| GET /v3/{project_id}/instances/{instance_id}/starrocks/slowlog-sensitive                              | gaussdbformysql:log:getSlowLogs                   | -              |
| PUT /v3/{project_id}/instances/{instance_id}/starrocks/slowlog-sensitive                              | gaussdbformysql:log:setSlowLogSensitiveStatus     | -              |

## Resources

A resource type indicates the resources that a policy applies to. If you specify a resource type for any action in [Table 3-121](#), the resource URN must be specified in the policy statements using that action, and the policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the policy applies to all resources. You can also set condition keys in a policy to define resource types.

The following table lists the resource type that you can define in custom policies for TaurusDB.

**Table 3-121** Resource type supported by TaurusDB

| Resource Type | URN                                                          |
|---------------|--------------------------------------------------------------|
| instance      | gaussdbformysql:<region>:<account-id>:instance:<instance-id> |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, **gaussdbformysql:**) apply only to operations of the TaurusDB service. For details, see [Table 3-122](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so **g:SourceVpce** is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so **g:TagKeys** is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can only be applied when its request conditions are met. For supported condition operators, see [Condition operators](#).

### Service-specific Condition Keys Supported by TaurusDB

The following table lists the condition keys that you can define in identity policies for TaurusDB. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-122** Service-specific condition keys supported by TaurusDB

| Service-specific Condition Key                          | Type   | Single-valued/<br>Multivalued | Description                                                                                             |
|---------------------------------------------------------|--------|-------------------------------|---------------------------------------------------------------------------------------------------------|
| <a href="#">gaussdbformysql:FlavorType</a>              | String | Single-valued                 | Filters access by the specification type tag key that is passed in the request.                         |
| <a href="#">gaussdbformysql:SubnetId</a>                | String | Single-valued                 | Filters access by the subnet ID tag key that is passed in the request.                                  |
| <a href="#">gaussdbformysql:VpcId</a>                   | String | Single-valued                 | Filters access by the VPC ID tag key that is passed in the request.                                     |
| <a href="#">gaussdbformysql:ReplicationTargetRegion</a> | String | Single-valued                 | Filters access by the tag key that specifies the region a backup is to be replicated to in the request. |

### Examples of Condition Keys

- gaussdbformysql:FlavorType

For example, only Arm instances can be created.

```
{
  "Version": "5.0",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "gaussdbformysql:instance:create"
      ],
      "Condition": {
        "StringEquals": {
          "gaussdbformysql:FlavorType": [
            "ARM"
          ]
        }
      }
    }
  ]
}
```

- gaussdbformysql:SubnetId

For example, only instances whose **SubnetId** is **SubnetId-a** can be created.

```
{
  "Version": "5.0",
  "Statement": [
```

```
{
  "Effect": "Allow",
  "Action": [
    "gaussdbformysql:instance:create"
  ],
  "Condition": {
    "StringEquals": {
      "gaussdbformysql:SubnetId": [
        "SubnetId-a"
      ]
    }
  }
}
```

- gaussdbformysql:VpcId

For example, only instances whose **VPC** is **vpcId-a** can be created.

```
{
  "Version": "5.0",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "gaussdbformysql:instance:create"
      ],
      "Condition": {
        "StringEquals": {
          "gaussdbformysql:VpcId": [
            "vpcId-a"
          ]
        }
      }
    }
  ]
}
```

- gaussdbformysql:ReplicationTargetRegion

For example, cross-region backups can only be stored in the destination **region-a**.

```
{
  "Version": "5.0",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "gaussdbformysql:backup:modifyPolicy"
      ],
      "Condition": {
        "StringEquals": {
          "gaussdbformysql:ReplicationTargetRegion": [
            "region-a"
          ]
        }
      }
    }
  ]
}
```

### 3.6.6 DAS

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the **Organizations** service also provides **Service Control Policy (SCP)** to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM policies are different from Organizations SCPs, see **What Are the Differences in Access Control Between IAM and Organizations?**

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see **Creating a Custom Identity Policy**.
- For details about how to use these elements to create a custom SCP, see **Creating an SCP**.

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by DAS, see **Resources**.

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by DAS, see **Conditions**.

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see **Policies and Identity Policies**.

The following table lists the actions that you can define in identity policy statements for DAS.

**Table 3-123** Actions supported by DAS

| Action                                | Description                                                      | Access Level | Resource Type (*: required) | Condition Key                                               | Alias                  |
|---------------------------------------|------------------------------------------------------------------|--------------|-----------------------------|-------------------------------------------------------------|------------------------|
| das:instance:createConnection         | Grants the permission to add database connections.               | Write        | Instance                    | -                                                           | das:connections:create |
| das:connection:login                  | Grants the permission to connect to a DB instance.               | Write        | Connection                  | -                                                           | das:connections:login  |
| das:instance:dbLogin                  | Grants the permission to connect to a DB instance from DBS.      | Write        | Instance                    | -                                                           | das:connections:login  |
| das:connection:modify                 | Grants the permission to modify database connection information. | Write        | Connection                  | -                                                           | das:connections:modify |
| das:connection:delete                 | Grants the permission to delete database connection information. | Write        | Connection                  | -                                                           | das:connections:delete |
| das:connection:list                   | Grants the permission to obtain the connection information list. | List         | Connection                  | -                                                           | das:connections:list   |
| das:connection:createShareConnections | Grants the permission to create shared connections.              | Write        | Connection                  | das:TargetOrgPath<br>das:TargetOrgId<br>das:TargetAccountId | -                      |

| Action                                | Description                                                 | Access Level | Resource Type (*: required) | Condition Key | Alias |
|---------------------------------------|-------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| das:connection:cancelShareConnections | Grants the permission to delete shared connections.         | Write        | Connection                  | -             | -     |
| das:clouddba:getDbUser                | Grants the permission to obtain database user information.  | Read         | Instance                    | -             | -     |
| das:clouddba:registerDbUser           | Grants the permission to add database connections.          | Write        | Instance                    | -             | -     |
| das:clouddba:listDbUser               | Grants permission to query database users.                  | List         | Instance                    | -             | -     |
| das:clouddba:modifyDbUser             | Grants permission to change permissions of a database user. | Write        | Instance                    | -             | -     |
| das:clouddba:deleteDbUser             | Grants permission to delete a database user.                | Write        | Instance                    | -             | -     |
| das:clouddba:listInnoDBLock           | Grants the permission to display InnoDB lock waits.         | List         | Instance                    | -             | -     |
| das:clouddba:listMetadataLock         | Grants the permission to query metadata locks.              | List         | Instance                    | -             | -     |
| das:clouddba:deleteProcess            | Grants the permission to delete an instance session.        | Write        | Instance                    | -             | -     |

| Action                             | Description                                             | Access Level | Resource Type (*: required) | Condition Key | Alias                         |
|------------------------------------|---------------------------------------------------------|--------------|-----------------------------|---------------|-------------------------------|
| das:clouddba:listSlowSql           | Grants the permission to query the slow query logs.     | List         | Instance                    | -             | das:clouddba:slowSqlList      |
| das:clouddba:slowSqlExport         | Grants the permission to export slow query logs.        | List         | Instance                    | -             | -                             |
| das:clouddba:listFullSql           | Grants the permission to query the all query logs.      | List         | Instance                    | -             | das:clouddba:fullSqlList      |
| das:clouddba:fullSqlExport         | Grants the permission to export all query logs.         | List         | Instance                    | -             | -                             |
| das:clouddba:listTopSql            | Grants the permission to query the top SQL list.        | List         | Instance                    | -             | das:clouddba:topSqlList       |
| das:clouddba:listProcess           | Grants the permission to query sessions of an instance. | List         | Instance                    | -             | -                             |
| das:clouddba:changePaymentMode     | Grants the permission to set the payment mode.          | Write        | Instance                    | -             | -                             |
| das:clouddba:dailyReportsSubscribe | Grants the permission to subscribe to daily reports.    | Write        | Instance                    | -             | -                             |
| das:clouddba:listDailyReports      | Grants the permission to query daily reports.           | List         | Instance                    | -             | das:clouddba:dailyReportsList |

| Action                                | Description                                                                                                     | Access Level | Resource Type (*: required) | Condition Key | Alias                            |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|----------------------------------|
| das:clouddba:listSpaceAnalysis        | Grants the permission to query space diagnosis tasks.                                                           | List         | Instance                    | -             | -                                |
| das:clouddba:listSqlLimitRules        | Grants the permission to query SQL throttling rules.                                                            | List         | Instance                    | -             | -                                |
| das:clouddba:showSqlExecutionPlan     | Grants the permission to display SQL execution plans.                                                           | Read         | Connection Instance         | -             | das:clouddba:getSqlExecutionPlan |
| das:clouddba:sqlDiagnosis             | Grants the permission to perform SQL diagnosis.                                                                 | Write        | Connection Instance         | -             | -                                |
| das:clouddba:showSqlLimitJobInfo      | Grants permission to query SQL throttling task information.                                                     | Read         | Instance                    | -             | -                                |
| das:clouddba:showSqlLimitSwitchStatus | Grants the permission to query the SQL throttling status.                                                       | Read         | Instance                    | -             | -                                |
| das:clouddba:showSqlSwitchStatus      | Grants the permission to query the status of <b>Collect All Query Logs</b> and <b>Collect Slow Query Logs</b> . | Read         | Instance                    | -             | -                                |
| das:clouddba:deleteSqlLimitRules      | Grants the permission to delete SQL throttling rules.                                                           | Write        | Instance                    | -             | -                                |

| Action                                  | Description                                                                                           | Access Level | Resource Type (*: required) | Condition Key | Alias                          |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|--------------------------------|
| das:clouddba:modifySqlLimitRules        | Grants the permission to modify SQL throttling rules.                                                 | Write        | Instance                    | -             | -                              |
| das:clouddba:changeSqlLimitSwitchStatus | Grants the permission to modify the status of SQL throttling.                                         | Write        | Instance                    | -             | -                              |
| das:clouddba:changeSqlSwitch            | Grants the permission to configure <b>Collect All Query Logs</b> and <b>Collect Slow Query Logs</b> . | Write        | Instance                    | -             | -                              |
| das:clouddba:createSpaceAnalysisTask    | Grants the permission to create space diagnosis tasks.                                                | Write        | Instance                    | -             | -                              |
| das:clouddba:createSqlLimitRules        | Grants the permission to create SQL throttling rules.                                                 | Write        | Instance                    | -             | -                              |
| das:clouddba:executeSql                 | Grants the permission to execute SQL statements.                                                      | Write        | Instance                    | -             | -                              |
| das:clouddba:listBinlog                 | Grants the permission to view binlogs.                                                                | List         | Instance                    | -             | -                              |
| das:clouddba:createBinlogAnalysisTask   | Grants the permission to create a binlog parsing task.                                                | Write        | Instance                    | -             | -                              |
| das::addQuota                           | Grants the permission to add quotas.                                                                  | Write        | -                           | -             | das:clouddba:changePaymentMode |

| Action                             | Description                                                                            | Access Level | Resource Type (*: required) | Condition Key | Alias                  |
|------------------------------------|----------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|------------------------|
| das::showQuotas                    | Grants the permission to query resource quotas.                                        | Read         | -                           | -             | das:clouddba:menuList  |
| das::getSupported                  | Grants the permission to query the engine types supported in the current region.       | Read         | -                           | -             | das:connections:list   |
| das::getWhitelist                  | Grants the permission to query the function whitelist supported in the current region. | Read         | -                           | -             | das:connections:list   |
| das::listInstances                 | Grants the permission to query all types of DB instances.                              | List         | -                           | -             | das:connections:list   |
| das:instance:executeTestConnection | Grants the permission to execute a test connection.                                    | Write        | Instance                    | -             | das:connections:login  |
| das:connection:getSharedList       | Grants the permission to obtain the share list of a connection.                        | List         | Connection                  | -             | das:connections:list   |
| das:connection:updateSharedInfo    | Grants the permission to update a shared connection.                                   | Write        | Connection                  | -             | das:connections:modify |
| das:connection:getConnection       | Grants the permission to view connection information.                                  | Read         | Connection                  | -             | das:connections:list   |

| Action                            | Description                                                                 | Access Level | Resource Type (*: required) | Condition Key | Alias                |
|-----------------------------------|-----------------------------------------------------------------------------|--------------|-----------------------------|---------------|----------------------|
| das::getGlobalPrivacy             | Grants the permission to view the privacy statement.                        | Read         | -                           | -             | das:connections:list |
| das::putGlobalPrivacy             | Grants the permission to update the privacy description.                    | Write        | -                           | -             | das:connections:list |
| das::showCloudDBAInfo             | Grants the permission to view Intelligent O&M information.                  | Read         | -                           | -             | -                    |
| das:clouddba:showKillTaskSwitch   | Grants the permission to view the switch for continuously killing sessions. | Read         | Instance                    | -             | -                    |
| das:clouddba:changeKillTaskSwitch | Grants the permission to modify a task of continuously killing sessions.    | Write        | Instance                    | -             | -                    |
| das:clouddba:listKillTaskRecord   | Grants the permission to view tasks of continuously killing sessions.       | List         | Instance                    | -             | -                    |
| das:clouddba:createKillTask       | Grants the permission to create a task of continuously killing sessions.    | Write        | Instance                    | -             | -                    |
| das:clouddba:stopKillTask         | Grants the permission to stop a task of continuously killing sessions.      | Write        | Instance                    | -             | -                    |

| Action                               | Description                                  | Access Level | Resource Type (*: required) | Condition Key | Alias |
|--------------------------------------|----------------------------------------------|--------------|-----------------------------|---------------|-------|
| das:clouddba:buildInAccountLogin     | Logs in using a built-in account.            | Write        | Instance                    | -             | -     |
| das:clouddba:buildInAccountLogout    | Logs out a built-in account.                 | Write        | Instance                    | -             | -     |
| das:clouddba:changeTransactionSwitch | Enables or disables historical transactions. | Write        | Instance                    | -             | -     |
| das:clouddba:updateSqlLimitRules     | Modifies a SQL throttling rule.              | Write        | Instance                    | -             | -     |
| das::setMetricThreshold              | Sets metric thresholds.                      | Write        | -                           | -             | -     |

Each API of DAS usually supports one or more actions. [Table 3-124](#) lists the supported actions and dependencies.

**Table 3-124** Actions and dependencies supported by DAS APIs

| API                                                                   | Action                            | Dependencies |
|-----------------------------------------------------------------------|-----------------------------------|--------------|
| GET /v3/{project_id}/instances/{instance_id}/db-users                 | das:clouddba:listDbUser           | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-125](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for DAS.

**Table 3-125** Resource types supported by DAS

| Resource Type | URN                                                  | Condition Key |
|---------------|------------------------------------------------------|---------------|
| Instance      | das:<region>:<account-id>:instance:<instance-id>     | -             |
| Connection    | das:<region>:<account-id>:connection:<connection-id> | -             |

## Conditions

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- A key in the **Condition** element of a statement can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the

system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).

- Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, **DAS:**) apply only to operations of DAS. For details, see [Table 3-126](#).
- The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so `g:SourceVpce` is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so `g:TagKeys` is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can only be applied when its request conditions are met. For supported condition operators, see [condition operators](#).

The following table lists the condition keys that you can define in custom policies for DAS. You can use these condition keys to specify additional conditions under which the policy is applied.

**Table 3-126** Service-specific condition keys supported by DAS

| Service-specific Condition Key   | Type   | Description                                                                       |
|----------------------------------|--------|-----------------------------------------------------------------------------------|
| <code>das:TargetOrgPath</code>   | String | Controls permissions of target shared accounts based on their organization paths. |
| <code>das:TargetOrgId</code>     | String | Controls permissions of target shared accounts based on their organization IDs.   |
| <code>das:TargetAccountId</code> | String | Controls permissions of target shared accounts based on their IDs.                |

## 3.7 Security & Compliance

### 3.7.1 Data Encryption Workshop (DEW)

#### 3.7.1.1 Key Management Service (KMS)

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by KMS, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by KMS, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for KMS.

**Table 3-127** Actions supported by KMS

| Action         | Description                                                     | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                | Alias |
|----------------|-----------------------------------------------------------------|--------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| kms:cmk:create | Grants permission to create KMS keys.                           | Write        | KeyId*                      | <ul style="list-style-type: none"> <li>• kms:KeyOrigin</li> <li>• kms:KeySpec</li> <li>• kms:KeyUsage</li> </ul>                                                                                                             | -     |
|                |                                                                 |              | -                           | <ul style="list-style-type: none"> <li>• g:EnterpriseProjectId</li> <li>• g:RequestTag/&lt;tag-key&gt;</li> <li>• g:TagKeys</li> </ul>                                                                                       |       |
| kms:cmk:list   | Grants permission to View All KMS Key Information.              | List         | KeyId*                      | -                                                                                                                                                                                                                            | -     |
|                |                                                                 |              | -                           | g:EnterpriseProjectId                                                                                                                                                                                                        |       |
| kms:cmk:enable | Grants permission to change the status of a KMS key to Enabled. | Write        | KeyId*                      | <ul style="list-style-type: none"> <li>• kms:KeyOrigin</li> <li>• kms:KeySpec</li> <li>• kms:KeyUsage</li> <li>• kms:MultiRegionKeyType</li> <li>• g:EnterpriseProjectId</li> <li>• g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -     |

| Action          | Description                                       | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                | Alias |

Each API of KMS usually supports one or more actions. [Table 3-128](#) lists the supported actions and dependencies.

**Table 3-128** Actions and dependencies supported by KMS APIs

| API                                                          | Action                                | Dependencies |
|--------------------------------------------------------------|---------------------------------------|--------------|
| POST /v1.0/{project_id}/kms/create-key                       | kms:cmk:create                        | -            |
| POST /v1.0/{project_id}/kms/list-keys                        | kms:cmk:list                          | -            |
| POST /v1.0/{project_id}/kms/enable-key                       | kms:cmk:enable                        | -            |
| POST /v1.0/{project_id}/kms/disable-key                      | kms:cmk:disable                       | -            |
| POST /v1.0/{project_id}/kms/describe-key                     | kms:cmk:get                           | -            |
| POST /v1.0/{project_id}/kms/create-datakey                   | kms:cmk:createDataKey                 | -            |
| POST /v1.0/{project_id}/kms/create-datakey-without-plaintext | kms:cmk:createDataKeyWithoutPlaintext | -            |
| POST /v1.0/{project_id}/kms/encrypt-datakey                  | kms:cmk:encryptDataKey                | -            |

| POST /v1.0/{project_id}/kms/alias/associate                  | kms:alias:associate         | -            |
| POST /v1.0/{project_id}/kms/create-pin                       | kms:cmk:createDataKey       | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-129](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for KMS.

**Table 3-129** Resource types supported by KMS

| Resource Type | URN                                          |
|---------------|----------------------------------------------|
| KeyId         | kms:<region>:<account-id>:KeyId:<cmk-id>     |
| alias         | kms:<region>:<account-id>:alias:<alias-name> |

| Resource Type | URN                                              |
|---------------|--------------------------------------------------|
| keystore      | kms:<region>:<account-id>:keystore:<keystore-id> |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, kms) apply only to operations of the xx service. For details, see [Table 3-130](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [operators](#).

### Service-specific condition keys supported by KMS

The following table lists the condition keys that you can define in identity policies for KMS. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-130** Service-specific condition keys supported by KMS

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                                                                                                           |
|--------------------------------|--------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| kms:EncryptionAlgorithm        | string | Single-valued                 | Filters access to encryption/decryption operations based on the encryption/decryption algorithm value in the request. |
| kms:GranteePrincipal-Type      | string | Single-valued                 | Filters access to the CreateGrant operation based on the authorization principal type constraint in the request.      |
| kms:GrantOperations            | string | Multivalued                   | Filters access to the CreateGrant operation based on the operation to be authorized.                                  |
| kms:GranteePrincipal           | string | Single-valued                 | Filters access to the CreateGrant operation based on the authorized party principal in the authorization.             |
| kms:KeyOrigin                  | string | Single-valued                 | Filters access to an API operation based on the origin attribute of the KMS key created or used for the operation.    |
| kms:KeySpec                    | string | Single-valued                 | Filters access to API operations based on the key_spec attribute that created or used the operation KMS key.          |
| kms:KeyUsage                   | string | Single-valued                 | Filters access to API operations based on the key_usage attribute of the KMS key created or used for the operation.   |

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                                                                                                                                                                                        |
|--------------------------------|--------|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| kms:MessageType                | string | Single-valued                 | Filters access to signing and verifying signature operations based on the value of the message_type parameter in the request.                                                                      |
| kms:RetiringPrincipal          | string | Single-valued                 | Filters access to CreateGrant operations based on retiring_principal in authorization.                                                                                                             |
| kms:SigningAlgorithm           | string | Single-valued                 | Filters access to signing and verifying operations based on signing_algorithm in the request.                                                                                                      |
| kms:ExpirationTime             | date   | Single-valued                 | Filters access to the ImportKeyMaterial operation based on the value of the expiration_time parameter in the request.                                                                              |
| kms:WrappingAlgorithm          | string | Single-valued                 | Filters access to the CreateParametersForImport operation based on the value of the wrapping_algorithm parameter in the request.                                                                   |
| kms:RecipientAttestation       | string | Single-valued                 | Filters access to the CreateDatakey, DecryptData, DecryptDatakey, and CreateRandom operations based on the Platform Configuration Register (PCR) value of the attestation document in the request. |

| Service-specific Condition Key             | Type    | Single-valued/<br>Multivalued | Description                                                                                         |
|--------------------------------------------|---------|-------------------------------|-----------------------------------------------------------------------------------------------------|
| kms:MacAlgorithm                           | string  | Single-valued                 | Filters access to MAC generation and verification operations based on mac_algorithm in the request. |
| kms:RequestAlias                           | string  | Single-valued                 | Filters access to MAC generation and verification operations based on mac_algorithm in the request. |
| kms:ResourceAliases                        | string  | Multivalued                   | Filters access to MAC generation and verification operations based on mac_algorithm in the request. |
| kms:MultiRegionKeyType                     | string  | Single-valued                 | Filters access to API operations based on MultiRegionKeyType in the KMS key field.                  |
| kms:PrimaryRegion                          | string  | Single-valued                 | Filters access to API operations based on primary_region in the request.                            |
| kms:EncryptionContext                      | string  | Single-valued                 | Filters access to API operations based on additional_authenticated_data in the request.             |
| kms:ScheduleKeyDeletionPendingWindowInDays | numeric | Single-valued                 | Filters access to API operations based on pending_days in the request.                              |

### 3.7.1.2 Key Pair Service (KPS)

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by KPS, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by KPS, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for KPS.

