| DELETE /v1/{project_id}/kie/kv                                   | cse:namespace:update                 | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-225](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for ServiceStage.

**Table 3-225** Resource types supported by ServiceStage

| Resource Type  | URN                                                                     |
|----------------|-------------------------------------------------------------------------|
| app            | servicestage:<region>:<account-id>:app:<app-id>                         |
| environment    | servicestage:<region>:<account-id>:environment:<environment-id>         |
| pipeline       | servicestage:<region>:<account-id>:pipeline:<pipeline-id>               |
| assembling     | servicestage:<region>:<account-id>:assembling:<assembling-id>           |
| repositoryAuth | servicestage:<region>:<account-id>:repositoryAuth:<repositoryAuth-id>   |
| configGroup    | servicestage:<region>:<account-id>:configGroup:<config-group-id>        |
| config         | servicestage:<region>:<account-id>:config:<config-group-id>/<config-id> |

## Condition

ServiceStage does not support service-specific condition keys in policies.

It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.11.2 CodeArts

The [Organizations](#) service provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU.

This section describes the elements used by Organizations SCPs. The elements include actions, resources, and conditions.

For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an SCP.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an SCP.

- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions, and you must specify all resources ("\*") in your SCP statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by the CodeArts console, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an SCP statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by the CodeArts console, see [Conditions](#).

The following table lists the actions that you can define in SCP statements for the CodeArts console.

**Table 3-226** Actions supported by the CodeArts console

| Action                        | Description                                                             | Access Level | Resource Type (*: required) | Condition Key |
|-------------------------------|-------------------------------------------------------------------------|--------------|-----------------------------|---------------|
| codearts:projectman:viewUsage | Grants permission to check CodeArts Req resource usage on the console.  | read         | -                           | -             |
| codearts:codehub:viewUsage    | Grants permission to check CodeArts Repo resource usage on the console. | read         | -                           | -             |

| Action                          | Description                                                                                   | Access Level | Resource Type (*: required) | Condition Key |
|---------------------------------|-----------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|
| codearts:cloudbuild:viewUsage   | Grants permission to check CodeArts Build resource usage on the console.                      | read         | -                           | -             |
| codearts:codecheck:viewUsage    | Grants permission to check CodeArts Check resource usage on the console.                      | read         | -                           | -             |
| codearts:clouddtest:viewUsage   | Grants permission to check CodeArts TestPlan (Test Management) resource usage on the console. | read         | -                           | -             |
| codearts:apitest:viewUsage      | Grants permission to check CodeArts TestPlan (APITest) resource usage on the console.         | read         | -                           | -             |
| codearts:cloudrelease:viewUsage | Grants permission to check CodeArts Artifact resource usage on the console.                   | read         | -                           | -             |

| Action                                      | Description                                                                         | Access Level | Resource Type (*: required) | Condition Key |
|---------------------------------------------|-------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|
| codearts:cloudide:viewUsage                 | Grants permission to check CodeArts IDE resource usage on the console.              | read         | -                           | -             |
| codearts:classroom:viewUsage                | Grants permission to check Classroom resource usage on the console.                 | read         | -                           | -             |
| codearts:monthlyPackage:changeSpecification | Grants permission to change package specifications on the console.                  | write        | -                           | -             |
| codearts:monthlyPackage:subscribe           | Grants permission to purchase packages on the console.                              | write        | -                           | -             |
| codearts:projectman:subscribeService        | Grants permission to subscribe to CodeArts Req in pay-per-use mode on the console.  | write        | -                           | -             |
| codearts:codehub:subscribeService           | Grants permission to subscribe to CodeArts Repo in pay-per-use mode on the console. | write        | -                           | -             |

| Action                                 | Description                                                                                               | Access Level | Resource Type (*: required) | Condition Key |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|
| codearts:cloudbuild:subscribeService   | Grants permission to subscribe to CodeArts Build in pay-per-use mode on the console.                      | write        | -                           | -             |
| codearts:codecheck:subscribeService    | Grants permission to subscribe to CodeArts Check in pay-per-use mode on the console.                      | write        | -                           | -             |
| codearts:clouddtest:subscribeService   | Grants permission to subscribe to CodeArts TestPlan (Test Management) in pay-per-use mode on the console. | write        | -                           | -             |
| codearts:apitest:subscribeService      | Grants permission to subscribe to CodeArts TestPlan (APITest) in pay-per-use mode on the console.         | write        | -                           | -             |
| codearts:cloudrelease:subscribeService | Grants permission to subscribe to CodeArts Artifact in pay-per-use mode on the console.                   | write        | -                           | -             |

| Action                                 | Description                                                                             | Access Level | Resource Type (*: required) | Condition Key |
|----------------------------------------|-----------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|
| codearts:package:subscribeService      | Grants permission to subscribe to a pay-per-use package on the console.                 | write        | -                           | -             |
| codearts:cloudide:subscribeService     | Grants permission to subscribe to CodeArts IDE in pay-per-use mode on the console.      | write        | -                           | -             |
| codearts:classroom:subscribeService    | Grants permission to subscribe to Classroom in pay-per-use mode on the console.         | write        | -                           | -             |
| codearts:projectman:unsubscribeService | Grants permission to unsubscribe from CodeArts Req in pay-per-use mode on the console.  | write        | -                           | -             |
| codearts:codehub:unsubscribeService    | Grants permission to unsubscribe from CodeArts Repo in pay-per-use mode on the console. | write        | -                           | -             |

| Action                                 | Description                                                                                                   | Access Level | Resource Type (*: required) | Condition Key |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|
| codearts:cloudbuild:unsubscribeService | Grants permission to unsubscribe from CodeArts Build in pay-per-use mode on the console.                      | write        | -                           | -             |
| codearts:codecheck:unsubscribeService  | Grants permission to unsubscribe from CodeArts Check in pay-per-use mode on the console.                      | write        | -                           | -             |
| codearts:clouddtest:unsubscribeService | Grants permission to unsubscribe from CodeArts TestPlan (Test Management) in pay-per-use mode on the console. | write        | -                           | -             |
| codearts:apitest:unsubscribeService    | Grants permission to unsubscribe from CodeArts TestPlan (APITest) in pay-per-use mode on the console.         | write        | -                           | -             |

| Action                                       | Description                                                                                 | Access Level | Resource Type (*: required) | Condition Key |
|----------------------------------------------|---------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|
| codearts:cloudrelease:unsubscribeService     | Grants permission to unsubscribe from CodeArts Artifact in pay-per-use mode on the console. | write        | -                           | -             |
| codearts:package:unsubscribeService          | Grants permission to unsubscribe from a pay-per-use package on the console.                 | write        | -                           | -             |
| codearts:cloudide:unsubscribeService         | Grants permission to unsubscribe from CodeArts IDE in pay-per-use mode on the console.      | write        | -                           | -             |
| codearts:classroom:unsubscribeService        | Grants permission to unsubscribe from Classroom in pay-per-use mode on the console.         | write        | -                           | -             |
| codearts:authorization:list                  | Grants permission to view the authorization list on the console.                            | list         | -                           | -             |
| codearts:payPerUsePackage:listResourceDetail | Grants permission to view details of a pay-per-use package on the console.                  | list         | -                           | -             |

| Action                                     | Description                                                                             | Access Level | Resource Type (*: required) | Condition Key |
|--------------------------------------------|-----------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|
| codearts:monthlyPackage:listResourceDetail | Grants permission to view package resources on the console.                             | list         | -                           | -             |
| codearts:projectman:listResourceDetail     | Grants permission to view CodeArts Req resources on the console.                        | list         | -                           | -             |
| codearts:codehub:listResourceDetail        | Grants permission to view CodeArts Repo resources on the console.                       | list         | -                           | -             |
| codearts:cloudbuild:listResourceDetail     | Grants permission to view CodeArts Build resources on the console.                      | list         | -                           | -             |
| codearts:codecheck:listResourceDetail      | Grants permission to view CodeArts Check resources on the console.                      | list         | -                           | -             |
| codearts:clouddtest:listResourceDetail     | Grants permission to view CodeArts TestPlan (Test Management) resources on the console. | list         | -                           | -             |
| codearts:cloudrelease:listResourceDetail   | Grants permission to view CodeArts Artifact resources on the console.                   | list         | -                           | -             |

| Action                                                  | Description                                                                                  | Access Level | Resource Type (*: required) | Condition Key |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|
| codearts:cloudide:listResourceDetail                    | Grants permission to view CodeArts IDE resources on the console.                             | list         | -                           | -             |
| codearts:classroom:listResourceDetail                   | Grants permission to view Classroom resources on the console.                                | list         | -                           | -             |
| codearts:agileDevopsTrainingServices:listResourceDetail | Grants permission to view resources of the Agile and DevOps Training Service on the console. | list         | -                           | -             |
| codearts:projectman:listSubscriptionHistory             | Grants permission to view CodeArts Req subscription history on the console.                  | list         | -                           | -             |
| codearts:codehub:listSubscriptionHistory                | Grants permission to view CodeArts Repo subscription history on the console.                 | list         | -                           | -             |
| codearts:cloudbuild:listSubscriptionHistory             | Grants permission to view CodeArts Build subscription history on the console.                | list         | -                           | -             |

| Action                                        | Description                                                                                        | Access Level | Resource Type (*: required) | Condition Key |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|
| codearts:codecheck:listSubscriptionHistory    | Grants permission to view CodeArts Check subscription history on the console.                      | list         | -                           | -             |
| codearts:cloudtest:listSubscriptionHistory    | Grants permission to view CodeArts TestPlan (Test Management) subscription history on the console. | list         | -                           | -             |
| codearts:apitest:listSubscriptionHistory      | Grants permission to view CodeArts TestPlan (APITest) subscription history on the console.         | list         | -                           | -             |
| codearts:cloudrelease:listSubscriptionHistory | Grants permission to view CodeArts Artifact subscription history on the console.                   | list         | -                           | -             |
| codearts:package:listSubscriptionHistory      | Grants permission to view pay-per-use package subscription history on the console.                 | list         | -                           | -             |
| codearts:cloudide:listSubscriptionHistory     | Grants permission to view CodeArts IDE subscription history on the console.                        | list         | -                           | -             |

| Action                                     | Description                                                                                    | Access Level | Resource Type (*: required) | Condition Key |
|--------------------------------------------|------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|
| codearts:classroom:listSubscriptionHistory | Grants permission to view Classroom subscription history on the console.                       | list         | -                           | -             |
| codearts:authorization:create              | Grants permission to authorize enterprise accounts on the console.                             | permissions  | -                           | -             |
| codearts:authorization:cancel              | Grants permission to cancel the authorization granted to enterprise accounts on the console.   | permissions  | -                           | -             |
| codearts:authorization:update              | Grants permission to accept or reject authorization from an enterprise account on the console. | permissions  | -                           | -             |

## Resources

The CodeArts console does not support resource-level authorization. To allow access to the CodeArts console, use a wildcard (\*) in the Resource element of the SCP, indicating that the SCP will be applied to all resources.

## Conditions

The CodeArts console does not support service-specific condition keys in SCPs.

It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.11.3 CodeArts Pipeline

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

#### Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by CodeartsPipeline, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.

- If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by CodeartsPipeline, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for CodeartsPipeline.

**Table 3-227** Actions supported by CodeartsPipeline

| Action                                    | Description                                           | Access Level | Resource Type (*: required) | Condition Key | Alias                                                                                    |
|-------------------------------------------|-------------------------------------------------------|--------------|-----------------------------|---------------|------------------------------------------------------------------------------------------|
| codeartspipeline:pipeline-template:create | Grants permission to create a pipeline template.      | Write        | -                           | -             | -                                                                                        |
| codeartspipeline:pipeline-template:update | Grants permission to update a pipeline template.      | Write        | -                           | -             | <ul style="list-style-type: none"> <li>cloudpipeline:pipeline-template:update</li> </ul> |
| codeartspipeline:pipeline-template:delete | Grants permission to delete a pipeline template.      | Write        | -                           | -             | <ul style="list-style-type: none"> <li>cloudpipeline:pipeline-template:update</li> </ul> |
| codeartspipeline:pipeline-template:get    | Grants permission to view a pipeline template.        | Read         | -                           | -             | -                                                                                        |
| codeartspipeline:pipeline-template:list   | Grants permission to view the pipeline template list. | List         | -                           | -             | -                                                                                        |
| codeartspipeline:rule:create              | Grants permission to create a rule.                   | Write        | -                           | -             | <ul style="list-style-type: none"> <li>cloudpipeline:rule:update</li> </ul>              |

| Action                            | Description                                      | Access Level | Resource Type (*: required) | Condition Key | Alias                                                                               |
|-----------------------------------|--------------------------------------------------|--------------|-----------------------------|---------------|-------------------------------------------------------------------------------------|
| codeartspipeline:rule:update      | Grants permission to update a rule.              | Write        | -                           | -             | <ul style="list-style-type: none"> <li>cloudpipeline:rule:update</li> </ul>         |
| codeartspipeline:rule:delete      | Grants permission to delete a rule.              | Write        | -                           | -             | <ul style="list-style-type: none"> <li>cloudpipeline:rule:update</li> </ul>         |
| codeartspipeline:rule:get         | Grants permission to view a rule.                | Read         | -                           | -             | -                                                                                   |
| codeartspipeline:rule:list        | Grants permission to view the rule list.         | List         | -                           | -             | -                                                                                   |
| codeartspipeline:strategy:create  | Grants permission to create a strategy.          | Write        | -                           | -             | <ul style="list-style-type: none"> <li>cloudpipeline:ruletemplate:update</li> </ul> |
| codeartspipeline:strategy:update  | Grants permission to update a strategy.          | Write        | -                           | -             | <ul style="list-style-type: none"> <li>cloudpipeline:ruletemplate:update</li> </ul> |
| codeartspipeline:strategy:delete  | Grants permission to delete a strategy.          | Write        | -                           | -             | <ul style="list-style-type: none"> <li>cloudpipeline:ruletemplate:update</li> </ul> |
| codeartspipeline:strategy:get     | Grants permission to view a strategy.            | Read         | -                           | -             | -                                                                                   |
| codeartspipeline:strategy:list    | Grants permission to view the strategy list.     | List         | -                           | -             | -                                                                                   |
| codeartspipeline:extension:create | Grants permission to create an extension plugin. | Write        | -                           | -             | <ul style="list-style-type: none"> <li>cloudpipeline:extensions:update</li> </ul>   |

| Action                            | Description                                        | Access Level | Resource Type (*: required) | Condition Key | Alias                                                                           |
|-----------------------------------|----------------------------------------------------|--------------|-----------------------------|---------------|---------------------------------------------------------------------------------|
| codeartspipeline:extension:update | Grants permission to update an extension plugin.   | Write        | -                           | -             | <ul style="list-style-type: none"><li>cloudpipeline:extensions:update</li></ul> |
| codeartspipeline:extension:delete | Grants permission to delete an extension plugin.   | Write        | -                           | -             | <ul style="list-style-type: none"><li>cloudpipeline:extensions:update</li></ul> |
| codeartspipeline:extension:get    | Grants permission to view an extension plugin.     | Read         | -                           | -             | -                                                                               |
| codeartspipeline:extension:list   | Grants permission to list all pipeline extensions. | List         | -                           | -             | -                                                                               |

## Resources

CodeartsPipeline does not support resource-level authorization. To allow access to CodeartsPipeline, use a wildcard (\*) in the Resource element of the identity policy, indicating that the identity policy will be applied to all resources.

## Conditions

CodeartsPipeline does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.11.4 Cloud Application Engine

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational

unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by cae, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by cae, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for cae.

**Table 3-228** Actions supported by CAE

| Action                            | Description                                  | Access Level | Resource Type (*: required) | Condition Key                         | Alias                  |
|-----------------------------------|----------------------------------------------|--------------|-----------------------------|---------------------------------------|------------------------|
| cae:environment:listEnvironments  | Grant permission to query all environments.  | List         | environment *               | -                                     | cae:environment:list   |
| cae:environment:createEnvironment | Grant permission to create an environment.   | Write        | environment *               | -                                     | cae:environment:create |
|                                   |                                              |              | -                           | <a href="#">g:EnterpriseProjectId</a> |                        |
| cae:environment:deleteEnvironment | Grant permission to delete an environment.   | Write        | environment *               | -                                     | cae:environment:delete |
|                                   |                                              |              | -                           | <a href="#">g:EnterpriseProjectId</a> |                        |
| cae:environment:getEnvironment    | Grant permission to query an environment.    | Read         | environment *               | -                                     | cae:environment:get    |
|                                   |                                              |              | -                           | <a href="#">g:EnterpriseProjectId</a> |                        |
| cae:environment:listCloudVolumes  | Grant permission to query all cloud storage. | List         | environment *               | -                                     | cae:environment:list   |
|                                   |                                              |              | -                           | <a href="#">g:EnterpriseProjectId</a> |                        |
| cae:environment:createCloudVolume | Grant permission to authorize cloud storage. | Write        | environment *               | -                                     | cae:environment:create |
|                                   |                                              |              | -                           | <a href="#">g:EnterpriseProjectId</a> |                        |
| cae:environment:deleteCloudVolume | Grant permission to unbind cloud storage.    | Write        | environment *               | -                                     | cae:environment:delete |
|                                   |                                              |              | -                           | <a href="#">g:EnterpriseProjectId</a> |                        |

| Action                            | Description                                 | Access Level | Resource Type (*: required) | Condition Key                         | Alias                  |
|-----------------------------------|---------------------------------------------|--------------|-----------------------------|---------------------------------------|------------------------|
| cae:environment:listDomains       | Grant permission to query all domain names. | List         | environment *               | -                                     | cae:environment:get    |
|                                   |                                             |              | -                           | <a href="#">g:EnterpriseProjectId</a> |                        |
| cae:environment:createDomain      | Grant permission to create a domain name.   | Write        | environment *               | -                                     | cae:environment:create |

## Resources

A resource type indicates the resources that an SCP applies to. If you specify a resource type for any action in [Table 3-230](#), the resource URN must be specified in the SCP statements using that action, and the SCP applies only to resources of this

type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the SCP applies to all resources. You can also set condition keys in an SCP to define resource types.

The following table lists the resource types that you can define in SCP statements for CAE.

**Table 3-230** Resource types supported by CAE

| Resource Type | URN                                                                 |
|---------------|---------------------------------------------------------------------|
| component     | cae:<region>:<account-id>:component:<application-id>/<component-id> |
| environment   | cae:<region>:<account-id>:environment:<environment-id>              |
| application   | cae:<region>:<account-id>:application:<application-id>              |

## Conditions

cae does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

## 3.12 Business Applications

### 3.12.1 Domain Name Service

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by DNS, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by DNS, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for DNS.

**Table 3-231** Actions supported by DNS

| Action        | Description                          | Access Level | Resource Type (*: required) | Condition Key | Alias |
|---------------|--------------------------------------|--------------|-----------------------------|---------------|-------|
| dns:zone:list | Grants permission to list the zones. | List         | zone *                      | -             | -     |

| Action                                | Description                                   | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                          | Alias |
|---------------------------------------|-----------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
|                                       |                                               |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> |       |
| dns:zone:create                       | Grants permission to create a zone.           | Write        | zone *                      | -                                                                                                                                                                                      |       |
|                                       |                                               |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> |       |
| dns:zone:createBatchPublicZonesByName | Grants permission to create zones in batches. | Write        | zone *                      | -                                                                                                                                                                                      |       |
|                                       |                                               |              | -                           | <a href="#">g:EnterpriseProjectId</a>                                                                                                                                                  |       |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-233](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for DNS.

**Table 3-233** Resource types supported by DNS

| Resource Type | URN                                                       |
|---------------|-----------------------------------------------------------|
| resolverRule  | dns:<region>:<account-id>:resolverRule:<resolver-rule-id> |
| lineGroup     | dns::<account-id>:lineGroup:<line-group-id>               |
| customLine    | dns::<account-id>:customLine:<custom-line-id>             |
| zone          | dns::<account-id>:zone:<zone-id>                          |
| endpoint      | dns:<region>:<account-id>:endpoint:<endpoint-id>          |
| ptr           | dns:<region>:<account-id>:ptr:<ptr-id>                    |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, dns) apply only to operations of the xx service. For details, see [Table 3-234](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple

tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.

- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [operators](#).

### Service-specific condition keys supported by DNS

The following table lists the condition keys that you can define in identity policies for DNS. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-234** Service-specific condition keys supported by DNS

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                                                                                                      |
|--------------------------------|--------|-------------------------------|------------------------------------------------------------------------------------------------------------------|
| dns:RecordSetNames             | string | Multivalued                   | Filters access by record set name. The name can contain only lowercase letters and cannot have the trailing dot. |
| dns:RecordSetTypes             | string | Multivalued                   | Filters access by record set type. The type can be A, AAAA, MX, CNAME, TXT, NS, SRV or CAA.                      |

## 3.13 Media Services

### 3.13.1 Live (Live)

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by Live, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by Live, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for Live.

**Table 3-235** Actions supported by Live

| Action                                | Description                                                                          | Access Level | Resource Type (*: required) | Condition Key | Alias |
|---------------------------------------|--------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| live:domain:createDomain              | Grants permission to create a domain name.                                           | Write        | -                           | -             | -     |
| live:domain:getDomains                | Grants permission to query a domain name.                                            | Read         | -                           | -             | -     |
| live:domain:deleteDomain              | Grants permission to delete a domain name.                                           | Write        | -                           | -             | -     |
| live:domain:updateDomain              | Grants permission to modify a domain name.                                           | Write        | -                           | -             | -     |
| live:domain:createDomains Mapping     | Grants permission to map domain names.                                               | Write        | -                           | -             | -     |
| live:domain:deleteDomains Mapping     | Grants permission to delete the mapping between domain names.                        | Write        | -                           | -             | -     |
| live:domain:updateStream Notification | Grants permission to add or modify the configuration of stream status notifications. | Write        | -                           | -             | -     |

| Action                               | Description                                                                   | Access Level | Resource Type (*: required) | Condition Key | Alias |
|--------------------------------------|-------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| live:domain:getStreamNotifications   | Grants permission to query the configuration of stream status notifications.  | Read         | -                           | -             | -     |
| live:domain:deleteStreamNotification | Grants permission to delete the configuration of stream status notifications. | Write        | -                           | -             | -     |
| live:domain:createCDNConfig          | Grants permission to create domain name configuration items.                  | Write        | -                           | -             | -     |
| live:domain:updateCDNConfig          | Grants permission to modify domain name configuration items.                  | Write        | -                           | -             | -     |
| live:domain:getCDNConfig             | Grants permission to query domain name configuration items.                   | Read         | -                           | -             | -     |
| live:domain:deleteCDNConfig          | Grants permission to delete domain name configuration items.                  | Write        | -                           | -             | -     |

| Action                         | Description                                                                 | Access Level | Resource Type (*: required) | Condition Key | Alias |
|--------------------------------|-----------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| live:domain:getIPAuthList      | Grants permission to query the IP address blacklist or whitelist.           | Read         | -                           | -             | -     |
| live:domain:updateIPAuthList   | Grants permission to modify the IP address blacklist or whitelist.          | Write        | -                           | -             | -     |
| live:domain:getGeoBlockingList | Grants permission to obtain regions with livestreaming restrictions.        | Read         | -                           | -             | -     |
| live:domain:updateGeoBlocking  | Grants permission to modify regions with livestreaming restrictions.        | Write        | -                           | -             | -     |
| live:domain:updateRefererChain | Grants permission to set the referer validation blacklist and whitelist.    | Write        | -                           | -             | -     |
| live:domain:deleteRefererChain | Grants permission to delete the referer validation blacklist and whitelist. | Write        | -                           | -             | -     |

| Action                      | Description                                                                | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-----------------------------|----------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| live:domain:getRefererChain | Grants permission to query the referer validation blacklist and whitelist. | Read         | -                           | -             | -     |
| live:logs:listLog           | Grants permission to obtain the link for downloading playback logs.        | Read         | -                           | -             | -     |
| live:domain:getCertificates | Grants permission to query HTTPS certificate information.                  | Read         | -                           | -             | -     |
| live:record:createRule      | Grants permission to create a recording rule.                              | Write        | -                           | -             | -     |
| live:record:listRules       | Grants permission to query recording rules.                                | Read         | -                           | -             | -     |
| live:record:updateRule      | Grants permission to modify a recording rule.                              | Write        | -                           | -             | -     |
| live:record:deleteRule      | Grants permission to delete a recording rule.                              | Write        | -                           | -             | -     |

| Action                     | Description                                                      | Access Level | Resource Type (*: required) | Condition Key | Alias |
|----------------------------|------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| live:record:getRule        | Grants permission to query a recording rule.                     | Read         | -                           | -             | -     |
| live:record:listContents   | Grants permission to query recordings.                           | Read         | -                           | -             | -     |
| live:record:createCommand  | Grants permission to submit a command for controlling recording. | Write        | -                           | -             | -     |
| live:record:createCallback | Grants permission to create a recording callback rule.           | Write        | -                           | -             | -     |
| live:record:listCallbacks  | Grants permission to query recording callback rules.             | Read         | -                           | -             | -     |
| live:record:updateCallback | Grants permission to modify a recording callback rule.           | Write        | -                           | -             | -     |
| live:record:getCallback    | Grants permission to query a recording callback rule.            | Read         | -                           | -             | -     |
| live:record:deleteCallback | Grants permission to delete a recording callback rule.           | Write        | -                           | -             | -     |

| Action                            | Description                                                     | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-----------------------------------|-----------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| live:snapshot:createRule          | Grants permission to configure snapshot capture.                | Write        | -                           | -             | -     |
| live:snapshot:updateRule          | Grants permission to modify snapshot capture.                   | Write        | -                           | -             | -     |
| live:snapshot:listRules           | Grants permission to query snapshot capture.                    | Read         | -                           | -             | -     |
| live:snapshot:deleteRule          | Grants permission to delete snapshot capture.                   | Write        | -                           | -             | -     |
| live:stream:createStreamForbidden | Grants permission to disable a push stream.                     | Write        | -                           | -             | -     |
| live:stream:listStreamForbidden   | Grants permission to query disabled streams.                    | Read         | -                           | -             | -     |
| live:stream:deleteStreamForbidden | Grants permission to resume a push stream.                      | Write        | -                           | -             | -     |
| live:stream:updateStreamForbidden | Grants permission to modify the attribute of a disabled stream. | Write        | -                           | -             | -     |

| Action                                | Description                                                                      | Access Level | Resource Type (*: required) | Condition Key | Alias |
|---------------------------------------|----------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| live:stream:createStreamForbiddenOnce | Grants permission to disconnect a stream.                                        | Write        | -                           | -             | -     |
| live:stream:listLiveStreamsOnline     | Grants permission to query online streams.                                       | Read         | -                           | -             | -     |
| live:stream:createPullTask            | Grants permission to create a task for ingesting streams from external networks. | Write        | -                           | -             | -     |
| live:stream:deletePullTask            | Grants permission to delete a task for ingesting streams from external networks. | Write        | -                           | -             | -     |
| live:stream:listPullTask              | Grants permission to query a task for ingesting streams from external networks.  | Read         | -                           | -             | -     |
| live:tenant:updateChargingMode        | Grants permission to configure the billing mode.                                 | Write        | -                           | -             | -     |
| live:tenant:getTenantInformation      | Grants permission to query tenant information.                                   | Read         | -                           | -             | -     |

| Action                                    | Description                                         | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-------------------------------------------|-----------------------------------------------------|--------------|-----------------------------|---------------|-------|
| live:transcode:createTranscodingsTemplate | Grants permission to create a transcoding template. | Write        | -                           | -             | -     |
| live:transcode:deleteTranscodingsTemplate | Grants permission to delete a transcoding template. | Write        | -                           | -             | -     |
| live:transcode:updateTranscodingsTemplate | Grants permission to modify a transcoding template. | Write        | -                           | -             | -     |
| live:transcode:listTranscodingTemplate    | Grants permission to query a transcoding template.  | Read         | -                           | -             | -     |
| live:transcode:createSEI                  | Grants permission to add transcoding SEI.           | Write        | -                           | -             | -     |

Each API of Live usually supports one or more actions. [Table 3-236](#) lists the supported actions and dependencies.

