# 1 System-defined Policies/Roles

New IAM users do not have any permissions assigned by default. You need to first **add them to one or more groups**, and then **attach policies or roles to these groups** on the old IAM console. The users then inherit permissions from the groups and can perform specified operations on cloud services based on the permissions they have been assigned.

**Scope:** The projects for which permissions granted to a user group will be applied.

- Global services: Services deployed without specifying physical regions, such as Object Storage Service (OBS) and Content Delivery Network (CDN), are called global services. Permissions for these services must be assigned globally.
- Region-specific projects: Services deployed in specific regions, such as Elastic Cloud Server (ECS) and Bare Metal Server (BMS), are called project-level services. Permissions for these services must be assigned in region-specific projects and will be applied only for specific regions.
- All resources: Permissions will be applied for both global services and all region-specific projects, including projects created later.

**Type:** You can assign users permissions by using roles and policies. Policies are a type of fine-grained authorization mechanism that defines permissions required to perform operations on specific cloud resources under certain conditions. For details, see **Permissions**.

- For services that provide both roles and policies, preferentially use policies to assign permissions.
- For services that support policy-based access control, you can **create custom policies** to supplement system-defined policies to allow or deny access to specific types of resources under certain conditions.

## BASE

| Service | Scope           | Policy/<br>Role<br>Name | Type   | Description                                                                |
|---------|-----------------|-------------------------|--------|----------------------------------------------------------------------------|
| BASE    | Global services | FullAccess              | Policy | Full permissions for all services that support policy-based authorization. |

| Service | Scope           | Policy/<br>Role<br>Name | Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# 2 System-defined Identity Policies

New IAM users do not have any permissions assigned by default. You need to attach identity policies to the users or add them to one or more groups and attach identity policies to these groups on the new IAM console. The users then inherit permissions from the groups and can perform specified operations on cloud services based on the permissions they have been assigned.

IAM provides system-defined identity policies to define common actions supported by cloud services. System-defined identity policies cannot be modified. They can be directly used to assign permissions to users.

If there are no system-defined identity policies for a specific service, it indicates that IAM does not support this service. The administrator can [submit a service ticket](#) and request to register permissions for that service in IAM.

If system-defined identity policies cannot meet your requirements, you can create custom identity policies for more refined access control. For the permissions, resources, and condition keys supported by each service, see [3 Identity Policy-based Authorization](#).

## Global

| Service         | Identity Policy            | Description                                                                                                                                                       |
|-----------------|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global services | ReadOnlyPolicy             | Read-only permissions for all services.                                                                                                                           |
| Global services | AdministratorAccess-Policy | Full permissions for all services.<br><b>NOTE</b><br>All services refer to the <a href="#">cloud services that support identity policies and trust agencies</a> . |

|                                 | EVReadOnlyPolicy                    | Read-only permissions for EVS.                                                                                                                                                                                                                       |
| Cloud Backup and Recovery (CBR) | CBRFullAccessPolicy                 | Administrator permissions for using all vaults, backups, and policies on CBR.                                                                                                                                                                        |
|                                 | CBRReadOnlyPolicy                   | Read-only permissions for CBR.                                                                                                                                                                                                                       |
|                                 | CBRBackupsAndVaultsFullAccessPolicy | Common user permissions for CBR, excluding the permissions for creating, updating, and deleting a policy.                                                                                                                                            |
|                                 | CBRServiceLinkedAgencyPolicy        | Permissions of service-linked agencies for CBR across accounts.                                                                                                                                                                                      |

| Service                     | Identity Policy           | Description                                                                                                    |
|-----------------------------|---------------------------|----------------------------------------------------------------------------------------------------------------|
| Scalable File Service (SFS) | SFSTurboFullAccess-Policy | Administrator permissions for SFS. Users granted these permissions can perform all operations on file systems. |
|                             | SFSTurboReadOnly-Policy   | Read-only permissions for SFS.                                                                                 |

## Networking

| Service                       | Identity Policy            | Description                                                                                                                       |
|-------------------------------|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Virtual Private Cloud (VPC)   | VPCFullAccessPolicy        | Full permissions for VPC.                                                                                                         |
|                               | VPCReadOnlyPolicy          | Read-only permissions for VPC.                                                                                                    |
|                               | VPCConsoleFullAccessPolicy | Permissions for all operations on the VPC console.                                                                                |
|                               | VPCConsoleReadOnlyPolicy   | Read-only permissions for VPC console.                                                                                            |
| Elastic Load Balance (ELB)    | ELBFullAccessPolicy        | Full permissions for ELB.                                                                                                         |
|                               | ELBReadOnlyAccessPolicy    | Read-only permissions for ELB.                                                                                                    |
| NAT Gateway                   | NATFullAccessPolicy        | Full permissions for NAT Gateway.                                                                                                 |
|                               | NATReadOnlyPolicy          | Read-only permissions for NAT Gateway.                                                                                            |
| Direct Connect                | DCAASFullAccessPolicy      | Full permissions for Direct Connect.                                                                                              |
|                               | DCAASReadOnlyPolicy        | Read-only permissions for Direct Connect.                                                                                         |
| Virtual Private Network (VPN) | VPNFullAccessPolicy        | Full permissions for VPN.                                                                                                         |
|                               | VPNReadOnlyPolicy          | Read-only permissions for VPN.                                                                                                    |
| Domain Name Service (DNS)     | DNSFullAccessPolicy        | Administrator permissions for performing all operations (including creating, deleting, querying, and modifying resources) on DNS. |
|                               | DNSReadOnlyAccessPolicy    | Read-only permissions for DNS. Users granted these permissions can only view DNS resources.                                       |
| VPC Endpoint (VPCEP)          | VPCEPFullAccessPolicy      | Full permissions for VPCEP.                                                                                                       |

| Service            | Identity Policy         | Description                                   |
|--------------------|-------------------------|-----------------------------------------------|
|                    | VPCEPReadOnlyPolicy     | Read-only permissions for VPCEP.              |
| Cloud Connect      | CCFullAccessPolicy      | Full permissions for Cloud Connect.           |
|                    | CCReadOnlyPolicy        | Read-only permissions for Cloud Connect.      |
| Enterprise Router  | ERFullAccessPolicy      | Full permissions for Enterprise Router.       |
|                    | ERReadOnlyPolicy        | Read-only permissions for Enterprise Router.  |
| Elastic IP (EIP)   | EIPReadOnlyAccessPolicy | Read-only permissions for EIP.                |
|                    | EIPFullAccessPolicy     | Full permissions for EIP.                     |
| Global Accelerator | GAFullAccessPolicy      | Full permissions for Global Accelerator.      |
|                    | GAReReadOnlyPolicy      | Read-only permissions for Global Accelerator. |

## Containers

| Service                                 | Identity Policy         | Description                    |
|-----------------------------------------|-------------------------|--------------------------------|
| Cloud Container Engine (CCE)            | CCEFullPolicy           | Full permissions for CCE.      |
|                                         | CCEReReadOnlyPolicy     | Read-only permissions for CCE. |
| Cloud Container Instance (CCI)          | CCIFullAccessPolicy     | Full permissions for CCI.      |
|                                         | CCIReReadOnlyPolicy     | Read-only permissions for CCI. |
| Software Repository for Container (SWR) | SWRReadOnlyAccessPolicy | Read-only permissions for SWR. |
|                                         | SWROperateAccessPolicy  | Operation permissions for SWR. |
|                                         | SWRFullAccessPolicy     | Full permissions for SWR.      |

## Content Delivery & Edge Computing

| Service                        | Identity Policy                                   | Description                                                                                                    |
|--------------------------------|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| Content Delivery Network (CDN) | CDNLogsReadOnlyPolicy                             | Read-only permissions for the CDN log service.                                                                 |
|                                | CDNSecurityProtectionConfiguration-ReadOnlyPolicy | Read-only permissions for the CDN security service.                                                            |
|                                | CDNRefreshAndPreheatPolicy                        | Permissions to configure CDN cache refreshing and preheating.                                                  |
|                                | CDNAdministratorPolicy                            | Full permissions for CDN.                                                                                      |
|                                | CDNSecurityProtectionConfigurationPolicy          | Permissions for adding, modifying, and deleting a CDN security policy, and binding or unbinding a domain name. |
|                                | CDNReadOnlyPolicy                                 | Read-only permissions for all CDN services.                                                                    |
|                                | CDNFullPolicy                                     | Full permissions for CDN.                                                                                      |
|                                | CDNStatisticsReadOnlyPolicy                       | Read-only permissions for the CDN statistics service.                                                          |
|                                | CDNSecurityProtectionStatisticsReadOnlyPolicy     | Read-only permissions for CDN security statistics.                                                             |
|                                | CDNDomainConfigurationPolicy                      | Permissions for configuring CDN acceleration domain names.                                                     |
|                                | CDNDomainReadOnlyPolicy                           | Read-only permissions for CDN acceleration domain names.                                                       |
|                                | CDNChargeConfigurationPolicy                      | Permission for enabling CDN billing and modifying and querying the billing option.                             |
|                                | CDNStatisticsFullPolicy                           | Full permissions for the CDN statistics service.                                                               |
| CloudPond                      | IESFullAccessPolicy                               | Full permissions for CloudPond.                                                                                |
|                                | IESReadOnlyPolicy                                 | Read-only permissions for CloudPond.                                                                           |

## Security & Compliance

| Service                                | Identity Policy               | Description                                                                                            |
|----------------------------------------|-------------------------------|--------------------------------------------------------------------------------------------------------|
| Advanced Anti-DDoS (AAD)               | AADFullAccessPolicy           | Full permissions for AAD.                                                                              |
|                                        | AADReadOnlyAccessPolicy       | AAD read-only permissions. Users with these permissions can only view AAD information.                 |
| Cloud Native Anti-DDoS Advanced (CNAD) | CNADFullAccessPolicy          | Full permissions for CNAD.                                                                             |
|                                        | CNADReadOnlyPolicy            | Read-only permissions for CNAD. Users granted these permissions can only view CNAD resources.          |
| CNAD Basic (Anti-DDoS)                 | Anti-DDoSFullAccessPolicy     | Full permissions for Anti-DDoS.                                                                        |
|                                        | Anti-DDoSReadOnlyPolicy       | Read-only permissions for Anti-DDoS. Users with these permissions can only view Anti-DDoS information. |
| Host Security Service (HSS)            | HSSServiceLinkedAgencyPolicy  | Permissions of service-linked agencies for HSS across accounts.                                        |
|                                        | HSSFullAccessPolicy           | Full permissions for HSS.                                                                              |
|                                        | HSSReadOnlyAccessPolicy       | Read-only permissions for HSS.                                                                         |
|                                        | HSSAdministratorPolicy        | HSS administrator with full permissions.                                                               |
| Database Security Service (DBSS)       | DBSSReadOnlyPolicy            | Read-only permissions for DBSS.                                                                        |

|                               | RMSServiceLinkedAgencyPolicy            | Permissions of service-linked agencies for Config across accounts.                                                              |
|                               | RMSConformsServiceLinkedAgencyPolicy    | Service agencies for conformance package configuration management.                                                              |
| Resource Access Manager (RAM) | RAMFullAccessPolicy                     | Full permissions for RAM.                                                                                                       |
|                               | RAMReadOnlyPolicy                       | Read-only permissions for RAM.                                                                                                  |
|                               | RAMResourceShareParticipantAccessPolicy | Permissions for accepting or reject the invitation to a resource share.                                                         |
| IAM Identity Center           | IdentityCenterFullAccessPolicy          | Administrator permissions for IAM Identity Center. Users with this permission can manage and use IAM Identity Center resources. |
|                               | IdentityCenterReadOnlyPolicy            | Read-only permissions for IAM Identity Center. Users with this permission can only view data on IAM Identity Center.            |
|                               | IdentityCenterServiceLinkedAgencyPolicy | Permissions of service-linked agencies for IAM Identity Center.                                                                 |
| Organizations                 | OrganizationsReadOnlyAccessPolicy       | Read-only permissions for Organizations.                                                                                        |

| Service                          | Identity Policy                        | Description                                                    |
|----------------------------------|----------------------------------------|----------------------------------------------------------------|
|                                  | OrganizationsFullAccessPolicy          | Full permissions for Organizations.                            |
|                                  | OrganizationsServiceLinkedAgencyPolicy | Permissions for creating and deleting service-linked agencies. |
| Resource Formation Service (RFS) | RFFullAccessPolicy                     | Full permissions for RFS.                                      |
|                                  | RFReadOnlyPolicy                       | Read-only permissions for RFS.                                 |
|                                  | RFDeployPolicy                         | Deployment permissions for RFS.                                |
|                                  | RFStackSetFullAccessPolicy             | Full permissions for the stack set.                            |
|                                  | RFStackSetReadOnlyPolicy               | Read-only permissions for the stack set.                       |
| Resource Governance Center (RGC) | RGCServiceLinkedAgencyPolicy           | Permissions for deleting service-linked agencies.              |

## Application

| Service                         | Identity Policy              | Description                                                                                                                                                                                                            |
|---------------------------------|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ServiceStage                    | ServiceStageFullAccessPolicy | Full permissions for ServiceStage.                                                                                                                                                                                     |
|                                 | ServiceStageReadOnlyPolicy   | Read-only permissions for ServiceStage.                                                                                                                                                                                |
|                                 | ServiceStageDeveloperPolicy  | Developer permissions for ServiceStage, including permissions for performing operations on applications, components, and environments, but excluding approval permissions and permissions for creating infrastructure. |
| Cloud Service Engine (CSE)      | CSEFullAccessPolicy          | Full permissions for CSE.                                                                                                                                                                                              |
|                                 | CSEReadOnlyPolicy            | Permissions for viewing CSE resources.                                                                                                                                                                                 |
|                                 | CSEServiceLinkedAgencyPolicy | Agency permissions required for creating and maintaining CSE instances.                                                                                                                                                |
| Distributed Cache Service (DCS) | DCSFullAccessPolicy          | Full permissions for DCS.                                                                                                                                                                                              |
|                                 | DCSUserAccessPolicy          | Common user permissions for DCS operations except creating, modifying, deleting, and scaling instances.                                                                                                                |

| Service                                                          | Identity Policy              | Description                                                                                                       |
|------------------------------------------------------------------|------------------------------|-------------------------------------------------------------------------------------------------------------------|
|                                                                  | DCSReadOnlyAccessPolicy      | Read-only permissions for DCS.                                                                                    |
|                                                                  | DCSServiceLinkedAgencyPolicy | Agency permissions required by DCS for migrating faulty instances.                                                |
| Distributed Message Service (DMS for Kafka and DMS for RabbitMQ) | DMSFullAccessPolicy          | Full permissions for DMS.                                                                                         |
|                                                                  | DMSConsoleFullAccessPolicy   | Full permissions for operations on the DMS console.                                                               |
|                                                                  | DMSUserAccessPolicy          | Common user permissions for DMS, excluding permissions for creating, deleting, scaling up instances, and dumping. |
|                                                                  | DMSReadOnlyAccessPolicy      | Read-only permissions for DMS.                                                                                    |
|                                                                  | DMSServiceLinkedAgencyPolicy | Permissions of service-linked agencies for DMS.                                                                   |
| Simple Message Notification (SMN)                                | SMNFullAccessPolicy          | Full permissions for SMN.                                                                                         |
|                                                                  | SMNReadOnlyPolicy            | Read-only permissions for SMN.                                                                                    |
| API Gateway                                                      | APIGFullAccessPolicy         | Full permissions for APIG.                                                                                        |
|                                                                  | APIGReadOnlyAccessPolicy     | Read-only permissions for APIG.                                                                                   |

## Database

| Service                           | Identity Policy              | Description                                                                                 |
|-----------------------------------|------------------------------|---------------------------------------------------------------------------------------------|
| Relational Database Service (RDS) | RDSFullAccessPolicy          | Full permissions for RDS.                                                                   |
|                                   | RDSReadOnlyPolicy            | Read-only permissions for RDS.                                                              |
|                                   | RDSServiceLinkedAgencyPolicy | Permissions of service-linked agencies for RDS across accounts.                             |
| Document Database Service (DDS)   | DDSFullAccessPolicy          | Full permissions for DDS.                                                                   |
|                                   | DDSReadOnlyPolicy            | Read-only permissions for DDS.                                                              |
|                                   | DDSServiceLinkedAgencyPolicy | Permissions of service-linked agencies for DDS across accounts.                             |
| Data Replication Service (DRS)    | DRSFullAccessPolicy          | Administrator permissions for DRS. Users granted these permissions can operate and use DRS. |

| Service            | Identity Policy                           | Description                                                                    |
|--------------------|-------------------------------------------|--------------------------------------------------------------------------------|
|                    | DRSFullWithOutDeleteAccessPolicy          | Full permissions for DRS, except for those for stopping and deleting tasks.    |
|                    | DRSReadOnlyAccessPolicy                   | Read-only permissions for DRS.                                                 |
|                    | DRSServiceLinkedAgencyPolicy              | Permissions of service-linked agencies for DRS across accounts.                |
| GeminiDB           | GaussDBforNoSQL-FullAccessPolicy          | Full permissions for GeminiDB.                                                 |
|                    | GaussDBforNoSQL-ReadOnlyPolicy            | Read-only permissions for GeminiDB.                                            |
|                    | GaussDBforNoSQL-ServiceLinkedAgencyPolicy | Permissions of service-linked agencies for GeminiDB across accounts.           |
| GaussDB            | GaussDBFullAccessPolicy                   | Full permissions for GaussDB.                                                  |
|                    | GaussDBReadOnlyPolicy                     | Read-only permissions for GaussDB.                                             |
|                    | GaussDBServiceLinkedAgencyPolicy          | Permissions of service-linked agencies for GaussDB across accounts.            |
| GaussDB(for MySQL) | GaussDBforMySQL-ReadOnlyPolicy            | Read-only permissions for GaussDB(for MySQL).                                  |
|                    | GaussDBforMySQL-FullAccessPolicy          | Full permissions for GaussDB(for MySQL).                                       |
|                    | GaussDBforMySQL-ServiceLinkedAgencyPolicy | Permissions of service-linked agencies for GaussDB(for MySQL) across accounts. |

## Migration

| Service                                | Identity Policy     | Description                                                                                                     |
|----------------------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------|
| Server Migration Service (SMS)         | SMSFullAccessPolicy | Full permissions for SMS.                                                                                       |
|                                        | SMSReadOnlyPolicy   | Read-only permissions for SMS.                                                                                  |
| Object Storage Migration Service (OMS) | OMSFullAccessPolicy | Administrator permissions for OMS. Users granted these permissions can create, operate, and view OMS resources. |
|                                        | OMSReadOnlyPolicy   | Full permissions for OMS.                                                                                       |

| Service                | Identity Policy              | Description                                                 |
|------------------------|------------------------------|-------------------------------------------------------------|
| Migration Center (MgC) | MGCFullAccessPolicy          | Full permissions for MgC.                                   |
|                        | MGCReadOnlyPolicy            | Read-only permissions for MgC.                              |
|                        | MGCCollectionAccessPolicy    | Permissions for resource discovery and collection with MgC. |
|                        | MGCAssessmentAccessPolicy    | Permissions for resource assessment with MgC.               |
|                        | MGCManagementAccessPolicy    | Permissions for managing migration settings on MgC.         |
|                        | MGCWorkflowAccessPolicy      | Permissions for using MgC migration workflows.              |
|                        | MGCMigrationPlanAccessPolicy | Permissions for designing migration plans with MgC.         |
|                        | MGCBigdataAccessPolicy       | Permissions for migrating and verifying big data with MgC.  |

## AI

| Service                 | Identity Policy                 | Description                                                                                                   |
|-------------------------|---------------------------------|---------------------------------------------------------------------------------------------------------------|
| ModelArts               | ModelArtsFullAccessPolicy       | Full permissions for ModelArts.                                                                               |
|                         | ModelArtsCommonOperationsPolicy | Common user permissions for ModelArts (excluding creating, updating, and deleting a dedicated resource pool). |
|                         | ModelArtsDependencyAccessPolicy | Permissions for common dependent services of ModelArts.                                                       |
|                         | OptVerseFullAccessPolicy        | Full permissions for OptVerse.                                                                                |
|                         | OptVerseReadOnlyPolicy          | Read-only permissions for OptVerse.                                                                           |
|                         | OptVerseTaskFullAccessPolicy    | Full permissions for OptVerse task management.                                                                |
| MapReduce Service (MRS) | MRSFullAccessPolicy             | Administrator permissions for MRS. Users granted these permissions can operate and use MRS clusters.          |
|                         | MRSReadOnlyAccessPolicy         | Read-only permissions for MRS.                                                                                |

| Service           | Identity Policy                             | Description                                       |
|-------------------|---------------------------------------------|---------------------------------------------------|
|                   | CODEARTSReadOnlyPolicy                      | Read-only permissions for the CodeArts console.   |
| CodeArts Pipeline | CODEARTSPIPELINE-FullAccessPolicy           | Full permissions for CodeArts Pipeline.           |
|                   | CODEARTSPIPELINE-ReadOnlyPolicy             | Read-only permissions for CodeArts Pipeline.      |
|                   | CODEARTSPIPELINE-TemplateFullAccess-Policy  | Full permissions for pipeline templates.          |
|                   | CODEARTSPIPELINE-RuleFullAccessPolicy       | Full permissions for pipeline rules.              |
|                   | CODEARTSPIPELINE-StrategyFullAccess-Policy  | Full permissions for pipeline policies.           |
|                   | CODEARTSPIPELINE-ExtensionFullAccess-Policy | Full permissions for pipeline extension plug-ins. |

## Customer Services

| Service                       | Identity Policy          | Description                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Business Support System (BSS) | BILLINGFullAccess-Policy | Full permissions for Billing Center, Account Center, Cost Center, Enterprise Center, and Message Center. It is generally granted to administrators.                                                                                                                                                                                    |
|                               | BILLINGOperatorPolicy    | Permissions for viewing information in Billing Center, Account Center, Cost Center, Enterprise Center, and Message Center, for example, viewing the change, management, and use of cloud services. This policy does not have financial permissions. It is generally granted to the technical personnel, such as R&D and O&M personnel. |
|                               | BILLINGFinancePolicy     | Permissions for financial operations, including payment, consumption, invoicing, and cost. This policy does not have permission for modifying cloud services. It is generally granted to financial personnel.                                                                                                                          |

| Service                                     | Identity Policy                            | Description                                                                                                                                                        |
|---------------------------------------------|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enterprise Center                           | BusinessUnitCenter-FullAccessPolicy        | Full permissions for Enterprise Center. It is generally granted to the management personnel of an organization.                                                    |
|                                             | BusinessUnitCenter-ReadOnlyPolicy          | Permissions to view data in Enterprise Center. It is generally granted to the members in an enterprise organization.                                               |
|                                             | BusinessUnitCenter-MemberFinanceReadPolicy | Permissions for a master account to view the financial information of its member accounts. It is generally granted to the management personnel of an organization. |
| Enterprise Project Management Service (EPS) | EPSReadOnlyPolicy                          | Read-only permissions for EPS.                                                                                                                                     |
|                                             | EPSFullAccessPolicy                        | Full permissions for EPS.                                                                                                                                          |
| Cost Center                                 | CostCenterFullAccessPolicy                 | Full permissions for Cost Center. Generally, this policy is granted to cost administrators and cost analysis personnel.                                            |
|                                             | CostCenterReadOnlyPolicy                   | Permissions to view data in Cost Center. Generally, this policy is granted to those who want to view cost reports.                                                 |

# 3 Identity Policy-based Authorization

---

## 3.1 Compute

### 3.1.1 Auto Scaling (AS)

IAM provides common system-defined identity policies for services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.

- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify a URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by AS, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column of an action is empty (-), the action does not support any condition keys.

For details about the condition keys defined by AS, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for AS.

**Table 3-1** Actions supported by AS

| Action                 | Description                                  | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                                                                                                                                                                                                                                           | Alias            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-3](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all

resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can specify in identity policy statements for AS.

**Table 3-3** Resource types supported by AS

| Resource Type | URN                                                        |
|---------------|------------------------------------------------------------|
| scalingGroup  | as:<region>:<account-id>:scalingGroup:<scaling-group-id>   |
| scalingConfig | as:<region>:<account-id>:scalingConfig:<scaling-config-id> |
| scalingPolicy | as:<region>:<account-id>:scalingPolicy:<scaling-policy-id> |

## Conditions

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, **as:**) only apply to operations of the AS service. For details, see [Table 3-4](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so **g:SourceVpce** is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so **g:TagKeys** is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [Condition operators](#).

The following table lists the condition keys that you can define in identity policies for AS. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-4** Service-specific condition keys supported by AS

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                                       |
|--------------------------------|---------|-------------------------------|-------------------------------------------------------------------|
| as:ScalingConfigId             | String  | Single-valued                 | Filters access by AS configuration ID.                            |
| as:VpcId                       | String  | Single-valued                 | Filters access by VPC ID.                                         |
| as:VpcSubnetId                 | String  | Multivalued                   | Filters access by subnet ID.                                      |
| as:ElbPoolId                   | String  | Multivalued                   | Filters access by ELB backend server group ID.                    |
| as:MaxInstanceSize             | Integer | Single-valued                 | Filters access by the maximum number of instances in an AS group. |
| as:MinInstancesSize            | Integer | Single-valued                 | Filters access by the minimum number of instances in an AS group. |
| as:EcsInstanceId               | String  | Single-valued                 | Filters access by the ECS ID used for AS configuration creation.  |
| as:EcsInstanceType             | String  | Single-valued                 | Filters access by the spot or pay-per-use billing mode.           |
| as:EcsFlavorId                 | String  | Multivalued                   | Filters access by the flavor ID used for ECS creation.            |
| as:ImageId                     | String  | Single-valued                 | Filters access by the image ID used for ECS creation.             |
| as:ImsDiskImageId              | String  | Multivalued                   | Filters access by the disk image ID used for ECS creation.        |
| as:CbrDiskSnapshotId           | String  | Multivalued                   | Filters access by the disk backup ID used for ECS creation.       |
| as:EcsServerGroupId            | String  | Single-valued                 | Filters access by the ECS group ID used for ECS creation.         |

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                                     |
|--------------------------------|---------|-------------------------------|-----------------------------------------------------------------|
| as:EvsEncrypted                | Boolean | Single-valued                 | Filters access based on whether disk encryption is enabled.     |
| as:KmsKeyId                    | String  | Multivalued                   | Filters access by the key ID used for disk encryption.          |
| as:EvsVolumeType               | String  | Multivalued                   | Filters access by the disk type used for ECS creation.          |
| as:KpsSSHKeyPairName           | String  | Single-valued                 | Filters access by the key pair name used for ECS creation.      |
| as:AssociatePublicIp           | Boolean | Single-valued                 | Filters access based on whether auto EIP assignment is enabled. |

### 3.1.2 Bare Metal Server (BMS)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by BMS, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column of an action is empty (-), the action does not support any condition keys.