**Table 3-131** Actions supported by KPS

| Action                | Description                                                     | Access Level | Resource Type (*: required) | Condition Key                                                                                                             | Alias                                                                                                                                   |
|-----------------------|-----------------------------------------------------------------|--------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| kps:SSHKeyPair:create | Grants permission to create and import an SSH key pair.         | Write        | SSHKeyPair*                 | <ul style="list-style-type: none"> <li>• <a href="#">kps:KmsKeyId</a></li> <li>• <a href="#">kps:Algorithm</a></li> </ul> | <ul style="list-style-type: none"> <li>• kps:domainKeypairs:create</li> </ul>                                                           |
| kps:SSHKeyPair:delete | Grants permission to delete an SSH key pair.                    | Write        | SSHKeyPair*                 | -                                                                                                                         | <ul style="list-style-type: none"> <li>• kps:domainKeypairs:delete</li> </ul>                                                           |
| kps:SSHKeyPair:get    | Grants permission to query the details about an SSH key pair.   | Read         | SSHKeyPair*                 | -                                                                                                                         | <ul style="list-style-type: none"> <li>• kps:domainKeypairs:get</li> </ul>                                                              |
| kps:SSHKeyPair:list   | Grants permission to query the SSH key pairs list.              | List         | SSHKeyPair*                 | -                                                                                                                         | <ul style="list-style-type: none"> <li>• kps:domainKeypairs:list</li> </ul>                                                             |
| kps:SSHKeyPair:update | Grants permission to update the description of an SSH key pair. | Write        | SSHKeyPair*                 | -                                                                                                                         | <ul style="list-style-type: none"> <li>• kps:domainKeypairs:update</li> </ul>                                                           |
| kps:SSHKeyPair:bind   | Grants permission to bind ECS to a new SSH key pair.            | Write        | SSHKeyPair*                 | -                                                                                                                         | <ul style="list-style-type: none"> <li>• kps:domainKeypairs:bind</li> </ul>                                                             |
| kps::deleteFailedTask | Grants permission to delete failed tasks.                       | Write        | -                           | -                                                                                                                         | <ul style="list-style-type: none"> <li>• kps:domainKeypairs:deletefailedtask</li> <li>• kps:domainKeypairs:deletefailedtasks</li> </ul> |

| Action                           | Description                                                   | Access Level | Resource Type (*: required) | Condition Key | Alias                                                                                                          |
|----------------------------------|---------------------------------------------------------------|--------------|-----------------------------|---------------|----------------------------------------------------------------------------------------------------------------|
| kps::SSHKeyPair:unbind           | Grants permission to unbind ECS from an SSH key pair.         | Write        | SSHKeyPair *                | -             | <ul style="list-style-type: none"> <li>kps:domainKeypairs:unbind</li> <li>ecs:serverKeypairs:unbind</li> </ul> |
| kps::getFailedTask               | Grants permission to query information about failed tasks.    | List         | -                           | -             | <ul style="list-style-type: none"> <li>kps:domainKeypairs:getfailtask</li> </ul>                               |
| kps::getTask                     | Grants permission to query the current task execution status. | List         | -                           | -             | <ul style="list-style-type: none"> <li>kps:domainKeypairs:gettask</li> </ul>                                   |
| kps::getRunningTask              | Grants permission to query information about ongoing tasks.   | List         | -                           | -             | <ul style="list-style-type: none"> <li>kps:domainKeypairs:getrunningtask</li> </ul>                            |
| kps::SSHKeyPair:importPrivateKey | Grants permission to import a private key to a key pair.      | Write        | SSHKeyPair *                | kps::KmsKeyId | <ul style="list-style-type: none"> <li>kps:domainKeypairs:importpk</li> </ul>                                  |
| kps::SSHKeyPair:exportPrivateKey | Grants permission to export the private key of a key pair.    | Write        | SSHKeyPair *                | -             | <ul style="list-style-type: none"> <li>kps:domainKeypairs:exportpk</li> </ul>                                  |
| kps::SSHKeyPair:clearPrivateKey  | Grants permission to clear the private key of a key pair.     | Write        | SSHKeyPair *                | -             | <ul style="list-style-type: none"> <li>kps:domainKeypairs:clearpk</li> </ul>                                   |

Each API of KPS usually supports one or more actions. [Table 3-132](#) lists the supported actions and dependencies.

**Table 3-132** Actions and dependencies supported by KPS APIs

| API                                                         | Action                | Dependencies                                                                                   |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-133](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for KPS.

**Table 3-133** Resource types supported by KPS

| Resource Type | URN                                                 |
|---------------|-----------------------------------------------------|
| SSHKeyPair    | kps:<region>:<account-id>:SSHKeyPair:<keypair-name> |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, kps) apply only to operations of the xx service. For details, see [Table 3-134](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [operators](#).

### Service-specific condition keys supported by KPS

The following table lists the condition keys that you can define in identity policies for KPS. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-134** Service-specific condition keys supported by KPS

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                       |
|--------------------------------|--------|-------------------------------|-----------------------------------|
| kps:KmsKeyId                   | string | Single-valued                 | Filters access by the KMS key ID. |

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                          |
|--------------------------------|--------|-------------------------------|--------------------------------------|
| kps:Algorithm                  | string | Single-valued                 | Filters access by SSH key algorithm. |

### 3.7.1.3 Cloud Secret Management Service (CSMS)

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by CSMS, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by CSMS, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for CSMS.

**Table 3-135** Actions supported by CSMS

| Action             | Description                                       | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                           | Alias |
|--------------------|---------------------------------------------------|--------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| csms:secret:create | Grants permission to create or recover a secret.  | Write        | secret Name *               | <ul style="list-style-type: none"> <li>• <a href="#">csms:Type</a></li> <li>• <a href="#">csms:KmsKeyId</a></li> </ul>                                                                  | -     |
|                    |                                                   |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul>  |       |
| csms:secret:delete | Grants permission to delete a secret immediately. | Write        | secret Name *               | <ul style="list-style-type: none"> <li>• <a href="#">csms:Type</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | -     |

| Action                    | Description                                                                                       | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                    | Alias                                                                         |
|---------------------------|---------------------------------------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| csms:secret:update        | Grants permission to update the metadata of a secret.                                             | Write        | secret Name *               | <ul style="list-style-type: none"> <li>• <a href="#">csms:Type</a></li> <li>• <a href="#">csms:KmsKeyId</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | -                                                                             |
| csms:secret:get           | Grants permission to query or download the secret information.                                    | Read         | secret Name *               | <ul style="list-style-type: none"> <li>• <a href="#">csms:Type</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                          | -                                                                             |
| csms:secret:list          | Grants permission to query all the secrets created by the current user under the current project. | List         | secret Name *               | <a href="#">g:EnterpriseProjectId</a>                                                                                                                                                                                            | -                                                                             |
| csms:secret:createVersion | Grants permission to create a secret version in a specified secret.                               | Write        | secret Name *               | <ul style="list-style-type: none"> <li>• <a href="#">csms:Type</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                          | <ul style="list-style-type: none"> <li>• csms:secretVersion:create</li> </ul> |

| Action                  | Description                                                                                             | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                        | Alias                                                                       |
|-------------------------|---------------------------------------------------------------------------------------------------------|--------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|
| csms:secret:getVersion  | Grants permission to query information about a specified secret version and its plaintext secret value. | Read         | secret Name *               | <ul style="list-style-type: none"> <li>• <a href="#">csms:Type</a></li> <li>• <a href="#">csms:VersionId</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>    | <ul style="list-style-type: none"> <li>• csms:secretVersion:get</li> </ul>  |
| csms:secret:listVersion | Grants permission to list the available versions of a secret.                                           | List         | secret Name *               | <ul style="list-style-type: none"> <li>• <a href="#">csms:Type</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                              | <ul style="list-style-type: none"> <li>• csms:secretVersion:list</li> </ul> |
| csms:secret:createStage | Grants permission to create a secret version stage.                                                     | Write        | secret Name *               | <ul style="list-style-type: none"> <li>• <a href="#">csms:Type</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                              | <ul style="list-style-type: none"> <li>• csms:secretStage:create</li> </ul> |
| csms:secret:getStage    | Grants permission to query version information about a specified secret version stage.                  | Read         | secret Name *               | <ul style="list-style-type: none"> <li>• <a href="#">csms:Type</a></li> <li>• <a href="#">csms:VersionStage</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | <ul style="list-style-type: none"> <li>• csms:secretStage:get</li> </ul>    |
| csms:secret:updateStage | Grants permission to update a secret version stage.                                                     | Write        | secret Name *               | <ul style="list-style-type: none"> <li>• <a href="#">csms:Type</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                              | <ul style="list-style-type: none"> <li>• csms:secretStage:update</li> </ul> |

| Action                       | Description                                                         | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                            | Alias                                                                            |
|------------------------------|---------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| csms:secret:deleteStage      | Grants permission to delete a specified secret version stage.       | Write        | secret Name *               | <ul style="list-style-type: none"> <li>• <b>csms:Type</b></li> <li>• <b>g:EnterpriseProjectId</b></li> <li>• <b>g:ResourceTag/&lt;tag-key&gt;</b></li> </ul>                                             | <ul style="list-style-type: none"> <li>• csms:secret Stage:delete</li> </ul>     |
| csms::getSecretQuota         | Grants permission to query the secret quota of a specified project. | Read         | -                           | -                                                                                                                                                                                                        | <ul style="list-style-type: none"> <li>• csms:secret Quota:get</li> </ul>        |
| csms:secret:scheduleDeletion | Grants permission to schedule the deletion of a secret.             | Write        | secret Name *               | <ul style="list-style-type: none"> <li>• <b>csms:Type</b></li> <li>• <b>csms:RecoveryWindowInDays</b></li> <li>• <b>g:EnterpriseProjectId</b></li> <li>• <b>g:ResourceTag/&lt;tag-key&gt;</b></li> </ul> | <ul style="list-style-type: none"> <li>• csms:secret :deleteScheduled</li> </ul> |
| csms:secret:restoreSecret    | Grants permission to cancel the scheduled deletion of a secret.     | Write        | secret Name *               | <ul style="list-style-type: none"> <li>• <b>csms:Type</b></li> <li>• <b>g:EnterpriseProjectId</b></li> <li>• <b>g:ResourceTag/&lt;tag-key&gt;</b></li> </ul>                                             | <ul style="list-style-type: none"> <li>• csms:secret :deleteCancelled</li> </ul> |
| csms:secret:rotate           | Grants permission to start secret rotation.                         | Write        | secret Name *               | <ul style="list-style-type: none"> <li>• <b>csms:Type</b></li> <li>• <b>g:EnterpriseProjectId</b></li> <li>• <b>g:ResourceTag/&lt;tag-key&gt;</b></li> </ul>                                             | -                                                                                |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-137](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for CSMS.

**Table 3-137** Resource types supported by CSMS

| Resource Type | URN                                                 |
|---------------|-----------------------------------------------------|
| secretName    | csms:<region>:<account-id>:secretName:<secret-name> |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, csms) apply only to operations of the xx service. For details, see [Table 3-138](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [operators](#).

### Service-specific condition keys supported by CSMS

The following table lists the condition keys that you can define in identity policies for CSMS. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-138** Service-specific condition keys supported by CSMS

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                    |
|--------------------------------|--------|-------------------------------|--------------------------------|
| csms:Type                      | string | Single-valued                 | Filters access by secret type. |

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                |
|--------------------------------|---------|-------------------------------|--------------------------------------------|
| csms:KmsKeyId                  | string  | Single-valued                 | Filters access by KMS key ID.              |
| csms:VersionId                 | string  | Single-valued                 | Filters access by secret version ID.       |
| csms:VersionStage              | string  | Single-valued                 | Filters access by secret version stage.    |
| csms:RecoveryWindowInDays      | numeric | Single-valued                 | Filters access by scheduled deletion time. |

## 3.7.2 Anti-DDoS Service (AAD)

### 3.7.2.1 Cloud Native Anti-DDoS Basic

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.

- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by Anti-DDoS, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by Anti-DDoS, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for Anti-DDoS.

**Table 3-139** Actions supported by Anti-DDoS

| Action                               | Description                                                     | Access Level | Resource Type (*: required) | Condition Key | Alias |
|--------------------------------------|-----------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| anti-ddos:task:list                  | Grants permission to query Anti-DDoS tasks.                     | List         | -                           | -             | -     |
| anti-ddos:quota:list                 | Grants permission to query quotas.                              | List         | -                           | -             | -     |
| anti-ddos:optionalDefensePolicy:list | Grants permission to query Anti-DDoS protection specifications. | List         | -                           | -             | -     |

| Action                           | Description                                         | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias |
|----------------------------------|-----------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| anti-ddos:logConfig:update       | Grants permission to update LTS configurations.     | Write        | -                           | -                                                                                                                                                  | -     |
| anti-ddos:logConfig:get          | Grants permission to query LTS configurations.      | Read         | -                           | -                                                                                                                                                  | -     |
| anti-ddos:ip:updateDefensePolicy | Grants permission to update Anti-DDoS.              | Write        | ip *                        | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
| anti-ddos:ip:untagResource       | Grants permission to delete tags in batches.        | Write        | ip *                        | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
| anti-ddos:ip:tagResource         | Grants permission to add tags in batches.           | Write        | ip *                        | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
| anti-ddos:ip:listTagsForResource | Grants permission to query resource tags.           | List         | ip *                        | -                                                                                                                                                  | -     |
| anti-ddos:ip:listDefenseStatuses | Grants permission to query EIP protection statuses. | List         | ip *                        | -                                                                                                                                                  | -     |

| Action                             | Description                                                 | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias |
|------------------------------------|-------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| anti-ddos:ip:getWeeklyReport       | Grants permission to query weekly protection statistics.    | Read         | ip *                        | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
| anti-ddos:ip:getDefenseStatus      | Grants permission to query the protection status of an EIP. | Read         | ip *                        | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
| anti-ddos:ip:getDefensePolicy      | Grants permission to query Anti-DDoS.                       | Read         | ip *                        | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
| anti-ddos:ip:getDailyTrafficReport | Grants permission to query protected traffic of an EIP.     | Read         | ip *                        | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
| anti-ddos:ip:getDailyEventReport   | Grants permission to query abnormal events of an EIP.       | Read         | ip *                        | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
| anti-ddos:ip:enableDefensePolicy   | Grants permission to enable Anti-DDoS.                      | Write        | ip *                        | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |

| Action                                | Description                                                           | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias |
|---------------------------------------|-----------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| anti-ddos:ip:disableDefensePolicy     | Grants permission to disable Anti-DDoS.                               | Write        | ip *                        | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
| anti-ddos:defaultDefensePolicy:get    | Grants permission to query default Anti-DDoS protection policies.     | Read         | -                           | -                                                                                                                                                  | -     |
| anti-ddos:defaultDefensePolicy:delete | Grants permission to delete default Anti-DDoS protection policies.    | Write        | -                           | -                                                                                                                                                  | -     |
| anti-ddos:defaultDefensePolicy:create | Grants permission to configure default Anti-DDoS protection policies. | Write        | -                           | -                                                                                                                                                  | -     |
| anti-ddos:alertConfig:update          | Grants permission to update alarm configurations.                     | Write        | -                           | -                                                                                                                                                  | -     |
| anti-ddos:alertConfig:get             | Grants permission to query alarm configurations.                      | Read         | -                           | -                                                                                                                                                  | -     |

Each API of Anti-DDoS usually supports one or more actions. [Table 3-140](#) lists the supported actions and dependencies.

**Table 3-140** Actions and dependencies supported by Anti-DDoS APIs

| API                                                           | Action                               | Dependencies |
|---------------------------------------------------------------|--------------------------------------|--------------|
| GET /v2/{project_id}/query-task-status                        | anti-ddos:task:list                  | -            |
| GET /v1/{project_id}/antiddos/quotas                          | anti-ddos:quota:list                 | -            |
| GET /v1/{project_id}/antiddos/query-config-list               | anti-ddos:optionalDefensePolicy:list | -            |
| PUT /v1/{project_id}/antiddos/lts-config                      | anti-ddos:logConfig:update           | -            |
| GET /v1/{project_id}/antiddos/lts-config                      | anti-ddos:logConfig:get              | -            |
| PUT /v1/{project_id}/antiddos/{floating_ip_id}                | anti-ddos:ip:updateDefensePolicy     | -            |
| DELETE /v1/{project_id}/antiddos-ip/{resource_id}/tags/delete | anti-ddos:ip:untagResource           | -            |
| POST /v1/{project_id}/antiddos-ip/{resource_id}/tags/create   | anti-ddos:ip:tagResource             | -            |
| GET /v1/{project_id}/antiddos-ip/{resource_id}/tags           | anti-ddos:ip:listTagsForResource     | -            |
| GET /v1/{project_id}/antiddos-ip/tags                         | anti-ddos:ip:listTagsForResource     | -            |
| GET /v1/{project_id}/antiddos                                 | anti-ddos:ip:listDefenseStatuses     | -            |
| POST /v1/{project_id}/antiddos-ip/resource-instances/count    | anti-ddos:ip:listDefenseStatuses     | -            |
| POST /v1/{project_id}/antiddos-ip/resource-instances/filter   | anti-ddos:ip:listDefenseStatuses     | -            |
| GET /v1/{project_id}/antiddos/weekly                          | anti-ddos:ip:getWeeklyReport         | -            |

| API                                                              | Action                                | Dependencies |
|------------------------------------------------------------------|---------------------------------------|--------------|
| GET /v1/{project_id}/antiddos/weekly-export                      | anti-ddos:ip:getWeeklyReport          | -            |
| GET /v1/{project_id}/antiddos/{floating_ip_id}/status            | anti-ddos:ip:getDefenseStatus         | -            |
| GET /v1/{project_id}/antiddos/{floating_ip_id}                   | anti-ddos:ip:getDefensePolicy         | -            |
| GET /v1/{project_id}/antiddos/queryIsEnabledResult/query         | anti-ddos:ip:getDefensePolicy         | -            |
| GET /v1/{project_id}/antiddos/{floating_ip_id}/daily             | anti-ddos:ip:getDailyTrafficReport    | -            |
| GET /v1/{project_id}/antiddos/{floating_ip_id}/daily-export      | anti-ddos:ip:getDailyTrafficReport    | -            |
| GET /v1/{project_id}/antiddos/{floating_ip_id}/logs              | anti-ddos:ip:getDailyEventReport      | -            |
| POST /v1/{project_id}/antiddos/{floating_ip_id}                  | anti-ddos:ip:enableDefensePolicy      | -            |
| POST /v1/{project_id}/antiddos/immediate_protection              | anti-ddos:ip:enableDefensePolicy      | -            |
| DELETE /v1/{project_id}/antiddos/{floating_ip_id}                | anti-ddos:ip:disableDefensePolicy     | -            |
| DELETE /v1/{project_id}/antiddos/{floating_ip_id}/closeAndReason | anti-ddos:ip:disableDefensePolicy     | -            |
| GET /v1/{project_id}/antiddos/default/config                     | anti-ddos:defaultDefensePolicy:get    | -            |
| DELETE /v1/{project_id}/antiddos/default/config                  | anti-ddos:defaultDefensePolicy:delete | -            |

| API                                                | Action                                | Dependencies |
|----------------------------------------------------|---------------------------------------|--------------|
| POST /v1/{project_id}/antiddos/default/config      | anti-ddos:defaultDefensePolicy:create | -            |
| POST /v2/{project_id}/warnalert/alertconfig/update | anti-ddos:alertConfig:update          | -            |
| GET /v2/{project_id}/warnalert/alertconfig/query   | anti-ddos:alertConfig:get             | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-141](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for Anti-DDoS.

**Table 3-141** Resource types supported by Anti-DDoS

| Resource Type | URN                                        |
|---------------|--------------------------------------------|
| ip            | anti-ddos:<region>:<account-id>:ip:<ip-id> |

## Conditions

Anti-DDoS does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.7.2.2 Cloud Native Anti-DDoS Advanced

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that

OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by CNAD, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by CNAD, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for CNAD.