**Table 3-236** Actions and dependencies supported by Live APIs

| API                            | Action                   | Dependencies |
|--------------------------------|--------------------------|--------------|
| POST /v1/{project_id}/domain   | live:domain:createDomain | -            |
| DELETE /v1/{project_id}/domain | live:domain:deleteDomain | -            |
| PUT /v1/{project_id}/domain    | live:domain:updateDomain | -            |

| API                                           | Action                                | Dependencies |
|-----------------------------------------------|---------------------------------------|--------------|
| GET /v1/{project_id}/domain                   | live:domain:getDomains                | -            |
| PUT /v1/{project_id}/domains_mapping          | live:domain:createDomains Mapping     | -            |
| DELETE /v1/{project_id}/domains_mapping       | live:domain:deleteDomains Mapping     | -            |
| PUT /v1/{project_id}/notifications/publish    | live:domain:updateStreamN otification | -            |
| GET /v1/{project_id}/notifications/publish    | live:domain:getStreamNotif ications   | -            |
| DELETE /v1/{project_id}/notifications/publish | live:domain:deleteStreamN otification | -            |
| POST /v1/{project_id}/domain/config           | live:domain:createCDNConfi g          | -            |
| PUT /v1/{project_id}/domain/config            | live:domain:updateCDNConf ig          | -            |
| GET /v1/{project_id}/domain/config            | live:domain:getCDNConfig              | -            |
| DELETE /v1/{project_id}/domain/config         | live:domain:deleteCDNConf ig          | -            |
| GET /v1/{project_id}/guard/ip                 | live:domain:getIPAuthList             | -            |
| PUT /v1/{project_id}/guard/ip                 | live:domain:updateIPAuthLi st         | -            |
| GET /v1/{project_id}/guard/geo-blocking       | live:domain:getGeoBlocking List       | -            |
| PUT /v1/{project_id}/guard/geo-blocking       | live:domain:updateGeoBloc king        | -            |

| API                                         | Action                         | Dependencies |
|---------------------------------------------|--------------------------------|--------------|
| PUT /v1/{project_id}/guard/referer-chain    | live:domain:updateRefererChain | -            |
| DELETE /v1/{project_id}/guard/referer-chain | live:domain:deleteRefererChain | -            |
| GET /v1/{project_id}/guard/referer-chain    | live:domain:getRefererChain    | -            |
| GET /v1/{project_id}/logs                   | live:logs:listLog              | -            |

## Resources

Live does not support resource-level authorization. To allow access to Live, use a wildcard (\*) in the Resource element of the identity policy, indicating that the identity policy will be applied to all resources.

## Conditions

Live does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.13.2 Media Processing Center (MPC)

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that

OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by MPC, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by MPC, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for MPC.

**Table 3-237** Actions supported by MPC

| Action                       | Description                                                                | Access Level | Resource Type (*: required) | Condition Key | Alias |
|------------------------------|----------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| mpc:transcodeTemplate:create | Grants permission to create a transcoding template.                        | Write        | -                           | -             | -     |
| mpc:transcodeTemplate:update | Grants permission to modify a custom transcoding template.                 | Write        | -                           | -             | -     |
| mpc:transcodeTemplate:delete | Grants permission to delete a custom transcoding template.                 | Write        | -                           | -             | -     |
| mpc:transcodeTemplate:view   | Grants permission to queries one or more custom transcoding templates.     | List         | -                           | -             | -     |
| mpc:templateGroup:create     | Grants permission to create a transcoding template group.                  | Write        | -                           | -             | -     |
| mpc:templateGroup:view       | Grants permission to query one or more custom transcoding template groups. | Write        | -                           | -             | -     |

| Action                       | Description                                                        | Access Level | Resource Type (*: required) | Condition Key | Alias |
|------------------------------|--------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| mpc:templateGroup:update     | Grants permission to modify a custom transcoding template group.   | Write        | -                           | -             | -     |
| mpc:templateGroup:delete     | Grants permission to delete a custom transcoding template group.   | Write        | -                           | -             | -     |
| mpc:watermarkTemplate:create | Grants permission to Create a custom watermark template.           | Write        | -                           | -             | -     |
| mpc:watermarkTemplate:update | Grants permission to modify a watermark template.                  | Write        | -                           | -             | -     |
| mpc:watermarkTemplate:delete | Grants permission to delete a watermark template.                  | Write        | -                           | -             | -     |
| mpc:watermarkTemplate:view   | Grants permission to query one or more custom watermark templates. | List         | -                           | -             | -     |
| mpc:transcodeTask:create     | Grants permission to create a transcoding task.                    | Write        | -                           | -             | -     |

| Action                                  | Description                                               | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-----------------------------------------|-----------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| mpc:transcodeTask:delete                | Grants permission to cancel a transcoding task.           | Write        | -                           | -             | -     |
| mpc:transcodeTask:view                  | Grants permission to query one or more transcoding tasks. | Read         | -                           | -             | -     |
| mpc:transcodeTask:deleteRecord          | Grants permission to delete transcoding task records.     | Write        | -                           | -             | -     |
| mpc:transcodeTask:viewSummaryStatistics | Grants permission to query the task duration statistics.  | List         | -                           | -             | -     |
| mpc:remuxTask:create                    | Grants permission to create a packaging task.             | Write        | -                           | -             | -     |
| mpc:remuxTask:retry                     | Grants permission to retry a failed packaging task.       | Write        | -                           | -             | -     |
| mpc:remuxTask:view                      | Grants permission to query one or more packaging tasks.   | List         | -                           | -             | -     |

| Action                          | Description                                                                           | Access Level | Resource Type (*: required) | Condition Key | Alias |
|---------------------------------|---------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| mpc:remuxTask:delete            | Grants permission to cancel a packaging task.                                         | Write        | -                           | -             | -     |
| mpc:remuxTask:deleteRecord      | Grants permission to delete packaging task records.                                   | Write        | -                           | -             | -     |
| mpc:animatedGraphicsTask:create | Grants permission to create an animated GIF task.                                     | Write        | -                           | -             | -     |
| mpc:animatedGraphicsTask:view   | Grants permission to query one or more animated GIF tasks.                            | List         | -                           | -             | -     |
| mpc:animatedGraphicsTask:delete | Grants permission to cancel an animated GIF task.                                     | Write        | -                           | -             | -     |
| mpc:extractTask:create          | Grants permission to create a task to parse the metadata of a video file.             | Write        | -                           | -             | -     |
| mpc:extractTask:view            | Grants permission to query the status and results of one or more video parsing tasks. | List         | -                           | -             | -     |

| Action                    | Description                                                                   | Access Level | Resource Type (*: required) | Condition Key | Alias |
|---------------------------|-------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| mpc:extractTask:delete    | Grants permission to cancel a video parsing task.                             | Write        | -                           | -             | -     |
| mpc:thumbnailsTask:view   | Grants permission to query one or more snapshot tasks.                        | List         | -                           | -             | -     |
| mpc:thumbnailsTask:delete | Grants permission to cancel a snapshot task.                                  | Write        | -                           | -             | -     |
| mpc:notification:config   | Grants permission to configure event notifications on the transcoding server. | Write        | -                           | -             | -     |
| mpc:notification:view     | Grants permission to query the enabling statuses of subscription events.      | List         | -                           | -             | -     |
| mpc:notifyEvent:view      | Grants permission to query all subscription events of an SMN topic.           | List         | -                           | -             | -     |
| mpc:bucket:view           | Grants permission to query the list of buckets in a specified region.         | List         | -                           | -             | -     |

| Action                      | Description                                                                             | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-----------------------------|-----------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| mpc:bucket:updateAuthorized | Grants permission to authorizes MPC to access OBS buckets or cancels the authorization. | Write        | -                           | -             | -     |
| mpc:bucketObject:view       | Grants permission to queries objects in a bucket.                                       | List         | -                           | -             | -     |
| mpc:agencyTask:create       | Grants permission to enables or disables OBS Authorization.                             | Write        | -                           | -             | -     |
| mpc:agencyTask:view         | Grants permission to queries the status of creating an OBS authorization task.          | Read         | -                           | -             | -     |

Each API of MPC usually supports one or more actions. [Table 3-238](#) lists the supported actions and dependencies.

**Table 3-238** Actions and dependencies supported by MPC APIs

| API                                         | Action                       | Dependencies |
|---------------------------------------------|------------------------------|--------------|
| POST /v1/{project_id}/template/transcodings | mpc:transcodeTemplate:create | -            |
| PUT /v1/{project_id}/template/transcodings  | mpc:transcodeTemplate:update | -            |

| API                                                 | Action                       | Dependencies |
|-----------------------------------------------------|------------------------------|--------------|
| DELETE /v1/{project_id}/template/transcodings       | mpc:transcodeTemplate:delete | -            |
| GET /v1/{project_id}/template/transcodings          | mpc:transcodeTemplate:view   | -            |
| POST /v1/{project_id}/template_group/transcodings   | mpc:templateGroup:create     | -            |

## Resources

MPC does not support resource-level authorization. To allow access to MPC, use a wildcard (\*) in the Resource element of the identity policy, indicating that the identity policy will be applied to all resources.

## Conditions

MPC does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

## 3.14 Management & Governance

### 3.14.1 Identity and Access Management (IAM)

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by IAM, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by IAM, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for IAM.

**Table 3-239** Actions supported by IAM

| Action               | Description                                         | Access Level | Resource Type (*: required) | Condition Key | Alias                                                                                |
|----------------------|-----------------------------------------------------|--------------|-----------------------------|---------------|--------------------------------------------------------------------------------------|
| iam::listAccessKeys  | Grants permission to list permanent access keys.    | List         | -                           | -             | <ul style="list-style-type: none"> <li>• iam:credentials:listCredentials</li> </ul>  |
| iam::createAccessKey | Grants permission to create a permanent access key. | Write        | -                           | -             | <ul style="list-style-type: none"> <li>• iam:credentials:createCredential</li> </ul> |
| iam::getAccessKey    | Grants permission to query a permanent access key.  | Read         | -                           | -             | <ul style="list-style-type: none"> <li>• iam:credentials:getCredential</li> </ul>    |
| iam::updateAccessKey | Grants permission to update a permanent access key. | Write        | -                           | -             | <ul style="list-style-type: none"> <li>• iam:credentials:updateCredential</li> </ul> |

| Action                   | Description                                             | Access Level | Resource Type (*: required) | Condition Key | Alias                                                                              |
|--------------------------|---------------------------------------------------------|--------------|-----------------------------|---------------|------------------------------------------------------------------------------------|
| iam::deleteAccessKey     | Grants permission to delete a permanent access key.     | Write        | -                           | -             | <ul style="list-style-type: none"> <li>iam:credentials:deleteCredential</li> </ul> |
| iam:projects:list        | Grants permission to list projects.                     | List         | -                           | -             | <ul style="list-style-type: none"> <li>iam:projects:listProjects</li> </ul>        |
| iam:projects:create      | Grants permission to create a project.                  | Write        | -                           | -             | <ul style="list-style-type: none"> <li>iam:projects:createProject</li> </ul>       |
| iam:projects:listForUser | Grants permission to list projects of a specified user. | List         | -                           | -             | <ul style="list-style-type: none"> <li>iam:projects:listProjectsForUser</li> </ul> |
| iam:projects:update      | Grants permission to update a project.                  | Write        | -                           | -             | <ul style="list-style-type: none"> <li>iam:projects:updateProject</li> </ul>       |
| iam:groups:list          | Grants permission to list groups.                       | List         | -                           | -             | <ul style="list-style-type: none"> <li>iam:groups:listGroups</li> </ul>            |
| iam:groups:create        | Grants permission to create a group.                    | Write        | -                           | -             | <ul style="list-style-type: none"> <li>iam:groups:createGroup</li> </ul>           |
| iam:groups:get           | Grants permission to query a group.                     | Read         | -                           | -             | <ul style="list-style-type: none"> <li>iam:groups:getGroup</li> </ul>              |
| iam:groups:delete        | Grants permission to delete a group.                    | Write        | -                           | -             | <ul style="list-style-type: none"> <li>iam:groups:deleteGroup</li> </ul>           |

| Action                | Description                                                | Access Level | Resource Type (*: required) | Condition Key | Alias                                                                                 |
|-----------------------|------------------------------------------------------------|--------------|-----------------------------|---------------|---------------------------------------------------------------------------------------|
| iam:groups:update     | Grants permission to update a group.                       | Write        | -                           | -             | <ul style="list-style-type: none"> <li>iam:groups:updateGroup</li> </ul>              |
| iam:groups:removeUser | Grants permission to remove user from a group.             | Write        | -                           | -             | <ul style="list-style-type: none"> <li>iam:permissions:removeUserFromGroup</li> </ul> |

| iam::getAccountSummaryV5            | Grants permission to retrieve information about IAM entity usage and IAM quotas in the IAM account. | List         | -                           | -                                                                                                                                     | -     |
| iam::getAsymmetricSignatureSwitchV5 | Grants permission to query asymmetric signature switch status of security token.                    | Read         | -                           | -                                                                                                                                     | -     |
| iam::setAsymmetricSignatureSwitchV5 | Grants permission to set asymmetric signature switch status of security token.                      | Write        | -                           | -                                                                                                                                     | -     |

Each API of IAM usually supports one or more actions. [Table 3-240](#) lists the supported actions and dependencies.

**Table 3-240** Actions and dependencies supported by IAM APIs

| API                                 | Action              | Dependencies |
|-------------------------------------|---------------------|--------------|
| GET /v3.0/OS-CREDENTIAL/credentials | iam::listAccessKeys | -            |

| API                                                 | Action                    | Dependencies |
|-----------------------------------------------------|---------------------------|--------------|
| POST /v3.0/OS-CREDENTIAL/credentials                | iam::createAccessKey      | -            |
| GET /v3.0/OS-CREDENTIAL/credentials/{access_key}    | iam::getAccessKey         | -            |
| PUT /v3.0/OS-CREDENTIAL/credentials/{access_key}    | iam::updateAccessKey      | -            |
| DELETE /v3.0/OS-CREDENTIAL/credentials/{access_key} | iam::deleteAccessKey      | -            |
| GET /v3.0/OS-QUOTA/domains/{domain_id}              | iam:quotas:list           | -            |
| GET /v3.0/OS-QUOTA/projects/{project_id}            | iam:quotas:listForProject | -            |
| GET /v3/projects                                    | iam:projects:list         | -            |
| POST /v3/projects                                   | iam:projects:create       | -            |
| GET /v3/users/{user_id}/projects                    | iam:projects:listForUser  | -            |

| GET /v5/account-summary                              | iam::getAccountSummaryV5   | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-241](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for IAM.

**Table 3-241** Resource types supported by IAM

| Resource Type | URN                                              |
|---------------|--------------------------------------------------|
| agency        | iam::<account-id>:agency:<agency-name-with-path> |
| policy        | iam::<account-id>:policy:<policy-name-with-path> |
| user          | iam::<account-id>:user:<user-name>               |
| mfa           | iam::<account-id>:mfa:<mfa-name>                 |
| group         | iam::<account-id>:group:<group-name>             |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.

- Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
- Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, iam) apply only to operations of the xx service. For details, see [Table 3-242](#).
- The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [operators](#).

#### Service-specific condition keys supported by IAM

The following table lists the condition keys that you can define in identity policies for IAM. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-242** Service-specific condition keys supported by IAM

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                                                                                                 |
|--------------------------------|--------|-------------------------------|-------------------------------------------------------------------------------------------------------------|
| iam:PolicyURN                  | string | Single-valued                 | Filters access by the URN of an identity policy.                                                            |
| iam:ServicePrincipal           | string | Single-valued                 | Filters access by the service principal of the cloud service to which this service linked agency is passed. |

## 3.14.2 Organizations

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by Organizations, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by Organizations, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for Organizations.

**Table 3-243** Actions supported by Organizations

| Action                                     | Description                                                   | Access Level | Resource Type (*: required) | Condition Key                                                                                                                     | Alias |
|--------------------------------------------|---------------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------|-------|
| organizations:<br>organizations:<br>create | Grants permission to create an organization.                  | Write        | -                           | -                                                                                                                                 | -     |
| organizations:<br>organizations:<br>get    | Grants permission to show information about the organization. | Read         | -                           | -                                                                                                                                 | -     |
| organizations:<br>organizations:<br>delete | Grants permission to delete the organization.                 | Write        | -                           | -                                                                                                                                 | -     |
| organizations:<br>organizations:<br>leave  | Grants permission to leave the current organization.          | Write        | -                           | -                                                                                                                                 | -     |
| organizations:<br>roots:list               | Grants permission to list roots of the organization.          | List         | -                           | -                                                                                                                                 | -     |
| organizations:<br>ous:create               | Grants permission to create an organizational unit.           | Write        | ou                          | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     | -     |
|                                            |                                                               |              | root                        | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     |       |
|                                            |                                                               |              | -                           | <ul style="list-style-type: none"> <li><a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li><a href="#">g:TagKeys</a></li> </ul> |       |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-245](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for Organizations.

**Table 3-245** Resource types supported by Organizations

| Resource Type | URN                                                    |
|---------------|--------------------------------------------------------|
| builtinpolicy | organizations::system:policy:<policy-type>/<policy-id> |

| Resource Type | URN                                                                                       |
|---------------|-------------------------------------------------------------------------------------------|
| ou            | organizations::<management-account-id>:ou:<organization-id>/<organization-unit-id>        |
| root          | organizations::<management-account-id>:root:<organization-id>/<root-id>                   |
| organization  | organizations::<management-account-id>:organization:<organization-id>                     |
| account       | organizations::<management-account-id>:account:<organization-id>/<account-id>             |
| policy        | organizations::<management-account-id>:policy:<organization-id>/<policy-type>/<policy-id> |
| handshake     | organizations::<management-account-id>:handshake:<organization-id>/<handshake-id>         |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, organizations) apply only to operations of the xx service. For details, see [Table 3-246](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [operators](#).

### Service-specific condition keys supported by Organizations

The following table lists the condition keys that you can define in identity policies for Organizations. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-246** Service-specific condition keys supported by Organizations

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                                                          |
|--------------------------------|--------|-------------------------------|----------------------------------------------------------------------|
| organizations:ServicePrincipal | string | Single-valued                 | Filters access based on the specified name of the service principal. |

### 3.14.3 Resource Access Manager (RAM)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.

- You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
- If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
- Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by RAM, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by RAM, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for RAM.

**Table 3-247** Actions supported by RAM

| Action               | Description                                                 | Access Level | Resource Type (*: required) | Condition Key | Alias |
|----------------------|-------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| ram:permissions:list | Grants permission to list the RAM permissions.              | List         | permission *                | -             | -     |
| ram:permissions:get  | Grants permission to get the contents of an RAM permission. | Read         | permission *                | -             | -     |

| Action                    | Description                                                                                        | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                                                                                                                                                                                | Alias |
|---------------------------|----------------------------------------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| ram:resourceShares:create | Grants permission to create a resource share with provided resource(s) and/or principal(s).        | Write        | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> <li>• <a href="#">ram:RequestedResourceType</a></li> <li>• <a href="#">ram:ResourceUrn</a></li> <li>• <a href="#">ram:Principal</a></li> <li>• <a href="#">ram:TargetOrgPaths</a></li> <li>• <a href="#">ram:RequestedAllowExternalPrincipals</a></li> </ul> | -     |
| ram:resourceShares:search | Grants permission to get a set of resource shares from a provided list or with a specified status. | Read         | -                           | <a href="#">g:TagKeys</a>                                                                                                                                                                                                                                                                                                                                                                    | -     |
| ram:resourceShares:update | Grants permission to update attributes of the resource share.                                      | Write        | resourceShare *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">ram:AllowExternalPrincipals</a></li> </ul>                                                                                                                                                                                                                                     | -     |
|                           |                                                                                                    |              | -                           | <a href="#">ram:RequestedAllowExternalPrincipals</a>                                                                                                                                                                                                                                                                                                                                         |       |

| Action                          | Description                                                                              | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                   | Alias |
|---------------------------------|------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| ram:resourceShares:delete       | Grants permission to delete resource share.                                              | Write        | resourceShare *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">ram:AllowExternalPrincipals</a></li> </ul>                                                                        | -     |
| ram:resourceShares:associate    | Grants permission to associate resource(s) and/or principal(s) to a resource share.      | Write        | resourceShare *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">ram:AllowExternalPrincipals</a></li> </ul>                                                                        | -     |

| ram:resourceTypes:list                       | Grants permission to list resource type.                                                                                      | List         | -                           | -             | -     |
| ram:permission:listVersions                  | Grants permission to list all of the versions of specified RAM permission.                                                    | List         | -                           | -             | -     |

Each API of RAM usually supports one or more actions. [Table 3-248](#) lists the supported actions and dependencies.