For details about the condition keys defined by BMS, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for BMS.

**Table 3-5** Actions supported by BMS

| Action                            | Description                        | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                   | Alias           |
|-----------------------------------|------------------------------------|--------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| bms:servers:updateBaremetalServer | Grants permission to modify a BMS. | write        | instance*                   | <ul style="list-style-type: none"><li>• <a href="#">g:EnterpriseProjectId</a></li><li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li></ul> | bms:servers:put |

| Action                                              | Description                                                                      | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias           |
|-----------------------------------------------------|----------------------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| bms:servers:showBaremetalServerInterfaceAttachments | Grants permission to query BMS NICs.                                             | read         | instance*                   | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | bms:servers:get |
| bms:servers:resetServerPwd                          | Grants permission to reset a BMS password with a few clicks.                     | write        | instance*                   | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | -               |
| bms:servers:showResetPasswordFlag                   | Grants permission to check whether BMS passwords can be reset with a few clicks. | read         | instance*                   | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | bms:servers:get |
| bms:servers:showWindowsBaremetalServerPwd           | Grants permission to obtain Windows BMS passwords.                               | read         | instance*                   | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | bms:servers:get |
| bms:servers:deletePassword                          | Grants permission to delete Windows BMS passwords.                               | write        | instance*                   | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | -               |
| bms:servers:showBaremetalServerVolumeInfo           | Grants permission to query EVS disks attached to a BMS.                          | read         | instance*                   | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | bms:servers:get |

| Action             | Description                       | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Alias |
|--------------------|-----------------------------------|--------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| bms:servers:create | Grants permission to create BMSs. | write        | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:TagKeys</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">bms:FlavorId</a></li> <li>• <a href="#">bms:VpcId</a></li> <li>• <a href="#">bms:SubnetId</a></li> <li>• <a href="#">bms:KmsKeyId</a></li> <li>• <a href="#">evs:Encrypted</a></li> <li>• <a href="#">bms:ImageId</a></li> <li>• <a href="#">bms:SSHKeyPairName</a></li> <li>• <a href="#">bms:AvailabilityZone</a></li> <li>• <a href="#">bms:VolumeType</a></li> <li>• <a href="#">bms:MetadataOptionsHttpEndpoint</a></li> <li>• <a href="#">bms:MetadataOptionsHttpTokens</a></li> <li>• <a href="#">bms:MetadataAgencyName</a></li> </ul> | -     |

| Action                          | Description                                       | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                                                                                                         | Alias           |
|---------------------------------|---------------------------------------------------|--------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| bms:servers:showBaremetalServer | Grants permission to query details about a BMS.   | read         | instance*                   | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                                                                                                                                                    | bms:servers:get |
| bms:servers:attachVolume        | Grants permission to attach EVS disks to a BMS.   | write        | instance*                   | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">bms:KmsKeyId</a></li> <li>• <a href="#">evs:Encrypted</a></li> <li>• <a href="#">bms:VolumeType</a></li> <li>• <a href="#">bms:VolumeId</a></li> </ul> | -               |
| bms:servers:detachVolume        | Grants permission to detach EVS disks from a BMS. | write        | instance*                   | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                                                                                                                                                    | -               |
| bms:servers:updateMetadata      | Grants permission to update BMS metadata.         | write        | instance*                   | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">bms:MetadataAgencyName</a></li> </ul>                                                                                                                  | -               |

| Action                              | Description                                   | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                                                                     | Alias             |
|-------------------------------------|-----------------------------------------------|--------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| bms:servers:reinstallOS             | Grants permission to reinstall a BMS OS.      | write        | instance*                   | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">bms:KmsKeyId</a></li> <li>• <a href="#">evs:Encrypted</a></li> <li>• <a href="#">bms:SSHKeyPairName</a></li> </ul> | -                 |
| bms:servers:showBaremetalServerTags | Grants permission to query BMS tags.          | read         | instance*                   | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                                                                                                                | bms: servers: get |
| bms:servers:start                   | Grants permission to start BMSs in a batch.   | write        | instance*                   | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                                                                                                                | -                 |

| POST /v1/{project_id}/baremetalservers/{server_id}/tags/action           | bms:servers:batchCreateBaremetalServerTags | -            |
| POST /v1/{project_id}/baremetalservers/{server_id}/tags/action           | bms:servers:batchDeleteBaremetalServerTags | -            |
| POST /v1/{project_id}/baremetalservers/{server_id}/nics                  | bms:servers:addNics                        | -            |
| POST /v1/{project_id}/baremetalservers/{server_id}/nics/delete           | bms:server:deleteNics                      | -            |
| POST /v1/{project_id}/baremetalservers/{server_id}/remote_console        | bms:servers:serialConsole                  | -            |
| POST /v1/{project_id}/baremetalservers/{server_id}/changeos              | bms:servers:changeOS                       | -            |
| PUT /v1/{project_id}/baremetalservers/{server_id}/os-interface/{port_id} | bms:server:updateInterface                 | -            |
| PUT /v1/{project_id}/baremetalservers/{server_id}/metadata-options       | bms:servers:updateMetadataOptions          | -            |
| GET /v1/{project_id}/baremetalservers/{server_id}/metadata-options       | bms:servers:showMetadataOptions            | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-7](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for BMS.

**Table 3-7** Resource types supported by BMS

| Resource Type | URN                                            |
|---------------|------------------------------------------------|
| instance      | bms:<region>:<account-id>:instance:<server-id> |

## Conditions

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, **bms:**) only apply to operations of the BMS service. For details, see [Table 3-8](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so **g:SourceVpce** is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so **g:TagKeys** is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [Condition operators](#).

### Service-specific condition keys supported by BMS

The following table lists the condition keys that you can define in identity policies for BMS. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-8** Service-specific condition keys supported by BMS

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                                                                |
|--------------------------------|--------|-------------------------------|----------------------------------------------------------------------------|
| bms:KmsKeyId                   | string | Multivalued                   | Filters access based on the KMS key ID specified in the request parameter. |

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                                                                                                       |
|--------------------------------|--------|-------------------------------|-------------------------------------------------------------------------------------------------------------------|
| bms:FlavorId                   | string | Multivalued                   | Filters access based on the flavor ID specified in the request parameter.                                         |
| bms:VpcId                      | string | Multivalued                   | Filters access based on the VPC ID specified in the request parameter.                                            |
| bms:SubnetId                   | string | Multivalued                   | Filters access based on the subnet ID specified in the request parameter.                                         |
| bms:ImageId                    | string | Single-valued                 | Filters access based on the image ID specified in the request parameter.                                          |
| bms:SSHKeyPair Name            | string | Single-valued                 | Filters access based on the key name specified in the request parameter.                                          |
| bms:Availability Zone          | string | Single-valued                 | Filters access based on the availability zone specified in the request parameter.                                 |
| bms:VolumeType                 | string | Multivalued                   | Filters access based on the EVS disk type specified in the request parameter.                                     |
| bms:VolumeId                   | string | Single-valued                 | Filters access based on the volume ID specified in the request parameter.                                         |
| bms:MetadataOptionsHttpTokens  | string | Single-valued                 | Filters access based on the <b>http_tokens</b> parameter in the <b>metadata-options</b> structure in the request. |

| Service-specific Condition Key  | Type   | Single-valued/<br>Multivalued | Description                                                                                                         |
|---------------------------------|--------|-------------------------------|---------------------------------------------------------------------------------------------------------------------|
| bms:MetadataAgencyName          | string | Single-valued                 | Filters access based on the <b>agency_name</b> parameter in the <b>metadata</b> structure in the request.           |
| bms:MetadataOptionsHttpEndpoint | string | Single-valued                 | Filters access based on the <b>http_endpoint</b> parameter in the <b>metadata-options</b> structure in the request. |

### 3.1.3 Elastic Cloud Server (ECS)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.

- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by ECS, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by ECS, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for ECS.

**Table 3-9** Actions supported by ECS

| Action                         | Description                       | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Alias                   |
|--------------------------------|-----------------------------------|--------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| ecs:cloudServers:createServers | Grants permission to create ECSs. | write        | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:TagKeys</a></li> <li>• <a href="#">ecs:imageId</a></li> <li>• <a href="#">ecs:FlavorId</a></li> <li>• <a href="#">ecs:VpcId</a></li> <li>• <a href="#">ecs:SubnetId</a></li> <li>• <a href="#">ecs:PortId</a></li> <li>• <a href="#">ecs:KmsKeyId</a></li> <li>• <a href="#">ecs:AvailabilityZone</a></li> <li>• <a href="#">evs:Encrypted</a></li> <li>• <a href="#">cbr:VaultId</a></li> <li>• <a href="#">ecs:SSHKeyPairName</a></li> <li>• <a href="#">ecs:SupportAgentType</a></li> <li>• <a href="#">ecs:ImageSupportAgentType</a></li> <li>• <a href="#">ecs:ImageType</a></li> <li>• <a href="#">ecs:OsVersion</a></li> <li>• <a href="#">ecs:OsType</a></li> <li>• <a href="#">ecs:ImagePlatform</a></li> </ul> | ecs:cloudServers:create |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-11](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for ECS.

**Table 3-11** Resource types supported by ECS

| Resource Type | URN                                            |
|---------------|------------------------------------------------|
| instance      | ecs:<region>:<account-id>:instance:<server-id> |

## Conditions

### About condition keys

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, ecs:) only apply to operations of the ECS service. For details, see [Table 3-12](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [Condition Operators](#).

### Service-specific condition keys supported by ECS

The following table lists the condition keys that you can define in identity policies for ECS. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-12** Service-specific condition keys supported by ECS

| Condition Key        | Type   | Single-valued/<br>Multivalued | Description                                                                       |
|----------------------|--------|-------------------------------|-----------------------------------------------------------------------------------|
| ecs:imageId          | string | Multivalued                   | Filters access based on the image ID specified in the request parameter.          |
| ecs:FlavorId         | string | Multivalued                   | Filters access based on the flavor ID specified in the request parameter.         |
| ecs:VpcId            | string | Multivalued                   | Filters access based on the VPC ID specified in the request parameter.            |
| ecs:SubnetId         | string | Multivalued                   | Filters access based on the subnet ID specified in the request parameter.         |
| ecs:KmsKeyId         | string | Multivalued                   | Filters access based on the KMS key ID specified in the request parameter.        |
| ecs:ServerId         | string | Single-valued                 | Filters access based on ECS ID.                                                   |
| ecs:SSHKeyPair Name  | string | Single-valued                 | Filters access based on the SSH key pair name specified in the request parameter. |
| ecs:AvailabilityZone | string | Single-valued                 | Filters access based on the AZ name specified in the request parameter.           |
| ecs:PortId           | string | Multivalued                   | Filters access based on the port ID specified in the request parameter.           |
| ecs:SupportAgentType | string | Multivalued                   | Filters access based on the agent type specified in the request parameter.        |

| Condition Key             | Type   | Single-valued/<br>Multivalued | Description                                                                                                                                                 |
|---------------------------|--------|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ecs:ImageSupportAgentType | string | Multivalued                   | Filters access based on the supported image agent type in the request parameter.                                                                            |
| ecs:VolumeId              | string | Single-valued                 | Filters access based on the volume ID specified in the request parameter.                                                                                   |
| ecs:ImageType             | string | Single-valued                 | Filters access based on the image type specified in the request parameter, for example, public images, private images, shared images, or KooGallery images. |
| ecs:OsType                | string | Single-valued                 | Filters access based on the OS type of the image specified in the request parameter, for example, Linux or Windows.                                         |
| ecs:OsVersion             | string | Single-valued                 | Filters access based on the OS version of the image specified in the request, for example, CentOS 7.3 64bit.                                                |
| ecs:ImagePlatform         | string | Single-valued                 | Filters access based on the platform of the image specified in the request, for example, Windows, Ubuntu, Red Hat, SUSE or CentOS.                          |
| ecs:LegacyAPIFlavor       | string | Single-valued                 | Filters access based on the API type. Currently, only native OpenStack APIs are supported.                                                                  |

### 3.1.4 Image Management Service (IMS)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify a URN for the Resource element in your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by IMS, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column of an action is empty (-), the action does not support any condition keys.

For details about the condition keys defined by IMS, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for IMS.

**Table 3-13** Supported Actions

| Action                                                                                                                                                                                                                                                                                                      | Description                             | Access Level          | Resource Type (*: required) | Condition Key                                                                                                                                                                              | Alias           |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-15](#), a resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to the resource. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can specify in identity policy statements for IMS.

**Table 3-15** Resource types supported by IMS

| Resource Type | URN                                        |
|---------------|--------------------------------------------|
| Image         | ims:<region>:<account-id>:image:<image-id> |

- <region> indicates the region where a user is authorized to perform operations.
- <account-id> indicates the ID of an authorized user account. Obtain an account ID as instructed in [API Credentials](#).
- <image-id> indicates the ID of the image on which a user is authorized to perform operations.

 **NOTE**

You can use a wildcard (\*) in URN to indicate all resources.

## Conditions

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global or service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, IAM automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, **ims:**) only apply to operations of IMS. For details, see [Table 3-16](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so **g:SourceVpce** is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so **g:TagKeys** is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [Condition operators](#).

The following table lists the condition keys that you can define in identity policies for IMS. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-16** Service-specific condition keys supported by IMS

| Condition Key      | Value Type | Single-valued/<br>Multivalued | Description                                                                                     |
|--------------------|------------|-------------------------------|-------------------------------------------------------------------------------------------------|
| ims:TargetOrgPaths | string     | Multivalued                   | Filters access based on the <b>Organizations Path</b> of the specified sharing account.         |
| ims:Encrypted      | boolean    | Single-valued                 | Controls operations such as image import and replication based on whether images are encrypted. |

| Condition Key              | Value Type | Single-valued/<br>Multivalued | Description                                                                                              |
|----------------------------|------------|-------------------------------|----------------------------------------------------------------------------------------------------------|
| ims:TargetBucketOrgPaths   | string     | Multivalued                   | Filters access based on the <b>Organizations Path</b> of the specified destination bucket owner account. |
| ims:OriginBucketOrgPaths   | string     | Multivalued                   | Filters access based on the <b>Organizations Path</b> of the specified source bucket owner account.      |
| ims:SourceAvailabilityZone | string     | Multivalued                   | Filters access based on the specified AZ.                                                                |
| ims:InstanceId             | string     | Single-valued                 | Controls full-ECS image creation based on the specified ECS ID.                                          |
| ims:VaultId                | string     | Single-valued                 | Controls creation and cross-region replication of full-ECS images based on the specified vault ID.       |
| ims:VolumeId               | string     | Multivalued                   | Controls image creation based on the specified volume ID.                                                |
| ims:BackupId               | string     | Single-valued                 | Controls full-ECS image creation based on the specified backup ID.                                       |
| ims:Region                 | string     | Single-valued                 | Controls cross-region replication based on the specified destination region.                             |

### 3.1.5 FunctionGraph

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the **Organizations** service provides **Service Control Policies (SCPs)** to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the defined resource types, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the defined condition keys, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for FunctionGraph.

**Table 3-17** Supported Actions

| Action                                 | Description                                        | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias                            |
|----------------------------------------|----------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|
| functiongraph:function:createFunction  | Grants permission to create a function.            | Write        | function *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | • functiongraph:function:create  |
|                                        |                                                    |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul>              |                                  |
| functiongraph:function:deleteFunction  | Grants permission to delete a function.            | Write        | function *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | • functiongraph:function:delete  |
|                                        |                                                    |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul>              |                                  |
| functiongraph:function:listFunctions   | Grants permission to list functions.               | List         | function *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | • functiongraph:function:list    |
|                                        |                                                    |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul>              |                                  |
| functiongraph:function:getFunctionCode | Grants permission to query the code of a function. | Read         | function *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | • functiongraph:function:getCode |

| DELETE /v2/{project_id}/fgs/servicebridge/{bridge_name}     | functiongraph:bridge:deleteServiceBridge       | -          |
| PUT /v2/{project_id}/fgs/servicebridge/{bridge_name}/config | functiongraph:bridge:updateServiceBridgeConfig | -          |
| GET /v2/{project_id}/fgs/servicebridge                      | functiongraph:bridge:listServiceBridges        | -          |
| GET /v2/{project_id}/fgs/servicebridge/{bridge_name}/config | functiongraph:bridge:getServiceBridgeConfig    | -          |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-19](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for FunctionGraph.

**Table 3-19** Supported resource types

| Resource Type | URN                                                                         |
|---------------|-----------------------------------------------------------------------------|
| workflow      | functiongraph:<region>:<account-id>:workflow:<workflow-id>                  |
| function      | functiongraph:<region>:<account-id>:function:<package-name>/<function-name> |
| trigger       | functiongraph:<region>:<account-id>:trigger:<trigger-id>                    |

## Conditions

FunctionGraph does not support service-specific condition keys in policies.

It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.1.6 Cloud Data Center

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include [actions](#), [resources](#), and [conditions](#).

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (such as **List**, **Read**, **Write**, or **Tagging**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources (\*) in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by CloudDC, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by CloudDC, see [Conditions](#).

The following table lists the actions that you can define in identity policy statements for CloudDC.

**Table 3-20** Actions supported by CloudDC

| Action                              | Description                                      | Access Level | Resource Condition Key                         | Global Condition Key |
|-------------------------------------|--------------------------------------------------|--------------|------------------------------------------------|----------------------|
| clouddc:imetal:list                 | Batch querying physical servers                  | list         | -                                              | -                    |
| clouddc:imetal:get                  | Querying information about physical servers      | read         | <a href="#">g:ResourceTag /&lt;tag-key&gt;</a> | -                    |
| clouddc:imetal:getHardwareAttribute | Querying server hardware details                 | read         | <a href="#">g:ResourceTag /&lt;tag-key&gt;</a> | -                    |
| clouddc:imetal:getFirmwareAttribute | Querying server firmware details                 | read         | <a href="#">g:ResourceTag /&lt;tag-key&gt;</a> | -                    |
| clouddc:imetal:updatePowerStatus    | Modifying the power statuses of physical servers | write        | <a href="#">g:ResourceTag /&lt;tag-key&gt;</a> | -                    |
| clouddc:imetal:createDumpLog        | Exporting server logs                            | write        | <a href="#">g:ResourceTag /&lt;tag-key&gt;</a> | -                    |
| clouddc:imetal:getDumpLogProgress   | Querying the export status of logs               | read         | <a href="#">g:ResourceTag /&lt;tag-key&gt;</a> | -                    |

| Action                                 | Description                            | Access Level | Resource Condition Key                         | Global Condition Key |
|----------------------------------------|----------------------------------------|--------------|------------------------------------------------|----------------------|
| cloudcc:imetal:createDownloadLog       | Downloading logs                       | write        | <a href="#">g:ResourceTag /&lt;tag-key&gt;</a> | -                    |
| cloudcc:imetal:createRemoteConsoleLink | Obtaining the console address          | write        | <a href="#">g:ResourceTag /&lt;tag-key&gt;</a> | -                    |
| cloudcc:instance:createBatch           | Batch creating instances               | write        | -                                              | -                    |
| cloudcc:instance:list                  | Batch querying instances               | list         | -                                              | -                    |
| cloudcc:instance:deleteBatch           | Batch deleting instances               | write        | -                                              | -                    |
| cloudcc:instance:create                | Creating an instance                   | write        | -                                              | -                    |
| cloudcc:instance:delete                | Deleting an instance                   | write        | -                                              | -                    |
| cloudcc:instance:changePassword        | Changing the password of an instance   | write        | -                                              | -                    |
| cloudcc:instance:reinstallOS           | Reinstalling the OS on an instance     | write        | -                                              | -                    |
| cloudcc:instance:get                   | Querying the status of an instance     | read         | -                                              | -                    |
| cloudcc:instance:updateIP              | Changing the IP address of an instance | write        | -                                              | -                    |
| cloudcc::listResourcesByTag            | Listing resources                      | list         | -                                              | g:TagKeys            |
| cloudcc::listTagsForResource           | Querying tags of a resource            | list         | <a href="#">g:ResourceTag /&lt;tag-key&gt;</a> | -                    |

| Action                      | Description                                    | Access Level | Resource Condition Key                         | Global Condition Key                |
|-----------------------------|------------------------------------------------|--------------|------------------------------------------------|-------------------------------------|
| cloudcc::listTags           | Querying resource tags in a specified project. | list         | -                                              | -                                   |
| cloudcc::listResourcesByTag | Querying the number of instances               | list         | -                                              | g:TagKeys                           |
| cloudcc::tagResource        | Batch creating iMetal server tags              | tagging      | <a href="#">g:ResourceTag /&lt;tag-key&gt;</a> | g:RequestTag/<tag-key><br>g:TagKeys |
| cloudcc::unTagResource      | Batch deleting iMetal server tags              | tagging      | <a href="#">g:ResourceTag /&lt;tag-key&gt;</a> | g:RequestTag/<tag-key><br>g:TagKeys |
| cloudcc::listStatus         | Obtaining server overview                      | list         | -                                              | -                                   |
| cloudcc::listAlarmStat      | Obtaining server alarm overview                | list         | -                                              | -                                   |
| cloudcc::listAlarmTrend     | Obtaining the server alarm trend               | list         | -                                              | -                                   |
| cloudcc::listAlarm          | Obtaining the server alarm list                | list         | -                                              | -                                   |
| cloudcc::listEvent          | Obtaining the server event list                | list         | -                                              | -                                   |
| cloudcc::listEventDicts     | Querying event definitions                     | list         | -                                              | -                                   |
| cloudcc::updateRepairs      | Updating or creating server maintenance data   | write        | -                                              | -                                   |

| Action                       | Description                                | Access Level | Resource Condition Key                         | Global Condition Key                 |
|------------------------------|--------------------------------------------|--------------|------------------------------------------------|--------------------------------------|
| cloudcc::listRepairs         | Querying server maintenance data           | list         | -                                              | -                                    |
| cloudcc::updateSpareParts    | Creating and updating spare parts          | write        | -                                              | -                                    |
| cloudcc::listSpareParts      | Querying spare parts                       | list         | -                                              | -                                    |
| cloudcc:irack:update         | Modifying the intelligent rack description | write        | <a href="#">g:ResourceTag /&lt;tag-key&gt;</a> | -                                    |
| cloudcc:irack:list           | Querying the intelligent rack list         | list         | -                                              | -                                    |
| cloudcc:idc:update           | Modifying the IDC description              | write        | -                                              | -                                    |
| cloudcc:idc:list             | Querying the IDC list                      | list         | -                                              | -                                    |
| cloudcc::listResourcesByTag  | Querying the rack list                     | list         | -                                              | g:TagKeys                            |
| cloudcc::listTagsForResource | Querying rack tags                         | list         | <a href="#">g:ResourceTag /&lt;tag-key&gt;</a> | -                                    |
| cloudcc::listTags            | Querying rack tags in a specified project  | list         | -                                              | -                                    |
| cloudcc::listResourcesByTag  | Querying the number of racks               | list         | -                                              | g:TagKeys                            |
| cloudcc::tagResource         | Batch creating rack tags                   | tagging      | <a href="#">g:ResourceTag /&lt;tag-key&gt;</a> | g:RequestTag /<tag-key><br>g:TagKeys |

| Action                   | Description                                    | Access Level | Resource Condition Key                        | Global Condition Key                |
|--------------------------|------------------------------------------------|--------------|-----------------------------------------------|-------------------------------------|
| clouddc::unTagResource   | Batch deleting rack tags                       | tagging      | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | g:RequestTag/<tag-key><br>g:TagKeys |
| clouddc::createRackOrder | Granting permissions to check order parameters | write        | -                                             | -                                   |

Each API of CloudDC usually supports one or more actions. [Table 3-21](#) lists the supported APIs and actions.