**Table 3-142** Actions supported by CNAD

| Action                | Description                                            | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-----------------------|--------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| cnad:schedule:update  | Grants permission to update scheduling specifications. | Write        | schedule *                  | -             | -     |
| cnad:schedule:list    | Grants permission to query the scheduling rule list.   | List         | schedule *                  | -             | -     |
| cnad:schedule:get     | Grants permission to query scheduling rules.           | Read         | schedule *                  | -             | -     |
| cnad:schedule:delete  | Grants permission to delete scheduling rules.          | Write        | schedule *                  | -             | -     |
| cnad:schedule:create  | Grants permission to create scheduling rules.          | Write        | schedule *                  | -             | -     |
| cnad:quota:update     | Grants permission to modify quotas.                    | Write        | -                           | -             | -     |
| cnad:blockade:release | Grants permission to unblock IP addresses.             | Write        | -                           | -             | -     |
| cnad:blockade:list    | Grants permission to query the blocking list.          | List         | -                           | -             | -     |

| Action                   | Description                                              | Access Level | Resource Type (*: required) | Condition Key | Alias                  |
|--------------------------|----------------------------------------------------------|--------------|-----------------------------|---------------|------------------------|
| cnad:blockade:get        | Grants permission to query blocking records.             | Read         | -                           | -             | -                      |
| cnad:alarmConfig:update  | Grants permission to modify alarm notifications.         | Write        | -                           | -             | -                      |
| cnad:alarmConfig:create  | Grants permission to create alarm notifications.         | Write        | -                           | -             | -                      |
| cnad:alarmConfig:delete  | Grants permission to delete alarm notifications.         | Write        | -                           | -             | -                      |
| cnad:alarmConfig:get     | Grants permission to query alarm notifications.          | Read         | -                           | -             | -                      |
| cnad:attackReport:list   | Grants permission to query attack events.                | List         | -                           | -             | -                      |
| cnad:attackReport:update | Grants permission to update attack event configurations. | Write        | -                           | -             | cnad:attackReport:list |
| cnad:attackTop:list      | Grants permission to query top 10 attacked IP addresses. | List         | -                           | -             | -                      |

| Action                         | Description                                                              | Access Level | Resource Type (*: required) | Condition Key | Alias |
|--------------------------------|--------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| cnad:attackTypeReport:list     | Grants permission to query attack type distribution.                     | List         | -                           | -             | -     |
| cnad:bindPolicy:create         | Grants permission to bind protection policies to protected IP addresses. | Write        | -                           | -             | -     |
| cnad:blackWhitelistList:create | Grants permission to create an IP address blacklist or whitelist.        | Write        | -                           | -             | -     |
| cnad:blackWhitelistList:delete | Grants permission to delete an IP address blacklist or whitelist.        | Write        | -                           | -             | -     |
| cnad:cleanCountReport:list     | Grants permission to query the DDoS protection trend.                    | List         | -                           | -             | -     |
| cnad:cleanKbpsReport:list      | Grants permission to query statistics on peak scrubbing traffic.         | List         | -                           | -             | -     |

| Action                       | Description                                                     | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias |
|------------------------------|-----------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| cnad:cleanScaleDropList:list | Grants permission to query the scrubbing scope.                 | List         | -                           | -                                                                                                                                                  | -     |
| cnad:countReport:get         | Grants permission to query statistics.                          | Read         | -                           | -                                                                                                                                                  | -     |
| cnad:ipTag:put               | Grants permission to update the tags of protected IP addresses. | Write        | -                           | -                                                                                                                                                  | -     |
| cnad:package:create          | Grants permission to create an instance.                        | Write        | package *                   | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | -     |
| cnad:package:get             | Grants permission to query an instance.                         | Read         | package *                   | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | -     |
| cnad:package:list            | Grants permission to query the instance list.                   | List         | package *                   | -                                                                                                                                                  | -     |
| cnad:package:put             | Grants permission to update an instance.                        | Write        | package *                   | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul> | -     |

| Action                       | Description                                                   | Access Level | Resource Type (*: required) | Condition Key                         | Alias |
|------------------------------|---------------------------------------------------------------|--------------|-----------------------------|---------------------------------------|-------|
| cnad:packageDropList:list    | Grants permission to query the instance summary list.         | List         | -                           | -                                     | -     |
| cnad:packetAttackReport:list | Grants permission to query attack data packets.               | List         | -                           | -                                     | -     |
| cnad:policy:create           | Grants permission to create protection policies.              | Write        | policy *                    | <a href="#">g:EnterpriseProjectId</a> | -     |
| cnad:policy:delete           | Grants permission to delete protection policies.              | Write        | policy *                    | <a href="#">g:EnterpriseProjectId</a> | -     |
| cnad:policy:get              | Grants permission to query details about a protection policy. | Read         | policy *                    | <a href="#">g:EnterpriseProjectId</a> | -     |
| cnad:policy:list             | Grants permission to query protection policy details.         | List         | policy *                    | -                                     | -     |
| cnad:policy:update           | Grants permission to update protection policies.              | Write        | policy *                    | <a href="#">g:EnterpriseProjectId</a> | -     |
| cnad:policyDropList:list     | Grants permission to query the protected IP address list.     | List         | -                           | -                                     | -     |

| Action                                | Description                                                                  | Access Level | Resource Type (*: required) | Condition Key | Alias                        |
|---------------------------------------|------------------------------------------------------------------------------|--------------|-----------------------------|---------------|------------------------------|
| cnad:protecte<br>dlp:create           | Grants permission to bind protected IP addresses to an instance.             | Write        | -                           | -             | -                            |
| cnad:protecte<br>dlp:list             | Grants permission to query the protected IP address list.                    | List         | -                           | -             | -                            |
| cnad:protecte<br>dlpDropList:lis<br>t | Grants permission to query the protected IP address drop list.               | List         | -                           | -             | -                            |
| cnad:quota:ge<br>t                    | Grants permission to query quotas.                                           | Read         | -                           | -             | -                            |
| cnad:securityS<br>tatusReport:ge<br>t | Grants permission to query asset security status.                            | Read         | -                           | -             | -                            |
| cnad:trafficAtt<br>ackReport:list     | Grants permission to query attack traffic.                                   | List         | -                           | -             | -                            |
| cnad:policy:un<br>bind                | Grants permission to remove a protection policy from a protected IP address. | Write        | -                           | -             | cnad:unbindP<br>olicy:create |
| cnad:weekSta<br>tisticsReport:ge<br>t | Grants permission to query weekly security statistics.                       | Read         | -                           | -             | -                            |

Each API of CNAD usually supports one or more actions. [Table 3-143](#) lists the supported actions and dependencies.

**Table 3-143** Actions and dependencies supported by CNAD APIs

| API                                                         | Action                       | Dependencies |
|-------------------------------------------------------------|------------------------------|--------------|
| GET /v1/unblockservice/{domain_id}/unblock-quota-statistics | cnad:quota:get               | -            |
| POST /v1/unblockservice/{domain_id}/unblock                 | cnad:blockade:release        | -            |
| GET /v1/unblockservice/{domain_id}/unblock-record           | cnad:blockade:list           | -            |
| GET /v1/unblockservice/{domain_id}/block-statistics         | cnad:blockade:get            | -            |
| POST /v1/cnad/alarm-config                                  | cnad:alarmConfig:update      | -            |
| DELETE /v1/cnad/alarm-config                                | cnad:alarmConfig:delete      | -            |
| GET /v1/cnad/alarm-config                                   | cnad:alarmConfig:get         | -            |
| POST /v1/cnad/policies/{policy_id}/bind                     | cnad:bindPolicy:create       | -            |
| POST /v1/cnad/policies/{policy_id}/ip-list/add              | cnad:blackWhitelpList:create | -            |
| POST /v1/cnad/policies/{policy_id}/ip-list/delete           | cnad:blackWhitelpList:delete | -            |
| PUT /v1/cnad/protected-ips/tags                             | cnad:ipTag:put               | -            |
| GET /v1/cnad/packages                                       | cnad:package:list            | -            |
| PUT /v1/cnad/packages/{package_id}/name                     | cnad:package:put             | -            |
| POST /v1/cnad/policies                                      | cnad:policy:create           | -            |
| DELETE /v1/cnad/policies/{policy_id}                        | cnad:policy:delete           | -            |
| GET /v1/cnad/policies/{policy_id}                           | cnad:policy:get              | -            |
| GET /v1/cnad/policies                                       | cnad:policy:list             | -            |

| API                                                      | Action                         | Dependencies |
|----------------------------------------------------------|--------------------------------|--------------|
| PUT /v1/cnad/policies/{policy_id}                        | cnad:policy:put                | -            |
| POST /v1/cnad/packages/{package_id}/protected-ips        | cnad:protectedIp:create        | -            |
| GET /v1/cnad/protected-ips                               | cnad:protectedIp:list          | -            |
| GET /v1/cnad/packages/{package_id}/unbound-protected-ips | cnad:protectedIpDrop-List:list | -            |
| POST /v1/cnad/policies/{policy_id}/unbind                | cnad:policy:unbind             | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-144](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for CNAD.

**Table 3-144** Resource types supported by CNAD

| Resource Type | URN                                       |
|---------------|-------------------------------------------|
| policy        | cnad::<account-id>:policy:<policy-id>     |
| schedule      | cnad::<account-id>:schedule:<schedule-id> |
| package       | cnad::<account-id>:package:<package-id>   |

## Conditions

CNAD does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.7.2.3 Advanced Anti-DDoS

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by AAD, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by AAD, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for AAD.

**Table 3-145** Actions supported by AAD

| Action                 | Description                                                    | Access Level | Resource Type (*: required) | Condition Key         | Alias |
|------------------------|----------------------------------------------------------------|--------------|-----------------------------|-----------------------|-------|
| aad:alarmConfig:create | Grants permission to create alarm settings.                    | Write        | alarmConfig *               | -                     | -     |
| aad:alarmConfig:put    | Grants permission to modify alarm settings.                    | Write        | alarmConfig *               | -                     | -     |
| aad:alarmConfig:get    | Grants permission to query alarm settings.                     | Read         | alarmConfig *               | -                     | -     |
| aad:alarmConfig:delete | Grants permission to delete alarm settings.                    | Write        | alarmConfig *               | -                     | -     |
| aad:certificate:delete | Grants permission to delete certificates.                      | Write        | certificate *               | -                     | -     |
| aad:certificate:list   | Grants permission to query the certificate list.               | List         | certificate *               | -                     | -     |
| aad:certificate:set    | Grants permission to modify the certificate for a domain name. | Write        | certificate *               | -                     | -     |
|                        |                                                                |              | domain *                    | g:EnterpriseProjectId |       |
| aad:dashboard:delete   | Grants permission to delete report log configurations.         | Write        | -                           | -                     | -     |

| Action            | Description                                                     | Access Level | Resource Type (*: required) | Condition Key                         | Alias |
|-------------------|-----------------------------------------------------------------|--------------|-----------------------------|---------------------------------------|-------|
| aad:dashboard:get | Grants permission to obtain report data and log configurations. | Read         | -                           | -                                     | -     |
| aad:dashboard:set | Grants permission to modify report log configurations.          | Write        | -                           | -                                     | -     |
| aad:domain:create | Grants permission to add protected domain names.                | Write        | domain *                    | <a href="#">g:EnterpriseProjectId</a> | -     |
| aad:domain:delete | Grants permission to delete protected domain names.             | Write        | domain *                    | <a href="#">g:EnterpriseProjectId</a> | -     |
| aad:domain:get    | Grants permission to query domain name details.                 | Read         | domain *                    | <a href="#">g:EnterpriseProjectId</a> | -     |
| aad:domain:list   | Grants permission to query the domain name list.                | List         | domain *                    | <a href="#">g:EnterpriseProjectId</a> | -     |
| aad:domain:put    | Grants permission to modify domain protection attributes.       | Write        | domain *                    | <a href="#">g:EnterpriseProjectId</a> | -     |

| Action                    | Description                                                                       | Access Level | Resource Type (*: required) | Condition Key                         | Alias |
|---------------------------|-----------------------------------------------------------------------------------|--------------|-----------------------------|---------------------------------------|-------|
| aad:forwardingRule:create | Grants permission to add forwarding rules.                                        | Write        | forwardingRule *            | <a href="#">g:EnterpriseProjectId</a> | -     |
| aad:forwardingRule:delete | Grants permission to delete forwarding rules.                                     | Write        | forwardingRule *            | <a href="#">g:EnterpriseProjectId</a> | -     |
| aad:forwardingRule:get    | Grants permission to query forwarding rules.                                      | Read         | forwardingRule *            | <a href="#">g:EnterpriseProjectId</a> | -     |
| aad:forwardingRule:list   | Grants permission to export forwarding rules.                                     | List         | forwardingRule *            | <a href="#">g:EnterpriseProjectId</a> | -     |
| aad:forwardingRule:put    | Grants permission to modify the back-to-source IP address in the forwarding rule. | Write        | forwardingRule *            | <a href="#">g:EnterpriseProjectId</a> | -     |
| aad:instance:create       | Grants permission to create an instance.                                          | Write        | instance *                  | <a href="#">g:EnterpriseProjectId</a> | -     |
| aad:instance:get          | Grants permission to query instance attributes.                                   | Read         | instance *                  | <a href="#">g:EnterpriseProjectId</a> | -     |
| aad:instance:list         | Grants permission to query the instance list.                                     | List         | instance *                  | <a href="#">g:EnterpriseProjectId</a> | -     |

| Action                      | Description                                                          | Access Level | Resource Type (*: required) | Condition Key                         | Alias |
|-----------------------------|----------------------------------------------------------------------|--------------|-----------------------------|---------------------------------------|-------|
| aad:instance:put            | Grants permission to modify instance attributes.                     | Write        | instance *                  | <a href="#">g:EnterpriseProjectId</a> | -     |
| aad:policy:create           | Grants permission to add protection rules.                           | Write        | policy *                    | <a href="#">g:EnterpriseProjectId</a> | -     |
| aad:policy:delete           | Grants permission to delete protection rules.                        | Write        | policy *                    | <a href="#">g:EnterpriseProjectId</a> | -     |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-147](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for AAD.

**Table 3-147** Resource types supported by AAD

| Resource Type    | URN                                                         |
|------------------|-------------------------------------------------------------|
| forwardingRule   | aad::<account-id>:forwardingRule:<forwarding-rule-id>       |
| package          | aad::<account-id>:package:<package-id>                      |
| policy           | aad::<account-id>:policy:<policy-id>                        |
| alarmConfig      | aad::<account-id>:alarmConfig:<alarm-config-id>             |
| domain           | aad::<account-id>:domain:<domain-id>                        |
| certificate      | aad::<account-id>:certificate:<certificate-id>              |
| instance         | aad::<account-id>:instance:<instance-id>                    |
| whiteBlackIpRule | aad::<account-id>:whiteBlackIpRule:<white-black-ip-rule-id> |

## Conditions

AAD does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.7.3 Cloud Firewall (CFW)

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

#### Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by CFW, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by CFW, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for CFW.

**Table 3-148** Actions supported by CFW

| Action                              | Description                                     | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias            |
|-------------------------------------|-------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| cfw:acl:createAclRule               | Grants permission to create an acl rule.        | Write        | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | • cfw:acl:create |
| cfw:acl:deleteAclRule               | Grants permission to delete an acl rule.        | Write        | acl *                       | -                                                                                                                                                  | • cfw:acl:delete |
|                                     |                                                 |              | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> |                  |
| cfw:acl:deleteHitCount              | Grants permission to delete acl rule hit count. | Write        | acl *                       | -                                                                                                                                                  | • cfw:acl:list   |
|                                     |                                                 |              | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> |                  |
| cfw:instance:listDomainParseServers | Grants permission to get domain parse server.   | List         | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | • cfw:domain:get |

| Action                            | Description                                   | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias                                                              |
|-----------------------------------|-----------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|
| cfw:instance:getDomainParseResult | Grants permission to parse domain.            | Read         | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | <ul style="list-style-type: none"> <li>• cfw:domain:get</li> </ul> |
| cfw:acl:getExportStatus           | Grants permission to get acl export status.   | Read         | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | <ul style="list-style-type: none"> <li>• cfw:acl:list</li> </ul>   |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-150](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for CFW.

**Table 3-150** Resource types supported by CFW

| Resource Type  | URN                                                          |
|----------------|--------------------------------------------------------------|
| blackWhiteList | cfw:<region>:<account-id>:blackWhiteList:<blackWhiteList-id> |

| Resource Type | URN                                                      |
|---------------|----------------------------------------------------------|
| acl           | cfw:<region>:<account-id>:acl:<acl-id>                   |
| instance      | cfw:<region>:<account-id>:instance:<fwInstance-id>       |
| serviceGroup  | cfw:<region>:<account-id>:serviceGroup:<serviceGroup-id> |
| domainGroup   | cfw:<region>:<account-id>:domainGroup:<domainGroup-id>   |
| ipGroup       | cfw:<region>:<account-id>:ipGroup:<ipGroup-id>           |
| eip           | cfw:<region>:<account-id>:eip:<eip-id>                   |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, cfw) apply only to operations of the xx service. For details, see [Table 3-151](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [operators](#).

### Service-specific condition keys supported by CFW

The following table lists the condition keys that you can define in identity policies for CFW. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-151** Service-specific condition keys supported by CFW

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                                                  |
|--------------------------------|--------|-------------------------------|--------------------------------------------------------------|
| cfw:LogGroupId                 | string | Single-valued                 | Filters access based on the LTS log group ID in the request. |

### 3.7.4 Cloud Bastion Host (CBH)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.

- Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by CBH, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by CBH, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for CBH.

**Table 3-152** Actions supported by CBH

| Action                  | Description                                               | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-------------------------|-----------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| cbh::listAvailableZones | Grants permission to list AZs.                            | List         | -                           | -             | -     |
| cbh::getEcsQuota        | Grants permission to query ECS resource quotas.           | Read         | -                           | -             | -     |
| cbh::getQuota           | Grants permission to query the quota of the bastion host. | Read         | -                           | -             | -     |
| cbh::listSpecifications | Grants permission to list bastion host specifications.    | List         | -                           | -             | -     |

| Action                         | Description                                     | Access Level | Resource Type (*: required) | Condition Key                                                                                                                              | Alias |
|--------------------------------|-------------------------------------------------|--------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|-------|
| cbh:instance:listInstances     | Grants permission to list bastion hosts.        | List         | instance *                  | -                                                                                                                                          | -     |
| cbh:instance:getInstanceStatus | Grants permission to query bastion host status. | Read         | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/tag-key</a></li> </ul> | -     |
| cbh:instance:startInstance     | Grants permission to start bastion host.        | Write        | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/tag-key</a></li> </ul> | -     |
| cbh:instance:stopInstance      | Grants permission to stop bastion host.         | Write        | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/tag-key</a></li> </ul> | -     |
| cbh:instance:rebootInstance    | Grants permission to reboot bastion host.       | Write        | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/tag-key</a></li> </ul> | -     |
| cbh:instance:upgradeInstance   | Grants permission to upgrade bastion host.      | Write        | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/tag-key</a></li> </ul> | -     |

| Action                                | Description                                                | Access Level | Resource Type (*: required) | Condition Key                                                                                                                              | Alias |
|---------------------------------------|------------------------------------------------------------|--------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|-------|
| cbh:instance:loginInstance            | Grants permission to login bastion host as the IAM user.   | Write        | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/tag-key</a></li> </ul> | -     |
| cbh:instance:resetInstancePassword    | Grants permission to reset the password of bastion host.   | Write        | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/tag-key</a></li> </ul> | -     |
| cbh:instance:resetInstanceLoginMethod | Grants permission to reset the login mode of bastion host. | Write        | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/tag-key</a></li> </ul> | -     |
| cbh:instance:deleteInstance           | Grants permission to delete faulty bastion host.           | Write        | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/tag-key</a></li> </ul> | -     |
| cbh:instance:alterInstance            | Grants permission to alter bastion host.                   | Write        | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/tag-key</a></li> </ul> | -     |
| cbh:instance:createInstance           | Grants permission to create bastion host.                  | Write        | instance *                  | -                                                                                                                                          | -     |

| Action                                   | Description                                                                            | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                                                                                                | Alias |

| POST /v2/{project_id}/cbs/instance/{resource_id}/tags/action | cbh:instance:operateInstanceTags | -                                                                                                  |
| GET /v2/{project_id}/cbs/instance/get-om-url                 | cbh:instance:getOmUrl            | -                                                                                                  |
| POST /v2/{project_id}/cbs/instance/rollback                  | cbh:instance:rollbackInstance    | -                                                                                                  |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-154](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for CBH.

**Table 3-154** Resource types supported by CBH

| Resource Type | URN                                              |
|---------------|--------------------------------------------------|
| instance      | cbh:<region>:<account-id>:instance:<instance-id> |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, cbh) apply only to operations of the xx service. For details, see [Table 3-155](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [operators](#).

### Service-specific condition keys supported by CBH

The following table lists the condition keys that you can define in identity policies for CBH. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-155** Service-specific condition keys supported by CBH

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                                                  |
|--------------------------------|---------|-------------------------------|------------------------------------------------------------------------------|
| cbh:VpcId                      | string  | Single-valued                 | Filters access to control which VPC (ID) the instance can communicate with.  |
| cbh:SubnetId                   | string  | Single-valued                 | Filters access to control which CIDR (ID) the instance can communicate with. |
| cbh:AllowBindPublicIp          | boolean | Single-valued                 | Filters access to control whether EIPs can be bound to the instance.         |

### 3.7.5 Cloud Certificate & Manager (CCM)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify a URN for the Resource element in your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table.

For details about the resource types defined by the PCA, see [Table 3-158](#).

- The **Condition Key** contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key only takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by PCA, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for PCA.

**Table 3-156** Actions supported by PCA

| Action        | Description                                   | Access Level | Resource Type (*: Required) | Condition Key            | Alias |
|---------------|-----------------------------------------------|--------------|-----------------------------|--------------------------|-------|
| pca:ca:create | Grants the permission to create a private CA. | write        | ca *                        | -                        | -     |
|               |                                               |              | -                           | g:EnterpriseProjectId    |       |
| pca:ca:delete | Grants the permission to delete a private CA. | write        | ca *                        | g:ResourceTag /<tag-key> | -     |
|               |                                               |              | -                           | g:EnterpriseProjectId    |       |

| Action          | Description                                                                            | Access Level | Resource Type (*: Required) | Condition Key            | Alias         |
|-----------------|----------------------------------------------------------------------------------------|--------------|-----------------------------|--------------------------|---------------|
| pca:ca:disable  | Grants the permission to disable a private CA.                                         | write        | ca *                        | g:ResourceTag /<tag-key> | -             |
|                 |                                                                                        |              | -                           | g:EnterpriseProjectId    |               |
| pca:ca:enable   | Grants the permission to enable a private CA.                                          | write        | ca *                        | g:ResourceTag /<tag-key> | -             |
|                 |                                                                                        |              | -                           | g:EnterpriseProjectId    |               |
| pca:ca:export   | Grants the permission to export a private CA certificate.                              | read         | ca *                        | g:ResourceTag /<tag-key> | -             |
|                 |                                                                                        |              | -                           | g:EnterpriseProjectId    |               |
| pca:ca:getCsr   | Grants the permission to export the certificate signing request (CSR) of a private CA. | read         | ca *                        | g:ResourceTag /<tag-key> | -             |
|                 |                                                                                        |              | -                           | g:EnterpriseProjectId    |               |
| pca:ca:import   | Grants the permission to import a certificate as a private CA certificate.             | write        | ca *                        | -                        | -             |
|                 |                                                                                        |              | -                           | g:EnterpriseProjectId    |               |
| pca:ca:activate | Grants the permission to activate a private CA.                                        | write        | ca *                        | g:ResourceTag /<tag-key> | pca:ca:active |
|                 |                                                                                        |              | -                           | g:EnterpriseProjectId    |               |
| pca:ca:list     | Grants the permission to query the private CA list.                                    | list         | ca *                        | -                        | -             |
|                 |                                                                                        |              | -                           | g:EnterpriseProjectId    |               |

| Action           | Description                                                      | Access Level | Resource Type (*: Required) | Condition Key                                                                                                                    | Alias |
|------------------|------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------|-------|
| pca:ca:restore   | Grants the permission to restore a private CA.                   | write        | ca *                        | g:ResourceTag /<tag-key>                                                                                                         | -     |
|                  |                                                                  |              | -                           | g:EnterpriseProjectId                                                                                                            |       |
| pca:ca:revoke    | Grants the permission to revoke a private CA.                    | write        | ca *                        | g:ResourceTag /<tag-key>                                                                                                         | -     |
|                  |                                                                  |              | -                           | g:EnterpriseProjectId                                                                                                            |       |
| pca:ca:get       | Grants the permission to query private CA details.               | read         | ca *                        | g:ResourceTag /<tag-key>                                                                                                         | -     |
|                  |                                                                  |              | -                           | g:EnterpriseProjectId                                                                                                            |       |
| pca:ca:quota     | Grants the permission to query the private CA quota.             | read         | -                           | -                                                                                                                                | -     |
| pca:ca:createTag | Grants the permission to create or update tags for a private CA. | tagging      | ca *                        | g:ResourceTag /<tag-key>                                                                                                         | -     |
|                  |                                                                  |              | -                           | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:RequestTag/&lt;tag-key&gt;</li> <li>g:TagKeys</li> </ul> |       |
| pca:ca:deleteTag | Grants the permission to delete a private CA tag.                | tagging      | ca *                        | g:ResourceTag /<tag-key>                                                                                                         | -     |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-158](#), the resource URN must be specified in the identity policy using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the **Resource** element is marked with an asterisk (\*) and the policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for PCA.

**Table 3-158** Resource types supported by PCA

| Resource Type | URN                                  |
|---------------|--------------------------------------|
| ca            | pca:<region>:<account-id>:ca:<ca-id> |

## Conditions

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, IAM automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, **pca:**) apply only to operations of the corresponding service. For details, see [Table 3-159](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so **g:SourceVpce** is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so **g:TagKeys** is a multivalued condition key.
- A condition operator, a condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [Condition operators](#).