**Table 3-248** Actions and dependencies supported by RAM APIs

| API                                 | Action                    | Dependencies |
|-------------------------------------|---------------------------|--------------|
| GET /v1/permissions                 | ram:permissions:list      | -            |
| GET /v1/permissions/{permission_id} | ram:permissions:get       | -            |
| POST /v1/resource-shares            | ram:resourceShares:create | -            |

| API                                                                  | Action                                             | Dependencies |
|----------------------------------------------------------------------|----------------------------------------------------|--------------|
| POST /v1/resource-shares/search                                      | ram:resourceShares:search                          | -            |
| PUT /v1/resource-shares/{resource_share_id}                          | ram:resourceShares:update                          | -            |
| DELETE /v1/resource-shares/{resource_share_id}                       | ram:resourceShares:delete                          | -            |
| POST /v1/resource-shares/{resource_share_id}/associate               | ram:resourceShares:associate                       | -            |
| POST /v1/resource-shares/{resource_share_id}/disassociate            | ram:resourceShares:disassociate                    | -            |
| POST /v1/resource-share-associations/search                          | ram:resourceShares:searchResourceShareAssociations | -            |
| POST /v1/resource-shares/{resource_share_id}/associate-permission    | ram:resourceShares:associatePermission             | -            |
| POST /v1/resource-shares/{resource_share_id}/disassociate-permission | ram:resourceShares:disassociatePermission          | -            |
| GET /v1/resource-shares/{resource_share_id}/associated-permissions   | ram:resourceShares:listAssociatedPermissions       | -            |
| POST /v1/resource-shares/{resource_share_id}/tags/create             | ram:resourceShares:tag                             | -            |
| POST /v1/resource-shares/{resource_share_id}/tags/delete             | ram:resourceShares:untag                           | -            |

| API                                                                       | Action                                                 | Dependencies |
|---------------------------------------------------------------------------|--------------------------------------------------------|--------------|
| GET /v1/resource-shares/tags                                              | ram:resourceShares:listTags                            | -            |
| POST /v1/resource-shares/resource-instances/filter                        | ram:resourceShares:listResourceSharesByTag             | -            |
| POST /v1/resource-shares/resource-instances/count                         | ram:resourceShares:searchResourceShareCountByTag       | -            |
| POST /v1/shared-resources/search                                          | ram:sharedResources:search                             | -            |
| POST /v1/shared-principals/search                                         | ram:sharedPrincipals:search                            | -            |
| POST /v1/resource-share-invitations/{resource_share_invitation_id}/accept | ram:resourceShareInvitations:accept                    | -            |
| POST /v1/resource-share-invitations/{resource_share_invitation_id}/reject | ram:resourceShareInvitations:reject                    | -            |
| POST /v1/resource-share-invitations/search                                | ram:resourceShareInvitations:search                    | -            |
| POST /v1/organization-share/enable                                        | ram:resourceShares:enableSharingWithOrganization       | -            |
| POST /v1/organization-share/disable                                       | ram:resourceShares:disableSharingWithOrganization      | -            |
| GET /v1/organization-share                                                | ram:resourceShares:searchEnableSharingWithOrganization | -            |
| POST /v1/shared-resources/search-distinct-resource                        | ram:sharedResources:searchDistinctResource             | -            |
| POST /v1/shared-principals/search-distinct-principal                      | ram:sharedPrincipals:searchDistinctPrincipal           | -            |
| GET /v1/resource-shares/quotas                                            | ram:resourceShares:listQuota                           | -            |

| API                                          | Action                       | Dependencies |
|----------------------------------------------|------------------------------|--------------|
| GET /v1/resource-types                       | ram:resourceTypes:list       | -            |
| GET /v1/permissions/{permission_id}/versions | ram:permissions:listVersions | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-249](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for RAM.

**Table 3-249** Resource types supported by RAM

| Resource Type           | URN                                                                      |
|-------------------------|--------------------------------------------------------------------------|
| resourceShare           | ram::<account-id>:resourceShare:<resource-share-id>                      |
| resourceShareInvitation | ram::<account-id>:resourceShareInvitation:<resource-share-invitation-id> |
| permission              | ram::system:permission:<permission-id>                                   |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, ram) apply only to operations of the xx service. For details, see [Table 3-250](#).

- The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so `g:SourceVpce` is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so `g:TagKeys` is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [operators](#).

### Service-specific condition keys supported by RAM

The following table lists the condition keys that you can define in identity policies for RAM. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-250** Service-specific condition keys supported by RAM

| Service-specific Condition Key         | Type   | Single-valued/<br>Multivalued | Description                                                            |
|----------------------------------------|--------|-------------------------------|------------------------------------------------------------------------|
| <code>ram:RequestedResourceType</code> | string | Multivalued                   | Filters access based on the specified resource type.                   |
| <code>ram:ResourceUrn</code>           | string | Multivalued                   | Filters access based on a resource with the specified URN.             |
| <code>ram:Principal</code>             | string | Multivalued                   | Filters access based on the format of the specified principal.         |
| <code>ram:TargetOrgPaths</code>        | string | Multivalued                   | Filters access based on the specified organization path of principals. |
| <code>ram:PermissionUrn</code>         | string | Single-valued                 | Filters access based on the specified Permission URN.                  |

| Service-specific Condition Key       | Type    | Single-valued/<br>Multivalued | Description                                                                                                                                                                                                                                                                                 |
|--------------------------------------|---------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ram:ShareOwnerAccountId              | string  | Single-valued                 | Filters access based on resource shares owned by a specific account. For example, you can use this condition key to specify which resource share invitations can be accepted or rejected based on the resource share owner's account ID.                                                    |
| ram:AllowExternalPrincipals          | boolean | Single-valued                 | Filters access by resource shares that allow or deny sharing with external principals. For example, specify true if the action can only be performed on resource shares that allow sharing with external principals. External principals are accounts that are outside of its Organization. |
| ram:RequestedAllowExternalPrincipals | boolean | Single-valued                 | Filters access by the specified value for 'allow_external_principals'. External principals are accounts that are outside of its Organization.                                                                                                                                               |

### 3.14.4 IAM Identity Center

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational

unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by IdentityCenter, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by IdentityCenter, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for IdentityCenter.

**Table 3-251** Actions supported by IdentityCenter

| Action                             | Description                                     | Access Level | Resource Type (*: required) | Condition Key | Alias |
|------------------------------------|-------------------------------------------------|--------------|-----------------------------|---------------|-------|
| IdentityCenter:user:create         | Grants permission to create a user.             | Write        | -                           | -             | -     |
| IdentityCenter:user:list           | Grants permission to query the user list.       | Read         | -                           | -             | -     |
| IdentityCenter:user:describe       | Grants permission to query user details.        | Read         | -                           | -             | -     |
| IdentityCenter:user:describe Users | Grants permission to batch obtain user details. | Read         | -                           | -             | -     |
| IdentityCenter:user:update         | Grants permission to update a user.             | Write        | -                           | -             | -     |
| IdentityCenter:user:delete         | Grants permission to delete a user.             | Write        | -                           | -             | -     |
| IdentityCenter:user:getUserId      | Grants permission to obtain the user ID.        | Read         | -                           | -             | -     |
| IdentityCenter:user:enableUser     | Grants permission to enable a user.             | Write        | -                           | -             | -     |
| IdentityCenter:user:disableUser    | Grants permission to disable a user.            | Write        | -                           | -             | -     |
| IdentityCenter:group:create        | Grants permission to create a group.            | Write        | -                           | -             | -     |

| Action                                       | Description                                                    | Access Level | Resource Type (*: required) | Condition Key | Alias |
|----------------------------------------------|----------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| IdentityCenter:group:list                    | Grants permission to query the group list.                     | Read         | -                           | -             | -     |
| IdentityCenter:group:describe                | Grants permission to query group details.                      | Read         | -                           | -             | -     |
| IdentityCenter:group:describeGroups          | Grants permission to batch obtain group details.               | Read         | -                           | -             | -     |
| IdentityCenter:group:update                  | Grants permission to update a group.                           | Write        | -                           | -             | -     |
| IdentityCenter:group:delete                  | Grants permission to delete a group.                           | Write        | -                           | -             | -     |
| IdentityCenter:group:getGroupID              | Grants permission to obtain the group ID.                      | Read         | -                           | -             | -     |
| IdentityCenter:groupMembership:create        | Grants permission to add a member to a group.                  | Write        | -                           | -             | -     |
| IdentityCenter:groupMemberships:list         | Grants permission to query all members in a group.             | Read         | -                           | -             | -     |
| IdentityCenter:groupMembership:listForMember | Grants permission to query all groups that a user is added to. | Read         | -                           | -             | -     |

| Action                                              | Description                                                                                      | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| IdentityCenter:groupMembership:describe             | Grants permission to query the group membership.                                                 | Read         | -                           | -             | -     |
| IdentityCenter:groupMembership:delete               | Grants permission to disassociate users and groups.                                              | Write        | -                           | -             | -     |
| IdentityCenter:groupMembership:getGroupMembershipId | Grants permission to query the membership ID.                                                    | Read         | -                           | -             | -     |
| IdentityCenter:groupMembership:isMembershipInGroup  | Grants permission to query whether a user is in a group.                                         | Read         | -                           | -             | -     |
| IdentityCenter:externalIdp:create                   | Grants permission to create an external identity provider.                                       | Write        | -                           | -             | -     |
| IdentityCenter:externalIdp:list                     | Grants permission to obtain the identity source configuration of the external identity provider. | Read         | -                           | -             | -     |

| Action                                       | Description                                                                                | Access Level | Resource Type (*: required) | Condition Key | Alias |
|----------------------------------------------|--------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| IdentityCenter:externaldp:enable             | Grants permission to enable an external identity provider.                                 | Write        | -                           | -             | -     |
| IdentityCenter:externaldp:disable            | Grants permission to disable an external identity provider.                                | Write        | -                           | -             | -     |
| IdentityCenter:externaldp:getSpConfiguration | Grants permission to obtain the configuration of the IAM Identity Center service provider. | Read         | -                           | -             | -     |
| IdentityCenter:externaldp:update             | Grants permission to update the configuration of the external identity provider.           | Write        | -                           | -             | -     |
| IdentityCenter:externaldp:delete             | Grants permission to delete the configuration of the external identity provider.           | Write        | -                           | -             | -     |
| IdentityCenter:externaldp:importCertificate  | Grants permission to import a certificate.                                                 | Write        | -                           | -             | -     |

| Action                                              | Description                                       | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-----------------------------------------------------|---------------------------------------------------|--------------|-----------------------------|---------------|-------|
| IdentityCenter:externalldp:deleteCertificate        | Grants permission to delete a certificate.        | Write        | -                           | -             | -     |
| IdentityCenter:externalldp:listCertificates         | Grants permission to obtain the certificate list. | Read         | -                           | -             | -     |
| IdentityCenter:externalldp:createProvisioningTenant | Grants permission to create a tenant.             | Write        | -                           | -             | -     |
| IdentityCenter:externalldp:listProvisioningTenant   | Grants permission to query the tenant list.       | Read         | -                           | -             | -     |
| IdentityCenter:externalldp:deleteProvisioningTenant | Grants permission to delete a tenant.             | Write        | -                           | -             | -     |
| IdentityCenter:externalldp:createBearerToken        | Grants permission to create a bearer token.       | Write        | -                           | -             | -     |
| IdentityCenter:externalldp:listBearerTokens         | Grants permission to query the bearer token list. | Read         | -                           | -             | -     |
| IdentityCenter:externalldp:deleteBearerToken        | Grants permission to delete a bearer token.       | Write        | -                           | -             | -     |

| Action                                       | Description                                                                                                                     | Access Level | Resource Type (*: required) | Condition Key | Alias |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| IdentityCenter:user:updatePassword           | Grants permission to update a password by sending a password reset link via email or generating a one-time password for a user. | Write        | -                           | -             | -     |
| IdentityCenter:user:deleteUserMfaDevice      | Grants permission to delete an MFA device for a specified user.                                                                 | Write        | -                           | -             | -     |
| IdentityCenter:user:updateMfaDevice          | Grants permission to update MFA device information.                                                                             | Write        | -                           | -             | -     |
| IdentityCenter:user:listMfaDevice            | Grants permission to query the MFA device list.                                                                                 | Read         | -                           | -             | -     |
| IdentityCenter:user:registerVirtualMfaDevice | Grants permission to begin the creation process of a virtual MFA device.                                                        | Write        | -                           | -             | -     |
| IdentityCenter:user:verifyEmail              | Grants permission to verify an email address of a user.                                                                         | Write        | -                           | -             | -     |

| Action                                             | Description                                                   | Access Level | Resource Type (*: required) | Condition Key | Alias |
|----------------------------------------------------|---------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| IdentityCenter:user:batchDeleteSession             | Grants permission to delete user sessions in batches.         | Write        | -                           | -             | -     |
| IdentityCenter:user:listSessions                   | Grants permission to query the user session list.             | List         | -                           | -             | -     |
| IdentityCenter:serviceProvider:activateCertificate | Grants permission to activate identity provider certificates. | Write        | -                           | -             | -     |
| IdentityCenter:serviceProvider:deleteCertificate   | Grants permission to delete identity provider certificates.   | Write        | -                           | -             | -     |
| IdentityCenter:serviceProvider:createCertificate   | Grants permission to create identity provider certificates.   | Write        | -                           | -             | -     |
| IdentityCenter:serviceProvider:listCertificates    | Grants permission to obtain identity provider certificates.   | List         | -                           | -             | -     |
| IdentityCenter:permissionSet:create                | Grants permission to create a permission set.                 | Write        | instance *                  | -             | -     |

| IdentityCenter:application:listProfiles                                         | Grants permission to check whether an application instance is associated with a user or user group. | List         | -                           | -             | -     |
| IdentityCenter:application:updateApplicationInstanceActiveCertificate           | Grants permission to set a certificate as the active one for this application instance.             | Write        | -                           | -             | -     |
| IdentityCenter:application:updateApplicationInstanceDisplayData                 | Grants permission to update the display details of an application instance.                         | Write        | -                           | -             | -     |
| IdentityCenter:application:updateApplicationInstanceResponseConfiguration       | Grants permission to update federation response configuration for the application instance.         | Write        | -                           | -             | -     |
| IdentityCenter:application:updateApplicationInstanceResponseSchemaConfiguration | Grants permission to update federation response schema configuration for the application instance.  | Write        | -                           | -             | -     |

| Action                                                                           | Description                                                                                      | Access Level | Resource Type (*: required) | Condition Key | Alias |
|----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| IdentityCenter:application:updateApplicationInstanceSecurityConfiguration        | Grants permission to update the security configurations of an application instance.              | Write        | -                           | -             | -     |
| IdentityCenter:application:updateApplicationInstanceServiceProviderConfiguration | Grants permission to update service provider related configuration for the application instance. | Write        | -                           | -             | -     |
| IdentityCenter:application:updateApplicationInstanceStatus                       | Grants permission to update the status of an application instance.                               | Write        | -                           | -             | -     |
| IdentityCenter:applicationProvider:describeApplicationProvider                   | Grants permission to describe an application provider.                                           | Read         | application Provider *      | -             | -     |
| IdentityCenter:applicationProvider:listApplicationProviders                      | Grants permission to list application providers.                                                 | List         | application Provider        | -             | -     |
| IdentityCenter:applicationAssignment:create                                      | Grants permission to create an application assignment.                                           | Write        | application *               | -             | -     |

| Action                                                 | Description                                                       | Access Level | Resource Type (*: required) | Condition Key | Alias |
|--------------------------------------------------------|-------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| IdentityCenter:applicationAssignment:delete            | Grants permission to delete an application assignment.            | Write        | application *               | -             | -     |
| IdentityCenter:applicationAssignment:list              | Grants permission to list application assignments.                | List         | application *               | -             | -     |
| IdentityCenter:applicationAssignmentsForPrincipal:list | Grants permission to list applications assigned to user or group. | List         | instance *                  | -             | -     |

Each API of IdentityCenter usually supports one or more actions. [Table 3-252](#) lists the supported actions and dependencies.

**Table 3-252** Actions and dependencies supported by IdentityCenter APIs

| API                                                            | Action                             | Dependencies                               |
|----------------------------------------------------------------|------------------------------------|--------------------------------------------|
| POST /v1/identity-stores/{identity_store_id}/users             | IdentityCenter:user:create         | organizations:delegatedAdministrators:list |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-253](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all

resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for IdentityCenter.

**Table 3-253** Resource types supported by IdentityCenter

| Resource Type       | URN                                                                                         |
|---------------------|---------------------------------------------------------------------------------------------|
| application         | IdentityCenter::<management-account-id>:application:<instance-id>/<application-instance-id> |
| account             | IdentityCenter::<management-account-id>:account:<account-id>                                |

## Conditions

IdentityCenter does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.14.5 Resource Management Service (RMS)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).

- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by Config, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by Config, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for Config.

**Table 3-254** Actions supported by Config

| Action                                  | Description                                                                         | Access Level | Resource Type (*: required)    | Condition Key | Alias |
|-----------------------------------------|-------------------------------------------------------------------------------------|--------------|--------------------------------|---------------|-------|
| rms:organizationConformancePacks:create | Grants permission to create organization conformancePack.                           | Write        | -                              | -             | -     |
| rms:organizationConformancePacks:get    | Grants permission to return the details of a specific organization conformancePack. | Read         | organizationConformancePacks * | -             | -     |
| rms:organizationConformancePacks:delete | Grants permission to delete organization conformancePack.                           | Write        | organizationConformancePacks * | -             | -     |
| rms:organizationConformancePacks:update | Grants permission to update organization conformancePack.                           | Write        | organizationConformancePacks * | -             | -     |
| rms:organizationConformancePacks:list   | Grants permission to return a list of organization conformancePack.                 | List         | -                              | -             | -     |
| rms:conformancePacks:create             | Grants permission to create conformancePack.                                        | Write        | -                              | -             | -     |

| Action                      | Description                                                            | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-----------------------------|------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| rms:conformancePacks:get    | Grants permission to return the details of a specific conformancePack. | Read         | conformancePacks *          | -             | -     |
| rms:conformancePacks:delete | Grants permission to delete conformancePack.                           | Write        | conformancePacks *          | -             | -     |
| rms:conformancePacks:update | Grants permission to update conformancePack.                           | Write        | conformancePacks *          | -             | -     |
| rms:conformancePacks:list   | Grants permission to return a list of conformancePacks.                | List         | -                           | -             | -     |
| rms:storedQueries:create    | Grants permission to save a new query.                                 | Write        | -                           | -             | -     |
| rms:storedQueries:update    | Grants permission to update an existing saved query.                   | Write        | storedQueries *             | -             | -     |
| rms:storedQueries:delete    | Grants permission to delete the stored query.                          | Write        | storedQueries *             | -             | -     |
| rms:storedQueries:get       | Grants permission to return the details of a specific stored query.    | Read         | storedQueries *             | -             | -     |

| Action                                | Description                                                                               | Access Level | Resource Type (*: required) | Condition Key                                                                                                                         | Alias |
|---------------------------------------|-------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|-------|
| rms:storedQueries:list                | Grants permission to list the stored queries.                                             | List         | -                           | -                                                                                                                                     | -     |
| rms:policyAssignments:create          | Grants permission to create a policy assignments.                                         | Write        | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:TagKeys</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> </ul> | -     |
| rms:policyAssignments:update          | Grants permission to update a policy assignments.                                         | Write        | policy Assignments *        | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                         | -     |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-256](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for Config.

**Table 3-256** Resource types supported by Config

| Resource Type                 | URN                                                                                                    |
|-------------------------------|--------------------------------------------------------------------------------------------------------|
| policyAssignments             | rms::<account-id>:policyAssignments:<policy-assignment-id>                                             |
| aggregationAuthorizations     | rms::<account-id>:aggregationAuthorizations:<authorized-account-id>                                    |
| policyAssignmentsRemediation  | rms::<account-id>:policyAssignmentsRemediation:<policy-assignment-id>                                  |
| aggregators                   | rms::<account-id>:aggregators:<aggregator-id>                                                          |
| organizationConformancePacks  | rms::<account-id>:organizationConformancePacks:<organization-id>/<organization-conformance-pack-id>    |
| conformancePacks              | rms::<account-id>:conformancePacks:<conformance-pack-id>                                               |
| storedQueries                 | rms::<account-id>:storedQueries:<query-id>                                                             |
| organizationPolicyAssignments | rms::<account-id>:organizationPolicyAssignments:<organization-id>/<organization-policy-assignments-id> |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains **condition keys** and **operators**.

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, config) apply only to operations of the xx service. For details, see [Table 3-257](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.

- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [operators](#).

### Service-specific condition keys supported by Config

The following table lists the condition keys that you can define in identity policies for Config. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-257** Service-specific condition keys supported by Config

| Service-specific Condition Key               | Type   | Single-valued/<br>Multivalued | Description                                                                                            |
|----------------------------------------------|--------|-------------------------------|--------------------------------------------------------------------------------------------------------|
| <a href="#">rms:AuthorizedAccountOrgPath</a> | string | Single-valued                 | Filters access based on the Organizations Path of the specified resource aggregate authorized account. |
| <a href="#">rms:TrackerBucketName</a>        | string | Single-valued                 | Filters access based on the specified dump target bucket name.                                         |
| <a href="#">rms:TrackerBucketPathPrefix</a>  | string | Single-valued                 | Filters access based on the specified dump target bucket prefix.                                       |

### Examples of Condition Keys

- `rms:AuthorizedAccountOrgPath`

For example, preventing aggregation authorization to accounts outside the current organization.

```
{
  "Version": "5.0",
  "Statement": [
    {
      "Effect": "Deny",
      "Action": [
        "rms:aggregationAuthorizations:create"
      ],
      "Resource": [
        "*"
      ],
      "Condition": {
        "StringNotMatch": {
          "rms:AuthorizedAccountOrgPath": [
            "organization_id/root_id/ou_id" [Note: Enter organization path ID.]
          ]
        }
      }
    }
  ]
}
```

- rms:TrackerBucketName

For example, trackerConfig is not allowed to deliver data to unexpected OBS buckets.

```
{
  "Version": "5.0",
  "Statement": [
    {
      "Effect": "Deny",
      "Action": [
        "rms:trackerConfig:put"
      ],
      "Resource": [
        "*"
      ],
      "Condition": {
        "StringNotMatch": {
          "rms:TrackerBucketName": [
            "BucketName"
          ]
        }
      }
    }
  ]
}
```

- rms:TrackerBucketPathPrefix

For example, trackerConfig is not allowed to deliver data to unexpected OBS Path.

```
{
  "Version": "5.0",
  "Statement": [
    {
      "Effect": "Deny",
      "Action": [
        "rms:trackerConfig:put"
      ],
      "Resource": [
        "*"
      ],
      "Condition": {
        "StringNotMatch": {
          "rms:TrackerBucketPathPrefix": [
            "BucketFolder"
          ]
        }
      }
    }
  ]
}
```

### 3.14.6 Tag Management Service (TMS)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are

available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by TMS, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by TMS, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for TMS.

**Table 3-258** Actions supported by TMS

| Action                   | Description                                  | Access Level | Resource Type (*: required) | Condition Key | Alias |
|--------------------------|----------------------------------------------|--------------|-----------------------------|---------------|-------|
| tms:predefineTags:create | Grants permission to create predefined tags. | Write        | -                           | -             | -     |
| tms:predefineTags:update | Grants permission to update predefined tags. | Write        | -                           | -             | -     |
| tms:predefineTags:delete | Grants permission to delete predefined tags. | Write        | -                           | -             | -     |

Each API of TMS usually supports one or more actions. [Table 3-259](#) lists the supported actions and dependencies.

**Table 3-259** Actions and dependencies supported by TMS APIs

| API                                 | Action                   | Dependencies |
|-------------------------------------|--------------------------|--------------|
| POST /v1.0/predefine_tags/action    | tms:predefineTags:create | -            |
| PUT /v1.0/predefine_tags            | tms:predefineTags:update | -            |
| POST 01 /v1.0/predefine_tags/action | tms:predefineTags:delete | -            |

## Resources

TMS does not support resource-level authorization. To allow access to TMS, use a wildcard (\*) in the Resource element of the identity policy, indicating that the identity policy will be applied to all resources.

## Conditions

TMS does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.14.7 Enterprise Project Management Service (EPS)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by EPS, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.

- If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
- If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
- If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by EPS, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for EPS.

**Table 3-260** Actions supported by EPS

| Action                         | Description                                            | Access Level | Resource Type (*: required) | Condition Key | Alias |
|--------------------------------|--------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| eps:enterpriseProjects:list    | Grants permission to view the enterprise project list. | List         | enterpriseProject*          | -             | -     |
| eps:enterpriseProjects:create  | Grants permission to create an enterprise project.     | Write        | enterpriseProject*          | -             | -     |
| eps:enterpriseProjects:update  | Grants permission to modify an enterprise project.     | Write        | enterpriseProject*          | -             | -     |
| eps:enterpriseProjects:enable  | Grants permission to enable an enterprise project.     | Write        | enterpriseProject*          | -             | -     |
| eps:enterpriseProjects:disable | Grants permission to disable an enterprise project.    | Write        | enterpriseProject*          | -             | -     |

| Action                        | Description                                                   | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-------------------------------|---------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| eps:enterpriseProjects:delete | Grants permission to delete an enterprise project.            | Write        | enterpriseProject*          | -             | -     |
| eps:resources:list            | Grants permission to view resources in an enterprise project. | List         | enterpriseProject*          | -             | -     |
| eps:resources:add             | Grants permission to add resources to an enterprise project.  | Write        | enterpriseProject*          | -             | -     |

Each API of EPS usually supports one or more actions. [Table 3-261](#) lists the supported actions and dependencies.