**Table 3-21** APIs and actions

| API URI                                                   | Request Type | Description                                 | Action                              | Action |
|-----------------------------------------------------------|--------------|---------------------------------------------|-------------------------------------|--------|
| /v1/{project_id}/physicalservers                          | GET          | Batch querying physical servers             | clouddc:imetal:list                 | -      |
| /v1/{project_id}/physicalservers/{id}                     | GET          | Querying information about physical servers | clouddc:imetal:get                  | -      |
| /v1/{project_id}/physicalservers/{id}/hardware-attributes | GET          | Querying server hardware details            | clouddc:imetal:getHardwareAttribute | -      |
| /v1/{project_id}/physicalservers/{id}/firmware-attributes | GET          | Querying server firmware details            | clouddc:imetal:getFirmwareAttribute | -      |

| API URI                                                                | Request Type | Description                                      | Action                                 | Action |
|------------------------------------------------------------------------|--------------|--------------------------------------------------|----------------------------------------|--------|

| /v1/{project_id}/repairs                                   | PUT          | Updating or creating server maintenance data | cloudcc::updateRepairs  | -                     |
| /v1/{project_id}/repairs                                   | GET          | Querying server maintenance data             | cloudcc::listRepairs    | -                     |

| API URI                                                              | Request Type | Description                                | Action                       | Action |
|----------------------------------------------------------------------|--------------|--------------------------------------------|------------------------------|--------|
| /v1/{project_id}/spareparts                                          | PUT          | Creating and updating spare parts          | cloudcc::updateSpareParts    | -      |
| /v1/{project_id}/spareparts                                          | GET          | Querying spare parts                       | cloudcc::listSpareParts      | -      |
| /v1/{project_id}/iracks/{irack_id}                                   | PUT          | Modifying the intelligent rack description | cloudcc::irack:update        | -      |
| /v1/{project_id}/iracks                                              | GET          | Querying the intelligent rack list         | cloudcc::irack:list          | -      |
| /v1/{project_id}/idcs                                                | PUT          | Modifying the IDC description              | cloudcc::idc:update          | -      |
| /v1/{project_id}/idcs                                                | GET          | Querying the IDC list                      | cloudcc::idc:list            | -      |
| /v1/{version}/{project_id}/{resource_type}/resource-instances/filter | POST         | Querying the rack list                     | cloudcc::listResourcesByTag  | -      |
| /v1/{version}/{project_id}/{resource_type}/{resource_id}/tags        | GET          | Querying rack tags                         | cloudcc::listTagsForResource | -      |
| /v1/{version}/{project_id}/{resource_type}/tags                      | GET          | Querying rack tags in a specified project  | cloudcc::listTags            | -      |
| /v1/{version}/{project_id}/{resource_type}/resource-instances/count  | POST         | Querying the number of racks               | cloudcc::listResourcesByTag  | -      |

| API URI                                  | Request Type | Description                                    | Action                    | Action |
|------------------------------------------|--------------|------------------------------------------------|---------------------------|--------|
| /v1/{project_id}/iracks/{id}/tags/create | POST         | Batch creating rack tags                       | clouddc::tagResource      | -      |
| /v1/{project_id}/iracks/{id}/tags/delete | POST         | Batch deleting rack tags                       | clouddc::unTagResource    | -      |
| /v1/services/unibuy/extend               | POST         | Granting permissions to check order parameters | clouddc::createIRackOrder | -      |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-22](#), a resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to the resource. If no resource type is specified, the **Resource** element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can specify in identity policy statements for CloudDC.

**Table 3-22** Resource types supported by CloudDC

| Resource Type | URN                                                |
|---------------|----------------------------------------------------|
| iMetal        | clouddc:<region>:<account-id>:imetal:<resource-id> |
| iRack         | clouddc:<region>:<account-id>:irack:<resource-id>  |

## Conditions

### About condition keys

A Condition element lets you specify conditions for when an identity policy is in effect. It contains **condition keys** and **operators**.

- The condition key that you specify can be a global condition key or a service-specific condition key.

- Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Table 3-23](#). For details about global condition keys, see [Common global condition keys](#).
- Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, **clouddc:**) only apply to operations of that service. CloudDC does not support service-specific condition keys in identity policies.
- The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so **g:SourceVpce** is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so **g:TagKeys** is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met.

The following table lists the condition keys that you can define in identity policies for CloudDC. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-23** Global condition keys supported by CloudDC

| Global Condition Key                 | Type                 | Description                             |
|--------------------------------------|----------------------|-----------------------------------------|
| <b>g:ResourceTag/&lt;tag-key&gt;</b> | Single-valued string | Tag attached to the requested resource. |
| <b>g:RequestTag/&lt;tag-key&gt;</b>  | Single-valued string | Tag contained in a request.             |
| <b>g:TagKeys</b>                     | Multivalued string   | List of tag keys in a request.          |

## 3.2 Storage

### 3.2.1 Object Storage Service (OBS)

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational

unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by OBS, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by OBS, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for OBS.

**Table 3-24** Actions supported by OBS

| Action                          | Description                                       | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                   | Alias |
|---------------------------------|---------------------------------------------------|--------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| obs:object:abortMultipartUpload | Grants the permission to abort multipart uploads. | Write        | object *                    | <a href="#">g:EnterpriseProjectId</a>                                                                                                                                                                           | -     |
|                                 |                                                   |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">obs:EpochTime</a></li> <li>• <a href="#">obs:SourceIp</a></li> <li>• <a href="#">obs:TlsVersion</a></li> <li>• <a href="#">obs:CustomDomain</a></li> </ul> |       |
| obs:object:deleteObject         | Grants the permission to delete an object.        | Write        | object *                    | <a href="#">g:EnterpriseProjectId</a>                                                                                                                                                                           | -     |
|                                 |                                                   |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">obs:EpochTime</a></li> <li>• <a href="#">obs:SourceIp</a></li> <li>• <a href="#">obs:TlsVersion</a></li> <li>• <a href="#">obs:CustomDomain</a></li> </ul> |       |
| obs:object:deleteObjectTagging  | Grants permission to delete object tags.          | Tagging      | object *                    | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                                              | -     |
|                                 |                                                   |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">obs:EpochTime</a></li> <li>• <a href="#">obs:SourceIp</a></li> <li>• <a href="#">obs:TlsVersion</a></li> <li>• <a href="#">obs:CustomDomain</a></li> </ul> |       |

| GET /?bucketStatus                                | obs:bucket:getBucketPublic-Status        | -                                                                                                                                                                                                                                                                                                 |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-26](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for OBS.

**Table 3-26** Resource types supported by OBS

| Resource Type | URN                                      |
|---------------|------------------------------------------|
| bucket        | obs:::bucket:<bucket-name>               |
| object        | obs:::object:<bucket-name>/<object-name> |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, obs) apply only to operations of the xx service. For details, see [Table 3-27](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
  - A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [Condition operators](#).

### Service-specific condition keys supported by OBS

The following table lists the condition keys that you can define in identity policies for OBS. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-27** Service-specific condition keys supported by OBS

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                                                                                                                                           |
|--------------------------------|---------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| obs:versionId                  | string  | Single-valued                 | Filters requests by the object version ID.                                                                                                                            |
| obs:prefix                     | string  | Single-valued                 | Filters requests by the prefix specified for objects to be listed.                                                                                                    |
| obs:delimiter                  | string  | Single-valued                 | Filters requests by the delimiter character for grouping objects.                                                                                                     |
| obs:max-keys                   | numeric | Single-valued                 | Filters requests by the maximum number of objects to return. The max-keys parameter indicates how many objects can be returned at most in alphabetical order.         |
| obs:x-obs-acl                  | string  | Single-valued                 | Filters requests by the ACL header. The ACL value can be private, public-read, public-read-write, bucketowner-read, bucket-owner-full-control, or log-delivery-write. |
| obs:x-obs-copy-source          | string  | Single-valued                 | Filters requests by the source bucket and object used for replication. The format is /bucketname/keyname.                                                             |

| Service-specific Condition Key   | Type       | Single-valued/<br>Multivalued | Description                                                                                                                                                                   |
|----------------------------------|------------|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| obs:x-obs-metadata-directive     | string     | Single-valued                 | Filters requests by whether the metadata of the destination object is copied from the source object or replaced with the metadata contained in the request (COPY or REPLACE). |
| obs:x-obs-server-side-encryption | string     | Single-valued                 | Filters requests by whether objects in the bucket are encrypted. The value is kms.                                                                                            |
| obs:SourceIp                     | ip_address | Single-valued                 | Filters requests by the first IP address in the x-forward-for header or the source IP address of the request.                                                                 |
| obs:EpochTime                    | numeric    | Single-valued                 | Filters requests by the time when the request is received by the server, which is the number of non-leap seconds that have elapsed since 1970.01.01 00:00:00 UTC.             |
| obs:BucketEncrypted              | boolean    | Single-valued                 | Filters requests by the encryption status of the bucket after the bucket is created, encrypted, or decrypted.                                                                 |
| obs:TlsVersion                   | numeric    | Single-valued                 | Filters requests by the TLS protocol version used by the client.                                                                                                              |
| obs:CustomDomain                 | boolean    | Single-valued                 | Filters requests by whether the requester client uses a custom domain name.                                                                                                   |

## 3.2.2 Cloud Backup and Recovery (CBR)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

### Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by CBR, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by CBR, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for CBR.

**Table 3-28** Actions supported by CBR

| Action                       | Description                                         | Access Level | Resource Type (*: required) | Condition Key | Alias                                                                              |
|------------------------------|-----------------------------------------------------|--------------|-----------------------------|---------------|------------------------------------------------------------------------------------|
| cbr:backups:getMetadata      | Grants permission to get backup metadata.           | Read         | backup *                    | -             | -                                                                                  |
| cbr::getAgentAutoUpgrade     | Grants permission to get agent auto upgrade status. | Read         | -                           | -             | <ul style="list-style-type: none"> <li>• cbr:agents:getAgentAutoUpgrade</li> </ul> |
| cbr::updateSnapshotMetadata  | Grants permission to update snapshot metadata.      | Write        | -                           | -             | <ul style="list-style-type: none"> <li>• cbr:snapshotMetadata:update</li> </ul>    |
| cbr::updateThirdAuth         | Grants permission to update third auth.             | Write        | -                           | -             | <ul style="list-style-type: none"> <li>• cbr:thirdAuth:update</li> </ul>           |
| cbr::setAgentAutoUpgrade     | Grants permission to set agent auto upgrade status. | Write        | -                           | -             | <ul style="list-style-type: none"> <li>• cbr:agents:setAgentAutoUpgrade</li> </ul> |
| cbr::readBucketAuthorization | Grants permission to read bucket authorization.     | Read         | -                           | -             | <ul style="list-style-type: none"> <li>• cbr:bucketAuthorization:read</li> </ul>   |
| cbr::listExportSnapshotJob   | Grants permission to create export snapshot job.    | List         | -                           | -             | <ul style="list-style-type: none"> <li>• cbr:exportSnapshotJob:list</li> </ul>     |

| Action                          | Description                                         | Access Level | Resource Type (*: required) | Condition Key | Alias                                                                             |
|---------------------------------|-----------------------------------------------------|--------------|-----------------------------|---------------|-----------------------------------------------------------------------------------|
| cbr::listThirdAuth              | Grants permission to list third auth.               | List         | -                           | -             | <ul style="list-style-type: none"> <li>cbr:thirdAuth:list</li> </ul>              |
| cbr::listFeatures               | Grants permission to list features.                 | Read         | -                           | -             | <ul style="list-style-type: none"> <li>cbr:features:list</li> </ul>               |
| cbr::listExportSnapshotAgency   | Grants permission to list export snapshot agency.   | List         | -                           | -             | <ul style="list-style-type: none"> <li>cbr:exportSnapshotAgency:list</li> </ul>   |
| cbr::getThirdAuth               | Grants permission to get third auth.                | Read         | -                           | -             | <ul style="list-style-type: none"> <li>cbr:thirdAuth:get</li> </ul>               |
| cbr::getFeature                 | Grants permission to get feature.                   | Read         | -                           | -             | <ul style="list-style-type: none"> <li>cbr:feature:get</li> </ul>                 |
| cbr::getExportSnapshotJob       | Grants permission to list export snapshot job.      | Read         | -                           | -             | <ul style="list-style-type: none"> <li>cbr:exportSnapshotJob:get</li> </ul>       |
| cbr::deleteThirdAuth            | Grants permission to delete third auth.             | Write        | -                           | -             | <ul style="list-style-type: none"> <li>cbr:thirdAuth:delete</li> </ul>            |
| cbr::deleteExportSnapshotAgency | Grants permission to delete export snapshot agency. | Write        | -                           | -             | <ul style="list-style-type: none"> <li>cbr:exportSnapshotAgency:delete</li> </ul> |
| cbr::deleteExportSnapshotJob    | Grants permission to delete export snapshot job.    | Write        | -                           | -             | <ul style="list-style-type: none"> <li>cbr:exportSnapshotJob:delete</li> </ul>    |

| Action                          | Description                                           | Access Level | Resource Type (*: required) | Condition Key                                                                                                  | Alias                                                                             |
|---------------------------------|-------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| cbr::createExportSnapshotAgency | Grants permission to create export snapshot agency.   | Write        | -                           | -                                                                                                              | <ul style="list-style-type: none"> <li>cbr:exportSnapshotAgency:create</li> </ul> |
| cbr::createSnapshotMetadata     | Grants permission to create snapshot metadata.        | Write        | -                           | -                                                                                                              | <ul style="list-style-type: none"> <li>cbr:snapshotMetadata:create</li> </ul>     |
| cbr::createThirdAuth            | Grants permission to create third auth.               | Write        | -                           | -                                                                                                              | <ul style="list-style-type: none"> <li>cbr:thirdAuth:create</li> </ul>            |

| PUT /v3/{project_id}/organization-policies/{organization_policy_id}               | cbr:organizationPolicies:update           | -            |
| GET /v3/{project_id}/organization-policies                                        | cbr:organizationPolicies:list             | -            |

| API                                                                 | Action                       | Dependencies |
|---------------------------------------------------------------------|------------------------------|--------------|
| GET /v3/{project_id}/organization-policies/{organization_policy_id} | cbr:organizationPolicies:get | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-30](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for CBR.

**Table 3-30** Resource types supported by CBR

| Resource Type | URN                                                 |
|---------------|-----------------------------------------------------|
| vault         | cbr:<region>:<account-id>:vault:<vault-id>          |
| policy        | cbr:<region>:<account-id>:policy:<policy-id>        |
| rackGroup     | cbr:<region>:<account-id>:rackGroup:<rack-group-id> |
| task          | cbr:<region>:<account-id>:task:<task-id>            |
| backup        | cbr:<region>:<account-id>:backup:<backup-id>        |
| agent         | cbr:<region>:<account-id>:agent:<agent-id>          |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).

- Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, cbr) apply only to operations of the xx service. For details, see [Table 3-31](#).
- The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [operators](#).

### Service-specific condition keys supported by CBR

The following table lists the condition keys that you can define in identity policies for CBR. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-31** Service-specific condition keys supported by CBR

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                                           |
|--------------------------------|---------|-------------------------------|-----------------------------------------------------------------------|
| cbr:TargetOrgPaths             | string  | Single-valued                 | Filters access destination project's organization path of add member. |
| cbr:VaultId                    | string  | Single-valued                 | Filters access based on the vault ID in the request.                  |
| cbr:PolicyId                   | string  | Single-valued                 | Filters access based on the policy ID in the request.                 |
| cbr:EnabledPolicy              | boolean | Single-valued                 | Filters access by whether the policy is enabled.                      |

## 3.2.3 Elastic Volume Service (EVS)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by EVS, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by EVS, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for identity policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for EVS.

**Table 3-32** Actions supported by EVS

| Action                          | Description                                                | Access Level | Resource Type (*: required) | Condition Key                | Alias |
|---------------------------------|------------------------------------------------------------|--------------|-----------------------------|------------------------------|-------|
| evs::enableEncryptionByDefault  | Grants permission to enable default encryption.            | Write        | -                           | -                            | -     |
| evs::disableEncryptionByDefault | Grants permission to disable default encryption.           | Write        | -                           | -                            | -     |
| evs::getEncryptionByDefault     | Grants permission to query default encryption.             | Write        | -                           | -                            | -     |
| evs::modifyDefaultKmsKeyId      | Grants permission to change the default key.               | Write        | -                           | <a href="#">evs:KmsKeyId</a> | -     |
| evs::resetDefaultKmsKeyId       | Grants permission to reset the default key to evs/default. | Write        | -                           | -                            | -     |
| evs::getDefaultKmsKeyId         | Grants permission to query the default key.                | Write        | -                           | -                            | -     |
| evs:volumes:create              | Grants permission to create disks.                         | Write        | volume *                    | -                            | -     |

| Action | Description | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Alias |
|--------|-------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|

|                         |                                                     |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">evs:SourceAvailabilityZone</a></li> <li>• <a href="#">evs:AvailabilityZone</a></li> </ul>     |                       |
| evs:snapshots:list      | Grants permission to list snapshots.                | List         | -                           | <a href="#">g:EnterpriseProjectId</a>                                                                                                              | -                     |
| evs:snapshots:get       | Grants permission to query snapshots.               | Read         | -                           | <a href="#">g:EnterpriseProjectId</a>                                                                                                              | -                     |
| evs:snapshots:delete    | Grants permission to delete snapshots.              | Write        | -                           | <a href="#">g:EnterpriseProjectId</a>                                                                                                              | -                     |
| evs:snapshots:update    | Grants permission to update snapshots.              | Write        | -                           | <a href="#">g:EnterpriseProjectId</a>                                                                                                              | -                     |
| evs:snapshots:rollback  | Grants permission to roll back data from snapshots. | Write        | -                           | <a href="#">g:EnterpriseProjectId</a>                                                                                                              | -                     |
| evs:types:get           | Grants permission to query disk types.              | Read         | -                           | -                                                                                                                                                  | -                     |
| evs:quotas:get          | Grants permission to query EVS quotas.              | Read         | -                           | -                                                                                                                                                  | -                     |
| evs:volumes:tagResource | Grants permission to add tags to a disk.            | Write        | volume *                    | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | evs:volumeTags:create |

| Action                          | Description                                                | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias                  |
|---------------------------------|------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|
|                                 |                                                            |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul>              |                        |
| evs:volumes:unTagResource       | Grants permission to delete tags from a disk.              | Write        | volume *                    | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | evs:volumeTags:delete  |
|                                 |                                                            |              | -                           | <a href="#">g:TagKeys</a>                                                                                                                          |                        |
| evs:volumes:listTags            | Grants permission to query all disk tags in a project.     | List         | -                           | -                                                                                                                                                  | evs:volumeTags:list    |
| evs:volumes:listTagsForResource | Grants permission to query disk tags.                      | Read         | volume *                    | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | evs:volumeTags:getById |
| evs:volumes:listResourcesByTag  | Grants permission to list disks by tag.                    | List         | -                           | <a href="#">g:TagKeys</a>                                                                                                                          | evs:volumeTags:get     |
| evs:volumes:use                 | Grants permission to allow ECSs and BMSs to use EVS disks. | Write        | -                           | <a href="#">g:EnterpriseProjectId</a>                                                                                                              | -                      |

Each API of EVS usually supports one or more actions. [Table 3-33](#) lists the supported actions and dependencies.

**Table 3-33** Actions and dependencies supported by EVS APIs

| API                                               | Action                          | Dependencies      |
|---------------------------------------------------|---------------------------------|-------------------|
| POST /v5/{project_id}/default-encryption/enable   | evs::enableEncryptionByDefault  | -                 |
| POST /v5/{project_id}/default-encryption/disable  | evs::disableEncryptionByDefault | -                 |
| GET /v5/{project_id}/default-encryption/status    | evs::getEncryptionByDefault     | -                 |
| PUT /v5/{project_id}/default-encryption/key       | evs::modifyDefaultKmsKeyId      | -                 |
| PUT /v5/{project_id}/default-encryption/key/reset | evs::resetDefaultKmsKeyId       | -                 |
| GET /v5/{project_id}/default-encryption/key       | evs::getDefaultKmsKeyId         | -                 |
| POST /v2.1/{project_id}/cloudvolumes              | evs:volumes:create              | billing:order:pay |
| POST /v2/{project_id}/cloudvolumes                | evs:volumes:create              | -                 |
| POST /v3/{project_id}/cloudvolumes                | evs:volumes:create              | -                 |
| GET /v2/{project_id}/cloudvolumes/detail          | evs:volumes:list                | -                 |
| GET /v2/{project_id}/cloudvolumes/{volume_id}     | evs:volumes:get                 | -                 |
| DELETE /v2/{project_id}/cloudvolumes/{volume_id}  | evs:volumes:delete              | -                 |

| API                                                     | Action                       | Dependencies                                                                                                |
|---------------------------------------------------------|------------------------------|-------------------------------------------------------------------------------------------------------------|
| PUT /v2/{project_id}/cloudvolumes/{volume_id}           | evs:volumes:update           | -                                                                                                           |

| POST /v2/{project_id}/cloudvolumes/resource_instances/action  | evs:volumes:listResourcesByTag  | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-34](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for EVS.

**Table 3-34** Resource types supported by EVS

| Resource Type | URN                                                  |
|---------------|------------------------------------------------------|
| imageCache    | evs:<region>:<account-id>:imageCache:<imageCache-id> |
| snapshot      | evs:<region>:<account-id>:snapshot:<snapshot-id>     |
| volume        | evs:<region>:<account-id>:volume:<volume-id>         |

## Conditions

### About condition keys

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, evs:) apply only to operations of EVS. For details, see [Table 3-35](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [Condition operators](#).

### Service-specific condition keys supported by EVS

The following table lists the condition keys that you can define in custom identity policies for EVS. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-35** Service-specific condition keys supported by EVS

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                                   |
|--------------------------------|---------|-------------------------------|---------------------------------------------------------------|
| evs:KmsKeyId                   | string  | Single-valued                 | Filters access based on the key ID used by the disk.          |
| evs:Encrypted                  | boolean | Single-valued                 | Filters access based on whether the disk is encrypted.        |
| evs:KmsKeyId                   | string  | Single-valued                 | Filters access based on the key ID used by the disk.          |
| evs:ImageId                    | string  | Single-valued                 | Filters access by image ID.                                   |
| evs:BackupId                   | string  | Single-valued                 | Filters access by backup ID.                                  |
| evs:SnapshotId                 | string  | Single-valued                 | Filters access by snapshot ID.                                |
| evs:AvailabilityZone           | string  | Single-valued                 | Filters access based on the AZ of the disk.                   |
| evs:SourceAvailability-Zone    | string  | Single-valued                 | Filters access by source AZ.                                  |
| evs:VolumeType                 | string  | Single-valued                 | Filters access by disk type.                                  |
| evs:VolumeSize                 | numeric | Single-valued                 | Filters access by disk capacity.                              |
| evs:Volumelops                 | numeric | Single-valued                 | Filters access by disk IOPS.                                  |
| evs:VolumeThroughput           | numeric | Single-valued                 | Filters access by disk throughput.                            |
| evs:ChargingMode               | string  | Single-valued                 | Filters access by disk billing mode.                          |
| evs:ServerServiceType          | string  | Single-valued                 | Filters access based on the service type of the cloud server. |
| evs:Volumeld                   | string  | Single-valued                 | Filters access by disk ID.                                    |

### 3.2.4 Scalable File Service Turbo (SFS Turbo)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by SFS Turbo, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.

- If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by SFS Turbo, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for identity policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for SFS Turbo.

**Table 3-36** Actions supported by SFS Turbo

| Action                       | Description                                                       | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                | Alias |
|------------------------------|-------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| sfsturbo:shares:createShare  | Grants permission to create SFS Turbo file systems.               | write        | shares *                    | <ul style="list-style-type: none"> <li>• g:EnterpriseProjectId</li> <li>• g:TagKeys</li> <li>• g:RequestTag/&lt;tag-key&gt;</li> <li>• sfsturbo:CryptKeyId</li> <li>• cbr:VaultId</li> </ul> | -     |
| sfsturbo:shares:deleteShare  | Grants permission to delete SFS Turbo file systems.               | write        | shares *                    | <ul style="list-style-type: none"> <li>• g:ResourceTag/&lt;tag-key&gt;</li> <li>• g:EnterpriseProjectId</li> </ul>                                                                           | -     |
| sfsturbo:shares:getAllShares | Grants permission to list SFS Turbo file systems.                 | list         | -                           | <ul style="list-style-type: none"> <li>• g:EnterpriseProjectId</li> <li>• g:RequestTag/&lt;tag-key&gt;</li> <li>• g:TagKeys</li> </ul>                                                       | -     |
| sfsturbo:shares:getShare     | Grants permission to query SFS Turbo file systems.                | read         | shares *                    | <ul style="list-style-type: none"> <li>• g:ResourceTag/&lt;tag-key&gt;</li> <li>• g:EnterpriseProjectId</li> </ul>                                                                           | -     |
| sfsturbo:shares:extendShare  | Grants permission to expand capacities of SFS Turbo file systems. | write        | shares *                    | <ul style="list-style-type: none"> <li>• g:ResourceTag/&lt;tag-key&gt;</li> <li>• g:EnterpriseProjectId</li> </ul>                                                                           | -     |

| Action                                   | Description                                                                | Access Level | Resource Type (*: required) | Condition Key                                                                                                  | Alias |
|------------------------------------------|----------------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------|-------|
| sfsturbo:shares:updateHpcShare           | Grants permission to update SFS Turbo file systems.                        | write        | shares *                    | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> | -     |
| sfsturbo:shares:updateShareSecurityGroup | Grants permission to change the security groups of SFS Turbo file systems. | write        | shares *                    | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> | -     |
| sfsturbo:shares:addTag                   | Grants permission to add a tag to an SFS Turbo file system.                | tagging      | shares *                    | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:TagKeys</li> </ul>             | -     |
| sfsturbo:shares:getTag                   | Grants permission to query tags of an SFS Turbo file system.               | read         | shares *                    | g:EnterpriseProjectId                                                                                          | -     |
| sfsturbo:shares:deleteTag                | Grants permission to delete tags from an SFS Turbo file system.            | tagging      | shares *                    | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:TagKeys</li> </ul>             | -     |
| sfsturbo:shares:batchResTag              | Grants permission to batch add tags to an SFS Turbo file system.           | tagging      | shares *                    | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:TagKeys</li> </ul>             | -     |
| sfsturbo:shares:getAllTag                | Grants permission to list all tags of an SFS Turbo file system.            | list         | -                           | g:EnterpriseProjectId                                                                                          | -     |

| Action                                    | Description                                                                     | Access Level | Resource Type (*: required) | Condition Key                                                                                                  | Alias |
|-------------------------------------------|---------------------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------|-------|
| sfsturbo:shares:renameShare               | Grants permission to change SFS Turbo file system names.                        | write        | shares *                    | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> | -     |
| sfsturbo:shares:showClientInfo            | Grants permission to query the client IP addresses of an SFS Turbo file system. | read         | shares *                    | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> | -     |
| sfsturbo:shares:createDataRepositoryTask  | Grants permission to create SFS Turbo backup vaults.                            | write        | shares *                    | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> | -     |
| sfsturbo:shares:deleteDataRepositoryTask  | Grants permission to delete SFS Turbo backup vaults.                            | write        | shares *                    | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> | -     |
| sfsturbo:shares:getDataRepositoryTask     | Grants permission to query SFS Turbo backup vaults.                             | read         | shares *                    | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> | -     |
| sfsturbo:shares:getAllDataRepositoryTasks | Grants permission to list SFS Turbo backup vaults.                              | list         | shares *                    | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> | -     |
| sfsturbo:shares:getAZInfo                 | Grants permission to query the AZ information of the current region.            | read         | -                           | -                                                                                                              | -     |
| sfsturbo:shares:getQuota                  | Grants permission to query SFS Turbo quotas.                                    | read         | -                           | -                                                                                                              | -     |

| Action                           | Description                                                                            | Access Level | Resource Type (*: required) | Condition Key                                                                                                  | Alias |
|----------------------------------|----------------------------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------|-------|
| sfsturbo:shares:getFlavors       | Grants permission to query SFS Turbo file system types.                                | read         | -                           | -                                                                                                              | -     |
| sfsturbo:shares:checkShareName   | Grants permission to check SFS Turbo file system names.                                | read         | -                           | -                                                                                                              | -     |
| sfsturbo:shares:createFsDir      | Grants permission to create directories in SFS Turbo file systems.                     | write        | shares *                    | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> | -     |
| sfsturbo:shares:showFsDir        | Grants permission to query directories of SFS Turbo file systems.                      | read         | shares *                    | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> | -     |
| sfsturbo:shares:deleteFsDir      | Grants permission to delete directories from SFS Turbo file systems.                   | write        | shares *                    | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> | -     |
| sfsturbo:shares:createFsDirQuota | Grants permission to configure quota limits for directories in SFS Turbo file systems. | write        | shares *                    | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> | -     |
| sfsturbo:shares:showFsDirQuota   | Grants permission to query quota limits of directories in SFS Turbo file systems.      | read         | shares *                    | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> | -     |

| Action                                 | Description                                                                                  | Access Level | Resource Type (*: required) | Condition Key                                                                                                  | Alias |
|----------------------------------------|----------------------------------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------|-------|
| sfsturbo:shares:deleteFsDirQuota       | Grants permission to remove quota limits from directories in SFS Turbo file systems.         | write        | shares *                    | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> | -     |
| sfsturbo:shares:updateFsDirQuota       | Grants permission to update quota limits of directories in SFS Turbo file systems.           | write        | shares *                    | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> | -     |

| PUT /v1/{project_id}/sfs-turbo/shares/{share_id}/fs/active-directory-domain | sfsturbo:shares:updateActiveDirectoryDomain | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-38](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for SFS Turbo.