The following table lists the condition keys that you can define in identity policies for PCA. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-159** Service-specific condition keys supported by PCA

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                                                                           |
|--------------------------------|--------|-------------------------------|---------------------------------------------------------------------------------------|
| pca:CommonName                 | string | Single-valued                 | Filters access based on the common name of the certificate in the request parameters. |

### 3.7.6 Database Security Service (DBSS)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

#### Action

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN for the **Resource** element of your statements.
  - Required resources are marked with asterisks (\*) in the table.

For details about the resource types defined by DBSS, see [Resource](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by DBSS, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for identity policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for DBSS.

**Table 3-160** Actions supported by DBSS

| Action                                 | Description                                                    | Access Level | Resource Type (*: Required) | Condition Key                                                                                                                                      | Alias                            |
|----------------------------------------|----------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|
| dbss:auditInstance:listSqlInjectRules  | Grants permission to query SQL injection rules.                | List         | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:createOnOrder |
| dbss:auditInstance:listSqls            | Grants permission to obtain audit results.                     | List         | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:list          |
| dbss:auditInstance:switchSqlInjectRule | Grants permission to enable or disable SQL injection policies. | Write        | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:createOnOrder |
| dbss:auditInstance:addSqlInjectRule    | Grants permission to add custom SQL injection rules.           | Write        | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:createOnOrder |
| dbss:auditInstance:orderSqlInjectRule  | Grants permission to sort SQL rules by priority.               | Write        | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:createOnOrder |

| Action                                 | Description                                                    | Access Level | Resource Type (*: Required) | Condition Key                                                                                                                                      | Alias                            |
|----------------------------------------|----------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|
| dbss:auditInstance:createReporter      | Grants permission to generate reports immediately.             | Write        | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:createOnOrder |
| dbss:auditInstance:listReporters       | Grants permission to query report information.                 | List         | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:list          |
| dbss:auditInstance:getRiskRuleDetail   | Grants permission to query a specified risk rule policy.       | Read         | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:list          |
| dbss:auditInstance:listAlarmEmails     | Grants permission to query alarm email information.            | List         | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:list          |
| dbss:auditInstance:downloadReporter    | Grants permission to download reports.                         | Read         | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:list          |
| dbss:auditInstance:listAuditScopeRules | Grants permission to query the policy list for an audit scope. | List         | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:list          |

| Action                               | Description                                                       | Access Level | Resource Type (*: Required) | Condition Key                                                                                                                                      | Alias                            |
|--------------------------------------|-------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|
| dbss:auditInstance:addSensitiveRule  | Grants permission to add a privacy data protection rule.          | Write        | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:createOnOrder |
| dbss:auditInstance:editSensitiveRule | Grants permission to edit privacy data protection rules.          | Write        | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:createOnOrder |
| dbss:auditInstance:deleteReporter    | Grants permission to delete reports.                              | Write        | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:createOnOrder |
| dbss:auditInstance:listOperationLog  | Grants permission to query user operation logs.                   | List         | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:list          |
| dbss:auditInstance:listMonitorInfos  | Grants permission to query audit instance monitoring information. | List         | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:list          |
| dbss:auditInstance:listSessionInfo   | Grants permission to query audit instance session information.    | List         | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:list          |

| Action                           | Description                                                       | Access Level | Resource Type (*: Required) | Condition Key                                                                                                                                      | Alias                            |
|----------------------------------|-------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|
| dbss:auditInstance:switchBackup  | Grants permission to enable or disable the backup function.       | Write        | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:createOnOrder |
| dbss::downloadLicense            | Grants permission to download a sales license.                    | Read         | -                           | -                                                                                                                                                  | dbss:auditInstance:list          |
| dbss::deleteAuditInstanceJob     | Grants permission to delete failed audit instance creation tasks. | Write        | -                           | -                                                                                                                                                  | dbss:auditInstance:delete        |
| dbss::listRdsDb                  | Grants permission to query RDS databases.                         | List         | -                           | -                                                                                                                                                  | dbss:auditInstance:list          |
| dbss:auditInstance:instanceStart | Grants permission to enable audit instances.                      | Write        | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:start         |
| dbss:auditInstance:reboot        | Grants permission to restart audit instances.                     | Write        | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -                                |
| dbss:auditInstance:stop          | Grants permission to disable audit instances.                     | Write        | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -                                |

| Action                                 | Description                                                          | Access Level | Resource Type (*: Required) | Condition Key                                                                                                                                      | Alias                            |
|----------------------------------------|----------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|
| dbss:auditInstance:upgrade             | Grants permission to upgrade audit instances.                        | Write        | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:createOnOrder |
| dbss::queryUpgradeStatus               | Grants permission to query the upgrade status of an audit instance.  | List         | -                           | -                                                                                                                                                  | dbss:auditInstance:createOnOrder |
| dbss:auditInstance:updateSecurityGroup | Grants permission to modify the security group of an audit instance. | Write        | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:createOnOrder |
| dbss:auditInstance:modifyAttribute     | Grants permission to modify attributes of audit instances.           | Write        | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:createOnOrder |
| dbss:auditInstance:downloadAgent       | Grants permission to download agents.                                | Read         | auditInstance *             | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dbss:auditInstance:createOnOrder |

| GET /dbss/v1/{project_id}/{resource_type}/{resource_id}/tags | dbss::listTagsForResource | -          |

## Resource

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-162](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for DBSS.

**Table 3-162** Resource types supported by DBSS

| Resource Type | URN                                                    |
|---------------|--------------------------------------------------------|
| auditInstance | dbss:<region>:<account-id>:auditInstance:<instance-id> |

## Conditions

### Condition Key

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- Condition keys are the key values in the Condition element of an identity policy statement. Condition keys are classified into global condition keys and service-specific condition keys based on the application scope.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, dbss:) apply only to operations of the specific service. For details, see [Table 3-163](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the

request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so `g:SourceVpce` is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so `g:TagKeys` is a multivalued condition key.

- A condition operator, a condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [Condition operators](#).

### Service-specific condition keys supported by DBSS

The following table lists the condition keys that you can define in identity policies for DBSS. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-163** Service-specific condition keys supported by DBSS

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Important Notes                                                            |
|--------------------------------|--------|-------------------------------|----------------------------------------------------------------------------|
| <code>dbss:VpcId</code>        | string | Single-valued                 | Filters access based on the network ID specified in the request parameter. |
| <code>dbss:SubnetId</code>     | string | Single-valued                 | Filters access based on the subnet ID specified in the request parameter.  |

## 3.7.7 Data Security Center (DSC)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by DSC, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by DSC, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for DSC.

**Table 3-164** Actions supported by DSC

| Action                  | Description                                                           | Access Level          | Resource Type (*: required) | Condition Key | Alias |
|-------------------------|-----------------------------------------------------------------------|-----------------------|-----------------------------|---------------|-------|
| dsc:authorization:get   | Grants permission to query authorization status of cloud data assets. | permission_management | -                           | -             | -     |
| dsc:authorization:grant | Grants permission to authorize or deauthorize cloud data assets.      | permission_management | -                           | -             | -     |
| dsc:asset:delete        | Grants permission to delete data assets.                              | write                 | asset *                     | -             | -     |
| dsc:asset:list          | Grants permission to query data asset list.                           | list                  | asset *                     | -             | -     |
| dsc:asset:create        | Grants permission to create data assets.                              | write                 | asset *                     | -             | -     |
| dsc:asset:update        | Grants permission to update data asset info.                          | write                 | asset *                     | -             | -     |
| dsc:overview:list       | Grants permission to view data security overview.                     | list                  | -                           | -             | -     |
| dsc:maskTask:create     | Grants permission to create data masking tasks.                       | write                 | maskTask *                  | -             | -     |

| Action                    | Description                                                                               | Access Level | Resource Type (*: required) | Condition Key | Alias |
|---------------------------|-------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| dsc:maskTask:update       | Grants permission to update data masking tasks.                                           | write        | mask Task *                 | -             | -     |
| dsc:maskTask:list         | Grants permission to query data masking tasks list.                                       | list         | mask Task *                 | -             | -     |
| dsc:maskTask:get          | Grants permission to query the detail of a data masking task.                             | read         | mask Task *                 | -             | -     |
| dsc:maskTask:delete       | Grants permission to delete data masking tasks.                                           | write        | mask Task *                 | -             | -     |
| dsc:maskTask:operate      | Grants permission to operate (such as start, stop, enable or disable) data masking tasks. | write        | mask Task *                 | -             | -     |
| dsc:maskTask:listSubTasks | Grants permission to query the subtask list of a data masking task.                       | list         | mask Task *                 | -             | -     |
| dsc:common:operate        | Grants permission to operate DSC general resources.                                       | write        | -                           | -             | -     |

| Action                   | Description                                                         | Access Level | Resource Type (*: required) | Condition Key | Alias |
|--------------------------|---------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| dsc:scanTask:create      | Grants permission to create data scan tasks.                        | write        | scanTask *                  | -             | -     |
| dsc:scanTask:update      | Grants permission to update data scan tasks.                        | write        | scanTask *                  | -             | -     |
| dsc:scanTask:delete      | Grants permission to delete data scan tasks or subtasks.            | write        | scanTask *                  | -             | -     |
| dsc:scanTask:operate     | Grants permission to operate data scan tasks or subtasks.           | write        | scanTask *                  | -             | -     |
| dsc:scanTask:list        | Grants permission to query the list of data scan tasks or subtasks. | list         | scanTask *                  | -             | -     |
| dsc:scanRuleGroup:update | Grants permission to update info of scan rule groups.               | write        | -                           | -             | -     |
| dsc:scanRuleGroup:list   | Grants permission to query the list of scan rule groups.            | list         | -                           | -             | -     |
| dsc:scanRuleGroup:create | Grants permission to create scan rule groups.                       | write        | -                           | -             | -     |

| Action                   | Description                                                 | Access Level | Resource Type (*: required) | Condition Key | Alias |
|--------------------------|-------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| dsc:scanRuleGroup:get    | Grants permission to query the detail of a scan rule group. | read         | -                           | -             | -     |
| dsc:scanRuleGroup:delete | Grants permission to delete scan rule groups.               | write        | -                           | -             | -     |
| dsc:scanRule:list        | Grants permission to query the list of scan rules.          | list         | scanRule *                  | -             | -     |
| dsc:scanRule:create      | Grants permission to create scan rules.                     | write        | scanRule *                  | -             | -     |
| dsc:scanRule:update      | Grants permission to update info of scan rules.             | write        | scanRule *                  | -             | -     |
| dsc:scanRule:get         | Grants permission to query the detail of a scan rule.       | read         | scanRule *                  | -             | -     |
| dsc:scanRule:delete      | Grants permission to delete scan rules.                     | write        | scanRule *                  | -             | -     |
| dsc:scanTask:getResults  | Grants permission to query the scan results of a scan task. | read         | scanTask *                  | -             | -     |

| Action                  | Description                                                                 | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-------------------------|-----------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| dsc:common:list         | Grants permission to query DSC general resource list.                       | list         | -                           | -             | -     |
| dsc:sensitiveData:mask  | Grants permission to perform dynamic masking for sensitive data.            | write        | -                           | -             | -     |
| dsc:watermark:embed     | Grants permission to embed watermark into documents, images or databases.   | write        | -                           | -             | -     |
| dsc:watermark:extract   | Grants permission to extract watermark from documents, images or databases. | write        | -                           | -             | -     |
| dsc:scanTemplate:list   | Grants permission to query scan template list.                              | list         | scanTemplate *              | -             | -     |
| dsc:scanTemplate:create | Grants permission to create scan templates.                                 | write        | scanTemplate *              | -             | -     |
| dsc:scanTemplate:update | Grants permission to update scan templates.                                 | write        | scanTemplate *              | -             | -     |

| Action                  | Description                                              | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-------------------------|----------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| dsc:scanTemplate:delete | Grants permission to delete scan templates.              | write        | scanTemplate *              | -             | -     |
| dsc:scanTemplate:get    | Grants permission to query the detail of scan templates. | read         | scanTemplate *              | -             | -     |

Each API of DSC usually supports one or more actions. [Table 3-165](#) lists the supported actions and dependencies.

**Table 3-165** Actions and dependencies supported by DSC APIs

| API                                                     | Action             | Dependencies                |
|---------------------------------------------------------|--------------------|-----------------------------|
| DELETE/v1/{project_id}/sdg/asset/obs/bucket/{bucket_id} | dsc:asset:delete   | obs:bucket:GetBucketLogging |
|                                                         |                    | obs:bucket:PutBucketLogging |
| GET/v1/{project_id}/sdg/asset/obs/buckets               | dsc:asset:list     | obs:bucket:listAllMyBuckets |
| POST/v1/{project_id}/sdg/asset/obs/buckets              | dsc:asset:create   | obs:bucket:GetBucketStorage |
|                                                         |                    | obs:bucket:listAllMyBuckets |
| PUT/v1/{project_id}/sdg/asset/{asset_id}/name           | dsc:asset:update   | -                           |
| POST/v1/{project_id}/period/order                       | dsc:common:operate | bss:renewal:update          |
|                                                         |                    | bss:order:update            |
| GET/v1/{project_id}/period/product/specification        | dsc:common:list    | -                           |

| API                                                                        | Action                    | Dependencies   |
|----------------------------------------------------------------------------|---------------------------|----------------|
| POST/v1/{project_id}/sdg/server/mask/dbs/templates/{template_id}/operation | dsc:maskTask:operate      | -              |
| GET/v1/{project_id}/sdg/server/mask/dbs/templates/{template_id}/tasks      | dsc:maskTask:listSubTasks | -              |
| PUT/v1/{project_id}/sdg/smn/topic                                          | dsc:common:operate        | -              |
| GET/v1/{project_id}/sdg/smn/topics                                         | dsc:common:list           | smn:topic:list |
| GET/v1/{project_id}/openapi/called-records                                 | dsc:common:list           | -              |
| POST/v1/{project_id}/sdg/scan/job                                          | dsc:scanTask:create       | -              |
| GET/v1/{project_id}/sdg/scan/jobs                                          | dsc:scanTask:list         | -              |
| GET/v1/{project_id}/sdg/server/scan/groups                                 | dsc:scanRuleGroup:list    | -              |
| POST/v1/{project_id}/sdg/server/scan/groups                                | dsc:scanRuleGroup:create  | -              |
| DELETE/v1/{project_id}/sdg/server/scan/groups/{group_id}                   | dsc:scanRuleGroup:delete  | -              |
| GET/v1/{project_id}/sdg/server/scan/rules                                  | dsc:scanRule:list         | -              |
| POST/v1/{project_id}/sdg/server/scan/rules                                 | dsc:scanRule:create       | -              |

| API                                                                                          | Action                  | Dependencies |
|----------------------------------------------------------------------------------------------|-------------------------|--------------|
| PUT/v1/<br>{project_id}/sdg/<br>server/scan/rules                                            | dsc:scanRule:update     | -            |
| DELETE/v1/<br>{project_id}/sdg/<br>server/scan/rules/<br>{rule_id}                           | dsc:scanRule:delete     | -            |
| GET/v1/<br>{project_id}/sdg/<br>scan/job/{job_id}/<br>results                                | dsc:scanTask:getResults | -            |
| GET/v1/<br>{project_id}/sdg/<br>server/relation/jobs/<br>{job_id}/dbs                        | dsc:common:list         | -            |

| API                                                          | Action                | Dependencies |
|--------------------------------------------------------------|-----------------------|--------------|
| GET/v1/{project_id}/sdg/asset/{asset_type}/{asset_id}/detail | dsc:common:list       | -            |
| GET /v1/{project_id}/sdg/asset/authorization                 | dsc:authorization:get | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-166](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for DSC.

**Table 3-166** Resource types supported by DSC

| Resource Type | URN                                                  |
|---------------|------------------------------------------------------|
| scanTask      | dsc:<region>:<account-id>:scanTask:<task-id>         |
| scanRule      | dsc:<region>:<account-id>:scanRule:<rule-id>         |
| scanTemplate  | dsc:<region>:<account-id>:scanTemplate:<template-id> |
| maskTask      | dsc:<region>:<account-id>:maskTask:<task-id>         |
| asset         | dsc:<region>:<account-id>:asset:<asset-id>           |

## Conditions

DSC does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.7.8 Web Application Firewall (WAF)

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by waf, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by waf, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for waf.

**Table 3-167** Actions supported by waf

| Action           | Description                                             | Access Level | Resource Type (*: required) | Condition Key                         | Alias                 |
|------------------|---------------------------------------------------------|--------------|-----------------------------|---------------------------------------|-----------------------|
| waf:host:list    | Grants permission to query all protected domain names.  | List         | host *                      | -                                     | • waf:instance:list   |
|                  |                                                         |              | -                           | <a href="#">g:EnterpriseProjectId</a> |                       |
| waf:host:create  | Grants permission to create a protection domain name.   | Write        | host *                      | -                                     | • waf:instance:create |
|                  |                                                         |              | policy                      | -                                     |                       |
|                  |                                                         |              | certificate                 | -                                     |                       |
|                  |                                                         |              | -                           | <a href="#">g:EnterpriseProjectId</a> |                       |
| waf:host:get     | Grants permission to query the protected domain name.   | Read         | host *                      | <a href="#">g:EnterpriseProjectId</a> | • waf:instance:get    |
| waf:host:put     | Grants permission to update the protected domain name.  | Write        | host *                      | <a href="#">g:EnterpriseProjectId</a> | • waf:instance:put    |
|                  |                                                         |              | certificate                 | -                                     |                       |
| waf:host:delete  | Grants permission to delete the protection domain name. | Write        | host *                      | <a href="#">g:EnterpriseProjectId</a> | • waf:instance:delete |
| waf:sourcelp:get | Grants permission to query WAF IP addresses.            | Read         | -                           | -                                     | -                     |

| Action            | Description                                                | Access Level | Resource Type (*: required) | Condition Key                         | Alias                                                                 |
|-------------------|------------------------------------------------------------|--------------|-----------------------------|---------------------------------------|-----------------------------------------------------------------------|
| waf:policy:list   | Grants permission to query all protected policies.         | List         | policy *                    | -                                     | -                                                                     |
|                   |                                                            |              | -                           | <a href="#">g:EnterpriseProjectId</a> |                                                                       |
| waf:policy:create | Grants permission to create a protection policy.           | Write        | policy *                    | -                                     | -                                                                     |
|                   |                                                            |              | -                           | <a href="#">g:EnterpriseProjectId</a> |                                                                       |
| waf:policy:get    | Grants permission to query the protected policy.           | Read         | policy *                    | <a href="#">g:EnterpriseProjectId</a> | -                                                                     |
| waf:policy:put    | Grants permission to update the protected policy.          | Write        | policy *                    | <a href="#">g:EnterpriseProjectId</a> | -                                                                     |
|                   |                                                            |              | host                        | -                                     |                                                                       |

| waf:alert:get         | Grants permission to query the alertConfig.             | List         | -                           | -                                                                                                                                                                                      | -     |
| waf:alert:put         | Grants permission to update the alertConfig.            | Write        | -                           | -                                                                                                                                                                                      | -     |
| waf:consoleConfig:get | Grants permission to query the console configurations.  | Read         | -                           | -                                                                                                                                                                                      | -     |
| waf:bundle:get        | Grants permission to query the user bundle.             | Read         | -                           | <a href="#">g:EnterpriseProjectId</a>                                                                                                                                                  | -     |

| Action                              | Description                                                  | Access Level | Resource Type (*: required) | Condition Key                         | Alias |
|-------------------------------------|--------------------------------------------------------------|--------------|-----------------------------|---------------------------------------|-------|
| waf:securityReportSubscription:list | Grants permission to query the security report subscription. | Read         | -                           | <a href="#">g:EnterpriseProjectId</a> | -     |
| waf:tmsProjectTags:get              | Grants permission to query the tms project tags.             | Read         | -                           | <a href="#">g:EnterpriseProjectId</a> | -     |

Each API of waf usually supports one or more actions. [Table 3-168](#) lists the supported actions and dependencies.

**Table 3-168** Actions and dependencies supported by waf APIs

| API                                                   | Action          | Dependencies |
|-------------------------------------------------------|-----------------|--------------|
| POST /v1/{project_id}/waf/instance                    | waf:host:create | -            |
| DELETE /v1/{project_id}/waf/instance/{instance_id}    | waf:host:delete | -            |
| GET /v1/{project_id}/waf/instance                     | waf:host:list   | -            |
| GET /v1/{project_id}/waf/instance/{instance_id}/route | waf:host:get    | -            |
| GET /v1/{project_id}/waf/instance/{instance_id}       | waf:host:get    | -            |

| API                                                            | Action            | Dependencies |
|----------------------------------------------------------------|-------------------|--------------|
| PATCH /v1/{project_id}/waf/instance/{instance_id}              | waf:host:put      | -            |
| PUT /v1/{project_id}/waf/instance/{instance_id}/protect-status | waf:host:put      | -            |
| POST /v1/{project_id}/premium-waf/host                         | waf:host:create   | -            |

| -   | waf:policy:get | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-169](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for waf.

**Table 3-169** Resource types supported by waf

| Resource Type   | URN                                                     |
|-----------------|---------------------------------------------------------|
| policy          | waf:<region>:<account-id>;policy:<policy-id>            |
| host            | waf:<region>:<account-id>;host:<host-id>                |
| premiumInstance | waf:<region>:<account-id>;premiumInstance:<instance-id> |
| certificate     | waf:<region>:<account-id>;certificate:<certificate-id>  |

## Conditions

waf does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.7.9 Host Security Service (HSS)

#### Actions Supported by Identity Policy-based Authorization

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that

OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by HSS, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by HSS, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for HSS.