**Table 3-261** Actions and dependencies supported by EPS APIs

| API                                                           | Action                        | Dependencies |
|---------------------------------------------------------------|-------------------------------|--------------|
| GET /v1.0/enterprise-projects                                 | eps:enterpriseProjects:list   | -            |
| POST /v1.0/enterprise-projects                                | eps:enterpriseProjects:create | -            |
| PUT /v1.0/enterprise-projects/{enterprise_project_id}         | eps:enterpriseProjects:update | -            |
| POST /v1.0/enterprise-projects/{enterprise_project_id}/action | eps:enterpriseProjects:enable | -            |

| API                                                                      | Action                         | Dependencies         |
|--------------------------------------------------------------------------|--------------------------------|----------------------|
| POST /v1.0/enterprise-projects/{enterprise_project_id}/action            | eps:enterpriseProjects:disable | -                    |
| DELETE /v1.0/enterprise-projects/{enterprise_project_id}                 | eps:enterpriseProjects:delete  | -                    |
| POST /v1.0/enterprise-projects/{enterprise_project_id}/resources/filter  | eps:resources:list             | -                    |
| POST /v1.0/enterprise-projects/{enterprise_project_id}/resources-migrate | eps:resources:add              | eps:resources:remove |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-262](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for EPS.

**Table 3-262** Resource types supported by EPS

| Resource Type     | URN                                                         |
|-------------------|-------------------------------------------------------------|
| enterpriseProject | eps::<account-id>:enterpriseProject:<enterprise-project-id> |

## Conditions

EPS does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

## 3.14.8 Cloud Eye

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

### Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by Cloud Eye, see [Resources](#).

- **Condition Key** contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.

- If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by Cloud Eye, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for identity policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for Cloud Eye.

**Table 3-263** Actions supported by Cloud Eye

| Action                | Description                                           | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                   | Alias                  |
|-----------------------|-------------------------------------------------------|--------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|
| ces:alarms:create     | Grants permission to create an alarm rule.            | Write        | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> <li>• <a href="#">ces:namespace</a></li> </ul> | -                      |
| ces:alarms:list       | Grants permission to list alarm rules.                | List         | -                           | <a href="#">g:EnterpriseProjectId</a>                                                                                                                                                                                           | -                      |
| ces:alarms:put        | Grants permission to update an alarm rule.            | Write        | alarm *                     | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul>                                                                              | • ces:alarms:onoff:put |
|                       |                                                       |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul>                                                                                           |                        |
| ces:alarms:put Action | Grants permission to enable or disable an alarm rule. | Write        | alarm *                     | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul>                                                                              | • ces:alarms:put       |

| Action                        | Description                                                                         | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                  | Alias                                                                         |
|-------------------------------|-------------------------------------------------------------------------------------|--------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| ces:alarms:get                | Grants permission to query an alarm rule.                                           | Read         | alarm *                     | <a href="#">g:EnterpriseProjectId</a>                                                                                                          | <ul style="list-style-type: none"> <li>ces:alarms:list</li> </ul>             |
| ces:alarms:delete             | Grants permission to delete an alarm rule.                                          | Write        | alarm *                     | <ul style="list-style-type: none"> <li><a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li><a href="#">g:EnterpriseProjectId</a></li> </ul> | -                                                                             |
| ces:alarms:getInstanceStatus  | Grants permission to query the instance alarm status.                               | Read         | alarm *                     | <a href="#">g:EnterpriseProjectId</a>                                                                                                          | <ul style="list-style-type: none"> <li>ces:alarmInstanceStatus:get</li> </ul> |
| ces:alarms:getClassInfo       | Grants permission to query the number of alarm rules of different types.            | Read         | alarm *                     | <ul style="list-style-type: none"> <li><a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li><a href="#">g:EnterpriseProjectId</a></li> </ul> | <ul style="list-style-type: none"> <li>ces:alarmClassInfo:get</li> </ul>      |
| ces:alarms:listNamespaces     | Grants permission to list alarm namespaces.                                         | List         | -                           | <a href="#">g:EnterpriseProjectId</a>                                                                                                          | <ul style="list-style-type: none"> <li>ces:alarmNamespaces:list</li> </ul>    |
| ces:alarms:listOneClickAlarms | Grants permission to list services and resources that support one-click monitoring. | List         | -                           | <a href="#">g:EnterpriseProjectId</a>                                                                                                          | <ul style="list-style-type: none"> <li>ces:oneClickAlarms:list</li> </ul>     |
| ces:alarms:putOneClickAlarms  | Grants permission to batch enable or disable one-click monitoring.                  | Write        | -                           | <a href="#">g:EnterpriseProjectId</a>                                                                                                          | <ul style="list-style-type: none"> <li>ces:oneClickAlarms:put</li> </ul>      |

| ces:netDetection:createDetectCase  | Grants permission to add a tenant detection case.                        | Write        | -                           | -             | -     |
| ces:netDetection:listDetectCases   | Grants permission to query a tenant detection case.                      | List         | -                           | -             | -     |
| ces:netDetection:updateDetectCase  | Grants permission to update a tenant detection case.                     | Write        | -                           | -             | -     |

| Action                                   | Description                                                    | Access Level | Resource Type (*: required) | Condition Key | Alias |
|------------------------------------------|----------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| ces:netDetection:deleteDetectCase        | Grants permission to delete a tenant detection case.           | Write        | -                           | -             | -     |
| ces:netDetection:listDetectCaseReports   | Grants permission to query a tenant detection case report.     | List         | -                           | -             | -     |
| ces:netDetection:listAndCreateUploadCode | Grants permission to query and create an upload code.          | List         | -                           | -             | -     |
| ces:smartReportTask:create               | Grants permission to create an intelligent reporting task.     | Write        | -                           | -             | -     |
| ces:smartReportTask:list                 | Grants permission to query an intelligent reporting task.      | List         | -                           | -             | -     |
| ces:smartReportTask:update               | Grants permission to update an intelligent reporting task.     | Write        | -                           | -             | -     |
| ces:smartReportTask:delete               | Grants permission to batch delete intelligent reporting tasks. | Write        | -                           | -             | -     |

| Action                                    | Description                                                                           | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-------------------------------------------|---------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| ces:smartReportTask:changeStatus          | Grants permission to batch enable or disable intelligent reporting tasks.             | Write        | -                           | -             | -     |
| ces:smartReportTask:listExecuteHistory    | Grants permission to query execution records of an intelligent reporting task.        | List         | -                           | -             | -     |
| ces:smartReportTask:downloadReportJob     | Grants permission to download an intelligent report.                                  | Read         | -                           | -             | -     |
| ces:smartReportTask:listSupportedServices | Grants permission to query cloud products supported by an intelligent reporting task. | List         | -                           | -             | -     |
| ces:smartReportJob:listResources          | Grants permission to list resources of an intelligent reporting task.                 | List         | -                           | -             | -     |
| ces:smartReportJob:show                   | Grants permission to query details about an intelligent reporting task.               | Read         | -                           | -             | -     |

Each API of Cloud Eye usually supports one or more actions. en-us\_topic\_0000001604910018.xml#EN-US\_TOPIC\_0000001604910018/EN-US\_TOPIC\_0000001604910018\_mMcCpPsS\_api\_relation\_table lists the supported actions and dependencies.

**Table 3-264** Actions and dependencies supported by Cloud Eye APIs

| API                                                            | Action                           | Dependencies |
|----------------------------------------------------------------|----------------------------------|--------------|
| POST /v2/{project_id}/alarms                                   | ces:alarms:create                | -            |
| POST /v2/{project_id}/alarms/batch-delete                      | ces:alarms:delete                | -            |
| POST /v2/{project_id}/alarms/action                            | ces:alarms:putAction             | -            |
| GET /v2/{project_id}/alarms                                    | ces:alarms:list                  | -            |
| POST /v2/{project_id}/alarms/{alarm_id}/resources/batch-create | ces:alarms:addResources          | -            |
| POST /v2/{project_id}/alarms/{alarm_id}/resources/batch-delete | ces:alarms:deleteResources       | -            |
| GET /v2/{project_id}/alarms/{alarm_id}/resources               | ces:alarms:getResources          | -            |
| PUT /v2/{project_id}/alarms/{alarm_id}/policies                | ces:alarms:updatePolicies        | -            |
| GET /v2/{project_id}/alarms/{alarm_id}/policies                | ces:alarms:getPolicies           | -            |
| PUT /v2/{project_id}/alarms/{alarm_id}/notifications           | ces:alarms:putAlarmNotifications | -            |

| API                                                                   | Action                                        | Dependencies |
|-----------------------------------------------------------------------|-----------------------------------------------|--------------|

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [3](#), a resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to the resource. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for Cloud Eye.

**Table 3-265** Resource types supported by Cloud Eye

| Resource Type | URN                                                |
|---------------|----------------------------------------------------|
| alarm         | ces:<region>:<account-id>:alarm:<alarm-id>         |
| dashboard     | ces:<region>:<account-id>:dashboard:<dashboard-id> |

## Conditions

### About condition keys

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. It uses global condition keys applicable to all services but excludes **g:RequestedRegion**. For details, see [Global Condition Keys](#).

#### NOTE

Cloud Eye provides global capabilities (such as **Alarm Notifications** and **Task Center**). As a result, it functions as a global-level service and does not support the global condition key **g:RequestedRegion**.

- Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, ces:) apply only to operations of EVS. For details, see [Table 3-266](#).

- The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so `g:SourceVpce` is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so `g:TagKeys` is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [Condition operators](#).

### Service-specific condition keys supported by Cloud Eye

The following table lists the condition keys that you can define in custom identity policies for Cloud Eye. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-266** Service-specific condition keys supported by Cloud Eye

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                                                                                                                                                 |
|--------------------------------|--------|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ces:namespace</code>     | string | Multi-value                   | Filters access requests based on the namespace specified in the request parameter. For details, see <a href="#">Granting Permissions by Cloud Service</a> . |

## 3.14.9 Simple Message Notification (SMN)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by SMN, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by SMN, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for SMN.

**Table 3-267** Actions supported by SMN

| Action                | Description                                | Access Level | Resource Type (*: Mandatory) | Condition Key                                                                                                                                                                          | Alias                                                                |
|-----------------------|--------------------------------------------|--------------|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
| smn:topic:create      | Grants permissions to create a topic.      | Write        | topic *                      | N/A                                                                                                                                                                                    | N/A                                                                  |
|                       |                                            |              | N/A                          | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul> |                                                                      |
| smn:topic:listTopic   | Grants permissions to query topics.        | List         | topic *                      | N/A                                                                                                                                                                                    | <ul style="list-style-type: none"> <li>• smn:topic:list</li> </ul>   |
|                       |                                            |              | N/A                          | <a href="#">g:EnterpriseProjectId</a>                                                                                                                                                  |                                                                      |
| smn:topic:updateTopic | Grants permissions to update a topic.      | Write        | topic *                      | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                     | <ul style="list-style-type: none"> <li>• smn:topic:update</li> </ul> |
| smn:topic:get         | Grants permissions to query topic details. | Read         | topic *                      | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                     | <ul style="list-style-type: none"> <li>• smn:topic:list</li> </ul>   |
| smn:topic:delete      | Grants permissions to delete a topic.      | Write        | topic *                      | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                     | N/A                                                                  |

| Action                    | Description                                          | Access Level | Resource Type (*: Mandatory) | Condition Key                                                                                                                                                                   | Alias                                                                |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-269](#), a resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to the resource. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for SMN.

**Table 3-269** Resource types supported by SMN

| Resource Type     | URN                                                        |
|-------------------|------------------------------------------------------------|
| application       | smn::<account-id>:application:<application-id>             |
| topic             | smn:<region>:<account-id>:topic:<topic-id>                 |
| subscription_user | smn::<account-id>:subscription_user:<subscription-user-id> |
| template          | smn:<region>:<account-id>:template:<template-id>           |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, smn:) only apply to operations of the SMN service. For details, see [Table 3-270](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [Condition operators](#).

#### Service-specific condition keys supported by SMN

The following table lists the condition keys that you can define in custom identity policies for SMN. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-270** Service-specific condition keys supported by SMN

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                                         |
|--------------------------------|--------|-------------------------------|-----------------------------------------------------|
| smn:TargetOrgPath              | string | Single-valued                 | The organization path authorized in a topic policy. |
| smn:TargetOrgId                | string | Single-valued                 | The organization ID authorized in a topic policy.   |
| smn:TargetAccountId            | string | Single-valued                 | The account ID authorized in a topic policy.        |
| smn:Protocol                   | string | Single-valued                 | The subscription protocol.                          |
| smn:Endpoint                   | string | Single-valued                 | The subscription endpoint address.                  |

### 3.14.10 Log Tank Service (LTS)

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

#### Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by LTS, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by LTS, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for LTS.

**Table 3-271** Actions supported by LTS

| Action                        | Description                               | Access Level | Resource Type (*: required) | Condition Key                                                                                                                         | Alias                                                                                         |
|-------------------------------|-------------------------------------------|--------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| lts:logGroup:deleteLogGroup   | Grants permission to delete log group.    | Write        | logGroup *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                         | <ul style="list-style-type: none"> <li>• lts:groups:delete</li> </ul>                         |
| lts:logGroup:listLogGroup     | Grants permission to get log group list.  | List         | -                           | -                                                                                                                                     | <ul style="list-style-type: none"> <li>• lts:groups:get</li> <li>• lts:groups:list</li> </ul> |
| lts:logGroup:createLogGroup   | Grants permission to create log group.    | Write        | logGroup *                  | -                                                                                                                                     | <ul style="list-style-type: none"> <li>• lts:groups:create</li> </ul>                         |
|                               |                                           |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul> |                                                                                               |
| lts:logGroup:updateLogGroup   | Grants permission to update log group.    | Write        | logGroup *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                         | <ul style="list-style-type: none"> <li>• lts:groups:put</li> </ul>                            |
|                               |                                           |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul> |                                                                                               |
| lts:logStream:listLogStream   | Grants permission to get log stream list. | List         | logGroup *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                         | <ul style="list-style-type: none"> <li>• lts:topics:get</li> <li>• lts:topics:list</li> </ul> |
| lts:logStream:deleteLogStream | Grants permission to delete log stream.   | Write        | logStream *                 | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                         | <ul style="list-style-type: none"> <li>• lts:topics:delete</li> </ul>                         |

| Action                           | Description                                 | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                    | Alias                                                                                                            |
|----------------------------------|---------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| lts:logStream:createLogStream    | Grants permission to create log stream.     | Write        | logGroup *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                                                                    | <ul style="list-style-type: none"> <li>lts:topics:create</li> </ul>                                              |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-273](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for LTS.

**Table 3-273** Resource types supported by LTS

| Resource Type | URN                                                        |
|---------------|------------------------------------------------------------|
| logStream     | lts:<region>:<account-id>:logStream:<group_id>/<stream_id> |
| logGroup      | lts:<region>:<account-id>:logGroup:<group_id>              |

| Resource Type | URN                                                 |
|---------------|-----------------------------------------------------|
| dashboard     | lts:<region>:<account-id>:dashboard:<dashboard_id>  |

## Conditions

LTS does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.14.11 Actions Supported by Identity Policy-based Authorization

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.

- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by cts, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by cts, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for cts.

**Table 3-274** Actions supported by cts

| Action             | Description                           | Access Level | Resource Type (*: required) | Condition Key | Alias |
|--------------------|---------------------------------------|--------------|-----------------------------|---------------|-------|
| cts:trace:list     | Grants permission to query cts trace. | List         | -                           | -             | -     |
| cts:tracker:create | Grants permission to create tracker.  | Write        | -                           | -             | -     |
| cts:tracker:list   | Grants permission to list trackers.   | List         | -                           | -             | -     |

| Action                  | Description                                               | Access Level | Resource Type (*: required) | Condition Key                                                                                                                         | Alias |
|-------------------------|-----------------------------------------------------------|--------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|-------|
| cts:tracker:update      | Grants permission to update tracker.                      | Write        | tracker                     | -                                                                                                                                     | -     |
| cts:tracker:delete      | Grants permission to delete an tracker.                   | Write        | tracker                     | -                                                                                                                                     | -     |
| cts:quota:get           | Grants permission to query the tracker quota of a tenant. | Read         | -                           | -                                                                                                                                     | -     |
| cts:notification:create | Grants permission to create notification.                 | Write        | -                           | -                                                                                                                                     | -     |
| cts:notification:update | Grants permission to update notification.                 | Write        | notification                | -                                                                                                                                     | -     |
| cts:notification:list   | Grants permission to list notifications.                  | List         | -                           | -                                                                                                                                     | -     |
| cts:notification:delete | Grants permission to delete the notification.             | Write        | notification                | -                                                                                                                                     | -     |
| cts:tag:create          | Grants permission to create the resource tags.            | Tagging      | tracker                     | -                                                                                                                                     | -     |
|                         |                                                           |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:TagKeys</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> </ul> |       |
| cts:tag:delete          | Grants permission to delete the tracker tags.             | Tagging      | tracker                     | -                                                                                                                                     | -     |

| Action                         | Description                                              | Access Level | Resource Type (*: required) | Condition Key                                                                                                                         | Alias |
|--------------------------------|----------------------------------------------------------|--------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|-------|
|                                |                                                          |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:TagKeys</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> </ul> |       |
| cts:notification:listOperation | Grants permission to query all operation list.           | List         | -                           | -                                                                                                                                     | -     |
| cts:trace:listTraceUser        | Grants permission to query all user list.                | List         | -                           | -                                                                                                                                     | -     |
| cts:trace:listResource         | Grants permission to query all trace resource type list. | List         | -                           | -                                                                                                                                     | -     |

Each API of cts usually supports one or more actions. [Table 3-275](#) lists the supported actions and dependencies.

**Table 3-275** Actions and dependencies supported by cts APIs

| API                         | Action         | Dependencies |
|-----------------------------|----------------|--------------|
| GET /v3/{project_id}/traces | cts:trace:list | -            |
| GET /v3/{project_id}/quotas | cts:quota:get  | -            |

| API                                   | Action                  | Dependencies                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POST /v3/{project_id}/tracker         | cts:tracker:create      | <ul style="list-style-type: none"> <li>• lts:topics:list</li> <li>• lts:topics:create</li> <li>• lts:groups:list</li> <li>• lts:groups:create</li> <li>• obs:bucket:CreateBucket</li> <li>• obs:bucket:HeadBucket</li> <li>• obs:bucket:GetLifecycleConfiguration</li> <li>• obs:bucket:PutLifecycleConfiguration</li> <li>• obs:bucket:GetBucketAcl</li> <li>• obs:bucket:PutBucketAcl</li> <li>• kms:cmk:list</li> </ul> |

| GET /v3/{domain_id}/resources                                     | cts:trace:listResource         | -                           |
| GET /v3/{project_id}/operations                                   | cts:notification:listOperation | -                           |
| GET /v3/{project_id}/user-resources                               | cts:trace:listTraceUser        | -                           |
| POST /v3/{domain_id}/checkbucket                                  | cts:tracker:list               | obs:bucket:ListAllMyBuckets |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-276](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for cts.

**Table 3-276** Resource types supported by cts

| Resource Type | URN                                            |
|---------------|------------------------------------------------|
| tracker       | cts:<region>:<account-id>:tracker:<tracker-id> |

| Resource Type | URN                                                      |
|---------------|----------------------------------------------------------|
| notification  | cts:<region>:<account-id>:notification:<notification-id> |

## Conditions

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, **cts:**) only apply to operations of the BMS service. For details, see [Table 3-277](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so **g:SourceVpce** is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so **g:TagKeys** is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [Condition operators](#).

The following table lists the condition keys that you can define in SCPs for CTS. You can include these condition keys to specify conditions for when your SCP is in effect.

**Table 3-277** Service-specific condition keys supported by CTS

| Condition Key  | Type   | Single-valued/<br>Multivalued | Description                                  |
|----------------|--------|-------------------------------|----------------------------------------------|
| cts:TargetType | string | Single-valued                 | Filter access permissions by data dump type. |

| Condition Key       | Type   | Single-valued/<br>Multivalued | Description                                                                                                |
|---------------------|--------|-------------------------------|------------------------------------------------------------------------------------------------------------|
| cts:TargetAccountId | string | Single-valued                 | Filter access permissions based on the domain ID (account ID) of the user to which the OBS bucket belongs. |
| cts:TargetOrgId     | string | Single-valued                 | Filter access permissions based on the organization to which the OBS bucket belongs.                       |
| cts:TargetOrgPath   | string | Single-valued                 | Filter access permissions based on the OU path of the organization to which the OBS bucket belongs.        |

### 3.14.12 Resource Formation Service (RFS)

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by STS, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by STS, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for IAC.

**Table 3-278** Actions supported by IAC

| Action                  | Description                                                   | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-------------------------|---------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| rf:privateTemplate:list | Grants permission to obtain private template list of project. | list         | privateTemplate*            | -             | -     |

| Action                                | Description                                                           | Access Level | Resource Type (*: required) | Condition Key | Alias |
|---------------------------------------|-----------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| rf:privateTemplate:create             | Grants permission to create a private template.                       | write        | privateTemplate*            | -             | -     |
| rf:privateTemplate:delete             | Grants permission to delete a private template.                       | write        | privateTemplate*            | -             | -     |
| rf:privateTemplate:showMetadata       | Grants permission to display the details of private template.         | read         | privateTemplate*            | -             | -     |
| rf:privateTemplate:updateMetadata     | Grants permission to update the metadata of private template.         | write        | privateTemplate*            | -             | -     |
| rf:privateTemplate:listVersions       | Grants permission to display all version details of private template. | list         | privateTemplate*            | -             | -     |
| rf:privateTemplate:createVersion      | Grants permission to create a private template version.               | write        | privateTemplate*            | -             | -     |
| rf:privateTemplate:showVersionContent | Grants permission to obtain the content of private template version.  | read         | privateTemplate*            | -             | -     |

| Action                                 | Description                                                        | Access Level | Resource Type (*: required) | Condition Key | Alias                     |
|----------------------------------------|--------------------------------------------------------------------|--------------|-----------------------------|---------------|---------------------------|
| rf:privateTemplate:deleteVersion       | Grants permission to delete a private template version.            | write        | privateTemplate*            | -             | -                         |
| rf:privateTemplate:showVersionMetadata | Grants permission to get the metadata of private template version. | read         | privateTemplate*            | -             | -                         |
| rf:stack:create                        | Grants permission to create a stack.                               | write        | stack*                      | -             | rf:stack:createStack      |
| rf:stack:deploy                        | Grants permission to deploy a stack.                               | write        | stack*                      | -             | rf:stack:deployStack      |
| rf:stack:list                          | Grants permission to list all stacks.                              | list         | stack*                      | -             | rf:stack:listStacks       |
| rf:stack:getMetadata                   | Grants permission to get the metadata of a stack.                  | read         | stack*                      | -             | rf:stack:getStackMetadata |
| rf:stack:delete                        | Grants permission to delete a stack.                               | write        | stack*                      | -             | rf:stack:deleteStack      |
| rf:stack:getTemplate                   | Grants permission to get the template of a stack.                  | read         | stack*                      | -             | rf:stack:getStackTemplate |

| Action                            | Description                                                 | Access Level | Resource Type (*: required) | Condition Key | Alias                       |
|-----------------------------------|-------------------------------------------------------------|--------------|-----------------------------|---------------|-----------------------------|
| rf:stack:listEvents               | Grants permission to list deployment events of a stack.     | list         | stack *                     | -             | rf:stack:listStackEvents    |
| rf:stack:listResources            | Grants permission to list all resources of a stack.         | list         | stack *                     | -             | rf:stack:listStackResources |
| rf:stack:listOutputs              | Grants permission to list all outputs of a stack.           | list         | stack *                     | -             | rf:stack:listStackOutputs   |
| rf:stack:createExecutionPlan      | Grants permission to create an execution plan.              | write        | stack *                     | -             | -                           |
| rf:stack:getExecutionPlanMetadata | Grants permission to get the metadata of an execution plan. | read         | stack *                     | -             | -                           |
| rf:stack:getExecutionPlan         | Grants permission to get an execution plan.                 | read         | stack *                     | -             | -                           |
| rf:stack:applyExecutionPlan       | Grants permission to apply an execution plan.               | write        | stack *                     | -             | -                           |
| rf:stack:listExecutionPlans       | Grants permission to list all execution plans.              | list         | stack *                     | -             | -                           |

| Action                              | Description                                                   | Access Level | Resource Type (*: required) | Condition Key | Alias                          |
|-------------------------------------|---------------------------------------------------------------|--------------|-----------------------------|---------------|--------------------------------|
| rf:stack:deleteExecutionPlan        | Grants permission to delete an execution plan.                | write        | stack *                     | -             | -                              |
| rf:stack:continueRollback           | Grants permission to continue rolling back the stack.         | write        | stack *                     | -             | rf:stack:continueRollbackStack |
| rf:stack:continueDeploy             | Grants permission to continue to deploy the stack.            | write        | stack *                     | -             | rf:stack:continueDeployStack   |
| rf:stack:estimateExecutionPlanPrice | Grants permission to estimate the price of an execution plan. | read         | stack *                     | -             | -                              |
| rf:stack:update                     | Grants permission to update stack properties.                 | write        | stack *                     | -             | rf:stack:updateStack           |
| rf:stackSet:create                  | Grants permission to create a stack set.                      | write        | stack Set *                 | -             | -                              |
| rf:stackSet:list                    | Grants permission to list all stack sets.                     | list         | stack Set *                 | -             | -                              |
| rf:stackSet:showTemplate            | Grants permission to show the template of a stack set.        | read         | stack Set *                 | -             | -                              |

| Action                            | Description                                                       | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-----------------------------------|-------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| rf:stackSet:showMetadata          | Grants permission to show the metadata of a stack set.            | read         | stack Set *                 | -             | -     |
| rf:stackSet:deploy                | Grants permission to deploy a stack set.                          | write        | stack Set *                 | -             | -     |
| rf:stackSet:delete                | Grants permission to delete a stack set.                          | write        | stack Set *                 | -             | -     |
| rf:stackSet:update                | Grants permission to update stack set properties.                 | write        | stack Set *                 | -             | -     |
| rf:stackSet:listStackInstances    | Grants permission to list all stack instances.                    | list         | stack Set *                 | -             | -     |
| rf:stackSet:createStackInstances  | Grants permission to create stack instances.                      | write        | stack Set *                 | -             | -     |
| rf:stackSet:deleteStackInstances  | Grants permission to delete stack instances.                      | write        | stack Set *                 | -             | -     |
| rf:stackSet:showOperationMetadata | Grants permission to show the metadata of an stack set operation. | read         | stack Set *                 | -             | -     |
| rf:stackSet:listOperations        | Grants permission to list all stack set operations.               | list         | stack Set *                 | -             | -     |

Each API of IAC usually supports one or more actions. [Table 3-279](#) lists the supported actions and dependencies.