**Table 3-38** Resource types supported by SFS Turbo

| Resource Type | URN      |
|---------------|----------|
| shares        | shares * |

## Conditions

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name as the prefix, for example, sfsturbo) apply only to operations of SFS Turbo. For details, see [Table 3-39](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple

tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.

- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [Condition operators](#).

### Service-specific condition keys supported by SFS Turbo

The following table lists the condition keys that you can define in identity policies for SFS Turbo. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-39** Service-specific condition keys supported by SFS Turbo

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                                                            |
|--------------------------------|--------|-------------------------------|------------------------------------------------------------------------|
| sfsturbo:CryptKeyId            | String | Single-valued                 | Filters access based on the key ID specified in the request parameter. |

## 3.3 Networking

### 3.3.1 Enterprise Router

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by er, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by er, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for er.

**Table 3-40** Actions supported by er

| Action           | Description                                    | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias |
|------------------|------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| er:instances:get | Grants permission to get an enterprise router. | Read         | instances *                 | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | -     |

| Action                           | Description                                                 | Access Level | Resource Type (*: required) | Condition Key                                                                                                                | Alias                 |
|----------------------------------|-------------------------------------------------------------|--------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| er:instances:create              | Grants permission to create an enterprise router.           | Write        | instances *                 | <b>g:EnterpriseProjectId</b>                                                                                                 | -                     |
|                                  |                                                             |              | -                           | <ul style="list-style-type: none"> <li><b>g:RequestTag/&lt;tag-key&gt;</b></li> <li><b>g:TagKeys</b></li> </ul>              |                       |
| er:instances:list                | Grants permission to list enterprise routers.               | List         | instances *                 | -                                                                                                                            | -                     |
| er:instances:update              | Grants permission to update an enterprise router.           | Write        | instances *                 | <ul style="list-style-type: none"> <li><b>g:EnterpriseProjectId</b></li> <li><b>g:ResourceTag/&lt;tag-key&gt;</b></li> </ul> | -                     |
| er:instances:delete              | Grants permission to delete an enterprise router.           | Write        | instances *                 | <ul style="list-style-type: none"> <li><b>g:EnterpriseProjectId</b></li> <li><b>g:ResourceTag/&lt;tag-key&gt;</b></li> </ul> | -                     |
| er:instances:changeAZ            | Grants permission to change the AZ of an enterprise router. | Write        | instances *                 | <ul style="list-style-type: none"> <li><b>g:EnterpriseProjectId</b></li> <li><b>g:ResourceTag/&lt;tag-key&gt;</b></li> </ul> | -                     |
| er:instances:createVpcAttachment | Grants permission to create a VPC attachment.               | Write        | instances *                 | <ul style="list-style-type: none"> <li><b>g:EnterpriseProjectId</b></li> <li><b>g:ResourceTag/&lt;tag-key&gt;</b></li> </ul> | er:attachments:create |

| Action                           | Description                                   | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias                 |
|----------------------------------|-----------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| er:instances:showVpcAttachment   | Grants permission to get a VPC attachment.    | Read         | instances *                 | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | er:attachments:get    |
| er:instances:listVpcAttachments  | Grants permission to list VPC attachments.    | List         | instances *                 | -                                                                                                                                                  | er:attachments:list   |
| er:instances:updateVpcAttachment | Grants permission to update a VPC attachment. | Write        | instances *                 | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | er:attachments:update |
| er:instances:deleteVpcAttachment | Grants permission to delete a VPC attachment. | Write        | instances *                 | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | er:attachments:delete |
| er:commonAttachments:get         | Grants permission to get an attachment.       | Read         | attachments *               | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | er:attachments:get    |
| er:commonAttachments:list        | Grants permission to list attachments.        | List         | attachments *               | -                                                                                                                                                  | er:attachments:list   |
| er:commonAttachments:update      | Grants permission to update an attachment.    | Write        | attachments *               | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | er:attachments:update |

| Action                | Description                                | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                  | Alias |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-42](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for er.

**Table 3-42** Resource types supported by er

| Resource Type | URN                                                   |
|---------------|-------------------------------------------------------|
| instances     | er:<region>:<account-id>:instances:<instance-id>      |
| routeTables   | er:<region>:<account-id>:routeTables:<route-table-id> |
| flowLogs      | er:<region>:<account-id>:flowLogs:<flow-log-id>       |
| attachments   | er:<region>:<account-id>:attachments:<attachment-id>  |

## Conditions

er does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.3.2 Virtual Private Cloud

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by vpc, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by vpc, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for vpc.

**Table 3-43** Actions supported by vpc

| Action          | Description                      | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                                       | Alias |
|-----------------|----------------------------------|--------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| vpc:vpcs:create | Grants permission to create vpc. | Write        | vpc *                       | -                                                                                                                                                                                                                                                   | -     |
|                 |                                  |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> <li>• <a href="#">vpc:VpcBlockServiceEndpointStates</a></li> </ul> |       |

Each API of vpc usually supports one or more actions. [Table 3-44](#) lists the supported actions and dependencies.

**Table 3-44** Actions and dependencies supported by vpc APIs

| API                                   | Action             | Dependencies |
|---------------------------------------|--------------------|--------------|
| POST /v1/{project_id}/vpcs            | vpc:vpcs:create    | -            |
| GET /v1/{project_id}/vpcs/{vpc_id}    | vpc:vpcs:get       | -            |
| GET /v1/{project_id}/vpcs             | vpc:vpcs:list      | -            |
| PUT /v1/{project_id}/vpcs/{vpc_id}    | vpc:vpcs:update    | -            |
| DELETE /v1/{project_id}/vpcs/{vpc_id} | vpc:vpcs:delete    | -            |
| POST /v1/{project_id}/subnets         | vpc:subnets:create | -            |

| API                                                       | Action                    | Dependencies |
|-----------------------------------------------------------|---------------------------|--------------|

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-45](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for vpc.

**Table 3-45** Resource types supported by vpc

| Resource Type       | URN                                                                      |
|---------------------|--------------------------------------------------------------------------|
| network             | vpc:<region>:<account-id>:network:<network-id>                           |
| securityGroupRule   | vpc:<region>:<account-id>:securityGroupRule:<security-group-rule-id>     |
| addressGroup        | vpc:<region>:<account-id>:addressGroup:<address-group-id>                |
| firewall            | vpc:<region>:<account-id>:firewall:<firewall-id>                         |
| port                | vpc:<region>:<account-id>:port:<port-id>                                 |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains **condition keys** and **operators**.

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, vpc) apply only to operations of the xx service. For details, see [Table 3-46](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when

its request conditions are met. For supported condition operators, see [operators](#).

### Service-specific condition keys supported by vpc

The following table lists the condition keys that you can define in identity policies for vpc. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-46** Service-specific condition keys supported by vpc

| Service-specific Condition Key    | Type   | Single-valued/<br>Multivalued | Description                                                                                          |
|-----------------------------------|--------|-------------------------------|------------------------------------------------------------------------------------------------------|
| vpc:VpcId                         | string | Multivalued                   | Filters access based on the specified vpc id.                                                        |
| vpc:VpcBlockServiceEndpointStates | string | Single-valued                 | Filters access based on the specified vpc block service endpoint, valid values should be on and off. |
| vpc:SubnetId                      | string | Multivalued                   | Filters access based on the specified subnet id.                                                     |
| vpc:SecurityGroupId               | string | Multivalued                   | Filters access based on the specified securityGroup id.                                              |
| vpc:PeeringId                     | string | Multivalued                   | Filters access based on the specified peering id.                                                    |
| vpc:AccepterVpcId                 | string | Multivalued                   | Filters access based on the specified accepter vpc id.                                               |
| vpc:AccepterVpcOrgPath            | string | Multivalued                   | Filters access based on the org path of specified accepter vpc owner.                                |
| vpc:AccepterVpcOwner              | string | Multivalued                   | Filters access based on the specified accepter vpc owner.                                            |
| vpc:RequesterVpcOrgPath           | string | Multivalued                   | Filters access based on the org path of specified requester vpc owner.                               |

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                                                                                                         |
|--------------------------------|--------|-------------------------------|---------------------------------------------------------------------------------------------------------------------|
| vpc:RequesterVpcOwner          | string | Multivalued                   | Filters access based on the specified requester vpc owner.                                                          |
| vpc:RequesterVpcId             | string | Multivalued                   | Filters access based on the specified requester vpc id.                                                             |
| vpc:RouteTableId               | string | Multivalued                   | Filters access based on the specified routeTable id.                                                                |
| vpc:FlowLogId                  | string | Multivalued                   | Filters access based on the specified flowLog id.                                                                   |
| vpc:AddressGroupId             | string | Multivalued                   | Filters access based on the specified addressGroup id.                                                              |
| vpc:FirewallId                 | string | Multivalued                   | Filters access based on the specified firewall id.                                                                  |
| vpc:PrivateIpId                | string | Multivalued                   | Filters access based on the specified privateIp id.                                                                 |
| vpc:PortId                     | string | Multivalued                   | Filters access based on the specified port id.                                                                      |
| vpc:SubNetworkInterfaceId      | string | Multivalued                   | Filters access based on the specified subNetworkInterface id.                                                       |
| vpc:FirewallRuleDirection      | string | Multivalued                   | Filters access based on the specified firewallRule direction, valid values should be ingress and egress.            |
| vpc:FirewallRuleProtocol       | string | Multivalued                   | Filters access based on the specified firewallRule protocol, valid values should be tcp, udp, icmp, icmpv6 and any. |

| Service-specific Condition Key  | Type    | Single-valued/<br>Multivalued | Description                                                                                                                                                                  |
|---------------------------------|---------|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vpc:FirewallRuleAction          | string  | Multivalued                   | Filters access based on the specified firewallRule action, valid values should be allow and deny.                                                                            |
| vpc:FirewallRuleSourcePort      | numeric | Multivalued                   | Filters access based on the specified firewallRule source port.                                                                                                              |
| vpc:FirewallRuleDestinationPort | numeric | Multivalued                   | Filters access based on the specified firewallRule destination port.                                                                                                         |
| vpc:FirewallOperation-Type      | string  | Multivalued                   | Filters access based on the specified firewall operation type, valid values should be updateAcl, associateSubnet, disassociateSubnet, insertRule, updateRule and removeRule. |
| vpc:TrafficMirrorFilter-Id      | string  | Multivalued                   | Filters access based on the specified traffic mirror filter id.                                                                                                              |
| vpc:TrafficMirrorTargetType     | string  | Multivalued                   | Filters access based on the specified traffic mirror session target resource type, valid values should be eni and elb.                                                       |
| vpc:TrafficMirrorTargetId       | string  | Multivalued                   | Filters access based on the specified traffic mirror session target resource id.                                                                                             |
| vpc:TrafficMirrorSourceType     | string  | Multivalued                   | Filters access based on the specified traffic mirror session source resource type, valid values should be eni.                                                               |

| Service-specific Condition Key            | Type       | Single-valued/<br>Multivalued | Description                                                                                                                      |
|-------------------------------------------|------------|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| vpc:TrafficMirrorSourceId                 | string     | Multivalued                   | Filters access based on the specified traffic mirror session source resource id.                                                 |
| vpc:FirewallRuleSourceIp                  | ip_address | Single-valued                 | Filters access based on the source address in the specified network ACL rule.                                                    |
| vpc:FirewallRuleSourceIpAddressGroup      | string     | Single-valued                 | Filters access based on the unique ID of the IP address group used by the source address in the specified network ACL rule.      |
| vpc:FirewallRuleDestinationIp             | ip_address | Single-valued                 | Filters access based on the destination address in the specified network ACL rule.                                               |
| vpc:FirewallRuleDestinationIpAddressGroup | string     | Single-valued                 | Filters access based on the unique ID of the IP address group used by the destination address in the specified network ACL rule. |
| vpc:AvailabilityZone                      | string     | Single-valued                 | Filters access based on the specified AvailabilityZone.                                                                          |
| vpc:LegacyAPIFlavor                       | string     | Single-valued                 | Filters access based on the native api.                                                                                          |
| vpc:SecurityGroupRuleDirection            | string     | Single-valued                 | Filters access based on the specified securityGroupRule direction, valid values should be ingress and egress.                    |

| Service-specific Condition Key            | Type       | Single-valued/<br>Multivalued | Description                                                                                                                          |
|-------------------------------------------|------------|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| vpc:SecurityGroupRuleProtocol             | string     | Single-valued                 | Filters access based on the specified securityGroupRule protocol, valid values should be tcp, udp, icmp, icmpv6, gre and any.        |
| vpc:SecurityGroupRuleAction               | string     | Single-valued                 | Filters access based on the specified securityGroupRule action, valid values should be allow and deny.                               |
| vpc:SecurityGroupRulePort                 | numeric    | Multivalued                   | Filters access based on the specified securityGroupRule port.                                                                        |
| vpc:SecurityGroupRuleRemoteIpAddressGroup | string     | Single-valued                 | Filters access based on the unique ID of the IP address group used by the remote address group in the specified security group rule. |
| vpc:SecurityGroupRuleRemoteSecurityGroup  | string     | Single-valued                 | Filters access based on the unique security group ID used by the remote security group in the specified security group rule.         |
| vpc:SecurityGroupRuleRemoteIpPrefix       | ip_address | Single-valued                 | Filters access based on the IP address used by the remote IP address in the specified security group rule.                           |
| vpc:VirusubnetCidrReservationId           | string     | Multivalued                   | Filters access based on the specified virusubnetCidrReservation id.                                                                  |
| vpc:SubnetIpv6Enable                      | boolean    | Single-valued                 | Filters access based on the IPv6 enabling status of the specified subnet.                                                            |

### 3.3.3 Elastic IP

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by EIP, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.

- If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
- If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by EIP, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for EIP.

**Table 3-47** Actions supported by EIP

| Action                   | Description                                         | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias                   |
|--------------------------|-----------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| eip:publicips:createTags | Grants permission to create a tag for an EIP.       | Tagging      | public ip *                 | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | vpc:publicipTags:create |
|                          |                                                     |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul>              |                         |
| eip:publicips:listTags   | Grants permission to query tags of a specified EIP. | List         | public ip *                 | -                                                                                                                                                  | vpc:publicipTags:get    |
| eip:publicips:deleteTags | Grants permission to delete an EIP tag.             | Tagging      | public ip *                 | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | vpc:publicipTags:delete |
|                          |                                                     |              | -                           | <a href="#">g:TagKeys</a>                                                                                                                          |                         |
| eip:publicips:count      | Grants permission to count EIPs.                    | List         | public ip *                 | -                                                                                                                                                  | vpc:publicips:list      |

| Action                     | Description                                                         | Access Level | Resource Type (*: required) | Condition Key                                                                                                                | Alias                 |
|----------------------------|---------------------------------------------------------------------|--------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| eip:bandwidths:create      | Grants permission to create shared bandwidth.                       | Write        | bandwidth*                  | -                                                                                                                            | vpc:bandwidths:create |
|                            |                                                                     |              | -                           | <b>g:EnterpriseProjectId</b>                                                                                                 |                       |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-49](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for EIP.

**Table 3-49** Resource types supported by EIP

| Resource Type     | URN                                                                |
|-------------------|--------------------------------------------------------------------|
| bandwidthRule     | eip:<region>:<account-id>:bandwidthRule:<bandwidthRule-id>         |
| bandwidth         | vpc:<region>:<account-id>:bandwidth:<bandwidth-id>                 |
| bandwidthPkg      | eip:<region>:<account-id>:bandwidthPkg:<bandwidthPkg-id>           |
| publicipPool      | eip:<region>:<account-id>:publicipPool:<publicipPool-id>           |
| geipSegment       | eip:<region>:<account-id>:geipSegment:<geipSegment-id>             |
| vpclgw            | eip:<region>:<account-id>:vpclgw:<vpclgw-id>                       |
| internetBandwidth | eip:<region>:<account-id>:internetBandwidth:<internetBandwidth-id> |

| Resource Type | URN                                                |
|---------------|----------------------------------------------------|
| publicip      | vpc:<region>:<account-id>:publicip:<publicip-id>   |
| globalEip     | eip:<region>:<account-id>:globalEip:<globalEip-id> |

## Conditions

EIP does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.3.4 Direct Connect

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.

- Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by DC, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by DC, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for DC.

**Table 3-50** Actions supported by DC

| Action                     | Description                               | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                          | Alias |
|----------------------------|-------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| dcaas:directConnect:create | Grants permission to create a connection. | Write        | direct Connect *            | -                                                                                                                                                                                      |       |
|                            |                                           |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> |       |
| dcaas:directConnect:update | Grants permission to update a connection. | Write        | direct Connect *            | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                     | -     |

| Action                                        | Description                                                                                                      | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias                        |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| dcaas:directConnect:delete                    | Grants permission to delete a pay-per-use connection. A yearly/monthly connection can only be unsubscribed from. | Write        | directConnect *             | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | -                            |
| dcaas:directConnect:get                       | Grants permission to query details of a connection.                                                              | Read         | directConnect *             | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | -                            |
| dcaas:directConnect:list                      | Grants permission to list the connections .                                                                      | List         | directConnect *             | -                                                                                                                                                  | -                            |
|                                               |                                                                                                                  |              | -                           | <a href="#">g:EnterpriseProjectId</a>                                                                                                              |                              |
| dcaas:directConnect:createHostedDirectConnect | Grants permission to allow a partner to create a hosted connection.                                              | Write        | directConnect *             | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | • dcaas:directConnect:create |
| dcaas:directConnect:updateHostedDirectConnect | Grants permission to allow a partner to update a hosted connection.                                              | Write        | directConnect *             | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | • dcaas:directConnect:update |

| dcaas:lgw:update         | Grants permission to update a local gateway.                                                | Write        | lgw *                       | -             | -     |
| dcaas:lgw:delete         | Grants permission to delete a local gateway.                                                | Write        | lgw *                       | -             | -     |
| dcaas:lgw:get            | Grants permission to query details of a local gateway.                                      | Read         | lgw *                       | -             | -     |
| dcaas:lgw:list           | Grants permission to list the local gateways.                                               | List         | lgw *                       | -             | -     |
| dcaas:lgwTable:create    | Grants permission to create a local gateway route table.                                    | Write        | lgwTable *                  | -             | -     |
|                          |                                                                                             |              | lgw *                       | -             |       |

| Action                             | Description                                                           | Access Level | Resource Type (*: required) | Condition Key | Alias |
|------------------------------------|-----------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| dcaas:lgwTable:update              | Grants permission to update a local gateway route table.              | Write        | lgwTable *                  | -             | -     |
| dcaas:lgwTable:delete              | Grants permission to delete a local gateway route table.              | Write        | lgwTable *                  | -             | -     |
| dcaas:lgwTable:get                 | Grants permission to query details of a local gateway route table.    | Read         | lgwTable *                  | -             | -     |
| dcaas:lgwTable:list                | Grants permission to list the local gateway route tables.             | List         | lgwTable *                  | -             | -     |
| dcaas:lgwTable:createLgwTableRoute | Grants permission to create a route in a local gateway route table.   | Write        | lgwTable *                  | -             | -     |
| dcaas:lgwTable:updateLgwTableRoute | Grants permission to update a route in a local gateway route table.   | Write        | lgwTable *                  | -             | -     |
| dcaas:lgwTable:deleteLgwTableRoute | Grants permission to delete a route from a local gateway route table. | Write        | lgwTable *                  | -             | -     |

| Action                                  | Description                                                                     | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-----------------------------------------|---------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| dcaas:lgwTable:getLgwTableRoute         | Grants permission to query details of a route in a local gateway route table.   | Read         | lgwTable *                  | -             | -     |
| dcaas:lgwTable:listLgwTableRoute        | Grants permission to list the routes in a local gateway route table.            | List         | lgwTable *                  | -             | -     |
| dcaas:lgwTable:batchDeleteLgwTableRoute | Grants permission to delete routes from a local gateway route table in batches. | Write        | lgwTable *                  | -             | -     |
| dcaas:lgwTable:createLgwTableVpc        | Grants permission to associate a local gateway route table with a VPC.          | Write        | lgwTable *                  | -             | -     |
|                                         |                                                                                 |              | vpc *                       | -             |       |
| dcaas:lgwTable:updateLgwTableVpc        | Grants permission to update a VPC for a local gateway route table.              | Write        | lgwTable *                  | -             | -     |
| dcaas:lgwTable:deleteLgwTableVpc        | Grants permission to disassociate a local gateway route table from a VPC.       | Write        | lgwTable *                  | -             | -     |

| Action                         | Description                                                                                      | Access Level | Resource Type (*: required) | Condition Key | Alias |
|--------------------------------|--------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| dcaas:lgwTable:getLgwTableVpc  | Grants permission to query details of a VPC that a local gateway route table is associated with. | Read         | lgwTable *                  | -             | -     |
| dcaas:lgwTable:listLgwTableVpc | Grants permission to list the VPCs that a local gateway route table is associated with.          | List         | lgwTable *                  | -             | -     |

Each API of DC usually supports one or more actions. [Table 3-51](#) lists the supported actions and dependencies.

**Table 3-51** Actions and dependencies supported by DC APIs

| API                                                               | Action                     | Dependencies |
|-------------------------------------------------------------------|----------------------------|--------------|
| GET /v3/{project_id}/dcaas/direct-connects/{direct_connect_id}    | dcaas:directConnect:get    | -            |
| GET /v3/{project_id}/dcaas/direct-connects                        | dcaas:directConnect:list   | -            |
| PUT /v3/{project_id}/dcaas/direct-connects/{direct_connect_id}    | dcaas:directConnect:update | -            |
| DELETE /v3/{project_id}/dcaas/direct-connects/{direct_connect_id} | dcaas:directConnect:delete | -            |

| API                                                                  | Action                                        | Dependencies                                                                                 |
|----------------------------------------------------------------------|-----------------------------------------------|----------------------------------------------------------------------------------------------|

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-52](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for DC.

**Table 3-52** Resource types supported by DC

| Resource Type  | URN                                                            |
|----------------|----------------------------------------------------------------|
| instances      | er:<region>:<account-id>:instances:<instance-id>               |
| lgw            | dcaas:<region>:<account-id>:lgw:<lgw-id>                       |
| vif            | dcaas:<region>:<account-id>:vif:<vif-id>                       |
| lgwTable       | dcaas:<region>:<account-id>:lgwTable:<lgwTable-id>             |
| gdgw           | dcaas:<region>:<account-id>:gdgw:<gdgw-id>                     |
| vifPeer        | dcaas:<region>:<account-id>:vifPeer:<vifPeer-id>               |
| vpc            | vpc:<region>:<account-id>:vpc:<vpc-id>                         |
| vgw            | dcaas:<region>:<account-id>:vgw:<vgw-id>                       |
| directConnect  | dcaas:<region>:<account-id>:directConnect:<directConnect-id>   |
| lag            | dcaas:<region>:<account-id>:lag:<lag-id>                       |
| connectGateway | dcaas:<region>:<account-id>:connectGateway:<connectGateway-id> |

## Conditions

DC does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.3.5 VPC Endpoint

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by VPCEP, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by VPCEP, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for VPCEP.