**Table 3-170** Actions supported by HSS

| Action                              | Description                                                                   | Access Level | Resource Type (*: required) | Condition Key                         | Alias                                                                             |
|-------------------------------------|-------------------------------------------------------------------------------|--------------|-----------------------------|---------------------------------------|-----------------------------------------------------------------------------------|
| hss:host:addHostsGroup              | Grants permission to create a server group.                                   | Write        | host *                      | <a href="#">g:EnterpriseProjectId</a> | <ul style="list-style-type: none"> <li>hss:hostGroup:set</li> </ul>               |
| hss:ars:addPWLPolicyHost            | Grants permission to add servers to a whitelist policy.                       | Write        | host *                      | <a href="#">g:EnterpriseProjectId</a> | <ul style="list-style-type: none"> <li>hss:ars:set</li> </ul>                     |
| hss:rasp:addRaspPolicy              | Grants permission to add protection policies.                                 | Write        | -                           | <a href="#">g:EnterpriseProjectId</a> | <ul style="list-style-type: none"> <li>hss:rasp:set</li> </ul>                    |
| hss:safetyReport:addSecurityReport  | Grants permission to create or copy new reports.                              | Write        | -                           | <a href="#">g:EnterpriseProjectId</a> | <ul style="list-style-type: none"> <li>hss:safetyReport:set</li> </ul>            |
| hss:wtp:addTimingOffConfigInfo      | Grants permission to add the configuration of scheduled protection disabling. | Write        | host *                      | <a href="#">g:EnterpriseProjectId</a> | <ul style="list-style-type: none"> <li>hss:wtpScheduledProtections:set</li> </ul> |
| hss:wtp:addWtpHostProtectDirInfo    | Grants permission to add protected directories.                               | Write        | host *                      | <a href="#">g:EnterpriseProjectId</a> | <ul style="list-style-type: none"> <li>hss:wtpDirectories:set</li> </ul>          |
| hss:wtp:addWtpPrivilegedProcessInfo | Grants permission to add privileged processes.                                | Write        | host *                      | <a href="#">g:EnterpriseProjectId</a> | <ul style="list-style-type: none"> <li>hss:wtpPrivilegedProcess:set</li> </ul>    |

| Action                                 | Description                                                                           | Access Level | Resource Type (*: required) | Condition Key                         | Alias                                                                       |
|----------------------------------------|---------------------------------------------------------------------------------------|--------------|-----------------------------|---------------------------------------|-----------------------------------------------------------------------------|

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-172](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for HSS.

**Table 3-172** Resource types supported by HSS

| Resource Type | URN                                                        |
|---------------|------------------------------------------------------------|
| event         | hss:<region>:<account-id>:event:<event-id>                 |
| policy        | hss:<region>:<account-id>:policy:<resource-type>/<type-id> |
| host          | hss:<region>:<account-id>:host:<host-id>                   |
| baseline      | hss:<region>:<account-id>:baseline:<type>/<check_rule_id>  |

## Conditions

HSS does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.7.10 SecMaster

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to

that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an SCP.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an SCP.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions, and you must specify all resources ("\*") in your SCP statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by SecMaster, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the **Condition** element of an SCP statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by SecMaster, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for SecMaster.

**Table 3-173** Actions supported by SecMaster (part 1)

| Action                           | Description                                                           | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|----------------------------------|-----------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| secmaster:playbook:get           | Grants the permission to query playbook details.                      | read         | playbook*                   | -             | -     |
| secmaster:playbook:create        | Grants the permission to create a playbook.                           | write        | playbook*                   | -             | -     |
| secmaster:playbook:delete        | Grants the permission to delete a playbook.                           | write        | playbook*                   | -             | -     |
| secmaster:playbook:update        | Grants the permission to update a playbook.                           | write        | playbook*                   | -             | -     |
| secmaster:playbook:list          | Grants the permission to query the playbook list.                     | list         | playbook*                   | -             | -     |
| secmaster:playbook:getStatistics | Grants the permission to obtain playbook statistics.                  | read         | playbook*                   | -             | -     |
| secmaster:playbook:getMonitor    | Grants the permission to obtain the playbook running monitoring data. | read         | playbook*                   | -             | -     |
| secmaster:playbook:copyVersion   | Grants the permission to clone a playbook.                            | write        | playbook*                   | -             | -     |
| secmaster:playbook:approve       | Grants the permission to review a playbook.                           | write        | playbook*                   | -             | -     |

| Action                                 | Description                                                               | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|----------------------------------------|---------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| secmaster:playbook:listApproves        | Grants the permission to query the playbook review list.                  | list         | playbook*                   | -             | -     |
| secmaster:playbook:listInstances       | Grants the permission to query the playbook instance list.                | list         | playbook*                   | -             | -     |
| secmaster:playbook:getInstanceAuditlog | Grants the permission to query the audit log list of a playbook instance. | list         | playbook*                   | -             | -     |
| secmaster:playbook:createVersion       | Grants the permission to create a playbook version.                       | write        | playbook*                   | -             | -     |
| secmaster:playbook:getVersion          | Grants the permission to obtain a playbook version.                       | read         | playbook*                   | -             | -     |
| secmaster:playbook:deleteVersion       | Grants the permission to delete a playbook version.                       | write        | playbook*                   | -             | -     |
| secmaster:playbook:updateVersion       | Grants the permission to update a playbook version.                       | write        | playbook*                   | -             | -     |
| secmaster:playbook:listVersions        | Grants the permission to obtain the list of playbook versions.            | list         | playbook*                   | -             | -     |

| Action                                 | Description                                                                | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|----------------------------------------|----------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| secmaster:playbook:getInstance         | Grants the permission to query details about a playbook instance.          | read         | playbook *                  | -             | -     |
| secmaster:playbook:getInstanceTopology | Grants the permission to query details about a playbook instance topology. | read         | playbook *                  | -             | -     |
| secmaster:playbook:operateInstance     | Grants permissions to operate a playbook instance.                         | write        | playbook *                  | -             | -     |
| secmaster:workflow:list                | Grants the permission to query the workflow list.                          | list         | workflow *                  | -             | -     |
| secmaster:workflow:get                 | Grants the permission to obtain details about a workflow.                  | read         | workflow *                  | -             | -     |
| secmaster:workflow:delete              | Grants the permission to delete a workflow.                                | write        | workflow *                  | -             | -     |
| secmaster:workflow:create              | Grants the permission to create a workflow.                                | write        | workflow *                  | -             | -     |
| secmaster:workflow:update              | Grants the permission to update a workflow.                                | write        | workflow *                  | -             | -     |

| Action                            | Description                                                                 | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|-----------------------------------|-----------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| secmaster:workflow:listVersions   | Grants the permission to obtain the list of workflow versions.              | list         | workflow*                   | -             | -     |
| secmaster:workflow:getVersion     | Grants the permission to obtain details about a workflow version.           | read         | workflow*                   | -             | -     |
| secmaster:workflow:deleteVersion  | Grants the permission to delete a workflow version.                         | write        | workflow*                   | -             | -     |
| secmaster:workflow:createVersion  | Grants the permission to create a workflow version.                         | write        | workflow*                   | -             | -     |
| secmaster:workflow:updateVersion  | Grants the permission to update a workflow version.                         | write        | workflow*                   | -             | -     |
| secmaster:workflow:approveVersion | Grants the permission to review a workflow version.                         | write        | workflow*                   | -             | -     |
| secmaster:workflow:validate       | Grants the permission to verify a workflow version.                         | write        | workflow*                   | -             | -     |
| secmaster:workflow:simulate       | Grants the permission to update the debugging result of a workflow version. | write        | workflow*                   | -             | -     |

| Action                              | Description                                                         | Access Level | Resource Type (*: Required) | Condition Key | Alias                      |
|-------------------------------------|---------------------------------------------------------------------|--------------|-----------------------------|---------------|----------------------------|
| secmaster:workflow:getInstance      | Grants the permission to query the topology of a workflow instance. | read         | workflow *                  | -             | -                          |
| secmaster:workflow:operateInstance  | Grants the permission to update or create a workflow instance.      | write        | workflow *                  | -             | -                          |
| secmaster:connection:list           | Grants the permission to query the asset connection list.           | list         | connection *                | -             | -                          |
| secmaster:connection:create         | Grants the permissions to create an asset connection.               | write        | connection *                | -             | -                          |
| secmaster:connection:get            | Grants the permissions to obtain asset connection details.          | read         | connection *                | -             | -                          |
| secmaster:connection:delete         | Grants the permissions to delete an asset connection.               | write        | connection *                | -             | -                          |
| secmaster:connection:update         | Grants the permissions to update an asset connection.               | write        | connection *                | -             | -                          |
| secmaster:workspace:listWorkspace   | Grants the permission to query the workspace list.                  | list         | workspace *                 | -             | secmaster:workspace:list   |
| secmaster:workspace:createWorkspace | Grants the permission to create a workspace.                        | write        | workspace *                 | -             | secmaster:workspace:create |

| Action                              | Description                                                 | Access Level | Resource Type (*: Required) | Condition Key                          | Alias                      |
|-------------------------------------|-------------------------------------------------------------|--------------|-----------------------------|----------------------------------------|----------------------------|
| secmaster:workspace:updateWorkspace | Grants the permission to update a workspace.                | write        | workspace *                 | -                                      | secmaster:workspace:update |
| secmaster:workspace:getWorkspace    | Grants the permission to obtain workspace details.          | read         | workspace *                 | -                                      | secmaster:workspace:get    |
| secmaster:workspace:deleteWorkspace | Grants the permission to delete a workspace.                | write        | workspace *                 | -                                      | secmaster:workspace:delete |
| secmaster:workspace:listAgency      | Grants the permission to query the workspace agencies list. | list         | workspace *                 | -                                      | secmaster:workspace:list   |
| secmaster:workspace:createAgency    | Grants the permission to create a workspace agency.         | write        | workspace *                 | <a href="#">secmaster:TargetRegion</a> | secmaster:workspace:create |
| secmaster:workspace:updateAgency    | Grants the permission to update a workspace agency.         | write        | workspace *                 | -                                      | secmaster:workspace:update |
| secmaster:workspace:getAgency       | Grants the permission to obtain workspace agency details.   | read         | workspace *                 | -                                      | secmaster:workspace:get    |

| secmaster:shipper:pause              | Grants the permission to suspend a delivery rule.               | write        | shipper *                   | -             | -     |
| secmaster:shipper:getDelegateAuth    | Grants the permission to obtain an agency.                      | read         | shipper *                   | -             | -     |
| secmaster:shipper:createDelegateAuth | Grants the permission to create an agency.                      | write        | shipper *                   | -             | -     |
| secmaster:shipper:retryAuthorization | Grants the permission to re-authorize.                          | write        | shipper *                   | -             | -     |
| secmaster:shipper:retry              | Grants the permission to re-deliver.                            | write        | shipper *                   | -             | -     |
| secmaster:adHocQuery:create          | Grants the permission to execute the analysis statement.        | write        | -                           | -             | -     |
| secmaster:adHocQuery:get             | Grants the permission to query statement results.               | read         | -                           | -             | -     |
| secmaster:adHocQuery:delete          | Grants the permission to disable query operations.              | write        | -                           | -             | -     |

| Action                              | Description                                                | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|-------------------------------------|------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| secmaster:dataTransformation:list   | Grants the permission to query data transfer tasks.        | list         | -                           | -             | -     |
| secmaster:dataTransformation:get    | Grants the permission to query data transfer task details. | read         | -                           | -             | -     |
| secmaster:dataTransformation:enable | Grants the permission to enable a data transfer task.      | write        | -                           | -             | -     |
| secmaster:dataTransformation:create | Grants the permission to create a data transfer task.      | write        | -                           | -             | -     |
| secmaster:dataTransformation:delete | Grants the permission to delete a data transfer task.      | write        | -                           | -             | -     |
| secmaster:dataTransformation:update | Grants the permission to update a data transfer task.      | write        | -                           | -             | -     |

**Table 3-174** Actions supported by SecMaster (part 2)

| Action                                   | Description                                                    | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|------------------------------------------|----------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| secmaster:dataTransformation:listMetrics | Grants the permission to query metrics of data transfer tasks. | read         | -                           | -             | -     |
| secmaster:dataTransformation:disable     | Grants the permission to disable data transfer tasks.          | write        | -                           | -             | -     |

| Action                          | Description                                             | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|---------------------------------|---------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| secmaster:analysisScript:list   | Grants the permission to query analysis scripts.        | list         | -                           | -             | -     |
| secmaster:analysisScript:create | Grants the permission to create analysis scripts.       | write        | -                           | -             | -     |
| secmaster:analysisScript:get    | Grants the permission to query analysis script details. | read         | -                           | -             | -     |
| secmaster:analysisScript:update | Grants the permission to update analysis scripts.       | write        | -                           | -             | -     |
| secmaster:analysisScript:delete | Grants the permission to delete analysis scripts.       | write        | -                           | -             | -     |
| secmaster:codeSegment:list      | Grants the permission to query code snippets.           | list         | -                           | -             | -     |
| secmaster:codeSegment:create    | Grants the permission to create code snippets.          | write        | -                           | -             | -     |
| secmaster:codeSegment:get       | Grants the permission to query code snippet details.    | read         | -                           | -             | -     |
| secmaster:codeSegment:update    | Grants the permission to update code snippets.          | write        | -                           | -             | -     |
| secmaster:codeSegment:delete    | Grants the permission to delete code snippets.          | write        | -                           | -             | -     |

| Action                              | Description                                              | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|-------------------------------------|----------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| secmaster:retrieveScript:list       | Grants the permission to query retrieval scripts.        | list         | -                           | -             | -     |
| secmaster:retrieveScript:create     | Grants the permission to create retrieval scripts.       | write        | -                           | -             | -     |
| secmaster:retrieveScript:get        | Grants the permission to query retrieval script details. | read         | -                           | -             | -     |
| secmaster:retrieveScript:update     | Grants the permission to update retrieval scripts.       | write        | -                           | -             | -     |
| secmaster:retrieveScript:delete     | Grants the permission to delete retrieval scripts.       | write        | -                           | -             | -     |
| secmaster:pipe:updateSchema         | Grants the permission to modify pipeline fields.         | write        | pipe *                      | -             | -     |
| secmaster:node:create               | Grants the permission to create a node.                  | write        | -                           | -             | -     |
| secmaster:node:monitor              | Grants the permission to monitor node information.       | write        | -                           | -             | -     |
| secmaster:node:updateTaskNodeStatus | Grants the permission to modify the node task status.    | write        | -                           | -             | -     |
| secmaster:node:taskQueueDetail      | Grants the permission to query node task details.        | read         | -                           | -             | -     |

| Action                                | Description                                                                    | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|---------------------------------------|--------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| secmaster:analysisScript:export       | Grants the permission to export analysis scripts.                              | read         | analysisScript *            | -             | -     |
| secmaster:analysisScript:import       | Grants the permission to import analysis scripts.                              | write        | analysisScript *            | -             | -     |
| secmaster:cloudLog:create             | Grants the permission to save cloud service log subscription configurations.   | write        | -                           | -             | -     |
| secmaster:cloudLog:delete             | Grants the permission to delete cloud service log subscription configurations. | write        | -                           | -             | -     |
| secmaster:cloudLog:list               | Grants the permission to obtain cloud service log subscription configurations. | list         | -                           | -             | -     |
| secmaster:cloudLog:listResourceConfig | Grants the permission to query asset subscription configurations.              | list         | workspace *                 | -             | -     |
| secmaster:collector:createConfig      | Grants the permission to save cloud service log subscription configurations.   | write        | -                           | -             | -     |
| secmaster:collector:listConfig        | Grants the permission to obtain cloud service log subscription configurations. | list         | -                           | -             | -     |

| Action                                     | Description                                                           | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|--------------------------------------------|-----------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| secmaster:collectorChannel:create          | Grants the permission to create collection channels.                  | write        | collectorChannel *          | -             | -     |
| secmaster:collectorChannel:createOperation | Grants the permission to control collection channels.                 | write        | collectorChannel *          | -             | -     |
| secmaster:collectorChannel:delete          | Grants the permission to delete collection channels.                  | write        | collectorChannel *          | -             | -     |
| secmaster:collectorChannel:get             | Grants the permission to obtain collection channel details.           | read         | collectorChannel *          | -             | -     |
| secmaster:collectorChannel:list            | Grants the permission to obtain the collection channel list.          | list         | collectorChannel *          | -             | -     |
| secmaster:collectorChannel:listInstances   | Grants the permission to obtain the collection channel instance list. | list         | collectorChannel *          | -             | -     |
| secmaster:collectorChannel:listNodes       | Grants the permission to obtain the collection channel node list.     | list         | collectorChannel *          | -             | -     |
| secmaster:collectorChannel:update          | Grants the permission to update collection channels.                  | write        | collectorChannel *          | -             | -     |
| secmaster:collectorChannelGroup:create     | Grants the permission to create collection channel groups.            | write        | collectorChannelGroup *     | -             | -     |

| Action                                 | Description                                                        | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|----------------------------------------|--------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| secmaster:collectorChannelGroup:delete | Grants the permission to delete collection channel groups.         | write        | collectorChannelGroup *     | -             | -     |
| secmaster:collectorChannelGroup:list   | Grants the permission to obtain the collection channel group list. | list         | collectorChannelGroup *     | -             | -     |
| secmaster:collectorChannelGroup:update | Grants the permission to update the collection channel group list. | write        | collectorChannelGroup *     | -             | -     |
| secmaster:collectorConnection:create   | Grants the permission to create collector connections.             | write        | collectorConnection *       | -             | -     |
| secmaster:collectorConnection:delete   | Grants the permission to delete collector connections.             | write        | collectorConnection *       | -             | -     |
| secmaster:collectorConnection:get      | Grants the permission to obtain collector connection details.      | read         | collectorConnection *       | -             | -     |
| secmaster:collectorConnection:list     | Grants the permission to obtain the collector connection list.     | list         | collectorConnection *       | -             | -     |
| secmaster:collectorConnection:update   | Grants the permission to update collector connections.             | write        | collectorConnection *       | -             | -     |
| secmaster:collectorNode:list           | Grants the permission to obtain the collector node list.           | list         | workspace *                 | -             | -     |

| Action                                         | Description                                                                                      | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|------------------------------------------------|--------------------------------------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| secmaster:collectorParser:create               | Grants the permission to create a collector parser.                                              | write        | collectorParser *           | -             | -     |
| secmaster:collectorParser:delete               | Grants the permission to delete a collector parser.                                              | write        | collectorParser *           | -             | -     |
| secmaster:collectorParser:export               | Grants the permission to export a collector parser.                                              | read         | collectorParser *           | -             | -     |
| secmaster:collectorParser:get                  | Grants the permission to obtain collector parser details.                                        | read         | collectorParser *           | -             | -     |
| secmaster:collectorParser:list                 | Grants the permission to obtain the collector parser list.                                       | list         | collectorParser *           | -             | -     |
| secmaster:collectorParser:listTemplates        | Grants the permission to obtain the collector parser template list.                              | list         | collectorParser *           | -             | -     |
| secmaster:component:get                        | Grants the permission to obtain component details.                                               | read         | component *                 | -             | -     |
| secmaster:component:list                       | Grants the permission to obtain the component list.                                              | list         | component *                 | -             | -     |
| secmaster:component:listConfiguration-Versions | Grants the permission to obtain the configuration data of the historical version of a component. | list         | component *                 | -             | -     |

| Action                                   | Description                                                       | Access Level | Resource Type (*: Required) | Condition Key | Alias |
|------------------------------------------|-------------------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| secmaster:component:listConfigurations   | Grants the permission to obtain the component configuration list. | list         | component *                 | -             | -     |
| secmaster:component:listRunningNodes     | Grants the permission to obtain the component running node list.  | list         | component *                 | -             | -     |
| secmaster:component:listTemplates        | Grants the permission to obtain the component template list.      | list         | component *                 | -             | -     |
| secmaster:component:updateConfigurations | Grants the permission to update component configurations.         | write        | component *                 | -             | -     |
| secmaster:node:delete                    | Grants the permission to delete node information.                 | write        | node *                      | -             | -     |
| secmaster:node:list                      | Grants the permission to query the node information list.         | list         | node *                      | -             | -     |

## Resources

A resource type indicates the resources that an SCP applies to. If you specify a resource type for any action, the resource URN must be specified in the SCP statements using that action, and the SCP applies only to resources of this type. If no resource type is specified, the **Resource** element is marked with an asterisk (\*) and the SCP applies to all resources. You can also set condition keys in an SCP to define resource types.

The following table lists the resource types that you can define in SCP statements for SecMaster.

**Table 3-176** Resource types supported by SecMaster

| Resource Type          | URN                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------|
| workspace              | secmaster:<region>:<account-id>:workspace:<workspace-id>                                           |

## Conditions

### Condition Key

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- Condition keys are the key values in the Condition element of an identity policy statement. Condition keys are classified into global condition keys and service-specific condition keys based on the application scope.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, secmaster:) apply only to operations of the service. For details, see [Table 3-177](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, a condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [Condition operators](#).

### Service-specific condition keys supported by SecMaster

The following table lists the condition keys that you can define in identity policies for SecMaster. You can include these condition keys to specify conditions for when your identity policy is in effect.

SecMaster does not support service-specific condition keys in SCP statements.

**Table 3-177** Service-specific condition keys supported by SecMaster

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Important Notes                                                                                                                                                                                                                                                |
|--------------------------------|--------|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| secmaster:TargetRegion         | String | Multivalued                   | Only the action secmaster:workspace:createAgency supports this service-level condition key. The target region specified by the condition key <b>secmaster:TargetRegion</b> are filtered based on the region attribute of the managed workspace in the request. |

### Condition Key Examples

- secmaster:TargetRegion

Example: Workspace agencies cannot be created in the region with ID 1.

```
{
  "Version": "5.0",
  "Statement": [
    {
      "Effect": "Deny",
      "Action": [
        "secmaster:workspace:createAgency"
      ],
      "Condition": {
        "ForAllValues:StringEquals": {
          "secmaster:TargetRegion": [
            "region_id_1"
          ]
        }
      }
    }
  ]
}
```

## 3.8 AI

### 3.8.1 ModelArts

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are

available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by modelarts, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by modelarts, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for modelarts.

**Table 3-178** Actions supported by modelarts

| Action                    | Description                                                       | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                                                                    | Alias |
|---------------------------|-------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| modelarts:notebook:list   | Grants permission to list the development environment instances.  | List         | notebook *                  | -                                                                                                                                                                                                                                                                                | -     |
|                           |                                                                   |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul>                                                                                           |       |
| modelarts:notebook:create | Grants permission to create a development environment instance.   | Write        | notebook *                  | -                                                                                                                                                                                                                                                                                | -     |
|                           |                                                                   |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:TagKeys</a></li> <li>• <a href="#">modelarts:poolType</a></li> <li>• <a href="#">modelarts:poolId</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> </ul> |       |
| modelarts:notebook:get    | Grants permission to get development environment instance detail. | Read         | notebook *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                                                                                                                                                                    | -     |
|                           |                                                                   |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">modelarts:poolType</a></li> <li>• <a href="#">modelarts:poolId</a></li> </ul>                                                                                              |       |
| modelarts:notebook:update | Grants permission to update a development environment instance.   | Write        | notebook *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                                                                                                                                                                    | -     |

| Action                    | Description                                                                 | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                       | Alias |

| modelarts:image:listGroup        | Grants permission to list the image groups.                     | List         | image *                     | -                                     | -     |
| modelarts:devserver:bindPublicIP | Grant the permission to bind an EIP to the DevServer.           | Write        | devserver *                 | -                                     | -     |
|                                  |                                                                 |              | -                           | <a href="#">g:EnterpriseProjectId</a> |       |
| modelarts:devserver:listPublicIP | Grant the permission to query the EIP bound to the DevServer.   | Read         | devserver *                 | -                                     | -     |
|                                  |                                                                 |              | -                           | <a href="#">g:EnterpriseProjectId</a> |       |

Each API of modelarts usually supports one or more actions. [Table 3-179](#) lists the supported actions and dependencies.

