is to be installed.

By default, the client software package is stored on the active OMS node in the cluster. To install the client on other nodes in the cluster, log in to the active OMS node as user **omm** and run the following command to copy the software package to the specified node. Otherwise, skip this step.

For example, copy the software package to the **/tmp/clienttemp** directory.

```
scp -p /tmp/FusionInsight-Client/FusionInsight_Cluster_1_Services_Client.tar IP
address of the node where the client is to be installed:/tmp/clienttemp
```

**Step 3** Log in to the target node as a user, for example, **user\_client**.

 **NOTE**

You can install the client as user **root** or any other OS user. The user must have the operation permission on the client file storage directory and installation directory. The permission on the two directories is **755**.

**Step 4** Decompress the client software package.

1. Go to the directory where the package is stored, for example, **/tmp/clienttemp**.

```
cd /tmp/clienttemp
```

2. Run the following commands to decompress the package and obtain **FusionInsight\_Cluster\_1\_Services\_ClientConfig.tar**:

```
tar -xvf FusionInsight_Cluster_1_Services_Client.tar
```

3. Run the following command to verify the decompressed file and check whether the command output is consistent with the information in the **sha256** file.

```
sha256sum -c FusionInsight_Cluster_1_Services_ClientConfig.tar.sha256
```

```
FusionInsight_Cluster_1_Services_ClientConfig.tar: OK
```

4. Run the following command to decompress

```
FusionInsight_Cluster_1_Services_ClientConfig.tar:
```

```
tar -xvf FusionInsight_Cluster_1_Services_ClientConfig.tar
```

**Step 5** Go to the package directory and run the following command to install the client to a specified directory:

```
cd FusionInsight_Cluster_1_Services_ClientConfig
```

```
./install.sh Client installation directory
```

For example, run the **./install.sh /opt/hadoopclient** command to install the client and wait until the installation is complete.

```
...
The component client is installed successfully
```

 **NOTE**

- If there is no specified client installation directory, it will be automatically created. If you specify an existing directory, it must be empty, and the path cannot contain spaces. The value can contain only uppercase letters, lowercase letters, digits, and underscores (**\_**).
- You need to manually delete the client installation directory when uninstalling a client.
- To ensure that the installed client can be used only by the installation user, add the **-o** parameter during the installation. For example, run the **./install.sh /opt/hadoopclient -o** command to install the client.

**Step 6** Use the client by referring to "Using the client of Each Component".

----End

## Installing a Client on a Node Outside a Cluster

**Step 1** Create an ECS that meets the following requirements:

- A Linux ECS has been prepared. For details about the supported OS of the ECS, see [Table 4-2](#).

**Table 4-2** Reference list

| CPU Architecture        | OS      | Supported Version                               |
|-------------------------|---------|-------------------------------------------------|
| x86 computing           | EulerOS | EulerOS 2.5                                     |
|                         | SUSE    | SUSE Linux Enterprise Server 12 SP4 (SUSE 12.4) |
|                         | Red Hat | Red Hat-7.5-x86_64 (Red Hat 7.5)                |
|                         | CentOS  | CentOS 7.6                                      |
| Kunpeng computing (Arm) | EulerOS | EulerOS 2.8                                     |
|                         | CentOS  | CentOS 7.6                                      |

In addition, sufficient disk space is allocated for the ECS, for example, 40 GB.

- The ECS and the MRS cluster are in the same VPC.
- The security group of the ECS must be the same as that of the master node in the MRS cluster.
- The NTP service has been installed on the ECS OS and is running properly. If the NTP service is not installed, run the **yum install ntp -y** command to install it when the **yum** source is configured.
- A user can log in to the Linux ECS using the password (in SSH mode).
- All ports in the inbound direction of the MRS cluster security group are open to the client node. For details, see [Adding a Security Group Rule](#).

**Step 2** Perform NTP time synchronization to synchronize the time of nodes outside the cluster with the time of the MRS cluster.

1. Run the **vi /etc/ntp.conf** command to edit the NTP client configuration file, add the IP addresses of the master node in the MRS cluster, and comment out the IP address of other servers.

```
server master1_ip prefer
server master2_ip
```

Figure 4-2 Adding the master node IP addresses

```
For more information about this file, see the man pages
ntp.conf(5), ntp_acc(5), ntp_auth(5), ntp_clock(5), ntp_misc(5), ntp_mon(5).

driftfile /var/lib/ntp/drift

Permit time synchronization with our time source, but do not
permit the source to query or modify the service on this system.

#manycastclient autokey # manycast client

Enable public key cryptography.
#crypto
```

2. Run the **service ntpd stop** command to stop the NTP service.
3. Run the following command to manually synchronize the time:  
**/usr/sbin/ntpdate 192.168.10.8**

 NOTE

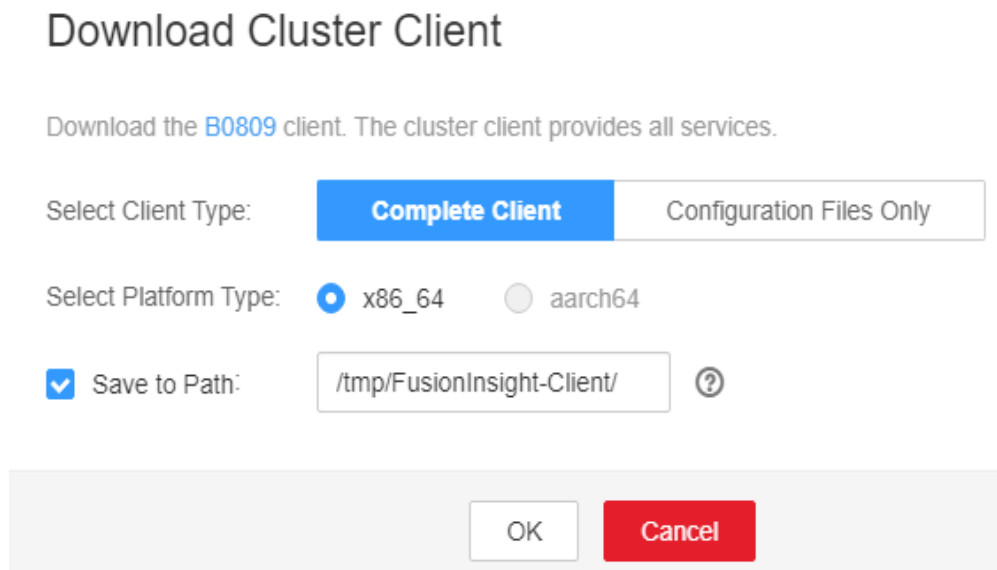

192.168.10.8 indicates the IP address of the active Master node.

4. Run the **service ntpd start** or **systemctl restart ntpd** command to start the NTP service.
5. Run the **ntpstat** command to check the time synchronization result.

**Step 3** Obtain the client software package.

Log in to FusionInsight Manager by referring to [Accessing FusionInsight Manager \(MRS 3.x or Later\)](#). On the **Cluster > Dashboard** page, click the more sign (...) and select **Download Client**. In the **Download Cluster Client** dialog box displayed, configure parameters and click **OK**.

**Figure 4-3** Downloading a client

**NOTE**

- The client software package downloaded from the FusionInsight Manager homepage contains the clients of all services (excluding Flume) in the cluster. To download the client of a single service, choose **Cluster > Services > Service name**, click **More**, and select **Download Client**.
- For MRS 3.3.0 or later, click **Download Client** on the home page.

**Table 4-3** Client download parameters

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Example Value   |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Select Client Type | <ul style="list-style-type: none"> <li>• <b>Complete Client:</b> contains the complete client software package and configuration files, which applies to non-development task scenarios.</li> <li>• <b>Configuration Files Only:</b> downloads only client configuration files in the scenario where the administrator modifies the server configuration on FusionInsight Manager after the complete client is downloaded and installed in an application development task, and developers need to update client configuration files.</li> </ul> | Complete Client |

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Example Value              |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| Select Platform Type | <p><b>The client type must match the architecture of the node where the client is to be installed. Otherwise, the installation fails. For clusters of the LTS version, only the client software package whose type is the same as that of FusionInsight Manager can be downloaded.</b></p> <ul style="list-style-type: none"> <li>• <b>x86_64</b>: indicates the client software package that can be deployed on a x86 platform.</li> <li>• <b>aarch64</b>: indicates the client software package that can be deployed on a TaiShan server.</li> </ul>                                                                                                                                                                                           | x86_64                     |
| Save to Path         | <p>The path for storing the client software package on the active OMS node</p> <ul style="list-style-type: none"> <li>• <b>Select Save to Path</b>: Customize the path for storing the client software package on the active OMS node. User <b>omm</b> must have the read, write, and execute permissions on the path.<br/>If the path is not changed, the client file generated is saved in the <b>/tmp/FusionInsight-Client</b> directory on the active OMS node in the cluster by default.</li> <li>• <b>Not to select Save to Path</b>: The generated client file is automatically downloaded and saved to the local host. Before installing the client, you need to upload the file to a specified directory on the target node.</li> </ul> | Select <b>Save to Path</b> |

**Step 4** Copy the client software package to a specified directory on the node where the client is to be installed.

The generated client software package is stored on the active OMS node of the cluster by default. You need to log in to the active OMS node as user **omm** and run the following command to copy the software package to a specified ECS:

For example, copy the software package to the **/tmp/clienttemp** directory.

```
scp -p /tmp/FusionInsight-Client/FusionInsight_Cluster_1_Services_Client.tar IP
address of the node where the client is to be installed:/tmp/clienttemp
```

**Step 5** Log in to the target node as a user, for example, **user\_client**.

 **NOTE**

You can install the client as user **root** or any other OS user. The user must have the operation permission on the client file storage directory and installation directory. The permission on the two directories is **755**.

**Step 6** Decompress the client software package.

1. Go to the directory where the package is stored, for example, `/tmp/clienttemp`.
2. Run the following commands to decompress the package and obtain `FusionInsight_Cluster_1_Services_ClientConfig.tar`:
3. Run the following command to verify the decompressed file and check whether the command output is consistent with the information in the `sha256` file.

```
cd /tmp/clienttemp
```

```
tar -xvf FusionInsight_Cluster_1_Services_ClientConfig.tar
```

```
sha256sum -c FusionInsight_Cluster_1_Services_ClientConfig.tar.sha256
```

```
FusionInsight_Cluster_1_Services_ClientConfig.tar: OK
```

4. Run the following command to decompress `FusionInsight_Cluster_1_Services_ClientConfig.tar`:

```
tar -xvf FusionInsight_Cluster_1_Services_ClientConfig.tar
```

**Step 7** Check the network connection of the client.

1. Ensure that the host where the client is installed can communicate with the hosts listed in the `hosts` file stored in the directory containing the decompressed package, for example, `/tmp/FusionInsight_Cluster_1_Services_ClientConfig/hosts`.
2. If the host where the client is installed is not a host in the cluster, you need to set the mapping between the host name and the service plane IP address for each cluster node in `/etc/hosts`, as user `root`. Each host name uniquely maps an IP address. You can perform the following steps to import the domain name mapping of the cluster to the `hosts` file:
  - a. Switch to user `root` or a user who has the permission to modify the `hosts` file.

```
su - root
```
  - b. Go to the directory where the client package is decompressed.

```
cd /tmp/clienttemp/FusionInsight_Cluster_1_Services_ClientConfig
```
  - c. Run the `cat realm.ini >> /etc/hosts` command to import the domain name mapping to the `hosts` file.

 **NOTE**

- If the host where the client is installed is not a node in the cluster, configure network connections for the client to prevent errors when you run commands on the client.
- If Spark tasks are executed in yarn-client mode, add the `spark.driver.host` parameter to the file `Client installation directory/Spark/spark/conf/spark-defaults.conf` and set the parameter to the client IP address.
- If the yarn-client mode is used, you need to configure the mapping between the IP address and host name of the client in the `hosts` file on the active and standby Yarn nodes (ResourceManager nodes in the cluster) to make sure that the Spark web UI is properly displayed.

**Step 8** Log in to the node where the client is to be installed as user `user_client`, go to the client software package directory, and run the following command to install the client to a specified directory:

```
cd /tmp/clienttemp/FusionInsight_Cluster_1_Services_ClientConfig
```

`./install.sh` *Client installation directory*

For example, run the `./install.sh /opt/hadoopclient` command to install the client and wait until the installation is complete.

```
...
The component client is installed successfully
```

 **NOTE**

- If there is no specified client installation directory, it will be automatically created. If you specify an existing directory, it must be empty, and the path cannot contain spaces. The value can contain only uppercase letters, lowercase letters, digits, and underscores (\_).
- You need to manually delete the client installation directory when uninstalling a client.
- To ensure that the installed client can be used only by the installation user, add the `-o` parameter during the installation. For example, run the `./install.sh /opt/hadoopclient -o` command to install the client.

**Step 9** Use the client by referring to "Using the client of Each Component".

----End

## 4.1.2 Installing a Client (Versions Earlier Than 3.x)

### Scenario

An MRS client is required. The MRS cluster client can be installed on the Master or Core node in the cluster or on a node outside the cluster.

After a cluster of versions earlier than MRS 3.x is created, a client is installed on the active Master node by default. You can directly use the client. The installation directory is `/opt/client`.

For details about how to install a client of MRS 3.x or later, see [Installing a Client \(MRS 3.x or Later\)](#).

 **NOTE**

If a client has been installed on the node outside the MRS cluster and the client only needs to be updated, update the client using the user who installed the client, for example, user `root`.

### Installing a Client on the Core Node

1. Log in to MRS Manager and choose **Services > Download Client** to download the client installation package to the active management node.

 **NOTE**

If only the client configuration file needs to be updated, see method 2 in [Updating a Client \(Versions Earlier Than 3.x\)](#).

2. Use the IP address to search for the active management node, and log in to the active management node using VNC.
3. Log in to the active management node, and run the following command to switch the user:

```
sudo su - omm
```

4. On the MRS management console, view the IP address on the **Nodes** tab page of the specified cluster.  
Record the IP address of the Core node where the client is to be used.
5. On the active management node, run the following command to copy the client installation package to the Core node:  
**scp -p /tmp/MRS-client/MRS\_Services\_Client.tar IP address of the Core node:/opt/client**
6. Log in to the Core node as user **root**.  
Master nodes support Cloud-Init. The preset username for Cloud-Init is **root** and the password is the one you set during cluster creation.
7. Run the following commands to install the client:  
**cd /opt/client**  
**tar -xvf MRS\_Services\_Client.tar**  
**tar -xvf MRS\_Services\_ClientConfig.tar**  
**cd /opt/client/MRS\_Services\_ClientConfig**  
**./install.sh Client installation directory**  
For example, run the following command:  
**./install.sh /opt/client**
8. For details about how to use the client, see [Using an MRS Client](#).

## Using an MRS Client

1. On the node where the client is installed, run the **sudo su - omm** command to switch the user. Run the following command to go to the client directory:  
**cd /opt/client**
2. Run the following command to configure environment variables:  
**source bigdata\_env**
3. If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step.  
**kinit MRS cluster user**  
Example: **kinit admin**  
  
 **NOTE**  
User **admin** is created by default for MRS clusters with Kerberos authentication enabled and is used for administrators to maintain the clusters.
4. Run the client command of a component directly.  
For example, run the **hdfs dfs -ls /** command to view files in the HDFS root directory.

## Installing a Client on a Node Outside the Cluster

**Step 1** Create an ECS that meets the following requirements:

- For clusters of versions earlier than MRS 3.x, you need to confirm the CPU architecture of the current MRS cluster nodes. For clusters of versions earlier than MRS 3.x, the CPU architecture of the ECS must be the same as that of

the MRS cluster node. For MRS 3.x or later, the MRS client is compatible with both of the following CPU architectures.

- An ECS has been prepared. For details about the OS and its version of the ECS, see [Table 4-4](#).

**Table 4-4** Reference list

| CPU Architecture        | OS      | Supported Version                                                                                                                          |
|-------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------|
| x86 computing           | EulerOS | <ul style="list-style-type: none"><li>- Available: EulerOS 2.2</li><li>- Available: EulerOS 2.3</li><li>- Available: EulerOS 2.5</li></ul> |
| Kunpeng computing (Arm) | EulerOS | Available: EulerOS 2.8                                                                                                                     |

For example, a user can select an ECS running the EulerOS.

In addition, sufficient disk space is allocated for the ECS, for example, 40 GB.

- The ECS and the MRS cluster are in the same VPC.
- The security group of the ECS is the same as that of the master node in the MRS cluster.

If this requirement is not met, modify the ECS security group or configure the inbound and outbound rules of the ECS security group to allow the ECS security group to be accessed by all security groups of MRS cluster nodes.

- To enable users to log in to a Linux ECS using a password (SSH), see *"Instances" > "Logging In to a Linux ECS" > "Login Using an SSH Password"* in *Elastic Cloud Server User Guide*.
- All ports in the inbound direction of the MRS cluster security group are open to the client node. For details, see [Adding a Security Group Rule](#).

**Step 2** Log in to MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#). Then, choose **Services**.

**Step 3** Click **Download Client**.

**Step 4** In **Client Type**, select **All client files**.

**Step 5** In **Download To**, select **Remote host**.

**Step 6** Set **Host IP Address** to the IP address of the ECS, **Host Port** to **22**, and **Save Path** to **/tmp**.

- If the default port **22** for logging in to an ECS using SSH has been changed, set **Host Port** to the new port.
- **Save Path** contains a maximum of 256 characters.

**Step 7** Set **Login User** to **root**.

If other users are used, ensure that the users have read, write, and execute permission on the save path.

**Step 8** Select **Password** or **SSH Private Key** for **Login Mode**.

- **Password:** Enter the password of user **root** set during cluster creation.
- **SSH Private Key:** Select and upload the key file used for creating the cluster.

**Step 9** Click **OK** to generate a client file.

If the following information is displayed, the client package is saved. Click **Close**. Obtain the client file from the save path on the remote host that is set when the client is downloaded.

Client files downloaded to the remote host successfully.

If the following information is displayed, check the username, password, and security group configurations of the remote host. Ensure that the username and password are correct and an inbound rule of the SSH (22) port has been added to the security group of the remote host. And then, go to [Step 2](#) to download the client again.

Failed to connect to the server. Please check the network connection or parameter settings.

 **NOTE**

Generating a client will occupy a large number of disk I/Os. You are advised not to download a client when the cluster is being installed, started, and patched, or in other unstable states.

**Step 10** Log in to the ECS using VNC. For details, see **Instance > Logging In to a Linux > Logging In to a Linux** in the *Elastic Cloud Server User Guide*

All images support Cloud-Init. The preset username for Cloud-Init is **root** and the password is the one you set during cluster creation. It is recommended that you change the password upon the first login.

**Step 11** Perform NTP time synchronization to synchronize the time of nodes outside the cluster with the time of the MRS cluster.

1. Check whether the NTP service is installed. If it is not installed, run the **yum install ntp -y** command to install it.
2. Run the **vim /etc/ntp.conf** command to edit the NTP client configuration file, add the IP address of the Master node in the MRS cluster, and comment out the IP addresses of other servers.

```
server master1_ip prefer
server master2_ip
```

Figure 4-4 Adding the master node IP addresses

```
For more information about this file, see the man pages
ntp.conf(5), ntp_acc(5), ntp_auth(5), ntp_clock(5), ntp_misc(5), ntp_mon(5).

driftfile /var/lib/ntp/drift

Permit time synchronization with our time source, but do not
permit the source to query or modify the service on this system.

#manycastclient # autokey # manycast client

Enable public key cryptography.
#crypto
```

3. Run the **service ntpd stop** command to stop the NTP service.
4. Run the following command to manually synchronize the time:  
**/usr/sbin/ntpdate 192.168.10.8**

**NOTE**

192.168.10.8 indicates the IP address of the active Master node.

5. Run the **service ntpd start** or **systemctl restart ntpd** command to start the NTP service.
6. Run the **ntpstat** command to check the time synchronization result:

**Step 12** On the ECS, switch to user **root** and copy the installation package in **Save Path** in **Step 6** to the **/opt** directory. For example, if **Save Path** is set to **/tmp**, run the following commands:

```
sudo su - root
```

```
cp /tmp/MRS_Services_Client.tar /opt
```

**Step 13** Run the following command in the **/opt** directory to decompress the package and obtain the verification file and the configuration package of the client:

```
tar -xvf MRS_Services_Client.tar
```

**Step 14** Run the following command to verify the configuration file package of the client:

```
sha256sum -c MRS_Services_ClientConfig.tar.sha256
```

The command output is as follows:

```
MRS_Services_ClientConfig.tar: OK
```

**Step 15** Run the following command to decompress **MRS\_Services\_ClientConfig.tar**:

```
tar -xvf MRS_Services_ClientConfig.tar
```

**Step 16** Run the following command to install the client to a new directory, for example, **/opt/Bigdata/client**. A directory is automatically generated during the client installation.

```
sh /opt/MRS_Services_ClientConfig/install.sh /opt/Bigdata/client
```

If the following information is displayed, the client has been successfully installed:

```
Components client installation is complete.
```

**Step 17** Check whether the IP address of the ECS node is connected to the IP address of the cluster Master node.

For example, run the following command: **ping** *Master node IP address*.

- If yes, go to **Step 18**.
- If no, check whether the VPC and security group are correct and whether the ECS and the MRS cluster are in the same VPC and security group, and go to **Step 18**.

**Step 18** Run the following command to configure environment variables:

```
source /opt/Bigdata/client/bigdata_env
```

**Step 19** If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step.

```
kinit MRS cluster user
```

Example: **kinit admin**

**Step 20** Run the client command of a component.

For example, run the following command to query the HDFS directory:

```
hdfs dfs -ls /
```

```
----End
```

## 4.2 Updating a Client

### 4.2.1 Updating a Client (Version 3.x or Later)

A cluster provides a client for you to connect to a server, view task results, or manage data. If you modify service configuration parameters on Manager and restart the service, you need to download and install the client again or use the configuration file to update the client.

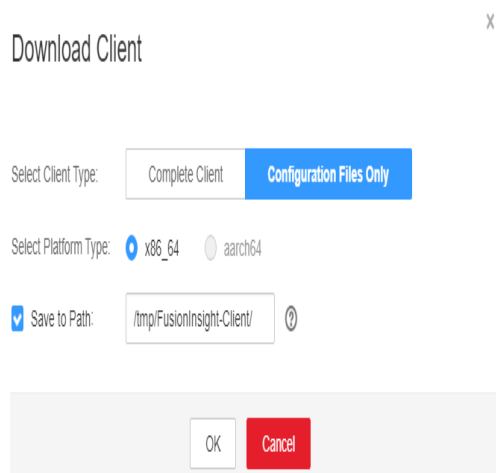

#### Updating the Client Configuration

**Method 1:**

**Step 1** Log in to FusionInsight Manager. For details, see [Accessing FusionInsight Manager \(MRS 3.x or Later\)](#). Click the name of the cluster to be operated in the **Cluster** drop-down list.

**Step 2** Choose **More > Download Client > Configuration Files Only**.

The generated compressed file contains the configuration files of all services.

**Step 3** Determine whether to generate a configuration file on the cluster node.

- If yes, select **Save to Path**, and click **OK** to generate the client file. By default, the client file is generated in **/tmp/FusionInsight-Client** on the active management node. You can also store the client file in other directories, and user **omm** has the read, write, and execute permissions on the directories. Then go to [Step 4](#).
- If no, click **OK**, specify a local save path, and download the complete client. Wait until the download is complete and go to [Step 4](#).

**Step 4** Use WinSCP to save the compressed file to the client installation directory, for example, **/opt/hadoopclient**, as the client installation user.

**Step 5** Decompress the software package.

Run the following commands to go to the directory where the client is installed, and decompress the file to a local directory. For example, the downloaded client file is **FusionInsight\_Cluster\_1\_Services\_Client.tar**.

```
cd /opt/hadoopclient
```

```
tar -xvf FusionInsight_Cluster_1_Services_Client.tar
```

**Step 6** Verify the software package.

Run the following command to verify the decompressed file and check whether the command output is consistent with the information in the **sha256** file.

```
sha256sum -c
FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles.tar.sha256
```

```
FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles.tar: OK
```

**Step 7** Decompress the package to obtain the configuration file.

```
tar -xvf FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles.tar
```

**Step 8** Run the following command in the client installation directory to update the client using the configuration file:

```
sh refreshConfig.sh Client installation directory Directory where the configuration file is located
```

For example, run the following command:

```
sh refreshConfig.sh /opt/hadoopclient /opt/hadoopclient/
FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles
```

If the following information is displayed, the configurations have been updated successfully.

```
Succeed to refresh components client config.
```

----End

**Method 2:**

**Step 1** Log in to the client installation node as user **root**.

**Step 2** Go to the client installation directory, for example, **/opt/hadoopclient** and run the following commands to update the configuration file:

```
cd /opt/hadoopclient
```

```
sh autoRefreshConfig.sh
```

**Step 3** Enter the username and password of the FusionInsight Manager administrator and the floating IP address of OMS.

 **NOTE**

To obtain the floating IP address of OMS, log in to the Master2 node remotely, and run the **ifconfig** command. In the command output, **eth0:wsom** indicates the floating IP address of OMS. Record the value of **inet**. If the floating IP address of OMS cannot be queried on the Master2 node, switch to the Master1 node to query and record the floating IP address. If there is only one Master node, query and record the IP address on the Master node.

**Step 4** Enter the names of the components whose configuration needs to be updated. Use commas (,) to separate the component names. Press **Enter** to update the configurations of all components if necessary.

If the following information is displayed, the configurations have been updated successfully.

```
Succeed to refresh components client config.
```

----End

## 4.2.2 Updating a Client (Versions Earlier Than 3.x)

 **NOTE**

This section applies to clusters of versions earlier than MRS 3.x. For MRS 3.x or later, see [Updating a Client \(Version 3.x or Later\)](#).

## Updating a Client Configuration File

### Scenario

An MRS cluster provides a client for you to connect to a server, view task results, or manage data. Before using an MRS client, you need to download and update the client configuration file if service configuration parameters are modified and a service is restarted on MRS Manager.

During cluster creation, the original client is stored in the `/opt/client` directory on all nodes in the cluster by default. After the cluster is created, only the client of a Master node can be directly used. To use the client of a Core node, you need to update the client configuration file first.

### Procedure

#### Method 1: applicable to all versions

**Step 1** Log in to MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#). Then, choose **Services**.

**Step 2** Click **Download Client**.

Set **Client Type** to **Only configuration files**, **Download To** to **Server**, and click **OK** to generate the client configuration file. The generated file is saved in the `/tmp/MRS-client` directory on the active management node by default. You can customize the file path.

**Figure 4-5** Downloading the client configuration file

### Download Client

**Warning:** Generating a client will occupy a large number of disk I/Os. You are advised not to download a client when the cluster is being installed, started, and patched, or in other unstable states.

\* Client Type  All client files  Only configuration files

\* Download To  Server  Remote host

Files will only be saved to the following path on the server. Existing client files in the path will be overwritten.

\* Client Path

OK

Cancel

**Step 3** Query and log in to the active Master node.

**Step 4** If you use the client in the cluster, run the following command to switch to user **omm**. If you use the client outside the cluster, switch to user **root**.

**sudo su - omm**

**Step 5** Run the following command to go to the client directory:

```
cd Client installation directory
```

**Step 6** Run the following command to update client configurations:

```
sh refreshConfig.sh Client installation directory Full path of the client configuration file package
```

For example, run the following command:

```
sh refreshConfig.sh /opt/Bigdata/client /tmp/MRS-client/
MRS_Services_Client.tar
```

If the following information is displayed, the configurations have been updated successfully.

```
ReFresh components client config is complete.
Succeed to refresh components client config.
```

----End

#### Method 2:

**Step 1** After the cluster is installed, run the following command to switch to user **omm**. If you use the client outside the cluster, switch to user **root**.

```
sudo su - omm
```

**Step 2** Run the following command to go to the client directory:

```
cd Client installation directory
```

**Step 3** Run the following command and enter the name of an MRS Manager user with the download permission and its password (for example, the username is **admin** and the password is the one set during cluster creation) as prompted to update client configurations.

```
sh autoRefreshConfig.sh
```

**Step 4** After the command is executed, the following information is displayed, where *XXX* indicates the name of the component installed in the cluster. To update client configurations of all components, press **Enter**. To update client configurations of some components, enter the component names and separate them with commas (,).

```
Components "xxx" have been installed in the cluster. Please input the comma-separated names of the components for which you want to update client configurations. If you press Enter without inputting any component name, the client configurations of all components will be updated:
```

If the following information is displayed, the configurations have been updated successfully.

```
Succeed to refresh components client config.
```

If the following information is displayed, the username or password is incorrect.

```
login manager failed,Incorrect username or password.
```

 NOTE

- This script automatically connects to the cluster and invokes the **refreshConfig.sh** script to download and update the client configuration file.
- By default, the client uses the floating IP address specified by **wsom=xxx** in the **Version** file in the installation directory to update the client configurations. To update the configuration file of another cluster, modify the value of **wsom=xxx** in the **Version** file to the floating IP address of the corresponding cluster before performing this step.

----End

## Fully Updating the Original Client of the Active Master Node

### Scenario

During cluster creation, the original client is stored in the **/opt/client** directory on all nodes in the cluster by default. The following uses **/opt/Bigdata/client** as an example.

- For a normal MRS cluster, you will use the pre-installed client on a Master node to submit a job on the management console page.
- You can also use the pre-installed client on the Master node to connect to a server, view task results, and manage data.

After installing the patch on the cluster, you need to update the client on the Master node to ensure that the functions of the built-in client are available.

### Procedure

**Step 1** Log in to MRS Manager. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#). Then, choose **Services**.

**Step 2** Click **Download Client**.

Set **Client Type** to **All client files**, **Download To** to **Server**, and click **OK** to generate the client configuration file. The generated file is saved in the **/tmp/MRS-client** directory on the active management node by default. You can customize the file path.

**Step 3** Query and log in to the active Master node.

**Step 4** On the ECS, switch to user **root** and copy the installation package to the **/opt** directory.

```
sudo su - root
```

```
cp /tmp/MRS-client/MRS_Services_Client.tar /opt
```

**Step 5** Run the following command in the **/opt** directory to decompress the package and obtain the verification file and the configuration package of the client:

```
tar -xvf MRS_Services_Client.tar
```

**Step 6** Run the following command to verify the configuration file package of the client:

```
sha256sum -c MRS_Services_ClientConfig.tar.sha256
```

The command output is as follows:

```
MRS_Services_ClientConfig.tar: OK
```

**Step 7** Run the following command to decompress **MRS\_Services\_ClientConfig.tar**:

```
tar -xvf MRS_Services_ClientConfig.tar
```

**Step 8** Run the following command to move the original client to the **/opt/Bigdata/client\_bak** directory:

```
mv /opt/Bigdata/client /opt/Bigdata/client_bak
```

**Step 9** Run the following command to install the client in a new directory. The client path must be **/opt/Bigdata/client**.

```
sh /opt/MRS_Services_ClientConfig/install.sh /opt/Bigdata/client
```

If the following information is displayed, the client has been successfully installed:

```
Components client installation is complete.
```

**Step 10** Run the following command to modify the user and user group of the **/opt/Bigdata/client** directory:

```
chown omm:wheel /opt/Bigdata/client -R
```

**Step 11** Run the following command to configure environment variables:

```
source /opt/Bigdata/client/bigdata_env
```

**Step 12** If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step.

```
kinit MRS cluster user
```

Example: **kinit admin**

**Step 13** Run the client command of a component.

For example, run the following command to query the HDFS directory:

```
hdfs dfs -ls /
```

```
----End
```

## Fully Updating the Original Client of the Standby Master Node

**Step 1** Repeat [Step 1](#) to [Step 3](#) to log in to the standby Master node, and run the following command to switch to user **omm**:

```
sudo su - omm
```

**Step 2** Run the following command on the standby master node to copy the downloaded client package from the active master node:

```
scp omm@master1 nodeIP address:/tmp/MRS-client/
MRS_Services_Client.tar /tmp/MRS-client/
```

### NOTE

- In this command, **master1** node is the active master node.
- **/tmp/MRS-client/** is an example target directory of the standby master node.

**Step 3** Repeat [Step 4](#) to [Step 13](#) to update the client of the standby Master node.

----End

## 4.3 Using the Client of Each Component

### 4.3.1 Using a ClickHouse Client

ClickHouse is a column-based database oriented to online analysis and processing. It supports SQL query and provides good query performance. The aggregation analysis and query performance based on large and wide tables is excellent, which is one order of magnitude faster than other analytical databases.

#### Prerequisites

The client has been installed in a directory, for example, `/opt/client`. The client directory in the following operations is only an example. Change it to the actual installation directory. Before using the client, download and update the client configuration file, and ensure that the active management node of Manager is available.

#### Procedure

**Step 1** Install the client. For details, see [Installing a Client](#).

**Step 2** Log in to the node where the client is installed as the client installation user.

**Step 3** Run the following command to go to the client installation directory:

```
cd /opt/client
```

**Step 4** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 5** If Kerberos authentication has been enabled for the current cluster, run the following command to authenticate the user. The current user must have the permission to create ClickHouse tables. For details about how to configure the permission, see [ClickHouse User and Permission Management](#), and bind roles to the user. If Kerberos authentication is disabled for the current cluster, skip this step.

For an MRS 3.1.0 cluster, run the `export CLICKHOUSE_SECURITY_ENABLED=true` command first.

```
kinit Component service user
```

Example: `kinit clickhouseuser`

**Step 6** Run the client command of the ClickHouse component.

Run the `clickhouse -h` command to view the command help of ClickHouse.

The command output is as follows:

```
Use one of the following commands:
clickhouse local [args]
```

```
clickhouse client [args]
clickhouse benchmark [args]
clickhouse server [args]
clickhouse performance-test [args]
clickhouse extract-from-config [args]
clickhouse compressor [args]
clickhouse format [args]
clickhouse copier [args]
clickhouse obfuscator [args]
...
```

For MRS 3.1.0, run the **clickhouse client** command to connect to the ClickHouse server.

- Command for using a non-SSL mode to log in to a ClickHouse cluster with Kerberos authentication disabled  
**clickhouse client --host *IP address of the ClickHouse instance* --port 9000 --user *Username* --password**  
*Enter the user password.*

- Using SSL for login when Kerberos authentication is enabled for the current cluster:

There are no default users in clusters with Kerberos authentication enabled. You must create a user on FusionInsight Manager. For details about how to create a user, see [ClickHouse User and Permission Management](#).

After the user authentication is successful, you do not need to carry the **--user** and **--password** parameters when logging in to the client as the authenticated user.

**clickhouse client --host *IP address of the ClickHouse instance* --port 9440 --secure**

For MRS 3.1.2 or later, run the **clickhouse client** command to connect to the ClickHouse server.

- Command for using a non-SSL mode to log in to a ClickHouse cluster with Kerberos authentication disabled  
**clickhouse client --host *IP address of the ClickHouse instance* --port 9000 --user *Username* --password**  
*Enter the user password.*

- Using SSL for login when Kerberos authentication is enabled for the current cluster:

There are no default users in clusters with Kerberos authentication enabled. You must create a user on FusionInsight Manager. For details about how to create a user, see [ClickHouse User and Permission Management](#).

**clickhouse client --host *IP address of the ClickHouse instance* --port 9440 --user *Username* --password --secure**

*Enter the user password.*

Run the **quit;** command to exit the ClickHouse server connection.

[Table 4-5](#) describes related parameters.

**Table 4-5** Parameters of the **clickhouse client** command

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| --host      | <p>Host name of the server. The default value is <b>localhost</b>. You can use the host name or IP address of the node where the ClickHouse instance is located.</p> <p><b>NOTE</b><br/>You can log in to FusionInsight Manager and choose <b>Cluster &gt; Services &gt; ClickHouse &gt; Instance</b> to obtain the service IP address of the ClickHouseServer instance.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| --port      | <p>Port for connection.</p> <ul style="list-style-type: none"><li>• If the SSL security connection is used, the default port number is <b>9440</b>, the parameter <b>--secure</b> must be carried. For details about the port number, search for the <b>tcp_port</b> parameter in the ClickHouseServer instance configuration.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| --user      | <p>Username.</p> <p>You can create a user on FusionInsight Manager and bind roles to it. For details about how to create a user, see <a href="#">ClickHouse User and Permission Management</a>.</p> <ul style="list-style-type: none"><li>• If Kerberos authentication has been enabled for the current cluster (the cluster is in security mode) and the user authentication is successful, you do not need to carry the <b>--user</b> and <b>--password</b> parameters during your login to the client as the authenticated user. You must create a user with this name on Manager because there is no default user in the Kerberos cluster scenario.</li><li>• If Kerberos authentication has not been enabled for the current cluster (the cluster is in normal mode), you cannot use the ClickHouse user created on FusionInsight Manager if you need to specify the username and password when you log in to the client. You need to execute the <b>create user SQL</b> statement on the client to create a ClickHouse user. If you do not need to specify the username and password during your login to the client, the default user is used by default.</li></ul> |
| --password  | <p>Password. The default password is an empty string. This parameter is used together with the <b>--user</b> parameter. You can set a password when creating a user on Manager.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| --query     | <p>Query to process when using non-interactive mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| --database  | <p>Current default database. The default value is <b>default</b>, which is the default configuration on the server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| --multiline | <p>If this parameter is specified, multiline queries are allowed. (<b>Enter</b> only indicates line feed and does not indicate that the query statement is complete.)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Parameter      | Description                                                                                                                                                                                                                                                |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| --multiquery   | If this parameter is specified, multiple queries separated with semicolons (;) can be processed. This parameter is valid only in non-interactive mode.                                                                                                     |
| --format       | Specified default format used to output the result.                                                                                                                                                                                                        |
| --vertical     | If this parameter is specified, the result is output in vertical format by default. In this format, each value is printed on a separate line, which helps to display a wide table.                                                                         |
| --time         | If this parameter is specified, the query execution time is printed to <b>stderr</b> in non-interactive mode.                                                                                                                                              |
| --stacktrace   | If this parameter is specified, stack trace information will be printed when an exception occurs.                                                                                                                                                          |
| --config-file  | Name of the configuration file.                                                                                                                                                                                                                            |
| --secure       | If this parameter is specified, the server will be connected in SSL mode.                                                                                                                                                                                  |
| --history_file | Path of files that record command history.                                                                                                                                                                                                                 |
| --param_<name> | Query with parameters. Pass values from the client to the server. For details, see <a href="https://clickhouse.tech/docs/en/interfaces/cli/#cli-queries-with-parameters">https://clickhouse.tech/docs/en/interfaces/cli/#cli-queries-with-parameters</a> . |

----End

## 4.3.2 Using a Flink Client

This section describes how to use Flink to run wordcount jobs.

### Prerequisites

- Flink has been installed in an MRS cluster.
- The cluster runs properly and the client has been correctly installed, for example, in the **/opt/hadoopclient** directory. The client directory in the following operations is only an example. Change it to the actual installation directory.

### Using the Flink Client (MRS 3.x or Later)

**Step 1** Install a client.

The following uses installing a Flink client on a node in the cluster as an example:

1. Log in to FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, click **More**, and select **Download Client**.
2. In the **Download Cluster Client** dialog box that is displayed, select **Complete Client** for **Select Client Type**, select the platform type that matches the

architecture of the node where the client is to install, select **Save to Path**, and click **OK**.

- The generated file is stored in the **/tmp/FusionInsight-Client** directory on the active management node by default.
- The name of the client software package is in the follow format: **FusionInsight\_Cluster\_<Cluster ID>\_Services\_Client.tar**. In this section, the cluster ID **1** is used as an example. Replace it with the actual cluster ID.

3. Log in to the server where the client is to be installed as the client installation user.

4. Go to the directory where the installation package is stored and run the following commands to decompress the package:

```
cd /tmp/FusionInsight-Client
```

```
tar -xvf FusionInsight_Cluster_1_Services_Client.tar
```

5. Run the following command to verify the decompressed file and check whether the command output is consistent with the information in the **sha256** file:

```
sha256sum -c FusionInsight_Cluster_1_Services_ClientConfig.tar.sha256
```

```
FusionInsight_Cluster_1_Services_ClientConfig.tar: OK
```

6. Decompress the obtained installation file.

```
tar -xvf FusionInsight_Cluster_1_Services_ClientConfig.tar
```

7. Go to the directory where the installation package is stored, and run the following command to install the client to a specified directory (absolute path), for example, **/opt/hadoopclient**:

```
cd /tmp/FusionInsight-Client/
FusionInsight_Cluster_1_Services_ClientConfig
./install.sh /opt/hadoopclient
```

The client is installed if information similar to the following is displayed:

```
The component client is installed successfully
```

**Step 2** Log in to the node where the client is installed as the client installation user.

**Step 3** Run the following command to go to the client installation directory:

```
cd /opt/hadoopclient
```

**Step 4** Run the following command to initialize environment variables:

```
source /opt/hadoopclient/bigdata_env
```

**Step 5** Perform the following operations if Kerberos authentication is enabled for the cluster. Otherwise, skip these operations.

1. Prepare a user for submitting Flink jobs.

Log in to FusionInsight Manager and choose **System > Permission > Role**. Click **Create Role** and configure **Role Name** and **Description**. In **Configure Resource Permission**, choose *Name of the desired cluster* > **Flink** and select **FlinkServer Admin Privilege**. Then click **OK**.

Choose **System > Permission > User** and click **Create User**. Configure **Username**, set **User Type** to **Human-Machine**, configure **Password** and **Confirm Passowrd**, click **Add** next to **User Group** to add the **hadoop**,

**yarnviewgroup**, and **hadoopmanager** user groups as needed, click **Add** next to **Role** to add the **System\_administrator**, **default**, and the created role, and click **OK**. (If you create a Flink job user for the first time, log in to FusionInsight Manager as the user and change the password.)

2. Log in to Manager and download the authentication credential.

Log in to FusionInsight Manager. For details, see [Accessing FusionInsight Manager \(MRS 3.x or Later\)](#). Choose **System > Permission > User**. In the **Operation** column of the created user, click **More** and select **Download Authentication Credential**.

Figure 4-6 Downloading the authentication credential

3. Decompress the downloaded authentication credential package and copy the obtained file to a directory on the client node, for example, **/opt/hadoopclient/Flink/flink/conf**. If the client is installed on a node outside the cluster, copy the obtained file to the **/etc/** directory on this node.
4. Add the service IP address of the node where the client is installed and IP addresses of all master nodes to the **jobmanager.web.access-control-allow-origin** and **jobmanager.web.allow-access-address** configuration items in the **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml** file. Use commas (,) to separate the IP addresses.

```
jobmanager.web.access-control-allow-origin: xx.xx.xxx.xxx,xx.xx.xxx.xxx,xx.xx.xxx.xxx
jobmanager.web.allow-access-address: xx.xx.xxx.xxx,xx.xx.xxx.xxx,xx.xx.xxx.xxx
```

#### NOTE

To obtain the service IP address of the node where the client is installed, perform the following operations:

- Node inside the cluster:
  - In the navigation tree of the MRS management console, choose **Clusters > Active Clusters**, select a cluster, and click its name to switch to the cluster details page.
  - On the **Nodes** tab page, view the IP address of the node where the client is installed.
- Node outside the cluster: IP address of the ECS where the client is installed.

5. Configure security authentication by adding the **keytab** path and username in the **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml** configuration file.

```
security.kerberos.login.keytab: <user.keytab file path>
security.kerberos.login.principal: <Username>
```

Example:

```
security.kerberos.login.keytab: /opt/hadoopclient/Flink/flink/conf/user.keytab
security.kerberos.login.principal: test
```

6. In the **bin** directory of the Flink client, run the following command to perform security hardening and configure a password used for submitting jobs:

```
cd /opt/hadoopclient/Flink/flink/bin
sh generate_keystore.sh
```

The script automatically replaces the SSL value in the `/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml` file.

 NOTE

After authentication and encryption, the `flink.keystore` and `flink.truststore` files are generated in the `conf` directory on the Flink client and the following configuration items are set to the default values in the `flink-conf.yaml` file:

- Set `security.ssl.keystore` to the absolute path of the `flink.keystore` file.
- Set `security.ssl.truststore` to the absolute path of the `flink.truststore` file.
- Set `security.cookie` to a random password automatically generated by the `generate_keystore.sh` script.
- By default, `security.ssl.encrypt.enabled` is set to `false` in the `flink-conf.yaml` file by default. The `generate_keystore.sh` script sets `security.ssl.key-password`, `security.ssl.keystore-password`, and `security.ssl.truststore-password` to the password entered when the `generate_keystore.sh` script is called. There can be security risks if a configuration file contains the authentication password. You are advised to delete the configuration file or use other secure methods to keep the password.
- For MRS 3.x or later, if ciphertext is required and `security.ssl.encrypt.enabled` is set to `true` in the `flink-conf.yaml` file, the `generate_keystore.sh` script does not set `security.ssl.key-password`, `security.ssl.keystore-password`, and `security.ssl.truststore-password`. To obtain the values, use the Manager plaintext encryption API by running `curl -k -i -u Username:Password -X POST -HContent-type:application/json -d '{"plainText":"Password"}' 'https://x.x.x.x:28443/web/api/v2/tools/encrypt'`.

In the preceding command, `Username:Password` indicates the user name and password for logging in to the system. The password of `"plainText"` indicates the one used to call the `generate_keystore.sh` script. `x.x.x.x` indicates the floating IP address of Manager. There can be security risks if a command contains the authentication password. You are advised to disable the command recording function (history) before running the command.

7. Configure paths for the client to access the `flink.keystore` and `flink.truststore` files.

- Relative path (recommended):

Perform the following steps to set the file path of `flink.keystore` and `flink.truststore` to the relative path and ensure that the directory where the Flink client command is executed can directly access the relative paths.

- i. Create a directory, for example, `ssl`, in `/opt/hadoopclient/Flink/flink/conf/`.

```
cd /opt/hadoopclient/Flink/flink/conf/
mkdir ssl
```

- ii. Move the `flink.keystore` and `flink.truststore` files to the `/opt/hadoopclient/Flink/flink/conf/ssl/` directory.

```
mv flink.keystore ssl/
mv flink.truststore ssl/
```

- iii. Change the values of the following parameters to relative paths in the `flink-conf.yaml` file:

```
security.ssl.keystore: ssl/flink.keystore
security.ssl.truststore: ssl/flink.truststore
```

- Absolute path:

After the `generate_keystore.sh` script is executed, the file path of `flink.keystore` and `flink.truststore` is automatically set to the absolute path `/opt/hadoopclient/Flink/flink/conf/` in the `flink-conf.yaml` file. In this case, you need to move the `flink.keystore` and `flink.truststore` files from the `conf` directory to this absolute path on the Flink client and YARN nodes.

#### Step 6 Run a wordcount job.

#### NOTICE

When a user submits or runs a job in Flink, the user must have the following permissions based on whether Ranger authentication is enabled for related services (such as HDFS and Kafka):

- If Ranger authentication is enabled, the current user must belong to the **hadoop** group or the user has been granted the `/flink` read and write permissions in Ranger.
  - If Ranger authentication is disabled, the current user must belong to the **hadoop** group.
- 
- For a normal cluster (Kerberos authentication disabled), you can submit jobs in either of the following ways:
    - Run the following commands to start a session and submit a job in the session:

```
yarn-session.sh -nm "session-name" -d
flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
```
    - Run the following command to submit a single job on Yarn:

```
flink run -m yarn-cluster /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
```
  - For a security cluster (Kerberos authentication enabled), you can submit jobs in either of the following ways based on the paths of the `flink.keystore` and `flink.truststore` files:
    - If the `flink.keystore` and `flink.truststore` files are stored in the relative path:
      - Run the following command in the directory at the same level as `ssl` to start the session and submit the job in the session:

```
ssl
```

 is a relative path. For example, if `ssl` is in `opt/hadoopclient/Flink/flink/conf/`, run the command in the `opt/hadoopclient/Flink/flink/conf/` directory.

```
cd /opt/hadoopclient/Flink/flink/conf
yarn-session.sh -t ssl/ -nm "session-name" -d
flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
```
      - Run the following command to submit a single job on Yarn:

```
cd /opt/hadoopclient/Flink/flink/conf
```

```
flink run -m yarn-cluster -yt ssl/ /opt/hadoopclient/Flink/flink/
examples/streaming/WordCount.jar
```

- If the **flink.keystore** and **flink.truststore** files are stored in the absolute path:

- Run the following commands to start a session and submit a job in the session:

```
cd /opt/hadoopclient/Flink/flink/conf
yarn-session.sh -nm "session-name" -d
```

```
flink run /opt/hadoopclient/Flink/flink/examples/streaming/
WordCount.jar
```

- Run the following command to submit a single job on Yarn:

```
flink run -m yarn-cluster /opt/hadoopclient/Flink/flink/
examples/streaming/WordCount.jar
```

**Step 7** After the job has been successfully submitted, the following information is displayed on the client:

**Figure 4-7** Job submitted successfully on Yarn

```
[root@node-master1kszp ~]# flink run -m yarn-cluster /opt/client/Flink/flink/examples/streaming/WordCount.jar
2019-07-10 16:30:11,090 | WARN | [main] | The short-circuit local reads feature cannot be used because libhadoop cannot be loaded. | org.apache.hadoop.hdfs.shortcircuit.DomainSocketFactory (DomainSocketFactory.java:118)

----End

## Using the Flink Client (Versions Earlier Than MRS 3.x)

### Step 1 Install a client.

The following uses installing a Flink client on a core node as an example:

1. Log in to MRS Manager and choose **Services** > **Download Client** to download the client installation package to the active management node.
2. Use the IP address to search for the active management node, and log in to the active management node over VNC.
3. Log in to the active management node, and run the following command to switch the user:

```
sudo su - omm
```

4. On the MRS management console, view the IP address on the **Nodes** tab page of the specified cluster.

Record the IP address of the core node where the client is to be used.

5. On the active management node, run the following command to copy the client installation package to the core node:

```
scp -p /tmp/MRS-client/MRS_Services_Client.tar IP address of the core node:/opt/client
```

6. Log in to the core node as user **root**.

Master nodes support Cloud-Init. The preset username for Cloud-Init is **root**, and the password is the one set during cluster creation.

7. Run the following commands to install the client:

```
cd /opt/client
tar -xvf MRS_Services_Client.tar
tar -xvf MRS_Services_ClientConfig.tar
cd /opt/client/MRS_Services_ClientConfig
./install.sh Client installation directory
```

For example, run the following command:

```
./install.sh /opt/hadoopclient
```

**Step 2** Log in to the node where the client is installed as the client installation user.

**Step 3** Run the following command to go to the client installation directory:

```
cd /opt/hadoopclient
```

**Step 4** Run the following command to initialize environment variables:

```
source /opt/hadoopclient/bigdata_env
```

**Step 5** If Kerberos authentication is enabled for the cluster, perform the following steps. If not, skip this whole step.

1. Prepare a user for submitting Flink jobs.

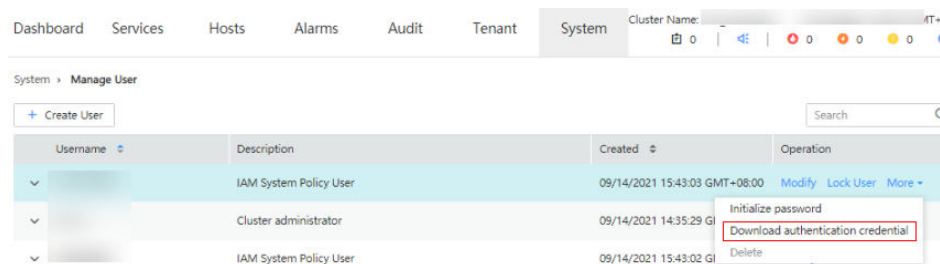

Log in to MRS Manager and choose **System > Manage Role**. Click **Add Role** to add a role, for example, **flinkrole**. In **Permission**, choose **HDFS > File System > hdfs://hacluster/** and select **Read, Write, and Execute**. After you finish configuring this service, click **Service** in the **Permission** area. Choose **Yarn > Scheduler Queue > root**, select **Submit** for **default**, and click **OK**.

Choose **System > Manage User Group**. Click **Create User Group** to create a user group for the sample project, for example, **flinkgroup**. Choose **System > Manage User**. Click **Create User** to create a user for the sample project. Enter a username, for example, **flinkuser**. Set **User Type** to **Human-machine**, add the user to user groups **flinkgroup** and **hadoop**, bind the role **flinkrole** to the user to obtain permissions, and click **OK**. (If you create a user for the first time, log in to MRS Manager as this user to change the password.)

2. Log in to Manager and download the authentication credential.

Log in to Manager of the cluster. For details, see [Accessing MRS Manager \(MRS 2.x or Earlier\)](#). Choose **System Settings > User Management**. In the **Operation** column of the row that contains the added user, choose **More > Download Authentication Credential**.

**Figure 4-11** Downloading the authentication credential

3. Decompress the downloaded authentication credential package and copy the obtained file to a directory on the client node, for example, **/opt/hadoopclient/Flink/flink/conf**. If the client is installed on a node outside the cluster, copy the obtained file to the **/etc/** directory on this node.
4. Configure security authentication by adding the **keytab** path and username in the **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml** configuration file.

```
security.kerberos.login.keytab: <user.keytab file path>
security.kerberos.login.principal: <Username>
```

Example:

```
security.kerberos.login.keytab: /opt/hadoopclient/Flink/flink/conf/user.keytab
security.kerberos.login.principal: test
```

5. Generate the **generate\_keystore.sh** script by referring to [Example of Issuing a Certificate](#) and place it in the **bin** directory on the Flink client. In the **bin**

directory of the Flink client, run the following command to perform security hardening and configure a password used for submitting jobs:

```
cd /opt/hadoopclient/Flink/flink/bin
```

```
sh generate_keystore.sh
```

This script automatically replaces the SSL value in the `/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml` file. For MRS 2.x or earlier, external SSL is disabled for security clusters by default. To enable external SSL, configure it by referring to "Authentication and Encryption" and run this script again.

 NOTE

- You do not need to manually generate the `generate_keystore.sh` script.
  - After authentication and encryption, the generated `flink.keystore`, `flink.truststore`, and `security.cookie` items are automatically filled in the corresponding configuration items in `flink-conf.yaml`.
6. Configure paths for the client to access the `flink.keystore` and `flink.truststore` files.
- Relative path (recommended):  
Perform the following steps to set the file path of `flink.keystore` and `flink.truststore` to the relative path and ensure that the directory where the Flink client command is executed can directly access the relative paths.
    - i. Create a directory, for example, `ssl`, in `/opt/hadoopclient/Flink/flink/conf/`.

```
cd /opt/hadoopclient/Flink/flink/conf/
mkdir ssl
```
    - ii. Move the `flink.keystore` and `flink.truststore` files to the `/opt/hadoopclient/Flink/flink/conf/ssl/` directory.

```
mv flink.keystore ssl/
mv flink.truststore ssl/
```
    - iii. Change the values of the following parameters to relative paths in the `flink-conf.yaml` file:

```
security.ssl.internal.keystore: ssl/flink.keystore
security.ssl.internal.truststore: ssl/flink.truststore
```
  - Absolute path:  
After the `generate_keystore.sh` script is executed, the file path of `flink.keystore` and `flink.truststore` is automatically set to the absolute path `/opt/hadoopclient/Flink/flink/conf/` in the `flink-conf.yaml` file. In this case, you need to move the `flink.keystore` and `flink.truststore` files from the `conf` directory to this absolute path on the Flink client and YARN nodes.

**Step 6** Run a wordcount job.

**NOTICE**

When a user submits or runs a job in Flink, the user must have the following permissions based on whether Ranger authentication is enabled for related services (such as HDFS and Kafka):

- If Ranger authentication is enabled, the current user must belong to the **hadoop** group or the user has been granted the **/flink** read and write permissions in Ranger.
- If Ranger authentication is disabled, the current user must belong to the **hadoop** group.

- For a normal cluster (Kerberos authentication disabled), you can submit jobs in either of the following ways:

- Run the following commands to start a session and submit a job in the session:

```
yarn-session.sh -nm "session-name" -d
flink run /opt/hadoopclient/Flink/flink/examples/streaming/
WordCount.jar
```

- Run the following command to submit a single job on Yarn:

```
flink run -m yarn-cluster /opt/hadoopclient/Flink/flink/examples/
streaming/WordCount.jar
```

- For a security cluster (Kerberos authentication enabled), you can submit jobs in either of the following ways based on the paths of the **flink.keystore** and **flink.truststore** files:

- If the **flink.keystore** and **flink.truststore** files are stored in the relative path:

- Run the following command in the directory at the same level as **ssl** to start the session and submit the job in the session:

**ssl** is a relative path. For example, if **ssl** is in **opt/hadoopclient/Flink/flink/conf/**, run the command in the **opt/hadoopclient/Flink/flink/conf/** directory.

```
cd /opt/hadoopclient/Flink/flink/conf
yarn-session.sh -t ssl/ -nm "session-name" -d
flink run /opt/hadoopclient/Flink/flink/examples/streaming/
WordCount.jar
```

- Run the following command to submit a single job on Yarn:

```
cd /opt/hadoopclient/Flink/flink/conf
flink run -m yarn-cluster -yt ssl/ /opt/hadoopclient/Flink/flink/
examples/streaming/WordCount.jar
```

- If the **flink.keystore** and **flink.truststore** files are stored in the absolute path:

- Run the following commands to start a session and submit a job in the session:

```
cd /opt/hadoopclient/Flink/flink/conf
yarn-session.sh -nm "session-name" -d
```

### flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar

- Run the following command to submit a single job on Yarn:  
**flink run -m yarn-cluster /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar**

**Step 7** After the job has been successfully submitted, the following information is displayed on the client:

Figure 4-12 Job submitted successfully on Yarn

```
[root@node-master1kszp ~]# flink run -m yarn-cluster /opt/client/Flink/flink/examples/streaming/WordCount.jar

[root@node-master1kszp ~]#
```

**Step 8** Go to the native Yarn service page, find the application of the job, and click the application name to go to the job details page. For details, see [Viewing Flink Job Information](#).

- If the job is not completed, click **Tracking URL** to go to the native Flink page and view the job running information.
- If the job submitted in a session has been completed, you can click **Tracking URL** to log in to the native Flink service page to view job information.

Figure 4-15 Application

The screenshot shows the Hadoop Yarn web interface for an application. The top left has the Hadoop logo and a navigation menu with options like 'Cluster', 'About', 'Nodes', 'Node Labels', 'Applications', 'NEW', 'SAVING', 'SUBMITTED', 'RECEIVED', 'BUILDING', 'FINISHED', 'KILLED', 'QUEUED', and 'Scheduler'. The main content area is titled 'Application application\_...' and includes an 'Application Overview' section with the following details:

- User: test
- Name: testjob
- Application Type: Apache Flink
- Application Tags:
- Application Priority: 0 (Higher Integer value indicates higher priority)
- YarnApplicationState: RUNNING: AM has registered with RM and started running.
- Queue: default
- FinalStatus Reported by AM: Application has not completed yet.
- Started:
- Elapsed: 245ms, 1 mins, 6sec
- Tracking URL: [ApplicationMaster](#)
- Log Aggregation Status: NOT START
- Diagnosis:
- Unmanaged Application: false
- Application Node Label expression: <Not set>
- AM container Node Label expression: <DEFAULT\_PARTITION>

Below the overview is an 'Application Metrics' section:

- Total Resource Preempted: <memory0, vCores0>
- Total Number of Non-AM Containers Preempted: 0
- Total Number of AM Containers Preempted: 0
- Resource Preempted from Current Attempt: <memory0, vCores0>
- Number of Non-AM Containers Preempted from Current Attempt: 0
- Aggregate Resource Allocation: 334592478 MB-seconds, 522062 vcore-seconds
- Aggregate Preempted Resource Allocation: 0 MB-seconds, 0 vcore-seconds

At the bottom, there is a table with columns: Attempt ID, Started, Node, Logs, Nodes blacklisted by the app, and Nodes blacklisted by the system. The table shows one attempt with ID 'appattempt\_...' and a 'Show 20 entries' button.

----End

## 4.3.3 Using a Flume Client

### Scenario

You can use Flume to import collected log information to Kafka.

### Prerequisites

- A streaming cluster that contains components such as Flume and Kafka and has Kerberos authentication enabled has been created. For details, see [Buying a Custom Cluster](#).
- The streaming cluster can properly communicate with the node where logs are generated.

### Using the Flume Client (Versions Earlier Than MRS 3.x)

#### NOTE

You do not need to perform [Step 2](#) to [Step 6](#) for a normal cluster.

#### Step 1 Install the Flume client.

Install the Flume client in a directory, for example, `/opt/Flumeclient`, on the node where logs are generated by referring to [Installing the Flume Client on Clusters of Versions Earlier Than MRS 3.x](#). The Flume client installation directories in the following steps are only examples. Change them to the actual installation directories.

#### Step 2 Copy the configuration file of the authentication server from the Master1 node to the *Flume client installation directory/fusioninsight-flume-Flume component version number/conf* directory on the node where the Flume client is installed.

``${BIGDATA_HOME}/MRS_Current/1_X_KerberosClient/etc/kdc.conf` is used as the full file path.

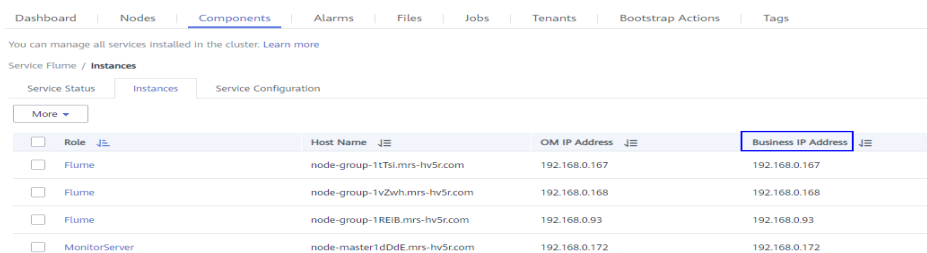

In the preceding paths, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

#### Step 3 Check the service IP address of any node where the Flume role is deployed.

Log in to the cluster details page, choose *Name of the desired cluster* > **Components** > **Flume** > **Instances**, and check the service IP address of any node where the Flume role is deployed.

#### NOTE

If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

| Role          | Host Name                     | OM IP Address | Business IP Address |
|---------------|-------------------------------|---------------|---------------------|
| Flume         | node-group-1Tsl.mrs-hv5r.com  | 192.168.0.167 | 192.168.0.167       |
| Flume         | node-group-1v2wh.mrs-hv5r.com | 192.168.0.168 | 192.168.0.168       |
| Flume         | node-group-1REIB.mrs-hv5r.com | 192.168.0.93  | 192.168.0.93        |
| MonitorServer | node-master1dDdE.mrs-hv5r.com | 192.168.0.172 | 192.168.0.172       |

- Step 4** Copy the user authentication file from this node to the *Flume client installation directory/fusioninsight-flume-Flume component version number/conf* directory on the Flume client node.

``${BIGDATA_HOME}/MRS_XXX/install/FusionInsight-Flume-Flume component version number/flume/conf/flume.keytab` is used as the full file path.

In the preceding paths, **XXX** indicates the product version number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

- Step 5** Copy the **jaas.conf** file from this node to the **conf** directory on the Flume client node.

``${BIGDATA_HOME}/MRS_Current/1_X_Flume/etc/jaas.conf` is used as the full file path.

In the preceding path, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

- Step 6** Log in to the Flume client node and go to the client installation directory. Run the following command to modify the file:

```
vi conf/jaas.conf
```

Change the full path of the user authentication file defined by **keyTab** to the **Flume client installation directory/fusioninsight-flume-Flume component version number/conf** saved in [Step 4](#), and save the modification and exit.

- Step 7** Run the following command to modify the **flume-env.sh** configuration file of the Flume client:

```
vi Flume client installation directory/fusioninsight-flume-Flume component version number/conf/flume-env.sh
```

Add the following information after **-XX:+UseCMSCompactAtFullCollection**:

```
-Djava.security.krb5.conf=Flume client installation directory/fusioninsight-flume-1.9.0/conf/kdc.conf -
Djava.security.auth.login.config=Flume client installation directory/fusioninsight-flume-1.9.0/conf/jaas.conf -
Dzookeeper.request.timeout=120000
```

Example: **"-XX:+UseCMSCompactAtFullCollection -  
Djava.security.krb5.conf=/opt/FlumeClient/fusioninsight-flume-Flume component version number/conf/kdc.conf -  
Djava.security.auth.login.config=/opt/FlumeClient/fusioninsight-flume-Flume component version number/conf/jaas.conf -  
Dzookeeper.request.timeout=120000"**

Change *Flume client installation directory* to the actual installation directory. Then save and exit.

- Step 8** Run the following command to restart the Flume client:

```
cd Flume client installation directory/fusioninsight-flume-Flume component version number/bin
```

```
./flume-manage.sh restart
```

Example:

```
cd /opt/FlumeClient/fusioninsight-flume-Flume component version number/bin
./flume-manage.sh restart
```

**NOTE**

The Flume client will be automatically restarted after being stopped. If you do not need automatic restart, run the following command:

```
./flume-manage.sh stop force
```

If you want to restart the Flume client, run the following command:

```
./flume-manage.sh start force
```

**Step 9** Run the following command to configure and save jobs in the Flume client configuration file **properties.properties** based on service requirements. For details, see [Flume Configuration Parameter Description](#).

```
vi Flume client installation directory/fusioninsight-flume-Flume component version number/conf/properties.properties
```

The following uses SpoolDir Source+File Channel+Kafka Sink as an example:

```
#####
#####
client.sources = static_log_source
client.channels = static_log_channel
client.sinks = kafka_sink
#####
#####
#LOG_TO_HDFS_ONLINE_1

client.sources.static_log_source.type = spooldir
client.sources.static_log_source.spoolDir = Monitoring directory
client.sources.static_log_source.fileSuffix = .COMPLETED
client.sources.static_log_source.ignorePattern = ^$
client.sources.static_log_source.trackerDir = Metadata storage path during transmission
client.sources.static_log_source.maxBlobLength = 16384
client.sources.static_log_source.batchSize = 51200
client.sources.static_log_source.inputCharset = UTF-8
client.sources.static_log_source.deserializer = LINE
client.sources.static_log_source.selector.type = replicating
client.sources.static_log_source.fileHeaderKey = file
client.sources.static_log_source.fileHeader = false
client.sources.static_log_source.basenameHeader = true
client.sources.static_log_source.basenameHeaderKey = basename
client.sources.static_log_source.deletePolicy = never

client.channels.static_log_channel.type = file
client.channels.static_log_channel.dataDirs = Data cache path. Multiple paths, separated by commas (,), can be configured to improve performance.
client.channels.static_log_channel.checkpointDir = Checkpoint storage path
client.channels.static_log_channel.maxFileSize = 2146435071
client.channels.static_log_channel.capacity = 1000000
client.channels.static_log_channel.transactionCapacity = 612000
client.channels.static_log_channel.minimumRequiredSpace = 524288000

client.sinks.kafka_sink.type = org.apache.flume.sink.kafka.KafkaSink
client.sinks.kafka_sink.kafka.topic = Topic to which data is written, for example, flume_test
client.sinks.kafka_sink.kafka.bootstrap.servers = XXX.XXX.XXX.XXX:Kafka port number,XXX.XXX.XXX.XXX:Kafka port number,XXX.XXX.XXX.XXX:Kafka port number
client.sinks.kafka_sink.flumeBatchSize = 1000
client.sinks.kafka_sink.kafka.producer.type = sync
client.sinks.kafka_sink.kafka.security.protocol = SASL_PLAINTEXT
client.sinks.kafka_sink.kafka.kerberos.domain.name = Kafka domain name. This parameter is mandatory for a security cluster
client.sinks.kafka_sink.requiredAcks = 0
```

```
client.sources.static_log_source.channels = static_log_channel
client.sinks.kafka_sink.channel = static_log_channel
```

**NOTE**

- **client.sinks.kafka\_sink.kafka.topic:** Topic to which data is written. If the topic does not exist in Kafka, it is automatically created by default.
- **client.sinks.kafka\_sink.kafka.bootstrap.servers:** List of Kafka Brokers, which are separated by commas (.). By default, the port is **21007** for a security cluster and **9092** for a normal cluster.
- **client.sinks.kafka\_sink.kafka.security.protocol:** The value is **SASL\_PLAINTEXT** for a security cluster and **PLAINTEXT** for a normal cluster.
- **client.sinks.kafka\_sink.kafka.kerberos.domain.name:**  
You do not need to set this parameter for a normal cluster. For a security cluster, the value of this parameter is the value of **kerberos.domain.name** in the Kafka cluster.  
Obtain the value by checking **\${BIGDATA\_HOME}/MRS\_Current/1\_X\_Broker/etc/server.properties** on the node where the broker instance resides.  
In the preceding paths, **X** indicates a random number. Change it based on site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

**Step 10** After the parameters are set and saved, the Flume client automatically loads the content configured in **properties.properties**. When new log files are generated by `spoolDir`, the files are sent to Kafka producers and can be consumed by Kafka consumers. For details about how to view data consumption information, see [Managing Messages in Kafka Topics](#).

----End

## Using the Flume Client (MRS 3.x or Later)

**NOTE**

You do not need to perform [Step 2](#) to [Step 6](#) for a normal cluster.

**Step 1** Install the Flume client.

Install the Flume client in a directory, for example, `/opt/Flumeclient`, on the node where logs are generated by referring to [Installing the Flume Client on MRS 3.x or Later Clusters](#). The Flume client installation directories in the following steps are only examples. Change them to the actual installation directories.

**Step 2** Copy the configuration file of the authentication server from the Master1 node to the *Flume client installation directory/fusioninsight-flume-Flume component version number/conf* directory on the node where the Flume client is installed.

The full file path is **\${BIGDATA\_HOME}/FusionInsight\_BASE\_XXX/1\_X\_KerberosClient/etc/kdc.conf**. In the preceding path, **XXX** indicates the product version number. **X** indicates a random number. Replace them based on site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

**Step 3** Check the service IP address of any node where the Flume role is deployed.

Log in to FusionInsight Manager, click **Cluster**, click **Services**, and click Flume. On the displayed page, click **Instance**. For details, see [Accessing FusionInsight Manager \(MRS 3.x or Later\)](#). Check the service IP address of any node where the Flume role is deployed.

 NOTE

If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

- Step 4** Copy the user authentication file from this node to the *Flume client installation directory/fusioninsight-flume-Flume component version number/conf* directory on the Flume client node.

The full file path is **`${BIGDATA_HOME}/FusionInsight_Porter_XXX/install/FusionInsight-Flume-Flume component version number/flume/conf/flume.keytab`**.

In the preceding paths, **XXX** indicates the product version number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

- Step 5** Copy the **jaas.conf** file from this node to the **conf** directory on the Flume client node.

The full file path is **`${BIGDATA_HOME}/FusionInsight_Current/1_X_Flume/etc/jaas.conf`**.

In the preceding path, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

- Step 6** Log in to the Flume client node and go to the client installation directory. Run the following command to modify the file:

```
vi conf/jaas.conf
```

Change the full path of the user authentication file defined by **keyTab** to the **Flume client installation directory/fusioninsight-flume-Flume component version number/conf** saved in **Step 4**, and save the modification and exit.

- Step 7** Run the following command to modify the **flume-env.sh** configuration file of the Flume client:

```
vi Flume client installation directory/fusioninsight-flume-Flume component version number/conf/flume-env.sh
```

Add the following information after **-XX:+UseCMSCompactAtFullCollection**:

```
-Djava.security.krb5.conf=Flume client installation directory/fusioninsight-flume-1.9.0/conf/kdc.conf -
Djava.security.auth.login.config=Flume client installation directory/fusioninsight-flume-1.9.0/conf/jaas.conf -
Dzookeeper.request.timeout=120000
```

Example: **"-XX:+UseCMSCompactAtFullCollection -  
Djava.security.krb5.conf=/opt/FlumeClient/fusioninsight-flume-Flume component version number/conf/kdc.conf -  
Djava.security.auth.login.config=/opt/FlumeClient/fusioninsight-flume-Flume component version number/conf/jaas.conf -  
Dzookeeper.request.timeout=120000"**

Change *Flume client installation directory* to the actual installation directory. Then save and exit.

- Step 8** Run the following command to restart the Flume client:

```
cd Flume client installation directory/fusioninsight-flume-Flume component version number/bin
```

```
./flume-manage.sh restart
```

Example:

```
cd /opt/FlumeClient/fusioninsight-flume-Flume component version number/bin
```

```
./flume-manage.sh restart
```

**Step 9** Configure jobs based on actual service scenarios.

- Some parameters, for MRS 3.x or later, can be configured on Manager. For details, see [Non-Encrypted Transmission](#) or [Encrypted Transmission](#).
- Set the parameters in the **properties.properties** file. The following uses SpoolDir Source+File Channel+Kafka Sink as an example.

Run the following command on the node where the Flume client is installed. Configure and save jobs in the Flume client configuration file **properties.properties** based on actual service requirements. For details, see [Flume Service Configuration Guide](#).

```
vi Flume client installation directory/fusioninsight-flume-Flume component version number/conf/properties.properties
```

```

## 4.3.4 Using an HBase Client

### Scenario

This section describes how to use the HBase client in an O&M scenario or a service scenario.

### Prerequisites

- The client has been installed. For example, the installation directory is **/opt/hadoopclient**. The client directory in the following operations is only an example. Change it to the actual installation directory.
- Service component users have been created by the MRS cluster administrator. A machine-machine user needs to download the **keytab** file and a human-machine user needs to change the password upon the first login.
- If a non-**root** user uses the HBase client, ensure that the owner of the HBase client directory is this user. Otherwise, run the following command to change the owner.

```
chown user:group -R Client installation directory/HBase
```

## Using the HBase Client (Versions Earlier Than MRS 3.x)

**Step 1** Install the client. For details, see [Installing a Client](#).

**Step 2** Log in to the node where the client is installed as the client installation user.

**Step 3** Run the following command to go to the client directory:

```
cd /opt/hadoopclient
```

**Step 4** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 5** If Kerberos authentication has been enabled for the current cluster, run the following command to authenticate the current user. The current user must have the permission to create HBase tables. For details about how to configure a role with corresponding permissions, see [Creating a Role](#). To bind a role to a user, see [Creating a User](#). If Kerberos authentication is disabled for the current cluster, skip this step.

```
kinit Component service user
```

For example, **kinit hbaseuser**.

**Step 6** Run the following HBase client command:

```
hbase shell
```

```
----End
```

## Using the HBase Client (MRS 3.x or Later)

**Step 1** Install the client. For details, see [Installing a Client](#).

**Step 2** Log in to the node where the client is installed as the client installation user.

**Step 3** Run the following command to go to the client directory:

```
cd /opt/hadoopclient
```

**Step 4** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 5** If Kerberos authentication has been enabled for the current cluster, run the following command to authenticate the current user. The current user must have the permission to create HBase tables. For details about how to configure a role with the corresponding permissions, see [Managing Roles](#). To bind a role to a user, see [Creating a User](#). If Kerberos authentication is disabled for the current cluster, skip this step.

```
kinit Component service user
```

For example, **kinit hbaseuser**.

**Step 6** Run the following HBase client command:

```
hbase shell
```

```
----End
```

## Common HBase client commands

The following table lists common HBase client commands. For more commands, see <http://hbase.apache.org/2.2/book.html>.

**Table 4-6** HBase client commands

| Command  | Description                                                                                                                                                                                                                                  |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| create   | Used to create a table, for example, <b>create 'test', 'f1', 'f2', 'f3'</b> .                                                                                                                                                                |
| disable  | Used to disable a specified table, for example, <b>disable 'test'</b> .                                                                                                                                                                      |
| enable   | Used to enable a specified table, for example, <b>enable 'test'</b> .                                                                                                                                                                        |
| alter    | Used to alter the table structure. You can run the <b>alter</b> command to add, modify, or delete column family information and table-related parameter values, for example, <b>alter 'test', {NAME =&gt; 'f3', METHOD =&gt; 'delete'}</b> . |
| describe | Used to obtain the table description, for example, <b>describe 'test'</b> .                                                                                                                                                                  |
| drop     | Used to delete a specified table, for example, <b>drop 'test'</b> . Before deleting a table, you must stop it.                                                                                                                               |
| put      | Used to write the value of a specified cell, for example, <b>put 'test','r1','f1:c1','myvalue1'</b> . The cell location is unique and determined by the table, row, and column.                                                              |
| get      | Used to get the value of a row or the value of a specified cell in a row, for example, <b>get 'test','r1'</b> .                                                                                                                              |
| scan     | Used to query table data, for example, <b>scan 'test'</b> . The table name and scanner must be specified in the command.                                                                                                                     |

## 4.3.5 Using an HDFS Client

### Scenario

This section describes how to use the HDFS client in an O&M scenario or service scenario.

### Prerequisites

- The client has been installed.  
For example, the installation directory is **/opt/client**. The client directory in the following operations is only an example. Change it based on the actual installation directory onsite.
- Service component users have been created by the MRS cluster administrator. In security mode, machine-machine users need to download the keytab file. A human-machine user needs to change the password upon the first login. (This operation is not required in normal mode.)

## Using the HDFS Client

**Step 1** Install a client.

- For versions earlier than MRS 3.x, see [Installing a Client](#).
- For MRS 3.x or later, see [Installing a Client](#).

**Step 2** Log in to the node where the client is installed as the client installation user.

**Step 3** Run the following command to go to the client installation directory:

```
cd /opt/client
```

**Step 4** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 5** If the cluster is in security mode, run the following command to authenticate the user. In normal mode, user authentication is not required.

```
kinit Component service user
```

**Step 6** Run the HDFS Shell command. Example:

```
hdfs dfs -ls /
```

```
----End
```

## Common HDFS Client Commands

The following table lists common HDFS client commands.

For more commands, see [https://hadoop.apache.org/docs/stable/hadoop-project-dist/hadoop-common/CommandsManual.html#User\\_Commands](https://hadoop.apache.org/docs/stable/hadoop-project-dist/hadoop-common/CommandsManual.html#User_Commands).

**Table 4-7** Common HDFS client commands

| Command                                                                              | Description                                                 | Example                                                                                                                                  |
|--------------------------------------------------------------------------------------|-------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>hdfs dfs -mkdir</b> <i>Folder name</i>                                            | Used to create a folder.                                    | <b>hdfs dfs -mkdir /tmp/mydir</b>                                                                                                        |
| <b>hdfs dfs -ls</b> <i>Folder name</i>                                               | Used to view a folder.                                      | <b>hdfs dfs -ls /tmp</b>                                                                                                                 |
| <b>hdfs dfs -put</b> <i>Local file on the client node Specified HDFS path</i>        | Used to upload a local file to a specified HDFS path.       | <b>hdfs dfs -put /opt/test.txt /tmp</b><br>Upload the <b>/opt/test.txt</b> file on the client node to the <b>/tmp</b> directory of HDFS. |
| <b>hdfs dfs -get</b> <i>Specified file on HDFS Specified path on the client node</i> | Used to download the HDFS file to the specified local path. | <b>hdfs dfs -get /tmp/test.txt /opt/</b><br>Download the <b>/tmp/test.txt</b> file on HDFS to the <b>/opt</b> path on the client node.   |
| <b>hdfs dfs -rm -r -f</b> <i>Specified folder on HDFS</i>                            | Used to delete a folder.                                    | <b>hdfs dfs -rm -r -f /tmp/mydir</b>                                                                                                     |

| Command                                                                        | Description                                                 | Example                              |
|--------------------------------------------------------------------------------|-------------------------------------------------------------|--------------------------------------|
| <b>hdfs dfs -chmod</b><br><i>Permission parameter</i><br><i>File directory</i> | Used to configure the HDFS directory permission for a user. | <b>hdfs dfs -chmod 700 /tmp/test</b> |

## Client-related FAQs

1. What do I do when the HDFS client exits abnormally and error message "java.lang.OutOfMemoryError" is displayed after the HDFS client command is running?

This problem occurs because the memory required for running the HDFS client exceeds the preset upper limit (128 MB by default). You can change the memory upper limit of the client by modifying **CLIENT\_GC\_OPTS** in *<Client installation path>/HDFS/component\_env*. For example, if you want to set the upper limit to 1 GB, run the following command:

```
CLIENT_GC_OPTS="-Xmx1G"
```

After the modification, run the following command to make the modification take effect:

```
source <Client installation path>/bigdata_env
```

2. How do I set the log level when the HDFS client is running?

By default, the logs generated during the running of the HDFS client are printed to the console. The default log level is INFO. To enable the DEBUG log level for fault locating, run the following command to export an environment variable:

```
export HADOOP_ROOT_LOGGER=DEBUG,console
```

Then run the HDFS Shell command to generate the DEBUG logs.

If you want to print INFO logs again, run the following command:

```
export HADOOP_ROOT_LOGGER=INFO,console
```

3. How do I delete HDFS files permanently?

HDFS provides a recycle bin mechanism. Typically, after an HDFS file is deleted, the file is moved to the recycle bin of HDFS. If the file is no longer needed and the storage space needs to be released, clear the corresponding recycle bin directory, for example, **hdfs://hacluster/user/xxx/.Trash/Current/xxx**.

## 4.3.6 Using a Hive Client

### Scenario

This section guides users to use a Hive client in an O&M or service scenario.

## Prerequisites

- The client has been installed. For example, the client is installed in the `/opt/hadoopclient` directory. The client directory in the following operations is only an example. Change it to the actual installation directory.
- Service component users have been created by the MRS cluster administrator. In security mode, machine-machine users need to download the keytab file. A human-machine user must change the password upon the first login.

## Using the Hive Client (Versions Earlier Than MRS 3.x)

**Step 1** Install the client. For details, see [Installing a Client](#).

**Step 2** Log in to the node where the client is installed as the client installation user.

**Step 3** Run the following command to go to the client installation directory:

```
cd /opt/hadoopclient
```

**Step 4** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 5** Log in to the Hive client based on the cluster authentication mode.

- In security mode, run the following command to complete user authentication and log in to the Hive client:

```
kinit Component service user
```

```
beeline
```

- In common mode, run the following command to log in to the Hive client. If no component service user is specified, the current OS user is used to log in to the Hive client.

```
beeline -n component service user
```

### NOTE

After a beeline connection is established, you can compile and submit HQL statements to execute related tasks. To run the Catalog client command, you need to run the `!q` command first to exit the beeline environment.

**Step 6** Run the following command to execute the HCatalog client command:

```
hcat -e "cmd"
```

`cmd` must be a Hive DDL statement, for example, `hcat -e "show tables"`.

 NOTE

- To use the HCatalog client, choose **More > Download Client** on the service page to download the clients of all services. This restriction does not apply to the beeline client.
- Due to permission model incompatibility, tables created using the HCatalog client cannot be accessed on the HiveServer client. However, the tables can be accessed on the WebHCat client.
- If you use the HCatalog client in Normal mode, the system performs DDL commands using the current user who has logged in to the operating system.
- Exit the beeline client by running the **!q** command instead of by pressing **Ctrl + c**. Otherwise, the temporary files generated by the connection cannot be deleted and a large number of junk files will be generated as a result.
- If multiple statements need to be entered during the use of beeline clients, separate the statements from each other using semicolons (;) and set the value of **entireLineAsCommand** to **false**.

Setting method: If beeline has not been started, run the **beeline --entireLineAsCommand=false** command. If the beeline has been started, run the **!set entireLineAsCommand false** command.

After the setting, if a statement contains semicolons (;) that do not indicate the end of the statement, escape characters must be added, for example, **select concat\_ws('\;', collect\_set(col1)) from tbl**.

----End

## Using the Hive Client (MRS 3.x or Later)

**Step 1** Install the client. For details, see [Installing a Client](#).

**Step 2** Log in to the node where the client is installed as the client installation user.

**Step 3** Run the following command to go to the client installation directory:

```
cd /opt/hadoopclient
```

**Step 4** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 5** Log in to the Hive client based on the cluster authentication mode.

- In security mode, run the following command to complete user authentication and log in to the Hive client:

```
kinit Component service user
```

```
beeline
```

- In common mode, run the following command to log in to the Hive client. If no component service user is specified, the current OS user is used to log in to the Hive client.

```
beeline -n component service user
```

**Step 6** Run the following command to execute the HCatalog client command:

```
hcat -e "cmd"
```

*cmd* must be a Hive DDL statement, for example, **hcat -e "show tables"**.

 NOTE

- To use the HCatalog client, choose **More > Download Client** on the service page to download the clients of all services. This restriction does not apply to the beeline client.
- Due to permission model incompatibility, tables created using the HCatalog client cannot be accessed on the HiveServer client. However, the tables can be accessed on the WebHCat client.
- If you use the HCatalog client in Normal mode, the system performs DDL commands using the current user who has logged in to the operating system.
- Exit the beeline client by running the **!q** command instead of by pressing **Ctrl + C**. Otherwise, the temporary files generated by the connection cannot be deleted and a large number of junk files will be generated as a result.
- If multiple statements need to be entered during the use of beeline clients, separate the statements from each other using semicolons (;) and set the value of **entireLineAsCommand** to **false**.

Setting method: If beeline has not been started, run the **beeline --entireLineAsCommand=false** command. If the beeline has been started, run the **!set entireLineAsCommand false** command.

After the setting, if a statement contains semicolons (;) that do not indicate the end of the statement, escape characters must be added, for example, **select concat\_ws('\;', collect\_set(col1)) from tbl.**

----End

## Common Hive Client Commands

The following table lists common Hive Beeline commands.

For more commands, see <https://cwiki.apache.org/confluence/display/Hive/HiveServer2+Clients#HiveServer2Clients-BeelineCommands>.

**Table 4-8** Common Hive Beeline commands

| Command                                                                                                                   | Description                                                                                                                                                      |
|---------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| set <key>=<value>                                                                                                         | Sets the value of a specific configuration variable (key).<br><b>NOTE</b><br>If the variable name is incorrectly spelled, the Beeline does not display an error. |
| set                                                                                                                       | Prints the list of configuration variables overwritten by users or Hive.                                                                                         |
| set -v                                                                                                                    | Prints all configuration variables of Hadoop and Hive.                                                                                                           |
| add FILE[S] <filepath><br><filepath>*<br>add JAR[S] <filepath><br><filepath>*<br>add ARCHIVE[S]<br><filepath> <filepath>* | Adds one or more files, JAR files, or ARCHIVE files to the resource list of the distributed cache.                                                               |

| Command                                                                                                                | Description                                                                                                                                                                                                                     |
|------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| add FILE[S] <ivyurl><br><ivyurl>*<br>add JAR[S] <ivyurl><br><ivyurl>*<br>add ARCHIVE[S] <ivyurl><br><ivyurl>*          | Adds one or more files, JAR files, or ARCHIVE files to the resource list of the distributed cache using the lvy URL in the <b>ivy://goup:module:version?query_string</b> format.                                                |
| list FILE[S]<br>list JAR[S]<br>list ARCHIVE[S]                                                                         | Lists the resources that have been added to the distributed cache.                                                                                                                                                              |
| list FILE[S] <filepath>*<br>list JAR[S] <filepath>*<br>list ARCHIVE[S]<br><filepath>*                                  | Checks whether given resources have been added to the distributed cache.                                                                                                                                                        |
| delete FILE[S] <filepath>*<br>delete JAR[S] <filepath>*<br>delete ARCHIVE[S]<br><filepath>*                            | Deletes resources from the distributed cache.                                                                                                                                                                                   |
| delete FILE[S] <ivyurl><br><ivyurl>*<br>delete JAR[S] <ivyurl><br><ivyurl>*<br>delete ARCHIVE[S]<br><ivyurl> <ivyurl>* | Delete the resource added using <b>&lt;ivyurl&gt;</b> from the distributed cache.                                                                                                                                               |
| reload                                                                                                                 | Enable HiveServer2 to discover the change of the JAR file <b>hive.reloadable.aux.jars.path</b> in the specified path. (You do not need to restart HiveServer2.) Change actions include adding, deleting, or updating JAR files. |
| dfs <dfs command>                                                                                                      | Runs the <b>dfs</b> command.                                                                                                                                                                                                    |
| <query string>                                                                                                         | Executes the Hive query and prints the result to the standard output.                                                                                                                                                           |

### 4.3.7 Using an Impala Client

Impala is a massively parallel processing (MPP) SQL query engine for processing vast amounts of data stored in Hadoop clusters. It is an open source software written in C++ and Java. It provides high performance and low latency compared with other SQL engines for Hadoop.

## Background

Suppose a user develops an application to manage users who use service A in an enterprise. The procedure of operating service A on the Impala client is as follows:

### Operations on common tables:

- Create the **user\_info** table.
- Add users' educational backgrounds and titles to the table.
- Query user names and addresses by user ID.
- Delete the user information table after service A ends.

**Table 4-9** User information

| No.         | Name | Gender | Age | Address |
|-------------|------|--------|-----|---------|
| 12005000201 | A    | Male   | 19  | City A  |
| 12005000202 | B    | Female | 23  | City B  |
| 12005000203 | C    | Male   | 26  | City C  |
| 12005000204 | D    | Male   | 18  | City D  |
| 12005000205 | E    | Female | 21  | City E  |
| 12005000206 | F    | Male   | 32  | City F  |
| 12005000207 | G    | Female | 29  | City G  |
| 12005000208 | H    | Female | 30  | City H  |
| 12005000209 | I    | Male   | 26  | City I  |
| 12005000210 | J    | Female | 25  | City J  |

## Prerequisites

The client has been installed. For example, the client is installed in the **/opt/hadoopclient** directory. The client directory in the following operations is only an example. Change it to the actual installation directory.

## Procedure

**Step 1** Log in to the node where the client is installed as the client installation user.

**Step 2** Run the following command to go to the client installation directory:

```
cd /opt/hadoopclient
```

**Step 3** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 4** Run the Impala client command to implement service A.

- **Operations on internal tables:**

Run the Impala client command **impala-shell**.

 **NOTE**

By default, **impala-shell** attempts to connect to the Impala daemon on port 21000 of **localhost**. To connect to another host, use the **-i < host:port >** option, for example, **impala-shell -i xxx.xxx.xxx.xxx:21000**. To automatically connect to a specific Impala database, use the **-d <database>** option. For example, if all your Kudu tables are in the **impala\_kudu** database, **-d impala\_kudu** can use this database. To exit Impala Shell, run the **quit** command.

- a. Create the **user\_info** user information table according to [Table 4-9](#) and add data to it.

```
create table user_info(id string,name string,gender string,age int,addr string);
insert into table user_info(id,name,gender,age,addr) values("12005000201", "A", "Male", 19,
"City A");
```

... (Other statements are the same.)

- b. Add users' educational backgrounds and titles to the **user\_info** table.

For example, to add educational background and title information about user 12005000201, run the following commands.

```
alter table user_info add columns(education string,technical string);
```

- c. Query user names and addresses by user ID.

For example, to query the name and address of user 12005000201, run the following command:

```
select name,addr from user_info where id='12005000201';
```

- d. Delete the user information table:

```
drop table user_info;
```

- **Operations on external partition tables:**

Create an external partition table and import data.

- a. Create a path for storing external table data.

**kinit hive** (Run this command only in security mode.)

 **NOTE**

The user must have the hive administrator permissions.

**hdfs dfs -mkdir /hive**

**hdfs dfs -mkdir /hive/user\_info**

- b. Create a table.

**impala-shell**

 **NOTE**

By default, **impala-shell** attempts to connect to the Impala daemon on port 21000 of **localhost**. To connect to another host, use the **-i < host:port >** option, for example, **impala-shell -i xxx.xxx.xxx.xxx:21000**. To automatically connect to a specific Impala database, use the **-d <database>** option. For example, if all your Kudu tables are in the **impala\_kudu** database, **-d impala\_kudu** can use this database. To exit Impala Shell, run the **quit** command.

```
create external table user_info(id string,name string,gender string,age int,addr string)
partitioned by(year string) row format delimited fields terminated by ' ' lines terminated by '\n'
stored as textfile location '/hive/user_info';
```

 NOTE

- **fields terminated** indicates delimiters, for example, spaces.
  - **lines terminated** indicates line breaks, for example, `\n`.
  - `/hive/user_info` indicates the path of the data file.
- c. Import data.
- i. Execute the **insert** statement to insert data.  
`insert into user_info partition(year="2018") values ("12005000201", "A", "Male", 19, "City A");`
  - ii. Run the **load data** command to import file data.
    - 1) Create a file based on the data in [Table 4-9](#). For example, the file name is `txt.log`. Fields are separated by space, and the line feed characters are used as the line breaks.
    - 2) Upload the file to HDFS.  
**`hdfs dfs -put txt.log /tmp`**
    - 3) Load data to the table.  
**`load data inpath '/tmp/txt.log' into table user_info partition (year='2018');`**
- d. Query the imported data:  
`select * from user_info;`
- e. Delete the user information table:  
`drop table user_info;`

----End

## 4.3.8 Using a Kafka Client

### Scenario

This section guides users to use a Kafka client in an O&M or service scenario.

This section applies to MRS 3.x or later.

### Prerequisites

- The client has been installed. For example, the installation directory is `/opt/client`.
- Service component users have been created by the MRS cluster administrator. Machine-machine users need to download the keytab file. A human-machine user must change the password upon the first login. (Not involved in normal mode)
- After changing the domain name of a cluster, redownload the client to ensure that the **`kerberos.domain.name`** value in the configuration file of the client is set to the correct server domain name.

### Procedure

**Step 1** Log in to the node where the client is installed as the client installation user.

- Step 2** Run the following command to go to the client installation directory:
- ```
cd /opt/client
```
- Step 3** Run the following command to configure environment variables:
- ```
source bigdata_env
```
- Step 4** Run the following command to perform user authentication (skip this step in normal mode):
- ```
kinit Component service user
```
- Step 5** Run the following command to switch to the Kafka client installation directory:
- ```
cd Kafka/kafka/bin
```
- Step 6** Run the following command to use the client tool to view and use the help information:
- `./kafka-console-consumer.sh`: Kafka message reading tool
  - `./kafka-console-producer.sh`: Kafka message publishing tool
  - `./kafka-topics.sh`: Kafka topic management tool
- End

### 4.3.9 Using a Kudu Client

Kudu is a columnar storage manager developed for the Apache Hadoop platform. Kudu shares the common technical properties of Hadoop ecosystem applications. It is horizontally scalable and supports highly available operations.

#### Prerequisites

The cluster client has been installed. For example, the client is installed in the `/opt/hadoopclient` directory. The client directory in the following operations is only an example. Change it to the actual installation directory.

#### Procedure

- Step 1** Log in to the node where the client is installed as the client installation user.
- Run the `su - omm` command to switch to user `omm`.
- Step 2** Run the following command to go to the client installation directory:
- ```
cd /opt/hadoopclient
```
- Step 3** Run the following command to configure environment variables:
- ```
source bigdata_env
```
- Step 4** Run the Kudu command line tool.
- Run the command line tool of the Kudu component to view help information.
- ```
kudu -h
```
- The command output is as follows:

Usage: kudu <command> [<args>]

<command> can be one of the following:

```
cluster  Operate on a Kudu cluster
diagnose Diagnostic tools for Kudu servers and clusters
  fs     Operate on a local Kudu filesystem
  hms    Operate on remote Hive Metastores
local_replica Operate on local tablet replicas via the local filesystem
master   Operate on a Kudu Master
  pbc   Operate on PBC (protobuf container) files
  perf  Measure the performance of a Kudu cluster
remote_replica Operate on remote tablet replicas on a Kudu Tablet Server
table    Operate on Kudu tables
tablet   Operate on remote Kudu tablets
test     Various test actions
tserver  Operate on a Kudu Tablet Server
wal      Operate on WAL (write-ahead log) files
```

NOTE

The Kudu command line tool does not support DDL and DML operations, but provides the refined query function for the **cluster**, **master**, **tserver**, **fs**, and **table** parameters.

Common operations:

- Check the tables in the current cluster.
kudu table list *KuduMaster instance IP1:7051, KuduMaster instance IP2:7051, KuduMaster instance IP3:7051*
- Query the configurations of the KuduMaster instance of the Kudu service.
kudu master get_flags *KuduMaster instance IP:7051*
- Query the schema of a table.
kudu table describe *KuduMaster instance IP1:7051, KuduMaster instance IP2:7051, KuduMaster instance IP3:7051 Table name*
- Delete a table.
kudu table delete *KuduMaster instance IP1:7051, KuduMaster instance IP2:7051, KuduMaster instance IP3:7051 Table name*

NOTE

To obtain the IP address of the KuduMaster instance, choose **Components > Kudu > Instances** on the cluster details page.

----End

4.3.10 Using the Oozie Client

Scenario

This section describes how to use the Oozie client in an O&M scenario or service scenario.

Prerequisites

- The client has been installed in a directory, for example, **/opt/client**. The client directory in the following operations is only an example. Change it based on site requirements.

- Service component users have been created by the MRS cluster administrator. In security mode, machine-machine users need to download the keytab file. A human-machine user must change the password upon the first login.

Using the Oozie Client

Step 1 Install the client. For details, see [Installing a Client](#).

Step 2 Log in to the node where the client is installed as the client installation user.

Step 3 Run the following command to switch to the client installation directory (change it to the actual installation directory):

```
cd /opt/client
```

Step 4 Run the following command to configure environment variables:

```
source bigdata_env
```

Step 5 Check the cluster authentication mode.

- If the cluster is in security mode, run the following command to authenticate the user: *exampleUser* indicates the name of the user who submits tasks.

```
kinit exampleUser
```

- If the cluster is in normal mode, go to [Step 6](#).

Step 6 Perform the following operations to configure Hue:

1. Configure the Spark2x environment (skip this step if the Spark2x task is not involved):

```
hdfs dfs -put /opt/client/Spark2x/spark/jars/*.jar /user/oozie/share/lib/spark2x/
```

When the JAR package in the HDFS directory **/user/oozie/share** changes, you need to restart the Oozie service.

2. Upload the Oozie configuration file and JAR package to HDFS.

```
hdfs dfs -mkdir /user/exampleUser
```

```
hdfs dfs -put -f /opt/client/Oozie/oozie-client-*/examples /user/exampleUser/
```

NOTE

- *exampleUser* indicates the name of the user who submits tasks.
- If the user who submits the task and other files except **job.properties** are not changed, client installation directory **Oozie/oozie-client-*/examples** can be repeatedly used after being uploaded to HDFS.
- Resolve the JAR file conflict between Spark and Yarn about Jetty.

```
hdfs dfs -rm -f /user/oozie/share/lib/spark/jetty-all-9.2.22.v20170606.jar
```

- In normal mode, if **Permission denied** is displayed during the upload, run the following commands:

```
su - omm
```

```
source /opt/client/bigdata_env
```

```
hdfs dfs -chmod -R 777 /user/oozie
```

```
exit
```

----End

4.3.11 Using a Storm Client

Scenario

This section describes how to use the Storm client in an O&M scenario or service scenario.

Prerequisites

- You have installed the client. For example, the installation directory is **/opt/hadoopclient**.
- Service component users have been created by the MRS cluster administrator. In security mode, machine-machine users have downloaded the keytab file. A human-machine user must change the password upon the first login. (Not involved in normal mode)

Procedure

Step 1 Prepare the client based on service requirements. Log in to the node where the client is installed.

Log in to the node where the client is installed based on the client location. For details, see [Installing a Client](#).

Step 2 Run the following command to go to the client installation directory:

```
cd /opt/hadoopclient
```

Step 3 Run the following command to configure environment variables:

```
source bigdata_env
```

Step 4 If multiple Storm instances are installed, run the following command to load the environment variables of a specific instance when running the Storm command to submit the topology. Otherwise, skip this step. The following command uses the instance Storm-2 as an example.

```
source Storm-2/component_env
```

Step 5 Run the following command to perform user authentication (skip this step in normal mode):

```
kinit Component service user
```

Step 6 Run the following command to perform operations on the client:

For example, run the following command:

- **cql**
- **storm**

NOTE

A Storm client cannot be connected to secure and non-secure ZooKeepers at the same time.

----End

4.3.12 Using a Yarn Client

Scenario

This section guides users to use a Yarn client in an O&M or service scenario.

Prerequisites

- The client has been installed.
For example, the installation directory is **/opt/client**. The client directory in the following operations is only an example. Change it based on the actual installation directory onsite.
- Service component users have been created by the MRS cluster administrator. In security mode, machine-machine users need to download the keytab file. A human-machine user must change the password upon the first login. In common mode, you do not need to download the keytab file or change the password.

Using the Yarn Client

Step 1 Install a client.

- For versions earlier than MRS 3.x, see [Installing a Client](#).
- For MRS 3.x or later, see [Installing a Client](#).

Step 2 Log in to the node where the client is installed as the client installation user.

Step 3 Run the following command to go to the client installation directory:

```
cd /opt/client
```

Step 4 Run the following command to configure environment variables:

```
source bigdata_env
```

Step 5 If the cluster is in security mode, run the following command to authenticate the user. In normal mode, user authentication is not required.

```
kinit Component service user
```

Step 6 Run the Yarn command. The following provides an example:

```
yarn application -list
```

```
----End
```

Client-related FAQs

1. What Do I Do When the Yarn Client Exits Abnormally and Error Message "java.lang.OutOfMemoryError" Is Displayed After the Yarn Client Command Is Run?

This problem occurs because the memory required for running the Yarn client exceeds the upper limit (128 MB by default) set on the Yarn client. For clusters of MRS 3.x or later: You can modify **CLIENT_GC_OPTS** in *<Client installation path>/HDFS/component_env* to change the memory upper limit

of the Yarn client. For example, if you want to set the maximum memory to 1 GB, run the following command:

```
export CLIENT_GC_OPTS="-Xmx1G"
```

For clusters earlier than MRS 3.x: You can modify **GC_OPTS_YARN** in *< Client installation path >/HDFS/component_env* to change the memory upper limit of the Yarn client. For example, if you want to set the maximum memory to 1 GB, run the following command:

```
export GC_OPTS_YARN="-Xmx1G"
```

After the modification, run the following command to make the modification take effect:

```
source <Client installation path>/bigdata_env
```

2. How Can I Set the Log Level When the Yarn Client Is Running?

By default, the logs generated during the running of the Yarn client are printed to the console. The default log level is INFO. To enable the DEBUG log level for fault locating, run the following command to export an environment variable:

```
export YARN_ROOT_LOGGER=DEBUG,console
```

Then run the Yarn Shell command to print DEBUG logs.

If you want to print INFO logs again, run the following command:

```
export YARN_ROOT_LOGGER=INFO,console
```

5 Configuring a Cluster with Decoupled Storage and Compute

5.1 MRS Storage-Compute Decoupling

In scenarios that require large storage capacity and elastic compute resources, MRS enables you to store data in OBS and use an MRS cluster for data computing only. In this way, storage and compute are separated.

NOTE

In the big data storage-compute decoupling scenario, the OBS parallel file system must be used to configure a cluster. For details, see [Parallel File System](#). Using common object buckets will greatly affect the cluster performance.