**Table 3-53** Actions supported by VPCEP

| Action                 | Description                                                         | Access Level | Resource Type (*: required) | Condition Key                                                                                                                          | Alias |
|------------------------|---------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------|-------|
| vpcep:endpoints:create | Grants permission to create a VPC endpoint for a specified service. | Write        | endpoints *                 | <ul style="list-style-type: none"> <li>vpcep:VpcServiceName</li> <li>vpcep:VpcServiceOrgPath</li> <li>vpcep:VpcServiceOwner</li> </ul> | -     |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-55](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for VPCEP.

**Table 3-55** Resource types supported by VPCEP

| Resource Type    | URN                                                                |
|------------------|--------------------------------------------------------------------|
| routeTable       | vpc:<region>:<account-id>:routeTable:<route-table-id>              |
| vpc              | vpc:<region>:<account-id>:vpc:<vpc-id>                             |
| endpointServices | vpcep:<region>:<account-id>:endpointServices:<endpoint-service-id> |
| subnet           | vpc:<region>:<account-id>:subnet:<subnet-id>                       |
| endpoints        | vpcep:<region>:<account-id>:endpoints:<endpoint-id>                |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains **condition keys** and **operators**.

- The condition key that you specify can be a global condition key or a service-specific condition key.

- Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
- Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, vpcep) apply only to operations of the xx service. For details, see [Table 3-56](#).
- The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [operators](#).

#### Service-specific condition keys supported by VPCEP

The following table lists the condition keys that you can define in identity policies for VPCEP. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-56** Service-specific condition keys supported by VPCEP

| Service-specific Condition Key  | Type   | Single-valued/<br>Multivalued | Description                                                                                 |
|---------------------------------|--------|-------------------------------|---------------------------------------------------------------------------------------------|
| vpcep:VpceServiceName           | string | Single-valued                 | Filters access by the name of the VPC endpoint service.                                     |
| vpcep:VpceServiceOwner          | string | Single-valued                 | Filters access by the service owner of the VPC endpoint service (huawei, or an account ID). |
| vpcep:VpceServicePrivateDnsName | string | Single-valued                 | Filters access by the vpceServicePrivateDnsName that is passed in the request.              |
| vpcep:VpceServiceOrgPath        | string | Single-valued                 | Filters access by the organization path of the VPC endpoint service owner.                  |

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                                                        |
|--------------------------------|--------|-------------------------------|--------------------------------------------------------------------|
| vpcep:VpceEndpointOrgPath      | string | Multivalued                   | Filters access by the organization path of the VPC endpoint owner. |
| vpcep:VpceEndpointOwner        | string | Multivalued                   | Filters access by the accountId of VPC endpoint owner.             |

### 3.3.6 Global accelerator

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.

- If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
- Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by GA, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by GA, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for GA.

**Table 3-57** Actions supported by GA

| Action                | Description                                 | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias |
|-----------------------|---------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| ga:accelerator:list   | Grants permission to list accelerators.     | List         | accelerator *               | -                                                                                                                                                  | -     |
| ga:accelerator:create | Grants permission to create an accelerator. | Write        | accelerator *               | <a href="#">g:EnterpriseProjectId</a>                                                                                                              | -     |
|                       |                                             |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul>              |       |
| ga:accelerator:get    | Grants permission to get an accelerator.    | Read         | accelerator *               | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | -     |

| Action                | Description                                 | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias |
|-----------------------|---------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| ga:accelerator:update | Grants permission to update an accelerator. | Write        | accelerator *               | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | -     |
| ga:accelerator:delete | Grants permission to delete an accelerator. | Write        | accelerator *               | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | -     |
| ga:listener:list      | Grants permission to list listeners.        | List         | listener *                  | -                                                                                                                                                  | -     |
| ga:listener:create    | Grants permission to create a listener.     | Write        | listener *                  | -                                                                                                                                                  | -     |
|                       |                                             |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul>              |       |
| ga:listener:get       | Grants permission to get a listener.        | Read         | listener *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                                      | -     |
| ga:listener:update    | Grants permission to update a listener.     | Write        | listener *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                                      | -     |
| ga:listener:delete    | Grants permission to delete a listener.     | Write        | listener *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                                      | -     |
| ga:endpointgroup:list | Grants permission to list endpoint groups.  | List         | endpointgroup *             | -                                                                                                                                                  | -     |

| Action                  | Description                                    | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                     | Alias |
|-------------------------|------------------------------------------------|--------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| ga:endpointgroup:create | Grants permission to create an endpoint group. | Write        | endpointgroup *             | -                                                                                                                                                                 |       |
|                         |                                                |              | -                           | ga:RequestId                                                                                                                                                      |       |
| ga:endpointgroup:get    | Grants permission to get an endpoint group.    | Read         | endpointgroup *             | ga:RegionId                                                                                                                                                       | -     |
| ga:endpointgroup:update | Grants permission to update an endpoint group. | Write        | endpointgroup *             | ga:RegionId                                                                                                                                                       | -     |
| ga:endpointgroup:delete | Grants permission to delete an endpoint group. | Write        | endpointgroup *             | ga:RegionId                                                                                                                                                       | -     |
| ga:endpoint:list        | Grants permission to list endpoints.           | List         | endpoint *                  | -                                                                                                                                                                 | -     |
| ga:endpoint:create      | Grants permission to create an endpoint.       | Write        | endpoint *                  | -                                                                                                                                                                 |       |
|                         |                                                |              | -                           | <ul style="list-style-type: none"> <li>ga:RequestResourceType</li> <li>ga:RequestResourceId</li> <li>ga:RequestIpAddress</li> <li>ga:RequestDomainName</li> </ul> |       |

| Action                | Description                                | Access Level | Resource Type (*: required) | Condition Key                                                                                                                         | Alias |
|-----------------------|--------------------------------------------|--------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|-------|
| ga:endpoint:get       | Grants permission to get an endpoint.      | Read         | endpoint *                  | <ul style="list-style-type: none"> <li>ga:ResourceType</li> <li>ga:ResourceId</li> <li>ga:IpAddress</li> <li>ga:DomainName</li> </ul> | -     |
| ga:endpoint:update    | Grants permission to update an endpoint.   | Write        | endpoint *                  | <ul style="list-style-type: none"> <li>ga:ResourceType</li> <li>ga:ResourceId</li> <li>ga:IpAddress</li> <li>ga:DomainName</li> </ul> | -     |
| ga:endpoint:delete    | Grants permission to delete an endpoint.   | Write        | endpoint *                  | <ul style="list-style-type: none"> <li>ga:ResourceType</li> <li>ga:ResourceId</li> <li>ga:IpAddress</li> <li>ga:DomainName</li> </ul> | -     |
| ga:healthcheck:list   | Grants permission to list health checks.   | List         | healthcheck *               | -                                                                                                                                     | -     |
| ga:healthcheck:create | Grants permission to create a healthcheck. | Write        | healthcheck *               | -                                                                                                                                     | -     |
| ga:healthcheck:get    | Grants permission to get a healthcheck.    | Read         | healthcheck *               | -                                                                                                                                     | -     |

| Action                 | Description                                               | Access Level | Resource Type (*: required) | Condition Key                                                                                                                     | Alias                     |
|------------------------|-----------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| ga:healthcheck:update  | Grants permission to update a healthcheck.                | Write        | healthcheck *               | -                                                                                                                                 | -                         |
| ga:healthcheck:delete  | Grants permission to delete a healthcheck.                | Write        | healthcheck *               | -                                                                                                                                 | -                         |
| ga:tag:create          | Grants permission to create tags for a resource.          | Tagging      | accelerator                 | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     | -                         |
|                        |                                                           |              | listener                    | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     |                           |
|                        |                                                           |              | -                           | <ul style="list-style-type: none"> <li><a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li><a href="#">g:TagKeys</a></li> </ul> |                           |
| ga:tag:delete          | Grants permission to delete tags of a specified resource. | Tagging      | accelerator *               | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     | -                         |
|                        |                                                           |              | listener *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     |                           |
|                        |                                                           |              | -                           | <a href="#">g:TagKeys</a>                                                                                                         |                           |
| ga:tag:get             | Grants permission to query tags of resource.              | Read         | accelerator                 | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     | -                         |

| ga:tag:list            | Grants permission to list tags.                           | List         | -                           | -                                                                                                                                 | -                         |
| ga::listResourcesByTag | Grants permission to list resource instances by tag.      | List         | -                           | <a href="#">g:TagKeys</a>                                                                                                         | ga:tag:listResourcesByTag |
| ga:ipgroup:list        | Grants permission to list ip groups.                      | List         | ipgroup *                   | -                                                                                                                                 | -                         |

| Action                          | Description                                                         | Access Level | Resource Type (*: required) | Condition Key | Alias |
|---------------------------------|---------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| ga:ipgroup:create               | Grants permission to create an ip group.                            | Write        | ipgroup *                   | -             | -     |
| ga:ipgroup:get                  | Grants permission to get an ip group.                               | Read         | ipgroup *                   | -             | -     |
| ga:ipgroup:update               | Grants permission to update an ip group.                            | Write        | ipgroup *                   | -             | -     |
| ga:ipgroup:delete               | Grants permission to delete an ip group.                            | Write        | ipgroup *                   | -             | -     |
| ga:ipgroup:addips               | Grants permission to add ips of a specified ip group.               | Write        | ipgroup *                   | -             | -     |
| ga:ipgroup:removelps            | Grants permission to remove ips of a specified ip group.            | Write        | ipgroup *                   | -             | -     |
| ga:ipgroup:associateListener    | Grants permission to associate listener of a specified ip group.    | Write        | ipgroup *                   | -             | -     |
| ga:ipgroup:disassociateListener | Grants permission to disassociate listener of a specified ip group. | Write        | ipgroup *                   | -             | -     |

| Action             | Description                            | Access Level | Resource Type (*: required) | Condition Key | Alias             |
|--------------------|----------------------------------------|--------------|-----------------------------|---------------|-------------------|
| ga::listByoipPools | Grants permission to list byoip pools. | List         | -                           | -             | ga:byoippool:list |
| ga:logtank:list    | Grants permission to list logtanks.    | List         | logtank *                   | -             | -                 |
| ga:logtank:create  | Grants permission to create logtank.   | Write        | logtank *                   | -             | -                 |
| ga:logtank:get     | Grants permission to get logtank info. | Read         | logtank *                   | -             | -                 |
| ga:logtank:update  | Grants permission to modify logtank.   | Write        | logtank *                   | -             | -                 |
| ga:logtank:delete  | Grants permission to delete logtank.   | Write        | logtank *                   | -             | -                 |

Each API of GA usually supports one or more actions. [Table 3-58](#) lists the supported actions and dependencies.

**Table 3-58** Actions and dependencies supported by GA APIs

| API                                   | Action                | Dependencies |
|---------------------------------------|-----------------------|--------------|
| GET /v1/accelerators                  | ga:accelerator:list   | -            |
| POST /v1/accelerators                 | ga:accelerator:create | -            |
| GET /v1/accelerators/{accelerator_id} | ga:accelerator:get    | -            |

| API                                                                 | Action                  | Dependencies |
|---------------------------------------------------------------------|-------------------------|--------------|
| PUT /v1/accelerators/{accelerator_id}                               | ga:accelerator:update   | -            |
| DELETE /v1/accelerators/{accelerator_id}                            | ga:accelerator:delete   | -            |
| GET /v1/listeners                                                   | ga:listener:list        | -            |
| POST /v1/listeners                                                  | ga:listener:create      | -            |
| GET /v1/listeners/{listener_id}                                     | ga:listener:get         | -            |
| PUT /v1/listeners/{listener_id}                                     | ga:listener:update      | -            |
| DELETE /v1/listeners/{listener_id}                                  | ga:listener:delete      | -            |
| GET /v1/endpoint-groups                                             | ga:endpointgroup:list   | -            |

| POST /v1/logtanks                                      | ga:logtank:create               | -            |
| GET /v1/logtanks/{logtank_id}                          | ga:logtank:get                  | -            |
| PUT /v1/logtanks/{logtank_id}                          | ga:logtank:update               | -            |
| DELETE /v1/logtanks/{logtank_id}                       | ga:logtank:delete               | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-59](#), the resource URN must be

specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for GA.

**Table 3-59** Resource types supported by GA

| Resource Type | URN                                               |
|---------------|---------------------------------------------------|
| ipgroup       | ga::<account-id>:ipgroup:<ipgroup-id>             |
| endpoint      | ga::<account-id>:endpoint:<endpoint-id>           |
| accelerator   | ga::<account-id>:accelerator:<accelerator-id>     |
| logtank       | ga::<account-id>:logtank:<logtank-id>             |
| listener      | ga::<account-id>:listener:<listener-id>           |
| healthcheck   | ga::<account-id>:healthcheck:<healthcheck-id>     |
| endpointgroup | ga::<account-id>:endpointgroup:<endpointgroup-id> |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains **condition keys** and **operators**.

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, ga) apply only to operations of the xx service. For details, see [Table 3-60](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when

its request conditions are met. For supported condition operators, see [operators](#).

### Service-specific condition keys supported by GA

The following table lists the condition keys that you can define in identity policies for GA. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-60** Service-specific condition keys supported by GA

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                                                        |
|--------------------------------|--------|-------------------------------|--------------------------------------------------------------------|
| ga:RequestRegionId             | string | Single-valued                 | Filters access by the region id that is passed in the request.     |
| ga:RequestResource-Type        | string | Single-valued                 | Filters access by the resource type that is passed in the request. |
| ga:RequestResourceId           | string | Single-valued                 | Filters access by the resource id that is passed in the request.   |
| ga:RequestIpAddress            | string | Single-valued                 | Filters access by the ip address that is passed in the request.    |
| ga:RequestDomainName           | string | Single-valued                 | Filters access by the domain name that is passed in the request.   |
| ga:RegionId                    | string | Single-valued                 | Filters access by endpoint-group region id.                        |
| ga:ResourceType                | string | Single-valued                 | Filters access by endpoint resource type.                          |
| ga:ResourceId                  | string | Single-valued                 | Filters access by endpoint resource id.                            |
| ga:IpAddress                   | string | Single-valued                 | Filters access by endpoint ip address.                             |
| ga:DomainName                  | string | Single-valued                 | Filters access by endpoint domain name.                            |

### 3.3.7 NAT Gateway

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

#### Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by NAT, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by NAT, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for NAT.

**Table 3-61** Actions supported by NAT

| Action                        | Description                                                  | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                          | Alias |
|-------------------------------|--------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| nat:privateNatGateways:list   | Grants permission to query private NAT gateways.             | List         | privateGateway *            | <a href="#">g:EnterpriseProjectId</a>                                                                                                                                                  | -     |
| nat:privateNatGateways:create | Grants permission to create a private NAT gateway.           | Write        | privateGateway *            | -                                                                                                                                                                                      | -     |
|                               |                                                              |              | subnet *                    | -                                                                                                                                                                                      |       |
|                               |                                                              |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul> |       |
| nat:privateNatGateways:delete | Grants permission to delete a specified private NAT gateway. | Write        | privateGateway *            | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                     | -     |
| nat:privateNatGateways:get    | Grants permission to query a specified private NAT gateway.  | Read         | privateGateway *            | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                     | -     |

| Action                         | Description                                                                 | Access Level | Resource Type (*: required) | Condition Key                                                                                                  | Alias |
|--------------------------------|-----------------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------|-------|
| nat:privateNatGateways:update  | Grants permission to update a specified private NAT gateway.                | Write        | privateGateway *            | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -     |
| nat:privateNatDnatRules:list   | Grants permission to query DNAT rules of private NAT gateways.              | List         | privateDnatRule *           | g:EnterpriseProjectId                                                                                          | -     |
| nat:privateNatDnatRules:create | Grants permission to create a DNAT rule for a private NAT gateway.          | Write        | privateGateway *            | g:ResourceTag/<tag-key>                                                                                        | -     |
|                                |                                                                             |              | privateDnatRule *           | -                                                                                                              |       |
|                                |                                                                             |              | privateTransitIp *          | g:ResourceTag/<tag-key>                                                                                        |       |
|                                |                                                                             |              | port                        | -                                                                                                              |       |
|                                |                                                                             |              | -                           | g:EnterpriseProjectId                                                                                          |       |
| nat:privateNatDnatRules:delete | Grants permission to delete a specified DNAT rule of a private NAT gateway. | Write        | privateGateway *            | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -     |
|                                |                                                                             |              | privateDnatRule *           | g:EnterpriseProjectId                                                                                          |       |

| Action                         | Description                                                                 | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias |
|--------------------------------|-----------------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| nat:privateNatDnatRules:get    | Grants permission to query a specified DNAT rule of a private NAT gateway.  | Read         | privateGateway *            | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | -     |
|                                |                                                                             |              | privateDnatRule *           | <a href="#">g:EnterpriseProjectId</a>                                                                                                              |       |
| nat:privateNatDnatRules:update | Grants permission to update a specified DNAT rule of a private NAT gateway. | Write        | privateGateway *            | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                                      | -     |
|                                |                                                                             |              | privateDnatRule *           | -                                                                                                                                                  |       |

|                            |                                                                             |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul>              |                           |
| nat:natGateways:listTags   | Grants permission to query tags of public NAT gateways.                     | List         | gateway                     | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | nat:natGatewayTags:get    |

Each API of NAT usually supports one or more actions. [Table 3-62](#) lists the supported actions and dependencies.

**Table 3-62** Actions and dependencies supported by NAT APIs

| API                                                           | Action                         | Dependencies |
|---------------------------------------------------------------|--------------------------------|--------------|
| GET /v3/{project_id}/private-nat/gateways                     | nat:privateNatGateways:list    | -            |
| POST /v3/{project_id}/private-nat/gateways                    | nat:privateNatGateways:create  | -            |
| DELETE /v3/{project_id}/private-nat/gateways/{gateway_id}     | nat:privateNatGateways:delete  | -            |
| GET /v3/{project_id}/private-nat/gateways/{gateway_id}        | nat:privateNatGateways:get     | -            |
| PUT /v3/{project_id}/private-nat/gateways/{gateway_id}        | nat:privateNatGateways:update  | -            |
| GET /v3/{project_id}/private-nat/dnat-rules                   | nat:privateNatDnatRules:list   | -            |
| POST /v3/{project_id}/private-nat/dnat-rules                  | nat:privateNatDnatRules:create | -            |
| DELETE /v3/{project_id}/private-nat/dnat-rules/{dnat_rule_id} | nat:privateNatDnatRules:delete | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-63](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for NAT.

**Table 3-63** Resource types supported by NAT

| Resource Type    | URN                                                                |
|------------------|--------------------------------------------------------------------|
| snatRule         | nat:<region>:<account-id>:snatRule:<snat-rule-id>                  |
| privateSnatRule  | nat:<region>:<account-id>:privateSnatRule:<private-snat-rule-id>   |
| port             | vpc:<region>:<account-id>:port:<port-id>                           |
| privateGateway   | nat:<region>:<account-id>:privateGateway:<private-gateway-id>      |
| vpc              | vpc:<region>:<account-id>:vpc:<vpc-id>                             |
| publicip         | vpc:<region>:<account-id>:publicip:<publicip-id>                   |
| gateway          | nat:<region>:<account-id>:gateway:<gateway-id>                     |
| privateTransitIp | nat:<region>:<account-id>:privateTransitIp:<private-transit-ip-id> |
| dnatRule         | nat:<region>:<account-id>:dnatRule:<dnat-rule-id>                  |
| globalEip        | eip:<region>:<account-id>:globalEip:<geip-id>                      |
| privateDnatRule  | nat:<region>:<account-id>:privateDnatRule:<private-dnat-rule-id>   |
| subnet           | vpc:<region>:<account-id>:subnet:<subnet-id>                       |
| transitSubnet    | nat:<region>:<account-id>:transitSubnet:<transit-subnet-id>        |

## Conditions

NAT does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.3.8 Cloud Connect

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

#### Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by CC, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by CC, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for CC.

**Table 3-64** Actions supported by CC

| Action                     | Description                                                   | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                          | Alias |
|----------------------------|---------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| cc:cloudConnections:create | Grants permission to create a cloud connection.               | Write        | cloud Connection *          | -                                                                                                                                                                                      | -     |
|                            |                                                               |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul> |       |
| cc:cloudConnections:delete | Grants permission to delete a cloud connection.               | Write        | cloud Connection *          | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                     | -     |
| cc:cloudConnections:update | Grants permission to update a cloud connection.               | Write        | cloud Connection *          | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                     | -     |
| cc:cloudConnections:get    | Grants permission to query the details of a cloud connection. | Read         | cloud Connection *          | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                     | -     |

| Action                       | Description                                                      | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias |
|------------------------------|------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| cc:cloudConnections:list     | Grants permission to query the cloud connections.                | List         | cloud Connection *          | -                                                                                                                                                  | -     |
| cc:cloudConnections:tag      | Grants permission to add tags to a cloud connection.             | Tagging      | cloud Connection *          | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | -     |
|                              |                                                                  |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul>              |       |
| cc:cloudConnections:unTag    | Grants permission to delete tags from a cloud connection.        | Tagging      | cloud Connection *          | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | -     |
|                              |                                                                  |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul>              |       |
| cc:cloudConnections:listTags | Grants permission to query the tags added to a cloud connection. | List         | cloud Connection *          | -                                                                                                                                                  | -     |
| cc:networkInstances:create   | Grants permission to create a network instance.                  | Write        | networkInstance *           | -                                                                                                                                                  | -     |

| POST /v3/{domain_id}/dcaas/site-network/{site_network_id}/connections/{site_connection_id}/associate             | cc:siteNetwork:associateBandwidth    | -            |
| POST /v3/{domain_id}/dcaas/site-network/{site_network_id}/connections/{site_connection_id}/update-bandwidth-size | cc:siteNetwork:updateBandwidthSize   | -            |
| POST /v3/{domain_id}/dcaas/site-network/{site_network_id}/connections/{site_connection_id}/update-bandwidth      | cc:siteNetwork:updateBandwidth       | -            |
| GET /v3/{domain_id}/dcaas/site-network/capabilities                                                              | cc:capability:list                   | -            |
| GET /v3/{domain_id}/dcaas/site-network/quotas                                                                    | cc:quota:list                        | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-66](#), the resource URN must be

specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for CC.

**Table 3-66** Resource types supported by CC

| Resource Type            | URN                                                                       |
|--------------------------|---------------------------------------------------------------------------|
| cloudConnection          | cc::<account-id>:cloudConnection:<cloud-connection-id>                    |
| gcbandwidth              | cc::<account-id>:gcbandwidth:<gcbandwidth-id>                             |
| interRegionBandwidth     | cc::<account-id>:interRegionBandwidth:<inter-region-bandwidth-id>         |
| networkInstance          | cc::<account-id>:networkInstance:<network-instance-id>                    |
| siteNetwork              | cc::<account-id>:siteNetwork:<site-network-id>                            |
| bandwidthPackage         | cc::<account-id>:bandwidthPackage:<bandwidth-package-id>                  |
| centralNetwork           | cc::<account-id>:centralNetwork:<central-network-id>                      |
| centralNetworkAttachment | cc::<account-id>:centralNetworkAttachment:<central-network-attachment-id> |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains **condition keys** and **operators**.

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see **Global Condition Keys**.
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, cc) apply only to operations of the xx service. For details, see **Table 3-67**.
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have

multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so `g:SourceVpce` is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so `g:TagKeys` is a multivalued condition key.

- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [operators](#).