**Table 3-179** Actions and dependencies supported by modelarts APIs

| API                             | Action                    | Dependency |
|---------------------------------|---------------------------|------------|
| GET /v1/{project_id}/notebooks  | modelarts:notebook:list   | -          |
| POST /v1/{project_id}/notebooks | modelarts:notebook:create | -          |

| API                                                   | Action                                 | Dependency |
|-------------------------------------------------------|----------------------------------------|------------|
| GET /v1/{project_id}/notebooks/{id}                   | modelarts:notebook:get                 | -          |
| PUT /v1/{project_id}/notebooks/{id}                   | modelarts:notebook:update              | -          |
| DELETE /v1/{project_id}/notebooks/{id}                | modelarts:notebook:delete              | -          |
| POST /v1/{project_id}/notebooks/{id}/create-image     | modelarts:image:create                 | -          |
| POST /v1/{project_id}/notebooks/{id}/start            | modelarts:notebook:start               | -          |
| POST /v1/{project_id}/notebooks/{id}/stop             | modelarts:notebook:stop                | -          |
| GET /v1/{project_id}/images                           | modelarts:image:list                   | -          |
| POST /v1/{project_id}/images                          | modelarts:image:register               | -          |
| GET /v1/{project_id}/images/{id}                      | modelarts:image:get                    | -          |
| DELETE /v1/{project_id}/images/{id}                   | modelarts:image:delete                 | -          |
| GET /v1/{project_id}/notebooks/{instance_id}/storage  | modelarts:notebook:listMountedStorages | -          |
| POST /v1/{project_id}/notebooks/{instance_id}/storage | modelarts:notebook:mountStorage        | -          |

| API                                                                  | Action                               | Dependency |
|----------------------------------------------------------------------|--------------------------------------|------------|

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-180](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for modelarts.

**Table 3-180** Resource types supported by modelarts

| Resource Type  | URN                                                                 |
|----------------|---------------------------------------------------------------------|
| workspace      | modelarts:<region>:<account-id>:workspace:<workspace-id>            |
| dataAnnotation | modelarts:<region>:<account-id>:dataAnnotation:<data-annotation-id> |
| trainJob       | modelarts:<region>:<account-id>:trainJob:<train-job-id>             |
| devserver      | modelarts:<region>:<account-id>:devserver:<devserver-id>            |
| image          | modelarts:<region>:<account-id>:image:<image-id>                    |
| service        | modelarts:<region>:<account-id>:service:<service-id>                |
| network        | modelarts:<region>:<account-id>:network:<network-id>                |
| pool           | modelarts:<region>:<account-id>:pool:<pool-id>                      |

| Resource Type | URN                                                           |
|---------------|---------------------------------------------------------------|
| model         | modelarts:<region>:<account-id>:model:<model-id>              |
| workflow      | modelarts:<region>:<account-id>:workflow:<workflow-id>        |
| aiAlgorithm   | modelarts:<region>:<account-id>:aiAlgorithm:<ai-algorithm-id> |
| dataset       | modelarts:<region>:<account-id>:dataset:<dataset-id>          |
| nodeservice   | modelarts:<region>:<account-id>:nodeservice:<node-service-id> |
| notebook      | modelarts:<region>:<account-id>:notebook:<notebook-id>        |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, modelarts) apply only to operations of the xx service. For details, see [Table 3-181](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [operators](#).

### Service-specific condition keys supported by modelarts

The following table lists the condition keys that you can define in identity policies for modelarts. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-181** Service-specific condition keys supported by modelarts

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                         |
|--------------------------------|--------|-------------------------------|-------------------------------------|
| modelarts:poolType             | string | Single-valued                 | Filters access ModelArts pool type. |
| modelarts:poolId               | string | Single-valued                 | Filters access ModelArts pool ID.   |

## 3.9 Analytics

### 3.9.1 Cloud Search Service (CSS)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Action

Actions are specific operations that are allowed in an identity policy.

- The **Access Level** column describes how the action is classified (such as **list**, **read**, or **write**). This classification helps you understand the level of access that an action grants when you use it in a policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.

- You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
- If this column includes a resource type, you must specify the URN in the Resource element of your statements.
- Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by CSS, see [Resource Type](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about condition keys defined by CSS, see [Condition](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for CSS.

**Table 3-182** Actions supported by CSS

| Action                          | Description                                                            | Access Level | Resource Type (*: Required) | Condition Key                                                                                                      | Alias |
|---------------------------------|------------------------------------------------------------------------|--------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------|-------|
| css:VPCEndpoint:updateWhitelist | Grant the permission to update an existing whitelist of VPC endpoints. | write        | cluster *                   | <ul style="list-style-type: none"> <li>• g:EnterpriseProjectId</li> <li>• g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -     |
| css:log:updateBackupPolicy      | Grant the permission to modify or delete log backups.                  | write        | cluster *                   | <ul style="list-style-type: none"> <li>• g:EnterpriseProjectId</li> <li>• g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -     |

| Action                               | Description                                                   | Access Level | Resource Type (*: Required) | Condition Key                                                                                                  | Alias |
|--------------------------------------|---------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------|-------|
| css:snapshot:setSnapshotPolicy       | Grant the permission to set backup policies.                  | write        | cluster *                   | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -     |
| css:snapshot:getSnapshotPolicy       | Grant the permission to query backup policies.                | read         | cluster *                   | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -     |
| css:snapshot:restore                 | Grant the permission to restore data from a snapshot.         | write        | cluster *                   | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -     |
| css:snapshot:create                  | Grant the permission to create a snapshot.                    | write        | cluster *                   | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -     |
| css:publicIpAddress:associates       | Grant the permission to enable or disable public access.      | write        | cluster *                   | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -     |
| css:publicIpAddress:setAccessControl | Grant the permission to manage whitelists for access control. | write        | cluster *                   | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -     |
| css:tag:get                          | Grant the permission to query resource tags.                  | read         | cluster *                   | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -     |

| Action                                | Description                                                | Access Level | Resource Type (*: Required) | Condition Key                                                                                                  | Alias                  |
|---------------------------------------|------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------|------------------------|
| css:publicIpAddress:modifyBandwidth   | Grant the permission to modify the bandwidth size.         | write        | cluster *                   | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -                      |
| css:VPCEndpoint:enableOrDisable       | Grant the permission to create or delete a VPCEP.          | write        | cluster *                   | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -                      |
| css:log:getBasicConfigurations        | Grant the permission to query basic configurations.        | read         | cluster *                   | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -                      |
| css:snapshot:list                     | Grant the permission to view the snapshot list.            | list         | cluster *                   | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -                      |
| css:log:list                          | Grant the permission to view logs.                         | list         | cluster *                   | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -                      |
| css:snapshot:setSnapshotConfiguration | Grant the permission to set basic snapshot configurations. | write        | cluster *                   | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -                      |
| css:cluster:listFlavors               | Grant the permission to query the flavor ID list.          | list         | -                           | -                                                                                                              | css:cluster:showFlavor |
| css:cluster:listDiskType              | Grant the permission to list available disk types.         | list         | -                           | -                                                                                                              | -                      |

| Action                               | Description                                                                     | Access Level | Resource Type (*: Required) | Condition Key                                                                                                  | Alias                   |
|--------------------------------------|---------------------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------|-------------------------|
| css:tag:list                         | Grant the permission to query project tags.                                     | list         | cluster *                   | -                                                                                                              | -                       |
| css:VPCEndpoint:manageConnection     | Grant the permission to configure the connection of the endpoint.               | write        | cluster *                   | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -                       |
| css:log:listJob                      | Grant the permission to query the job list.                                     | list         | cluster *                   | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -                       |
| css:cluster:downloadCert             | Grant the permission to obtain the content of a certificate.                    | read         | -                           | -                                                                                                              | -                       |
| css:cluster:get                      | Grant the permission to query cluster details.                                  | read         | cluster *                   | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | css:cluster:getInstance |
| css:snapshot:enableAutomaticSnapshot | Grant the permission to set basic configurations for automatic snapshot backup. | write        | cluster *                   | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -                       |
| css:snapshot:delete                  | Grant the permission to delete a specified snapshot.                            | write        | cluster *                   | <ul style="list-style-type: none"> <li>g:EnterpriseProjectId</li> <li>g:ResourceTag/&lt;tag-key&gt;</li> </ul> | -                       |

## Resource Type

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-184](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for CSS.

**Table 3-184** Resource types supported by CSS

| Resource Type | URN                                            |
|---------------|------------------------------------------------|
| cluster       | css:<region>:<account-id>:cluster:<cluster-id> |

## Condition

### About condition keys

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, **css:**) apply only to operations of the service. For details, see [Table 3-185](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so **g:SourceVpce** is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so **g:TagKeys** is a multivalued condition key.
- A condition operator, a condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [Condition operators](#).

### Service-specific condition keys supported by CSS

The following table lists the condition keys that you can define in identity policies for CSS. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-185** Service-specific condition keys supported by CSS

| Service-specific Condition Key        | Type    | Single-valued/<br>Multivalued | Description                                       |
|---------------------------------------|---------|-------------------------------|---------------------------------------------------|
| <a href="#">css:AssociatePublicIp</a> | boolean | Single-valued                 | Whether to enable public access for the instance. |

### Examples of condition keys

- `css:AssociatePublicIp`

Example: Disallow the creation of CSS clusters that have an EIP associated with it.

```
{
  "Version": "5.0",
  "Statement": [
    {
      "Effect": "Deny",
      "Action": [
        "css:cluster:create"
      ],
      "Condition": {
        "Bool": {
          "css:AssociatePublicIp": [
            "true"
          ]
        }
      }
    }
  ]
}
```

Example: Disallow the association of an EIP with a CSS cluster.

```
{
  "Version": "5.0",
  "Statement": [
    {
      "Effect": "Deny",
      "Action": [
        "css:publicIpAddress:associates",
        "css:publicKibana:open"
      ]
    }
  ]
}
```

## 3.9.2 Actions Supported by Identity Policy-based Authorization

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied by an SCP in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify a URN for the Resource element in your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by DataArts Studio, see [Resources](#).

- **Condition Key** contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by DataArts Studio, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in custom identity policies for DataArts Studio.

 NOTE

Due to API restrictions, if the resource type is specified for a custom identity policy, the permission configuration may not meet expectations because some operations are unavailable for specified workspace or instance resources. For example, if an operation that does not support specified resources is allowed but a specific resource is specified for the operation, all resource operations are denied. If an operation that does not support specified resources is denied but a specific resource is specified for the operation, all resource operations are allowed.

Therefore, if you want to specify the resource type for a custom identity policy, you must exclude such operations. Instead, you can only configure identity policies without specified resources or with global resources for such operations, and use multiple identity policies to grant permissions to users. Identity policies without specified resources or with global resources do not contain the **Resource** element in the JSON content, or contain the following **Resource** element:

```
"Resource": [
  "DataArtsStudio:*:*:workspace:*",
  "DataArtsStudio:*:*:instance:*"
]
```

The operations that cannot be performed on specified resources in DataArts Studio are as follows:

- Operations that can be performed only on specified instance resources but not on specified workspace resources:
  - DataArtsStudio:workspace:create
  - DataArtsStudio:workspace:list
- Operations that cannot be performed on specified instance or workspace resources:
  - DataArtsStudio:instance:create
  - DataArtsStudio:instance:get
  - DataArtsStudio:instance:list
  - DataArtsStudio:instance:resize
  - DataArtsStudio:instance:getAgency
  - DataArtsStudio:instance:createAgency
  - DataArtsStudio:instance:uploadDriver
  - DataArtsStudio:instance:deleteDriver
  - DataArtsStudio:instance:listDrivers
  - DataArtsStudio:instance:listTags
  - DataArtsStudio:workspace:listTags

**Table 3-186** Actions supported by DataArts Studio

| Action                        | Description                                    | Access Level | Resource Type (*: Required) | Condition Key                                 | Alias                                                                  |
|-------------------------------|------------------------------------------------|--------------|-----------------------------|-----------------------------------------------|------------------------------------------------------------------------|
| DataArtsStudio:workspace:list | Grants the permission to query all workspaces. | List         | workspace *                 | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>• dgc:workspace:list</li> </ul> |
|                               |                                                |              | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> |                                                                        |

| Action                            | Description                                           | Access Level | Resource Type (*: Required) | Condition Key                                                                                                                     | Alias                                                                |
|-----------------------------------|-------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
| DataArtsStudio:workspace:create   | Grants the permission to create a workspace.          | Write        | workspace *                 | -                                                                                                                                 | -                                                                    |
|                                   |                                                       |              | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     |                                                                      |
|                                   |                                                       |              | -                           | <ul style="list-style-type: none"> <li><a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li><a href="#">g:TagKeys</a></li> </ul> |                                                                      |
| DataArtsStudio:workspace:get      | Grants the permission to query workspace information. | Read         | workspace *                 | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     | -                                                                    |
|                                   |                                                       |              | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     |                                                                      |
| DataArtsStudio:workspace:freeze   | Grants the permission to freeze a workspace.          | Write        | workspace *                 | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     | -                                                                    |
|                                   |                                                       |              | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     |                                                                      |
| DataArtsStudio:workspace:unfreeze | Grants the permissions to unfreeze a workspace.       | Write        | workspace *                 | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     | -                                                                    |
|                                   |                                                       |              | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     |                                                                      |
| DataArtsStudio:workspace:update   | Grants the permission to update a workspace.          | Write        | workspace *                 | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     | -                                                                    |
|                                   |                                                       |              | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     |                                                                      |
| DataArtsStudio:instance:list      | Grants the permission to query all instances.         | List         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                     | <ul style="list-style-type: none"> <li>dgc:workspace:list</li> </ul> |
| DataArtsStudio:instance:create    | Grants the permission to create an instance.          | Write        | instance *                  | -                                                                                                                                 | -                                                                    |

| Action                               | Description                                              | Access Level | Resource Type (*: Required) | Condition Key                                                                                                                         | Alias |
|--------------------------------------|----------------------------------------------------------|--------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|-------|
|                                      |                                                          |              | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul> |       |
| DataArtsStudio:instance:get          | Grants the permission to query an instance.              | Read         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                         | -     |
| DataArtsStudio:instance:resize       | Grants the permission to change instance specifications. | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                         | -     |
| DataArtsStudio:instance:listDrivers  | Grants the permission to query all driver files.         | List         | -                           | -                                                                                                                                     | -     |
| DataArtsStudio:instance:uploadDriver | Grants the permission to upload a driver file.           | Write        | -                           | -                                                                                                                                     | -     |
| DataArtsStudio:instance:deleteDriver | Grants the permission to delete a driver file.           | Write        | -                           | -                                                                                                                                     | -     |
| DataArtsStudio:workspace:delete      | Grants the permission to delete a workspace.             | Write        | workspace *                 | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                         | -     |
|                                      |                                                          |              | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a>                                                                                         |       |

|                                                            |                                                                                               |              | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> |       |
| DataArtsStudio:workspace:executeDataServiceInstanceAction  | Grants the permission to run commands to perform operations on DataArts DataService clusters. | Write        | workspace *                 | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | -     |
|                                                            |                                                                                               |              | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> |       |
| DataArtsStudio:instance:configureDataSecurityAdministrator | Grants the permission to configure the data security administrator.                           | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | -     |
| DataArtsStudio:instance:listResourcesByTag                 | Grants the permission to filter instances by tag.                                             | List         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | -     |
| DataArtsStudio:workspace:listResourcesByTag                | Grants the permission to filter workspaces by tag.                                            | List         | workspace *                 | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | -     |
|                                                            |                                                                                               |              | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> |       |

Each API of DataArts Studio usually supports one or more actions. [Table 3-187](#) lists the actions and dependencies supported by DataArts Studio APIs.

**Table 3-187** Actions and dependencies supported by DataArts Studio APIs

| API                                                          | Action                          | Dependency |
|--------------------------------------------------------------|---------------------------------|------------|
| GET /v1/{project_id}/workspaces/{instance_id}                | DataArtsStudio:workspace:list   | -          |
| POST /v1/{project_id}/workspaces/{instance_id}               | DataArtsStudio:workspace:create | -          |
| GET /v1/{project_id}/workspaces/{instance_id}/{workspace_id} | DataArtsStudio:workspace:get    | -          |
| POST /v1/{project_id}/change-resource                        | DataArtsStudio:instance:resize  | -          |
| GET /v1/{project_id}/instances                               | DataArtsStudio:instance:list    | -          |
| POST /v1/{project_id}/instances/onekey-purchase              | DataArtsStudio:instance:create  | -          |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-188](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for DataArts Studio.

**Table 3-188** Resource types supported by DataArts Studio

| Resource Type | URN                                                                         |
|---------------|-----------------------------------------------------------------------------|
| workspace     | DataArtsStudio:<region>:<account-id>:workspace:<instance-id>/<workspace-id> |

| Resource Type | URN                                                         |
|---------------|-------------------------------------------------------------|
| instance      | DataArtsStudio:<region>:<account-id>:instance:<instance-id> |

## Conditions

### About condition keys

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- Condition keys are the key values in the Condition element of an identity policy statement. They are classified into global condition keys and service-specific condition keys based on the application scope.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, dataarts studio:) apply only to operations of the specific service. For details, see [Table 3-189](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- An operator, a condition key, and a condition value together constitute a complete condition statement. An identity policy becomes in effect only when its request conditions are met. For supported condition operators, see [Condition operators](#).

### Service-specific condition keys supported by DataArts Studio

The following table lists the condition keys that you can define in custom identity policies for DataArts Studio. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-189** Service-specific condition keys supported by DataArts Studio

| Service-specific Condition Key    | Type    | Single-valued/<br>Multivalued | Description                                         |
|-----------------------------------|---------|-------------------------------|-----------------------------------------------------|
| DataArtsStudio:EnablePublicAccess | boolean | Single-valued                 | Whether the service is accessible over the Internet |

### 3.9.3 Data Lake Insight(DLI)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted IAM identity permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM policies are different from Organizations SCPs, see [What Are the Differences Between IAM Policies and Organizations SCPs?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP policy, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in a policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by DLI, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.

- If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
- If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by DLI, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization.

For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in custom identity policies for DLI.

**Table 3-190** Actions supported by DLI

| Action              | Description                                       | Access Level          | Resource Type (*: required) | Condition Key |
|---------------------|---------------------------------------------------|-----------------------|-----------------------------|---------------|
| dli::operateAuth    | Grants the permission to manage DLI permissions.  | permission_management | -                           | -             |
| dli::listAuth       | Grants the permission to query DLI permissions.   | list                  | -                           | -             |
| dli:variable:list   | Grants the permission to list global variables.   | list                  | variable *                  | -             |
| dli:variable:create | Grants the permission to create global variables. | write                 | variable *                  | -             |
| dli:variable:update | Grants the permission to update global variables. | write                 | variable *                  | -             |
| dli:variable:delete | Grants the permission to delete global variables. | write                 | variable *                  | -             |
| dli:catalog:list    | Grants the permission to list data catalogs.      | list                  | -                           | -             |

| Action           | Description                                          | Access Level | Resource Type (*: required) | Condition Key                                                                                                                    |
|------------------|------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| dli:catalog:bind | Grants the permission to bind data catalogs.         | write        | -                           | -                                                                                                                                |
| dli:catalog:get  | Grants the permission to query data catalog details. | read         | -                           | -                                                                                                                                |
| dli:queue:list   | Grants the permission to list queues.                | list         | queue *                     | -                                                                                                                                |
|                  |                                                      |              | -                           | <ul style="list-style-type: none"> <li>g:RequestTag/&lt;tag-key&gt;</li> <li>g:TagKeys</li> </ul>                                |
| dli:queue:create | Grants the permission to create queues.              | write        | queue *                     | -                                                                                                                                |
|                  |                                                      |              | -                           | <ul style="list-style-type: none"> <li>g:RequestTag/&lt;tag-key&gt;</li> <li>g:TagKeys</li> <li>g:EnterpriseProjectId</li> </ul> |
| dli:queue:get    | Grants the permission to query queue details.        | read         | queue *                     | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul>                   |
| dli:queue:update | Grants the permission to update queues.              | write        | queue *                     | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul>                   |
| dli:queue:delete | Grants the permission to delete queues.              | write        | queue *                     | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul>                   |
| dli:queue:scale  | Grants the permission to scale out/in a queue.       | write        | queue *                     | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul>                   |

| Action                    | Description                                                           | Access Level | Resource Type (*: required) | Condition Key                                                                                                  |
|---------------------------|-----------------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------|
| dli:queue:checkConnection | Grants the permission to test the connectivity of an address.         | write        | queue *                     | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> |
| dli:queue:getConnection   | Grants the permission to query connectivity results.                  | read         | queue *                     | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> |
| dli:queue:listPlans       | Grants the permission to list scheduled scaling plans of a queue.     | list         | queue *                     | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> |
| dli:queue:createPlan      | Grants the permission to create scheduled scaling plans for a queue.  | write        | queue *                     | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> |
| dli:queue:deletePlan      | Grants the permission to delete scheduled scaling plans from a queue. | write        | queue *                     | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> |
| dli:queue:updatePlan      | Grants the permission to update scheduled scaling plans for a queue.  | write        | queue *                     | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> |
| dli:queue:createProperty  | Grants the permission to create configurations for a queue.           | write        | queue *                     | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> |
| dli:queue:listProperties  | Grants the permission to list queue configurations.                   | list         | queue *                     | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> |

| Action                   | Description                                                  | Access Level | Resource Type (*: required) | Condition Key                                                                                                  |
|--------------------------|--------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------|
| dli:queue:updateProperty | Grants the permission to update configurations for a queue.  | write        | queue *                     | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> |
| dli:queue:deleteProperty | Grants the permission to delete configurations from a queue. | write        | queue *                     | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> |
| dli:jobs:list            | Grants the permission to list jobs.                          | list         | jobs *                      | -                                                                                                              |
|                          |                                                              |              | -                           | <ul style="list-style-type: none"> <li>g:RequestTag/&lt;tag-key&gt;</li> <li>g:TagKeys</li> </ul>              |
| dli:queue:submitJob      | Grants the permission to submit jobs on a queue.             | write        | queue *                     | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> |
| dli:jobs:get             | Grants the permission to query job details.                  | read         | jobs *                      | g:ResourceTag/<tag-key>                                                                                        |
| dli:table:select         | Grants the permission to query tables.                       | read         | table *                     | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> |

| POST /v1.0/{project_id}/orders/queues                                                                           | dli:queue:create       | -          |
| PUT /v1.0/{project_id}/orders/queues                                                                            | dli:queue:scale        | -          |
| PUT /v3/{project_id}/queues/{queue_name}/scale-range                                                            | dli:queue:scale        | -          |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-193](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for DLI.