Perform the following steps to use the storage-compute decoupling function:

1. Configure a cluster with decoupled storage and compute.

Select one of the following configurations (Using an agency is recommended.):

- Bind an agency of the ECS type to an MRS cluster to access OBS, preventing the AK/SK from being exposed in the configuration file. For details, see [Configuring a Storage-Compute Decoupled Cluster \(Agency\)](#).
- Configure the AK/SK in an MRS cluster. The AK/SK will be exposed in the configuration file in plaintext. Exercise caution when performing this operation. For details, see [Configuring a Storage-Compute Decoupled Cluster \(AK/SK\)](#).

2. Use the cluster.

After the required permissions for accessing OBS are obtained, components in the MRS cluster can access the corresponding files through the client.

For details about how to configure components to access OBS, see the following content:

- [Interconnecting MRS with OBS Using an Agency](#)

5.2 Interconnecting with OBS Using the Cluster Agency Mechanism

5.2.1 Configuring a Storage-Compute Decoupled Cluster (Agency)

MRS allows you to store data in OBS and use an MRS cluster for data computing only. In this way, storage and compute are separated. You can create an IAM agency, which enables ECS to automatically obtain the temporary AK/SK to access OBS. This prevents the AK/SK from being exposed in the configuration file.

By binding an agency, ECSs or BMSs can manage some of your resources. Determine whether to configure an agency based on the actual service scenario.

MRS provides the following configuration modes for accessing OBS. You can select one of them. The agency mode is recommended.

- Bind an agency of the ECS type to an MRS cluster to access OBS, preventing the AK/SK from being exposed in the configuration file. For details, see the following part in this section.
- Configure the AK/SK in an MRS cluster. The AK/SK will be exposed in the configuration file in plaintext. Exercise caution when performing this operation. For details, see [Configuring a Storage-Compute Decoupled Cluster \(AK/SK\)](#).

This function is available for components Hadoop, Hive, Spark, Presto, and Flink in clusters of .

(Optional) Step 1: Create an ECS Agency with OBS Access Permissions

NOTE

- MRS presets **MRS_ECS_DEFAULT_AGENCY** in the agency list of IAM so that you can select this agency when creating a cluster. This agency has the **OBSOperateAccess** permission and the **CESFullAccess** (only available for users who have enabled fine-grained policies), **CES Administrator**, and **KMS Administrator** permissions in the region where the cluster is located. Do not modify **MRS_ECS_DEFAULT_AGENCY** on IAM.
- If you want to use the preset agency, skip the step for creating an agency. If you want to use a custom agency, perform the following steps to create an agency. (To create or modify an agency, you must have the Security Administrator permission.) If you need fine-grained permission control on specified paths in the OBS file system, see [Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS](#) and create custom role policies.

1. Log in to the Huawei Cloud management console.
2. Choose **Service List > Management & Governance > Identity and Access Management**.
3. Choose **Agencies**. On the displayed page, click **Create Agency**.
4. Enter an agency name, for example, **mrs_ecs_obs**.
5. Set **Agency Type** to **Cloud service** and select **ECS BMS** to authorize ECS or BMS to invoke OBS. See [Figure 5-1](#).

6. Set **Validity Period** to **Unlimited** and click **Next**.

Figure 5-1 Creating an agency

* Agency Name

* Agency Type Account
Delegate another HUAWEI CLOUD account to perform operations on your resources.
 Cloud service
Delegate a cloud service to access your resources in other cloud services.

* Cloud Service

* Validity Period

Description

0/255

7. On the displayed page, search for the **OBS OperateAccess** and select it, as shown in [Figure 5-2](#).

NOTE

If KMS encryption is configured for an OBS bucket, the **KMS Administrator** policy must be selected.

Figure 5-2 Configuring permissions

8. Click **Next**. On the page that is displayed, select the desired scope for the permissions you selected. By default, **All resources** is selected. Click **Show More**, select **Global resources**, and click **OK**.
9. In the dialog box that is displayed, click **OK** to start authorization. After the message "**Authorization successful.**" is displayed, click **Finish**. The agency is successfully created.

Step 2: Create a Cluster with Storage and Compute Separated

You can configure an agency when creating a cluster or bind an agency to an existing cluster to separate storage and compute. This section uses a cluster with Kerberos authentication enabled as an example.

Configuring an agency when creating a cluster:

1. Go to the [Buy Cluster](#) page.
2. Click the **Custom Config** tab.

Figure 5-3 Custom purchase of a cluster

3. On the **Custom Config** tab page, set software parameters.
 - **Region:** Select a region as required.
 - **Cluster Name:** You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing.
 - **Cluster Version:** Select a cluster version.
 - **Cluster Type:** Select **Analysis cluster** or **Hybrid cluster** and select all components.
 - **Metadata:** Select **Local**.
4. Click **Next** and set hardware parameters.
 - **Billing Mode:** Select **Pay-per-use**.
 - **AZ:** Use the default value.
 - **VPC:** Use the default value.
 - **Subnet:** Use the default value.
 - **Security Group:** Use the default value.
 - **EIP:** Use the default value.
 - **Enterprise Project:** Use the default value.
 - **CPU Architecture:** Use the default value. This parameter is supported in the versions earlier than MRS 3.x .
 - **Cluster Node:** Select the number of cluster nodes and node specifications based on site requirements.
5. Click **Next** and set related parameters.
 - **Kerberos Authentication:** This function is enabled by default. You can enable or disable it.
 - **Username:** The default username is **admin**, which is used to log in to MRS Manager.
 - **Password:** Set a password for user **admin**.
 - **Confirm Password:** Enter the password of user **admin** again.
 - **Login Mode:** Select a method for logging in to ECSs. In this example, select **Password**.
 - **Username:** The default username is **root**, which is used to remotely log in to ECSs.
 - **Password:** Set a password for user **root**.
 - **Confirm Password:** Enter the password of user **root** again.
6. In this example, configure an agency and leave other parameters blank. For details about how to configure other parameters, see [Advanced Options](#).

Agency: Select the agency created in [\(Optional\) Step 1: Create an ECS Agency with OBS Access Permissions](#) or `MRS_ECS_DEFAULT_AGENCY` preset in IAM.

Figure 5-4 Configuring an agency

7. Select the check box for secure communications. For details, see [Communication Security Authorization](#).
8. Click **Buy Now** and wait until the cluster is created.
If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

Configuring an agency for an existing cluster:

1. Log in to the MRS console. In the navigation pane on the left, choose **Active Clusters**.
2. Click the name of the cluster to enter its details page.
3. On the **Dashboard** page, click **Synchronize** on the right of **IAM User Sync** to synchronize IAM users.
4. On the **Dashboard** tab page, click **Manage Agency** on the right side of **Agency** to select an agency and click **OK** to bind it. Alternatively, click **Create Agency** to go to the IAM console to create an agency and select it.

Figure 5-5 Binding an agency

Step 3: Create an OBS File System for Storing Data

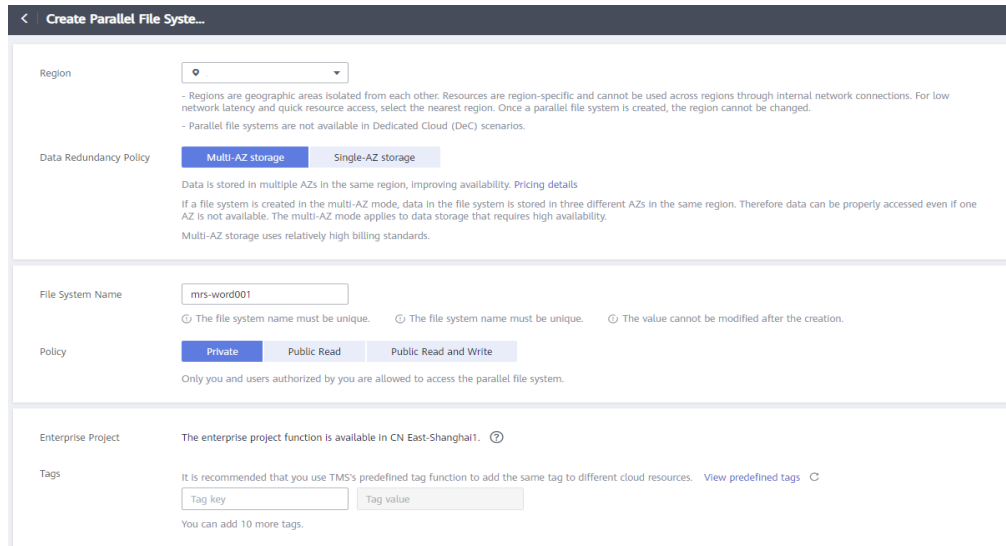

NOTE

In storage-compute decoupled scenarios, the OBS parallel file system must be used to store data. For details, see [Parallel File System](#). The cluster performance will be significantly affected if common object buckets are used.

1. Log in to the OBS Console.
2. Choose **Parallel File System > Create Parallel File System**.
3. Enter the file system name, for example, **mrs-word001**.

Set other parameters as required.

Figure 5-6 Creating an OBS parallel file system

4. Click **Create Now**.
5. In the parallel file system list on the OBS console, click the file system name to go to the details page.
6. In the navigation pane, choose **Files** and create the **program** and **input** folders.
 - **program**: Upload the program package to this folder.
 - **input**: Upload the input data to this folder.

Step 4: Access the OBS File System

1. Log in to a Master node as user **root**. For details, see [Logging In to an ECS](#).
2. Run the following command to set the environment variables:
 For versions earlier than MRS 3.x, run the **source /opt/client/bigdata_env** command.
 For MRS 3.x or later, run the **source /opt/Bigdata/client/bigdata_env** command.
3. Verify that Hadoop can access OBS.
 - a. View the list of files in the file system **mrs-word001**.
hadoop fs -ls obs://mrs-word001/
 - b. Check whether the file list is returned. If it is returned, OBS access is successful.

Figure 5-7 Returned file list

```
Found 2 items
drwxrwxrwx - root root      0 2019-12-21 11:04 obs://mrs-word001/input
drwxrwxrwx - root root      0 2019-12-21 11:04 obs://mrs-word001/program
```

4. Verify that Hive can access OBS.
 - a. If Kerberos authentication has been enabled for the cluster, run the following command to authenticate the current user. The current user

must have a permission to create Hive tables. For details about how to configure a role with a permission to create Hive tables, see [Creating a Role](#). For details about how to create a user and bind a role to the user, see [Creating a User](#). If Kerberos authentication is disabled for the current cluster, skip this step.

kinit *MRS cluster user*

Example: **kinit hiveuser**

- b. Run the client command of the Hive component.

beeline

- c. Access the OBS directory in the beeline. For example, run the following command to create a Hive table and specify that data is stored in the **test_obs** directory of the file system **mrs-word001**:

create table test_obs(a int, b string) row format delimited fields terminated by ',' stored as textfile location "obs://mrs-word001/test_obs";

- d. Run the following command to query all tables. If table **test_obs** is displayed in the command output, OBS access is successful.

show tables;

Figure 5-8 Returned table name

- e. Press **Ctrl+C** to exit the Hive beeline.

- 5. Verify that Spark can access OBS.

- a. Run the client command of the Spark component.

spark-beeline

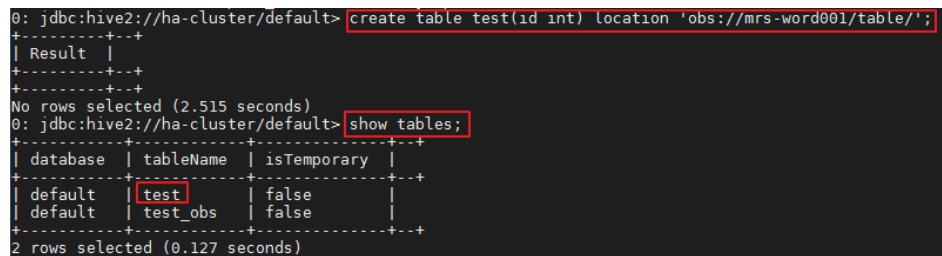

- b. Access OBS in spark-beeline. For example, create table **test** in the **obs://mrs-word001/table/** directory.

create table test(id int) location 'obs://mrs-word001/table/';

- c. Run the following command to query all tables. If table **test** is displayed in the command output, OBS access is successful.

show tables;

Figure 5-9 Returned table name

- d. Press **Ctrl+C** to exit the Spark beeline.

6. Verify that Presto can access OBS.
 - For normal clusters with Kerberos authentication disabled
 - i. Run the following command to connect to the client:
presto_cli.sh
 - ii. On the Presto client, run the following statement to create a schema and set **location** to an OBS path:
CREATE SCHEMA hive.demo WITH (location = 'obs://mrs-word001/presto-demo02/');
 - iii. Create a table in the schema. The table data is stored in the OBS file system. The following is an example.
CREATE TABLE hive.demo.demo_table WITH (format = 'ORC') AS SELECT * FROM tpch.sf1.customer;

Figure 5-10 Return result

```
[root@node-master2mdc0 ~]# presto_cli.sh
--server http://192.168.3.66:7520
presto> CREATE SCHEMA hive.demo WITH (location = 'obs://mrs-word001/presto-demo02/');
CREATE SCHEMA
presto> CREATE TABLE hive.demo.demo_table WITH (format = 'ORC') AS SELECT * FROM tpch.sf1.customer;
CREATE TABLE: 150000 rows

Query 20191221_033019_00001_ukfbz, FINISHED, 2 nodes
Splits: 42 total, 42 done (100.00%)
0:09 [150K rows, 0B] [16K rows/s, 0B/s]
```

- iv. Run **exit** to exit the client.
 - For security clusters with Kerberos authentication enabled
 - i. Log in to MRS Manager and create a role with the Hive Admin Privilege permissions, for example, **prestorole**. For details about how to create a role, see [Creating a Role](#).
 - ii. Create a user that belongs to the Presto and Hive groups and bind the role created in [6.i](#) to the user, for example, **presto001**. For details about how to create a user, see [Creating a User](#).
 - iii. Authenticate the current user.
kinit presto001
 - iv. Download the user credential.
 - 1) For MRS 3.x earlier, on MRS Manager, choose **System > Manage User**. In the row of the new user, choose **More > Download Authentication Credential**.

Figure 5-11 Downloading the Presto user authentication credential

- 2) On FusionInsight Manager for MRS 3.x or later,, choose **System > Permission > User**. In the row that contains the newly added user, click **More > Download Authentication Credential**.

Figure 5-12 Downloading the Presto user authentication credential

- v. Decompress the downloaded user credential file, and save the obtained **krb5.conf** and **user.keytab** files to the client directory, for example, **/opt/Bigdata/client/Presto/**.
- vi. Run the following command to obtain a user principal:
klist -kt /opt/Bigdata/client/Presto/user.keytab
- vii. For clusters with Kerberos authentication enabled, run the following command to connect to the Presto Server of the cluster:
presto_cli.sh --krb5-config-path {krb5.conf file path} --krb5-principal {user principal} --krb5-keytab-path {user.keytab file path} --user {presto username}
 - o **krb5.conf** file path: Replace it with the file path set in **6.v**, for example, **/opt/Bigdata/client/Presto/krb5.conf**.
 - o **user.keytab** file path: Replace it with the file path set in **6.v**, for example, **/opt/Bigdata/client/Presto/user.keytab**.
 - o **user principal**: Replace it with the result returned in **6.vi**.
 - o **presto username**: Replace it with the name of the user created in **6.ii**, for example, **presto001**.
- viii. On the Presto client, run the following statement to create a schema and set **location** to an OBS path:
CREATE SCHEMA hive.demo01 WITH (location = 'obs://mrs-word001/presto-demo002/');
- ix. Create a table in the schema. The table data is stored in the OBS file system. The following is an example.
CREATE TABLE hive.demo01.demo_table WITH (format = 'ORC') AS SELECT * FROM tpch.sf1.customer;

Figure 5-13 Return result

```

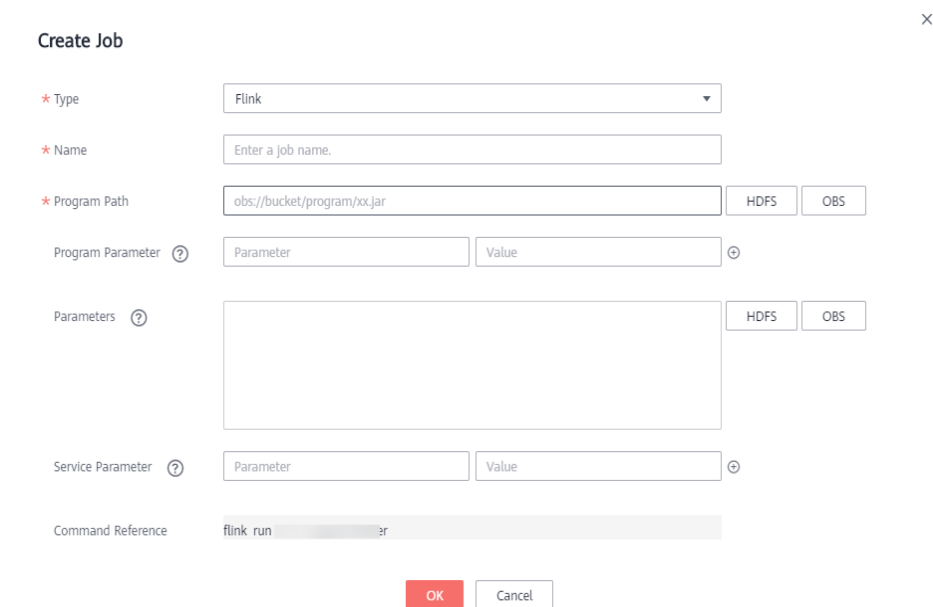

[root@node-master2962 ~]# presto_cli.sh --krb5-config-path /opt/client/presto/krb5.conf --krb5-principal presto001@B85C97.1710.408.070.00042090A1.COM --krb5-keytab-path /opt/client/presto/user.keytab --user presto001
krb5_remote_service_name HTTP --server https://192.168.1.22:7521 --krb5-keytab-path /opt/client/presto/user.keytab --krb5-principal presto001@B85C97.1710.408.070.00042090A1.COM --krb5-config-path /opt/client/presto/krb5.conf --user presto001
presto> CREATE SCHEMA hive.demo01 WITH (location = 'obs://mrs-word001/presto-demo002/');
CREATE SCHEMA
presto> CREATE TABLE hive.demo01.demo_table WITH (format = 'ORC') AS SELECT * FROM tpch.sf1.customer;
CREATE TABLE: 150000 rows
Query 20191221_105909_00006_1[high, FINISHED, 2 nodes
201912-21 10:59:13] - 42 Rows (150.49K)
Pill [150K rows, 0B] [13.7K rows/s, 0B/s]

```

- x. Run **exit** to exit the client.
7. Verify that Flink can access OBS.
 - a. On the **Dashboard** page, click **Synchronize** on the right of **IAM User Sync** to synchronize IAM users.
 - b. After user synchronization is complete, choose **Jobs > Create** on the cluster details page to create a Flink job. In **Parameters**, enter

parameters in `--input <Job input path> --output <Job output path>` format. You can click **OBS** to select a job input path, and enter a job output path that does not exist, for example, `obs://mrs-word001/output/`.

Figure 5-14 Creating a Flink job

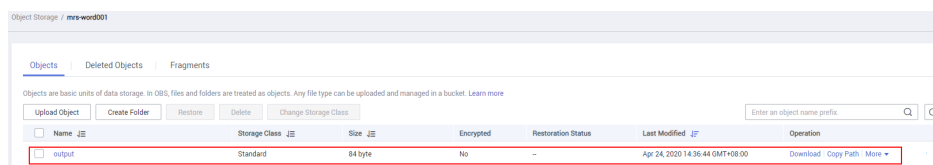

The screenshot shows a 'Create Job' form with the following fields and options:

- Type: Flink
- Name: Enter a job name.
- Program Path: obs://bucket/program/xx.jar (with HDFS and OBS buttons)
- Program Parameter: Parameter (with a help icon)
- Value: Value (with a plus icon)
- Parameters: (with a help icon)
- Service Parameter: Parameter (with a help icon)
- Value: Value (with a plus icon)
- Command Reference: flink run

Buttons: OK, Cancel

- On OBS Console, go to the output path specified during job creation. If the output directory is automatically created and contains the job execution results, OBS access is successful.

Figure 5-15 Flink job execution result

Name	Storage Class	Size	Encrypted	Restoration Status	Last Modified	Operation
output	Standard	84 byte	No	-	Apr 24, 2020 14:36:44 GMT+08:00	Download Copy Path More

Step 5: Configure a Lifecycle Rule

In MRS 3.2.0-LTS.1 and later versions, components prevent mis-deletion by default. That is, file data deleted by component users is not directly deleted but stored in the recycle bin directory in the OBS file system.

To save OBS space, you need to enable periodical deletion of file data from the OBS recycle bin by referring to [Configuring the Policy for Clearing Component Data in the Recycle Bin](#).

Reference

For details about how to control permissions to access OBS, see [Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS](#).

5.2.2 Configuring a Storage-Compute Decoupled Cluster (AK/SK)

In MRS 1.9.2 or later, OBS can be interconnected with MRS using **obs://**. Currently, Hadoop, Hive, Spark, Presto, and Flink are supported. HBase cannot use **obs://** to interconnect with OBS.

MRS provides the following configuration modes for accessing OBS. You can select one of them. The agency mode is recommended.

- Bind an agency of the ECS type to an MRS cluster to access OBS, preventing the AK/SK from being exposed in the configuration file. For details, see [Configuring a Storage-Compute Decoupled Cluster \(Agency\)](#).
- Configure the AK/SK in an MRS cluster. The AK/SK will be exposed in the configuration file in plaintext. Exercise caution when performing this operation. For details, see the following part in this section.

NOTICE

- To improve data write performance, log in to the Manager and choose **Cluster > Services > Name of the service to be modified > Configurations**. Change the value of **fs.obs.buffer.dir** to the data disk directory.
- In the storage-compute decoupled scenario, the OBS parallel file system must be used to configure a cluster. For details, see [Parallel File System](#). Using common object buckets will greatly affect the cluster performance.
- **In MRS 3.2.0-LTS.1 and later versions, components prevent mis-deletion by default. That is, file data deleted by component users is not directly deleted but stored in the recycle bin directory in the OBS file system.**

To save OBS space, you need to enable periodical deletion of file data from the OBS recycle bin by referring to [Configuring the Policy for Clearing Component Data in the Recycle Bin](#).

- Configuration files containing authentication passwords pose security risks. Delete such files after configuration or store them securely.
 - Commands carrying authentication passwords pose security risks. Disable historical command recording before running such commands to prevent information leakage.
-

Using Hadoop to Access OBS

- Add the following content to the **core-site.xml** file in the *Client installation directory/HDFS/hadoop/etc/hadoop* directory on the HDFS client. For details about how to install the MRS client, see [Installing the Client](#).

```
<property>
  <name>fs.obs.access.key</name>
  <value>ak</value>
</property>
<property>
  <name>fs.obs.secret.key</name>
  <value>sk</value>
</property>
<property>
  <name>fs.obs.endpoint</name>
```

```
<value>obs_endpoint</value>
</property>
```

If you use commands that need to submit jobs to Yarn, such as **distcp**, you need to add the preceding content to the **core-site.xml** file in the Yarn directory (**\$client_home/Yarn/config**) on the MRS client.

NOTICE

AK and SK will be displayed as plaintext in the configuration file. Exercise caution when setting AK and SK in the file.

After the configuration is added, you can directly access data on OBS without manually adding the AK/SK and endpoint. For example, run the following command to view the file list of the **test_obs_orc** directory in the **obs-test** file system:

```
hadoop fs -ls "obs://obs-test/test_obs_orc"
```

- Add AK/SK and endpoint to the command line to access data on OBS.

```
hadoop fs -Dfs.obs.endpoint=xxx -Dfs.obs.access.key=xx -
Dfs.obs.secret.key=xx -ls "obs://obs-test/ test_obs_orc"
```

Using Hive to Access OBS

Step 1 Log in to the service configuration page.

- For versions earlier than MRS 3.x, log in to the cluster details page and choose **Components > Hive > Service Configuration**.
- For MRS 3.x or later, log in to FusionInsight Manager. For details, see [Accessing FusionInsight Manager \(MRS 3.x or Later\)](#). Choose **Cluster > Services > Hive > Configurations**.

Step 2 In the configuration type drop-down box, switch **Basic Configurations** to **All Configurations**.

Step 3 Configure the AK and SK of OBS.

- For versions earlier than MRS 3.x, click **Hive**, select **Customization**, and add the following two configurations to **core.site.customized.configs**: **Name: fs.obs.access.key**; **Value: AK** for accessing OBS; **Name: fs.obs.secret.key**; **Value: SK** for accessing OBS.

Figure 5-16 Setting the AK/SK for accessing OBS

- For MRS 3.x or later, click **Hive(Service)**, select **Customization**, and add the following two configurations to **core.site.customized.configs**: **Name: fs.obs.access.key**; **Value: AK** for accessing OBS; **Name: fs.obs.secret.key**; **Value: SK** for accessing OBS.

Figure 5-17 Configuring the AK/SK for accessing OBS

Step 4 Save the configurations and restart Hive.

Step 5 Access the OBS directory in Beeline. For example, run the following command to create a Hive table and specify that data is stored in the **test_obs** directory in the **test-bucket** file system:

```
create table test_obs(a int, b string) row format delimited fields terminated by "," stored as textfile location "obs://test-bucket/test_obs";
```

----End

Using Spark to Access OBS

NOTE

- SparkSQL depends on Hive. Therefore, when configuring OBS on Spark, you need to modify the OBS configuration used in [Using Hive to Access OBS](#).
- In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JobHistory2x is changed to JobHistory. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.
- spark-beeline and spark-sql
You can use spark-beeline or spark-sql to log in to the Spark client and run the following commands to configure AK and SK information for accessing OBS:

```
set fs.obs.access.key=AK
set fs.obs.secret.key=SK
set fs.obs.endpoint=OBS Endpoint
```
- spark-beeline
The spark-beeline can access OBS by configuring service parameters on Manager. The procedure is as follows:
 - a. Log in to the service configuration page.
 - For versions earlier than MRS 3.x, log in to the cluster details page and choose **Components > Spark > Service Configuration**.
 - For MRS 3.x or later, log in to FusionInsight Manager. For details, see [Accessing FusionInsight Manager \(MRS 3.x or Later\)](#). Choose **Cluster > Services > Spark2x > Configurations**.
 - b. In the configuration type drop-down box, switch **Basic Configurations** to **All Configurations**.
 - c. Choose **JDBCServer > OBS**, and set values for **fs.obs.access.key** and **fs.obs.secret.key**.
If the preceding two parameters cannot be found in the current cluster, choose **JDBCServer > Customization** in the navigation tree on the left and add the two parameters to the customized parameter **spark.core-site.customized.configs**.

Figure 5-18 Parameters for adding an OBS

- d. Save the configurations and restart Spark.
- e. Access OBS in **spark-beeline**. For example, access the **obs://obs-demo-input/table/** directory.

create table test(id int) location 'obs://obs-demo-input/table/';

- spark-sql and spark-submit

Both spark-sql and spark-submit can access OBS if you add the following content to the **core-site.xml** configuration file in the *Client installation directory/Spark/spark/conf* directory:

```
<property>
  <name>fs.obs.access.key</name>
  <value>ak</value>
</property>
<property>
  <name>fs.obs.secret.key</name>
  <value>sk</value>
</property>
<property>
  <name>fs.obs.endpoint</name>
  <value>obs endpoint</value>
</property>
```

Using Presto to Access OBS

- Step 1** Go to the cluster details page and choose **Components > Presto > Service Configuration**.
- Step 2** In the configuration type drop-down box, switch **Basic Configurations** to **All Configurations**.
- Step 3** Search for and configure the following parameters:
 - Set **fs.obs.access.key** to **AK**.
 - Set **fs.obs.secret.key** to **SK**.

If the preceding two parameters cannot be found in the current cluster, choose **Presto > Hive** in the navigation tree on the left and add the two parameters to the customized parameter **core.site.customized.configs**.

- Step 4** Save the configurations and restart Presto.
- Step 5** Choose **Components > Hive > Service Configuration**.
- Step 6** In the configuration type drop-down box, switch **Basic Configurations** to **All Configurations**.
- Step 7** Search for and configure the following parameters:
 - Set **fs.obs.access.key** to **AK**.
 - Set **fs.obs.secret.key** to **SK**.
- Step 8** Save the configurations and restart Hive.

- Step 9** On the Presto client, run the following statement to create a schema and set **location** to an OBS path:

```
presto_cli.sh
```

```
CREATE SCHEMA hive.demo WITH (location = 'obs://obs-demo/presto-  
demo/');
```

- Step 10** Create a table in the schema. The table data is stored in the OBS file system. The following is an example.

```
USE hive.demo;
```

```
CREATE TABLE Table name (id int);
```

```
INSERT INTO Table name VALUES (2);
```

In this command, 2 is only used as an example. Replace it with the real value.

```
CREATE TABLE hive.demo.demo_table WITH (format = 'ORC') AS SELECT *  
FROM tpch.sf1.customer;
```

```
----End
```

Using Flink to Access OBS

Add the following configuration to the Flink configuration file of the MRS client in ***Client installation path*/Flink/flink/conf/flink-conf.yaml**:

```
fs.obs.access.key: ak  
fs.obs.secret.key: sk  
fs.obs.endpoint: OBS Endpoint
```

NOTICE

AK and SK will be displayed as plaintext in the configuration file. Exercise caution when setting AK and SK in the file.

After the configuration is added, you can directly access data on OBS without manually adding the AK/SK and endpoint.

5.2.3 Configuring the Policy for Clearing Component Data in the Recycle Bin

Scenario

By default, components in an MRS 3.2.0-LTS.1 or later cluster support prevention against accidental data deletion. Native HDFS garbage collection can be used in the Hadoop big data systems that use OBS.

The file data deleted by a component user is not directly deleted, but is stored in the recycle bin of the OBS file system instead. This section describes how to set a lifecycle rule for the recycle bin directory to periodically clear related data.

 CAUTION

- For clusters that use decoupled storage and compute, configure a lifecycle policy for the related directories by referring to this chapter. Otherwise, the storage space may be used up and storage fees may increase. For details about OBS billing, see [OBS Billing Overview](#).
- The recycle bin directory is created per user. When a user is created in the MRS cluster and the user has the permission to delete component data, you need to configure the recycle bin clearing rule for this new user.
- For HBase components that use decoupled storage and compute in MRS 3.1.2 or later versions, refer to this topic to set a policy for clearing component data in the recycle bin.

You need to configure lifecycle policies for the recycle bin directories of preset users in the MRS cluster and the recycle bin directories of new users who need accidental deletion prevention. If a low privileged agency is used or only the permission for MRS users to access OBS file system directories is configured by referring to [Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS](#), you will need the operation permission for the recycle bin directory.

Table 5-1 Directories for which a lifecycle policy needs to be configured

Cluster Version	Directory Type	Component	Directory	How to Create
Versions earlier than MRS 3.3.0-LTS	Recycle bin directories that must be configured by default for each component in an MRS cluster	Hive	<ul style="list-style-type: none"> • user/omm/.Trash • user/hive/.Trash 	If the .Trash folder does not exist, create it on the cluster client as user omm . Run the following command: hdfs dfs -mkdir -p obs://Name of the OBS parallel file system where the table is stored/ Folder path
		Spark	<ul style="list-style-type: none"> • user/omm/.Trash • user/root/.Trash • user/spark2x/.Trash 	
		HetuEngine	<ul style="list-style-type: none"> • user/omm/.Trash • user/hetuserver/.Trash 	
		HBase	<ul style="list-style-type: none"> • user/hbase/.Trash • user/omm/.Trash 	

Cluster Version	Directory Type	Component	Directory	How to Create
	Recycle bin directories of users who need accidental deletion prevention	Hive/ Spark/ HetuEngine	user/<New service user>/.Trash	
MRS 3.3.0-LTS or later	Default recycle bin directories configured for each component in an MRS cluster	Hive/ Spark/ HetuEngine	/user/.Trash	

For example, if a new user in the cluster has the following permissions, you need to create a recycle bin directory clearing rule for the user in the parallel file system:

- Permissions to delete the HDFS files
- **DROP, INSERT OVERWRITE, and TRUNCATE** permissions on Hive tables
- **DROP, TRUNCATE, DELETE, INSERT OVERWRITE, and LOAD OVERWRITE** permissions on HetuEngine

Configuring the Lifecycle Rule of an OBS Directory

Step 1 Log in to the OBS console.

Step 2 Click **Parallel File Systems** and click the name of the file system used by the current MRS cluster.

Step 3 In the navigation pane on the left, choose **Basic Configurations > Lifecycle Rules**. Click **Create** to create a lifecycle rule for a specified directory. For details about the parameters, see [Configuring a Lifecycle Rule](#).

Table 5-2 Parameters for creating a lifecycle rule

Name	Description	Example Value
Status	Whether to enable the lifecycle rule.	Enable
Rule Name	Rule name that identifies different lifecycle configurations.	rule-test

Name	Description	Example Value
Prefix	<p>Prefix of the objects to which the lifecycle rule applies. Objects that have the specified prefix will be managed by the lifecycle rule. The prefix cannot start with a slash (/), have consecutive slashes (/), or contain the following special characters: \:*?"<> If this parameter is not specified, the rule will take effect for the entire file system.</p> <p>NOTE To prevent other service data from being deleted by mistake, you are not advised to use the lifecycle rule configured for the entire file system or high-level directories.</p> <p>Generally, the recycle bin directory of MRS components is in the following format. If the folder does not exist, create it. user/<Username>/.Trash</p>	user/omm/.Trash
Delete Files After (Days)	The object within the rule configuration scope expires and is automatically deleted by OBS if the number of days since its last update reaches this parameter value.	30 days

Step 4 Click **OK** to complete the lifecycle rule configuration.

You can click **Edit** in the **Operation** column of a lifecycle rule to edit it. You can also click **Disable** or **Enable** to disable or enable it.

Step 5 Repeat the preceding steps to create recycle bin directory clearing rules for all users who have the data deletion permission in the current MRS cluster one by one until all recycle bin directories in the OBS file system are configured.

----End

5.2.4 Interconnecting MRS with OBS Using an Agency

5.2.4.1 Interconnecting Flink with OBS

Before performing the following operations, ensure that you have configured a storage-compute decoupled cluster by referring to [Configuring a Storage-Compute Decoupled Cluster \(Agency\)](#).

Step 1 Log in to the Flink client installation node as the client installation user.

Step 2 Run the following command to initialize environment variables:

```
source Client installation directory/bigdata_env
```

Step 3 Configure the Flink client. For details, see [Using Flink from Scratch](#).

Step 4 Start a session.

- Normal cluster (Kerberos authentication disabled)
yarn-session.sh -nm "session-name" -d
- Security cluster (Kerberos authentication enabled)
 - If the **flink.keystore** and **flink.truststore** file paths are relative paths:
Run the following command in the directory at the same level as **ssl** to start the session. **ssl/** is a relative path.
cd /opt/hadoopclient/Flink/flink/conf/
yarn-session.sh -t ssl/ -nm "session-name" -d
...
Cluster started: Yarn cluster with application id application_1624937999496_0017
JobManager Web Interface: http://192.168.1.150:32261
 - If the **flink.keystore** and **flink.truststore** file paths are absolute paths:
Run the following command to start a session:
cd /opt/hadoopclient/Flink/flink/conf/
yarn-session.sh -nm "session-name" -d

Step 5 For a security cluster, run the following command to perform user authentication. If Kerberos authentication is not enabled for the current cluster, you do not need to run this command.

```
kinit Username
```

Step 6 Explicitly add the OBS file system to be accessed in the Flink command line.

```
echo -e 'test' >/tmp/test
```

```
hdfs dfs -mkdir -p obs://Parallel file system name/tmp/flinkjob
```

```
hdfs dfs -put /tmp/test/ obs://Parallel file system name/tmp/flinkjob/
```

```
flink run Client installation directory/Flink/flink/examples/batch/WordCount.jar  
-input obs://Parallel file system name/tmp/flinkjob/test -output obs://Parallel  
file system name/tmp/flinkjob/output
```

```
----End
```

NOTE

Flink jobs are running on Yarn. Before configuring Flink to interconnect with the OBS file system, ensure that the interconnection between Yarn and the OBS file system is normal.

5.2.4.2 Interconnecting Flume with OBS

This section applies to MRS 3.x or later.

Before performing the following operations, ensure that you have configured a storage-compute decoupled cluster by referring to [Configuring a Storage-Compute Decoupled Cluster \(Agency\)](#) or [Configuring a Storage-Compute Decoupled Cluster \(AK/SK\)](#).

Step 1 Configure an agency.

1. Log in to the MRS console. In the navigation pane on the left, choose **Active Clusters**.

2. Click the name of a cluster to go to the cluster details page.
3. On the **Dashboard** page, click **Synchronize** on the right of **IAM User Sync** to synchronize IAM users.
4. Click **Manage Agency** on the right of **Agency**, select the target agency, and click **OK**.

Step 2 Create an OBS file system for storing data.

1. Log in to the OBS console.
2. In the navigation pane on the left, choose **Parallel File Systems**. On the displayed page, click **Create Parallel File System**.
3. Enter the file system name, for example, **esdk-c-test-pfs1**, and set other parameters as required. Click **Create Now**.
4. In the parallel file system list on the OBS console, click the created file system name to go to its details page.
5. In the navigation pane on the left, choose **Files** and click **Create Folder** to create the **testFlumeOutput** folder.

Step 3 Prepare the **properties.properties** file and upload it to the **/opt/flumeInput** directory.

1. Prepare the **properties.properties** file on the local host. Its content is as follows:

```
# source
server.sources = r1
# channels
server.channels = c1
# sink
server.sinks = obs_sink
# ----- define net source -----
server.sources.r1.type = seq
server.sources.r1.spoolDir = /opt/flumeInput
# ---- define OBS sink ----
server.sinks.obs_sink.type = hdfs
server.sinks.obs_sink.hdfs.path = obs://esdk-c-test-pfs1/testFlumeOutput
server.sinks.obs_sink.hdfs.filePrefix = %[localhost]
server.sinks.obs_sink.hdfs.useLocalTimeStamp = true
# set file size to trigger roll
server.sinks.obs_sink.hdfs.rollSize = 0
server.sinks.obs_sink.hdfs.rollCount = 0
server.sinks.obs_sink.hdfs.rollInterval = 5
#server.sinks.obs_sink.hdfs.threadsPoolSize = 30
server.sinks.obs_sink.hdfs.fileType = DataStream
server.sinks.obs_sink.hdfs.writeFormat = Text
server.sinks.obs_sink.hdfs.fileCloseByEndEvent = false

# define channel
server.channels.c1.type = memory
server.channels.c1.capacity = 1000
# transaction size
server.channels.c1.transactionCapacity = 1000
server.channels.c1.byteCapacity = 800000
server.channels.c1.byteCapacityBufferPercentage = 20
server.channels.c1.keep-alive = 60
server.sources.r1.channels = c1
server.sinks.obs_sink.channel = c1
```

NOTE

- The value of **server.sinks.obs_sink.hdfs.path** is the OBS file system created in [Step 2](#).
2. Log in to the node where the Flume client is installed as user **root**.

3. Create the **/opt/flumeInput** directory and create a customized **.txt** file in this directory.
4. Log in to FusionInsight Manager.
5. Choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the displayed page, click **Configurations** and then **Upload File** in the **Value** column corresponding to the **flume.config.file** parameter, upload the **properties.properties** file prepared in [Step 3.1](#), and click **Save**.

Step 4 View the result in the OBS system.

1. Log in to the OBS console.
2. Click **Parallel File Systems** and go to the folder created in [Step 2](#) to view the result.

----End

5.2.4.3 Interconnecting HDFS with OBS

Before performing the following operations, ensure that you have configured a storage-compute decoupled cluster by referring to [Configuring a Storage-Compute Decoupled Cluster \(Agency\)](#) or [Configuring a Storage-Compute Decoupled Cluster \(AK/SK\)](#).

Step 1 Log in to the node on which the HDFS client is installed as a client installation user.

Step 2 Run the following command to switch to the client installation directory.

```
cd Client installation directory
```

Step 3 Run the following command to configure environment variables:

```
source bigdata_env
```

Step 4 If the cluster is in security mode, authenticate the user. In normal mode, skip user authentication.

```
kinit Component service user
```

Step 5 Explicitly add the OBS file system to be accessed in the HDFS command line.

For example:

- Run the following command to access the OBS file system:

```
hdfs dfs -ls obs://OBS parallel file system name/Path
```
- Run the following command to upload the **/opt/test.txt** file from the client node to the OBS file system path:

```
hdfs dfs -put /opt/test.txt obs://OBS parallel file system name/Path
```

----End

NOTE

If a large number of logs are printed in the OBS file system, the read and write performance may be affected. You can adjust the log level of the OBS client as follows:

```
cd Client installation directory/HDFS/hadoop/etc/hadoop
```

```
vi log4j.properties
```

Add the OBS log level configuration to the file as follows:

```
log4j.logger.org.apache.hadoop.fs.obs=WARN
```

```
log4j.logger.com.obs=WARN
```

Figure 5-19 Adding an OBS log level

```
[root@node-master1AuKK hadoop]# tail -4 log4j.properties
log4j.logger.org.apache.commons.beanutils=WARN

log4j.logger.org.apache.hadoop.fs.obs=WARN
log4j.logger.com.obs=WARN
[root@node-master1AuKK hadoop]# █
```

5.2.4.4 Interconnecting Hive with OBS

Before performing the following operations, ensure that you have configured a storage-compute decoupled cluster by referring to [Configuring a Storage-Compute Decoupled Cluster \(Agency\)](#) or [Configuring a Storage-Compute Decoupled Cluster \(AK/SK\)](#).

Setting the Location to an OBS Path When Creating a Table

Step 1 Log in to the client installation node as the client installation user.

Step 2 Run the following command to initialize environment variables:

```
source Client installation directory/bigdata_env
```

Step 3 For a security cluster, run the following command to perform user authentication (the user must have the permission to perform Hive operations). If Kerberos authentication is not enabled for the current cluster, you do not need to run this command.

```
kinit User performing Hive operations
```

Step 4 Log in to FusionInsight Manager of a cluster earlier than MRS 3.2.0, choose **Cluster > Services > Hive**, and click **Configurations > All Configurations**.

In the navigation pane on the left, choose **Hive > Customization**. In custom configuration items, add **dfs.namenode.acls.enabled** to **hdfs.site.customized.configs** and set its value to **false**.

Figure 5-20 Adding custom parameters

Step 5 Click **Save** to save the configuration for versions earlier than MRS 3.2.0. On the **Dashboard** page, click **More** and select **Restart Service**. Enter the password of the current user, click **OK**, and select **Restart upper-layer services**. Click **OK** to restart Hive.

Step 6 Log in to the beeline client and set **Location** to the OBS file system path when creating a table.

beeline

For example, run the following command to create the table **test** in **obs://OBS parallel file system name/user/hive/warehouse/Database name/Table name**.

```
create table test(name string) location "obs://OBS parallel file system name/
user/hive/warehouse/Database name/Table name";
```

NOTE

You need to add the component operator to the URL policy in the Ranger policy. Set the URL to the complete path of the object on OBS. Select the Read and Write permissions.

For versions earlier than MRS 3.x, see [Configuring Hive Access Permissions in Ranger](#). For MRS 3.x or later, see [Adding a Ranger Access Permission Policy for Hive](#).

----End

Interconnecting Hive with OBS Through MetaStore

Step 1 Log in to FusionInsight Manager and choose **Cluster > Services > Hive > Configurations > All Configurations**.

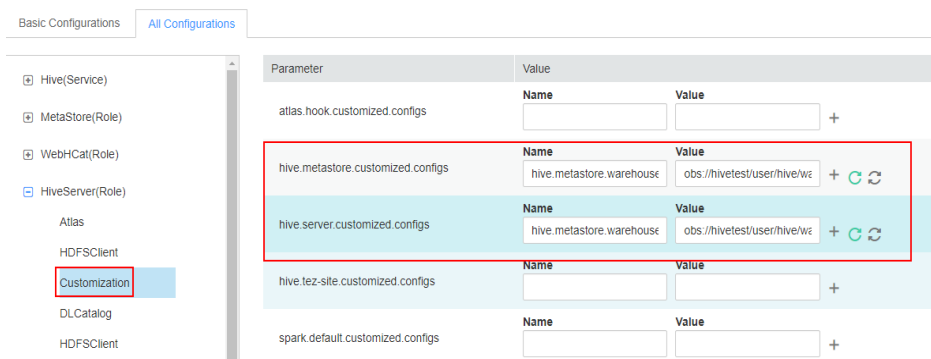

- For versions earlier than MRS 3.2.0:
 - In the navigation pane on the left, choose **MetaStore (role) > Customization**. Add the configuration item **hive.metastore.warehouse.dir** to the custom parameter **hive.metastore.customized.configs** and set the value to an OBS path. For example, set it to **obs://hivetest/user/hive/warehouse/**, where **hivetest** is the name of the OBS parallel file system.

Figure 5-21 Configuring `hive.metastore.warehouse.dir`

- In the navigation pane on the left, choose **HiveServer (role) > Customization**. Add the configuration item **hive.metastore.warehouse.dir** to **hive.metastore.customized.configs** and **hive.server.customized.configs** and set the value to an OBS path. For example, set it to **obs://hivetest/user/hive/warehouse/**, where **hivetest** is the name of the OBS parallel file system.

Figure 5-22 Configuring `hive.metastore.warehouse.dir`

- For MRS 3.2.0 and later versions:
Search for **hive.metastore.warehouse.dir** in the search box and change the parameter value to an OBS path, for example, **obs://hivetest/user/hive/warehouse/**. **hivetest** indicates the OBS file system name.

Figure 5-23 Configuring `hive.metastore.warehouse.dir`

- Step 2** Save the change and restart Hive.
- Step 3** (Optional) Install the client by referring to [Installing a Client](#). If the client has been installed in the cluster, go to **Step 4**.
- Step 4** Update the client configuration file.
 1. Run the following command to open **hivemetastore-site.xml** in the Hive configuration file directory on the client:
vim Client installation directory/Hive/config/hivemetastore-site.xml
 2. Change the value of **hive.metastore.warehouse.dir** to the corresponding OBS path, for example, **obs://hivetest/user/hive/warehouse/**, where **hivetest** is the OBS bucket name.

Figure 5-24 Configuring the OBS Path

```
</property>
<property>
<name>hive.metastore.warehouse.dir</name>
<value>obs://hivetest/user/hive/warehouse</value>
</property>
<property>
```

- For MRS 3.2.0 and later versions, change the value of **hive.metastore.warehouse.dir** in **hivemetastore-site.xml** to the corresponding OBS path, for example, **obs://hivetest/user/hive/warehouse/**. The XML file is stored in the HCatalog client configuration file directory.

vi *Client installation directory*/Hive/HCatalog/conf/hivemetastore-site.xml

Step 5 Log in to the beeline client, create a table, and check whether the location is the OBS path.

beeline

create table test(name string);

desc formatted test;

Location of the table is the OBS path.

Figure 5-25 Location of the Hive table

```
+-----+
|                                     data_type
+-----+
| data_type
| string
| NULL
| NULL
| default
| USER
| root
| Wed May 10 19:18:31 CST 2023
| UNKNOWN
| 0
| obs://[redacted]
| MANAGED_TABLE
| NULL
| bucketing_version
| transient_lastDdlTime
```

NOTE

If the location of the current database points to HDFS, tables created in the database also point to HDFS by default. You do not need to specify the location. To modify the default table creation policy, modify the location of the database to point to OBS. Perform the following steps to modify the parameters:

1. Run the following command to query the location of the database:

```
show create database obs_test;
```

Figure 5-26 Viewing the location of the Hive Table

```
INFO : Concurrency mode is disabled, not creating a lock manager
+-----+
|                createdb_stmt                |
+-----+
| CREATE DATABASE `obs_test`                   |
| LOCATION                                     |
| 'hdfs://hacluster/user/hive/warehouse/obs_test.db' |
+-----+
3 rows selected (0.038 seconds)
```

2. Run the following command to change the database location:

```
alter database obs_test set location 'obs://OBS parallel file system name/user/hive/warehouse/Database name'
```

Run the **show create database** `obs_test` command to check whether the database location points to OBS.

Figure 5-27 Check the location of the modified Hive table.

```
INFO : Concurrency mode is disabled, not creating
+-----+
|                createdb_stmt                |
+-----+
| CREATE DATABASE `obs_test`                   |
| LOCATION                                     |
| 'obs://test1231/'                           |
+-----+
3 rows selected (0.063 seconds)
```

3. Run the following command to modify the table location:

```
alter table user_info set location 'obs://OBS parallel file system name/user/hive/warehouse/Database name/Table name'
```

If the table contains data, migrate the original data file to the new location.

----End

5.2.4.5 Interconnecting MapReduce with OBS

Before performing the following operations, ensure that you have configured a storage-compute decoupled cluster by referring to [Configuring a Storage-Compute Decoupled Cluster \(Agency\)](#) or [Configuring a Storage-Compute Decoupled Cluster \(AK/SK\)](#).

- Step 1** Log in to the MRS management console and click the cluster name to go to the cluster details page.
- Step 2** Choose **Components > MapReduce**. The **All Configurations** page is displayed. In the navigation tree on the left, choose **MapReduce > Customization**. In the

customized configuration items, add the configuration item **mapreduce.jobhistory.always-scan-user-dir** to **core-site.xml** and set its value to **true**.

Figure 5-28 Adding a custom parameter

Step 3 Save the configurations and restart the MapReduce service.

----End

5.2.4.6 Interconnecting Spark2x with OBS

The OBS file system can be interconnected with Spark2x after an MRS cluster is installed.

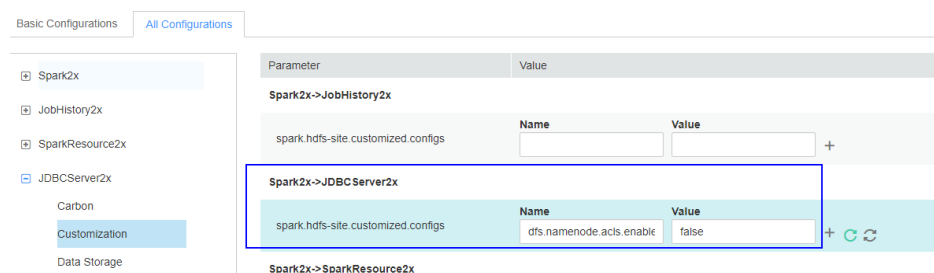

Before performing the following operations, ensure that you have configured a storage-compute decoupled cluster by referring to [Configuring a Storage-Compute Decoupled Cluster \(Agency\)](#) or [Configuring a Storage-Compute Decoupled Cluster \(AK/SK\)](#).

Verifying OBS Access with Spark Beeline

Step 1 Log in to FusionInsight Manager and choose **Cluster > Services > Spark2x > Configurations > All Configurations**.

In the left navigation tree, choose **JDBCServer2x > Customization**. Add **dfs.namenode.acls.enabled** to the **spark.hdfs-site.customized.configs** parameter and set its value to **false**.

Figure 5-29 Adding Spark custom parameters

Step 2 Search for the **spark.sql.statistics.fallBackToHdfs** parameter and set its value to **false**.

Figure 5-30 Setting **spark.sql.statistics.fallBackToHdfs**

Step 3 Save the configurations and restart the JDBCServer2x instance.

Step 4 Log in to the client installation node as the client installation user.

Step 5 Run the following commands to configure environment variables:

```
source Client installation directory/bigdata_env
```

Step 6 For a security cluster, run the following command to perform user authentication. If Kerberos authentication is not enabled for the current cluster, you do not need to run this command.

```
kinit Username
```

Step 7 Access OBS using Spark beeline. The following example creates a table named **test** in the **obs://mrs-word001/table/** directory.

```
create table test(id int) location 'obs://mrs-word001/table/';
```

Step 8 Run the following command to query all tables. If table **test** is returned, OBS access is successful.

```
show tables;
```

Figure 5-31 Returned table names

```
0: jdbc:hive2://ha-cluster/default> create table test(id int) location 'obs://mrs-word001/table/';
+-----+--+
| Result |
+-----+--+
No rows selected (2.515 seconds)
0: jdbc:hive2://ha-cluster/default> show tables;
+-----+-----+-----+
| database | tableName | isTemporary |
+-----+-----+-----+
| default  | test      | false       |
| default  | test_obs  | false       |
+-----+-----+-----+
2 rows selected (0.127 seconds)
```

Step 9 Press **Ctrl+C** to exit Spark beeline.

----End

Verifying OBS Access with Spark SQL

Step 1 Log in to the client installation node as the client installation user.

Step 2 Run the following commands to configure environment variables:

```
source Client installation directory/bigdata_env
```

Step 3 Modify the configuration file:

```
vim Client installation directory/Spark2x/spark/conf/hdfs-site.xml
```

```
<property>
<name>dfs.namenode.acls.enabled</name>
<value>>false</value>
</property>
```

Step 4 For a security cluster, run the following command to perform user authentication. If Kerberos authentication is not enabled for the current cluster, you do not need to run this command.

```
kinit Username
```

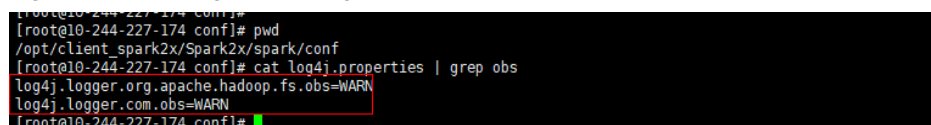

- Step 5** Access OBS using Spark SQL CLI. For example, create a table named **test** in the **obs://mrs-word001/table/** directory.
1. Go to the **cd Client installation directory/Spark2x/spark/bin** directory and run the **./spark-sql** command to log in to the Spark SQL CLI.
 2. Run the following command in the Spark SQL CLI:
create table test(id int) location 'obs://mrs-word001/table/';
- Step 6** Run the **show tables;** command to confirm that the table is created successfully.
- Step 7** Run **exit;** to exit the Spark SQL CLI.

 **NOTE**

If a large number of logs are printed in the OBS file system, read and write performance may be affected. You can adjust the log level of the OBS client as follows:

```
cd Client installation directory/Spark2x/spark/conf
vi log4j.properties
Add the OBS log level configuration to the file as follows:
log4j.logger.org.apache.hadoop.fs.obs=WARN
log4j.logger.com.obs=WARN
```

Figure 5-32 Adding an OBS log level

```
[root@10-244-227-174 conf]#
[root@10-244-227-174 conf]# pwd
/opt/client_spark2x/Spark2x/spark/conf
[root@10-244-227-174 conf]# cat log4j.properties | grep obs
log4j.logger.org.apache.hadoop.fs.obs=WARN
log4j.logger.com.obs=WARN
[root@10-244-227-174 conf]#
```

----End

Using Spark Shell to Read OBS Files

- Step 1** Log in to the client installation node as the client installation user.
- Step 2** Run the following commands to configure environment variables:
source Client installation directory/bigdata_env
- Step 3** Modify the configuration file:
vim Client installation directory/Spark2x/spark/conf/hdfs-site.xml
- ```
<property>
<name>dfs.namenode.acls.enabled</name>
<value>false</value>
</property>
```
- Step 4** For a security cluster, run the following command to perform user authentication. If Kerberos authentication is not enabled for the current cluster, you do not need to run this command.  
**kinit Username**
- Step 5** Create an OBS file.
1. Run the following commands to log in to the Spark SQL CLI:  
**cd Client installation directory/Spark2x/spark/conf**  
**./spark-sql**

2. Run the following commands to create a table and import data to the table:  
**create database test location "obs://Parallel file system path/test";**  
**use test;**  
**create table test1(a int,b int) using parquet;**  
**insert into test1 values(1,2);**  
**desc formatted test1;**

Figure 5-33 Checking the location of the table

```
spark-sql> desc formatted test11;
a int NULL
b int NULL

Detailed Table Information
Database test1
Table test11
Owner root
Created Time Tue Nov 21 10:35:40 CST 2023
Last Access UNKNOWN
Created By Spark : -315000
Type MANAGED
Provider parquet
Location obs:// /test11/test11
Serde Library org.apache.hadoop.hive.q1.io.parquet.serde.ParquetHiveSerDe
InputFormat org.apache.hadoop.hive.q1.io.parquet.MapredParquetInputFormat
OutputFormat org.apache.hadoop.hive.q1.io.parquet.MapredParquetOutputFormat
Time taken: 0.235 seconds, Fetched 16 row(s)
spark-sql>
```

- Step 6** Run the following command to go to the Spark **bin** directory:

```
cd Client installation directory/Spark2x/spark/conf
```

Run **./spark-sql** to log in to the Spark SQL CLI.

- Step 7** In the Spark Shell CLI, run the following command to query the table created in [Step 5.2](#):

```
spark.read.format("parquet").load ("obs://Parallel file system path/
test1").show();
```

Figure 5-34 Viewing table data

```
scala> spark.read.format("parquet").load("obs:// /test11/test11").show();
ERROR StatusLogger Log4j2 could not find a logging implementation. Please add log4j-core to the classpath. Using SimpleLogger to
log to the console...

```

- Step 8** Run the **:quit** command to exit the Spark Shell CLI.

----End

### 5.2.4.7 Interconnecting Sqoop with External Storage Systems

Before you start operations in this section, you have interconnected the HDFS client with OBS by referring to [Configuring a Storage-Compute Decoupled Cluster \(Agency\)](#). You also need to download the MySQL driver package of the required version from the MySQL official website <https://downloads.mysql.com/>

[archives/c-j/](#), decompress the package, and upload it to *Client installation directory/Sqoop/sqoop/lib* directory on the node where the Sqoop client is installed.

## Exporting Data from HDFS to MySQL

**Step 1** Log in to the node where the client is located.

**Step 2** Run the following command to initialize environment variables:

```
source /opt/client/bigdata_env
```

**Step 3** Run the following command to operate the Sqoop client:

```
sqoop export --connect jdbc:mysql://10.100.xxx.xxx:3306/test --username root
--password xxx --table component13 --export-dir hdfs://hacluster/user/hive/
warehouse/component_test3 --fields-terminated-by ',' -m 1
```

For details about more parameters, see [Common Sqoop Commands and Parameters](#).

**Table 5-3** Parameter description

Parameter	Description
--connect	Specifies the URL for connecting to JDBC. The value is in <b>jdbc:mysql://IP address of the MySQL database.MySQL Port/Database name</b> format.
--username	Specifies the username for connecting to the MySQL database.
-password	Specifies the password for connecting to the MySQL database. There can be security risks if a command contains the authentication password. You are advised to disable the command recording function (history) before running the command.
-table <table-name>	Specifies the name of the MySQL table used to store exported data.
-export-dir <dir>	Specifies the HDFS path of the Sqoop table to be exported.
--fields-terminated-by	Specifies the delimiter of the exported data, which must be the same as that in the HDFS data table to be exported.
-m or -num-mappers <n>	Starts <i>n</i> (4 by default) maps to import data concurrently. The value cannot be greater than the maximum number of maps in a cluster.
-direct	Imports data to a relational database using a database import tool, for example, mysqlimport of MySQL, more efficient than the JDBC connection mode.

Parameter	Description
-update-key <col-name>	Specifies the column used for updating the existing data in a relational database.
-update-mode <mode>	Specifies how updates are performed. The value can be <b>updateonly</b> or <b>allowinsert</b> . This parameter is used only when the relational data table does not contain the data record to be imported. For example, if the HDFS data to be imported to the destination table contains a data record <b>id=1</b> and the table contains an existing data record <b>id=2</b> , the update will fail.
-input-null-string <null-string>	This parameter is optional. If it is not specified, <b>null</b> will be used.
-input-null-non-string <null-string>	This parameter is optional. If it is not specified, <b>null</b> will be used.
-staging-table <staging-table-name>	Creates a table with the same data structure as the destination table for storing data before it is imported to the destination table.  This parameter ensures the transaction security when data is imported to a relational database table. Due to multiple transactions during an import, this parameter can prevent other transactions from being affected when one transaction fails. For example, the imported data is incorrect or duplicate records exist.
-clear-staging-table	Clears data in the staging table before data is imported if the staging-table is not empty.

----End

## Importing Data from MySQL to Hive

**Step 1** Log in to the node where the client is located.

**Step 2** Run the following command to initialize environment variables:

```
source /opt/client/bigdata_env
```

**Step 3** Run the following command to operate the Sqoop client:

```
sqoop import --connect jdbc:mysql://10.100.xxx.xxx:3306/test --username root --password xxx --table component --hive-import --hive-table component_test2 --delete-target-dir --fields-terminated-by "," -m 1 --as-textfile
```

**Table 5-4** Parameter description

Parameter	Description
--hive-import	Imports data from a relational database to MRS Hive.

Parameter	Description
--delete-target-dir	Deletes the existing target file (if any) from Hive and imports again.
-append	Appends data to an existing dataset in the HDFS. Once this parameter is used, Sqoop imports data to a temporary directory, renames the temporary file where the data is stored, and moves the file to a formal directory to avoid duplicate file names in the directory.
-as-avrodatafile	Imports data to a data file in the Avro format.
-as-sequencefile	Imports data to a sequence file.
-as-textfile	Import data to a text file. After the text file is generated, you can run SQL statements in Hive to query the result.
-boundary-query <statement>	Specifies the SQL statement for performing boundary query. Before importing data, use a SQL statement to obtain a result set and import the data in the result set. The data format can be <b>-boundary-query 'select id,creationdate from person where id = 3'</b> (indicating a data record whose ID is 3) or <b>select min(&lt;split-by&gt;), max(&lt;split-by&gt;) from &lt;table name&gt;</b> . The fields to be queried cannot contain fields whose data type is string. Otherwise, the error message "java.sql.SQLException: Invalid value for getLong()" is displayed.
- columns<col,col,col...>	Specifies the fields to be imported. The format is - <b>Column id,Username</b> .
-direct	Imports data to a relational database using a database import tool, for example, mysqlimport of MySQL, more efficient than the JDBC connection mode.
-direct-split-size	Splits the imported streams by byte. Especially when data is imported from PostgreSQL using the direct mode, a file that reaches the specified size can be divided into several independent files.
-inline-lob-limit	Sets the maximum value of an inline LOB.
-m or -num-mappers	Starts $n$ (4 by default) maps to import data concurrently. The value cannot be greater than the maximum number of maps in a cluster.

Parameter	Description
-query, -e<statement>	Imports data from the query result. To use this parameter, you must specify the <b>-target-dir</b> and <b>-hive-table</b> parameters and use the query statement containing the WHERE clause as well as \$CONDITIONS. Example: <b>-query'select * from person where \$CONDITIONS' -target-dir /user/hive/warehouse/person -hive-table person</b>
-split-by<column-name>	Specifies the column of a table used to split work units. Generally, the column name is followed by the primary key ID.
-table <table-name>	Specifies the relational database table from which data is obtained.
-target-dir <dir>	Specifies the HDFS path.
-warehouse-dir <dir>	Specifies the directory for storing data to be imported. This parameter is applicable when data is imported to HDFS but cannot be used when you import data to Hive directories. This parameter cannot be used together with <b>-target-dir</b> .
-where	Specifies the WHERE clause when data is imported from a relational database, for example, <b>-where 'id = 2'</b> .
-z,-compress	Compresses sequence, text, and Avro data files using the GZIP compression algorithm. Data is not compressed by default.
-compression-codec	Specifies the Hadoop compression codec. GZIP is used by default.
-null-string <null-string>	Specifies the string to be interpreted as <b>NULL</b> for string columns.
-null-non-string<null-string>	Specifies the string to be interpreted as null for non-string columns. If this parameter is not specified, <b>NULL</b> will be used.
-check-column (col)	Specifies the column for checking incremental data import, for example, <b>id</b> .
-incremental (mode) append or last modified	Incrementally imports data. <b>append</b> : appends records, for example, appending records that are greater than the value specified by <b>last-value</b> . <b>lastmodified</b> : appends data that is modified after the date specified by <b>last-value</b> .

Parameter	Description
-last-value (value)	Specifies the maximum value (greater than the specified value) of the column after the last import. This parameter can be set as required.

----End

## Sqoop Usage Example

- Importing data from MySQL to HDFS using the **sqoop import** command  
**sqoop import --connect jdbc:mysql://10.100.231.134:3306/test --username root --password xxx --query 'SELECT \* FROM component where \$CONDITIONS and component\_id ="MRS 1.0\_002"' --target-dir /tmp/component\_test --delete-target-dir --fields-terminated-by "," -m 1 --as-textfile**
- Exporting data from OBS to MySQL using the **sqoop export** command  
**sqoop export --connect jdbc:mysql://10.100.231.134:3306/test --username root --password xxx --table component14 -export-dir obs://obs-file-bucket/xx/part-m-00000 --fields-terminated-by ',' -m 1**
- Importing data from MySQL to OBS using the **sqoop import** command  
**sqoop import --connect jdbc:mysql://10.100.231.134:3306/test --username root --password xxx --table component --target-dir obs://obs-file-bucket/xx --delete-target-dir --fields-terminated-by "," -m 1 --as-textfile**
- Importing data from MySQL to OBS tables outside Hive  
**sqoop import --connect jdbc:mysql://10.100.231.134:3306/test --username root --password xxx --table component --hive-import --hive-table component\_test01 --fields-terminated-by "," -m 1 --as-textfile**

## MySQL Driver Package Is Missing During Data Import or Export

If the error "Could not load db driver class: com.mysql.jdbc.Driver" is reported when you run the **sqoop import** or **sqoop export** command, the MySQL driver package is missing. Download the MySQL driver package from the MySQL official website, decompress it, upload it to the *Client installation directory/Sqoop/sqoop/lib*, and run the command again.

Figure 5-35 An error indicating that the MySQL driver package is missing

```
SLF4J: See http://www.slf4j.org/codes.html#multiple_bindings for an explanation.

### 5.2.4.8 Interconnecting Hudi with OBS

**Step 1** Log in to the client installation node as the client installation user.

**Step 2** Run the following commands to configure environment variables:

```
source Client installation directory/bigdata_env
```

```
source Client installation directory/Hudi/component_env
```

**Step 3** Modify the configuration file:

```
vim Client installation directory/Hudi/hudi/conf/hdfs-site.xml
```

```
<property>
<name>dfs.namenode.acls.enabled</name>
<value>>false</value>
</property>
```

**Step 4** For a security cluster, run the following command to perform user authentication. If Kerberos authentication is not enabled for the current cluster, you do not need to run this command.

```
kinit Username
```

**Step 5** Start spark-shell and run the following commands to create a COW table and save it in OBS:

```
import org.apache.hudi.QuickstartUtils._
import scala.collection.JavaConversions._
import org.apache.spark.sql.SaveMode._
import org.apache.hudi.DataSourceReadOptions._
import org.apache.hudi.DataSourceWriteOptions._
import org.apache.hudi.config.HoodieWriteConfig._
val tableName = "hudi_cow_table"
val basePath = "obs://testhudi/cow_table/"
val dataGen = new DataGenerator
val inserts = convertToStringList(dataGen.generateInserts(10))
val df = spark.read.json(spark.sparkContext.parallelize(inserts, 2))
df.write.format("org.apache.hudi").
options(getQuickstartWriteConfigs).
option(PRECOMBINE_FIELD_OPT_KEY, "ts").
option(RECORDKEY_FIELD_OPT_KEY, "uuid").
option(PARTITIONPATH_FIELD_OPT_KEY, "partitionpath").
option(TABLE_NAME, tableName).
mode(Overwrite).
save(basePath);
```

 NOTE

`obs://testhudi/cow_table/` is the OBS path, and `testhudi` is the bucket name. Change them based on site requirements.

**Step 6** Use `DataSource` to check whether the table is successfully created and whether the data is normal.

```
val roViewDF = spark.
```

```
read.
```

```
format("org.apache.hudi").
```

```
load(basePath + "/*/*/*/*")
```

```
roViewDF.createOrReplaceTempView("hudi_ro_table")
```

```
spark.sql("select * from hudi_ro_table").show()
```

**Step 7** Run the `:q` command to exit the spark-shell CLI.

```
----End
```

## 5.2.5 Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS

When fine-grained permission control is enabled, you can configure OBS access permissions to implement access control on directories in OBS file systems.

 NOTE

This section does not apply to MRS 1.9.2.

This function enables you to control MRS users' access to OBS resources. For example, if you allow user group A to only access log files in a specified OBS file system, perform the following operations:

1. Configure an agency with OBS access permissions for an MRS cluster so that OBS can be accessed using the temporary AK/SK automatically obtained by the ECS. This prevents the AK/SK from being exposed in the configuration file.
2. Create a policy on the IAM console to allow access to log files in a specified OBS file system, and create an agency bound to the policy permission.
3. In the MRS cluster, bind the new agency to user group A so that user group A only has the permission to access log files in the specified OBS file system.

In the following scenarios, the username used for submitting jobs is an internal username so that MRS multi-user access to OBS is not supported.

- For spark-beeline, the internal username used for submitting jobs is **spark** in a security cluster and **omm** in a normal cluster.
- For the HBase shell, the internal username used for submitting jobs is **hbase** in a security cluster and **omm** in a normal cluster.
- For Presto, the internal username used for submitting jobs in the security cluster is **omm** or **hive**, and that in the normal cluster is **omm**. (Choose **Components** > **Presto** > **Service Configuration**. Change **Basic** to **All** in the parameter type drop-down box.) Then, search for and change the value of

**hive.hdfs.impersonation.enabled** to **true** to enable MRS multi-user to access OBS with fine-grained permissions.

## Prerequisites

- Fine-grained permission control has been enabled. For details about permissions management, see [Creating an MRS User](#).
- You have a basic knowledge of [Cloud Service Delegation](#) and OBS fine-grained policies.

## Step 1: Configuring an Agency with OBS Access Permission for a Cluster

Follow instructions in [Configuring a Storage-Compute Decoupled Cluster \(Agency\)](#) to configure an agency with OBS access permissions.

The agency takes effect for all users (including internal users) and user groups in the cluster. To control the permissions of users and user groups in the cluster to access OBS, perform the following operations.

### NOTE

When you configure permissions on an OBS path, if the write permission is configured, you need to configure the corresponding recycle bin path.

The default recycle bin path is `/user/${current.user}/.Trash/`, in which `${current.user}` indicates the current user.

## Step 2: Creating a Policy and an Agency on IAM

Create policies with different access permissions and bind the policies to the agency. For details, see [Creating a Policy and an Agency on IAM](#).

## Step 3: Configuring OBS Permission Control Mappings on the MRS Cluster Details Page

- Step 1** On the MRS management console, choose **Active Clusters** and click the cluster name.
- Step 2** In the **Basic Information** area on the **Dashboard** tab page, click **Manage** next to **OBS Permission Control**.
- Step 3** Click **Add Mapping** and set parameters according to [Table 5-5](#).

**Table 5-5** OBS permission control parameters

Parameter	Description
IAM Agency	Select the agency created in <a href="#">Step 2</a> .

Parameter	Description
Type	<ul style="list-style-type: none"><li>• <b>User</b>: User-level mapping</li><li>• <b>Group</b>: User group-level mapping</li></ul> <b>NOTE</b> <ul style="list-style-type: none"><li>• User-level mapping takes priority over user group-level mapping. If you select <b>Group</b>, you are advised to enter the primary group name in <b>MRS User (User Group)</b>.</li><li>• Do not use the same username (user group) for multiple mapping records.</li></ul>
MRS User (User Group)	Use commas (,) to separate multiple names of users or user groups. <b>NOTE</b> <ul style="list-style-type: none"><li>• If OBS permission control is not configured for a user and no AK and SK are configured, the <b>OBS OperateAccess</b> permission in <b>MRS_ECS_DEFAULT_AGENCY</b> will be used for accessing OBS. You are advised not to bind the internal user of a component to an agency.</li><li>• If you need to configure an agency for the internal user of a component when submitting a job in the following scenarios, the requirements are as follows:<ul style="list-style-type: none"><li>– To control permissions on spark-beeline operations, set the username to <b>spark</b> for a security cluster and <b>omm</b> for a normal cluster.</li><li>– To control permissions on HBase shell operations, set the username to <b>hbase</b> for a security cluster and <b>omm</b> for a normal cluster.</li><li>– To control permissions on Presto, set the username to <b>omm</b>, <b>hive</b>, and the username used for logging in to the client for a security cluster and <b>omm</b> and the username used for logging in to the client for a normal cluster.</li><li>– If you want to use Hive to create tables in beeline mode, set the username to the internal user <b>hive</b>.</li></ul></li></ul>

**Step 4** Click **OK**.

**Step 5** Select **I agree to authorize the trust relationships between MRS Users (Groups) and IAM agencies**, and click **OK**. The mapping between the MRS user and OBS permission is added.

If  appears next to **OBS Permission Control** on the **Dashboard** tab page or the mapping table has been updated for OBS permission control, the mapping takes effect. It takes about 1 minute to for the mapping to take effect.

In the **Operation** column of the mapping list, you can edit or delete the added mapping.

 **NOTE**

- If OBS permission control is not configured for a user and no AK and SK are configured, the permissions owned by the agency configured for the cluster in the **Object Storage Service (OBS)** project will be used to access OBS.
- Regardless of whether OBS permission control is configured, AK/SK permission is used for accessing OBS once it is configured.
- Security Administrator permission is required to modify, create, or delete a mapping.
- To apply the mapping changes in spark-beeline, hive beeline, and Presto, you need to restart Spark, exit beeline and enter again, and restart Presto, respectively.

----End

## Component Access to OBS When OBS Permission Control Is Enabled

**Step 1** Log in to any node in a cluster as user **root** using the password set during cluster creation.

**Step 2** Set environment variables (The default client installation path for MRS 3.x or later is `/opt/Bigdata/client`, and for versions earlier than MRS 3.x is `/opt/client`. Configure the path based on site requirements.).

```
source /opt/Bigdata/client/bigdata_env
```

**Step 3** If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If the Kerberos authentication is disabled for the current cluster, skip this step:

```
kinit MRS cluster user
```

Example: **kinit admin**

**Step 4** If the Kerberos authentication is disabled for the current cluster, run the following commands to log in. Note that you should create a user that belongs to the **supergroup** group by referring to [Creating a User](#) and replace *XXXX* with the username:

```
mkdir /home/XXXX
```

```
chown XXXX /home/XXXX
```

```
su - XXXX
```

**Step 5** Access OBS. You do not need to configure the AK, SK, and endpoint. The OBS path format is `obs://buck_name/XXX`.

Example: **hadoop fs -ls "obs://obs-example/job/hadoop-mapreduce-examples-3.1.2.jar"**

 NOTE

- If you want to use **hadoop fs** to delete files on OBS, use **hadoop fs -rm -skipTrash** to delete the files.
- If data import is not involved when a table is created using **spark-sql** and **spark-beeline**, OBS will not be accessed. That is, if you create a table in an OBS directory on which you do not have permission, the **CREATE TABLE** operation will still be successful, but the error message "**403 AccessDeniedException**" is displayed when you insert data.

----End

## Creating a Policy and an Agency on IAM

### Step 1 Create a policy on IAM.

1. Log in to the IAM console.
2. Choose **Permissions**. On the displayed page, click **Create Custom Policy**.
3. Set parameters according to [Table 5-6](#). Obtain the customized OBS policy samples that are frequently used by referring to [OBS Custom Policies](#).

**Table 5-6** Policy parameters

Parameter	Description
Policy Name	Only letters, digits, spaces, and special characters (-_.,) are allowed.
Scope	Select <b>Global services</b> , because OBS is a global service.
Policy View	Select <b>Visual editor</b> .

Parameter	Description
Policy Content	<ol style="list-style-type: none"> <li>1. <b>Allow:</b> Select <b>Allow</b>.</li> <li>2. <b>Select service:</b> Select <b>Object Storage Service (OBS)</b>.</li> <li>3. <b>Select action:</b> Select <b>WriteOnly, ReadOnly, and ListOnly</b>.</li> <li>4. <b>Specific resources:</b> <ol style="list-style-type: none"> <li>a. Set <b>object</b> to <b>Specify resource path</b>, click <b>Add Resource Path</b>, and enter <i>obs_bucket_name/tmp/</i> and <i>obs_bucket_name/tmp/*</i>. The <b>/tmp</b> directory is used as an example. If you need to add permissions for other directories, perform the following steps to add the directories and resource paths of all objects in the directories.</li> <li>b. Set <b>bucket</b> to <b>Specify resource path</b>, click <b>Add Resource Path</b>, and enter <i>obs_bucket_name</i>.</li> </ol> </li> <li>5. (Optional) Add request condition, which does not need to be added currently.</li> </ol>
Description	(Optional) Brief description about the policy.

 **NOTE**

If the data write operation of each component is implemented in **rename** mode, the permission to delete objects must be configured when data is written.

4. Click **OK** to save the policy.

**Step 2** Create an agency on IAM.

1. Log in to the IAM console.
2. Choose **Agencies**. On the displayed page, click **Create Agency**.
3. Set parameters according to [Table 5-7](#).

**Table 5-7** Agency parameters

Parameter	Description
Agency Name	Only letters, digits, spaces, and special characters (-_.,) are allowed.

Parameter	Description
Agency Type	Select <b>Common account</b> .
Delegated Account	Enter your cloud account, that is, the account you register using your mobile phone number. It cannot be a federated user or an IAM user created using your cloud account.
Validity Period	Set this parameter as required.
Description	(Optional) Brief description about the agency.
Permissions	<ol style="list-style-type: none"><li>1. In the <b>Project [Region]</b> column, locate the row where <b>OBS</b> is, click <b>Attach Policy</b>.</li><li>2. Select the policy created in <b>Step 1</b> to display it in <b>Selected Policies</b>.</li><li>3. Click <b>OK</b>.</li></ol>

4. Click **OK** to save the agency.

 **NOTE**

If you modify an agency and policies bound to it after using the agency to access OBS, the modification will take effect within 15 minutes.

----End

## 5.2.6 Accessing OBS from a Client on a Node Outside the Cluster

### Scenario

In the OBS decoupled storage and compute scenario, obtain a temporary AK/SK through an agency to access the OBS server. To access OBS from a client on a node outside the cluster, obtain an AK/SK through Guardian. Guardian is an MRS self-developed component that helps clients outside the cluster access OBS through temporary AKs/SKs.

 **NOTE**

This function is available in MRS 3.1.5 or later.

### How Does Guardian Enable a Client on a Node Outside the Cluster to Access OBS?

**Step 1** Install Guardian in the cluster.

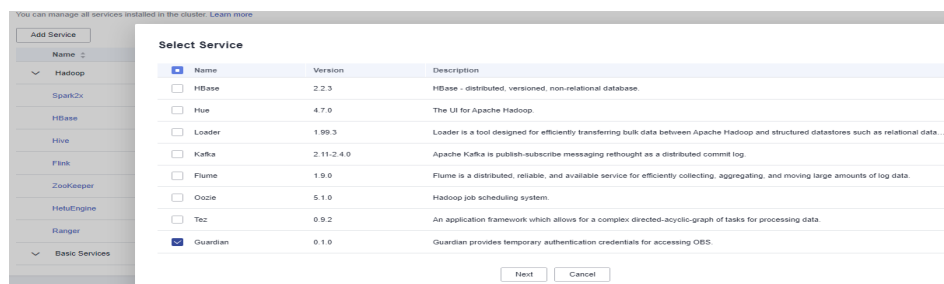

- For a new cluster in creation, select **Guardian**.

Figure 5-36 Selecting Guardian

<input checked="" type="checkbox"/>	Zookeeper	3.6.3	A centralized service for maintaining configuration information, naming, performing distributed synchronization, and providing group services.
<input checked="" type="checkbox"/>	Ranger	2.0.0	RANGER is a framework to enable, monitor and manage comprehensive data security across the Hadoop platform.
<input type="checkbox"/>	Tez	0.9.2	An application framework which allows for a complex directed-acyclic-graph of tasks for processing data.
<input type="checkbox"/>	Impala	3.4.0	An SQL query engine for processing huge volumes of data.
<input type="checkbox"/>	Presto	333	An open source distributed SQL query engine.
<input type="checkbox"/>	ClickHouse	21.3.4.25	ClickHouse is a column-oriented database management system (DBMS) for online analytical processing of queries (OLAP).
<input type="checkbox"/>	Kudu	1.12.1	Kudu is a columnar storage manager developed for the Apache Hadoop platform.
<input type="checkbox"/>	Spooop	1.4.7	Spooop is a tool designed for efficiently transferring bulk data between Apache Hadoop and structured datastores such as relational databases.
<input checked="" type="checkbox"/>	Guardian	0.1.0	Guardian provides temporary authentication credentials for accessing OBS.

- For an existing cluster, add the Guardian component in the **Components** tab.
  - a. On the cluster details page, choose **Components** and click **Add Service**.
  - b. In the service list, select the services to be added and click **Next**.

Figure 5-37 Adding Guardian

- c. On the **Topology Adjustment** page, select the node where the service is to be deployed. (You are advised to deploy the Guardian service on the master node.)
- d. Click **OK**. After the service is added, you can view the added service on the **Components** page.

**NOTE**

The services added on the console are automatically synchronized to Manager.

**Step 2** Configure storage and compute decoupling for the cluster by referring to [Configuring a Storage-Compute Decoupled Cluster \(Agency\)](#) or [Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS](#).

**Step 3** Install or update the client.

- For details about how to install the client on a node outside the cluster, see [Installing a Client \(MRS 3.x or Later\)](#).
- For details about how to update an existing client, see [Updating a Client \(Version 3.x or Later\)](#).

**Step 4** After the installation is successful, you can access OBS.

Example:

If the client directory is `/opt/client`, run the `source /opt/client/bigdata_env` command. Use the actual client installation path.

Run the `hdfs dfs -ls obs` command.

If the information in the following figure is displayed, the installation is successful:

## 5.3 FAQ

### 5.3.1 Example Interconnecting HDFS with OBS

#### Interconnection Principles

- The code for creating a FileSystem object in HDFS queries the corresponding implementation class based on the URI scheme. That is, the implementation classes provided by different underlying layers are configured in the HDFS configuration file. HDFS creates the corresponding implementation class based on **fs.AbstractFileSystem.%s.impl**.

\*Create a file system instance for the specified uri using the conf. The conf is used to find the class name that implements the file system. The conf is also passed to the file system for its configuration.

\*

\*@param uri URI of the file system

\*@param conf Configuration for the file system

\*

\*@return Returns the file system for the given URI

\*

\*@throws UnsupportedOperationException file system for <code>uri</code> is not found

\*/

```
public static AbstractFileSystem createFileSystem(URI uri, Configuration conf)
 throws UnsupportedOperationException {
 final String fsImplConf = String.format("fs.AbstractFileSystem.%s.impl", uri.getScheme());

 Class<?> clazz = conf.getClass(fsImplConf, null);
 if (clazz == null) {
 throw new UnsupportedOperationException(String.format(
 "%s=null: %s: %s",
 fsImplConf, NO_ABSTRACT_FS_ERROR, uri.getScheme()));
 }
 return (AbstractFileSystem) newInstance(clazz, uri, conf);
}
```

- In core-default of HDFS, corresponding implementation classes have been added for different URLs such as adl, hdfs, and file.

```
<property>
 <name>fs.AbstractFileSystem.adl.impl</name>
 <value>org.apache.hadoop.fs.adl.Adl</value>
</property>
<property>
 <name>fs.AbstractFileSystem.hdfs.impl</name>
 <value>org.apache.hadoop.fs.Hdfs</value>
 <description>The FileSystem for hdfs: uris.</description>
</property>
<property>
 <name>fs.AbstractFileSystem.file.impl</name>
 <value>org.apache.hadoop.fs.local.LocalFs</value>
 <description>The AbstractFileSystem for file: uris.</description>
</property>
<property>
 <name>fs.AbstractFileSystem.har.impl</name>
 <value>org.apache.hadoop.fs.HarFs</value>
```

```
<description>The AbstractFileSystem for har: uris.</description>
</property>
```

- The OBS implementation class has been added to the default configuration file of MRS to connect to OBS.

```
<property>
<name>fs.AbstractFileSystem.obs.impl</name>
<value>org.apache.hadoop.fs.obs.OBS</value>
</property>
```

## Obtaining the Configuration File of a Cluster

1. Download and decompress the client by referring to [Installing a Client](#).
2. Obtain **core-site.xml** and **hdfs-site.xml** from the downloaded HDFS client configuration file (*Download path/HDFS/hadoop/etc/hadoop*) and **core-site.xml** from the Yarn client configuration file (*Download path/Yarn/config*).

### NOTE

These files are used to replace the configuration files used in the original code.

3. Add the following OBS access information to HDFS' and Yarn's **core-site.xml** files:

```
<property>
<name>fs.obs.endpoint</name>
<value>obs endpoint</value>
</property>
<property>
<name>fs.obs.access.key</name>
<value>xxx</value>
<description>huaweicloud access key</description>
</property>
<property>
<name>fs.obs.secret.key</name>
<value>xxx</value>
<description>huaweicloud secret key</description>
</property>
```

### NOTE

- Configuration files containing authentication passwords pose security risks. Delete such files after configuration or store them securely.
4. Change the value of **fs.defaultFS** in the **core-site.xml** file on the HDFS client.

For example, the value is **hdfs://hacluster** before the change.

```
<property>
<name>fs.defaultFS</name>
<value>hdfs://hacluster</value>
</property>
```

Change the value to **obs://Bucket name**.

```
<property>
<name>fs.defaultFS</name>
<value>obs://Bucket name</value>
</property>
```

5. To reduce OBS logs, add the following configuration to the **log4j.properties** file:

```
log4j.logger.org.apache.hadoop.fs.obs=WARN
log4j.logger.com.obs=WARN
```

 NOTE

If a large number of logs are printed in the OBS file system, the read and write performance may be affected. You can adjust the log level of the OBS client as follows:

```
cd ${client_home}/HDFS/hadoop/etc/hadoop
```

```
vi log4j.properties
```

Add the OBS log level configuration to the file as follows:

```
log4j.logger.org.apache.hadoop.fs.obs=WARN
log4j.logger.com.obs=WARN
```

```
[root@node-master1AuKK hadoop]# tail -4 log4j.properties
log4j.logger.org.apache.commons.beanutils=WARN