### Service-specific condition keys supported by CC

The following table lists the condition keys that you can define in identity policies for CC. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-67** Service-specific condition keys supported by CC

| Service-specific Condition Key                  | Type   | Single-valued/<br>Multivalued | Description                                                      |
|-------------------------------------------------|--------|-------------------------------|------------------------------------------------------------------|
| <a href="#">cc:VpcId</a>                        | string | Single-valued                 | Filters access by VPC ID.                                        |
| <a href="#">cc:VirtualGatewayId</a>             | string | Single-valued                 | Filters access by virtual gateway ID.                            |
| <a href="#">cc:EnterpriseRouterId</a>           | string | Single-valued                 | Filters access by enterprise router ID.                          |
| <a href="#">cc:MultipleEnterpriseRouterIds</a>  | string | Multivalued                   | Filters access by enterprise router IDs.                         |
| <a href="#">cc:BandwidthPackageId</a>           | string | Single-valued                 | Filters access by bandwidth package ID.                          |
| <a href="#">cc:GlobalConnection-BandwidthId</a> | string | Single-valued                 | Filters access by global connection bandwidth ID.                |
| <a href="#">cc:GlobalDcGatewayId</a>            | string | Single-valued                 | Filters access by global DC gateway ID.                          |
| <a href="#">cc:gcbAssociateResourceType</a>     | string | Single-valued                 | Filters access to global connection bandwidths by resource type. |

### Examples of Condition Keys

- `cc:VpcId`  
For example, Filters access to network instances by VPC ID.

```
{
  "Version": "5.0",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "cc:networkInstances:create",
        "cc:networkInstances:delete",
        "cc:networkInstances:update"
      ],
      "Condition": {
        "StringEquals": {
          "cc:VpcId": [
            "xxx"
          ]
        }
      }
    }
  ]
}
```

- cc:VirtualGatewayId

For example, Filters access to network instances by virtual gateway ID.

```
{
  "Version": "5.0",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "cc:networkInstances:create",
        "cc:networkInstances:delete",
        "cc:networkInstances:update"
      ],
      "Condition": {
        "StringEquals": {
          "cc:VirtualGatewayId": [
            "xxx"
          ]
        }
      }
    }
  ]
}
```

- cc:EnterpriseRouterId

For example, Filters access to global DC gateways attached to a central network by enterprise router ID.

```
{
  "Version": "5.0",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "cc:centralNetworkAttachment:createGdgw",
        "cc:centralNetworkAttachment:updateGdgw",
        "cc:centralNetworkAttachment:getGdgw",
        "cc:centralNetworkAttachment:delete"
      ],
      "Condition": {
        "StringEquals": {
          "cc:EnterpriseRouterId": [
            "xxx"
          ]
        }
      }
    }
  ]
}
```

- **cc:MultipleEnterpriseRouterIds**

For example, Filters access to central networks and enterprise router route table attachments by enterprise router IDs.

```
{
  "Version": "5.0",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "cc:centralNetwork:create",
        "cc:centralNetwork:createPolicy",
        "cc:centralNetworkAttachment:createErRouteTable",
        "cc:centralNetworkAttachment:updateErRouteTable",
        "cc:centralNetworkAttachment:getErRouteTable",
        "cc:centralNetworkAttachment:delete"
      ],
      "Condition": {
        "StringEquals": {
          "cc:MultipleEnterpriseRouterIds": [
            "xxx"
          ]
        }
      }
    }
  ]
}
```

- **cc:BandwidthPackageId**

For example, Filters access to inter-region bandwidths by bandwidth package ID.

```
{
  "Version": "5.0",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "cc:interRegionBandwidths:create",
        "cc:interRegionBandwidths:delete",
        "cc:interRegionBandwidths:update"
      ],
      "Condition": {
        "StringEquals": {
          "cc:BandwidthPackageId": [
            "xxx"
          ]
        }
      }
    }
  ]
}
```

- **cc:GlobalConnectionBandwidthId**

For example, Filters access to central network connections by global connection bandwidth ID.

```
{
  "Version": "5.0",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "cc:centralNetwork:updateConnection"
      ],
      "Condition": {
        "StringEquals": {
          "cc:GlobalConnectionBandwidthId": [
            "xxx"
          ]
        }
      }
    }
  ]
}
```

```

    ]
  }
}
]
}

```

- **cc:GlobalDcGatewayId**

For example, Filters access to global DC gateways attached to a central network by global DC gateway ID.

```

{
  "Version": "5.0",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "cc:centralNetworkAttachment:createGdgw",
        "cc:centralNetworkAttachment:updateGdgw",
        "cc:centralNetworkAttachment:getGdgw",
        "cc:centralNetworkAttachment:delete"
      ],
      "Condition": {
        "StringEquals": {
          "cc:GlobalDcGatewayId": [
            "xxx"
          ]
        }
      }
    }
  ]
}

```

- **cc:gcbAssociateResourceType**

For example, Filters access to the resource binding API or resource unbinding API by the type of the resource bound to the global connection bandwidth.

```

{
  "Version": "5.0",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "cc:gcbandwidth:associateInstance",
        "cc:gcbandwidth:disassociateInstance",
      ],
      "Condition": {
        "StringEquals": {
          "cc:gcbAssociateResourceType": [
            "xxx"
          ]
        }
      }
    }
  ]
}

```

### 3.3.9 Elastic Load Balance

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational

unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by ELB, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by ELB, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for ELB.

**Table 3-68** Actions supported by ELB

| Action                      | Description                                 | Access Level | Resource Type (*: required) | Condition Key                                                                                                                | Alias                 |
|-----------------------------|---------------------------------------------|--------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------|-----------------------|

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-70](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for ELB.

**Table 3-70** Resource types supported by ELB

| Resource Type    | URN                                                               |
|------------------|-------------------------------------------------------------------|
| pool             | elb:<region>:<account-id>:pool:<pool-id>                          |
| loadbalancer     | elb:<region>:<account-id>:loadbalancer:<loadbalancer-id>          |
| certificate      | elb:<region>:<account-id>:certificate:<certificate-id>            |
| healthmonitor    | elb:<region>:<account-id>:healthmonitor:<healthmonitor-id>        |
| ipgroup          | elb:<region>:<account-id>:ipgroup:<ipgroup-id>                    |
| securityPolicy   | elb:<region>:<account-id>:securityPolicy:<security-policy-id>     |
| logtank          | elb:<region>:<account-id>:logtank:<logtank-id>                    |
| availabilityZone | elb:<region>:<account-id>:availabilityZone:<availability-zone-id> |
| member           | elb:<region>:<account-id>:member:<pool-id>/<member-id>            |
| l7policy         | elb:<region>:<account-id>:l7policy:<l7policy-id>                  |
| l7rule           | elb:<region>:<account-id>:l7rule:<l7policy-id>/<l7rule-id>        |
| flavor           | elb:<region>:<account-id>:flavor:<flavor-id>                      |

| Resource Type | URN                                              |
|---------------|--------------------------------------------------|
| subnet        | vpc:<region>:<account-id>:subnet:<subnet-id>     |
| listener      | elb:<region>:<account-id>:listener:<listener-id> |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, elb) apply only to operations of the xx service. For details, see [Table 3-71](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [operators](#).

### Service-specific condition keys supported by ELB

The following table lists the condition keys that you can define in identity policies for ELB. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-71** Service-specific condition keys supported by ELB

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                                                                                                                                                                                                                                            |
|--------------------------------|---------|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| elb:AssociatePublicips         | boolean | Single-valued                 | Filters access based on whether creating or binding a public network is involved during load balancer creation or modification. To prevent the Elastic Load Balancer from accessing the public network, you need to use the EIP-related actions for policy management. |
| elb:UpdateListenerIpgroup      | boolean | Single-valued                 | Filters access permissions based on whether the access control needs to be updated when the listener is modified.                                                                                                                                                      |
| elb:OnlyUpdateListenerIpgroup  | boolean | Single-valued                 | Filters access permissions based on whether only the access control needs to be updated when the listener is modified.                                                                                                                                                 |

## 3.4 Containers

### 3.4.1 Cloud Container Engine

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are

available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by CCE, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by CCE, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for CCE.

**Table 3-72** Actions supported by CCE

| Action                       | Description                                                       | Access Level | Resource Type (*: required) | Condition Key | Alias                                                                |
|------------------------------|-------------------------------------------------------------------|--------------|-----------------------------|---------------|----------------------------------------------------------------------|
| cce:imageCache:create        | Grants permission to create image cache.                          | Write        | -                           | -             | -                                                                    |
| cce:imageCache:delete        | Grants permission to delete image cache.                          | Write        | imageCache *                | -             | -                                                                    |
| cce:imageCache:list          | Grants permission to return the list of all image caches.         | List         | -                           | -             | -                                                                    |
| cce:imageCache:get           | Grants permission to return details of the specified image cache. | Read         | imageCache *                | -             | -                                                                    |
| cce:packageProduct:list      | Grants permission to return the list of all package products.     | List         | -                           | -             | -                                                                    |
| cce:packageProduct:subscribe | Grants permission to subscribe package products.                  | Write        | -                           | -             | -                                                                    |
| cce:cluster:createCluster    | Grants permission to create cluster.                              | Write        | cluster *                   | -             | <ul style="list-style-type: none"> <li>cce:cluster:create</li> </ul> |

| cce:cluster:updateLongAKSKConfig | Grants permission to update cluster longAKSK config. | Write        | cluster *                   | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | -     |
| cce:accessPolicy:get             | Grants permission to get access policy.              | Read         | -                           | -                                                                                                                                                  | -     |
| cce:accessPolicy:list            | Grants permission to list access policy.             | Read         | -                           | -                                                                                                                                                  | -     |
| cce:accessPolicy:post            | Grants permission to create access policy.           | Write        | -                           | -                                                                                                                                                  | -     |
| cce:accessPolicy:put             | Grants permission to update access policy.           | Write        | -                           | -                                                                                                                                                  | -     |

| Action                       | Description                                                    | Access Level | Resource Type (*: required) | Condition Key | Alias |
|------------------------------|----------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| cce:accessPolicy:delete      | Grants permission to delete access policy.                     | Write        | -                           | -             | -     |
| cce:imageCache:get           | Grants permission to get image cache.                          | Read         | -                           | -             | -     |
| cce:imageCache:list          | Grants permission to list image caches.                        | List         | -                           | -             | -     |
| cce:imageCache:create        | Grants permission to create image cache.                       | Write        | -                           | -             | -     |
| cce:imageCache:delete        | Grants permission to delete image cache.                       | Write        | -                           | -             | -     |
| cce:hypernode:list           | Grants permission to return the list of hypernodes in cluster. | List         | cluster *                   | -             | -     |
| cce:packageProduct:list      | Grants permission to return the list of all package products.  | List         | -                           | -             | -     |
| cce:packageProduct:subscribe | Grants permission to subscribe package products.               | Write        | -                           | -             | -     |

Each API of CCE usually supports one or more actions. [Table 3-73](#) lists the supported actions and dependencies.

**Table 3-73** Actions and dependencies supported by CCE APIs

| API                                                                                         | Action                               | Dependencies |
|---------------------------------------------------------------------------------------------|--------------------------------------|--------------|
| POST /v5/<br>imagecaches                                                                    | cce:imageCache:create                | -            |
| DELETE /v5/<br>imagecaches/<br>{image_cache_id}                                             | cce:imageCache:delete                | -            |
| GET /v5/<br>imagecaches/<br>{image_cache_id}                                                | cce:imageCache:get                   | -            |
| GET /v5/<br>imagecaches                                                                     | cce:imageCache:list                  | -            |

| GET /<br>autopilot/cam/v3/<br>clusters/<br>{cluster_id}/releases                                                      | cce:release:list | -            |
| GET /<br>autopilot/cam/v3/<br>clusters/<br>{cluster_id}/<br>namespace/<br>{namespace}/<br>releases/{name}/<br>history | cce:release:get  | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-74](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for CCE.

**Table 3-74** Resource types supported by CCE

| Resource Type  | URN                                                            |
|----------------|----------------------------------------------------------------|
| cluster        | cce:<region>:<account-id>:cluster:<cluster-name>               |
| imageCache     | cce:<region>:<account-id>:imageCache:<imageCache-name>         |
| packageProduct | cce:<region>:<account-id>:packageProduct:<packageProduct-name> |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the

system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).

- Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, cce) apply only to operations of the xx service. For details, see [Table 3-75](#).
- The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [operators](#).

#### Service-specific condition keys supported by CCE

The following table lists the condition keys that you can define in identity policies for CCE. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-75** Service-specific condition keys supported by CCE

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                                           |
|--------------------------------|---------|-------------------------------|-----------------------------------------------------------------------|
| cce:ClusterId                  | string  | Single-valued                 | Filters access by the cluster ID that is passed in the request.       |
| cce:nodeTransferSourceCluster  | string  | Single-valued                 | Filters access by the cluster ID from whom nodes migrate.             |
| cce:nodeTransferTargetCluster  | string  | Single-valued                 | Filters access by the cluster ID to whom nodes migrate.               |
| cce:AssociatePublicIp          | boolean | Single-valued                 | Filters access by the associate switch value for binding eip to node. |
| cce:VpcId                      | string  | Single-valued                 | Filters access by the vpc id.                                         |
| cce:SubnetId                   | string  | Single-valued                 | Filters access by the subnet id.                                      |

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                           |
|--------------------------------|--------|-------------------------------|---------------------------------------|
| cce:Subnets                    | string | Multivalued                   | Filters access by the subnet ids.     |
| cce:KmsKeys                    | string | Multivalued                   | Filters access by the kms key ids.    |
| cce:AvailableZones             | string | Multivalued                   | Filters access by the availableZones. |

## 3.4.2 Cloud Container Instance

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an SCP.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an SCP.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions, and you must specify all resources ("\*") in your SCP statements.

- If this column includes a resource type, you must specify the URN in the Resource element of your statements.
- Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by CCI, see [Resources](#).

- The **Condition Key** column includes keys that you can specify in the Condition element of an SCP statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by CCI, see [Conditions](#).

The following table lists the actions that you can define in statements for CCI.

**Table 3-76** Actions supported by CCI

| Action               | Description                               | Access Level | Resource Type (*: required) | Condition Key                                 |
|----------------------|-------------------------------------------|--------------|-----------------------------|-----------------------------------------------|
| cci:namespace:list   | Grants permission to list all namespaces. | List         | Namespace *                 | -                                             |
| cci:namespace:create | Grants permission to create a namespace.  | Write        | Namespace *                 | -                                             |
| cci:namespace:get    | Grants permission to query a namespace.   | Read         | Namespace *                 | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> |
| cci:namespace:delete | Grants permission to delete a namespace.  | Write        | Namespace *                 | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> |
| cci:network:list     | Grants permission to list all secrets.    | List         | Network *                   | -                                             |
| cci:network:create   | Grants permission to create a network.    | Write        | Network *                   | -                                             |
| cci:network:get      | Grants permission to query a network.     | Read         | Network *                   | -                                             |

| Action               | Description                                 | Access Level | Resource Type (*: required) | Condition Key                         |
|----------------------|---------------------------------------------|--------------|-----------------------------|---------------------------------------|
| cci:network:delete   | Grants permission to delete a network.      | Write        | Network *                   | -                                     |
| cci:network:update   | Grants permission to update a network.      | Write        | Network *                   | -                                     |
| cci:configmap:list   | Grants permission to list all ConfigMaps.   | List         | ConfigMap *                 | -                                     |
| cci:configmap:create | Grants permission to create a ConfigMap.    | Write        | ConfigMap *                 | -                                     |
| cci:configmap:get    | Grants permission to query a ConfigMap.     | Read         | ConfigMap *                 | -                                     |
| cci:configmap:delete | Grants permission to delete a ConfigMap.    | Write        | ConfigMap *                 | -                                     |
| cci:configmap:update | Grants permission to update a ConfigMap.    | Write        | ConfigMap *                 | -                                     |
| cci:pod:list         | Grants permission to list all pods.         | List         | Pod *                       | -                                     |
| cci:pod:create       | Grants permission to create a pod.          | Write        | Pod *                       | <a href="#">cci:AssociatePublicIp</a> |
| cci:pod:get          | Grants permission to query a pod.           | Read         | Pod *                       | -                                     |
| cci:pod:delete       | Grants permission to delete a pod.          | Write        | Pod *                       | -                                     |
| cci:pod:update       | Grants permission to update a pod.          | Write        | Pod *                       | -                                     |
| cci:pod:getLog       | Grants permission to query pod logs.        | Read         | Pod *                       | -                                     |
| cci:pod:exec         | Grants permission to run commands in a pod. | Write        | Pod *                       | <a href="#">cci:ContainerName</a>     |

| Action                           | Description                                           | Access Level | Resource Type (*: required) | Condition Key |
|----------------------------------|-------------------------------------------------------|--------------|-----------------------------|---------------|
| cci:secret:list                  | Grants permission to list all secrets.                | List         | Secret *                    | -             |
| cci:secret:create                | Grants permission to create a secret.                 | Write        | Secret *                    | -             |
| cci:secret:get                   | Grants permission to query a secret.                  | Read         | Secret *                    | -             |
| cci:secret:delete                | Grants permission to delete a secret.                 | Write        | Secret *                    | -             |
| cci:secret:update                | Grants permission to update a secret.                 | Write        | Secret *                    | -             |
| cci:persistentvolume:list        | Grants permission to list all PersistentVolumes.      | List         | PersistentVolume *          | -             |
| cci:persistentvolume:create      | Grants permission to create a PersistentVolume.       | Write        | PersistentVolume *          | -             |
| cci:persistentvolume:get         | Grants permission to query a PersistentVolume.        | Read         | PersistentVolume *          | -             |
| cci:persistentvolume:update      | Grants permission to update a PersistentVolume.       | Write        | PersistentVolume *          | -             |
| cci:persistentvolume:delete      | Grants permission to delete a PersistentVolume.       | Write        | PersistentVolume *          | -             |
| cci:persistentvolumeclaim:list   | Grants permission to list all PersistentVolumeClaims. | List         | PersistentVolumeClaim *     | -             |
| cci:persistentvolumeclaim:create | Grants permission to create a PersistentVolumeClaim.  | Write        | PersistentVolumeClaim *     | -             |

| Action                           | Description                                          | Access Level | Resource Type (*: required) | Condition Key                         |
|----------------------------------|------------------------------------------------------|--------------|-----------------------------|---------------------------------------|
| cci:persistentvolumeclaim:get    | Grants permission to query a PersistentVolumeClaim.  | Read         | PersistentVolumeClaim *     | -                                     |
| cci:persistentvolumeclaim:update | Grants permission to update a PersistentVolumeClaim. | Write        | PersistentVolumeClaim *     | -                                     |
| cci:persistentvolumeclaim:delete | Grants permission to delete a PersistentVolumeClaim. | Write        | PersistentVolumeClaim *     | -                                     |
| cci:storageclass:list            | Grants permission to list all StorageClasses.        | List         | -                           | -                                     |
| cci:deployment:list              | Grants permission to list all Deployments.           | List         | Deployment *                | -                                     |
| cci:deployment:create            | Grants permission to create a Deployment.            | Write        | Deployment *                | <a href="#">cci:AssociatePublicIp</a> |
| cci:deployment:get               | Grants permission to query a Deployment.             | Read         | Deployment *                | -                                     |
| cci:deployment:delete            | Grants permission to delete a Deployment.            | Write        | Deployment *                | -                                     |
| cci:deployment:update            | Grants permission to update a Deployment.            | Write        | Deployment *                | <a href="#">cci:AssociatePublicIp</a> |
| cci:service:list                 | Grants permission to list all Services.              | List         | Service *                   | -                                     |
| cci:service:create               | Grants permission to create a Service.               | Write        | Service *                   | -                                     |
| cci:service:get                  | Grants permission to query a Service.                | Read         | Service *                   | -                                     |

| Action                                | Description                                             | Access Level | Resource Type (*: required) | Condition Key |
|---------------------------------------|---------------------------------------------------------|--------------|-----------------------------|---------------|
| cci:service:delete                    | Grants permission to delete a Service.                  | Write        | Service *                   | -             |
| cci:service:update                    | Grants permission to update a Service.                  | Write        | Service *                   | -             |
| cci:horizontalpodautoscaler:list      | Grants permission to list all HorizontalPodAutoscalers. | List         | -                           | -             |
| cci:horizontalpodautoscaler:create    | Grants permission to create a HorizontalPodAutoscaler.  | Write        | -                           | -             |
| cci:horizontalpodautoscaler:get       | Grants permission to query a HorizontalPodAutoscaler.   | Read         | -                           | -             |
| cci:horizontalpodautoscaler:delete    | Grants permission to delete a HorizontalPodAutoscaler.  | Write        | -                           | -             |
| cci:horizontalpodautoscaler:update    | Grants permission to update a HorizontalPodAutoscaler.  | Write        | -                           | -             |
| cci::updateobservabilityconfiguration | Grants permission to update ObservabilityConfiguration. | Write        | -                           | -             |
| cci::getobservabilityconfiguration    | Grants permission to query ObservabilityConfiguration.  | Read         | -                           | -             |
| cci:poolbinding:list                  | Grants permissions to list all PoolBindings.            | List         | -                           | -             |

| Action                 | Description                                | Access Level | Resource Type (*: required) | Condition Key |
|------------------------|--------------------------------------------|--------------|-----------------------------|---------------|
| cci:poolbinding:create | Grants permission to create a PoolBinding. | Write        | -                           | -             |
| cci:poolbinding:get    | Grants permissions to query a PoolBinding. | Read         | -                           | -             |
| cci:poolbinding:delete | Grants permission to delete a PoolBinding  | Write        | -                           | -             |

Each API of CCI usually supports one or more actions. [Table 3-77](#) lists the supported actions and dependencies.

**Table 3-77** Actions and dependencies supported by CCI APIs

| API                                                      | Action               | Dependencies |
|----------------------------------------------------------|----------------------|--------------|
| GET /apis/ci/v2/namespaces                               | cci:namespace:list   | -            |
| POST /apis/ci/v2/namespaces                              | cci:namespace:create | -            |
| GET /apis/ci/v2/namespaces/{name}                        | cci:namespace:get    | -            |
| DELETE /apis/ci/v2/namespaces/{name}                     | cci:namespace:delete | -            |
| GET /apis/ci/v2/namespaces/{namespace}/configmaps        | cci:configmap:list   | -            |
| POST /apis/ci/v2/namespaces/{namespace}/configmaps       | cci:configmap:create | -            |
| GET /apis/ci/v2/namespaces/{namespace}/configmaps/{name} | cci:configmap:get    | -            |

| API                                                                          | Action               | Dependencies |
|------------------------------------------------------------------------------|----------------------|--------------|
| PUT /apis/cce/v2/<br>namespaces/<br>{namespace}/<br>configmaps/{name}        | cce:configmap:update | -            |
| DELETE /<br>apis/cce/v2/<br>namespaces/<br>{namespace}/<br>configmaps/{name} | cce:configmap:delete | -            |
| GET /apis/cce/v2/<br>namespaces/<br>{namespace}/pods                         | cce:pod:list         | -            |
| POST /apis/cce/v2/<br>namespaces/<br>{namespace}/pods                        | cce:pod:create       | -            |
| GET /apis/cce/v2/<br>namespaces/<br>{namespace}/pods/<br>{name}              | cce:pod:get          | -            |
| PUT /apis/cce/v2/<br>namespaces/<br>{namespace}/pods/<br>{name}              | cce:pod:update       | -            |
| DELETE /<br>apis/cce/v2/<br>namespaces/<br>{namespace}/pods/<br>{name}       | cce:pod:delete       | -            |
| PATCH /apis/cce/v2/<br>namespaces/<br>{namespace}/pods/<br>{name}            | cce:pod:update       | -            |

| GET /apis/loadbalancer.network.openvessel.io/v1/namespaces/{namespace}/poolbindings/{name}    | ccl:poolbinding:get                   | -            |
| DELETE /apis/loadbalancer.network.openvessel.io/v1/namespaces/{namespace}/poolbindings/{name} | ccl:poolbinding:delete                | -            |

**CAUTION**

If you want to disable OpenStack APIs in SCP policies, do not disable the **vpc:nativeSubnets:get** and **vpc:subnets:get** actions, or the network function of CCI will be abnormal.

## Resources

A resource type indicates the resources that an SCP policy applies to. If you specify a resource type for any action in [Table 3-78](#), the resource URN must be specified in the SCP statements using that action, and the SCP applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the SCP applies to all resources. You can also set condition keys in an SCP to define resource types.

The following table lists the resource types that you can define in SCP statements for CCI.

**Table 3-78** Resource types supported by CCI

| Resource Type          | URN                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------|
| Deployment             | cci:<region>:<account-id>:deployment:<namespace-name>/<deployment-name>                       |
| Secret                 | cci:<region>:<account-id>:secret:<namespace-name>/<secret-name>                               |
| Namespace              | cci:<region>:<account-id>:namespace:<namespace-name>                                          |
| Service                | cci:<region>:<account-id>:service:<namespace-name>/<service-name>                             |
| Network                | cci:<region>:<account-id>:network:<namespace-name>/<network-name>                             |
| PersistentVolume       | cci:<region>:<account-id>:persistentvolume:<persistentvolume-name>                            |
| ImageSnapshot          | cci:<region>:<account-id>:imagesnapshot:<imagesnapshot-name>                                  |
| ConfigMap              | cci:<region>:<account-id>:configmap:<namespace-name>/<configmap-name>                         |
| Pod                    | cci:<region>:<account-id>:pod:<namespace-name>/<pod-name>                                     |
| PersistentVolume-Claim | cci:<region>:<account-id>:persistentvolumeclaim:<namespace-name>/<persistentvolumeclaim-name> |

## Conditions

### Condition Key

A Condition element lets you specify conditions for when an SCP is in effect. It contains **condition keys** and **operators**.

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, **cci:**) apply only to operations of the service. For details, see [Table 3-79](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so **g:SourceVpce** is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so **g:TagKeys** is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An SCP can be applied only when its request conditions are met. For supported condition operators, see [Condition operators](#).

### Service-specific condition keys supported by CCI

The following table lists the condition keys that you can define in custom SCP policies for CCI. You can include these condition keys to specify conditions for when your SCP policy is in effect.

**Table 3-79** Service-specific condition keys supported by CCI

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                                                                |
|--------------------------------|---------|-------------------------------|--------------------------------------------------------------------------------------------|
| cci:AssociatePublicIp          | Boolean | Single-valued                 | Filters the permission to bind EIPs to pods by the value of <b>cci:AssociatePublicIp</b> . |
| cci:ContainerName              | String  | Single-valued                 | Filters the permission to run commands in pods by container name.                          |

### 3.4.3 SWR Basic Edition

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by SWR, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by SWR, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for SWR.