**Table 3-279** Actions and dependencies supported by IAC APIs

| API                                                                  | Action                                | Dependencies |
|----------------------------------------------------------------------|---------------------------------------|--------------|
| GET /v1/{project_id}/templates                                       | rf:privateTemplate:list               | -            |
| POST /v1/{project_id}/templates                                      | rf:privateTemplate:create             | -            |
| DELETE /v1/{project_id}/templates/{template_name}                    | rf:privateTemplate:delete             | -            |
| GET /v1/{project_id}/templates/{template_name}/metadata              | rf:privateTemplate:showMetadata       | -            |
| PATCH /v1/{project_id}/templates/{template_name}/metadata            | rf:privateTemplate:updateMetadata     | -            |
| GET /v1/{project_id}/templates/{template_name}/versions              | rf:privateTemplate:listVersions       | -            |
| POST /v1/{project_id}/templates/{template_name}/versions             | rf:privateTemplate:createVersion      | -            |
| GET /v1/{project_id}/templates/{template_name}/versions/{version_id} | rf:privateTemplate:showVersionContent | -            |

| API                                                                                                   | Action                                 | Dependencies                                                                                        |
|-------------------------------------------------------------------------------------------------------|----------------------------------------|-----------------------------------------------------------------------------------------------------|

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-280](#), the resource URN must be

specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for IAC.

**Table 3-280** Resource types supported by IAC

| Resource Type   | URN                                                               |
|-----------------|-------------------------------------------------------------------|
| privateTemplate | rf:<region>:<account-id>:privateTemplate:<template-name>          |
| stackSet        | rf:<region>:<account-id>:stackSet:<stack-set-name>/<stack-set-id> |
| stack           | rf:<region>:<account-id>:stack:<stack-name>                       |

## Conditions

IAC does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.14.13 Security Token Service (STS)

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by STS, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by STS, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for STS.

**Table 3-281** Actions supported by STS

| Action                          | Description                                                                                                                                               | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                                                                                                                                                                                                     | Alias |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| sts:agencies:assume             | Grants permission to obtain a set of temporary credentials that you can use to access resources that you might not normally have access to.               | Write        | agency *                    | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                                                                                                                                                                                                                                                                                                     | -     |
|                                 |                                                                                                                                                           |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">sts:ExternalId</a></li> <li>• <a href="#">sts:SourceIdentity</a></li> <li>• <a href="#">sts:TransitiveTagKeys</a></li> <li>• <a href="#">sts:AgencySessionName</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> <li>• <a href="#">g:SourceAccount</a></li> <li>• <a href="#">g:SourceUrn</a></li> </ul> |       |
| sts::decodeAuthorizationMessage | Grants permission to decode additional information about the authorization status of a request from an encoded message returned in response to a request. | Write        | -                           | -                                                                                                                                                                                                                                                                                                                                                                                                                 | -     |
| sts::setSourceIdentity          | Grants permission to set a source identity on a STS session.                                                                                              | Write        | agency *                    | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                                                                                                                                                                                                                                                                                                     | -     |
|                                 |                                                                                                                                                           |              | -                           | <a href="#">sts:SourceIdentity</a>                                                                                                                                                                                                                                                                                                                                                                                |       |

| Action                        | Description                                        | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                          | Alias |
|-------------------------------|----------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| sts::tagSession               | Grants permission to add tags to a STS session.    | Tagging      | agency *                    | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                                                                          | -     |
|                               |                                                    |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">sts:TransitiveTagKeys</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul> |       |
| sts::createServiceBearerToken | Grants permission to get the service bearer token. | Write        | -                           | <ul style="list-style-type: none"> <li>• <a href="#">sts:DurationTime</a></li> <li>• <a href="#">sts:ServiceName</a></li> </ul>                                                        | -     |

Each API of STS usually supports one or more actions. [Table 3-282](#) lists the supported actions and dependencies.

**Table 3-282** Actions and dependencies supported by STS APIs

| API                                   | Action                           | Dependencies                                                                                        |
|---------------------------------------|----------------------------------|-----------------------------------------------------------------------------------------------------|
| POST /v5/agencies/assume              | sts:agencies:assume              | <ul style="list-style-type: none"> <li>• sts:tagSession</li> <li>• sts:setSourceIdentity</li> </ul> |
| POST /v5/decode-authorization-message | sts::decodeAuthorization-Message | -                                                                                                   |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-283](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for STS.

**Table 3-283** Resource types supported by STS

| Resource Type  | URN                                                           |
|----------------|---------------------------------------------------------------|
| agency         | iam::<account-id>:agency:<agency-name-with-path>              |
| assumed-agency | sts::<account-id>:assumed-agency:<agency-name>/<session-name> |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, sts) apply only to operations of the xx service. For details, see [Table 3-284](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [operators](#).

### Service-specific condition keys supported by STS

The following table lists the condition keys that you can define in identity policies for STS. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-284** Service-specific condition keys supported by STS

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                                                   |
|--------------------------------|---------|-------------------------------|-------------------------------------------------------------------------------|
| sts:ExternalId                 | string  | Single-valued                 | Filters access by the external ID that is passed in the request.              |
| sts:SourceIdentity             | string  | Single-valued                 | Filters access by the source identity that is passed in the request.          |
| sts:TransitiveTagKeys          | string  | Multivalued                   | Filters access by the transitive tag keys that are passed in the request.     |
| sts:AgencySessionName          | string  | Single-valued                 | Filters access by the agency session name required when you assume an agency. |
| sts:DurationTime               | numeric | Single-valued                 | Filters access by the duration times when you create a bearer token.          |
| sts:ServiceName                | string  | Single-valued                 | Filters access by the service name when you create a bearer token.            |

### 3.14.14 IAM Access Analyzer (IAA)

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by IAM Access Analyzer, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by IAM Access Analyzer, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for IAM Access Analyzer.

**Table 3-285** Actions supported by IAM Access Analyzer

| Action                             | Description                                                          | Access Level | Resource Type (*: required) | Condition Key                                                                                     | Alias |
|------------------------------------|----------------------------------------------------------------------|--------------|-----------------------------|---------------------------------------------------------------------------------------------------|-------|
| AccessAnalyzer:analyzer:create     | Grants permission to create an access analyzer.                      | Write        | analyzer *                  | -                                                                                                 | -     |
|                                    |                                                                      |              | -                           | <ul style="list-style-type: none"> <li>g:RequestTag/&lt;tag-key&gt;</li> <li>g:TagKeys</li> </ul> |       |
| AccessAnalyzer:analyzer:get        | Grants permission to retrieve the access analyzer information.       | Read         | analyzer *                  | g:ResourceTag/<tag-key>                                                                           | -     |
| AccessAnalyzer:analyzer:list       | Grants permission to retrieve the access analyzer list.              | List         | analyzer *                  | -                                                                                                 | -     |
| AccessAnalyzer:analyzer:delete     | Grants permission to delete an access analyzer.                      | Write        | analyzer *                  | g:ResourceTag/<tag-key>                                                                           | -     |
| AccessAnalyzer:analyzer:update     | Grants permission to update the specified access analyzer.           | Write        | analyzer *                  | g:ResourceTag/<tag-key>                                                                           | -     |
| AccessAnalyzer:analyzer:scan       | Grants permission to start a scan for the specified access analyzer. | Write        | analyzer *                  | g:ResourceTag/<tag-key>                                                                           | -     |
| AccessAnalyzer:analyzer:getFinding | Grants permission to retrieve findings.                              | Read         | analyzer *                  | g:ResourceTag/<tag-key>                                                                           | -     |

| Action                                  | Description                                                                       | Access Level | Resource Type (*: required) | Condition Key                                                                                                                     | Alias |
|-----------------------------------------|-----------------------------------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------|-------|
| AccessAnalyzer::analyzer:listFindings   | Grants permission to retrieve the finding list.                                   | List         | analyzer *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     | -     |
| AccessAnalyzer::analyzer:updateFindings | Grants permission to update the findings.                                         | Write        | analyzer *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     | -     |
| AccessAnalyzer::tagResource             | Grants permission to add a tag to a resource.                                     | Tagging      | analyzer *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     | -     |
|                                         |                                                                                   |              | -                           | <ul style="list-style-type: none"> <li><a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li><a href="#">g:TagKeys</a></li> </ul> |       |
| AccessAnalyzer::untagResource           | Grants permission to remove a tag from a resource.                                | Tagging      | analyzer *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     | -     |
|                                         |                                                                                   |              | -                           | <a href="#">g:TagKeys</a>                                                                                                         |       |
| AccessAnalyzer::archiveRule:create      | Grants permission to create an archive rule for the specified access analyzer.    | Write        | archiveRule *               | -                                                                                                                                 | -     |
| AccessAnalyzer::archiveRule:get         | Grants permission to retrieve the archive rule for the specified access analyzer. | Read         | archiveRule *               | -                                                                                                                                 | -     |

| Action                                | Description                                                                            | Access Level | Resource Type (*: required) | Condition Key                                 | Alias |
|---------------------------------------|----------------------------------------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------|-------|
| AccessAnalyzer:archiveRule:list       | Grants permission to retrieve the archive rule list for the specified access analyzer. | List         | archiveRule *               | -                                             | -     |
| AccessAnalyzer:archiveRule:update     | Grants permission to modify the archive rule for the specified access analyzer.        | Write        | archiveRule *               | -                                             | -     |
| AccessAnalyzer:archiveRule:delete     | Grants permission to delete the archive rule for the specified access analyzer.        | Write        | archiveRule *               | -                                             | -     |
| AccessAnalyzer:archiveRule:apply      | Grants permission to apply an archive rule.                                            | Write        | archiveRule *               | -                                             | -     |
| AccessAnalyzer:analyzer:createPreview | Grants permission to create an access preview for the specified access analyzer.       | Write        | analyzer *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | -     |

| Action                                               | Description                                                                                     | Access Level | Resource Type (*: required) | Condition Key                                 | Alias |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------|-------|
| AccessAnalyzer:analyzer:get Preview                  | Grants permission to retrieve the access preview information for the specified access analyzer. | Read         | analyzer *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | -     |
| AccessAnalyzer:analyzer:list Previews                | Grants permission to retrieve the access preview list for the specified access analyzer.        | List         | analyzer *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | -     |
| AccessAnalyzer:analyzer:list PreviewFindings         | Grants permission to retrieve the preview finding list for the specified access analyzer.       | List         | analyzer *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | -     |
| AccessAnalyzer:analyzer:createResourceConfigurations | Grants permission to create or update resource configurations.                                  | Write        | analyzer *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | -     |
| AccessAnalyzer:analyzer:list ResourceConfigurations  | Grants permission to retrieve the list for resource configurations.                             | List         | analyzer *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | -     |

| Action                                                | Description                                                                       | Access Level | Resource Type (*: required) | Condition Key                                 | Alias |
|-------------------------------------------------------|-----------------------------------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------|-------|
| AccessAnalyzer::analyzer:deleteResourceConfigurations | Grants permission to delete the resource configurations.                          | Write        | analyzer *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | -     |
| AccessAnalyzer::validatePolicy                        | Grants permission to validate a policy.                                           | Read         | -                           | -                                             | -     |
| AccessAnalyzer::checkNoNewAccess                      | Grants permission to check whether the updated policy has new access permissions. | Read         | -                           | -                                             | -     |
| AccessAnalyzer::notificationSetting:list              | Grants permission to retrieve the notification setting list.                      | Read         | notificationSetting *       | -                                             | -     |
| AccessAnalyzer::notificationSetting:create            | Grants permission to create a notification setting.                               | Write        | notificationSetting *       | -                                             | -     |
| AccessAnalyzer::notificationSetting:get               | Grants permission to retrieve the notification setting.                           | Read         | notificationSetting *       | -                                             | -     |
| AccessAnalyzer::notificationSetting:update            | Grants permission to modify the notification setting.                             | Write        | notificationSetting *       | -                                             | -     |

| Action                                    | Description                                           | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-------------------------------------------|-------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| AccessAnalyzer:notificationSetting:delete | Grants permission to delete the notification setting. | Write        | notificationSetting *       | -             | -     |

Each API of IAM Access Analyzer usually supports one or more actions. [Table 3-286](#) lists the supported actions and dependencies.

**Table 3-286** Actions and dependencies supported by IAM Access Analyzer APIs

| API                                                   | Action                                 | Dependencies                             |
|-------------------------------------------------------|----------------------------------------|------------------------------------------|
| POST /v5/analyzers                                    | AccessAnalyzer:analyzer:create         | iam:agencies:createServiceLinkedAgencyV5 |
| GET /v5/analyzers/{analyzer_id}                       | AccessAnalyzer:analyzer:get            | -                                        |
| GET /v5/analyzers                                     | AccessAnalyzer:analyzer:list           | -                                        |
| DELETE /v5/analyzers/{analyzer_id}                    | AccessAnalyzer:analyzer:delete         | -                                        |
| PUT /v5/analyzers/{analyzer_id}                       | AccessAnalyzer:analyzer:update         | -                                        |
| POST /v5/analyzers/{analyzer_id}/scan                 | AccessAnalyzer:analyzer:scan           | -                                        |
| GET /v5/analyzers/{analyzer_id}/findings/{finding_id} | AccessAnalyzer:analyzer:getFinding     | -                                        |
| POST /v5/analyzers/{analyzer_id}/findings             | AccessAnalyzer:analyzer:listFindings   | -                                        |
| PUT /v5/analyzers/{analyzer_id}/findings              | AccessAnalyzer:analyzer:updateFindings | -                                        |

| API                                                                    | Action                                | Dependencies |
|------------------------------------------------------------------------|---------------------------------------|--------------|
| POST /v5/{resource_type}/{resource_id}/tags/create                     | AccessAnalyzer::tagResource           | -            |
| POST /v5/{resource_type}/{resource_id}/tags/delete                     | AccessAnalyzer::untagResource         | -            |
| POST /v5/analyzers/{analyzer_id}/archive-rules                         | AccessAnalyzer:archiveRule:create     | -            |
| GET /v5/analyzers/{analyzer_id}/archive-rules/{archive_rule_id}        | AccessAnalyzer:archiveRule:get        | -            |
| GET /v5/analyzers/{analyzer_id}/archive-rules                          | AccessAnalyzer:archiveRule:list       | -            |
| PUT /v5/analyzers/{analyzer_id}/archive-rules/{archive_rule_id}        | AccessAnalyzer:archiveRule:update     | -            |
| DELETE /v5/analyzers/{analyzer_id}/archive-rules/{archive_rule_id}     | AccessAnalyzer:archiveRule:delete     | -            |
| POST /v5/analyzers/{analyzer_id}/archive-rules/{archive_rule_id}/apply | AccessAnalyzer:archiveRule:apply      | -            |
| POST /v5/analyzers/{analyzer_id}/access-previews                       | AccessAnalyzer:analyzer:createPreview | -            |

| POST /v5/analyzers/{analyzer_id}/resource-configurations/create               | AccessAnalyzer:analyzer:createResourceConfigurations   | -            |
| GET /v5/analyzers/{analyzer_id}/resource-configurations                       | AccessAnalyzer:analyzer:list<br>ResourceConfigurations | -            |
| POST /v5/analyzers/{analyzer_id}/resource-configurations/delete               | AccessAnalyzer:analyzer:deleteResourceConfigurations   | -            |
| POST /v5/policies/validate                                                    | AccessAnalyzer::validatePolicy                         | -            |
| POST /v5/policies/check-no-new-access                                         | AccessAnalyzer::checkNoNewAccess                       | -            |
| GET /v5/notification-settings                                                 | AccessAnalyzer:notification<br>Setting:list            | -            |
| POST /v5/notification-settings                                                | AccessAnalyzer:notification<br>Setting:create          | -            |
| GET /v5/notification-settings/{notification_setting_id}                       | AccessAnalyzer:notification<br>Setting:get             | -            |
| PUT /v5/notification-settings/{notification_setting_id}                       | AccessAnalyzer:notification<br>Setting:update          | -            |
| DELETE /v5/notification-settings/{notification_setting_id}                    | AccessAnalyzer:notification<br>Setting:delete          | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-287](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for IAM Access Analyzer.

**Table 3-287** Resource types supported by IAM Access Analyzer

| Resource Type       | URN                                                                                |
|---------------------|------------------------------------------------------------------------------------|
| analyzer            | AccessAnalyzer:<region>:<account-id>:analyzer:<analyzer-id>                        |
| notificationSetting | AccessAnalyzer:<region>:<account-id>:notificationSetting:<notification-setting-id> |
| archiveRule         | AccessAnalyzer:<region>:<account-id>:archiveRule:<analyzer-id>/<archive-rule-id>   |

## Conditions

IAM Access Analyzer does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.14.15 Resource Governance Center (RGC)

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by RGC, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by RGC, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for RGC.

**Table 3-288** Actions supported by RGC

| Action                    | Description                                                               | Access Level | Resource Type (*: required) | Condition Key | Alias |
|---------------------------|---------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| rgc:control:list          | Grants permission to list governance policies.                            | List         | -                           | -             | -     |
| rgc:controlViolation:list | Grants permission to list non-compliant resources.                        | List         | -                           | -             | -     |
| rgc:control:get           | Grants permission to get the details about a governance policy.           | Read         | -                           | -             | -     |
| rgc:control:enable        | Grants permission to enable a governance policy.                          | Write        | -                           | -             | -     |
| rgc:control:disable       | Grants permission to disable a governance policy.                         | Write        | -                           | -             | -     |
| rgc:controlOperate:get    | Grants permission to identify the enabling status of a governance policy. | Read         | -                           | -             | -     |

| Action                                 | Description                                                                                               | Access Level | Resource Type (*: required) | Condition Key | Alias |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|

|------------------------------------------|------------------------------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| rgc:externalConfigRuleCompliance:list    | Grants permission to list managed accounts for compliance against external Config rules.                               | List         | -                           | -             | -     |
| rgc:driftDetail:list                     | Grants permission to list the drift summary of the landing zone.                                                       | List         | -                           | -             | -     |
| rgc:managedOrganizationalUnit:register   | Grants permission to register an organizational unit.                                                                  | Write        | -                           | -             | -     |
| rgc:managedOrganizationalUnit:reRegister | Grants permission to re-register an organizational unit.                                                               | Write        | -                           | -             | -     |
| rgc:managedOrganizationalUnit:deregister | Grants permission to deregister an organizational unit.                                                                | Write        | -                           | -             | -     |
| rgc:operation:get                        | Grants permission to get the details about registration, re-registration, or deregistration of an organizational unit. | Read         | -                           | -             | -     |

| Action                               | Description                                                                                               | Access Level | Resource Type (*: required) | Condition Key | Alias |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| rgc:managedOrganizationalUnit:delete | Grants permission to delete an organizational unit.                                                       | Write        | -                           | -             | -     |
| rgc:managedOrganizationalUnit:get    | Grants permission to get the details about a registered organizational unit.                              | Read         | -                           | -             | -     |
| rgc:managedOrganizationalUnit:create | Grants permission to create an organizational unit.                                                       | Write        | -                           | -             | -     |
| rgc:managedOrganizationalUnit:list   | Grants permission to list registered organizational units that governance policies have been enabled for. | List         | -                           | -             | -     |
| rgc:managedAccount:enroll            | Grants permission to manage an account.                                                                   | Write        | -                           | -             | -     |
| rgc:managedAccount:unenroll          | Grants permission to unmanage an account.                                                                 | Write        | -                           | -             | -     |
| rgc:managedAccount:update            | Grants permission to update a managed account.                                                            | Write        | -                           | -             | -     |

| Action                            | Description                                                                                | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-----------------------------------|--------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| rgc:managedAccount:get            | Grants permission to get the details about a managed account.                              | Read         | -                           | -             | -     |
| rgc:managedAccountsForParent:list | Grants permission to list managed accounts in a registered organizational unit.            | List         | -                           | -             | -     |
| rgc:managedAccount:create         | Grants permission to create an account.                                                    | Write        | -                           | -             | -     |
| rgc:managedAccount:list           | Grants permission to list managed accounts that governance policies have been enabled for. | List         | -                           | -             | -     |
| rgc:managedCoreAccount:get        | Grants permission to get the details about a managed core account.                         | Read         | -                           | -             | -     |
| rgc:homeRegion:get                | Grants permission to get the details about the home region of the landing zone.            | Read         | -                           | -             | -     |

| Action                           | Description                                                                                      | Access Level | Resource Type (*: required) | Condition Key | Alias |
|----------------------------------|--------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| rgc:preLaunch:check              | Grants permission to check whether the current region is eligible for setting up a landing zone. | Write        | -                           | -             | -     |
| rgc:landingZone:setup            | Grants permission to set up a landing zone.                                                      | Write        | -                           | -             | -     |
| rgc:landingZone:delete           | Grants permission to delete a landing zone.                                                      | Write        | -                           | -             | -     |
| rgc:landingZoneStatus:get        | Grants permission to identify the status of landing zone setup.                                  | Read         | -                           | -             | -     |
| rgc:availableUpdate:get          | Grants permission to identify the available updates of a landing zone.                           | Read         | -                           | -             | -     |
| rgc:landingZoneConfiguration:get | Grants permission to get the configurations of a landing zone.                                   | Read         | -                           | -             | -     |

| Action                             | Description                                                                                       | Access Level | Resource Type (*: required) | Condition Key | Alias |
|------------------------------------|---------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| rgc:landingZonelidentityCenter:get | Grants permission to get the details about IAM Identity Center users of a landing zone.           | Read         | -                           | -             | -     |
| rgc:operation:list                 | Grants permission to obtain the current operation status of a registered OU or a managed account. | List         | -                           | -             | -     |
| rgc:templateDeployParam:get        | Grants permission to show the deploy parameters of the template.                                  | Read         | -                           | -             | -     |
| rgc:template:create                | Grants permission to create template.                                                             | Write        | -                           | -             | -     |
| rgc:template:delete                | Grants permission to delete template.                                                             | Write        | -                           | -             | -     |
| rgc:predefinedTemplate:list        | Grants permission to list the predefined templates.                                               | List         | -                           | -             | -     |

| Action                         | Description                                                            | Access Level | Resource Type (*: required) | Condition Key | Alias |
|--------------------------------|------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| rgc:managedAccountTemplate:get | Grants permission to get the template details about a managed account. | Read         | -                           | -             | -     |

Each API of RGC usually supports one or more actions. [Table 3-289](#) lists the supported actions and dependencies.