log4j.logger.org.apache.hadoop.fs.obs=WARN
log4j.logger.com.obs=WARN
[root@node-master1AuKK hadoop]#
```

## Adding Dependency Packages to Service Programs

Obtain the JAR files **hadoop-huaweicloud-xxx-hw-xx.jar** and **mrs-obs-provider-xxx.jar** from the MRS HDFS client installation package, place them in the **classpath** directory of the program, and modify the permissions and owner of the JAR files.

# 6 Accessing Web Pages of Open Source Components Managed in MRS Clusters

---

## 6.1 Web UIs of Open Source Components

### Scenario

Web UIs of different components are created and hosted on the Master or Core nodes in the MRS cluster by default. You can view information about the components on these web UIs.

Procedure for accessing the web UIs of open-source component:

1. Select an access method.

MRS provides the following methods for accessing the web UIs of open-source components:

- **EIP-based Access:** This method is recommended because it is easy to bind an EIP to a cluster.
- **Access Using a Windows ECS:** Independent ECSs need to be created and configured.
- **Creating an SSH Channel for Connecting to an MRS Cluster and Configuring the Browser:** Use this method when the user and the MRS cluster are on different networks.

2. Access the web UIs. For details, see [Table 6-1](#).

### Web UIs

#### NOTE

For clusters with Kerberos authentication enabled, user **admin** does not have the management permission on each component. To access the web UI of each component, create a user who has the management permission on the corresponding component.

**Table 6-1** Web UI addresses of open-source components

Cluster Type	Web UI Type	Address (Earlier than MRS 3.x)	Address (MRS 3.x and Later)
All Types	MRS Manager	<ul style="list-style-type: none"> <li>Method 1: Clusters of all versions <b>https://Floating IP address of Manager:28443/web</b></li> </ul> <p><b>NOTE</b></p> <ol style="list-style-type: none"> <li>Ensure that the local host can communicate with the MRS cluster.</li> <li>Log in to the Master2 node remotely, and run the <b>ifconfig</b> command. In the command output, <b>eth0:wsom</b> indicates the floating IP address of MRS Manager. Record the value of <b>inet</b>. If the floating IP address of MRS Manager cannot be queried on the Master2 node, switch to the Master1 node to query and record the floating IP address. If there is only one Master node, query and record the cluster manager IP address of the Master node.</li> </ol> <ul style="list-style-type: none"> <li>Method 2: Earlier than MRS 3.x <b>https://&lt;EIP&gt;:9022/mrsmanager?locale=en-us</b> For details, see <a href="#">Accessing MRS Manager (MRS 2.x or Earlier)</a>.</li> </ul>	<ul style="list-style-type: none"> <li>Method 1: Clusters of all versions <b>https://Floating IP address of Manager:28443/web</b></li> </ul> <p><b>NOTE</b></p> <ol style="list-style-type: none"> <li>Ensure that the local host can communicate with the MRS cluster.</li> <li>Log in to the Master2 node remotely, and run the <b>ifconfig</b> command. In the command output, <b>eth0:wsom</b> indicates the floating IP address of MRS Manager. Record the value of <b>inet</b>. If the floating IP address of MRS Manager cannot be queried on the Master2 node, switch to the Master1 node to query and record the floating IP address. If there is only one master node, query and record the cluster manager IP address of the master node.</li> </ol> <ul style="list-style-type: none"> <li>Method 2: MRS 3.x or later For details, see <a href="#">Accessing FusionInsight Manager (MRS 3.x or Later)</a>.</li> </ul>
Analysis cluster	HDFS Name Node	Earlier than MRS 3.x: On the cluster details page, choose <b>Components &gt; HDFS &gt; NameNode Web UI &gt; NameNode (Active)</b> .	MRS 3.x or later: On the Manager homepage, choose <b>Cluster &gt; Services &gt; HDFS &gt; NameNode Web UI &gt; NameNode (Host name, Active)</b> .
	HBase HMaster	Earlier than MRS 3.x: On the cluster details page, choose <b>Components &gt; HBase &gt; HMaster Web UI &gt; HMaster (Active)</b> .	MRS 3.x or later: On the Manager homepage, choose <b>Cluster &gt; Services &gt; HBase &gt; HMaster Web UI &gt; HMaster (Host name, Active)</b> .

Cluster Type	Web UI Type	Address (Earlier than MRS 3.x)	Address (MRS 3.x and Later)
	MapReduce JobHistory Server	Earlier than MRS 3.x: On the cluster details page, choose <b>Components &gt; MapReduce &gt; JobHistoryServer Web UI &gt; JobHistoryServer</b> . 	Hue	Earlier than MRS 3.x: On the cluster details page, choose <b>Components &gt; Hue &gt; Hue Web UI &gt; Hue (Active)</b> . Loader is a graphical data migration management tool based on the open-source Sqoop web UI, and its interface is hosted on the Hue web UI.	MRS 3.x or later: On the Manager homepage, choose <b>Cluster &gt; Services &gt; Hue &gt; Hue Web UI &gt; Hue (Host name, Active)</b> . Loader is a graphical data migration management tool based on the open-source Sqoop web UI, and its interface is hosted on the Hue web UI.
	Tez	Earlier than MRS 3.x: On the cluster details page, choose <b>Components &gt; Tez &gt; Tez Web UI &gt; TezUI</b> .	MRS 3.x or later: On the Manager homepage, choose <b>Cluster &gt; Services &gt; Tez &gt; Tez Web UI &gt; TezUI (Host name)</b> .
	Presto	Earlier than MRS 3.x: On the cluster details page, choose <b>Components &gt; Presto &gt; Presto Web UI &gt; Coordinator (Active)</b> .	MRS 3.x or later: On the Manager homepage, choose <b>Cluster &gt; Services &gt; Presto &gt; Coordinator Web UI &gt; Coordinator(Coordinator)</b> .
	Ranger	Earlier than MRS 3.x: On the cluster details page, choose <b>Components &gt; Ranger &gt; Ranger Web UI &gt; RangerAdmin (Active)</b> .	MRS 3.x or later: On the Manager homepage, choose <b>Cluster &gt; Services &gt; Ranger &gt; Ranger Web UI &gt; RangerAdmin</b> .

Cluster Type	Web UI Type	Address (Earlier than MRS 3.x)	Address (MRS 3.x and Later)
Stream processing cluster	Storm	Earlier than MRS 3.x: On the cluster details page, choose <b>Components &gt; Storm &gt; Storm Web UI &gt; UI</b> .	MRS 3.x or later: On the Manager homepage, choose <b>Cluster &gt; Services &gt; Storm &gt; Storm Web UI &gt; UI (Host name)</b> .

## 6.2 Common Ports of Components

### Scenario

When you [buy a custom cluster](#) of an LTS version, you can customize the component port. If you do not want to customize a port, an open source port is used.

- **Open source:** Find the default port of the component in the Default Open Source Port column of the following table.
- **Custom:** Find the default port of the component in the Default Custom Port column of the following table.
- If there is only the Default Port column, the open source port of the component is the same as the default custom port.

If the cluster is not of an LTS version, the **Component Port** parameter is unavailable and only an open source port can be used. For details, see the Default Open Source Port or Default Port column.

### Common HBase Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
hbase.master.port	16000	21300	<p>HMaster RPC port. This port is used to connect the HBase client to HMaster.</p> <p><b>NOTE</b> The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>
hbase.master.info.port	16010	21301	<p>HMaster HTTPS port. This port is used by the remote web client to connect to the HMaster UI.</p> <p><b>NOTE</b> The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>
hbase.regionserver.port	16020	21302	<p>RegionServer (RS) RPC port. This port is used to connect the HBase client to RegionServer.</p> <p><b>NOTE</b> The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>

Parameter	Default Open Source Port	Default Custom Port	Port Description
hbase.regionserver.info.port	16030	21303	<p>HTTPS port of the Region server. This port is used by the remote web client to connect to the RegionServer UI.</p> <p><b>NOTE</b> The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>
hbase.thrift.info.port	9095	21304	<p>Thrift Server listening port of Thrift Server</p> <p>This port is used for: Listening when the client is connected</p> <p><b>NOTE</b> The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>
hbase.regionserver.thrift.port	9090	21305	<p>Thrift Server listening port of RegionServer</p> <p>This port is used for: Listening when the client is connected to the RegionServer</p> <p><b>NOTE</b> The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>

Parameter	Default Open Source Port	Default Custom Port	Port Description
hbase.rest.info.port	8085	21308	Port of the RegionServer RESTServer native web page
-	21309	21309	REST port of RegionServer RESTServer

## Common HDFS Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
dfs.namenode.rpc.port	<ul style="list-style-type: none"> <li>9820 (versions earlier than MRS 3.x)</li> <li>8020 (MRS 3.x and later)</li> </ul>	25000	<p>NameNode RPC port</p> <p>This port is used for:</p> <ol style="list-style-type: none"> <li>1. Communication between the HDFS client and NameNode</li> <li>2. Connection between the DataNode and NameNode</li> </ol> <p><b>NOTE</b> The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>
dfs.namenode.http.port	9870	25002	<p>HDFS HTTP port (NameNode)</p> <p>This port is used for:</p> <ol style="list-style-type: none"> <li>1. Point-to-point NameNode checkpoint operations</li> <li>2. Connecting the remote web client to the NameNode UI</li> </ol> <p><b>NOTE</b> The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>

Parameter	Default Open Source Port	Default Custom Port	Port Description
dfs.namenode.https.port	9871	25003	<p>HDFS HTTPS port (NameNode)</p> <p>This port is used for:</p> <ol style="list-style-type: none"> <li>1. Point-to-point NameNode checkpoint operations</li> <li>2. Connecting the remote web client to the NameNode UI</li> </ol> <p><b>NOTE</b> The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>
dfs.datanode.ipc.port	9867	25008	<p>IPC server port of DataNode</p> <p>This port is used for:</p> <p>Connection between the client and DataNode to perform RPC operations.</p> <p><b>NOTE</b> The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>
dfs.datanode.port	9866	25009	<p>DataNode data transmission port</p> <p>This port is used for:</p> <ol style="list-style-type: none"> <li>1. Transmitting data from HDFS client from or to the DataNode</li> <li>2. Point-to-point DataNode data transmission</li> </ol> <p><b>NOTE</b> The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>

Parameter	Default Open Source Port	Default Custom Port	Port Description
dfs.datanode.http.port	9864	25010	<p>DataNode HTTP port</p> <p>This port is used for:</p> <p>Connecting to the DataNode from the remote web client in security mode</p> <p><b>NOTE</b></p> <p>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>
dfs.datanode.https.port	9865	25011	<p>HTTPS port of DataNode</p> <p>This port is used for:</p> <p>Connecting to the DataNode from the remote web client in security mode</p> <p><b>NOTE</b></p> <p>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>
dfs.JournalNode.rpc.port	8485	25012	<p>RPC port of JournalNode</p> <p>This port is used for:</p> <p>Client communication to access multiple types of information</p> <p><b>NOTE</b></p> <p>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>

Parameter	Default Open Source Port	Default Custom Port	Port Description
dfs.journalnode.http.port	8480	25013	<p>JournalNode HTTP port</p> <p>This port is used for:</p> <p>Connecting to the JournalNode from the remote web client in security mode</p> <p><b>NOTE</b></p> <p>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>
dfs.journalnode.https.port	8481	25014	<p>HTTPS port of JournalNode</p> <p>This port is used for:</p> <p>Connecting to the JournalNode from the remote web client in security mode</p> <p><b>NOTE</b></p> <p>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>
httpfs.http.port	14000	25018	<p>Listening port of the HttpFS HTTP server</p> <p>This port is used for:</p> <p>Connecting to the HttpFS from the remote REST API</p> <p><b>NOTE</b></p> <p>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>

## Common HetuEngine Ports

The protocol type of the port in the table is TCP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
server.port (HSBroker)	29860	29860	Specifies the port number that HSBroker listens to.
server.port (HSConsole)	29880	29880	Specifies the port number that HSConsole listens to.
server.port (HSFabric)	29900	29900	Specifies the port number that HSFabric listens to, which is used for cross-domain connections
gateway.port	29902	29902	Specifies the port number that HSFabric listens to, which is used for JDBC connections

## Common Hive Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
templeton.port	9111	21055	Port used for WebHCat to provide the REST service This port is used for: Communication between the WebHCat client and WebHCat server <ul style="list-style-type: none"><li>• Is the port enabled by default during the installation: Yes</li><li>• Is the port enabled after security hardening: Yes</li></ul>

Parameter	Default Open Source Port	Default Custom Port	Port Description
hive.server2.thrift.port	10000	21066	Port for HiveServer to provide Thrift services This port is used for: Communication between the HiveServer and HiveServer client <ul style="list-style-type: none"><li>• Is the port enabled by default during the installation: Yes</li><li>• Is the port enabled after security hardening: Yes</li></ul>
hive.metastore.port	9083	21088	Port for MetaStore to provide Thrift services This port is used for: Communication between the MetaStore client and MetaStore, that is, communication between HiveServer and MetaStore. <ul style="list-style-type: none"><li>• Is the port enabled by default during the installation: Yes</li><li>• Is the port enabled after security hardening: Yes</li></ul>
hive.server2.webui.port	10002	-	Web UI port of Hive This port is used for: HTTPS/HTTP communication between Web requests and the Hive UI server

## Common Hue Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
HTTP_PORT	8888	21200	Port for Hue to provide HTTPS services This port is used to provide web services in HTTPS mode, which can be changed. <ul style="list-style-type: none"> <li>Is the port enabled by default during the installation: Yes</li> <li>Is the port enabled after security hardening: Yes</li> </ul>

## Common Kafka Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
port	9092	21005	Port for a broker to receive data and obtain services
ssl.port	9093	21008	SSL port used by a broker to receive data and obtain services
sasl.port	21007	21007	SASL security authentication port provided by a broker, which provides the secure Kafka service
sasl-ssl.port	21009	21009	Port used by a broker to provide encrypted service based on the SASL and SSL protocols

## Common Loader Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
LOADER_HTTPS_PORT	21351	This port is used to provide REST APIs for configuration and running of Loader jobs. <ul style="list-style-type: none"> <li>Is the port enabled by default during the installation: Yes</li> <li>Is the port enabled after security hardening: Yes</li> </ul>

## Common Manager Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port (Versions Earlier Than MRS 3.x)	Port Description
-	8080	Port provided by WebService for user access This port is used to access the web UI over HTTP. <ul style="list-style-type: none"><li>• Is the port enabled by default during the installation: Yes</li><li>• Is the port enabled after security hardening: Yes</li></ul>
-	28443	Port provided by WebService for user access This port is used to access the web UI over HTTPS. <ul style="list-style-type: none"><li>• Is the port enabled by default during the installation: Yes</li><li>• Is the port enabled after security hardening: Yes</li></ul>

## Common MapReduce Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
mapreduce.jobhistory.webapp.port	19888	26012	Web HTTP port of the JobHistory server This port is used for: viewing the web page of the JobHistory server <b>NOTE</b> The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. <ul style="list-style-type: none"><li>• Is the port enabled by default during the installation: Yes</li><li>• Is the port enabled after security hardening: Yes</li></ul>

Parameter	Default Open Source Port	Default Custom Port	Port Description
mapreduce.jobhistory.port	10020	26013	<p>Port of the JobHistory server</p> <p>This port is used for:</p> <ol style="list-style-type: none"><li>1. Task data restoration in the MapReduce client</li><li>2. Obtaining task report in the Job client</li></ol> <p><b>NOTE</b></p> <p>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"><li>• Is the port enabled by default during the installation: Yes</li><li>• Is the port enabled after security hardening: Yes</li></ul>
mapreduce.jobhistory.webapp.https.port	19890	26014	<p>Web HTTPS port of the JobHistory server</p> <p>This port is used to view the web page of the JobHistory server.</p> <p><b>NOTE</b></p> <p>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"><li>• Is the port enabled by default during the installation: Yes</li><li>• Is the port enabled after security hardening: Yes</li></ul>

## Common Spark Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
hive.server2.thrift.port	22550	22550	<p>JDBC thrift port</p> <p>This port is used for: Socket communication between Spark2.1.0 CLI/JDBC client and server</p> <p><b>NOTE</b> If <b>hive.server2.thrift.port</b> is occupied, an exception indicating that the port is occupied is reported.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>
spark.ui.port	4040	22950	<p>Web UI port of JDBC</p> <p>This port is used for: HTTPS/HTTP communication between Web requests and the JDBC Server Web UI server</p> <p><b>NOTE</b> The system verifies the port configuration. If the port is invalid, the value of the port plus 1 is used till the calculated value is valid. (A maximum number of 16 attempts are allowed. The number of attempts is specified by <b>spark.port.maxRetries</b>.)</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>
spark.history.ui.port	18080	22500	<p>JobHistory Web UI port</p> <p>This port is used for: HTTPS/HTTP communication between Web requests and Spark2.1.0 History Server</p> <p><b>NOTE</b> The system verifies the port configuration. If the port is invalid, the value of the port plus 1 is used till the calculated value is valid. (A maximum number of 16 attempts are allowed. The number of attempts is specified by <b>spark.port.maxRetries</b>.)</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>

## Common Storm Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
nimbus.thrift.port	6627	29200	Port for Nimbus to provide thrift services
supervisor.slots.ports	6700,6701,6702,6703	29200-29499	Port for receiving service requests that are forwarded from other servers
logviewer.https.port	29248	29248	Port for LogViewer to provide HTTPS services
ui.https.port	29243	29243	Port for Storm UI to provide HTTPS services (ui.https.port)

## Common Yarn Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
yarn.resourcemanager.webapp.port	8088	26000	Web HTTP port of the ResourceManager service
yarn.resourcemanager.webapp.https.port	8090	26001	Web HTTPS port of the ResourceManager service This port is used to access the Resource Manager web applications in security mode. <b>NOTE</b> The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. <ul style="list-style-type: none"> <li>Is the port enabled by default during the installation: Yes</li> <li>Is the port enabled after security hardening: Yes</li> </ul>
yarn.nodemanager.webapp.port	8042	26006	NodeManager Web HTTP port

Parameter	Default Open Source Port	Default Custom Port	Port Description
yarn.nodemanager.webapp.https.port	8044	26010	<p>NodeManager Web HTTPS port</p> <p>This port is used for:</p> <p>Accessing the NodeManager web application in security mode</p> <p><b>NOTE</b></p> <p>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>

## Common ZooKeeper Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
clientPort	2181	24002	<p>ZooKeeper client port</p> <p>This port is used for:</p> <p>Connection between the ZooKeeper client and server.</p> <p><b>NOTE</b></p> <p>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>

## Common Kerberos Ports

The protocol type of all ports in the table is TCP and UDP.

Parameter	Default Port	Port Description
KADMIN_PORT	21730	Kerberos user management port This port is used for user management. <ul style="list-style-type: none"><li>• Whether the port is enabled by default during the installation: Yes</li><li>• Whether the port is enabled after security hardening: Yes</li></ul>
KPASSWD_PORT	21731	Kerberos password changing port This port is used for user management. <ul style="list-style-type: none"><li>• Whether the port is enabled by default during the installation: Yes</li><li>• Whether the port is enabled after security hardening: Yes</li></ul>
kdc_ports	21732	Kerberos server port This port is used for performing Kerberos authentication for components. This parameter may be used during the configuration of mutual trust between clusters. <b>NOTE</b> The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. <ul style="list-style-type: none"><li>• Is the port enabled by default during the installation: Yes</li><li>• Is the port enabled after security hardening: Yes</li></ul>

## Common OpenTSDB Ports

The protocol type of the port in the table is TCP.

Parameter	Default Port	Port Description
tsd.network.port	4242	Web UI port of OpenTSDB This port is used for: HTTPS/HTTP communication between web requests and the OpenTSDB UI server

## Common Tez Ports

The protocol type of the port in the table is TCP.

Parameter	Default Port	Port Description
tez.ui.port	28888	Web UI port of Tez

## Common KafkaManager Ports

The protocol type of the port in the table is TCP.

Parameter	Default Port	Port Description
kafka_manager_port	9099	Web UI port of KafkaManager

## Common Presto Ports

The protocol type of the port in the table is TCP.

Parameter	Default Port	Port Description
http-server.http.port	7520	HTTP port for Presto coordinator to provide services to external systems
http-server.https.port	7521	HTTPS port for Presto coordinator to provide services to external systems
http-server.http.port	7530	HTTP port for Presto worker to provide services to external systems
http-server.https.port	7531	HTTPS port for Presto worker to provide services to external systems

## Common Flink Ports

The protocol type of the port in the table is TCP.

Parameter	Default Port	Port Description
jobmanager.web.port	32261-32325	Web UI port of Flink This port is used for: HTTP/HTTPS communication between the client web requests and Flink server

## Common ClickHouse Ports

The protocol type of the port in the table is TCP and HTTP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
interserver_http_port	9009	9009	HTTP port for the communication between ClickHouse servers.
interserver_https_port	9010	9010	HTTPS port for the communication between ClickHouse servers.
http_port	8123	8123	Port for connecting to the ClickHouse server through HTTP.
https_port	8443	8443	Port for connecting to the ClickHouse server through HTTPS.
tcp_port	9000	9000	Port for connecting the client to the ClickHouse server through TCP.
tcp_port_secure	9440	9440	Port for connecting the client to the ClickHouse server through TCP SSL.
lb_tcp_port	21424	21424	TCP port listened by ClickHouseBalancer
lb_http_port	21425	21425	HTTP port listened by ClickHouseBalancer
lb_https_port	21426	21426	HTTPS port listened by ClickHouseBalancer
lb_tcp_secure_port	21428	21428	TCP SSL port listened by ClickHouseBalancer

## Common Impala Ports

The protocol type of the port in the table is TCP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
--beeswax_port	21000	21970	Port for impala-shell communication
--hs2_port	21050	21971	Port for Impala application communication
--hs2_http_port	28000	21981	Port used by Impala to provide the HiveServer2 protocol for external systems

## Common Doris Ports

The protocol type of the port in the table is TCP and HTTP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
http_port	8030	29980	HTTP port of the FE service
https_port	8050	29991	HTTPS port of the FE service
query_port	9030	29982	Port used by the Doris FE to query connections through the MySQL protocol
rpc_port	9020	29981	Thrift Server port of the FE service
be_port	9060	29984	Thrift Server Port on BE for receiving requests from FE
brpc_port	8060	29987	BRPC port on BE, which is used for communications between BE instances.
heartbeat_service_port	9050	29985	Thrift heartbeat service port on BE, which is used to receive heartbeat messages from FE
webserver_port	8040	29986	HTTP server port on BE
broker_ipc_port	8000	29990	Thrift Server communication port on Broker, which is used to receive requests.

Parameter	Default Open Source Port	Default Custom Port	Port Description
single_replica_load_brpc_port	9070	29988	RPC port used for the communication between the master and slave replicas to import single-replica data
single_replica_load_download_port	8050	29989	Port used by the slave replica to download data files from the master replica through HTTP for single-copy data import

## 6.3 Access Through Direct Connect

MRS allows you to access MRS clusters using Direct Connect. Direct Connect is a high-speed, low-latency, stable, and secure dedicated network connection that connects your local data center to an online cloud VPC. It extends online cloud services and existing IT facilities to build a flexible, scalable hybrid cloud computing environment.

### Prerequisites

Direct Connect is available, and the connection between the local data center and the online VPC has been established. For details, see [What Is Direct Connect?](#)

### Accessing an MRS Cluster Using Direct Connect

- Step 1** Log in to the MRS console.
- Step 2** Click the name of the cluster to enter its details page.
- Step 3** On the **Dashboard** tab page of the cluster details page, click **Access Manager** next to **MRS Manager**.
- Step 4** Set **Access Mode** to **Direct Connect** and select **I confirm that the network between the local PC and the floating IP address is connected and that MRS Manager is accessible using the Direct Connect connection**.

The floating IP address is automatically allocated by MRS to access MRS Manager. Before using Direct Connect to access MRS Manager, ensure that the connection between the local data center and the online VPC has been established.

### Access MRS Manager

You can use an EIP or a Direct Connect connection to access MRS Manager. [Learn more](#)

Access Mode EIP **Direct Connect**

Floating IP Address ? 192 - 168 - 8 - 78

I confirm that the network between the local PC and the floating IP address is connected and that MRS Manager is accessible using the Direct Connect connection.

OK Cancel

**Step 5** Click **OK**. The MRS Manager login page is displayed. Enter the username **admin** and the password set during cluster creation.

----End

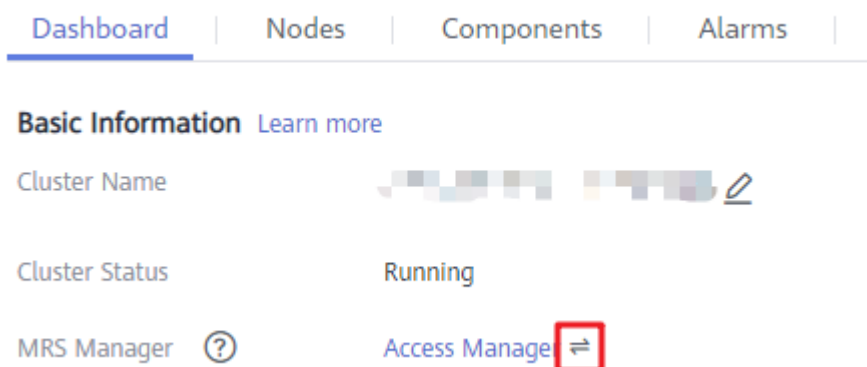

### Switching the MRS Manager Access Mode

To facilitate user operations, the browser cache records the selected Manager access mode. To change the access mode, perform the following steps:

**Step 1** Log in to the MRS console.

**Step 2** Click the name of the cluster to enter its details page.

**Step 3** On the **Dashboard** tab page of the cluster details page, click  next to **MRS Manager**.

**Step 4** On the displayed page, set **Access Mode**.

- To change **EIP** to **Direct Connect**, ensure that the network for direct connections is available, set **Access Mode** to **Direct Connect**, and select **I confirm that the network between the local PC and the floating IP address is connected and that MRS Manager is accessible using the Direct Connect connection**. Click **OK**.

## Access MRS Manager

You can use an EIP or a Direct Connect connection to access MRS Manager. [Learn more](#)

Access Mode  EIP  Direct Connect

Floating IP Address

I confirm that the network between the local PC and the floating IP address is connected and that MRS Manager is accessible using the Direct Connect connection.

- To change **Direct Connect** to **EIP**, set **Access Mode** to **EIP** and configure the EIP by referring to [Accessing Manager Using an EIP](#). If a public IP address has been configured for the cluster, click **OK** to access MRS Manager using an EIP.

----End

## 6.4 EIP-based Access

You can bind an EIP to a cluster to access the web UIs of the open-source components managed in the MRS cluster. This method is simple and easy to use and is recommended for accessing the web UIs of the open-source components.

### Video Tutorial

This tutorial demonstrates how to bind an EIP to an MRS cluster and access the web UIs of cluster components.

#### NOTE

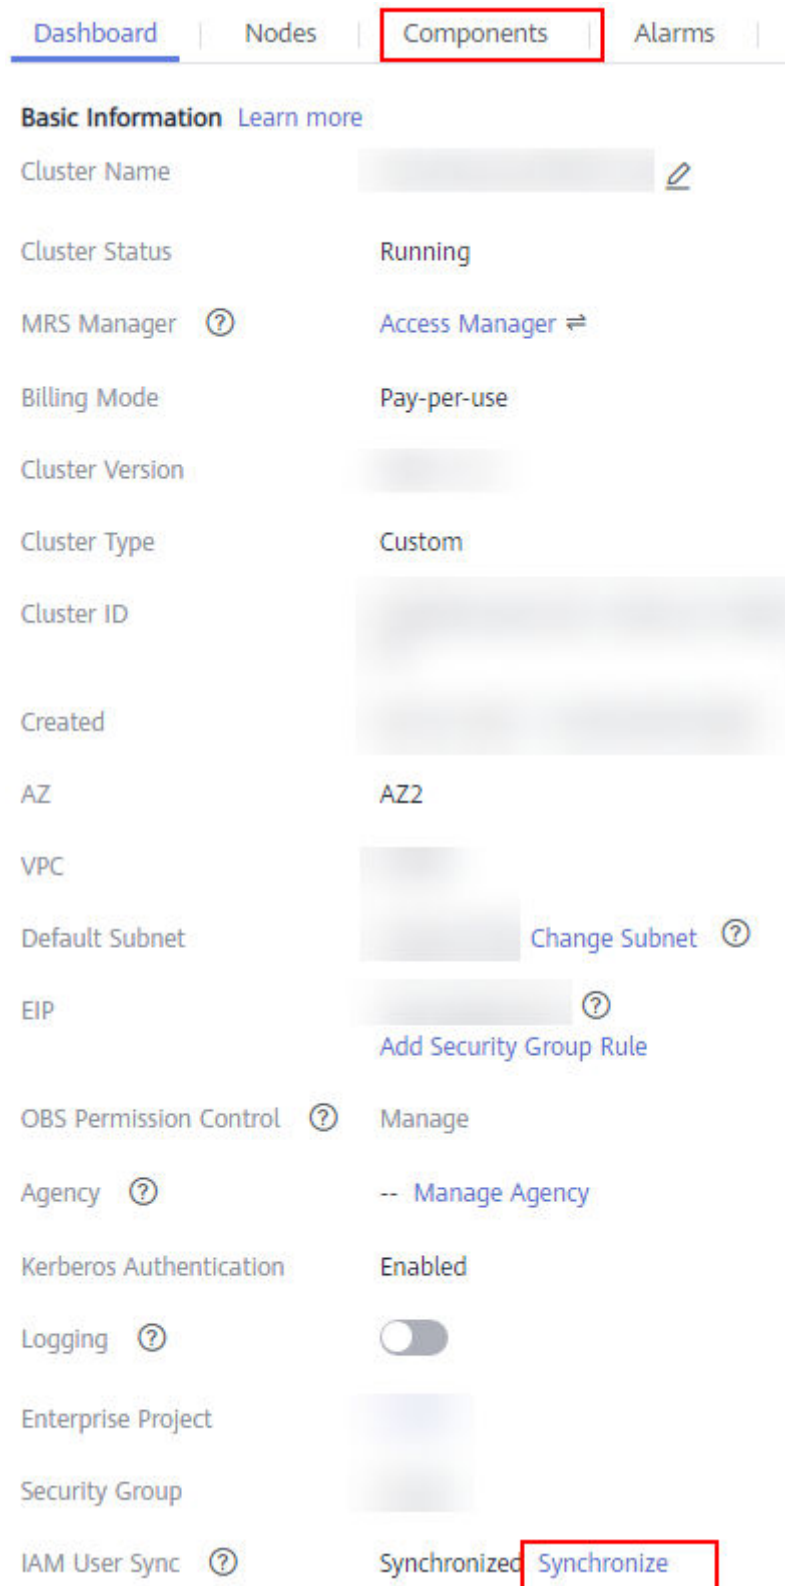

The UI may vary depending on the version. This tutorial is for reference only.

### Binding an EIP to a Cluster and Adding a Security Group Rule

1. On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users. After the IAM users are synchronized, the **Components** tab is available.

**Figure 6-1** Synchronizing users to access the **Component** tab page

2. Click **Access Manager** on the right of **MRS Manager**.

3. The page for accessing MRS Manager is displayed. Bind an EIP and add a security group rule. Perform the following operations only when you access the web UIs of the open-source components of the cluster for the first time.
  - a. Select an available EIP from the EIP drop-down list to bind it. If there is no available EIP, click **Manage EIP** to buy an EIP. If an EIP has been bound during cluster creation, skip this step.
  - b. Select the security group to which the security group rule to be added belongs. The security group is configured when the group is created.
  - c. Add a security group rule. By default, your public IP address used for accessing port 9022 is filled in the rule. If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

**NOTE**

- It is normal that the automatically generated public IP address is different from the local IP address and no action is required.
  - If port 9022 is a Knox port, you need to enable the permission of port 9022 to access Knox for accessing MRS components.
- d. Select the checkbox stating that **I confirm that xx.xx.xx.xx is a trusted public IP address and MRS Manager can be accessed using this IP address**.

**Figure 6-2** Accessing MRS Manager

- e. Click **OK**. The login page is displayed. Enter the username **admin** and the password set during cluster creation.
4. Log in to FusionInsight Manager and choose **Cluster > Services > HDFS**. On the displayed page, click **NameNode(Host name, active)** to access the HDFS web UI. The HDFS NameNode is used as an example. For details about the web UIs of other components, see [Web UIs of Open Source Components](#).

## 6.5 Access Using a Windows ECS

MRS allows you to access the web UIs of open-source components through a Windows ECS. This method is complex and is recommended for MRS clusters that do not support the EIP function.

**Step 1** Log in to the MRS management console.

**Step 2** On the **Active Clusters** page, click the name of the specified cluster.

On the cluster details page, record the **AZ**, **VPC**, **Floating IP Address of OMS**, and **Security Group** of the cluster.

### NOTE

To obtain the floating IP address of OMS, log in to the Master2 node remotely, and run the **ifconfig** command. In the command output, **eth0:wsom** indicates the floating IP address of OMS. Record the value of **inet**. If the floating IP address of OMS cannot be queried on the Master2 node, switch to the Master1 node to query and record the floating IP address. If there is only one Master node, query and record the cluster manager IP address of the Master node.

**Step 3** On the ECS management console, create an ECS.

- The **AZ**, **VPC**, and **Security Group** of the ECS must be the same as those of the cluster to be accessed.
- Select a Windows public image. For example, select the standard image **Windows Server 2012 R2 Standard 64bit(40GB)**.

- For details about other configuration parameters, see [Purchasing an ECS](#).

 **NOTE**

If the security group of the ECS is different from **Security Group** of the MRS cluster, you can modify the configuration using either of the following methods:

- Change the security group of the ECS to the security group of the MRS cluster. For details, see [Changing a Security Group](#).
- Add two security group rules to the security groups of the Master and Core nodes to enable the ECS to access the cluster. Set **Protocol** to **TCP** and **ports** of the two security group rules to **28443** and **20009**, respectively. For details, see [Creating a Security Group](#).

**Step 4** On the VPC management console, apply for an EIP and bind it to the ECS.

For details, see [Assigning an EIP and Binding It to an ECS](#).

**Step 5** Log in to the ECS.

The Windows system account, password, EIP, and security group rules are required for logging in to the ECS. For details, see [Logging In to a Windows ECS](#).

**Step 6** On the Windows remote desktop, use your browser to access Manager.

The Manager access address is in **https://OMS floating IP address:28443/web** format. Enter the name and password of the MRS cluster user, for example, user **admin**.

 **NOTE**

- To obtain the floating IP address of OMS, log in to the Master2 node remotely, and run the **ifconfig** command. In the command output, **eth0:wsom** indicates the floating IP address of OMS. Record the value of **inet**. If the floating IP address of OMS cannot be queried on the Master2 node, switch to the Master1 node to query and record the floating IP address. If there is only one Master node, query and record the cluster manager IP address of the Master node.
- If you access MRS Manager with other MRS cluster usernames, change the password upon your first access. The new password must meet the requirements of the current password complexity policies.
- By default, a user is locked after inputting an incorrect password five consecutive times. The user is automatically unlocked after 5 minutes.

**Step 7** Visit the web UIs of the open-source components by referring to the addresses listed in [Web UIs of Open Source Components](#).

----End

## Related Tasks

### Configuring the Mapping Between Cluster Node Names and IP Addresses

**Step 1** Log in to MRS Manager, and choose **Host Management**.

Record the host names and management IP addresses of all nodes in the cluster.

**Step 2** In the work environment, use Notepad to open the **hosts** file and add the mapping between node names and IP addresses to the file.

Fill in one row for each mapping relationship, as shown in the following figure.

```
192.168.4.127 node-core-Jh3ER
192.168.4.225 node-master2-PaWVE
192.168.4.19 node-core-mtZ81
192.168.4.33 node-master1-zbYN8
192.168.4.233 node-core-7KoGY
```

Save the modifications.

----End

## 6.6 Creating an SSH Channel for Connecting to an MRS Cluster and Configuring the Browser

### Scenario

Users and an MRS cluster are in different networks. As a result, an SSH channel needs to be created to send users' requests for accessing websites to the MRS cluster and dynamically forward them to the target websites.

The MAC system does not support this function. For details about how to access MRS, see [EIP-based Access](#).

### Prerequisites

- You have prepared an SSH client for creating the SSH channel, for example, the Git open-source SSH client. You have downloaded and installed the client.
- You have created a cluster and prepared a key file in PEM format or obtained the password used during cluster creation.
- Users can access the Internet on the local PC.

### Procedure

**Step 1** Log in to the MRS management console and choose **Active Clusters**.

**Step 2** Click the specified MRS cluster name.

Record the security group of the cluster.

**Step 3** Add an inbound rule to the security group of the Master node to allow data access to the IP address of the MRS cluster through port **22**.

For details, see [Adding a Security Group Rule](#).

**Step 4** Query the primary management node of the cluster. For details, see [Determining Active and Standby Management Nodes](#).

**Step 5** Bind an elastic IP address to the primary management node.

For details, see [Assigning an EIP and Binding It to an ECS](#).

**Step 6** Start Git Bash locally and run the following command to log in to the active management node of the cluster: **ssh root@Elastic IP address** or **ssh -i Path of the key file root@Elastic IP address**.

**Step 7** Run the following command to view data forwarding configurations:

```
cat /etc/sysctl.conf | grep net.ipv4.ip_forward
```

- If **net.ipv4.ip\_forward=1** is displayed, the forwarding function has been configured. Go to [Step 9](#).
- If **net.ipv4.ip\_forward=0** is displayed, the forwarding function has not been configured. Go to [Step 8](#).
- If **net.ipv4.ip\_forward** fails to be queried, this parameter has not been configured. Run the following command and then go to [Step 9](#):  

```
echo "net.ipv4.ip_forward = 1" >> /etc/sysctl.conf
```

**Step 8** Modify forwarding configurations on the node.

1. Run the following command to switch to user **root**:

```
sudo su - root
```

2. Run the following commands to modify forwarding configurations:

```
echo 1 > /proc/sys/net/ipv4/ip_forward
```

```
sed -i "s/net.ipv4.ip_forward=0/net.ipv4.ip_forward = 1/g" /etc/sysctl.conf
```

```
sysctl -w net.ipv4.ip_forward=1
```

3. Run the following command to modify the **sshd** configuration file:

```
vi /etc/ssh/sshd_config
```

Press **I** to enter the edit mode. Locate **AllowTcpForwarding** and **GatewayPorts** and delete comment tags. Modify them as follows. Save the changes and exit.

```
AllowTcpForwarding yes
GatewayPorts yes
```

4. Run the following command to restart the **sshd** service:

```
service sshd restart
```

**Step 9** Run the following command to view the floating IP address:

```
ifconfig
```

In the command output, **eth0:FI\_HUE** indicates the floating IP address of Hue and **eth0:wsom** specifies the floating IP address of Manager. Record the value of **inet**.

Run the **exit** command to exit.

**Step 10** Run the following command on the local PC to create an SSH channel supporting dynamic port forwarding:

```
ssh -i Path of the key file -v -ND Local port root@Elastic IP address or ssh -v -ND Local port root@Elastic IP address. After running the command, enter the password you set when you create the cluster.
```

In the command, set **Local port** to the user's local port that is not occupied. Port **8157** is recommended.

After the SSH channel is created, add **-D** to the command and run the command to start the dynamic port forwarding function. By default, the dynamic port forwarding function enables a SOCKS proxy process and monitors the user's local port. Port data will be forwarded to the primary management node using the SSH channel.

**Step 11** Run the following command to configure the browser proxy.

1. Go to the Google Chrome client installation directory on the local PC.

2. Press **Shift** and right-click the blank area, choose **Open Command Window Here** and enter the following command:

```
chrome --proxy-server="socks5://localhost:8157" --host-resolver-rules="MAP * 0.0.0.0 , EXCLUDE localhost" --user-data-dir=c:/tmp/path --proxy-bypass-list="*google*.com,*gstatic.com,*gvt*.com,*.80"
```

 **NOTE**

- In the preceding command, **8157** is the local proxy port configured in [Step 10](#).
- If the local OS is Windows 10, start the Windows OS, click **Start** and enter **cmd**. In the displayed CLI, run the command in [Step 11.2](#). If this method fails, click **Start**, enter the command in the search box, and run the command in [Step 11.2](#).

**Step 12** In the address box of the browser, enter the address for accessing Manager.

Address format: **https://Floating IP address of FusionInsight Manager:28443/web**

The username and password of the MRS cluster need to be entered for accessing clusters with Kerberos authentication enabled, for example, user **admin**. They are not required for accessing clusters with Kerberos authentication disabled.

When accessing Manager for the first time, you must add the address to the trusted site list.

**Step 13** Prepare the website access address.

1. Obtain the website address format and the role instance according to [Web UIs](#).
2. Click **Services**.
3. Click the specified service name, for example, HDFS.
4. Click **Instance** and view **Service IP Address of NameNode(Active)**.

**Step 14** In the address bar of the browser, enter the website address to access it.

**Step 15** When logging out of the website, terminate and close the SSH tunnel.

----End

# 7 Accessing Manager

## 7.1 Accessing FusionInsight Manager (MRS 3.x or Later)

### Scenario

In MRS 3.x or later, FusionInsight Manager is used to monitor, configure, and manage clusters. After a cluster is installed, you can use an account to log in to FusionInsight Manager.

Currently, you can access FusionInsight Manager using the following methods:

- [Accessing FusionInsight Manager Using EIP](#)
- [Accessing FusionInsight Manager Using Direct Connect](#)
- [Accessing FusionInsight Manager from an ECS](#)

You can switch the access methods between **EIP** and **Direct Connect** on the MRS console by performing the following steps:

Log in to the MRS management console and click the desired cluster. On the displayed page, click  next to **MRS Manager** on the **Dashboard** tab, and switch the access method.

#### NOTE

If you cannot log in to the WebUI of the component, access FusionInsight Manager by referring to [Accessing FusionInsight Manager from an ECS](#).

FusionInsight Manager cannot be accessed when the cluster is in any of the following states:

Starting, Stopping, Stopped, Deleting, Deleted, and Frozen.

### Accessing FusionInsight Manager Using EIP

If the EIP address function is enabled for the cluster, perform the following steps:

**Step 1** Log in to the MRS management console.

**Step 2** In the navigation pane, choose **Active Clusters**. Click the target cluster name to access the cluster details page.

**Step 3** Click **Manager** next to **MRS Manager**. In the displayed dialog box, configure the EIP information.

1. If no EIP is bound during MRS cluster creation, select an available EIP from the drop-down list on the right of **IEP**. If you have bound an EIP when you create a cluster, go to **Step 3.2**.

 **NOTE**

- If no EIPs are available, click **Manage EIP** to buy one. Then, select the EIP from the drop-down list.
  - To unbind or release an EIP after using it, log in to the **EIPs** page, locate the row containing the target EIP, and click **Unbind** or choose **More > Release** in the **Operation** column.
  - If an EIP has been created but cannot be found during binding, the EIP may have been bound to another cluster. In this case, unbind the EIP on the **EIPs** page and then bind it to the current cluster.
2. In **Security Group**, select the security group to which the current cluster belongs. The security group is configured during cluster creation or is automatically created by the cluster.

 **NOTE**

- When creating a custom cluster, you can configure a security group created in advance or retain the default value **Auto create**. When you quickly create a cluster, the security group is automatically created by the cluster.
  - You can view the security group name in **Security Group** on the **Dashboard** tab page of the cluster.
3. Add a security group rule. By default, the filled-in rule is used to access the EIP. To enable multiple IP address segments to access Manager, see steps **Step 6** to **Step 9**. If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

 **NOTE**

"MRS Manager public ip access control rule" is added to the **Description** column of the the security group rule you added. To view this description, choose **Manage Security Group Rule**, click **Security Group**, and click the **Inbound Rules** tab.

4. Select the information to be confirmed and click **OK**.

 **NOTE**

Click  on the right of **Access Manager** to change the FusionInsight Manager access mode. For details about how to access FusionInsight Manager by using **Direct Connect**, see [Accessing FusionInsight Manager by Using Direct Connect](#).

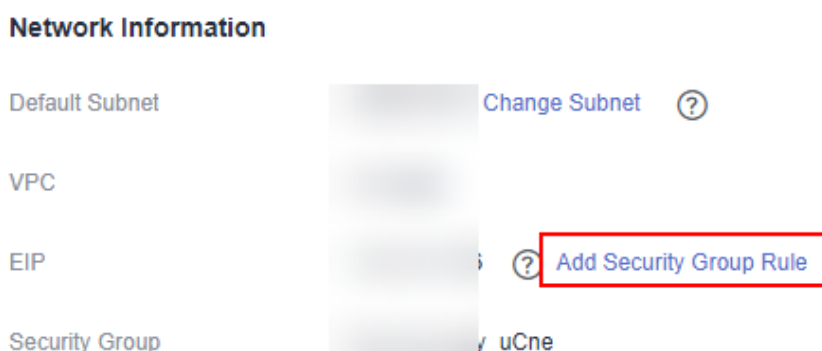

- Step 4** Click **OK**. The Manager login page is displayed.
- Step 5** Enter the default username **admin** and the password set during cluster creation, and click **Log In**. The Manager page is displayed.
- Step 6** On the MRS management console, choose **Clusters > Active Clusters**. Click the target cluster name to access the cluster details page.

 **NOTE**

To grant other users the permission to access Manager, perform [Step 6](#) to [Step 9](#) to add the users' public IP addresses to the trusted IP address range.

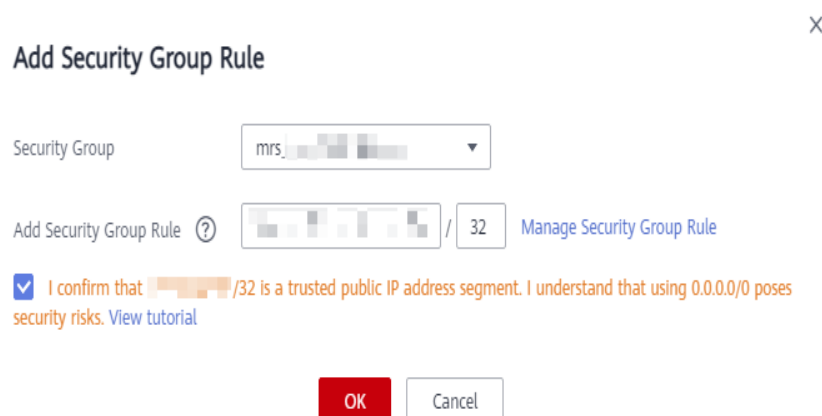

- Step 7** Click **Add Security Group Rule** next to **EIP**.

**Figure 7-1** Cluster details

- Step 8** On the **Add Security Group Rule** page, add the IP address segment for users to access the public network and select **I confirm that *public network IP/port* is a trusted public IP address. I understand that using 0.0.0.0/0 poses security risks.** See [Figure 7-2](#).

**Figure 7-2** Adding a security group rule

By default, the IP address used for accessing the public network is filled. You can change the IP address segment as required. To enable multiple IP address segments, repeat steps [Step 6](#) to [Step 9](#). If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

**Step 9** Click **OK**.

----End

## Accessing FusionInsight Manager by Using Direct Connect

You need to ensure that Direct Connect is available, and the connection between the local data center and the online VPC has been established. For details, see [What Is Direct Connect?](#)

**Step 1** Log in to the MRS console.

**Step 2** Click the name of the cluster to enter its details page.

**Step 3** On the **Dashboard** tab page of the cluster details page, click **Access Manager** next to **MRS Manager**.

**Step 4** Set **Access Mode** to **Direct Connect** and select **I confirm that the network between the local PC and the floating IP address is connected and that MRS Manager is accessible using the Direct Connect connection**.

The floating IP address is automatically allocated by MRS to access MRS Manager. Before using Direct Connect to access MRS Manager, ensure that the connection between the local data center and the online VPC has been established.

### Access MRS Manager

You can use an EIP or a Direct Connect connection to access MRS Manager. [Learn more](#)

Access Mode

EIP

Direct Connect

Floating IP Address ?

192 . 168 . 8 . 78

I confirm that the network between the local PC and the floating IP address is connected and that MRS Manager is accessible using the Direct Connect connection.

OK

Cancel

**Step 5** Click **OK**. The MRS Manager login page is displayed. Enter the username **admin** and the password set during cluster creation.

----End

## Accessing FusionInsight Manager from an ECS

**Step 1** Log in to the MRS management console.

**Step 2** On the **Active Clusters** page, click the name of the specified cluster.

Record the **AZ**, **VPC**, **MRS ManagerSecurity Group** of the cluster.

**Step 3** On the homepage of the management console, choose **Service List > Elastic Cloud Server** to switch to the ECS management console and create an ECS.

- The **AZ**, **VPC**, and **Security Group** of the ECS must be the same as those of the cluster to be accessed.
- Select a Windows public image. For example, a standard image **Windows Server 2012 R2 Standard 64bit(40GB)**.
- For details about other configuration parameters, see [Purchasing an ECS with Customized Configurations](#).

 **NOTE**

If the security group of the ECS is different from **Default Security Group** of the Master node, you can modify the configuration using either of the following methods:

- Change the security group of the ECS to the default security group of the Master node. For details, see [Changing a Security Group](#).
- Add two security group rules to the security groups of the Master and Core nodes to enable the ECS to access the cluster. Set **Protocol** to **TCP**, **Ports** of the two security group rules to **28443** and **20009**, respectively. For details, see [Creating a Security Group](#).

If "Failed to add security group rules." is displayed, check whether the security group quota is sufficient. If more quotas are needed, increase the quotas or delete security group rules that are no longer used.

**Step 4** On the VPC management console, apply for an EIP and bind it to the ECS.

For details, see [Assigning an EIP and Binding It to an ECS](#).

**Step 5** Log in to the ECS.

The Windows system account, password, EIP, and security group rules are required for logging in to the ECS. For details, see [Logging In to a Windows ECS](#).

**Step 6** On the Windows remote desktop, use your browser to access Manager.

The address for accessing Manager is the address of the **MRS Manager** page. Enter the name and password of the cluster user, for example, user **admin**.

 **NOTE**

- If you access Manager with other cluster usernames, change the password upon your first access. The new password must meet the requirements of the current password complexity policies. For details, contact the administrator.
- By default, a user is locked after inputting an incorrect password five consecutive times. The user is automatically unlocked after 5 minutes.

**Step 7** Log out of FusionInsight Manager. To log out of Manager, move the cursor to  in the upper right corner and click **Log Out**.

----End

## 7.2 Accessing MRS Manager (MRS 2.x or Earlier)

### Scenario

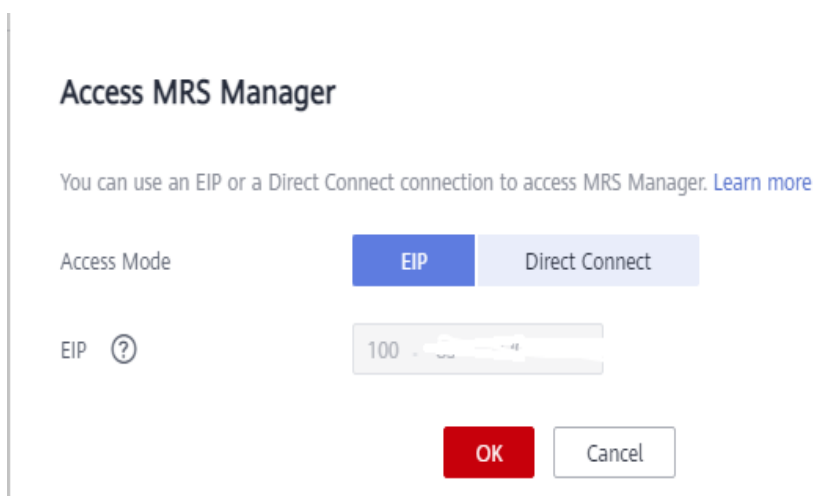

MRS uses Manager to monitor, configure, and manage clusters. You can go to the Manager management page on the MRS console and use the admin account and password configured during cluster creation to log in to Manager.

**NOTE**

The Manager cannot be accessed when the cluster is in any of the following states: Starting, Stopping, Stopped, Deleting, Deleted, and Frozen.

## Accessing Manager Using an EIP

- Step 1** Log in to the MRS management console.
- Step 2** In the navigation pane, choose **Active Clusters**. Click the target cluster name to access the cluster details page.
- Step 3** Click **Access Manager** next to **MRS Manager**. In the displayed dialog box, set **Access Mode** to **EIP**. For details about **Direct Connect**, see [Access Through Direct Connect](#).

1. If no EIP is bound during MRS cluster creation, select an available EIP from the drop-down list on the right of **IEP**. If you have bound an EIP when creating a cluster, go to [Step 3.2](#).

**NOTE**

- If no EIPs are available, click **Manage EIP** to buy one. Then, select the EIP from the drop-down list.
  - To unbind or release an EIP after using it, log in to the **EIPs** page, locate the row containing the target EIP, and click **Unbind** or choose **More > Release** in the **Operation** column.
  - If an EIP has been created but cannot be found during binding, the EIP may have been bound to another cluster. In this case, unbind the EIP on the **EIPs** page and then bind it to the current cluster.
2. In **Security Group**, select the security group to which the current cluster belongs. The security group is configured during cluster creation or is automatically created by the cluster.

**NOTE**

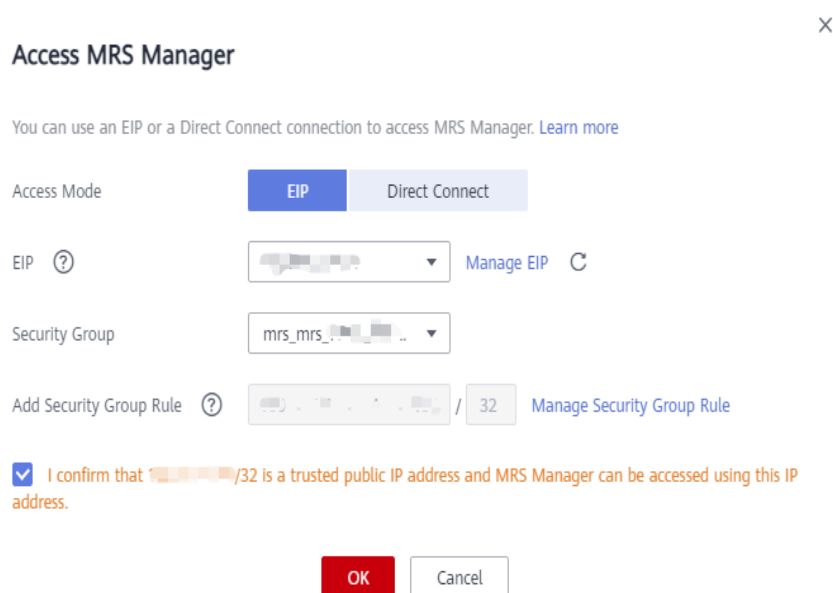

- When creating a custom cluster, you can configure a security group created in advance or retain the default value **Auto create**. When you quickly create a cluster, the security group is automatically created by the cluster.
- You can view the security group name in **Security Group** on the **Dashboard** tab page of the cluster.

3. Add a security group rule. By default, your public IP address used for accessing port 9022 is filled in the rule. To enable multiple IP address segments to access MRS Manager, see [Step 6](#) to [Step 9](#). If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

 **NOTE**

- It is normal that the automatically generated public IP address is different from the local IP address and no action is required.
  - If port 9022 is a Knox port, you need to enable the permission of port 9022 to access Knox for accessing MRS Manager.
4. Select the checkbox stating that **I confirm that xx.xx.xx.xx is a trusted public IP address and MRS Manager can be accessed using this IP address**.

**Figure 7-3** Binding an EIP

**Step 4** Click **OK**. The MRS Manager login page is displayed.

**Step 5** Enter the default username **admin** and the password set during cluster creation, and click **Log In**. The MRS Manager page is displayed.

**Step 6** On the MRS management console, choose **Clusters > Active Clusters**, and click the target cluster name to access the cluster details page.

 **NOTE**

To assign MRS Manager access permissions to other users, follow instructions from [Step 6](#) to [Step 9](#) to add the users' public IP addresses to the trusted range.

**Step 7** Click **Add Security Group Rule** next to **EIP**.

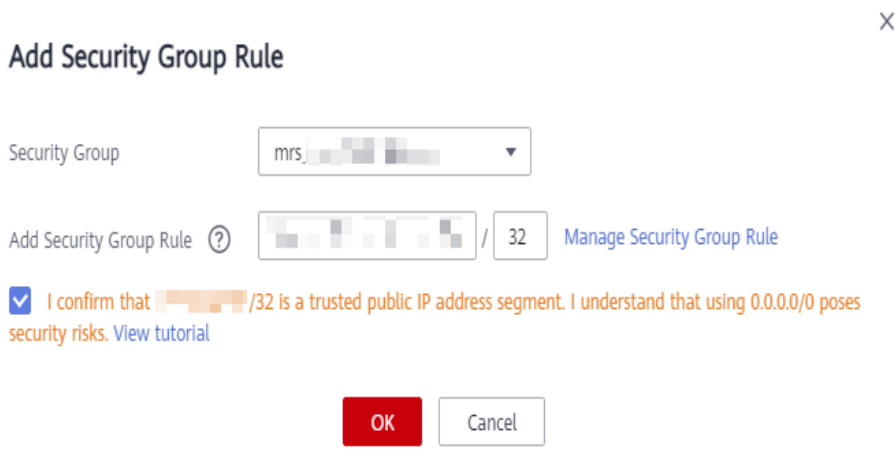

**Figure 7-4** Cluster details

**Network Information**

**Step 8** On the **Add Security Group Rule** page, add the IP address segment for users to access the public network and select **I confirm that the authorized object is a trusted public IP address range. Do not use 0.0.0.0/0. Otherwise, security risks may arise.** See [Figure 7-5](#).

**Figure 7-5** Adding a security group rule

By default, the IP address used for accessing the public network is filled. You can change the IP address segment as required. To enable multiple IP address segments, repeat steps [Step 6](#) to [Step 9](#). If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

**Step 9** Click **OK**.

----End

## Accessing MRS Manager Using an ECS

**Step 1** Log in to the MRS management console.

**Step 2** On the **Active Clusters** page, click the name of the specified cluster.

Record the **AZ**, **VPC**, and **Security Group** of the cluster.

**Step 3** On the ECS management console, create an ECS.

- The **AZ**, **VPC**, and **Security Group** of the ECS must be the same as those of the cluster to be accessed.
- Select a Windows public image. For example, select the standard image **Windows Server 2012 R2 Standard 64bit(40GB)**.
- For details about other configuration parameters, see [Purchasing an ECS](#).

 **NOTE**

If the security group of the ECS is different from **Default Security Group** of the MRS cluster, you can modify the configuration using either of the following methods:

- Change the default security group of the ECS to the security group of the MRS cluster. For details, see [Changing a Security Group](#).
- Add two security group rules to the security groups of the Master and Core nodes to enable the ECS to access the cluster. Set **Protocol** to **TCP** and **ports** of the two security group rules to **28443** and **20009**, respectively. For details, see [Creating a Security Group](#).

**Step 4** On the VPC management console, apply for an EIP and bind it to the ECS.

For details, see [Assigning an EIP and Binding It to an ECS](#).

**Step 5** Log in to the ECS.

The Windows system account, password, EIP, and security group rules are required for logging in to the ECS. For details, see [Logging In to a Windows ECS](#).

**Step 6** On the Windows remote desktop, use your browser to access Manager.

For example, you can use Internet Explorer 11 in the Windows 2012 OS.

The Manager access address is in **https://OMS floating IP address:28443/web** format. Enter the name and password of the MRS cluster user, for example, user **admin**.

 **NOTE**

- To obtain the floating IP address of OMS, log in to the Master2 node remotely, and run the **ifconfig** command. In the command output, **eth0:wsom** indicates the floating IP address of OMS. Record the value of **inet**. If the floating IP address of OMS cannot be queried on the Master2 node, switch to the Master1 node to query and record the floating IP address. If there is only one Master node, query and record the cluster manager IP address of the Master node.
- If you access MRS Manager with other MRS cluster usernames, change the password upon your first access. The new password must meet the requirements of the current password complexity policies.
- By default, a user is locked after inputting an incorrect password five consecutive times. The user is automatically unlocked after 5 minutes.

**Step 7** Log out of FusionInsight Manager. To log out of Manager, move the cursor to  in the upper right corner and click **Log Out**.

----End

## Changing an EIP for a Cluster

- Step 1** On the MRS management console, choose **Clusters > Active Clusters**, and click the target cluster name to access the cluster details page.
- Step 2** View EIPs
- Step 3** Log in to the VPC management console.
- Step 4** Choose **Elastic IP and Bandwidth > EIPs**.
- Step 5** Search for the EIP bound to the MRS cluster and click **Unbind** in the **Operation** column to unbind the EIP from the MRS cluster.

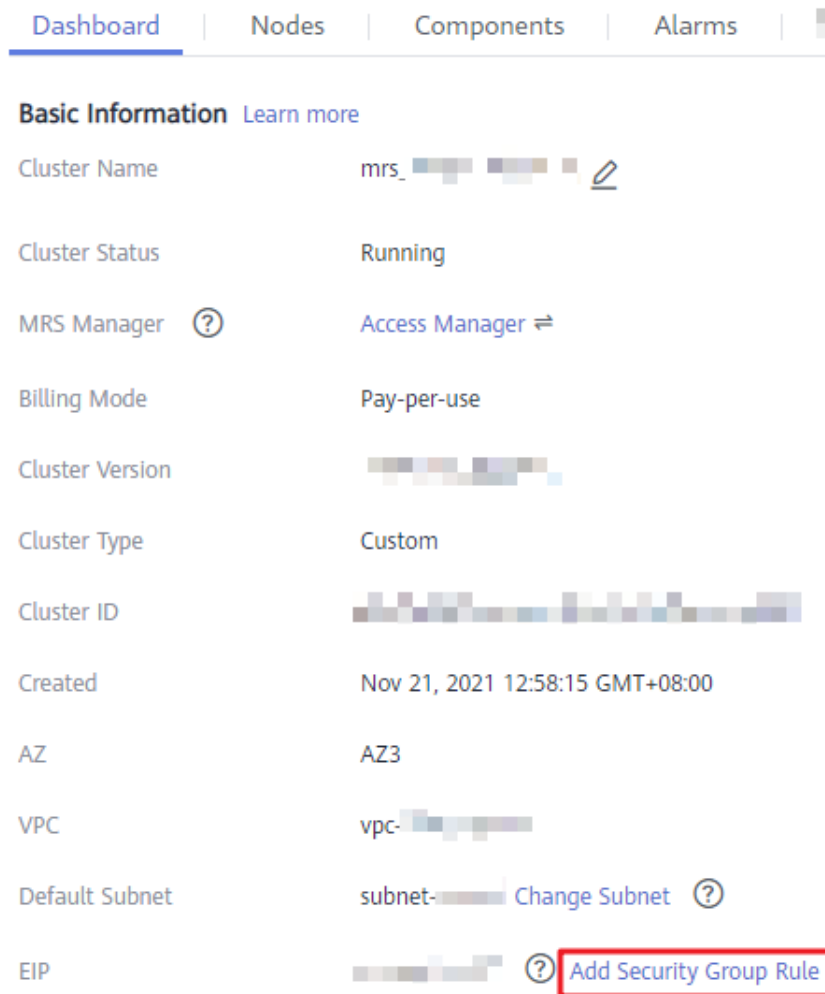

- Step 6** Log in to the MRS management console, choose **Clusters > Active Clusters**, and click the target cluster name to access the cluster details page.  
**EIP** on the cluster details page is displayed as **Unbound**.
- Step 7** Click **Access Manager** next to **MRS Manager**. In the displayed dialog box, set **Access Mode** to **EIP**.
- Step 8** Select a new EIP from the EIP drop-down list and configure other parameters. For details, see [Accessing Manager Using an EIP](#).

----End

## Granting the Permission to Access MRS Manager to Other Users

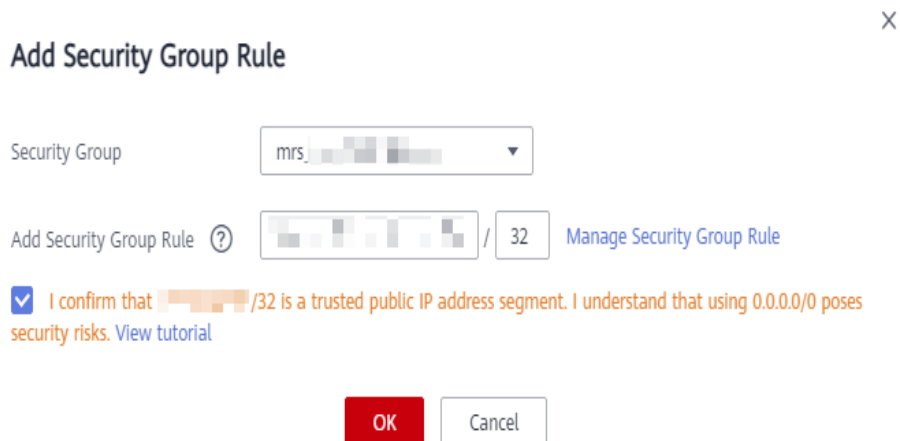

- Step 1** On the MRS management console, choose **Clusters > Active Clusters**, and click the target cluster name to access the cluster details page.
- Step 2** Click **Add Security Group Rule** on the right of **EIP**, as shown in [Figure 7-6](#).

Figure 7-6 Cluster details

**Step 3** On the **Add Security Group Rule** page, add the IP address segment for users to access the public network and select **I confirm that the authorized object is a trusted public IP address range. Do not use 0.0.0.0/0. Otherwise, security risks may arise.** See [Figure 7-7](#).

**Figure 7-7** Adding a security group rule

By default, the IP address used for accessing the public network is filled. You can change the IP address segment as required. To enable multiple IP address segments, repeat steps [Step 1](#) to [Step 4](#). If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

**Step 4** Click **OK**.

----End

# 8 FusionInsight Manager Operation Guide (Available for 3.x)

## 8.1 Homepage

### 8.1.1 Overview

After you log in to FusionInsight Manager, the home page is displayed by default. You can preview the status of each cluster, view the monitoring information, and view alarm statistics and analysis in the cluster.

- On the right of the home page, you can view the number of alarms of different severities, number of running tasks, current user, and help information.

**Figure 8-1** Cluster status information

- Click  to view the task name, status, progress, start time, and end time of the last 100 operation tasks in **Task Management Center**.

#### NOTE

For a start, stop, restart, or rolling restart task, you can abort it by clicking the task name in the task list, clicking **Abort**, and then entering the system administrator password in the dialog box that is displayed. An aborted task is no longer executed.

- Click About under  to view the Manager version.
- The taskbar at the bottom of the home page displays the language options of FusionInsight Manager and the current cluster time and time zone information. You can switch the system language as needed.

**Figure 8-2** Taskbar at the bottom of the home page

## Service Status Preview Area

The list of installed service components in the cluster is displayed on the left of the home page. You can view the status and alarms of each service.

The  icon on the left of each service name indicates that the service is running properly; the  icon indicates that the current service fails to start; and the  icon indicates that the current service is not started.

You can also check whether alarms have been generated for the service on the right of the service name. If alarms have been generated, the alarm severities and the number of alarms are displayed.

The  icon displayed on the right of the service name indicates that the service configuration has expired.

## Monitoring Status Report Area

The chart area is on the right of the homepage, which displays key monitoring metric reports, such as the status of all hosts in the cluster, host CPU usage, and host memory usage. You can customize monitoring reports to display in this area. For details about how to manage monitoring metrics, see [Managing Monitoring Metric Reports](#).

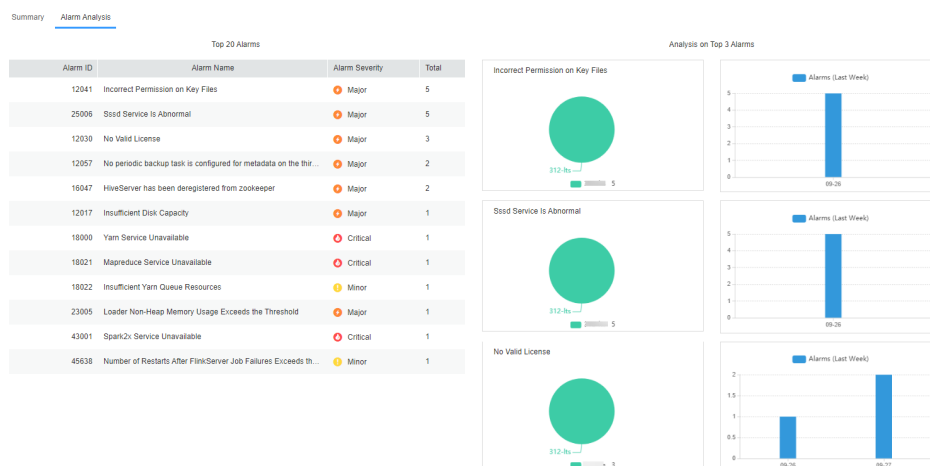

You can view the data source of a monitoring chart in the lower left corner of the chart. You can zoom in on a monitoring report to view chart values more clearly or close the monitoring report.

Figure 8-3 Monitoring status report

## Alarm Analysis

On the **Alarm Analysis** tab page, you can view the **Top 20 Alarms** table and **Analysis on Top 3 Alarms** chart. You can click an alarm name in the **Top 20 Alarms** table to view analysis information of this alarm only. Alarm analysis allows you to view top alarms and their occurrence time so you can handle alarms accordingly, improving system stability.

**Figure 8-4** Alarm Analysis tab page

## 8.1.2 Managing Monitoring Metric Reports

### Scenario

On FusionInsight Manager, you can customize monitoring items to display on the homepage and export monitoring data.

#### NOTE

The interval on the horizontal axis of the chart varies depending on the time period you specify. Data monitoring rules are as follows:

- If the disk usage of the partition where GaussDB is deployed exceeds 80%, real-time monitoring data and monitoring data whose interval is 5 minutes will be deleted.
- **Storage resources (HDFS) in Tenant Resources (0 to 300 hours):** The interval is 1 hour. The cluster must have been installed for at least 1 hour, and monitoring data of a maximum of 3 months is saved.
- **0 to 25 hours:** The interval is 5 minutes. The cluster must have been installed for at least 10 minutes, and monitoring data of a maximum of 15 days is saved.
- **25 to 150 hours:** The interval is 30 minutes. The cluster must have been installed for at least 30 minutes, and monitoring data of a maximum of 3 months is saved.
- **150 to 300 hours:** The interval is 1 hour. The cluster must have been installed for at least 1 hour, and monitoring data of a maximum of 3 months is saved.
- **300 hours to 300 days:** The interval is 1 day. The cluster must have been installed for at least 1 day, and monitoring data of a maximum of 6 months is saved.
- **Over 300 days:** The interval is 7 days. The cluster must have been installed for more than 7 days, and monitoring data of a maximum of 1 year is saved.

### Customizing a Monitoring Metric Report

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Homepage**.

**Step 3** In the upper right corner of the chart area, click  and choose **Customize** from the displayed menu.

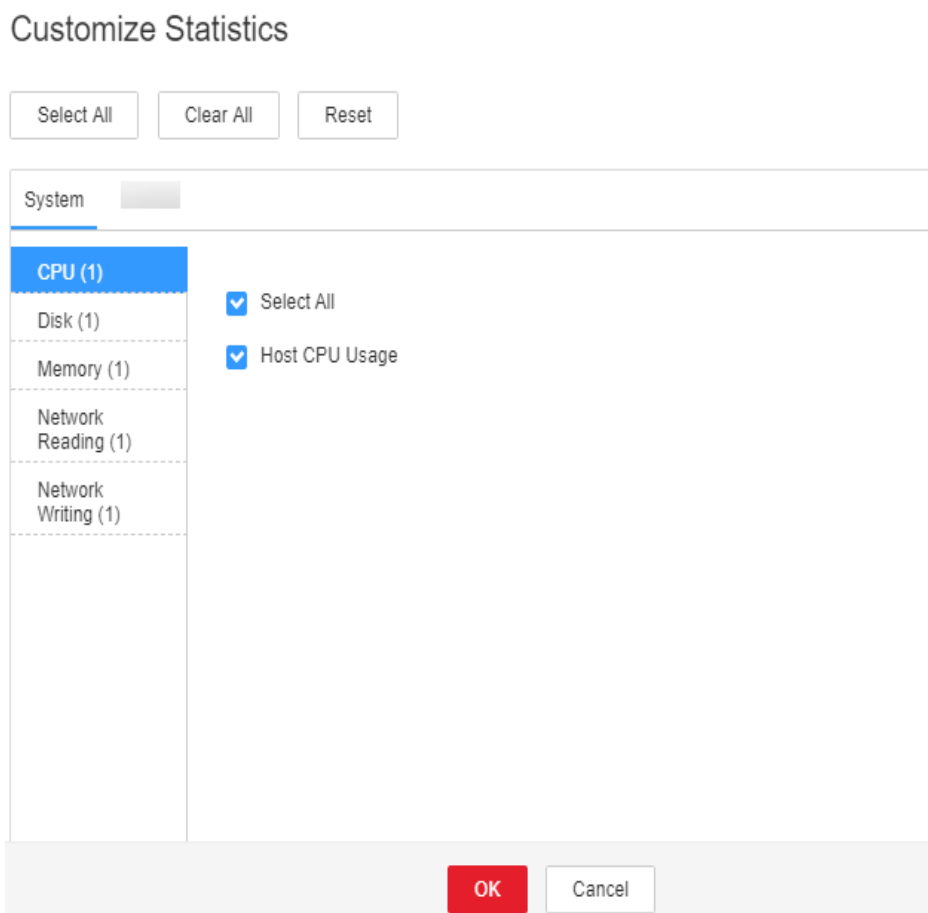

**NOTE**

Monitoring data of the past 1 hour is displayed at an interval of 5 minutes. After you enter the **Real-time Monitoring** page, you can view that real-time monitoring data is displayed on the right of the monitoring chart at an interval of 5 minutes.

**Step 4** In the left pane of the **Customize Statistics** dialog box, select a resource to monitor.

**Step 5** Select one or multiple monitoring metrics in the right pane.

**Figure 8-5** Customizing a monitoring metric report

**Step 6** Click **OK**.

----End

## Exporting All Monitoring Data

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Homepage**.

**Step 3** In the upper right corner of the chart area, select a time range to obtain monitoring data, for example, **1w**.

Real-time data is displayed by default, which cannot be exported. You can click  to customize a time range.

**Figure 8-6** Customizing a time range

**Step 4** In the upper right corner of the chart area, click  and choose **Export** from the displayed menu.

----End

## Exporting Monitoring Data of a Specified Monitoring Item

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Homepage**.

**Step 3** Click  in the upper right corner of any monitoring report pane in the chart area of the target cluster.

**Step 4** Select a time range to obtain monitoring data, for example, **1w**.

Real-time data is displayed by default, which cannot be exported. You can click  to customize a time range.

**Figure 8-7** Customizing a time range for a specified monitoring item

**Step 5** Click **Export**.

----End

## 8.1.3 Querying the FusionInsight Manager Version

By viewing the FusionInsight Manager version, you can prepare for system upgrade and routine maintenance.

- Using the GUI:

Log in to FusionInsight Manager. On the home page, click  in the upper right corner and choose **About** from the drop-down list. In the dialog box that is displayed, view the FusionInsight Manager version.

**Figure 8-8** Viewing the version

# About

## FusionInsight Manager

Version:  

- Using the CLI
  - a. Log in to the FusionInsight Manager active OMS node as user **root**. To obtain the IP address of the active OMS node, view the host information marked with ★ in the **Hosts** tab of FusionInsight Manager.
  - b. Run the following commands to check the version and platform information of FusionInsight Manager:

```
su - omm
```

```
cd ${BIGDATA_HOME}/om-server/om/sbin/pack
```

```
./queryManager.sh
```

The following information is displayed:

Version	Package	Cputype
***	FusionInsight_Manager_***	x86_64

### NOTE

\*\*\* indicates the version number. Replace it with the actual version number.

## 8.2 Cluster

### 8.2.1 Cluster Management

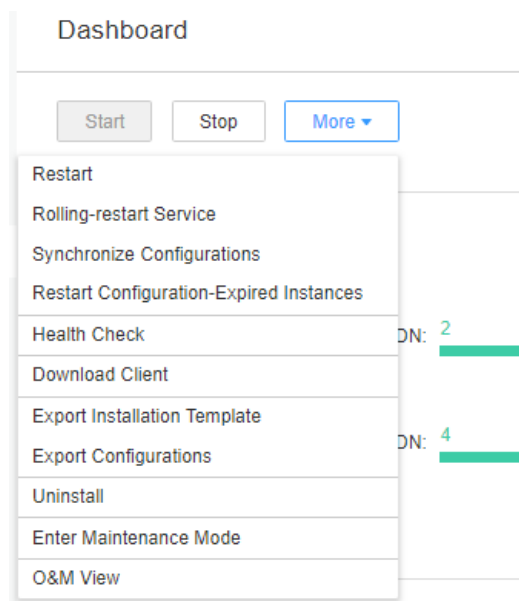

#### 8.2.1.1 Overview

##### Dashboard

Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Dashboard** to view the status of the cluster.

In the **Dashboard** tab, you can start, stop, perform a rolling restart of, synchronize configurations to the cluster, and perform other basic operations.

**Figure 8-9** Dashboard

**Table 8-1** Maintenance and management operations

UI Portal	Description
<b>Start</b>	Starts all services in the cluster.
<b>Stop</b>	Stops all services in the cluster.
<b>More &gt; Restart</b>	Restarts all services in the cluster.
<b>More &gt; Rolling-restart Service</b>	Restarts all services in the cluster one at a time without interrupting workloads. For details about how to perform a rolling restart, see <a href="#">Performing a Rolling Restart of a Cluster</a> .
<b>More &gt; Synchronize Configurations</b>	Enables new configuration parameters for all services in the cluster.
<b>More &gt; Restart Configuration-Expired Instances</b>	Restarts expired instances for all services in the cluster. For details, see <a href="#">Managing Expired Configurations</a> .
<b>More &gt; Health Check</b>	Performs a health check on the OMS nodes, all services, and the rest nodes in the cluster. There are three types of check items: running status, related alarms, and custom monitoring metrics. The health check results are not always the same as the values of <b>Running Status</b> displayed on the GUI.  You can export check results by clicking <b>Export</b> in the upper left corner of the checklist. If any issues are detected, you can click <b>View Help</b> to find a troubleshooting method.

UI Portal	Description
<b>More &gt; Download Client</b>	Downloads the default client. For details, see <a href="#">Downloading the Client</a> .
<b>More &gt; Export Installation Template</b>	Batch exports all installation configurations of the cluster, such as the cluster authentication mode, node information, and service configuration. You can use this function when you need to reinstall the cluster in the same environment.
<b>More &gt; Export Configurations</b>	Batch exports configurations of all services in the cluster.
<b>More &gt; Enter Maintenance Mode</b> and <b>More &gt; Exit Maintenance Mode</b>	Enters or exits the cluster maintenance mode.
<b>More &gt; O&amp;M View</b>	Allows you to view services or hosts that are in the maintenance mode.

## 8.2.1.2 Performing a Rolling Restart of a Cluster

### Scenario

A rolling restart is batch restarting all services in a cluster after they are modified or upgraded without interrupting workloads.

You can perform a rolling restart of a cluster as needed.

#### NOTE

- Certain services in a cluster do not support rolling restart. These services are restarted in normal mode during the rolling restart of the cluster. As a result, workloads may be interrupted. So, you need to determine whether to perform this operation as prompted.
- Configurations that must take effect immediately, for example, server port configurations, should be restarted in normal mode.

### Impact on the System

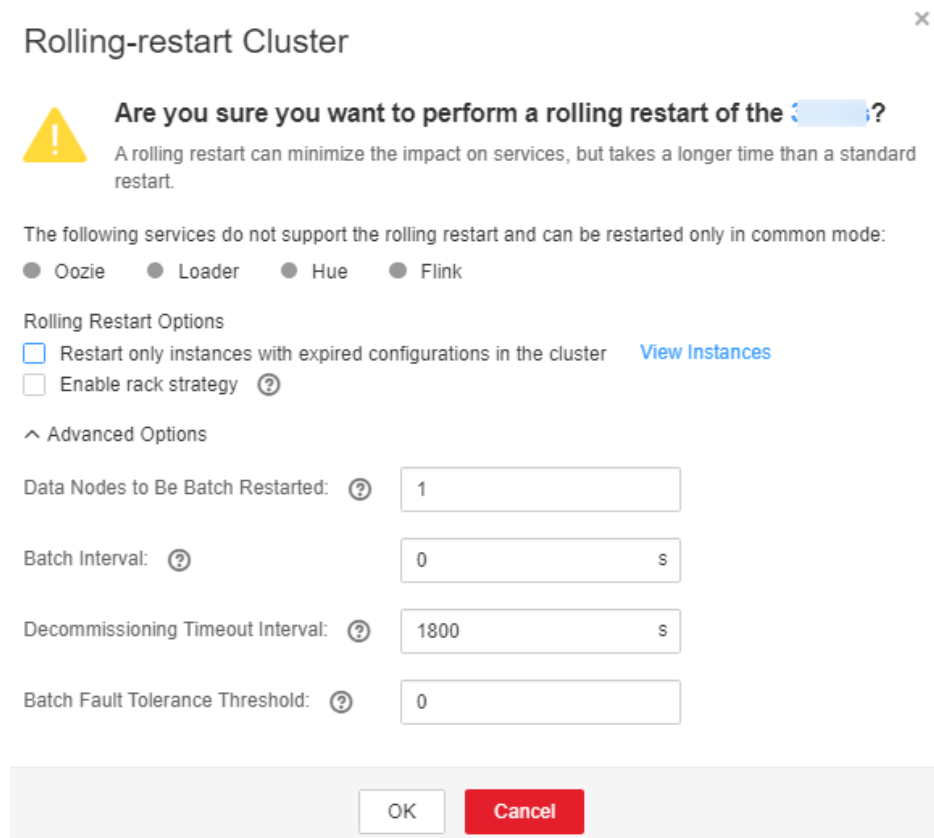

A rolling restart takes a longer time and may affect service throughput and performance.

### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Cluster > Dashboard**. In the upper right corner, click **More > Service Rolling Restart**.
- Step 3** In the dialog box that is displayed, enter the password of the current login user and click **OK**.

**Step 4** Configure the parameters based on site requirements.

**Figure 8-10** Rolling-restart Cluster

**Table 8-2** Rolling restart parameters

Parameter	Description
Restart only instances with expired configurations in the cluster	Whether to restart only the modified instances in a cluster
Enable rack strategy	Whether to enable the concurrent rack rolling restart strategy. This parameter takes effect only for roles that meet the rack rolling restart strategy. (The roles support rack awareness, and instances of the roles belong to two or more racks.) <b>NOTE</b> This parameter is configurable only when a rolling restart is performed on HDFS or YARN.

Parameter	Description
Data Nodes to Be Batch Restarted	<p>Number of instances that are restarted in each batch when the batch rolling restart strategy is used. The default value is <b>1</b>.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• This parameter is valid only when the batch rolling restart strategy is used and the instance type is DataNode.</li><li>• This parameter is invalid when the rack strategy is enabled. In this case, the cluster uses the maximum number of instances (20 by default) configured in the rack strategy as the maximum number of instances that are concurrently restarted in a rack.</li><li>• This parameter is configurable only when a rolling restart is performed on HDFS, HBase, YARN, Kafka, Storm, or Flume.</li><li>• This parameter for the RegionServer of HBase cannot be manually configured. Instead, it is automatically adjusted based on the number of RegionServer nodes. Specifically, if the number of RegionServer nodes is less than 30, the parameter value is <b>1</b>. If the number is greater than or equal to 30 and less than 300, the parameter value is <b>2</b>. If the number is greater than or equal to 300, the parameter value is 1% of the number (rounded-down).</li></ul>
Batch Interval	Interval between two batches of instances to be roll-restarted. The default value is <b>0</b> .
Decommissioning Timeout Interval	<p>Decommissioning interval for role instances during a rolling restart. The default value is <b>1800s</b>.</p> <p>Some roles (such as HiveServer and JDBCServer) stop providing services before the rolling restart. Stopped instances cannot be connected to new clients. Existing connections will be completed after a period of time. An appropriate timeout interval can ensure service continuity.</p> <p><b>NOTE</b> This parameter is configurable only when a rolling restart is performed on Hive or Spark2x.</p>
Batch Fault Tolerance Threshold	Tolerance times when the rolling restart of instances fails to be batch executed. The default value is <b>0</b> , which indicates that the rolling restart task ends after any batch of instances fails to restart.

 NOTE

Advanced parameters, such as **Data Nodes to Be Batch Restarted**, **Batch Interval**, and **Batch Fault Tolerance Threshold**, should be properly configured based on site requirements. Otherwise, services may be interrupted or cluster performance may be severely affected.

Example:

- If **Data Nodes to Be Batch Restarted** is set to an unnecessarily large value, a large number of instances are restarted concurrently. As a result, services are interrupted or cluster performance is severely affected due to too few working instances.
- If **Batch Fault Tolerance Threshold** is too large, services will be interrupted because a next batch of instances will be restarted after a batch of instances fails to restart.

**Step 5** Click **OK**.

----End

### 8.2.1.3 Managing Expired Configurations

#### Scenario

If a new configuration needs to be delivered to all services in the cluster, or **Configuration Status** of multiple services changes to **Expired** or **Failed** after a configuration is modified, the configuration parameters of these services are not synchronized and do not take effect. In this case, synchronize the configurations and restart related service instances for the cluster so that the new parameters take effect for all services.

If the configuration of the services in the cluster has been synchronized but do not take effect, you need to restart the instances whose configuration has expired.

#### Impact on the System

- After synchronizing the cluster configuration, you need to restart the services whose configuration has expired. These services are unavailable during restart.
- The instances whose configuration has expired are unavailable during restart.

#### Procedure

**Synchronize the configuration.**

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Dashboard**.

**Step 3** On this page, choose **More** > **Synchronize Configuration**.

**Step 4** In the dialog box that is displayed, click **OK**.

----End

**Restart configuration-expired instances.**

**Step 1** Choose **More** > **Restart Configuration-Expired Instances**.

**Step 2** In the dialog box that is displayed, enter the password of the current login user and click **OK**.

**Step 3** In the displayed dialog box, click **OK**.

You can click **View Instance** to open the list of all expired instances and confirm that the instances have been restarted.

----End

## 8.2.1.4 Downloading the Client

### Scenario

Use the default client provided by MRS clusters to manage the cluster, run services, and perform secondary development. Before you use this client, you need to download its software package.

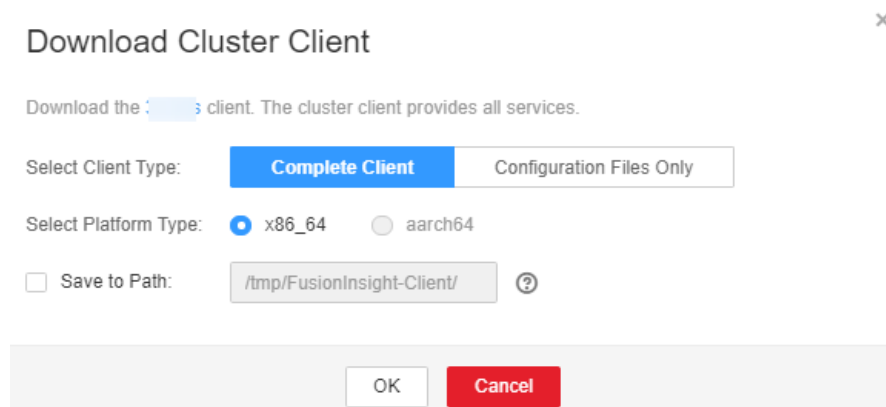

### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster > Dashboard**. In the upper right corner, click **More > Download Client**.

The **Download Cluster Client** dialog box is displayed.

**Figure 8-11** Downloading the cluster client

**Step 3** Select a client type for **Select Client Type**.

- **Complete Client:** the package contains scripts, compilation files, and configuration files.
- **Configuration Files Only:** the package contains only the client configuration files.

This type is applicable to application development tasks. For example, after a complete client is downloaded and installed, the cluster administrator modifies the service configuration on FusionInsight Manager, and developers need to update the client configuration files.

**NOTE**

The two platform types (**x86\_64** and **aarch64**) correspond to x86 and ARM nodes, respectively. Select the platform type based on the architecture types of the nodes where you will install the client.

**Step 4** Determine whether to generate a client software package file on the cluster node.

- If yes, select **Save to Path** and click **OK** to generate the client file.

The generated file is stored in the **/tmp/FusionInsight-Client** directory on the active management node by default. You can also store the client file in other directories, and user **omm** has the read, write, and execute permissions on the directory. If the client file already exists in the path, the existing client file will be replaced.

After the file is generated, copy the obtained package to another directory, for example, **/opt/Bigdata/hadoopclient**, as user **omm** or client installation user.

- If no, click **OK** to download the client file to the local host.

The system starts to download the client software package.

----End

## 8.2.1.5 Modifying Cluster Attributes

### Scenario

View basic cluster attributes on FusionInsight Manager.

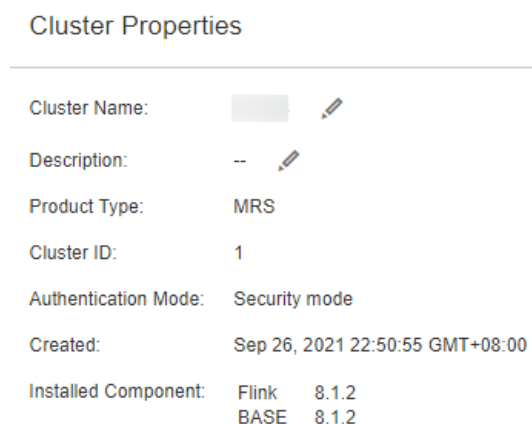

### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster > Name of the desired cluster > Cluster Properties**.

By default, you can view the cluster name, cluster description, product type, cluster ID, authentication mode, creation time, and installed components.

**Figure 8-12** Cluster Properties page

**Step 3** Change the cluster name.

1. Click and enter a new name.

Enter 2 to 199 characters. Only letters, digits, underscores (\_), hyphens (-), and spaces are allowed, and the name cannot start with a space.

2. Click **OK** for the new cluster name to take effect.

#### Step 4 Modify the cluster description.

1. Click  and enter a new description.

Enter a maximum of 199 characters. Only letters, digits, commas (,), periods (.), underscores (\_), spaces, and newline characters (\n) are allowed.

2. Click **OK** for the new description to take effect.

----End

## 8.2.1.6 Managing Cluster Configurations

### Scenario

FusionInsight Manager allows you to view the changes of service configuration parameters in a cluster with one click, helping you quickly locate faults and improve configuration management efficiency.

You can quickly view all non-default values of each service in the cluster, non-uniform values between instances of the same role, historical records of cluster configuration modifications, and expired parameters in the cluster on the configuration page.

### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Configurations**.

**Step 3** Select an operation page based on the scenario.

- To view all non-default values:
  - a. Click **All Non-default Values**. The system displays the parameters whose values are different from the default values configured for each service, role, or instance in the current cluster.

You can click  next to a parameter value to quickly restore the value to the default one. You can click  to view the historical modification records of the parameter.

If there are a large number of parameters to configure, you can filter the parameters in the filter box in the upper right corner of the page or enter keywords in the search box.

- b. To change the values of the parameters, change the values according to the parameter description and click **Save**. In the dialog box that is displayed, click **OK**.
- To view all non-uniform values:
    - a. Click **All Non-uniform Values**. The system displays parameters with different role, service, instance group, or instance configurations in the current cluster.

You can click  next to a parameter value and view the differences in the dialog box that is displayed.

- b. To change the value of a parameter, click  to cancel the configuration difference or manually adjust the parameter value, click **OK**, and then click **Save**. In the dialog box that is displayed, click **OK**.
- To check expired configurations:
    - a. Click **Expired Configurations**. Expired configuration items in the current cluster are displayed.
    - b. You can filter services using the service filter box in the upper part of the page to view expired configurations of different services. Alternatively, you can enter keywords in the search box.
    - c. Expired configuration items do not take effect completely. Restart the services or instances whose configurations have expired in a timely manner.
  - To view historical configuration records:
    - a. Click **Historical Configurations**. The historical configuration change records of the current cluster are displayed. You can view details about parameter value changes, including the service to which the parameter belongs, parameter values before and after the modification, and parameter files.
    - b. To restore a configuration change, click **Restore Configuration** in the **Operation** column of the target record. In the dialog box that is displayed, click **OK**.

#### NOTE

Some configuration items take effect only after the corresponding services are restarted. After the configurations are saved, restart the services or instances whose configurations have expired in a timely manner.

----End

## 8.2.1.7 Managing Static Service Pools

### 8.2.1.7.1 Static Service Resources

#### Overview

A cluster allocates static service resources to services Flume, HBase, HDFS, and YARN. The total volume of computing resources allocated to each service is fixed, and they are static. A tenant can exclusively use or share a service to obtain the resources required for running this service.

#### Static Service Pool

Static service pools are used to specify service resource configurations.

Static service pools centrally manage resources that can be used by each service.

- Limits the total number of resources that can be used by each service. Specifically, the total number of CPU, I/O, and memory resources can be

configured on the nodes where services Flume, HBase, HDFSioTDB, Kafka (Kafka supports static service pools only in MRS 3.2.0 or later), and YARN are deployed.

- Isolates the resources of services in a cluster from those of other services. In this way, the load of one service has very limited impact on other services.

## Scheduling Mechanism

The time-based dynamic resource scheduling mechanism enables different volumes of static resources to be configured for services at different time, optimizing service running environments and improving the cluster efficiency.

In a complex cluster environment, multiple services share resources in the cluster, but the resource service period of each service may be different.

The following use a bank customer as an example:

- The HBase query service is heavy in the daytime.
- The query service is light, but the Hive analysis service is heavy at night.

If fixed resources are allocated to each service, the following problems may occur:

- The query service cannot obtain sufficient resources while the resources for the analysis service are idle in the daytime.
- The analysis service cannot obtain sufficient resources while the resources for the query service are idle at night.

As a result, the cluster resource utilization is low and the service capability is weak. Resolve the problem in the following ways:

- Sufficient resources need to be configured for HBase in the daytime.
- Sufficient resources need to be configured for Hive at night.

The time-based dynamic scheduling mechanism can efficiently utilize resources and run tasks.

### 8.2.1.7.2 Configuring Cluster Static Resources

#### Scenario

You can adjust resource base on FusionInsight Manager and customize resource configuration groups if you need to control service resources used on each node in a cluster or the available CPU or I/O quotas on each node at different time segments.

#### Impact on the System

- After a static service pool is configured, the configuration status of affected services is displayed as **Expired**. You need to restart the services. Services are unavailable during restart.
- After a static service pool is configured, the maximum number of resources used by each service and role instance cannot exceed the upper limit.

## Procedure

### Modify the Resource Adjustment Base

- Step 1** On FusionInsight Manager, choose **Cluster**, click the name of the target cluster, and choose **Static Service Pool Configurations**.
- Step 2** Click **Configuration** in the upper right corner. The page for configuring resource pools is displayed.
- Step 3** Change the values of **CPU (%)** and **Memory (%)** in the **System Resource Adjustment Base** area.

Modifying the system resource adjustment base changes the maximum physical CPU and memory usage on nodes by services. If multiple services are deployed on the same node, the maximum physical resource usage of all services cannot exceed the adjusted CPU or memory usage.

- Step 4** Click **Next**.

To modify parameters again, click **Previous**.

### Modify the Default Resource Configuration Group

- Step 5** Click **default**. In the **Configure weight** table, set **CPU LIMIT(%)**, **CPU SHARE(%)**, **I/O(%)**, and **Memory(%)** for each service.

Figure 8-13 Weight Configuration

default Add

Step 1: Weight Configuration Service Name Q

Services	CPU LIMIT (%)	CPU SHARE (%)	I/O (%)	Memory (%)
Flume	0	0	0	0
HBase	0	0	0	0
HDFS	0	0	0	0
Impala	0	0	0	0
Kudu	0	0	0	0
Yarn	0	0	0	0
Total:	0	0	0	0

Step 2: Generate detailed configurations based on weight configurations Service Name Q

**NOTE**

- The sum of **CPU LIMIT(%)** and **CPU SHARE(%)** used by all services can exceed 100%.
- The sum of **I/O(%)** used by all services can exceed 100% but cannot be 0.
- The sum of **Memory(%)** used by all services can be greater than, smaller than, or equal to 100%.
- **Memory(%)** cannot take effect dynamically and can only be modified in the default configuration group.
- **CPU LIMIT(%)** is used to configure the ratio of the number of CPU cores that can be used by a service to those can be allocated to related nodes.
- **CPU SHARE(%)** is used to configure the ratio of the time when a service uses a CPU core to the time when other services use the CPU core. That is, the ratio of time when multiple services compete for the same CPU core.

**Step 6** Click **Generate detailed configurations based on weight configurations**. FusionInsight Manager generates the actual values of the parameters in the default weight configuration table based on the cluster hardware resources and allocation information.

**Step 7** Click **OK**.

In the displayed dialog box, click **OK**.

**Add a Customized Resource Configuration Group**

**Step 8** Determine whether to automatically adjust resource configurations at different time segments.

- If yes, go to [Step 9](#).
- If no, use the default configurations, and no further action is required.

**Step 9** Click **Configuration**, change the system resource adjustment base values, and click **Next**.

**Step 10** Click **Add** to add a resource configuration group.

**Figure 8-14** Adding a resource configuration group

default dynamic-config1 Add

Step 1: Scheduling Time Configuration

Step 2: Weight Configuration Service Name Q

Services	CPU LIMIT (%)	CPU SHARE (%)	I/O (%)
Flume	0	0	0
HBase	0	0	0
HDFS	0	0	0
Impala	0	0	0
Kudu	0	0	0
Yarn	0	0	0
Total:	0	0	0

Step 3: Generate detailed configurations based on weight configurations Service Name Q

**Step 11** In **Step 1: Scheduling Time**, click **Configuration**.

The page for configuring the time policy is displayed.

Modify the following parameters based on service requirements and click **OK**.

- **Repeat:** If this parameter is selected, the customized resource configuration is applied repeatedly based on the scheduling period. If this parameter is not selected, set the date and time when the configuration of the group of resources can be applied.
- **Repeat Policy:** The available values are **Daily**, **Weekly**, and **Monthly**. This parameter is valid only when **Repeat** is selected.
- **On:** indicates the time period between the start time and end time when the resource configuration is applied. Set a unique time range. If the time range overlaps with that of an existing group of resource configuration, the time range cannot be saved.

 **NOTE**

- The default group of resource configuration takes effect in all undefined time segments.
- The newly added resource group is a parameter set that takes effect dynamically in a specified time range.
- The newly added resource group can be deleted. A maximum of four resource configuration groups that take effect dynamically can be added.
- Select a repetition policy. If the end time is earlier than the start time, the resource configuration ends in the next day by default. For example, if a validity period ranges from 22:00 to 06:00, the customized resource configuration takes effect from 22:00 on the current day to 06:00 on the next day.
- If the repetition policy types of multiple configuration groups are different, the time ranges can overlap. The policy types are listed as follows by priority from low to high: daily, weekly, and monthly. The following is an example. There are two resource configuration groups using the monthly and daily policies, respectively. Their application time ranges in a day overlap as follows: 04:00 to 07:00 and 06:00 to 08:00. In this case, the configuration of the group that uses the monthly policy prevails.
- If the repetition policy types of multiple resource configuration groups are the same, the time ranges of different dates can overlap. For example, if there are two weekly scheduling groups, you can set the same time range on different day for them, such as to 04:00 to 07:00, on Monday and Wednesday, respectively.

**Step 12** Modify the resource configuration of each service in **Step 2: Weight Configuration**.

**Step 13** Click **Generate detailed configuration**. FusionInsight Manager generates the actual values of the parameters in the default weight configuration table based on the cluster hardware resources and allocation information.

**Step 14** Click **OK**.

In the displayed dialog box, click **OK**.

----End

### 8.2.1.7.3 Viewing Cluster Static Resources

#### Scenario

The big data management platform can manage and isolate service resources that are not running on YARN using static service resource pools. The system supports time-based automatic adjustment of static service resource pools. This enables the

cluster to automatically adjust the parameter values at different periods to ensure more efficient resource utilization.

System administrators can view the monitoring indicators of resources used by each service in the static service pool on FusionInsight Manager. The monitoring indicators are as follows:

- CPU usage of services
- Total disk I/O read rate of services
- Total disk I/O write rate of services
- Total used memory of services

## Procedure

**Step 1** On FusionInsight Manager, choose **Cluster**, click the name of the target cluster, and choose **Static Service Pool Configurations**.

**Step 2** In the configuration group list, click a configuration group, for example, **default**.

**Step 3** Check the system resource adjustment base values.

- **System Resource Adjustment Base** indicates the maximum volume of resources that can be used by each node in the cluster. If a node has only one service, the service exclusively occupies the available resources on the node. If a node has multiple services, all services share the available resources on the node.
- **CPU** indicates the maximum number of CPUs that can be used by services on a node.
- **Memory** indicates the maximum memory that can be used by services on a node.

**Step 4** In **Chart**, view the metric data of the cluster service resource usage.

### NOTE

- You can click **Add Service to Chart** to add static service resource data of specific services (up to 12 services) to the chart.
- For details about how to manage a chart, see [Managing Monitoring Metric Reports](#).

----End

## 8.2.1.8 Managing Clients

### 8.2.1.8.1 Managing a Client

#### Scenario

FusionInsight Manager supports unified management of cluster client installation information. After a user downloads and installs a client, FusionInsight Manager automatically records information about the installed (registered) client to facilitate query and management. In addition, you can manually add or modify the information about clients that are not automatically registered, for example, clients installed in earlier versions.

## Procedure

### View client information.

**Step 1** Log in to FusionInsight Manager.

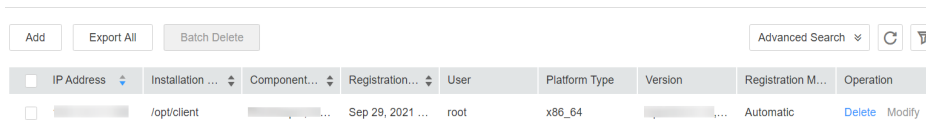

**Step 2** Choose **Cluster**, click the name of the desired cluster, and choose **Client Management** to view information about clients installed in the cluster.

You can view the IP address, installation path, component list, registration time, and installation user of the node where the client is located.

When the client is downloaded and installed in the cluster of the latest version, the client information is automatically registered.

**Figure 8-15** Client information

Client Management

The screenshot shows a web interface for Client Management. At the top, there are buttons for 'Add', 'Export All', and 'Batch Delete', along with an 'Advanced Search' dropdown and refresh/refresh icons. Below this is a table with columns: IP Address, Installation Path, Component, Registration Time, User, Platform Type, Version, Registration Method, and Operation. A single row is visible with the following data: [redacted], /opt/client, [redacted], Sep 29, 2021, root, x86\_64, [redacted], Automatic, and links for Delete and Modify.

IP Address	Installation ...	Component...	Registration...	User	Platform Type	Version	Registration M...	Operation
[redacted]	/opt/client	[redacted]	Sep 29, 2021 ...	root	x86_64	[redacted]	Automatic	Delete Modify

### Add client information.

**Step 3** To manually add information about an installed client, click **Add** and manually add the IP address, installation path, user, platform information, and registration information of the client as prompted.

**Step 4** Configure the client information and click **OK**.

### Modify client information.

**Step 5** Modify information about the manually registered client.

On the **Client Management** page, select the target client and click **Modify**. After modifying the information, click **OK**.

### Delete client information.

**Step 6** On the **Client Management** page, select the target client and click **Delete**. In the displayed dialog box, click **OK**.

To delete multiple clients, select the all of them and click **Batch Delete**. In the displayed dialog box, click **OK**.

### Export client information.

**Step 7** On the **Client Management** page, click **Export All** to export information about all registered clients to the local PC.

#### NOTE

On the **Client Management** page, only components that have clients are displayed in the component list. Therefore, some components that do not have clients and have special components are not displayed.

The following components are not displayed:

LdapServer, KrbServer, DBService, Hue, MapReduce, and Flume

----End

## 8.2.1.8.2 Batch Upgrading Clients

### Scenario

The client package downloaded from FusionInsight Manager contains the client batch upgrade tool. When multiple clients need to be upgraded after the cluster upgrade or scale-out, you can use this tool to upgrade the clients in batches with a few clicks. In addition, the tool provides the lightweight function of batch updating the `/etc/hosts` file on the nodes where the clients are located.

### Procedure

#### Prepare for the client upgrade.

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Cluster > Overview > More > Download Client** to download the client to a specified directory on the server.

For details, see [Downloading the Client](#).

Decompress the downloaded client package and find the `batch_upgrade` directory, for example, `/tmp/FusionInsight-Client/FusionInsight_Cluster_1_Services_ClientConfig/batch_upgrade`.

- Step 3** Choose **Cluster > Client Management**. On the **Client Management** page, click **Export All** to export all client information to the local PC.
- Step 4** Decompress the exported client information and upload the `client-info.cfg` file to the `batch_upgrade` directory.
- Step 5** Supplement the password in the `client-info.cfg` file by referring to [Reference Information](#).

#### Upgrade clients in batches.

- Step 6** Run the `sh client_batch_upgrade.sh -u -f /tmp/FusionInsight-Client/FusionInsight_Cluster_1_Services_ClientConfig/batch_upgrade/client-info.cfg` command to perform the upgrade.

---

#### NOTICE

You are advised to delete the `client-info.cfg` file as soon as possible after the upgrade because the password has been configured.

---

- Step 7** After the upgrade is complete, verify the upgrade result by running the `sh client_batch_upgrade.sh -c` command.
- Step 8** If the client is faulty, run the `sh client_batch_upgrade.sh -s` command to roll back the client.

 NOTE

- The client batch upgrade tool moves the original client to the backup directory, and then uses the client package specified by the **-f** parameter to install the client. Therefore, if the original client contains customized content, manually save the customized content from the backup directory or move the customized content to the client directory after the upgrade before running the **-c** command. The backup path on the client is *{Original client path}-backup*.
- The **-u** command is the prerequisite for the **-c** and **-s** commands. You can run the **-c** command to commit the upgrade or the **-s** command to perform a rollback only after the **-u** command is executed to perform an upgrade.
- You can run the **-u** command multiple times to upgrade only the clients that fail to be upgraded.
- The client batch upgrade tool also supports the clients of earlier versions.
- When upgrading a client installed by a non-root user, ensure that the user has the read and write permissions on the directory where the client is located and the parent directory on the target node. Otherwise, the upgrade will fail.
- The client package specified by the **-f** parameter must be a full client package. The client packages of a single component or some components cannot be used as the input.

----End

## Reference Information

Before upgrading clients in batches, you need to manually configure the user password for remotely logging in to the client node.

Run the **vi client-info.cfg** command to add a user password.

Example:

```
clientIp,clientPath,user,password
10.10.10.100,/home/omm/client /home/omm/client2,omm,Password
```

The fields in the configuration file are as follows:

- **clientIp**: indicates the IP address of the node where the client is located.
- **clientPath**: indicates the client installation path. Multiple paths are separated by spaces. Note that the path cannot end with a slash (/).
- **user**: indicates the username of the node.
- **password**: indicates the user password of the node.

 NOTE

- If the execution fails, view the **node.log** file in the **work\_space/log\_XXX** directory.
- There can be security risks if a configuration file contains the authentication password. You are advised to delete the configuration file or use other secure methods to keep the password.

### 8.2.1.8.3 Updating the hosts File in Batches

#### Scenario

The client package downloaded from FusionInsight Manager contains the client batch upgrade tool. This tool provides the function of upgrading clients in batches

and the lightweight function of batch updating the `/etc/hosts` file on the node where the client is located.

## Prerequisites

You have made preparations for the upgrade. For details, see "Prepare for the client upgrade." in [Batch Upgrading Clients](#).

## Updating the hosts File in Batches

**Step 1** Check whether the user configured for the node where the `/etc/hosts` file needs to be updated is **root**.

- If yes, go to [Step 2](#).
- If no, change the user to **root** and go to [Step 2](#).

**Step 2** Run the `sh client_batch_upgrade.sh -r -f /tmp/FusionInsight-Client/FusionInsight_Cluster_1_Services_Client.tar -g /tmp/FusionInsight-Client/FusionInsight_Cluster_1_Services_ClientConfig/batch_upgrade/client-info.cfg` command to batch update the `/etc/hosts` file on the nodes where the client resides.

### NOTE

- When you batch update the `/etc/hosts` file, the entered client package can be a complete client package or a client package that contains only configuration files (recommended).
- The user configured for the host where the `/etc/hosts` file needs to be updated must be **root**. Otherwise, the update fails.

----End

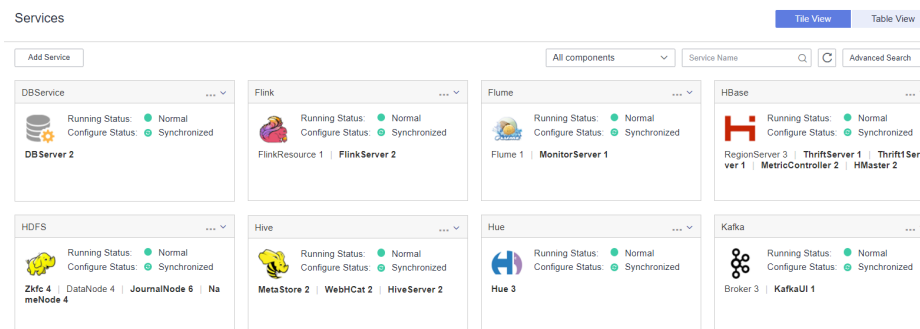

## 8.2.2 Managing a Service

### 8.2.2.1 Overview

#### Dashboard

Log in to FusionInsight Manager. Choose **Cluster**, click the name of the desired cluster, and choose **Services**. The service management page is displayed, including the functional area and service list.

**Figure 8-16** Service management page

## Functional Area

In the functional area of the service management page, you can select a view type and filter and search for services by service type. You can use the advanced search to select required services based on the running status and configuration status.

## Service List

The service list on the service management page contains all installed services in the cluster. If the tile view is selected, the services will be displayed in pane style. If you select the list view, the services will be displayed in a table.

### NOTE

In this section, the **Tile View** is used by default.

The service list displays the running status, configuration status, role type, and number of instances of each service. On this page, you can perform some service maintenance tasks, such as starting, stopping, and restarting services.

**Table 8-3** Service running status

Status	Description
<b>Normal</b>	Indicates that the service is running properly.
<b>Faulty</b>	Indicates that the service cannot run properly.
<b>Partially Healthy</b>	Indicates that some enhanced functions of the service are abnormal.
<b>Not started</b>	Indicates that the service is stopped.
<b>Unknown</b>	Indicates that the initial status of the service cannot be detected.
<b>Starting</b>	Indicates that the service is being started.
<b>Stopping</b>	Indicates that the service is being stopped.
<b>Failed to start</b>	Indicates that the service fails to be started.
<b>Failed to stop</b>	Indicates that the service fails to be stopped.

### NOTE

- If the running status of a service is **Faulty**, an alarm is generated. Rectify the fault based on the alarm information.
- HBase, Hive, Spark, and Loader may be in the **Subhealthy** state.
  - If Yarn is installed but is abnormal, HBase is in the **Subhealthy** state.
  - If HBase is installed but is abnormal, Hive, Spark, and Loader are in the **Subhealthy** state.

**Table 8-4** Service configuration status

Status	Description
<b>Synchronized</b>	Indicates that all service parameter settings have taken effect in the cluster.
<b>Expired</b>	Indicates that the latest configuration is not synchronized and does not take effect after the service parameters are modified. You need to synchronize the configurations and restart the services. You can click  next to <b>Configuration Status</b> to view expired configuration items.
<b>Failed</b>	Indicates that a communication or read/write exception occurs during the parameter configuration synchronization. Use <b>Synchronize Configuration</b> to rectify the fault.
<b>Synchronizing</b>	Indicates that the service parameter configuration is being synchronized.
<b>Unknown</b>	Indicates that the initial status of the service cannot be detected.

You can click a service in the service list to perform simple maintenance and management operations on the service, as described in [Table 8-5](#).

**Table 8-5** Basic maintenance and management

Menu Item on the UI	Description
Start Service	Start a specified service in the cluster.
Stop Service	Stop a specified service in the cluster.
Restart Service	Restart a specified service in the cluster. <b>NOTE</b> If a service is restarted, other services that depend on this service will be unavailable. Therefore, select <b>Restart upper-layer services</b> . Determine whether to perform this operation based on the displayed service list. Services are restarted one by one due to their dependency. <a href="#">Table 8-6</a> describes the restart duration of a single service.
Service Rolling Restart	Restart a specified service in the cluster without interrupting services. For details about the parameter settings, see <a href="#">Table 8-2</a> .

Menu Item on the UI	Description
<b>Synchronize Configuration</b>	<ul style="list-style-type: none"> <li>• Enable new configuration parameters for a specified service in the cluster.</li> <li>• Distribute new configuration parameters for services whose <b>Configuration Status is Expired</b>.</li> </ul> <p><b>NOTE</b> After some services are synchronized, restart the services for the settings to take effect.</p>

**Table 8-6** Restart duration for reference

Service	Restart Duration	Startup Duration	Remarks
IoTDB	3 min	IoTDBServer: 3 min	-
CDL	2 min	CDLConnector: 1 min CDLService: 1 min	-
ClickHouse	4 min	ClickHouseServer: 2 min ClickHouseBalancer: 2 min	-
HDFS	10min+x	NameNode: 4 min + x DataNode: 2 min JournalNode: 2 min Zkfc: 2 min	x indicates the NameNode metadata loading duration. It takes about 2 minutes to load 10,000,000 files. For example, x is 10 minutes for 50 million files. The startup duration fluctuates with reporting of DataNode data blocks.
Yarn	5 min + x	ResourceManager: 3 min + x NodeManager: 2 min	x indicates the time required for restoring ResourceManager reserved tasks. It takes about 1 minute to restore 10,000 reserved tasks.
MapReduce	2 min + x	JobHistoryServer: 2 min + x	x indicates the scanning duration of historical tasks. It takes about 2.5 minutes to scan 100,000 tasks.
ZooKeeper	2 min + x	quorumpeer: 2 min + x	x indicates the duration for loading znodes. It takes about 1 minute to load 1 million znodes.

Service	Restart Duration	Startup Duration	Remarks
Hive	3.5 min	HiveServer: 3 min MetaStore: 1 min 30s WebHcat: 1 min Hive service: 3 min	-
Spark2x	5 min	JobHistory2x: 5 min SparkResource 2x: 5 min JDBCServer2x: 5 min	-
Flink	4 min	FlinkResource: 1 min FlinkServer: 3 min	-
Kafka	2 min + x	Broker: 1 min + x	x indicates the data restoration duration. It takes about 2 minutes to start 20,000 partitions for a single instance.
Storm	6 min	Nimbus: 3 min UI: 1 min Supervisor: 1 min Logviewer: 1 min	-
Flume	3 min	Flume: 2 min MonitorServer: 1 min	-
Doris	2 min	FE: 1min BE: 1min DBroker: 1min	-

### 8.2.2.2 Service Management Operations

### 8.2.2.2.1 Service Details Page

#### Overview

Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services**. In the service list, click the specified service name to go to the service details page, including the **Dashboard**, **Instance**, **Instance Groups** and **Configurations** tab pages as well as function areas. For some services, the custom management tool page can be displayed. For details about the supported management tools, see [Table 8-7](#).

**Table 8-7** Customized management tools

Tool	Service	Description
Flume configuration tool	Flume	Configures collection parameters for the Flume server and client.
Flume client management tool	Flume	Views the monitoring information about the Flume client.
Kafka topic monitoring tool	Kafka	Monitors and manages Kafka topics.

The **Dashboard** page is the default page, which contains the basic information, role list, dependency table, and monitoring chart, and more. You can manage services in the upper right corner. For details about basic service management, such as starting, stopping, rolling restart, and synchronization configuration, see [Table 8-5](#). For details about other service management operations, see [Table 8-8](#).

**Table 8-8** Service management operations

Navigation Path	Description
<b>More</b> > <b>Health Check</b>	Performs a health check for the current service. The health check items include the health status of each check object, related alarms, and user-defined monitoring indicators. The check result is not the same as the values of <b>Running Status</b> displayed on the GUI.  To export the result of the health check, click <b>Export Report</b> in the upper left corner of the checklist. If you find any problem, click <b>View Help</b> .

Navigation Path	Description
<b>More &gt; Download Client</b>	Download the default client that contains only specific services and perform management operations, run services, or perform secondary development on the client. For details, see <a href="#">Downloading the Client</a> .
<b>More &gt; Change Service Name</b>	Changes the name of the current service.
<b>More &gt; Perform <i>XX</i> Switchover</b>	For details, see <a href="#">Performing Active/Standby Switchover of a Role Instance</a> .
<b>More &gt; Enter/Exit Maintenance Mode</b>	Configures a service to enter/exit the maintenance mode.
<b>Configurations &gt; Import/Export</b>	In the scenario where services are migrated to a new cluster or the same services are deployed again, you can import or export all configuration data of a specific service to quickly copy the configuration results.

## Basic Information Area

The basic information area on the **Dashboard** tab page contains the basic status data of the service, including the running status, configuration details, version, and key information of the service. If the service supports the open-source web UIs, you can access the open-source web UIs by clicking the links in the basic information area.

### NOTE

In the current version, user **admin** does not have the permission to access all the service functions provided on the open source web UI. Create a component service administrator to access the WebUI address.

## Role List

The role list on the **Dashboard** tab page contains all roles of the service. The role list displays the running status and the number of instances of each role.

## Dependency

The dependency relationship table on the **Dashboard** tab page displays the services on which the current service depends and other services that depend on the service.

## Historical Records of Alarms and Events

The alarm and event history area displays the key alarms and events reported by the current service. Up to 20 historical records are displayed.

## Chart

The chart area is displayed on the right of the **Dashboard** tab page and contains the key monitoring indicator report of the service. You can customize the monitoring report that is displayed in the chart area, view the description of the monitoring metrics, or export the monitoring data. For a customized resource contribution chart, you can zoom in on the chart and switch between the trend chart and distribution chart.

### NOTE

Some services in the cluster provide service-level resource monitoring items. For details, see [Resource Monitoring](#).

### 8.2.2.2.2 Performing Active/Standby Switchover of a Role Instance

#### Scenario

Some service roles are deployed in active/standby mode. If the active instance needs to be maintained and cannot provide services, or other maintenance is required, you can manually trigger an active/standby switchover.

#### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.
- Step 3** Click the specified service name on the service management page.
- Step 4** On the service details page, expand the **More** drop-down list and select **Perform Role Instance Switchover**.
- Step 5** In the displayed dialog box, enter the password of the current login user and click **OK**.
- Step 6** In the displayed dialog box, click **OK** to perform active/standby switchover for the role instance.

### NOTE

- The Manager component package only supports the active/standby switchover of DBService role instances.
- The HD component package supports the active/standby switchover of the following service role instances: HDFS, YARN, Storm, HBase, and MapReduce.
- When an active/standby switchover is performed for a NameNode on HDFS, a NameService must be set.
- The Porter component package only supports the active/standby switchover of Loader role instances.
- This function cannot be used for other role instances.

----End

### 8.2.2.2.3 Resource Monitoring

Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**, and click **Resource**. The resource monitoring page is displayed.

Some services in the cluster provide service-level resource monitoring metrics. By default, the monitoring data of the latest 12 hours is displayed. You can click  to customize a time range. Time range options are **12h**, **1d**, **1w**, and **1m**. You can click  to export the corresponding report information. If a monitoring item has no data, the report cannot be exported. [Table 8-9](#) lists the services and monitoring items that support resource monitoring.

**Table 8-9** Service resource monitoring

Service	Metrics	Description
HDFS	Resource Usage (by Tenant)	<ul style="list-style-type: none"> <li>Collects statistics on HDFS resource usage by tenant.</li> <li>Views the metrics <b>Capacity</b> or <b>Number of File Objects</b>.</li> </ul>
	Resource Usage (by User)	<ul style="list-style-type: none"> <li>Collects statistics on HDFS resource usage by user.</li> <li>Views the metrics <b>Used Capacity</b> or <b>Number of File Objects</b>.</li> </ul>
	Resource Usage (by Directory)	<ul style="list-style-type: none"> <li>Collects statistics on HDFS resource usage by directory.</li> <li>Views the metrics <b>Used Capacity</b> or <b>Number of File Objects</b>.</li> <li>You can click  to configure space monitoring. Alternatively, you can specify an HDFS file system directory for monitoring.</li> </ul>
	Resource Usage (by Replica)	<ul style="list-style-type: none"> <li>Collects statistics on HDFS resource usages by replica count.</li> <li>Views the metrics <b>Used Capacity</b> or <b>File Count</b>.</li> </ul>
	Resource Usage (by File Size)	<ul style="list-style-type: none"> <li>Collects statistics on HDFS resource usages by file size.</li> <li>Views the metrics <b>Used Capacity</b> or <b>File Count</b>.</li> </ul>
	Recycle Bin (by User)	<ul style="list-style-type: none"> <li>Collects statistics on the usage of the HDFS recycle bin by user.</li> <li>Views the metrics <b>Recycle Bin Capacity</b> or <b>Number of File Objects</b>.</li> </ul>
	Operation Count	<ul style="list-style-type: none"> <li>Collects the number of operations in HDFS.</li> </ul>

Service	Metrics	Description
	Automatic Balancer	<ul style="list-style-type: none"> <li>Collects statistics on the execution speed of HDFS automatic balancer and the total capacity of the current balancer migration.</li> </ul>
	NameNode RPC Open Connections (by User)	<ul style="list-style-type: none"> <li>Displays the number of connections of each user in the Client RPC requests connected to NameNodes.</li> </ul>
	Slow DataNodes	Displays DataNode that transmits or processes data slowly in the cluster.
	Slow Disks	Displays the disk that processes data slowly on the DataNode in the cluster.
HBase	Operation Requests in Tables	Displays the number of PUT, DELETE, GET, SCAN, INCREMENT, and APPEND operation requests in all tables on all RegionServers.
	Operation Requests on RegionServers	Displays the number of PUT, DELETE, GET, SCAN, INCREMENT, and APPEND operation requests and number of all operation requests in RegionServer.
	Operation Requests for Service	Displays the number of PUT, DELETE, GET, SCAN, INCREMENT, and APPEND operation requests in all regions on RegionServers.
	HFiles on RegionServers	Displays the number of HFiles in all RegionServers.
HetuEngine	Coordinator Resource Usage	Displays the coordinator resource usage in the selected queue.
	Coordinator Resource Usage Ratio	Displays the coordinator resource usage in the selected queue.
	Worker Resource Usage	Displays the worker resource usage in the selected queue.
	Worker Resource Usage Ratio	Displays the worker resource usage in the selected queue.
	Number of Coordinators and Workers	Displays the number of coordinators and workers in the selected queue.
Hive	HiveServer2-Background-Pool Threads (by IP)	Displays the number of HiveServer2-Background-Pool threads of top users. These threads are measured and displayed in a measurement period.

Service	Metrics	Description
	HiveServer2-Handler-Pool Threads (by IP)	Displays the number of HiveServer2-Handler-Pools of top users collected and displayed in a period.
	Used MetaStore Number (by IP)	Collects statistics on and displays the MetaStore usage of top users in a period.
	Number of Hive jobs	Displays the number of user-related jobs collected by Hive in a period.
	Number of Files Accessed in the Split Phase	Displays the number of files accessed by the underlying file storage system (HDFS by default) in the Split phase in a period.
	Hive Basic Operation Time	Collects time for creating a directory (mkdirTime), creating a file (touchTime), writing a file (writeFileTime), renaming a file (renameTime), moving a file (moveTime), deleting a file (deleteFileTime), and deleting a directory (deleteCatalogTime) in a period of time.
	Table Partitions	Displays the number of partitions in all Hive tables, which is displayed in the following format: <i>database # table name, number of table partitions</i> .
	HQL Map Count	Collects statistics on HQL statements executed in a period and the number of Map statements invoked during the execution. The displayed information includes users, HQL statements, and the number of Map statements.
	HQL Access Statistics	Displays the number of HQL access times in a period.
Kafka	Kafka Disk Usage Distribution	Displays the disk usage distribution statistics of the Kafka cluster.
Spark/ Spark2x	HQL Access Statistics	Collects HQL access statistics in a period, including the username, HQL statement, and HQL statement execution times.
Yarn	Used resources (by task)	<ul style="list-style-type: none"> <li>Displays the number of CPU cores and memory used by a task.</li> <li>Views the metrics <b>By memory</b> or <b>By CPU</b>.</li> </ul>

Service	Metrics	Description
	Resource usage (by tenant)	<ul style="list-style-type: none"> <li>Displays the number of CPU cores and memory used by a tenant.</li> <li>Views the metrics <b>By memory</b> or <b>By CPU</b>.</li> </ul>
	Resource usage ratio (by tenant)	<ul style="list-style-type: none"> <li>Displays the ratio of the number of CPU cores to the memory used by a tenant.</li> <li>Views the metrics <b>By memory</b> or <b>By CPU</b>.</li> </ul>
	Task Duration Ranking	Displays Yarn tasks sorted by time consumption.
	ResourceManager RPC Open Connections (by User)	Displays the number of client RPC connections to ResourceManager by user.
	Operation Count	Collects statistics on the number and proportion of operations corresponding to each Yarn operation type.
	Ranking of Tasks in a Queue by Resource Usage	<ul style="list-style-type: none"> <li>Displays the resources consumed by the tasks running in a queue after the queue (tenant) is selected on the GUI.</li> <li>Views the metrics <b>By memory</b> or <b>By CPU</b>.</li> </ul>
	Ranking of Users in a Queue by Resource Usage	<ul style="list-style-type: none"> <li>Displays the resources consumed by the users who are running tasks in the queue after a queue (tenant) is selected on the GUI.</li> <li>Views the metrics <b>By memory</b> or <b>By CPU</b>.</li> </ul>
ZooKeeper	Used Resources (By Second-Level Znode)	<ul style="list-style-type: none"> <li>Displays the ZooKeeper level-2 znode resource status.</li> <li>Views the metrics <b>By Znode quantity</b> or <b>By capacity</b>.</li> </ul>
	Number of Connections (by Client IP Address)	Displays the ZooKeeper client connection resource status.

#### 8.2.2.2.4 Collecting Stack Information

##### Scenario

To meet actual service requirements, the cluster administrator can collect stack information about a specified role or instance on FusionInsight Manager, save the

information to a local directory, and download the information. The following information can be collected:

1. jstack information.
2. jmap -histo information.
3. jmap -dump information.
4. Thr jstack and jmap-histo information can be collected continuously for comparison.

## Procedure

### Collecting stack information

**Step 1** Log in to FusionInsight Manager.

**Step 2** Click **Cluster**, click the name of the desired cluster, click **Services**, and click the target service.

**Step 3** On the displayed page, Choose **More > Collect Stack Information**.

#### NOTE

- To collect stack information of multiple instances, go to the instance list, select the desired instances in the instance list and choose **More > Collect Stack Information**.
- To collect stack information of a single instance, click the desired instance and choose **More > Collect Stack Information**.

**Step 4** In the displayed dialog box, select the desired role and content, configure advanced options (retain the default settings if there is no special requirement), and click **OK**.

**Figure 8-17** Collecting stack information

### Collect Stack Information

 You can collect stack information about all instances of specified roles on this page. If you only need to collect the stack information of some instances, select the instances on the Instance page.

Role:

RegionServer       HMaster

Content:

jstack        jmap -histo        jmap -dump 

Enable continuous collection of jstack and jmap -histo information

Interval:  Second  Duration:  Hour

Advanced Options

The following options are global policies. Modifying the directory will affect download of previous collected contents.

\* Maximum File Size Printed by jstack and jmap -histo:  MB

\* Number of Archived Files Printed by jstack and jmap -histo:

\* Enable Live Option:   true  false

\* File Directory: 

\* Timeout Period:  s

**Step 5** After the collection is successful, click **Download**.

### Downloading Stack Information

**Step 6** Click **Cluster**, click the name of the desired cluster, click **Services**, and click the target service. Choose **More > Download Stack Information** in the upper right corner.

**Step 7** Select the desired role and content and click **Download** to download the stack information to the local PC.

**Figure 8-18** Downloading stack information

### Download Stack Information

 You can download stack information about all instances of specified roles on this page. If you only need to download the stack information of some instances, select the instances on the Instance page.

Role:

RegionServer                       HMaster

Content:

jstack and jmap -histo                       jmap -dump

^ Advanced Options

\* File Directory: 

### Clearing stack information

- Step 8** Click **Cluster**, click the name of the desired cluster, click **Services**, and click the target service.
- Step 9** Choose **More > Clear Stack Information** in the upper right corner.
- Step 10** Select the desired role and content and configure **File Directory**. Click **OK**.

**Figure 8-19** Clearing stack information

### Clear Stack Information

 To release disk space, you can clear stack information by deleting collection files. You can also stop the continuous collection.

Role:

RegionServer                       HMaster

Content:

jstack and jmap -histo                       jmap -dump                       Continuous collection task 

^ Advanced Options

\* File Directory: 

----End

### 8.2.2.2.5 Switching Ranger Authentication

#### Scenario

By default, the Ranger service is installed and Ranger authentication is enabled for a newly installed cluster in security mode. You can set fine-grained security access policies for accessing component resources through the permission plug-in of the component. If Ranger authentication is not required, the cluster administrator can manually disable Ranger authentication on the service page. After Ranger authentication is disabled, the system continues to perform permission control based on the role model of FusionInsight Manager when accessing component resources.

In a cluster upgraded from an earlier version, Ranger authentication is not used by default when users access component resources. The cluster administrator can manually enable Ranger authentication after installing the Ranger service.

#### NOTE

- In a cluster in security mode, the following components support Ranger authentication: HDFS, YARN, Kafka, Hive, HBase, Storm, Impala, HetuEngine, CDL, and Spark/Spark2x.
- In a cluster in non-security mode, Ranger supports permission control on component resources based on OS users. The following components support Ranger authentication: HBase, HDFS, Hive, Spark/Spark2x, and YARN.
- After Ranger authentication is enabled, all authentication of the component will be managed by Ranger. The permissions set by the original authentication plug-in will become invalid (The ACL rules of HDFS and YARN components still take effect). Exercise caution when performing this operation. You are advised to deploy permissions on Ranger in advance.
- After Ranger authentication is disabled, all authentication of the component will be managed by the permission plug-in of the component. The permission set on Ranger will become invalid. Exercise caution when performing this operation. You are advised to deploy permissions on Manager in advance.

#### Enabling Ranger Authentication

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster > Services**.

**Step 3** Click the specified service name on the service management page.

**Step 4** On the service details page, expand the **More** drop-down list and select **Enable Ranger**.

**Step 5** In the displayed dialog box, enter the password of the current login user and click **OK**.

**Step 6** In the service list, restart the service whose configuration has expired.

----End

#### Disabling Ranger Authentication

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster > Services**.

- Step 3** Click the specified service name on the service management page.
- Step 4** On the service details page, expand the **More** drop-down list and select **Disable Ranger**.
- Step 5** Enter the password of the current login user and click **OK**. In the displayed dialog box, click **OK**.
- Step 6** In the service list, restart the service whose configuration has expired.
- End

## 8.2.2.3 Service Configuration

### 8.2.2.3.1 Modifying Service Configuration Parameters

#### Scenario

To meet actual service requirements, cluster administrators can quickly view and modify default service configurations on FusionInsight Manager. Configure parameters based on the information provided in the configuration description.

#### NOTE

The parameters of DBService cannot be modified when only one DBService role instance exists in the cluster.

#### Impact on the System

- After configuring properties of a service, you need to restart the service if the service status is **Expired**. The service is unavailable during the restart.
- After the service configuration parameters are modified and then take effect after restart, you need to download and install the client again or download the configuration file to update the client.

#### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.
- Step 3** Click the specified service name on the service management page.
- Step 4** Click **Configuration**.

The **Basic Configuration** page is displayed by default. To modify more parameters, click the **All Configurations** tab. The navigation tree displays all configuration parameters of the service. The level-1 nodes in the navigation tree are service names or role names. The parameter category is displayed after the level-1 node is expanded.

As shown in the following figure, the first node **LdapServer** indicates the service name, and the second node **SlapdServer** indicates the role name. The configuration parameter displayed takes effect for all instances of the role and the service.

**Figure 8-20** Configuration parameter navigation tree

**Step 5** In the navigation tree, select the specified parameter category and change the parameter values on the right.

 **NOTE**

Select a port parameter value from the value range on the right. Ensure that all parameter values in the same service are within the value range and are unique. Otherwise, the service fails to be started.

If you are not sure about the location of a parameter, you can enter the parameter name in search box in the upper right corner. The system searches for the parameter in real time and displays the result.

**Step 6** Click **Save**. In the confirmation dialog box, click **OK**.

Wait until the message "Operation succeeded." is displayed. Click **Finish**.

The configuration is modified.

 **NOTE**

- To update the queue configuration of the YARN service without restarting service, choose **More > Refresh Queue** to update the queue for the configuration to take effect.
- During configuration of the **flume.config.file** parameter, you can upload and download files. After a configuration file is uploaded, the old file will be overwritten. If the configuration is not saved and the service is restarted, the configuration does not take effect. Save the configuration in time.
- If you need to restart the service for the configuration to take effect after modifying service configuration parameters, choose **More > Restart Service** in the upper right corner of the service page.
- If the  is displayed before a parameter, this parameter takes effect dynamically. After the configuration is saved, the parameter value is automatically updated to the configuration file. This function is supported only in MRS 3.2.0 or later.

----End

### 8.2.2.3.2 Modifying Custom Configuration Parameters of a Service

#### Scenario

All open source parameters can be configured for all MRS cluster components. Parameters used in some key application scenarios can be modified on FusionInsight Manager, and some parameters of open source features may not be configured for some component clients. To modify the component parameters that are not directly supported by Manager, cluster administrators can add new parameters for components using the configuration customization function on Manager. Newly added parameters are saved in component configuration files and take effect after restart.

## Impact on the System

- After configuring properties of a service, you need to restart the service if the service status is **Expired**. The service is unavailable during the restart.
- After the service configuration parameters are modified and then take effect after restart, you need to download and install the client again or download the configuration file to update the client.

## Prerequisites

Cluster administrators have fully understood the meanings of the parameters to be added, configuration files to take effect, and the impact on components.

## Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.

**Step 3** Click the specified service name on the service management page.

**Step 4** Click **Configuration** and click **All Configurations**.

**Step 5** In the navigation tree on the left, locate a level-1 node and select **Customization**. The system displays the customized parameters of the current component.

The configuration files that save the newly added custom parameters are displayed in the **Parameter File** column. Different configuration files may have same open source parameters. After the parameters in different files are set to different values, the configuration takes effect depends on the loading sequence of the configuration files by components. You can customize parameters for services and roles as required. Adding customized parameters for a single role instance is not supported.

**Step 6** Locate the row where a specified parameter resides, enter the parameter name supported by the component in the **Name** column and enter the parameter value in the **Value** column.

You can click + or - to add or delete a customized parameter.

**Step 7** Click **Save**. In the displayed **Save Configuration** dialog box, confirm the modification and click **OK**. After the system displays "Operation succeeded", click **Finish**. The configuration is saved successfully.

Restart the expired service or instance for the configuration to take effect.

----End

## Task Example (Configuring Customized Hive Parameters)

Hive depends on HDFS. By default, Hive accesses the HDFS client. The configuration parameters that have taken effect are controlled by HDFS. For example, the HDFS parameter **ipc.client.rpc.timeout** affects the RPC timeout interval for all clients to connect to the HDFS server. Cluster administrators can modify the timeout interval for Hive to connect to HDFS by configuring custom parameters. After this parameter is added to the **core-site.xml** file of Hive, this

parameter can be identified by the Hive service and its configuration overwrites the parameter configuration in HDFS.

- Step 1** On FusionInsight Manager, click **Cluster**, click the name of the desired cluster, and click **Services**.
- Step 2** On the displayed page, click **Configuration** and click **All Configurations**.
- Step 3** In the navigation tree on the left, select **Customization** for the Hive service. The system displays the custom service parameters supported by Hive.
- Step 4** In **core-site.xml**, locate the row that contains the **core.site.customized.configs** parameter, enter **ipc.client.rpc.timeout** in the **Name** column, and enter a new value in the **Value** column, for example, 150000. The unit is ms.

**Figure 8-21** Adding custom parameters

Parameter	Value	
core.site.customized.configs	<b>Name</b>	<b>Value</b>
	ipc.client.rpc.timeout	150000

- Step 5** Click **Save**. In the displayed **Save Configuration** dialog box, confirm the modification and click **OK**. Wait until the message "Operation succeeded" is displayed, and click **Finish**.

The configuration is saved successfully.

After the configuration is saved, restart the expired service or instance for the configuration to take effect.

----End

## 8.2.3 Instance Management

### 8.2.3.1 Overview

#### Overview

Log in to FusionInsight Manager and choose **Cluster > Services > Name of the service to be operated**. On the displayed page, click **Instance**. The instance management page is displayed, including the function area and role instance list.

#### Functional Area

After selecting the instances to be operated in the function area, you can maintain and manage the role instances, such as starting or stopping the instances. [Table 8-10](#) shows the main operations.

**Table 8-10** Instance maintenance and management

UI Portal	Description
<b>Start Instance</b>	Start a specified instance in the cluster. You can start a role instance in the <b>Not Started</b> , <b>Stop Failed</b> , or <b>Startup Failed</b> state to use the role instance.
<b>More &gt; Stop Instance</b>	Stop a specified instance in the cluster. You can stop a role instance that is no longer used or is abnormal.
<b>More &gt; Restart Instance</b>	Restart a specified instance in the cluster. You can restart an abnormal role instance to restore it.
<b>More &gt; Instance Rolling Restart</b>	Restart a specified instance in the cluster without interrupting services. For details about the parameter settings, see <a href="#">Performing a Rolling Restart of a Cluster</a> .
<b>More &gt; Decommission/Recommission</b>	Recommission or decommission a specified instance in the cluster to change the service availability status of the service. For details, see <a href="#">Decommissioning and Recommissioning an Instance</a> . <b>NOTE</b> Only the role DataNode in HDFS, role NodeManager in Yarn, and role RegionServer in HBase support the recommissioning and decommissioning functions.
<i>Desired instance</i> > <b>More &gt; Synchronize Configuration</b>	If the <b>Configuration Status</b> of a role instance is <b>Expired</b> , the role instance has not been restarted after the configuration is modified, and the new configuration is saved only on FusionInsight Manager. In this case, use this function to deliver the new configuration to the specified instance. <b>NOTE</b> <ul style="list-style-type: none"> <li>After synchronizing the role instance configuration, you need to restart the role instance whose configuration has expired. The role instance is unavailable during the restart.</li> <li>After the synchronization is complete, restart the instance for the configuration to take effect.</li> </ul>
<i>Desired instance</i> > <b>Instance Configurations</b>	For details, see <a href="#">Managing Instance Configurations</a> .

You can filter instances based on the role they belong to or their running status in the function area.

 **NOTE**

Click **Advanced Search** to search for specified instances by specifying other filter criteria, such as **Host Name**, **Management IP Address**, **Business IP Address**, or **Instance Groups**.

## Role Instance List

The role instance list contains the instances of all roles in the cluster. The list displays the running status, configuration status, hosts, and related IP addresses of each instance.

**Table 8-11** Instance running status

Status	Description
<b>Normal</b>	Indicates that the instance is running properly.
<b>Faulty</b>	Indicates that the instance cannot run properly.
<b>Decommissioned</b>	Indicates that the instance is out of service.
<b>Not started</b>	Indicates that the instance is stopped.
<b>Unknown</b>	Indicates that the initial status of the instance cannot be detected.
<b>Starting</b>	Indicates that the instance is being started.
<b>Stopping</b>	Indicates that the instance is being stopped.
<b>Restoring</b>	Indicates that an exception may occur in the instance and the instance is being automatically rectified.
<b>Decommissioning</b>	Indicates that the instance is being decommissioned.
<b>Recommissioning</b>	Indicates that the instance is being recommissioned.
<b>Failed to start</b>	Indicates that the service fails to be started.
<b>Failed to stop</b>	Indicates that the service fails to be stopped.

## Instance Details

You can click an instance name to go to the instance details page and view the basic information, configuration file, instance logs, and monitoring metric reports of the instance.

### 8.2.3.2 Decommissioning and Recommissioning an Instance

#### Scenario

Some role instances provide services for external services in distributed and parallel mode. Services independently store information about whether each instance can be used. Therefore, you need to use FusionInsight Manager to recommission or decommission these instances to change the instance running status.

Some instances do not support the recommissioning and decommissioning functions.

 NOTE

The following roles support decommissioning and recommissioning: HDFS DataNode, YARN NodeManager, and HBase RegionServer.

- By default, if the number of the DataNodes is less than or equal to that of HDFS replicas, decommissioning cannot be performed. If the number of HDFS replicas is three and the number of DataNodes is less than four in the system, decommissioning cannot be performed. In this case, an error will be reported and force FusionInsight Manager to exit the decommissioning 30 minutes after FusionInsight Manager attempts to perform the decommissioning.
- During MapReduce task execution, files with 10 replicas are generated. Therefore, if the number of DataNode instances is less than 10, decommissioning cannot be performed.
- If the number of DataNode racks (the number of racks is determined by the number of racks configured for each DataNode) is greater than 1 before the decommissioning, and after some DataNodes are decommissioned, that of the remaining DataNodes changes to 1, the decommissioning will fail. Therefore, before decommissioning DataNode instances, you need to evaluate the impact of decommissioning on the number of racks to adjust the DataNodes to be decommissioned.
- If multiple DataNodes are decommissioned at the same time, and each of them stores a large volume of data, the DataNodes may fail to be decommissioned due to timeout. To avoid this problem, it is recommended that one DataNode be decommissioned each time and multiple decommissioning operations be performed.

## Procedure

**Step 1** Perform the following steps to perform a health check for the DataNodes before decommissioning:

1. Log in to the client installation node as a client user and switch to the client installation directory.
2. For a security cluster, use user **hdfs** for permission authentication.

```
source bigdata_env #Configure client environment variables.
kinit hdfs #Configure kinit authentication.
Password for hdfs@HADOOP.COM: #Enter the login password of user hdfs.
```
3. Run the **hdfs fsck / -list-corruptfileblocks** command, and check the returned result.
  - If "has 0 CORRUPT files" is displayed, go to [Step 2](#).
  - If the result does not contain "has 0 CORRUPT files" and the name of the damaged file is returned, go to [Step 1.4](#).
4. Run the **hdfs dfs -rm *Name of the damaged file*** command to delete the damaged file.

 NOTE

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

**Step 2** Log in to FusionInsight Manager.

**Step 3** Choose **Cluster** > *Name of the desired cluster* > **Services**.

**Step 4** Click the specified service name on the service management page. On the displayed page, click the **Instance** tab.

**Step 5** Select the specified role instance to be decommissioned.

**Step 6** Select **Decommission** or **Recommission** from the **More** drop-down list.

In the displayed dialog box, enter the password of the current login user and click **OK**.

Select **I confirm to decommission these instances and accept the consequence of service performance deterioration** and click **OK** to perform the corresponding operation.

 **NOTE**

During the instance decommissioning, if the service corresponding to the instance is restarted in the cluster using another browser, FusionInsight Manager displays a message indicating that the instance decommissioning is stopped, but the operating status of the instance is displayed as **Started**. In this case, the instance has been decommissioned on the background. You need to decommission the instance again to synchronize the operating status.

----End

### 8.2.3.3 Managing Instance Configurations

#### Scenario

Configuration parameters of each role instance can be modified. In the scenario where instances are migrated to a new cluster or the service is redeployed, the cluster administrator can import or export all configuration data of a service on FusionInsight Manager to quickly copy configuration results.

FusionInsight Manager can manage configuration parameters of a single role instance. Modifying configuration parameters and importing or exporting instance configurations do not affect other instances.

#### Impact on the System

After modifying the configuration of a role instance, you need to restart the instance if the instance status is **Expired**. The role instance is unavailable during restart.

#### Modifying Instance Configuration

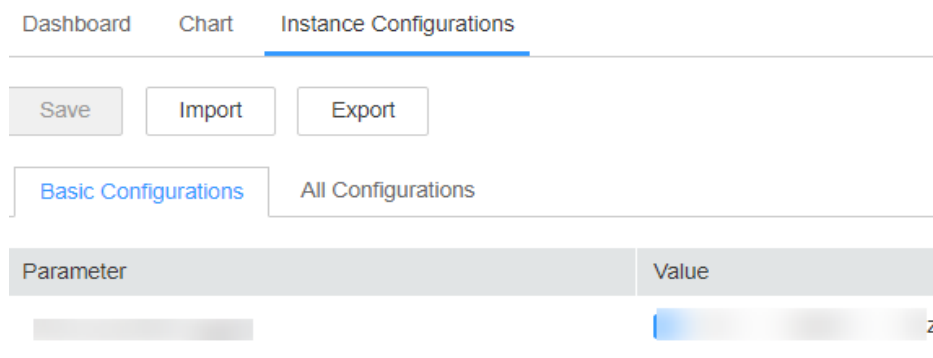

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.

**Step 3** On the page that is displayed, click the **Instance** tab.

**Step 4** Click the specified instance and select **Instance Configuration**.

By default, **Basic Configuration** is displayed. To modify more parameters, click **All Configurations**. All parameter categories supported by the instance are displayed on the **All Configurations** tab page.

**Figure 8-22** Instance configurations

**Step 5** In the navigation tree, select the specified parameter category and change the parameter values on the right.

If you are not sure about the location of a parameter, you can enter the parameter name in search box in the upper right corner. The system searches for the parameter in real time and displays the result.

**Step 6** Click **Save**. In the confirmation dialog box, click **OK**.

Wait until the message "Operation succeeded." is displayed. Click **Finish**.

The configuration is modified.

#### NOTE

After the configuration parameters of a role instance are modified, you need to restart the instance if the instance status is **Expired**. You can select the expired instance on the **Instances** page and choose **More > Restart Instance**.

If the  is displayed before a parameter, this parameter takes effect dynamically. After the configuration is saved, the parameter value is automatically updated to the configuration file.  is supported only in MRS 3.2.0 or later.

----End

## Exporting/Importing Instance Configuration

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster > Name of the desired cluster > Services**.

**Step 3** Click the specified service name on the service management page. On the displayed page, click the **Instance** tab.

**Step 4** Click the specified instance and select **Instance Configurations**.

**Step 5** Click **Export** to export the configuration parameter file to the local host.

**Step 6** On the **Instance Configurations** page, click **Import**, select the configuration parameter file of the instance, and import the file.

----End

## 8.2.3.4 Viewing the Instance Configuration File

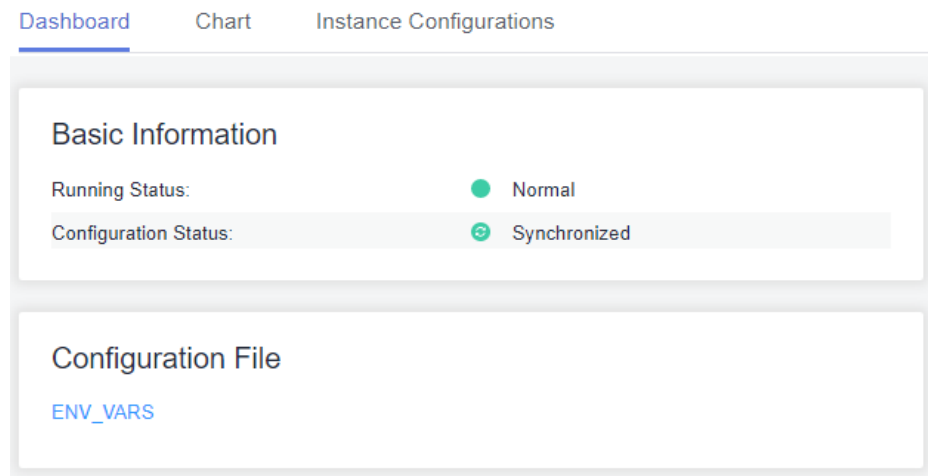

### Scenario

FusionInsight Manager allows O&M personnel to view the content configuration files such as environment variables and role configurations of the instance node on the management page. If O&M personnel need to quickly check whether configuration items of the instance are incorrectly configured or when some hidden configuration items need to be viewed, the O&M personnel can directly view the configuration files on FusionInsight Manager. In this case, users quickly analyze configuration problems.

### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Cluster** > *Name of the desired cluster* > **Service**.
- Step 3** Click the specified service name on the service management page. On the displayed page, click the **Instance** tab.
- Step 4** Click the name of the target instance. In the **Configuration File** area on the **Instance Status** page, the configuration file list of the instance is displayed.

**Figure 8-23** Viewing the instance configuration file

- Step 5** Click the name of the configuration file to be viewed to view the parameter values in the configuration file.

To obtain the configuration file, you can download the configuration file to the local PC.

#### NOTE

If a node in the cluster is faulty, the configuration file cannot be viewed. Rectify the fault before viewing the configuration file again.

----End

## 8.2.3.5 Instance Group

### 8.2.3.5.1 Managing Instance Groups

#### Scenario

Instance groups can be managed on FusionInsight Manager. That is, you can group multiple instances in the same role based on a specified principle, such as the nodes with the same hardware configuration. The modification on the configuration parameters of an instance group applies to all instances in the group.

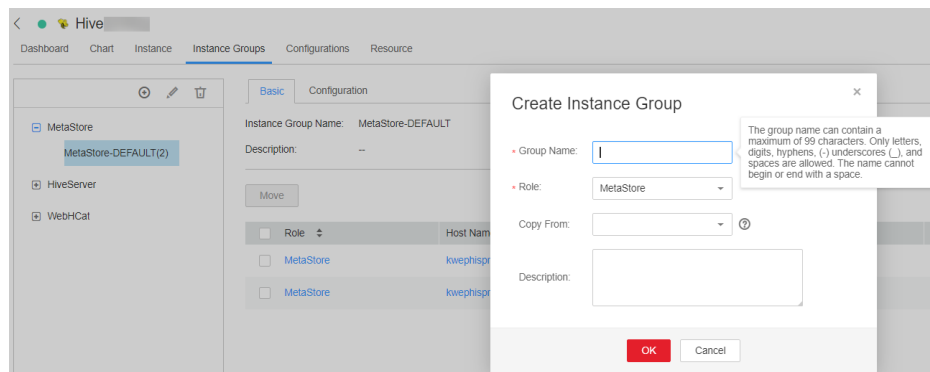

In a large cluster, instance groups are used to improve the capability of managing instances in batches in the heterogeneous environment. After instances are grouped, the instances can be configured repeatedly to reduce redundant instance configuration items and improve system performance.

#### Creating an Instance Group

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.
- Step 3** Click the specified service name on the service management page.
- Step 4** On the displayed page, click the **Instance Groups** tab.

Click  and configure parameters as prompted.

**Figure 8-24** Creating an Instance Group

**Table 8-12** Instance group configuration parameters

Parameter	Description
<b>The group name</b>	Indicates the instance group name. The value can contain only letters, digits, underscores (_), hyphens (-), and spaces. It must start with a letter, digit, underscore (_), or hyphen (-) and cannot end with a space. It can contain a maximum of 99 characters.
<b>Role</b>	Indicates the role to which an instance group belongs.

Parameter	Description
<b>Copy From</b>	Indicates that the parameter values of a specified instance group are copied to the parameters of a new group. If the value is null, the default values are used for the parameters of the new group.
<b>Description</b>	Indicates the instance group description. It can contain only letters, digits, commas (,), periods (.), underscores (_), spaces, and line breaks, and can contain a maximum of 200 characters.

 **NOTE**

- Each instance must belong to only one instance group. When an instance is installed for the first time, it belongs to the instance group *Role name-DEFAULT* by default.
- You can delete unnecessary or unused instance groups. Before deleting an instance group, migrate all instances in the group to other instance groups, and then delete the instance group by referring to [Deleting an Instance Group](#). The default instance group cannot be deleted.

**Step 5** Click **OK**.

The instance group is created.

----End

## Modifying Properties of an Instance Group

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.

**Step 3** Click the specified service name on the service management page.

**Step 4** Click the **Instance Groups** tab. On the **Instance Groups** tab page, locate the row that contains the target instance group.

Click  and modify parameters as prompted.

**Step 5** Click **OK** to save the modifications.

The default instance group cannot be modified.

----End

## Deleting an Instance Group

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.

**Step 3** Click the specified service name on the service management page.

**Step 4** Click the **Instance Groups** tab. On the **Instance Groups** tab page, locate the row that contains the target instance group.

**Step 5** Click .

**Step 6** In the displayed dialog box, click **OK**.

The default instance group cannot be deleted.

----End

### 8.2.3.5.2 Viewing Information About an Instance Group

#### Scenario

The cluster administrator can view the instance group of a specified service on FusionInsight Manager.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.

**Step 3** Click the specified service name on the service management page.

**Step 4** On the displayed page, click the **Instance Groups** tab.

**Step 5** In the navigation tree, select a role. On the **Basic** tab page, view all instances in the instance group.

#### NOTE

To move an instance from an instance group to another, perform the following operations:

1. Select the instance to be moved and click **Move**.
2. In the displayed dialog box, select an instance group to which the instance to be moved.

During the migration, the configuration of the new instance group is automatically inherited. If the instance configuration is modified before the migration, the configuration of the instance prevails.

3. Click **OK**.

Restart the expired service or instance for the configuration to take effect.

----End

### 8.2.3.5.3 Configuring Instantiation Group Parameters

#### Scenario

In a large cluster, users can configure parameters for multiple instances in batches by configuring the related instance groups on FusionInsight Manager, reducing redundant instance configuration items and improving system performance.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.

- Step 3** Click the specified service name on the service management page.
- Step 4** On the displayed page, click the **Instance Groups** tab.
- Step 5** In the navigation tree, select the instance group name of a role, and switch to the **Configuration** tab page. Adjust parameters to be modified, and click **Save**. The configuration takes effect for all instances in the instance group.
- End

## 8.3 Hosts

### 8.3.1 Host Management Page

#### 8.3.1.1 Viewing the Host List

##### Overview

Log in to FusionInsight Manager, click **Hosts**, and the host list is displayed on the host management page. You can view the host list and basic information of each host.

You can switch view types and set search criteria to filter and search for hosts.

##### Host View

You can click **Role View** to view the roles deployed on each host. If the role supports the active/standby mode, the role name is displayed in bold.

##### Host List

The host list on the host management page contains all hosts in the cluster, and O&M operations can be performed on these hosts.

On the host management page, you can filter hosts by node type or cluster. The rules for filtering host types are as follows:

- A management node is the node where OMS is deployed. Additionally, control roles and data roles may also be deployed on management nodes.
- A control node is the node where control roles are deployed. Additionally, data roles may also be deployed on control nodes.
- A Data Node is the node where only data roles are deployed.

If you select the **Host View**, the IP address, rack planning, AZ name, running status, cluster name, and hardware resource usage of each host are displayed.

**Table 8-13** Host running status

Status	Description
Normal	Indicates that the host is in the normal state.

Status	Description
Faulty	Indicates that the host is abnormal.
Unknown	Indicates that the initial status of the host cannot be detected.
Isolated	Indicates that the host is isolated.
Suspended	Indicates that the host is stopped.

### 8.3.1.2 Viewing the Host Dashboard

#### Overview

Log in to FusionInsight Manager, click **Hosts**, and click a host name in the host list. The host details page contains the basic information area, disk status area, role list area, and monitoring chart.

#### Basic Information Area

The basic information area contains the key information about the host, such as the management IP address, service IP address, host type, rack, firewall, number of CPU cores, and OS.

#### Disk Status Area

The disk status area contains all disk partitions configured for the cluster on the host and the usage of each disk partition.

#### Instance List Area

The instance list area displays all role instances installed on the host and the status of each role instance. You can click the log file next to a role instance name to view the log file content of the instance online.

#### Alarm and Event History

The alarm and event history area displays the key alarms and events reported by the current host. The system can display a maximum of 20 historical records.

#### Chart

The monitoring chart area is displayed on the right of the host details page, and contains the key monitoring metrics of the host.

You can choose ▼ > **Customize** in the upper right corner to customize the monitoring reports to be displayed in the chart area. Select a time range and choose ▼ > **Export** to export detailed monitoring metric data within the specified time range.

You can click  next to the title of a monitoring indicator to open the description of the monitoring indicator.

Click the **Chart** tab of the host to view the full monitoring chart information about the host.

### 8.3.1.3 Checking Host Processes and Resources

#### Overview

Log in to FusionInsight Manager, click **Hosts**, and click the specified host name in the host list. On the host details page, click the **Process** and **Resource** tabs.

#### Host Process

On the **Process** tab page, the information about the role processes of the deployed service instances on the current host is displayed, including the process status, PID, and process running time. You can directly view the log files of each process online.

#### Host Resource

On the **Resource** tab page, the detailed resource usage of deployed service instances on the current host is displayed, including the CPU, memory, disk, and port usage.

## 8.3.2 Host Maintenance Operations

### 8.3.2.1 Starting and Stopping All Instances on a Host

#### Scenario

If a host is faulty, you may need to stop all the roles on the host and perform maintenance check on the host. After the host fault is rectified, start all roles running on the host to recover host services. You can start or stop all instances on a host on the host management page or host details page on FusionInsight Manager. The following describes how to perform such operations on the host management page.

#### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Click **Hosts**.
- Step 3** Select the check box of the target host.
- Step 4** Select **Start All Instances** or **Stop All Instances** from the **More** drop-down list to start or stop all role instances.

----End

### 8.3.2.2 Performing a Host Health Check

#### Scenario

If the running status of a host is not **Normal**, you can perform health checks on the host to check whether some basic functions are abnormal. During routine O&M, you can perform host health checks to ensure that the configuration parameters and monitoring of each role instance on the host are normal and can run stably for a long time.

#### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Click **Hosts**.
- Step 3** Select the check box of the target host.
- Step 4** Select **Health Check** from the **More** drop-down list to start the health check.

To export the result of the health check, click **Export Report** in the upper left corner. If any problem is detected, click **Help**.

----End

### 8.3.2.3 Configuring Racks for Hosts

#### Scenario

All hosts in a large cluster are usually deployed on multiple racks. Hosts on different racks communicate with each other through switches. The network bandwidth between different hosts on the same rack is much greater than that on different racks. In this case, plan the network topology based on the following requirements:

- To improve the communication speed, it is recommended that data be exchanged between hosts on the same rack.
- To improve the fault tolerance capability, distribute processes or data of distributed services on different hosts of multiple racks as dispersedly as possible.

Hadoop uses a file directory structure to represent hosts.

The HDFS cannot automatically determine the network topology of each DataNode in the cluster. You need to set the rack name to identify the rack where the host is located so that the NameNode can draw the network topology of the required DataNodes and back up data of the DataNodes to different racks. Similarly, YARN needs to obtain rack information and allocate tasks to different NodeManagers as required.

If the cluster network topology changes, you need to reallocate racks for hosts on FusionInsight Manager so that related services can be automatically adjusted.

#### Impact on the System

If the name of the host rack is changed, storage policy for HDFS replicas, YARN task assignment, and storage location of Kafka partitions will be affected. After

the modification, you need to restart the HDFS, YARN, and Kafka for the configuration to take effect.

Improper rack configuration will unbalance loads (including CPU, memory, disk, and network) among nodes in the cluster, which decreases the cluster reliability and stability. Therefore, before allocating racks, take all aspects into consideration and properly set racks.

## Rack Allocation Policies

### NOTE

Physical rack: indicates the real rack where the host resides.

Logical rack: indicates the rack name of the host on FusionInsight Manager.

Policy 1: Each logical rack has nearly the same number of hosts.

Policy 2: The name of the logical rack of the host must comply with that of the physical rack to which the host belongs.

Policy 3: If there are only few hosts on a physical rack, combine this physical rack and other physical racks with few hosts into a logical rack, which complies with policy 1. Hosts in two equipment rooms cannot be placed in one logical rack. Otherwise, performance problems may be caused.

Policy 4: If there are lots of hosts on a physical rack, divide these hosts into multiple logical racks, which complies with policy 1. Hosts with great differences should not be placed in the same logical rack. Otherwise, the cluster reliability will be decreased.

Policy 5: You are advised to set **default** or other values for logical racks on the first layer, and the values in the same cluster must be consistent.

Policy 6: The number of hosts in each rack cannot be less than 3.

Policy 7: A cluster can contain at most 50 logical racks. If there are too many logical racks in a cluster, the maintenance is difficult.

## Best Practices

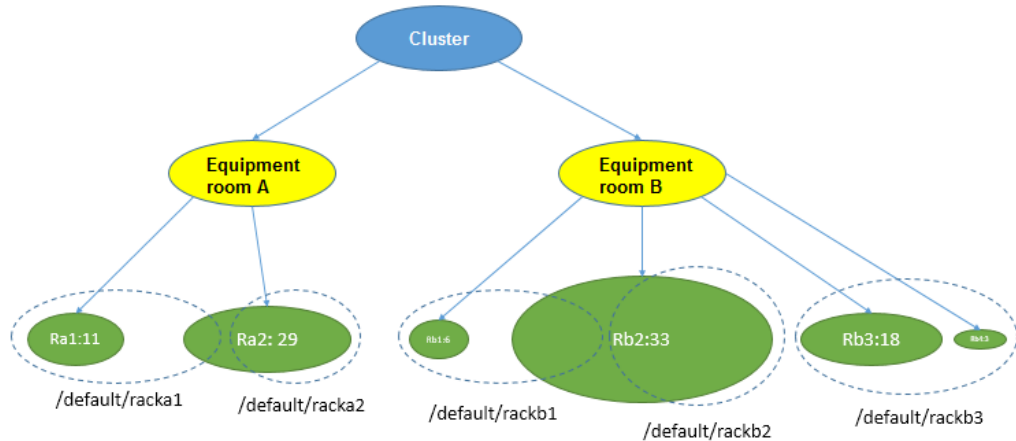

For example, in a cluster, 100 hosts are located in two equipment rooms A and B. A has 40 hosts and B has 60 hosts. In room A, there are 11 hosts on physical rack Ra1 and 29 hosts on physical rack Ra2. In room B, there are six hosts on physical rack Rb1, 33 hosts on physical rack Rb2, 18 hosts on physical rack Rb3, and three hosts on physical rack Rb4.

According to the rack allocation policy, each logical rack contains nearly the same number (for example, 20) of hosts. The allocation details are as follows:

- Logical rack /default/racka1: 11 hosts on physical rack Ra1 and nine hosts on physical rack Ra2
- Logical rack /default/racka2: the remaining 20 hosts (except the nine hosts of logical rack /default/racka1) on physical rack Ra2
- Logical rack /default/rackb1: six hosts on physical rack Rb1 and 13 hosts on physical rack Rb2
- Logical rack /default/rackb2: the remaining 20 hosts on physical rack Rb2

- Logical rack /default/rackb3: 18 hosts on physical rack Rb3 and three hosts on physical rack Rb4

Rack allocation example:

## Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Click **Hosts**.

**Step 3** Select the check box of the target host.

**Step 4** Select **Set Rack** from the **More** drop-down list.

- Set rack names in hierarchy based on the actual network topology. Separate racks from different layers using slashes (/).
- Rack naming rules are as follows: */level1/level2/...*. The number of levels must be at least 1, and the name cannot be empty. A rack can contain letters, digits, and underscores (\_) and cannot exceed 200 characters.  
For example, /default/rack0.
- If the hosts in the rack to be modified contain DataNode instances, ensure that the rack name levels of the hosts where all DataNode instances reside are the same. Otherwise, the configuration fails to be delivered.

**Step 5** Click **OK**.

----End

### 8.3.2.4 Isolating a Host

#### Scenario

If a host is abnormal or faulty and cannot provide services or affects the cluster performance, you can remove the host from the available node in the cluster temporarily so that the client can access other available nodes.

#### NOTE

Only non-management nodes can be isolated.

## Impact on the System

- After a host is isolated, all role instances on the host will be stopped, and you cannot start, stop, or configure the host and all instances on the host.
- For some services, after a host is isolated, some instances on other nodes do not work, and the service configuration status may expire.
- After a host is isolated, statistics about the monitoring status and indicator data of the host hardware and instances on the host cannot be collected or displayed.
- Retain the default SSH port (22) of the target node. Otherwise, the task described in this section will fail.

## Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Click **Hosts**.

**Step 3** Select the check box of the host to be isolated.

**Step 4** Select **Isolate** from the **More** drop-down list.

In the displayed dialog box, enter the password of the current login user and click **OK**.

**Step 5** In the displayed confirmation dialog box, select "I confirm to isolate the selected hosts and accept possible consequences of service faults." Click **OK**.

Wait until the message "Operation succeeded" is displayed, and click **Finish**.

The host is successfully isolated and **Running Status** is **Isolated**.

**Step 6** Log in to the isolated host as user **root** and run the **pkill -9 -u omm** command to stop the processes of user **omm** on the node. Then run the **ps -ef | grep 'container' | grep '\${BIGDATA\_HOME}' | awk '{print \$2}' | xargs -l '{}' kill -9 '{}'** command to find and stop the container process.

**Step 7** Cancel the isolation status of the host before using the host if you have rectified the host exception or fault.

On the **Hosts** page, select the isolated host and choose **More > Cancel Isolation**.

### NOTE

After the isolation is canceled, all role instances on the host are not started by default. To start role instances on the host, select the target host on the Hosts page and choose **More > Start All Instances**.

----End

## 8.3.2.5 Exporting Host Information

### Scenario

Administrators can export information about all hosts on FusionInsight Manager.

## Procedure

- Step 1** Log in to FusionInsight Manager.
  - Step 2** Click **Hosts**.
  - Step 3** Specify the status of required hosts in the drop-down list box on the upper right corner, or click **Advanced Search** to specify hosts.
  - Step 4** Click **Export All**, select **TXT** or **CSV** for **Save As**, and click **OK**.
- End

## 8.3.3 Resource Overview

### 8.3.3.1 Distribution

Log in to FusionInsight Manager and choose **Hosts > Resource Overview**. On the **Resource Overview** page that is displayed, click the **Distribution** tab to view resource distribution of each cluster. By default, the monitoring data of the past one hour (**1h**) is displayed. You can click  to customize a time range. Time range options are **1h**, **2h**, **6h**, **12h**, **1d**, **1w**, and **1m**.

**Figure 8-25** Distribution tab

- You can click **Select Metric** to customize the metric to monitor. [Table 8-14](#) describes all the metrics that you can select. After you select a metric, the host distribution in each range of the metric is displayed.
- When you hover your cursor over a color column, the number of hosts in the current metric range is displayed. See [Figure 8-25](#). You can click a color column to view the list of hosts in the metric range.
  - You can click a host name in the **Host Name** column to access the host details page.
  - You can click **View Trends** in the **Operation** column of a host to view the maximum, minimum, and average values of the current metric in the cluster as well as the value of the current host. In the current cluster, if you have selected **Host CPU-Memory-Disk Usage**, **View Trends** is unavailable.
- You can click **Export Data** to export the maximum, minimum, and average values of the current metric of all nodes in the cluster within the time range you have specified.

**Table 8-14** Metrics

Category	Metric
Process	<ul style="list-style-type: none"><li>• Number of Running Processes</li><li>• Total Number of Processes</li><li>• Total Number of omm Processes</li><li>• Uninterruptible Sleep Process</li></ul>
Network Status	<ul style="list-style-type: none"><li>• Host Network Packet Collisions</li><li>• Number of LAST_ACK States</li><li>• Number of CLOSING States</li><li>• Number of LISTENING States</li><li>• Number of CLOSED States</li><li>• Number of ESTABLISHED States</li><li>• Number of SYN_RECV States</li><li>• Number of TIME_WAITING States</li><li>• Number of FIN_WAIT2 States</li><li>• Number of FIN_WAIT1 States</li><li>• Number of CLOSE_WAIT States</li><li>• DNS Name Resolution Duration</li><li>• TCP Ephemeral Port Usage</li><li>• Host Network Packet Frame Errors</li></ul>
Network Reading	<ul style="list-style-type: none"><li>• Host Network Read Packets</li><li>• Host Network Read Dropped Packets</li><li>• Host Network Read Error Packets</li><li>• Host Network Rx Speed</li></ul>
Disk	<ul style="list-style-type: none"><li>• Host Disk Write Speed</li><li>• Host Used Disk</li><li>• Host Free Disk</li><li>• Host Disk Read Speed</li><li>• Host Disk Usage</li></ul>
Memory	<ul style="list-style-type: none"><li>• Free Memory</li><li>• Cache Memory Size</li><li>• Total Kernel Cache Memory Size</li><li>• Shared Memory Size</li><li>• Host Memory Usage</li><li>• Used Memory</li></ul>

Category	Metric
Network Writing	<ul style="list-style-type: none"> <li>• Host Network Write Packets</li> <li>• Host Network Write Error Packets</li> <li>• Host Network Tx Speed</li> <li>• Host Network Write Dropped Packets</li> </ul>
CPU	<ul style="list-style-type: none"> <li>• CPU Usage of Processes Whose Priorities Have Been Changed</li> <li>• CPU Usage of User Space Processes</li> <li>• CPU Usage of Kernel Space Processes</li> <li>• Host CPU Usage</li> <li>• CPU Total Time</li> <li>• CPU Idle Time</li> </ul>
Host Status	<ul style="list-style-type: none"> <li>• Host File Handle Usage</li> <li>• Average OS Load in 1 Minute</li> <li>• Average OS Load in 5 Minutes</li> <li>• Average OS Load in 15 Minutes</li> <li>• Host PID Usage</li> </ul>

### 8.3.3.2 Trend

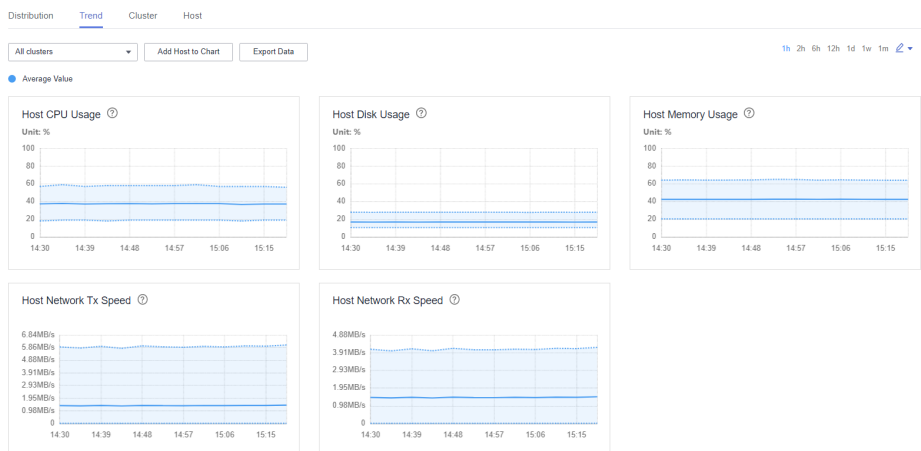

Log in to FusionInsight and choose **Hosts > Resource Overview**. On the **Resource Overview** page that is displayed, click the **Trend** tab to view resource trends of all clusters or a single cluster. By default, the monitoring data of the past one hour (1h) is displayed. You can click  to customize a time range. Time range options are **1h**, **2h**, **6h**, **12h**, **1d**, **1w**, and **1m**. By default, the trend chart of each metric displays the maximum, minimum, and average values of the entire cluster.

Figure 8-26 Trend tab

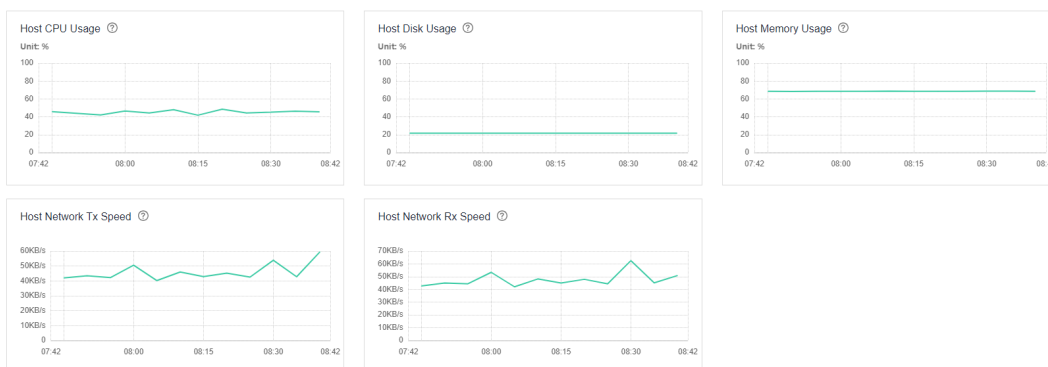

- You can click **Add Host to Chart** to add trend lines of up to 12 hosts to the trend charts.
- You can choose **> Customize** to customize the metrics to display on the tab page. For details about the metrics, see [Table 8-14](#) in [Distribution](#).
- You can click **Export Data** to export the maximum, minimum, and average values of all nodes in the cluster for all selected metrics within the time range you have specified.

### 8.3.3.3 Cluster

Log in to FusionInsight Manager and choose **Hosts > Resource Overview**. On the **Resource Overview** page that is displayed, click the **Cluster** tab to view resource monitoring of all clusters.

By default, the monitoring data of the past one hour (**1h**) is displayed. You can click [🔗](#) to customize a time range. Time range options are **1h**, **2h**, **6h**, **12h**, **1d**, **1w**, and **1m**.

**Figure 8-27** Cluster tab

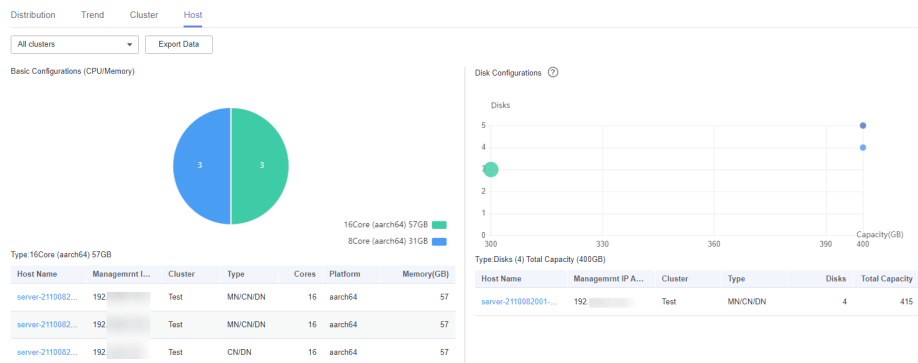

- You can choose **> Customize** to customize the metrics to display on the tab page. For details about the metrics, see [Table 8-14](#) in [Distribution](#).
- You can click **Export Data** to export the metric values of each cluster within the time range you have specified.

### 8.3.3.4 Host

Log in to FusionInsight Manager and choose **Hosts > Resource Overview**. On the **Resource Overview** page that is displayed, click the **Host** tab to view host resource overview, including basic configurations (CPU/memory) and disk configurations.

You can click **Export Data** to export the configuration list of all hosts in the cluster, including the host name, management IP address, host type, number of cores, CPU architecture, memory capacity, and disk size.

**Figure 8-28** Host tab

## Basic Configurations (CPU/Memory)

You can hover your cursor over the pie chart to view the number of hosts of each hardware configuration in the cluster. The information is displayed in the format of *Number of cores (CPU architecture) Memory size*.

You can click a slice on the pie chart to view the list of hosts.

## Disk Configurations

The horizontal axis indicates the total disk capacity (including the OS disk) of a node, and the vertical axis indicates the number of logical disks (including the OS disk).

You can hover your cursor over a dot to view information about disks of the current configuration, including the quantity of disks, total capacity, and number of hosts.

You can click a dot on the chart to view the list of hosts.

# 8.4 O&M

## 8.4.1 Alarms

### 8.4.1.1 Overview of Alarms and Events

#### Alarms

Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. You can view information about alarms reported by all clusters on the page shown in [Figure 8-29](#), including the alarm name, ID, severity, and generation time. By default, the latest 10 alarms are displayed on each page.

**Figure 8-29 Alarms**

You can click  on the left of an alarm to view detailed alarm parameters. [Table 8-15](#) describes the parameters.

**Table 8-15 Alarm parameters**

Parameter	Description
Alarm ID	Alarm ID
Alarm Name	Alarm name
Severity	Alarm severity. Value options are <b>Critical, Major, Minor, and Suggestion.</b>
Generated	Time when an alarm is generated
Cleared	Time when an alarm is cleared. If the alarm is not cleared, -- is displayed.
Source	Cluster name
Object	Service, process, or module that triggers the alarm
Automatically Cleared	Whether the alarm can be automatically cleared after the fault is rectified
Alarm Status	Current status of the alarm. Value options are <b>Auto, Manual, and Uncleared.</b>
Alarm Cause	Indicates the possible cause of an alarm.
Serial Number	Indicates the number of alarms generated by the system.
Additional Information	Indicates the error information.
Location	Detailed information for locating the alarm, which includes the following: <ul style="list-style-type: none"> <li>● <b>Source:</b> cluster for which the alarm is generated</li> <li>● <b>ServiceName:</b> service for which the alarm is generated</li> <li>● <b>RoleName:</b> role for which the alarm is generated</li> <li>● <b>HostName:</b> host for which the alarm is generated</li> </ul>

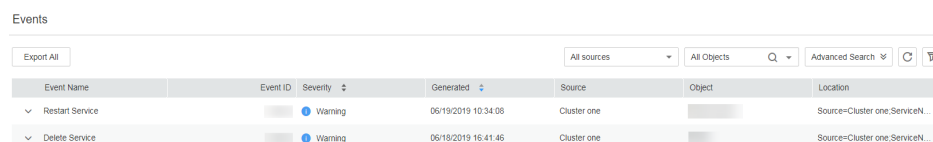

## Manage alarms.

- Click **Export All** to export all alarm details.
- If multiple alarms have been handled, you can select one or more alarms to be cleared and click **Clear Alarm** to clear the alarms in batches. A maximum of 300 alarms can be cleared in each batch.
- You can click  to manually refresh the current page and click  to filter columns to display.
- You can filter alarms by object or severity.
- You can click **Advanced Search** to search for alarms by alarm ID, name, type, start time, or end time. Click **Search** to filter alarms that meet the search criteria. Click **Advanced Search** again to view the number of search criteria that you have configured.
- You can click **Clear**, **Mask**, or **View Help** to perform corresponding operations on an alarm.
- If there are a large number of alarms, you can click **View by Category** to sort uncleared alarms by alarm ID. After alarms are classified, click the number of uncleared alarms to view alarm details.

## Events

Log in to FusionInsight Manager and choose **O&M > Alarm > Events**. On the **Events** page that is displayed, you can view information about all events in the cluster, including the event name, ID, severity, generation time, object, and location. By default, the latest 10 events are displayed on each page.

**Figure 8-30** Events page

Event Name	Event ID	Severity	Generated	Source	Object	Location
Restart Service		Warning	06/19/2019 10:34:09	Cluster one		Source=Cluster one.ServiceN...
Delete Service		Warning	06/18/2019 16:41:46	Cluster one		Source=Cluster one.ServiceN...

You can click  on the left of an event to view detailed event parameters. [Table 8-16](#) describes the parameters.

**Table 8-16** Event parameters

Parameter	Description
Event ID	Event ID
Event Name	Event name
Severity	Event severity. Value options are <b>Critical</b> , <b>Major</b> , <b>Minor</b> , and <b>Suggestion</b> .
Generated	Time when an event is generated
Object	Object for which the event may be generated

Parameter	Description
Serial Number	Number of the event generated by the system
Location	Detailed information for locating the event, which includes the following: <ul style="list-style-type: none"><li>● <b>Source</b>: cluster for which the event is generated</li><li>● <b>ServiceName</b>: service for which the event is generated</li><li>● <b>RoleName</b>: role for which the event is generated</li><li>● <b>HostName</b>: host for which the event is generated</li></ul>
Additional Information	Indicates the error information.
Event Cause	Indicates the possible cause of an event.
Source	Cluster name

#### Manage events.

- Click **Export All** to export all event details.
- You can click  to manually refresh the current page and click  to filter columns to display.
- You can filter events by object or cluster.
- You can click **Advanced Search** to search for events by event ID, name, severity, start time, or end time.

### 8.4.1.2 Alarm Threshold

#### Scenario

You can configure monitoring indicator thresholds to monitor the health status of indicators on FusionInsight Manager. If abnormal data occurs and the preset conditions are met, the system triggers an alarm and displays the alarm information on the alarm page.

#### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **O&M > Alarm > Thresholds**.
- Step 3** Select a monitoring metric for a host or service in the cluster.

**Figure 8-31** Configuring the threshold for a metric

For example, after selecting **Host Memory Usage**, the information about this indicator threshold is displayed.

- If the alarm sending switch is turned on, an alarm will be triggered if the threshold is reached.
- When **Alarm Severity** is on, hierarchical alarms are enabled. The system dynamically reports alarms at each severity based on the real-time metric values and hierarchical thresholds set for the severity. MRS 3.3.0 or later supports this function.
- **Alarm ID** and **Alarm Name**: alarm information triggered against the threshold
- **Trigger Count**: FusionInsight Manager checks whether the value of a monitoring metric reaches the threshold. If the number of consecutive checks reaches the value of **Trigger Count**, an alarm is generated. **Trigger Count** is configurable.
- **Check Period (s)**: interval for the system to check the monitoring metric.
- The rules in the rule list are used to trigger alarms.

**Step 4** Click **Create Rule** to add rules used for monitoring indicators.

**Table 8-17** Monitoring indicator rule parameters

Parameter	Description	Example Value
Rule Name	Name of a rule.	CPU_MAX
Severity	Select an alarm severity.	<ul style="list-style-type: none"> <li>• Critical</li> <li>• Major</li> <li>• Minor</li> <li>• Warning</li> </ul>

Parameter	Description	Example Value
Threshold Type	You can use the maximum or minimum value of an indicator as the alarm triggering threshold. If <b>Threshold Type</b> is set to <b>Max value</b> , the system generates an alarm when the value of the specified indicator is greater than the threshold. If <b>Threshold Type</b> is set to <b>Min value</b> , the system generates an alarm when the value of the specified indicator is less than the threshold.	<ul style="list-style-type: none"> <li>• Max value</li> <li>• Min value</li> </ul>
Date	This parameter is used to set the date when the rule takes effect.	<ul style="list-style-type: none"> <li>• Daily</li> <li>• Weekly</li> <li>• Others</li> </ul>
Add Date	This parameter is available only when <b>Date</b> is set to <b>Others</b> . You can set the date when the rule takes effect. Multiple options are available.	09-30
Thresholds	This parameter is used to set the time range when the rule takes effect.	Start and End Time: 00:00-08:30
	Threshold of the rule monitoring metric	Threshold: 10

 **NOTE**

You can click  to set multiple time ranges for the threshold or click  to delete one.

**Step 5** Click **OK** to save the rules.

**Step 6** Locate the row that contains an added rule, and click **Apply** in the **Operation** column. The value of **Effective** for this rule changes to **Yes**.

A new rule can be applied only after you click **Cancel** for an existing rule.

----End

## Monitoring Metric Reference

FusionInsight Manager alarm monitoring metrics are classified as node information metrics and cluster service metrics. [Table 8-18](#) lists the metrics whose thresholds can be configured for a node, and [Table 8-19](#) lists metrics whose thresholds can be configured for a component.

**Table 8-18** Node monitoring metrics

Metric Group	Metric	Description	Default Threshold
CPU	Host CPU Usage	This indicator reflects the computing and control capabilities of the current cluster in a measurement period. By observing the indicator value, you can better understand the overall resource usage of the cluster.	90.0%
Disk	Disk Usage	Indicates the disk usage of a host.	90.0%
	Disk Inode Usage	Indicates the disk inode usage in a measurement period.	80.0%
Memory	Host Memory Usage	Indicates the average memory usage at the current time.	90.0%
Host Status	Host File Handle Usage	Indicates the usage of file handles of the host in a measurement period.	80.0%
	Host PID Usage	Indicates the PID usage of a host.	90%

Metric Group	Metric	Description	Default Threshold
Network Status	TCP Ephemeral Port Usage	Indicates the usage of temporary TCP ports of the host in a measurement period.	80.0%
Network Reading	Read Packet Error Rate	Indicates the read packet error rate of the network interface on the host in a measurement period.	0.5%
	Read Packet Dropped Rate	Indicates the read packet dropped rate of the network interface on the host in a measurement period.	0.5%
	Read Throughput Rate	Indicates the average read throughput (at MAC layer) of the network interface in a measurement period.	80%
Network Writing	Write Packet Error Rate	Indicates the write packet error rate of the network interface on the host in a measurement period.	0.5%
	Write Packet Dropped Rate	Indicates the write packet dropped rate of the network interface on the host in a measurement period.	0.5%

Metric Group	Metric	Description	Default Threshold
	Write Throughput Rate	Indicates the average write throughput (at MAC layer) of the network interface in a measurement period.	80%
Process	Uninterruptible Sleep Process	Number of D state processes on the host in a measurement period	0
	omm Process Usage	omm process usage in a measurement period	90

**Table 8-19** Cluster service indicators

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
DBService	Database	Usage of the Number of Database Connections	Usage of database connections	90%
		Disk Space Usage of the Data Directory	Disk space usage of the data directory	80%
Flume	Agent	Heap Memory Usage Calculate	Flume heap memory usage	95.0%
		Flume Direct Memory Usage Statistics	Flume direct memory usage	80.0%
		Flume Non-heap Memory Usage	Flume non-heap memory usage	80.0%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
		Total GC duration of Flume process	Flume total GC time	12000 ms
HBase	GC	GC time for old generation	Total GC time of RegionServer	5000 ms
		GC time for old generation	Total GC time of HMaster	5000 ms
	CPU & memory	RegionServer Direct Memory Usage Statistics	RegionServer direct memory usage	90%
		RegionServer Heap Memory Usage Statistics	RegionServer heap memory usage	90%
		HMaster Direct Memory Usage	HMaster direct memory usage	90%
		HMaster Heap Memory Usage Statistics	HMaster heap memory usage	90%
	Service	Number of Online Regions of a RegionServer	Number of regions of a RegionServer	2000
		Region in transaction count over threshold	Number of regions that are in the RIT state and reach the threshold duration	1

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
	Replication	Replication sync failed times (RegionServer)	Number of times that DR data fails to be synchronized	1
		Number of Log Files to Be Synchronized in the Active Cluster	Number of log files to be synchronized in the active cluster	128
		Number of HFiles to Be Synchronized in the Active Cluster	Number of HFiles to be synchronized in the active cluster	128
	Queue	Compaction Queue Size	Size of the Compaction queue	100
HDFS	File and Block	Lost Blocks	Number of block copies that the HDFS lacks of	0
		Blocks Under Replicated	Total number of blocks that need to be replicated by the NameNode	1000
	RPC	Average Time of Active NameNode RPC Processing	Average NameNode RPC processing time	100 ms
		Average Time of Active NameNode RPC Queuing	Average NameNode RPC queuing time	200 ms
	Disk	HDFS Disk Usage	HDFS disk usage	80%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
		DataNode Disk Usage	Disk usage of DataNodes in the HDFS	80%
		Percentage of Reserved Space for Replicas of Unused Space	Percentage of the reserved disk space of all the copies to the total unused disk space of DataNodes.	90%
	Resource	Faulty DataNodes	Indicates the number of faulty DataNodes.	3
		NameNode Non-Heap Memory Usage Statistics	Indicates the percentage of NameNode non-heap memory usage.	90%
		NameNode Direct Memory Usage Statistics	Indicates the percentage of direct memory used by NameNodes.	90%
		NameNode Heap Memory Usage Statistics	Indicates the percentage of NameNode non-heap memory usage.	95%
		DataNode Direct Memory Usage Statistics	Indicates the percentage of direct memory used by DataNodes.	90%
		DataNode Heap Memory Usage Statistics	DataNode heap memory usage	95%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
	Garbage Collection	DataNode Heap Memory Usage Statistics	Indicates the percentage of DataNode non-heap memory usage.	90%
		GC Time (NameNode)/ GC Time (DataNode)	Indicates the Garbage collection (GC) duration of NameNodes per minute.	12000 ms
		GC Time	Indicates the GC duration of DataNodes per minute.	12000 ms
Hive	HQL	Percentage of HQL Statements That Are Executed Successfully by Hive	Indicates the percentage of HQL statements that are executed successfully by Hive.	90.0%
	Background	Background Thread Usage	Background thread usage	90%
	GC	Total GC time of MetaStore	Indicates the total GC time of MetaStore.	12000 ms
		Total GC Time in Milliseconds	Indicates the total GC time of HiveServer.	12000 ms
	Capacity	Percentage of HDFS Space Used by Hive to the Available Space	Indicates the percentage of HDFS space used by Hive to the available space.	85.0%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
	CPU & memory	MetaStore Direct Memory Usage Statistics	MetaStore direct memory usage	95%
		MetaStore Non-Heap Memory Usage Statistics	MetaStore non-heap memory usage	95%
		MetaStore Heap Memory Usage Statistics	MetaStore heap memory usage	95%
		HiveServer Direct Memory Usage Statistics	HiveServer direct memory usage	95%
		HiveServer Non-Heap Memory Usage Statistics	HiveServer non-heap memory usage	95%
		HiveServer Heap Memory Usage Statistics	HiveServer heap memory usage	95%
	Session	Percentage of Sessions Connected to the HiveServer to Maximum Number of Sessions Allowed by the HiveServer	Indicates the percentage of the number of sessions connected to the HiveServer to the maximum number of sessions allowed by the HiveServer.	90.0%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
Kafka	Partition	Percentage of Partitions That Are Not Completely Synchronized	Indicates the percentage of partitions that are not completely synchronized to total partitions.	50%
		Others	Unavailable Partition Percentage	Percentage of unavailable partitions of each Kafka topic
		User Connection Usage on Broker	Usage of user connections on Broker	80%
	Disk	Broker Disk Usage	Indicates the disk usage of the disk where the Broker data directory is located.	80.0%
		Disk I/O Rate of a Broker	I/O usage of the disk where the Broker data directory is located	80%
	Process	Broker GC Duration per Minute	Indicates the GC duration of the Broker process per minute.	12000 ms
		Heap Memory Usage of Kafka	Indicates the Kafka heap memory usage.	95%
		Kafka Direct Memory Usage	Indicates the Kafka direct memory usage.	95%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
Loader	Memory	Heap Memory Usage Calculate	Indicates the Loader heap memory usage.	95%
		Direct Memory Usage of Loader	Indicates the Loader direct memory usage.	80.0%
		Non-heap Memory Usage of Loader	Indicates the Loader non-heap memory usage.	80%
	GC	Total GC time of Loader	Indicates the total GC time of Loader.	12000 ms
MapReduce	Garbage Collection	GC Time	Indicates the GC time.	12000 ms
	Resource	JobHistoryServer Direct Memory Usage Statistics	Indicates the JobHistoryServer direct memory usage.	90%
		JobHistoryServer Non-Heap Memory Usage Statistics	Indicates the JobHistoryServer non-heap memory usage.	90%
		JobHistoryServer Heap Memory Usage Statistics	Indicates the JobHistoryServer non-heap memory usage.	95%
Oozie	Memory	Oozie Heap Memory Usage Calculate	Indicates the Oozie heap memory usage.	95.0%
		Oozie Direct Memory Usage	Indicates the Oozie direct memory usage.	80.0%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
		Oozie Non-heap Memory Usage	Indicates the Oozie non-heap memory usage.	80%
	GC	Total GC duration of Oozie	Indicates the Oozie total GC time.	12000 ms
Spark/ Spark2x	Memory	JDBCServer2x Heap Memory Usage Statistics	JDBCServer2x heap memory usage	95%
		JDBCServer2x Direct Memory Usage Statistics	JDBCServer2x direct memory usage	95%
		JDBCServer2x Non-Heap Memory Usage Statistics	JDBCServer2x non-heap memory usage	95%
		JobHistory2x Direct Memory Usage Statistics	JobHistory2x direct memory usage	95%
		JobHistory2x Non-Heap Memory Usage Statistics	JobHistory2x non-heap memory usage	95%
		JobHistory2x Heap Memory Usage Statistics	JobHistory2x heap memory usage	95%
		IndexServer2x Direct Memory Usage Statistics	IndexServer2x direct memory usage	95%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold	
		IndexServer2x Heap Memory Usage Statistics	IndexServer2x heap memory usage	95%	
		IndexServer2x Non-Heap Memory Usage Statistics	IndexServer2x non-heap memory usage	95%	
	GC Count	Full GC Number of JDBCServer2x	Full GC times of JDBCServer2x	12	
		Full GC Number of JobHistory2x	Full GC times of JobHistory2x	12	
		Full GC Number of IndexServer2x	Full GC times of IndexServer2x	12	
	GC Time	Total GC Time in Milliseconds	Total GC time of JDBCServer2x	12000 ms	
		Total GC Time in Milliseconds	Total GC time of JobHistory2x	12000 ms	
		Total GC Time in Milliseconds	Total GC time of IndexServer2x	12000 ms	
	Storm	Cluster	Number of Available Supervisors	Indicates the number of available Supervisor processes in the cluster in a measurement period.	1
			Slot Usage	Indicates the slot usage in the cluster in a measurement period.	80.0%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
	Nimbus	Nimbus Heap Memory Usage Calculate	Indicates the Nimbus heap memory usage.	80%
Yarn	Resources	NodeManager Direct Memory Usage Statistics	Indicates the percentage of direct memory used by NodeManagers.	90%
		NodeManager Heap Memory Usage Statistics	Indicates the percentage of NodeManager heap memory usage.	95%
		NodeManager Non-Heap Memory Usage Statistics	Indicates the percentage of NodeManager non-heap memory usage.	90%
		ResourceManager Direct Memory Usage Statistics	Indicates the Kafka direct memory usage.	90%
		ResourceManager Heap Memory Usage Statistics	Indicates the ResourceManager heap memory usage.	95%
		ResourceManager Non-Heap Memory Usage Statistics	Indicates the ResourceManager non-heap memory usage.	90%
	Garbage collection	GC Time	Indicates the GC duration of NodeManager per minute.	12000 ms

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
		GC Time	Indicates the GC duration of ResourceManager per minute.	12000 ms
	Others	Failed Applications of root queue	Number of failed tasks in the root queue	50
		Terminated Applications of root queue	Number of killed tasks in the root queue	50
	CPU & memory	Pending Memory	Pending memory capacity	83886080MB
	Application	Pending Applications	Pending tasks	60
ZooKeeper	Connection	ZooKeeper Connections Usage	Indicates the percentage of the used connections to the total connections of ZooKeeper.	80%
	CPU & memory	Directmemory Usage Calculate	Indicates the ZooKeeper heap memory usage.	95%
		Heap Memory Usage Calculate	Indicates the ZooKeeper direct memory usage.	80%
	GC	ZooKeeper GC Duration per Minute	Indicates the GC time of ZooKeeper every minute.	12000 ms
Ranger	GC	UserSync GC Duration	UserSync garbage collection (GC) duration	12000 ms
		RangerAdmin GC Duration	RangerAdmin GC duration	12000 ms

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
		TagSync GC Duration	TagSync GC duration	12000 ms
	CPU & memory	UserSync Non-Heap Memory Usage	UserSync non-heap memory usage	80.0%
		UserSync Direct Memory Usage	UserSync direct memory usage	80.0%
		UserSync Heap Memory Usage	UserSync heap memory usage	95.0%
		RangerAdmin Non-Heap Memory Usage	RangerAdmin non-heap memory usage	80.0%
		RangerAdmin Heap Memory Usage	RangerAdmin heap memory usage	95.0%
		RangerAdmin Direct Memory Usage	RangerAdmin direct memory usage	80.0%
		TagSync Direct Memory Usage	TagSync direct memory usage	80.0%
		TagSync Non-Heap Memory Usage	TagSync non-heap memory usage	80.0%
		TagSync Heap Memory Usage	TagSync heap memory usage	95.0%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
ClickHouse	Cluster Quota	Clickhouse service quantity quota usage in ZooKeeper	Quota of the ZooKeeper nodes used by a ClickHouse service	90%
		Capacity quota usage of the Clickhouse service in ZooKeeper	Capacity quota of ZooKeeper directory used by the ClickHouse service	90%
IoTDB	GC	IoTDBServer GC Duration	IoTDBServer garbage collection (GC) duration	12000 ms
	CPU & memory	IoTDBServer Heap Memory Usage	IoTDBServer heap memory usage	90%
		IoTDBServer Direct Memory Usage	IoTDBServer direct memory usage	90%

### 8.4.1.3 Configuring the Alarm Masking Status

#### Scenario

If you do not want FusionInsight Manager to report specified alarms in the following scenarios, you can manually mask the alarms.

- Some unimportant alarms and minor alarms need to be masked.
- When a third-party product is integrated with MRS, some alarms of the product are duplicated with the alarms of MRS and need to be masked.
- When the deployment environment is special, certain alarms may be falsely reported and need to be masked.

After an alarm is masked, new alarms with the same ID as the alarm are neither displayed on the **Alarm** page nor counted. The reported alarms are still displayed.

#### Procedure

- Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **O&M > Alarm > Masking Setting**.

**Step 3** In the **Masking Setting** area, select the specified service or module.

**Step 4** Select an alarm from the alarm list.

**Figure 8-32** Masking an alarm

The information about the alarm is displayed, including the alarm name, ID, severity, masking status, and operations can be performed on the alarm.

- The masking status includes **Display** and **Masking**.
- Operations include **Masking** and **Help**.

**NOTE**

You can filter specified alarms based on the masking status and alarm severity.

**Step 5** Set the masking status for an alarm:

- Click **Masking**. In the displayed dialog box, click **OK** to change the alarm masking status to **Masking**.
- Click **Cancel Masking**. In the dialog box that is displayed, click **OK** to change the masking status of the alarm to **Display**.

----End

## 8.4.2 Log

### 8.4.2.1 Log Online Search

#### Scenario

FusionInsight Manager allows you to search for logs online and view the log content of components to locate faults.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **O&M > Log > Online Search**.

**Figure 8-33** Online Search

**Step 3** Configure the parameters listed in [Table 8-20](#) to search for the logs you need. You can select a default log search duration (including **0.5h**, **1h**, **2h**, **6h**, **12h**, **1d**, **1w**, and **1m**), or click  to customize **Start Data** and **End Data**.

**Table 8-20** Log search parameters

Parameter	Description
Search Content	Keywords or regular expression to be searched for
Service	Service or module for which you want to query logs
File	Log files to be searched for when only one role is selected
Lowest Log Level	Lowest level of logs to be queried. After you select a level, the logs of this level and higher levels are displayed. The levels in ascending order are as follows: TRACE < DEBUG < INFO < WARN < ERROR < FATAL
Host Scope	<ul style="list-style-type: none"> <li>You can click  to select hosts.</li> <li>Enter the host name of the node for which you want to query logs or the IP address of the management plane.</li> <li>Use commas (,) to separate IP addresses, for example, <b>192.168.10.10,192.168.10.11</b>.</li> <li>Use hyphens (-) to indicate an IP address segment if the IP addresses are consecutive, for example, <b>192.168.10.[10-20]</b>.</li> <li>Use hyphens (-) to indicate an IP address segment if the IP addresses are consecutive, and use commas (,) to separate IP address segments, for example, <b>192.168.10.[10-20,30-40]</b>.</li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>If this parameter is not specified, all hosts are selected by default.</li> <li>A maximum of 10 expressions can be entered at a time.</li> <li>A maximum of 2,000 hosts can be matched for all entered expressions at a time.</li> </ul>
Advanced Configurations	<ul style="list-style-type: none"> <li><b>Max Quantity:</b> maximum number of logs that can be displayed at a time. If the number of queried logs exceeds the value of this parameter, the earliest logs will be ignored. If this parameter is not set, the maximum number of logs that can be displayed at a time is not limited.</li> <li><b>Timeout Duration:</b> log query timeout duration. This parameter is used to limit the maximum log query time on each node. When the query times out, the query is stopped and the logs that have been searched for are still displayed.</li> </ul>

**Step 4** Click **Search**. [Table 8-21](#) describes the fields in search results.

**Table 8-21** Parameters in search results

Parameter	Description
Time	Time when a line of log is generated
Host Name	Host name of the node where the log file recording the line of log is located
Location	Path of the log file recording the line of log Click the location information to go to the online log browsing page. By default, 100 lines of logs before and 100 lines after the line of log are displayed. You can click <b>Load More</b> on the top or bottom of the page to view more logs. Click <b>Download</b> to download the log file to the local PC.
Line No.	Line number of a line of log in the log file
Level	Level of the line of log
Log	Log content

 **NOTE**

You can click **Stop** to forcibly stop the search. You can view the search results in the list.

- Step 5** Click **Filter** to filter the logs to display on the page. [Table 8-22](#) lists the fields that you can use to filter logs. After you configure these parameters, click **Filter** to search for logs meeting the search criteria. You can click **Reset** to clear the information that you have filled in.

**Table 8-22** Parameters for filtering logs

Parameter	Description
Keywords	Keywords of the log to be searched for
Host Name	Name of the host to be searched for
Location	Path of the log file to be searched for
Started	Start time for logs to be searched for
Completed	End time for logs to be searched for

----End

## 8.4.2.2 Log Download

### Scenario

FusionInsight Manager allows you to batch export logs generated on all instances of each service.

### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **O&M > Log > Download**.

**Step 3** Select a log download range:

1. **Service:** Click  and select a service.
2. **Host:** Enter the IP address of the host where the service is deployed. You can also click  to select the required host.
3. Click  in the upper right corner and configure **Start Time** and **End Time**.

**Step 4** Click **Download**.

The downloaded log package contains the topology information of the start time and end time, helping you quickly find the log you need.

The topology file is named in the format of **topo\_<Topology structure change time>.txt**. The file contains the node IP address, host name, and service instances that reside on the node. (OMS nodes are identified by **Manager:Manager**.)

Example:

```
192.168.204.124|suse-124|
DBService:DBServer;KrbClient:KerberosClient;LdapClient:SlapdClient;LdapServer:SlapdServer;Manager:Manager;meta:meta
```

----End

## 8.4.3 Perform a Health Check

### 8.4.3.1 Viewing a Health Check Task

#### Scenario

Administrators can view all health check tasks in the health check management center to check whether the cluster is affected after the modification.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **O&M > Health Check**.

**Figure 8-34** Health Check

By default, all saved health check reports are listed. The parameters for a health check report are as follows:

**Table 8-23** Parameters for a health check report

Parameter	Description
Check Object	Object to be checked. You can expand the list to view its details.
Status	Check result status. Value options are <b>No problems found</b> , <b>Problems found</b> , and <b>Checking</b> .
Check Type	Entity on which the check is to be performed. Value options are <b>System</b> , <b>Cluster</b> , <b>Host</b> , <b>Service</b> , and <b>OMS</b> . If you select <b>Cluster</b> , all items are checked by default.
Start Mode	Whether the health check is automatically or manually performed
Started	Start time of the check
Completed	End time of the check
Operation	Operations you can perform. Value options are <b>Export Report</b> and <b>View Help</b> .

 **NOTE**

- In the upper right corner of the check list, you can filter health checks by check type or status.
- If **Check Type** is **Cluster**, **View Help** is displayed in the **Check Object** drop-down list.
- During a health check, the system determines whether check objects are healthy based on their historical monitoring metric data.

----End

### 8.4.3.2 Managing Health Check Reports

#### Scenario

FusionInsight Manager allows you to download and delete health check reports.

## Procedure

- Step 1** Log in to FusionInsight Manager.
  - Step 2** Choose **O&M > Health Check**.
  - Step 3** Locate the row containing the target health check report and click **Export Report** in the **Operation** to download the report.
- End

### 8.4.3.3 Modifying Health Check Configuration

#### Scenario

Administrators can enable automatic health check to reduce manual operation time. By default, the automatic health check checks the entire cluster.

#### Procedure

- Step 1** Log in to FusionInsight Manager.
  - Step 2** Choose **O&M > Health Check > Configuration**.  
**Periodic Health Check** indicates whether to enable automatic health check. Selecting **Enable** to enable the automatic health check, and selecting **Disable** to disable the function.  
Set the health check period to **Daily**, **Weekly**, or **Monthly** as required.
  - Step 3** Click **OK** to save the configurations.
- End

### 8.4.4 Configuring Backup and Backup Restoration

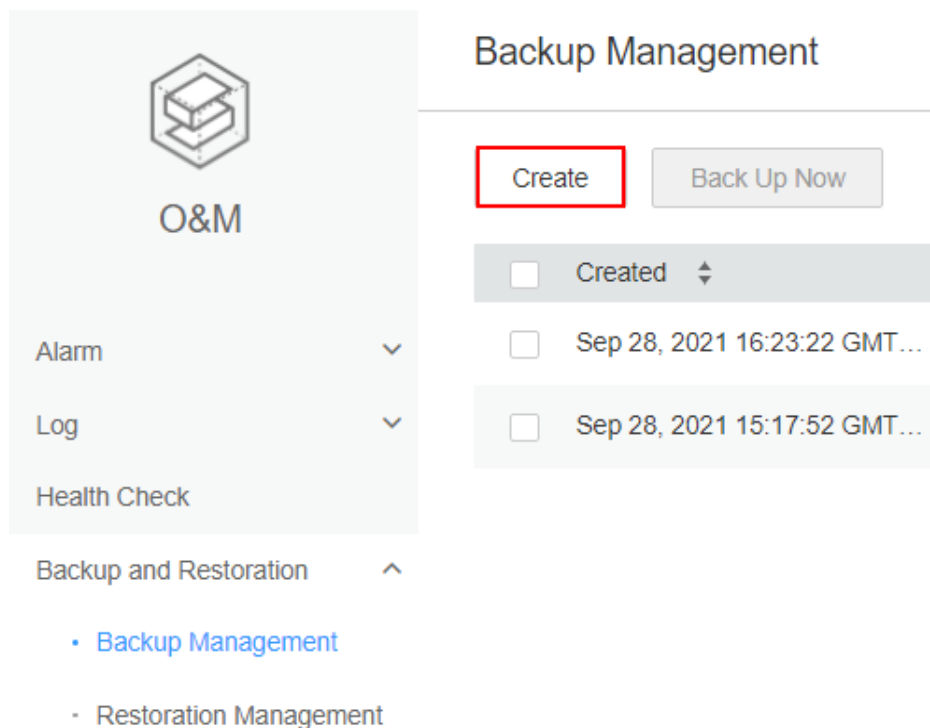

#### 8.4.4.1 Creating a Backup Task

#### Scenario

You can create backup tasks on FusionInsight Manager. Executing backup tasks backs up related data.

#### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **O&M > Backup and Restoration > Backup Management**. On the page that is displayed, click **Create**.

**Figure 8-35** Creating a backup task

**Step 3** Set **Backup Object** to **OMS** or the cluster whose data you want to back up.

**Step 4** Enter a task name in the **Name** text box.

**Step 5** Set **Mode** to **Periodic** or **Manual** as required.

**Table 8-24** Backup types

Type	Parameter	Description
Periodic backup	Start Time	Indicates the time when a periodic backup task is started for the first time.
	Period	Task execution interval. Value options are <b>Hours</b> and <b>Days</b> .
	Backup Policy	The following policies can be selected: <ul style="list-style-type: none"> <li>• Full backup at the first time and subsequent incremental backup</li> <li>• Full backup every time</li> <li>• Full backup once every n times</li> </ul>
Manual backup	N/A	You need to manually execute the task to back up data.

**Step 6** Set required parameters in the **Configuration** area.

- Metadata and service data can be backed up.
- For details about how to back up data of different components, see [Backup and Recovery Management](#).

**Step 7** Click **OK** to save the configurations.

**Step 8** In the backup task list, you can view the created backup task.

Locate the row that contains the target backup task, choose **More > Back Up Now** in the **Operation** column to execute the task immediately.

----End

### 8.4.4.2 Creating a Backup Restoration Task

#### Scenario

You can create a backup restoration task on FusionInsight Manager. After the restoration task is executed, the specified backup data is restored to the cluster.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **O&M > Backup and Restoration > Restoration Management**. On the page that is displayed, click **Create**.

**Step 3** Configure **Task Name**.

**Step 4** Set **Recovery Object** to **OMS** or the cluster whose data you want to restore.

**Step 5** Set the required parameters in the **Recovery Configuration** area.

- Metadata and service data can be restored.
- For details about how to restore data of different components, see [Backup and Recovery Management](#).

**Step 6** Click **OK** to save the configurations.

**Step 7** In the restoration task list, you can view the created restoration tasks.

Locate the row containing the target restoration task, click **Start** in the **Operation** column to execute the restoration task immediately.

----End

### 8.4.4.3 Managing Backup and Backup Restoration Tasks

#### Scenario

You can also maintain and manage backup restoration tasks on FusionInsight Manager.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **O&M > Backup and Restoration > Backup Management** or **Restoration Management**.

**Step 3** In the **Operation** column of the specified task in the task list, select the operation to be performed.

**Table 8-25** Maintenance and management operations

Operation Entry	Description
<b>Config</b>	Modify parameters for the backup task.
<b>Recover</b>	After some service data is successfully backed up, you can use this function to quickly restore data.
<b>More &gt; Back Up Now</b>	Perform this operation to execute the backup task immediately.
<b>More &gt; Stop</b>	Perform this operation to stop a running task.
<b>More &gt; Delete</b> or <b>Delete</b>	This operation is used to delete tasks.
<b>More &gt; Suspend</b>	Perform this operation to disable the automatic backup task function.
<b>More &gt; Resume</b>	Perform this operation to enable the automatic backup task function.
<b>More &gt; View History</b> or <b>View History</b>	Perform this operation to switch to the task run log page to view the task running details and backup path.
<b>View</b>	Perform this operation to check the parameter settings of the restoration task.
<b>Start</b>	Perform this operation to run the restoration task.

----End

## 8.5 Audit

### 8.5.1 Overview

#### Scenario

The **Audit** page displays the user operations on Manager. On this page, administrators can view historical user operations on Manager. For details about the audit information, see [Audit Logs](#).

#### Overview

Log in to FusionInsight Manager and choose **Audit**. The **Audit** page displays the operation type, risk level, start time, end time, user, host name, service, instance, and operation result.

**Figure 8-36** Audit information list

Audit

Operation Type	Risk Level	Started	Completed	User	Source name	Host	Service	Instance	Operation Res...
Lock screen	Notice	Aug 5, 2022 16:05...	Aug 5, 2022 16:05...	admin	OMS	--	--	--	Successful
User login	Notice	Aug 5, 2022 15:59...	Aug 5, 2022 15:59...	admin	OMS	--	--	--	Successful
Unlock screen	Notice	Aug 5, 2022 15:59...	Aug 5, 2022 15:59...	admin	OMS	--	--	--	Successful
Lock screen	Notice	Aug 5, 2022 15:55...	Aug 5, 2022 15:55...	admin	OMS	--	--	--	Successful
User login	Notice	Aug 5, 2022 15:55...	Aug 5, 2022 15:55...	admin	OMS	--	--	--	Successful
User login	Notice	Aug 5, 2022 15:55...	Aug 5, 2022 15:55...	admin	OMS	--	--	--	Successful
User login	Notice	Aug 5, 2022 15:54...	Aug 5, 2022 15:54...	admin	OMS	--	--	--	Successful
User login	Notice	Aug 5, 2022 15:45...	Aug 5, 2022 15:45...	admin	OMS	--	--	--	Successful
User logout	Notice	Aug 5, 2022 15:43...	Aug 5, 2022 15:43...	admin	OMS	--	--	--	Successful
User login	Notice	Aug 5, 2022 15:43...	Aug 5, 2022 15:43...	admin	OMS	--	--	--	Successful

10 Total Records: 244 < 1 2 3 4 5 ... 25 >

- You can select audit logs at the **Critical, Major, Minor, or Notice** level from the **All risk levels** drop-down list.
  - In **Advanced Search**, you can set filter criteria to query audit logs.
    - a. You can query audit logs by user management, cluster, service, and health in the **Operation Type** column.
    - b. In the **Service** column, you can select a service to query corresponding audit logs.
-  **NOTE**
- You can select -- to search for audit logs using all other search criteria except services.
- c. You can query audit logs by operation result. Value options are **All, Successful, Failed, and Unknown**.
- You can click  to manually refresh the current page or click  to filter the columns displayed in the page.
  - Click **Export All** to export all audit information at a time. The audit information can be exported in **TXT** or **CSV** format.

## 8.5.2 Configuring Audit Log Dumping

### Scenario

The audit logs of FusionInsight Manager are stored in the database by default. If the audit logs are retained for a long time, the disk space of the data directory may be insufficient. To store audit logs to another archive server, administrators can set the required dump parameters to automatically dump these logs. This facilitates the management of audit logs.

If you do not configure the audit log dumping, the system automatically saves the audit logs to a file when the number of audit logs reaches 100,000 pieces. The path is ``${BIGDATA_DATA_HOME}/dbdata_om/dumpData/iam/operatelog` on the active management node. The file name format is **OperateLog\_store\_YY\_MM\_DD\_HH\_MM\_SS.csv**. A maximum of 50 historical audit log files can be saved.

**NOTE**

Archived audit logs will not be displayed on FusionInsight Manager. Only new audit logs generated after the old logs are automatically saved are displayed.

**Procedure**

**Step 1** Log in to FusionInsight Manager.

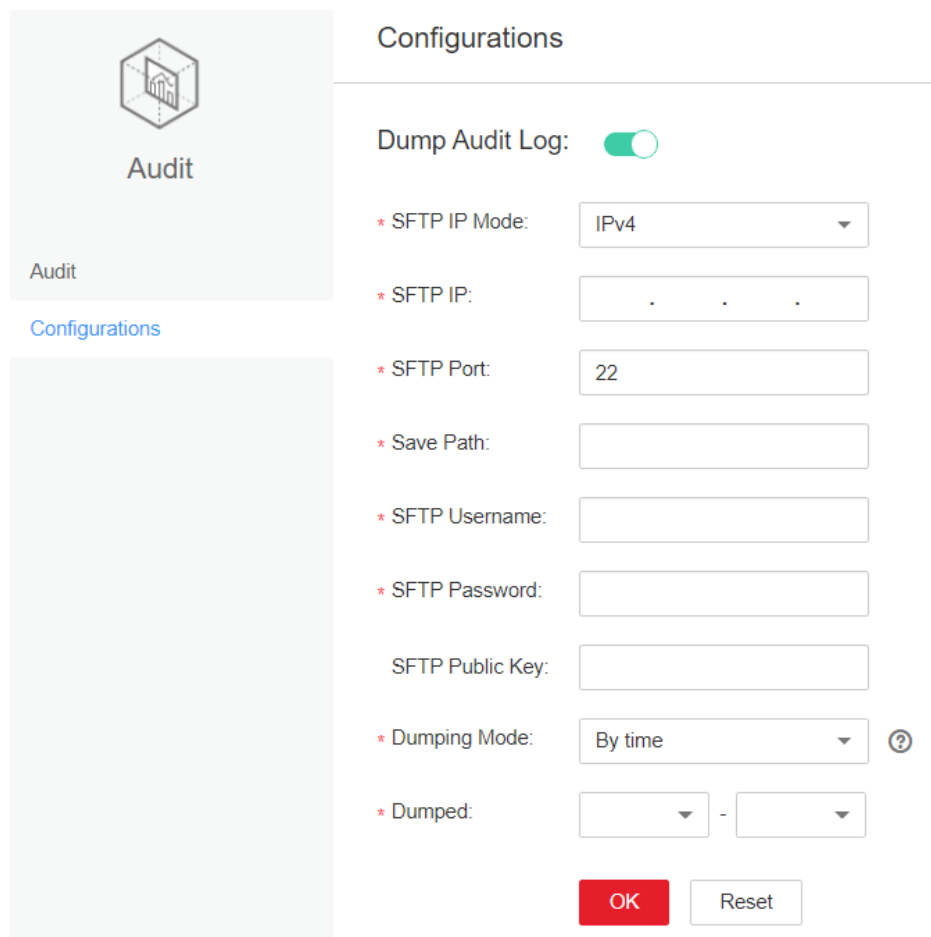

**Step 2** Choose **Audit > Configuration**.

**Step 3** Click the switch on the right of **Audit Log Dumping Flag**.

**Audit Log Dump** is disabled by default. If  is displayed, **Audit Log Dump** is enabled.

**Step 4** Set the dump parameters based on information provided in [Table 8-26](#)

**Figure 8-37** Dump parameters

**Table 8-26** Audit log dump parameters

Parameter	Description	Value
SFTP IP Mode	Mode of the destination IP address. The value can be <b>IPv4</b> or <b>IPv6</b> .	IPv4

Parameter	Description	Value
SFTP IP	SFTP server for storing dumped audit logs. You are advised to use the SFTP service based on SSH v2 to prevent security risks.	<b>192.168.10.51</b> (example value)
SFTP Port	Connection port of the SFTP server for storing dumped audit logs	<b>22</b> (example value)
Save Path	Path for storing audit logs on the SFTP server	<b>/opt/omm/oms/auditLog</b> (example value)
SFTP Username	User name for logging in to the SFTP server	<b>root</b> (example value)
SFTP Password	Password for logging in to the SFTP server	<i>Password for logging in to the SFTP server</i>
SFTP Public key	Specifies the public key of the SFTP server. This parameter is optional. You are advised to set the public key of the SFTP server. Otherwise, security risks may exist.	-
Dumping Mode	Dump mode. Value options are as follows: <ul style="list-style-type: none"><li>• <b>By Quantity</b>: If the number of pieces of logs reaches the value of this parameter (<b>100000</b> by default), the logs are dumped.</li><li>• <b>By Time</b>: specifies the date when logs are dumped. The dumping frequency is once a year.</li></ul>	<ul style="list-style-type: none"><li>• By Quantity</li><li>• By Time</li></ul>
Dumping Date	This parameter is available only when <b>Dumping Mode</b> is set to <b>By time</b> . After you select a dump date, the system starts dumping on this date. The logs to be dumped include all the audit logs generated before January 1 00:00 of the current year.	11-06

 **NOTE**

If the SFTP public key is empty, the system displays a security risk warning. Evaluate the security risk and then save the configuration.

**Step 5** Click **OK** to complete the settings.

 **NOTE**

Key fields in the audit log dump file are as follows:

- **USERTYPE** indicates the user type. Value **0** indicates a human-machine user, and value **1** indicates a machine-machine user.
- **LOGLEVEL** indicates the security level. Value **0** indicates Critical, value **1** indicates Major, value **2** indicates Minor, and value **3** indicates Warning.
- **OPERATERESULT** indicates the operation result. Value **0** indicates that the operation is successful, and value **1** indicates that the operation is failed.

----End

## 8.6 Tenant Resources

### 8.6.1 Multi-Tenancy

#### 8.6.1.1 Overview

##### Definition

Multi-tenancy refers to multiple resource sets (a resource set is a tenant) in the MRS big data cluster and is able to allocate and schedule resources. The resources include computing resources and storage resources.

##### Context

Modern enterprises' data clusters are becoming more and more centralized and cloud-based. Enterprise-class big data clusters must meet the following requirements:

- Carry data of different types and formats and run jobs and applications of different types (such analysis, query, and stream processing).
- Isolate data of a user from that of another user who has demanding requirements on data security, such as a bank or government institute.

The preceding requirements bring the following challenges to the big data clusters:

- Proper allocation and scheduling of resources to ensure stable operating of applications and jobs.
- Strict access control to ensure data and service security.

Multi-tenancy isolates the resources of a big data cluster into resource sets. Users can lease desired resource sets to run applications and jobs and store data. In a big data cluster, multiple resource sets can be deployed to meet diverse requirements of multiple users.

The MRS big data cluster provides a complete enterprise-class big data multi-tenant solution.

## Highlights

- Proper resource configuration and isolation  
The resources of a tenant are isolated from those of another tenant. The resource use of a tenant does not affect other tenants. This mechanism ensures that each tenant can configure resources based on service requirements, improving resource utilization.
- Resource consumption measurement and statistics  
Tenants are system resource applicants and consumers. System resources are planned and allocated based on tenants. Resource consumption by tenants can be measured and collected.
- Assured data security and access security  
In multi-tenant scenarios, the data of each tenant is stored separately to ensure data security. The access to tenants' resources is controlled to ensure access security.

### 8.6.1.2 Technical Principles

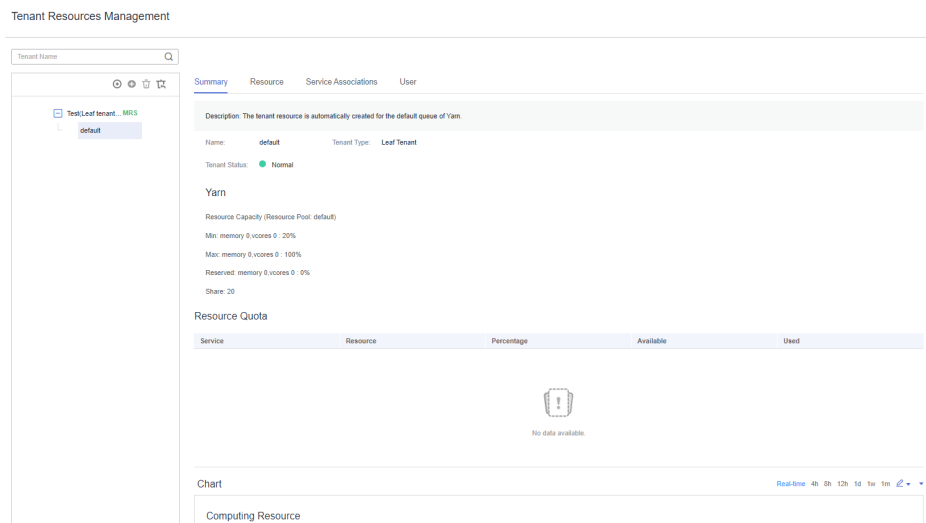

#### 8.6.1.2.1 Multi-Tenant Management

##### Unified Multi-Tenant Management

Log in to FusionInsight Manager and choose **Tenant Resources > Tenant Resources Management**. On the page that is displayed, you can find that FusionInsight Manager is a unified multi-tenant management platform that integrates multiple functions such as tenant lifecycle management, tenant resource configuration, tenant service association, and tenant resource usage statistics, delivering a mature multi-tenant management model and achieving centralized tenant and service management.

##### Graphical User Interface

FusionInsight Manager provides the graphical multi-tenant management interface and manages and operates multiple levels of tenants using the tree structure. Additionally, FusionInsight Manager integrates the basic information and resource quota of the current tenant in one interface to facilitate O&M and management, as shown in [Figure 8-38](#).

**Figure 8-38** Tenant management page of FusionInsight Manager

## Hierarchical Tenant Management

FusionInsight Manager supports a hierarchical tenant management model in which you can add sub-tenants to an existing tenant to re-configure resources. Sub-tenants of level-1 tenants are level-2 tenants. So on and so forth. FusionInsight Manager provides enterprises with a field-tested multi-tenant management model, enabling centralized tenant and service management.

## Simplified Permission Management

FusionInsight Manager hides internal permission management details from common users and simplifies permission management operations for administrators, improving usability and user experience of tenant permission management.

- FusionInsight Manager employs role-based access control (RBAC) to configure different permissions for users based on service scenarios during multi-tenant management.
- The administrator of tenants has tenant management permissions, including viewing resources and services of the current tenant, adding or deleting sub-tenants of the current tenant, and managing permissions of sub-tenants' resources. FusionInsight Manager supports setting of the administrator for a single tenant so that the management over this tenant can be delegated to a user who is not the system administrator.
- Roles of a tenant have all permissions on the computing resources and storage resources of the tenant. When a tenant is created, the system automatically creates roles for this tenant. You can add a user and bind the user to the tenant roles so that the user can use the resources of the tenant.

## Clear Resource Management

- **Self-Service Resource Configuration**

In FusionInsight Manager, you can configure the computing resources and storage resources during the creation of a tenant and add, modify, or delete the resources of the tenant.

Permissions of the roles that are associated with a tenant are updated automatically when you modify the computing or storage resources of the tenant.

- **Resource Usage Statistics**

Resource usage statistics are critical for administrators to determine O&M activities based on the status of cluster applications and services, improving the cluster O&M efficiency. FusionInsight Manager displays the resource statistics of tenants in **Resource Quota**, including the vCores, memory, and HDFS storage resources.

 **NOTE**

- **Resource Quota** dynamically calculates the resource usage of tenants.

Service	Resource	Percentage	Available	Used
HDFS	Space	 0.00%	20.00 GB	0 MB
Yarn	Memory	 0.00%	8.00 GB	0 MB
Yarn	CPU	 0.00%	4 vCores	0 vCores

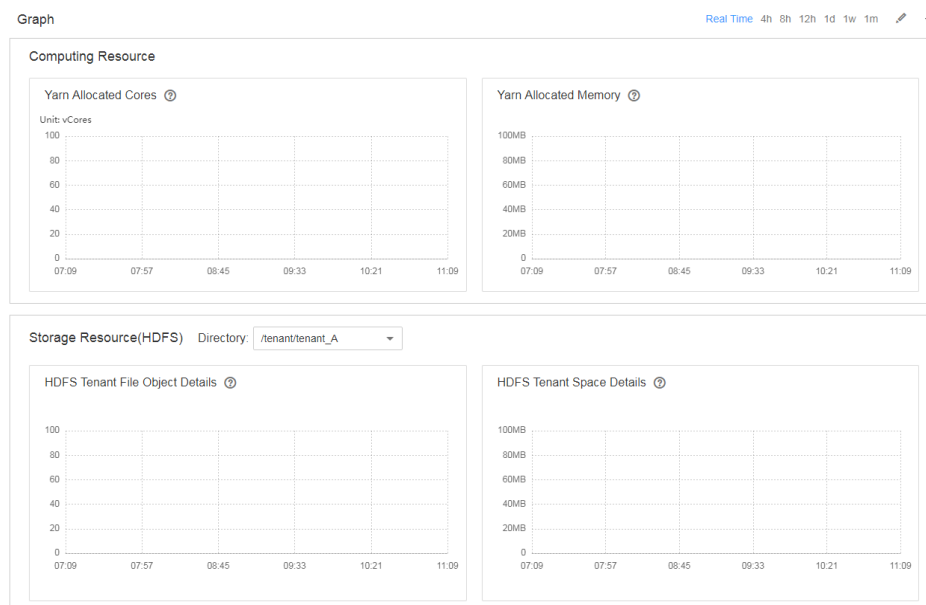

The available resources of the Superior scheduler are calculated as follows:

- Superior  
The available Yarn resources (memory and CPU) are allocated in proportion based on the queue weight.
- When the tenant administrator is bound to a tenant role, the tenant administrator has the permissions to manage the tenant and use all resources of the tenant.

- **Graphical Resource Monitoring**

Graphical resource monitoring supports the graphical display of monitoring metrics listed in [Table 8-27](#), as shown in [Figure 8-39](#).

**Figure 8-39** Refined monitoring

By default, the real-time monitoring data is displayed. You can click  to customize a time range. The default time ranges include 4 hours, 8 hours, 12 hours, 1 day, 1 week, and 1 month. Click  and select **Export** to export the monitoring metric information.

**Table 8-27** Monitoring metrics

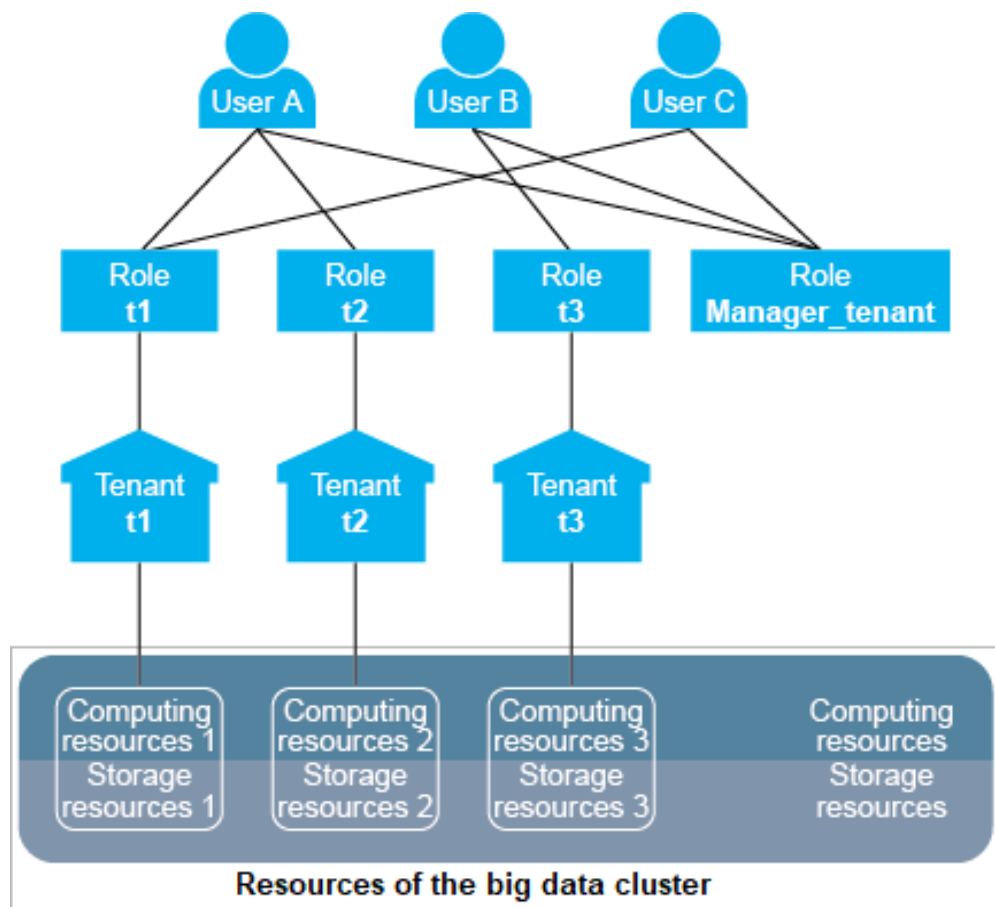

Service	Metric Item	Description
HDFS	HDFS Tenant Space Details <ul style="list-style-type: none"> <li>Allocated Space</li> <li>Used Space</li> </ul>	HDFS can monitor a specified storage directory. The storage directory is the same as the directory added by the current tenant in <b>Resource</b> .
	HDFS Tenant File Object Details <ul style="list-style-type: none"> <li>Number of Used File Objects</li> </ul>	
Yarn	Yarn Allocated Cores <ul style="list-style-type: none"> <li>Maximum Number of CPU Cores in an AM</li> <li>Allocated Cores</li> <li>Number of Used CPU Cores in an AM</li> </ul>	Monitoring information of the current tenant is displayed. If no sub-item is configured for a tenant, this information is not displayed.  The monitoring data is obtained from <b>Scheduler &gt; Application Queues &gt; Queue: <i>Tenant name</i></b> on the native web UI of Yarn.
	Yarn Allocated Memory <ul style="list-style-type: none"> <li>Allocated Maximum AM Memory</li> <li>Allocated Memory</li> <li>Used AM Memory</li> </ul>	

### 8.6.1.2.2 Multi-Tenant Model

#### Related Model

The following figure shows a multi-tenant model.

**Figure 8-40** Multi-tenant model

**Table 8-28** describes the concepts involved in **Figure 8-40**.

**Table 8-28** Concepts in the model

Concept	Description
User	A natural person who has a username and password and uses the big data cluster. There are three different users in <b>Figure 8-40</b> : user A, user B, and user C.
Role	A role is a carrier of one or more permissions. Permissions are assigned to specific objects, for example, access permissions for the <b>/tenant</b> directory in HDFS. <b>Figure 8-40</b> shows four roles: <b>t1</b> , <b>t2</b> , <b>t3</b> , and <b>Manager_tenant</b> . <ul style="list-style-type: none"> <li>Roles <b>t1</b>, <b>t2</b>, and <b>t3</b> are automatically generated when tenants are created. The role names are the same as the tenant names. That is, roles <b>t1</b>, <b>t2</b>, and <b>t3</b> map to tenants <b>t1</b>, <b>t2</b>, and <b>t3</b>. Role names and tenant names need to be used in pair.</li> <li>Role <b>Manager_tenant</b> is defaulted in the cluster and cannot be used separately.</li> </ul>

Concept	Description
Tenant	<p>A tenant is a resource set in a big data cluster. Multiple tenants are referred to as multi-tenancy. The resource sets further divided under a tenant are called sub-tenants.</p> <p><b>Figure 8-40</b> shows three tenants: <b>t1</b>, <b>t2</b>, and <b>t3</b>.</p>
Resource	<ul style="list-style-type: none"> <li>Computing resources include CPUs and memory. The computing resources of a tenant are allocated from the total computing resources in the cluster. One tenant cannot occupy the computing resources of another tenant. In <b>Figure 8-40</b>, computing resources 1, 2, and 3 are allocated for tenants <b>t1</b>, <b>t2</b>, and <b>t3</b> respectively from the cluster's computing resources.</li> <li>Storage resources include disks and third-party storage systems. The storage resources of a tenant are allocated from the total storage resources in the cluster. One tenant cannot occupy the storage resources of another tenant. In <b>Figure 8-40</b>, storage resources 1, 2, and 3 are allocated for tenants <b>t1</b>, <b>t2</b>, and <b>t3</b> respectively from the cluster's storage resources.</li> </ul>

If a user wants to use a tenant's resources or add or delete a sub-tenant of a tenant, the user needs to be bound to both the tenant role and role **Manager\_tenant**. **Table 8-29** lists the roles bound to each user in **Figure 8-40**.

**Table 8-29** Roles bound to each user

User	Role	Permission
User A	<ul style="list-style-type: none"> <li>Role <b>t1</b></li> <li>Role <b>t2</b></li> <li>Role <b>Manager_tenant</b></li> </ul>	<ul style="list-style-type: none"> <li>Uses the resources of tenants <b>t1</b> and <b>t2</b>.</li> <li>Adds or deletes sub-tenants of tenants <b>t1</b> and <b>t2</b>.</li> </ul>
User B	<ul style="list-style-type: none"> <li>Role <b>t3</b></li> <li>Role <b>Manager_tenant</b></li> </ul>	<ul style="list-style-type: none"> <li>Uses the resources of tenant <b>t3</b>.</li> <li>Adds or deletes sub-tenants of tenant <b>t3</b>.</li> </ul>
User C	<ul style="list-style-type: none"> <li>Role <b>t1</b></li> <li>Role <b>Manager_tenant</b></li> </ul>	<ul style="list-style-type: none"> <li>Uses the resources of tenant <b>t1</b>.</li> <li>Adds or deletes sub-tenants of tenant <b>t1</b>.</li> </ul>

A user can be bound to multiple roles, and one role can also be bound to multiple users. Users are associated with tenants after being bound to the tenant roles. Therefore, tenants and users form a many-to-many relationship. One user can use the resources of multiple tenants, and multiple users can use the resources of the

same tenant. For example, in [Figure 8-40](#), user A uses the resources of tenants **t1** and **t2**, and users A and C uses the resources of tenant **t1**.

#### NOTE

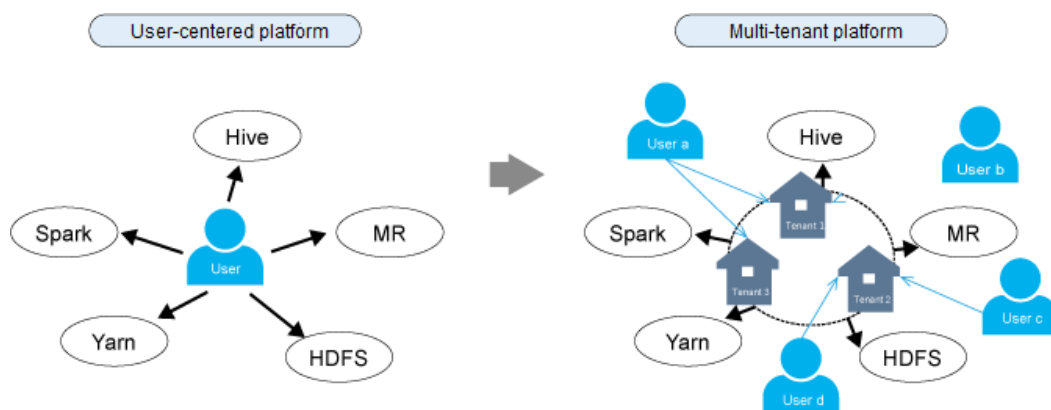

The concepts of a parent tenant, sub-tenant, level-1 tenant, and level-2 tenant are all designed for the multi-tenant service scenarios. Pay attention to the differences these concepts and the concepts of a leaf tenant resource and non-leaf tenant resource on FusionInsight Manager.

- Level-1 tenant: determined based on the tenant's level. For example, the first created tenant is a level-1 tenant and its sub-tenant is a level-2 tenant.
- Parent tenant and sub-tenant: indicates the hierarchical relationship between tenants.
- Non-leaf tenant resource: indicates the tenant type selected during tenant creation. This tenant type can be used to create sub-tenants.
- Leaf tenant resource: indicates the tenant type selected during tenant creation. This tenant type cannot be used to create sub-tenants.

## Multi-Tenant Platform

Tenant is a core concept of the FusionInsight big data platform. It plays an important role in big data platforms' transformation from user-centered to multi-tenant to keep up with enterprises' multi-tenant application environments. [Figure 8-41](#) shows the transformation of big data platforms.

**Figure 8-41** Platform transformation from user-centered to multi-tenant

On a user-centered big data platform, users can directly access and use all resources and services.

- However, user applications may use only partial cluster resources, resulting in low resource utilization.
- The data of different users may be stored together, decreasing data security.

On a multi-tenant big data platform, users use required resources and services by accessing the tenants.

- Resources are allocated and scheduled based on application requirements and used based on tenants, increasing resource utilization.
- Users can access the resources of tenants only after being associated with tenant roles, enhancing access security.

- The data of tenants is isolated, ensuring data security.

### 8.6.1.2.3 Resource Overview

MRS cluster resources are classified into computing resources and storage resources. The multi-tenant architecture implements resource isolation.

- **Computing resources**

Computing resources include CPUs and memory. One tenant cannot occupy the computing resources of another tenant.

- **Storage resources**

Storage resources include disks and third-party storage systems. One tenant cannot access the data of another tenant.

## Computing Resources

Computing resources are divided into static service resources and dynamic resources.

- **Static Service Resources**

Static service resources are computing resources allocated to each service and are not shared between services. The total computing resources of each service are fixed. These services include Flume, HBase, HDFS, and Yarn.

- **Dynamic Resources**

Dynamic resources are computing resources dynamically scheduled to a job queue by the distributed resource management service Yarn. Yarn dynamically schedules resources for the job queues of MapReduce, Spark2x, Flink, and Hive.

 **NOTE**

The resources allocated to Yarn in a big data cluster are static service resources but can be dynamically allocated to job queues by Yarn.

## Storage Resources

Storage resources are data storage resources that can be allocated by the distributed file storage service HDFS. Directory is the basic unit of allocating HDFS storage resources. Tenants can obtain storage resources from the specified directories in the HDFS file system.

### 8.6.1.2.4 Dynamic Resources

#### Overview

Yarn provides distributed resource management for a big data cluster. The total volume of resources allocated to Yarn can be configured. Then Yarn allocates and schedules computing resources for job queues. The computing resources of MapReduce, Spark, Flink, and Hive job queues are allocated and scheduled by Yarn.

Yarn queues are fundamental units of scheduling computing resources.

The resources obtained by tenants using Yarn queues are dynamic resources. Users can dynamically create and modify the queue quotas and view the status and statistics of the queues.

## Resource Pools

Nowadays, enterprise IT systems often face complex cluster environments and diverse upper-layer requirements. For example:

- Heterogeneous cluster: The computing speed, storage capacity, and network performance of each node in the cluster are different. All the tasks of complex applications need to be properly allocated to each compute node in the cluster based on service requirements.
- Computing isolation: Data must be shared among multiple departments but computing resources must be distributed onto different compute nodes.

These require that the compute nodes be further partitioned.

Resource pools are used to specify the configuration of dynamic resources. Yarn queues are associated with resource pools for resource allocation and scheduling.

One tenant can have only one default resource pool. Users can be bound to the role of a tenant to use the resources in the resource pool of the tenant. To use resources in multiple resource pools, a user can be bound to roles of multiple tenants.

## Scheduling Mechanism

Yarn dynamic resources support label-based scheduling. This policy creates labels for compute nodes (Yarn NodeManagers) and adds the compute nodes with the same label into the same resource pool. Then Yarn dynamically associates the queues with resource pools based on the resource requirements of the queues.

For example, a cluster has more than 40 nodes which are labeled by **Normal**, **HighCPU**, **HighMEM**, or **HighIO** based on their hardware and network configurations and added into four resource pools, respectively. [Table 8-30](#) describes the performance of each node in the resource pool.

**Table 8-30** Performance of each node in a resource pool

Label	Number of Nodes	Hardware and Network Configuration	Added To	Associated With
Normal	10	General	Resource pool A	Common queue
HighCPU	10	High-performance CPU	Resource pool B	Computing-intensive queue
HighMEM	10	Large memory	Resource pool C	Memory-intensive queue

Label	Number of Nodes	Hardware and Network Configuration	Added To	Associated With
HighIO	10	High-performance network	Resource pool D	I/O-intensive queue

A queue can use only the compute nodes in its associated resource pool.

- A common queue is associated with resource pool A and uses **Normal** nodes with general hardware and network configurations.
- A computing-intensive queue is associated with resource pool B and uses **HighCPU** nodes with high-performance CPUs.
- A memory-intensive queue is associated with resource pool C and uses **HighMEM** nodes with large memory.
- An I/O-intensive queue is associated with resource pool C and uses **HighIO** nodes with high-performance network.

Yarn queues are associated with specified resource pools to efficiently utilize resources in resource pools and maximize node performance.

FusionInsight Manager supports a maximum of 50 resource pools. The system has a default resource pool.

## Schedulers

By default, the Superior scheduler is enabled for the MRS cluster.

- The Superior scheduler is an enhanced version and named after the Lake Superior, indicating that the scheduler can manage a large amount of data.

To meet enterprise requirements and tackle scheduling challenges faced by the Yarn community, the Superior scheduler makes the following enhancements:

- Enhanced resource sharing policy  
The Superior scheduler supports queue hierarchy. It integrates the functions of open-source schedulers and shares resources based on configurable policies. In terms of instances, administrators can use the Superior scheduler to configure an absolute value or percentage policy for queue resources. The resource sharing policy of the Superior scheduler enhances label-based scheduling of Yarn as a resource pool feature. The nodes in the Yarn cluster can be grouped based on the capacity or service type to ensure that queues can more efficiently utilize resources.
- Tenant-based resource reservation policy  
Some tenants may run critical tasks at some time, and their resource requirements must be preferentially addressed. The Superior scheduler builds a mechanism to support the resource reservation policy. Reserved resources can be allocated to the critical tasks running in the specified tenant queues in a timely manner to ensure proper task execution.

- Fair sharing among tenants and resource pool users  
The Superior scheduler allows shared resources to be configured for users in a queue. Each tenant may have users with different weights. Heavily weighted users may require more shared resources.
- Ensured scheduling performance in a big cluster  
The Superior scheduler receives heartbeats from each NodeManager and saves resource information in memory, which enables the scheduler to control cluster resource usage globally. The Superior scheduler uses the push scheduling model, which makes the scheduling more precise and efficient and remarkably improves cluster resource utilization. Additionally, the Superior scheduler delivers excellent performance when the interval between NodeManager heartbeats is long and prevents heartbeat storms in big clusters.
- Priority policy  
If the minimum resource requirement of a service cannot be met after the service obtains all available resources, a preemption occurs. The preemption function is disabled by default.

### 8.6.1.2.5 Storage Resources

#### Overview

As a distributed file storage service in a big data cluster, HDFS stores all the user data of the upper-layer applications in the big data cluster, including the data written to HBase tables or Hive tables.

A directory is the basic unit of allocating HDFS storage resources. HDFS supports the conventional hierarchical file structure. Users or applications can create directories and create, delete, move, or rename files in directories. Tenants can obtain storage resources from specified directories in the HDFS file system.

#### Scheduling Mechanism

HDFS directories can be stored on nodes with specified labels or disks of specified hardware types. For example:

- When both real-time query and data analysis tasks are running in the same cluster, the real-time query tasks need to be deployed only on certain nodes, and the task data must also be stored on these nodes.
- Based on actual service requirements, key data needs to be stored on highly reliable nodes.

Administrators can flexibly configure HDFS data storage policies based on actual service requirements and data features to store data on specified nodes.

For tenants, storage resources refer to the HDFS resources they use. Data of specified directories can be stored to the tenant-specified storage paths, thereby implementing storage resource scheduling and ensuring data isolation between tenants.

Users can add or delete HDFS storage directories of tenants and set the file quantity quota and storage capacity quota of directories to manage storage resources.

## 8.6.1.3 Multi-Tenancy Usage

### 8.6.1.3.1 Overview

Tenants are used in resource control and service isolation scenarios. Administrators need to determine the service scenarios of cluster resources and then plan tenants.

 **NOTE**

- Yarn in a new cluster uses the Superior scheduler by default. For details, see [Using the Superior Scheduler](#).

Multi-tenancy involves three types of operations: creating a tenant, managing tenants, and managing resources. [Table 8-31](#) describes these operations.

**Table 8-31** Multi-tenant operations

Operation	Action	Description
Creating a tenant	<ul style="list-style-type: none"><li>• Add a tenant.</li><li>• Add a sub-tenant.</li><li>• Create a user and bind the user to the role of a tenant.</li></ul>	<p>During the creation of a tenant, you can configure its computing resources, storage resources, and associated services based on service requirements. In addition, you can add users to the tenant and bind necessary roles to these users.</p> <p>A user to create a level-1 tenant needs to be bound to the <b>Manager_administrator</b> or <b>System_administrator</b> role.</p> <p>A user to create a sub-tenant needs to be bound to the role of the parent tenant at least.</p>
Managing tenants	<ul style="list-style-type: none"><li>• Manage the tenant directory.</li><li>• Restore tenant data.</li><li>• Clear non-associated queues of a tenant.</li><li>• Delete a tenant.</li></ul>	<p>You can edit tenants as services change.</p> <p>A user to manage or delete a level-1 tenant or restore tenant data needs to be bound to the <b>Manager_administrator</b> or <b>System_administrator</b> role.</p> <p>A user to manage or delete a sub-tenant needs to be bound to the role of the parent tenant at least.</p>

Operation	Action	Description
Managing resources	<ul style="list-style-type: none"><li>• Create a resource pool.</li><li>• Modify a resource pool.</li><li>• Delete a resource pool.</li><li>• Configure a queue.</li><li>• Configure the queue capacity policy of a resource pool.</li><li>• Clear configurations of a queue.</li></ul>	<p>You can reconfigure resources for tenants as the services change.</p> <p>A user to manage resources needs to be bound to the <b>Manager_administrator</b> or <b>System_administrator</b> role.</p>

### 8.6.1.3.2 Process Overview

Administrators need to determine the service scenarios of cluster resources and then plan tenants. After that, administrators add tenants and configure dynamic resources, storage resources, and associated services for the tenants on FusionInsight Manager.

[Process Overview](#) shows the process for creating a tenant.

**Figure 8-42** Creating a tenant

**Table 8-32** describes the operations for creating a tenant.

**Table 8-32** Operations for creating a tenant

Operation	Description
Add a tenant.	You can configure the computing resources, storage resources, and associated services of the tenant.
Add a sub-tenant.	You can configure the computing resources, storage resources, and associated services of the sub-tenant.
Add a user and bind the user to the tenant role.	If a user wants to use the resources of tenant <b>tenant1</b> or add or delete sub-tenants for <b>tenant1</b> , the user must be bound to both the <b>Manager_tenant</b> and <b>tenant1_Cluster ID</b> roles.

## 8.6.2 Using the Superior Scheduler

### 8.6.2.1 Creating Tenants

#### 8.6.2.1.1 Adding a Tenant

##### Scenario

You can create tenants on FusionInsight Manager based on the resource consumption and isolation planning and requirements of services.

##### Prerequisites

- A tenant name has been planned based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.
- Resources to be allocated to the current tenant have been planned to ensure that the sum of resources of direct sub-tenants at each level does not exceed the resources of the current tenant.

##### Procedure

**Step 1** Log in to FusionInsight Manager and choose **Tenant Resources**.

**Step 2** Click . On the page that is displayed, configure tenant attributes according to [Table 8-33](#).

**Table 8-33** Tenant parameters

Parameter	Description
Cluster	Indicates the cluster for which you want to create a tenant.
Name	<ul style="list-style-type: none"><li>• Indicates the name of the current tenant. The value consists of 3 to 50 characters, including digits, letters, and underscores (_).</li><li>• Plan a tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.</li></ul>

Parameter	Description
Tenant Resource Type	<p>Specifies whether the tenant is a leaf tenant.</p> <ul style="list-style-type: none"><li>• When <b>Leaf Tenant Resource</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added.</li><li>• When <b>Non-leaf Tenant Resource</b> is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant.</li></ul> <p><b>NOTE</b> MRS 3.2.0 or later: If you select <b>ClickHouse</b> for <b>Service</b>, this parameter can only be set to <b>Leaf Tenant</b>.</p>
Computing Resource	<p>Specifies the dynamic computing resources for the current tenant.</p> <ul style="list-style-type: none"><li>• When <b>Yarn</b> is selected, the system automatically creates a queue in Yarn and the queue is named the same as the tenant name.<ul style="list-style-type: none"><li>– A leaf tenant can directly submit jobs to the queue.</li><li>– A non-leaf tenant cannot directly submit jobs to the queue. However, Yarn adds an extra queue (hidden) named <b>default</b> for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual jobs do not run in this queue.</li></ul></li><li>• If <b>Yarn</b> is not selected, the system does not automatically create a queue.</li></ul>
Configuration Mode	<p>Indicates the configuration mode of computing resource parameters.</p> <ul style="list-style-type: none"><li>• If you select <b>Basic</b>, you only need to set <b>Default Resource Pool Capacity (%)</b>.</li><li>• If you select <b>Advanced</b>, you can manually configure the resource allocation weight and the minimum, maximum, and reserved resources of the tenant.</li></ul>
Default Resource Pool Capacity (%)	<p>Indicates the percentage of computing resources used by the current tenant in the default resource pool. The value ranges from <b>0</b> to <b>100%</b>.</p>
Weight	<p>Indicates the resource allocation weight. The value ranges from <b>0</b> to <b>100</b>.</p>

Parameter	Description
Minimum Resource	Indicates the resources guaranteed for the tenant (preemption supported). The value can be a percentage or an absolute value of the parent tenant's resources. When a tenant has a light workload, the resources of the tenant are automatically allocated to other tenants. When the available tenant resources are less than the value of <b>Minimum Resource</b> , the tenant can preempt the resources that have been lent to other tenants.
Maximum Resource	Indicates the maximum resources that can be used by the tenant. The tenant cannot obtain more resources than the value configured. The value can be a percentage or an absolute value of the parent tenant's resources.
Reserved Resource	Indicates the resources reserved for the tenant. The reserved resources cannot be used by other tenants even if no job is running in the current tenant resources. The value can be a percentage or an absolute value of the parent tenant's resources.
Storage Resource	Specifies storage resources for the current tenant. <ul style="list-style-type: none"><li>• When <b>HDFS</b> is selected, the system automatically allocates storage resources.</li><li>• When <b>HDFS</b> is not selected, the system does not automatically allocate storage resources.</li></ul>
Quota	Indicates the quota for files and directories.
Space Quota	Indicates the quota for the HDFS storage space used by the current tenant. <ul style="list-style-type: none"><li>• If the unit is set to <b>MB</b>, the value ranges from <b>1</b> to <b>8796093022208</b>. If the unit is set to <b>GB</b>, the value ranges from <b>1</b> to <b>8589934592</b>.</li><li>• This parameter indicates the maximum HDFS storage space that can be used by the tenant, but not the actual space used.</li><li>• If its value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk.</li></ul>
Storage Path	Indicates an HDFS directory for tenant resource data. <ul style="list-style-type: none"><li>• The system automatically creates a folder named after the tenant name in the <b>/tenant</b> directory by default. For example, the default HDFS storage directory for tenant <b>ta1</b> is <b>/tenant/ta1</b>.</li><li>• When a tenant is created for the first time, the system creates the <b>/tenant</b> directory in the HDFS root directory. The storage path is customizable.</li></ul>

Parameter	Description
Service	Specifies whether to associate resources of other services. For details, see <a href="#">Step 4</a> .
Description	Indicates the description of the current tenant.

 NOTE

Roles, computing resources, and storage resources are automatically created when tenants are created.

- The new role has permissions on the computing and storage resources. This role and its permissions are automatically controlled by the system and cannot be manually managed by choosing **System > Permission > Role**. The role name is in the format of *Tenant name\_Cluster ID*. The ID of the first cluster is not displayed by default.
- When using this tenant, create a system user and bind the user to the role of the tenant. For details, see [Adding a User and Binding the User to a Tenant Role](#).
- During the tenant creation, the system automatically creates a Yarn queue named after the tenant. If the queue name already exists, the new queue is named **Tenant name-N**. *N* indicates a natural number starting from 1. When a same name exists, the value *N* increases automatically to differentiate the queue from others. For example, **saletenant**, **saletenant-1**, and **saletenant-2**.

**Step 3** Check whether the current tenant needs to be associated with resources of other services.

- If yes, go to [Step 4](#).
- If no, go to [Step 5](#).

**Step 4** Click **Associate Service** to configure other service resources used by the current tenant, and click **OK**.

- Set **Service** to **HBase** and **Association Type** to **Exclusive** or **Shared**.

 NOTE

- **Exclusive** indicates that the service resources are used by the tenant exclusively and cannot be associated with other tenants.
- **Shared** indicates that the service resources can be shared with other tenants.
- MRS 3.2.0 or later: Select **ClickHouse** for **Service**.
  - **Association Type**: When **Service** is set to **ClickHouse**, **Association Type** can only be set to **Shared**.
  - **Associate Logical Cluster**: If the logical cluster function is not enabled for ClickHouse, **default\_cluster** is selected by default. If the function is enabled, select the logical cluster to which you want to associate.
  - **CPU Priority**: The CPU priority ranges from -20 to 19. This value is associated with the NICE value of the OS. A smaller value indicates a higher CPU priority.
  - **Memory**: The maximum value of this parameter is **100**, in percentage. For example, if this parameter is set to **80**, the total memory that can be used by the current tenant is calculated as follows: Available memory x 80%.

 **NOTE**

- Only HBase can be associated with a new tenant. However, HDFS, HBase, and Yarn can be associated with existing tenants.
- To associate an existing tenant with service resources, click the target tenant in the tenant list, switch to the **Service Associations** page, and click **Associate Service** to configure resources to be associated with the tenant.
- To disassociate an existing tenant from service resources, click the target tenant in the tenant list, switch to the **Service Associations** page, and click **Delete** in the **Operation** column. In the displayed dialog box, select **I have read the information and understand the impact** and click **OK**.

**Step 5** Click **OK**. Wait until the system displays a message indicating that the tenant is successfully created.

----End

### 8.6.2.1.2 Adding a Sub-Tenant

#### Scenario

You can create sub-tenants on FusionInsight Manager and allocate resources of the current tenant to the sub-tenants based on the resource consumption and isolation planning and requirements of services.

#### Prerequisites

- A parent non-leaf tenant has been added.
- A sub-tenant name has been planned based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.
- Resources to be allocated to the current tenant have been planned to ensure that the sum of resources of direct sub-tenants at each level does not exceed the resources of the current tenant.

#### Procedure

**Step 1** Log in to FusionInsight Manager and choose **Tenant Resources**.

**Step 2** In the tenant list on the left, select a parent tenant and click . On the page for adding a sub-tenant, set attributes for the sub-tenant according to [Table 8-34](#).

**Table 8-34** Sub-tenant parameters

Parameter	Description
Cluster	Indicates the cluster to which the parent tenant belongs.
Parent Tenant Resource	Indicates the name of the parent tenant.

Parameter	Description
Name	<ul style="list-style-type: none"><li>Indicates the name of the current tenant. The value consists of 3 to 50 characters, including digits, letters, and underscores (_).</li><li>Plan a sub-tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.</li></ul>
Tenant Resource Type	<p>Specifies whether the tenant is a leaf tenant.</p> <ul style="list-style-type: none"><li>When <b>Leaf Tenant Resource</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added.</li><li>When <b>Non-leaf Tenant Resource</b> is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant. However, the tenant depth cannot exceed 5 levels.</li></ul>
Computing Resource	<p>Specifies the dynamic computing resources for the current tenant.</p> <ul style="list-style-type: none"><li>When <b>Yarn</b> is selected, the system automatically creates a queue in Yarn and the queue is named the same as the sub-tenant name.<ul style="list-style-type: none"><li>A leaf tenant can directly submit jobs to the queue.</li><li>A non-leaf tenant cannot directly submit jobs to the queue. However, Yarn adds an extra queue (hidden) named <b>default</b> for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual jobs do not run in this queue.</li></ul></li><li>If <b>Yarn</b> is not selected, the system does not automatically create a queue.</li></ul>
Configuration Mode	<p>Indicates the configuration mode of computing resource parameters.</p> <ul style="list-style-type: none"><li>If you select <b>Basic</b>, you only need to set <b>Default Resource Pool Capacity (%)</b>.</li><li>If you select <b>Advanced</b>, you can manually configure the resource allocation weight and the minimum, maximum, and reserved resources of the tenant.</li></ul>
Default Resource Pool Capacity (%)	<p>Indicates the percentage of computing resources used by the current tenant. The base value is the total resources of the parent tenant.</p>
Weight	<p>Indicates the resource allocation weight. The value ranges from <b>0</b> to <b>100</b>.</p>

Parameter	Description
Minimum Resource	Indicates the resources guaranteed for the tenant (preemption supported). The value can be a percentage or an absolute value of the parent tenant's resources. When a tenant has a light workload, the resources of the tenant are automatically allocated to other tenants. When the available tenant resources are less than the value of <b>Minimum Resource</b> , the tenant can preempt the resources that have been lent to other tenants.
Maximum Resource	Indicates the maximum resources that can be used by the tenant. The tenant cannot obtain more resources than the value configured. The value can be a percentage or an absolute value of the parent tenant's resources.
Reserved Resource	Indicates the resources reserved for the tenant. The reserved resources cannot be used by other tenants even if no job is running in the current tenant resources. The value can be a percentage or an absolute value of the parent tenant's resources.
Storage Resource	Specifies storage resources for the current tenant. <ul style="list-style-type: none"><li>• When <b>HDFS</b> is selected, the system automatically creates a folder named after the sub-tenant in the HDFS parent tenant directory.</li><li>• When <b>HDFS</b> is not selected, the system does not automatically allocate storage resources.</li></ul>
Quota	Indicates the quota for files and directories.
Space Quota	Indicates the quota for the HDFS storage space used by the current tenant. <ul style="list-style-type: none"><li>• If the unit is set to <b>MB</b>, the value ranges from <b>1</b> to <b>8796093022208</b>. If the unit is set to <b>GB</b>, the value ranges from <b>1</b> to <b>8589934592</b>.</li><li>• This parameter indicates the maximum HDFS storage space that can be used by the tenant, but not the actual space used.</li><li>• If its value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk.</li><li>• If this quota is greater than the quota of the parent tenant, the actual storage space does not exceed the quota of the parent tenant.</li></ul>

Parameter	Description
Storage Path	Indicates the HDFS storage directory for the tenant. <ul style="list-style-type: none"><li>The system automatically creates a folder named after the sub-tenant name in the directory of the parent tenant by default. For example, if the sub-tenant is <b>ta1s</b> and the parent directory is <b>/tenant/ta1</b>, the storage path for the sub-tenant is then <b>/tenant/ta1/ta1s</b>.</li><li>The storage path is customizable in the parent directory.</li></ul>
Service	Specifies whether to associate resources of other services. For details, see <a href="#">Step 4</a> .
Description	Indicates the description of the current tenant.

 **NOTE**

Roles, computing resources, and storage resources are automatically created when tenants are created.

- The new role has permissions on the computing and storage resources. This role and its permissions are automatically controlled by the system and cannot be manually managed by choosing **System > Permission > Role**. The role name is in the format of *Tenant name\_Cluster ID*. The ID of the first cluster is not displayed by default.
- When using this tenant, create a system user and bind the user to the role of the tenant. For details, see [Adding a User and Binding the User to a Tenant Role](#).
- The sub-tenant can further allocate the resources of its parent tenant. The sum of the resource percentages of direct sub-tenants under a parent tenant at each level cannot exceed 100%. The sum of the computing resource percentages of all level-1 tenants cannot exceed 100%.

**Step 3** Check whether the current tenant needs to be associated with resources of other services.

- If yes, go to [Step 4](#).
- If no, go to [Step 5](#).

**Step 4** Click **Associate Service** to configure other service resources used by the current tenant.

- Set **Services** to **HBase**.
- Set **Association Type** as follows:
  - Exclusive** indicates that the service resources are used by the tenant exclusively and cannot be associated with other tenants.
  - Shared** indicates that the service resources can be shared with other tenants.

 **NOTE**

- Only HBase can be associated with a new tenant. However, HDFS, HBase, and Yarn can be associated with existing tenants.
  - To associate an existing tenant with service resources, click the target tenant in the tenant list, switch to the **Service Associations** page, and click **Associate Service** to configure resources to be associated with the tenant.
  - To disassociate an existing tenant from service resources, click the target tenant in the tenant list, switch to the **Service Associations** page, and click **Delete** in the **Operation** column. In the displayed dialog box, select **I have read the information and understand the impact** and click **OK**.
3. Click **OK**.

**Step 5** Click **OK**. Wait until the system displays a message indicating that the tenant is successfully created.

----End

### 8.6.2.1.3 Adding a User and Binding the User to a Tenant Role

#### Scenario

A newly created tenant cannot directly log in to the cluster to access resources. You need to add a user for the tenant on FusionInsight Manager and bind the user to the role of the tenant to assign operation permissions to the user.

#### Prerequisites

You have clarified service requirements and created a tenant.

#### Procedure

**Step 1** Log in to FusionInsight Manager and choose **System > Permission > User**.

**Step 2** If you want to add a user to the system, click **Create**.

**Figure 8-43** Adding a user

User > Create

---

\* Username:

\* User Type:  Human-Machine  
 Machine-Machine

\* Password:

\* Confirm Password:

User Group: [Add](#) [Clear All](#) [Create User Group](#)

Primary Group:

Role: [Add](#) [Clear All](#) [Create Role](#)

Description:

If you want to bind tenant roles to an existing user in the system, locate the row of the user and click **Modify** in the **Operation** column.

Set user attributes according to [Table 8-35](#).

**Table 8-35** User parameters

Parameter	Description
Username	<p>Indicates the current username. The value contains 3 to 32 characters, including digits, letters, underscores (_), hyphens (-), and spaces.</p> <ul style="list-style-type: none"><li>• The username cannot be the same as the OS username of any node in the cluster. Otherwise, the user cannot be used.</li><li>• A username that differs only in alphabetic case from an existing username is not allowed. For example, if <b>User1</b> has been created, you cannot create <b>user1</b>. Enter the correct username when using <b>User1</b>.</li></ul>
User Type	<p>The options are <b>Human-Machine</b> and <b>Machine-Machine</b>.</p> <ul style="list-style-type: none"><li>• <b>Human-Machine</b> user: used for FusionInsight Manager O&amp;M and component client operations. If you select this option, set both <b>Password</b> and <b>Confirm Password</b> accordingly.</li><li>• <b>Machine-Machine</b> user: used for application development. If you select this option, the password is randomly generated.</li></ul>
Password	<p>This parameter is mandatory if <b>User Type</b> is set to <b>Human-Machine</b>.</p> <p>The password must contain 8 to 64 characters of at least four types of the following: uppercase letters, lowercase letters, digits, special characters, and spaces. The password cannot be the username or the username spelled backwards.</p>
Confirm Password	Enter the password again.
User Group	<p>In the <b>User Group</b> area, click <b>Add</b> and select user groups to add the user to the groups.</p> <ul style="list-style-type: none"><li>• If roles have been added to the user groups, the user can be granted the permissions of the roles.</li><li>• For example, add the user to the Hive user group to assign Hive permissions to the user.</li></ul>
Primary Group	Select a group as the primary group for the user to create directories and files. The drop-down list contains all groups selected in <b>User Group</b> .

Parameter	Description
Role	Click <b>Add</b> to bind a tenant role to the user. <b>NOTE</b> <ul style="list-style-type: none"><li>• If a user wants to use the resources of tenant <b>tenant1</b> and to add or delete sub-tenants for <b>tenant1</b>, the user must be bound to both the <b>Manager_tenant</b> and <b>tenant1_Cluster ID</b> roles.</li><li>• If the tenant has been associated with the HBase service and Ranger authentication is enabled for the cluster, you need to configure the HBase execution permissions on the Ranger page.</li></ul>
Description	Indicates the description of the current user.

**Step 3** Click **OK**.

----End

## 8.6.2.2 Managing Tenants

### 8.6.2.2.1 Managing Tenant Directories

#### Scenario

You can manage the HDFS storage directories used by specified tenants based on service requirements on FusionInsight Manager, such as adding tenant directories, changing the quotas for directories and files and for storage space, and deleting directories.

#### Prerequisites

A tenant with HDFS storage resources has been added.

#### Viewing a Tenant Directory

**Step 1** Log in to FusionInsight Manager and choose **Tenant Resources**.

**Step 2** In the tenant list on the left, click the target tenant.

**Step 3** Click the **Resource** tab.

**Step 4** View the **HDFS Storage** table.

- The **File Number Threshold** column provides the quota for files and directories of the tenant directory.
- The **Space Quota** column provides the storage space size of the tenant directory.

----End

## Adding a Tenant Directory

**Step 1** On FusionInsight Manager, choose **Tenant Resources**.

**Step 2** In the tenant list on the left, click the target tenant.

**Step 3** Click the **Resource** tab.

**Step 4** In the **HDFS Storage** area, click **Create Directory**.

- **Parent Directory**: indicates the storage directory used by the parent tenant of the current tenant.

 **NOTE**

This parameter is not displayed if the current tenant is not a sub-tenant.

- Set **Path** to a tenant directory path.

 **NOTE**

If the current tenant is not a sub-tenant, the new path is created in the HDFS root directory.

- Set **Quota** to the quota for files and directories.
- **File Number Threshold (%)** is valid only when **Quota** is set. If the ratio of the number of used files to the value of **Quota** exceeds the value of this parameter, an alarm is generated. If this parameter is not specified, no alarm is reported in this scenario.

 **NOTE**

The number of used files is collected every hour. Therefore, the alarm indicating that the ratio of used files exceeds the threshold is delayed.

- Set **Space Quota** to the storage space size of the tenant directory.
- If the ratio of used storage space to the value of **Space Quota** exceeds the **Storage Space Threshold (%)** value, an alarm is generated. If this parameter is not specified, no alarm is reported in this scenario.

 **NOTE**

The used storage space is collected every hour. Therefore, the alarm indicating that the ratio of used storage space exceeds the threshold is delayed.

**Step 5** Click **OK**.

----End

## Modifying a Tenant Directory

**Step 1** On FusionInsight Manager, choose **Tenant Resources**.

**Step 2** In the tenant list on the left, click the target tenant.

**Step 3** Click the **Resource** tab.

**Step 4** In the **HDFS Storage** table, click **Modify** in the **Operation** column of the specified tenant directory.

- Set **Quota** to the quota for files and directories.
- **File Number Threshold (%)** is valid only when **Quota** is set. If the ratio of the number of used files to the value of **Quota** exceeds the value of this

parameter, an alarm is generated. If this parameter is not specified, no alarm is reported in this scenario.

- Set **Space Quota** to the storage space size of the tenant directory.
- If the ratio of used storage space to the value of **Space Quota** exceeds the **Storage Space Threshold (%)** value, an alarm is generated. If this parameter is not specified, no alarm is reported in this scenario.

**Step 5** Click **OK**.

----End

## Deleting a Tenant Directory

**Step 1** On FusionInsight Manager, choose **Tenant Resources**.

**Step 2** In the tenant list on the left, click the target tenant.

**Step 3** Click the **Resource** tab.

**Step 4** In the **HDFS Storage** table, click **Delete** in the **Operation** column of the specified tenant directory.

### NOTE

The tenant directory that is created by the system during tenant creation cannot be deleted.

**Step 5** Click **OK**.

----End

## 8.6.2.2.2 Restoring Tenant Data

### Scenario

Tenant data is stored on FusionInsight Manager and cluster components. When components are recovered from failures or reinstalled, some configuration data of all tenants may become abnormal. In this case, you need to manually restore the configuration data on FusionInsight Manager.

### Procedure

**Step 1** Log in to FusionInsight Manager and choose **Tenant Resources**.

**Step 2** In the tenant list on the left, click the target tenant.

**Step 3** Check the tenant data status.

1. On the **Summary** page, check **Tenant Status**. A green icon indicates that the tenant is available and gray indicates that the tenant is unavailable.
2. Click **Resource** and check the icons on the left of **Yarn** and **HDFS Storage**. A green icon indicates that the resource is available, and gray indicates that the resource is unavailable.
3. Click **Service Associations** and check the **Status** column of the associated services. **Normal** indicates that the component can provide services for the associated tenant. **Not Available** indicates that the component cannot provide services for the tenant.

4. If any of the preceding check items is abnormal, go to **Step 4** to restore tenant data.

**Step 4** Click . In the displayed dialog box, enter the password of the current login user and click **OK**.

**Step 5** In the **Restore Tenant Resource Data** window, select one or more components to restore data, and click **OK**. The system automatically restores the tenant data.

----End

### 8.6.2.2.3 Deleting a Tenant

#### Scenario

You can delete tenants that are no longer used on FusionInsight Manager based on service requirements to release resources occupied by the tenants.

#### Prerequisites

- A tenant has been added.
- The tenant has no sub-tenants. If the tenant has sub-tenants, delete them; otherwise, the tenant cannot be deleted.
- The role of the tenant is not associated with any user or user group.

#### Procedure

**Step 1** Log in to FusionInsight Manager and choose **Tenant Resources**.

**Step 2** In the tenant list on the left, click the target tenant and click .

##### NOTE

- If you want to retain the tenant data, select **Reserve the data of this tenant resource**. Otherwise, the storage space of the tenant will be deleted.

**Step 3** In the **Delete Tenant** dialog box, enter **DELETE** in the confirmation text box. Click **OK**.

It takes a few minutes to save the configuration. After the tenant is deleted, the role and storage space of the tenant are also deleted.

##### NOTE

After the tenant is deleted, the queue of the tenant still exists in Yarn. The queue of the tenant is not displayed on the role management page in Yarn.

----End

### 8.6.2.3 Managing Resources

#### 8.6.2.3.1 Adding a Resource Pool

#### Scenario

In a cluster, you can logically group Yarn NodeManagers into Yarn resource pools. Each NodeManager belongs to only one resource pool. You can create a custom

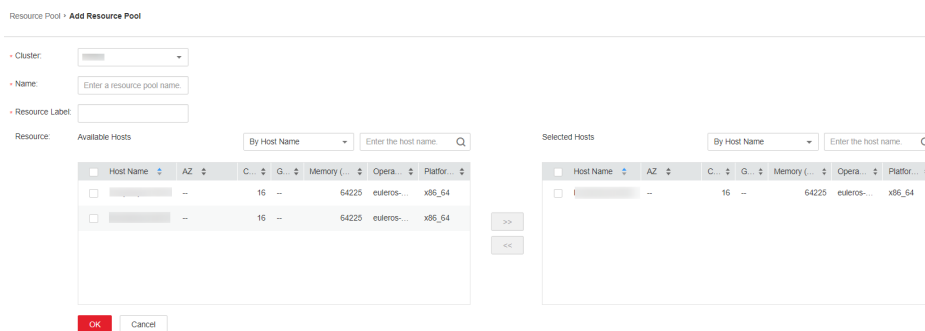

resource pool on FusionInsight Manager and add the hosts that have not been added to any custom resource pools to this resource pool so that specified queues can use the computing resources provided by these hosts.

The system contains a **default** resource pool by default. All NodeManagers that are not added to custom resource pools belong to this resource pool.

## Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Tenant Resources > Resource Pool**.
- Step 3** Click **Add Resource Pool**.
- Step 4** Set resource pool attributes.

**Figure 8-44** Adding resources

- **Cluster:** Select the cluster to which the resource pool is to be added.
- **Name:** Enter the name of the resource pool. The name contains 1 to 50 characters, including digits, letters, and underscores (`_`), and cannot start with an underscore (`_`).
- **Resource Label:** Enter the resource label of the resource pool. The value can contain 1 to 50 characters, including digits, letters, underscores (`_`), and hyphens (`-`), and must start with a digit or letter.
- **Resource:** In the **Available Hosts** area, select specified hosts and click  to add the hosts to the **Selected Hosts** area. Only hosts in the cluster can be selected. The host list in the resource pool can be left blank.

### NOTE

You can filter hosts by host name, number of CPU cores, memory, operating system, or platform type based on service requirements.

- Step 5** Click **OK**.

After the resource pool is created, you can view its name, members, and mode in the resource pool list. Hosts that are added to the custom resource pool are no longer members of the **default** resource pool.

----End

### 8.6.2.3.2 Modifying a Resource Pool

#### Scenario

When hosts in a resource pool need to be adjusted based on service requirements, you can modify members in the resource pool on FusionInsight Manager.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Tenant Resources > Resource Pool**.

**Step 3** In the resource pool list, locate the row that contains the specified resource pool, and click **Edit** in the **Operation** column.

**Step 4** In the **Resource** area, modify hosts.

- Adding hosts: Select desired hosts in **Available Hosts** and click  to add them to the resource pool.
- Deleting hosts: Select desired hosts in **Selected Hosts** and click  to remove them from the resource pool. The host list in the resource pool can be left blank.

**Step 5** Click **OK**.

----End

### 8.6.2.3.3 Deleting a Resource Pool

#### Scenario

If a resource pool is no longer used based on service requirements, you can delete it on FusionInsight Manager.

#### Prerequisites

- Any queue in the cluster does not use the resource pool to be deleted as the default resource pool. Before deleting the resource pool, cancel the default resource pool. For details, see [Modifying Queue Resources](#).
- Resource distribution policies of all queues have been cleared from the resource pool to be deleted. For details, see [Clearing Queue Configurations](#).

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Tenant Resources > Resource Pool**.

**Step 3** Locate the row that contains the specified resource pool, and click **Delete** in the **Operation** column.

**Step 4** In the displayed dialog box, click **OK**.

----End

### 8.6.2.3.4 Modifying Queue Resources

#### Scenario

If resources need to be adjusted based on service requirements, you can scale up or down a queue by modifying the queue configuration of a specified tenant on FusionInsight Manager. Yarn queues are associated with resource pools for resource allocation and scheduling.

#### Prerequisites

A tenant who uses the Superior scheduler has been added.

#### Procedure

- Step 1** On FusionInsight Manager, choose **Tenant Resources**.
- Step 2** Choose **Dynamic Resource Plan**.
- Step 3** Click the **Queue Configurations** tab.
- Step 4** In **All tenants resources** area, locate the row that contains the target tenant resource and click **Modify** in the **Operation** column.

#### NOTE

- You can also access the **Modify Queue Configuration** page as follows: In the tenant list on the **Tenant Resources Management** page, click the target tenant, click the **Resource** tab, and click  next to **Queue Configurations (Queue name)**.
- A queue can be bound to only one non-default resource pool.
- For parameters such as **Max Allocated vCores**, **Max Allocated Memory(MB)**, **Max Running Apps**, **Max Running Apps per User**, and **Max Pending Apps**, if the value of a sub-tenant is **-1**, the value of the parent tenant can be set to a specific limit. If the parent tenant value is a specific limit, the sub-tenant value can be set to **-1**.
- Max Allocated vCores** and **Max Allocated Memory(MB)** must be both changed to values other than **-1**.
- For queues with cross-resource-pool scheduling enabled, existing resource pools cannot be deleted during job running. Otherwise, running jobs may be continuously blocked because they cannot obtain resources. Similarly, if a new resource pool is configured for a queue during job running, the queue in the running state may not immediately use the resources in the new resource pool. The new resources are available only for jobs submitted after modification.

**Table 8-36** Queue configuration parameters

Parameter	Description
Max Master Shares(%)	Indicates the maximum percentage of resources occupied by all ApplicationMasters in the current queue.
Max Allocated vCores	Indicates the maximum number of cores that can be allocated to a single Yarn container in the current queue. The default value is <b>-1</b> , indicating that the number of cores is not limited within the value range.

Parameter	Description
Max Allocated Memory(MB)	Indicates the maximum memory that can be allocated to a single Yarn container in the current queue. The default value is <b>-1</b> , indicating that the memory is not limited within the value range.
Max Running Apps	Indicates the maximum number of tasks that can be executed at the same time in the current queue. The default value is <b>-1</b> , indicating that the number is not limited within the value range (the meaning is the same if the value is empty). Value <b>0</b> indicates that tasks cannot be executed. The value ranges from <b>-1</b> to <b>2147483647</b> .
Max Running Apps per User	Indicates the maximum number of tasks that can be executed by each user in the current queue at the same time. The default value is <b>-1</b> , indicating that the number is not limited within the value range (the meaning is the same if the value is empty). Value <b>0</b> indicates that tasks cannot be executed. The value ranges from <b>-1</b> to <b>2147483647</b> .
Max Pending Apps	Indicates the maximum number of tasks that can be suspended at the same time in the current queue. The default value is <b>-1</b> , indicating that the number is not limited within the value range (the meaning is the same if the value is empty). Value <b>0</b> indicates that tasks cannot be suspended. The value ranges from <b>-1</b> to <b>2147483647</b> .
Resource Allocation Rule	Indicates the rule for allocating resources to different tasks of a user. The rule can be <b>FIFO</b> or <b>FAIR</b> . If a user submits multiple tasks in the current queue and the rule is <b>FIFO</b> , the tasks are executed one by one in sequential order; If the rule is <b>FAIR</b> , resources are evenly allocated to all tasks.
Default Resource Label	Indicates that tasks are executed on a node with a specified resource label.
Cross-Pool Scheduling	Indicates whether containers in the current queue support cross-pool scheduling. This parameter is available for clusters of MRS 3.3.0 or later. This function cannot be enabled for the default queue.
Cross-Pool AM Scheduling	Indicates whether ApplicationMasters in the current queue support cross-pool scheduling. This parameter is available for clusters of MRS 3.3.0 or later. This function cannot be enabled for the default queue.

Parameter	Description
Active	<ul style="list-style-type: none"><li>● <b>ACTIVE</b>: indicates that the current queue can receive and execute tasks.</li><li>● <b>INACTIVE</b>: indicates that the current queue can receive but cannot execute tasks. Tasks submitted to the queue are suspended.</li></ul>
Open	<ul style="list-style-type: none"><li>● <b>OPEN</b>: indicates that the current queue is opened.</li><li>● <b>CLOSED</b>: indicates that the current queue is closed. Tasks submitted to the queue are rejected.</li></ul>
Migrate Queue Upon Fault	If cross-AZ HA is enabled for a cluster and an AZ is faulty, set <b>Migrate Queue Upon Fault</b> to <b>TRUE</b> to migrate running queues of the tenant to other AZs.

**Step 5** Click **OK**.

----End

### 8.6.2.3.5 Configuring the Queue Capacity Policy of a Resource Pool

#### Scenario

After a resource pool is added, you can configure the capacity policy of available resources for Yarn queues so that jobs in the queues can be properly executed in the resource pool.

This section describes how to configure the queue policy on FusionInsight Manager. Tenant queues equipped with the Superior scheduler can use resources in different resource pools.

#### Prerequisites

- You have logged in to FusionInsight Manager.
- A resource pool has been added.
- The target queue is not associated with the resource pools of other queues except the default resource pool.

#### Procedure

**Step 1** On FusionInsight Manager, choose **Tenant Resources**.

**Step 2** Choose **Dynamic Resource Plan**.

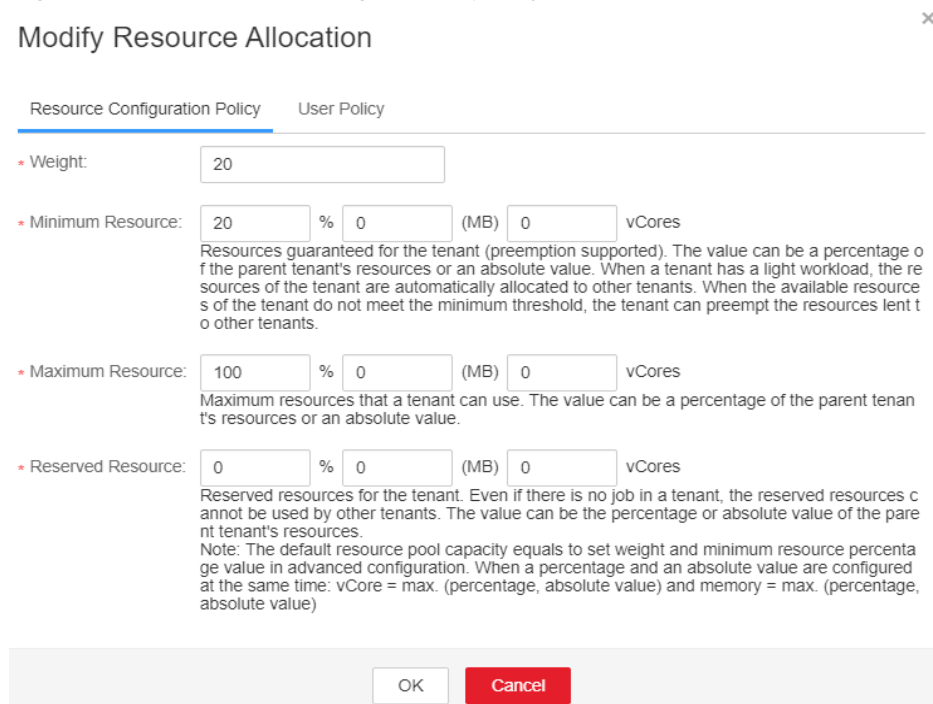

**Step 3** Click the **Resource Distribution Policy** tab.

**Step 4** Select the name of the target cluster from **Cluster** and select a resource pool from **Resource Pool**.

**Step 5** Locate the row that contains the target queue in the **Resource Allocation** area, and click **Modify** in the **Operation** column.

**Step 6** On the **Resource Configuration Policy** tab of the **Modify Resource Allocation** window, set the resource configuration policy of the queue in the resource pool.

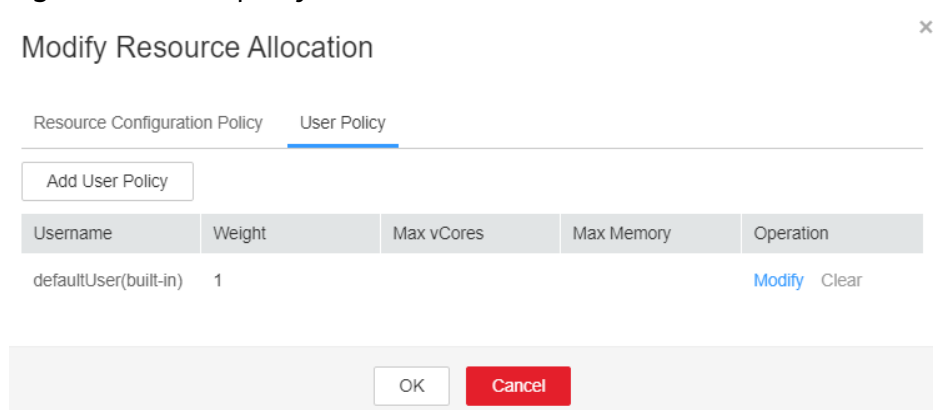

**Figure 8-45** Resource configuration policy

- **Weight:** The task queue with a larger weight preempts resources first when resources are insufficient. Its initial value is the same as the minimum resource percentage.
- **Minimum Resource:** indicates the minimum resources that a tenant can obtain.
- **Maximum Resource:** indicates the maximum resources that a tenant can obtain.
- **Reserved Resource:** indicates the resources that are reserved for the tenant's queues and cannot be lent to other tenants' queues.

**Step 7** Click the **User Policy** tab in the **Modify Resource Allocation** window and set the user policy.

**Figure 8-46** User policy

 NOTE

**defaultUser(built-in)** indicates that the policy specified for **defaultUser** is used if a user does not have a policy. The default policy cannot be deleted.

- Click **Add User Policy** to add a user policy.

**Figure 8-47** Adding a user policy

- **Username:** indicates the name of a user.
  - **Weight:** The task queue with a larger weight preempts resources first when resources are insufficient.
  - **Max vCores:** indicates the maximum number of virtual cores that the user can obtain.
  - **Max Memory(MB):** indicates the maximum memory that the user can obtain.
- Click **Modify** in the **Operation** column to modify an existing user policy.
  - Click **Clear** in the **Operation** column to delete an existing user policy.

**Step 8** Click **OK**.

----End

### 8.6.2.3.6 Clearing Queue Configurations

#### Scenario

You can clear the configurations of a queue on FusionInsight MRS Manager when the queue does not need resources of a resource pool or the resource pool needs to be disassociated from the queue. Clearing queue configurations cancels the resource capacity policy of the queue in the resource pool.

## Prerequisites

You have changed the default resource pool of the queue to another one. If a queue is to be disassociated from a resource pool, this resource pool cannot serve as the default resource pool of the queue. For details, see [Modifying Queue Resources](#).

## Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Tenant Resources > Dynamic Resource Plan**.
- Step 3** In **Resource Pools**, select the target resource pool.
- Step 4** Locate the row that contains the target resource name in the **Resource Allocation** area, and click **Clear** in the **Operation** column.
- Step 5** In the displayed dialog box, click **OK** to clear the queue configurations from the current resource pool.

----End

### 8.6.2.4 Managing Global User Policies

#### Scenario

If a tenant uses a Superior scheduler, you can configure the global policy for users to use the resource scheduler, including:

- Maximum running apps
- Maximum pending apps
- Default queue

#### Procedure

- Add a policy.
  - a. On FusionInsight Manager, choose **Tenant Resources**.
  - b. Choose **Dynamic Resource Plan**.
  - c. Click the **Global User Policy** tab.

#### NOTE

**defaults(default setting)** indicates that the policy specified for **defaults** is used if a user does not have a global policy. The default policy cannot be deleted.

- d. Click **Create Global User Policy**. In the displayed dialog box, set the following parameters:

**Figure 8-48** Creating a global user policy

Global User Policy

\* Cluster:

\* Username:

Max Running Apps:

Max Pending Apps:

Default Queue:

- **Cluster:** Select the target cluster.
  - **Username:** indicates the user for whom resource scheduling is controlled. Enter an existing username in the current cluster.
  - **Max Running Apps:** indicates the maximum number of tasks that the user can run in the current cluster.
  - **Max Pending Apps:** indicates the maximum number of tasks that the user can suspend in the current cluster.
  - **Default Queue:** indicates the queue of the user. Enter the name of an existing queue in the current cluster.
- Modify a policy.
    - a. On FusionInsight Manager, choose **Tenant Resources**.
    - b. Choose **Dynamic Resource Plan**.
    - c. Click the **Global User Policy** tab.
    - d. In the row that contains the desired user policy, click **Modify** in the **Operation** column.
    - e. In the displayed dialog box, modify parameters and click **OK**.
  - Delete a policy.
    - a. On FusionInsight Manager, choose **Tenant Resources**.
    - b. Choose **Dynamic Resource Plan**.
    - c. Click the **Global User Policy** tab.
    - d. In the row that contains the desired user policy, click **Delete** in the **Operation** column.  
In the displayed dialog box, click **OK**.

### 8.6.3 Using the Capacity Scheduler

## 8.6.3.1 Creating Tenants

### 8.6.3.1.1 Adding a Tenant

#### Scenario

You can create tenants on FusionInsight Manager based on the resource consumption and isolation planning and requirements of services.

#### Prerequisites

- A tenant name has been planned based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.
- Resources to be allocated to the current tenant have been planned to ensure that the sum of resources of direct sub-tenants at each level does not exceed the resources of the current tenant.

#### Procedure

**Step 1** Log in to FusionInsight Manager and choose **Tenant Resources**.

**Step 2** Click . On the page that is displayed, configure tenant attributes according to [Table 8-37](#).

Table 8-37 Tenant parameters

Parameter	Description
Cluster	Indicates the cluster for which you want to create a tenant.
Name	<ul style="list-style-type: none"><li>• Indicates the name of the current tenant. The value consists of 3 to 50 characters, including digits, letters, and underscores (_).</li><li>• Plan a tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.</li></ul>
Tenant Resource Type	<p>Specifies whether the tenant is a leaf tenant.</p> <ul style="list-style-type: none"><li>• When <b>Leaf Tenant Resource</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added.</li><li>• When <b>Non-leaf Tenant Resource</b> is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant.</li></ul> <p><b>NOTE</b> MRS 3.2.0 or later: If you select <b>ClickHouse</b> for <b>Service</b>, this parameter can only be set to <b>Leaf Tenant</b>.</p>

Parameter	Description
Computing Resource	<p>Specifies the dynamic computing resources for the current tenant.</p> <ul style="list-style-type: none"><li>• When <b>Yarn</b> is selected, the system automatically creates a queue in Yarn and the queue is named the same as the tenant name.<ul style="list-style-type: none"><li>- A leaf tenant can directly submit jobs to the queue.</li><li>- A non-leaf tenant cannot directly submit jobs to the queue. However, Yarn adds an extra queue (hidden) named <b>default</b> for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual jobs do not run in this queue.</li></ul></li><li>• If <b>Yarn</b> is not selected, the system does not automatically create a queue.</li></ul>
Configuration Mode	<p>Indicates the configuration mode of computing resource parameters.</p> <ul style="list-style-type: none"><li>• If you select <b>Basic</b>, you only need to set <b>Default Resource Pool Capacity (%)</b>.</li><li>• If you select <b>Advanced</b>, you can manually configure the resource allocation weight and the minimum, maximum, and reserved resources of the tenant.</li></ul>
Default Resource Pool Capacity (%)	<p>Indicates the percentage of computing resources used by the current tenant in the default resource pool. The value ranges from <b>0</b> to <b>100%</b>.</p>
Weight	<p>Indicates the resource allocation weight. The value ranges from <b>0</b> to <b>100</b>.</p>
Minimum Resource	<p>Indicates the resources guaranteed for the tenant (preemption supported). The value can be a percentage or an absolute value of the parent tenant's resources. When a tenant has a light workload, the resources of the tenant are automatically allocated to other tenants. When the available tenant resources are less than the value of <b>Minimum Resource</b>, the tenant can preempt the resources that have been lent to other tenants.</p>
Maximum Resource	<p>Indicates the maximum resources that can be used by the tenant. The tenant cannot obtain more resources than the value configured. The value can be a percentage or an absolute value of the parent tenant's resources.</p>

Parameter	Description
Reserved Resource	Indicates the resources reserved for the tenant. The reserved resources cannot be used by other tenants even if no job is running in the current tenant resources. The value can be a percentage or an absolute value of the parent tenant's resources.
Storage Resource	Specifies storage resources for the current tenant. <ul style="list-style-type: none"><li>• When <b>HDFS</b> is selected, the system automatically allocates storage resources.</li><li>• When <b>HDFS</b> is not selected, the system does not automatically allocate storage resources.</li></ul>
Quota	Indicates the quota for files and directories.
Space Quota	Indicates the quota for the HDFS storage space used by the current tenant. <ul style="list-style-type: none"><li>• If the unit is set to <b>MB</b>, the value ranges from <b>1</b> to <b>8796093022208</b>. If the unit is set to <b>GB</b>, the value ranges from <b>1</b> to <b>8589934592</b>.</li><li>• This parameter indicates the maximum HDFS storage space that can be used by the tenant, but not the actual space used.</li><li>• If its value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk.</li></ul>
Storage Path	Indicates an HDFS directory for tenant resource data. <ul style="list-style-type: none"><li>• The system automatically creates a folder named after the tenant name in the <b>/tenant</b> directory by default. For example, the default HDFS storage directory for tenant <b>ta1</b> is <b>/tenant/ta1</b>.</li><li>• When a tenant is created for the first time, the system creates the <b>/tenant</b> directory in the HDFS root directory. The storage path is customizable.</li></ul>
Service	Specifies whether to associate resources of other services. For details, see <a href="#">Step 4</a> .
Description	Indicates the description of the current tenant.

 NOTE

Roles, computing resources, and storage resources are automatically created when tenants are created.

- The new role has permissions on the computing and storage resources. This role and its permissions are automatically controlled by the system and cannot be manually managed by choosing **System > Permission > Role**. The role name is in the format of *Tenant name\_Cluster ID*. The ID of the first cluster is not displayed by default.
- When using this tenant, create a system user and bind the user to the role of the tenant. For details, see [Adding a User and Binding the User to a Tenant Role](#).
- During the tenant creation, the system automatically creates a Yarn queue named after the tenant. If the queue name already exists, the new queue is named **Tenant name-N**. *N* indicates a natural number starting from 1. When a same name exists, the value *N* increases automatically to differentiate the queue from others. For example, **saletenant**, **saletenant-1**, and **saletenant-2**.

**Step 3** Check whether the current tenant needs to be associated with resources of other services.

- If yes, go to [Step 4](#).
- If no, go to [Step 5](#).

**Step 4** Click **Associate Service** to configure other service resources used by the current tenant.

- Set **Service** to **HBase** and **Association Type** to **Exclusive** or **Shared**.

 NOTE

- **Exclusive** indicates that the service resources are used by the tenant exclusively and cannot be associated with other tenants.
- **Shared** indicates that the service resources can be shared with other tenants.
- MRS 3.2.0 or later: Select **ClickHouse** for **Service**.
  - **Association Type**: When **Service** is set to **ClickHouse**, **Association Type** can only be set to **Shared**.
  - **Associate Logical Cluster**: If the logical cluster function is not enabled for ClickHouse, **default\_cluster** is selected by default. If the function is enabled, select the logical cluster to which you want to associate.
  - **CPU Priority**: The CPU priority ranges from -20 to 19. This value is associated with the NICE value of the OS. A smaller value indicates a higher CPU priority.
  - **Memory**: The maximum value of this parameter is **100**, in percentage. For example, if this parameter is set to **80**, the total memory that can be used by the current tenant is calculated as follows: Available memory x 80%.

 NOTE

- Only HBase can be associated with a new tenant. However, HDFS, HBase, and Yarn can be associated with existing tenants.
- To associate an existing tenant with service resources, click the target tenant in the tenant list, switch to the **Service Associations** page, and click **Associate Service** to configure resources to be associated with the tenant.
- To disassociate an existing tenant from service resources, click the target tenant in the tenant list, switch to the **Service Associations** page, and click **Delete** in the **Operation** column. In the displayed dialog box, select **I have read the information and understand the impact** and click **OK**.

1. Click **OK**.

**Step 5** Click **OK**. Wait until the system displays a message indicating that the tenant is successfully created.

----End

### 8.6.3.1.2 Adding a Sub-Tenant

#### Scenario

You can create sub-tenants on FusionInsight Manager and allocate resources of the current tenant to the sub-tenants based on the resource consumption and isolation planning and requirements of services.

#### Prerequisites

- A parent non-leaf tenant has been added.
- A tenant name has been planned based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.
- Resources to be allocated to the current tenant have been planned to ensure that the sum of resources of direct sub-tenants at each level does not exceed the resources of the current tenant.

#### Procedure

**Step 1** Log in to FusionInsight Manager and choose **Tenant Resources**.

**Step 2** In the tenant list on the left, select a parent tenant and click . On the page for adding a sub-tenant, set attributes for the sub-tenant according to [Table 8-38](#).

**Table 8-38** Sub-tenant parameters

Parameter	Description
Cluster	Indicates the cluster to which the parent tenant belongs.
Parent Tenant Resource	Indicates the name of the parent tenant.
Name	<ul style="list-style-type: none"><li>• Indicates the name of the current tenant. The value consists of 3 to 50 characters, including digits, letters, and underscores (_).</li><li>• Plan a sub-tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.</li></ul>

Parameter	Description
Tenant Type	<p>Specifies whether the tenant is a leaf tenant.</p> <ul style="list-style-type: none"><li>• When <b>Leaf Tenant</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added.</li><li>• When <b>Non-leaf Tenant</b> is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant. However, the tenant depth cannot exceed 5 levels.</li></ul>
Computing Resource	<p>Specifies the dynamic computing resources for the current tenant.</p> <ul style="list-style-type: none"><li>• When <b>Yarn</b> is selected, the system automatically creates a queue in Yarn and the queue is named the same as the sub-tenant name.<ul style="list-style-type: none"><li>– A leaf tenant can directly submit jobs to the queue.</li><li>– A non-leaf tenant cannot directly submit jobs to the queue. However, Yarn adds an extra queue (hidden) named <b>default</b> for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual jobs do not run in this queue.</li></ul></li><li>• If <b>Yarn</b> is not selected, the system does not automatically create a queue.</li></ul>
Default Resource Pool Capacity (%)	<p>Indicates the percentage of computing resources used by the current tenant. The base value is the total resources of the parent tenant.</p>
Default Resource Pool Max Capacity (%)	<p>Indicates the maximum percentage of computing resources used by the current tenant. The base value is the total resources of the parent tenant.</p>
Storage Resource	<p>Specifies storage resources for the current tenant.</p> <ul style="list-style-type: none"><li>• When <b>HDFS</b> is selected, the system automatically creates a folder named after the sub-tenant in the HDFS parent tenant directory.</li><li>• When <b>HDFS</b> is not selected, the system does not automatically allocate storage resources.</li></ul>
Quota	<p>Indicates the quota for files and directories.</p>

Parameter	Description
Space Quota	<p>Indicates the quota for the HDFS storage space used by the current tenant.</p> <ul style="list-style-type: none"><li>• If the unit is set to <b>MB</b>, the value ranges from <b>1</b> to <b>8796093022208</b>. If the unit is set to <b>GB</b>, the value ranges from <b>1</b> to <b>8589934592</b>.</li><li>• This parameter indicates the maximum HDFS storage space that can be used by the tenant, but not the actual space used.</li><li>• If its value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk.</li><li>• If this quota is greater than the quota of the parent tenant, the actual storage space does not exceed the quota of the parent tenant.</li></ul>
Storage Path	<p>Indicates the HDFS storage directory for the tenant.</p> <ul style="list-style-type: none"><li>• The system automatically creates a folder named after the sub-tenant name in the directory of the parent tenant by default. For example, if the sub-tenant is <b>ta1s</b> and the parent directory is <b>/tenant/ta1</b>, the storage path for the sub-tenant is then <b>/tenant/ta1/ta1s</b>.</li><li>• The storage path is customizable in the parent directory.</li></ul>
Description	Indicates the description of the current tenant.

 **NOTE**

Roles, computing resources, and storage resources are automatically created when tenants are created.

- The new role has permissions on the computing and storage resources. This role and its permissions are automatically controlled by the system and cannot be manually managed by choosing **System** > **Permission** > **Role**. The role name is in the format of *Tenant name\_Cluster ID*. The ID of the first cluster is not displayed by default.
- When using this tenant, create a system user and bind the user to the role of the tenant. For details, see [Adding a User and Binding the User to a Tenant Role](#).
- The sub-tenant can further allocate the resources of its parent tenant. The sum of the resource percentages of direct sub-tenants under a parent tenant at each level cannot exceed 100%. The sum of the computing resource percentages of all level-1 tenants cannot exceed 100%.

**Step 3** Check whether the current tenant needs to be associated with resources of other services.

- If yes, go to [Step 4](#).
- If no, go to [Step 5](#).

**Step 4** Click **Associate Service** to configure other service resources used by the current tenant.

1. Set **Services** to **HBase**.
2. Set **Association Type** as follows:
  - **Exclusive** indicates that the service resources are used by the tenant exclusively and cannot be associated with other tenants.
  - **Shared** indicates that the service resources can be shared with other tenants.

 **NOTE**

- Only HBase can be associated with a new tenant. However, HDFS, HBase, and Yarn can be associated with existing tenants.
- To associate an existing tenant with service resources, click the target tenant in the tenant list, switch to the **Service Associations** page, and click **Associate Service** to configure resources to be associated with the tenant.
- To disassociate an existing tenant from service resources, click the target tenant in the tenant list, switch to the **Service Associations** page, and click **Delete** in the **Operation** column. In the displayed dialog box, select **I have read the information and understand the impact** and click **OK**.

3. Click **OK**.

**Step 5** Click **OK**. Wait until the system displays a message indicating that the tenant is successfully created.

----End

### 8.6.3.1.3 Adding a User and Binding the User to a Tenant Role

#### Scenario

A newly created tenant cannot directly log in to the cluster to access resources. You need to add a user for the tenant on FusionInsight Manager and bind the user to the role of the tenant to assign operation permissions to the user.

#### Prerequisites

You have clarified service requirements and created a tenant.

#### Procedure

**Step 1** Log in to FusionInsight Manager and choose **System > Permission > User**.

**Step 2** If you want to add a user to the system, click **Create**.

If you want to bind tenant roles to an existing user in the system, locate the row of the user and click **Modify** in the **Operation** column.

Set user attributes according to [Table 8-39](#).

**Table 8-39** User parameters

Parameter	Description
Username	<p>Specifies the current user name. The value can contain 3 to 32 characters, including digits, letters, underscores (_), hyphens (-), and spaces.</p> <ul style="list-style-type: none"><li>• The username cannot be the same as the OS username of any node in the cluster. Otherwise, the user cannot be used.</li><li>• A username that differs only in alphabetic case from an existing username is not allowed. For example, if <b>User1</b> has been created, you cannot create <b>user1</b>. Enter the correct username when using <b>User1</b>.</li></ul>
User Type	<p>The options are <b>Human-Machine</b> and <b>Machine-Machine</b>.</p> <ul style="list-style-type: none"><li>• <b>Human-Machine</b> user: used for FusionInsight Manager O&amp;M and component client operations. If you select this option, set both <b>Password</b> and <b>Confirm Password</b> accordingly.</li><li>• <b>Machine-Machine</b> user: used for application development. If you select this option, the password is randomly generated.</li></ul>
Password	<p>This parameter is mandatory if <b>User Type</b> is set to <b>Human-Machine</b>.</p> <p>The password must contain 8 to 64 characters of at least four types of the following: uppercase letters, lowercase letters, digits, special characters, and spaces. The password cannot be the username or the username spelled backwards.</p>
Confirm Password	Enter the password again.
User Group	<p>In the <b>User Group</b> area, click <b>Add</b> and select user groups to add the user to the groups.</p> <ul style="list-style-type: none"><li>• If roles have been added to the user groups, the user can be granted the permissions of the roles.</li><li>• For example, add the user to the Hive user group to assign Hive permissions to the user.</li></ul>
Primary Group	Select a group as the primary group for the user to create directories and files. The drop-down list contains all groups selected in <b>User Group</b> .
Role	<p>Click <b>Add</b> to bind a tenant role to the user.</p> <p><b>NOTE</b></p> <p>If a user wants to use the resources of tenant <b>tenant1</b> and to add or delete sub-tenants for <b>tenant1</b>, the user must be bound to both the <b>Manager_tenant</b> and <b>tenant1_Cluster ID</b> roles.</p>

Parameter	Description
Description	Indicates the description of the current user.

**Step 3** Click **OK**.

----End

## 8.6.3.2 Managing Tenants

### 8.6.3.2.1 Managing Tenant Directories

#### Scenario

You can manage the HDFS storage directories used by specified tenants based on service requirements on FusionInsight Manager, such as adding tenant directories, changing the quotas for directories and files and for storage space, and deleting directories.

#### Prerequisites

A tenant with HDFS storage resources has been added.

#### Viewing a Tenant Directory

**Step 1** On FusionInsight Manager, choose **Tenant Resources**.

**Step 2** In the tenant list on the left, click the target tenant.

**Step 3** Click the **Resource** tab.

**Step 4** View the **HDFS Storage** table.

- The **File Number Threshold** column provides the quota for files and directories of the tenant directory.
- The **Space Quota** column provides the storage space size of the tenant directory.

----End

#### Adding a Tenant Directory

**Step 1** On FusionInsight Manager, choose **Tenant Resources**.

**Step 2** In the tenant list on the left, click the target tenant.

**Step 3** Click the **Resource** tab.

**Step 4** In the **HDFS Storage** area, click **Create Directory**.

**Figure 8-49** Creating a directory

## Create Directory

* Path:	<input type="text" value="E.g. /PathName,hdfs://Cluster/PathName"/>
Quota:	<input type="text"/>
File Number Threshold (%):	<input type="text"/>
* Space Quota:	<input type="text"/> <input type="text" value="GB"/>
Storage Space Threshold (%):	<input type="text"/>

- **Parent Directory:** indicates the storage directory used by the parent tenant of the current tenant.

 **NOTE**

This parameter is not displayed if the current tenant is not a sub-tenant.

- Set **Path** to a tenant directory path.

 **NOTE**

If the current tenant is not a sub-tenant, the new path is created in the HDFS root directory.

- Set **Quota** to the quota for files and directories.
- **File Number Threshold (%)** is valid only when **Quota** is set. If the ratio of the number of used files to the value of **Quota** exceeds the value of this parameter, an alarm is generated. If this parameter is not specified, no alarm is reported in this scenario.

 **NOTE**

The number of used files is collected every hour. Therefore, the alarm indicating that the ratio of used files exceeds the threshold is delayed.

- Set **Space Quota** to the storage space size of the tenant directory.
- If the ratio of used storage space to the value of **Space Quota** exceeds the **Storage Space Threshold (%)** value, an alarm is generated. If this parameter is not specified, no alarm is reported in this scenario.

 **NOTE**

The used storage space is collected every hour. Therefore, the alarm indicating that the ratio of used storage space exceeds the threshold is delayed.

**Step 5** Click **OK**.

----End

## Modifying a Tenant Directory

**Step 1** On FusionInsight Manager, choose **Tenant Resources**.

**Step 2** In the tenant list on the left, click the target tenant.

**Step 3** Click the **Resource** tab.

**Step 4** In the **HDFS Storage** table, click **Modify** in the **Operation** column of the specified tenant directory.

- Set **Quota** to the quota for files and directories.
- **File Number Threshold (%)** is valid only when **Quota** is set. If the ratio of the number of used files to the value of **Quota** exceeds the value of this parameter, an alarm is generated. If this parameter is not specified, no alarm is reported in this scenario.
- Set **Space Quota** to the storage space size of the tenant directory.
- If the ratio of used storage space to the value of **Space Quota** exceeds the **Storage Space Threshold (%)** value, an alarm is generated. If this parameter is not specified, no alarm is reported in this scenario.

**Step 5** Click **OK**.

----End

## Deleting a Tenant Directory

**Step 1** On FusionInsight Manager, choose **Tenant Resources**.

**Step 2** In the tenant list on the left, click the target tenant.

**Step 3** Click the **Resource** tab.

**Step 4** In the **HDFS Storage** table, click **Delete** in the **Operation** column of the specified tenant directory.

### NOTE

The tenant directory that is created by the system during tenant creation cannot be deleted.

**Step 5** Click **OK**.

----End

### 8.6.3.2.2 Restoring Tenant Data

#### Scenario

Tenant data is stored on FusionInsight Manager and cluster components. When components are recovered from failures or reinstalled, some configuration data of all tenants may become abnormal. In this case, you need to manually restore the configuration data on FusionInsight Manager.

## Procedure

**Step 1** Log in to FusionInsight Manager and choose **Tenant Resources**.

**Step 2** In the tenant list on the left, click the target tenant.

**Step 3** Check the tenant data status.

1. On the **Summary** page, check **Tenant Status**. A green icon indicates that the tenant is available and gray indicates that the tenant is unavailable.
2. Click **Resource** and check the icons on the left of **Yarn** and **HDFS Storage**. A green icon indicates that the resource is available, and gray indicates that the resource is unavailable.
3. Click **Service Associations** and check the **Status** column of the associated services. **Normal** indicates that the component can provide services for the associated tenant. **Not Available** indicates that the component cannot provide services for the tenant.
4. If any of the preceding check items is abnormal, go to **Step 4** to restore tenant data.

**Step 4** Click . In the displayed dialog box, enter the password of the current login user and click **OK**.

**Step 5** In the **Restore Tenant Resource Data** window, select one or more components to restore data, and click **OK**. The system automatically restores the tenant data.

----End

### 8.6.3.2.3 Deleting a Tenant

#### Scenario

You can delete tenants that are no longer used on FusionInsight Manager based on service requirements to release resources occupied by the tenants.

#### Prerequisites

- A tenant has been added.
- The tenant has no sub-tenants. If the tenant has sub-tenants, delete them; otherwise, the tenant cannot be deleted.
- The role of the tenant is not associated with any user or user group.

## Procedure

**Step 1** Log in to FusionInsight Manager and choose **Tenant Resources**.

**Step 2** In the tenant list on the left, click the target tenant and click .

#### NOTE

- If you want to retain the tenant data, select **Reserve the data of this tenant resource**. Otherwise, the storage space of the tenant will be deleted.
- To delete a tenant without retaining the tenant data as a user who does not belong to the supergroup, you should first log in to the HDFS client as a user who belongs to the supergroup and then manually clear the storage space of that tenant to avoid residual data.

**Step 3** In the **Delete Tenant** dialog box, enter **DELETE** in the confirmation text box. Click **OK**.

It takes a few minutes to save the configuration. After the tenant is deleted, the role and storage space of the tenant are also deleted.

 **NOTE**

After the tenant is deleted, the queue of the tenant still exists in Yarn. The queue of the tenant is not displayed on the role management page in Yarn.

----End

### 8.6.3.2.4 Clearing Non-associated Queues of a Tenant

#### Scenario

If Yarn uses the Capacity scheduler, deleting a tenant only sets the queue capacity of the tenant to **0** and the tenant status to **STOPPED** but does not clear the queues of the tenant in Yarn. Limited by the Yarn mechanism, queues cannot be dynamically deleted. You can run commands to manually delete residual queues.

#### Impact on the System

- During the script execution, the Controller service is restarted, Yarn configurations are synchronized, and the active and standby ResourceManagers are restarted.
- FusionInsight Manager becomes inaccessible during the restart of the Controller service.
- After the active and standby ResourceManagers are restarted, an alarm is generated indicating that Yarn and components that depend on Yarn are temporarily unavailable.

#### Prerequisites

Queues of a deleted tenant still exist.

#### Procedure

**Step 1** Check that queues of the deleted tenant still exist.

1. On FusionInsight Manager, choose **Cluster**, click the name of the target cluster, and choose **Services > Yarn**. Click the link of the active ResourceManager in **ResourceManager WebUI** to go to the ResourceManager web UI.
2. Click **Scheduler** in the navigation tree on the left. In the right pane, you can view that queues of the tenant still exist in the **STOPPED** state and their **Configured Capacity** is **0**.

**Step 2** Log in to the active management node as user **omm**.

**Step 3** Switch the directory and execute the **cleanQueuesAndRestartRM.sh** script.

```
cd ${BIGDATA_HOME}/om-server/om/sbin
./cleanQueuesAndRestartRM.sh -c Cluster ID
```

 NOTE

You can choose **Cluster**, click the cluster name, and choose **Cluster Properties** on FusionInsight Manager to view the cluster ID.

During the script execution, you need to enter **yes** and the password.

```
Running the script will restart Controller and restart ResourceManager.
Are you sure you want to continue connecting (yes/no)?yes
Please input admin password:
Begin to backup queues ...
...
```

**Step 4** After the script is executed successfully, log in to FusionInsight Manager, choose **Cluster**, click the cluster name, and choose **Services > Yarn**. Click the link of the active ResourceManager in **ResourceManager WebUI** to go to the ResourceManager web UI.

**Step 5** Click **Scheduler** in the navigation tree on the left. In the right pane, you can view that queues of the tenant have been cleared.

----End

### 8.6.3.3 Managing Resources

#### 8.6.3.3.1 Adding a Resource Pool

##### Scenario

In a cluster, you can logically group Yarn NodeManagers into Yarn resource pools. Each NodeManager belongs to only one resource pool. You can create a custom resource pool on FusionInsight Manager and add the hosts that have not been added to any custom resource pools to this resource pool so that specified queues can use the computing resources provided by these hosts.

The system contains a **default** resource pool by default. All NodeManagers that are not added to custom resource pools belong to this resource pool.

##### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Tenant Resources > Resource Pool**.

**Step 3** Click **Add Resource Pool**.

**Step 4** Set resource pool attributes.

- **Cluster:** Select the cluster to which the resource pool is to be added.
- **Name:** Enter the name of the resource pool. The name contains 1 to 50 characters, including digits, letters, and underscores (\_), and cannot start with an underscore (\_).
- **Resource Label:** Enter the resource label of the resource pool. The value can contain 1 to 50 characters, including digits, letters, underscores (\_), and hyphens (-), and must start with a digit or letter.

- **Resource:** In the **Available Hosts** area, select specified hosts and click  to add the hosts to the **Selected Hosts** area. Only hosts in the cluster can be selected. The host list in the resource pool can be left blank.

 **NOTE**

You can filter hosts by host name, number of CPU cores, memory, operating system, or platform type based on service requirements.

**Step 5** Click **OK**.

After the resource pool is created, you can view its name, members, and mode in the resource pool list. Hosts that are added to the custom resource pool are no longer members of the **default** resource pool.

----End

### 8.6.3.3.2 Modifying a Resource Pool

#### Scenario

When hosts in a resource pool need to be adjusted based on service requirements, you can modify members in the resource pool on FusionInsight Manager.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Tenant Resources > Resource Pool**.

**Step 3** In the resource pool list, locate the row that contains the specified resource pool, and click **Edit** in the **Operation** column.

**Step 4** In the **Resource** area, modify hosts.

- Adding hosts: Select desired hosts in **Available Hosts** and click  to add them to the resource pool.
- Deleting hosts: Select desired hosts in **Selected Hosts** and click  to remove them from the resource pool. The host list in the resource pool can be left blank.

**Step 5** Click **OK**.

----End

### 8.6.3.3.3 Deleting a Resource Pool

#### Scenario

If a resource pool is no longer used based on service requirements, you can delete it on FusionInsight Manager.

## Prerequisites

- Any queue in the cluster does not use the resource pool to be deleted as the default resource pool. Before deleting the resource pool, cancel the default resource pool. For details, see [Modifying Queue Resources](#).
- Resource distribution policies of all queues have been cleared from the resource pool to be deleted. For details, see [Clearing Queue Configurations](#).

## Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Tenant Resources > Resource Pool**.

**Step 3** Locate the row that contains the specified resource pool, and click **Delete** in the **Operation** column.

**Step 4** In the displayed dialog box, click **OK**.

----End

### 8.6.3.3.4 Modifying Queue Resources

## Scenario

If resources need to be adjusted based on service requirements, you can scale up or down a queue by modifying the queue configuration of a specified tenant on FusionInsight Manager. Yarn queues are associated with resource pools for resource allocation and scheduling.

## Prerequisites

A tenant who uses the Capacity scheduler has been added.

## Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Tenant Resources > Dynamic Resource Plan**.

The **Resource Distribution Policy** page is displayed by default.

**Step 3** Click the **Queue Configurations** tab.

**Step 4** In **All tenants resources** area, locate the row that contains the target tenant resource and click **Modify** in the **Operation** column.

### NOTE

- You can also access the **Modify Queue Configuration** page as follows: In the tenant list on the **Tenant Resources Management** page, click the target tenant, click the **Resource** tab, and click  next to **Queue Configurations (Queue name)**.
- A queue can be bound to only one non-default resource pool. That is, a newly added resource pool can be bound to only one queue to serve as the default resource pool of the queue.

**Table 8-40** Queue configuration parameters

Parameter	Description
Tenant Resources Name (Queue)	Indicates the tenant name and queue name.
Maximum Applications	Indicates the maximum number of applications.
Maximum AM Resource Percent	Indicates the maximum percentage of resources that can be used to run the ApplicationMaster in a cluster.
Minimum User Resource Upper-Limit Percent (%)	<p>Indicates the minimum resource guarantee (percentage) of a user. The resources for each user in a queue are limited at any time. If applications of multiple users are running at the same time in a queue, the resource usage of each user fluctuates between the minimum value and the maximum value. The minimum value is determined by the number of running applications, while the maximum value is determined by this parameter.</p> <p>For example, assume that this parameter is set to <b>25</b>. If two users submit applications to the queue, each user can use a maximum of 50% resources; if three users submit applications to the queue, each user can use a maximum of 33% resources; if four users submit applications to the queue, each user can use a maximum of 25% resources.</p>
User Resource Upper-Limit Factor	Indicates the limit factor of the maximum user resource usage. The maximum user resource usage percentage can be obtained by multiplying the limit factor with the percentage of the tenant's actual resource usage in the cluster.
Status	Indicates the status of a resource plan. The value can be <b>Running</b> or <b>Stopped</b> .
Default Resource Pool	<p>Indicates the resource pool used by the queue. The default value is <b>default</b>.</p> <p>If you want to change the resource pool, configure the queue capacity first. For details, see <a href="#">Configuring the Queue Capacity Policy of a Resource Pool</a>.</p>

**Step 5** Click **OK**.

----End

### 8.6.3.3.5 Configuring the Queue Capacity Policy of a Resource Pool

#### Scenario

After a resource pool is added, you can configure the capacity policy of available resources for Yarn queues so that jobs in the queues can be properly executed in

the resource pool. A queue can have the queue capacity policy of only one resource pool.

You can view queues and configure queue capacity policies in any resource pool. After the queue policies are configured, Yarn queues are associated with resource pools.

## Prerequisites

A queue has been added, that is, a tenant associated with computing resources has been created.

## Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Tenant Resources > Dynamic Resource Plan**.

The **Resource Distribution Policy** page is displayed by default.

**Step 3** Select the name of the target cluster from **Cluster** and select a resource pool from **Resource Pool**.

**Step 4** Locate the row that contains the target resource name in the **Resource Allocation** area, and click **Modify** in the **Operation** column.

**Step 5** In the **Modify Resource Allocation** window, configure the resource capacity policy of the queue in the resource pool.

- **Capacity (%)**: indicates the percentage of computing resources used by the current tenant.
- **Maximum Capacity (%)**: indicates the maximum percentage of computing resources used by the current tenant.

**Step 6** Click **OK**.

### NOTE

After the resource capacity values of a queue are deleted and saved, the resource capacity policy of the queue in the resource pool is canceled, indicating that the queue is disassociated from the resource pool. To achieve this, you need to change the default resource pool of the queue to another one. For details, see [Modifying Queue Resources](#).

----End

### 8.6.3.3.6 Clearing Queue Configurations

#### Scenario

You can clear the configurations of a queue on FusionInsight MRS Manager when the queue does not need resources of a resource pool or the resource pool needs to be disassociated from the queue. Clearing queue configurations cancels the resource capacity policy of the queue in the resource pool.

#### Prerequisites

You have changed the default resource pool of the queue to another one. If a queue is to be disassociated from a resource pool, this resource pool cannot serve

as the default resource pool of the queue. For details, see [Modifying Queue Resources](#).

## Procedure

- Step 1** Log in to FusionInsight Manager.
  - Step 2** Choose **Tenant Resources > Dynamic Resource Plan**.
  - Step 3** Select the name of the target cluster from **Cluster** and select a resource pool from **Resource Pool**.
  - Step 4** Locate the row that contains the target resource name in the **Resource Allocation** area, and click **Clear** in the **Operation** column.
  - Step 5** In the displayed dialog box, click **OK** to clear the queue configurations from the current resource pool.
- End

## 8.6.4 Switching the Scheduler

### Scenario

The newly installed MRS cluster uses the Superior scheduler by default. If the cluster is upgraded from an earlier version, you can switch the YARN scheduler from the Capacity scheduler to the Superior scheduler with a few clicks.

### Prerequisites

- The network connectivity of the cluster is proper and secure, and the YARN service status is normal.
- During scheduler switching, tenants cannot be added, deleted, or modified. In addition, services cannot be started or stopped.

### Switching from the Capacity Scheduler to the Superior Scheduler

#### Impact on the system

- Because the ResourceManager is restarted during scheduler switching, submitting jobs to YARN will fail at that time.
- During scheduler switching, tasks in a job being executed on YARN will continue, but new tasks cannot be started.
- After scheduler switching is complete, jobs executed on YARN may fail, causing service interruptions.
- After scheduler switching is complete, parameters of the Superior scheduler are used for tenant management.
- After scheduler switching is complete, tenant queues whose capacity is 0 in the Capacity scheduler cannot be allocated resources in the Superior scheduler. As a result, jobs submitted to these tenant queues fail to be executed. Therefore, you are advised not to set the capacity of a tenant queue to 0 in the Capacity scheduler.
- After scheduler switching is complete, you cannot add or delete resource pools, YARN node labels, or tenants during the observation period. If such an

operation is performed, the scheduler cannot be rolled back to the Capacity scheduler.

#### NOTE

The recommended observation period for scheduler switching is one week. If resource pools, YARN node labels, or tenants are added or deleted during this period, the observation period ends immediately.

- Rollback may cause the loss of partial or all Yarn job information.

#### Procedure

**Step 1** Modify YARN service parameters and ensure that the YARN service status is normal.

1. Log in to FusionInsight Manager as an administrator.
2. Log in to FusionInsight Manager and choose **Cluster > Services > Yarn**. Click **Configurations** then **All Configurations**, search for **yarn.resourcemanager.webapp.pagination.enable**, and check whether the value is **true**.
  - If yes, go to **Step 1.3**.
  - If no, set the parameter to **true** and click **Save** to save the configuration. On the **Dashboard** tab page of YARN, choose **More > Restart Service**, verify the identity, and click **OK**. After the service is restarted, go to **Step 1.3**.
3. Choose **Cluster > Name of the desired cluster > Services**, and check whether the YARN service status is normal.

**Step 2** Log in to the active management node as user **omm**.

**Step 3** Switch the scheduler.

The following switching modes are available:

**0**: converts the Capacity scheduler configurations into the Superior scheduler configurations and then switches the Capacity scheduler to the Superior scheduler.

**1**: converts the Capacity scheduler configurations into the Superior scheduler configurations only.

**2**: switches the Capacity scheduler to the Superior scheduler only.

- Mode **0** is recommended if the cluster environment is simple and the number of tenants is less than 20.

Run the following command:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/switchScheduler.sh -c Cluster ID -m 0
```

#### NOTE

You can choose **Cluster**, click the cluster name, and choose **Cluster Properties** on FusionInsight Manager to view the cluster ID.

```
Start to convert Capacity scheduler to Superior Scheduler, clusterId=1
Start to convert Capacity scheduler configurations to Superior. Please wait...
Convert configurations successfully.
Start to switch the Yarn scheduler to Superior. Please wait...
Switch the Yarn scheduler to Superior successfully.
```

- If the cluster environment or tenant information is complex and you need to retain the queue configurations of the Capacity scheduler on the Superior scheduler, it is recommended that you use mode **1** first to convert the Capacity scheduler configurations, check the converted configurations, and then use mode **2** to switch the Capacity scheduler to the Superior scheduler.
  - a. Run the following command to convert the Capacity scheduler configurations into the Superior scheduler configurations:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/switchScheduler.sh -c
Cluster ID -m 1
```

Start to convert Capacity scheduler to Superior Scheduler, clusterId=1  
Start to convert Capacity scheduler configurations to Superior. Please wait...  
Convert configurations successfully.
  - b. Run the following command to switch the Capacity scheduler to the Superior scheduler:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/switchScheduler.sh -c
Cluster ID -m 2
```

Start to convert Capacity scheduler to Superior Scheduler, clusterId=1  
Start to switch the Yarn scheduler to Superior. Please wait...  
Switch the Yarn scheduler to Superior successfully.
- If you do not need to retain the queue configurations of the Capacity scheduler, use mode **2**.
  - a. Log in to FusionInsight Manager and delete all tenants except the default tenant.
  - b. On FusionInsight Manager, delete all resource pools except the default resource pool.