**Table 3-193** Resource types supported by DLI

| Resource Type       | URN                                                                                  |
|---------------------|--------------------------------------------------------------------------------------|
| variable            | dli:<region>:<account-id>:variable:<variable-name-with-prefix>                       |
| queue               | dli:<region>:<account-id>:queue:<queue-name-with-prefix>                             |
| jobs                | dli:<region>:<account-id>:jobs:<job-id-with-prefix>                                  |
| table               | dli:<region>:<account-id>:table:<table-name-with-prefix>                             |
| database            | dli:<region>:<account-id>:database:<database-name-with-prefix>                       |
| resource            | dli:<region>:<account-id>:resource:<resource-name-with-prefix>                       |
| template            | dli:<region>:<account-id>:template:<template-name-with-prefix>                       |
| elasticresourcepool | dli:<region>:<account-id>:elasticresourcepool:<elasticresourcepool-name-with-prefix> |
| edsconnection       | dli:<region>:<account-id>:edsconnection:<edsconnection-id-with-prefix>               |
| datasourceauth      | dli:<region>:<account-id>:datasourceauth:<datasourceauth-name-with-prefix>           |

## Conditions

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the **g:** prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name as the prefix, for example, **dli:**) apply only to DLI operations. For details, see [Table 3-194](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have

multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so `g:SourceVpce` is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so `g:TagKeys` is a multivalued condition key.

- An operator, a condition key, and a condition value together constitute a complete condition statement. An identity policy becomes in effect only when its request conditions are met. For supported condition operators, see [Condition operators](#).

The following table lists the condition keys that you can define in custom identity policies for DLI. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-194** Service-specific condition keys supported by DLI

| Service-specific Condition Key | Type   | Single-valued/<br>Multivalued | Description                           |
|--------------------------------|--------|-------------------------------|---------------------------------------|
| <code>dli:VpcId</code>         | String | Single-valued                 | Filters access permissions by VPC ID. |

### 3.9.4 MapReduce Service (MRS)

IAM provides system-defined identity policies to define common actions supported by cloud services. MRS provides system-defined policies that can be directly used in IAM. You can also create custom policies to supplement system-defined policies for more refined access control.

In addition to IAM, the [Organizations](#) service provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in a policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by MRS, see [Resources](#).

- **Condition Key** contains keys that you can specify in the Condition element of an identity policy statement for MRS.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by MRS, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in policy statements for MRS.

**Table 3-195** Actions supported by MRS

| Action                    | Description                             | Access Level | Resource Type (*: required)                    | Condition Key                                          | Alias              |
|---------------------------|-----------------------------------------|--------------|------------------------------------------------|--------------------------------------------------------|--------------------|
| mrs:cluster:createCluster | Grants permissions to create a cluster. | write        | mrs:<region>:<account-id>:cluster:<cluster-id> | g:RequestTag/<tag-key>,g:TagKeys,g:EnterpriseProjectId | mrs:cluster:create |

| Action                    | Description                                               | Access Level | Resource Type (*: required)                    | Condition Key                                          | Alias              |
|---------------------------|-----------------------------------------------------------|--------------|------------------------------------------------|--------------------------------------------------------|--------------------|
| mrs:cluster:deleteCluster | Grants the permission to delete a cluster.                | write        | mrs:<region>:<account-id>:cluster:<cluster-id> | g:EnterpriseProjectId                                  | mrs:cluster:delete |
| mrs:cluster:listHosts     | Grants permissions to query nodes in the cluster.         | list         | mrs:<region>:<account-id>:cluster:<cluster-id> | g:EnterpriseProjectId                                  | mrs:host:list      |
| mrs:cluster:listFiles     | Grants permissions to query the file list in the cluster. | list         | mrs:<region>:<account-id>:cluster:<cluster-id> | g:EnterpriseProjectId                                  | mrs:file:list      |
| mrs:cluster:createJob     | Grants permissions to execute jobs in the cluster.        | write        | mrs:<region>:<account-id>:cluster:<cluster-id> | g:EnterpriseProjectId                                  | mrs:job:submit     |
| mrs:cluster:list          | Grants permissions to query the cluster list.             | list         | -                                              | g:RequestTag/<tag-key>,g:TagKeys,g:EnterpriseProjectId | -                  |
| mrs:cluster:listJobs      | Grants permissions to query the job list of the cluster.  | list         | mrs:<region>:<account-id>:cluster:<cluster-id> | g:EnterpriseProjectId                                  | mrs:job:list       |
| mrs:cluster:getJob        | Grants permissions to query job details in the cluster.   | read         | mrs:<region>:<account-id>:cluster:<cluster-id> | g:EnterpriseProjectId                                  | mrs:job:get        |

| Action                        | Description                                                          | Access Level | Resource Type (*: required)                    | Condition Key                                          | Alias                                                    |
|-------------------------------|----------------------------------------------------------------------|--------------|------------------------------------------------|--------------------------------------------------------|----------------------------------------------------------|
| mrs:cluster:getCluster        | Grants permissions to query cluster details.                         | read         | mrs:<region>:<account-id>:cluster:<cluster-id> | -                                                      | mrs:cluster:get                                          |
| mrs:cluster:resizeNodes       | Grants permissions to adjust cluster nodes.                          | write        | mrs:<region>:<account-id>:cluster:<cluster-id> | g:EnterpriseProjectId                                  | mrs:cluster:resize                                       |
| mrs:cluster:updateClusterName | Grants permissions to rename a cluster.                              | write        | mrs:<region>:<account-id>:cluster:<cluster-id> | g:EnterpriseProjectId                                  | -                                                        |
| mrs:cluster:listTags          | Grants permissions to query cluster tags.                            | list         | -                                              | g:EnterpriseProjectId                                  | mrs:tag:list                                             |
| mrs:cluster:updateTags        | Grants permissions to add or delete cluster tags.                    | tagging      | -                                              | g:RequestTag/<tag-key>,g:TagKeys,g:EnterpriseProjectId | mrs:tag:create<br>mrs:tag:delete<br>mrs:tag:batchOperate |
| mrs:cluster:listClustersByTag | Grants permissions to query the list of clusters with specific tags. | list         | -                                              | g:RequestTag/<tag-key>,g:TagKeys                       | mrs:tag:listResource                                     |
| mrs:cluster:stopJob           | Grants permissions to stop cluster jobs.                             | write        | mrs:<region>:<account-id>:cluster:<cluster-id> | g:EnterpriseProjectId                                  | mrs:job:stop                                             |

| Action                       | Description                                                          | Access Level | Resource Type (*: required)                    | Condition Key         | Alias                               |
|------------------------------|----------------------------------------------------------------------|--------------|------------------------------------------------|-----------------------|-------------------------------------|
| mrs:cluster:deleteJobs       | Grants permissions to delete cluster jobs in batches.                | write        | mrs:<region>:<account-id>:cluster:<cluster-id> | g:EnterpriseProjectId | mrs:job:batchDelete                 |
| mrs:cluster:stopSql          | Grants permissions to cancel SQL execution.                          | write        | mrs:<region>:<account-id>:cluster:<cluster-id> | g:EnterpriseProjectId | mrs:sql:cancel                      |
| mrs:cluster:createSql        | Grants permissions to submit a SQL statement for execution.          | write        | mrs:<region>:<account-id>:cluster:<cluster-id> | g:EnterpriseProjectId | mrs:sql:execute<br>mrs:job:checkSql |
| mrs:cluster:listPolicies     | Grants permissions to obtain all auto scaling policies in a cluster. | list         | mrs:<region>:<account-id>:cluster:<cluster-id> | g:EnterpriseProjectId | mrs:cluster:policy                  |
| mrs:cluster:updatePolicies   | Grants permissions to modify auto scaling policies of a cluster.     | write        | mrs:<region>:<account-id>:cluster:<cluster-id> | g:EnterpriseProjectId | mrs:cluster:policy                  |
| mrs:cluster:getAgencyMapping | Grants permissions to obtain user agent information.                 | read         | mrs:<region>:<account-id>:cluster:<cluster-id> | g:EnterpriseProjectId | -                                   |

| Action                          | Description                                            | Access Level | Resource Type (*: required)                    | Condition Key         | Alias                |
|---------------------------------|--------------------------------------------------------|--------------|------------------------------------------------|-----------------------|----------------------|
| mrs:cluster:updateAgencyMapping | Grants permissions to update user agent information.   | write        | mrs:<region>:<account-id>:cluster:<cluster-id> | g:EnterpriseProjectId | mrs:cluster:syncUser |
| mrs:cluster:getSql              | Grants permissions to obtain the SQL execution result. | read         | mrs:<region>:<account-id>:cluster:<cluster-id> | g:EnterpriseProjectId | mrs:sql:get          |

## Resources

A resource type indicates the resources that a policy applies to. If you specify a resource type for any action in [Table 3-196](#), the resource URN must be specified in the policy statements using that action, and the policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the policy applies to all resources. You can also set condition keys in a policy to define resource types.

The following table lists the resource types that you can define in policy statements for MRS.

**Table 3-196** Resource types supported by MRS

| Resource Type | URN                                            |
|---------------|------------------------------------------------|
| cluster       | mrs:<region>:<account-id>:cluster:<cluster-id> |

## Conditions

MRS does not support service-specific condition keys in identity policies.

It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.9.5 Data Warehouse Service (DWS)

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by dws, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by dws, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for dws.

**Table 3-197** Actions supported by dws

| Action                | Description                              | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                           | Alias                                                                                                            |
|-----------------------|------------------------------------------|--------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| dws:cluster:list      | Grants permission to query cluster list. | List         | -                           | -                                                                                                                                                                                       | -                                                                                                                |
| dws:cluster:getDetail | Grants permission to get cluster detail. | Read         | cluster *                   | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul>                                      | <ul style="list-style-type: none"> <li>• dws:openAPICluster:getDetail</li> </ul>                                 |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-199](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for dws.

**Table 3-199** Resource types supported by dws

| Resource Type | URN                                            |
|---------------|------------------------------------------------|
| cluster       | dws:<region>:<account-id>:cluster:<cluster-id> |

## Conditions

dws does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

## 3.10 Middleware

### 3.10.1 Cloud Service Engine CSE

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set permissions boundaries for the entity. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [What Are the Differences in Access Control Between IAM and Organizations?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to create an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to create a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.

- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify a URN for the Resource element in your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by CSE, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by CSE, see [Conditions](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for CSE.

**Table 3-200** Supported actions

| Action              | Description                                                   | Access Level | Resource Type (*: required) | Condition Key                         | Alias             |
|---------------------|---------------------------------------------------------------|--------------|-----------------------------|---------------------------------------|-------------------|
| cse:config:upload   | Assigning permissions to upload microservice configurations   | write        | -                           | <a href="#">g:EnterpriseProjectId</a> | cse:config:modify |
| cse:config:download | Assigning permissions to download microservice configurations | write        | -                           | <a href="#">g:EnterpriseProjectId</a> | cse:config:modify |

| Action               | Description                                               | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                           | Alias               |
|----------------------|-----------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| cse:namespace:list   | Assigning permissions to view the namespace resource list | list         | -                           | -                                                                                                                                                                                       | cse:namespace:read  |
| cse:namespace:get    | Assigning permissions to view namespaces                  | read         | engine                      | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul>                                      | cse:namespace:read  |

| cse:engine:list               | Assigning permissions to view the engine list                                                   | list         | -                           | -                                                                                                                                                             | -                     |
| cse:engine:backupRecover      | Assigning permissions to back up and restore ServiceComb engine data and change backup policies | write        | engine                      | <ul style="list-style-type: none"> <li><i><a href="#">g:Resource Tag/&lt;tag-key&gt;</a></i></li> <li><i><a href="#">g:EnterpriseProjectId</a></i></li> </ul> | -                     |
| cse:engine:associatePublicips | Assigning permissions to bind or unbind a ServiceComb engine to or from a public network        | write        | engine                      | <ul style="list-style-type: none"> <li><i><a href="#">g:Resource Tag/&lt;tag-key&gt;</a></i></li> <li><i><a href="#">g:EnterpriseProjectId</a></i></li> </ul> | -                     |

| Action                 | Description                                                                                | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                     | Alias             |
|------------------------|--------------------------------------------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| cse:engine:update      | Assigning permissions to modify the ServiceComb engine configuration and system management | write        | engine                      | <ul style="list-style-type: none"> <li><a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li><a href="#">g:EnterpriseProjectId</a></li> </ul>                                    | -                 |
| cse:engine:resize      | Assigning permissions to change ServiceComb engine specifications                          | write        | engine                      | <ul style="list-style-type: none"> <li><a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li><a href="#">g:EnterpriseProjectId</a></li> </ul>                                    | -                 |
| cse:engine:create      | Assigning permissions to create an engine                                                  | write        | -                           | <ul style="list-style-type: none"> <li><a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li><a href="#">g:EnterpriseProjectId</a></li> <li><a href="#">g:TagKeys</a></li> </ul> | -                 |
| cse:engine:upgrade     | Assigning permissions to upgrade engine permissions                                        | write        | engine                      | <ul style="list-style-type: none"> <li><a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li><a href="#">g:EnterpriseProjectId</a></li> </ul>                                    | -                 |
| cse:engine:delete      | Assigning permissions to deleting an engine                                                | write        | engine                      | <ul style="list-style-type: none"> <li><a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li><a href="#">g:EnterpriseProjectId</a></li> </ul>                                    | -                 |
| cse:engine:tagResource | Assigning permissions to add engine tags                                                   | write        | engine                      | <ul style="list-style-type: none"> <li><a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li><a href="#">g:EnterpriseProjectId</a></li> </ul>                                    | cse:engine:modify |

| Action                         | Description                                                | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                  | Alias             |
|--------------------------------|------------------------------------------------------------|--------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| cse:engine:unTagResource       | Assigning permissions to delete engine tags                | write        | engine                      | <ul style="list-style-type: none"> <li><a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li><a href="#">g:EnterpriseProjectId</a></li> </ul> | cse:engine:modify |
| cse:engine:listTags            | Assigning permissions to view all engine tags of a project | list         | -                           | -                                                                                                                                              | cse:engine:list   |
| cse:engine:listTagsForResource | Assigning permissions to view engine tags                  | list         | engine                      | <ul style="list-style-type: none"> <li><a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li><a href="#">g:EnterpriseProjectId</a></li> </ul> | cse:engine:get    |
| cse:engine:listResourcesByTag  | Assigning permissions to query the engine list by tag      | list         | -                           | <a href="#">g:TagKeys</a>                                                                                                                      | cse:engine:list   |

Each API of CSE usually supports one or more actions. [Table 3-201](#) lists the actions and dependencies supported by CSE APIs.

**Table 3-201** Actions and dependencies supported by CSE APIs

| API                                                              | Action            | Dependencies |
|------------------------------------------------------------------|-------------------|--------------|
| GET /v2/{project_id}/enginemgr/engines/{engine_id}               | cse:engine:get    | -            |
| PUT /v2/{project_id}/enginemgr/engines/{engine_id}/actions       | cse:engine:update | -            |
| GET /v2/{project_id}/enginemgr/engines/{engine_id}/jobs/{job_id} | cse:engine:get    | -            |
| GET /v2/{project_id}/enginemgr/engines                           | cse:engine:list   | -            |

| API                                                             | Action                 | Dependencies |
|-----------------------------------------------------------------|------------------------|--------------|
| POST /v3/{project_id}/accounts/{name}/password                  | cse:engine:update      | -            |
| POST /v1/{project_id}/kie/download                              | cse:config:download    | -            |
| POST /v1/{project_id}/kie/file                                  | cse:config:upload      | -            |
| GET /v1/{project_id}/kie/kv                                     | cse:namespace:get      | -            |
| POST /v1/{project_id}/kie/kv                                    | cse:namespace:update   | -            |
| DELETE /v1/{project_id}/kie/kv                                  | cse:namespace:update   | -            |
| PUT /v1/{project_id}/kie/kv/{kv_id}                             | cse:namespace:update   | -            |
| DELETE /v1/{project_id}/kie/kv/{kv_id}                          | cse:namespace:update   | -            |
| GET /v1/{project_id}/nacos/v1/console/namespaces                | cse:namespace:get      | -            |

| POST /cseengine/v1/<br>engines/{engine_id}/<br>backups/{backup_id}/<br>recovery | cse:engine:create | -            |
| POST /cseengine/v1/<br>engines/{engineId}/<br>backup-strategies                 | cse:engine:create | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-202](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an SCP to define resource types.

The following table lists the resource types that you can define in SCP statements for CSE.

**Table 3-202** Resource types supported by CSE

| Resource Type | URN                                                            |
|---------------|----------------------------------------------------------------|
| namespace     | cse:<region>:<account-id>:namespace:<engine-id>/<namespace-id> |
| policy        | cse:<region>:<account-id>;policy:<namespace-id>/<policy-name>  |
| engine        | cse:<region>:<account-id>;engine:<engine-id>                   |

## Conditions

CSE does not support service-specific condition keys in policies.

It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.10.2 Distributed Message Service for Kafka (Kafka)

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#).

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

#### Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by DMS for Kafka, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.

- If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
- If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by DMS for Kafka, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for DMS for Kafka.

**Table 3-203** Actions supported by DMS for Kafka

| Action                             | Description                                             | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias |
|------------------------------------|---------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| dms:instance:connector             | Grants permission to enable instance connector feature. | Write        | kafka *                     | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |
| dms:instance:list                  | Grants permission to query instance list.               | List         | kafka *                     | <a href="#">g:EnterpriseProjectId</a>                                                                                                              | -     |
| dms:instance:scale                 | Grants permission to scale up instance.                 | Write        | kafka *                     | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -     |

| PUT /v2/{engine}/{project_id}/instances/{instance_id}/users/{user_name}      | dms:user:modify          | -            |
| POST /v2/{project_id}/recycle                                                | dms:instance:restore     | -            |
| PUT /v2/{project_id}/recycle                                                 | dms::updateRecyclePolicy | -            |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-205](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for DMS for Kafka.

**Table 3-205** Resource types supported by DMS for Kafka

| Resource Type | URN                                                                        |
|---------------|----------------------------------------------------------------------------|
| kafka         | dms:<region>:<account-id>:kafka:<instance-id>                              |
| topic         | dms:<region>:<account-id>:topic:<instance-id>/<topic-name>                 |
| consumerGroup | dms:<region>:<account-id>:consumerGroup:<instance-id>/<consumerGroup-name> |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, dms) apply only to operations of the xx service. For details, see [Table 3-206](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when

its request conditions are met. For supported condition operators, see [operators](#).

#### Service-specific condition keys supported by DMS for Kafka

The following table lists the condition keys that you can define in identity policies for DMS for Kafka. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-206** Service-specific condition keys supported by DMS for Kafka

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                                                   |
|--------------------------------|---------|-------------------------------|-------------------------------------------------------------------------------|
| dms:ssl                        | boolean | Single-valued                 | Filters access based on whether the instance is enabled for SSL access.       |
| dms:publicip                   | boolean | Single-valued                 | Filters access based on whether the instance is enabled for public IP access. |
| dms:connector                  | boolean | Single-valued                 | Filters access based on whether the instance connector is enabled.            |

### 3.10.3 Distributed Message Service for RabbitMQ (RabbitMQ)

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).

- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by DMS for RabbitMQ, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by DMS for RabbitMQ, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for DMS for RabbitMQ.

**Table 3-207** Actions supported by DMS for RabbitMQ

| Action                            | Description                                            | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                                           | Alias |
|-----------------------------------|--------------------------------------------------------|--------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| dms:instance:list                 | Grants permission to query instance list.              | List         | rabbitmq *                  | <a href="#">g:EnterpriseProjectId</a>                                                                                                                                                                                                                   | -     |
| dms:instance:scale                | Grants permission to scale up instance.                | Write        | rabbitmq                    | <ul style="list-style-type: none"> <li><a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li><a href="#">g:EnterpriseProjectId</a></li> </ul>                                                                                                          | -     |
| dms:instance:getBackgroundTask    | Grants permission to query instance background tasks.  | Read         | rabbitmq                    | <ul style="list-style-type: none"> <li><a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li><a href="#">g:EnterpriseProjectId</a></li> </ul>                                                                                                          | -     |
| dms:instance:deleteBackgroundTask | Grants permission to delete instance background tasks. | Write        | rabbitmq                    | <ul style="list-style-type: none"> <li><a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li><a href="#">g:EnterpriseProjectId</a></li> </ul>                                                                                                          | -     |
| dms:instance:create               | Grants permission to create instance.                  | Write        | rabbitmq *                  | <ul style="list-style-type: none"> <li><a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li><a href="#">g:TagKeys</a></li> <li><a href="#">g:EnterpriseProjectId</a></li> <li><a href="#">dms:ssl</a></li> <li><a href="#">dms:publicIp</a></li> </ul> | -     |

| Action                     | Description                                             | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                                   | Alias                 |
|----------------------------|---------------------------------------------------------|--------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| dms:instance:update        | Grants permission to modify instance.                   | Write        | rabbitmq *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul> | • dms:instance:modify |
| dms:instance:getDetail     | Grants permission to query instance detail information. | Read         | rabbitmq *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul>                                                                                              | • dms:instance:get    |
| dms:instance:delete        | Grants permission to delete instance.                   | Write        | rabbitmq                    | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul>                                                                                              | -                     |
| dms:instance:resetAuthInfo | Grants permission to reset access password of instance. | Write        | rabbitmq                    | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul>                                                                                              | -                     |
| dms:plugin:list            | Grants permission to list plugins of instance.          | List         | rabbitmq                    | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul>                                                                                              | • dms:instance:list   |

| Action                  | Description                                                 | Access Level | Resource Type (*: required) | Condition Key                                                                                                  | Alias                                                                 |
|-------------------------|-------------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| dms:plugin:modifyStatus | Grants permission to enable or disable plugins of instance. | Write        | rabbitmq                    | <ul style="list-style-type: none"> <li>g:ResourceTag/&lt;tag-key&gt;</li> <li>g:EnterpriseProjectId</li> </ul> | <ul style="list-style-type: none"> <li>dms:instance:modify</li> </ul> |

Each API of DMS for RabbitMQ usually supports one or more actions. [Table 3-208](#) lists the supported actions and dependencies.

**Table 3-208** Actions and dependencies supported by DMS for RabbitMQ APIs

| API                                                           | Action                 | Dependencies                                                                                                                                                              |
|---------------------------------------------------------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POST /v2/{project_id}/instances/action                        | dms:instance:delete    | -                                                                                                                                                                         |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-209](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for DMS for RabbitMQ.

**Table 3-209** Resource types supported by DMS for RabbitMQ

| Resource Type | URN                                              |
|---------------|--------------------------------------------------|
| rabbitmq      | dms:<region>:<account-id>:rabbitmq:<instance-id> |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains **condition keys** and **operators**.

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see **Global Condition Keys**.
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, dms) apply only to operations of the xx service. For details, see **Table 3-210**.
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see **operators**.