**Table 3-289** Actions and dependencies supported by RGC APIs

| API                                                                       | Action                    | Dependencies |
|---------------------------------------------------------------------------|---------------------------|--------------|
| GET /v1/governance/controls                                               | rgc:control:list          | -            |

## Resources

RGC does not support resource-level authorization. To allow access to RGC, use a wildcard (\*) in the Resource element of the identity policy, indicating that the identity policy will be applied to all resources.

## Conditions

RGC does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.14.16 Cloud Operations Center (COC)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, [Service Control Policies \(SCPs\)](#) in [Organizations](#) can also use these actions to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the entity. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted IAM permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify a URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by COC, see [Resource Types \(Resource\)](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by COC, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for COC.

**Table 3-290** Actions supported by COC

| Action               | Description                                            | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|----------------------|--------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| coc:application:list | Provides the permission to query the application list. | List         | application *               | -             | -     |

| Action                            | Description                                                          | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|-----------------------------------|----------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| coc:application:create            | Provides the permission to create an application.                    | Write        | application *               | -             | -     |
| coc:application:update            | Provides the permission to modify an application.                    | Write        | application *               | -             | -     |
| coc:application:delete            | Provides the permission to delete an application.                    | Write        | application *               | -             | -     |
| coc:application:createGroup       | Provides the permission to create an application group.              | Write        | application *               | -             | -     |
| coc:application:listGroups        | Provides the permission to query a specified application group list. | List         | application *               | -             | -     |
| coc:application:updateGroup       | Provides the permission to modify an application group.              | Write        | application *               | -             | -     |
| coc:application:deleteGroup       | Provides the permission to delete an application group.              | Write        | application *               | -             | -     |
| coc:application:syncGroupResource | Provides the permissions to synchronize application group resources. | Write        | application *               | -             | -     |
| coc:application:updateResources   | Provides the permission to modify application resources.             | Write        | application *               | -             | -     |

| Action                                 | Description                                                                             | Access Level | Resource Type (*: Required) | Condition Key                            | Alias |
|----------------------------------------|-----------------------------------------------------------------------------------------|--------------|-----------------------------|------------------------------------------|-------|
| coc:application:addResources           | Provides the permission to add resources to an application.                             | Write        | application *               | -                                        | -     |
| coc:application:removeResources        | Provides the permission to remove application resources.                                | Write        | application *               | -                                        | -     |
| coc:application:listResources          | Provides the permission to query the application resource list.                         | List         | application *               | -                                        | -     |
|                                        |                                                                                         |              | -                           | <a href="#">coc:ApplicationGroupCode</a> |       |
| coc:application:countResourceRelations | Provides the permission to query the number of resource relationships.                  | List         | application *               | -                                        | -     |
| coc:application:getCapacity            | Provides the permission to query resource capacities in an application.                 | List         | application *               | -                                        | -     |
| coc:application:getSortedCapacity      | Provides the permission to query the capacities of ordered resources in an application. | List         | application *               | -                                        | -     |
| coc:application:listModel              | Provides the permission to query application models.                                    | List         | application *               | -                                        | -     |
| coc:vendorAccount:create               | Provides the permission to add a cloud vendor account.                                  | Write        | -                           | -                                        | -     |

| Action                         | Description                                                                           | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|--------------------------------|---------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| coc:vendorAccount:list         | Provides the permission to query a cloud vendor account.                              | List         | -                           | -             | -     |
| coc:vendorAccount:update       | Provides the permission to modify a cloud vendor account.                             | Write        | -                           | -             | -     |
| coc:vendorAccount:delete       | Provides the permission to delete a cloud vendor account.                             | Write        | -                           | -             | -     |
| coc:resourceView:list          | Provides the permission to query resource views.                                      | List         | -                           | -             | -     |
| coc:resourceView:create        | Provides the permission to create a resource view.                                    | Write        | resource View *             | -             | -     |
| coc:resourceView:update        | Provides the permission to update a resource view.                                    | Write        | resource View *             | -             | -     |
| coc:resourceView:delete        | Provides the permission to delete a resource view.                                    | Write        | resource View *             | -             | -     |
| coc:resourceView:syncResources | Provides the permission to synchronize the resource list in a specific resource view. | Write        | resource View *             | -             | -     |

| Action                           | Description                                                                                                       | Access Level | Resource Type (*: Required) | Condition Key | Alias                           |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|---------------------------------|
| coc:resourceView:listResources   | Provides the permission to query the resource list in a specific resource view.                                   | List         | resourceView*               | -             | -                               |
| coc:resourceView:countResources  | Provides the permission to query the number of resources in a specific resource view.                             | List         | -                           | -             | -                               |
| coc:instance:listResources       | Provides the permission to query the resource list.                                                               | List         | -                           | -             | -                               |
| coc:instance:syncResources       | Provides the permission to synchronize the resource list.                                                         | Write        | -                           | -             | -                               |
| coc:instance:countOtherResources | Provides the permission to query the total number of offline resources (such as physical machine and middleware). | List         | -                           | -             | -                               |
| coc:instance:listTagsForResource | Provides the permission to query resource tags.                                                                   | List         | -                           | -             | coc:instance:listResourceTags   |
| coc:instance:addResourceToTags   | Provides the permission to add resource tags.                                                                     | Write        | -                           | -             | coc:instance:createResourceTags |
| coc:instance:countResources      | Provides the permission to query the total number of resources.                                                   | List         | -                           | -             | -                               |

| coc::getTopologyEdgeDetails             | Provides the permission to query historical metrics of edges.                                                  | Read         | -                           | -             | coc:system:getTopologyEdgeDetails             |
| coc::listTopologyConfigurations         | Provides the permission to query topology configurations.                                                      | List         | -                           | -             | coc:system:listTopologyConfigurations         |
| coc::createTopologyConfigurations       | Provides the permission to create topology configurations.                                                     | Write        | -                           | -             | coc:system:createTopologyConfigurations       |
| coc::updateTopologyConfigurations       | Provides the permission to update topology configurations.                                                     | Write        | -                           | -             | coc:system:updateTopologyConfigurations       |
| coc::listCrossAccountEnterpriseProjects | Provides the permission to query the enterprise project list of a specified tenant in cross-account scenarios. | List         | -                           | -             | coc:system:listCrossAccountEnterpriseProjects |
| coc::getUserIdentity                    | Provides the permission to query the identity of a login user.                                                 | Read         | -                           | -             | coc:system:getUserIdentity                    |

| Action                            | Description                                                       | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|-----------------------------------|-------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| coc:template:list                 | Provides the permission to query the template list.               | List         | -                           | -             | -     |
| coc:template:get                  | Provides the permission to query template details.                | Read         | template*                   | -             | -     |
| coc:template:create               | Provides the permission to create a template.                     | Write        | -                           | -             | -     |
| coc:template:update               | Provides the permission to update a template.                     | Write        | template*                   | -             | -     |
| coc:template:delete               | Provides the permission to delete a template.                     | Write        | template*                   | -             | -     |
| coc:template:listVersions         | Provides the permission to query the template version list.       | List         | -                           | -             | -     |
| coc:template:getVersion           | Provides the permission to query the template version details.    | Read         | template*                   | -             | -     |
| coc:template:searchAuthorizations | Provides the permission to query the template authorization list. | List         | -                           | -             | -     |
| coc:template:createAuthorization  | Provides the permission to add template authorization.            | Write        | template*                   | -             | -     |

| Action                           | Description                                                     | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|----------------------------------|-----------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| coc:template:deleteAuthorization | Provides the permission to delete template authorization.       | Write        | template *                  | -             | -     |
| coc:template:listConstraint      | Provides the permission to query the template constraint list.  | List         | -                           | -             | -     |
| coc:template:createConstraint    | Provides the permission to create a template constraint.        | Write        | template *                  | -             | -     |
| coc:template:updateConstraint    | Provides the permission to update a template constraint.        | Write        | template *                  | -             | -     |
| coc:template:deleteConstraint    | Provides the permission to delete a template constraint.        | Write        | template *                  | -             | -     |
| coc:templateInstance:create      | Provides the permission to create a template instance.          | Write        | -                           | -             | -     |
| coc:templateInstance:list        | Provides the permission to query the template instance list.    | List         | -                           | -             | -     |
| coc:templateInstance:get         | Provides the permission to query the template instance details. | Read         | template Instance *         | -             | -     |

| Action                             | Description                                                                | Access Level | Resource Type (*: Required) | Condition Key | Alias                                  |
|------------------------------------|----------------------------------------------------------------------------|--------------|-----------------------------|---------------|----------------------------------------|
| coc:templateInstance:listEvents    | Provides the permission to query the incident list of a template instance. | List         | template Instance *         | -             | -                                      |
| coc:templateInstance:listResources | Provides the permission to query the resource list of a template instance. | List         | template Instance *         | -             | -                                      |
| coc:templateInstance:delete        | Provides the permission to delete a template instance.                     | Write        | template Instance *         | -             | -                                      |
| coc:templateInstance:createRetry   | Provides the permission to retry template instance creation.               | Write        | -                           | -             | -                                      |
| coc::getBiBackboneNetworkTopo      | Provides the permission to query the BI backbone network topology.         | Read         | -                           | -             | coc:system:getBiBackboneNetworkTopo    |
| coc::updateBiBackboneNetworkTopo   | Provides the permission to modify the BI backbone network topology.        | Write        | -                           | -             | coc:system:updateBiBackboneNetworkTopo |
| coc::getBiBackboneNetworkTraffic   | Provides the permission to obtain backbone network traffic data.           | Read         | -                           | -             | coc:system:getBiBackboneNetworkTraffic |

| Action                                | Description                                                                               | Access Level | Resource Type (*: Required) | Condition Key | Alias                                       |
|---------------------------------------|-------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|---------------------------------------------|
| coc::refreshBiBackboneNetworkTopology | Provides the permission to refresh the backbone network topology.                         | Write        | -                           | -             | coc:system:refreshBiBackboneNetworkTopology |
| coc::getBiBackboneNetworkMetrics      | Provides the permission to obtain backbone network bandwidth data.                        | Read         | -                           | -             | coc:system:getBiBackboneNetworkMetrics      |
| coc::getBiScreenConfig                | Provides the permission to obtain BI dashboard configuration parameters.                  | Read         | -                           | -             | coc:system:getBiScreenConfig                |
| coc::updateBiScreenConfig             | Provides the permission to modify BI dashboard configurations.                            | Write        | -                           | -             | coc:system:updateBiScreenConfig             |
| coc::getBiResourceAlarmResourceInfos  | Provides the permission to obtain resource information from the resource alarm dashboard. | Read         | -                           | -             | coc:system:getBiResourceAlarmResourceInfos  |
| coc::getBiResourceAlarmAlarmInfos     | Provides the permission to obtain alarm information from the resource alarm dashboard.    | Read         | -                           | -             | coc:system:getBiResourceAlarmAlarmInfos     |
| coc::createAlarmFilterTemplate        | Provides the permission to create an original alarm filter template.                      | Write        | -                           | -             | coc:system:createAlarmFilterTemplate        |

| Action                            | Description                                                                                | Access Level | Resource Type (*: Required) | Condition Key | Alias                                |
|-----------------------------------|--------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|--------------------------------------|
| coc::deleteAlarmFilterTemplate    | Provides the permission to delete an original alarm filter template.                       | Write        | -                           | -             | coc:system:deleteAlarmFilterTemplate |
| coc::listAlarmFilterTemplate      | Provides the permission to query the original alarm filter template list.                  | List         | -                           | -             | coc:system:listAlarmFilterTemplate   |
| coc::getResourceTopology          | Provides the permission to query resource topology details.                                | Read         | -                           | -             | coc:system:getResourceTopology       |
| coc::listConfigurationItem        | Provides the permission to view the configuration item list.                               | List         | -                           | -             | coc:system:listConfigurationItem     |
| coc:ciRelationshipBaseline:create | Provides the permission to create a new configuration item relationship baseline.          | Write        | -                           | -             | -                                    |
| coc:ciRelationshipBaseline:delete | Provides the permission to delete an existing configuration item relationship baseline.    | Write        | ciRelationshipBaseline*     | -             | -                                    |
| coc:ciRelationshipBaseline:get    | Provides the permission to view the details of a configuration item relationship baseline. | Read         | ciRelationshipBaseline*     | -             | -                                    |

| Action                            | Description                                                                             | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|-----------------------------------|-----------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| coc:ciRelationshipBaseline:list   | Provides the permission to view the list of configuration item relationship baselines.  | List         | -                           | -             | -     |
| coc:ciRelationshipBaseline:update | Provides the permission to update an existing configuration item relationship baseline. | Write        | ciRelationshipBaseline*     | -             | -     |

Each API of COC usually supports one or more actions. [Table 3-291](#) lists the supported actions and dependencies.

**Table 3-291** Actions and dependencies supported by APIs

| API                          | Action                            | Related Action |
|------------------------------|-----------------------------------|----------------|
| GET /v1/resources/count      | coc:instance:countResources       | -              |
| GET /v1/applications         | coc:application:list              | -              |
| POST /v1/applications        | coc:application:create            | -              |
| PUT /v1/applications/{id}    | coc:application:update            | -              |
| DELETE /v1/applications/{id} | coc:application:delete            | -              |
| POST /v1/groups              | coc:application:createGroup       | -              |
| GET /v1/groups               | coc:application:listGroups        | -              |
| PUT /v1/groups/{id}          | coc:application:updateGroup       | -              |
| DELETE /v1/groups/{id}       | coc:application:deleteGroup       | -              |
| POST /v1/groups/{id}/sync    | coc:application:syncGroupResource | -              |

| API                                    | Action                                 | Related Action |
|----------------------------------------|----------------------------------------|----------------|
| PUT /v1/group-resource-relations       | coc:application:updateResources        | -              |
| POST /v1/group-resource-relations      | coc:application:addResources           | -              |
| DELETE /v1/group-resource-relations    | coc:application:removeResources        | -              |
| GET /v1/group-resource-relations       | coc:application:listResources          | -              |
| GET /v1/group-resource-relations/count | coc:application:countResourceRelations | -              |
| POST /v1/other-resources/import        | coc:instance:syncResources             | -              |
| POST /v1/components                    | coc:application:create                 | -              |
| GET /v1/components                     | coc:application:list                   | -              |
| PUT /v1/components/{id}                | coc:application:update                 | -              |
| DELETE /v1/components/{id}             | coc:application:delete                 | -              |
| GET /v1/application-view/search        | coc:application:list                   | -              |
| POST /v1/capacity                      | coc:application:getCapacity            | -              |
| GET /v1/capacity/order                 | coc:application:getSortedCapacity      | -              |
| POST /v1/vendor-account                | coc:vendorAccount:create               | -              |
| GET /v1/vendor-account                 | coc:vendorAccount:list                 | -              |
| PUT /v1/vendor-account                 | coc:vendorAccount:update               | -              |
| DELETE /v1/vendor-account              | coc:vendorAccount:delete               | -              |
| GET /v1/multicloud-resources/count     | coc:instance:countResources            | -              |
| POST /v1/multicloud-resources/sync     | coc:instance:syncResources             | -              |
| GET /v1/resource/views                 | coc:resourceView:list                  | -              |
| POST /v1/resource/views                | coc:resourceView:create                | -              |
| PUT /v1/resource/views/{id}            | coc:resourceView:update                | -              |
| DELETE /v1/resource/views/{id}         | coc:resourceView:delete                | -              |

| API                                           | Action                           | Related Action |
|-----------------------------------------------|----------------------------------|----------------|

## Resource Types (Resource)

A resource type indicates the resource to which a policy applies to. If you specify a resource type for any action in [Table 3-292](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in a policy to define resource types.

The following table lists the resource types that you can define in policy statements for COC.

**Table 3-292** Resource types supported by COC

| Resource Type   | URN                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| instance        | <ul style="list-style-type: none"> <li>ecs:&lt;region&gt;:&lt;account-id&gt;:instance:&lt;server-id&gt;</li> <li>bms:&lt;region&gt;:&lt;account-id&gt;:instance:&lt;server-id&gt;</li> <li>rds:&lt;region&gt;:&lt;account-id&gt;:instance:&lt;server-id&gt;</li> <li>gaussdb:&lt;region&gt;:&lt;account-id&gt;:instance:&lt;server-id&gt;</li> </ul> |

## Conditions

A condition element lets you specify conditions for when an identity policy is in effect. It contains **condition keys** and **operators**.

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, **bms:**) only apply to operations of the COC service. For details, see [Table 3-293](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a

request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.

- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For details about supported operators, see [Condition operators](#).

The following table lists the condition keys that you can define in identity policies for COC. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-293** Service-specific condition keys supported by COC

| Service-specific condition key | Type    | Single-valued/<br>Multivalued | Description                                                                            |
|--------------------------------|---------|-------------------------------|----------------------------------------------------------------------------------------|
| coc:TicketLevel                | String  | Single-valued                 | Filters access based on the ticket level in the request parameter.                     |
| coc:TicketCurrentHandlers      | String  | Multivalued                   | Filters access based on the ticket operator in the request parameter.                  |
| coc:TicketStatus               | String  | Single-valued                 | Filters access based on the ticket status in the request parameter.                    |
| coc:TicketType                 | String  | Single-valued                 | Filters access based on the ticket type in the request parameter.                      |
| coc:TicketBeginTime            | date    | Single-valued                 | Filters access based on the ticket start time in the request parameter.                |
| coc:TicketEndTime              | date    | Single-valued                 | Filters access based on the ticket end time in the request parameter.                  |
| coc:OperatorName               | String  | Single-valued                 | Filters access based on the operator in the request parameter.                         |
| coc:RequestTarget              | String  | Single-valued                 | Filters access based on the privilege escalation application in the request parameter. |
| coc:TicketTarget               | String  | Multivalued                   | Filters access based on the ticket application in the request parameter.               |
| coc:TicketScope                | String  | Multivalued                   | Filters access based on the ticket scope in the request parameter.                     |
| coc:RequestScope               | String  | Single-valued                 | Filters access based on the privilege escalation scope in the request.                 |
| coc:EscapeSwitchsEnabled       | boolean | Single valued                 | Filters access based on the escape feature in the request parameter.                   |

| Service-specific condition key | Type   | Single-valued/Multivalued | Description                                                                                |
|--------------------------------|--------|---------------------------|--------------------------------------------------------------------------------------------|
| coc:Creator                    | String | Single-valued             | Filters access based on the creator of resource in COC.                                    |
| coc:Executor                   | String | Single-valued             | Filters access based on the executor specified by the service ticket in COC.               |
| coc:DocumentRiskLevel          | String | Single-valued             | Filters access based on the document risk level specified in the request parameter.        |
| coc:JobType                    | String | Single-valued             | Filters access based on the service ticket type specified in the request parameter.        |
| coc:Application Code           | String | Multivalued               | Filters access based on the application code specified in the request parameter.           |
| coc:Application GroupCode      | String | Single-valued             | Filters access based on the application group code specified in the request parameter.     |
| coc:AttackTargetType           | String | Single-valued             | Filters access based on the attack target type specified in the request parameter.         |
| coc:QuickSetup Type            | String | Single-valued             | Filters access based on the request configuration type specified in the request parameter. |

### 3.14.17 Application Performance Management (APM)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by APM, see [Resources](#).

- **Condition Key** contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by APM, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for APM.

**Table 3-294** Supported actions

| Action                         | Description                                                             | Access Level          | Resource Type (*: required) | Condition Key                | Alias                           |
|--------------------------------|-------------------------------------------------------------------------|-----------------------|-----------------------------|------------------------------|---------------------------------|
| apm:application:list           | Grants permission to obtain the information about the application list. | List                  | -                           | -                            | apm:apm2BusinessBusiness:list   |
| apm:application:getService     | Grants permission to obtain service information.                        | Read                  | -                           | <b>g:EnterpriseProjectId</b> | apm:apm2Service:get             |
| apm::retrieveCredential        | Grants permission to obtain an access credential.                       | Permission_management | -                           | -                            | apm:apm2ApiKey:read             |
| apm::createCredential          | Grants permission to create an access credential.                       | Permission_management | -                           | -                            | apm:apm2ApiKey:create           |
| apm::deleteCredential          | Grants permission to delete an access credential.                       | Permission_management | -                           | -                            | apm:apm2ApiKey:delete           |
| apm:application:get            | Grants permission to obtain the information about an application.       | Read                  | -                           | <b>g:EnterpriseProjectId</b> | apm:apm2BusinessBusiness:get    |
| apm:application:updateInstance | Grants permission to modify an instance.                                | Write                 | -                           | <b>g:EnterpriseProjectId</b> | apm:apm2BusinessInstance:update |

| Action                                | Description                                                 | Access Level | Resource Type (*: required) | Condition Key                         | Alias                                                     |
|---------------------------------------|-------------------------------------------------------------|--------------|-----------------------------|---------------------------------------|-----------------------------------------------------------|
| apm:application:deleteInstance        | Grants permission to delete an instance.                    | Write        | -                           | <a href="#">g:EnterpriseProjectId</a> | apm:apm2BusinessInstance:delete                           |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-296](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource

element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for APM.

**Table 3-296** Resource types supported by APM

| Resource Type | URN                                            |
|---------------|------------------------------------------------|
| application   | apm::<account-id>:application:<application-id> |

## Conditions

APM does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

## 3.14.18 Application Operations Management

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.

- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by AOM, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by AOM, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for AOM.

**Table 3-297** Actions supported by AOM

| Action            | Description                                           | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-------------------|-------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| aom:view:delete   | Grants permission to delete dashboard.                | Write        | -                           | -             | -     |
| aom:view:get      | Grants permission to get dashboard.                   | Read         | -                           | -             | -     |
| aom:metric:delete | Grants permission to delete monitoring configuration. | Write        | -                           | -             | -     |

| Action                    | Description                                                   | Access Level | Resource Type (*: required) | Condition Key | Alias          |
|---------------------------|---------------------------------------------------------------|--------------|-----------------------------|---------------|----------------|
| aom:icmgr:get             | Grants permission to get collection component version info.   | Read         | -                           | -             | -              |
| aom:agency:get            | Grants permission to querying agency permissions.             | Read         | -                           | -             | -              |
| aom:icmgr:list            | Grants permission to query ICAgent list.                      | List         | -                           | -             | -              |
| aom:metric:set            | Grants permission to modify monitoring configuration.         | Write        | -                           | -             | -              |
| aom:metric:list           | Grants permission to query metric item.                       | List         | -                           | -             | aom:metric:get |
| aom:metric:put            | Grants permission to report metric.                           | Write        | -                           | -             | -              |
| aom:discovery Rule:set    | Grants permission to create or update service discovery rule. | Write        | -                           | -             | -              |
| aom:discovery Rule:delete | Grants permission to delete service discovery rule.           | Write        | -                           | -             | -              |
| aom:discovery Rule:list   | Grants permission to list service discovery rule.             | List         | -                           | -             | -              |

| Action                     | Description                                      | Access Level | Resource Type (*: required) | Condition Key                                                                                                                         | Alias                   |
|----------------------------|--------------------------------------------------|--------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| aom:alarmRule:create       | Grants permission to create alarm rule.          | Write        | alarm Rule *                | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                         | -                       |
|                            |                                                  |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:TagKeys</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> </ul> |                         |
| aom:alarmRule:list         | Grants permission to query alarm rule list.      | List         | -                           | -                                                                                                                                     | -                       |
| aom:alarmRule:update       | Grants permission to update alarm rule.          | Write        | -                           | -                                                                                                                                     | aom:alarmRule:set       |
| aom:alarmRule:delete       | Grants permission to delete alarm rule.          | Write        | alarm Rule *                | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                         | -                       |
| aom:alarm:put              | Grants permission to push alarms and events.     | Write        | -                           | -                                                                                                                                     | -                       |
| aom:alarmRule:get          | Grants permission to query alarm rule.           | Read         | -                           | -                                                                                                                                     | -                       |
| aom:event2AlarmRule:list   | Grants permission to list event to alarm rule.   | List         | -                           | -                                                                                                                                     | -                       |
| aom:event2AlarmRule:create | Grants permission to create event to alarm rule. | Write        | -                           | -                                                                                                                                     | -                       |
| aom:event2AlarmRule:update | Grants permission to update event to alarm rule. | Write        | -                           | -                                                                                                                                     | aom:event2AlarmRule:set |

| Action                     | Description                                      | Access Level | Resource Type (*: required) | Condition Key | Alias |
|----------------------------|--------------------------------------------------|--------------|-----------------------------|---------------|-------|
| aom:event2AlarmRule:delete | Grants permission to delete event to alarm rule. | Write        | -                           | -             | -     |
| aom:muteRule:create        | Grants permission to create mute rule.           | Write        | -                           | -             | -     |
| aom:muteRule:list          | Grants permission to list mute rule.             | List         | -                           | -             | -     |
| aom:muteRule:update        | Grants permission to update mute rule.           | Write        | -                           | -             | -     |
| aom:muteRule:delete        | Grants permission to delete mute rule.           | Write        | -                           | -             | -     |
| aom:actionRule:get         | Grants permission to query action rule.          | Read         | -                           | -             | -     |
| aom:actionRule:list        | Grants permission to query action rule list.     | List         | -                           | -             | -     |
| aom:actionRule:create      | Grants permission to create action rule.         | Write        | -                           | -             | -     |
| aom:actionRule:update      | Grants permission to update action rule.         | Write        | -                           | -             | -     |
| aom:actionRule:delete      | Grants permission to delete action rule.         | Write        | -                           | -             | -     |

| Action                          | Description                                           | Access Level | Resource Type (*: required) | Condition Key | Alias |
|---------------------------------|-------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| aom:alarm:list                  | Grants permission to query alarms and events.         | List         | -                           | -             | -     |
| aom:notificationTemplate:create | Grants permission to create notification template.    | Write        | -                           | -             | -     |
| aom:notificationTemplate:delete | Grants permission to delete notification template.    | Write        | -                           | -             | -     |
| aom:notificationTemplate:update | Grants permission to update notification template.    | Write        | -                           | -             | -     |
| aom:notificationTemplate:list   | Grants permission to get notification template list.  | List         | -                           | -             | -     |
| aom:notificationTemplate:get    | Grants permission to get notification template.       | Read         | -                           | -             | -     |
| aom:alarmRuleTemplate:list      | Grants permission to query alarm rule policy V4 list. | List         | -                           | -             | -     |
| aom:alarmRuleTemplate:delete    | Grants permission to delete alarm rule policy V4.     | Write        | -                           | -             | -     |

Each API of AOM usually supports one or more actions. [Table 3-298](#) lists the supported actions and dependencies.