Run the following command to switch the Capacity scheduler to the Superior scheduler:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/switchScheduler.sh -c
Cluster ID -m 2
```

Start to convert Capacity scheduler to Superior Scheduler, clusterId=1  
Start to switch the Yarn scheduler to Superior. Please wait...  
Switch the Yarn scheduler to Superior successfully.

#### NOTE

You can query the scheduler switching logs on the active management node.

- `${BIGDATA_LOG_HOME}/controller/aos/switch_scheduler.log`
- `${BIGDATA_LOG_HOME}/controller/aos/aos.log`

----End

## Rollback Operations

You can manually switch the Superior scheduler back to the Capacity scheduler. However, this operation is only a workaround and is not allowed in most cases.

If the customer has special requirements for switching back to the Capacity scheduler, the following conditions must be met:

- The observation period has not expired.
- No resource pool, YARN node label, or tenant is added or deleted during the observation period.

**NOTICE**

If resource pools, YARN node labels, or tenants are added or deleted, resource pools or queues may not exist after the Superior scheduler is switched back to the Capacity scheduler. As a result, the Capacity scheduler cannot run properly.

The procedure is as follows:

**Step 1** Change the scheduler to the Capacity scheduler and start YARN.

1. Log in to FusionInsight Manager.
2. Go to the **Configurations** page of YARN and modify the parameters listed in **Table 8-41**.

**Table 8-41** Modifying YARN configuration items

Parameter	Description
yarn.resourcemanager.scheduler.class	org.apache.hadoop.yarn.server.resourcemanagerscheduler.capacity.CapacityScheduler
yarn.http.rmwebapp.external.classes	Left empty
hadoop.http.rmwebapp.scheduler.page.classes	Left empty
yarn.resourcemanager.webapp.pagination.enable	false

3. Click **Save** and then click **OK** in the displayed dialog box.
4. Roll restart the YARN service, enter the password, and click **OK**.

**Step 2** Log in to the active management node and restart the AOS service.

1. Log in to the active OMS server as user **omm** using PuTTY.
2. Run the following command to disable logout upon timeout:

```
TMOUT=0
```

 **NOTE**

After the operations in this section are complete, run the **TMOUT=Timeout interval** command to restore the timeout interval in a timely manner. For example, **TMOUT=600** indicates that a user is logged out if the user does not perform any operation within 600 seconds.

3. Run the following command to restart the AOS service:  
**`\${BIGDATA\_HOME}/om-server/om/sbin/aos\_cmd.sh restart**

----End

## 8.7 System

## 8.7.1 Configuring Permissions

### 8.7.1.1 Managing Users

#### 8.7.1.1.1 Creating a User

##### Scenario

FusionInsight Manager supports a maximum of 50,000 users (including built-in users). By default, only user **admin** has the highest operation permissions of FusionInsight Manager. You need to create users on FusionInsight Manager and assign operation permissions to the users based on service requirements.

##### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > User**.

**Step 3** On the **User** page, click **Create**.

**Step 4** Set **Username**. The username can contain digits, letters, underscores (\_), hyphens (-), and spaces. It is case-insensitive and cannot be the same as any existing username in the system or OS.

**Step 5** Set **User Type** to **Human-Machine** or **Machine-Machine**.

- **Human-Machine** user: used for FusionInsight Manager O&M and component client operations. If you select this option, you also need to select the password policy and set **Password** and **Confirm Password**.
- **Machine-Machine** user: used for component application development. If you select this option, the password is randomly generated.

**Step 6** In the **User Group** area, click **Add** to add one or more user groups to the list.

##### NOTE

- If the selected user group has been bound to a role or a permission policy has been configured in Ranger, the user can obtain the corresponding permissions.
- After FusionInsight Manager is installed, some user groups generated by default have special permissions. Select desired user groups based on the descriptions on the UI.
- If existing user groups cannot meet your requirements, click **Create User Group** to create a user group. For details, see [Creating a User Group](#).

**Step 7** Select a group from the **Primary Group** drop-down list to create directories and files.

The drop-down list contains all groups selected in **User Group**.

##### NOTE

A user can belong to multiple groups (including the primary group and secondary groups). The primary group is set to facilitate maintenance and comply with the permission mechanism of the Hadoop community. The primary group has the same permission control functionality as other groups.

**Step 8** In the **Role** area, click **Add** to bind roles to the user.

 **NOTE**

- Adding a role when you create a user can specify the user permissions.
- If the permissions granted to the user from the user group cannot meet service requirements, you can bind other created roles to the user. You can also click **Create Role** to create a role first. For details, see [Creating a Role](#).  
It takes 3 minutes to make role permission assignment to the user take effect. If the permissions obtained from the user group are enough, you do not need to add a role.
- After Ranger authentication is enabled for a component, you need to configure Ranger policies to assign permissions to the user except the permissions of default user group or role.
- If a user is not added to a user group or assigned a role, the user cannot view information or perform operations after logging in to FusionInsight Manager.

**Step 9** Enter information in **Description**.

**Step 10** Click **OK**.

After a human-machine user is created, you need to change the initial password as prompted after logging in to FusionInsight Manager.

----End

### 8.7.1.1.2 Modifying User Information

#### Scenario

You can modify user information on FusionInsight Manager, including the user group, primary group, role permission assignment, and user description.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > User**.

**Step 3** Locate the row that contains the target user and click **Modify** in the **Operation** column.

Modify the parameters based on service requirements.

 **NOTE**

It takes three minutes at most for the change of the user group or role permissions to take effect.

MRS 3.1.2 or later:

- Users (except **admin**) cannot modify their own password policies.
- Locked users cannot modify their password policies.
- After the password policy bound to a user is modified, the modification takes effect when the user changes the password next time.
- After the password policy bound to a user is modified, if the remaining password validity period is greater than the password validity period in the new password policy, the password validity period is set to the validity period in the new password policy. If the remaining password validity period is less than the password validity period in the new password policy, the password validity period remains unchanged.

**Step 4** Click **OK**.

----End

### 8.7.1.1.3 Exporting User Information

#### Scenario

You can export information about all created users on FusionInsight Manager.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > User**.

**Step 3** Click **Export All** to export all user information at a time.

The exported user information contains the username, creation time, description, user type (**0** indicates a human-machine account, **1** indicates a machine-machine account), primary group, user group list, and roles bound to the user.

**Step 4** Set **Save AS** to **TXT** or **CSV**. Click **OK**.

----End

### 8.7.1.1.4 Locking a User

#### Scenario

A user may be suspended for a long period of time due to service changes. For security purposes, you can lock such a user.

You can lock a user in using either of the following methods:

- Automatic locking: You can set **Password Retries** in the password policy to automatically lock the user whose login attempts exceed this parameter value. For details, see [Configuring Password Policies](#).
- Manual locking: You manually lock a user.

This section describes how to lock a user manually. Machine-machine users cannot be locked.

#### Impact on the System

A locked user cannot log in to FusionInsight Manager or perform identity authentication in the cluster. A locked user can be used only after being manually unlocked or the lock time expires.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > User**.

**Step 3** Locate the row that contains the target user and click **Lock** in the **Operation** column.

**Step 4** In the window that is displayed, select **I have read the information and understand the impact**. Click **OK**.

----End

### 8.7.1.1.5 Unlocking a User

#### Scenario

You can unlock a user on FusionInsight Manager if the user has been locked because the number of login attempts exceeds the threshold. Only users created on FusionInsight Manager can be unlocked.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > User**.

**Step 3** Locate the row that contains the target user and click **Unlock** in the **Operation** column.

**Step 4** In the window that is displayed, select **I have read the information and understand the impact**. Click **OK**.

----End

### 8.7.1.1.6 Deleting a User

#### Scenario

Based on service requirements, you can delete system users that are no longer used on FusionInsight Manager.

#### NOTE

- After a user is deleted, the provisioned ticket granting ticket (TGT) is still valid within 24 hours. The user can use the TGT for security authentication and access the system.
- If a new user has the same name as the deleted user, the new user will inherit all owner permissions of the deleted user. You are advised to determine whether to delete the resources owned by the deleted user based on service requirements, for example, files in HDFS.
- The default user **admin** cannot be deleted.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > User**.

**Step 3** Locate the row that contains the target user, click **More**, and select **Delete**.

#### NOTE

To delete users in batches, select the users at a time and click **Delete**.

**Step 4** In the displayed dialog box, click **OK**.

----End

### 8.7.1.1.7 Changing a User Password

#### Scenario

For security purposes, the password of a human-machine user must be changed periodically.

If users have the permission to use FusionInsight Manager, they can change their passwords on FusionInsight Manager.

If users do not have the permission to use FusionInsight Manager, they can change their passwords on the client.

#### Prerequisites

- You have obtained the current password policy.
- The user has installed the client on any node in the cluster and obtained the IP address of the node. The password of the client installation user can be obtained from the administrator.

### Changing the Password on FusionInsight Manager

**Step 1** Log in to FusionInsight Manager.

**Step 2** Move the cursor to the username in the upper right corner of the page.

On the user account drop-down menu, choose **Change Password**.

**Figure 8-50** Changing the password

Change Password

Log Out

Download Authentication Credential

**Step 3** On the displayed page, set **Current Password**, **New Password**, and **Confirm Password**, and click **OK**.

The password must meet the following complexity requirements:

- Contains at least 8 characters.
- Contains at least four types of the following: uppercase letters, lowercase letters, numbers, spaces, and special characters (~!@#\$\$%^&\*()-\_+=|[{]}';<.>/\?).
- Cannot be the same as the username or the username spelled backwards.
- Cannot be a common easily-cracked password.

- Cannot be the same as the password used in the latest  $N$  times.  $N$  indicates the value of **Repetition Rule** configured in [Configuring Password Policies](#).

----End

## Changing the Password on the Client

**Step 1** Log in to the node where the client is installed as the client installation user.

**Step 2** Run the following command to switch to the client directory, for example, `/opt/client`:

```
cd /opt/client
```

**Step 3** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 4** Change the user password. This operation takes effect for all servers.

```
kpasswd System username
```

For example, if you want to change the password of system user **test1**, run the **kpasswd test1** command.

The password must meet the following complexity requirements:

- Contains at least 8 characters.
- Contains at least four types of the following: uppercase letters, lowercase letters, numbers, spaces, and special characters (`~!@#$$%^&*()-_+=|[{]}';<.>/\?`).
- Cannot be the same as the username or the username spelled backwards.
- Cannot be a common easily-cracked password.
- Cannot be the same as the password used in the latest  $N$  times.  $N$  indicates the value of **Repetition Rule** configured in [Configuring Password Policies](#).

### NOTE

If an error occurs during the running of the **kpasswd** command, try the following operations:

- Stop the SSH session and start it again.
- Run the **kdestroy** command and then run the **kpasswd** command again.

----End

### 8.7.1.1.8 Initializing a Password

#### Scenario

If a user forgets the password or the public account password needs to be changed periodically, you can initialize the password on FusionInsight Manager. After the password is initialized, the system user needs to change the password upon first login.

### NOTE

This operation applies only to human-machine users.

## Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > User**.

**Step 3** Locate the row that contains the target user, click **More**, and select **Initialize Password**. In the displayed dialog box, enter the password of the current login user and click **OK**. In the **Initialize Password** dialog box, click **OK**.

**Step 4** Set **New Password** and **Confirm Password**, and click **OK**.

The password must meet the following complexity requirements:

- Contains at least 8 characters.
- Contains at least four types of the following: uppercase letters, lowercase letters, numbers, spaces, and special characters (~!@#\$\$%^&\*()-\_+=|[]{}';<.>/\?).
- Cannot be the same as the username or the username spelled backwards.
- Cannot be a common easily-cracked password.
- Cannot be the same as the password used in the latest *N* times. *N* indicates the value of **Repetition Rule** configured in [Configuring Password Policies](#).

----End

### 8.7.1.1.9 Exporting an Authentication Credential File

#### Scenario

If a user uses a security mode cluster to develop applications, the keytab file of the user needs to be obtained for security authentication. You can export keytab files on FusionInsight Manager.

#### NOTE

After a user password is changed, the exported keytab file becomes invalid, and you need to export a keytab file again.

#### Prerequisites

Before downloading the keytab file of a Human-Machine user, the password of the user must be changed at least once on the Manager portal or a client; otherwise, the downloaded keytab file cannot be used. For details, see [Changing a User Password](#).

## Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > User**.

**Step 3** Locate the row that contains the user whose keytab file needs to be exported, choose **More > Download Authentication Credential**, specify the save path after the file is automatically generated, and keep the file properly.

The authentication credential includes the **krb5.conf** file of the Kerberos service.

After the authentication credential file is decompressed, you can obtain the following two files:

- The **krb5.conf** file contains the authentication service connection information.
- The **user.keytab** file contains user authentication information.

----End

## 8.7.1.2 Managing User Groups

### Scenario

FusionInsight Manager supports a maximum of 5000 user groups (including built-in user groups). You can create and manage different user groups based on service scenarios on FusionInsight Manager. A user group is bound to a role to obtain operation permissions. After a user is added to a user group, the user can obtain the operation permissions of the user group. A user group can be used to classify users and manage multiple users.

### Prerequisites

- You have learned service requirements and created roles required by service scenarios.
- You have logged in to FusionInsight Manager.

### Creating a User Group

**Step 1** Choose **System > Permission > User Group**.

**Step 2** Above the user group list, click **Create User Group**.

**Figure 8-51** Creating a user group

User Group > **Create User Group**

---

\* Group Name:

Role: [Add](#) [Clear All](#)

User: [Add](#) [Clear All](#)

Description:

**Step 3** Set **Group Name** and **Description**.

The group name contains 1 to 64 characters, including case-insensitive letters, digits, underscores (\_), hyphens (-), and spaces. It cannot be the same as an existing user group name in the system.

**Step 4** In the **Role** area, click **Add** to select a role and add it.**NOTE**

- For components (except HDFS and Yarn) for which Ranger authorization has been enabled, the permissions of non-default roles on Manager do not take effect. You need to configure Ranger policies to assign permissions to user groups.
- If the resource requests of HDFS and Yarn are beyond the Ranger policies, the ACL rules of the components still take effect.

**Step 5** In the **User** area, click **Add** to select a user and add it.**Step 6** Click **OK**.

The user group is created.

----End

## Viewing User Group Information

By default, all user groups are displayed in the user group list. You can click the arrow on the left of a user group name to view details about the user group, including the user quantity, specific users, and bound roles of the user group.

## Modifying Information About a User Group

Locate the row that contains the target user group, and click **Modify** to modify its information.

## Exporting Information About a User Group

Click **Export All** to export all user group information at a time in **TXT** or **CSV** format.

The user group information contains the user group name, description, user list, and role list.

## Deleting a User Group

Locate the row that contains the target user group, and click **Delete**. To delete multiple user groups in batches, select the target user groups and click **Delete** above the user group list. A user group that contains users cannot be deleted. To delete such a user group, delete all its users by modifying the user group first.

### 8.7.1.3 Managing Roles

#### Scenario

FusionInsight Manager supports a maximum of 5000 roles (including system built-in roles but excluding roles automatically created by tenants). Based on different service requirements, you need to create and manage different roles on FusionInsight Manager and perform authorization management for FusionInsight Manager and components using roles.

#### Prerequisites

- You have learned service requirements.
- You have logged in to FusionInsight Manager.

#### Creating a Role

**Step 1** Choose **System > Permission > Role**.

**Step 2** On the displayed page, click **Create Role** and fill in **Role Name** and **Description**.

The role name consists of 3 to 50 characters, including digits, letters, and underscores (\_). It cannot be the same as an existing role name in the system. The role name cannot start with **Manager**, **System**, or **default**. For example, the role name cannot be **Manager\_test**.

**Figure 8-52** Creating a role

Role > Create Role

---

\* Role Name:

Configure Resource Permission:

All resources	Description
All resources	
Manager	Cluster Management
312ts	

Description:

**Step 3** In the **Configure Resource Permission** area, click the cluster whose permissions are to be added and select service permissions for the role.

When setting permissions for a component, enter a resource name in the search text box in the upper right corner and click the search icon to view the search result.

The search result contains only directories, but not subdirectories. Search by keyword supports fuzzy match and is case-insensitive.

#### NOTE

- For components (except HDFS and Yarn) for which Ranger authorization has been enabled, the permissions of non-default roles on Manager do not take effect. You need to configure Ranger policies to assign permissions to user groups.
- If the resource requests of HDFS and Yarn are beyond the Ranger policies, the ACL rules of the components still take effect.
- A maximum of 1000 permissions can be set for a component at a time.

**Step 4** Click **OK**.

----End

## Modifying Role Information

Locate the row that contains the target role and click **Modify**.

## Exporting Role Information

Click **Export All** to export all role information at a time in **TXT** or **CSV** format.

Role information includes the role name and description.

## Deleting a Role

Locate the row that contains the target role and click **Delete**. To delete multiple roles in batches, select the target roles and click **Delete** above the role list. A role

bound to a user cannot be deleted. To delete such a role, disassociate the role from the user by modifying the user first.

## Task Example (Creating a Manager Role)

**Step 1** Choose **System > Permission > Role**.

**Step 2** On the displayed page, click **Create Role** and fill in **Role Name** and **Description**.

**Step 3** In the **Configure Resource Permission** area, click **Manager** and set permissions for the role.

**Figure 8-53** Setting permissions

Role Name:

Configure Resource Permission: All resources > Manager > **Manager**

Resource Name	Resource Type	Permission		Recursive
		view	management	
Cluster	Manager access path	<input type="checkbox"/>	<input type="checkbox"/>	
User	Manager access path	<input type="checkbox"/>	<input type="checkbox"/>	
Audit	Manager access path	<input type="checkbox"/>	<input type="checkbox"/>	
Tenant	Manager access path	<input type="checkbox"/>	<input type="checkbox"/>	
System	Manager access path	<input type="checkbox"/>	<input type="checkbox"/>	

Manager permissions:

- Cluster
  - **view** permission: permission to view information on the **Cluster** page and view alarms and events under **O&M > Alarm**.
  - **management** permission: permission for management on the **Cluster** and **O&M** pages.
- User
  - **view** permission: permission to view information on pages under **System > Permission**.
  - **management** permission: permission for management on pages under **System > Permission**.
- Audit
  - management** permission: permission for management on the **Audit** page.
- Tenant
  - management** permission: permission for management on the **Tenant** page and permission to view alarms and events under **O&M > Alarm**.
- System
  - management** permission: permission for management on all pages except those under **Permission** on the **System** page and permission to view alarms and events under **O&M > Alarm**.

**Step 4** Click **OK**.

----End

### 8.7.1.4 Security Policies

### 8.7.1.4.1 Configuring Password Policies

#### Scenario

To keep up with service security requirements, you can set password security rules, user login security rules, and user locking rules on FusionInsight Manager.

---

**NOTICE**

- Modify password policies based on service security requirements, because they involve user management security. Otherwise, security risks may be incurred.
  - Change the user password after modifying the password policy, and then the new password policy can take effect.
- 

#### Modifying a Password Policy (Versions Earlier Than MRS 3.1.2)

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > Security Policy > Password Policy**.

**Step 3** Click **Modify** in the **Operation** column and modify the password policy as prompted.

For details about the parameters, see [Table 8-42](#).

**Figure 8-54** Modifying a password policy

### Security Policy

---

Password Policy
Independent Configurations

---

#### Basic Settings

- \* Minimum Password Length:
- \* Character Types:  4  5

#### Lockup Settings

- \* Password Retries:
- \* User Lock Duration (Min):

#### Advanced Settings

- \* Password Validity Period (Day):
- \* Repetition Rule:
- \* Password Expiration Notification (Days):
- \* Interval for Deleting Authentication Failure Records (Min):

OK
Reset

**Table 8-42** Password policy parameters

Parameter	Description
Minimum Password Length	Indicates the minimum number of characters a password contains. The value ranges from <b>8</b> to <b>32</b> . The default value is <b>8</b> .

Parameter	Description
Character Types	Indicates how many character types in the following types a password can contain at least: uppercase letters, lowercase letters, digits, spaces, and special characters (~`!?,;:_'(){}/<>@#\$\$%^&*+ \=). The value can be <b>4</b> or <b>5</b> . The default value is <b>4</b> , which means that a password can contain uppercase letters, lowercase letters, digits, and special characters. If you set the parameter to <b>5</b> , a password can contain all the five character types mentioned above.
Password Retries	Indicates the number of consecutive wrong password attempts allowed before the system locks the user. The value ranges from <b>3</b> to <b>30</b> . The default value is <b>5</b> .
User Lock Duration (Min)	Indicates the time period in which a user is locked when the user lockout conditions are met. The value ranges from <b>5</b> to <b>120</b> . The default value is <b>5</b> .
Password Validity Period (Day)	Indicates the validity period of a password. The value ranges from <b>0</b> to <b>90</b> . <b>0</b> indicates that the password is permanently valid. The default value is <b>90</b> .
Repetition Rule	Indicates the number of previous passwords that cannot be reused when you change the password. The value ranges from <b>1</b> to <b>5</b> . The default value is <b>1</b> . This policy applies to only human-machine accounts.
Password Expiration Notification (Days)	Indicates the number of days in advance users are notified that their passwords are about to expire. After the value is set, if the difference between the cluster time and the password expiration time is smaller than this value, the user receives password expiration notifications. When logging in to FusionInsight Manager, the user will be notified that the password is about to expire and a message is displayed asking the user to change the password. The value ranges from <b>0</b> to $X$ ( $X$ must be set to the half of the password validity period and rounded down). Value <b>0</b> indicates that no notification is sent. The default value is <b>5</b> .
Interval for Deleting Authentication Failure Records (Min)	Indicates the interval of retaining incorrect password attempts. The value ranges from <b>0</b> to <b>1440</b> . <b>0</b> indicates that incorrect password attempts are permanently retained, and <b>1440</b> indicates that incorrect password attempts are retained for one day. The default value is <b>5</b> .

**Step 4** Click **OK** to save the configurations. Change the user password after modifying the password policy, and then the new password policy can take effect.

----End

## Adding a Password Policy (MRS 3.1.2 or Later)

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > Security Policy > Password Policy**.

**Step 3** Click **Add Password Policy** and modify the password policy as prompted.

For details about the parameters, see [Table 8-43](#).

**Table 8-43** Password policy parameters

Parameter	Description
Password Policy Name	The value is a string of 3 to 32 characters, including case-insensitive letters, digits, underscores (_), and hyphens (-). It cannot start with a hyphen (-).
Minimum Password Length	Indicates the minimum number of characters a password contains. The value ranges from <b>8</b> to <b>32</b> .
Character Types	Indicates how many character types in the following types a password can contain at least: uppercase letters, lowercase letters, digits, spaces, and special characters (~!?,,;:_'(){}[]/;<>@#\$\$%^&*+ \=). The value can be <b>4</b> or <b>5</b> . The default value is <b>4</b> , which means that a password can contain uppercase letters, lowercase letters, digits, and special characters. If you set the parameter to <b>5</b> , a password can contain all the five character types mentioned above.
Password Retries	Indicates the number of consecutive wrong password attempts allowed before the system locks the user. The value ranges from <b>3</b> to <b>30</b> .
User Lock Duration (Min)	Indicates the time period in which a user is locked when the user lockout conditions are met. The value ranges from <b>5</b> to <b>120</b> .
Password Validity Period (Day)	Indicates the validity period of a password. The value ranges from <b>0</b> to <b>90</b> . <b>0</b> indicates that the password is permanently valid.
Repetition Rule	Indicates the number of previous passwords that cannot be reused when you change the password. The value ranges from <b>1</b> to <b>5</b> . The default value is <b>1</b> .  This policy applies to only human-machine accounts.

Parameter	Description
Password Expiration Notification (Days)	Indicates the number of days in advance users are notified that their passwords are about to expire. After the value is set, if the difference between the cluster time and the password expiration time is smaller than this value, the user receives password expiration notifications. When logging in to FusionInsight Manager, the user will be notified that the password is about to expire and a message is displayed asking the user to change the password. The value ranges from <b>0</b> to <i>X</i> ( <i>X</i> must be set to the half of the password validity period and rounded down). Value <b>0</b> indicates that no notification is sent.
Interval for Deleting Authentication Failure Records (Min)	Indicates the interval of retaining incorrect password attempts. The value ranges from <b>0</b> to <b>1440</b> . <b>0</b> indicates that incorrect password attempts are permanently retained, and <b>1440</b> indicates that incorrect password attempts are retained for one day.

**Step 4** Click **OK** to save the configurations.

A new user uses the default password policy. After a new password policy is created, you can manually select the password policy when creating a user. You can modify the password policy of an existing user. For details, see [Modifying User Information](#).

----End

 **NOTE**

A maximum of 32 password policies can be created.

## Modifying a Password Policy (MRS 3.1.2 or Later)

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > Security Policy > Password Policy**.

**Step 3** Click **Modify** in the row that contains the target password policy. On the **Modify Password Policy** page, modify the password policy as prompted.

For details about the parameters, see [Table 8-43](#).

**Step 4** Click **OK** to save the configurations.

----End

 **NOTE**

- Users (except **admin**) cannot modify their own password policies.
- After the password policy bound to a user is modified, if the remaining password validity period is greater than the password validity period in the new password policy, the password validity period is set to the validity period in the new password policy. If the remaining password validity period is less than the password validity period in the new password policy, the password validity period remains unchanged.

## Deleting a Password Policy (MRS 3.1.2 or Later)

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > Security Policy > Password Policy**.

**Step 3** Click **Delete** in the row that contains the target password policy. In the dialog box that is displayed, click **OK**.

----End

### NOTE

The default password policy and the password policy that has been bound to a user cannot be deleted.

### 8.7.1.4.2 Configuring the Independent Attribute

#### Scenario

User **admin** or administrators who are bound to the `Manager_administrator` role can configure the independent attribute on FusionInsight Manager so that common users (all service users in the cluster) can set or cancel their own independent attributes.

After the independent attribute option is toggled on, service users need to log in to the system and set the independent attribute.

#### Constraints

- Administrators cannot set or cancel the independent attribute of a user.
- Administrators cannot obtain the authentication credentials of independent users.

#### Prerequisites

You have obtained the required administrator username and password.

#### Procedure

##### Toggling On or Off the Independent Attribute

**Step 1** Log in to FusionInsight Manager as user **admin** or a user bound to the `Manager_administrator` role.

**Step 2** Choose **System > Permission > Security Policy > Independent Configurations**.

**Step 3** Toggle on or off **Independent Attribute**, enter the password as prompted, and click **OK**.

**Step 4** After the identity is authenticated, wait until the OMS configuration is modified and click **Finish**.

 NOTE

After the independent attribute is disabled:

- A user who has the attribute can cancel it from the drop-down list of the username in the upper right corner of the page. The user cannot set the independent attribute again once it is cancelled. After the attribute is cancelled, existing independent tables will retain the attribute. However, the user cannot create independent tables again.
- Users without this attribute cannot set or cancel the attribute.

### Configuring the Independent Attribute

**Step 5** Log in to FusionInsight Manager as a service user.

---

**NOTICE**

Administrators cannot initialize the password of the user after the independent attribute is set. If the user password is forgotten, the password cannot be retrieved.

User **admin** cannot set the independent attribute.

---

**Step 6** Move the cursor to the username in the upper right corner of the page.

**Step 7** Select **Set Independent** or **Cancel Independent**.

 NOTE

- If the independent attribute is toggled on and has been set for the service user, **Cancel Independent** is displayed.
- If the independent attribute is toggled on but has been cancelled for the service user, **Set Independent** is displayed.
- If the independent attribute is toggled off but has been set for the service user, **Cancel Independent** is displayed.
- If the independent attribute is toggled off and has been cancelled for the service user, no option related to the independent attribute is displayed.

**Step 8** Enter the password as prompted and click **OK**.

**Step 9** After the identity is authenticated, click **OK** in the dialog box.

----End

## 8.7.2 Configuring Interconnections

### 8.7.2.1 Configuring SNMP Northbound Parameters

#### Scenario

If users need to view alarms and monitoring data of a cluster on the O&M platform, you can use Simple Network Management Protocol (SNMP) on FusionInsight Manager to report related data to the network management system (NMS).

## Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Interconnection > SNMP**.

**Step 3** Toggle on **SNMP Service**.

The SNMP service is disabled by default.  indicates that the service is enabled.

**Step 4** Set interconnection parameters according to [Table 8-44](#).

**Table 8-44** Interconnection parameters

Parameter	Description
Version	Specifies the version of SNMP, which can be: <ul style="list-style-type: none"><li>• <b>V2C</b>: This is an earlier version with low security.</li><li>• <b>V3</b>: This is a later version with higher security than SNMPv2c</li></ul> SNMPv3 is recommended.
Local Port	Specifies the local port. The default value is <b>20000</b> . The value ranges from <b>1025</b> to <b>65535</b> .
Read Community Name	Specifies the read-only community name. This parameter is available only when <b>Version</b> is set to <b>V2C</b> .
Write Community Name	Specifies the write community name. This parameter is available only when <b>Version</b> is set to <b>V2C</b> .
Security Username	Specifies the SNMP security username. This parameter is available only when <b>Version</b> is set to <b>V3</b> .
Authentication Protocol	Specifies the authentication protocol. This parameter is available only when <b>Version</b> is set to <b>V3</b> . SHA is recommended.
Authentication Password	Specifies the authentication password. This parameter is available only when <b>Version</b> is set to <b>V3</b> .
Confirm Password	Used to confirm the authentication password. This parameter is available only when <b>Version</b> is set to <b>V3</b> .
Encryption Protocol	Specifies the encryption protocol. This parameter is available only when <b>Version</b> is set to <b>V3</b> . AES256 is recommended.
Encryption Password	Specifies the encryption password. This parameter is available only when <b>Version</b> is set to <b>V3</b> .

Parameter	Description
Confirm Password	Used to confirm the encryption password. This parameter is available only when <b>Version</b> is set to <b>V3</b> .

**NOTE**

- The value of **Security Username** cannot contain repeated strings with the unit length as a common factor of 64 (such as 1, 2, 4, and 8), for example, **abab** and **abcdabcd**.
- The **Authentication Password** and **Encryption Password** must contain 8 to 16 characters, including at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters. The two passwords must be different. The two passwords cannot be the same as the security username or the reverse of the security username.
- For security purposes, periodically change the authentication password and encryption password when the SNMP protocol is used.
- If SNMP v3 is used, a security user will be locked after five consecutive authentication failures within 5 minutes. The user will be automatically unlocked 5 minutes later.

**Step 5** Click **Create Trap Target** in the **Trap Target** area. In the displayed dialog box, set the following parameters:

- **Target Symbol:** specifies the trap target ID, which is the ID of the NMS or host that receives traps. The value consists of 1 to 255 characters, including letters or digits.
- **Target IP Address Mode:** specifies the mode of the target IP address. The value can be **IPv4** or **IPv6**.
- **Target IP Address:** specifies the target IP address, which can communicate with the management plane IP address of the management node.
- **Target Port:** specifies the port receiving traps. The port number must be consistent with the peer end and ranges from 0 to 65535.
- **Trap Community Name:** This parameter is available only when **Version** is set to **V2C** and is used to report the community name.

Click **OK**.

The **Create Trap Target** dialog box is closed.

**Step 6** Click **OK**.

----End

## 8.7.2.2 Configuring Syslog Northbound Parameters

### Scenario

If users need to view alarms and events of a cluster on the unified alarm reporting platform, you can use the Syslog protocol on FusionInsight Manager to report related data to the alarm platform.

**NOTICE**

If the Syslog protocol is not encrypted, data may be stolen.

**Procedure**

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Interconnection > Syslog**.

**Step 3** Toggle on **Syslog Service**.

The Syslog service is disabled by default.  indicates that the service is enabled.

**Step 4** Set northbound parameters according to [Table 8-45](#).

**Table 8-45** Syslog interconnection parameters

Parameter Area	Parameter	Description
Syslog Protocol	Server IP Address Mode	Specifies the IP address mode of the interconnected server. The value can be <b>IPV4</b> or <b>IPV6</b> .
	Server IP Address	Specifies the IP address of the interconnected server.
	Server Port	Specifies the port number for interconnection.
	Protocol	Specifies the protocol type. The options are as follows: <ul style="list-style-type: none"><li>• <b>TCP</b></li><li>• <b>UDP</b></li></ul>
	Severity Level	Specifies the severity of the reported message. The options are as follows: <ul style="list-style-type: none"><li>• <b>Emergency</b></li><li>• <b>Alert</b></li><li>• <b>Critical</b></li><li>• <b>Error</b></li><li>• <b>Warning</b></li><li>• <b>Notice</b></li><li>• <b>Informational</b> (default value)</li><li>• <b>Debug</b></li></ul> <p><b>NOTE</b> <b>Severity Level</b> and <b>Facility</b> determine the priority of the sent message.</p> <p><b>Priority = Facility × 8 + Severity Level</b></p> <p>For details about the values of <b>Severity Level</b> and <b>Facility</b>, see <a href="#">Table 8-46</a>.</p>

Parameter Area	Parameter	Description
	Facility	Specifies the module where the log is generated. For details about the available values of this parameter, see <a href="#">Table 8-46</a> . Default value <b>local use 0 (local0)</b> is recommended.
	Identifier	Specifies the product ID. The default value is <b>FusionInsight Manager</b> . The identifier can contain a maximum of 256 characters, including letters, digits, underscores (_), periods (.), hyphens (-), spaces, and the following special characters:   \$ { }
Report Message	Report Format	Specifies the message format of the alarm report. For details, see the help information on the page. The report format can contain a maximum of 1024 characters, including letters, digits, underscores (_), periods (.), hyphens (-), spaces, and the following special characters:   \$ { } <b>NOTE</b> For details about each field in the report format, see <a href="#">Table 8-47</a> .
	Alarm Type	Specifies the type of the alarm to be reported.
	Alarm Severities	Specifies the level of the alarm to be reported.
Uncleared Alarm Reporting	Periodic Uncleared Alarm Reporting	Specifies whether to report uncleared alarms in a specified period. You can toggle on or off the function. The function is toggled off by default.
	Report Interval (min)	Specifies the interval for periodically reporting uncleared alarms. This parameter is valid only when <b>Periodic Uncleared Alarm Reporting</b> is enabled. The default value is <b>15</b> , in minutes. The value ranges from <b>5</b> to <b>1440</b> (one day).
Heartbeat Settings	Heartbeat Reporting	Specifies whether to periodically report Syslog heartbeat messages. You can toggle on or off the function. The function is toggled off by default.
	Heartbeat Interval (minutes)	Specifies the interval for periodically reporting heartbeat messages. This parameter is valid only when <b>Heartbeat Reporting</b> is enabled. The default value is <b>15</b> , in minutes. The value ranges from <b>1</b> to <b>60</b> .

Parameter Area	Parameter	Description
	Heartbeat Packet	Specifies the heartbeat message to be reported. This parameter is valid when <b>Heartbeat Reporting</b> is toggled on and cannot be left blank. The value can contain a maximum of 256 characters, including digits, letters, underscores (_), vertical bars ( ), colons (:), spaces, commas (,), and periods (.).

 **NOTE**

After the periodic heartbeat packet function is enabled, packets may be interrupted during automatic recovery of some cluster error tolerance (for example, active/standby OMS switchover). In this case, wait for automatic recovery.

**Step 5** Click **OK**.

----End

### 8.7.2.3 Configuring Monitoring Metric Dumping

#### Scenario

The monitoring data reporting function writes the monitoring data collected in the system into a text file and uploads the file to a specified server in FTP or SFTP mode.

Before using this function, you need to perform related configurations on FusionInsight Manager.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Interconnection > Upload Performance Data**.

**Step 3** Toggle on **Upload Performance Data**.

The performance data upload service is disabled by default.  indicates that the service is enabled.

**Step 4** Set the upload parameters according to [Table 8-48](#).

**Table 8-48** Upload parameters

Parameter	Description
FTP IP Address Mode	Specifies the server IP address mode. This parameter is mandatory. The value can be <b>IPV4</b> or <b>IPV6</b> .
FTP IP Address	Specifies the IP address of the FTP server for storing monitoring files after the monitoring metric data is interconnected. This parameter is mandatory.
FTP Port	Specifies the port for connecting to the FTP server. This parameter is mandatory.
FTP Username	Specifies the username for logging in to the FTP server. This parameter is mandatory.
FTP Password	Specifies the password for logging in to the FTP server. This parameter is mandatory.
Save Path	Specifies the path for storing monitoring files on the FTP server. This parameter is mandatory.

Parameter	Description
Dump Interval (second)	Specifies the interval at which monitoring files are periodically stored on the FTP server, in seconds. This parameter is mandatory.
Dump Mode	Specifies the protocol used for sending monitoring files. This parameter is mandatory. The value can be <b>SFTP</b> or <b>FTP</b> . You are advised to use the SFTP mode based on SSH v2. Otherwise, security risks may be incurred.
SFTP Service Public Key	Specifies the public key of the FTP server. This parameter is optional. It is valid only when <b>Dump Mode</b> is set to <b>SFTP</b> .

**Step 5** Click **OK**. **NOTE**

If the dump mode is SFTP and the public key of the SFTP service is empty, the system displays a security risk warning. You need to evaluate the security risk and then save the configuration.

----**End****Data Format**

After the configuration is complete, the monitoring data reporting function periodically writes monitoring data in the cluster to text files and reports the files to the corresponding FTP/SFTP service based on the configured reporting period.

- Principles for generating monitoring files
  - The monitoring metrics are written to files generated every 30, 60, and 300 seconds based on the metric collection period.
    - 30s: real-time metrics that are collected every 30s by default
    - 60s: real-time metrics that are collected every 60s by default
    - 300s: all metrics that are not collected every 30s or 60s
  - File name format: *metric\_{Interval}\_{File creation time YYYYMMDDHHMMSS}.log*  
Example: **metric\_60\_20160908085915.log**  
**metric\_300\_20160908085613.log**
- Monitoring file content
  - Format of monitoring files:  
"Cluster ID|Cluster name|Displayed name|Service name|Metric ID|Collection time|Collection host@m@Sub-metric|Unit|Metric value", where fields are separated using vertical bars (|). For example:  

```
1|xx1|Host|Host|10000413|2019/06/18 10:05:00|189-66-254-146|KB/s|309.910
1|xx1|Host|Host|10000413|2019/06/18 10:05:00|189-66-254-152|KB/s|72.870
2|xx2|Host|Host|10000413|2019/06/18 10:05:00|189-66-254-163|KB/s|100.650
```

 Note: The actual files are not in that format.
  - Interval for uploading monitoring files:

The interval for uploading monitoring files can be set using the **Dump Interval (second)** parameter on the page. Currently, the interval can range from **30** to **300**. After the configuration is complete, the system periodically uploads files to the corresponding FTP/SFTP server at the specified interval.

- Monitoring metric description file

- Metric set file

The metric set file **all-shown-metric-zh\_CN** contains detailed information about all metrics. After obtaining the metric IDs from the files reported by the third-party system, you can query details about the metrics from the metric set file.

Location of the metric set file:

Active and standby OMS nodes: `{FusionInsight installation path} /om-server/om/etc/om/all-shown-metric-zh_CN`

Content of the metric set file:

```
Real-Time Metric ID,5-Minute Metric ID,Metric Name,Metric Collection Period (s),Collected by
Default,Service Belonged To,Role Belonged To
00101,10000101,JobHistoryServer non-heap memory usage,30,false,Mapreduce,JobHistoryServer
00102,10000102,JobHistoryServer non-heap memory allocation
volume,30,false,Mapreduce,JobHistoryServer
00103,10000103,JobHistoryServer heap memory usage,30,false,Mapreduce,JobHistoryServer
00104,10000104,JobHistoryServer heap memory allocation
volume,30,false,Mapreduce,JobHistoryServer
00105,10000105,Number of blocked threads,30,false,Mapreduce,JobHistoryServer
00106,10000106,Number of running threads,30,false,Mapreduce,JobHistoryServer
00107,10000107,GC time,30,false,Mapreduce,JobHistoryServer
00110,10000110,JobHistoryServer CPU usage,30,false,Mapreduce,JobHistoryServer
...
```

- Field description of critical metrics

**Real-Time Metric ID:** indicates the ID of the metric whose collection period is 30s or 60s.

**5-Minute Metric ID:** indicates the ID of a 5-minute (300s) metric.

**Metric Collection Period (s):** indicates the collection period of real-time metrics. The value can be **30** or **60**.

**Service Belonged To:** indicates the name of the service to which a metric belongs, for example, HDFS and HBase.

**Role Belonged To:** indicates the name of the role to which a metric belongs, for example, JobServer and RegionServer.

- Description

For metrics whose collection period is 30s/60s, you can find the corresponding metric description by referring to the first column, that is, **Real-Time Metric ID**.

For metrics whose collection period is 300s, you can find the corresponding metric description by referring to the second column, that is, **5-Minute Metric ID**.

## 8.7.3 Importing a Certificate

### Scenario

CA certificates are used to encrypt data during communication between FusionInsight Manager modules and between cluster component clients and

servers to ensure security. CA certificates can be quickly imported to FusionInsight Manager for product security. Import CA certificates in following scenarios:

- When the cluster is installed for the first time, you need to replace the enterprise certificate.
- If the enterprise certificate has expired or security hardening is required, you need to replace it with a new certificate.

## Impact on the System

- During certificate replacement, the cluster needs to be restarted. In this case, the system becomes inaccessible and cannot provide services.
- After the certificate is replaced, the certificates used by all components and FusionInsight Manager modules are automatically updated.
- After the certificate is replaced, you need to reinstall the certificate in the local environment where the certificate is not trusted.

## Prerequisites

- You have generated the certificate file and key file or obtained them from the enterprise certificate administrator.
- You have obtained the files to be imported to the cluster, including the CA certificate file (\*.crt), key file (\*.key), and file that saves the key file password (**password.property**). The certificate name and key name can contain uppercase letters, lowercase letters, and digits. After the preceding files are generated, compress them into a TAR package.
- You have obtained a password for accessing the key file, for example, **Userpwd@123**.  
To avoid potential security risks, the password must meet the following complexity requirements:
  - Contains at least 8 characters.
  - Contains at least four types of the following: uppercase letters, lowercase letters, numbers, and special characters (~`!?,,:-\_'(){}/<>@#\$\$%^&\*+|\|=).
- When applying for certificates from the certificate administrator, you have provided the password for accessing the key file and applied for the certificate files in CRT, CER, CERT, and PEM formats and the key files in KEY and PEM formats. The requested certificates must have the issuing function.

## Procedure

**Step 1** Log in to FusionInsight Manager and choose **System > Certificate**.

**Step 2** Click **\*\*\*** or **Select File** on the right of **Upload Certificate**. In the file selection window, browse to select the obtained TAR package of the certificate files.

**Step 3** Click **Upload**.

Manager uploads the compressed package and automatically imports the package.

**Step 4** After the certificate is imported, the system displays a message asking you to synchronize the cluster configuration and restart the web service for the new certificate to take effect. Click **OK**.

- Step 5** In the displayed dialog box, enter the password of the current login user and click **OK**. The cluster configuration is automatically synchronized and the web service is restarted.
- Step 6** After the cluster is restarted, enter the URL for accessing FusionInsight Manager in the address box of the browser and check whether the FusionInsight Manager web page can be successfully displayed.
- Step 7** Log in to FusionInsight Manager.
- Step 8** Choose **Cluster > Dashboard**. In the upper right corner, click **More > Restart**.
- Step 9** In the displayed dialog box, enter the password of the current login user and click **OK**.
- End

## 8.7.4 OMS Management

### 8.7.4.1 Overview of the OMS Page

#### Overview

Log in to FusionInsight Manager and choose **System > OMS**. You can perform maintenance operations on the OMS page, including viewing basic information, viewing the service status of OMS service modules, and manually triggering health checks.

#### NOTE

OMS is the management node of the O&M system. Generally, there are two OMS nodes that work in active/standby mode.

#### Basic Information

OMS-associated information is displayed on FusionInsight Manager, as listed in [Table 8-49](#).

**Table 8-49** OMS information

Item	Description
Version	Indicates the OMS version, which is consistent with the FusionInsight Manager version.
IP Mode	Indicates the IP address mode of the current cluster network.
HA Mode	Indicates the OMS working mode, which is specified by the configuration file during FusionInsight Manager installation.
Current Active	Indicates the host name of the active OMS node, that is, the host name of the active management node. Click a host name to go to the host details page.

Item	Description
Current Standby	Indicates the host name of the standby OMS node, that is, the host name of the standby management node. Click a host name to go to the host details page.
Duration	Indicates the duration for starting the OMS process.

## OMS Service Status

FusionInsight Manager displays the running status of all OMS service modules. If the status of each service module is displayed as , the OMS is running properly.

## Health Check

You can click **Health Check** on the OMS page to check the OMS status. If some check items are faulty, you can view the check description for troubleshooting.

**Figure 8-55** Health check

## Entering or Exiting Maintenance Mode

Configure OMS to enter or exit the maintenance mode.

## System Parameters

Connect to the DMPS cluster in large-scale cluster scenarios.

### 8.7.4.2 Modifying OMS Service Configuration Parameters

#### Scenario

Based on the security requirements of the user environment, you can modify the Kerberos and LDAP configurations in the OMS on FusionInsight Manager.

#### Impact on the System

After the OMS service configuration parameters are modified, the corresponding OMS module needs to be restarted. In this case, FusionInsight Manager cannot be used.

#### Procedure

##### Modifying the okerberos configuration

- Step 1** Log in to FusionInsight Manager and choose **System > OMS**.
- Step 2** Locate the row that contains okerberos and click **Modify Configuration**.
- Step 3** Modify the parameters according to [Table 8-50](#).

**Table 8-50** okerberos parameters

Parameter	Description
KDC Timeout (ms)	Timeout duration for an application to connect to Kerberos, in milliseconds. The value must be an integer.
Max Retries	Maximum number of retries for an application to connect to Kerberos, in seconds. The value must be an integer.
LDAP Timeout (ms)	Timeout duration for Kerberos to connect to LDAP, in milliseconds.
LDAP Search Timeout (ms)	Timeout duration for Kerberos to query user information in LDAP, in milliseconds.
Kadmin Listening Port	Port number of the Kadmin service.
KDC Listening Port	Port number of the kinit service.
Kpasswd Listening Port	Port number of the Kpasswd service.
Reset LDAP Account Password	Machine-machine users ( <b>cn=krbadmin,ou=Users,dc=hadoop,dc=com</b> and <b>cn=krbkdc,ou=Users,dc=hadoop,dc=com</b> ) used by Kerberos to access LDAP. If this parameter is selected, the passwords will be replaced by random passwords. <b>NOTE</b> This parameter is available only in MRS 3.1.2 or later.

- Step 4** Click **OK**.

In the displayed dialog box, enter the password of the current login user and click **OK**. In the displayed confirmation dialog box, click **OK**.

#### Modifying the oldap configuration

- Step 5** Locate the row that contains the oldap and click **Modify Configuration**.

**Step 6** Modify the parameters according to [Table 8-51](#).

**Table 8-51** OLDAP parameters

Parameter	Description
LDAP Listening Port	Port number of the LDAP service.
Reset LDAP Account Password	Machine-machine users ( <b>cn=root,dc=hadoop,dc=com</b> and <b>cn=pg_search_dn,ou=Users,dc=hadoop,dc=com</b> ) used by LDAP for data management, synchronization, and status check. If this parameter is selected, the passwords will be replaced by random passwords. <b>NOTE</b> This parameter is available only in MRS 3.1.2 or later.

**Step 7** Click **OK**.

In the displayed dialog box, enter the password of the current login user and click **OK**. In the displayed confirmation dialog box, click **OK**.

 **NOTE**

To reset the password of the LDAP account, you need to restart ACS. The procedure is as follows:

1. Log in to the active management node as user **omm** using PuTTY, and run the following command to update the domain configuration:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/restart-RealmConfig.sh
```

The command is run successfully if the following information is displayed:

```
Modify realm successfully. Use the new password to log in to FusionInsight again.
```

2. Run the **sh \$CONTROLLER\_HOME/sbin/acs\_cmd.sh stop** command to stop ACS.
3. Run the **sh \$CONTROLLER\_HOME/sbin/acs\_cmd.sh start** command to start ACS.

### Restarting the cluster

**Step 8** Log in to FusionInsight Manager and restart the cluster by referring to [Performing a Rolling Restart of a Cluster](#).

----End

## 8.7.5 Viewing Component Packages

### Scenario

A complete MRS cluster consists of multiple component packages. Before installing some services on FusionInsight Manager, check whether the component packages of those services have been installed.

## Procedure

**Step 1** Log in to FusionInsight Manager and choose **System > Component**.

**Step 2** On the **Installed Component** page, view all components.

 **NOTE**

In the **Platform Type** column, you can view the registered OS and platform type of the component.

**Step 3** Click  on the left of a component name to view the services and version numbers contained in the component.

----End

## 8.8 Cluster Management

### 8.8.1 Cluster Mutual Trust Management

#### 8.8.1.1 Overview of Mutual Trust Between Clusters

##### Function Description

By default, users of a big data cluster in security mode can only access resources in the cluster but cannot perform identity authentication or access resources in other clusters in security mode.

##### Feature Description

- **Domain**  
The secure usage scope of users in each system is called a domain. Each FusionInsight Manager must have a unique domain name. Cross-Manager access allows users to use resources across domains.
- **User Encryption**  
Mutual trust can be configured across FusionInsight Managers. The current Kerberos server supports only the aes256-cts-hmac-sha1-96:normal and aes128-cts-hmac-sha1-96:normal encryption types for encrypting cross-domain users, and the encryption types cannot be changed.
- **User Authentication**  
After cross-Manager mutual trust is configured, if a user with the same name exists in two systems and the user in the peer system has the permission to access a resource in that system, this user can also access the remote resource.
- **Direct Mutual Trust**  
The system saves the mutual trust ticket of the peer system in two clusters with mutual trust configured and uses the mutual trust ticket to access the peer system.

## 8.8.1.2 Changing Manager's Domain Name

### Scenario

The secure usage scope of users in each system is called a domain. Each system must have a unique domain name. The domain name of FusionInsight Manager is generated during installation. The system administrator can change the domain name on FusionInsight Manager.

#### NOTICE

- Changing the system domain name is a high-risk operation. Before performing operations in this section, ensure that the OMS data has been backed up by referring to [Backing Up Manager Data](#).

### Impact on the System

- During the configuration, all of the clusters need to be restarted and are unavailable during restart.
- After the domain name is changed, the passwords of the Kerberos administrator and OMS Kerberos administrator will be initialized. You need to use the default passwords and then change the passwords. If a component user whose password is generated randomly by the system is used for identity authentication, see [Exporting an Authentication Credential File](#) to download the keytab file again.
- After the domain name is changed, passwords of the **admin** user, component user, and human-machine user added by the system administrator before the domain name change will be reset to the same one. Change these passwords. The reset password consists of two parts: one part is generated by the system and the other is set by the user. The system generating part is **Admin@123**, which is the default password. For details about the user-defined part, see descriptions of **Password Suffix** in [Table 8-53](#). For example, if the system generates **Admin@123** and the user sets **Test#\$%@123**, the new password after reset is **Admin@123Test#\$%@123**.
- The new password must meet the password policies. To obtain the new human-machine user password, log in to the active OMS as user **omm** and run the following script:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/get_reset_pwd.sh Password
suffix user_name
```

- *Password suffix* is a parameter set by the user. If it is not specified, the default value **Admin@123** is used.
- *user\_name* is optional. The default value is **admin**.
- There can be security risks if a command contains the authentication password. You are advised to disable the command recording function (history) before running the command.

Example:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/get_reset_pwd.sh Test#$
%@123
```

To get the reset password after changing cluster domain name.

```
pwd_min_len : 8
pwd_char_types : 4
```

The password reset after changing cluster domain name is: "Admin@123Test#\$%@123"

In this example, **pwd\_min\_len** and **pwd\_char\_types** indicate the minimum password length and number of password character types respectively defined in the password policies. **Admin@123Test#\$%@123** indicates the human-machine user password after the system domain name is changed.

- After the system domain name is changed, the reset password consists of two parts: one part is generated by the system and the other is set by the user. The reset password must meet the password policies. If the password is not long enough, one or multiple at signs (@) are added between **Admin@123** and the user-defined part. If there are five character types, a space is added after **Admin@123**.

When the user-defined part is **Test@123** and the default user password policy is used, the new password is **Admin@123Test@123**. The password contains 17 characters of four types. To meet the current password policy, the new password is processed according to [Table 8-52](#).

**Table 8-52** Password processing

Minimum Password Length	Number of Character Types	Processing Against the Password Policy	New Password
8 to 17 characters	4	The user password policy is met.	Admin@123Test@123
18 characters	4	Add an at sign (@).	Admin@123@Test@123
19 characters	4	Add two at signs (@).	Admin@123@@Test@123
8 to 18 characters	5	Add a space.	Admin@123 Test@123
19 characters	5	Add a space and an at sign (@).	Admin@123 @Test@123
20 characters	5	Add a space and two at signs (@).	Admin@123 @@Test@123

- After the system domain name is changed, download the **keytab** file for the machine-machine user added by the system administrator before the domain name is changed.
- After the system domain name is changed, download and install the client again.
- After the system domain name is changed, if there is any running HetuEngine compute instance, restart the instance.

## Prerequisites

- The system administrator has clarified service requirements and planned domain names for the systems.  
A domain name can contain only uppercase letters, numbers, periods (.), and underscores (\_), and must start with a letter or number, for example, **DOMAINA.HW** and **DOMAINB.HW**.
- The running status of all components in the Manager clusters is **Normal**.
- The **acl.compare.shortName** parameter of the ZooKeeper service of all clusters in Manager is set to default value **true**. Otherwise, change the value to **true** and restart the ZooKeeper service.

## Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > Domain and Mutual Trust**.

**Figure 8-56** Domain and mutual trust

The screenshot shows the 'Domain and Mutual Trust' configuration interface. On the left, a sidebar lists navigation options: System, Permission, User, User Group, Role, Security Policy, Domain and Mutual Trust (highlighted), and Third-Party AD. The main content area is titled 'Domain and Mutual Trust' and contains the following fields:

- Local Domain:** A text input field containing 'HADOOPTEST.COM'.
- Password Suffix:** A text input field containing '\*\*\*\*\*'.
- Confirm Password Suffix:** A text input field containing '\*\*\*\*\*'.
- Peer Mutual Trust Domain:** Two text input fields labeled 'realm\_name' and 'ip\_port'.

At the bottom of the main area, there are 'OK' and 'Reset' buttons.

**Step 3** Modify required parameters.

**Table 8-53** Related parameters

Parameter	Description
Local Domain	Planned domain name of the system.
Password Suffix	<p>Part of the password set by the user after the password of the human-machine user is reset. This parameter is mandatory. The default value is <b>Admin@123</b>.</p> <p><b>NOTE</b> This parameter takes effect only after <b>Local Domain</b> is modified. The following conditions must be met:</p> <ul style="list-style-type: none"> <li>• The password ranges from 8 to 16 characters.</li> <li>• The password must contain at least three types of the following: uppercase letters, lowercase letters, numbers, and special characters (^~!@#\$\$%^&amp;*()-_+=+ [{];:;&lt;.&gt;/? and spaces).</li> </ul>

**Step 4** Determine whether to set up mutual trust between managers across cluster.

- If you need to do so, perform operations by referring to [Configuring Cross-Manager Mutual Trust Between Clusters](#) and skip subsequent steps in this section.
- If you do not need such configuration, go to [Step 5](#).

**Step 5** Click **OK**. Proceed with the subsequent steps only after the modification is complete.

**Step 6** Log in to the active management node as user **omm**.

**Step 7** Run the following command to update the domain configuration:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/restart-RealmConfig.sh
```

The command is executed successfully if the following information is displayed:

```
Modify realm successfully. Use the new password to log in to FusionInsight again.
```

 **NOTE**

After the restart, some hosts and services cannot be accessed and an alarm is generated. This problem can be automatically resolved in about 1 minute after **restart-RealmConfig.sh** is run.

**Step 8** Log in to FusionInsight Manager using the new password of user **admin** (for example, **Admin@123Admin@123**). On the dashboard, click  or **More** and select **Restart**.

In the displayed dialog box, enter the password of the current login user and click **OK**.

In the displayed dialog box, click **OK**. Wait for a while until a message indicating that the operation is successful is displayed. Click **Finish**.

**Step 9** Log out of FusionInsight Manager and then log in again. If the login is successful, the configuration is successful.

**Step 10** Log in to the active management node as user **omm** and run the following command to update the configurations of the job submission client:

```
sh /opt/executor/bin/refresh-client-config.sh
```

**Step 11** If a HetuEngine compute instance is running, restart the compute instance.

1. Log in to FusionInsight Manager as the user who is used to access the HetuEngine web UI.
2. Choose **Cluster > Services > HetuEngine** to go to the HetuEngine service page.
3. In the **Basic Information** area on the **Dashboard** page, click the link next to **HSConsole WebUI**. The HSConsole page is displayed.
4. For a running compute instance, click **Stop** in the **Operation** column. After the compute instance is in the **Stopped** state, click **Start** to restart the compute instance.

----End

### 8.8.1.3 Configuring Cross-Manager Mutual Trust Between Clusters

#### Scenario

When two security-mode clusters managed by different FusionInsight Managers need to access each other's resources, the system administrator can configure cross-Manager mutual trust for them.

The secure usage scope of users in each system is called a domain. Each FusionInsight Manager must have a unique domain name. Cross-Manager access allows users to use resources across domains.

#### NOTE

A maximum of 500 mutually trusted clusters can be configured.

#### Impact on the System

- After cross-Manager cluster mutual trust is configured, users of an external system can be used in the local system. The system administrator needs to periodically check the user permissions in Manager based on enterprise service and security requirements.
- If you set up mutual trust between clusters, affected services need to be restarted and services will be interrupted.
- After cross-Manager cluster mutual trust is configured, internal Kerberos users **krbtgt/Local cluster domain name@External cluster domain name** and **krbtgt/External cluster domain name@Local cluster domain name** are added to the two mutually trusted clusters. The internal users cannot be deleted. The system administrator needs to change the passwords periodically based on enterprise service and security requirements. The passwords of these four users in the two systems must be the same. For details, see [Changing the Password for a Component Running User](#). When the passwords are changed, the connectivity between cross-cluster service applications may be affected.
- If the system domain name is changed and there is any running HetuEngine compute instance, restart the compute instance.
- After cross-Manager cluster mutual trust is configured, the clients of each cluster need to be downloaded and installed again.
- After cross-Manager cluster mutual trust is configured, you need to check whether the system works properly and how to access resources of the peer system as a user of the local system. For details, see [Assigning User Permissions After Cross-Cluster Mutual Trust Is Configured](#).

#### Prerequisites

- The system administrator has clarified service requirements and planned domain names for the systems. A domain name can contain only uppercase letters, numbers, periods (.), and underscores (\_), and must start with a letter or number, for example, **DOMAINA.HW** and **DOMAINB.HW**.
- The domain names of the two Managers are different. When an ECS or BMS cluster is created on MRS, a unique system domain name is randomly generated. Generally, you do not need to change the system domain name.

- The two clusters do not have the same host name or the same IP address.
- The system time of the two clusters is consistent, and the NTP services in the two systems use the same clock source.
- The running status of all components in the Manager clusters is **Normal**.
- The **acl.compare.shortName** parameter of the ZooKeeper service of all clusters in Manager is set to default value **true**. Otherwise, change the value to **true** and restart the ZooKeeper service.
- The two clusters are in the same VPC. If they are not, create a VPC peering connection between them. For details, see [VPC Peering Connection](#).

## Procedure

**Step 1** Log in to a FusionInsight Manager of one cluster.

**Step 2** Choose **System > Permission > Domain and Mutual Trust**.

**Step 3** Modify **Peer Mutual Trust Domain**.

**Table 8-54** Related parameters

Parameter	Description
realm_name	Enter the domain name of the peer system.
ip_port	<p>Enter the KDC address of the peer system.</p> <p>Value format: <i>IP address of the node accommodating the Kerberos service in the peer system:Port number</i></p> <ul style="list-style-type: none"><li>• In dual-plane networking, enter the service plane IP address.</li><li>• If an IPv6 address is used, the IP address must be enclosed in square brackets ([ ]).</li><li>• Use commas (,) to separate the KDC addresses if the active and standby Kerberos services are deployed or multiple clusters in the peer system need to establish mutual trust with the local system.</li><li>• You can obtain the port number from the <b>kdc_ports</b> parameter of the KrbServer service. The default value is <b>21732</b>. To obtain the IP address of the node where the service is deployed, click the <b>Instance</b> tab on the KrbServer page and view <b>Service IP Address</b> of the KerberosServer role.</li></ul> <p>For example, if the Kerberos service is deployed on nodes at <b>10.0.0.1</b> and <b>10.0.0.2</b> that have established mutual trust with the local system, the parameter value is <b>10.0.0.1:21732,10.0.0.2:21732</b>.</p>

### NOTE

If you need to configure mutual trust for multiple Managers, click  to add a new item and set parameters. Click  to delete unnecessary configurations.

**Step 4** Click **OK**.

**Step 5** Log in to the active management node as user **omm**, and run the following command to update the domain configuration:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/restart-RealmConfig.sh
```

The command is executed successfully if the following information is displayed:

Modify realm successfully. Use the new password to log in to FusionInsight again.

After the restart, some hosts and services cannot be accessed and an alarm is generated. This problem can be automatically resolved in about 1 minute after **restart-RealmConfig.sh** is run.

**Step 6** Log in to FusionInsight Manager and restart the cluster or configure expired instances:

Check whether the system domain name of Manager is changed.

- If the system domain name is changed, click **\*\*\*** or **More** on the home page, click **Start**, enter the password, select the checkbox for confirming the impact, and click **OK**. Wait until the cluster is started successfully.
- If the system domain name is not changed, click **\*\*\*** or **More** on the home page and select **Restart Configuration-Expired Instances**. Enter the password, select the checkbox for confirming the impact, and click **OK**. Wait until the service is restarted.

**Step 7** Log out of FusionInsight Manager and then log in again. If the login is successful, the configuration is successful.

**Step 8** If a HetuEngine compute instance is running, restart the compute instance.

1. Log in to FusionInsight Manager as the user who is used to access the HetuEngine web UI.
2. Choose **Cluster > Services > HetuEngine** to go to the HetuEngine service page.
3. In the **Basic Information** area on the **Dashboard** page, click the link next to **HSConsole WebUI**. The HSConsole page is displayed.
4. For a running compute instance, click **Stop** in the **Operation** column. After the compute instance is in the **Stopped** state, click **Start** to restart the compute instance.

**Step 9** Log in to FusionInsight Manager of another cluster and repeat the preceding steps.

----End

## 8.8.1.4 Assigning User Permissions After Cross-Cluster Mutual Trust Is Configured

### Scenario

After cross-Manager cluster mutual trust is configured, assign user access permissions on FusionInsight Managers so that these users can perform service operations in the mutually trusted Managers.

## Prerequisites

The mutual trust between the two Managers has been configured.

## Procedure

- Step 1** Log in to the local FusionInsight Manager.
- Step 2** Choose **System > Permission > User** to check whether the target user exists.
  - If yes, go to **Step 3**.
  - If no, go to **Step 4**.
- Step 3** Click  on the left of the target user, and check whether the permissions assigned to the user group of the user and the roles meet service requirements. If not, create a role and bind the role to the user by referring to **Configuring Permissions**, or modify the user group or role permissions of the user.
- Step 4** Create a user required by the service operations and associate the required user group or role. For details, see **Creating a User**.
- Step 5** Log in to the other FusionInsight Manager and repeat **Step 2** to **Step 4** to create a user with the same name and set permissions.

----End

## 8.8.2 Configuring Scheduled Backup of Alarm and Audit Information

### Scenario

You can modify the configuration file to periodically back up FusionInsight Manager alarm information, FusionInsight Manager audit information, and audit information of all services to the specified storage location.

The backup can be performed using FTP or SFTP. FTP does not encrypt data, which may cause security risks. Therefore, SFTP is recommended.

### Procedure

- Step 1** Log in to the active management node as user **omm**.

#### NOTE

Perform this operation only on the active management node. Scheduled backup is not supported on the standby management node.

- Step 2** Run the following command to switch the directory:

```
cd ${BIGDATA_HOME}/om-server/om/sbin
```

- Step 3** Run the following command to configure scheduled backup of FusionInsight Manager's alarm and audit information or service audit information:

```
./setNorthBound.sh -t Information type -i Remote server IP address -p SFTP or
FTP port used by the server -u Username -d Save path -c Interval (minutes) -m
Number of records in each file -s Whether to enable backup -e Protocol
```

Example:

```
./setNorthBound.sh -t alarm -i 10.0.0.10 -p 22 -u sftpuser -d /tmp/ -c 10 -m 100 -s true -e sftp
```

This script modifies the alarm backup configuration file `alarm_collect_upload.properties`. The file save path is `${BIGDATA_HOME}/om-server/tomcat/webapps/web/WEB-INF/classes/config`.

```
./setNorthBound.sh -t audit -i 10.0.0.10 -p 22 -u sftpuser -d /tmp/ -c 10 -m 100 -s true -e sftp
```

This script modifies the audit backup configuration file `audit_collect_upload.properties`. The file save path is `${BIGDATA_HOME}/om-server/tomcat/webapps/web/WEB-INF/classes/config`.

```
./setNorthBound.sh -t service_audit -i 10.0.0.10 -p 22 -u sftpuser -d /tmp/ -c 10 -m 100 -s true -e sftp
```

This script modifies the service audit backup configuration file `service_audit_collect_upload.properties`. The file save path is `${BIGDATA_HOME}/om-server/tomcat/webapps/web/WEB-INF/classes/config`.

**Step 4** Enter the password as prompted. The password is encrypted and saved in the configuration file.

```
Please input sftp/ftp server password:
```

**Step 5** Check the configuration result. If the following information is displayed, the configuration is successful. The configuration file will be automatically synchronized to the standby management node.

```
execute command syncfile successfully.
Config Succeed.
```

----End

## 8.8.3 Modifying the FusionInsight Manager Routing Table

### Scenario

When FusionInsight Manager is installed, two pieces of routing information are automatically created on the active management node. You can run the `ip rule list` command to view the routing information, as shown in the following example:

```
0:from all lookup local
32764:from all to 10.10.100.100 lookup ntp_rt #NTP routing information created by FusionInsight
Manager (this information is unavailable if no external NTP clock source is configured).
32765:from 192.168.0.117 lookup om_rt #OM routing information created by the FusionInsight Manager.
32766:from all lookup main
32767:from all lookup default
```

#### NOTE

If no external NTP server has been configured, only OM routing information `om_rt` will be created.

If the routing information created by FusionInsight Manager conflicts with the routing information configured in the enterprise network planning, the cluster administrator can use `autoroute.sh` to disable or enable the routing information created by FusionInsight Manager.

## Impact on the System

After the routing information created by FusionInsight Manager is disabled and before the new routing information is set, FusionInsight Manager cannot be accessed but the clusters are running properly.

## Prerequisites

FusionInsight Manager has been installed.

You have obtained routing information about the WS floating IP address.

## Disable the Routing Information Created by the System

- Step 1** Log in to the active management node as user **omm**. Run the following commands to disable the routing information created by the system:

```
cd ${BIGDATA_HOME}/om-server/om/sbin
./autoroute.sh disable
```

```
Deactivating Route.
Route operation (disable) successful.
```

- Step 2** Run the following command to view the execution result:

```
ip rule list
```

```
0:from all lookup local
32766:from all lookup main
32767:from all lookup default
```

- Step 3** Run the following command and enter the password of user **root** to switch to user **root**:

```
su - root
```

- Step 4** Run the following commands to manually create the routing information about the WS floating IP address:

```
ip route add Network segment of the WS floating IP address/Subnet mask of the WS floating IP address scope link src WS floating IP address dev NIC of the WS floating IP address table om_rt
```

```
ip route add default via Gateway of the WS floating IP address dev NIC of the WS floating IP address table om_rt
```

```
ip rule add from WS floating IP address table om_rt
```

Example:

```
ip route add 192.168.0.0/255.255.255.0 scope link src 192.168.0.117 dev eth0:ws table om_rt
```

```
ip route add default via 192.168.0.254 dev eth0:ws table om_rt
```

```
ip rule add from 192.168.0.117 table om_rt
```

### NOTE

If IPv6 addresses are used, run the **ip -6 route add** command.

**Step 5** Run the following commands to manually create the NTP service routing information. Skip this step when no external NTP clock source is configured.

```
ip route add default via IP gateway of the NTP service dev NIC of the local IP address table ntp_rt
```

```
ip rule add to ntpIP table ntp_rt
```

*NIC of the local IP address* indicates the NIC that can communicate with the network segment where the NTP server is located.

Example:

```
ip route add default via 10.10.100.254 dev eth0 table ntp_rt
```

```
ip rule add to 10.10.100.100 table ntp_rt
```

**Step 6** View the execution result.

In the following example, if the command output contains **om\_rt** and **ntp\_rt**, the operation is successful.

```
ip rule list
```

```
0:from all lookup local
32764:from all to 10.10.100.100 lookup ntp_rt #This information is not displayed if no external NTP clock
source is configured.
32765:from 192.168.0.117 lookup om_rt
32766:from all lookup main
32767:from all lookup default
```

```
----End
```

## Enable the Routing Information Created by the System

**Step 1** Log in to the active management node as user **omm**.

**Step 2** Run the following commands to enable the routing information created by the system:

```
cd ${BIGDATA_HOME}/om-server/om/sbin
```

```
./autoroute.sh enable
```

```
Activating Route.
Route operation (enable) successful.
```

**Step 3** View the execution result.

In the following example, if the command output contains **om\_rt** and **ntp\_rt**, the operation is successful.

```
ip rule list
```

```
0:from all lookup local
32764:from all to 10.10.100.100 lookup ntp_rt #This information is not displayed if no external NTP clock
source is configured.
32765:from 192.168.0.117 lookup om_rt
32766:from all lookup main
32767:from all lookup default
```

```
----End
```

## 8.8.4 Replacing the NTP Server for the Cluster

### Scenario

After FusionInsight Manager is installed, if no NTP server is configured or the configured NTP server is no longer used, you can specify a new NTP server for the cluster or replace the NTP server with a new one to enable the cluster to synchronize time with the new NTP clock source.

### Impact on the System

- Replacing the NTP server is a high-risk operation and may result in time change in the cluster.
- If the time difference between the NTP server and the cluster is greater than 150s before the NTP server replacement, you need to stop the cluster first to prevent data loss. Services are unavailable when the cluster is stopped.

### Prerequisites

- You have prepared a new NTP server and obtained its IP address, and have configured the network between the cluster and the new NTP server. Ensure that the NTP service status of the server is normal. Otherwise, the operations in this section will fail.

### Procedure

**Step 1** Log in to FusionInsight Manager and check whether there are uncleared alarms.

- If yes, clear the alarm. After the alarm is cleared, go to [Step 2](#).
- If no, go to [Step 2](#).

**Step 2** Log in to the active and standby management nodes as user **omm**.

**Step 3** Run the following command on the active management node to check the management plane gateway:

```
cat ${BIGDATA_HOME}/om-server/OMS/workspace/conf/oms-config.ini | grep om_gateway
```

**Step 4** Run the **ping Management plane gateway** command on the active and standby management nodes and check whether the nodes are connected to the management plane gateway.

- If yes, go to [Step 5](#).
- If no, contact the network administrator to rectify the network fault. After the fault is rectified, go to [Step 5](#).

**Step 5** Run the following command on the active management node to obtain the domain name of the NTP server in the current environment:

This section uses **ntp.myhuaweicloud.com** as an example.

```
cat /opt/Bigdata_func/cloudinit/cloudinit_params | grep ntpserver
```

**Step 6** On the active management node, check the time difference between the new NTP server and the cluster. The unit is second.

For example, to check the time different with the NTP server at **ntp.myhuaweicloud.com**, run the **ntpdate -d ntp.myhuaweicloud.com** command. The following information is displayed:

```
6 Dec 15:16:10 ntpdate[2861453]: step time server 10.79.3.251 offset +2.118107 sec
```

In the preceding information, **+2.118107 sec** indicates the time offset. A positive value indicates that the NTP server time is earlier than the current cluster time. A negative value indicates the opposite.

●  **NOTE**

You can run the **ntpq -v** or **ntpq --version** command to query the NTP version. The command output may vary with the actual service environment.

- Output of the **ntpq -v** command:

```
10.1.1.112: ~# ntpq -v
ntpq - standard NTP query program - Ver. 4.2.4p8
```

- Output of the **ntpq --version** command:

```
10.1.1.112: ~# ntpq --version
ntpq 4.2.8p10@1.3728-o Mon Jun 6 08:01:59 UTC 2016 (1)
```

**Step 7** Check whether the absolute value of the time difference exceeds **150**.

- If yes, go to **Step 8**.
- If no, perform **Step 10** as user **omm**.

**Step 8** Check whether the cluster can be stopped.

- If yes, stop upper-layer services and the cluster, and go to **Step 9**.
- If no, no further action is required.

**Step 9** Check whether the time of the NTP server is slower than the time of the cluster.

- If yes, wait a period of the time difference obtained in **Step 6** after message **Operation successful** is displayed on the UI, perform **Step 11** as user **omm**.
- If no, after message **Operation successful** is displayed on the UI, perform **Step 11** as user **omm**.

**Step 10** Run the following command on the active management node to replace the NTP server:

```
sh ${BIGDATA_HOME}/om-server/om/bin/tools/modifyntp.sh --ntp_server_ip
ntp.myhuaweicloud.com
```

 **NOTE**

The IP address of the NTP server cannot be set to the IP address of a node in the cluster. Otherwise, the service network between the node and the active/standby OMS node may be disconnected.

**Step 11** Run the following command on the active management node to forcibly synchronize time from the NTP server at **ntp.myhuaweicloud.com** immediately and replace the NTP server:

```
sh ${BIGDATA_HOME}/om-server/om/bin/tools/modifyntp.sh --ntp_server_ip
ntp.myhuaweicloud.com --force_sync_time
```

 NOTE

- If the cluster is stopped, start the cluster after the NTP server is replaced.
- After the command for forcible time synchronization is executed, it takes about five minutes for time synchronization on cluster nodes.

----End

## 8.8.5 Switching to the Maintenance Mode

### Scenario

FusionInsight Manager allows you to set clusters, services, hosts, or OMSs to the maintenance mode. Objects in maintenance mode do not report alarms. This prevents the system from generating a large number of unnecessary alarms during maintenance changes, such as upgrade, because these alarms may influence O&M personnel's judgment on the cluster status.

- **Cluster maintenance mode**  
If a cluster is not brought online or has been brought offline due to O&M operations (for example, non-rolling upgrade), you can set the entire cluster to the maintenance mode.
- **Service maintenance mode**  
When performing maintenance operations on a specific service (for example, performing service-affecting commissioning operations like batch restart of service instances, directly powering on or off nodes of the service, or repairing the service), you can set only this service to the maintenance mode.
- **Host maintenance mode**  
When performing maintenance operations on a host (such as powering on or off, isolating, or reinstalling the host, upgrading its OS, or replacing the host), you can set only this host to the maintenance mode.
- **OMS maintenance mode**  
When restarting, replacing, or repairing an OMS node, you can set the OMS node to the maintenance mode.

### Impact on the System

After the maintenance mode is set, alarms caused by non-maintenance operations are suppressed and cannot be reported. Alarms can be reported only when faults persist after the system exits the maintenance mode. Therefore, exercise caution when setting the maintenance mode.

### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Set the maintenance mode.

Determine the object to set the maintenance mode based on the service scenario. For details, see [Table 8-55](#).

**Table 8-55** Setting to the maintenance mode

Scenario	Operation
Configure a cluster to enter the maintenance mode.	<ol style="list-style-type: none"> <li>1. On the management page, choose <b>***</b> or <b>More &gt; Enter Maintenance</b>.</li> <li>2. In the displayed dialog box, click <b>OK</b>. After the cluster enters the maintenance state, the status of the cluster becomes . After maintenance is complete, click <b>Exit Maintenance Mode</b>. The cluster then exits the maintenance mode.</li> </ol>
Configure a service to enter the maintenance mode.	<ol style="list-style-type: none"> <li>1. On FusionInsight Manager, choose <b>Cluster &gt; Services &gt; Service name</b>.</li> <li>2. On the service details page, click <b>More</b> and select <b>Enter Maintenance Mode</b>.</li> <li>3. In the displayed dialog box, click <b>OK</b>. After a service enters the maintenance mode, the status of the service becomes  in the service list. After maintenance is complete, click <b>Exit Maintenance Mode</b>. The service then exits the maintenance mode.</li> </ol> <p><b>NOTE</b> When configuring a service to enter the maintenance mode, you are advised to set the upper-layer services that depend on this service to the maintenance mode as well.</p>
Configure a host to the maintenance mode.	<ol style="list-style-type: none"> <li>1. On FusionInsight Manager, choose <b>Hosts</b>.</li> <li>2. On the <b>Hosts</b> page, select the target host, click <b>More</b>, and select <b>Enter Maintenance Mode</b>.</li> <li>3. In the displayed dialog box, click <b>OK</b>. After the host enters the maintenance mode, the status of the host becomes  in the host list. After maintenance is complete, click <b>Exit Maintenance Mode</b>. The host then exits the maintenance mode.</li> </ol>
Configure the OMS to enter the maintenance mode.	<ol style="list-style-type: none"> <li>1. On FusionInsight Manager, choose <b>System &gt; OMS &gt; Enter Maintenance Mode</b>.</li> <li>2. In the displayed dialog box, click <b>OK</b>. After the OMS enters the maintenance state, the OMS status becomes . After maintenance is complete, click <b>Exit Maintenance Mode</b>. The OMS then exits the maintenance mode.</li> </ol>

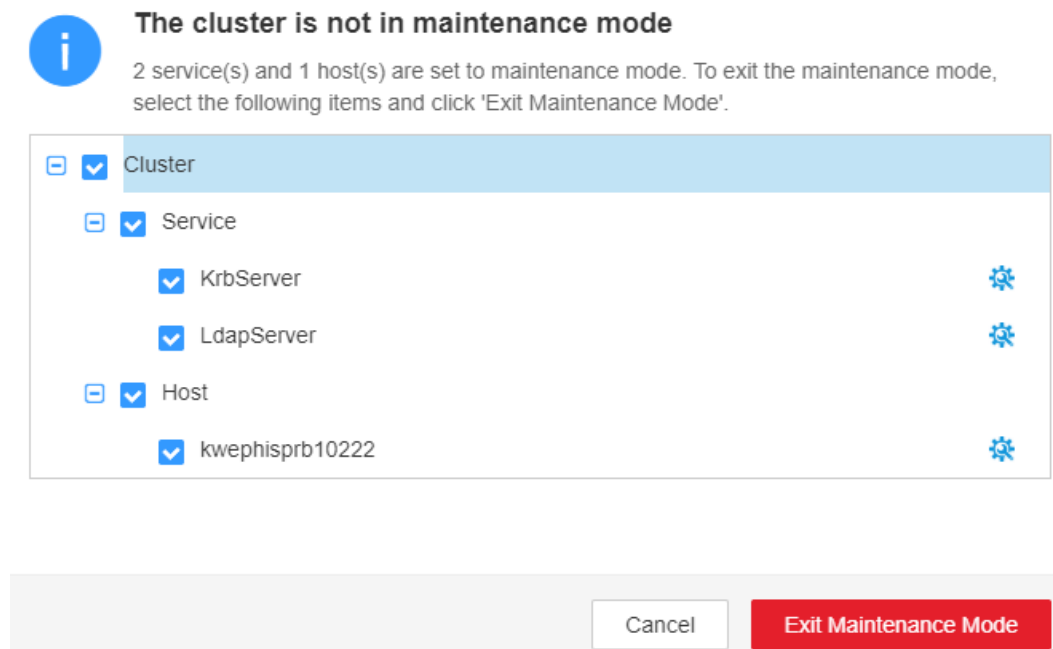

**Step 3** Check the cluster maintenance view.

On FusionInsight Manager, click **\*\*\*** or **More** next to the cluster name and select **Maintenance Mode View**. In the displayed window, you can view the services and hosts in maintenance mode in the cluster.

After maintenance is complete, you can select services and hosts in batches in the maintenance mode view and click **Exit Maintenance Mode** to make them exit the maintenance mode.

**Figure 8-57** Exiting the maintenance mode in batches

### Maintenance Mode View

----End

## 8.8.6 Routine Maintenance of Manager

To ensure long-term and stable running of the system, administrators or maintenance engineers need to periodically check items listed in [Table 8-56](#) and rectify the detected faults based on the check results. It is recommended that administrators or engineers record the result in each task scenario and sign off based on the enterprise management regulations.

**Table 8-56** Routine maintenance check items

Routine Maintenance Frequency	Task Scenario	Check Item
Daily	Check the cluster service status.	<ul style="list-style-type: none"> <li>● Check whether the running status and configuration status of each service are normal and whether the status icons are green.</li> <li>● Check whether the running status and configuration status of the role instances in each service are normal and whether the status icons are green.</li> <li>● Check whether the active/standby status of role instances in each service can be properly displayed.</li> <li>● Check whether the dashboard of the services and role instances can be displayed properly.</li> </ul>
	Check the cluster host status.	<ul style="list-style-type: none"> <li>● Check whether the running status of each host is normal and whether the status icon is green.</li> <li>● Check the current disk usage, memory usage, and CPU usage of each host. Check whether the current memory usage and CPU usage are increasing.</li> </ul>
	Check the cluster alarm information.	Check whether alarms were generated for unhandled exceptions on the previous day, including alarms that were automatically cleared.
	Check the cluster audit information.	Check whether critical and major operations are performed on the previous day and whether the operations are valid.
	Check the cluster backup status.	Check whether OMS, LDAP, DBService, and NameNode have been automatically backed up on the previous day.
	View the health check result.	Perform a health check on FusionInsight Manager and download the health check report to check whether the current cluster is abnormal. You are advised to enable the automatic health check, export the latest cluster health check result, and repair unhealthy items based on the result.

Routine Maintenance Frequency	Task Scenario	Check Item
	Check the network communication.	Check the cluster network status and check whether the network communication between nodes is delayed.
	Check the storage status.	Check whether the total data storage volume of the cluster increases abruptly. <ul style="list-style-type: none"> <li>● Check whether the disk usage is close to the threshold. If yes, locate the causes. For example, check whether the junk data or cold data left by services needs to be cleared.</li> <li>● Check whether disk partitions need to be expanded based on the service growth trend.</li> </ul>
	Check logs.	<ul style="list-style-type: none"> <li>● Check whether there are failed or unresponsive MapReduce and Spark tasks. Check the <b>/tmp/logs/\${username}/logs/\${application id}</b> log file in HDFS and rectify faults.</li> <li>● Check Yarn task logs, view the logs of failed and unresponsive tasks, and delete duplicate data.</li> <li>● Check the worker logs of Storm.</li> <li>● Back up logs to the storage server.</li> </ul>
Weekly	Manage users.	Check whether the user password is about to expire and notify the user of changing the password. To change the password of a machine-machine user, you need to download the keytab file again.
	Analyze alarms.	Export and analyze alarms generated in a specified period.
	Scan disks.	Check the disk health status. You are advised to use a dedicated disk check tool.
	Collect statistics on storage.	Check in batches whether the disk data of cluster nodes is evenly stored, filter out the disks whose data increases significantly or is insufficient, and check whether the disks are normal.
	Record changes.	Arrange and record the operations on cluster configuration parameters and files to provide reference for fault analysis and handling.

Route Maintenance Frequency	Task Scenario	Check Item
Monthly	Analyze logs.	<ul style="list-style-type: none"> <li>Collect and analyze hardware logs of cluster node servers, such as BMC system logs.</li> <li>Collect and analyze the OS logs of the cluster node servers.</li> <li>Collect and analyze cluster logs.</li> </ul>
	Diagnose the network.	Analyze the network health status of the cluster.
	Manage hardware.	Check the equipment room environment and clean the devices.

## 8.9 Log Management

### 8.9.1 About Logs

#### Log Description

MRS cluster logs are stored in the `/var/log/Bigdata` directory. The following table lists the log types.

**Table 8-57** Log types

Log Type	Description
Installation logs	Installation logs record information about FusionInsight Manager, cluster, and service installation to help users locate installation errors.
Run logs	Run logs record the running track information, debugging information, status changes, potential problems, and error information generated during the running of services.
Audit logs	Audit logs record information about users' activities and operation instructions, which can be used to locate fault causes in security events and determine who are responsible for these faults.

The following table lists the MRS log directories.

**Table 8-58** Log directories

Directory	Log
/var/log/Bigdata/audit	Component audit log.
/var/log/Bigdata/controller	Log collecting script log. Controller process log. Controller monitoring log.
/var/log/Bigdata/dbservice	DBService log.
/var/log/Bigdata/flume	Flume log.
/var/log/Bigdata/hbase	HBase log.
/var/log/Bigdata/hdfs	HDFS log.
/var/log/Bigdata/hive	Hive log.
/var/log/Bigdata/hetuengine	HetuEngine log.
/var/log/Bigdata/httpd	HTTPd log.
/var/log/Bigdata/hue	Hue log.
/var/log/Bigdata/kerberos	Kerberos log.
/var/log/Bigdata/ldapclient	LDAP client log.
/var/log/Bigdata/ldapserver	LDAP server log.
/var/log/Bigdata/loader	Loader log.
/var/log/Bigdata/logman	Logman script log management log.
/var/log/Bigdata/mapreduce	MapReduce log.
/var/log/Bigdata/nodeagent	NodeAgent log.
/var/log/Bigdata/okerberos	OMS Kerberos log.
/var/log/Bigdata/oldapserver	OMS LDAP log.
/var/log/Bigdata/ metric_agent	Run log file of MetricAgent.
/var/log/Bigdata/omm	<b>oms</b> : complex event processing log, alarm service log, HA log, authentication and authorization management log, and monitoring service run log of the OMM server. <b>oma</b> : installation log and run log of the OMM agent. <b>core</b> : dump log generated when the OMM agent and the HA process are suspended.
/var/log/Bigdata/spark2x	Spark2x log.

Directory	Log
/var/log/Bigdata/sudo	Log generated when the <b>sudo</b> command is executed by user <b>omm</b> .
/var/log/Bigdata/timestamp	Time synchronization management log.
/var/log/Bigdata/tomcat	Tomcat log.
/var/log/Bigdata/watchdog	Watchdog log.
/var/log/Bigdata/yarn	Yarn log.
/var/log/Bigdata/zookeeper	ZooKeeper log.
/var/log/Bigdata/oozie	Oozie log.
/var/log/Bigdata/kafka	Kafka log.
/var/log/Bigdata/storm	Storm log.
/var/log/Bigdata/iotdb	IoTDB log.
/var/log/Bigdata/cdl	CDL log.
/var/log/Bigdata/upgrade	OMS upgrade log.
/var/log/Bigdata/update-service	Upgrade service log.

## Installation Logs

**Table 8-59** Installation logs

Installation Log	Description
Configuration log	Records information about the configuration process before the installation.
FusionInsight Manager installation log	Records information about the two-node FusionInsight Manager installation.
Cluster installation log	Records information about the cluster installation.

## Run Logs

**Table 8-60** describes the running information recorded in run logs.

**Table 8-60** Running information

Run Log	Description
Installation preparation log	Records information about preparations for the installation, such as the detection, configuration, and feedback operation information.
Process startup log	Records information about the commands executed during the process startup.
Process startup exception log	Records information about exceptions during process startup, such as dependent service errors and insufficient resources.
Process run log	Records information about the process running track information and debugging information, such as function entries and exits as well as cross-module interface messages.
Process running exception log	Records errors that cause process running errors, for example, the empty input objects or encoding or decoding failure.
Process running environment log	Records information about the process running environment, such as resource status and environment variables.
Script log	Records information about the script execution process.
Resource reclamation log	Records information about the resource reclaiming process.
Uninstallation clearing logs	Records information about operations performed during service uninstallation, such as directory and execution time deletion.

## Audit Logs

Audit information recorded in audit logs includes FusionInsight Manager audit information and component audit information.

**Table 8-61** Audit information of FusionInsight Manager

Operation Type	Operation
User management	Creating a user. Modifying a user. Deleting a user. Creating a user group. Modifying a user group. Deleting a group. Adding a role. Changing the user's roles. Deleting a role. Changing a password policy. Changing a password. Resetting a password. Logging in. Logging out. Unlocking the screen. Downloading the authentication credential. Unauthorized operation. Unlocking a user account. Locking a user account Locking the screen. Exporting a user. Exporting a user group. Exporting a role.

Operation Type	Operation
Cluster management	<p>Starting a cluster.</p> <p>Stopping a cluster.</p> <p>Restarting a cluster.</p> <p>Performing a rolling restart of a cluster.</p> <p>Restarting all expired instances.</p> <p>Saving configurations.</p> <p>Synchronizing cluster configurations.</p> <p>Customizing cluster monitoring metrics.</p> <p>Configuring monitoring dumping.</p> <p>Saving monitoring thresholds.</p> <p>Downloading a client configuration file.</p> <p>Configuring the northbound Syslog interface.</p> <p>Configuring the northbound SNMP interface.</p> <p>Clearing alarms using SNMP.</p> <p>Adding a trap target using SNMP.</p> <p>Deleting a trap target using SNMP.</p> <p>Checking alarms using SNMP.</p> <p>Synchronizing alarms using SNMP.</p> <p>Creating a threshold template.</p> <p>Deleting a threshold template.</p> <p>Applying a threshold template.</p> <p>Saving cluster monitoring configurations.</p> <p>Exporting configurations.</p> <p>Importing cluster configurations.</p> <p>Exporting an installation template.</p> <p>Modifying a threshold template.</p> <p>Canceling the application of a threshold template.</p> <p>Masking an alarm.</p> <p>Sending an alarm.</p> <p>Changing the OMS database password.</p> <p>Resetting the component database password.</p> <p>Restarting OMM and Controller.</p> <p>Starting the health check of a cluster.</p> <p>Importing a certificate file.</p> <p>Configuring SSO information.</p> <p>Deleting historical health check reports.</p> <p>Modifying cluster properties.</p>

Operation Type	Operation
	<p>Running maintenance commands in synchronous mode.</p> <p>Running maintenance commands in asynchronous mode.</p> <p>Customizing report monitoring metrics.</p> <p>Exporting report monitoring data.</p> <p>Running a command in asynchronous mode using SNMP.</p> <p>Restarting the Web service.</p> <p>Customizing monitoring metrics for static resource pools.</p> <p>Exporting monitoring data of a static resource pool.</p> <p>Customizing dashboard monitoring metrics.</p> <p>Stopping a task.</p> <p>Restoring configurations.</p> <p>Modifying domain and mutual trust configurations.</p> <p>Modifying system parameters.</p> <p>Making a cluster enter the maintenance mode.</p> <p>Making a cluster exit the maintenance mode.</p> <p>Making OMS enter the maintenance mode.</p> <p>Making OMS exit the maintenance mode.</p> <p>Making services in a cluster exit the maintenance mode in batches.</p> <p>Modifying OMS configurations.</p> <p>Enabling threshold alarms.</p> <p>Synchronizing all cluster configurations.</p>

Operation Type	Operation
Service management	<p>Starting a service.</p> <p>Stopping a service.</p> <p>Synchronizing service configurations.</p> <p>Refreshing a service queue.</p> <p>Customizing service monitoring metrics.</p> <p>Restarting a service.</p> <p>Performing a rolling service restart.</p> <p>Exporting service monitoring data.</p> <p>Importing service configuration data.</p> <p>Starting the health check of a service.</p> <p>Configuring a service.</p> <p>Uploading a configuration file.</p> <p>Downloading a configuration file.</p> <p>Synchronizing instance configurations.</p> <p>Commissioning an instance.</p> <p>Decommissioning an instance.</p> <p>Starting an instance.</p> <p>Stopping an instance.</p> <p>Customizing instance monitoring metrics.</p> <p>Restarting an instance.</p> <p>Performing a rolling restart of an instance.</p> <p>Exporting instance monitoring data.</p> <p>Importing instance configuration data.</p> <p>Creating an instance group.</p> <p>Modifying an instance group.</p> <p>Deleting an instance group.</p> <p>Moving an instance to another instance group.</p> <p>Making a service enter the maintenance mode.</p> <p>Making a service exit the maintenance mode.</p> <p>Changing the name of a service.</p> <p>Modifying service association.</p> <p>Downloading monitoring data.</p> <p>Masking alarms.</p> <p>Unmasking alarms.</p> <p>Exporting report data of a service.</p> <p>Adding custom parameters for a report.</p> <p>Modifying custom parameters of a report.</p> <p>Deleting custom parameters of a report.</p>

Operation Type	Operation
	Switching over control nodes. Adding a mount table. Modifying a mount table.
Host management	Setting a node rack. Starting all roles. Stopping all roles. Isolating a host. Canceling isolation of a host. Customizing host monitoring metrics. Exporting host monitoring data. Making a host enter the maintenance mode. Making a host exit the maintenance mode. Exporting basic host information. Exporting host distribution report data. Exporting host trend report data. Exporting host cluster report data. Exporting report data of a service. Customizing host cluster monitoring metrics. Customizing host cluster trend monitoring metrics.
Alarm management	Exporting alarms. Clearing alarms. Exporting events. Clearing alarms in batches.
Log collection	Collecting log files. Downloading log files. Collecting service stack information. Collecting instance stack information. Preparing service stack information. Preparing instance stack information. Clearing service stack information. Clearing instance stack information.
Audit log management	Modifying audit dumping configurations. Exporting audit logs.

Operation Type	Operation
Data backup and restoration	Creating a backup task. Executing a backup task. Executing backup tasks in batches. Stopping a backup task. Deleting a backup task. Modifying a backup task. Locking a backup task. Unlocking a backup task. Creating a restoration task. Executing a restoration task. Stopping a restoration task. Retrying a restoration task. Deleting a restoration task.

Operation Type	Operation
Multi-tenant management	Saving static configurations. Adding a tenant. Deleting a tenant. Associating a service with a tenant. Deleting a service from a tenant. Configuring resources. Creating a resource. Deleting a resource. Adding a resource pool. Modifying a resource pool. Deleting a resource pool. Restoring tenant data. Modifying global configurations of a tenant. Modifying queue configurations of a capacity scheduler. Modifying queue configurations of a super scheduler. Modifying resource distribution of a capacity scheduler. Clearing resource distribution of a capacity scheduler. Modifying resource distribution of a super scheduler. Clearing resource distribution of a super scheduler. Adding a resource catalog. Modifying a resource catalog. Deleting a resource catalog. Customizing tenant monitoring metrics.

Operation Type	Operation
Health check	<ul style="list-style-type: none"> <li>Starting the health check of a cluster.</li> <li>Starting the health check of a service.</li> <li>Starting the health check of a host.</li> <li>Starting the health check of OMS.</li> <li>Starting the system health check.</li> <li>Updating the health check configurations.</li> <li>Exporting health check reports.</li> <li>Exporting health check results of a cluster.</li> <li>Exporting health check results of a service.</li> <li>Exporting health check results of a host.</li> <li>Deleting historical health check reports.</li> <li>Exporting historical health check reports.</li> <li>Downloading a health check report.</li> </ul>

**Table 8-62** Component audit information

Audit Log	Operation Type	Operation
CDL audit log	Service operations	<ul style="list-style-type: none"> <li>Creating a link.</li> <li>Deleting a link.</li> <li>Creating a job.</li> <li>Starting a Job.</li> <li>Deleting a job.</li> </ul>
IoTDB audit log	Maintenance management	<ul style="list-style-type: none"> <li>Granting permissions.</li> <li>Revoking permissions.</li> <li>Recording authentication and login information.</li> </ul>
	Service operations	<ul style="list-style-type: none"> <li>Deleting a time series, partition, function, or index.</li> <li>Modifying a time series.</li> </ul>
ClickHouse audit log	Maintenance management	<ul style="list-style-type: none"> <li>Granting permissions.</li> <li>Revoking permissions.</li> <li>Recording authentication and login information.</li> </ul>
	Service operations	<ul style="list-style-type: none"> <li>Creating databases or tables.</li> <li>Inserting, deleting, querying, and migrating data.</li> </ul>
DBService audit log	Maintenance management	<ul style="list-style-type: none"> <li>Performing backup restoration operations.</li> </ul>

Audit Log	Operation Type	Operation
HBase audit log	Data definition language (DDL) statements	Creating a table. Deleting a table. Modifying a table. Adding a column family. Modifying a column family. Deleting a column family. Enabling a table. Disabling a table. Modifying user information. Changing a password. Logging in.
	Data manipulation language (DML) statements	Putting data (to the <b>hbase:meta</b> , <b>_ctmeta_</b> , and <b>hbase:acl</b> tables). Deleting data (from the <b>hbase:meta</b> , <b>_ctmeta_</b> , and <b>hbase:acl</b> tables). Checking and putting data (to the <b>hbase:meta</b> , <b>_ctmeta_</b> , and <b>hbase:acl</b> tables). Checking and deleting data (from the <b>hbase:meta</b> , <b>_ctmeta_</b> , and <b>hbase:acl</b> tables).
	Permission control	Assigning permissions to a user. Canceling permission assigning.
HDFS audit log	Permission management	Managing access permissions on files or folders. Managing the owner information of files or folders.
	File operations	Creating a folder. Creating a file. Opening a file. Appending file content. Changing a file name. Deleting a file or folder. Setting time property of a file. Setting the number of file copies. Merging files. Checking the file system. Linking to a file.

Audit Log	Operation Type	Operation
Hive audit log	Metadata operations	Defining metadata, such as creating databases and tables. Deleting metadata, such as deleting databases and tables. Modifying metadata, such as adding columns and renaming tables. Importing and exporting metadata.
	Data maintenance	Loading data to a table. Inserting data into a table.
	Permission management	Creating or deleting a role. Granting/Reclaiming roles. Granting/Reclaiming permissions.
Hue audit log	Service startup	Starting Hue.
	User operations	Logging in. Logging out.
	Task operations	Creating a task. Modifying a task. Deleting a task. Submitting a task. Saving a task. Updating the status of a task.
KrbServer audit log	Maintenance management	Changing the password of a Kerberos account Adding a Kerberos account Deleting a Kerberos account Authenticating users.
LdapServer audit log	Maintenance management	Adding an OS user. Adding a user group. Adding a user to a user group. Deleting a user. Deleting a group.
Loader audit log	Security management	Logging in.
	Metadata management	Querying connector information. Querying a framework. Querying step information.

Audit Log	Operation Type	Operation
	Data source connection management	Querying a data source connection. Adding a data source connection. Updating a data source connection. Deleting a data source connection. Activating a data source connection. Disabling a data source connection.
	Job management	Querying a job. Creating a job. Updating a job. Deleting a job. Activating a job. Disabling a job. Querying all execution records of a job. Querying the latest execution record of a job. Submitting a job. Stopping a job.
MapReduce audit log	Application running	Starting a container request. Stopping a container request. After a container request is complete, the status of the request becomes successful. After a container request is complete, the status of the request becomes failed. After a container request is complete, the status of the request becomes suspended. Submitting a task. Ending a task.
Oozie audit log	Task management	Submitting a task. Starting a task. Killing a task. Suspending a task. Resuming a task. Running a task again.

Audit Log	Operation Type	Operation
Spark2x audit log	Metadata operations	Defining metadata, such as creating databases and tables. Deleting metadata, such as deleting databases and tables. Modifying metadata, such as adding columns and renaming tables. Importing and exporting metadata.
	Data maintenance	Loading data to a table. Inserting data into a table.
Storm audit log	Nimbus operations	Submitting a topology. Stopping a topology. Reallocating a topology. Deactivating a topology. Activating a topology.
	UI operations	Stopping a topology. Reallocating a topology. Deactivating a topology. Activating a topology.
Yarn audit log	Job submission	Submitting a job to a queue.
ZooKeeper audit log	Permission management	Setting access permissions to Znode.
	Znode operations	Creating Znodes. Deleting Znodes. Configuring Znode data.
HetuEngine audit log	Job management	Adding an external data source. Deleting an external data source. Modifying an external data source. Creating a compute instance. Starting a compute instance. Stopping a compute instance. Deleting a compute instance. Querying a compute instance. Modifying compute instance configurations.

FusionInsight Manager audit logs are stored in the database. You can view and export the audit logs on the **Audit** page.

The following table lists the directories to store component audit logs. Audit log files of some components are stored in **/var/log/Bigdata/audit**, such as HDFS, HBase, MapReduce, Hive, Hue, Yarn, Storm, and ZooKeeper. The component audit logs are automatically compressed and backed up to **/var/log/Bigdata/audit/bk** at 03:00 every day. A maximum of latest 90 compressed backup files are retained, and the backup time cannot be changed. For details about how to configure the number of reserved audit log files, see [Configuring the Number of Local Audit Log Backups](#).

Audit log files of other components are stored in the component log directory.

**Table 8-63** Directories for storing component audit logs

Component	Audit Log Directory
DBService	/var/log/Bigdata/audit/dbservice/dbservice_audit.log
HBase	/var/log/Bigdata/audit/hbase/hm/hbase-audit-hmaster.log /var/log/Bigdata/audit/hbase/hm/hbase-ranger-audit-hmaster.log /var/log/Bigdata/audit/hbase/rs/hbase-audit-regionserver.log /var/log/Bigdata/audit/hbase/rs/hbase-ranger-audit-regionserver.log /var/log/Bigdata/audit/hbase/rt/hbase-audit-restserver.log /var/log/Bigdata/audit/hbase/ts/hbase-audit-thriftserver.log
HDFS	/var/log/Bigdata/audit/hdfs/nn/hdfs-audit-namenode.log /var/log/Bigdata/audit/hdfs/nn/ranger-plugin-audit.log /var/log/Bigdata/audit/hdfs/dn/hdfs-audit-datanode.log /var/log/Bigdata/audit/hdfs/jn/hdfs-audit-journalnode.log /var/log/Bigdata/audit/hdfs/zkfc/hdfs-audit-zkfc.log /var/log/Bigdata/audit/hdfs/httpfs/hdfs-audit-httpfs.log /var/log/Bigdata/audit/hdfs/router/hdfs-audit-router.log
HetuEngine	/var/log/Bigdata/audit/hetuengine/hsbroker/hsbroker-audit.log.0 /var/log/Bigdata/audit/hetuengine/hsconsole/hsconsole-audit.log.0 /var/log/Bigdata/audit/hetuengine/hsfabric/hsfabric-audit.log.0 hdfs://hacluster/hetuserverhistory/ <i>Tenant name</i> /coordinator/application_ <i>ID</i> /container_ <i>ID</i> / <i>yyyyMMdd</i> /hetuserver-engine-audit.log hdfs://hacluster/hetuserverhistory/ <i>Tenant name</i> /coordinator or worker/application_ <i>ID</i> /container_ <i>ID</i> / <i>yyyyMMdd</i> /server.log
Hive	/var/log/Bigdata/audit/hive/hiveserver/hive-audit.log /var/log/Bigdata/audit/hive/hiveserver/hive-rangeraudit.log /var/log/Bigdata/audit/hive/metastore/metastore-audit.log /var/log/Bigdata/audit/hive/webhcat/webhcat-audit.log

Component	Audit Log Directory
Hue	/var/log/Bigdata/audit/hue/hue-audits.log
Kafka	/var/log/Bigdata/audit/kafka/audit.log
Loader	/var/log/Bigdata/loader/audit/default.audit
CDL	/var/log/Bigdata/audit/cdl/service/cdl-audit.log
MapReduce	/var/log/Bigdata/audit/mapreduce/jobhistory/mapred-audit-jobhistory.log
Oozie	/var/log/Bigdata/audit/oozie/oozie-audit.log
Spark2x	/var/log/Bigdata/audit/spark2x/jdbcserver/jdbcserver-audit.log /var/log/Bigdata/audit/spark2x/jdbcserver/ranger-audit.log /var/log/Bigdata/audit/spark2x/jobhistory/jobhistory-audit.log

Yarn	/var/log/Bigdata/audit/yarn/rm/yarn-audit-resource-manager.log /var/log/Bigdata/audit/yarn/rm/ranger-plugin-audit.log /var/log/Bigdata/audit/yarn/nm/yarn-audit-nodemanager.log
ZooKeeper	/var/log/Bigdata/audit/zookeeper/quorumpeer/zk-audit-quorumpeer.log
IoTDB	/var/log/Bigdata/audit/iotdb/iotdbserver/log_audit.log

## 8.9.2 Manager Log List

### Log Description

**Log path:** The default storage path of Manager log files is **/var/log/Bigdata/Manager component**.

- ControllerService: **/var/log/Bigdata/controller/** (OMS installation and run logs)
- HTTPd: **/var/log/Bigdata/httpd** (HTTPd installation and run logs)
- Logman: **/var/log/Bigdata/logman** (log packaging tool logs)
- NodeAgent: **/var/log/Bigdata/nodeagent** (NodeAgent installation and run logs)
- okerberos: **/var/log/Bigdata/okerberos** (okerberos installation and run logs)
- oldapserver: **/var/log/Bigdata/oldapserver** (oldapserver installation and run logs)

- MetricAgent: **/var/log/Bigdata/metric\_agent** (MetricAgent run logs)
- OMM: **/var/log/Bigdata/omm** (OMM installation and run logs)
- Timestamp: **/var/log/Bigdata/timestamp** (NodeAgent startup time logs)
- Tomcat: **/var/log/Bigdata/tomcat** (Web process logs)
- Watchdog: **/var/log/Bigdata/watchdog** (watchdog logs)
- Upgrade: **/var/log/Bigdata/upgrade** (OMS upgrade logs)
- UpdateService: **/var/log/Bigdata/update-service** (upgrade service logs)
- Sudo: **/var/log/Bigdata/sudo** (sudo script execution logs)
- OS: **/var/log/message file** (OS system logs)
- OS performance: **/var/log/osperf** (OS performance statistics logs)
- OS statistics: **/var/log/osinfo/statistics** (OS parameter configuration logs)

#### Log archive rule:

The automatic compression and archiving function is enabled for Manager logs. By default, when the size of a log file exceeds 10 MB, the log file is automatically compressed. The naming rule of a compressed log file is as follows: *<Original log name>-<yyyy-mm-dd\_hh-mm-ss>.[ID].log.zip* A maximum of 20 latest compressed files are retained.