**Table 3-80** Actions supported by SWR

| Action                        | Description                                                | Access Level | Resource Type (*: required) | Condition Key                         | Alias |
|-------------------------------|------------------------------------------------------------|--------------|-----------------------------|---------------------------------------|-------|

| swr::createLoginSecret              | Grants permission to create login secret for basic registry.                      | Write                 | -                           | -             | -     |
| swr::createAuthorizationToken       | Grants permission to create a new temporary access credential for basic registry. | Write                 | -                           | -             | -     |
| swr::listQuotas                     | Grants permission to list quotas for basic registry.                              | List                  | -                           | -             | -     |
| swr::getDomainOverview              | Grants permission to get overview of domain for basic registry.                   | Read                  | -                           | -             | -     |
| swr::getDomainResourceReports       | Grants permission to get down flow reports of domain for basic registry.          | Read                  | -                           | -             | -     |
| swr:namespace:multipartUpload       | Grants permission to multipart upload for basic registry.                         | Write                 | namespace *                 | -             | -     |
| swr:namespace:createNamespaceAccess | Grants permission to create namespace access for basic registry.                  | Permission_management | namespace *                 | -             | -     |

| Action                              | Description                                                       | Access Level          | Resource Type (*: required) | Condition Key | Alias |
|-------------------------------------|-------------------------------------------------------------------|-----------------------|-----------------------------|---------------|-------|
| swr:namespace:deleteNamespaceAccess | Grants permission to delete namespace access for basic registry.  | Permission_management | namespace *                 | -             | -     |
| swr:namespace:getNamespaceAccess    | Grants permission to get namespace access for basic registry.     | Read                  | namespace *                 | -             | -     |
| swr:namespace:updateNamespaceAccess | Grants permission to update namespace access for basic registry.  | Permission_management | namespace *                 | -             | -     |
| swr:repo:createRepoAccess           | Grants permission to create repository access for basic registry. | Permission_management | repo *                      | -             | -     |
| swr:repo:deleteRepoAccess           | Grants permission to delete repository access for basic registry. | Permission_management | repo *                      | -             | -     |
| swr:repo:getRepoAccess              | Grants permission to get repository access for basic registry.    | Read                  | repo *                      | -             | -     |
| swr:repo:updateRepoAccess           | Grants permission to update repository access for basic registry. | Permission_management | repo *                      | -             | -     |

| Action              | Description                                                      | Access Level | Resource Type (*: required) | Condition Key           | Alias |
|---------------------|------------------------------------------------------------------|--------------|-----------------------------|-------------------------|-------|
| swr:repo:upload     | Grants permission to upload repository for basic registry.       | Write        | repo *                      | -                       | -     |
|                     |                                                                  |              | -                           | swr:AllowCredentialType |       |
| swr:repo:download   | Grants permission to download repository for basic registry.     | Read         | repo *                      | swr:RepositoryIsPublic  | -     |
|                     |                                                                  |              | -                           | swr:AllowCredentialType |       |
| swr:repo:getRepoTag | Grants permission to query tag of repository for basic registry. | Read         | repo *                      | -                       | -     |

Each API of SWR usually supports one or more actions. [Table 3-81](#) lists the supported actions and dependencies.

**Table 3-81** Actions and dependencies supported by SWR APIs

| API                                          | Action                        | Dependencies |
|----------------------------------------------|-------------------------------|--------------|
| POST /v2/manage/namespaces                   | swr:namespace:createNamespace | -            |
| DELETE /v2/manage/namespaces/{namespace}     | swr:namespace:deleteNamespace | -            |
| GET /v2/manage/namespaces                    | swr:namespace:listNamespaces  | -            |
| GET /v2/manage/namespaces/{namespace}        | swr:namespace:getNamespace    | -            |
| POST /v2/manage/namespaces/{namespace}/repos | swr:repo:createRepo           | -            |

| API                                                                                                 | Action                    | Dependencies |
|-----------------------------------------------------------------------------------------------------|---------------------------|--------------|

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-82](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for SWR.

**Table 3-82** Resource types supported by SWR

| Resource Type | URN                                                         |
|---------------|-------------------------------------------------------------|
| repo          | swr:<region>:<account-id>:repo:<namespace-name>/<repo-name> |
| namespace     | swr:<region>:<account-id>:namespace:<namespace-name>        |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the

system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).

- Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, swr) apply only to operations of the xx service. For details, see [Table 3-83](#).
- The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [operators](#).

#### Service-specific condition keys supported by SWR

The following table lists the condition keys that you can define in identity policies for SWR. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-83** Service-specific condition keys supported by SWR

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                            |
|--------------------------------|---------|-------------------------------|--------------------------------------------------------|
| swr:TargetOrgPath              | string  | Single-valued                 | Filters access by destination's OrgPath.               |
| swr:TargetOrgId                | string  | Single-valued                 | Filters access by destination's OrgId.                 |
| swr:TargetAccountId            | string  | Single-valued                 | Filters access by destination's AccountId.             |
| swr:AllowPublicAccess          | boolean | Single-valued                 | Filters access by the repos that can be set to public. |
| swr:TargetRegion               | string  | Single-valued                 | Filters access by target region.                       |
| swr:AllowCredential-Type       | string  | Single-valued                 | Filters access by the credential type.                 |
| swr:RepositoryIsPublic         | boolean | Single-valued                 | Filters access by public repositories.                 |

### 3.4.4 SWR Enterprise Edition

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

#### Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by SWR, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by SWR, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for SWR.

**Table 3-84** Actions supported by SWR

| Action                             | Description                                                     | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias |
|------------------------------------|-----------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| swr:repository:createImmutableRule | Grants permission to create immutableRule for edition instance. | Write        | repository *                | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
| swr:repository:deleteImmutableRule | Grants permission to delete immutableRule for edition instance. | Write        | repository *                | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
| swr:repository:listImmutableRules  | Grants permission to list immutableRule for edition instance.   | List         | repository *                | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
| swr:repository:updateImmutableRule | Grants permission to update immutableRule for edition instance. | Write        | repository *                | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
| swr:repository:listArtifacts       | Grants permission to query the artifact list.                   | List         | repository *                | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |

| Action                             | Description                                                          | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias |
|------------------------------------|----------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| swr:repository:getArtifact         | Grants permission to query the policy of resource instance.          | Read         | repository *                | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
| swr:repository:deleteArtifact      | Grants permission to delete a artifact.                              | Write        | repository *                | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
| swr:repository:listAccessories     | Grants permission to query the accessory list.                       | List         | repository *                | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
| swr:repository:getArtifactAddition | Grants permission to query the addition information of a artifact.   | Read         | repository *                | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
| swr:instance:getConfigurations     | Grants permission to query the configurations of resource instance.  | Read         | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
| swr:instance:updateConfigurations  | Grants permission to update the configurations of resource instance. | Write        | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |

| Action                                 | Description                                                | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias |
|----------------------------------------|------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| swr:instance:listResourceInstances     | Grants permission to query the list of resource instance.  | List         | instance *                  | -                                                                                                                                                  | -     |
|                                        |                                                            |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:TagKeys</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> </ul>              | -     |
| swr:instance:getResourceInstancesCount | Grants permission to query the count of resource instance. | Read         | instance *                  | -                                                                                                                                                  | -     |
|                                        |                                                            |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:TagKeys</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> </ul>              | -     |
| swr:instance:createResourceTags        | Grants permission to create resource tags in batch.        | Tagging      | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
|                                        |                                                            |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul>              | -     |
| swr:instance:deleteResourceTags        | Grants permission to delete resource tags in batch.        | Tagging      | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
|                                        |                                                            |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul>              | -     |
| swr:instance:getProjectTags            | Grants permission to query the resource tags of project.   | Read         | -                           | -                                                                                                                                                  | -     |

| Action                       | Description                                                          | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                                                                                                       | Alias |
|------------------------------|----------------------------------------------------------------------|--------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| swr:instance:getResourceTags | Grants permission to query the resource tags of resource.            | Read         | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul>                                                                                                                                                                  | -     |
| swr:instance:create          | Grants permission to create an enterprise edition instance.          | Write        | instance *                  | -                                                                                                                                                                                                                                                                                                                   | -     |
|                              |                                                                      |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> <li>• <a href="#">swr:VpcId</a></li> <li>• <a href="#">swr:SubnetId</a></li> <li>• <a href="#">swr:EnableObsEncrypt</a></li> </ul> | -     |
| swr:instance:list            | Grants permission to query the list of enterprise edition instances. | List         | instance *                  | -                                                                                                                                                                                                                                                                                                                   | -     |
| swr:instance:get             | Grants permission to query an enterprise edition instance.           | Read         | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                                                                                                                                                  | -     |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-86](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for SWR.

**Table 3-86** Resource types supported by SWR

| Resource Type | URN                                                                    |
|---------------|------------------------------------------------------------------------|
| repository    | swr:<region>:<account-id>:repository:<instance-name>/<repository-path> |
| instance      | swr:<region>:<account-id>:instance:<instance-name>                     |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains **condition keys** and **operators**.

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see **Global Condition Keys**.
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, swr) apply only to operations of the xx service. For details, see **Table 3-87**.
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see **operators**.

#### Service-specific condition keys supported by SWR

The following table lists the condition keys that you can define in identity policies for SWR. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-87** Service-specific condition keys supported by SWR

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                                         |
|--------------------------------|---------|-------------------------------|---------------------------------------------------------------------|
| swr:VpcId                      | string  | Single-valued                 | Filters access by user's VPC ID.                                    |
| swr:SubnetId                   | string  | Single-valued                 | Filters access by user's Subnet ID.                                 |
| swr:EnablePublicNameSpace      | boolean | Single-valued                 | Filters access by enterprise instance's namespace public attribute. |
| swr:EnableObsEncrypt           | boolean | Single-valued                 | Filters access by enterprise instance's obs bucket encrypted type.  |

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                            |
|--------------------------------|---------|-------------------------------|----------------------------------------|
| swr:TargetRegion               | string  | Single-valued                 | Filters access by target region.       |
| swr:SourceRegion               | string  | Single-valued                 | Filters access by source region.       |
| swr:TargetUrls                 | string  | Multivalued                   | Filters access by target url.          |
| swr:SourceUrls                 | string  | Multivalued                   | Filters access by source url.          |
| swr:RepositoryIsPublic         | boolean | Single-valued                 | Filters access by public repositories. |

## 3.5 Content Delivery & Edge Computing

### 3.5.1 Content Delivery Network (CDN)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by CDN, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by CDN, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy SCP statements for CDN.

**Table 3-88** Actions supported by CDN

| Action                       | Description                        | Access Level | Resource Type (*: required) | Condition Key                         | Alias                      |
|------------------------------|------------------------------------|--------------|-----------------------------|---------------------------------------|----------------------------|
| cdn:statistics:queryStats    | Querying domain name statistics    | list         | domain *                    | <a href="#">g:EnterpriseProjectId</a> | cdn:statistics:queryTopUrl |
| cdn:statistics:downloadExcel | Downloading domain name statistics | list         | domain *                    | <a href="#">g:EnterpriseProjectId</a> | -                          |
| cdn:log:queryLogs            | Querying logs                      | read         | domain *                    | <a href="#">g:EnterpriseProjectId</a> | -                          |

| Action                                 | Description                              | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                  | Alias                              |
|----------------------------------------|------------------------------------------|--------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-90](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for CDN.

**Table 3-90** Resource types supported by CDN

| Resource Type | URN                                    |
|---------------|----------------------------------------|
| domain        | cdn::<account-id>:domain:<domain-name> |

## Conditions

CDN does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.5.2 CloudPond

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.

- Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by CloudPond, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by CloudPond, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for CloudPond.

**Table 3-91** Actions supported by CloudPond

| Action                    | Description                                   | Access Level | Resource Type (*: required) | Condition Key | Alias                                                                              |
|---------------------------|-----------------------------------------------|--------------|-----------------------------|---------------|------------------------------------------------------------------------------------|
| ies::listServerOfferings  | Grants permission to query server offerings.  | List         | -                           | -             | <ul style="list-style-type: none"> <li>ies::system:listServerOfferings</li> </ul>  |
| ies::listNetworkOfferings | Grants permission to query network offerings. | List         | -                           | -             | <ul style="list-style-type: none"> <li>ies::system:listNetworkOfferings</li> </ul> |
| ies::listStorageTypes     | Grants permission to query storage types.     | List         | -                           | -             | <ul style="list-style-type: none"> <li>ies::system:listStorageTypes</li> </ul>     |
| ies::listSaleCycles       | Grants permission to query sale cycles.       | List         | -                           | -             | <ul style="list-style-type: none"> <li>ies::system:listSaleCycles</li> </ul>       |

| Action                                | Description                                  | Access Level | Resource Type (*: required) | Condition Key                         | Alias |
|---------------------------------------|----------------------------------------------|--------------|-----------------------------|---------------------------------------|-------|
| ies:edgeSite:listServers              | Grants permission to query servers.          | List         | edgeSite *                  | <a href="#">g:EnterpriseProjectId</a> | -     |
| ies:edgeSite:getServer                | Grants permission to query a server.         | Read         | edgeSite *                  | <a href="#">g:EnterpriseProjectId</a> | -     |
| ies:edgeSite:listNetworkDevices       | Grants permission to query network devices.  | List         | edgeSite *                  | <a href="#">g:EnterpriseProjectId</a> | -     |
| ies:edgeSite:getNetworkDevice         | Grants permission to query a network device. | Read         | edgeSite *                  | <a href="#">g:EnterpriseProjectId</a> | -     |
| ies:deliveryOrder:createDeliveryOrder | Grants permission to create delivery orders. | Write        | deliveryOrder *             | -                                     | -     |
| ies:edgeSite:create                   | Grants permission to create edge site.       | Write        | edgeSite *                  | -                                     | -     |
|                                       |                                              |              | -                           | <a href="#">g:EnterpriseProjectId</a> |       |
| ies:edgeSite:list                     | Grants permission to list edge sites.        | List         | edgeSite *                  | -                                     | -     |
|                                       |                                              |              | -                           | <a href="#">g:EnterpriseProjectId</a> |       |
| ies:edgeSite:update                   | Grants permission to update edge site.       | Write        | edgeSite *                  | <a href="#">g:EnterpriseProjectId</a> | -     |
| ies:edgeSite:get                      | Grants permission to view edge site details. | Read         | edgeSite *                  | <a href="#">g:EnterpriseProjectId</a> | -     |

| Action                        | Description                                     | Access Level | Resource Type (*: required) | Condition Key                         | Alias                                                                  |
|-------------------------------|-------------------------------------------------|--------------|-----------------------------|---------------------------------------|------------------------------------------------------------------------|
| ies:edgeSite:delete           | Grants permission to delete edge site.          | Write        | edgeSite *                  | <a href="#">g:EnterpriseProjectId</a> | -                                                                      |
| ies::listQuotas               | Grants permission to query quotas.              | List         | -                           | -                                     | <ul style="list-style-type: none"> <li>ies:quota:list</li> </ul>       |
| ies::listRegions              | Grants permission to list regions.              | List         | -                           | -                                     | <ul style="list-style-type: none"> <li>ies:region:list</li> </ul>      |
| ies::listZones                | Grants permission to list zones.                | List         | -                           | -                                     | <ul style="list-style-type: none"> <li>ies:zone:list</li> </ul>        |
| ies:edgeSite:getMetricData    | Grants permission to view edge site capacity.   | Read         | edgeSite *                  | <a href="#">g:EnterpriseProjectId</a> | -                                                                      |
| ies:edgeSite:listRacks        | Grants permission to list racks.                | List         | edgeSite *                  | <a href="#">g:EnterpriseProjectId</a> | <ul style="list-style-type: none"> <li>ies:rack:list</li> </ul>        |
| ies:edgeSite:getRack          | Grants permission to view rack details.         | Read         | edgeSite *                  | <a href="#">g:EnterpriseProjectId</a> | <ul style="list-style-type: none"> <li>ies:rack:get</li> </ul>         |
| ies:edgeSite:listStoragePools | Grants permission to list storage pools.        | List         | edgeSite *                  | <a href="#">g:EnterpriseProjectId</a> | <ul style="list-style-type: none"> <li>ies:storagePool:list</li> </ul> |
| ies:edgeSite:getStoragePool   | Grants permission to view storage pool details. | Read         | edgeSite *                  | <a href="#">g:EnterpriseProjectId</a> | <ul style="list-style-type: none"> <li>ies:storagePool:get</li> </ul>  |

Each API of CloudPond usually supports one or more actions. [Table 3-92](#) lists the supported actions and dependencies.

**Table 3-92** Actions and dependencies supported by CloudPond APIs

| API                                                     | Action                          | Dependencies |
|---------------------------------------------------------|---------------------------------|--------------|
| GET /v2/{domain_id}/server-offerings                    | ies::listServerOfferings        | -            |
| GET /v2/{domain_id}/network-device-offerings            | ies::listNetworkOfferings       | -            |
| GET /v2/{domain_id}/storage-types                       | ies::listStorageTypes           | -            |
| GET /v2/{domain_id}/sale-cycles                         | ies::listSaleCycles             | -            |
| GET /v2/{domain_id}/servers                             | ies:edgeSite:listServers        | -            |
| GET /v2/{domain_id}/servers/{server_id}                 | ies:edgeSite:getServer          | -            |
| GET /v2/{domain_id}/network-devices                     | ies:edgeSite:listNetworkDevices | -            |
| GET /v2/{domain_id}/network-devices/{network_device_id} | ies:edgeSite:getNetworkDevice   | -            |
| GET /v2/{domain_id}/storage-pools                       | ies:edgeSite:listStoragePools   | -            |
| GET /v2/{domain_id}/storage-pools/{id}                  | ies:edgeSite:getStoragePool     | -            |
| GET /v2/{domain_id}/storage-gears                       | ies::listSupportedStorageGears  | -            |
| POST /v1/{domain_id}/edge-sites                         | ies:edgeSite:create             | -            |
| GET /v1/{domain_id}/edge-sites                          | ies:edgeSite:list               | -            |

| API                                                  | Action                     | Dependencies |
|------------------------------------------------------|----------------------------|--------------|
| PUT /v1/{domain_id}/edge-sites/{site_id}             | ies:edgeSite:update        | -            |
| GET /v1/{domain_id}/edge-sites/{site_id}             | ies:edgeSite:get           | -            |
| DELETE /v1/{domain_id}/edge-sites/{site_id}          | ies:edgeSite:delete        | -            |
| GET /v1/{domain_id}/quotas                           | ies::listQuotas            | -            |
| GET /v1/{domain_id}/regions                          | ies::listRegions           | -            |
| GET /v1/{domain_id}/zones                            | ies::listZones             | -            |
| GET /v1/{domain_id}/edge-sites/{site_id}/metric-data | ies:edgeSite:getMetricData | -            |
| GET /v1/{domain_id}/racks                            | ies:edgeSite:listRacks     | -            |
| GET /v1/{domain_id}/racks/{id}                       | ies:edgeSite:getRack       | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-93](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for CloudPond.

**Table 3-93** Resource types supported by CloudPond

| Resource Type | URN                                 |
|---------------|-------------------------------------|
| edgeSite      | ies::<domain-id>:edgeSite:<site-id> |

| Resource Type | URN                                                |
|---------------|----------------------------------------------------|
| deliveryOrder | ies::<domain-id>:deliveryOrder:<delivery-order-id> |

## Conditions

CloudPond does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

## 3.6 Databases

### 3.6.1 Relational Database Service (RDS)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [service control policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM policies are different from Organizations SCPs, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.

- If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
- Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by RDS, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by RDS, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for RDS.

**Table 3-94** Actions supported by RDS

| Action                       | Description                                                            | Access Level | Resource Type (*: required) | Condition Key                                                                          | Alias                |
|------------------------------|------------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------|----------------------|
| rds:param:apply              | Grants permission to apply a parameter template.                       | write        | -                           | -                                                                                      | -                    |
| rds:instance:updateParameter | Grants permission to modify parameters of an instance.                 | write        | instance                    | <a href="#">g:EnterpriseProjectId</a><br><a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | rds:parameter:modify |
| rds:instance:restoreInPlace  | Grants permission to restore data to an existing or original instance. | write        | -                           | -                                                                                      | -                    |

| Action                           | Description                                                                     | Access Level | Resource Type (*: required) | Condition Key                                                                          | Alias        |
|----------------------------------|---------------------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------|--------------|
| rds:instance:tableRestore        | Grants permission to restore tables.                                            | write        | -                           | -                                                                                      | -            |
| rds:database:drop                | Grants permission to delete a database.                                         | write        | instance                    | <a href="#">g:EnterpriseProjectId</a><br><a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for RDS.

**Table 3-96** Resource types supported by RDS

| Resource Type | URN                                              |
|---------------|--------------------------------------------------|
| instance      | rds:<region>:<account-id>:instance:<instance-id> |

## Conditions

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, **rds:**) apply only to operations of the RDS service. For details, see [Table 4](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so **g:SourceVpce** is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so **g:TagKeys** is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [condition operators](#).

The following table lists the condition keys that you can define in identity policies for RDS. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-97** Service-specific condition keys supported by RDS

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                                                                                                |
|--------------------------------|---------|-------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| rds:Encrypted                  | Boolean | Single-valued                 | Filters access permissions based on the tag key of whether to enable disk encryption transferred in the request parameter. |

| Service-specific Condition Key | Type    | Single-valued/Multivalued | Description                                                                                                                  |
|--------------------------------|---------|---------------------------|------------------------------------------------------------------------------------------------------------------------------|
| rds:BackupEnabled              | Boolean | Single-valued             | Filters access permissions based on the tag key of whether to enable the backup policy transferred in the request parameter. |

### 3.6.2 GaussDB

IAM provides system-defined policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.

- If this column includes a resource type, you must specify the URN in the Resource element of your policy statements.
- Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by GaussDB, see [Resources](#).

- **Condition Key** contains keys that you can specify in the Condition element of a policy statement for GaussDB. If this column is empty (-), the action does not support any condition keys.

For details about the condition keys defined by GaussDB, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for identity policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for GaussDB.

**Table 3-98** Actions supported by GaussDB

| Action                      | Description                                                    | Access Level | Resource Type (*: required) | Condition Key | Alias                 |
|-----------------------------|----------------------------------------------------------------|--------------|-----------------------------|---------------|-----------------------|
| gaussdb:backup:createBackup | Grants permission to create a manual backup for a DB instance. | write        | instance                    | -             | gaussdb:backup:create |
| gaussdb:backup:deleteBackup | Grants permission to delete a backup.                          | write        | instance                    | -             | gaussdb:backup:delete |
| gaussdb:backup:listAll      | Grants permission to query backups.                            | list         | instance                    | -             | gaussdb:backup:list   |

| Action                              | Description                                       | Access Level | Resource Type (*: required) | Condition Key                                                                                                    | Alias                                                                                                                                                          |
|-------------------------------------|---------------------------------------------------|--------------|-----------------------------|------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gaussdb:instance:updateBackupPolicy | Grants permission to configure a backup policy.   | write        | instance                    | <b>gaussdb:BackupEnabled</b>                                                                                     | <ul style="list-style-type: none"> <li>gaussdb:backup:enable</li> <li>gaussdb:backup:switchTableBackup</li> <li>gaussdb:instance:modifyBackupPolicy</li> </ul> |
| gaussdb:param:applyParam            | Grants permission to apply a parameter template.  | write        | instance                    | -                                                                                                                | <ul style="list-style-type: none"> <li>gaussdb:param:apply</li> <li>gaussdb:param:modify</li> <li>gaussdb:instance:modifyParameter</li> </ul>                  |
| gaussdb:tag:create                  | Grants permission to add tags.                    | tagging      | instance                    | -                                                                                                                | gaussdb:instance:dealTag                                                                                                                                       |
| gaussdb:instance:bindEIP            | Grants permission to bind an EIP.                 | write        | instance                    | -                                                                                                                | <ul style="list-style-type: none"> <li>gaussdb:instance:bindPublicIp</li> <li>gaussdb:instance:modify</li> </ul>                                               |
| gaussdb:instance:check              | Grants permission to verify instance information. | read         | instance                    | -                                                                                                                | gaussdb:instance:list                                                                                                                                          |
| gaussdb:instance:createInstance     | Grants permission to create a DB instance.        | write        | instance                    | <ul style="list-style-type: none"> <li><b>gaussdb:BackupEnabled</b></li> <li><b>gaussdb:Encrypted</b></li> </ul> | rds:instance:create                                                                                                                                            |

|----------------------|--------------------------------------------------|--------------|-----------------------------|---------------|-----------------------|
| gaussdb:param:reset  | Grants permission to reset a parameter template. | write        | instance                    | -             | gaussdb:param:modify  |
| gaussdb:quota:update | Grants permission to modify quotas.              | write        | instance                    | -             | gaussdb:quota:modify  |
| gaussdb:task:listAll | Grants permission to query tasks.                | list         | instance                    | -             | gaussdb:instance:list |
| gaussdb:task:delete  | Grants permission to delete a task record.       | write        | instance                    | -             | gaussdb:instance:list |
| gaussdb:task:get     | Grants permission to query task details.         | read         | instance                    | -             | gaussdb:instance:list |

Each API of GaussDB usually supports one or more actions. The following table lists the supported actions and dependencies.