**Table 3-298** Actions and dependencies supported by AOM APIs

| API                                                          | Action            | Dependencies |
|--------------------------------------------------------------|-------------------|--------------|
| DELETE /v2/{project_id}/aom/dashboards/{dashboard_id}        | aom:view:delete   | -            |
| GET /v2/{project_id}/aom/dashboards                          | aom:view:get      | -            |
| GET /v2/{project_id}/aom/dashboards/{dashboard_id}           | aom:view:get      | -            |
| DELETE /v2/{project_id}/aom/dashboards-folder/{folder_id}    | aom:view:delete   | -            |
| GET /v2/{project_id}/aom/dashboards-folder                   | aom:view:get      | -            |
| DELETE /v1/{project_id}/aom/prometheus                       | aom:metric:delete | -            |
| GET /v1/{project_id}/aom/prometheus                          | aom:metric:list   | -            |
| POST /v1/{project_id}/aom/prometheus                         | aom:metric:put    | -            |
| PUT /v1/{project_id}/aom/prometheus                          | aom:metric:set    | -            |
| POST /v1/{project_id}/{prometheus_instance}/aom/api/v1/rules | aom:metric:put    | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-299](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for AOM.

**Table 3-299** Resource types supported by AOM

| Resource Type | URN                                                 |
|---------------|-----------------------------------------------------|
| alarmRule     | aom:<region>:<account-id>:alarmRule:<alarm_rule_id> |

## Conditions

AOM does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.14.19 Optimization Advisor

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [service control policies \(SCPs\)](#) for access control.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM policies are different from Organizations SCPs, see [What Are the Differences Between IAM Policies and Organizations SCPs?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP policy, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (such as **list**, **read**, or **write**). This classification helps you understand the level of access that an action grants when you use it in a policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by OA, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by OA, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for OA.

**Table 3-300** Actions supported by OA

| Action                       | Description                                              | Access Level | Resource Type (*: Required) | Condition Key | Alias                    |
|------------------------------|----------------------------------------------------------|--------------|-----------------------------|---------------|--------------------------|
| oa::listAuthorizations       | Grants permission to obtain the user authorization list. | read         | -                           | -             | oa:authorizations:list   |
| oa::updateAuthorizations     | Grants permission to modify user authorizations.         | write        | -                           | -             | oa:authorizations:update |
| oa::deleteAuthorizations     | Grants permission to delete user authorizations.         | write        | -                           | -             | oa:authorizations:delete |
| oa:monthReports:list         | Grants permission to obtain the monthly report list.     | read         | -                           | -             | -                        |
| oa:monthReports:get          | Grants permission to get details about a monthly report. | read         | -                           | -             | -                        |
| oa:monthReports:download     | Grants permission to download a monthly report.          | read         | -                           | -             | -                        |
| oa:checkItemRules:update     | Grants permission to modify check item rules.            | write        | -                           | -             | -                        |
| oa:checkItemRules:list       | Grants permission to obtain check item rules.            | read         | -                           | -             | -                        |
| oa:autoCheckRule:update      | Grants permission to modify auto check rules.            | write        | -                           | -             | -                        |
| oa:autoCheckRule:get         | Grants permission to get auto check rules.               | read         | -                           | -             | -                        |
| oa:riskItemsCheck:createTask | Grants permission to create a risk check task.           | write        | -                           | -             | -                        |

| Action                                         | Description                                                                | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|------------------------------------------------|----------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| oa:riskItemsCheck:getTaskProgress              | Grants permission to obtain the progress of a risk check task.             | read         | -                           | -             | -     |
| oa:riskItemsCheck:getTaskResult                | Grants permission to obtain the risk check results.                        | read         | -                           | -             | -     |
| oa:riskItemsCheck:getTaskResultDimension       | Grants permission to obtain the dimensions of risk check results.          | read         | -                           | -             | -     |
| oa:riskItemsCheck:listReportSubscriptions      | Grants permission to obtain subscriptions to risk check reports.           | read         | -                           | -             | -     |
| oa:riskItemsCheck:getReportSubscriptionRule    | Grants permission to obtain the subscription rules for risk check reports. | read         | -                           | -             | -     |
| oa:riskItemsCheck:updateReportSubscriptionRule | Grants permission to modify the subscription rules for risk check reports. | write        | -                           | -             | -     |
| oa:riskItemsCheck:getRiskItemNum               | Grants permission to obtain the number of risky items.                     | read         | -                           | -             | -     |
| oa:riskItemsCheck:exportCheckItemResult        | Grants permission to export a risk check report.                           | read         | -                           | -             | -     |

| oa:applications:getSummary                             | Grants permission to obtain the architecture diagram summary.                                 | read         | -                           | -             | -                         |
| oa:applications:listCapacityAnalysis-SupportedServices | Grants permission to obtain supported services from the capacity optimization dashboard.      | read         | -                           | -             | -                         |

| Action                                           | Description                                                                                | Access Level | Resource Type (*: Required) | Condition Key | Alias                    |
|--------------------------------------------------|--------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|--------------------------|
| oa:applications:listCapacityAnalysis-Results     | Grants permission to obtain the analysis results from the capacity optimization dashboard. | read         | -                           | -             | -                        |
| oa:applications:startAutomaticDrawAnalysis       | Grants permission to create an automatic drawing analysis task.                            | write        | -                           | -             | -                        |
| oa:applications:getAutomaticDrawAnalysisProgress | Grants permission to obtain the progress of an automatic drawing analysis task.            | read         | -                           | -             | -                        |
| oa:applications:getAutomaticDrawAnalysisResult   | Grants permission to obtain the result of an automatic drawing analysis task.              | read         | -                           | -             | -                        |
| oa:applications:getVpcFlowLogsDockingStatus      | Grants permission to obtain the interconnection status of VPC flow logs.                   | read         | -                           | -             | -                        |
| oa::listResourceGroups                           | Grants permission to obtain the resource group list.                                       | read         | -                           | -             | oa:resourceGroups:list   |
| oa::getResourceGroups                            | Grants permission to obtain resource group details.                                        | read         | -                           | -             | oa:resourceGroups:get    |
| oa::updateResourceGroups                         | Grants permission to modify a resource group.                                              | write        | -                           | -             | oa:resourceGroups:update |

| Action                               | Description                                                                  | Access Level | Resource Type (*: Required) | Condition Key | Alias                                            |
|--------------------------------------|------------------------------------------------------------------------------|--------------|-----------------------------|---------------|--------------------------------------------------|
| oa::deleteResourceGroups             | Grants permission to delete a resource group.                                | write        | -                           | -             | oa:resourceGroups:delete                         |
| oa::listResourceGroupsRegions        | Grants permission to list the regions that the resource groups belong to.    | read         | -                           | -             | oa:resourceGroups:listRegions                    |
| oa::listResourceGroupsResources      | Grants permission to list the resources in a resource group.                 | read         | -                           | -             | oa:resourceGroups:listResources                  |
| oa::listEnterpriseProjectResources   | Grants permission to list the resources of an enterprise project.            | read         | -                           | -             | oa:resourceGroups:listEnterpriseProjectResources |
| oa::listServiceMetrics               | Grants permission to list metrics of a cloud service.                        | read         | -                           | -             | oa:system:listServiceMetrics                     |
| oa::listAlarmMetrics                 | Grants permission to list alarm metrics.                                     | read         | -                           | -             | oa:system:listAlarmMetrics                       |
| oa:applications:listServiceResources | Grants permission to list cloud service resources of an architecture design. | read         | -                           | -             | -                                                |
| oa:applications:saveResourceGroup    | Grants permission to save resource groups of an architecture design.         | write        | -                           | -             | -                                                |
| oa::listResourceTypes                | Grants permission to list resource types.                                    | read         | -                           | -             | oa:system:listResourceTypes                      |
| oa::listAllResourceGroups            | Grants permission to list all resource groups.                               | read         | -                           | -             | oa:resourceGroups:listAll                        |

| Action                                           | Description                                                                                         | Access Level | Resource Type (*: Required) | Condition Key | Alias                                      |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|--------------------------------------------|
| oa:applications:downloadResourceTemplate         | Grants permission to download the resource import template for an architecture design.              | read         | -                           | -             | oa:applications:downloadResourceTemplate   |
| oa:applications:importResources                  | Grants permission to import resources for an architecture design.                                   | read         | -                           | -             | -                                          |
| oa:applications:getResourcesImportResult         | Grants permission to obtain the resource import results of an architecture design.                  | read         | -                           | -             | -                                          |
| oa:applications:saveResourceGroups-Batch         | Grants permission to save resource groups in an architecture design in batches.                     | write        | -                           | -             | -                                          |
| oa:applications:getBatchSaveResourceGroupsResult | Grants permission to obtain the results for batch saving resource groups in an architecture design. | read         | -                           | -             | -                                          |
| oa::downloadResourceTemplate                     | Grants permission to download the resource import template for a resource group.                    | read         | -                           | -             | oa:resourceGroups:downloadResourceTemplate |
| oa::importResourceGroups                         | Grants permission to import resources to a resource group.                                          | read         | -                           | -             | oa:resourceGroups:importResources          |

| Action                                            | Description                                                                  | Access Level | Resource Type (*: Required) | Condition Key | Alias                                      |
|---------------------------------------------------|------------------------------------------------------------------------------|--------------|-----------------------------|---------------|--------------------------------------------|
| oa::getResourcesGroupsImportResult                | Grants permission to obtain the resource import results of a resource group. | read         | -                           | -             | oa:resourceGroups:getResourcesImportResult |
| oa:applications:startServiceRecommendAnalysis     | Grants permission to start service recommendation analysis.                  | write        | -                           | -             | -                                          |
| oa:applications:getServiceRecommendAnalysisResult | Grants permission to obtain the service recommendation analysis results.     | read         | -                           | -             | -                                          |
| oa:applications:listAttachedResources             | Grants permission to list resources associated with an architecture diagram. | read         | -                           | -             | -                                          |
| oa:applications:listNodeAttachedResources         | Grants permission to list resources corresponding to a diagram element.      | read         | -                           | -             | -                                          |
| oa:applications:downloadAttachedResources         | Grants the permission to export resources from an architecture diagram.      | write        | -                           | -             | -                                          |
| oa::getAutoloadConfigs                            | Grants permission to obtain system auto-loaded configurations                | read         | -                           | -             | oa:system:getAutoloadConfigs               |
| oa::listRiskItemsCheckReportsV4                   | Grants permission to obtain risk check reports.                              | read         | -                           | -             | oa:riskItemsCheck:listReportsV4            |

| Action                             | Description                                                                                   | Access Level | Resource Type (*: Required) | Condition Key | Alias                          |
|------------------------------------|-----------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|--------------------------------|
| oa::getResources                   | Grants permission to obtain auto-access resource data.                                        | read         | -                           | -             | oa:system:getAutoloadResources |
| oa:capacityAnalysis:getListMetrics | Grants permission to obtain metrics of risky resources for capacity optimization.             | read         | -                           | -             | -                              |
| oa:capacityAnalysis:getListMonitor | Grants permission to obtain the monitoring data of risky resources for capacity optimization. | read         | -                           | -             | -                              |

## Resources

OA does not support resource-level authorization. To allow access to OA, use a wildcard (\*) in the Resource element of the identity policy, indicating that the policy will be applied to all resources.

## Conditions

OA does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

# 3.15 Migration

## 3.15.1 Object Storage Migration Service (OMS)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [service control policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that

OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify a URN for the Resource element in your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by OMS, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by OMS, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for OMS.

**Table 3-301** Actions supported by OMS

| Action              | Description                                                         | Access Level | Resource Type (*: required) | Condition Key | Alias |
|---------------------|---------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| oms:task:list       | Grant the permission to list migration tasks.                       | list         | task                        | -             | -     |
| oms:task:create     | Grant the permission to create a migration task.                    | write        | task                        | -             | -     |
| oms:task:get        | Grant the permission to query details about a migration task.       | read         | task                        | -             | -     |
| oms:task:delete     | Grant the permission to delete a migration task.                    | write        | task                        | -             | -     |
| oms:task:update     | Grant the permission to update a migration task.                    | write        | task                        | -             | -     |
| oms:synctask:list   | Grant the permission to list synchronization tasks.                 | list         | synctask                    | -             | -     |
| oms:synctask:create | Grant the permission to create a synchronization task.              | write        | synctask                    | -             | -     |
| oms:synctask:get    | Grant the permission to query details about a synchronization task. | read         | synctask                    | -             | -     |
| oms:synctask:delete | Grant the permission to delete a synchronization task.              | write        | synctask                    | -             | -     |

| Action                   | Description                                                            | Access Level | Resource Type (*: required) | Condition Key | Alias |
|--------------------------|------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| oms:synctask:statistics  | Grant the permission to query statistics about a synchronization task. | read         | synctask                    | -             | -     |
| oms:synctask:update      | Grant the permission to update a synchronization task.                 | write        | synctask                    | -             | -     |
| oms:synctask:createEvent | Grant the permission to create a synchronization event.                | write        | synctask                    | -             | -     |
| oms:taskgroup:create     | Grant the permission to create a migration task group.                 | write        | taskgroup                   | -             | -     |
| oms:taskgroup:list       | Grant the permission to list migration task groups.                    | list         | taskgroup                   | -             | -     |
| oms:taskgroup:get        | Grant the permission to query details about a migration task group.    | read         | taskgroup                   | -             | -     |
| oms:taskgroup:delete     | Grant the permission to delete a migration task group.                 | write        | taskgroup                   | -             | -     |
| oms:taskgroup:update     | Grant the permission to update a migration task group.                 | write        | taskgroup                   | -             | -     |

| Action                 | Description                                                                         | Access Level | Resource Type (*: required) | Condition Key | Alias |
|------------------------|-------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| oms::listObjects       | Grant the permission to list objects in a bucket.                                   | list         | -                           | -             | -     |
| oms::checkCdnInfo      | Grant the permission to check the connectivity between a bucket and CDN.            | read         | -                           | -             | -     |
| oms::listBuckets       | Grant the permission to list buckets.                                               | list         | -                           | -             | -     |
| oms::listBucketRegions | Grant the permission to query the region of a bucket.                               | list         | -                           | -             | -     |
| oms::checkBucketPrefix | Grant the permission to check whether a bucket has objects with a specified prefix. | read         | -                           | -             | -     |
| oms::listCloudRegions  | Grant the permission to query regions supported for a cloud vendor.                 | list         | -                           | -             | -     |
| oms::listCloudTypes    | Grant the permission to list supported cloud vendors.                               | list         | -                           | -             | -     |

Each API of OMS usually supports one or more actions. [Table 3-302](#) lists the actions and dependencies supported by OMS APIs.

**Table 3-302** Actions and dependencies supported by OMS APIs

| API                                                               | Action                       | Dependencies |
|-------------------------------------------------------------------|------------------------------|--------------|
| POST /v2/{project_id}/tasks/<br>batch-update                      | oms:task:update              | -            |
| GET /v2/{project_id}/tasks                                        | oms:task:list                | -            |
| POST /v2/{project_id}/tasks                                       | oms:task:create              | -            |
| GET /v2/{project_id}/tasks/<br>{task_id}                          | oms:task:get                 | -            |
| DELETE /v2/{project_id}/<br>tasks/{task_id}                       | oms:task:delete              | -            |
| POST /v2/{project_id}/tasks/<br>{task_id}/stop                    | oms:task:update              | -            |
| POST /v2/{project_id}/tasks/<br>{task_id}/start                   | oms:task:update              | -            |
| PUT /v2/{project_id}/tasks/<br>{task_id}/bandwidth-policy         | oms:task:update              | -            |
| PUT /v2/{project_id}/tasks/<br>{task_id}/access-keys              | oms:task:update              | -            |
| GET /v2/{project_id}/sync-<br>tasks                               | oms:synctask:list            | -            |
| POST /v2/{project_id}/sync-<br>tasks                              | oms:synctask:create          | -            |
| GET /v2/{project_id}/sync-<br>tasks/{sync_task_id}                | oms:synctask:get             | -            |
| DELETE /v2/{project_id}/<br>sync-tasks/{sync_task_id}             | oms:synctask:delete          | -            |
| GET /v2/{project_id}/sync-<br>tasks/{sync_task_id}/<br>statistics | oms:synctask:statistic<br>s  | -            |
| POST /v2/{project_id}/sync-<br>tasks/{sync_task_id}/stop          | oms:synctask:update          | -            |
| POST /v2/{project_id}/sync-<br>tasks/{sync_task_id}/start         | oms:synctask:update          | -            |
| POST /v2/{project_id}/sync-<br>tasks/{sync_task_id}/events        | oms:synctask:createE<br>vent | -            |
| POST /v2/{project_id}/<br>taskgroups                              | oms:taskgroup:create         | -            |
| GET /v2/{project_id}/<br>taskgroups                               | oms:taskgroup:list           | -            |

| API                                                  | Action                 | Dependencies |
|------------------------------------------------------|------------------------|--------------|
| GET /v2/{project_id}/taskgroups/{group_id}           | oms:taskgroup:get      | -            |
| DELETE /v2/{project_id}/taskgroups/{group_id}        | oms:taskgroup:delete   | -            |
| PUT /v2/{project_id}/taskgroups/{group_id}/stop      | oms:taskgroup:update   | -            |
| PUT /v2/{project_id}/taskgroups/{group_id}/start     | oms:taskgroup:update   | -            |
| PUT /v2/{project_id}/taskgroups/{group_id}/retry     | oms:taskgroup:update   | -            |
| PUT /v2/{project_id}/taskgroups/{group_id}/update    | oms:taskgroup:update   | -            |
| POST /v2/{project_id}/objectstorage/buckets/objects  | oms::listObjects       | -            |
| POST /v2/{project_id}/objectstorage/buckets/cdn-info | oms::checkCdnInfo      | -            |
| POST /v2/{project_id}/objectstorage/buckets          | oms::listBuckets       | -            |
| POST /v2/{project_id}/objectstorage/buckets/regions  | oms::listBucketRegions | -            |
| POST /v2/{project_id}/objectstorage/buckets/prefix   | oms::checkBucketPrefix | -            |
| GET /v2/{project_id}/objectstorage/data-center       | oms::listCloudRegions  | -            |
| GET /v2/{project_id}/objectstorage/cloud-type        | oms::listCloudTypes    | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-303](#), a resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to the resource. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in a policy to define resource types.

The following table lists the resource types that you can specify in identity policy statements for OMS.

**Table 3-303** Resource types supported by OMS

| Resource Type | URN                                              |
|---------------|--------------------------------------------------|
| Task          | oms:<region>:<account-id>:task:*                 |
|               | oms:<region>:<account-id>:task:<task-id>         |
| SyncTask      | oms:<region>:<account-id>:synctask:*             |
|               | oms:<region>:<account-id>:synctask:<synctask-id> |
| TaskGroup     | oms:<region>:<account-id>:taskgroup:*            |
|               | oms:<region>:<account-id>:taskgroup:*            |

**NOTICE**

Currently, synchronization task APIs are available only in CN South-Guangzhou-InvitationOnly, CN North-Beijing4, and CN East-Shanghai1.

## Conditions

OMS does not support service-specific condition keys in identity policies.

It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

## 3.15.2 Server Migration Service (SMS)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [service control policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs just determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).

- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify a URN for the Resource element in your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by SMS, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by SMS, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for SMS.

**Table 3-304** Actions supported by SMS

| Action            | Description                          | Access Level | Resource Type (*: required) | Condition Key | Alias                  |
|-------------------|--------------------------------------|--------------|-----------------------------|---------------|------------------------|
| sms:template:list | Grants permission to list templates. | list         | template                    | -             | sms:server:queryServer |

| Action                         | Description                                                          | Access Level | Resource Type (*: required) | Condition Key         | Alias                      |
|--------------------------------|----------------------------------------------------------------------|--------------|-----------------------------|-----------------------|----------------------------|
| sms:template:create            | Grants permission to create a template.                              | write        | template                    | -                     | sms:server:migrationServer |
| sms:template:batchDelete       | Grants permission to batch delete templates.                         | write        | template                    | -                     | -                          |
| sms:template:get               | Grants permission to query the information about a template.         | read         | template                    | -                     | sms:server:queryServer     |
| sms:template:update            | Grants permission to modify a template.                              | write        | template                    | -                     | sms:server:migrationServer |
| sms:template:getTargetPassword | Grants permission to query the target server password in a template. | read         | template                    | -                     | sms:server:queryServer     |
| sms:template:delete            | Grants permission to delete a template.                              | write        | template                    | -                     | sms:server:migrationServer |
| sms:server:listErrors          | Grants permission to list failed source servers.                     | list         | server                      | -                     | server:queryServer         |
| sms:server:list                | Grants permission to list source servers.                            | list         | server                      | g:EnterpriseProjectId | sms:server:queryServer     |
| sms:server:register            | Grants permission to register a source server with SMS.              | write        | server                      | g:EnterpriseProjectId | sms:server:registerServer  |

| Action                    | Description                                                                | Access Level | Resource Type (*: required) | Condition Key                         | Alias                      |
|---------------------------|----------------------------------------------------------------------------|--------------|-----------------------------|---------------------------------------|----------------------------|
| sms:server:batchDelete    | Grants permission to batch delete source server records.                   | write        | server                      | <a href="#">g:EnterpriseProjectId</a> | -                          |
| sms:server:get            | Grants permission to query the details about a source server.              | read         | server                      | <a href="#">g:EnterpriseProjectId</a> | sms:server:queryServer     |
| sms:server:update         | Grants permission to modify a source server name.                          | write        | server                      | <a href="#">g:EnterpriseProjectId</a> | sms:server:migrationServer |
| sms:server:delete         | Grants permission to delete a source server record.                        | write        | server                      | <a href="#">g:EnterpriseProjectId</a> | sms:server:migrationServer |
| sms:server:updateDiskInfo | Grants permission to update disk information.                              | write        | server                      | <a href="#">g:EnterpriseProjectId</a> | sms:server:registerServer  |
| sms:server:overview       | Grants permission to obtain the summary of source servers.                 | read         | server                      | -                                     | sms:server:queryServer     |
| sms:server:updateState    | Grants permission to update the migration task status for a source server. | write        | server                      | <a href="#">g:EnterpriseProjectId</a> | sms:server:migrationServer |
| sms:server:listTask       | Grants permission to list migration tasks.                                 | list         | server                      | <a href="#">g:EnterpriseProjectId</a> | sms:server:queryServer     |
| sms:server:createTask     | Grants permission to create a migration task.                              | write        | server                      | <a href="#">g:EnterpriseProjectId</a> | sms:server:migrationServer |

| Action                        | Description                                                    | Access Level | Resource Type (*: required) | Condition Key                         | Alias                      |
|-------------------------------|----------------------------------------------------------------|--------------|-----------------------------|---------------------------------------|----------------------------|
| sms:server:batchDeleteTask    | Grants permission to batch delete migration tasks.             | write        | server                      | <a href="#">g:EnterpriseProjectId</a> | -                          |
| sms:server:getTask            | Grants permission to query the details about a migration task. | read         | server                      | <a href="#">g:EnterpriseProjectId</a> | sms:server:queryServer     |
| sms:server:updateTask         | Grants permission to update a migration task.                  | write        | server                      | <a href="#">g:EnterpriseProjectId</a> | sms:server:migrationServer |
| sms:server:deleteTask         | Grants permission to delete a migration task.                  | write        | server                      | <a href="#">g:EnterpriseProjectId</a> | sms:server:deleteTask      |
| sms:server:manageTask         | Grants permission to manage migration tasks.                   | write        | server                      | <a href="#">g:EnterpriseProjectId</a> | sms:server:migrationServer |
| sms:server:updateTaskProgress | Grants permission to report the migration progress and rate.   | write        | server                      | <a href="#">g:EnterpriseProjectId</a> | sms:server:migrationServer |
| sms:server:unlock             | Grants permission to unlock a target server.                   | write        | server                      | <a href="#">g:EnterpriseProjectId</a> | -                          |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-306](#), a resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to the resource. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in a policy to define resource types.