**Table 8-64** Manager logs

Log Type	Log File Name	Description
Controller run logs	controller.log	Log file that records component installation, upgrade, configuration, monitoring, alarm reporting, and routine O&M operations
	controller_client.log	Run log file of the Representational State Transfer (REST) APIs
	acs.log	ACS run log file
	acs_spnego.log	spnego user logs in ACS
	aos.log	AOS run log file
	plugin.log	AOS plug-in logs
	backupplugin.log	Run log file that records the backup and restoration operations
	controller_config.log	Configuration run log file
	controller_nodesetup.log	Controller loading task log file

Log Type	Log File Name	Description
	controller_root.log	System log file of the Controller process
	controller_trace.log	Log file that records the remote procedure call (RPC) communication between Controller and NodeAgent
	controller_monitor.log	Monitoring log file
	controller_fsm.log	State machine log file
	controller_alarm.log	Controller alarm log file
	controller_backup.log	Controller backup and recovery log file
	install.log, restore_package.log, installPack.log, distributeAdapterFiles.log, and install_os_optimization.log	OMS installation log file
	oms_ctl.log	OMS startup and stop log file
	preInstall_client.log	Preprocessing log file before client installation
	installntp.log	NTP installation log file
	modify_manager_param.log	Manager parameter modification log file
	backup.log	OMS backup script run log file
	supressionAlarm.log	Alarm script run log file
	om.log	OM certificate generation log file
	backupplugin_ctl.log	Startup log file of the backup and restoration plug-in process
	getLogs.log	Run log of the log collection script
	backupAuditLogs.log	Run log of the audit log backup script

Log Type	Log File Name	Description
	certStatus.log	Log file that records regular certificate checks
	distribute.log	Certificate distribution log
	ficertgenenerate.log	Certificate replacement log file, covering level-2 certificates, CAS certificates, and HTTPd certificates
	genPwFile.log	Log file that records the generation of certificate password files
	modifyproxyconf.log	Log file that records the modification of the HTTPd proxy configuration
	importTar.log	Log file that records the process for importing certificates into the trust store.
HTTPd	install.log	HTTPd installation log file
	access_log, error_log	HTTPd run log file
Logman	logman.log	Log packaging tool log file
NodeAgent	install.log and install_os_optimization.log	NodeAgent installation log file
	installntp.log	NTP installation log file
	start_ntp.log	NTP startup log file
	ntpChecker.log	NTP check log file
	ntpMonitor.log	NTP monitoring log file
	heartbeat_trace.log	Log file that records heartbeats between NodeAgent and Controller
	alarm.log	Alarm log file
	monitor.log	Monitoring log file

Log Type	Log File Name	Description
	nodeagent_ctl.log and start-agent.log	NodeAgent startup log file
	agent.log	NodeAgent run log file
	cert.log	Certificate log file
	agentplugin.log	Log file that records the Agent plug-in running status
	omapugin.log	OMA plug-in run log file
	diskhealth.log	Disk health check log file
	supressionAlarm.log	Alarm script run log file
	updateHostFile.log	Host list update log file
	collectLog.log	Run log file of the node log collection script
	host_metric_collect.log	Run log file of host metric collection
	checkfileconfig.log	Run log file of file permission check
	entropycheck.log	Entropy check run log file
	timer.log	Log file of scheduled node scheduling
	pluginmonitor.log	Component monitoring plug-in log file
agent_alarm_py.log	Log file that records alarms upon insufficient NodeAgent file permission	
oKerberos	addRealm.log and modifyKerberosRealm.log	Realm handover log file
	checkservice_detail.log	Okerberos health check log file
	genKeytab.log	keytab generation log file

Log Type	Log File Name	Description
	KerberosAdmin_genConfigDetail.log	Run log file of <b>kadmin.conf</b> generated during start of the kadmin process
	KerberosServer_genConfigDetail.log	Run log file of <b>krb5kdc.conf</b> generated during start of the krb5kdc process
	oms-kadmind.log	Run log file of the kadmin process
	oms_kerberos_install.log and postinstall_detail.log	Okerberos installation log file
	oms-krb5kdc.log	Run log file of the krbkdc process
	start_detail.log	Okerberos startup log file
	realmDataConfigProcess.log	Log file that records the rollback upon a realm handover failure
	stop_detail.log	Okerberos stop log file
oldapserver	ldapserver_backup.log	Oldapserver backup log file
	ldapserver_chk_service.log	Oldapserver health check log file
	ldapserver_install.log	Oldapserver installation log file
	ldapserver_start.log	Oldapserver startup log file
	ldapserver_status.log	Log file that records the status of the Oldapserver process
	ldapserver_stop.log	Oldapserver stop log file
	ldapserver_wrap.log	Oldapserver service management log file
	ldapserver_uninstall.log	Oldapserver uninstallation log file
	restart_service.log	Oldapserver restart log file

Log Type	Log File Name	Description
	ldapsrvr_unlockUser.log	Log file that records information about unlocking LDAP users and managing accounts
metric_agent	gc.log	MetricAgent JVM GC log file
	metric_agent.log	Run log file of MetricAgent
	metric_agent_qps.log	Log file that records MetricAgent Internal queue length and QPS information
	metric_agent_root.log	All run log files of MetricAgent
	start.log	Log file that records information about the MetricAgent startup and stop
OMM	omsconfig.log	OMS configuration log file
	check_oms_heartbeat.log	OMS heartbeat log file
	monitor.log	OMS monitoring log file
	ha_monitor.log	HA_Monitor operation log file
	ha.log	HA operation log file
	fms.log	Alarm log file
	fms_ha.log	HA alarm monitoring log file
	fms_script.log	Alarm control log file
	config.log	Alarm configuration log file
	iam.log	IAM log file
	iam_script.log	IAM control log file
	iam_ha.log	IAM HA monitoring log file
config.log	IAM configuration log file	

Log Type	Log File Name	Description
	operatelog.log	IAM operation log file
	heartbeatcheck_ha.log	OMS heartbeat HA monitoring log file
	install_oms.log	OMS installation log file
	pms_ha.log	HA monitoring log file
	pms_script.log	Monitoring control log file
	config.log	Monitoring configuration log file
	plugin.log	Monitoring plug-in run log file
	pms.log	Monitoring log file
	ha.log	HA run log file
	cep_ha.log	CEP HA monitoring log file
	cep_script.log	CEP control log file
	cep.log	CEP log file
	config.log	CEP configuration log file
	omm_gaussdba.log	GaussDB HA monitoring log file
	gaussdb-<SERIAL>.log	GaussDB run log file
	gs_ctl-<DATE>.log	Archive log file of GaussDB control logs
	gs_ctl-current.log	GaussDB control log file
	gs_guc-current.log	GaussDB operation log file
	encrypt.log	OMM encryption log file
	omm_agent_ctl.log	OMA control log file
	oma_monitor.log	OMA monitoring log file
	install_oma.log	OMA installation log file
	config_oma.log	OMA configuration log file

Log Type	Log File Name	Description
	omm_agent.log	OMA run log file
	acs.log	ACS resource log file
	aos.log	AOS resource log file
	controller.log	Controller resource log file
	floatip.log	Floating IP address resource log file
	ha_ntp.log	NTP resource log file
	httpd.log	HTTPd resource log file
	okerberos.log	Okerberos resource log file
	oldap.log	OLdap resource log file
	tomcat.log	Tomcat resource log file
	send_alarm.log	Run log file of the HA alarm sending script of the management node
feed_watchdog.log	feed_watchdog resource log	
Timestamp	restart_stamp	NodeAgent startup time log file
Tomcat	cas.log and localhost_access_cas_log.log	CAS run log file
	catalina.log, catalina.out, host-manager.log, localhost.log, and manager.log	Tomcat run log file
	localhost_access_web_log.log	Log file that records the access to REST APIs of FusionInsight Manager
	web.log	Run log file of the Web process
	northbound_ftp_sftp.log and snmp.log	Northbound log file
	perfStats.log	Performance statistics log file

Log Type	Log File Name	Description
Watchdog	watchdog.log and feed_watchdog.log	watchdog.log run log file
update-service	omm_upd_server.log	UPDServer run log file
	omm_upd_agent.log	UPDAgent run log file
	update-manager.log	UPDManager run log file
	install.log	Installation log file of the upgrade service
	uninstall.log	Uninstallation log file of the upgrade service
	catalina.<Time>.log, catalina.out, host-manager.<Time>.log, localhost.<Time>.log, manager.<Time>.log, manager_access_log.<Time>.txt, web_service_access_log.<Time>.txt, catalina.log, gc-update-service.log.0.current, update-manager.controller, update-web-service.controller, update-web-service.log, commit_rm_distributed.log, commit_rm_upload_package.log, common_omagent_operator.log, forbid_monitor.log, initialize_package_atoms.log, initialize_unzip_pack.log, omm-upd.log, register_patch_pack.log, resume_monitor.log, rollback_clear_patch.log, unregister_patch_pack.log, update-rcommupd.log, update-rcupdatemanager.log, and update-service.log	Run log file of the upgrade service
Upgrade	upgrade.log_<Time>	OMS upgrade log file

Log Type	Log File Name	Description
	rollback.log_<Time>	OMS rollback log file
sudo	sudo.log	Sudo script execution log file

## Log Levels

**Table 8-65** describes the log levels provided by Manager. The log levels are FATAL, ERROR, WARN, INFO, and DEBUG in descending order. Logs whose levels are higher than or equal to the set level are printed by the program. The number of printed logs decreases as the set log level increases.

**Table 8-65** Log levels

Level	Description
FATAL	Logs of this level record fatal error information about the current event processing that may result in a system crash.
ERROR	Logs of this level record error information about the current event processing, which indicates that system running is abnormal.
WARN	Logs of this level record abnormal information about the current event processing. These abnormalities will not result in system faults.
INFO	Logs of this level record normal running status information about the system and events.
DEBUG	Logs of this level record system information and debugging information.

## Log Formats

The following table lists the Manager log formats.

**Table 8-66** Log formats

Log Type	Component	Format	Example
Controller, HTTPd, Logman, NodeAgent, oKerberos, oldapserver, OMM, Tomcat, and upgrade	Controller, HTTPd, Logman, NodeAgent, oKerberos, oldapserver, OMM, Tomcat, and upgrade	<yyyy-MM-dd HH:mm:ss, SSS> <Log Level> <Name of the thread for which the log is generated> <Log message> <Location where the log event occurs>	2020-06-30 00:37:09,067 INFO [pool-1-thread-1] Completed Discovering Node.com.xxx.hadoop.om.controller.tasks.nodesetup.DiscoverNodeTask.execute(DiscoverNodeTask.java:299)

## 8.9.3 Configuring the Log Level and Log File Size

### Scenario

You can change the log levels of FusionInsight Manager. For a specific service, you can change the log level and the log file size to prevent the failure in saving logs due to insufficient disk space.

### Impact on the System

The services need to be restarted for the new configuration to take effect. During the restart, the services are unavailable.

### Changing the FusionInsight Manager Log Level

1. Log in to the active management node as user **omm**.
2. Run the following command to switch to the required directory:
3. Run the following command to change the log level:

```
./setLogLevel.sh Log level parameters
```

The priorities of log levels are FATAL, ERROR, WARN, INFO, and DEBUG in descending order. Logs whose levels are higher than or equal to the set level are printed. The number of printed logs decreases as the configured log level increases.

- **DEFAULT**: After this parameter is set, the default log level is used.
- **FATAL**: critical error log level. After this parameter is set, only logs of the **FATAL** level are printed.
- **ERROR**: error log level. After this parameter is set, logs of the **ERROR** and **FATAL** levels are printed.
- **WARN**: warning log level. After this parameter is set, logs of the **WARN**, **ERROR**, and **FATAL** levels are printed.

- **INFO** (default): informational log level. After this parameter is set, logs of the **INFO**, **WARN**, **ERROR**, and **FATAL** levels are printed.
- **DEBUG**: debugging log level. After this parameter is set, logs of the **DEBUG**, **INFO**, **WARN**, **ERROR**, and **FATAL** levels are printed.
- **TRACE**: tracing log level. After this parameter is set, logs of the **TRACE**, **DEBUG**, **INFO**, **WARN**, **ERROR**, and **FATAL** levels are printed.

 **NOTE**

The log levels of components are different from those defined in open-source code.

4. Download and view logs to verify that the log level settings have taken effect. For details, see [Log](#).

## Changing the Service Log Level and Log File Size

 **NOTE**

KrbServer, LdapServer, and DBService do not support the changing of service log levels and log file sizes.

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Cluster > Services**.
- Step 3** Click a service in the service list. On the displayed page, click the **Configuration** page.
- Step 4** On the displayed page, click the **All Configuration** tab. Expand the role instance displayed on the left of the page. Click **Log** of the role to be modified.
- Step 5** Search for each parameter and obtain the parameter description. On the parameter configuration page, select the required log level or change the log file size. The unit of the log file size is MB.

---

**NOTICE**

- The system automatically deletes logs based on the configured log size. To save more information, set the log file size to a larger value. To ensure the integrity of log files, you are advised to manually back up the log files to another directory based on the actual service volume before the log files are cleared according to clearance rules.
- Some services do not support change of the log level on the UI.

- 
- Step 6** Click **Save**. In the **Save Configuration** dialog box, click **OK**.
  - Step 7** Download and view logs to verify that the log level settings have taken effect.

----End

## 8.9.4 Configuring the Number of Local Audit Log Backups

### Scenario

Audit logs of cluster components are classified by name and stored in the `/var/log/Bigdata/audit` directory on each cluster node. The OMS automatically backs up the audit log directories at 03:00 every day.

The audit log directory on each node is compressed and named in the `<Node IP address>.tar.gz` format. All compressed files are compressed and named in the `<yyyy-MM-dd_HH-mm-ss>.tar.gz` format and saved in the `/var/log/Bigdata/audit/bk/` directory on the active management node. In addition, the standby management node saves a copy of the file.

By default, a maximum of 90 OMS backup files can be retained. This section describes how to configure the maximum number.

### Procedure

**Step 1** Log in to the active management node as user **omm**.

 **NOTE**

Perform this operation only on the active management node. This operation is not supported on the standby management nodes; otherwise, the cluster cannot work properly.

**Step 2** Run the following command to switch to the required directory:

```
cd ${BIGDATA_HOME}/om-server/om/sbin
```

**Step 3** Run the following command to change the maximum number of audit log backup files to be retained:

```
./modifyLogConfig.sh -m Maximum number of backup files that can be retained
```

The default value is **90**. The value ranges from **0** to **365**. A larger value means to consume more disk space.

If the following information is displayed, the operation is successful:

```
Modify log config successfully
```

```
----End
```

## 8.9.5 Viewing Role Instance Logs

### Scenario

FusionInsight Manager allows users to view logs of each role instance.

### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster > Services**, and click a service name. Then click the **Instances** tab of the service and click the name of the target instance to access the instance status page.

**Step 3** In the **Log** area, click the name of a log file to preview its content online.

 **NOTE**

- On the **Hosts** page, click a host name. In the instance list of the host, you can view the log files of all role instances on the host.
- By default, a maximum of 100 lines of logs can be displayed. You can click **Load More** to view more logs. Click **Download** to download the log file to the local PC. For details about how to download service logs in batches, see [Log Download](#).

**Figure 8-58** Viewing instance logs

## 8.10 Backup and Recovery Management

## 8.10.1 Introduction

### Overview

FusionInsight Manager provides the backup and restoration of system data and user data by component. The system can back up Manager data, component metadata, and service data.

Data can be backed up to local disks (LocalDir), local HDFS (LocalHDFS), remote HDFS (RemoteHDFS), NAS (NFS/CIFS), Object Storage Service (OBS), and SFTP server (SFTP). For details, see [Backing Up Data](#).

For a component that supports multiple services, multiple instances of a service can be backed up and restored. The backup and restoration operations are consistent with those of a service instance.

#### NOTE

Only MRS 3.1.0 or later supports data backup to OBS.

Backup and restoration tasks are performed in the following scenarios:

- Routine backup is performed to ensure the data security of the system and components.
- If the system is faulty, the data backup can be used to recover the system.
- If the active cluster is completely faulty, a mirrored cluster identical to the active cluster needs to be created. You can use the backup data to restore the active cluster.

**Table 8-67** Manager configuration data to be backed up

Backup Type	Backup Content	Backup Directory Type
OMS	Database data (excluding alarm data) and configuration data in the cluster management system by default	<ul style="list-style-type: none"><li>• LocalDir</li><li>• LocalHDFS</li><li>• RemoteHDFS</li><li>• NFS</li><li>• CIFS</li><li>• SFTP</li><li>• OBS</li></ul>

**Table 8-68** Component metadata or other data to be backed up

Backup Type	Backup Content	Backup Directory Type
DBService	Metadata of the components (including Loader, Hive, Spark, Oozie, CDL, and Hue) managed by DBService. For a cluster with multiple services installed, back up the metadata of multiple Hive and Spark service instances.	<ul style="list-style-type: none"> <li>• LocalDir</li> <li>• LocalHDFS</li> <li>• RemoteHDFS</li> <li>• NFS</li> <li>• CIFS</li> <li>• SFTP</li> <li>• OBS</li> </ul>
Flink (Applicable to MRS 3.2.0 and later versions)	Flink metadata.	<ul style="list-style-type: none"> <li>• LocalDir</li> <li>• LocalHDFS</li> <li>• RemoteHDFS</li> </ul>
Kafka	Kafka metadata.	<ul style="list-style-type: none"> <li>• LocalDir</li> <li>• LocalHDFS</li> <li>• RemoteHDFS</li> <li>• NFS</li> <li>• CIFS</li> <li>• OBS</li> </ul>
NameNode	HDFS metadata. After multiple NameServices are added, backup and restoration are supported for all of them and the operations are consistent with those of the default hacluster instance.	<ul style="list-style-type: none"> <li>• LocalDir</li> <li>• RemoteHDFS</li> <li>• NFS</li> <li>• CIFS</li> </ul>
Yarn	Information about the Yarn service resource pool.	<ul style="list-style-type: none"> <li>• SFTP</li> <li>• OBS</li> </ul>
HBase	<b>tableinfo</b> files and data files of HBase system tables.	
IoTDB	IoTDB metadata.	<ul style="list-style-type: none"> <li>• LocalDir</li> <li>• NFS</li> <li>• RemoteHDFS</li> <li>• CIFS</li> <li>• SFTP</li> </ul>
ClickHouse	ClickHouse metadata.	<ul style="list-style-type: none"> <li>• LocalDir</li> <li>• RemoteHDFS</li> </ul>

**Table 8-69** Service data of specific components to be backed up

Backup Type	Backup Content	Backup Directory Type
HBase	Table-level user data. For a cluster with multiple services installed, backup and restoration are supported for multiple HBase service instances and the backup and restoration operations are consistent with those of a single HBase service instance.	<ul style="list-style-type: none"> <li>• RemoteHDFS</li> <li>• NFS</li> <li>• CIFS</li> <li>• SFTP</li> </ul>
HDFS	Directories or files of user services. <b>NOTE</b> Encrypted directories cannot be backed up or restored.	
Hive	Table-level user data. For a cluster with multiple services installed, backup and restoration are supported for multiple Hive service instances and the backup and restoration operations are consistent with those of a single Hive service instance.	
IoTDB	IoTDB service data.	<ul style="list-style-type: none"> <li>• RemoteHDFS</li> </ul>
ClickHouse	Table-level user data.	<ul style="list-style-type: none"> <li>• RemoteHDFS</li> </ul>

Note that some components do not provide data backup or restoration:

- Kafka supports replicas and allows multiple replicas to be specified when a topic is created.
- CDL data is stored in DBService and Kafka. A system administrator can create DBService and Kafka backup tasks to back up data.
- MapReduce and Yarn data is stored in HDFS. Therefore, they rely on the backup and restoration provided by HDFS.
- Backup and restoration of service data in ZooKeeper are performed by their own upper-layer components.

## Principles

### Task

Before backup or restoration, you need to create a backup or restoration task and set task parameters, such as the task name, backup data source, and type of the directory for storing backup files. Then you can execute the tasks to back up or restore data. When Manager is used to restore the data of HDFS, HBase, Hive, and NameNode, the cluster cannot be accessed.

Each backup task can back up data of different data sources and generate an independent backup file for each data source. All the backup files generated in a

backup task form a backup file set, which can be used in restoration tasks. Backup data can be stored on Linux local disks, local cluster HDFS, and standby cluster HDFS.

Backup tasks support full backup and incremental backup policies. Cloud data backup tasks do not support incremental backup. If the backup directory type is NFS or CIFS, incremental backup is not recommended. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.

#### NOTE

Task execution rules:

- If a task is being executed, the task cannot be executed repeatedly and other tasks cannot be started at the same time.
- The interval at which a periodic task is automatically executed must be greater than 120s. Otherwise, the task is postponed and will be executed in the next period. Manual tasks can be executed at any interval.
- When a periodic task is to be automatically executed, the current time cannot be 120s later than the task start time. Otherwise, the task is postponed and executed in the next period.
- When a periodic task is locked, it cannot be automatically executed and needs to be manually unlocked.
- Before an OMS, DBService, Kafka, or NameNode backup task starts, ensure that the LocalBackup partition on the active management node has not less than 20 GB of available space. Otherwise, the backup task cannot be started.

When planning backup and restoration tasks, select the data to be backed up or restored strictly based on the service logic, data store structure, and database or table association. By default, the system creates periodic backup tasks **default-oms** and **default-cluster ID** at an interval of one hour. OMS metadata and cluster metadata, such as DBService and NameNode, can be fully backed up to local disks.

### Snapshot

The system uses the snapshot technology to quickly back up data. Snapshots include HBase and HDFS snapshots.

- HBase snapshots  
An HBase snapshot is a backup file of HBase tables at a specified time point. This backup file does not replicate service data or affect the RegionServer. The HBase snapshot replicates table metadata, including table descriptor, region info, and HFile reference information. The metadata can be used to restore data before the snapshot creation time.
- HDFS snapshots  
An HDFS snapshot is a read-only backup of HDFS at a specified time point. The snapshot is used in data backup, misoperation protection, and disaster recovery scenarios.  
The snapshot function can be enabled for any HDFS directory to create the related snapshot file. Before creating a snapshot for a directory, the system automatically enables the snapshot function for the directory. Creating a snapshot does not affect any HDFS operation. A maximum of 65,536 snapshots can be created for each HDFS directory.

When a snapshot is being created for an HDFS directory, the directory cannot be deleted or modified before the snapshot is created. Snapshots cannot be created for the upper-layer directories or subdirectories of the directory.

### DistCp

Distributed copy (DistCp) is a tool used to replicate a large amount of data in HDFS in a cluster or between the HDFSs of different clusters. In a backup or restoration task of HBase, HDFS, or Hive, if you back up the data to HDFS of the standby cluster, the system invokes DistCp to perform the operation. Install the MRS software of the same version for the active and standby clusters and install the cluster.

DistCp uses MapReduce to implement data distribution, troubleshooting, restoration, and report. DistCp specifies different Map jobs for various source files and directories in the specified list. Each Map job copies the data in the partition that corresponds to the specified file in the list.

If you use DistCp to replicate data between HDFSs of two clusters, configure the cross-cluster mutual trust (mutual trust does not need to be configured for clusters managed by the same FusionInsight Manager) and cross-cluster replication for both clusters. When backing up the cluster data to HDFS in another cluster, you need to install the Yarn component. Otherwise, the backup fails.

### Local rapid restoration

After using DistCp to back up the HBase, HDFS, and Hive data of the local cluster to the HDFS of the standby cluster, the HDFS of the local cluster retains the backup data snapshots. You can create local rapid restoration tasks to restore data by using the snapshot files in the HDFS of the local cluster.

### NAS

Network Attached Storage (NAS) is a dedicated data storage server which includes the storage components and embedded system software. It provides the cross-platform file sharing function. By using NFS (supporting NFSv3 and NFSv4) and CIFS (supporting SMBv2 and SMBv3), you can connect the service plane of MRS to the NAS server to back up data to the NAS or restore data from the NAS.

#### NOTE

- Before data is backed up to the NAS, the system automatically mounts the NAS shared address to a local partition of the backup task execution node. After the backup is complete, the system unmounts the NAS shared partition from the backup task execution node.
- To prevent backup and restoration failures, do not access the shared address where the NAS server has been mounted to, for example, `/srv/BigData/LocalBackup/nas`, during data backup and restoration.
- When service data is backed up to the NAS, DistCp is used.

## Specifications

**Table 8-70** Specifications of the backup and restoration feature

Item	Specification
Maximum number of backup or restoration tasks	100
Number of concurrent tasks in a cluster	1
Maximum number of waiting tasks	199
Maximum size (GB) of backup files on a Linux local disk	600

### NOTE

If service data is stored in the ZooKeeper upper-layer components, ensure that the number of znodes in a single backup or restoration task is not too large. Otherwise, the task will fail, and the ZooKeeper service performance will be affected. To check the number of znodes in a single backup or restoration task, perform the following operations:

- Ensure that the number of znodes in a single backup or restoration task is smaller than the upper limit of OS file handles. Specifically:
  1. To check the upper limit at the system level, run the **cat /proc/sys/fs/file-max** command.
  2. To check the upper limit at the user level, run the **ulimit -n** command.
- If the number of znodes in the parent directory exceeds the upper limit, back up and restore data in its sub-directories in batches. To check the number of znodes using ZooKeeper client scripts, perform the following operations:
  1. On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, choose **Services > ZooKeeper > Instance**, and view the management IP address of each ZooKeeper role.
  2. Log in to the node where the client is located and run the following command:  
**zkCli.sh -server ip:port**, where, *ip* can be any management IP address, and the default port number is 2181.
  3. If the following information is displayed, login to the ZooKeeper server is successful:  
WatchedEvent state:SyncConnected type:None path:null  
[zk: ip:port(CONNECIED) 0]
  4. Run the **getusage** command to check the number of znodes in the directory to be backed up.  
  
For example, **getusage /hbase/region**. In the command output, **Node count=xxxxxx** indicates the number of znodes stored in the **region** directory.

**Table 8-71** Specifications of the default task

Item	OMS	HBase	Kafka	DBService	NameNode
Backup period	1 hour				

Item	OMS	HBase	Kafka	DBService	NameNode
Maximum number of backups	168 (7-day historical data)				24 (one-day historical data)
Maximum size of a backup file	10 MB	10 MB	512 MB	100 MB	20 GB
Maximum size of disk space used	1.64 GB	1.64 GB	84 GB	16.41 GB	480 GB
Storage path of backup data	<i>Data storage path/LocalBackup/</i> of the active and standby management nodes				

 NOTE

- The backup data of the default backup task must be periodically transferred and saved outside the cluster based on the enterprise O&M requirements.
- Administrators can create DistCp backup tasks to save OMS, DBService, and NameNode data to external clusters.
- The execution time of a cluster data backup task can be calculated using the following formula: Task execution time = Volume of data to be backed up/Network bandwidth between the cluster and the backup device. In practice, you are advised to multiply the calculated time by 1.5 to get the reference value of the task execution time.
- Executing a data backup task affects the maximum I/O performance of the cluster. Therefore, you are advised to execute a backup task during off-peak hours.

## 8.10.2 Backing Up Data

### 8.10.2.1 Backing Up Manager Data

#### Scenario

To ensure data security of FusionInsight Manager routinely or before and after a critical operation (such as capacity expansion and reduction) on FusionInsight Manager, you need to back up FusionInsight Manager data. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up Manager data. Both automatic and manual backup tasks are supported.

#### Prerequisites

- If data needs to be backed up to the remote HDFS, you have prepared a standby cluster for data backup. The authentication mode of the standby cluster is the same as that of the active cluster. For other backup modes, you do not need to prepare the standby cluster.

- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.
- If you want to back up data to NAS, you have deployed the NAS server in advance.
- If you want to back up data to OBS, you have connected the current cluster to OBS and have the permission to access OBS.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Figure 8-59** Creating a backup task.

Backup Management > Create Backup Task

Name:  Enter 3 to 128 characters. Only digits, letters, and underscores ( \_ ) are allowed. The task name must be unique.

Backup Object: MRS\_0928

Mode:  Periodic  Manual ⓘ

Configuration: Metadata and other data

DBService

NameNode

Yarn

HBase

Kafka

Service data

HDFS

HBase

Hive

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Set **Backup Object** to **OMS**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.  
**Manual** indicates that the backup task is executed manually.

**Table 8-72** Periodic backup parameters

Parameter	Description
Started	Indicates the time when the task is started for the first time.
Period	Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> .
Backup Policy	<ul style="list-style-type: none"><li>● <b>Full backup at the first time and incremental backup subsequently</b></li><li>● <b>Full backup every time</b></li><li>● <b>Full backup once every n times</b></li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>● Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li><li>● If <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, incremental backup cannot be used. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.</li></ul>

**Step 6** In **Configuration**, select **OMS**.

**Step 7** Set **Path Type** of **OMS** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files.

The default storage directory is *Data storage path/LocalBackup/*, for example, */srv/BigData/LocalBackup*.

If you select this option, you need to set the maximum number of replicas to specify the number of backup file sets that can be retained in the backup directory.

- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.

If you select this option, set the following parameters:

- **Target Path**: indicates the HDFS directory for storing the backup files. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as */hbase* or */user/hbase/backup*.
- **Maximum Number of Backup Copies**: indicates the number of backup file sets that can be retained in the backup directory.
- **Cluster for Backup**: Enter the cluster name mapping to the backup directory.

- **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **RemoteHDFS:** indicates that the backup files are stored in the HDFS directory of the standby cluster.  
If you select this option, set the following parameters:
  - **Destination NameService Name:** indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Target NameNode IP Address:** indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
  - **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
  - **Source Cluster:** Select the cluster of the Yarn queue used by the backup data.
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the source cluster.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol.  
If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol.  
If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.

- **Username:** indicates the username set when the CIFS protocol is configured.
- **Password:** indicates the password set when the CIFS protocol is configured.
- **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.

If you select this option, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the server where the backup data is stored.
- **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username:** indicates the username for connecting to the server using the SFTP protocol.
- **Password:** indicates the password for connecting to the server using the SFTP protocol.
- **Server Shared Path:** indicates the backup path on the SFTP server.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **OBS:** indicates that backup files are stored in OBS.  
If you select this option, set the following parameters:
  - **Target Path:** indicates the OBS directory for storing backup data.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.

 **NOTE**

Only MRS 3.1.0 or later supports data backup to OBS.

**Step 8** Click **OK**.

**Step 9** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files.

The format of the backup file name is *Version\_Data source\_Task execution time.tar.gz*.

----End

## 8.10.2.2 Backing Up CDL Data

### Scenario

To ensure CDL service data security routinely or before a major operation on CDL (such as upgrade or migration), you need to back up CDL data. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

CDL data is stored in DBService and Kafka. You can create DBService and Kafka backup tasks on FusionInsight Manager to back up CDL data. Both automatic and manual backup tasks are supported.

### Prerequisites

- If data needs to be backed up to the remote HDFS, you have prepared a standby cluster for data backup. The authentication mode of the standby cluster is the same as that of the active cluster. For other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.
- If you want to back up data to NAS, you have deployed the NAS server in advance.
- If you want to back up data to OBS, you have connected the current cluster to OBS and have the permission to access OBS.

### Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.

**Manual** indicates that the backup task is executed manually.

**Table 8-73** Periodic backup parameters

Parameter	Description
Started	Indicates the time when the task is started for the first time.
Period	Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> .
Backup Policy	<ul style="list-style-type: none"><li>● <b>Full backup at the first time and incremental backup subsequently</b></li><li>● <b>Full backup every time</b></li><li>● <b>Full backup once every n times</b></li></ul> <b>NOTE</b> <ul style="list-style-type: none"><li>● Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li><li>● If <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, incremental backup cannot be used. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.</li></ul>

**Step 6** Set **Configuration** to **DBService** and **Kafka**.

**Step 7** Set **Path Type** of **DBService** to a backup directory type. For details about how to set the parameters, see [Step 7](#).

**Step 8** Set **Path Type** of **Kafka** to a backup directory type. For details about how to set the parameters, see [Step 7](#).

**Step 9** Click **OK**.

**Step 10** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files.

The format of the backup file name is *Version\_Data source\_Task execution time.tar.gz*.

----End

### 8.10.2.3 Backing Up ClickHouse Metadata

#### Scenario

To ensure ClickHouse metadata security or before a major operation (such as upgrade or migration), you need to back up ClickHouse metadata. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up ClickHouse metadata. Both automatic and manual backup tasks are supported.

---

**NOTICE**

This function is supported only by MRS 3.1.0 or later.

---

## Prerequisites

- If data needs to be backed up to the remote HDFS, you have prepared a standby cluster for data backup. The authentication mode of the standby cluster is the same as that of the active cluster. For other backup modes, you do not need to prepare the standby cluster.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.
- If the active and standby clusters are deployed in security mode and they are not managed by the same FusionInsight Manager, mutual trust must be configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active and standby clusters are deployed in normal mode, no mutual trust is required.
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- In the active/standby cluster, if data is remotely backed up to HDFS, ensure that the value of **HADOOP\_RPC\_PROTECTION** of ClickHouse is the same as that of **hadoop.rpc.protection** of HDFS.

## Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.
- Step 2** Click **Create**.
- Step 3** Set **Name** to the name of the backup task.
- Step 4** Select the cluster to be operated from **Backup Object**.
- Step 5** Set **Mode** to the type of the backup task. **Periodic** indicates that the backup task is periodically executed. **Manual** indicates that the backup task is manually executed.  
  
To create a periodic backup task, set the following parameters:
  - **Started**: indicates the time when the task is started for the first time.
  - **Period**: indicates the task execution interval. The options include **Hours** and **Days**.
  - **Backup Policy**: Only **Full backup every time** is supported.
- Step 6** In **Configuration**, select **ClickHouse** under **Metadata and other data**.

**Step 7** Set **Path Type** of **ClickHouse** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files.

The default storage directory is *Data storage path/LocalBackup/*, for example, */srv/BigData/LocalBackup*.

If you select this option, you need to set the maximum number of replicas to specify the number of backup file sets that can be retained in the backup directory.

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

This value option is available only after you configure the environment by referring to [How Do I Configure the Environment When I Create a ClickHouse Backup Task on FusionInsight Manager and Set the Path Type to RemoteHDFS?](#)

You also need to configure the following parameters:

- **Destination NameService Name**: indicates the NameService name of the standby cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Target NameNode IP Address**: indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
- **Target Path**: indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies**: indicates the number of backup file sets that can be retained in the backup directory.

**Step 8** Click **OK**.**Step 9** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *Data source\_Task execution time.tar.gz*.

----End

## 8.10.2.4 Backing Up ClickHouse Service Data

### Scenario

To ensure ClickHouse service data security routinely or before a major operation on ClickHouse (such as upgrade or migration), you need to back up ClickHouse service data. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up ClickHouse service data. Both automatic and manual backup tasks are supported.

---

**NOTICE**

This function is supported only by MRS 3.1.0 or later.

---

### Prerequisites

- If data needs to be backed up to the remote HDFS, you have prepared a standby cluster for data backup. The authentication mode of the standby cluster is the same as that of the active cluster. For other backup modes, you do not need to prepare the standby cluster.
- If the active and standby clusters are deployed in security mode and they are not managed by the same FusionInsight Manager, mutual trust must be configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active and standby clusters are deployed in normal mode, no mutual trust is required.
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- You have planned the backup type, period, object, and directory based on service requirements.
- The HDFS in the standby cluster has sufficient space. You are advised to save backup files in a custom directory.
- In the active/standby cluster, if data is remotely backed up to HDFS, ensure that the value of **HADOOP\_RPC\_PROTECTION** of ClickHouse is the same as that of **hadoop.rpc.protection** of HDFS.

### Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.  
**Manual** indicates that the backup task is executed manually.

**Table 8-74** Periodic backup parameters

Parameter	Description
Started	Indicates the time when the task is started for the first time.
Period	Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> .
Backup Policy	<ul style="list-style-type: none"><li>• <b>Full backup at the first time and incremental backup subsequently</b></li><li>• <b>Full backup every time</b></li><li>• <b>Full backup once every n times</b></li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li></ul>

**Step 6** In **Configuration**, select **ClickHouse** under **Service Data**.

**Step 7** Set **Path Type** of **ClickHouse** to a backup directory type.

Currently, only the **RemoteHDFS** type is available.

**RemoteHDFS**: indicates that backup files are stored in HDFS of the standby cluster.

This value option is available for MRS 3.1.0 or 3.1.2 clusters only after you configure the environment by referring to [How Do I Configure the Environment When I Create a ClickHouse Backup Task on FusionInsight Manager and Set the Path Type to RemoteHDFS?](#)

You also need to configure the following parameters for MRS 3.1.3 or later clusters:

- **Destination NameService Name**: indicates the NameService name of the standby cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Destination Active NameNode IP Address**: indicates the service plane IP address of the active NameNode in the standby cluster.
- **Destination Standby NameNode IP Address**: indicates the service plane IP address of the standby NameNode in the standby cluster.
- **Destination NameNode RPC Port**: indicates the value of **dfs.namenode.rpc.port** in the HDFS basic configuration of the destination cluster.
- **Target Path**: indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a

snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.

You also need to configure the following parameters for MRS 3.1.0 or 3.1.2 clusters:

- **Destination NameService Name:** indicates the NameService name of the standby cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Target NameNode IP Address:** indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
- **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.

**Step 8** Set **Maximum Number of Recovery Points** to the number of snapshots that can be retained in the cluster.

**Step 9** Set **Backup Content** to one or multiple ClickHouse tables to be backed up.

You can select backup data using either of the following methods:

- Adding a backup data file  
Click the name of a database in the navigation tree to show all the tables in the database, and select specified tables.  
MRS 3.2.0 or later:
  - a. Click **Add**.
  - b. Select the table to be backed up under **File Directory**, and click **Add** to add the table to **Backup Content**.
  - c. Click **OK**.
- MRS 3.2.0 or later: Regular expression filtering
  - a. Click **Query Regular Expression**.
  - b. Enter the logical cluster and database to which the ClickHouse table belongs in the first text box as prompted. The logical cluster and database must match the existing logical cluster and database, for example, **/default\_cluster/database**.
  - c. Enter a regular expression in the second box. Standard regular expressions are supported. For example, to filter all tables that contain the keyword **test** in the database, enter **test.\***.
  - d. Click **Refresh** to view the displayed tables in **Directory Name**.

- e. Click **Synchronize** to save the result.

 **NOTE**

- When entering regular expressions, click **+** or **-** to add or delete an expression.
  - If the selected table or directory is incorrect, click **Clear Selected Node** to deselect it.
- Versions earlier than MRS 3.2.0: Regular expression filtering
    - a. Click **Query Regular Expression**.
    - b. Enter the database where the ClickHouse tables are located in the first text box as prompted. The database must be the same as the existing database, for example, **default**.
    - c. Enter a regular expression in the second text box. Standard regular expressions are supported. For example, to get all tables in the database, enter **([\s\S]\*?)**. To get tables named in the format of letters and digits, for example, **tb1**, enter **tb\d\***.
    - d. Click **Refresh** to view the displayed tables in **Directory Name**.
    - e. Click **Synchronize** to save the result.

 **NOTE**

- When entering regular expressions, click **+** or **-** to add or delete an expression.
- If the selected table or directory is incorrect, click **Clear Selected Node** to deselect it.

**Step 10** Click **Verify** to check whether the backup task is configured correctly.

The possible causes of the verification failure are as follows:

- The target NameNode IP address is incorrect.
- The directory or table to be backed up does not exist.
- The name of the NameService is incorrect.

**Step 11** Click **OK**.

**Step 12** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Data source\_Task creation time*, and the subdirectory is used to save latest data source backup files.

----End

## 8.10.2.5 Backing Up DBService Data

### Scenario

To ensure DBService service data security routinely or before a major operation on DBService (such as upgrade or migration), you need to back up DBService data. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up DBService data. Both automatic and manual backup tasks are supported.

## Prerequisites

- If data needs to be backed up to the remote HDFS, you have prepared a standby cluster for data backup. The authentication mode of the standby cluster is the same as that of the active cluster. For other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.
- If you want to back up data to NAS, you have deployed the NAS server in advance.
- If you want to back up data to OBS, you have connected the current cluster to OBS and have the permission to access OBS.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.  
**Manual** indicates that the backup task is executed manually.

**Table 8-75** Periodic backup parameters

Parameter	Description
Started	Indicates the time when the task is started for the first time.
Period	Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> .

Parameter	Description
Backup Policy	<ul style="list-style-type: none"><li>● <b>Full backup at the first time and incremental backup subsequently</b></li><li>● <b>Full backup every time</b></li><li>● <b>Full backup once every n times</b></li></ul> <b>NOTE</b> <ul style="list-style-type: none"><li>● Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li><li>● If <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, incremental backup cannot be used. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.</li></ul>

**Step 6** In **Configuration**, select **DBService**. **NOTE**

If there are multiple DBService services, all DBService services are backed up by default. You can click **Assign Service** to specify the services to be backed up.

**Step 7** Set **Path Type** of **DBService** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files.

The default storage directory is *Data storage path/LocalBackup/*, for example, */srv/BigData/LocalBackup*.

If you select this option, you need to set the maximum number of replicas to specify the number of backup file sets that can be retained in the backup directory.

- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.

If you select this option, set the following parameters:

- **Target Path**: indicates the HDFS directory for storing the backup files. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as */hbase* or */user/hbase/backup*.
- **Maximum Number of Backup Copies**: indicates the number of backup file sets that can be retained in the backup directory.
- **Target NameService Name**: indicates the NameService name of the backup directory. The default value is **hacluster**.

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this option, set the following parameters:

- **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**,

- haclusterX1, haclusterX2, haclusterX3, or haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Target NameNode IP Address:** indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
  - **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the source cluster.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol. If you select this option, set the following parameters:
    - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
    - **Server IP Address:** indicates the IP address of the NAS server.
    - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
    - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
  - **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol. If you select this option, set the following parameters:
    - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
    - **Server IP Address:** indicates the IP address of the NAS server.
    - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
    - **Username:** indicates the username set when the CIFS protocol is configured.
    - **Password:** indicates the password set when the CIFS protocol is configured.
    - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)

- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.  
If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the server where the backup data is stored.
  - **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
  - **Username:** indicates the username for connecting to the server using the SFTP protocol.
  - **Password:** indicates the password for connecting to the server using the SFTP protocol.
  - **Server Shared Path:** indicates the backup path on the SFTP server.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **OBS:** indicates that backup files are stored in OBS.  
If you select this option, set the following parameters:
  - **Target Path:** indicates the OBS directory for storing backup data.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.

 **NOTE**

Only MRS 3.1.0 or later supports data backup to OBS.

**Step 8** Click **OK**.

**Step 9** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files.

The format of the backup file name is *Version\_Data source\_Task execution time.tar.gz*.

----End

## 8.10.2.6 Backing Up Flink Metadata

### Scenario

To ensure Flink metadata security or before a major operation on Flink (such as upgrade or migration), you need to back up Flink metadata. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up Flink metadata. Both automatic and manual backup tasks are supported.

## Prerequisites

- If data needs to be backed up to the remote HDFS, you have prepared a standby cluster for data backup. The authentication mode of the standby cluster is the same as that of the active cluster. For other backup modes, you do not need to prepare the standby cluster.
- The HDFS and Yarn services have been installed if data needs to be backed up to HDFS.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task. **Periodic** indicates that the backup task is periodically executed. **Manual** indicates that the backup task is manually executed.

To create a periodic backup task, set the following parameters:

- **Started:** indicates the time when the task is started for the first time.
- **Period:** indicates the task execution interval. The options include **Hours** and **Days**.
- **Backup Policy:** Only **Full backup every time** is supported.

**Step 6** In **Configuration**, select **Flink** under **Metadata and other data**.

**Step 7** Set **Path Type** of **Flink** to a backup directory type.

The following backup directory types are supported:

- **LocalDir:** indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files.

The default storage directory is *Data storage path/LocalBackup/*, for example, */srv/BigData/LocalBackup*.

If you select this option, you need to set the maximum number of replicas to specify the number of backup file sets that can be retained in the backup directory.

- **LocalHDFS:** indicates that the backup files are stored in the HDFS directory of the current cluster.

If you select this option, set the following parameters:

- **Target Path:** indicates the HDFS directory for storing the backup files. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as */hbase* or */user/hbase/backup*.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.

- **RemoteHDFS:** indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this option, set the following parameters:

- **Destination NameService Name:** indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Target NameNode IP Address:** indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
- **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as */hbase* or */user/hbase/backup*.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the source cluster.

**Step 8** Click **OK**.

**Step 9** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data

source backup files. The format of the backup file name is *Data source\_Task execution time.tar.gz*.

----End

## 8.10.2.7 Backing Up HBase Metadata

### Scenario

To ensure HBase metadata security (including tableinfo files and HFiles) or before a major operation on HBase system tables (such as upgrade or migration), you need to back up HBase metadata to prevent HBase service unavailability caused by HBase system table directory or file damages. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up HBase metadata. Both automatic and manual backup tasks are supported.

### Prerequisites

- If data needs to be backed up to the remote HDFS, you have prepared a standby cluster for data backup. The authentication mode of the standby cluster is the same as that of the active cluster. For other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.
- If you want to back up data to NAS, you have deployed the NAS server in advance.
- The `fs.defaultFS` parameter settings of HBase are the same as those of Yarn and HDFS.
- If HBase data is stored in the local HDFS, HBase metadata can be backed up to OBS. If HBase data is stored in OBS, data backup is not supported.
- If you want to back up data to OBS, you have connected the current cluster to OBS and have the permission to access OBS.

### Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.

**Manual** indicates that the backup task is executed manually.

**Table 8-76** Periodic backup parameters

Parameter	Description
Started	Indicates the time when the task is started for the first time.
Period	Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> .
Backup Policy	<ul style="list-style-type: none"><li>• <b>Full backup at the first time and incremental backup subsequently</b></li><li>• <b>Full backup every time</b></li><li>• <b>Full backup once every n times</b></li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li><li>• If <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, incremental backup cannot be used. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.</li></ul>

**Step 6** In **Configuration**, select **HBase** under **Metadata and other data**.

 **NOTE**

If there are multiple HBase services, all HBase services are backed up by default. You can click **Assign Service** to specify the services to be backed up.

**Step 7** Set **Path Type** of **HBase** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files.

The default storage directory is *Data storage path/LocalBackup/*, for example, */srv/BigData/LocalBackup*.

If you select this option, you need to set the maximum number of replicas to specify the number of backup file sets that can be retained in the backup directory.

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this option, set the following parameters:

- **Destination NameService Name:** indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Target NameNode IP Address:** indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
  - **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the source cluster.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol.

If you select this option, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol.

If you select this option, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the NAS server.
- **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
- **Username:** indicates the username set when the CIFS protocol is configured.
- **Password:** indicates the password set when the CIFS protocol is configured.
- **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory,

and the user group and owner group of the shared path must be **nobody:nobody**.)

- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.

If you select this option, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the server where the backup data is stored.
- **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username:** indicates the username for connecting to the server using the SFTP protocol.
- **Password:** indicates the password for connecting to the server using the SFTP protocol.
- **Server Shared Path:** indicates the backup path on the SFTP server.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **OBS:** indicates that backup files are stored in OBS.

If you select this option, set the following parameters:

- **Target Path:** indicates the OBS directory for storing backup data.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.

#### NOTE

Only MRS 3.1.0 or later supports data backup to OBS.

**Step 8** Click **OK**.

**Step 9** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *Version\_Data source\_Task execution time.tar.gz*.

----End

## 8.10.2.8 Backing Up HBase Service Data

### Scenario

To ensure HBase service data security routinely or before a major operation on HBase (such as upgrade or migration), you need to back up HBase service data. The backup data can be used to recover the system if an exception occurs or the

operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up HBase service data. Both automatic and manual backup tasks are supported.

The following situations may occur during the HBase service data backup:

- When a user creates an HBase table, **KEEP\_DELETED\_CELLS** is set to **false** by default. When the user backs up this HBase table, deleted data will be backed up and junk data may exist after data restoration. This parameter can be set to **true** manually when an HBase table is created based on service requirements.
- When a user manually specifies the timestamp when writing data into an HBase table and the specified time is earlier than the last backup time of the HBase table, new data may not be backed up in incremental backup tasks.
- The HBase backup function cannot back up the access control lists (ACLs) for reading, writing, executing, creating, and managing HBase global or namespaces. After HBase data is restored, you need to reset the role permissions on FusionInsight Manager.
- If the backup data of the standby cluster is lost in an existing HBase backup task, the next incremental backup will fail, and you need to create an HBase backup task again. However, the next full backup task will be normal.

## Prerequisites

- If data needs to be backed up to the remote HDFS, you have prepared a standby cluster for data backup. The authentication mode of the standby cluster is the same as that of the active cluster. For other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- Backup policies, including the backup task type, period, backup object, backup directory, and Yarn queue required by the backup task are planned based on service requirements.
- The HDFS in the standby cluster has sufficient space. You are advised to save backup files in a custom directory.
- On the HDFS client, you have executed the **hdfs lsSnapshottableDir** command as user **hdfs** to check the list of directories for which HDFS snapshots have been created in the current cluster and ensured that the HDFS parent directory or subdirectory where data files to be backed up are stored does not have HDFS snapshots. Otherwise, the backup task cannot be created.
- If you want to back up data to NAS, you have deployed the NAS server in advance.

- The **fs.defaultFS** parameter settings of HBase are the same as those of Yarn and HDFS.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.

**Manual** indicates that the backup task is executed manually.

**Table 8-77** Periodic backup parameters

Parameter	Description
Started	Indicates the time when the task is started for the first time.
Period	Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> .
Backup Policy	<ul style="list-style-type: none"><li>• <b>Full backup at the first time and incremental backup subsequently</b></li><li>• <b>Full backup every time</b></li><li>• <b>Full backup once every n times</b></li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li><li>• If <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, incremental backup cannot be used. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.</li></ul>

**Step 6** In **Configuration**, choose **HBase > HBase** under **Service data**.

**Step 7** Set **Path Type** of **HBase** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this option, set the following parameters:

- **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in

- remote cluster of the cluster, or the NameService name of a configured remote cluster.
- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Target NameNode IP Address:** indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
  - **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol. If you select this option, set the following parameters:
    - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
    - **Server IP Address:** indicates the IP address of the NAS server.
    - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
    - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
    - **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
    - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
    - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
  - **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol. If you select this option, set the following parameters:
    - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
    - **Server IP Address:** indicates the IP address of the NAS server.

- **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
- **Username:** indicates the username set when the CIFS protocol is configured.
- **Password:** indicates the password set when the CIFS protocol is configured.
- **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.

If you select this option, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the server where the backup data is stored.
- **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username:** indicates the username for connecting to the server using the SFTP protocol.
- **Password:** indicates the password for connecting to the server using the SFTP protocol.
- **Server Shared Path:** indicates the backup path on the SFTP server.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.

**Step 8** Set **Maximum Number of Recovery Points** to the number of snapshots that can be retained in the cluster.

**Step 9** Set **Backup Content** to one or multiple HBase tables to be backed up.

You can select backup data using either of the following methods:

- Adding a backup data file  
Click the name of a database in the navigation tree to show all the tables in the database, and select specified tables.  
MRS 3.2.0 or later:
  - a. Click **Add**.
  - b. Select the table to be backed up under **File Directory**, and click **Add** to add the table to **Backup Content**.
  - c. Click **OK**.
- Selecting using regular expressions
  - a. Click **Query Regular Expression**.
  - b. Enter the namespace where the HBase tables are located in the first text box as prompted. The namespace must be the same as the existing namespace, for example, **default**.
  - c. Enter a regular expression in the second text box. Standard regular expressions are supported. For example, to get all tables in the namespace, enter **([s\S]\*?)**. To get tables whose names consist of letters and digits, for example, **tb1**, enter **tb\d\***.
  - d. Click **Refresh** to view the displayed tables in **Directory Name**.
  - e. Click **Synchronize** to save the result.

 **NOTE**

- When entering regular expressions, click **+** or **-** to add or delete an expression.
- If the selected table or directory is incorrect, click **Clear Selected Node** to deselect it.

**Step 10** Click **Verify** to check whether the backup task is configured correctly.

The possible causes of the verification failure are as follows:

- The target NameNode IP address is incorrect.
- The queue name is incorrect.
- The parent directory or subdirectory of the HDFS directory where HBase table data files to be backed up are stored has HDFS snapshots.
- The directory or table to be backed up does not exist.

**Step 11** Click **OK**.

**Step 12** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *xxx/Backup task name\_Data source\_Task creation time*, and the subdirectory is used to save latest data source backup files. All the backup file sets are stored in the related snapshot directories.

----End

## 8.10.2.9 Backing Up NameNode Data

### Scenario

To ensure NameNode service data security routinely or before a major operation on NameNode (such as upgrade or migration), you need to back up NameNode data. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up NameNode data. Both automatic and manual backup tasks are supported.

### Prerequisites

- If data needs to be backed up to the remote HDFS, you have prepared a standby cluster for data backup. The authentication mode of the standby cluster is the same as that of the active cluster. For other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.
- If you want to back up data to NAS, you have deployed the NAS server in advance.
- If you want to back up data to OBS, you have connected the current cluster to OBS and have the permission to access OBS.

### Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.

**Manual** indicates that the backup task is executed manually.

**Table 8-78** Periodic backup parameters

Parameter	Description
Started	Indicates the time when the task is started for the first time.
Period	Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> .
Backup Policy	Only <b>Full backup every time</b> is supported. <b>NOTE</b> <ul style="list-style-type: none"><li>Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li><li>If <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, incremental backup cannot be used. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.</li></ul>

**Step 6** In **Configuration**, select **NameNode**.

**Step 7** Set **Path Type** of **NameNode** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files. By default, the backup files are stored in *Data storage path/LocalBackup/*.
  - **Maximum Number of Backup Copies**: indicates the number of backup file sets that can be retained in the backup directory.
  - **NameService Name**: indicates the NameService name of the backup directory. The default value is **hacluster**.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster. If you select this option, set the following parameters:
  - **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Target NameNode IP Address**: indicates the service plane IP address of the NameNode in the standby cluster.
  - **Target Path**: indicates the path for storing backup files.
  - **Maximum Number of Backup Copies**: indicates the number of backup file sets that can be retained in the backup directory.
  - **NameService Name**: indicates the NameService name of the backup directory. The default value is **hacluster**.

- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
  - **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
  - **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the server where the backup data is stored.
  - **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.

- **Username:** indicates the username for connecting to the server using the SFTP protocol.
- **Password:** indicates the password for connecting to the server using the SFTP protocol.
- **Server Shared Path:** indicates the backup path on the SFTP server.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **OBS:** indicates that backup files are stored in OBS.  
If you select this option, set the following parameters:
  - **Target Path:** indicates the OBS directory for storing backup data.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
  - **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.

 **NOTE**

Only MRS 3.1.0 or later supports data backup to OBS.

**Step 8** Click **OK**.

**Step 9** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files.

The format of the backup file name is *Version\_Data source\_Task execution time.tar.gz*.

----End

## 8.10.2.10 Backing Up HDFS Service Data

### Scenario

To ensure HDFS service data security routinely or before a major operation on HDFS (such as upgrade or migration), you need to back up HDFS service data. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up HDFS service data. Both automatic and manual backup tasks are supported.

 **NOTE**

Encrypted directories cannot be backed up or restored.

## Prerequisites

- If data needs to be backed up to the remote HDFS, you have prepared a standby cluster for data backup. The authentication mode of the standby cluster is the same as that of the active cluster. For other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- Backup policies, including the backup task type, period, backup object, backup directory, and Yarn queue required by the backup task are planned based on service requirements.
- The HDFS in the standby cluster has sufficient space. You are advised to save backup files in a custom directory.
- On the HDFS client, you have executed the `hdfs lsSnapshottableDir` command as user `hdfs` to check the list of directories for which HDFS snapshots have been created in the current cluster and ensured that the HDFS parent directory or subdirectory where data files to be backed up are stored does not have HDFS snapshots. Otherwise, the backup task cannot be created.
- If you want to back up data to NAS, you have deployed the NAS server in advance.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.

**Manual** indicates that the backup task is executed manually.

**Table 8-79** Periodic backup parameters

Parameter	Description
Started	Indicates the time when the task is started for the first time.
Period	Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> .

Parameter	Description
Backup Policy	<ul style="list-style-type: none"><li>● <b>Full backup at the first time and incremental backup subsequently</b></li><li>● <b>Full backup every time</b></li><li>● <b>Full backup once every n times</b></li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>● Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li><li>● If <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, incremental backup cannot be used. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.</li></ul>

**Step 6** In **Configuration**, select **HDFS**.

**Step 7** Set **Path Type** of **HDFS** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this option, set the following parameters:

- **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Target NameNode IP Address**: indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
- **Target Path**: indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies**: indicates the number of backup file sets that can be retained in the backup directory.
- **Queue Name**: indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value is **100**.

- **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
  - **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.

- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.

If you select this option, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the server where the backup data is stored.
- **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username:** indicates the username for connecting to the server using the SFTP protocol.
- **Password:** indicates the password for connecting to the server using the SFTP protocol.
- **Server Shared Path:** indicates the backup path on the SFTP server.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.

**Step 8** Set **Maximum Number of Recovery Points** to the number of snapshots that can be retained in the cluster.

**Step 9** Set **Backup Content** to one or multiple HDFS directories to be backed up based on service requirements.

You can select backup data using either of the following methods:

- Adding a backup data file  
Click the name of a database in the navigation tree to show all the tables in the database, and select specified tables.  
MRS 3.2.0 or later:
  - a. Click **Add**.
  - b. Select the table to be backed up under **File Directory**, and click **Add** to add the table to **Backup Content**.
  - c. Click **OK**.
- Selecting using regular expressions

- a. Click **Query Regular Expression**.
- b. Enter the parent directory full path of the directory in the first text box as prompted. The directory must be the same as the existing directory, for example, **/tmp**.
- c. Enter a regular expression in the second text box. Standard regular expressions are supported. For example, to get all files or subdirectories in the parent directory, enter **([\\s\\S]\*?)**. To get files whose names consist of letters and digits, for example, **file1**, enter **file\\d\***.
- d. Click **Refresh** to view the displayed directories in **Directory Name**.
- e. Click **Synchronize** to save the result.

**NOTE**

- When entering regular expressions, click **+** or **-** to add or delete an expression.
- If the selected table or directory is incorrect, click **Clear Selected Node** to deselect it.
- The backup directory cannot contain files that have been written for a long time. Otherwise, the backup task will fail. Therefore, you are not advised to perform operations on the top-level directory, such as **/user**, **/tmp**, and **/mr-history**.

**Step 10** Click **Verify** to check whether the backup task is configured correctly.

The possible causes of the verification failure are as follows:

- The target NameNode IP address is incorrect.
- The queue name is incorrect.
- The parent directory or subdirectory of the HDFS directory where data files to be backed up are stored has HDFS snapshots.
- The directory or table to be backed up does not exist.
- The name of the NameService is incorrect.

**Step 11** Click **OK**.

**Step 12** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Data source\_Task creation time*, and the subdirectory is used to save latest data source backup files. All the backup file sets are stored in the related snapshot directories.

----End

## 8.10.2.11 Backing Up Hive Service Data

### Scenario

To ensure Hive service data security routinely or before a major operation on Hive (such as upgrade or migration), you need to back up Hive service data. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up Hive service data. Both automatic and manual backup tasks are supported.

- Hive backup and restoration cannot identify the service and structure relationships of objects such as Hive tables, indexes, and views. When executing backup and restoration tasks, you need to manage unified restoration points based on service scenarios to ensure proper service running.
- Hive backup and restoration do not support Hive on RDB data tables. You need to back up and restore original data tables in external databases independently.
- If the backup data of the standby cluster is lost in an existing Hive backup task that contains Hive on HBase tables, the next incremental backup will fail, and you need to create a Hive backup task again. However, the next full backup task will be normal.
- After the backup function of FusionInsight Manager is used to back up the HDFS directories at the Hive table level, the Hive tables cannot be deleted and recreated.

## Prerequisites

- If data needs to be backed up to the remote HDFS, you have prepared a standby cluster for data backup. The authentication mode of the standby cluster is the same as that of the active cluster. For other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- Backup policies, including the backup task type, period, backup object, backup directory, and Yarn queue required by the backup task are planned based on service requirements.
- The HDFS in the standby cluster has sufficient space. You are advised to save backup files in a custom directory.
- On the HDFS client, you have executed the `hdfs lsSnapshottableDir` command as user `hdfs` to check the list of directories for which HDFS snapshots have been created in the current cluster and ensured that the HDFS parent directory or subdirectory where data files to be backed up are stored does not have HDFS snapshots. Otherwise, the backup task cannot be created.
- If you want to back up data to NAS, you have deployed the NAS server in advance.

## Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.

**Manual** indicates that the backup task is executed manually.

**Table 8-80** Periodic backup parameters

Parameter	Description
Started	Indicates the time when the task is started for the first time.
Period	Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> .
Backup Policy	<ul style="list-style-type: none"><li>• <b>Full backup at the first time and incremental backup subsequently</b></li><li>• <b>Full backup every time</b></li><li>• <b>Full backup once every n times</b></li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li><li>• If <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, incremental backup cannot be used. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.</li></ul>

**Step 6** In **Configuration**, choose **Hive > Hive**.

**Step 7** Set **Path Type** of **Hive** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster. If you select this option, set the following parameters:
  - **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Target NameNode IP Address**: indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.

- **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as `/hbase` or `/user/hbase/backup`.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
  - **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.

- **Password:** indicates the password set when the CIFS protocol is configured.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.  
If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the server where the backup data is stored.
  - **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
  - **Username:** indicates the username for connecting to the server using the SFTP protocol.
  - **Password:** indicates the password for connecting to the server using the SFTP protocol.
  - **Server Shared Path:** indicates the backup path on the SFTP server.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
  - **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.

**Step 8** Set **Maximum Number of Recovery Points** to the number of snapshots that can be retained in the cluster.

**Step 9** Set **Backup Content** to one or multiple Hive tables to be backed up.

You can select backup data using either of the following methods:

- Adding a backup data file  
Click the name of a database in the navigation tree to show all the tables in the database, and select specified tables.  
MRS 3.2.0 or later:
  - a. Click **Add**.
  - b. Select the table to be backed up under **File Directory**, and click **Add** to add the table to **Backup Content**.
  - c. Click **OK**.
- Selecting using regular expressions
  - a. Click **Query Regular Expression**.
  - b. Enter the database where the Hive tables are located in the first text box as prompted. The database must be the same as the existing database, for example, **default**.
  - c. Enter a regular expression in the second text box. Standard regular expressions are supported. For example, to get all tables in the database, enter **([\\s\\S]\*?)**. To get tables whose names consist of letters and digits, for example, **tb1**, enter **tb\\d\***.
  - d. Click **Refresh** to view the displayed tables in **Directory Name**.
  - e. Click **Synchronize** to save the result.

 **NOTE**

- When entering regular expressions, click **+** or **-** to add or delete an expression.
- If the selected table or directory is incorrect, click **Clear Selected Node** to deselect it.

**Step 10** Click **Verify** to check whether the backup task is configured correctly.

The possible causes of the verification failure are as follows:

- The target NameNode IP address is incorrect.
- The queue name is incorrect.
- The parent directory or subdirectory of the HDFS directory where data files to be backed up are stored has HDFS snapshots.
- The directory or table to be backed up does not exist.
- The name of the NameService is incorrect.

**Step 11** Click **OK**.

**Step 12** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Data source\_Task creation time*, and the subdirectory is used to save latest data source backup files. All the backup file sets are stored in the related snapshot directories.

----End

## 8.10.2.12 Backing Up IoTDB Metadata

### Scenario

To ensure IoTDB metadata security and prevent the IoTDB service from being unavailable due to IoTDB metadata file damages, you need to back up IoTDB metadata. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up IoTDB metadata. Both automatic and manual backup tasks are supported.

### Prerequisites

- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.
- If you want to back up data to NAS, you have deployed the NAS server in advance.
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- Backup policies, including the backup task type, period, backup object, backup directory, and Yarn queue required by the backup task are planned based on service requirements.
- The HDFS in the standby cluster has sufficient space. You are advised to save backup files in a custom directory.

### Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.  
**Manual** indicates that the backup task is executed manually.

**Table 8-81** Periodic backup parameters

Parameter	Description
Started	Indicates the time when the task is started for the first time.
Period	The task execution interval. Value options include <b>Hours</b> and <b>Days</b> .

Parameter	Description
Backup Policy	<p>Indicates a periodic backup policy.</p> <ul style="list-style-type: none"><li>● <b>Full backup at the first time and incremental backup subsequently</b></li><li>● <b>Full backup every time</b></li><li>● <b>Full backup once every n times</b></li></ul> <p><b>NOTE</b> Incremental backup is not supported when component metadata is backed up. Only <b>Full backup every time</b> is supported.</p>

**Step 6** In **Configuration**, select **IoTDB** under **Metadata and other data**.

**Step 7** Set **Path Type** of **IoTDB** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files. By default, the backup files are stored in *Data storage path/LocalBackup/*.  
If you select this option, you need to set the maximum number of replicas to specify the number of backup file sets that can be retained in the backup directory.
- **NFS**: indicates that backup files are stored in the NAS using the NFS protocol.  
If you select this option, set the following parameters:
  - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: indicates the IP address of the NAS server.
  - **Server Shared Path**: indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Maximum Number of Backup Copies**: indicates the number of backup file sets that can be retained in the backup directory.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.  
If you select this option, set the following parameters:
  - **Destination NameService Name**: indicates the NameService name of the standby cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
  - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Destination Active NameNode IP Address**: indicates the service plane IP address of the active NameNode in the standby cluster.
  - **Destination Standby NameNode IP Address**: indicates the service plane IP address of the standby NameNode in the standby cluster.

- **Destination NameNode RPC Port:** indicates the value of `dfs.namenode.rpc.port` in the HDFS basic configuration of the standby cluster.
- **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as `/hbase` or `/user/hbase/backup`.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol.  
If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.  
If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the server where the backup data is stored.
  - **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
  - **Username:** indicates the username for connecting to the server using the SFTP protocol.
  - **Password:** indicates the password for connecting to the server using the SFTP protocol.
  - **Server Shared Path:** indicates the backup path on the SFTP server.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.

**Step 8** Click **OK**.

**Step 9** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files.

The format of the backup file name is *Version\_Data source\_Task execution time.tar.gz*.

----End

## 8.10.2.13 Backing Up IoTDB Service Data

### Scenario

To ensure IoTDB service data security routinely or before a major operation on IoTDB (such as upgrade or migration), you need to back up IoTDB service data. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up IoTDB service data. Both automatic and manual backup tasks are supported.

### Prerequisites

- If data needs to be backed up to the remote HDFS, you have prepared a standby cluster for data backup. The authentication mode of the standby cluster is the same as that of the active cluster. For other backup modes, you do not need to prepare the standby cluster. Currently, IoTDB data can be backed up only to HDFS.
- For the IoTDB cluster in normal mode, service data cannot be backed up to HDFS in a cluster in security mode.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The HDFS in the standby cluster has sufficient space. You are advised to save backup files in a custom directory.

### Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.  
**Manual** indicates that the backup task is executed manually.

**Table 8-82** Periodic backup parameters

Parameter	Description
Started	Indicates the time when the task is started for the first time.
Period	The task execution interval. Value options include <b>Hours</b> and <b>Days</b> .
Backup Policy	Indicates a periodic backup policy. <ul style="list-style-type: none"><li>• <b>Full backup at the first time and incremental backup subsequently</b></li><li>• <b>Full backup every time</b></li><li>• <b>Full backup once every n times</b></li></ul>

**Step 6** In **Configuration**, choose **IoTDB > IoTDB** under **Service data**.

**Step 7** Set **Path Type** of **IoTDB** to a backup directory type.

The following backup directory types are supported:

**RemoteHDFS:** indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this option, set the following parameters:

- **Destination NameService Name:** indicates the NameService name of the standby cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Destination Active NameNode IP Address:** indicates the service plane IP address of the active NameNode in the standby cluster.
- **Destination Standby NameNode IP Address:** indicates the service plane IP address of the standby NameNode in the standby cluster.
- **Destination NameNode RPC Port:** indicates the value of **dfs.namenode.rpc.port** in the HDFS basic configuration of the standby cluster.
- **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.

**Step 8** Set **Backup Content** to one or multiple service data records to be backed up.

You can select backup data using either of the following methods:

- Adding a backup data file  
Click the name of a database in the navigation tree to show all the tables in the database, and select specified tables.  
MRS 3.2.0 or later:
  - a. Click **Add**.
  - b. Select the table to be backed up under **File Directory**, and click **Add** to add the table to **Backup Content**.
  - c. Click **OK**.
- Selecting using regular expressions
  - a. Click **Query Regular Expression**.
  - b. Enter the parent directory full path of the directory in the first text box as prompted. The directory must be the same as the existing directory, for example, **/root**.
  - c. Enter a regular expression in the second text box. Standard regular expressions are supported. For example, to get all files or subdirectories in the parent directory, enter **([\\s\\S]\*?)**. To get files whose names consist of letters and digits, for example, **file 1**, enter **file\\d\***.
  - d. Enter a regular expression in the second text box. Standard regular expressions are supported. For example, to get objects containing **test**, enter **.\*test.\***. To get objects starting with **test**, enter **test.\***. To get objects ending with **test**, enter **.\*test**.
  - e. Click **Refresh** to view the displayed directories in **Directory Name**.
  - f. Click **Synchronize** to save the result.

 **NOTE**

- When entering regular expressions, click **+** or **-** to add or delete an expression.
- If the selected table or directory is incorrect, click **Clear Selected Node** to deselect it.
- The backup directory cannot contain files that have been written for a long time. Otherwise, the backup task will fail. Therefore, you are not advised to perform operations on the top-level directory, such as **/user**, **/tmp**, and **/mr-history**.

**Step 9** Click **Verify** to check whether the backup task is configured correctly.

The possible causes of the verification failure are as follows:

- The target NameNode IP address is incorrect.
- The data to be backed up does not exist.

**Step 10** Click **OK**.**Step 11** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Data source\_Task creation time*, and the subdirectory is used

to save latest data source backup files. All the backup file sets are stored in the related snapshot directories.

----End

## 8.10.2.14 Backing Up Kafka Metadata

### Scenario

To ensure Kafka metadata security or before a major operation on ZooKeeper (such as upgrade or migration), you need to back up Kafka metadata. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up Kafka metadata. Both automatic and manual backup tasks are supported.

### Prerequisites

- If data needs to be backed up to the remote HDFS, you have prepared a standby cluster for data backup. The authentication mode of the standby cluster is the same as that of the active cluster. For other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.
- If you want to back up data to NAS, you have deployed the NAS server in advance.
- If you want to back up data to OBS, you have connected the current cluster to OBS and have the permission to access OBS.

### Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.
- Step 2** Click **Create**.
- Step 3** Set **Name** to the name of the backup task.
- Step 4** Select the cluster to be operated from **Backup Object**.
- Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.  
**Manual** indicates that the backup task is executed manually.

**Table 8-83** Periodic backup parameters

Parameter	Description
Started	Indicates the time when the task is started for the first time.
Period	Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> .
Backup Policy	<ul style="list-style-type: none"><li>• <b>Full backup at the first time and incremental backup subsequently</b></li><li>• <b>Full backup every time</b></li><li>• <b>Full backup once every n times</b></li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li><li>• If <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, incremental backup cannot be used. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.</li></ul>

**Step 6** In **Configuration**, select **Kafka**.

**Step 7** Set **Path Type** of **Kafka** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files. By default, the backup files are stored in *Data storage path/LocalBackup/*.

If you select this option, you need to set the maximum number of replicas to specify the number of backup file sets that can be retained in the backup directory.

- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.

If you select this option, set the following parameters:

- **Target Path**: indicates the HDFS directory for storing the backup files. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies**: indicates the number of backup file sets that can be retained in the backup directory.
- **Target NameService Name**: indicates the NameService name of the backup directory. The default value is **hacluster**.

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this option, set the following parameters:

- **Destination NameService Name:** indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Target NameNode IP Address:** indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
  - **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol.

If you select this option, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol.

If you select this option, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the NAS server.
- **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
- **Username:** indicates the username set when the CIFS protocol is configured.
- **Password:** indicates the password set when the CIFS protocol is configured.
- **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory,

and the user group and owner group of the shared path must be **nobody:nobody**.)

- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **OBS:** indicates that backup files are stored in OBS.  
If you select this option, set the following parameters:
  - **Target Path:** indicates the OBS directory for storing backup data.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.

 **NOTE**

Only MRS 3.1.0 or later supports data backup to OBS.

**Step 8** Click **OK**.

**Step 9** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *Version\_Data source\_Task execution time.tar.gz*.

----End

## 8.10.3 Recovering Data

### 8.10.3.1 Restoring Manager Data

#### Scenario

Manager data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After an administrator performs critical data adjustment in FusionInsight Manager, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable.

System administrators can create a restoration task in FusionInsight Manager to recover Manager data. Only manual restoration tasks are supported.

---

#### NOTICE

- Data restoration can be performed only when the system version is consistent with that of data backup.
  - To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the Manager data that is generated after the data backup and before the data restoration will be lost.
-

## Impact on the System

- In the restoration process, the Controller needs to be restarted and FusionInsight Manager cannot be logged in or operated during the restart.
- In the restoration process, all clusters need to be restarted and cannot be accessed during the restart.
- After data restoration, the data, such as system configuration, user information, alarm information, and audit information, that is generated after the data backup and before the data restoration will be lost. This may result in data query failure or cluster access failure.
- After the Manager data is recovered, the system forces the LdapServer of each cluster to synchronize data from the OLadp.

## Prerequisites

- To restore data from a remote HDFS, you need to prepare a standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, system mutual trust needs to be configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The status of the OMS resources and the LdapServer instances of each cluster is normal. If the status is abnormal, data restoration cannot be performed.
- The status of the cluster hosts and services is normal. If the status is abnormal, data restoration cannot be performed.
- The cluster host topologies during data restoration and data backup are the same. If the topologies are different, data restoration cannot be performed and you need to back up data again.
- The services added to the cluster during data restoration and data backup are the same. If the topologies are different, data restoration cannot be performed and you need to back up data again.
- The upper-layer applications that depend on the cluster are stopped.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, choose **More > View History** to view the historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.

Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restore > Restoring Management**. On the displayed page, click **Create**.

**Figure 8-60** Creating a restoration task

Restoration Management > Create Restoration Task

• Task Name:  The task name contains 3 to 128 characters, including digits, letters, and underscores (\_), and cannot be empty.

• Recovery Object:

• Restoration Configuration: Metadata and other data

- DBService
- NameNode (The NameNode instances must be stopped before the restoration.)
- Yarn
- HBase
- Kafka

Service data

- HDFS
- HBase
- Hive

**Step 4** Set **Task Name** to the name of the restoration task.

**Step 5** Set **Recovery Object** to **OMS**.

**Step 6** Select **OMS**.

**Step 7** Set **Path Type** of **OMS** to a backup directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node.  
If you select **LocalDir**, you also need to set **Source Path** to select the backup file to be restored, for example, *Version\_Data source\_Task execution time.tar.gz*.
- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.  
If you select **LocalHDFS**, set the following parameters:
  - **Source Path**: indicates the full path of the backup file in the HDFS, for example, *Backup path/Backup task name\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **Cluster for Restoration**: Enter the name of the cluster used during restoration task execution.
  - **Source NameService Name**: indicates the NameService name that corresponds to the backup directory when a restoration task is executed. The default value is **hacluster**.

- **RemoteHDFS:** indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select **RemoteHDFS**, set the following parameters:

- **Source NameService Name:** indicates the NameService name of the backup data cluster. You can enter the built-in NameService name of the remote cluster, for example, **haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**. You can also enter a configured NameService name of the remote cluster.
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address:** indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Source Path:** indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **Source Cluster:** Select the cluster of the Yarn queue used by the recovery data.
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol. If you select **NFS**, set the following parameters:
    - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
    - **Server IP Address:** indicates the IP address of the NAS server.
    - **Source Path:** indicates the complete path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol. If you select **CIFS**, set the following parameters:
    - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
    - **Server IP Address:** indicates the IP address of the NAS server.
    - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
    - **Username:** indicates the username set when the CIFS protocol is configured.
    - **Password:** indicates the password set when the CIFS protocol is configured.
    - **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.

- **SFTP**: indicates that backup files are stored in the server using the SFTP protocol.

If you select **SFTP**, set the following parameters:

- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: indicates the IP address of the server where the backup data is stored.
  - **Port**: indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
  - **Username**: indicates the username for connecting to the server using the SFTP protocol.
  - **Password**: indicates the password for connecting to the server using the SFTP protocol.
  - **Source Path**: indicates the full path of the backup file on the backup server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **OBS**: indicates that backup files are stored in OBS.

If you select **OBS**, set the following parameters:

- **Source Path**: indicates the full OBS path of a backup file, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.

#### NOTE

Only MRS 3.1.0 or later supports saving backup files in OBS.

**Step 8** Click **OK**.

**Step 9** In the restoration task list, locate a created task and click **Start** in the **Operation** column to execute the restoration task.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

**Step 10** Log in to the active and standby management nodes as user **omm**.

**Step 11** Run the following command to restart OMS:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/restart-oms.sh
```

The command is run successfully if the following information is displayed:

```
start HA successfully.
```

Run `sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh` to check whether **HAAllResOK** of the management node is **Normal** and whether FusionInsight Manager can be logged in again. If yes, OMS is restarted successfully.

**Step 12** On FusionInsight Manager, click **Cluster**, click the name of the target cluster, and choose **Services** > **KrbServer**. On the displayed page, choose **More** > **Synchronize**

**Configuration**, click **OK**, and wait for the KrbServer configuration to be synchronized and the service to be restarted.

**Step 13** Choose **Cluster**, click the name of the desired cluster, and choose **More > Synchronize Configurations**, click **OK**, and wait until the cluster configuration is synchronized successfully.

**Step 14** On FusionInsight Manager, click **Cluster**, click the name of the target cluster, and choose **More > Restart**. On the displayed page, enter the password of the current login user, click **OK**, and wait for the cluster to be restarted.

----End

### 8.10.3.2 Restoring CDL Data

#### Scenario

CDL data needs to be restored in the following scenarios: Data is modified or deleted unexpectedly and needs to be restored. After an administrator performs major operations (such as upgrade and data adjustment) on CDL, an exception occurs or the expected result is not achieved. All modules are faulty and become unavailable. Data is migrated to a new cluster.

CDL metadata is stored in DBService and Kafka. A system administrator can create DBService and Kafka restoration tasks on FusionInsight Manager to restore CDL data. Only manual restoration tasks are supported.

---

#### NOTICE

- Data restoration can be performed only when the system version is consistent with that during data backup.
  - To restore the data when services are normal, manually back up the latest management data first and then restore the data. Otherwise, the DBService and Kafka data that is generated after the data backup and before the data restoration will be lost.
  - By default, MRS clusters use DBService to store metadata of Hive, Hue, Loader, Spark, CDL, and Oozie. Restoring DBService data will restore the metadata of all these components.
- 

#### Impact on the System

- After the data is restored, the data generated after the data backup and before the data restoration is lost.
- After the data is restored, the configurations of the components that depend on DBService may expire and these components need to be restarted.
- After the metadata is restored, the offset information stored on ZooKeeper by Kafka consumers is rolled back, resulting in repeated consumption.

#### Prerequisites

- If you need to restore data from a remote HDFS, prepare a standby cluster. If the active cluster is deployed in security mode and the active and standby

clusters are not managed by the same FusionInsight Manager, mutual trust must be configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.

- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The status of the active and standby DBService instances is normal. If the status is abnormal, data restoration cannot be performed.
- The Kafka service is disabled first, and then enabled upon data restoration.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the row where the specified backup task is located, choose **More > View History** in the **Operation** column to display the historical execution records of the backup task.

In the window that is displayed, select a success record and click **View** in the **Backup Path** column to view its backup path information and find the following information:

- **Backup Object:** indicates the backup data source.
- **Backup Path:** indicates the full path where backup files are stored.  
Select the correct path, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In the **Restoration Configuration** area, select **DBService** and **Kafka**.

**Step 8** Set **Path Type** of **DBService** to a backup directory type. For details about how to configure the parameters, see [Step 8](#).

**Step 9** Set **Path Type** of **Kafka** to a backup directory type. For details about how to configure the parameters, see [Step 8](#).

**Step 10** Click **OK**.

**Step 11** In the restoration task list, locate the row where the created task is located, and click **Start** in the **Operation** column.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.

- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

### 8.10.3.3 Restoring ClickHouse Metadata

#### Scenario

ClickHouse metadata needs to be restored in the following scenarios: Data is modified or deleted unexpectedly and needs to be restored. After a user performs major operations (such as upgrade and migration) on ClickHouse, an exception occurs or the expected result is not achieved. The ClickHouse component is faulty and becomes unavailable. Data is migrated to a new cluster.

Users can create a ClickHouse restoration task on FusionInsight Manager. Only manual restoration tasks are supported.

---

#### NOTICE

- This function is supported only by MRS 3.1.0 or later.
  - Data restoration can be performed only when the system version is consistent with that during data backup.
  - To restore ClickHouse metadata when the service is running properly, you are advised to manually back up the latest ClickHouse metadata before restoration. Otherwise, the ClickHouse metadata that is generated after the data backup and before the data restoration will be lost.
  - ClickHouse metadata restoration and service data restoration cannot be performed at the same time. Otherwise, service data restoration fails. You are advised to restore service data after metadata restoration is complete.
- 

#### Impact on the System

- After the metadata is restored, the data generated after the data backup and before the data restoration is lost.
- After the metadata is restored, the ClickHouse upper-layer applications need to be started.

#### Prerequisites

- You have checked the path for storing ClickHouse metadata backup files.
- If you need to restore data from a remote HDFS, prepare a standby cluster. If the active and standby clusters are deployed in security mode and they are not managed by the same FusionInsight Manager, mutual trust must be configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active and standby clusters are deployed in normal mode, no mutual trust is required.
- In the active/standby cluster, when restoring data from the remote HDFS to the local host, ensure that the value of **HADOOP\_RPC\_PROTECTION** of ClickHouse is the same as that of **hadoop.rpc.protection** of HDFS.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of the specified task in the task list, choose **More > View History**.

In the window that is displayed, select a success record and click **View** in the **Backup Path** column to view its backup path information and find the following information:

- **Backup Object:** indicates the backup data source.
- **Backup Path:** indicates the full path where backup files are stored.

Select the correct path, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In **Restoration Configuration**, select **ClickHouse** under **Metadata and other data**.

**Step 8** Set **Path Type** of **ClickHouse** to a restoration directory type.

The configurations vary based on backup directory types:

- **LocalDir:** indicates that data is restored from the local disk of the active management node.

If you select this value, you also need to configure the following parameters:

- **Source Path:** backup file to be restored, for example, *Backup task name\_Data source\_Task execution time.tar.gz*.

- **RemoteHDFS:** indicates that data is restored from the HDFS directory of the standby cluster.

If you select this value option for MRS 3.2.0 or later clusters, you also need to configure the following parameters:

- **Source NameService Name:** indicates the NameService name of the backup data cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Source Active NameNode IP Address:** indicates the service plane IP address of the active NameNode in the standby cluster.
- **Source Standby NameNode IP Address:** indicates the service plane IP address of the standby NameNode in the standby cluster.

- **Source NameNode RPC Port:** indicates the value of `dfs.namenode.rpc.port` in the HDFS basic configuration of the destination cluster.
- **Source Path:** indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time/Data source\_Task execution time.tar.gz*.
- **Logical Cluster** of MRS 3.2.0 or later: Enter the ClickHouse logical cluster whose data has been backed up.

If you select this value option for MRS 3.1.0 or 3.1.2 clusters, you also need to configure the following parameters:

- **Source NameService Name:** indicates the NameService name of the backup data cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Source NameNode IP Address:** indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
- **Source Path:** indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time/Data source\_Task execution time.tar.gz*.

**Step 9** Click **OK**.

**Step 10** In the restoration task list, locate the row where the created task is located, and click **Start** in the **Operation** column. In the displayed dialog box, click **OK** to start the restoration task.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

**Step 11** Choose **Cluster > Services** and start the ClickHouse service.

----End

### 8.10.3.4 Restoring ClickHouse Service Data

#### Scenario

ClickHouse data needs to be restored in the following scenarios: Data is modified or deleted unexpectedly and needs to be restored. After a user performs major operations (such as upgrade and migration) on ClickHouse, an exception occurs or the expected result is not achieved. All modules are faulty and become unavailable. Data is migrated to a new cluster.

Users can create a ClickHouse restoration task on FusionInsight Manager to restore data. Only manual restoration tasks are supported.

The ClickHouse backup and restoration functions cannot identify the service and structure relationships of objects such as ClickHouse tables, indexes, and views. When executing backup and restoration tasks, you need to manage unified restoration points based on service scenarios to ensure proper service running.

---

**NOTICE**

- This function is supported only by MRS 3.1.0 or later.
  - Data restoration can be performed only when the system version is consistent with that during data backup.
  - To restore the data when services are normal, manually back up the latest management data first and then restore the data. Otherwise, the ClickHouse data that is generated after the data backup and before the data restoration will be lost.
  - ClickHouse metadata restoration and service data restoration cannot be performed at the same time. Otherwise, service data restoration fails. You are advised to restore service data after metadata restoration is complete.
- 

## Impact on the System

- During data restoration, user authentication stops and users cannot create new connections.
- After the data is restored, the data generated after the data backup and before the data restoration is lost.
- After the data is restored, the ClickHouse upper-layer applications need to be started.

## Prerequisites

- If you need to restore data from a remote HDFS, prepare a standby cluster. If the active and standby clusters are deployed in security mode and they are not managed by the same FusionInsight Manager, mutual trust must be configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active and standby clusters are deployed in normal mode, no mutual trust is required.
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The database for storing restored data tables, the HDFS save path of data tables, and the list of users who can access restored data are planned.
- The ClickHouse backup file save path is correct.
- The ClickHouse upper-layer applications are stopped.
- In the active/standby cluster, when restoring data from the remote HDFS to the local host, ensure that the value of `HADOOP_RPC_PROTECTION` of ClickHouse is the same as that of `hadoop.rpc.protection` of HDFS.

## Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the row where the specified backup task is located, choose **More > View History** in the **Operation** column to display the historical execution records of the backup task.

In the window that is displayed, select a success record and click **View** in the **Backup Path** column to view its backup path information and find the following information:

- **Backup Object:** indicates the backup data source.
- **Backup Path:** indicates the full path where backup files are stored.  
Select the correct path, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In **Restoration Configuration**, select **ClickHouse** under **Service data**.

**Step 8** Set **Path Type** of **ClickHouse** to a backup directory type.

Currently, the backup directory supports only the **RemoteHDFS** type.

- **RemoteHDFS:** indicates that the backup files are stored in the HDFS directory of the standby cluster. If you select this value option, you also need to configure the following parameters:
  - **Source NameService Name:** indicates the NameService name of the backup data cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address:** indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
  - **Source Path:** indicates the full path of HDFS directory for storing backup data of the standby cluster. For details, see the **Backup Path** obtained in step [Step 2](#), for example, *Backup path/Backup task name\_Data source\_Task creation time*.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.

**Step 9** Click **OK**.

**Step 10** In the restoration task list, locate the row where the created task is located, and click **Start** in the **Operation** column.

- After the restoration is successful, the progress bar is in green.

- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

### 8.10.3.5 Restoring DBService data

#### Scenario

DBService data needs to be restored in the following scenarios: Data is modified or deleted unexpectedly and needs to be restored. After an administrator performs critical data adjustment in DBService, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

System administrators can create a recovery task in FusionInsight Manager to recover DBService data. Only manual restoration tasks are supported.

---

#### NOTICE

- Data restoration can be performed only when the system version is consistent with that during data backup.
  - To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the DBService data that is generated after the data backup and before the data recovery will be lost.
  - By default, MRS clusters use DBService to store metadata of Hive, Hue, Loader, Spark, CDL, and Oozie. Restoring DBService data will restore the metadata of all these components.
- 

#### Impact on the System

- After the data is restored, the data generated after the data backup and before the data restoration is lost.
- After the data is restored, the configurations of the components that depend on DBService may expire and these components need to be restarted.

#### Prerequisites

- To restore data from a remote HDFS, you need to prepare a standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.

- The status of the active and standby DBService instances is normal. If the status is abnormal, data restoration cannot be performed.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, choose **More > View History** to view the historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In the **Restoration Configuration** area, select **DBService**.

### NOTE

If multiple DBServices are installed, select the DBServices to be restored.

**Step 8** Set **Path Type** of **DBService** to a backup directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node.  
If you select **LocalDir**, you also need to set **Source Path** to select the backup file to be restored, for example, *Version\_Data source\_Task execution time.tar.gz*.
- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.  
If you select **LocalHDFS**, set the following parameters:
  - **Source Path**: indicates the full path of the backup file in the HDFS, for example, *Backup path/Backup task name\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **Source NameService Name**: indicates the NameService name that corresponds to the backup directory when a restoration task is executed. The default value is **hacluster**.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select **RemoteHDFS**, set the following parameters:

- **Source NameService Name:** indicates the NameService name of the backup data cluster. You can enter the built-in NameService name of the remote cluster, for example, **haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**. You can also enter a configured NameService name of the remote cluster.
- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Source NameNode IP Address:** indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Source Path:** indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol.

If you select **NFS**, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the NAS server.
- **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol.

If you select **CIFS**, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the NAS server.
- **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
- **Username:** indicates the username set when the CIFS protocol is configured.
- **Password:** indicates the password set when the CIFS protocol is configured.
- **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.

If you select **SFTP**, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the server where the backup data is stored.
- **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username:** indicates the username for connecting to the server using the SFTP protocol.
- **Password:** indicates the password for connecting to the server using the SFTP protocol.
- **Source Path:** indicates the full path of the backup file on the backup server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **OBS:** indicates that backup files are stored in OBS.  
If you select **OBS**, set the following parameters:
  - **Source Path:** indicates the full OBS path of a backup file, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.

 **NOTE**

Only MRS 3.1.0 or later supports saving backup files in OBS.

**Step 9** Click **OK**.

**Step 10** In the restoration task list, locate a created task and click **Start** in the **Operation** column to execute the restoration task.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

### 8.10.3.6 Restoring Flink Metadata

#### Scenario

Flink metadata needs to be restored in the following scenarios: Data is modified or deleted unexpectedly and needs to be restored. After an administrator performs major operations (such as upgrade and data adjustment) on Flink, an exception occurs or the expected result is not achieved. The Flink component is faulty and becomes unavailable. Data is migrated to a new cluster.

System administrators can create a Flink restoration task on FusionInsight Manager. Only manual restoration tasks are supported.

**NOTICE**

- Data restoration can be performed only when the system version is consistent with that during data backup.
- To restore Flink metadata when the service is running properly, you are advised to manually back up the latest Flink metadata before restoration. Otherwise, the Flink metadata that is generated after the data backup and before the data restoration will be lost.
- Flink metadata restoration and service data restoration cannot be performed at the same time. Otherwise, service data restoration fails. You are advised to restore service data after metadata restoration is complete.

**Impact on the System**

- Before restoring the metadata, you need to stop the Flink service. During this period, all upper-layer applications are affected and cannot work properly.
- After the metadata is restored, the data generated after the data backup and before the data restoration is lost.
- After the metadata is restored, the Flink upper-layer applications of Solr need to be started.

**Prerequisites**

- You have checked the path for storing Flink metadata backup files.
- The Flink service has been stopped before its metadata is restored.
- If you need to restore data from a remote HDFS, prepare a standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).

**Procedure**

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of the specified task in the task list, choose **More > View History**.

In the displayed window, select a success record and click **View** in the **Backup Path** column to view its backup path information and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.

Select the correct path, and manually copy the full path of backup files in **Backup Path**.

- Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.
- Step 4** Click **Create**.
- Step 5** Set **Task Name** to the name of the restoration task.
- Step 6** Select the cluster to be operated from **Recovery Object**.
- Step 7** In **Restoration Configuration**, select **Flink** under **Metadata and other data**.
- Step 8** Set **Path Type** of **Flink** to a restoration directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that data is restored from the local disk of the active management node.  
If you select **LocalDir**, you also need to set **Source Path** to select the backup file to be restored, for example, *Backup task name\_Data source\_Task execution time.tar.gz*.
- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.  
If you select **LocalHDFS**, set the following parameters:
  - **Source Path**: indicates the full path of the backup file in the HDFS, for example, *Backup path/Backup task name\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **Source NameService Name**: indicates the NameService name that corresponds to the backup directory when a restoration task is executed.
- **RemoteHDFS**: indicates that data is restored from the HDFS directory of the standby cluster.  
If you select **RemoteHDFS**, set the following parameters:
  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can enter the built-in NameService name of the remote cluster, for example, **haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**. You can also enter a configured NameService name of the remote cluster.
  - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Source Path**: indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time/Data source\_Task execution time.tar.gz*.
  - **Queue Name**: indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the source cluster.

- Step 9** Click **OK**.

- Step 10** In the restoration task list, locate the row where the created task is located, and click **Start** in the **Operation** column. In the displayed dialog box, click **OK** to start the restoration task.
- After the restoration is successful, the progress bar is in green.
  - After the restoration is successful, the restoration task cannot be executed again.
  - If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.
- Step 11** Choose **Cluster > Services** and start the Flink service.
- End

### 8.10.3.7 Restoring HBase Metadata

#### Scenario

To ensure HBase metadata security (including tableinfo files and HFiles) or before a major operation on HBase system tables (such as upgrade or migration), you need to back up HBase metadata to prevent HBase service unavailability caused by HBase system table directory or file damages. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

System administrators can create a recovery task in FusionInsight Manager to recover HBase metadata. Only manual restoration tasks are supported.

---

#### NOTICE

- Data restoration can be performed only when the system version is consistent with that during data backup.
  - To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the HBase data that is generated after the data backup and before the data recovery will be lost.
  - It is recommended that a data restoration task restore the metadata of only one component to prevent the data restoration of other components from being affected by stopping a service or instance. If data of multiple components is restored at the same time, data restoration may fail.
- HBase metadata cannot be restored at the same time as NameNode metadata. As a result, data restoration fails.
- 

#### Impact on the System

- Before restoring the metadata, you need to stop the HBase service, during which the HBase upper-layer applications are unavailable.
- After the metadata is restored, the data generated after the data backup and before the data restoration is lost.
- After the metadata is restored, the upper-layer applications of HBase need to be started.

## Prerequisites

- If you need to restore data from a remote HDFS, prepare a standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- You have checked the path for storing HBase metadata backup files.
- The HBase service has been stopped before its metadata is restored.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, choose **More > View History** to view the historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In **Restoration Configuration**, select **HBase** under **Metadata and other data**.

### NOTE

If multiple HBase services are installed, select the HBase services to be restored.

**Step 8** Set **Path Type** of **HBase** to a backup directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node.  
If you select **LocalDir**, you also need to set **Source Path** to select the backup file to be restored, for example, *Version\_Data source\_Task execution time.tar.gz*.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select **RemoteHDFS**, set the following parameters:

- **Source NameService Name:** indicates the NameService name of the backup data cluster. You can enter the built-in NameService name of the remote cluster, for example, **haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**. You can also enter a configured NameService name of the remote cluster.
- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Source NameNode IP Address:** indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Source Path:** indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol.

If you select **NFS**, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the NAS server.
- **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **CIFS:** indicates that backup files are stored in NAS using the CIFS protocol.

If you select **CIFS**, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the NAS server.
- **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
- **Username:** indicates the username set when the CIFS protocol is configured.
- **Password:** indicates the password set when the CIFS protocol is configured.
- **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.

If you select **SFTP**, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the server where the backup data is stored.
- **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username:** indicates the username for connecting to the server using the SFTP protocol.
- **Password:** indicates the password for connecting to the server using the SFTP protocol.
- **Source Path:** indicates the full path of the backup file on the backup server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **OBS:** indicates that backup files are stored in OBS.  
If you select **OBS**, set the following parameters:
  - **Source Path:** indicates the full OBS path of a backup file, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.

 **NOTE**

Only MRS 3.1.0 or later supports saving backup files in OBS.

**Step 9** Click **OK**.

**Step 10** In the restoration task list, locate a created task and click **Start** in the **Operation** column to execute the restoration task.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

### 8.10.3.8 Restoring HBase Service Data

#### Scenario

HBase data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After an administrator performs critical data adjustment in HBase, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

System administrators can create a recovery task in FusionInsight Manager to recover HBase data. Only manual restoration tasks are supported.

**NOTICE**

- Data restoration can be performed only when the system version is consistent with that during data backup.
- To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the HBase data that is generated after the data backup and before the data recovery will be lost.

**Impact on the System**

- During the data recovery process, the system disables the HBase table to be recovered and the table cannot be accessed in this moment. The data recovery process takes several minutes, during which the HBase upper-layer applications are unavailable.
- During data restoration, user authentication stops and users cannot create new connections.
- After the data is restored, the data generated after the data backup and before the data restoration is lost.
- After the data is recovered, the HBase upper-layer applications need to be started.

**Prerequisites**

- If you need to restore data from a remote HDFS, prepare a standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The directory for saving the backup file has been checked.
- The HBase upper-layer applications have been stopped.

**Procedure**

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, choose **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.

- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In **Restoration Configuration**, select **HBase** under **Service Data**.

**Step 8** Set **Path Type** of **HBase** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster. If you select **RemoteHDFS**, set the following parameters:
  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can enter the built-in NameService name of the remote cluster, for example, **haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**. You can also enter a configured NameService name of the remote cluster.
  - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Source Path**: indicates the full path of the backup file in the HDFS, for example, *Backup path/xxx/Backup task name\_Data source\_Task creation time*. To obtain the backup path, locate the row that contains the target backup task in the backup management list, click **More > View History** in the **Operation** column, and click **View** in the **Backup Path** column.
  - **Queue Name**: indicates the name of the Yarn queue used for backup task execution.
  - **Recovery Point List**: Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value is **20**.
  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value is **100**.
- **NFS**: indicates that backup files are stored in the NAS using the NFS protocol. If you select **NFS**, set the following parameters:
  - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: indicates the IP address of the NAS server.

- **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/xxx/Backup task name\_Data source\_Task creation time*. To obtain the backup path, locate the row that contains the target backup task in the backup management list, click **More > View History** in the **Operation** column, and click **View** in the **Backup Path** column.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution.
- **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol. If you select **CIFS**, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.
  - **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/xxx/Backup task name\_Data source\_Task creation time*. To obtain the backup path, locate the row that contains the target backup task in the backup management list, click **More > View History** in the **Operation** column, and click **View** in the **Backup Path** column.
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution.
  - **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol. If you select **SFTP**, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the server where the backup data is stored.

- **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username:** indicates the username for connecting to the server using the SFTP protocol.
- **Password:** indicates the password for connecting to the server using the SFTP protocol.
- **Source Path:** indicates the full path of the backup file on the backup server, for example, *Backup path/xxx/Backup task name\_Data source\_Task creation time*. To obtain the backup path, locate the row that contains the target backup task in the backup management list, click **More > View History** in the **Operation** column, and click **View** in the **Backup Path** column.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution.
- **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.

**Step 9** Set **Backup Data** column in **Data Configuration** to one or multiple backup data sources to be recovered. In the **Target Namespace** column, specify the target naming space after backup data recovery.

You are advised to set **Target Namespace** to a location that is different from the backup naming space.

**Step 10** Set **Force recovery** to **true**, which indicates to forcibly recover all backup data when a data table with the same name already exists. If the data table contains new data added after backup, the new data will be lost after the data recovery. If you set the parameter to **false**, the restoration task is not executed if a data table with the same name exists.

**Step 11** Click **Verify** to check whether the restoration task is configured correctly.

- If the queue name is incorrect, the verification fails.
- If the specified naming space does not exist, the verification fails.
- If the forcible overwrite conditions are not met, the verification fails.

**Step 12** Click **OK** to save the settings.

**Step 13** In the restoration task list, locate a created task and click **Start** in the **Operation** column to execute the restoration task.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

**Step 14** Check whether HBase data is restored in an environment where HBase is newly installed or reinstalled.

- If yes, the administrator needs to set new permission for roles on FusionInsight Manager based on the original service plan.
- If no, no further operation is required.

----End

### 8.10.3.9 Restoring NameNode Data

#### Scenario

NameNode data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After an administrator performs critical data adjustment in NameNode, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

System administrators can create a recovery task in FusionInsight Manager to recover NameNode data. Only manual restoration tasks are supported.

---

#### NOTICE

- Data restoration can be performed only when the system version is consistent with that during data backup.
- To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the NameNode data that is generated after the data backup and before the data recovery will be lost.
- It is recommended that a data restoration task restore the metadata of only one component to prevent the data restoration of other components from being affected by stopping a service or instance. If data of multiple components is restored at the same time, data restoration may fail.

HBase metadata cannot be restored at the same time as NameNode metadata. As a result, data restoration fails.

---

#### Impact on the System

- After the data is restored, the data generated after the data backup and before the data restoration is lost.
- After the data is recovered, the NameNode needs to be restarted and is unavailable during the restart.
- After data is restored, metadata and service data may not be matched, the HDFS enters the security mode, and the HDFS service fails to be started. .

#### Prerequisites

- If you need to restore data from a remote HDFS, prepare a standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.

- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- On FusionInsight Manager, all the NameNode role instances whose data is to be recovered are stopped. Other HDFS role instances must keep running. After data is recovered, the NameNode role instances need to be restarted. The NameNode role instances cannot be accessed during the restart.
- The NameNode backup files are stored *Data path/LocalBackup/* on the active management node.

## Procedure

**Step 1** On FusionInsight Manager, click **Cluster**, click the name of the desired cluster, and choose **Services > HDFS**. On the displayed page, click **Instance** and click **NameNode** to check whether the NameNode instances of the data to be restored are stopped. If the NameNode instances are not stopped, stop them.

**Step 2** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 3** In the **Operation** column of a specified task in the task list, choose **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 4** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 5** Click **Create**.

**Step 6** Set **Task Name** to the name of the restoration task.

**Step 7** Select the cluster to be operated from **Recovery Object**.

**Step 8** In the **Restoration Configuration** area, select **NameNode**.

**Step 9** Set **Path Type** of **NameNode** to a backup directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node.

If you select **LocalDir**, set the following parameters:

- **Source Path**: indicates the full path of the backup file on the local disk, for example, *Backup path/Backup task name\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **Target NameService Name**: indicates the NameService name of the backup directory. The default value is **hacluster**.

- **RemoteHDFS:** indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select **RemoteHDFS**, set the following parameters:

- **Source NameService Name:** indicates the NameService name of the backup data cluster. You can enter the built-in NameService name of the remote cluster, for example, **haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**. You can also enter a configured NameService name of the remote cluster.
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address:** indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Source Path:** indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol. If you select **NFS**, set the following parameters:
    - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
    - **Server IP Address:** indicates the IP address of the NAS server.
    - **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
    - **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
  - **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol. If you select **CIFS**, set the following parameters:
    - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
    - **Server IP Address:** indicates the IP address of the NAS server.
    - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
    - **Username:** indicates the username set when the CIFS protocol is configured.
    - **Password:** indicates the password set when the CIFS protocol is configured.

- **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.

If you select **SFTP**, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the server where the backup data is stored.
  - **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
  - **Username:** indicates the username for connecting to the server using the SFTP protocol.
  - **Password:** indicates the password for connecting to the server using the SFTP protocol.
  - **Source Path:** indicates the full path of the backup file on the backup server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
  - **OBS:** indicates that backup files are stored in OBS.
- If you select **OBS**, set the following parameters:
- **Source Path:** indicates the full OBS path of a backup file, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.

 **NOTE**

Only MRS 3.1.0 or later supports saving backup files in OBS.

**Step 10** Click **OK**.

**Step 11** In the restoration task list, locate a created task and click **Start** in the **Operation** column to execute the restoration task.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

**Step 12** On FusionInsight Manager, click **Cluster**, click the name of the desired cluster, and choose **Services** > **HDFS**. On the displayed page, click **Configurations** and click **All Configurations**.

On the displayed page, enter the password of the administrator who has logged in for authentication and click **OK**. After the system displays "Operation succeeded", click **Finish**. The service is started successfully.

----End

### 8.10.3.10 Restoring HDFS Service Data

#### Scenario

HDFS data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After an administrator performs critical data adjustment in the HDFS, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

System administrators can create a recovery task in FusionInsight Manager to recover HDFS data. Only manual restoration tasks are supported.

---

#### NOTICE

- Data restoration can be performed only when the system version is consistent with that during data backup.
  - To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the HDFS data that is generated after the data backup and before the data recovery will be lost.
  - The HDFS restoration operation cannot be performed for the directories used by running Yarn tasks, for example, `/tmp/logs`, `/tmp/archived`, and `/tmp/hadoop-yarn/staging`. Otherwise, data restoration using Distcp tasks fails due to file loss.
- 

#### Impact on the System

- During data restoration, user authentication stops and users cannot create new connections.
- After the data is restored, the data generated after the data backup and before the data restoration is lost.
- After the data is recovered, the HDFS upper-layer applications need to be started.

#### Prerequisites

- If you need to restore data from a remote HDFS, prepare a standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).

- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The HDFS backup file save path is correct.
- The HDFS upper-layer applications are stopped.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, choose **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.

Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In **Restoration Configuration**, select **HDFS** under **Service Data**.

**Step 8** Set **Path Type** of **HDFS** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select **RemoteHDFS**, set the following parameters:

- **Source NameService Name**: indicates the NameService name of the backup data cluster. You can enter the built-in NameService name of the remote cluster, for example, **haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**. You can also enter a configured NameService name of the remote cluster.
- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Source Path**: indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time*.

- **Queue Name:** indicates the name of the Yarn queue used for backup task execution.
- **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
- **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **NFS:** indicates that backup files are stored in NAS using the NFS protocol. If you select **NFS**, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time*.
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution.
  - **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **CIFS:** indicates that backup files are stored in NAS using the CIFS protocol. If you select **CIFS**, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.
  - **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time*.
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution.

- **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
- **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.

If you select **SFTP**, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the server where the backup data is stored.
- **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username:** indicates the username for connecting to the server using the SFTP protocol.
- **Password:** indicates the password for connecting to the server using the SFTP protocol.
- **Source Path:** indicates the full path of the backup file on the backup server, for example, *Backup path/Backup task name\_Data source\_Task creation time*.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution.
- **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
- **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.

**Step 9** In the **Backup Data** column of the **Data Configuration** page, select one or more pieces of backup data that needs to be restored based on service requirements. In the **Target Path** column, specify the target location after backup data restoration.

You are advised to set **Target Path** to a new path that is different from the backup path.

**Step 10** Click **Verify** to check whether the restoration task is configured correctly.

- If the queue name is incorrect, the verification fails.
- If the specified directory to be restored does not exist, the verification fails.

**Step 11** Click **OK**.

**Step 12** In the restoration task list, locate a created task and click **Start** in the **Operation** column to execute the restoration task.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

### 8.10.3.11 Restoring Hive Service Data

#### Scenario

Hive data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After an administrator performs critical data adjustment in the Hive, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

System administrators can create a recovery task in FusionInsight Manager to recover Hive data. Only manual restoration tasks are supported.

Hive backup and restoration cannot identify the service and structure relationships of objects such as Hive tables, indexes, and views. When executing backup and restoration tasks, you need to manage unified restoration points based on service scenarios to ensure proper service running.

---

#### NOTICE

- Data restoration can be performed only when the system version is consistent with that during data backup.
  - To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the Hive data that is generated after the data backup and before the data recovery will be lost.
- 

#### Impact on the System

- During data restoration, user authentication stops and users cannot create new connections.
- After the data is restored, the data generated after the data backup and before the data restoration is lost.
- After the data is recovered, the Hive upper-layer applications need to be started.

#### Prerequisites

- If you need to restore data from a remote HDFS, prepare a standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust

has been configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.

- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The database for storing restored data tables, the HDFS save path of data tables, and the list of users who can access restored data are planned.
- The Hive backup file save path is correct.
- The Hive upper-layer applications are stopped.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, choose **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In the **Restoration Configuration** area, select **Hive**.

**Step 8** Set **Path Type** of **Hive** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster. If you select **RemoteHDFS**, set the following parameters:
  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can enter the built-in NameService name of the remote cluster, for example, **haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**. You can also enter a configured NameService name of the remote cluster.
  - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.

- **Source NameNode IP Address:** indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Source Path:** indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time*.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution.
- **Recovery Point List:** Click **Refresh** and select a Hive backup file set that has been backed up in the standby cluster.
- **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **NFS:** indicates that backup files are stored in NAS using the NFS protocol. If you select **NFS**, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time*.
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution.
  - **Recovery Point List:** Click **Refresh** and select a Hive backup file set that has been backed up in the standby cluster.
  - **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **CIFS:** indicates that backup files are stored in NAS using the CIFS protocol. If you select **CIFS**, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.

- **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time*.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution.
- **Recovery Point List:** Click **Refresh** and select a Hive backup file set that has been backed up in the standby cluster.
- **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.

If you select **SFTP**, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the server where the backup data is stored.
- **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username:** indicates the username for connecting to the server using the SFTP protocol.
- **Password:** indicates the password for connecting to the server using the SFTP protocol.
- **Source Path:** indicates the full path of the backup file on the backup server, for example, *Backup path/Backup task name\_Data source\_Task creation time*.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution.
- **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
- **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **1**.

**Step 9** Set **Backup Data** in the **Data Configuration** to one or multiple backup data sources to be recovered based on service requirements. In the **Target Database** and **Target Path** columns, specify the target database and file save path after backup data recovery.

Configuration restrictions:

- Data can be restored to the original database, but data tables must be stored in a new path that is different from the backup path.
- To restore Hive index tables, select the Hive data tables that correspond to the Hive index tables to be restored.
- If a new restoration directory is selected to avoid affecting the current data, HDFS permission must be manually granted so that users who have permission of backup tables can access this directory.
- Data can be restored to other databases. In this case, HDFS permission must be manually granted so that users who have permission of backup tables can access the HDFS directory that corresponds to the database.

**Step 10** Set **Force recovery** to **true**, which indicates to forcibly recover all backup data when a data table with the same name already exists. If the data table contains new data added after backup, the new data will be lost after the data recovery. If you set the parameter to **false**, the restoration task is not executed if a data table with the same name exists.

**Step 11** Click **Verify** to check whether the restoration task is configured correctly.

- If the queue name is incorrect, the verification fails.
- If the specified directory to be restored does not exist, the verification fails.
- If the forcible overwrite conditions are not met, the verification fails.

**Step 12** Click **OK**.

**Step 13** In the restoration task list, locate a created task and click **Start** in the **Operation** column to execute the restoration task.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

### 8.10.3.12 Restoring IoTDB Metadata

#### Scenario

To ensure IoTDB metadata security and prevent the IoTDB service from being unavailable due to IoTDB file damage, IoTDB metadata needs to be backed up. In this way, the system can restore data timely when an exception is reported or an operation does not achieve the expected result, minimizing the impact on services.

System administrators can create an IoTDB restoration task on FusionInsight Manager. Only manual restoration tasks are supported.

**NOTICE**

- Data restoration can be performed only when the system version is consistent with that during data backup.
- To restore the data when services are normal, manually back up the latest management data first and then restore the data. Otherwise, the IoTDB data that is generated after the data backup and before the data restoration will be lost.
- You are advised to restore the metadata of only one component in a restoration task to prevent the stop of a service or instance from affecting the data restoration of other components. If data of multiple components is restored at the same time, data restoration may fail.

## Impact on the System

After the metadata is restored, the data generated after the data backup and before the data restoration is lost.

## Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.
- Step 2** In the row where the specified backup task is located, choose **More > View History** in the **Operation** column to display the historical execution records of the backup task.
- In the window that is displayed, select a success record and click **View** in the **Backup Path** column to view its backup path information and find the following information:
- **Backup Object:** indicates the backup data source.
  - **Backup Path:** indicates the full path where backup files are stored.  
Select the correct path, and manually copy the full path of backup files in **Backup Path**.
- Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.
- Step 4** Click **Create**.
- Step 5** Set **Task Name** to the name of the restoration task.
- Step 6** Select the cluster to be operated from **Recovery Object**.
- Step 7** In **Restoration Configuration**, select **IoTDB** under **Metadata and other data**.
- Step 8** Select a backup directory type for **Path Type**.

The configurations vary based on backup directory types:

- **LocalDir:** indicates that the backup files are stored on the local disk of the active management node.

If you select this option, you also need to set **Source Path**, which indicates the backup file to be restored, for example, *Version\_Data source\_Task execution time.tar.gz*.

- **NFS**: indicates that backup files are stored in NAS using the NFS protocol.

If you select this option, configure the following parameters:

- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address**: indicates the IP address of the NAS server.
- **Source Path**: indicates the complete path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this option, configure the following parameters:

- **Source NameService Name**: indicates the NameService name of the backup data cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Source Active NameNode IP Address**: indicates the service plane IP address of the active NameNode in the standby cluster.
- **Source Standby NameNode IP Address**: indicates the service plane IP address of the standby NameNode in the standby cluster.
- **Source NameNode RPC Port**: indicates the value of **dfs.namenode.rpc.port** in the HDFS basic configuration of the standby cluster.
- **Source Path**: indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.

- **CIFS**: indicates that backup files are stored in NAS using the CIFS protocol.

If you select this option, configure the following parameters:

- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address**: indicates the IP address of the NAS server.
- **Port**: indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
- **Username**: indicates the username set when the CIFS protocol is configured.
- **Password**: indicates the password set when the CIFS protocol is configured.
- **Source Path**: indicates the complete path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.

- **SFTP**: indicates that backup files are stored in the server using the SFTP protocol.

If you select this option, configure the following parameters:

- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address**: indicates the IP address of the server where the backup data is stored.
- **Port**: indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username**: indicates the username for connecting to the server using the SFTP protocol.
- **Password**: indicates the password for connecting to the server using the SFTP protocol.
- **Source Path**: indicates the complete path of the backup file on the backup server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.

**Step 9** Click **OK**.

**Step 10** In the restoration task list, locate the row where the created task is located, and click **Start** in the **Operation** column.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

**Step 11** Choose **Cluster > Services** and start the IoTDB service.

----End

### 8.10.3.13 Restoring IoTDB Service Data

#### Scenario

IoTDB service data needs to be restored in the following scenarios: Data is modified or deleted unexpectedly and needs to be restored. After an administrator performs major operations (such as upgrade and data adjustment) on IoTDB, an exception occurs or the expected result is not achieved. All modules are faulty and become unavailable. Data is migrated to a new cluster.

System administrators can create an IoTDB restoration task on FusionInsight Manager. Only manual restoration tasks are supported.

**NOTICE**

- Data restoration can be performed only when the system version is consistent with that during data backup.
- To restore the data when services are normal, manually back up the latest management data first and then restore the data. Otherwise, the IoTDB data that is generated after the data backup and before the data restoration will be lost.

**Impact on the System**

- During data restoration, user authentication stops and users cannot create new connections.
- After the data is restored, the data generated after the data backup and before the data restoration is lost.
- After the data is restored, the IoTDB upper-layer applications need to be started.

**Prerequisites**

- If you need to restore data from a remote HDFS, prepare a standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust must be configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The IoTDB backup file save path is correct.
- The IoTDB upper-layer applications are stopped.

**Procedure**

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the row where the specified backup task is located, choose **More > View History** in the **Operation** column to display the historical execution records of the backup task.

In the window that is displayed, select a success record and click **View** in the **Backup Path** column to view its backup path information and find the following information:

- **Backup Object:** indicates the backup data source.
- **Backup Path:** indicates the full path where backup files are stored.  
Select the correct path, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In **Restoration Configuration**, choose **IoTDB > IoTDB** under **Service Data**.

**Step 8** Set **Path Type** of **IoTDB** to a backup directory type.

The following backup directory types are supported:

**RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this option, configure the following parameters:

- **Source NameService Name**: indicates the NameService name of the backup data cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Source Active NameNode IP Address**: indicates the service plane IP address of the active NameNode in the standby cluster.
- **Source Standby NameNode IP Address**: indicates the service plane IP address of the standby NameNode in the standby cluster.
- **Source NameNode RPC Port**: indicates the value of **dfs.namenode.rpc.port** in the HDFS basic configuration of the standby cluster.
- **Source Path**: indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time*.
- **Recovery Point List**: Click **Refresh** and select an IoTDB directory that has been backed up in the standby cluster.

**Step 9** In the **Backup Data** column of the **Data Configuration** page, select one or more pieces of backup data that needs to be restored based on service requirements. In the **Target Path** column, specify the target location after backup data restoration.

You are advised to set **Target Path** to a new path that is different from the backup path.

**Step 10** Set **Force recovery** to **true**, which indicates that all backup data is forcibly restored when a data table with the same name already exists. If the data table contains new data added after backup, the new data will be lost after the data restoration. If you set the parameter to **false**, the restoration task is not executed if a data table with the same name exists.

**Step 11** Click **Verify** to check whether the restoration task is configured correctly.

- If the queue name is incorrect, the verification fails.
- If the specified directory to be restored does not exist, the verification fails.

**Step 12** Click **OK**.

**Step 13** In the restoration task list, locate the row where the created task is located, and click **Start** in the **Operation** column.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

### 8.10.3.14 Restoring Kafka Metadata

#### Scenario

Kafka data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After an administrator performs critical data adjustment in ZooKeeper, an exception occurs or the operation has not achieved the expected result. All Kafka modules are faulty and become unavailable. Data is migrated to a new cluster.

System administrators can create a recovery task in FusionInsight Manager to recover Kafka data. Only manual restoration tasks are supported.

---

#### NOTICE

- Data restoration can be performed only when the system version is consistent with that during data backup.
  - To restore Kafka metadata when the service is running properly, you are advised to manually back up the latest Kafka metadata before restoration. Otherwise, the Kafka metadata that is generated after the data backup and before the data restoration will be lost.
- 

#### Impact on the System

- After the metadata is restored, the data generated after the data backup and before the data restoration is lost.
- After the metadata is restored, the offset information stored on ZooKeeper by Kafka consumers is rolled back, resulting in repeated consumption.

#### Prerequisites

- If you need to restore data from a remote HDFS, prepare a standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Cross-Manager Mutual Trust Between Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.

- The Kafka service is disabled first, and then enabled upon data restoration.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, choose **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.

Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In the **Restoration Configuration** area, select **Kafka**.

**Step 8** Set **Path Type** of **Kafka** to a backup directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node.  
If you select **LocalDir**, you also need to set **Source Path** to select the backup file to be restored, for example, *Version\_Data source\_Task execution time.tar.gz*.
- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.

If you select **LocalHDFS**, set the following parameters:

- **Source Path**: indicates the full path of the backup file in the HDFS, for example, *Backup path/Backup task name\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **Source NameService Name**: indicates the NameService name that corresponds to the backup directory when a restoration task is executed. The default value is **hacluster**.

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select **RemoteHDFS**, set the following parameters:

- **Source NameService Name**: indicates the NameService name of the backup data cluster. You can enter the built-in NameService name of the remote cluster, for example, **haclusterX**, **haclusterX1**, **haclusterX2**,

- haclusterX3**, or **haclusterX4**. You can also enter a configured NameService name of the remote cluster.
- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Source Path**: indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **Queue Name**: indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **NFS**: indicates that backup files are stored in NAS using the NFS protocol. If you select **NFS**, set the following parameters:
    - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
    - **Server IP Address**: indicates the IP address of the NAS server.
    - **Source Path**: indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **CIFS**: indicates that backup files are stored in NAS using the CIFS protocol. If you select **CIFS**, set the following parameters:
    - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
    - **Server IP Address**: indicates the IP address of the NAS server.
    - **Port**: indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
    - **Username**: indicates the username set when the CIFS protocol is configured.
    - **Password**: indicates the password set when the CIFS protocol is configured.
    - **Source Path**: indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **OBS**: indicates that backup files are stored in OBS. If you select **OBS**, set the following parameters:
    - **Source Path**: indicates the full OBS path of a backup file, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.

 **NOTE**

Only MRS 3.1.0 or later supports saving backup files in OBS.

**Step 9** Click **OK**.

**Step 10** In the restoration task list, locate a created task and click **Start** in the **Operation** column to execute the restoration task.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

#### NOTICE

- If the Kafka service is deleted after the backup is complete, reinstall the Kafka service, restore its metadata, and restart the Kafka service. It is found that the Broker service cannot be started. In this case, the **`/var/log/Bigdata/kafka/broker/server.log`** file contains an error. An error example is as follows:

```
ERROR Fatal error during KafkaServer startup. Prepare to shutdown
(kafka.server.KafkaServer)kafka.common.InconsistentClusterIdException: The Cluster ID
kVSgfurUQFGGpHMTBqBPiw doesn't match stored clusterId Some(0Qftv9yBTAmf2iDPSllk7g) in
meta.properties. The broker is trying to join the wrong cluster. Configured zookeeper.connect may
be wrong. at kafka.server.KafkaServer.startup(KafkaServer.scala:220) at
kafka.server.KafkaServerStartable.startup(KafkaServerStartable.scala:44) at kafka.Kafka
$.main(Kafka.scala:84) at kafka.Kafka.main(Kafka.scala)
```

Check the value of **`log.dirs`** in the Kafka Broker configuration file **`${BIGDATA_HOME}/Fusionsight_Current/*Broker/etc/server.properties`**. The value is the Kafka data directory. Go to the Kafka data directory and change the value **`0Qftv9yBTAmf2iDPSllk7g`** of **`cluster.id`** in **`meta.properties`** to **`kVSgfurUQFGGpHMTBqBPiw`** (the latest value in the error log).

- The preceding modification must be performed on each node where Broker is located. After the modification, restart the Kafka service.

----End

## 8.10.4 Enabling Cross-Cluster Replication

### Scenario

DistCp is used to replicate the data stored in HDFS from a cluster to another cluster. DistCp depends on the cross-cluster replication function, which is disabled by default. You need to enable it for both clusters.

This section describes how to modify parameters on FusionInsight Manager to enable the cross-cluster replication function. After this function is enabled, you can create a backup task for backing up data to the remote HDFS (RemoteHDFS).

### Impact on the System

Yarn needs to be restarted to enable the cross-cluster replication function and cannot be accessed during restart.

## Prerequisites

- The **hadoop.rpc.protection** parameter of HDFS in the two clusters for data replication must use the same data transmission mode. The default value is **privacy**, indicating encrypted transmission. The value **authentication** indicates that transmission is not encrypted.
- For clusters in security mode, you need to configure mutual trust between clusters.

## Procedure

**Step 1** Log in to FusionInsight Manager of one of the two clusters.

**Step 2** Choose **Cluster > Services > Yarn** and click **Configurations** then **All Configurations**.

**Step 3** In the navigation pane, choose **Yarn > Distcp**.

**Step 4** Modify **dfs.namenode.rpc-address**, set **haclusterX.remotenn1** to the service IP address and RPC port of one NameNode instance of the peer cluster, and set **haclusterX.remotenn2** to the service IP address and RPC port number of the other NameNode instance of the peer cluster.

**haclusterX.remotenn1** and **haclusterX.remotenn2** do not distinguish active and standby NameNodes. The default NameNode RPC port is 8020 and cannot be modified on Manager.

Examples of modified parameter values: **10.1.1.1:8020** and **10.1.1.2:8020**.

### NOTE

- If data of the current cluster needs to be backed up to the HDFS of multiple clusters, you can configure the corresponding NameNode RPC addresses to **haclusterX1**, **haclusterX2**, **haclusterX3**, and **haclusterX4**.

**Step 5** Click **Save**. In the confirmation dialog box, click **OK**.

**Step 6** Restart the Yarn service.

**Step 7** Log in to FusionInsight Manager of the other cluster and repeat **Step 2** to **Step 6**.

----End

## 8.10.5 Managing Local Quick Restoration Tasks

### Scenario

When DistCp is used to back up data, the backup snapshot is saved to HDFS of the active cluster. FusionInsight Manager supports using the local snapshot for quick data restoration, requiring less time than restoring data from the standby cluster.

Use FusionInsight Manager and the snapshots on HDFS of the active cluster to create a local quick restoration task and execute the task.

## Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.
- Step 2** In the backup task list, locate a created task and click **Restore** in the **Operation** column.
- Step 3** Check whether the system displays "No data is available for quick restoration. Create a task on the restoration management page to restore data".
- If yes, click **OK** to close the dialog box. No backup data snapshot is created in the active cluster, and no further action is required.
  - If no, go to **Step 4** to create a local quick restoration task.

 **NOTE**

Metadata does not support quick restoration.

- Step 4** Set **Name** to the name of the local quick restoration task.
- Step 5** Set **Configuration** to a data source.
- Step 6** Set **Recovery Point List** to a recovery point that contains the backup data.
- Step 7** Set **Queue Name** to the name of the Yarn queue used in the task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- Step 8** Set **Data Configuration** to the object to be recovered.
- Step 9** Click **Verify**, and wait for the system to display "The restoration task configuration is verified successfully."
- Step 10** Click **OK**.
- Step 11** In the restoration task list, locate a created task and click **Start** in the **Operation** column to execute the restoration task.

After the task is complete, **Task Status** of the task is displayed as **Successful**.

----End

## 8.10.6 Modifying a Backup Task

### Scenario

This section describes how to modify the parameters of a created backup task on FusionInsight Manager to meet changing service requirements. The parameters of restoration tasks can only be viewed but cannot be modified.

### Impact on the System

After a backup task is modified, the new parameters take effect when the task is executed next time.

## Prerequisites

- A backup task has been created.
- A new backup task policy has been planned based on the actual situation.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the task list, locate a specified task, click **Configure** in the **Operation** column to go to the configuration modification page.

On the displayed page, modify the following parameters:

- Started
- Period
- Destination NameService Name
- Target NameNode IP Address
- Target Path
- Max Number of Backup Copies
- Maximum Number of Recovery Points
- Maximum Number of Maps
- Maximum Bandwidth of a Map

### NOTE

After the **Target Path** parameter of a backup task is modified, this task will be performed as a full backup task for the first time by default.

**Step 3** Click **OK** to save the settings.

----End

## 8.10.7 Viewing Backup and Restoration Tasks

### Scenario

This section describes how to view created backup and recovery tasks and check their running status on FusionInsight Manager.

### Prerequisites

You have logged in to FusionInsight Manager.

### Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration**.

**Step 2** Click **Backup Management** or **Restoration Management**.

**Step 3** In the task list, obtain the previous execution result in the **Task Status** and **Task Progress** column. Green indicates that the task is executed successfully, and red indicates that the execution fails.

**Step 4** In the **Operation** column of a specified task in the task list, choose **More > View History** or click **View History** to view the historical record of backup and restoration task execution.

In the displayed window, click  before a specified record to display log information about the execution.

----End

## Related Tasks

- Starting a backup or restoration task  
In the task list, locate a specified task and choose **More > Back Up Now** or click **Start** in the **Operation** column to start a backup or restoration task that is ready or fails to be executed. Executed restoration tasks cannot be repeatedly executed.
- Stopping a backup or restoration task  
In the task list, locate a specified task and choose **More > Stop** or click **Stop** in the **Operation** column to stop a backup or restoration task that is running. After the task is successfully stopped, its **Task Status** changes to **Stopped**.
- Deleting a backup or restoration task  
In the **Operation** column of a specified task, choose **More > Delete** or click **Delete** and then click **OK** in the displayed dialog box to delete the backup and restoration task. Backup data will be reserved by default after a task is deleted.
- Suspending a backup task  
In the task list, locate a specified task and choose **More > Suspend** in the **Operation** column to suspend a backup task. Only periodic backup tasks can be suspended. Suspended backup tasks are no longer executed automatically. When you suspend a backup task that is being executed, the task execution stops. To resume a task, choose **More > Resume**.

## 8.10.8 How Do I Configure the Environment When I Create a ClickHouse Backup Task on FusionInsight Manager and Set the Path Type to RemoteHDFS?

### NOTE

This section applies only to MRS 3.1.0 and 3.1.2.

## Question

How do I configure the environment when I create a ClickHouse backup task on FusionInsight Manager and set the path type to RemoteHDFS?

## Answer

**Step 1** Log in to FusionInsight Manager of the standby cluster.

**Step 2** Choose **Cluster > Services > HDFS** and choose **More > Download Client**. Set **Select Client Type** to **Configuration Files Only**, select **x86\_64** for x86 or **aarch64**

for ARM based on the type of the node where the client is to be installed, and click **OK**.

**Step 3** After the client file package is generated, download the client to the local PC as prompted and decompress the package.

For example, if the client file package is **FusionInsight\_Cluster\_1\_HDFS\_Client.tar**, decompress it to obtain **FusionInsight\_Cluster\_1\_HDFS\_ClientConfig\_ConfigFiles.tar**, and then decompress **FusionInsight\_Cluster\_1\_HDFS\_ClientConfig\_ConfigFiles.tar** to the **D:\FusionInsight\_Cluster\_1\_HDFS\_ClientConfig\_ConfigFiles** directory on the local PC. The directory name cannot contain spaces.

**Step 4** Go to the **FusionInsight\_Cluster\_1\_HDFS\_ClientConfig\_ConfigFiles\client** directory and obtain the **hosts** file.

**Step 5** Go to **FusionInsight\_Cluster\_1\_HDFS\_ClientConfig\_ConfigFiles\HDFS\config** to obtain the **core-site.xml** and **hdfs-site.xml** files.

**Step 6** Log in to FusionInsight Manager of the source cluster.

**Step 7** Choose **Cluster > Services > ClickHouse**, choose **Configurations > All Configurations**, and select **backup** under **ClickHouse(Service)**.

For **remote\_connect\_core\_config\_file**, click **Upload File** and select the **core-site.xml** file prepared in [Step 5](#).

For **remote\_connect\_hdfs\_config\_file**, click **Upload File** and select the **hdfs-site.xml** file prepared in [Step 5](#).

**Step 8** Click **Save**, confirm the information, and click **OK** to save the configuration. After saving the configurations, click **Finish**.

**Step 9** Choose **Cluster > Services > ClickHouse**, click **Instance**, and view the instance IP address of **ClickHouseServer**.

**Step 10** Log in to the host nodes of the ClickHouseServer instances as user **root** and check whether the **/etc/hosts** file contains the host information in [Step 4](#). If not, add the host information in [Step 4](#) to the **/etc/hosts** file.

----End

## 8.11 Security Management

### 8.11.1 Security Overview

### 8.11.1.1 Right Model

#### Role-based Access Control

FusionInsight adopts the role-based access control (RBAC) mode to manage rights on the big data system. It integrates the right management functions of the components to centrally manage rights. Common users are shielded from internal right management details, and the right management operations are simplified for administrators, improving right management usability and user experience.

The right model of FusionInsight consists four parts, that is users, user groups, roles, and rights.

Figure 8-61 Right model

- **Right**

Right, which is defined by components, allows users to access a certain resource of one component. Different components have different rights for their resources.

For example:

- HDFS provides read, write, and execute permissions on files.
- HBase provides create, read, and write permissions on tables.

- **Role**

Role is a collection of component rights. Each role can have multiple rights of multiple components. Different roles can have the rights of a resource of one component.

- **User group**

User group is a collection of users. When a user group is bound to a role, users in this group obtain the rights defined by the role.

Different user groups can be associated with the same role. A user group can also be associated with no role, and this user group does not have the rights of any component resources.

 **NOTE**

In some components, the system grants related rights to specific user groups by default.

- **User**

A user is a visitor to the system. Each user has the rights of the user group and role associated with the user. Users need to be added to the user group or associated with roles to obtain the corresponding rights.

## Policy-based Access Control

The Ranger component uses policy-based access control (PBAC) to manage rights and implement fine-grained data access control on components such as HDFS, Hive, and HBase.

 **NOTE**

The component supports only one right control mechanism. After the Ranger right control policy is enabled for the component, the right on the component in the role created on FusionInsight Manager becomes invalid (The ACL rules of HDFS and Yarn still take effect). You need to add a policy on the Ranger management page to grant rights on resources.

The Ranger right model consists of multiple right policies. A right policy consists of the following parts:

- **Resource**

Resources are provided by components and can be accessed by users, such as HDFS files or folders, queues in Yarn, and databases, tables, and columns in Hive.

- **User**

A User is a visitor to the system. The rights of each user are obtained based on the policy associated with the user. Information about users, user groups, and roles in the LDAP is periodically synchronized to the Ranger.

- **Permission**

In a policy, you can configure various access conditions for resources, such as file read and write, permission conditions, rejection conditions, and exception conditions.

### 8.11.1.2 Right Mechanism

FusionInsight adopts the Lightweight Directory Access Protocol (LDAP) to store data of users and user groups. Information about role definitions is stored in the relational database and the mapping between roles and rights is saved in components.

FusionInsight uses Kerberos for unified authentication.

The verification process of user rights is as follows:

1. A client (a user terminal or FusionInsight component service) invokes the FusionInsight authentication interface.
2. FusionInsight uses the login username and password for Kerberos authentication.
3. If the authentication succeeds, the client sends a request for accessing the server (a FusionInsight component service).
4. The server finds the user group and role to which the login user belongs.
5. The server obtains all rights of the user group and the role.
6. The server checks whether the client has the right to access the resources it applies for.

**Example (RBAC):**

There are three files in HDFS, that is, fileA, fileB, and fileC.

- roleA has read and write right for fileA, and roleB has the read right for fileB.
- groupA is bound to roleA, and groupB is bound to roleB.
- userA belongs to groupA and roleB, and userB belongs to groupB.

When userA successfully logs in to the system and accesses the HDFS:

1. HDFS obtains the role (roleB) to which userA is bound.
2. HDFS also obtains the role (roleA) to which the user group of userA is bound.
3. In this case, userA has all the rights of roleA and roleB.
4. As a result, userA has read and write rights for fileA, has the read right on fileB, and has no right for fileC.

Similarly, when userB successfully logs in to the system and accesses the HDFS:

1. userB only has the rights of roleB.
2. As a result, userB has the read right on fileB, and has no rights for fileA and fileC.

### 8.11.1.3 Authentication Policies

The big data platform performs user identity authentication to prevent invalid users from accessing the cluster. The cluster provides authentication capabilities in both security mode and normal mode.

## Security Mode

The clusters in security mode use the Kerberos authentication protocol for security authentication. The Kerberos protocol supports mutual authentication between clients and servers. This eliminates the risks incurred by sending user credentials over the network for simulated authentication. In clusters, KrbServer provides the Kerberos authentication support.

### Kerberos user object

In the Kerberos protocol, each user object is a principal. A complete principal consists of username and domain name. In O&M or application development

scenarios, the user identity must be verified before a client connects to a server. Users for O&M and service operations are classified into human-machine and machine-machine users. The password of human-machine users is manually configured, while the password of machine-machine users is generated by the system randomly.

### Kerberos authentication

Kerberos supports password and keytab authentication. The validity period of authentication is 24 hours by default.

- Password authentication: User identity is verified by entering the correct password. This mode mainly used in O&M scenarios where human-machine users are used. The configuration command is **kinit** *Username*.
- Keytab authentication: Keytab files contain users' principal and encrypted credential information. When keytab files are used for authentication, the system automatically uses encrypted credential information to perform authentication and the user password does not need to be entered. This mode is mainly used in component application development scenarios where machine-machine users are used. Keytab authentication can also be configured using the **kinit** command.

## Normal Mode

Different components in a normal cluster use the native open-source authentication mode and do not support the **kinit** authentication command. FusionInsight Manager (including DBService, KrbServer, and LdapServer) uses the username and password for authentication. [Table 8-84](#) lists the authentication modes used by components.

**Table 8-84** Component authentication modes

Service	Authentication Mode
IoTDB	Simple authentication
CDL	No authentication
ClickHouse	Simple authentication
Flume	No authentication
HBase	<ul style="list-style-type: none"><li>• Web UI: No authentication</li><li>• Client: simple authentication</li></ul>
HDFS	<ul style="list-style-type: none"><li>• Web UI: no authentication</li><li>• Client: simple authentication</li></ul>
HetuEngine	<ul style="list-style-type: none"><li>• Web UI: no authentication</li><li>• Client: no authentication</li></ul>
Hive	Simple authentication
Hue	Username and password authentication

Service	Authentication Mode
Kafka	No authentication
Loader	<ul style="list-style-type: none"><li>• Web UI: username and password authentication</li><li>• Client: no authentication</li></ul>
MapReduce	<ul style="list-style-type: none"><li>• Web UI: no authentication</li><li>• Client: no authentication</li></ul>
Oozie	<ul style="list-style-type: none"><li>• Web UI: username and password authentication</li><li>• Client: simple authentication</li></ul>
Spark2x	<ul style="list-style-type: none"><li>• Web UI: no authentication</li><li>• Client: simple authentication</li></ul>
Storm	No authentication
YARN	<ul style="list-style-type: none"><li>• Web UI: no authentication</li><li>• Client: simple authentication</li></ul>
ZooKeeper	Simple authentication

The authentication modes are as follows:

- Simple authentication: When the client connects to the server, the client automatically authenticates the user (for example, the OS user **root** or **omm**) by default. The authentication is imperceptible to the administrator or service user, which does not require **kinit**.
- Username and password authentication: Use the username and password of human-machine users in the cluster for authentication.
- No authentication: Any user can access the server by default.

#### 8.11.1.4 Permission Verification Policies

### Security Mode

After a user is authenticated by the big data platform, the system determines whether to verify the user's permission based on the actual permission management configuration to ensure that the user has limited or all permission on resources. If the user does not have the permission for accessing cluster resources, the system administrator must grant the required permission to the user. Otherwise, the user fails to access the resources. The cluster provides permission verification capabilities in both security mode and normal mode. The specific permission items of the components are the same in the two modes.

By default, the Ranger service is installed and Ranger authentication is enabled for a newly installed cluster in security mode. You can set fine-grained security access policies for accessing component resources through the permission plug-in of the component. If Ranger authentication is not required, administrators can manually disable it on the service page. After Ranger authentication is disabled, the system

continues to perform permission control based on the role model of FusionInsight Manager when accessing component resources.

In a cluster in security mode, the following components support Ranger authentication: HDFS, YARN, Kafka, Hive, HBase, Storm, Impala, HetuEngine, CDL, and Spark2x.

For a cluster upgraded from an earlier version, Ranger authentication is not used by default when users access component resources. The administrator can manually enable Ranger authentication after installing Ranger.

By default, all components in the cluster of the security edition authenticate access. The authentication function cannot be disabled.

## Normal Mode

Different components in a normal cluster use their own native open-source authentication behavior. [Table 8-85](#) lists detailed permission verification modes.

In a normal cluster, Ranger supports permission control on component resources based on OS users. The following components support Ranger authentication: HBase, HDFS, Hive, Spark2x, and YARN.

**Table 8-85** Component permission verification modes in normal clusters

Service	Permission Verification	Permission Verification Enabling and Disabling
IoTDB	Required	Not supported
ClickHouse	Required	Not supported
Flume	Not required	Not supported
HBase	Not required	Supported
HDFS	Required	Supported
HetuEngine	Not required	Not supported
Hive	Not required	Not supported
Hue	Not required	Not supported
Kafka	Not required	Not supported
Loader	Not required	Not supported
MapReduce	Not required	Not supported
Oozie	Required	Not supported
Spark2x	Not required	Not supported
Storm	Not required	Not supported
YARN	Not required	Supported
ZooKeeper	Required	Supported

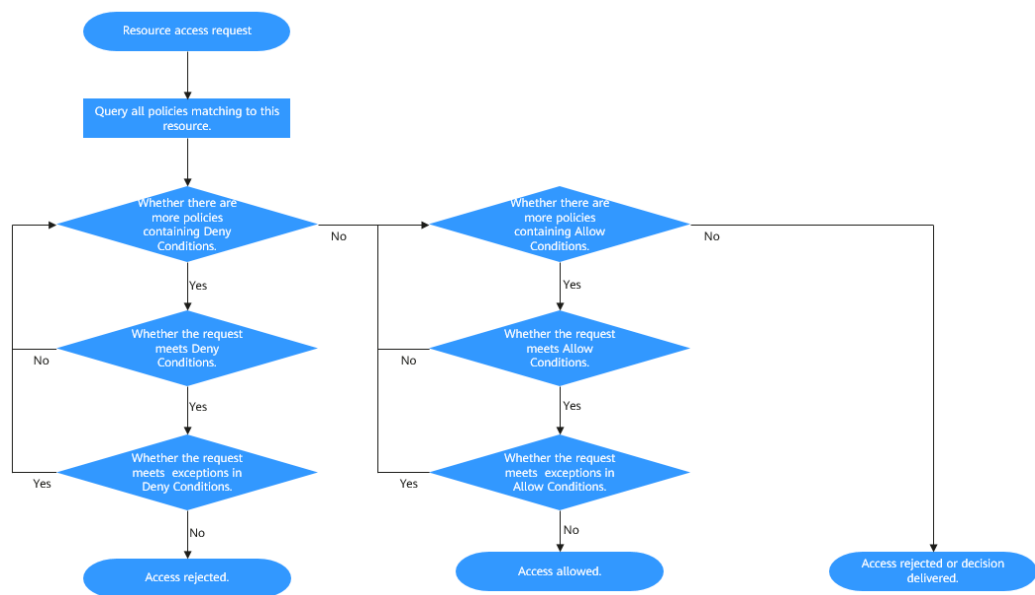

Service	Permission Verification	Permission Verification Enabling and Disabling
CDL	Not required	Not supported

### Condition Priorities of the Ranger Permission Policy

When configuring a permission policy for a resource, you can configure Allow Conditions, Exclude from Allow Conditions, Deny Conditions, and Exclude from Deny Conditions for the resource, to meet unexpected requirements in different scenarios.

The priorities of different conditions are listed in descending order: Exclude from Deny Conditions > Deny Conditions > Exclude from Allow Conditions > Allow Conditions

The following figure shows the process of determining condition priorities. If the component resource request does not match the permission policy in Ranger, the system rejects the access by default. However, for HDFS and Yarn, the system delivers the decision to the access control layer of the component for determination.

For example, if you want to grant the read and write permissions of the **FileA** folder to the **groupA** user group, but the user in the group is not **UserA**, you can add an allowed condition and an exception condition.

### 8.11.1.5 User Account List

#### User Classification

The MRS cluster provides the following three types of users. The system administrator needs to periodically change the passwords. It is not recommended to use the default passwords.

 NOTE

This section describes information about default users in MRS clusters.

User Type	Description
System users	<ul style="list-style-type: none"><li>• User created on FusionInsight Manager for O&amp;M and service scenarios. There are two types of users:<ul style="list-style-type: none"><li>- <b>Human-machine</b> user: used in scenarios such as FusionInsight Manager O&amp;M and operations on a component client. When creating a user of this type, you need to set password and confirm password by referring to <a href="#">Creating a User</a>.</li><li>- <b>Machine-machine</b> user: used for system application development.</li></ul></li><li>• User who runs OMS processes</li></ul>
Internal system users	Internal user to perform Kerberos authentication, process communications, save user group information, and associate user permissions. It is recommended that internal system users not be used in O&M scenarios. Operations can be performed as user <b>admin</b> or another user created by the system administrator based on service requirements.
Database users	<ul style="list-style-type: none"><li>• User who manages OMS database and accesses data</li><li>• User who runs service components (Hue, Hive, HetuEngine, Loader, Oozie, Ranger, and DBService) in the database.</li></ul>

## System Users

 NOTE

- User **root** of the OS is required, the password of user **root** on all nodes must be the same.
- User **ldap** of the OS is required. Do not delete this account. Otherwise, the cluster may not work properly. The OS administrator maintains the password management policies.

User Type	Username	Initial Password	Description	Password Change Method
System administrator	admin	User-defined password	<p>FusionInsight Manager administrator.</p> <p><b>NOTE</b> By default, user <b>admin</b> does not have the management permission on other components. For example, when accessing the native UI of a component, the user fails to access the complete component information due to insufficient management permission on the component.</p>	For details, see <a href="#">Changing the Password for User admin</a> .
Node OS user	ommdba	Random password	User that creates the system database. This user is an OS user generated on the management node and does not require a unified password. This account cannot be used for remote login.	For details, see <a href="#">Changing the Password for an OS User</a> .
	omm	Random password	Internal running user of the system. This user is an OS user generated on all nodes and does not require a unified password.	

### Internal System Users

User Type	Default User	Initial Password	Description	Password Change Method
Kerberos administrator	kadmin/admin	Admin@123	Used to add, delete, modify, and query user accounts on Kerberos.	For details, see <a href="#">Changing the Password for the Kerberos Administrator</a> .

User Type	Default User	Initial Password	Description	Password Change Method
OMS Kerberos administrator	kadmin/admin	Admin@123	Used to add, delete, modify, and query user accounts on OMS Kerberos.	For details, see <a href="#">Changing the Password for the OMS Kerberos Administrator</a> .
LDAP administrator	cn=root,dc=hadoop,dc=com	<ul style="list-style-type: none"><li>• Versions earlier than MRS 3.1.2: LdapChangeMe@123</li><li>• MRS 3.1.2 or later: randomly generated by the system</li></ul>	Used to add, delete, modify, and query the user account information on LDAP.	<ul style="list-style-type: none"><li>• For versions earlier than MRS 3.1.2, see <a href="#">Changing the Passwords of the LDAP Administrator and the LDAP User (Including OMS LDAP)</a>.</li><li>• For MRS 3.1.2 or later, see <a href="#">Modifying OMS Service Configuration Parameters</a>.</li></ul>

User Type	Default User	Initial Password	Description	Password Change Method
OMS LDAP administrator	cn=root,dc=hadoop,dc=com	<ul style="list-style-type: none"> <li>• Versions earlier than MRS 3.1.2: LdapChangeMe@123</li> <li>• MRS 3.1.2 or later: randomly generated by the system</li> </ul>	Used to add, delete, modify, and query the user account information on OMS LDAP.	
LDAP user	cn=pg_search_dn,ou=Users,dc=hadoop,dc=com	Randomly generated by the system	Used to query information about users and user groups on LDAP.	
OMS LDAP user	cn=pg_search_dn,ou=Users,dc=hadoop,dc=com	Randomly generated by the system	Used to query information about users and user groups on OMS LDAP.	

User Type	Default User	Initial Password	Description	Password Change Method
LDAP administrator account	cn=krbkdc, ou=Users, dc=hadoop, dc=com	<ul style="list-style-type: none"> <li>• Versions earlier than MRS 3.1.2: LdapChangeMe@123</li> <li>• MRS 3.1.2 or later: randomly generated by the system</li> </ul>	Used to query Kerberos component authentication account information.	<ul style="list-style-type: none"> <li>• For versions earlier than MRS 3.1.2, see <a href="#">Changing the Password for the LDAP Administrator</a>.</li> <li>• For MRS 3.1.2 or later, see <a href="#">Modifying OMS Service Configuration Parameters</a>.</li> </ul>
	cn=krbadmin, ou=Users, dc=hadoop, dc=com	<ul style="list-style-type: none"> <li>• Versions earlier than MRS 3.1.2: LdapChangeMe@123</li> <li>• MRS 3.1.2 or later: randomly generated by the system</li> </ul>	Used to add, delete, modify, and query Kerberos component authentication account information.	

User Type	Default User	Initial Password	Description	Password Change Method
Component running user	hdfs	Hdfs@123	<p>This user is the HDFS system administrator and has the following permissions:</p> <ol style="list-style-type: none"><li>File system operation permissions:<ul style="list-style-type: none"><li>Views, modifies, and creates files.</li><li>Views and creates directories.</li><li>Views and modifies the groups where files belong.</li><li>Views and sets disk quotas for users.</li></ul></li><li>HDFS management operation permissions:<ul style="list-style-type: none"><li>Views the web UI status.</li><li>Views and sets the active and standby HDFS status.</li><li>Enters and exits the HDFS in security mode.</li><li>Checks the HDFS file system.</li></ul></li><li>Logs in to the FTP service page.</li></ol>	For details, see <a href="#">Changing the Password for a Component Running User</a> .

User Type	Default User	Initial Password	Description	Password Change Method
	hbase	Hbase@123	<p>This user is the HBase and HBase1 to HBase4 system administrator and has the following permissions:</p> <ul style="list-style-type: none"> <li>• Cluster management permission: Performs <b>Enable</b> and <b>Disable</b> operations on tables to trigger MajorCompact and ACL operations.</li> <li>• Grants and revokes permissions, and shuts down the cluster.</li> <li>• Table management permission: Creates, modifies, and deletes tables.</li> <li>• Data management permission: Reads data in tables, column families, and columns.</li> <li>• Logs in to the HMaster web UI.</li> <li>• Logs in to the FTP service page.</li> </ul>	
	cdl	CDCUser123!	<p>System administrator of the CDL</p> <p>Currently, CDL does not involve user permissions.</p>	

User Type	Default User	Initial Password	Description	Password Change Method
	iotdb	iotdb@123	<p>This user is the IoTDB system administrator and has the following user permissions:</p> <ol style="list-style-type: none"> <li>1. IoTDB administrator permissions: <ul style="list-style-type: none"> <li>• Creates or deletes a storage group.</li> <li>• Uses TTL.</li> </ul> </li> <li>2. IoTDB data operation permissions: <ul style="list-style-type: none"> <li>• Creates, modifies, and deletes a time sequence.</li> <li>• Writes, reads, and deletes data in a time sequence.</li> </ul> </li> <li>3. Views user or role permission information.</li> <li>4. Grants or revokes permissions to or from a user or role.</li> </ol> <p><b>NOTE</b> In a normal cluster, the IoTDB service retains the features of open-source versions. The default username is <b>root</b>, and the default password is <b>root</b>. This user is an administrator and has all permissions, which cannot be assigned, revoked, or deleted.</p>	

User Type	Default User	Initial Password	Description	Password Change Method
	mapred	Mapred@123	<p>This user is the MapReduce system administrator and has the following permissions:</p> <ul style="list-style-type: none"> <li>• Submits, stops, and views the MapReduce tasks.</li> <li>• Modifies the Yarn configuration parameters.</li> <li>• Logs in to the FTP service page.</li> <li>• Logs in to the Yarn web UI.</li> </ul>	
	zookeeper	ZooKeeper@123	<p>This user is the ZooKeeper system administrator and has the following permissions:</p> <ul style="list-style-type: none"> <li>• Adds, deletes, modifies, and queries all nodes in ZooKeeper.</li> <li>• Modifies and queries quotas of all nodes in ZooKeeper.</li> </ul>	
	rangeradmin	Rangeradmin@123	<p>This user has the Ranger system management permissions and user permissions:</p> <ul style="list-style-type: none"> <li>• Ranger web UI management permission</li> <li>• Management permission of each component that uses Ranger authentication</li> </ul>	
	rangerauditor	Rangerauditor@123	Default audit user of the Ranger system.	

User Type	Default User	Initial Password	Description	Password Change Method
	hive	Hive@123	<p>This user is the Hive system administrator and has the following permissions:</p> <ol style="list-style-type: none"> <li>1. Hive administrator permissions: <ul style="list-style-type: none"> <li>• Creates, deletes, and modifies a database.</li> <li>• Creates, queries, modifies, and deletes a table.</li> <li>• Queries, inserts, and uploads data.</li> </ul> </li> <li>2. HDFS file operation permissions: <ul style="list-style-type: none"> <li>• Views, modifies, and creates files.</li> <li>• Views and creates directories.</li> <li>• Views and modifies the groups where files belong.</li> </ul> </li> <li>3. Submits and stops the MapReduce tasks.</li> <li>4. Ranger policy management permission</li> </ol>	

User Type	Default User	Initial Password	Description	Password Change Method
	kafka	Kafka@123	<p>This user is the Kafka system administrator and has the following permissions:</p> <ul style="list-style-type: none"> <li>• Creates, deletes, produces, and consumes the topic; modifies the topic configuration.</li> <li>• Controls the cluster metadata, modifies the configuration, migrates the replica, elects the leader, and manages ACL.</li> <li>• Submits, queries, and deletes the consumer group offset.</li> <li>• Queries the delegation token.</li> <li>• Queries and submits the transaction.</li> </ul>	
	storm	Admin@123	<p>Storm system administrator</p> <p>User permission: Submits Storm tasks.</p>	
	rangeruser sync	Randomly generated by the system	Synchronizes users and internal users of user groups.	
	rangertagsync	Randomly generated by the system	Internal user for synchronizing tags.	

User Type	Default User	Initial Password	Description	Password Change Method
	oms/ manager	Randomly generated by the system	Controller and NodeAgent authentication user. The user has the permission on the <b>supergroup</b> group.	
	backup/ manager	Randomly generated by the system	User for running backup and restoration tasks. The user has the permission on the <b>supergroup</b> , <b>wheel</b> , and <b>ficommon</b> groups. After cross-system mutual trust is configured, the user has the permission to access data in the HDFS, HBase, Hive, and ZooKeeper systems.	

User Type	Default User	Initial Password	Description	Password Change Method
	hdfs/hadoop.<System domain name>	Randomly generated by the system	<p>This user is used to start the HDFS and has the following permissions:</p> <ol style="list-style-type: none"> <li>1. File system operation permissions: <ul style="list-style-type: none"> <li>• Views, modifies, and creates files.</li> <li>• Views and creates directories.</li> <li>• Views and modifies the groups where files belong.</li> <li>• Views and sets disk quotas for users.</li> </ul> </li> <li>2. HDFS management operation permissions: <ul style="list-style-type: none"> <li>• Views the web UI status.</li> <li>• Views and sets the active and standby HDFS status.</li> <li>• Enters and exits the HDFS in security mode.</li> <li>• Checks the HDFS file system.</li> </ul> </li> <li>3. Logs in to the FTP service page.</li> </ol>	

User Type	Default User	Initial Password	Description	Password Change Method
	hetuser/ hadoop.< <i>System domain name</i> >	Randomly generated by the system	This user is used to start HetuEngine and has the following permissions: <ul style="list-style-type: none"> <li>• Accesses KrbServer and HDFS files in the cluster from HetuEngine.</li> <li>• Used for communication between HetuEngine internal nodes.</li> </ul>	
	mapred/ hadoop.< <i>System domain name</i> >	Randomly generated by the system	This user is used to start the MapReduce and has the following permissions: <ul style="list-style-type: none"> <li>• Submits, stops, and views the MapReduce tasks.</li> <li>• Modifies the Yarn configuration parameters.</li> <li>• Logs in to the FTP service page.</li> <li>• Logs in to the Yarn web UI.</li> </ul>	
	mr_zk/ hadoop.< <i>System domain name</i> >	Randomly generated by the system	Used for MapReduce to access ZooKeeper.	
	hbase/ hadoop.< <i>System domain name</i> >	Randomly generated by the system	User for the authentication between internal components during the HBase system startup.	

User Type	Default User	Initial Password	Description	Password Change Method
	hbase/ zkclient.< <i>System domain name</i> >	Randomly generated by the system	User for HBase to perform ZooKeeper authentication in a security mode cluster.	
	thrift/ hadoop.< <i>System domain name</i> >	Randomly generated by the system	ThriftServer system startup user.	
	thrift/ < <i>hostname</i> >	Randomly generated by the system	User for the ThriftServer system to access HBase. This user has the read, write, execution, creation, and administration permission on all NameSpaces and tables of HBase. < <i>hostname</i> > indicates the name of the host where the ThriftServer node is installed in the cluster.	

User Type	Default User	Initial Password	Description	Password Change Method
	hive/hadoop.<System domain name>	Randomly generated by the system	<p>User for the authentication between internal components during the Hive system startup. The user permissions are as follows:</p> <ol style="list-style-type: none"> <li>1. Hive administrator permissions: <ul style="list-style-type: none"> <li>• Creates, deletes, and modifies a database.</li> <li>• Creates, queries, modifies, and deletes a table.</li> <li>• Queries, inserts, and uploads data.</li> </ul> </li> <li>2. HDFS file operation permissions: <ul style="list-style-type: none"> <li>• Views, modifies, and creates files.</li> <li>• Views and creates directories.</li> <li>• Views and modifies the groups where files belong.</li> </ul> </li> <li>3. Submits and stops the MapReduce tasks.</li> </ol>	
	loader/hadoop.<System domain name>	Randomly generated by the system	User for Loader system startup and Kerberos authentication	

User Type	Default User	Initial Password	Description	Password Change Method
	HTTP/ <hostname>	Randomly generated by the system	Used to connect to the HTTP interface of each component. <hostname> indicates the host name of a node in the cluster.	
	hue	Randomly generated by the system	User for Hue system startup, Kerberos authentication, and HDFS and Hive access	
	flume	Randomly generated by the system	User for Flume system startup and HDFS and Kafka access. The user has read and write permission of the HDFS directory / <b>flume</b> .	
	flume_server	Randomly generated by the system	User for Flume system startup and HDFS and Kafka access. The user has read and write permission of the HDFS directory / <b>flume</b> .	
	spark2x/hadoop.<System domain name>	Randomly generated by the system	This user is the Spark2x system administrator and has the following user permissions: 1. Starts the Spark2x service. 2. Submits Spark2x tasks.	
	spark_zk/hadoop.<System domain name>	Randomly generated by the system	Used for Spark2x to access ZooKeeper.	

User Type	Default User	Initial Password	Description	Password Change Method
	zookeeper/hadoop.<System domain name>	Randomly generated by the system	ZooKeeper system startup user.	
	zkcli/hadoop.<System domain name>	Randomly generated by the system	ZooKeeper server login user.	
	oozie	Randomly generated by the system	User for Oozie system startup and Kerberos authentication.	
	kafka/hadoop.<System domain name>	Randomly generated by the system	Used for security authentication of Kafka.	
	storm/hadoop.<System domain name>	Randomly generated by the system	Storm system startup user.	
	storm_zk/hadoop.<System domain name>	Randomly generated by the system	Used for the Worker process to access ZooKeeper.	
	flink/hadoop.<System domain name>	Randomly generated by the system	Internal user of the Flink service.	
	check_ker_M	Randomly generated by the system	User who performs a system internal test about whether the Kerberos service is normal.	

User Type	Default User	Initial Password	Description	Password Change Method
	cdl/ hadoop.< <i>System domain name</i> >	Randomly generated by the system	Internal user of the CDL service.	
	clickhouse/ hadoop.< <i>System domain name</i> >	Randomly generated by the system	Used for security authentication of ClickHouse. This user is an internal user and can be used only in the cluster.	
	default	None	ClickHouse internal user, which is an administrator user that can be used only in non-security mode.	
	rangeradmin/ hadoop.< <i>System domain name</i> >	Randomly generated by the system	Ranger system startup user, which is used for authentication between internal components.	
	tez	Randomly generated by the system	User for TezUI system startup, Kerberos authentication, and access to Yarn	
	K/M	Randomly generated by the system	Kerberos internal functional user. It cannot be deleted, and its password cannot be changed. This internal account can only be used on nodes where Kerberos service is installed.	None
	kadmin/ changepw	Randomly generated by the system		
	kadmin/ history	Randomly generated by the system		

User Type	Default User	Initial Password	Description	Password Change Method
	krbtgt< <i>System domain name</i> >	Randomly generated by the system		
LDAP user	admin	None	FusionInsight Manager administrator. The primary group is <b>compcommon</b> , which does not have the group permission but has the permission of the <b>Manager_administrator</b> role.	The LDAP user cannot log in to the system, and the password cannot be changed.
	backup		The primary group is <b>compcommon</b> .	
	backup/manager		The primary group is <b>compcommon</b> .	
	oms		The primary group is <b>compcommon</b> .	
	oms/manager		The primary group is <b>compcommon</b> .	
	clientregis- ter		The primary group is <b>compcommon</b> .	
	zookeeper		The primary group is <b>hadoop</b> .	
	zookeeper/ hadoop.< <i>System domain name</i> >		The primary group is <b>hadoop</b> .	
	zkcli		The primary group is <b>hadoop</b> .	
	zkcli/ hadoop.< <i>System domain name</i> >		The primary group is <b>hadoop</b> .	

User Type	Default User	Initial Password	Description	Password Change Method
	flume		The primary group is <b>hadoop</b> .	
	flume_server		The primary group is <b>hadoop</b> .	
	hdfs		The primary group is <b>hadoop</b> .	
	hdfs/ hadoop.<System domain name>		The primary group is <b>hadoop</b> .	
	mapred		The primary group is <b>hadoop</b> .	
	mapred/ hadoop.<System domain name>		The primary group is <b>hadoop</b> .	
	mr_zk		The primary group is <b>hadoop</b> .	
	mr_zk/ hadoop.<System domain name>		The primary group is <b>hadoop</b> .	
	hue		The primary group is <b>supergroup</b> .	
	hive		The primary group is <b>hive</b> .	
	hive/ hadoop.<System domain name>		The primary group is <b>hive</b> .	
	hbase		The primary group is <b>hadoop</b> .	

User Type	Default User	Initial Password	Description	Password Change Method
	hbase/ hadoop.< <i>System domain name</i> >		The primary group is <b>hadoop</b> .	
	thrift		The primary group is <b>hadoop</b> .	
	thrift/ hadoop.< <i>System domain name</i> >		The primary group is <b>hadoop</b> .	
	oozie		The primary group is <b>hadoop</b> .	
	hbase/ zkclient.< <i>System domain name</i> >		The primary group is <b>hadoop</b> .	
	loader		The primary group is <b>hadoop</b> .	
	loader/ hadoop.< <i>System domain name</i> >		The primary group is <b>hadoop</b> .	
	spark2x		The primary group is <b>hadoop</b> .	
	spark2x/ hadoop.< <i>System domain name</i> >		The primary group is <b>hadoop</b> .	
	spark_zk		The primary group is <b>hadoop</b> .	
	kafka		The primary group is <b>kafkaadmin</b> .	

User Type	Default User	Initial Password	Description	Password Change Method
	kafka/ hadoop.< <i>System domain name</i> >		The primary group is <b>kafkaadmin</b> .	
	storm		The primary group is <b>stormadmin</b> .	
	storm/ hadoop.< <i>System domain name</i> >		The primary group is <b>stormadmin</b> .	
	storm_zk		The primary group is <b>storm</b> .	
	storm_zk/ hadoop.< <i>System domain name</i> >		The primary group is <b>storm</b> .	
	kms/ hadoop		The primary group is <b>kmsadmin</b> .	
	knox		The primary group is <b>compcommon</b> .	
	executor		The primary group is <b>compcommon</b> .	
	rangeradmin		The primary group is <b>supergroup</b> .	
	rangeradmin/ hadoop.< <i>System domain name</i> >		The primary group is <b>supergroup</b> .	
	rangeruser sync		The primary group is <b>supergroup</b> .	
	rangertags ync		The primary group is <b>supergroup</b> .	
	rangeraudi tor		The primary group is <b>compcommon</b> .	

 NOTE

Log in to FusionInsight Manager, choose **System > Permission > Domain and Mutual Trust**, and check the value of **Local Domain**. In the preceding table, all letters in the system domain name contained in the username of the system internal user are lowercase letters.

For example, if **Local Domain** is set to **9427068F-6EFA-4833-B43E-60CB641E5B6C.COM**, the username of default HDFS startup user is **hdfs/hadoop.9427068f-6efa-4833-b43e-60cb641e5b6c.com**.

## Database Users

The system database users include OMS database users and DBService database users.

Database Type	Default User	Initial Password	Description	Password Change Method
OMS database	ommdba	<ul style="list-style-type: none"> <li>• V e r s i o n s e a r l i e r t h a n M R S 3. 2. 0: <b>d b C h a n g e M e @ 1 2 3 4 5 6</b></li> <li>• M R S 3. 2. 0 0</li> </ul>	OMS database administrator who performs maintenance operations, such as creating, starting, and stopping.	For details, see <a href="#">Changing the Password of the OMS Database Administrator</a> .

Database Type	Default User	Initial Password	Description	Password Change Method
		r l a t e r: r a n d o m p a s s w o r d		

Database Type	Default User	Initial Password	Description	Password Change Method
	omm	<ul style="list-style-type: none"> <li data-bbox="675 434 737 1666">Versions earlier than MR S 3.2.0: <b>C h a n g e M e @ 1 2 3 4 5 6</b></li> <li data-bbox="675 1682 737 1973">MR S 3.2.0 or later</li> </ul>	User for accessing OMS database data	For details, see <a href="#">Changing the Password for the Data Access User of the OMS Database.</a>

Database Type	Default User	Initial Password	Description	Password Change Method
		a t e r: r a n d o m p a s s w o r d		

Database Type	Default User	Initial Password	Description	Password Change Method
DBService database	omm	<ul style="list-style-type: none"> <li>• Versions earlier than MRS 3.1.2: <code>dbserverAdmin@123</code></li> <li>• MRS 3.2.0 or later</li> </ul>	Administrator of the GaussDB database in the DBService component	<ul style="list-style-type: none"> <li>• For versions earlier than MRS 3.1.2, see <a href="#">Changing the Password for a Component Database User</a>.</li> <li>• The initial password cannot be changed in MRS 3.1.2 or later.</li> </ul>

Database Type	Default User	Initial Password	Description	Password Change Method
		r l a t e r: r a n d o m p a s s w o r d		
	compdb user	Ran dom pass wor d	MRS 3.1.2 or later: Administrator of the GaussDB database in the DBService component. It is used in service O&M scenarios. If the password of this account has expired, you need to reset the password upon your first login.	For details, see <a href="#">Changing the Password for User compdbuser of the DBService Database.</a>
	hetu	Ran dom pass wor d	User for HetuEngine to connect to the DBService database <b>hetumeta</b> . This user exists only in MRS 3.1.2 or later.	<ul style="list-style-type: none"> <li>• For versions earlier than MRS 3.1.2, see <a href="#">Changing the Password for a Component Database User.</a></li> <li>• For MRS 3.1.2 or later, see <a href="#">Resetting the Component Database User Password.</a></li> </ul>

Database Type	Default User	Initial Password	Description	Password Change Method
	hive	<ul style="list-style-type: none"> <li>• Versions earlier than MR S 3.1.2: Hive User @</li> <li>• MR S 3.1.2 or later: ran</li> </ul>	User for Hive to connect to the DBService database <b>hivemeta</b> .	

Database Type	Default User	Initial Password	Description	Password Change Method
		d o m p a s s w o r d		

Database Type	Default User	Initial Password	Description	Password Change Method
	hue	<ul style="list-style-type: none"> <li>• Versions earlier than MR S 3.1.2: Hue User@123</li> <li>• MR S 3.1.2 or later:</li> </ul>	User for Hue to connect to the DBService database <b>hue</b> .	

Database Type	Default User	Initial Password	Description	Password Change Method
		r a n d o m p a s s w o r d		

Database Type	Default User	Initial Password	Description	Password Change Method
	sqoop	<ul style="list-style-type: none"> <li>Version earlier than MRSS 3.1.2: SqoopUser@</li> <li>MRSS 3.1.2 or later: r</li> </ul>	User for Loader to connect to the DBService database <b>sqoop</b> .	

Database Type	Default User	Initial Password	Description	Password Change Method
		a n d o m p a s s w o r d		

Database Type	Default User	Initial Password	Description	Password Change Method
	oozie	<ul style="list-style-type: none"> <li>• Versions earlier than MR S 3.1.2: Oozie User @</li> <li>• MR S 3.1.2 or later: ra</li> </ul>	User for Oozie to connect to the DBService database <b>oozie</b> .	

Database Type	Default User	Initial Password	Description	Password Change Method
		n d o m p a s s w o r d		

Database Type	Default User	Initial Password	Description	Password Change Method
	rangera dmin	<ul style="list-style-type: none"> <li>• Versions earlier than MR S 3.1.2: Admin12!</li> <li>• MR S 3.1.2 or later: ran</li> </ul>	User for Ranger to connect to the DBService database.	

Database Type	Default User	Initial Password	Description	Password Change Method
		d o m p a s s w o r d		
	kafkaui	Random password	User for Kafka UI to connect to the DBService database. This user exists only in MRS 3.1.2 or later.	
	flink	Random password	User for Flink to connect to the DBService database. This user exists only in MRS 3.1.2 or later.	
	cdl	Random password	User for CDL to connect to the DBService database <b>cdl</b> . This user exists only in MRS 3.2.0 or later.	

### 8.11.1.6 Default Permission Information

#### Role

Default Role	Description
Manager_administrator	Manager administrator who has all permissions for Manager.  Manager administrators can create first-level tenants, create and modify user groups, and specify user permissions.
Manager_operator	Manager operator who has all the permissions on the <b>Homepage</b> , <b>Cluster</b> , <b>Hosts</b> , and <b>O&amp;M</b> tab pages.

Default Role	Description
Manager_auditor	Manager auditor who has all permissions on the <b>Audit</b> tab page. Manager auditors can view and manage Manager system audit logs.
Manager_viewer	Manager viewer who has the permission to view information about <b>Homepage, Cluster, Hosts, Alarm, Events</b> , and <b>System &gt; Permission</b> , and download clients. (Only MRS 3.2.0 or later supports client download.)
Manager_tenant	Manager tenant administrator. This role can create and manage sub-tenants for the non-leaf tenants to which the current user belongs. It has the permission to view alarms and events on <b>O&amp;M &gt; Alarm</b> .
System_administrator	System administrator, this role has Manager system administrator rights and all services administrator rights.
default	This role is the default role created for the <b>default</b> tenant. It has the management permissions on the Yarn component and the default queue. The default role of the default tenant that is not the first cluster to be installed is <b>c&lt;cluster ID&gt;_default</b> .
Manager_administrator_180	FusionInsight Manager System administrator group. Internal system user group, which is used only between components.
Manager_auditor_181	FusionInsight Manager system auditor group. Internal system user group, which is used only between components.
Manager_operator_182	FusionInsight Manager system operator group. Internal system user group, which is used only between components.
Manager_viewer_183	FusionInsight Manager system viewer group. Internal system user group, which is used only between components.
System_administrator_186	System administrator group. Internal system user group, which is used only between components.
Manager_tenant_187	Tenant system user group. Internal system user group, which is used only between components.
default_1000	This group is created for tenant. Internal system user group, which is used only between components.

## User group

Type	Default User Group	Description
OS User Group	hadoop	Users added to this group are granted the permission to submit all Yarn queue tasks.
	hadoopmanager	Users added to this user group can have the O&M manager rights of HDFS and Yarn. The O&M manager of HDFS can access the NameNode WebUI and perform active to standby switchover manually. The O&M manager of Yarn can access the ResourceManager WebUI, operate NodeManager nodes, refresh queues, and set node labels, but cannot submit tasks.
	hetuadmin	HetuEngine administrator group. Users in this group have the permission to perform operations on HSConsole.
	hive	Common user group. Hive users must belong to this user group.
	iotdbgroup	Users added to this user group have the administrator rights of the IoTDB component.
	kafka	Kafka common user group. A user in this group can access a topic only when a user in the kafkaadmin group grants the read and write permission of the topic to the user.
	kafkaadmin	Kafka administrator group. Users in this group have the rights to create, delete, authorize, read, and write all topics.
	kafkasuperuser	Topic read/write user group of Kafka. Users added to this group have the read and write permissions on all topics.
	cdladmin	CDL administrator group. Only users in this group can access CDL APIs.
	cdl	Common user group of CDL. Users in this group can create and query CDL jobs.
	storm	Users who are added to the storm user group can submit topologies and manage their own topologies.
	stormadmin	Users who are added to the stormadmin user group can have the storm administrator rights and can submit topologies and manage all topologies.
	supergroup	Users added to this user group have the administrator rights of HBase, HDFS, and Yarn and can use Hive.
yarnviewgroup	Indicates the read-only user group of the Yarn task. Users in this user group can have the view permission on Yarn and MapReduce tasks.	

Type	Default User Group	Description
	check_sec_ldap	Perform internal test on the active LDAP to see whether it works properly. This user group is generated randomly in a test and automatically deleted after the test is complete. Internal system user group, which is used only between components.
	compcommon	System internal group for accessing cluster system resources. All system users and system running users are added to this user group by default.
OS User Group	wheel	Primary group of the FusionInsight internal running user omm.
	ficommon	System common group that corresponds to <b>compcommon</b> for accessing cluster common resource files stored in the OS.

 **NOTE**

If the current cluster is not the cluster that is installed for the first time in FusionInsight Manager, the default user group name of all components except Manager in the cluster is *c<cluster ID>\_ default user group name*, for example, **c2\_hadoop**.

## User

For details, see [User Account List](#).

### Service-related User Security Parameters

- **HDFS**  
The **dfs.permissions.superusergroup** parameter specifies the administrator group with the highest permission on the HDFS. The default value is **supergroup**.
- **Spark2x**  
The **spark.admin.acls** parameter specifies the administrator list of the Spark2x. Members in the list are authorized to manage all Spark tasks. Users not added in the list cannot manage all Spark tasks. The default value is **admin**.

#### 8.11.1.7 FusionInsight Manager Security Functions

You can query and set user rights data through the following FusionInsight Manager modules:

- User management: Users can be added, deleted, modified, queried, bound to user groups, and assigned with roles.

For details, see [Managing Users](#).

- User group management: User groups can be added, deleted, modified, queried, and bound to roles.  
For details, see [Managing User Groups](#).
- Role management: Roles can be added, deleted, modified, queried, and assigned with the resource access rights of one or multiple components.  
For details, see [Managing Roles](#).
- Tenant management: Tenants can be added, deleted, modified, queried, and bound to component resources. FusionInsight generates a role for each tenant to facilitate management. If a tenant is assigned with the rights of some resources, its corresponding role also has these rights.  
For details, see [Tenant Resources](#).

## 8.11.2 Account Management

### 8.11.2.1 Account Security Settings

#### 8.11.2.1.1 Unlocking LDAP Users and Management Accounts

##### Scenario

If the LDAP user **cn=pg\_search\_dn,ou=Users,dc=hadoop,dc=com** and LDAP management accounts **cn=krbkdc,ou=Users,dc=hadoop,dc=com** and **cn=krbadmin,ou=Users,dc=hadoop,dc=com** are locked, the administrator must unlock these accounts.

##### NOTE

If you input an incorrect password for the LDAP user or management account for five consecutive times, the LDAP user or management account is locked. The account is automatically unlocked after 5 minutes.

##### Procedure

**Step 1** Log in to the active management node as user **omm**.

**Step 2** Run the following command to go to the related directory:

```
cd ${BIGDATA_HOME}/om-server/om/ldapserver/ldapserver/local/script
```

**Step 3** Run the following command to unlock the LDAP user or management account:

```
./ldapserver_unlockUsers.sh USER_NAME
```

In the command, *USER\_NAME* indicates the name of the user to be unlocked.

For example, to unlock the LDAP management **account** **cn=krbkdc,ou=Users,dc=hadoop,dc=com**, run the following command:

```
./ldapserver_unlockUsers.sh krbkdc
```

After the script is executed, enter the password of user **krbkdc** after **ROOT\_DN\_PASSWORD**. If the following information is displayed, the account is successfully unlocked.

Unlock user krbkdc successfully.

----End

### 8.11.2.1.2 Internal an Internal System User

#### Scenario

If the service is abnormal, the internal user of the system may be locked. Unlock the user promptly, or the cluster cannot run properly. For the list of system internal users, see [User Account List](#) in . The internal user of the system cannot be unlocked using FusionInsight Manager.

#### Prerequisites

Obtain the default password of the LDAP administrator `cn=root,dc=hadoop,dc=com` by referring to [User Account List](#) in .

#### Procedure

**Step 1** Use the following method to confirm whether the internal system username is locked:

1. Oldap port number obtaining method:
  - a. Log in to FusionInsight Manager, choose **System > OMS > oldap > Modify Configuration**.
  - b. The **LDAP Listening Port** parameter value is **oldap port**.
2. Domain name obtaining method:
  - a. Log in to FusionInsight Manager, choose **System > Permission > Domain and Mutual Trust**.
  - b. The **Local Domain** parameter value is the domain name.  
For example, the domain name of the current system is **9427068F-6EFA-4833-B43E-60CB641E5B6C.COM**.
3. Run the following command on each node in the cluster as user **omm** to query the number of password authentication failures:

```
ldapsearch -H ldaps://OMS Floating IP Address:Oldap port -LLL -x -D
cn=root,dc=hadoop,dc=com -b krbPrincipalName=Internal system
username@Domain name,cn=Domain
name,cn=krbcontainer,dc=hadoop,dc=com -w Password of LDAP
administrator -e ppolicy | grep krbLoginFailedCount
```

#### NOTE

To obtain the floating IP address of OMS, log in to the Master2 node remotely, and run the **ifconfig** command. In the command output, **eth0:wsom** indicates the floating IP address of OMS. Record the value of **inet**. If the floating IP address of OMS cannot be queried on the Master2 node, switch to the Master1 node to query and record the floating IP address. If there is only one Master node, query and record the IP address on the Master node.

For example, run the following command to check the number of password authentication failures for user **oms/manager**:

```
ldapsearch -H ldaps://10.5.146.118:21750 -LLL -x -D
cn=root,dc=hadoop,dc=com -b krbPrincipalName=oms/
```

```
manager@9427068F-6EFA-4833-
B43E-60CB641E5B6C.COM,cn=9427068F-6EFA-4833-
B43E-60CB641E5B6C.COM,cn=krbcontainer,dc=hadoop,dc=com -w
Password of user cn=root,dc=hadoop,dc=com -e ppolicy | grep
krbLoginFailedCount
```

```
krbLoginFailedCount: 5
```

4. Log in to FusionInsight Manager, choose **System > Permission > Security Policy > Password Policy**.
5. Check the value of the **Password Retries** parameter. If the value is less than or equal to the value of **krbLoginFailedCount**, the user is locked.

#### NOTE

You can also check whether internal users are locked by viewing operations logs.

- Step 2** Log in to the active management node as user **omm** and run the following command to unlock the user:

```
sh ${BIGDATA_HOME}/om-server/om/share/om/acs/config/unlockuser.sh --
userName Internal system username
```

Example: `sh ${BIGDATA_HOME}/om-server/om/share/om/acs/config/  
unlockuser.sh --userName oms/manager`

----End

### 8.11.2.1.3 Enabling and Disabling Permission Verification on Cluster Components

#### Scenario

HDFS and ZooKeeper verify the permission of users who attempt to access the services in both security and normal clusters by default. Users without related permission cannot access resources in HDFS and ZooKeeper. When the cluster is deployed in normal mode, HBase and YARN do not verify the permission of users who attempt to access the services by default. All users can access resources in HBase and YARN.

Based on actual service requirements, administrators can enable permission verification on HBase and YARN or disable permission verification on HDFS and ZooKeeper in normal clusters.

#### Impact on the System

After the enabling and disabling operations, the service configuration will expire. You need to restart the corresponding service for the configuration to take effect.

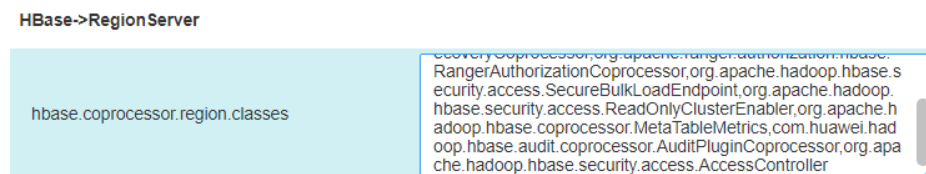

#### Enabling Permission Verification on HBase

- Step 1** Log in to FusionInsight Manager.
- Step 2** Click **Cluster**, click the name of the desired cluster, choose **Services > HBase**, and click **Configurations**.
- Step 3** Click **All Configurations**.

**Step 4** Search for parameters **hbase.coprocessor.region.classes**, **hbase.coprocessor.master.classes**, and **hbase.coprocessor.regionserver.classes**.

Add the coprocessor parameter **org.apache.hadoop.hbase.security.access.AccessController** to the end of the values of the preceding parameters, and use a comma (,) to separate the values from those of the original coprocessors. The **hbase.coprocessor.region.classes** parameter is used as an example.

**Figure 8-62** hbase.coprocessor.region.classes

**Step 5** Click **Save**, click **OK**, and wait for message "Operation successful" to display.

----End

## Disabling Permission Verification on HBase

### NOTE

After HBase permission verification is disabled, the existing permission data will be retained. If you want to delete permission information, disable permission verification, enter the HBase shell, and delete table **hbase:acl**.

**Step 1** Log in to FusionInsight Manager.

**Step 2** Click **Cluster**, click the name of the desired cluster, choose **Services > HBase**, and click **Configurations**.

**Step 3** Click **All Configurations**.

**Step 4** Search for parameters **hbase.coprocessor.region.classes**, **hbase.coprocessor.master.classes**, and **hbase.coprocessor.regionserver.classes**.

Delete the coprocessor parameter **org.apache.hadoop.hbase.security.access.AccessController**.

**Step 5** Click **Save**, click **OK**, and wait for message "Operation successful" to display.

----End

## Disabling Permission Verification on HDFS

**Step 1** Log in to FusionInsight Manager.

**Step 2** Click **Cluster**, click the name of the desired cluster, choose **Services > HDFS**, and click **Configurations**.

**Step 3** Click **All Configurations**.

**Step 4** Search for parameters **dfs.namenode.acls.enabled** and **dfs.permissions.enabled**.

- **dfs.namenode.acls.enabled** indicates whether to enable HDFS ACL. The default value is **true**, indicating that the ACL is enabled. Change the value to **false**.
- **dfs.permissions.enabled** indicates whether to enable permission check for HDFS. The default value is **true**, indicating that permission check is enabled. Change the value to **false**. After the modification, the owner, owner group, and permission of the directories and files in HDFS remain unchanged.

**Step 5** Click **Save**, click **OK**, and wait for message "Operation successful" to display.

----End

## Enabling Permission Verification on YARN

**Step 1** Log in to FusionInsight Manager.

**Step 2** Click **Cluster**, click the name of the desired cluster, choose **Services > Yarn**, and click **Configurations**.

**Step 3** Click **All Configurations**.

**Step 4** Search for parameter **yarn.acl.enable**.

**yarn.acl.enable** indicates whether to enable the permission check for YARN.

- In normal clusters, the value is set to **false** by default to disable permission check. To enable permission check, change the value to **true**.
- In security clusters, the value is set to **true** by default to enable authentication.

**Figure 8-63** Setting the yarn.acl.enable parameter

**Step 5** Click **Save**, click **OK**, and wait for message "Operation successful" to display.

----End

## Disabling Permission Verification on ZooKeeper

**Step 1** Log in to FusionInsight Manager.

**Step 2** Click **Cluster**, click the name of the desired cluster, choose **Services > ZooKeeper**, and click **Configurations**.

**Step 3** Click **All Configurations**.

**Step 4** Search for parameter **skipACL**.

**skipACL** indicates whether to skip the ZooKeeper permission check. The default value is **no**, indicating that permission check is enabled. Change the value to **yes**.

**Figure 8-64** Setting the skipACL parameter

**Step 5** Click **Save**, click **OK**, and wait for message "Operation successful" to display.

----End

### 8.11.2.1.4 Logging In to a Non-Cluster Node Using a Cluster User in Normal Mode

#### Scenario

When the cluster is installed in normal mode, the component clients do not support security authentication and cannot use the **kinit** command. Therefore, nodes outside the cluster cannot use users in the cluster by default. This may result in a user authentication failure when one of these nodes access a component server.

The node administrator can configure a user who has the same name as that of a user for a node outside the cluster, allow the user to log in to the node using the SSH protocol, and connect to the servers of components in the cluster by using the user who logs in to the OS.

#### Prerequisites

- Nodes outside the cluster can connect to the service plane of the cluster.
- The KrbServer service of the cluster is running properly.
- You have obtained the password of user **root** of the node outside the cluster.
- A human-machine user has been planned and added to the cluster, and you have obtained the authentication credential file. For details, see [Creating a User](#) and [Exporting an Authentication Credential File](#).

#### Procedure

**Step 1** Log in to the node where a user is to be added as user **root**.

**Step 2** Run the following command:

```
rpm -qa | grep pam and rpm -qa| grep krb5-client
```

The following RPM packages are displayed:

```
pam_krb5-32bit-2.3.1-47.12.1
pam-modules-32bit-11-1.22.1
yast2-pam-2.17.3-0.5.211
pam-32bit-1.1.5-0.10.17
pam_mount-32bit-0.47-13.16.1
pam-config-0.79-2.5.58
pam_krb5-2.3.1-47.12.1
pam-doc-1.1.5-0.10.17
pam-modules-11-1.22.1
pam_mount-0.47-13.16.1
pam_ldap-184-147.20
pam-1.1.5-0.10.17
krb5-client-1.6.3
```

**Step 3** Check whether the RPM packages in the list are installed in the OS.

- If yes, go to [Step 5](#).
- If no, go to [Step 4](#).

**Step 4** Obtain the lacked RPM packages from the OS image, upload the files to the current directory, and run the following command to install the RPM package:

```
rpm -ivh *.rpm
```

 NOTE

The RPM packages to be installed may bring security risks. The risks that may be brought by the installation of these RPM packages must be taken into consideration during OS hardening.

After the RPM packages are installed, go to [Step 5](#).

**Step 5** Run the following command to configure Kerberos authentication on PAM:

```
pam-config --add --krb5
```

 NOTE

If you need to cancel Kerberos authentication and system user login on a non-cluster node, run the `pam-config --delete --krb5` command as user **root**.

**Step 6** Decompress the authentication credential file to obtain **krb5.conf**, use WinSCP to upload this configuration file to the **/etc** directory on the node outside the cluster, and run the following command to configure related permission to enable other users to access the file, such as permission **604**:

```
chmod 604 /etc/krb5.conf
```

**Step 7** Run the following command in the connection session as user **root** to add the corresponding OS user to the human-machine user, and specify **root** as the primary group.

The OS user password is the same as the initial password when the human-machine user is created on Manager.

```
useradd User name -m -d /home/admin_test -g root -s /bin/bash
```

For example, if the name of the human-machine user is **admin\_test**, run the following command:

```
useradd admin_test -m -d /home/admin_test -g root -s /bin/bash
```

 NOTE

When you use the newly added OS user to log in to the node by using the SSH protocol for the first time, the system prompts that the password has expired after you enter the user password, and the system prompts that the password needs to be changed after you enter the user password again. You need to enter a new password that meets the password complexity requirements of both the node OS and the cluster.

----End

## 8.11.2.2 Changing the Password for a System User

### 8.11.2.2.1 Changing the Password for User admin

#### Scenario

User **admin** is the system administrator account of FusionInsight Manager. You are advised to periodically change the password on FusionInsight Manager to improve system security.

## Procedure

**Step 1** Log in to FusionInsight Manager.

User **admin** is required for login.

**Step 2** Move the cursor to **Hello, admin** in the upper right corner of the page.

In the displayed menu, click **Change Password**.

**Step 3** Set **Old Password**, **New Password**, and **Confirm Password**, and click **OK**.

The password must meet the following complexity requirements:

- Contains 8 to 64 characters.
- Contains at least four types of the following: uppercase letters, lowercase letters, numbers, spaces, and special characters (~`!?,;:\_'(){}/<>@#\$\$%^&\*+|\=).
- Cannot be the same as the username or the username spelled backwards.
- Cannot be a common easily-cracked password.
- Cannot be the same as the password used in the last *N* times. *N* indicates the value of **Repetition Rule** in [Configuring Password Policies](#).

----End

### 8.11.2.2.2 Changing the Password for an OS User

#### Scenario

During FusionInsight Manager installation, the system automatically creates user **omm** and **ommdba** on each node in the cluster. Periodically change the login passwords of the OS users **omm** and **ommdba** of the cluster node to improve the system O&M security.

The passwords of users **omm** and **ommdba** of the nodes can be different.

#### Prerequisites

- You have obtained the IP address of the node where the passwords of users **omm** and **ommdba** are to be changed.
- You have obtained the password of user **root** before changing the passwords of users **omm** and **ommdba**.

### Changing the Password of an OS User

**Step 1** Log in to the node where the password is to be changed as user **root**.

**Step 2** Run the following command to change the user password:

```
passwd ommdba
```

The command output in Red Hat is as follows:

```
Changing password for user ommdba.
New password:
```

**Step 3** Enter a new password. The policy for changing the password of an OS user varies according to the OS that is actually used.

```
Retype New Password:
Password changed.
```

----End

### 8.11.2.3 Changing the Password for a System Internal User

#### 8.11.2.3.1 Changing the Password for the Kerberos Administrator

##### Scenario

It is recommended that the administrator periodically change the password of Kerberos administrator **kadmin** to improve the system O&M security.

If the user password is changed, the OMS Kerberos administrator password is changed as well.

##### Prerequisites

You have installed the client on any node in the cluster and obtained the IP address of the node.

##### Procedure

**Step 1** Log in to the node where the client is installed as user **root**.

**Step 2** Run the following command to go to the client directory, for example, **/opt/hadoopclient**:

```
cd /opt/hadoopclient
```

**Step 3** Run the following command to set environment variables:

```
source bigdata_env
```

**Step 4** Run the following command to change the password for **kadmin/admin**. The password change takes effect on all servers. Keep the password secure because it cannot be retrieved once lost.

```
kpasswd kadmin/admin
```

Enter the password (default password: **Admin@123**) and set a new password. The new password must meet the following complexity requirements:

- Contains at least 8 characters.
- Contains at least four types of the following: uppercase letters, lowercase letters, numbers, spaces, and special characters (`~`!?,;:_'(){}[]/<>@#$$%^&*+|\=`).
- Cannot be the same as the username or the username spelled backwards.
- Cannot be a common easily-cracked password, for example, **Admin@12345**.
- Cannot be the same as the password used in the last *N* times. *N* indicates the value of **Repetition Rule** in [Configuring Password Policies](#).

----End

### 8.11.2.3.2 Changing the Password for the OMS Kerberos Administrator

#### Scenario

It is recommended that the administrator periodically change the password of OMS Kerberos administrator **kadmin** to improve the system O&M security.

If the user password is changed, the Kerberos administrator password is changed as well.

#### Procedure

**Step 1** Log in to any management node in the cluster as user **omm**.

**Step 2** Run the following command to go to the related directory:

```
cd ${BIGDATA_HOME}/om-server/om/meta-0.0.1-SNAPSHOT/kerberos/scripts
```

**Step 3** Run the following command to set environment variables:

```
source component_env
```

**Step 4** Run the following command to change the password for **kadmin/admin**. This operation takes effect for all servers. Keep the password secure because it cannot be retrieved once lost.

```
kpasswd kadmin/admin
```

Enter the password (default password: **Admin@123**) and set a new password. The new password must meet the following complexity requirements:

- Contains at least 8 characters.
- Contains at least four types of the following: uppercase letters, lowercase letters, numbers, and special characters (`~!?,;-'(){}/<>@#$$%^&*+|\=`).
- Cannot be the same as the username or the username spelled backwards.
- Cannot be a common easily-cracked password, for example, **Admin@12345**.
- Cannot be the same as the password used in the last *N* times. *N* indicates the value of **Repetition Rule** in [Configuring Password Policies](#).

----End

### 8.11.2.3.3 Changing the Passwords of the LDAP Administrator and the LDAP User (Including OMS LDAP)

#### NOTE

This section applies only to MRS 3.1.0. For later versions, see [Modifying OMS Service Configuration Parameters](#).

#### Scenario

It is recommended that the administrator periodically changes the passwords of LDAP administrator **cn=root,dc=hadoop,dc=com** and LDAP user **cn=pg\_search\_dn,ou=Users,dc=hadoop,dc=com** to improve the system O&M security.

If the passwords are changed, the password of the OMS LDAP administrator or user is changed as well.

#### NOTE

If the cluster is upgraded from an early version to a latest version, the LDAP administrator password will inherit the password policy of the old cluster. To ensure system security, you are advised to change the password after the cluster upgrade.

## Impact on the System

- Changing the user password of the LdapServer service is a high-risk operation and requires restarting the KrbServer and LdapServer services. If KrbServer is restarted, users may fail to be queried by running the **id** command on nodes in the cluster temporarily. Therefore, exercise caution when restarting KrbServer.
- After the password of LDAP user **cn=pg\_search\_dn,ou=Users,dc=hadoop,dc=com** is changed, the user may be locked in the LDAP component. Therefore, you are advised to unlock the user after changing the password. For details about how to unlock the user, see [Unlocking LDAP Users and Management Accounts](#).

## Prerequisites

Before changing the password of LDAP user **cn=pg\_search\_dn,ou=Users,dc=hadoop,dc=com**, ensure that the user is not locked by running the following command on the active management node of the cluster:

#### NOTE

To query the OLdap port number, perform the following steps:

1. Log in to FusionInsight Manager, choose **System > OMS > oldap > Modify Configuration**:
2. The value of **LDAP Service Listening Port** is the OLDAP port.

```
ldapsearch -H ldaps://Floating IP address of OMS:OLDAP port-LLL -x -D
cn=pg_search_dn,ou=Users,dc=hadoop,dc=com -W -b
cn=pg_search_dn,ou=Users,dc=hadoop,dc=com -e ppolicy
```

Enter the password of the LDAP user **pg\_search\_dn**. If the following information is displayed, the user is locked. In this case, unlock the user. For details, see [Unlocking LDAP Users and Management Accounts](#).

#### NOTE

The password of the LDAP user **pg\_search\_dn** is randomly generated by the system. You can obtain the password from the **/etc/sss/sss.conf** or **/etc/ldap.conf** file on the active node.

```
ldap_bind: Invalid credentials (49); Account locked
```

## Procedure

- Step 1** Log in to FusionInsight Manager, click **Cluster**, click the name of the desired cluster, and choose **Service > LdapServer**.

**Step 2** Choose **More > Change Database Password**. In the displayed dialog box, enter the password of the current login user and click **OK**.

**Step 3** In the **Change Password** dialog box, select the user whose password to be modified in the **User Information** drop-down box.

**Step 4** Enter the old password in the **Old Password** text box, and enter the new password in the **New Password** and **Confirm Password** text boxes.

The password must meet the following complexity requirements:

- Contains 16 to 32 characters.
- Contains at least three types of the following: uppercase letters, lowercase letters, numbers, spaces, and special characters (~!@#%&^&#x27;()\*-\_=+[]{};,<.>/?).
- Cannot be the same as the username or the username spelled backwards.
- Cannot be the same as the current password.

**Step 5** Select **I have read the information and understood the impact** and click **OK** to confirm the modification and restart the service.

----End

### 8.11.2.3.4 Changing the Password for the LDAP Administrator

#### NOTE

This section applies only to MRS 3.1.0. For later versions, see [Modifying OMS Service Configuration Parameters](#).

## Scenario

It is recommended that the administrator periodically changes the passwords of LDAP administrator accounts **cn=krbkdc,ou=Users,dc=hadoop,dc=com** and **cn=krbadmin,ou=Users,dc=hadoop,dc=com** to improve the system O&M security.

## Impact on the System

- You need to restart the KrbServer service after changing the password.
- After the password is changed, check whether the LDAP administrator accounts **cn=krbkdc,ou=Users,dc=hadoop,dc=com** and **cn=krbadmin,ou=Users,dc=hadoop,dc=com** are locked, run the following command on the active management node of the cluster to check whether **krbkdc** is locked (the method for user **krbadmin** is similar):

#### NOTE

OLdap port number obtaining method:

1. Log in to FusionInsight Manager, choose **System > OMS > oldap > Modify Configuration**:
2. The **LDAP Listening Port** parameter value is **oldap port**.

```
ldapsearch -H ldaps://OMS_FLOAT_IP address:OLdap port -LLL -x -D
cn=krbkdc,ou=Users,dc=hadoop,dc=com -W -b
cn=krbkdc,ou=Users,dc=hadoop,dc=com -e ppolicy
```

Enter the password of the LDAP administrator account **krbkdc**. The default password is **LdapChangeMe@123**. If the following message is displayed, the account is locked. For details about how to unlock the account, see [Unlocking LDAP Users and Management Accounts](#).

```
ldap_bind: Invalid credentials (49); Account locked
```

## Prerequisites

You have obtained the management node IP address.

## Procedure

**Step 1** Log in to the active management node as user **omm** with the IP address of the active management node.

**Step 2** Run the following command to go to the related directory:

```
cd ${BIGDATA_HOME}/om-server/om/meta-0.0.1-SNAPSHOT/kerberos/scripts
```

**Step 3** Run the following command to change the password of the LDAP administrator account:

```
./okerberos_modpwd.sh
```

Enter the old password and then enter a new password twice.

The password must meet the following complexity requirements:

- Contains 16 to 32 characters.
- Contains at least three types of the following: uppercase letters, lowercase letters, numbers, spaces, and special characters (`~!@#%&*()-_+=|[]{};,<.>/?`).
- Cannot be the same as the current password.

If the following information is displayed, the password is changed.

```
Modify kerberos server password successfully.
```

**Step 4** Log in to FusionInsight Manager, click **Cluster**, click the name of the desired cluster, and choose **Services > KrbServer**. On the displayed page, choose **More > Restart Service**.

Enter the password and do not select **Restart upper-layer services**. Click **OK** to restart the KrbServer service.

----End

### 8.11.2.3.5 Changing the Password for a Component Running User

#### Scenario

The administrator is advised to periodically change the password for each component running user to improve the system O&M security.

Component running users can be classified into the following two types depending on whether their initial passwords are randomly generated by the system:

- If the initial password of a component running user is randomly generated by the system, the user is of the machine-machine type.
- If the initial password of a component running user is not randomly generated by the system, the user is of the human-machine type.

## Impact on the System

If the initial password is randomly generated by the system, the cluster needs to be restarted for the password changing to take effect. Services are unavailable during the restart.

## Prerequisites

You have installed the client on any node in the cluster and obtained the IP address of the node.

## Procedure

- Step 1** Log in to the node where the client is installed as the client installation user
- Step 2** Run the following command to switch to the client directory, for example, **/opt/client**:

```
cd /opt/client
```

- Step 3** Run the following command to set environment variables:

```
source bigdata_env
```

- Step 4** Run the following command and enter the password of user **kadmin/admin** to log in to the **kadmin** console:

```
kadmin -p kadmin/admin
```

### NOTE

The default password of user **kadmin/admin** is **Admin@123**. The password will expire upon your first login. Change the password as prompted. Keep the password secure because it cannot be retrieved once lost.

- Step 5** Run the following command to change the password of an internal component running user.

```
cpw Internal system username
```

Example: **cpw hdfs**

User **hdfs** is an example. Replace it with the actual username.

The password must meet the following complexity requirements:

- Contains at least 8 characters.
- Contains at least four types of the following: uppercase letters, lowercase letters, numbers, spaces, and special characters (`~`!?,;:_'(){}[]/<>@#$$%^&*+|\=`).
- Cannot be the same as the username or the username spelled backwards.

- Cannot be a common easily-cracked password, for example, **Admin@12345**.
- Cannot be the same as the password used in latest *N* times. *N* indicates the value of **Number of Historical Passwords** configured in [Configuring Password Policies](#). This policy applies to only human-machine accounts.

 **NOTE**

Run the following command to check user information:

```
getprinc Internal system username
```

Example: `getprinc hdfs`

**Step 6** Determine the type of the user whose password needs to be changed.

- If the user is a machine-machine user, go to [Step 7](#).
- If the user is a human-machine user, the password is changed successfully and no further action is required.

**Step 7** Log in to FusionInsight Manager.

**Step 8** On the home page, click  or **More** and click **Restart**.

**Step 9** In the displayed window, enter the password of the current login user and click **OK**.

**Step 10** In the displayed restart confirmation dialog box, click **OK**.

**Step 11** Wait for message "Operation successful" to display.

----End

## 8.11.2.4 Changing the Password for a Database User

### 8.11.2.4.1 Changing the Password of the OMS Database Administrator

#### Scenario

It is recommended that the administrator periodically change the password of the OMS database administrator to improve the system O&M security.

#### Procedure

**Step 1** Log in to the active management node as user **root**.

 **NOTE**

The password of user **ommdba** cannot be changed on the standby management node. Otherwise, the cluster may not work properly. Change the password on the active management node only.

**Step 2** Run the following command to switch to another user:

```
su - omm
```

**Step 3** Run the following command to go to the related directory:

```
cd $OMS_RUN_PATH/tools
```

**Step 4** Run the following command to change the password for user **ommdba**:

```
mod_db_passwd ommdba
```

**Step 5** Enter the old password of user **ommdba** and enter a new password twice.

The password must meet the following complexity requirements:

- Contains 16 to 32 characters.
- Contains at least three types of the following: uppercase letters, lowercase letters, numbers, and special characters (~`!@#\$%^&\*()-+\_=\\[{}];",<.>/?).
- Cannot be the same as the username or the username spelled backwards.
- Cannot be the same as the last 20 historical passwords.

If the following information is displayed, the password is changed.

```
Congratulations, update [ommdba] password successfully.
```

```
----End
```

### 8.11.2.4.2 Changing the Password for the Data Access User of the OMS Database

#### Scenario

It is recommended that the administrator periodically change the password of the user accessing the OMS database to improve the system O&M security.

#### Impact on the System

The OMS service needs to be restarted for the new password to take effect. The service is unavailable during the restart.

#### Procedure

**Step 1** On FusionInsight Manager, choose **System > OMS > gaussDB > Change Password**.

**Step 2** Locate the row where user **omm** is located and click **Change Password** in the **Operation** column.

**Step 3** In the displayed window, enter the password of the current login user and click **OK**.

**Step 4** Enter the old and new passwords as prompted.

The password must meet the following complexity requirements:

- Contains 8 to 32 characters.
- Contains at least three types of the following: uppercase letters, lowercase letters, numbers, and special characters (~`!@#\$%^&\*()-+\_=\\[{}];",<.>/?).
- Cannot be the same as the username or the username spelled backwards.
- Cannot be the same as the last 20 historical passwords.

**Step 5** Click **OK**. Wait until the system displays a message indicating that the operation is successful.

- Step 6** Locate the row where user **omm** is located and click **Restart OMS Service** in the **Operation** column.
- Step 7** In the displayed window, enter the password of the current login user and click **OK**.
- Step 8** In the displayed restart confirmation dialog box, click **OK** to restart the OMS service.
- End

### 8.11.2.4.3 Changing the Password for a Component Database User

#### Scenario

It is recommended that the administrator periodically change the password for each component database user to improve the system O&M security.

#### NOTE

This section applies only to MRS 3.1.0. For versions later than MRS 3.1.0, see [Resetting the Component Database User Password](#).

#### Impact on the System

The services need to be restarted for the new password to take effect. The services are unavailable during the restart.

#### Procedure

- Step 1** On FusionInsight Manager, click **Cluster**, click the name of the desired cluster, and click **Services**.
- Step 2** Click the name of the service whose database user password is to be reset. On the **Dashboard** page displayed, click **Stop Service**.
- In the displayed dialog box, enter the password of the current login user and click **OK**.
- After confirming the impact of stopping the service, wait until the service is stopped.
- Step 3** Click the service whose database user password is to be changed, and choose **More > Change Database Password**. On the displayed page, enter the password of the current login user and click **OK**.
- Step 4** Enter the old and new passwords as prompted.

The password must meet the following complexity requirements:

- Contains 8 to 32 characters.
- Contains at least three types of the following: uppercase letters, lowercase letters, numbers, and special characters (~`!@#\$%^&\*()-+\_=\\|{}];",<.>/?).
- Cannot be the same as the username or the username spelled backwards.
- Cannot be the same as the last 20 historical passwords.

**Step 5** Select **I have read the information and understand the impact** and click **OK**.

**Step 6** After the password is changed, choose **More > Restart Service**. In the displayed dialog box, enter the password of the current login user, click **OK**, and select **Restart the upper-layer services**. Click **OK** to restart the services.

----End

#### 8.11.2.4.4 Resetting the Component Database User Password

##### Scenario

Default passwords for components in the MRS cluster to connect to the DBService database are random. You are advised to periodically reset the passwords of component database users to improve system O&M security.

##### NOTE