### Service-specific condition keys supported by DMS for RabbitMQ

The following table lists the condition keys that you can define in identity policies for DMS for RabbitMQ. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-210** Service-specific condition keys supported by DMS for RabbitMQ

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                                                   |
|--------------------------------|---------|-------------------------------|-------------------------------------------------------------------------------|
| dms:ssl                        | boolean | Single-valued                 | Filters access based on whether the instance is enabled for SSL access.       |
| dms:publicIp                   | boolean | Single-valued                 | Filters access based on whether the instance is enabled for public IP access. |

### 3.10.4 Distributed Message Service for RocketMQ (RocketMQ)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

#### Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by DMS for RocketMQ, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.

- If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by DMS for RocketMQ, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for DMS for RocketMQ.

**Table 3-211** Actions supported by DMS for RocketMQ

| Action              | Description                               | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                                                     | Alias               |
|---------------------|-------------------------------------------|--------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| dms:instance:list   | Grants permission to query instance list. | List         | rocketmq *                  | <a href="#">g:EnterpriseProjectId</a>                                                                                                                                                                                                                             | -                   |
| dms:instance:create | Grants permission to create instance.     | Write        | rocketmq *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">dms:ssl</a></li> <li>• <a href="#">dms:publicIp</a></li> </ul> | -                   |
| dms:instance:update | Grants permission to modify instance.     | Write        | rocketmq *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> </ul>                   | dms:instance:modify |

| Action                    | Description                                             | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                      | Alias               |
|---------------------------|---------------------------------------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| dms:instance:getDetail    | Grants permission to query instance detail information. | Read         | rocketmq *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dms:instance:get    |
| dms:instance:modifyConfig | Grants permission to modify instance config.            | Write        | rocketmq                    | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -                   |
| dms:instance:delete       | Grants permission to delete instance.                   | Write        | rocketmq                    | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | -                   |
| dms:message:export        | Grants permission to export messages.                   | Write        | rocketmq                    | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dms:instance:modify |
|                           |                                                         |              | topic                       | -                                                                                                                                                  |                     |
| dms:message:get           | Grants permission to query message detail.              | Read         | rocketmq                    | <ul style="list-style-type: none"> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:EnterpriseProjectId</a></li> </ul> | dms:instance:get    |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-213](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for DMS for RocketMQ.

**Table 3-213** Resource types supported by DMS for RocketMQ

| Resource Type | URN                                                        |
|---------------|------------------------------------------------------------|
| topic         | dms:<region>:<account-id>:topic:<instance-id>/<topic-name> |

| Resource Type | URN                                                                        |
|---------------|----------------------------------------------------------------------------|
| consumerGroup | dms:<region>:<account-id>:consumerGroup:<instance-id>/<consumerGroup-name> |
| rocketmq      | dms:<region>:<account-id>:rocketmq:<instance-id>                           |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains [condition keys](#) and [operators](#).

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see [Global Condition Keys](#).
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, dms for rocketmq) apply only to operations of the xx service. For details, see [Table 3-214](#).
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see [operators](#).

### Service-specific condition keys supported by DMS for RocketMQ

The following table lists the condition keys that you can define in identity policies for DMS for RocketMQ. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-214** Service-specific condition keys supported by DMS for RocketMQ

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                                                   |
|--------------------------------|---------|-------------------------------|-------------------------------------------------------------------------------|
| dms:ssl                        | boolean | Single-valued                 | Filters access based on whether the instance is enabled for SSL access.       |
| dms:publicIp                   | boolean | Single-valued                 | Filters access based on whether the instance is enabled for public IP access. |

### 3.10.5 API Gateway (APIG)

IAM provides system-defined identity policies to define typical cloud service permissions. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.

- You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
- If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
- Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by apig, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by apig, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for apig.

**Table 3-215** Actions supported by apig

| Action          | Description                                                 | Access Level | Resource Type (*: required) | Condition Key                                 | Alias                                                                |
|-----------------|-------------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------|----------------------------------------------------------------------|
| apig:acl:list   | Grants permission to query all the access control policies. | List         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>• apig:acls:list</li> </ul>   |
| apig:acl:create | Grants permission to create an access control policy.       | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>• apig:acls:create</li> </ul> |

| Action                   | Description                                                             | Access Level | Resource Type (*: required) | Condition Key                                 | Alias                                                                  |
|--------------------------|-------------------------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------|------------------------------------------------------------------------|
| apig:acl:batch Delete    | Grants permission to delete multiple access control policies.           | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:acls:delete</li> </ul>     |
| apig:acl:delete          | Grants permission to delete an access control policy.                   | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:acls:delete</li> </ul>     |
| apig:acl:get             | Grants permission to query the details of an access control policy.     | Read         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:acls:get</li> </ul>        |
| apig:acl:update          | Grants permission to modify an access control policy.                   | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:acls:update</li> </ul>     |
| apig:api:bindAcl         | Grants permission to bind an access control policy to a specified API.  | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:bindAcls</li> </ul>   |
| apig:api:batch UnbindAcl | Grants permission to unbind multiple access control policies from APIs. | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:unbindAcls</li> </ul> |
| apig:api:unbindAcl       | Grants permission to unbind an access control policy from an API.       | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:unbindAcls</li> </ul> |

| Action                                | Description                                                                                                | Access Level | Resource Type (*: required) | Condition Key                                 | Alias                                                                       |
|---------------------------------------|------------------------------------------------------------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------|-----------------------------------------------------------------------------|
| apig:api:listBoundAcl                 | Grants permission to query the access control policies that have been bound to a specified API.            | List         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:listBoundAcls</li> </ul>   |
| apig:acl:listBoundApi                 | Grants permission to query the APIs to which an access control policy has been bound.                      | List         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:acls:listBoundApis</li> </ul>   |
| apig:acl:listUnboundApi               | Grants permission to query the published APIs to which an access control policy has not been bound.        | List         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:acls:listUnboundApis</li> </ul> |
| apig:api:bindRequestThrottling        | Grants permission to bind a request throttling policy to an API that has been published in an environment. | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:bindThrottles</li> </ul>   |
| apig:api:batchUnbindRequestThrottling | Grants permission to unbind request throttling policies from APIs.                                         | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:unbindThrottles</li> </ul> |

| Action                                | Description                                                                                                 | Access Level | Resource Type (*: required) | Condition Key                                 | Alias                                                                            |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------|----------------------------------------------------------------------------------|
| apig:api:unbindRequestThrottling      | Grants permission to unbind a request throttling policy from an API.                                        | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:unbindThrottles</li> </ul>      |
| apig:requestThrottling:listBoundApi   | Grants permission to query the APIs to which a specified request throttling policy has been bound.          | List         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:throttles:listBoundApis</li> </ul>   |
| apig:api:listBoundRequestThrottling   | Grants permission to query the request throttling policies that have been bound to an API.                  | List         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:listBoundThrottles</li> </ul>   |
| apig:requestThrottling:listUnboundApi | Grants permission to query the self-developed APIs to which a request throttling policy has not been bound. | List         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:throttles:listUnboundApis</li> </ul> |
| apig:apiGroup:list                    | Grants permission to query API groups.                                                                      | List         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:groups:list</li> </ul>               |

| Action                                    | Description                                                                                                  | Access Level | Resource Type (*: required) | Condition Key                                 | Alias                                                                |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------|----------------------------------------------------------------------|
| apig:apiGroup:create                      | Grants permission to create an API group. An API group is an API management unit and the entry to a service. | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:groups:create</li> </ul> |
| apig:apiGroup:delete                      | Grants permission to delete an API group.                                                                    | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:groups:delete</li> </ul> |
| apig:apiGroup:get                         | Grants permission to query the details of an API group.                                                      | Read         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:groups:get</li> </ul>    |
| apig:apiGroup:update                      | Grants permission to modify the attributes of an API group.                                                  | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:groups:update</li> </ul> |
| apig:apiGroup:checkApiGroupNameExistOrNot | Grants permission to check whether the API group name exists.                                                | Read         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:groups:get</li> </ul>    |
| apig:api:list                             | Grants permission to query APIs to return details and publication information of the APIs.                   | List         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:list</li> </ul>     |
| apig:api:create                           | Grants permission to create an API.                                                                          | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:create</li> </ul>   |

| Action                                   | Description                                                                                           | Access Level | Resource Type (*: required) | Condition Key                                 | Alias                                                                                          |
|------------------------------------------|-------------------------------------------------------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------|------------------------------------------------------------------------------------------------|
| apig:api:delete                          | Grants permission to delete an API.                                                                   | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:delete</li> </ul>                             |
| apig:api:get                             | Grants permission to query the details of an API.                                                     | Read         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:get</li> </ul>                                |
| apig:api:update                          | Grants permission to modify the information about an API.                                             | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:update</li> </ul>                             |
| apig:api:onlineOrOffline                 | Grants permission to publish an API or take an API offline.                                           | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:publish</li> <li>apig:apis:offline</li> </ul> |
| apig:api:batchDelete                     | Grants permission to delete multiple APIs.                                                            | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:delete</li> </ul>                             |
| apig:api:checkApiPathOrApiNameExistOrNot | Grants permission to verify the API definition, that is, whether the API path or name already exists. | Read         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:get</li> </ul>                                |
| apig:api:debug                           | Grants permission to debug an API.                                                                    | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:debug</li> </ul>                              |

| Action                        | Description                                                                                                                                     | Access Level | Resource Type (*: required) | Condition Key                                 | Alias                                                                                          |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------|------------------------------------------------------------------------------------------------|
| apig:api:batchOnlineOrOffline | Grants permission to publish multiple APIs in an environment or to remove multiple APIs from the environment in which they have been published. | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:publish</li> <li>apig:apis:offline</li> </ul> |
| apig:api:listHistoryVersion   | Grants permission to query the historical versions of an API.                                                                                   | List         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:get</li> </ul>                                |
| apig:api:switchVersion        | Grants permission to switch the version of an API.                                                                                              | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:publish</li> </ul>                            |
| apig:api:getRuntimeDefinition | Grants permission to query the runtime definition of an API in a specified environment.                                                         | Read         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:get</li> </ul>                                |
| apig:api:deleteHistoryVersion | Grants permission to remove an effective version of an API.                                                                                     | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:offline</li> </ul>                            |

| Action                     | Description                                                                  | Access Level | Resource Type (*: required) | Condition Key                                 | Alias                                                                  |
|----------------------------|------------------------------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------|------------------------------------------------------------------------|
| apig:api:getHistoryVersion | Grants permission to query the details of a specified API version.           | Read         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:get</li> </ul>        |
| apig:app:list              | Grants permission to query apps.                                             | List         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apps:list</li> </ul>       |
| apig:app:create            | Grants permission to create an app.                                          | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apps:create</li> </ul>     |
| apig:app:delete            | Grants permission to delete an app.                                          | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apps:delete</li> </ul>     |
| apig:app:get               | Grants permission to query the details of an app.                            | Read         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apps:get</li> </ul>        |
| apig:app:update            | Grants permission to modify the information about an app.                    | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:update</li> </ul>     |
| apig:app:listAppCode       | Grants permission to query the AppCodes of an app.                           | List         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:appCodes:list</li> </ul>   |
| apig:app:createAppCode     | Grants permission to create an AppCode for an app for simple authentication. | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:appCodes:create</li> </ul> |

| Action                   | Description                                                                                        | Access Level | Resource Type (*: required) | Condition Key                                 | Alias                                                                  |
|--------------------------|----------------------------------------------------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------|------------------------------------------------------------------------|
| apig:app:generateAppCode | Grants permission to generate a random AppCode.                                                    | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:appCodes:update</li> </ul> |
| apig:app:deleteAppCode   | Grants permission to delete an AppCode.                                                            | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:appCodes:delete</li> </ul> |
| apig:app:getAppCode      | Grants permission to query the details of an AppCode created for an app for simple authentication. | Read         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:appCodes:get</li> </ul>    |
| apig:app:resetSecret     | Grants permission to reset the AppSecret of an app.                                                | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apps:update</li> </ul>     |
| apig:app:validate        | Grants permission to check whether an app exists.                                                  | Read         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apps:get</li> </ul>        |
| apig:app:getBoundQuota   | Grants permission to query the application quota associated with a specified client application.   | Read         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apps:get</li> </ul>        |

| Action                  | Description                                                                                                       | Access Level | Resource Type (*: required) | Condition Key                                 | Alias                                                                       |
|-------------------------|-------------------------------------------------------------------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------|-----------------------------------------------------------------------------|
| apig:app:bindApi        | Grants permission to bind the app to the API in the environment.                                                  | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:grantAppAccess</li> </ul>  |
| apig:app:unbindApi      | Grants permission to cancel the authorization of an app for accessing an API.                                     | Write        | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:revokeAppAccess</li> </ul> |
| apig:app:listBoundApi   | Grants permission to query the APIs to which a specified app has been bound.                                      | List         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apps:listBoundApis</li> </ul>   |
| apig:api:listBoundApp   | Grants permission to query the apps that have been bound to a specified API.                                      | List         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:listBoundApps</li> </ul>   |
| apig:app:listUnboundApi | Grants permission to query the self-developed APIs to which an app has not been bound in a specified environment. | List         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apps:listUnboundApis</li> </ul> |

| Action                  | Description                                                 | Access Level | Resource Type (*: required) | Condition Key                                 | Alias                                                                                        |
|-------------------------|-------------------------------------------------------------|--------------|-----------------------------|-----------------------------------------------|----------------------------------------------------------------------------------------------|
| apig:api:export         | Grants permission to export APIs in a specified API group.  | Read         | instance *                  | <a href="#">g:ResourceTag/&lt;tag-key&gt;</a> | <ul style="list-style-type: none"> <li>apig:apis:export</li> </ul>                           |

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-217](#), the resource URN must be specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for apig.

**Table 3-217** Resource types supported by apig

| Resource Type | URN                                               |
|---------------|---------------------------------------------------|
| instance      | apig:<region>:<account-id>:instance:<instance-id> |

## Conditions

apig does not support service-specific condition keys in identity policies. It can only use global condition keys applicable to all services. For details, see [Global Condition Keys](#).

### 3.10.6 Distributed Cache Service (DCS)

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to an entity. They only set the permissions boundary for the entity. When SCPs are attached to an organizational unit (OU) or a member account, the SCPs do not directly grant permissions to that OU or member account. Instead, the SCPs only determine what permissions are available for that member account or those member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The Access Level column describes how the action is classified (List, Read, or Write). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The Resource Type column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your identity policy statements.
  - If this column includes a resource type, you must specify the URN in the Resource element of your identity policy statements.
  - Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by DCS, see [Resources](#).

- The Condition Key column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the Resource Type column has values for an action, the condition key takes effect only for the listed resource types.
  - If the Resource Type column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the Condition Key column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by DCS, see [Conditions](#).

- The Alias column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for DCS.

**Table 3-218** Actions supported by DCS

| Action                      | Description                                                        | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                                                                       | Alias             |
|-----------------------------|--------------------------------------------------------------------|--------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| dcs:instance:create         | Grants permission to create DCS instances.                         | Write        | -                           | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:RequestTag/&lt;tag-key&gt;</a></li> <li>• <a href="#">g:TagKeys</a></li> <li>• <a href="#">dcs:backupEnabled</a></li> </ul> | -                 |
| dcs:instance:list           | Grants permission to query the DCS instance list.                  | List         | -                           | <a href="#">g:EnterpriseProjectId</a>                                                                                                                                                                                               | -                 |
| dcs:instance:exportListFile | Grants permission to download the exported DCS instance list file. | List         | -                           | -                                                                                                                                                                                                                                   | dcs:instance:list |
| dcs:instance:delete         | Grants permission to delete DCS instances.                         | Write        | instance                    | <a href="#">g:EnterpriseProjectId</a>                                                                                                                                                                                               | -                 |
| dcs:instance:get            | Grants permission to query DCS instances.                          | Read         | instance *                  | <a href="#">g:EnterpriseProjectId</a>                                                                                                                                                                                               | -                 |
| dcs:instance:modify         | Grants permission to modify DCS instances.                         | Write        | instance *                  | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">dcs:backupEnabled</a></li> </ul>                                                                                              | -                 |
| dcs:instance:scale          | Grants permission to scale up DCS instances.                       | Write        | instance *                  | <a href="#">g:EnterpriseProjectId</a>                                                                                                                                                                                               | -                 |

| dc:quota:get            | Grants permission to query tenant quotas.                                                 | Read         | -                           | -             | -                       |
| dc:instance:webcli      | Grants permission to connect DCS instances with WebCli.                                   | Write        | instance *                  | -             | -                       |
| dc:clientiptrans:modify | Grants permission to enables or disables transparent transmission of client IP addresses. | Write        | instance *                  | -             | dc:clientiptrans:modify |
| dc:clients:list         | Grants permission to query redis client list.                                             | Read         | instance *                  | -             | -                       |
| dc:clients:kill         | Grants permission to kill redis client.                                                   | Write        | instance *                  | -             | -                       |
| dc:ssl:get              | Grants permission to obtain SSL certificate information.                                  | Read         | instance *                  | -             | -                       |
| dc:ssl:modify           | Grants permission to modify SSL switch configuration.                                     | Write        | instance *                  | -             | -                       |
| dc:job:get              | Grants permission to obtain predecessor check results.                                    | Read         | -                           | -             | -                       |

| Action          | Description                                           | Access Level | Resource Type (*: required) | Condition Key | Alias |
|-----------------|-------------------------------------------------------|--------------|-----------------------------|---------------|-------|
| dcg:task:list   | Grants permission to obtain the background task list. | List         | -                           | -             | -     |
| dcg:task:delete | Grants permission to delete background task records.  | Write        | -                           | -             | -     |

Each API of DCS usually supports one or more actions. [Table 3-219](#) lists the supported actions and dependencies.

**Table 3-219** Actions and dependencies supported by DCS APIs

| API                                          | Action              | Dependencies                                                                                                                                                                                                                               |
|----------------------------------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Resources

A resource type indicates the resources that an identity policy applies to. If you specify a resource type for any action in [Table 3-220](#), the resource URN must be

specified in the identity policy statements using that action, and the identity policy applies only to resources of this type. If no resource type is specified, the Resource element is marked with an asterisk (\*) and the identity policy applies to all resources. You can also set condition keys in an identity policy to define resource types.

The following table lists the resource types that you can define in identity policy statements for DCS.

**Table 3-220** Resource types supported by DCS

| Resource Type | URN                                             |
|---------------|-------------------------------------------------|
| instance      | dc<region>:<account-id>:instance:<instance-id>  |
| migrationTask | dc<region>:<account-id>:migrationTask:<task-id> |

## Conditions

### Condition Key Overview

A Condition element lets you specify conditions for when an identity policy is in effect. It contains **condition keys** and **operators**.

- The condition key that you specify can be a global condition key or a service-specific condition key.
  - Global condition keys (with the g: prefix) apply to all actions. Cloud services do not need to provide user identity information. Instead, the system automatically obtains such information and authenticates users. For details, see **Global Condition Keys**.
  - Service-specific condition keys (with the abbreviation of a service name plus a colon as the prefix, for example, dcs) apply only to operations of the xx service. For details, see **Table 3-221**.
  - The number of values associated with a condition key in the request context of an API call makes the condition key single-valued or multivalued. Single-valued condition keys have at most one value in the request context of an API call. Multivalued condition keys can have multiple values in the request context of an API call. For example, a request can originate from at most one VPC endpoint, so g:SourceVpce is a single-valued condition key. You can tag resources and include multiple tag key-value pairs in a request, so g:TagKeys is a multivalued condition key.
- A condition operator, condition key, and a condition value together constitute a complete condition statement. An identity policy can be applied only when its request conditions are met. For supported condition operators, see **operators**.

### Service-specific condition keys supported by DCS

The following table lists the condition keys that you can define in identity policies for DCS. You can include these condition keys to specify conditions for when your identity policy is in effect.

**Table 3-221** Service-specific condition keys supported by DCS

| Service-specific Condition Key | Type    | Single-valued/<br>Multivalued | Description                                                     |
|--------------------------------|---------|-------------------------------|-----------------------------------------------------------------|
| dcs:backupEnabled              | boolean | Single-valued                 | Filters access for enabling automatic backup for DCS instances. |

## 3.11 Developer Services

### 3.11.1 ServiceStage

IAM provides system-defined identity policies to define common actions supported by cloud services. You can also create custom identity policies using the actions supported by cloud services for more refined access control.

In addition to IAM, the [Organizations](#) service also provides [Service Control Policies \(SCPs\)](#) to set access control policies.

SCPs do not actually grant any permissions to a principal. They only set the permissions boundary for the principal. When SCPs are attached to a member account or an organizational unit (OU), they do not directly grant permissions to that member account or OU. Instead, the SCPs just determine what permissions are available for that member account or the member accounts under that OU. The granted permissions can be applied only if they are allowed by the SCPs.

To learn more about how IAM is different from Organizations for access control, see [How IAM Is Different from Organizations for Access Control?](#)

This section describes the elements used by IAM custom identity policies and Organizations SCPs. The elements include actions, resources, and conditions.

- For details about how to use these elements to edit an IAM custom identity policy, see [Creating a Custom Identity Policy](#).
- For details about how to use these elements to edit a custom SCP, see [Creating an SCP](#).

## Actions

Actions are specific operations that are allowed or denied in an identity policy.

- The **Access Level** column describes how the action is classified (**List**, **Read**, or **Write**). This classification helps you understand the level of access that an action grants when you use it in an identity policy.
- The **Resource Type** column indicates whether the action supports resource-level permissions.
  - You can use a wildcard (\*) to indicate all resource types. If this column is empty (-), the action does not support resource-level permissions and you must specify all resources ("\*") in your policy statements.

- If this column includes a resource type, you must specify the URN in the Resource element of your statements.
- Required resources are marked with asterisks (\*) in the table. If you specify a resource in a statement using this action, then it must be of this type.

For details about the resource types defined by ServiceStage, see [Resources](#).

- The **Condition Key** column contains keys that you can specify in the Condition element of an identity policy statement.
  - If the **Resource Type** column has values for an action, the condition key takes effect only for the listed resource types.
  - If the **Resource Type** column is empty (-) for an action, the condition key takes effect for all resources that action supports.
  - If the **Condition Key** column is empty (-) for an action, the action does not support any condition keys.

For details about the condition keys defined by ServiceStage, see [Condition](#).

- The **Alias** column lists the policy actions that are configured in identity policies. With these actions, you can use APIs for policy-based authorization. For details, see [Policies and Identity Policies](#).

The following table lists the actions that you can define in identity policy statements for ServiceStage.

**Table 3-222** Actions supported by ServiceStage

| Action                             | Description             | Access Level | Resource Type (*: required) | Condition Key                                                                                                                                                                          | Alias                   |
|------------------------------------|-------------------------|--------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| servicestage:app:getApplication    | Querying an application | read         | app                         | <ul style="list-style-type: none"> <li>• <a href="#">g:EnterpriseProjectId</a></li> <li>• <a href="#">g:ResourceTag/&lt;tag-key&gt;</a></li> </ul>                                     | servicestage:app:get    |