The following table lists the resource types that you can specify in identity policy statements for SMS.

**Table 3-306** Resource types supported by SMS

| Resource Type | URN                                          |
|---------------|----------------------------------------------|
| server        | sms::<account-id>:server:*                   |
|               | sms::<account-id>:server:<server-id>         |
| Task          | sms::<account-id>:task:*                     |
|               | sms::<account-id>:task:<task-id>             |
| template      | sms::<account-id>:template:*                 |
|               | sms::<account-id>:template:<template-id>     |
| migproject    | sms::<account-id>:migproject:*               |
|               | sms::<account-id>:migproject:<migproject-id> |

## Conditions

SMS does not support service-specific condition keys in identity policies.

It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

## 3.16 Customer Services

### 3.16.1 Billing Center

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [service control policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM policies are different from Organizations SCPs, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (such as **list**, **read**, or **write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resources types defined by Billing Center, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by Billing Center, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for Billing Center.

**Table 3-307** Actions supported by Billing Center

| Action                          | Permissions                                                                                                                 | Access Level | Resource Type (*: required) | Condition Key                         | Alias |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------------------------------|-------|
| billing:balance:update          | Grants permission to withdraw money, top up the account, make payments, and enable balance alerting.                        | write        | -                           | -                                     | -     |
| billing:balance:view            | Grants permission to view account statements, payment records, expenditure quotas, account adjustment records, and arrears. | list         | -                           | <a href="#">g:EnterpriseProjectId</a> | -     |
| billing:balance:export          | Grants permission to export transaction and payment records.                                                                | read         | -                           | -                                     | -     |
| billing:bill:update             | Grants permission to update bills.                                                                                          | write        | -                           | -                                     | -     |
| billing:bill:view               | Grants permission to view bills, expenditures of the current month, and expenditure trends.                                 | list         | -                           | <a href="#">g:EnterpriseProjectId</a> | -     |
| billing:bill:export             | Grants permission to export the bill summary.                                                                               | read         | -                           | <a href="#">g:EnterpriseProjectId</a> | -     |
| billing:billDetail:update       | Grants permission to update bill details.                                                                                   | write        | -                           | <a href="#">g:EnterpriseProjectId</a> | -     |
| billing:billDetail:view         | Grants permission to view bill details.                                                                                     | read         | -                           | <a href="#">g:EnterpriseProjectId</a> | -     |
| billing:billDetail:export       | Grants permission to export bill details.                                                                                   | read         | -                           | <a href="#">g:EnterpriseProjectId</a> | -     |
| billing:resourcePackages:view   | Grants permission to view resource packages, remaining usage, and usage details, and to export resource usage details.      | list         | -                           | -                                     | -     |
| billing:resourcePackages:update | Grants permission to set alerts for remaining usage of resource packages.                                                   | write        | -                           | -                                     | -     |

| Action                           | Permissions                                                                                                                                         | Access Level | Resource Type (*: required) | Condition Key         | Alias |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|--------------|-----------------------------|-----------------------|-------|
| billing:contract:update          | Grants permission to view offline contracts.                                                                                                        | write        | -                           | -                     | -     |
| billing:coupon:view              | Grants permission to view and activate coupons.                                                                                                     | read         | -                           | -                     | -     |
| billing:contract:viewDiscount    | Grants permission to view commercial discounts.                                                                                                     | read         | -                           | -                     | -     |
| billing:invoice:manage           | Grants permission to manage invoices.                                                                                                               | write        | -                           | -                     | -     |
| billing:invoice:view             | Grants permission to view invoice history and details.                                                                                              | read         | -                           | -                     | -     |
| billing:invoice:export           | Grants permission to export invoice information and download invoices.                                                                              | read         | -                           | -                     | -     |
| billing:order:pay                | Grants permission to pay for orders.                                                                                                                | write        | -                           | g:EnterpriseProjectId | -     |
| billing:order:view               | Grants permission to view order information and pay-per-usage resource packages.                                                                    | list         | -                           | g:EnterpriseProjectId | -     |
| billing:subscription:renew       | Grants permission to renew resources, enable auto-renewal, set expiration policies, and change the billing mode from pay-per-use to yearly/monthly. | write        | -                           | g:EnterpriseProjectId | -     |
| billing:subscription:view        | Grants permission to view renewals and query resources that can be changed from pay-per-use to yearly/monthly.                                      | list         | -                           | g:EnterpriseProjectId | -     |
| billing:subscription:unsubscribe | Grants permission to view resources that can be unsubscribed from and have been unsubscribed from.                                                  | write        | -                           | g:EnterpriseProjectId | -     |
| billing:consumption:view         | Grants permission to view expenditure breakdowns by enterprise project.                                                                             | read         | -                           | -                     | -     |
| billing::activeEPFinance         | Grants permission to enable or disable EPS.                                                                                                         | write        | -                           | -                     | -     |

| Action                          | Permissions                                                                             | Access Level | Resource Type (*: required) | Condition Key | Alias |
|---------------------------------|-----------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| billing::activeEPFundQuota      | Grants permission to enable or disable the fund quota function for enterprise projects. | write        | -                           | -             | -     |
| billing::viewEPFundQuota        | Grants permission to query the fund quota of an enterprise project.                     | read         | -                           | -             | -     |
| billing::updateEPFundQuota      | Grants permission to modify the fund quota of an enterprise project.                    | write        | -                           | -             | -     |
| billing::listEPFundQuotaHistory | Grants permission to view the fund quota adjustment records of enterprise projects.     | read         | -                           | -             | -     |
| billing::updateEPGroup          | Grants permission to modify enterprise project groups.                                  | write        | -                           | -             | -     |
| billing::viewEPGroup            | Grants permission to view enterprise project groups.                                    | read         | -                           | -             | -     |

For details about the relationship between Billing Center APIs and actions, see [Customer Operations](#).

## Resources

Billing Center does not support resource-level authorization. To allow access to Billing Center, use a wildcard (\*) in the Resource element of the identity policy, indicating that the identity policy will be applied to all resources.

## Conditions

### Condition Key

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).

- Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, **BILLING:**) only apply to operations of the specified service. For details, see [Table 3-308](#).
- The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so `g:SourceVpce` is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so `g:TagKeys` is a multivalued condition key.
- A condition operator, a condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [Operators](#).

### Service-specific Condition Keys Supported by Billing Center

The following table lists the condition keys that you can define in identity policies for Billing Center. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-308** Service-specific condition keys supported by Billing Center

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                                                                       |
|--------------------------------|--------|-------------------------------|-----------------------------------------------------------------------------------|
| billing:cloudServiceType       | string | Multivalued                   | Filter access based on the cloud service type specified in the request parameter. |

### Condition Key Examples

billing:cloudServiceType

Example: Only cloud service resources of the `hws.service.type.ebs` type can be unsubscribed from.

```
{  "Version": "5.0",  "Statement": [{    "Effect": "Allow",    "Action": "billing:subscription:unsubscribe",    "Condition": {      "ForAnyValue:StringEquals": {        "billing:cloudServiceType": "hws.service.type.ebs"      }    }  } ]}
```

## 3.16.2 Cost Center

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [service control policies \(SCPs\)](#) for access control.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM policies are different from Organizations SCPs, see [What Are the Differences Between IAM Policies and Organizations SCPs?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP policy, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (such as **list**, **read**, or **write**). This classification helps you understand the level of access that an action grants when you use it in a policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by Cost Center, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by Cost Center, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for Cost Center.

**Table 3-309** Actions supported by Cost Center

| Action                                | Description                                                                                           | Access Level | Resource Type (*: required) | Condition Key | Alias                   |
|---------------------------------------|-------------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------------------------|
| costCenter:accessAccount:view         | Grants permission to view access accounts.<br>(Only available on the Chinese mainland website.)       | read         | -                           | -             | bss:accessAccount:view  |
| costCenter:costAnalysis:listCosts     | Grants permission to view cost analyses.                                                              | read         | -                           | -             | bss:costanalysis:view   |
| costCenter:costAnalysis:configReport  | Grants permission to manage cost reports, including creating, modifying, and deleting custom reports. | write        | -                           | -             | bss:costreport:update   |
| costCenter:costAnalysis:listReports   | Grants permission to view a list of cost reports.                                                     | read         | -                           | -             | bss:costreport:view     |
| costCenter:costDetail:listCostDetails | Grants permission to view cost details.                                                               | read         | -                           | -             | bss:costanalysis:view   |
| costCenter:budget:configBudget        | Grants permission to manage budgets, including creating, modifying, and deleting budgets.             | write        | -                           | -             | bss:budget:update       |
| costCenter:budget:viewBudget          | Grants permission to view budget information, including the budget list and budget details.           | read         | -                           | -             | bss:budget:view         |
| costCenter:budget:deleteBudgetReport  | Grants permission to delete a budget report.                                                          | write        | -                           | -             | bss:budgetreport:delete |
| costCenter:budget:configBudgetReport  | Grants permission to add and modify a budget report.                                                  | write        | -                           | -             | bss:budgetreport:update |
| costCenter:budget:viewBudgetReport    | Grants permission to view budget reports, including the report list and details.                      | read         | -                           | -             | bss:budgetreport:view   |

| Action                                                     | Description                                                                                       | Access Level | Resource Type (*: required) | Condition Key | Alias                         |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------------------------------|
| costCenter:costAnomalyDetection:deleteMonitor              | Grants permission to delete a cost monitor.                                                       | write        | -                           | -             | bss:monitor:delete            |
| costCenter:costAnomalyDetection:configMonitor              | Grants permission to add and edit a cost monitor.                                                 | write        | -                           | -             | bss:monitor:update            |
| costCenter:costAnomalyDetection:viewMonitor                | Grants permission to view cost monitors and anomalies.                                            | read         | -                           | -             | bss:monitor:view              |
| costCenter:costAnomalyDetection:configMonitorAlert         | Grants permission to configure alerting for cost anomalies.                                       | write        | -                           | -             | bss:monitor:alert:update      |
| costCenter:costAnomalyDetection:viewMonitorAlert           | Grants permission to view cost anomaly alerts.                                                    | read         | -                           | -             | bss:monitor:alert:view        |
| costCenter:recommendation:viewRecommendationSummary        | Grants permission to view the summary of cost optimization recommendations.                       | read         | -                           | -             | bss:recommendation:view       |
| costCenter:recommendation:viewRecommendationSubscription   | Grants permission to query subscriptions to cost optimization recommendations.                    | read         | -                           | -             | bss:recommendation:sub:view   |
| costCenter:recommendation:configRecommendationSubscription | Grants permission to configure or delete subscriptions to cost optimization recommendations.      | write        | -                           | -             | bss:recommendation:sub:update |
| costCenter:recommendation:viewYearlyMonthlyRecommendation  | Grants permission to view the cost optimization option of changing pay-per-use to yearly/monthly. | read         | -                           | -             | bss:costoptimization:view     |

| Action                                                       | Description                                                                                                                     | Access Level | Resource Type (*: required) | Condition Key | Alias                           |
|--------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|---------------------------------|
| costCenter:recommendation:viewResourcePkgRecommendation      | Grants permission to view resource package purchase recommendations.<br>(Only available on the Chinese mainland website.)       | read         | -                           | -             | bss:packageRecommendation:view  |
| costCenter:recommendation:viewResourceOptimizeRecommendation | Grants permission to view optimization recommendations for idle resources.<br>(Only available on the Chinese mainland website.) | read         | -                           | -             | bss:instanceOptimization:view   |
| costCenter:recommendation:configPreference                   | Grants permission to define idle resource identifying rules.<br>(Only available on the Chinese mainland website.)               | write        | -                           | -             | bss:instanceOptimization:update |
| costCenter:costTag:updateStatus                              | Grants permission to activate or deactivate cost tags.                                                                          | write        | -                           | -             | bss:costtag:update              |
| costCenter:costTag:listCostTags                              | Grants permission to view cost tags.                                                                                            | read         | -                           | -             | bss:costtag:view                |
| costCenter:costCategory:deleteCostCategory                   | Grants permission to delete a cost category.                                                                                    | write        | -                           | -             | bss:costunit:delete             |
| costCenter:costCategory:configCostCategory                   | Grants permission to configure cost categories, including creating and editing cost categories.                                 | write        | -                           | -             | bss:costunit:update             |
| costCenter:resourceCategory:view                             | Grants permission to view the multi-level cost directory.<br>(Only available on the Chinese mainland website.)                  | read         | -                           | -             | bss:resourceCategory:view       |

| Action                                                   | Description                                                                                                                               | Access Level | Resource Type (*: required) | Condition Key | Alias                               |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------------------------------------|
| costCenter:costCategory:viewCostCategory                 | Grants permission to view cost category information, including the cost category list and the details of each cost category.              | read         | -                           | -             | bss:costunit:view                   |
| costCenter:cloudIntelligenceDashboard:view               | Grants permission to view the cloud intelligence dashboard.<br>(Only available on the Chinese mainland website.)                          | read         | -                           | -             | bss:cloudIntelligenceDashboard:view |

| costCenter::updateCostConfig                 | Grants permission to enable Cost Center functions.                                                                         | write        | -                           | -             | bss:costpreferences:update            |
| costCenter:preference:delete                 | Grants permission to disable Cost Center functions.                                                                        | write        | -                           | -             | bss:costpreferences:delete            |
| costCenter:costdetailreport:viewReportTask   | Grants permission to view the task list for exporting cost details to OBS.                                                 | read         | -                           | -             | bss:costdetailreport:view             |
| costCenter:costdetailreport:configReportTask | Grants permission to create, modify, or delete the tasks of exporting cost details to OBS.                                 | write        | -                           | -             | bss:costdetailreport:update           |
| costCenter:resourcePackage:viewLowUsageAlert | Grants permission to view alerts for underutilized resource packages.<br>(Only available on the Chinese mainland website.) | read         | -                           | -             | bss:resourcepackage:viewlowusagealert |
| costCenter:helper:listCostAllocations        | Grants permission to view the percentage of allocated costs.                                                               | list         | -                           | -             | bss:costhelper:viewcostallocations    |
| costCenter:helper:viewCostRating             | Grants permission to view cost allocation maturity rating.                                                                 | read         | -                           | -             | bss:costhelper:viewcostrating         |
| costCenter:resourceCategory:config           | Grants permission to configure the multi-level cost directory.<br>(Only available on the Chinese mainland website.)        | write        | -                           | -             | bss:resourceCategory:config           |
| costCenter:accessAccount:config              | Grants permission to configure access accounts.<br>(Only available on the Chinese mainland website.)                       | write        | -                           | -             | bss:accessAccount:config              |

| Action                                          | Description                                                                                                                     | Access Level | Resource Type (*: required) | Condition Key | Alias                                   |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-----------------------------------------|
| costCenter:resourcePackage:configLowUsageAlert  | Grants permission to configure alerts for underutilized resource packages.<br>(Only available on the Chinese mainland website.) | write        | -                           | -             | bss:resourcepackage:configlowusagealert |
| costCenter:costAnomalyDetection:provideFeedback | Grants permission to provide feedback on cost anomalies.                                                                        | read         | -                           | -             | -                                       |

For details about the relationship between Cost Center APIs and actions, see [Customer Operations](#).

## Resources

Cost Center does not support resource-level authorization. To allow access to Cost Center, use a wildcard (\*) in the Resource element of the identity policy, indicating that the policy will be applied to all resources.

## Conditions

Cost Center does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.16.3 My Account

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [service control policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM policies are different from Organizations SCPs, see [What Are the Differences Between IAM Policies and Organizations SCPs?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP policy, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (such as **list**, **read**, or **write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.
- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by My Account, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for My Account.

**Table 3-310** Actions supported by My Account

| Action                     | Description                                                                | Access Level | Resource Type (*: required) | Condition Key | Alias |
|----------------------------|----------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| account:accountinfo:update | Update account information, including basic information and preferences.   | write        | -                           | -             | -     |
| account:cps:view           | View the promotion data of Recommendations and Rebates by cloud promoters. | read         | -                           | -             | -     |
| account:cps:update         | Join the reward promotion program.                                         | write        | -                           | -             | -     |
| account:privilege:view     | View my privileges and prizes.                                             | read         | -                           | -             | -     |

## Resources

My Account does not support resource-specific permission control in identity policies. If you want to allow access to My Account, use the wildcard (\*) for the Resource element to apply identity policies to all resources.

## Conditions

My Account does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.16.4 Enterprise Center

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM policies, you can use [service control policies \(SCPs\)](#) provided by [Organizations](#) for access control.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM policies are different from Organizations SCPs, see [What Are the Differences Between IAM Policies and Organizations SCPs?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP policy, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions, and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by Enterprise Center, see [Conditions](#).

- The **Alias** column lists the policy actions that can be configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for Enterprise Center.

**Table 3-311** Actions supported by Enterprise Center

| Action                                        | Description                                                                     | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-----------------------------------------------|---------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| businessUnitCenter::active                    | Grants permission to enable and disable Enterprise Center.                      | write        | -                           | -             | -     |
| businessUnitCenter:bill:update                | Grants permission to manage bills for enterprise members.                       | write        | -                           | -             | -     |
| businessUnitCenter:bill:view                  | Grants permission to view bills of member accounts.                             | read         | -                           | -             | -     |
| businessUnitCenter:billDetail:update          | Grants permission to perform operations on bill details for enterprise members. | write        | -                           | -             | -     |
| businessUnitCenter:billDetail:view            | Grants permission to view bill details of member accounts.                      | read         | -                           | -             | -     |
| businessUnitCenter:businessUnitFinance:update | Grants permission to modify organization accounting information.                | write        | -                           | -             | -     |
| businessUnitCenter:businessUnitFinance:view   | Grants permission to view organization accounting information.                  | read         | -                           | -             | -     |

| Action                                       | Description                                            | Access Level | Resource Type (*: required) | Condition Key | Alias |
|----------------------------------------------|--------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| businessUnitCenter:businessUnit:update       | Grants permission to modify organizations and accounts | write        | -                           | -             | -     |
| businessUnitCenter:businessUnit:view         | Grants permission to view organizations and accounts   | read         | -                           | -             | -     |
| businessUnitCenter:businessUnitBudget:update | Grants permission to update organization budgets       | write        | -                           | -             | -     |
| businessUnitCenter:businessUnitBudget:view   | Grants permission to view organization budgets         | read         | -                           | -             | -     |
| businessUnitCenter:businessUnitPolicy:update | Grants permission to modify organization policies.     | write        | -                           | -             | -     |

For details about the relationship between Enterprise Center APIs and actions, see [Customer Operations](#).

## Resource Type (\*: required)

Enterprise Center does not support resource-specific permission control in identity policies. If you want to allow access to Enterprise Center, use the wildcard (\*) for the Resource element to apply identity policies to all resources.

## Conditions

Enterprise Center does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.16.5 Customer Operation Capabilities

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted IAM permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM policies are different from Organizations SCPs, see [What Are the Differences Between IAM Policies and Organizations SCPs?](#)

This section describes the authorization elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP policy, see [Creating an SCP](#).

#### Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**list**, **read**, or **write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by BSS, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.

- If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about condition keys defined by BSS, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements.

 **NOTE**

The **billing:contract:viewDiscount** permission code only affects the discount information returned in the response, but it does not affect the API call. When there is no permission, the API can still be accessed normally, but it will not return the discount information.

**Table 3-312** Actions supported by BSS

| Action                        | Description                                                                                                                                | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| billing:contract:viewDiscount | Grants the permission to view discounts                                                                                                    | read         | -                           | -             | -     |
| billing:balance:view          | Grants the permission to view income and expense details, historical payment records, consumption quotas, adjustment records, and arrears. | list         | -                           | -             | -     |
| billing:coupon:view           | Grants the permission to view coupons, stored value cards, and cash coupons.                                                               | read         | -                           | -             | -     |
| billing:order:view            | Grants the permission to view order information and pay-per-use packages.                                                                  | list         | -                           | -             | -     |
| billing:order:pay             | Grants the permission to pay orders.                                                                                                       | write        | -                           | -             | -     |
| billing:subscription:view     | Grants the permission to view renewals and query resources that can be changed from pay-per-use to yearly/monthly.                         | read         | -                           | -             | -     |

| Action                               | Description                                                                                                                                         | Access Level | Resource Type (*: required) | Condition Key | Alias |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| billing:subscription:renew           | Grants the permission to renew subscriptions, enable auto-renewal, set expiration policies, and change pay-per-use subscriptions to yearly/monthly. | write        | -                           | -             | -     |
| billing:subscription:unsubscribe     | Grants the permission to view unsubscribed resources, unsubscribe from resources, cancel delivery, and return or replace hardware.                  | write        | -                           | -             | -     |
| billing:resourcePackages:view        | Grants the permission to view resource packages and remaining amount and query or export usage details.                                             | list         | -                           | -             | -     |
| billing:billDetail:view              | Grants the permission to view order details.                                                                                                        | read         | -                           | -             | -     |
| billing:bill:view                    | Grants the permission to view bills, expenditures of the current month, paid resources in the last seven days, and expenditure trends.              | list         | -                           | -             | -     |
| costCenter:costAnalysis:listCosts    | Grants the permission to view cost analysis.                                                                                                        | read         | -                           | -             | -     |
| Billing::activeEP Finance            | Grants the permission to enable the enterprise project function.                                                                                    | write        | -                           | -             | -     |
| businessUnitCenter:businessUnit:view | Grants the permission to view organizations and accounts.                                                                                           | read         | -                           | -             | -     |

| Action                 | Description                                                                                          | Access Level | Resource Type (*: required) | Condition Key | Alias |
|------------------------|------------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| billing:invoice:manage | Grants the permission to manage invoices, request invoices, and manage invoice titles and addresses. | write        | -                           | -             | -     |

Each API usually supports one or more actions. [Table 3-313](#) lists the supported actions and dependencies.

#### NOTE

If fine-grained authentication fails, the value of **encoded\_authorization\_message** in the response can be viewed only after being decrypted by calling the API provided by STS. APIE address of the decryption API: [Decoding the Authentication Failure Cause](#).

Note: The caller must have the **sts::decodeAuthorizationMessage** permission to call the decryption API on APIE. Otherwise, the error message "STS5.1001" is displayed.

**Table 3-313** Actions and dependencies supported by BSS APIs

| Scenario          | Sub-Scenario                          | API                                   | API URL                                                | Action                        | Action                                 | Dependency |

## Resources

BSS does not support resource-specific permission control in identity policies. If you want to allow access to BSS, use the wildcard (\*) for the Resource element to apply policies to all resources.

## Conditions

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, **BSS:**) only apply to operations of the BSS service. For details, see [Table 3-314](#).

- The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so `g:SourceVpce` is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so `g:TagKeys` is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see .

The following table lists the condition keys that you can define in identity policies for BSS. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-314** Service-specific condition keys supported by BSS

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                                                                                               |
|--------------------------------|--------|-------------------------------|-----------------------------------------------------------------------------------------------------------|
| billing:cloudServiceType       | string | Multi-value                   | Filter access based on the cloud service type specified in the request parameter.<br><a href="#">FAQs</a> |

### Condition Key Examples

- billing:cloudServiceType

Example: Only orders of cloud service resources whose service type is **hws.service.type.ebs** can be unsubscribed from.

```
{
  "Version": "5.0",
  "Statement": [{
    "Effect": "Allow",
    "Action": [
      "billing:subscription:unsubscribe"
    ],
    "Condition": {
      "ForAnyValue:StringEquals": {
        "billing:cloudServiceType": [
          "hws.service.type.ebs"
        ]
      }
    }
  ]
}
```