**Table 3-99** Instance management

| Permission             | API                                             | Action                          | Dependencies |
|------------------------|-------------------------------------------------|---------------------------------|--------------|
| Creating a DB instance | POST /v3/{project_id}/instances                 | gaussdb:instance:createInstance | -            |
| Deleting a DB instance | DELETE /v3/{project_id}/instances/{instance_id} | gaussdb:instance:delete         | -            |
| Querying DB instances  | GET /v3/{project_id}/instances                  | gaussdb:instance:listAll        | -            |

| Permission                                                                   | API                                                                                   | Action                            | Dependencies |
|------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|-----------------------------------|--------------|
| Resetting a database password                                                | POST /v3/{project_id}/instances/{instance_id}/password                                | gaussdb:instance:resetPassword    | -            |
| Changing a DB instance name                                                  | PUT /v3/{project_id}/instances/{instance_id}/name                                     | gaussdb:instance:rename           | -            |
| Rebooting a DB instance                                                      | POST /v3/{project_id}/instances/{instance_id}/restart                                 | gaussdb:instance:restart          | -            |
| Switching roles of the primary and standby DN in shards                      | POST /v3/{project_id}/instances/{instance_id}/switch-shard                            | gaussdb:instance:switchShard      | -            |
| Querying the components of a DB instance                                     | GET /v3/{project_id}/instances/{instance_id}/components                               | gaussdb:instance:listComponents   | -            |
| Changing vCPUs and memory of a DB instance                                   | PUT /v3/{project_id}/instance/{instance_id}/flavor                                    | gaussdb:instance:resizeFlavor     | -            |
| Checking whether host load is unbalanced due to a primary/standby switchover | GET /v3/{project_id}/instances/{instance_id}/balance                                  | gaussdb:instance:getBalanceStatus | -            |
| Querying solution template settings                                          | GET /v3/{project_id}/deployment-form                                                  | gaussdb:instance:listAll          | -            |
| Querying EIPs bound to a DB instance                                         | GET /v3/{project_id}/instances/{instance_id}/public-ips?offset={offset}&limit={limit} | gaussdb:instance:listPublicIps    | -            |

| Permission                                                     | API                                                                     | Action                           | Dependencies |
|----------------------------------------------------------------|-------------------------------------------------------------------------|----------------------------------|--------------|
| Validating password strength                                   | POST /v3/{project_id}/weak-password-verification                        | gaussdb:instance:check           | -            |
| Binding or unbinding an EIP                                    | POST /v3/{project_id}/instances/{instance_id}/nodes/{node_id}/public-ip | gaussdb:instance:bindPublicIp    | -            |
| Querying the SSL certificate download address of a DB instance | GET /v3/{project_id}/instances/{instance_id}/ssl-cert/download-link     | gaussdb:instance:downloadSslCert | -            |
| Querying the instance quotas of a tenant                       | GET /v3/{project_id}/project-quotas?type={type}                         | gaussdb:quota:listAll            | -            |

**Table 3-100** Parameter configuration

| Permission                                      | API                                                               | Action                    | Dependencies |
|-------------------------------------------------|-------------------------------------------------------------------|---------------------------|--------------|
| Obtaining parameter templates                   | GET /v3/{project_id}/configurations?offset={offset}&limit={limit} | gaussdb:param:listAll     | -            |
| Obtaining parameters of a specified DB instance | GET /v3/{project_id}/instances/{instance_id}/configurations       | gaussdb:instance:get      | -            |
| Modifying parameters of a specified DB instance | PUT /v3/{project_id}/instances/{instance_id}/configurations       | gaussdb:param:update      | -            |
| Creating a parameter template                   | POST /v3/{project_id}/configurations                              | gaussdb:param:createParam | -            |
| Deleting a parameter template                   | DELETE /v3/{project_id}/configurations/{config_id}                | gaussdb:param:delete      | -            |

| Permission                                                     | API                                                                  | Action                   | Dependencies |
|----------------------------------------------------------------|----------------------------------------------------------------------|--------------------------|--------------|
| Querying details about a parameter template                    | GET /v3/{project_id}/configurations/{config_id}                      | gaussdb:param:get        | -            |
| Replicating a parameter template                               | POST /v3/{project_id}/configurations/{config_id}/copy                | gaussdb:param:copy       | -            |
| Resetting a parameter template                                 | POST /v3/{project_id}/configurations/{config_id}/reset               | gaussdb:param:reset      | -            |
| Obtaining the differences of two parameter templates           | POST /v3/{project_id}/configurations/comparison                      | gaussdb:param:compare    | -            |
| Querying instances that a parameter template can be applied to | GET /v3/{project_id}/configurations/{config_id}/applicable-instances | gaussdb:instance:listAll | -            |
| Checking whether a parameter template name is unique           | GET /v3/{project_id}/configurations/name-validation?name={name}      | gaussdb:param:check      | -            |
| Applying a parameter template                                  | PUT /v3/{project_id}/configurations/{config_id}/apply                | gaussdb:param:apply      | -            |
| Querying application records of a parameter template           | GET /v3/{project_id}/configurations/{config_id}/applied-histories    | gaussdb:param:listAll    | -            |
| Querying the change history of a parameter template            | GET /v3/{project_id}/configurations/{config_id}/histories            | gaussdb:param:listAll    | -            |

**Table 3-101** Backup management

| Permission                                                                                           | API                                                                                                                                                                              | Action                                | Dependencies |
|------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------|
| Configuring an automated backup policy                                                               | PUT /v3/{project_id}/instances/{instance_id}/backups/policy                                                                                                                      | gaussdb:instance:updateBackupPolicy   | -            |
| Querying an automated backup policy                                                                  | GET /v3/{project_id}/instances/{instance_id}/backups/policy                                                                                                                      | gaussdb:instance:getBackupPolicy      | -            |
| Querying backups                                                                                     | GET /v3/{project_id}/backups?instance_id={instance_id}&backup_id={backup_id}&backup_type={backup_type}&offset={offset}&limit={limit}&begin_time={begin_time}&end_time={end_time} | gaussdb:backup:listAll                | -            |
| Creating a manual backup                                                                             | POST /v3/{project_id}/backups                                                                                                                                                    | gaussdb:backup:create                 | -            |
| Deleting a manual backup                                                                             | DELETE /v3/{project_id}/backups/{backup_id}                                                                                                                                      | gaussdb:backup:delete                 | -            |
| Querying the restoration time range                                                                  | GET /v3/{project_id}/instances/{instance_id}/restore-time?date={date}                                                                                                            | gaussdb:instance:listRecoverableTimes | -            |
| Restoring data to a new DB instance                                                                  | POST /v3/{project_id}/instances                                                                                                                                                  | gaussdb:instance:createInstance       | -            |
| Querying instances that can be used for backups and restorations                                     | GET /v3/{project_id}/restorable-instances                                                                                                                                        | gaussdb:instance:listAll              | -            |
| Querying the information of the original instance based on a specific point of time or a backup file | GET /v3/{project_id}/instance-snapshot?instance_id={instance_id}&backup_id={backup_id}&restore_time={restore_time}                                                               | gaussdb:instance:get                  | -            |

**Table 3-102** DB engine versions and specifications

| Permission                                                   | API                                                                                                                  | Action                       | Dependencies |
|--------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|------------------------------|--------------|
| Querying DB engine versions                                  | GET /v3/{project_id}/datastore/versions                                                                              | gaussdb:instance:list<br>All | -            |
| Querying instance specifications                             | GET /v3/{project_id}/flavors?limit={limit}&offset={offset}&ha_mode={ha_mode}&version={version}&spec_code={spec_code} | gaussdb:instance:list<br>All | -            |
| Querying DB engines                                          | GET /v3/{project_id}/datastores                                                                                      | gaussdb:instance:list<br>All | -            |
| Querying specifications that a DB instance can be changed to | GET /v3/{project_id}/instances/{instance_id}/available-flavors                                                       | gaussdb:instance:list<br>All | -            |

**Table 3-103** Database and account management

| Permission                     | API                                                        | Action                                  | Dependencies |
|--------------------------------|------------------------------------------------------------|-----------------------------------------|--------------|
| Creating a database            | POST /v3/{project_id}/instances/{instance_id}/database     | gaussdb:instance:createDatabase         | -            |
| Creating a database account    | POST /v3/{project_id}/instances/{instance_id}/db-user      | gaussdb:instance:createDatabaseUser     | -            |
| Creating a database schema     | POST /v3/{project_id}/instances/{instance_id}/schema       | gaussdb:instance:createDatabaseSchema   | -            |
| Authorizing a database account | POST /v3/{project_id}/instances/{instance_id}/db-privilege | gaussdb:instance:grantDatabasePrivilege | -            |

| Permission                                  | API                                                           | Action                             | Dependencies |
|---------------------------------------------|---------------------------------------------------------------|------------------------------------|--------------|
| Resetting a password for a database account | PUT /v3/{project_id}/instances/{instance_id}/db-user/password | gaussdb:instance:resetPassword     | -            |
| Querying databases                          | GET /v3/{project_id}/instances/{instance_id}/databases        | gaussdb:instance:listDatabases     | -            |
| Querying database accounts                  | GET /v3/{project_id}/instances/{instance_id}/db-users         | gaussdb:instance:listDatabaseUsers | -            |
| Querying database schemas                   | GET /v3/{project_id}/instances/{instance_id}/schemas          | gaussdb:instance:listSchemas       | -            |

**Table 3-104** Tag management

| Permission                           | API                                                | Action              | Dependencies |
|--------------------------------------|----------------------------------------------------|---------------------|--------------|
| Querying tags of a specific instance | GET /v3/{project_id}/instances/{instance_id}/tags  | gaussdb:tag:listAll | -            |
| Querying tags of a project           | GET /v3/{project_id}/tags                          | gaussdb:tag:listAll | -            |
| Querying predefined tags             | GET /v3/{project_id}/predefined-tags               | gaussdb:tag:listAll | -            |
| Adding tags to a DB instance         | POST /v3/{project_id}/instances/{instance_id}/tags | gaussdb:tag:create  | -            |

**Table 3-105** Storage management

| Permission                                  | API                                                                   | Action                        | Dependencies |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-110](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for GaussDB.

**Table 3-110** Resource types supported by GaussDB

| Resource Type | URN                                                  |
|---------------|------------------------------------------------------|
| instance      | gaussdb:<region>:<account-id>:instance:<instance-id> |

## Conditions

A Condition element lets you specify conditions for when an identity policy is in effect. It contains **condition keys** and **operators**.

- The condition key that you specify can be a global or service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, **gaussdb:**) only apply to operations of the STS service. For details, see [Table 3-111](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so **g:SourceVpce** is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so **g:TagKeys** is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [Condition operators](#).

The following table lists the condition keys that you can define in identity policies for GaussDB. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-111** Service-specific condition keys supported by GaussDB

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                                                                                                                                              |
|--------------------------------|---------|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gaussdb:Backup Enabled         | boolean | Single-valued                 | Filter access permissions based on the tag key of whether to enable the backup policy transferred in the request parameter. Select <b>Default</b> for <b>Qualifier</b> . |

| Service-specific Condition Key | Type    | Single-valued/Multivalued | Description                                                                                                                                                            |
|--------------------------------|---------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gaussdb:Encrypted              | boolean | Single-valued             | Filter access permissions based on the tag key of whether to enable disk encryption transferred in the request parameter. Select <b>Default</b> for <b>Qualifier</b> . |

### 3.6.3 Document Database Service (DDS)

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.

- If this column includes a resource type, you must specify the URN in the Resource element of your statements.
- Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by DDS, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by DDS, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for DDS.

**Table 3-112** Actions supported by DDS

| Action                 | Description                                               | Access Level          | Resource Type (*: required) | Condition Key | Aliases |
|------------------------|-----------------------------------------------------------|-----------------------|-----------------------------|---------------|---------|
| dds:instance:setSsl    | Grants permission to enable or disable SSL.               | permission_management | instance                    | -             | -       |
| dds:instance:unbindEIP | Grants permission to unbind an EIP from a DB instance.    | write                 | -                           | -             | -       |
| dds:instance:migrateAz | Grants permission to migrate a DB instance to another AZ. | write                 | -                           | -             | -       |

| Action                         | Description                                                          | Access Level          | Resource Type (*: required) | Condition Key | Aliases |
|--------------------------------|----------------------------------------------------------------------|-----------------------|-----------------------------|---------------|---------|
| dds:instance:listMigrateAZ     | Grants permission to query AZs to which an instance can be migrated. | list                  | -                           | -             | -       |
| dds:instance:updateIp          | Grants permission to change the private IP address of a DB instance. | write                 | instance                    | -             | -       |
| dds:instance:bindEIP           | Grants permission to bind an EIP to a DB instance.                   | write                 | -                           | -             | -       |
| dds:instance:resetPassword     | Grants permission to reset the password of a database user.          | write                 | instance                    | -             | -       |
| dds:instance:checkPassword     | Grants permission to check a database password.                      | read                  | instance                    | -             | -       |
| dds:instance:updatePort        | Grants permission to change a database port.                         | write                 | instance                    | -             | -       |
| dds:backup:download            | Grants permission to download backups.                               | read                  | instance                    | -             | -       |
| dds:instance:setAuditLogPolicy | Grants permission to configure an audit log policy.                  | permission_management | instance                    | -             | -       |

| Action                         | Description                                                     | Access Level | Resource Type (*: required) | Condition Key                         | Aliases |
|--------------------------------|-----------------------------------------------------------------|--------------|-----------------------------|---------------------------------------|---------|
| dds:instance:getAuditLogPolicy | Grants permission to query the audit log policy.                | list         | instance                    | -                                     | -       |

| dds:backup:getRestoreDatabases       | Grant permission to obtain the list of databases that can be restored.            | list         | -                           | -                                                                  | -       |
| dds:instance:getConnectionStatistics | Grants permission to query the number of connections to an instance.              | read         | instance                    | -                                                                  | -       |
| dds:instance:getQuotas               | Grants permission to query quotas.                                                | read         | -                           | -                                                                  | -       |

| Action                              | Description                                                | Access Level | Resource Type (*: required) | Condition Key | Aliases |
|-------------------------------------|------------------------------------------------------------|--------------|-----------------------------|---------------|---------|
| dds:instance:createDatabaseUser     | Grants permission to create a database user.               | write        | instance                    | -             | -       |
| dds:instance:getDatabaseUser        | Grants permission to query database users.                 | read         | instance                    | -             | -       |
| dds:instance:deleteDatabaseUser     | Grants permission to delete a database user.               | write        | instance                    | -             | -       |
| dds:instance:createDatabaseRole     | Grants permission to create a database role.               | write        | instance                    | -             | -       |
| dds:instance:deleteDatabaseRole     | Grants permission to delete a database role.               | write        | instance                    | -             | -       |
| dds:instance:getDatabaseRole        | Grants permission to query database roles.                 | read         | instance                    | -             | -       |
| dds:instance:setSourceSubnet        | Grants permission to configure network segments.           | write        | instance                    | -             | -       |
| dds:instance:upgradeDatabaseVersion | Grants permission to upgrade the version of a DB instance. | write        | instance                    | -             | -       |

| Action                           | Description                                                                  | Access Level | Resource Type (*: required) | Condition Key | Aliases |
|----------------------------------|------------------------------------------------------------------------------|--------------|-----------------------------|---------------|---------|
| dds:backup:create                | Grants permission to create a manual backup for a DB instance.               | write        | -                           | -             | -       |
| dds:instance:deleteSession       | Grants permission to kill sessions of an instance node.                      | write        | -                           | -             | -       |
| dds:instance:listSession         | Grants permission to query sessions of an instance node.                     | list         | -                           | -             | -       |
| dds:instance:getShardingBalancer | Grants permission to query the cluster balancer.                             | read         | instance                    | -             | -       |
| dds:instance:setShardingBalancer | Grants permission to set the cluster balancer.                               | write        | instance                    | -             | -       |
| dds:instance:setBalancerWindow   | Grants permission to set the activity time window for DDS cluster balancing. | write        | instance                    | -             | -       |
| dds:instance:updateOpsWindow     | Grants permission to set the maintenance window of a DB instance.            | write        | instance                    | -             | -       |

| Action                            | Description                                                                        | Access Level | Resource Type (*: required) | Condition Key | Aliases |
|-----------------------------------|------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|---------|
| dds:instance:listFlavors          | Grants permission to query specifications.                                         | read         | -                           | -             | -       |
| dds:instance:listStorageType      | Grants permission to query storage types.                                          | read         | -                           | -             | -       |
| dds:instance:listDatabaseVersion  | Grants permission to query the database version information.                       | read         | -                           | -             | -       |
| dds:tag:listAll                   | Grants permission to query all tags in a project.                                  | list         | -                           | -             | -       |
| dds:instance:reduceNode           | Grants permission to delete nodes from a cluster DB instance.                      | write        | instance                    | -             | -       |
| dds:instance:createDomainName     | Grants permission to create DNS.                                                   | write        | -                           | -             | -       |
| dds:instance:updateDomainName     | Grants permission to change a DNS name.                                            | write        | -                           | -             | -       |
| dds:instance:updateReplicaSetName | Grants permission to change the name of the replica set in the connection address. | write        | instance                    | -             | -       |

| Action                         | Description                                                                   | Access Level | Resource Type (*: required) | Condition Key | Aliases |
|--------------------------------|-------------------------------------------------------------------------------|--------------|-----------------------------|---------------|---------|
| dds:instance:getDetail         | Grants permission to query details about a DB instance.                       | read         | instance                    | -             | -       |
| dds:instance:getNodeList       | Grants permission to query instance nodes.                                    | read         | instance                    | -             | -       |
| dds:instance:updateTag         | Grants permission to change a DB instance tag.                                | tagging      | instance                    | -             | -       |
| dds:instance:deleteTag         | Grants permission to delete a DB instance tag.                                | tagging      | instance                    | -             | -       |
| dds:backup:get                 | Grants permission to query information about a backup.                        | read         | -                           | -             | -       |
| dds:offsiteBackup:listRegion   | Grants permission to obtain the remote backup region of a specified instance. | read         | -                           | -             | -       |
| dds:offsiteBackup:listInstance | Grants permission to obtain the cross-region backup instance.                 | read         | -                           | -             | -       |

| Action                        | Description                                                             | Access Level | Resource Type (*: required) | Condition Key                         | Aliases |
|-------------------------------|-------------------------------------------------------------------------|--------------|-----------------------------|---------------------------------------|---------|
| dds:offsiteBackup:listAll     | Grants permission to obtain cross-region backups.                       | read         | -                           | -                                     | -       |
| dds:instance:saveLogConfig    | Grants permission to enable log reporting for DB instances in batches.  | write        | -                           | -                                     | -       |
| dds:instance:deleteLogConfig  | Grants permission to disable log reporting for DB instances in batches. | write        | -                           | -                                     | -       |
| dds:backup:stop               | Grants permission to stop a backup.                                     | write        | -                           | -                                     | -       |
| dds:instance:createKillOpRule | Grants permission to create a SQL execution control rule.               | write        | instance                    | <a href="#">g:EnterpriseProjectId</a> | -       |
| dds:instance:deleteKillOpRule | Grants permission to delete a SQL execution control rule.               | write        | instance                    | <a href="#">g:EnterpriseProjectId</a> | -       |
| dds:instance:getKillOpRule    | Grants permission to query a SQL execution control rule.                | read         | instance                    | <a href="#">g:EnterpriseProjectId</a> | -       |

| Action                            | Description                                                                       | Access Level | Resource Type (*: required) | Condition Key                         | Aliases |
|-----------------------------------|-----------------------------------------------------------------------------------|--------------|-----------------------------|---------------------------------------|---------|
| dds:instance:updateKillOpRule     | Grants permission to update a SQL execution control rule.                         | write        | instance                    | <a href="#">g:EnterpriseProjectId</a> | -       |
| dds:offsiteBackup:getBackupPolicy | Grants the permission to obtain the remote backup policy of a specified instance. | read         | instance                    | <a href="#">g:EnterpriseProjectId</a> | -       |
| dds:offsiteBackup:setBackupPolicy | Grants permission to configure a remote backup policy.                            | write        | instance                    | <a href="#">g:EnterpriseProjectId</a> | -       |

Each API of DDS usually supports one or more actions. [Table 3-113](#) lists the supported actions and dependencies.

**Table 3-113** Actions and dependencies supported by DDS APIs

| API                                                   | Action                                                                                                             | Dependencies |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|--------------|
| POST /v3/{project_id}/instances                       | dds:instance:create<br>vpc:vpcs:list<br>vpc:vpcs:get<br>vpc:subnets:get<br>vpc:securityGroups:get<br>vpc:ports:get | -            |
| GET /v3/{project_id}/instances                        | dds:instance:listAll                                                                                               | -            |
| DELETE /v3/{project_id}/instances/{instance_id}       | dds:instance:delete                                                                                                | -            |
| POST /v3/{project_id}/instances/{instance_id}/restart | dds:instance:restart                                                                                               | -            |

| API                                                                 | Action                                                                                                              | Dependencies |
|---------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|--------------|
| POST /v3/{project_id}/instances/{instance_id}/enlarge-volume        | dds:instance:extendVolume                                                                                           | -            |
| POST /v3/{project_id}/instances/{instance_id}/enlarge               | dds:instance:addNode<br>vpc:vpcs:list<br>vpc:vpcs:get<br>vpc:subnets:get<br>vpc:securityGroups:get<br>vpc:ports:get | -            |
| POST /v3/{project_id}/instances/{instance_id}/resize                | dds:instance:updateSpec                                                                                             | -            |
| POST /v3/{project_id}/instances/{instance_id}/switchover            | dds:instance:switchover                                                                                             | -            |
| POST /v3/{project_id}/instances/{instance_id}/switch-ssl            | dds:instance:setSSL                                                                                                 | -            |
| PUT /v3/{project_id}/instances/{instance_id}/modify-name            | dds:instance:updateName                                                                                             | -            |
| POST /v3/{project_id}/instances/{instance_id}/modify-port           | dds:instance:updatePort                                                                                             | -            |
| POST /v3/{project_id}/instances/{instance_id}/modify-security-group | dds:instance:updateSecurityGroup                                                                                    | -            |
| POST /v3/{project_id}/nodes/{node_id}/bind-eip                      | dds:instance:bindEIP                                                                                                | -            |
| POST /v3/{project_id}/nodes/{node_id}/unbind-eip                    | dds:instance:unbindEIP                                                                                              | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for DDS.

**Table 3-114** Resource types supported by DDS

| Resource Type | URN                                                    |
|---------------|--------------------------------------------------------|
| instanceName  | dds:<region>:<account-id>:instanceName:<instance-name> |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the

system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).

- Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, **dds:**) only apply to operations of the DDS service. For details, see [Table 4](#).
- The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so **g:SourceVpce** is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so **g:TagKeys** is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [Condition operators](#).

#### Service-specific condition keys supported by DDS

The following table lists the condition keys that you can define in identity policies for DDS. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-115** Service-specific condition keys supported by DDS

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                                                                      |
|--------------------------------|---------|-------------------------------|--------------------------------------------------------------------------------------------------|
| <b>dds:Encrypted</b>           | boolean | Single-valued                 | Filters access by the tag key that specifies whether to enable disk encryption in the request.   |
| <b>dds:BackupEnabled</b>       | boolean | Single-valued                 | Filters access by the tag key that specifies whether to enable the backup policy in the request. |

#### Examples of Condition Keys

- **dds:Encrypted**

For example, it indicates that disk encryption is required.

```
{ "Version": "5.0", "Statement": [ { "Effect": "Allow", "Action":
[ "dds:instance:create" ], "Condition": { "Bool": { "dds:Encrypted":
[ "true" ] } } } ] }
```

- **dds:BackupEnabled**

For example, it indicates that backup is required.

```
{ "Version": "5.0", "Statement": [ { "Effect": "Allow", "Action":
[ "dds:instance:create" ], "Condition": { "Bool": { "dds:BackupEnabled":
[ "true" ] } } } ] }
```

- `g:EnterpriseProjectId`

For example, it indicates that the enterprise project IDs must be the same.

```
{ "Version": "5.0", "Statement": [ { "Effect": "Allow", "Action":
[ "dds:instance:restart" ], "Condition": { "StringEquals":
{ "g:EnterpriseProjectId":
[ "d1a6b48538e74473af064856a0e03515" ] } } } ] }
```

### 3.6.4 Data Replication Service (DRS)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by DRS, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by DRS, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for identity policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for DRS.

**Table 3-116** Actions supported by DRS

| Action                           | Description                                          | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                           | Alias                         |
|----------------------------------|------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|
| drs:backupMigrationJob:createJob | Grants permission to create a backup migration task. | write        | job                         | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul> | drs:backupMigrationJob:create |
| drs:backupMigrationJob:deleteJob | Grants permission to delete a backup migration task. | write        | job                         | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                      | drs:backupMigrationJob:delete |

| Action                                       | Description                                                            | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias                         |
|----------------------------------------------|------------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|
| drs:backupMigrationJob:getJobDetail          | Grants permission to query details about a backup migration task.      | list         | job                         | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | drs:backupMigrationJob:get    |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-118](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

**Table 3-118** Resource types supported by DRS

| Resource Type | URN                                    |
|---------------|----------------------------------------|
| job           | drs:<region>:<account-id>:job:<job-id> |

## Conditions

DRS does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.6.5 TaurusDB

IAM provides system-defined policies to define common actions supported by cloud services. You can also create custom policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM policies are different from Organizations SCPs, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom policy, see [Creating a Custom Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in a policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource type defined by TaurusDB, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.

- If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
- If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
- If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by TaurusDB, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in custom policy statements for TaurusDB.

**Table 3-119** Actions supported by TaurusDB

| Action                                      | Description                                                              | Access Level          | Resource Type (*: required) | Condition Key                                                                                                                                  | Alias                                                                                                          |
|---------------------------------------------|--------------------------------------------------------------------------|-----------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| gaussdbformysql:backup:modifyPolicy         | Grants permission to configure an automated backup policy.               | Permission management | -                           | <a href="#">gaussdbformysql:ReplicationTargetRegion</a>                                                                                        | <ul style="list-style-type: none"> <li>gaussdb:instance:modifyBackupPolicy</li> </ul>                          |
| gaussdbformysql:param:delete                | Grants permission to delete a parameter template.                        | Permission management | -                           | -                                                                                                                                              | <ul style="list-style-type: none"> <li>gaussdb:param:delete</li> </ul>                                         |
| gaussdbformysql:instance:switchover         | Grants permission to promote a read replica to primary.                  | Permission management | instance *                  | <ul style="list-style-type: none"> <li><a href="#">g:EnterpriseProjectId</a></li> <li><a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | <ul style="list-style-type: none"> <li>gaussdb:instance:modify</li> <li>gaussdb:instance:switchover</li> </ul> |
| gaussdbformysql:htapInstance:createDataSync | Grants permission to create a data synchronization task for an instance. | Write                 | instance *                  | <ul style="list-style-type: none"> <li><a href="#">g:EnterpriseProjectId</a></li> <li><a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | <ul style="list-style-type: none"> <li>gaussdb:htapInstance:createDataSync</li> </ul>                          |

| Action                                   | Description                                                    | Access Level          | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias                                                                                |
|------------------------------------------|----------------------------------------------------------------|-----------------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| gaussdbformysql:auditlog:list            | Grants permission to query audit logs.                         | List                  | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | <ul style="list-style-type: none"> <li>• gaussdb:instance:list</li> </ul>            |
